

HP LTO Ultrium 6 Tape Drives Technical Reference Manual Volume 3: Host Interface Guide

Abstract

This is one of five volumes that document HP LTO Ultrium 6 tape drives (Fibre Channel and SAS). This volume provides host interface information. See [“Support and other resources”](#) (page 263) for details of the other guides.

1 Interface Implementation

HP LTO Ultrium 6 drives use Fibre Channel or Serial Attached SCSI (SAS) as the interface to connect to the host system.

This chapter gives an overview of how the interface operates. Full details of the messages are given in “Messages” (page 18), of SAS response frames and task management functions in “Response frames and task management functions” (page 19), and of commands in “Introduction to commands” (page 22) and “Commands” (page 29).

The Fibre Channel interface

Fibre Channel is an industry standard, approved by the American National Standards Institute (ANSI). You are recommended to read the ANSI standard documents in conjunction with this manual. The ANSI specifications define the interface in general while this document describes the HP LTO Ultrium implementation.

The Fibre Channel implementation provides a drive with a standard set of features and functions. These include the following:

- Implementation of all mandatory and most optional commands of the Sequential Access command set, also SPC (SCSI Primary Commands)
- Auto-negotiation to 8 Gb/s, 4 Gb/s and 2 Gb/s with an 8 Gb/s transceiver, and 4 Gb/s, 2 Gb/s and 1 Gb/s with a 4 Gb/s transceiver.
- Dual port capability
- Conformance to the following SCSI standards:
 - SAM-4 ANSI INCITS 447-2008
 - FCP-3 ANSI INCITS.416:2006
 - FC-AL-2 ANSI INCITS.350:200x with AM1:2002
 - FC-FS3 ANSI INCITS.373-2003
 - FC-Tape ANSI INCITS TR-24:1999
 - FC-FLA ANSI INCITS TR-20:1998
 - SPC-4 T10/1731-D revision 23
 - SSC-4 (no version claimed)

Supported task management functions

The following task management functions are supported by the drives:

- ABORT TASK
- ABORT TASK SET
- CLEAR TASK SET
- LOGICAL UNIT RESET
- QUERY ASYNCHRONOUS EVENT
- QUERY TASK SET
- TARGET RESET

For implementation details on these, see [“Response frames and task management functions”](#) (page 19).

The SAS interface

Serial Attached SCSI (SAS) is an industry standard, approved by the American National Standards Institute (ANSI). You are recommended to read the ANSI standard documents in conjunction with this manual. The ANSI specifications defines the interface in general while this document describes the HP LTO Ultrium implementation.

The SAS implementation provides a drive with a standard set of features and functions. These include the following:

- Implementation of all mandatory and most optional commands of the Sequential Access command set
- SAS-2 compliant interface
- 6 Gbps serial transfers
- Conformance to the following SCSI standards:
 - SAM-4 ANSI INCITS 447-2008
 - SAS-2 (no version claimed)
 - SPC-4 T10/1731-D revision 23
 - SSC-4 (no version claimed)

NOTE:

There is backward compatibility with 3 Gb/s and 1.5 Gb/s SAS.

Supported task management functions

The following task management functions are supported by the drives:

- ABORT TASK
- ABORT TASK SET
- CLEAR TASK SET
- LOGICAL UNIT RESET
- QUERY ASYNCHRONOUS EVENT
- QUERY TASK
- QUERY TASK SET
- TARGET RESET

For implementation details on these, see [“Response frames and task management functions”](#) (page 19)

Supported commands

See [“Introduction to commands”](#) (page 22) for a list of supported commands. They include all Mandatory and Extended commands and most Optional commands.

For implementation details on these commands, see [“Commands”](#) (page 29).

SCSI features

Design approach

The features supported by the drive are based on standards, both official and de facto. The drive is fully compliant with the current SCSI standards: SPC-4, SSC-4, SAM-4, and the relevant transport protocol (such as SAS-2 for SAS drives). All mandatory commands and features are supported, as well as some that are optional. In addition, some features from older standards are still supported for backwards compatibility.

Power-on

The first command received from an initiator (other than INQUIRY, REQUEST SENSE and REPORT LUNS) will result in CHECK CONDITION status, with UNIT ATTENTION sense data reported for the power on. Once the drive has completed its self-test and set-up procedures, it will attempt to reload any tape that is already present in the drive. It may take some time to recover the tape, especially if it was positioned near EOM when the drive was power-cycled. During tape recovery, medium access commands will result in a sense key of NOT READY, with additional sense of 0401h (drive in process of becoming ready).

Reset strategy

Following on the receipt of a Logical Unit Reset Task Management Function, the following actions will be carried out by the drive:

- All tasks queued for that Logical Unit will be aborted.
- Mode parameters are cleared to their default values.
- The drive's reservation is released, but not the persistent reservation.
- Any buffered writes are flushed to tape.
- If Rewind-On-Reset has been configured, the tape will be rewound (Logical Position is BOM).
- A UNIT ATTENTION condition is set, based on the type of reset.

The first command from any initiator (other than INQUIRY, REQUEST SENSE and REPORT LUNS) to that particular Logical Unit will result in CHECK CONDITION status with UNIT ATTENTION sense data for the reset.

It is possible to force a hard reset in the drive, which is equivalent to a soft power-cycle.

The Reset button on the front panel is connected to the reset circuitry of the drive. The effect of depressing the Reset button is equivalent to power-cycling the drive.

The ACI_RST_L line on the ACI connector will also activate the reset circuitry when pulled low in an ACI automation environment. Activating the ACI_RST_L line in an ADI automation environment will result in an ADT port logout and will not activate the reset circuitry.

The contents of the tape and cartridge memory may not be consistent after a reset and any data in the drive buffer will be lost.

Abort handling

Link error handling (SAS drives)

In normal operation, random errors will occasionally be encountered on the link between the initiator and the tape drive. A single bit error may result in a frame with a bad CRC value, or in a communication failure if the error corrupts one of the special "primitive" messages used to manage the link. The SAS standard provides an optional mechanism to retry most link errors; this mechanism is known as Transport Layer Retries. See "[SAS Logical Unit Control mode page](#)" (page 112). By default the tape drive has retries disabled; an initiator which is also capable of handling retries

must enable them in the tape drive typically during the discovery phase. The tape drive will also support the TLR Control field in SSP command frames.

The following table indicates the drive behavior both with and without transport layer retries enabled, for a variety of possible error scenarios:

Error Type	Behavior	
	Transport Layer Retries Disabled	Transport Layer Retries Enabled
Data frame CRC error on writes	The drive sends NAK. The initiator aborts the command using the ABORT task management functions.	The drive sends NAK. The initiator restarts data transfer with the Changing Data Ptr bit set for the first resent frame.
Data frame CRC error on reads	The initiator sends NAK. The drive aborts the command with a sense key of ABORTED COMMAND and additional sense of 4B04h (NAK received).	The initiator sends NAK, drive restarts transfer from start of burst with Changing Data Ptr bit set for 1st resent frame
XFER_RDY frame CRC error	The initiator sends NAK. The drive aborts the command with a sense key of ABORTED COMMAND and additional sense of 4B04h (NAK received)	The initiator sends NAK. The drive re-issues XFER_RDY with the Retransmit bit set and a fresh TPTT value.
Response frame CRC error	The initiator sends NAK. The drive re-sends the response frame with the Retransmit bit set.	The initiator sends NAK. The drive re-sends the response frame with the Retransmit bit set.
Loss of ACK for a write data frame	The initiator times out the operation and sends an ABORT task management function.	The drive completes the operation (since all data was received successfully) and sends GOOD status.
Loss of ACK for read data frame	The drive times out the operation and aborts the command with a sense key of ABORTED COMMAND and additional sense of 4B03 (ACK/NAK Timeout).	The drive times out the operation, then restarts the transfer from the start of the burst with the Changing Data Ptr bit set for the first resent frame.
Loss of ACK for a XFER_RDY frame	The drive times out the operation and aborts the command with a sense key of ABORTED COMMAND and additional sense of 4B03 (ACK/NAK Timeout).	The drive times out the operation, then re-issues XFER_RDY with the Retransmit bit set and a fresh TPTT value.
Loss of ACK for a response frame	The drive times out the operation, then re-sends the response frame with the Retransmit bit set.	The drive times out the operation, then re-sends the response frame with the Retransmit bit set.

Multi-initiator support

All drives are designed to operate within a multi-initiator environment. The maximum number of concurrently connected initiators is:

- *FC drives*: 511 (shared across both ports)
- *SAS drives*: 32 (shared across both ports)

Sense Data, Unit Attention and Deferred Errors are maintained for each initiator. Most Mode parameters are common to all initiators.

Media access commands are executed in order of receipt. Non-media access commands are executed in order of receipt, but will queue-jump media access commands.

The drive implements a simple queueing model and will ignore 'Head of Queue' and 'Ordered Queueing' attributes.

FC drives support the full command queuing model with a queue depth of 4. See “Standard Inquiry Data format (LUN0)” (page 38) for details of the BQue and CmdQue bits which define this support.

Fibre Channel operation

The following sections have information specific to Fibre Channel operation:

- “Fibre Channel Logical Unit Control mode page” (page 112)
- “Fibre Channel Port Control mode page” (page 113)
- “Vital Product Data pages” (page 41)

Fibre Channel addressing

Before describing HP's implementation of Fibre Channel addressing, the concepts of **Names** and **Addresses** need to be clarified.

Names

Names are 64-bit identifiers assigned permanently to the tape drive during manufacture. They are commonly referred to as World Wide Names since they must be guaranteed unique. The names are typically used for identifying the device to operating systems, since addresses are assigned dynamically. One of the principal uses for WWNs in Storage Area Networks is to enable the division of fabrics into separate zones for security, load balancing, redundancy or manageability purposes.

There are at least eight different name formats distinguished by the Network Address Authority (NAA). Only one is used on HP LTO Ultrium drives. This is the IEEE Registered Name (NNA=5) and has the following format:

This name is made up of three fields:

- NAA Identifier (4 bits). “5” indicates a IEEE Registered Name.
- IEEE Company ID (24 bits). Assigned by IEEE to the company.
- Vendor Specified ID (36 bits). Assigned by the company.

Addresses

Each Fibre Channel port has an Address Identifier, which is unique on the fabric to which the port is attached. Address Identifiers are assigned automatically during link initialization and fabric login.

Each Fibre Channel port also has a Port Address which is assigned during loop initialization and/or Fabric Login. This is a 24-bit value in the following format:

The AL_PA is the Arbitrated Loop Physical Address. This is normally assigned dynamically during loop initialization.

If the drive is on a loop that is not attached to a fabric (in other words, when it is on a private link), the top two bytes will be zero. If the loop is attached to a fabric, the top two bytes are assigned when it logs into the fabric.

Together, the three bytes provide a unique address on the Fibre Channel fabric that is used for frame addressing. It forms the equivalent of the Target ID or Initiator ID in SCSI.

HP's implementation of names and addresses

The HP implementation uses three adjacent IEEE Registered Names:

- The first (last bits = 00) is used as the *Port 0 World Wide Name*.
- The second (last bits = 01) is used as the *Port 1 World Wide Name* (full-height drives only).
- The third name (last bits = 10) is used for the *Device World Wide Name*.

(These are assigned during manufacture from HP's pool of names, although only the first will actually be stored in the drive NV-RAM).

The port addresses will be assigned using the 'standard' AL_PA initialization mechanisms. The 'Fibre Channel Port Control mode page' controls this. The drive has the ability to support hard addresses as part of this scheme.

There are two further WWNs, the *SCSI Device WWN* (typically set equal to the Node WWN) and the *ADC Device WWN* (last bits = 11)

The values of the names can be obtained using the Device Identification Vital Product Information Page (part of the INQUIRY command).

Implications for libraries

- Normally a standalone drive will operate using its own factory-programmed 'hard' names.
- The drive knows it is in a library or other 'managed' environment since one of the signal lines on the Automation Interface will be tied down. In this guide, the term "Automation Interface" covers both ACI (Automation Control Interface) and ADI (Automation/Drive Interface).

In this case, the drive will not go on the FC loop or connect to the fabric until it is told to. The library can optionally configure new soft names (Port 0, Port 1 for full-height drives only, and Node Name) into the drive at this point. The drive will then use this as the origin of its names. The library manufacturer would be responsible for obtaining this IEEE Registered Name. It would be a property of the library, *not* the drive.

- If the library wants to 'warm swap' drives, it can. It just 'turns off' the drive with the soft name using the ACI and then turns on the spare drive, downloading the same name to it.
- If a drive is removed from the library, it will not have the ACI signal tied low and so will revert to its original hard name. It should forget the soft name in this case.
- After a power-cycle or hard reset soft names will revert to the original hard names assigned during manufacture.
- If the library controller breaks, the drive will continue to use the soft name last downloaded. This will allow drive access without confusing the host.

Field replaceable units

An FRU code identifies which part of the hardware is considered to have failed. These codes turn up in sense data byte 14 and as the sense code qualifier for sense codes 4400h (internal target failure) and 40XX (diagnostic failure).

Although there are no actual *Field Replaceable Units* on HP LTO Ultrium drives, the following sub-assemblies can be replaced at Repair Centres:

- Drive PCA
- Mechanism
- Head Assembly
- Front Panel

CD-ROM emulation (*SAS drives only*)

The One Button Disaster Recovery (OBDR) functionality in HP LTO Ultrium drives enables them to emulate CD-ROM devices in specific circumstances (also known as being in “Disaster Recovery” mode). The drive can then act as a boot device for PCs that support booting off CD-ROM.

A CD-ROM capable drive can be switched into CD-ROM mode by powering on with the eject button held down. The drive then alters its behavior as follows:

- The front panel lights flash a “warbling” sequence.
- CD-ROM commands are executed (as opposed to tape drive mode when they would be rejected). Commands specific to CD-ROM mode are READ 10, READ TOC and READ CAPACITY. In the case of SCSI commands 08h (READ), 1Bh (LOAD/UNLOAD) and 2Bh (LOCATE), these are interpreted as CD-ROM commands 08h (READ 6), 1Bh (START/STOP) and 2Bh (SEEK) respectively.
- Writing is disabled.
- Normal INQUIRY data is modified to add a field indicating that the drive supports CD emulation and to switch the peripheral device type field to indicate a CD-ROM drive.
- The mode header and mode block descriptor are modified.
- A CD-Emulation mode page is added.
- Mode data changes to reflect CD-ROM medium type and block size.
- Status reporting by the media access check is altered.
- The drive’s sense data when the media is not ready for access always indicates “loading”.

If a tape is inserted while the drive is in CD-ROM mode, the drive assumes that it will contain an image of a CD offset 20 blocks into the tape. It reads the first 250 kilobytes of this image into buffer space reserved for CD-caching. It then looks for a special message (“EL TORITO SPECIFICATION”) at the 8th byte of the 18th record of the image. If the drive fails to find this message, it ejects the tape and waits in CD-ROM mode for a properly-written CD-image tape to be inserted.

The drive will remain in CD-emulation mode until one of the following occurs:

- A MODE SELECT command switches it back to tape drive mode using the CD-emulation mode page.
- A Logical Unit Reset task management function or a HARD_RESET primitive sequence is received, following the reading of at least 100 blocks of CD-ROM data by a host.
- The user power-cycles the drive or resets it using the forced-eject mechanism.

NOTE: If the drive exits CD-ROM mode through either of the first two of these, the tape will remain at the last logical position when in CD-ROM mode.

2 Messages

Status

A Status byte is sent from the drive to the host during the Status phase at the end of each command as specified in the SCSI specification, unless the command has been cleared by an ABORT message, by a BUS DEVICE RESET message, or by a hard reset.

The Status bytes that the drive returns are as follows:

00h	GOOD: This status indicates that the drive has successfully completed the command.
02h	CHECK CONDITION: Any error, exception, or abnormal condition that causes sense data to be set returns CHECK CONDITION. The REQUEST SENSE command should be sent following this status to determine the nature of the error.
04h	CONDITION MET: This status will never be returned by an HP LTO Ultrium tape drive.
08h	BUSY: The drive is unable to execute the command at this time. Try again later. The drive tries to avoid using this status code during normal operation. It can sometimes be used after commands have been aborted, during power-on and if there are multiple selecting initiators.
10h	INTERMEDIATE: This status will never be returned by an HP LTO Ultrium tape drive.
14h	INTERMEDIATE CND: This status will never be returned by an HP LTO Ultrium tape drive.
18h	RESERVATION CONFLICT: Returned if the drive is reserved by another party. See the Reservation check.
22h	COMAND TERMINATED: This status will never be returned by an HP LTO Ultrium tape drive.
28h	TASK SET FULL
40h	ABORTED COMMAND

3 Response frames and task management functions

Response frames

This section describes the format of SAS response frames returned by HP LTO Ultrium tape drives. Response frames provide a way for the drive to report the outcome of all SCSI commands and task management functions:

	7	6	5	4	3	2	1	0	
0–7	Reserved (0)								
7	Status Qualifier (0000h)								
8									
10	Reserved (0)					DATAPRES			
11	Status								
12–15	Reserved (0)								
16	(MSB)	Sense Data Length (<i>n</i> bytes)						(LSB)	
19									
20	(MSB)	Response Data Length (<i>m</i> bytes)						(LSB)	
23									
24	Response Data (if any)								
23+ <i>m</i>									
24+ <i>m</i>	Sense Data (if any)								
23+ <i>m</i> + <i>n</i>									

DATAPRES	Specifies the format and content of the Status, Sense Data Length, Response Data Length, Response Data, and Sense Data fields:		
	Code	Name	Description
	00b	NO_DATA	Neither response data nor sense data are present
	01b	RESPONSE_DATA	Response data is present
	10b	SENSE_DATA	Sense data is present
	11b	Reserved	
Status	The Status byte is valid for all response frames, unless the DATAPRES field is set to RESPONSE_DATA. It indicates the outcome of the SCSI command:		
	00h	GOOD	The drive has successfully completed the command.
	02h	CHECK CONDITION	An error, exception, or abnormal condition has occurred that causes sense data to be set. Check the sense data in the RESPONSE frame to determine the nature of the error.
	04h	CONDITION MET	Never returned by an HP LTO Ultrium tape drive.
	08h	BUSY	The drive is unable to execute the command at this time. Try again later. The drive tries to avoid using this status code during normal operation.
	10h	INTERMEDIATE	Never returned by an HP LTO Ultrium tape drive.
	14h	INTERMEDIATE CND	Never returned by an HP LTO Ultrium tape drive.

	18h	RESERVATION CONFLICT	The drive is reserved by another party. See the Reservation check.
	22h	COMMAND TERMINATED	Never returned by an HP LTO Ultrium tape drive.
	28h	TASK SET FULL	The drive cannot accept another task at the moment because the internal limit has been reached. Try again later.
	30h	ACA ACTIVE	Never returned by an HP LTO drive.
	40h	TASK ABORTED	Returned to the host if the interface is reset by a different host on the same interface, or the interface is reset by the automation control interface.
Response Data	If the DATAPRES field is set to RESPONSE_DATA, the Status and Sense Data fields are not valid; the drive is reporting a response to a task management function or to an invalid request as indicated by the response code:		
	Code	Description	
	00h	Task management function complete ^a	
	02h	Invalid frame	
	04h	Task managements function not supported ^a	
	05h	Task management function failed ^a	
	08h	Task management function succeeded ^a	
	09h	Incorrect Logical Unit Number ^a	
	0Ah	Overlapped tag attempted ^b	
	All other codes are reserved.		

^a Only set for a task management frame.

^b Returned when a command/task management function or task management function/task management function tag conflicts.

Task management functions

This section includes all SCSI task management functions, both supported and unsupported.

Task Management functions provide an initiator and a target in the SAS domain with a means of managing specific operations or tasks. The supported functions are listed in this chapter.

In the following table, all the supported task management functions use the Logical Unit Number field, and ABORT TASK (01h) and QUERY TASK (80h) also use the Tag of Task to Be Managed field.

Code	Task Management Function	Description	Value	
			FC	SAS
01h	ABORT TASK	Performs the ABORT TASK task management function with: L = Logical Unit Number field Q = Tag of Task to Be Managed field	1	0
02h	ABORT TASK SET (SAS only)	Performs the ABORT TASK SET task management function with: L = Logical Unit Number field	1	1

Code	Task Management Function	Description	Value	
			FC	SAS
04h	CLEAR TASK SET	Performs the CLEAR TASK SET task management function with: L = Logical Unit Number field	1	1
08h	LOGICAL UNIT RESET	Performs the LOGICAL UNIT RESET task management function with: L = Logical Unit Number field	1	1
10h	TARGET RESET	Supported by FC for legacy FC host drivers.	1	0
10h	I_T NEXUS RESET		0	0
20h	Reserved			
40h	CLEAR ACA	<i>Not supported</i>	0	0
80h	QUERY TASK (SAS only)	Performs the QUERY TASK task management function with: L = Logical Unit Number field Q = Tag of Task to Be Managed field	0	1
81h	QUERY TASK SET		1	1
82h	QUERY ASYNCHRONOUS EVENT	Only supported for Fibre Channel.	1	1
others	Reserved			

4 Introduction to commands

This chapter contains notes relating to the SCSI commands listed in “Commands” (page 29).

Summary

The following table is a summary of the SCSI commands for sequential access devices, showing the operation code:

Opcode	Command Name
00h	TEST UNIT READY
01h	REWIND
03h	REQUEST SENSE
04h	FORMAT MEDIUM
05h	READ BLOCK LIMITS
08h	READ
08h	READ 6 (<i>CD-ROM, OBDR-capable drives only</i>)
0Ah	WRITE
0Bh	SET CAPACITY
10h	WRITE FILEMARKS
11h	SPACE 6
12h	INQUIRY
13h	VERIFY
15h	MODE SELECT
16h	RESERVE UNIT
17h	RELEASE UNIT
19h	ERASE
1Ah	MODE SENSE
1Bh	LOAD/UNLOAD
1Bh	START/STOP UNIT (<i>CD-ROM, OBDR-capable drives only</i>)
1Ch	RECEIVE DIAGNOSTIC RESULTS
1Dh	SEND DIAGNOSTIC
1Eh	PREVENT/ALLOW MEDIUM REMOVAL
25h	READ CAPACITY (<i>CD-ROM, OBDR-capable drives only</i>)
28h	READ 10 (<i>CD-ROM, OBDR-capable drives only</i>)
2Bh	LOCATE 10
2Bh	SEEK (<i>CD-ROM, OBDR-capable drives only</i>)
34h	READ POSITION
3Bh	WRITE BUFFER
3Ch	READ BUFFER

Opcode	Command Name
43h	READ TOC (<i>CD-ROM, OBDR-capable drives only</i>)
44h	REPORT DENSITY SUPPORT
4Ch	LOG SELECT
4Dh	LOG SENSE
55h	MODE SELECT
56h	RESERVE UNIT
57h	RELEASE UNIT
5Ah	MODE SENSE
5Eh	PERSISTENT RESERVE IN
5Fh	PERSISTENT RESERVE OUT
8Ch	READ ATTRIBUTE
8Dh	WRITE ATTRIBUTE
91h	SPACE 16
92h	LOCATE 16
A0h	REPORT LUNS
A2h	SECURITY PROTOCOL IN
A3 05h	REPORT DEVICE IDENTIFIER
A3 0Ah	REPORT TARGET PORT GROUPS
A3 0Ch	REPORT SUPPORTED OPERATION CODES
A3 0Dh	REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS
A3 0Fh	REPORT TIMESTAMP
A3 1F 05h	Enhanced FIRMWARE UPGRADE REPORT IMAGE INFORMATION
A3 1F 06h	READ LOGGED-IN HOST TABLE
A3 1F 07h	REPORT SNAPSHOTS AVAILABLE
A3 1F 08h	READ SNAPSHOT LOG
A3 1F 09h	READ STTF LOG
A3 1F 0Ah	REPORT SNAPSHOT COMMANDS
A3 1F 0Bh	REPORT SNAPSHOT CONFIGURATION
A3 1F 0Dh	REPORT Enhanced SNAPSHOT CONFIGURATION
A3 1F 0Eh	REPORT STTF CONFIGURATION
A3 1F 10h	READ FIRMWARE TRACE LOG
A3 1F 12h	REPORT IP CONFIGURATION
A3 1F 14h	MANAGEMENT ARM SELF-TEST
A3 1F 15h	REPORT NETWORK STATISTICS
A3 1F 18h	REPORT STTF AVAILABLE
A4 06h	SET DEVICE IDENTIFIER
A4 0Fh	SET TIMESTAMP

Opcode	Command Name
A4 1F 05h	Enhanced FIRMWARE UPGRADE DOWNLOAD FIRMWARE SEGMENT
A4 1F 06h	Enhanced FIRMWARE UPGRADE REBOOT
A4 1F 07h	FORCED EJECT
A4 1F 0Ah	SET SNAPSHOT COMMANDS
A4 1F 0Bh	SET SNAPSHOT CONFIGURATION
A4 1F 0Ch	FORCE SNAPSHOT
A4 1F 0Dh	SET Enhanced SNAPSHOT CONFIGURATION
A4 1F 0Eh	SET STTF CONFIGURATION
A4 1F 12h	SET IP CONFIGURATION
A4 1F 14h	CLEAR PROTECTED STTF LOG
A4 1F 42h	CREATE FIRMWARE UPGRADE TAPE FROM FLASH
AB 01h	READ MEDIA SERIAL NUMBER
B5h	SECURITY PROTOCOL OUT

Command details

The command descriptions in “[Commands](#)” (page 29) are listed in alphabetical order of command name (ignoring words like “Enhanced” and “Vendor-unique”). Each command is described briefly. This is followed by a list of pre-execution checks which are described below. The Command Descriptor Block (CDB) is then given, with details of the various parameter bits and fields.

Pre-execution checks

NOTE: In compliance with the SCSI specification, the drive terminates a command with a CHECK CONDITION status and sets the sense key to ILLEGAL REQUEST when a reserved bit, byte, field or code is received which is not zero.

Before executing a command, the drive performs a number of checks. They fall into three categories:

- Checks on the command sent by the host. These ensure that no reserved or fixed fields have been set to illegal values. They check the syntax of commands, in other words the cross dependency of fields. For example, the Flag bit must not be set if the Link bit is not set.
- Checks to ensure that there are no outstanding UNIT ATTENTION or DEFERRED ERROR events posted for the host that has sent the command.
- Checks on media access abilities. These are performed for commands requiring access to the cartridge. A command is rejected if it attempts to access the cartridge when no cartridge is present or the cartridge is unloaded.

The checks are described below in alphabetical order. The usual order of execution is Unit Attention checks, Reservation checks, Deferred Error checks, Illegal Field checks, Fixed Bit checks, LUN checks, Media Access checks, Media Write checks, Diagnostic Status checks, Humidity checks, Parameter List checks.

LUN check

NOTE: It is possible to have non-zero LUNs in a library environment.

For all commands except INQUIRY 12h, this checks that the LUN specified by the host is correct. The LUN is taken from the COMMAND frame that encapsulates the Command Descriptor Block.

- If the LUN is unsupported, and the host command is not REQUEST SENSE, INQUIRY or REPORT LUNS, CHECK CONDITION is reported to the host with a sense key of ILLEGAL REQUEST, and additional sense of 2500h (logical unit not supported).
- If the LUN is unsupported, and the host command is REQUEST SENSE, the original sense data is replaced with a sense key of ILLEGAL REQUEST, and additional sense of 2500h (logical unit not supported). This new sense data is returned to the host. Once the command has completed successfully, the sense data is cleared.

Deferred Error check

A deferred error is generated when a command with immediate report fails after the report has been returned. The check looks to see if a deferred error exists for the host which sent the command, in other words, a deferred error for which CHECK CONDITION status has not yet been reported. If such an error exists, then the drive reports CHECK CONDITION. The sense data for the command is set to DEFERRED ERROR (which was generated when some previous command failed).

Note that if a UNIT ATTENTION condition and a DEFERRED ERROR condition both exist for an initiator, the UNIT ATTENTION condition will be reported first.

Diagnostic Status check

This ensures that the drive is in a fit state to access the media. It does this by checking that there is no DIAGNOSTIC FAIL status within the drive.

If the drive has failed diagnostics, CHECK CONDITION is reported with a sense key of HARDWARE ERROR and additional sense of 400Xh (diagnostic failure on component X).

Fixed Bit check

For the READ, VERIFY and WRITE commands, a Fixed bit set to 1 indicates that the length parameter of the command is for fixed block mode. If fixed block mode is selected then the block size in the Mode Select block descriptor must not be zero. Otherwise CHECK CONDITION is reported and the sense data is set as described for the ILLEGAL FIELD check.

Illegal Command check

If the drive does not recognize the opcode of the command that it has been sent, it will do one of the following:

- Report CHECK CONDITION status. The sense key will be set to ILLEGAL REQUEST and the additional sense code will be set to 2000h (invalid command opcode).
- Report an invalid field in the Command Descriptor Block. The sense key will be set to ILLEGAL REQUEST, the additional sense code will be set to 2400h (invalid field in CDB) and the field pointer in the sense data will be zero.

Illegal Field/Request check

Checks are performed to ensure the host has not set any of the following in the Command Descriptor Block:

- a fixed field
- a reserved field
- the control field
- two or more fields to logically conflicting values

If a field has been set to an illegal value:

- CHECK CONDITION status is reported to the host with a sense key of ILLEGAL REQUEST and additional sense of 2400h “invalid field in CDB”.
- The sense key specific bit is set and the sense key specific bytes will be a field pointer.
- The command/data bit is set, indicating that the illegal parameter was in the command.

NOTE: Command descriptor blocks are scanned from left (bit 7) to right (bit 0), and down (from byte 0 to byte n). The field pointer will be set to point to the first bit of the first illegal field encountered using this scanning route. In some cases, where multiple fixed fields are contiguous, the field pointer might be set to point to the first bit of the first fixed field in the group of fixed fields, whereas the actual illegality may lie in a later bit.

Media Access check

This checks if the drive is able to perform media access commands. If the media is inaccessible then CHECK CONDITION status is reported with a sense key of NOT READY. The additional sense will be set to one of the codes associated with the NOT READY key.

Media Information check

During power-on and following a SCSI reset, knowledge of the whereabouts of the cartridge is unavailable. It is not possible to execute commands which assume that this knowledge is available until the drive has recovered from the power-on or reset.

The test checks whether the drive knows if a cartridge is physically present in the drive.

If information about the tape cartridge is not available, the test fails with CHECK CONDITION, a sense key of NOT READY, and additional sense of 3E00 (logical unit has not self-configured yet).

Media Write check

This checks whether the media is write-protected. If it is, CHECK CONDITION is reported with a sense key of DATA PROTECT and additional sense of 2700h (write-protected).

Parameter List check

For some commands (such as LOG SELECT and MODE SELECT), the associated data sent to the drive is in the form of parameter lists. These are described under the command names in the next chapter. Checks are performed to test the following:

- Fixed and reserved fields have not been modified. Fixed fields are indicated by a number in round brackets following the field name.
- A field has been set to an invalid value.
- The syntax of the page of parameters has been violated—for example, where a particular value in one field imposes limitations on the valid range for another field.

If a field has been set to an illegal value, CHECK CONDITION is reported to the host with a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).

The drive scans the data in the Command Description Block from “left” (bit 7) to “right”, and “down” (from byte 0 to byte n). It sets the field pointers to the first bit of the first bad field encountered. If the bad field is contained in a contiguous group of fixed fields, the pointers indicate the first bit of the first field in the group, even though the error may be in a later field in the group.

NOTE: With MODE SELECT, the drive checks the integrity of the whole parameter list before acting on any parameters, so all the mode parameters need to be correct before any of them are implemented.

Reservation check

This checks whether the drive has been reserved for use by one or more initiators, and if it has, whether the host is allowed to execute the current command because it owns the reservation.

If the drive has been reserved for some other host then RESERVATION CONFLICT status is reported.

See the commands “PERSISTENT RESERVE OUT 5Fh” (page 130), “RELEASE UNIT 17h/57h” (page 170) and “RESERVE UNIT 16h/56h” (page 214).

Unit Attention check

This checks if a UNIT ATTENTION condition exists for the host which sent the command. If it does, the drive reports CHECK CONDITION status with a sense key of UNIT ATTENTION. The remaining sense data will be set according to the unit attention condition which exists. See Unit Attention Sense in the description “REQUEST SENSE 03h” (page 198).

Command descriptor block

A SCSI Command Descriptor Block (CDB) is a sequence of 6, 10, 12, or 16 bytes (or >16 bytes for extended commands) sent by a host to a SCSI target with the bus in command phase. The CDB tells the drive what action should be performed.

	7	6	5	4	3	2	1	0
0	Group Code			Operation Code				
1	Various parameters, depending on the command							
2	(MSB)	Multi-Byte Parameter						(LSB)
$n-1$								
n	Control Byte							

There are a number of fields in a CDB which are common to *all* commands. These are shown in the following table.

Group Code and Operation Code	The operation code uniquely identifies the command. The top three bits of the operation code are known as the <i>group code</i> and these define the length of the Command Descriptor Block:	
	<i>Group 0</i>	Six-byte commands
	<i>Group 1</i>	Ten-byte commands
	<i>Group 2</i>	Ten-byte commands
	<i>Group 3</i>	Six-byte commands
	<i>Group 4</i>	Sixteen-byte commands
	<i>Group 5</i>	Twelve-byte commands
	<i>Group 6</i>	Vendor-unique commands
	<i>Group 7</i>	not supported
Multi-Byte Parameter	A multi-byte parameter field in a command is “big-endian”, that is, bit 7 of the first byte of this field is the most significant.	
Control	The control byte is zero.	

5 Commands

This chapter describes all SCSI commands. Parts of the chapter are based on sections of the SCSI specification (see “General documents and standardization” (page 265)).

For general notes on the command descriptions, see “Introduction to commands” (page 22).

CLEAR PROTECTED STTF LOG A4h (1Fh)

The CLEAR PROTECTED STTF LOG command clears the Protect attribute associated with a specified STTF log so that the log can be overwritten, and allowing the STTF Flash to be reconfigured or reset to the manufacturing default settings.

Pre-execution checks

Unit Attention

Illegal Field

Reservation

Deferred Error

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A4h)							
1	Reserved (0)				Service Action (1Fh)			
2	Service Action Qualifier (14h)							
3	Reserved (0)							CA
4	Log Identifier							
5–10	Reserved (0)							
11	Control							

CDB fields

CA	<i>Clear All</i>	
	0h	Overwriting is not allowed (disabled).
	1h	The device server allows all STTF logs in flash to be overwritten, cleared or reset. The Log Identifier field must be set to 00h.
Log Identifier	When the CA bit is set to zero, the Log Identifier field specifies the STTF log that can be overwritten, cleared or reset.	

- If the CA bit is set to one and the Log Identifier field is not set to 00h, the command is terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2400h (invalid field in CDB).
- If the Log Identifier is invalid the command is terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2400h (invalid field in CDB).

No error is reported if the command specifies an STTF log that is not protected.

Vendor-unique ENABLE TRANSPORT LAYER RETRIES (SAS drives only) C2h

This provides a fast benign command to enable SAS Transport Layer Retries. The state of the Transport Layer Retries set by this command for a given host is reflected in the Protocol-Specific Logical Unit mode page for SAS SSP (18h) for that host.

Pre-execution checks

Illegal Field

If the check passes, GOOD status is reported.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (C2h)							
1	Reserved (0)							Enable
2-4	Reserved (0)							
5	Control							

CDB fields

Enable	Enables or disables SAS Transport Layer Retries for this initiator:	
0	Disabled	
1	Enabled	

ERASE 19h

The ERASE command is used to erase data on tape from the current logical position. The Long bit is used to decide whether the 'old' data is physically overwritten or not.

FC drives only: ERASE commands (short or long) to a drive containing a WORM cartridge will not overwrite or erase user data on tape.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Media Access

Media Write

Diagnostic Status

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (19h)							
1	Reserved (0)						Immed	Long
2-4	Reserved (0)							
5	Control							

CDB fields

Immed	0	The drive reports status after the command has completed.
	1	The drive reports status when it starts the command (after any pre-execution checks and prerequisite unloads have completed).
Long	The Long bit controls the distance to be erased.	
	0	The current position becomes the end of logical data.
	1	End of Data is written, followed by Data Set Separators to the end of the tape.

NOTE: Short erase is only used to truncate data at the current logical position. It cannot be used to create a “hole” in the tape into which data can subsequently be written “in place”. This will merely cause the drive to streamfail. The logical tape position is unaffected by this command. A CHECK CONDITION for Early Warning EOM (drive error code 2C98h) will only be given if the tape is logically positioned past EOT immediately before the erase.

ERASE specific status

Event	Status	Key	Additional Sense
The erase fails	CHECK CONDITION	HARDWARE ERROR	5100h (erase failure)
<i>WORM media</i> : Erase would result in user data being over-written.	CHECK CONDITION	DATA PROTECT	300Ch (WORM medium —overwrite attempted)

Enhanced FIRMWARE UPGRADE DOWNLOAD FIRMWARE SEGMENT A4h (1Fh)

The Enhanced FIRMWARE UPGRADE DOWNLOAD FIRMWARE SEGMENT command allows the application client to download a firmware image, via an internal cache buffer, to the Secondary Image bank. No image should be considered written to the flash until this command, sent with LAST=1, returns GOOD status.

Pre-execution checks

Unit Attention

Illegal Field

Reservation

Deferred Error

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A4h)							
1	Reserved (0)			Service Action (1Fh)

5								
6	(MSB)	Segment Length						(LSB)
8								
9	Reserved (0)							
10	Reserved (0)							Last
11	Control							

CDB fields

Segment Offset	The offset within the bank at which this segment will be stored. The application client must set this to zero for the first download segment command. (It is possible to re-start the firmware download process many times by setting Segment Offset to zero). The field has the following restrictions:	
		<ul style="list-style-type: none"> It must be a multiple of 4 bytes. It must reside within the bank size (1.91 MB).
	0	The application client is starting a firmware download process.

Segment Length	The length in bytes allocated of the segment transferred.	
Last	0	The segment will be copied to the internal cache buffer at the specified offset.
	1	It is assumed that the last byte of the image is Segment Offset + Segment Length. Then the whole image is validated, and if correct, transferred from the cache buffer to flash. Status will not be returned until the firmware has been successfully written to the Secondary Image bank.

Enhanced FIRMWARE UPGRADE REBOOT A4h (1Fh)

The Enhanced FIRMWARE UPGRADE REBOOT command causes the drive to reset and boot from the Primary Image bank. Status will be returned before reboot takes place. Before the reboot, all buffered write data is written to tape, and the tape is unloaded, or unthreaded depending on configuration settings.

CDB fields

Swap	0	The drive resets and reboots the currently running firmware, so the association of Primary and Secondary Images will remain unchanged.
	1	The drive swaps banks associated with the Primary and Secondary Images before resetting the drive. Use this to reboot the drive with the firmware most recently downloaded to the Secondary Image.
Regardless of the value of the Swap field, the reboot command should not cause the drive to be offline for more than about 1 second.		

Enhanced FIRMWARE UPGRADE REPORT IMAGE INFO A3h (1Fh)

The Enhanced FIRMWARE UPGRADE REPORT IMAGE INFO command returns a number of image descriptors to the application client up to the size specified in the Allocation Length field.

Primary	This field will be set if this is the Primary Image bank.	
Publication Revision	As reported in bytes 32–35 of the standard INQUIRY data.	
Firmware Revision	As reported in bytes 30–48 of VPD page C0h.	
Image Build Time	The time (UTC-based) at which this firmware image was built.	
Image Size	The size of the stored image in bytes	
Bank Size	The size of the bank in bytes	

FORCED EJECT A4h (1Fh)

FORCED EJECT instructs the device server to perform an emergency unload. The device server may abort any command it is currently executing and start executing the forced eject immediately. The Prevent Medium Removal flag is set to Allow for all initiators. The drive mechanism bypasses the normal checks that may otherwise prevent the media being unloaded from the tape drive in order to eject the cartridge, at the expense of risking damage to the media.

⚠ CAUTION: This command may result in damage to the media.

CDB fields

Service Action	Must be 1Fh.
Service Action Qualifier	Must be 07h.

FORCE SNAPSHOT A4h (1Fh)

FORCE SNAPSHOT forces a snapshot to occur immediately. The command initiates the creation of a Snapshot log by the drive executing the commands defined in the Snapshot command set. The Snapshot command set is executed in the background when the FORCE SNAPSHOT command completes, so host-initiated commands can be executed before the Snapshot command set has been completed.

CDB fields

Service Action	Must be 1Fh.	
HP LTO VU MO Opcode	Must be 0Ch.	
STTF	<i>Save Trace To Flash</i>	
	0	The drive creates a Snapshot log in volatile memory.
	1	The drive creates a Snapshot log in volatile memory and then, if saving traces to flash is enabled, saves it to an area of non-volatile memory (flash). <ul style="list-style-type: none"> If saving traces to flash is not enabled, the device server terminates the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB). If the STTF bit is set to one and an STTF log is already being created or being read, the device server terminates with CHECK CONDITION, a sense key of NO SENSE and additional sense of 1600h (operation in progress).
Command Set	The snapshot command set to be executed to create the Snapshot log:	
	00h	Default/user-definable
	01h	Debug
	02h–FFh	Reserved (0)

FORCE SNAPSHOT specific status

Event	Status	Key	Additional Sense
A Snapshot log is already being created.	CHECK CONDITION	NO SENSE	0016h (operation in progress)
Snapshot commands are being set.	CHECK CONDITION	NO SENSE	0016h (operation in progress)

FORMAT MEDIUM 04h

CAUTION: This command may erase data on tape and host-type MAM attributes.

FORMAT MEDIUM is used to prepare the currently threaded tape for use. It is only accepted when the current logical position is BOP in Partition 0. However any unwritten data is guaranteed to be written to the tape (flushed). After successful completion of this command the logical position is also BOP in Partition 0.

2	Reserved (0)				Format			
3	(MSB)	Transfer Length (0)						(LSB)
4								
5	Control							

CDB fields

Immed	0	The drive will not report status until the format operation has completed.	
	1	The drive will report GOOD status (after some initial checks) and continue with the formatting operation in the background. Progress Indication is reported as part of the sense data returned.	
Verify	Not supported. Must be 0.		
Format	Value	Description	Effect
	0h	Use default format	Format medium as a single partition. All data on the physical volume is lost.
	1h	Partition volume	Format medium according to the parameters in the Medium Partitions mode page. All data on the physical volume may be lost. Some errors in the mode page may be detected now and reported as CHECK CONDITION with sense key of ILLEGAL REQUEST. Additional sense may be 2600h (invalid field in parameter list) or 2502h (parameter value invalid). Data may be lost.

	2h	Default format then partition	Equivalent to formatting with code 0h followed by formatting with code 1h
	3h–7h	Reserved	ILLEGAL REQUEST
	8h–Fh	Vendor-specific (not used)	ILLEGAL REQUEST

INQUIRY 12h

With INQUIRY, an initiator requests the drive to return information about the basic operating parameters. These parameters cannot be changed. The drive returns Inquiry data to the host in a data-in phase.

NOTE: This command is immune from most of the pre-execution checks that other commands must pass (for example, it can be executed while the unit is reserved for another host). Unit attention and deferred error conditions are preserved and reported on subsequent commands.

Pre-execution checks

Only the Illegal Field Check is performed before the command is executed.

If the EVPD bit is clear, the page code must be zero, otherwise illegal request is reported.

If the EVPD bit is set, the page code must be one of the supported page codes for Inquiry data. Otherwise illegal request is reported.

Command descriptor block

	C5h	ACI page
	C8h	Vendor-Specific Device Capabilities page
	CCh	HP Alternative Inquiry page (<i>variant specific</i>)
	D0h	HP Unique Inquiry page (<i>variant specific</i>)
Allocation Length	The maximum amount of data (in bytes) that should be returned. If more than this is available, the amount returned is truncated to allocation length. No error is reported.	

INQUIRY data pages

INQUIRY returned data

INQUIRY returns its standard data if the EVPD bit is zero, or returns a page of data as specified by the Page Code field when EVPD is one.

Standard Inquiry Data format (LUN0)

This is the data returned by the drive in response to an Inquiry command with its EVPD bit set to zero. The data also depends on the value of the LUN field in the Inquiry CDB, the LUN value in the identify message and the configuration of the drive.

Note that the data below is for the *standard distribution firmware*.

The Standard Inquiry Data is based on the SCSI 3 standard for Standard Inquiry Data.

For the LUN to which the drive is attached, the Peripheral Qualifier field is set to 000b, the Peripheral Device Type field is set to 01h, the Removable Medium (RMB) flag is set to 1 and the Device-type modifier is set to 0.

Inquiry Data fields

Peripheral Qualifier	000b	There is a device on the logical unit selected.
	011b	The LUN field in the identify message has specified an unsupported logical unit.
Peripheral Device Type	01h	Sequential Access Device
	05h	CD Device (reported when in OBDR mode)
	1Fh	No Device (the Peripheral Qualifier will be 011b in this case)
RMB	1	The Removable Medium bit is one, indicating that the tape can be removed.
Device-Type Modifier	0	This is a six-bit user defined code, set to zero.
Version Number	6	Indicating that the drive complies with the SPC-4 standard.
NACA	0	The Normal ACA flag is 0, indicating that it is not supported.
HiSup	0	The Hierarchical Support flag is 0, indicating that the hierarchical addressing model is not supported.
Response Data Format	2	The Inquiry Data format complies with the SPC-4 standard.
Additional Length	The length in bytes of the length of the rest of the Inquiry data.	
	5Bh	There are 91 (5Bh) more bytes of Inquiry data.

SCCS	0	No storage array controller component is embedded in the drive.		
ACC	0	No Access Controls Coordinator may be addressed through this LUN.		
TPGS	01b	<i>Target Port Group Support</i> . Only implicit asymmetric logical unit access is supported.		
3PC	0	Third-Party Copy commands are not supported.		
Protect	1	The logical unit supports logical block protection.		
BQue	<i>Basic Queuing</i> flag			
	0	The flag is 0 for all drives, with CmdQue = 1.		
EncSvr	0	The drive does not contain an embedded enclosure services component.		
VS	0	Vendor-Specific field—not currently used		
MultiP	1	The drive has multiple ports.		
MChngr	0	The drive is not embedded within or attached to a medium transport element.		
Adr16, WBus16, Sync	0	These features are not applicable.		
Linked	0	The drive does not support linked commands.		
CmdQue	1	For all drives, with BQue = 0.		
T10 Vendor Identification	A vendor-specific, 8-byte string of ASCII characters, left justified and padded with space characters "HP".			
Product Identification	<p>A left-justified, vendor-specific, 16-byte string field of ASCII characters with space character padding on the right. The string consists of two parts:</p> <ul style="list-style-type: none"> • First half (bytes 16–23): "Ultrium" • Second half (bytes 24–31): "<generation>-<interface type>" <p>For all LTO-6 drives (including FC and SAS), the following string has been defined: "Ultrium 6-SCSI"</p>			
Product Revision Level	<p>A vendor-specific string of four ASCII characters: "PdsV":</p> <ul style="list-style-type: none"> • P specifies the product (for LTO-6 drives, "J" for full-height FC, "O" for full-height SAS, "2" for half-height FC, "3" for half-height SAS). • d denotes the product development phase. • s is a sequence number associated with the "PdV" string. • V is a unique identifier for each variant of code. 			
WORM Version	The version of WORM supported.			
WORM	1	The drive supports the LTO WORM specification.		
OBDR string	"\$DR-10" if the drive supports Tape Disaster Recovery.			
Clocking	0	Not applicable		
QAS	0	The drive does not support Quick Arbitration and Selection.		
IUS	Information Units			
	0	Not applicable		
Version Descriptor	These fields can be used to identify up to eight standards to which the drive conforms. The values supported are listed below.			
		Value	Standard	
	<i>FC drives:</i>	1	0090h	SAM-4 ANSI INCITS 447:2008
		2	0A11h	FCP-3 ANSI INCITS.416:2006
3		0D7Dh	FC-AL-2 ANSI INCITS.350:200x with AM1:2002	

SAS drives:	4	0DBCh	FC-FS ANSI INCITS.373:2003
	5	131Ch	FC-Tape ANSI INCITS TR-24:1999
	6	133Ch	FC-FLA ANSI INCITS TR-20:1998
	7	0463h	SPC-4 T10/1731-D revision 23
	8	0520h	SSC-4 (no version claimed)
	1	0090h	SAM-4 ANSI INCITS 447-2008
	2	0C20h	SAS-2 (no version claimed)
	3	0463h	SPC-4 T10/1731-D revision 23
	4	0520h	SSC-4 (no version claimed)
	5-8	0000h	not used

Vendor Specific data may be sent after the Product Revision Level.

Vital Product Data pages

The following tables describe the vital product data pages. These pages are returned by the INQUIRY command when the EVPD bit is set and the appropriate Page Code is set in the Command Descriptor Block. They contain vendor-specific product information.

Supported Vital Product Data Pages page

This is the data returned by the drive in response to an INQUIRY command with its EVPD bit set to one and its Page Code field set to 0.

This page contains a list of all the VPD page-codes supported by the drive. The list of page codes will vary depending on the port-LUN combination to which the INQUIRY command has been sent to, as well as the firmware variant.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (00h)							
2	Reserved (0)							
3	Page Length ($n-3$)							
4	Supported Pages Code (00h)							
	Unit Serial Number page (80h)							
	Device Identification page (83h)							
	Management Network Address page (85h)							
	Extended Inquiry Data page (86h)							
	Mode Page Policy page (87h)

	Vendor-Specific Device Capabilities page (C8h)							
	HP Alternative Inquiry page (CCh)							
<i>n</i>	HP Unique Inquiry page (D0h)							

Unit Serial Number page

The Unit Serial Number page contains a single value which is a 10-byte ASCII string. The string, with the Vendor Identification and Product Identification fields in the standard Inquiry data, uniquely identifies the drive.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (80h)							
2	Reserved (0)							
3	Page Length (0Ah)							
4	(MSB)	Serial Number						(LSB)
13								

Device Identification page

The Device Identification page contains information that identifies the tape drive uniquely.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (83h)							
2	Reserved (0)							
3	Page Length ($n-3$)							
4	(MSB)	Identification Descriptors						(LSB)
<i>n</i>								

Identification Descriptors are constructed as follows:

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Code Set			
1	PIV	Rsvd (0)	Association		Identifier Type			
2	Reserved (0)							

	7	6	5	4	3	2	1	0
3	Identifier Length (n-3)							
4	(MSB)	Identifier						(LSB)
n								

Protocol Identifier	0h	Fibre Channel
	6h	Serial Attached SCSI (SAS)
Code Set	1	The Identification Descriptor is a binary field.
	2	The Identification Descriptor contains only ASCII data.
PIV	1	The Protocol Identifier field is valid. This is set for an Association value of 1 or 2.
Association	0	The Identifier field is associated with the addressed logical unit.
	1	The Identifier field is associated with the port that received the request.
	2	The Identifier field is associated with the SCSI target device that contains the addressed logical unit.
	3	Reserved
Identifier Type	1	Vendor ID followed by the product identification field from the standard inquiry data and the serial number field from the Serial Number Inquiry page.
	3	Identification descriptor is the 64-bit IEEE Registered World Wide Name (in NAA identifier format).
	4	Relative Port identifier
	5	Target Port Group identifier

Defined identifiers

The following identifiers will be returned in the given order. What Port Name is returned depends on which port the Inquiry is sent through.

Logical Unit Identifier

	7	6	5	4	3	2	1	0
0	Protocol Identifier (0)				Code Set (1)			
1	PIV (0)	Rsvd (0)	Association (0)		Identifier Type (3)			
2	Reserved (0)							
3	Identifier Length (8)							
4	(MSB)	SSC Device Logical Unit Name (IEEE Registered Name)						(LSB)
11								

Port Name

	7	6	5	4	3	2	1	0
0	Protocol Identifier (0)				Code Set (1)			
1	PIV (1)	Rsvd (0)	Association (1)		Identifier Type (3)			
2	Reserved (0)							

	7	6	5	4	3	2	1	0
3	Identifier Length (8)							
4	(MSB)	Port Name (IEEE Registered Name)						(LSB)
11								

Port Identifier

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Code Set (1)			
1	PIV (1)	Rsvd (0)	Association (1)		Identifier Type (4)			
2	Reserved (0)							
3	Identifier Length (4)							
4	(MSB)	Port Identifier						(LSB)
7								

The Port Identifier will be set to 1 if the addressed port is port 0, and set to 2 if the addressed port is Port 1.

Target Port Group Identifier

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Code Set (1)			
1	PIV (1)	Rsvd (0)	Association (1)		Identifier Type (5)			
2	Reserved (0)							
3	Identifier Length (4)							
4	Reserved (0)							
5								
6	(MSB)	Target Port Group						(LSB)
7								

Target Port Group indicates the group to which the target port is a member. For more information, see ["REPORT TARGET PORT GROUPS A3h"](#) (page 195).

Target Name (code set 1)

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Code Set (1)			
1	PIV (1)	Rsvd (0)	Association (2)		Identifier Type (3)			
2	Reserved (0)							
3	Identifier Length (8)							
4	(MSB)	Device Name (IEEE Registered Name)						(LSB)
11								

Target Name (code set 2)

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Code Set (2)			
1	PIV (1)	Rsvd (0)	Association (2)		Identifier Type (1)			
2	Reserved (0)							
3	Identifier Length (34)							
4	(MSB)	Vendor ID						(LSB)
11								
12	(MSB)	Product Identification						(LSB)
27								
28	(MSB)	Serial Number						(LSB)
37								

Management Network Address VPD page

The Management Network Addresses page provides a list of network addresses of management services associated with a SCSI target device, target port, or logical unit.

	7	6	5	4	3	2	1	0
0	Protocol Identifier				Peripheral Device Type			
1	Page Code (85h)							
2	Page Length ($n-3$)							
3								
4	(MSB)	Network Services Descriptor (first)						(LSB)
:	:							
	(MSB)	Network Services Descriptor (last)						(LSB)
n								

Each Network Services Descriptor is defined as follows:

NOTE: The contents of descriptors are set by an application client outside the scope of the definition of this page, so no detail is given here.

	7	6	5	4	3	2	1	0
0	Rsvd (0)	Association		Service Type				
1	Reserved (0)							
2	Network Address Length ($n-3$)							
3								
4	(MSB)	Network Address						(LSB)
n								

Extended INQUIRY Data VPD page

This page provides an application client with a means of obtaining information about the drive.

Activate Microcode	10b	<ol style="list-style-type: none"> The drive activates the microcode after either a vendor specific event, a power on event, or a hard reset event. The drive establishes a UNIT ATTENTION condition for the initiator port associated with every I_T nexus with additional sense code set to 3F01h (microcode has been changed).
SPT	001b	Protection type is Logical Block Protection .
SimSup	1	The drive supports the Simple Task attribute.
LUICLR	1	The drive clears the UNIT ATTENTION with additional sense of 3F0Eh (reported LUNs data has changed) for all LUNs for one initiator, if the UA has been reported to this initiator for any LUN it can access.

Mode Page Policy VPD page

The Mode Page Policy VPD page enables an application client to find what mode page policy is in effect for supported mode pages. One descriptor is returned for each mode page, or group of mode pages, that have a specific page policy in effect.

The returned data has the following format:

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (87h)							
3	Page Length (n-3)							
4								
<i>Mode Page Policy Descriptor List</i>								

Mode Page Policy Descriptors are as follows:

	7	6	5	4	3	2	1	0
0	Reserved (0)		Policy Page Code					
1	Policy Sub-Page Code							
3	MLUS	Reserved (0)					Mode Page Policy	
4	Reserved (0)							

Policy Page Code	The mode page to which this descriptor applies.	
	3Fh	All mode pages
Policy Sub-Page Code	The sub-page to which this descriptor applies.	
	FFh	All sub-pages
MLUS	<i>Multiple Logical Units Shared</i>	
	0	The mode page and sub-page indicated are maintained separately by each logical unit.
	1	This combination of Policy Page Code and Policy Sub-Page Code is shared by more than one logical unit.
Mode Page Policy	The policy in effect for the combination of Policy Page Code and Policy Sub-Page Code:	
	00b	Shared
	01b	Per Target port
	10b	Per Initiator port
	11b	Per L_T Nexus

The following Mode Page Policy Descriptors are returned:

FC drives:

Policy Page Code	Policy Sub-Page Code	Mode Page Policy	MLUS
3Fh	FFh	00b	0
02h	00h	00b	1
18h	00h	00b	1
19h	00h	00b	1
0Ah	00h	00b	1
0Ah	01h	00b	1
0Ah	F0h	11b	0

SAS drives:

Policy Page Code	Policy Sub-Page Code	Mode Page Policy	MLUS
3Fh	FFh	00b	0
02h	00h	00b	1
18h	00h	11b	1
19h	00h	01b	1

Policy Page Code	Policy Sub-Page Code	Mode Page Policy	MLUS
19h	01h	01b	1
0Ah	F0h	11b	0

SCSI Ports VPD page

The SCSI Ports VPD page provides a means of retrieving identification descriptors for all SCSI ports in a SCSI target device or SCSI target/initiator device.

The returned data has the following format:

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (88h)							
3	Page Length (n-3)							
4								
<i>SCSI Port Identification Descriptor List</i>								

FC drives:

The following SCSI Port Identification Descriptors (one per port enabled) are returned for FC drives:

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Port Identifier							
3								
4-9	Reserved (0)							
10	Target Port Descriptor Length (0Ch)							
11								
12	Protocol Identifier (0)				Code Set (1)			
13	PIV (1)	Rsvd (0)	Association (1)		Identifier Type (3)			
14	Reserved (0)							
15	Identifier Length (08h)							
16	Port Name (IEEE Registered Name—see “Names” (page 15))							
23								

SAS drives:

The following SCSI Port Identification Descriptors (one per port enabled) are returned for SAS devices:

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Port Identifier							
3								
4-9	Reserved (0)							

	7	6	5	4	3	2	1	0
10	Target Port Descriptor Length (0Ch)							
11								
12	Protocol Identifier (6)				Code Set (1)			
13	PIV (1)	Rsvd (0)	Association (1)		Identifier Type (3)			
14	Reserved (0)							
15	Identifier Length (08h)							
16	Port Name (IEEE Registered Name—see “Names” (page 15))							
23								

Port Identifier	0001h	The addressed port is port A.
	0002h	The addressed port is port B.
Protocol Identifier	00h	Fibre Channel
	01h	SCSI
	06h	SAS
Code Set	1	The Identification Descriptor is a binary field.
	2	The Identification Descriptor contains only ASCII data.
PIV	1	The Protocol Identifier field is valid. The PIV flag is set to one for an association value of 1 or 2.
Association	1	The Identifier field is associated with the port that received the request.
Identifier Type	1	The subsequent fields contain the Vendor ID followed by the product identification field from the standard inquiry data and the serial number field from the Serial Number Inquiry Page.
	3	The subsequent field is the Fibre Channel 64-bit Name Identifier.

Protocol-Specific Logical Unit Information VPD page (SAS only)

The Protocol-Specific Logical Unit Information VPD page (see SPC-4) contains parameters for the logical unit that are protocol-specific based on the L_T nexus being used to access the logical unit. The returned data has the following format for logical units with SAS target ports.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (90h)							
2	Page Length ($n-3$)							
3								
<i>Logical Unit Information Descriptor List</i>								
4	Logical unit information descriptor (first) (see table below)							
15								
:	:							
$n-15$	Logical unit information descriptor (last) (see table below)							
n								

The logical unit information descriptor for logical units with SAS target ports is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Relative Port Identifier _____ (LSB)							
1								
2	Reserved (0)				Protocol Identifier (6h)			
3–5	Reserved (0)							
6	(MSB) _____ Descriptor Length (0004h) _____ (LSB)							
7								
<i>Per logical unit SCSI transport specific data</i>								
8	Reserved (0)						TLR Control Supported (1)	
9–11	Reserved (0)							

Protocol Identifier	6h	This is a SAS SSP specific descriptor.
TLR Control Supported	1	The combination of SCSI target port and logical unit supports the TLR Control field in the SSP frame header.

Sequential Access Device Capabilities page

This page provides the application client with a means of determining which features are supported by the Device Server.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (B0h)							
2	Reserved (0)							
3	Page Length (4h)							
4	Reserved (0)							WORM
5–7	Reserved (0)							

WORM	1	The Device Server supports Write Once Read Many (WORM) operation.
-------------	---	---

Manufacturer-assigned Serial number page

The Manufacturer-assigned Serial Number page provides the application client with a method of determining the device serial number as originally assigned by the manufacturer. The same will be returned in the Unit Serial Number page unless an automation controller has provided a new serial number; however this page will always reflect the original serial number.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (B1h)							
2	Page Length (000Ah)							

	7	6	5	4	3	2	1	0
3								
4–13	Serial Number							

TapeAlert Supported Flags page

This page enables the application client to determine which TapeAlert flags are supported by the Device Server.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (B2h)							
2	Reserved (0)							
3	Page Length (8h)							
<i>Flags</i>								
4	01h (1)	02h (1)	03h (1)	04h (1)	05h (1)	06h (1)	07h (1)	08h (0)
5	09h (1)	0Ah (1)	0Bh (1)	0Ch (1)	0Dh (1)	0Eh (1)	0Fh (1)	10h (1)
6	11h (1)	12h (1)	13h (1)	14h (1)	15h (1)	16h (1)	17h (1)	18h (1)
7	19h (1)	1Ah (1)	1Bh (1)	1Ch (1)	1Dh (1)	1Eh (1)	1Fh (1)	20h (1)
8	21h (1)	22h (1)	23h (1)	24h (1)	25h (1)	26h (1)	27h (1)	28h (0)
9	29h (0)	2Ah (0)	2Bh (0)	2Ch (0)	2Dh (0)	2Eh (0)	2Fh (0)	30h (0)
10	31h (1)	32h (1)	33h (1)	34h (1)	35h (1)	36h (1)	37h (1)	38h (1)
11	39h (1)	3Ah (1)	3Bh (1)	3Ch (1)	3Dh (0)	3Eh (0)	3Fh (0)	40h (0)

Supported flags are set to 1. For information on the flags, see “TapeAlert log page” (page 87)

Automation Device Serial Number page

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (B3h)							
2	Reserved (0)							
3	Page Length ($n-3$)							
4	(MSB)	Automation Device Serial Number						(LSB)
n								

Automation Device Serial Number

The automation device serial number contained in the device entity. If configured, the automation device serial number is the product serial number of the media changer containing the device entity under control of the device server. If no automation device serial number has been configured, this field contains ASCII spaces (20h).

Data Transfer Element Address page

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (B4h)							
2	Reserved (0)							
3	Page Length (4)							
4	(MSB)	Data Transfer Device Element						(LSB)
7								

Data Transfer Device Element The data transfer device element address from the device entity. If no address has been configured, the field is set to FFFFFFFh.

Drive Component Revision Levels pages

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code							
2	Reserved (0)							
3	Page Length (5Ch)							
4	(MSB)	Component ("cccccccccccc")						(LSB)
29								
30	(MSB)	Version ("RRR.VVV")						(LSB)
48								
49	(MSB)	Date ("YYYY/MM/DD hh:mm")						(LSB)
72								
73	(MSB)	Variant ("xxxxxxxxxxxxx")						(LSB)
95								

The Drive Component Revision Levels pages contain details of the revisions of each of the major sub assemblies of the drive. For any given product, if these pages are the same then the drive has been built with the same components and with the same manufacturing process.

Each entry is a null-terminated ASCII string.

Page Code	Page Code	Component Name
	C0h—Firmware	"Firmware"
	C1h—Hardware	"Hardware"
	C2h—PCA	"PCA"
	C3h—Mechanism	"Mechanism"
	C4h—Head Assembly	"Head Assy"
	C5h—ACI	"ACI"
Component	A 12-character entry to identify the component that the revision is for.	

Version	A 7-character version code with a three-digit major revision number, a period and a three-digit minor version number.
Date	The date of the version.
Variant	An identifier indicating what version of the product this is.

Vendor-Specific Device Capabilities page

The Vendor-Specific Device Capabilities VPD Page provides the application client with a means to determine the failover features that are supported by the Device Server.

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (C8h)							
2	Page Length (0004h)							
3								
4	Reserved (0)				ADVFO	BasicFO	Rsvd (0)	
5-7	Reserved (0)							

ADVFO	<i>Advanced FailOver</i>							
	0	The device server does not support advanced path failover.						
	1	The device server supports advanced path failover.						
BasicFO	<i>Basic FailOver</i>							
	0	Support for basic path failover is not reported.						
	1	The device server supports basic path failover.						

HP Alternative Inquiry page

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (CCh)							
2	Reserved (0)							
3	Page Length (20h)							
4-6	Reserved (0)							
7	RelAdr (0)	Bus32 (0)	Bus16	Sync	Linked (0)	Rsvd (0)	CmdQ (1)	SoftRo (0)
8	(MSB)	Vendor Identification						(LSB)
15								
16	(MSB)	Product Identification (vendor-specific)						(LSB)
31								
32	(MSB)	Product Revision Level						(LSB)
35								

Product Identification	A left-justified field of ASCII characters with space character padding on the right. The string is set to:	
	Product	Product Identification
	LTO-6 full-height	"ULTRIUM8525 DRV"
	LTO-6 half-height	"ULTRIUM8000 DRV"

HP Unique Inquiry page

	7	6	5	4	3	2	1	0
0	Peripheral Qualifier (0)			Peripheral Device Type (1)				
1	Page Code (D0h)							
2	Reserved (0)							
3	Page Length (10h)							
4	(MSB)	Queue Depth						(LSB)
5								
6	PRS (0)	Reserved (0)				Multi-initiator Rev (2)		
7	Reserved (0)							
8	(MSB)	FW Image Size (KB)						(LSB)
9								
10	(MSB)	Drive Buffer Size (KB)						(LSB)
11								
12	(MSB)	Code Load Time (seconds)						(LSB)
13								
14	(MSB)	Format Time (seconds)						(LSB)
15								
16	Reserved (0)							RByte (0)
17–19	Reserved (0)							

Queue Depth	The total number of tags supported. For Fibre Channel drives, this is 4. For SAS drive, it is 32.	
PRS	Persistent Reserve In and Persistent Reserve Out have been certified.	
Multi-initiator Revision	The level of functionality to which multi-initiator has been implemented:	
	00h	A legacy device that cannot be reliably supported in a multi-initiator environment.
	01h	A device that supports simultaneous reading and writing from multi-initiators.
	02h	A device that: <ul style="list-style-type: none"> • Supports simultaneous reading and writing from multiple initiators. • Responds to an INQUIRY command from any host with valid data within 5s following a reset. • Supports Inquiry Page 83h (IEEE Extended Unique Identifier) of at least type 2. • Supports responding to INQUIRY with valid data while disconnected and processing a command from another initiator. • Supports the REPORT LUNs command.

	03h	Equivalent to 02h.
FW Image Size	The size in KB of the drive's downloadable firmware image file. The file itself is rounded to the nearest kilobyte, ensuring the file is a multiple of 1024 bytes.	
Drive Buffer Size	The size in KB of the drive's usable data buffer (not the memory component size) rounded to the nearest kilobyte. The value of this field is FFFFh (65535 KB), which is the closest to the main buffer size of 512 MB.	
Code Load Time	The time in seconds that the device takes to become ready following completion of the code load process. Set to B4h seconds (3 minutes).	
Format Time	The time in seconds that it takes a generic format command (all optional bits set to zero) to complete. Set to 0 (unknown).	
RByte	When set to 1, indicates that the drive expects the code to be sent in Big-Endian order during the WRITE BUFFER command (that is, bytes 01, 00, 03, 02, 05, 04.....n, n-1). The bit is set to 0.	

LOAD/UNLOAD 1Bh

The LOAD/UNLOAD command allows the host to specify that a tape cartridge present in the drive is either made ready for data transfer ("loaded") or disabled for data transfer (if Prevent Media Removal is set). It can also cause the cartridge to be ejected from the drive ("unloaded").

Pre-execution checks

Illegal Field	Reservation	Deferred Error
Unit Attention	Diagnostic Status	Media Information

If an *unload* is to be performed, the drive checks if the tape is currently being loaded. If it is, CHECK CONDITION is reported with a sense key of NOT READY and additional sense of 0401h (becoming ready).

If a *load* is to be performed, the drive checks to ensure that a tape cartridge is present. If not, it reports CHECK CONDITION with a sense key of NOT READY and additional sense of 3A00h (medium not present). If the media is currently being unloaded or ejected, it reports CHECK CONDITION with sense key of NOT READY and additional sense of 0400h (cause not reportable).

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (1Bh)							
1	Reserved (0)							Immed
2	Reserved (0)							
3	Reserved (0)							
4	Reserved (0)				Hold	EOT (0)	ReTen	Load
5	Control							

CDB fields

Immed	0	The drive reports status after the command has completed.
	1	The drive reports status when it starts the command (after any pre-execution checks and prerequisite unloads have completed).
Hold	0	A normal load/unload will be performed.

	1	A load will cause the cartridge to be pulled in and seated in the drive, but the tape will not be threaded. An unload will cause the tape to be unthreaded, but the cartridge will not be ejected. In Hold position, the Cartridge Memory is accessible.
ReTen		If this bit and the Load and Hold bits are set to one, the command will fail with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2400h (invalid field in CDB). Otherwise this bit is ignored.
Load	0	The drive performs an <i>unload</i> operation.
	1	The drive performs a <i>load</i> operation.

LOAD/UNLOAD specific status

Following a successful LOAD command, CHECK CONDITION is posted to all initiators other than the initiator of the LOAD command. The sense key is set to UNIT ATTENTION, with additional sense of 2800h (not ready to ready transition). There is an exception to this: if a load occurs when the tape is already loaded, no UNIT ATTENTION sense is generated.

Once UNIT ATTENTION is cleared, unsolicited positional sense is set. The sense key will be NO SENSE with additional sense of 0004h (BOT detected).

If an unformatted tape is inserted, the drive loads it and it behaves as if it is a blank tape.

If a cartridge with no Cartridge Memory or a failed Cartridge Memory is loaded, CHECK CONDITION is returned with a sense key of MEDIUM ERROR, with additional sense of 5200h (cartridge fault).

Loading a cartridge

A default non-automation configured drive loads an Ultrium 6, Ultrium 5 or Ultrium 4 tape automatically when it is inserted, without any host interaction. If the load is successful, media access commands are permissible (see the Media Access check).

If the tape is already loaded when a Load request is received, the tape is positioned at the beginning of the tape (as though a REWIND had been sent). Unlike a “full” load, UNIT ATTENTION with additional sense of 2800h (not ready to ready transition) is not generated for other hosts.

If the tape is in the process of being loaded when the Load request is received, the drive will wait for the load to complete and, assuming the load was successful, take one of the following actions:

- If the Load was issued by the current host (that is, a previous immediate-reported load) and completed successfully, GOOD status is reported. No further action is taken.
- If the Load was issued by some other host (or was an autoload) and completed successfully, CHECK CONDITION is reported, with a sense key of UNIT ATTENTION and additional sense of 2800h (not ready to ready transition).
- If the Load was issued by the current host and failed, CHECK CONDITION is reported, since a deferred error condition will exist for the current host.
- If the Load was issued by some other host and failed, the load will be re-attempted on behalf of the current host.

Unloading a cartridge

If an unload is requested and there is a tape present in the drive (either loaded, loading or unloading):

1. Any buffered data is written to tape.
2. The tape is rewound to the physical BOM (beginning of media).
3. If medium removal *is* prevented, CHECK CONDITION is reported with a sense key of ILLEGAL REQUEST and additional sense of 5302h (medium removal prevented).
4. GOOD status is reported if the tape unloaded successfully. Otherwise, another unload operation is initiated on behalf of the host that issued the unload request.

Following an unload, any media access commands will be rejected by the Media Access check.

- If an unload request is received while the tape is in the process of unloading (for example, as a result of pressing the eject button), it will be queued until the unload is complete.
- If an unload request is received while there is no tape present, or if a tape is present but not loaded and medium removal is prevented, GOOD status is reported.

It is possible to unload and eject the cartridge by pressing the Eject button on the front panel.

LOCATE 2Bh/92h

The LOCATE command moves the current logical position to the position specified by the command. The new position is specified by the offset from start of the media in terms of blocks. The first block (that is, BOT) is block address 0.

Any unwritten data is written to tape before the command is executed.

NOTE: Ideally an application should determine how many partitions there are on the tape before sending a LOCATE command with CP bit set to 1.

Pre-execution checks

Illegal Field	Reservation	Deferred Error
Unit Attention	Media Access	Diagnostic Status

Command descriptor block (10–byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (2Bh)							
1	Reserved (0)					BT (0)	CP	Immed
2	Reserved (0)							
3	(MSB)	Block Address						(LSB)
6								
7	Reserved (0)							
8	Partition							
9	Control							

Command descriptor block (16–byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (92h)							
1	Reserved (0)		Dest Type			Rsvd (0)	CP	Immed
2	Reserved (0)							BAM (0)
3	Partition							
4	(MSB)	Logical Identifier						(LSB)
11								
12	Reserved (0)							
14								
15	Control							

CDB fields

BT	<i>Block address Type.</i> This field is not supported and should always be set to zero indicating that the Block Address field represents the count of all blocks and filemarks between the beginning of the media and the current logical position.	
CP	<i>Change Partition.</i> If this bit is set, the Partition field is valid, otherwise it will be ignored.	
Immed	0	The drive only reports status after the Locate command has completed.
	1	The drive reports status when it starts the command and continues with the positioning in the background.
BAM	0	This field is not supported.
Block Address	The Block Address specifies the number of blocks and filemarks between BOM and the position to be located.	
Partition	If CP is set to 0, this field will be ignored If CP is set to 1, this field specifies the partition number to change to. LTO-5 tapes allow up to 2 partitions (0-1), LTO-6 tapes up to 4 (0-3).	
Dest type	000b	Specifies that the Logical Identifier field is a logical object identifier.
	001b	Specifies that the Logical Identifier field is a logical file identifier.
	011b	Specifies that the Logical Identifier field is EOD.
	Other values are not supported.	
Logical Identifier	The specific block on tape to locate. It can be a generic block, either a record or a filemark (Dest Type = 000b) or a specific filemark on tape (Dest Type = 001b). If the location is EOD (Dest Type = 011b), this field is ignored.	

LOCATE specific status

Event	Status	Key	Additional Sense
EOD encountered	CHECK CONDITION	BLANK CHECK	0005h (EOD encountered).
EOM encountered	CHECK CONDITION	MEDIUM ERROR	0002h (EOT encountered). EOM bit set.
Failed to read data—media error or non-fatal drive error	CHECK CONDITION	HARDWARE ERROR	3B00h (sequential positioning error)
Early Warning EOM encountered	Early warning end of medium information is not reported for Locate commands		
Data format corrupt	CHECK CONDITION	MEDIUM ERROR	3001h (cannot read media, unknown format)
Media that does not support partitions is loaded and the application sends a LOCATE command with the CP bit set to 1	CHECK CONDITION		

LOG SELECT 4Ch

The LOG SELECT command causes log data on the drive to be reset to its default value or to be set to an initiator specific value.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0	
0	Operation Code (4Ch)								
1	Reserved (0)						PCR	SP (0)	
2	PC		Reserved (0)						
3–6	Reserved (0)								
7	(MSB)	Parameter List Length						(LSB)	
8									
9	Control								

CDB fields

The following are valid combinations of values for the PCR (Parameter Code Reset), Parameter List Length and PC (Page Control) fields

PCR	Parameter List Length	PC	Result
1	0	01b or 11b	All the logs on the drive that can be reset are reset to their default values.
1	0	00b or 10b	No action is taken and GOOD status is returned.
0	>0	01b or 11b	Data is sent from the host and is written to the indicated logs, provided those logs are writable.

Otherwise CHECK CONDITION status is returned, the sense key is set to ILLEGAL REQUEST with additional sense of 2400h (invalid field in CDB).

PCR	0	<i>Parameter Code Reset.</i> The function performed is defined by the PC field.
SP	0	The Save Page (SP) flag is not supported and must be set to 0.
PC	The <i>Page Control</i> field defines the type of parameter values to be selected:	
	00b or 10b	No operation is performed. The Parameter List Length must be zero. If it is not, CHECK CONDITION with additional sense of 2400h (Invalid Field In CDB) is set.
	01b	The drive will clear logs as specified by the parameter data.
	11b	The drive will clear all of its internal logs.
Parameter List Length	0	No data is to be transferred. This is not considered an error.
	>0	Specifies how many bytes of parameter data are to be sent. The data transferred will consist of zero or more 4-byte log page headers with the page length in those headers set to zero. For each log page header received, the drive clears the associated log.

LOG SENSE 4Dh

LOG SENSE allows the host to read the drive's logs. A single log is returned with each invocation of LOG SENSE.

Pre-execution checks

Illegal Field

Deferred Error

Unit Attention

The Page Code must match one of the supported log page codes. If it does not, then CHECK CONDITION status is reported. Sense data will be as described in the Illegal Field Checks.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (4Dh)							
1	Reserved (0)						PPC (0)	SP (0)
2	PC		Page Code					
3	Reserved (0)							
4								
5	Parameter Pointer							
6								
7	(MSB)	Allocation Length						(LSB)
8								
9	Control							

CDB fields

PC	The <i>Page Control</i> field defines the type of log parameter to be returned:	
	00b	Current Threshold Values—any parameters in the log that are counters contain the maximum value that they can count to.
	01b	Current Cumulative Values—any parameters in the log that are counters contain their current counts. <i>Note:</i> Counts are reset to their default cumulative values (see below) following a power-on, reset or target/logical unit reset. Media related counts are also reset following a load. For SAS drives, the counters are reset following a power-on reset or a soft reset induced via the front panel. A LUN reset has no effect.
	10b	Default Threshold Values—same as the Current Threshold Values
	11b	Default Cumulative Values—any parameters in the log that are counters contain the initial values of those counters (set at power-on, reset or target/logical unit reset, and, in the case of media logs, load).
	The PC field has no effect on the data returned when the selected log contains event or trace codes rather than counts.	
Page Code	The <i>Page Code</i> field identifies which log page is being requested by the host. See “Supported Log Pages page” (page 62) for the list of valid page codes.	
Parameter Pointer	0	All parameters are returned.
	<i>n</i>	Parameter data of a specified log page is returned in ascending order beginning from this code. If this code is larger than the largest parameter in the page, the drive

		will return CHECK CONDITION with additional sense of 2400h (invalid field In CDB).
Allocation Length	The Allocation Length field specifies the maximum number of bytes of data that should be returned to the host. The drive will return the entire log or Allocation Length bytes, whichever is the lesser.	

Log page format

All log pages except Page 0 consist of a page code header followed by a number of parameters. The page header has the following format:

	7	6	5	4	3	2	1	0	
0	Page Code								
1	Reserved (0)								
2	(MSB)	Page Length							
3								(LSB)	

The Page Code specifies which Log page is being returned. The Page Length indicates the number of additional bytes in the parameters.

For the LOG SELECT command only, the four bytes shown above are sent for each log page to be cleared. The Page Length field should be set to zero.

For the LOG SENSE command one or more parameters is sent. See the actual page descriptions below for more information. Note that all the parameters for a particular page must be sent. Each parameter is composed of the following fields: Parameter Code, Parameter Control byte (byte 2), Parameter Length and Parameter Bytes. Some pages follow the SPC-3 format and others the SPC-4 format.

SPC-4 format:

	7	6	5	4	3	2	1	0	
0	(MSB)	Parameter Code							
1								(LSB)	
2	DU	Obsolete	TSD	ETC	TMC	Format and Linking			
3	Parameter Length ($n-3$)								
4	(MSB)	Parameter Bytes							
n								(LSB)	

SPC-3 format:

	7	6	5	4	3	2	1	0	
0	(MSB)	Parameter Code							
1								(LSB)	
2	DU	DS	TSD	ETC	TMC	LBin	LP		
3	Parameter Length ($n-3$)								
4	(MSB)	Parameter Bytes							
n								(LSB)	

Parameter Code	A two-byte value that uniquely identifies the parameter within the log.	
DU <i>Disable Update</i>	0	The parameter is updated every time a related event occurs.
	1	The update happens only in response to a LOG SELECT command that specifies a new parameter value.
DS <i>Disable Save</i>	0	The current threshold or cumulative value of the parameter is saved in response to a LOG SELECT or a LOG SENSE command, depending on their PC and SP bit values.
	1	The drive does not support this feature.
TSD <i>Target Save Disable</i>	0	The drive saves the parameter at vendor-specific intervals so that they are available after, for example, a power cycle.
	1	The drive does not implicitly save the log parameters to retain the value after a power cycle.
ETC <i>Enable Threshold Comparison</i>	1	A comparison to the threshold value is performed whenever the cumulative value is updated.
TMC	<i>Threshold Met Criteria</i> Defines the basis for comparison of the cumulative and threshold values. Only valid if ETC is set. It is 0 otherwise.	
LBin <i>List Binary</i>	0	Valid only if LP is set to one. The parameter is an ASCII list.
	1	Valid only if LP is set to one. The parameter is a binary list.
LP <i>List Parameter</i>	0	The parameter is a data counter.
	1	The parameter is a list parameter.
Format and Linking	00b	The parameter is a data counter. Stop incrementing after reaching its maximum value (until the next LOG SELECT).
	01b	The parameter is a list parameter (ASCII).
	10b	The parameter is a data counter.
	11b	The parameter is a list parameter (binary).
Parameter Length	The length of Parameter Bytes in bytes.	
Parameter Bytes	The actual parameter data.	

Supported Log Pages page

This SCSI log may be recovered using a LOG SENSE command with the PC field set to anything and the Page Code field set to 00h. The page lists the page codes of other logs supported by the drive. It can neither be reset nor written.

The page has the following format:

	7	6	5	4	3	2	1	0
0	Reserved (0)		Page Code (00h)					
1	Reserved (0)							
2	(MSB)	Page Length						(LSB)
3								
4	Supported Pages (00h)							
5	Write Error Counters (02h)							
6	Read Error Counters (03h)							

	7	6	5	4	3	2	1	0
7	Sequential Access Device Log (0Ch)							
8	Temperature Log (0Dh)							
9	DTD Status Log (11h)							
10	TapeAlert Response Log (12h)							
11	Requested Recovery Log (13h)							
12	Device Statistics Log (14h)							
13	Service Buffers Information Log (15h)							
14	Tape Diagnostics Data Log (16h)							
15	Volume Statistics Log (17h)							
16	SAS Port Log (18h)							
17	Data Compression Log (1Bh)							
18	TapeAlert Log (2Eh)							
19	Tape Usage Log (30h)							
20	Tape Capacity Log (31h)							
21	Data Compression (HP-only) Log (32h)							
22	Device Wellness Log (33h) ^a							
23	Performance Log (34h)							
24	DT Device Error Log (35h)							
25	Device Status Log (3Eh)							

^a May not be present in all firmware versions.

Write Error Counters log page

The Write Error Counters log is page 02h. The Page Length is 38h. There are seven parameters, 0 through 6. All fields are four bytes long.

All these counters are updated when the data set is physically written. They relate to the current tape and are cleared when the tape is unloaded.

Parm.	Definition	Description
0	Errors corrected without substantial delay	Total number of errors corrected without delay
1	Errors corrected with possible delays	Total number of errors corrected using retries
2	Total	Sum of parameters 3 and 6
3	Total errors corrected	The number of data sets that needed to be rewritten
4	Total times error correction processed	Number of CCQ sets rewritten
5	Total data sets processed	The total number of data sets written
6	Total uncorrected errors	The number of data sets that could not be written

This data can be reset to zero, but not written.

Read Error Counters log page

The Read Error Counters log is page 03h. The Page Length is 38h. There are seven parameters, 0 through 6. All fields are four bytes long.

All these counters are updated when the data set is physically read. They relate to the current tape and are cleared when the tape is unloaded.

Parm.	Definition	Description
0	Errors corrected without substantial delay	Total number of errors corrected without delay
1	Errors corrected with possible delays	Total number of errors corrected using retries
2	Total	Sum of parameters 3 and 6
3	Total errors corrected	The number of data sets that were corrected after a read retry
4	Total times error correction processed	Number of times C2 correction is invoked
5	Total bytes processed	The total number of data sets read
6	Total uncorrected errors	The number of data sets that could not be read after retries

This data can be reset to zero, but not written.

Sequential Access Device log page

The Sequential Access Device Log page is page 0Ch. With the exception of 0100h (cleaning required), all the parameters are updated when a data set is logically written, and cleared at the start of tape load; the values of each parameter relate to the current tape.

For parameter 0100h (cleaning requested), the parameter is updated asynchronously, and cleared when a cleaning cycle is performed. The parameter relates to the drive.

NOTE: Megabytes are expressed in 10^6 units.

Parm.	Description	Parm. Control Byte	Parm. Length
0000h	The number of data bytes received from application clients during write command operations. This is the number of bytes transferred over SCSI, before compression.	60h	08h
0001h	The number of data bytes written to the media as a result of write command operations, not counting the overhead from ECC and formatting. This is the number of data bytes transferred to media, after compression.	60h	08h
0002h	The number of data bytes read from the media during read command operations, not counting the overhead from ECC and formatting. This is the number of data bytes transferred from media with compression.	60h	08h
0003h	The number of data bytes transferred to the initiator or initiators during read command operations. This is the number of bytes transferred over SCSI, after decompression.	60h	08h
0004h	The approximate native capacity from BOP to EOD, in megabytes.	60h	04h
0005h	The approximate native capacity between BOP and EW in the current partition, in megabytes.	60h	04h
0006h	The minimum native capacity from EW and EOP in the current partition, in megabytes.	60h	04h
0007h	The approximate native capacity from BOP to the current position of the medium, in megabytes.	60h	04h

Parm.	Description	Parm. Control Byte	Parm. Length
0008h	The maximum native capacity that is currently allowed to be in the device object buffer, in megabytes.	60h	04h
0100h	Cleaning requested; a non-volatile cleaning indication.	40h	08h

A non-zero value of parameter 0100h (cleaning requested) indicates that the device has requested a head cleaning, and a subsequent cleaning cycle has not yet been completed. The parameter persists across logical unit resets, hard resets and power cycles.

Temperature log page

The Temperature Log page is page 0Dh. The following parameters are supported:

Parm.	Description
0h	The current temperature of the drive in °C (binary value). If the temperature is less than 0, 0 is reported. If the temperature sensor is not functioning properly, FFh is reported.
1h	The maximum temperature in °C (binary value) at which the drive can operate continuously without degrading reliability and operation. This parameter is not supported so FFh is returned.

DTD Status log page

The Data Transfer Device (DTD) Status Log page is page 11h. The following parameters are supported:

Parm.	Description
0000h	Very High Frequency data
0001h	Very High Frequency polling delay
0002h	DT device ADC data encryption control status <i>(only available in some variants)</i>
0003h	Key management error data <i>(only available in some variants)</i>
0101h–0104h	DTD primary port status
8000h	VU Very High Frequency data
8003h	VU key management error <i>(only available in some variants)</i>
8010h	VU extended VHF data
8020h	VU multi-initiator conflict warning <i>(only available in some variants)</i>
A101h–A102h	VU failover status <i>(dual-port Fibre Channel drives only)</i>

The parameters data follows as described in the following sections.

Very High Frequency (VHF) data

	7	6	5	4	3	2	1	0
0	(MSB)							
1	Parameter Code (0000h)							(LSB)
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (4h)							
4	PAMR	HIU	MAcc	Cmpr	WrtP	CRqst	CRqrd	DInit
5	InXtn	Rsvd (0)	RAA	MPrsnt	Rsvd (0)	MStd	MThrd	DAcc
6	DT Device Activity							
7	VS	Rsvd (0)	TDDEC	EPP	ESR	RRqst	IntfC	TAFC

PAMR	Prevent/Allow Medium Removal bit
HIU	Host Initiated Unload bit
MAcc	If set to 1, the MAM is accessible. MPrsnt must be set as well.
Cmpr	Compress bit. If set to 1, the DTD currently has data compression enabled.
WrtP	Write Protect bit. If set to 1, the media in the DTD is physically write-protected. Only valid if MPrsnt is set to 1.
CRqst	Clean Requested bit
CRqrd	Cleaning Required. Not supported. Must be zero.
DInit	DTD Initialized. When set to 1, the data returned by the VHF parameter data is valid.
InXtn	In Transition. If 0, the DTD is in the state reflected by the rest of byte 5 and is not attempting to leave this state. This bit must be 0 if RRqst is set.

RAA	Robotic Access Allowed. If set to 1, robotic media access to the DTD is allowed.	
MPrsnt	Media Present bit (hardware sensor)	
MStd	Media Seated. If set, the tape is mechanically seated, that is, physical loading is complete. Otherwise the tape is still threading.	
MThrd	Media Threaded	
DAcc	Data Accessible. If set to 1 to 1, the DTD has finished processing a load operation. The bit is cleared to 0 at the beginning of the next unload operation.	
DT Device Activity	00h	No tape motion
	01h	Cleaning operation in progress
	02h	Tape being loaded
	03h	Tape being unloaded
	04h	Other tape activity
	05h	Reading
	06h	Writing
	07h	Locating
	08h	Rewinding
	09h	Erasing
	0A–0Bh	Reserved
	0Ch	Other DT device activity
	0Dh	Microcode update in progress
	0Eh	Reading encrypted data from tape
	0Fh	Writing encrypted data to tape
	10h–7Fh	Reserved
	80h–FFh	Vendor unique
VS	<i>Vendor Specific</i> bit. Indicates changes in the VU Extended VHF Data log parameter.	
	0	No VU Extended VHF Data log parameter field has changed since the last retrieval of the Extended VHF Data log parameter by this I_T nexus.
	1	At least one field in the VU Extended VHF Data log parameter has changed since the last retrieval of the VU Extended VHF Data log parameter from the DT Device Status log page by this I_T nexus. The ADC device server sets the VS bit to zero after retrieval of the VU Extended VHF Data log parameter by this I_T nexus.
TDDEC	<i>Tape Diagnostic Data Entry Created</i>	
	0	The DT device has not created a new Tape Diagnostic Data log page entry since the last retrieval of any of the parameters from the Tape Diagnostic Data log page by this I_T nexus.
	1	The DT device has created a new Tape Diagnostic Data log page entry since the last retrieval of any of the parameters from the Tape Diagnostic Data log page by this I_T nexus.
EPP	<i>Encryption Parameters Present</i>	
	1	There is a set of saved data encryption parameters with either the Encryption Mode field set to a value other than Disable or the Decryption Mode field set to a value other than Disable associated with any I_T nexus.
ESR	<i>Encryption Service Request</i> (only available in some variants)	
	0	A value of zero means one of the following: <ul style="list-style-type: none"> No bits in the Service Request Indicators field in DT device ADC data encryption control status log parameter have been set to one since the

		<p>last retrieval of the data encryption control status log parameter by this I_T nexus</p> <ul style="list-style-type: none"> All of the bits in the Service Request Indicators field in the DT device ADC data encryption control status log parameter are set to zero. <p>The ESR bit is set to zero after retrieval of the DT device ADC data encryption control status log parameter by this I_T nexus.</p>
	1	At least one bit in the Service Request Indicators field in the DT device ADC data encryption control status log parameter has been set to one since the last retrieval of the data encryption control status log parameter by this I_T nexus.
RRqst	Recovery Requested. Set to 1 as long as a recovery procedure is available. In these circumstances, InXtn must be 0.	
IntfC	Interface Changed. If set to 1, the interface status has changed since the last time this page was retrieved. It is cleared to 0 when the page is retrieved for the initiator.	
TAFC	If set, at least one TapeAlert flag has changed since the last time the TapeAlert flags were retrieved.	

Very High Frequency polling delay (*only available in some variants*)

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code (0001h)							(LSB)
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (2h)							
4	(MSB) _____							
5	VHF Polling Delay in ms (10h)							(LSB)

The **VHF Polling Delay** is 16 milliseconds.

DT device ADC data encryption control status (*only available in some variants*)

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code (0002h)							(LSB)
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (8h)							
4	Reserved (0)							
5	EPR	DPR	KME	ABT	Reserved (0)			
6	(MSB) _____							
9	Parameters Request Sequence Identifier							(LSB)
10–11	Reserved (0)							

ABT	Set to 1 when the data encryption parameters request associated with the value in the Parameters Request Sequence Identifier field has been aborted.
KME	<i>Key Management Error</i> . If set to 1, it indicates that the Error Type field in the key management error data log parameter is set to a non-zero value.

DPR	<i>Decryption Parameters Request</i> . If set to 1, it indicates that the device requests a set of encryption parameters for decryption from the automation application client.
EPR	<i>Encryption Parameters Request</i> . If set to 1, it indicates that the device requests a set of data encryption parameters for encryption from the automation application client.
Parameters Request Sequence Identifier	A unique value that identifies one of the following: <ul style="list-style-type: none"> The data encryption parameters for an encryption request if EPR is set to 1. The data encryption parameters for a decryption request if DPR is set to 1. The data encryption parameters request that has been aborted if ABT is set to 1.

Key management error data (only available in some variants)

	7	6	5	4	3	2	1	0
0	(MSB) Parameter Code (0003h) (LSB)							
1								
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (Ch)							
4	Error Type				KTO	Reserved (0)		
5	Reserved (0)							
6	(MSB) Parameters Request Sequence Identifier (LSB)							
9								
10	Reserved (0)				Sense Key (0)			
11	Additional Sense Code (0)							
12	Additional Sense Code Qualifier (0)							
13–15	Reserved (0)							

Error Type	Indicates the type of the last key management error event.	
	0000b	No error
	0001b	Encryption parameters request error
	0010b	Decryption parameters request error
KTO	<i>Key Timeout</i> . If set to 1, the data encryption period timer expired.	
Parameters Request Sequence Identifier	A unique value that identifies the data encryption parameters request associated with the last key management error event. Otherwise this field is set to 0.	

DTD primary status log parameters

The parameter codes for ports are as follows:

Port	Parameter Code
Fibre Channel port A	101h
Fibre Channel port B	102h
Fibre Channel NPIV port A	103h
Fibre Channel NPIV port B	104h

Port	Parameter Code
SAS port A	101h
SAS port B	102h

Fibre Channel port status data

	7	6	5	4	3	2	1	0
0	(MSB) _____ Parameter Code _____ (LSB)							
1								
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (18h)							
4	CurrTop	Current Speed			LC	Conflict	Signal	PIC
5	Current N_Port ID							
7								
8–10	Reserved (0)							
11	Rsvd (0)	Current FC-AL Loop ID						
12	Current Port Name							
15								
16	Current Node Name							
23								

CurrTop	<i>Current Topology</i> . Ignored when the PIC bit is set to zero.	
	0	Current Topology. Ignored when the PIC bit is set to zero.
	1	The DT device primary port is currently operating in point-to-point mode.
Current Speed	The bit rate at which the DT device primary port is currently operating. The field is ignored when the PIC bit is set to zero. Valid values are:	
	000b 001b 010b 011b 100b—111b	1 Gbps 2 Gbps 4 Gbps 8 Gbps reserved
LC	<i>Login Complete</i>	
	0	A login has not successfully completed through the PRLI phase on the DT device primary port.
	1	At least one initiator port has completed process login (PRLI) with the DT device on the DT device primary port.
Conflict	0	There is no AL_PA conflict.
	1	Another device has the required Hard AL_PA, or no AL_PA is available for the DT device primary port.
Signal	0	No light detected
	1	Light detected

	Deassertion of the Signal bit is delayed for 30 seconds when the port is the standby port in a data path failover configuration. This is because Brocade switches signal-cycle the port causing "up/down" status indications to percolate to a library.			
PIC	<i>Port Initialization Complete</i>			
	<table border="1"> <tr> <td>0</td> <td>The DT device primary port is not in the ACTIVE state and is not synchronized, or has not successfully completed the most recent Loop Initialization Process.</td> </tr> <tr> <td>1</td> <td>The FC_Port state machine is in the ACTIVE state and the DT device primary port is operating in point-to-point topology, or the most recent Loop Initialization Process has completed successfully</td> </tr> </table>	0	The DT device primary port is not in the ACTIVE state and is not synchronized, or has not successfully completed the most recent Loop Initialization Process.	1
0	The DT device primary port is not in the ACTIVE state and is not synchronized, or has not successfully completed the most recent Loop Initialization Process.			
1	The FC_Port state machine is in the ACTIVE state and the DT device primary port is operating in point-to-point topology, or the most recent Loop Initialization Process has completed successfully			
Current N_Port ID	The 24-bit N_Port ID that is assigned to the DT device primary port. The field is ignored when the PIC bit is set to zero.			
Current FC_AL Loop ID	The loop identifier that is assigned to the DT device primary port. The field is ignored when the PIC bit is set to zero or when the CurrTop bit is set to one.

0	Host Login	Reserved (0)		Hardware Error	Media Error	Upgrade Cart.	Loading	Unloading
1	Reserved (0)					Snapshot	Load Complete	Unload Complete

Host Login	0	No host logins have changed.
	1	At least one fabric login has occurred since the last retrieval of the Host Login table using a SCSI MAINTENANCE IN command by this I_T nexus. The ADC device server sets Host Login to zero after this I_T nexus has retrieved the Host Login table.
Hardware Error	0	One of the following has occurred: <ul style="list-style-type: none"> The Hardware Error data log has been retrieved by this I_T nexus. An appropriate service action has been performed to correct the reported hardware error.
	1	The drive has detected a hardware error since the last retrieval of the Hardware Error data log. The Hardware Error bit is set to one at the same time that the drive indicates a hardware error on its physical user interface.
Media Error	0	One of the following has occurred: <ul style="list-style-type: none"> The Media Error data log has been retrieved by this I_T nexus. An appropriate service action has been performed to correct the reported media error.
	1	The drive has detected a media error since the last retrieval of the Media Error data log. The Media Error bit is set to one at the same time the drive indicates a media error on its physical user interface.
Upgrade Cart.	0	No firmware upgrade cartridge is loaded in the drive.
	1	A firmware upgrade cartridge is loaded in the drive to at least the seated position.
Loading	0	The drive is not loading media.
	1	The drive is in the process of executing one of the following: <ul style="list-style-type: none"> A SCSI LOAD/UNLOAD command, with the Load bit set to one. A load initiated by a cartridge being physically pushed into the drive. An ACI Load command.
Unloading	0	The drive is not unloading media.
	1	The drive is in the process of executing one of the following: <ul style="list-style-type: none"> A SCSI LOAD/UNLOAD command, with the Load bit set to zero. A unload initiated via the physical user interface of the drive. An ACI Unload command.
Snapshot	0	A snapshot log has not been created since this I_T nexus last retrieved the list of available snapshot logs using the REPORT SNAPSHOT AVAILABLE command or the DT Device has not created a Snapshot log. The ADC device server sets the Snapshot bit to zero after this I_T nexus has retrieved the list of available snapshot logs using the REPORT SNAPSHOT AVAILABLE command.
	1	A Snapshot log has been created since the last retrieval of the list of available snapshot logs by this I_T nexus using the REPORT SNAPSHOT AVAILABLE command.
Load Complete	0	The bit is set to zero when: <ul style="list-style-type: none"> A load operation has not been initiated. An unload operation has been initiated since the last load operation. A load operation is in progress. Media is not in load state (e) or (i) (see ADC 4.2.4.1).
	1	The drive has completed a load operation for the media that is currently loaded in the drive to load state (e) or (i) (see ADC 4.2.4.1).

Unload Complete	0	The bit is set to zero when: <ul style="list-style-type: none"> • An unload operation has not been initiated. • A load operation has been initiated since the last unload operation. • An unload operation is in progress.
	1	The drive has completed an unload operation.

MICW	<i>Multi-Initiator Conflict Warning</i>							
	0	The drive has detected a potential multi-initiator conflict since the last time the Multi-Initiator Conflict Warning log parameter was successfully reported on this I_T nexus.						

	1	The drive has not detected a potential multi-initiator conflict since the last time the Multi-Initiator Conflict Warning log parameter was successfully reported on this I_T nexus. <i>Only available in some variants.</i>
HM	<i>Hibernate Mode</i>	
	0	The drive is in its active state.
	1	The drive is in its standby state to reduce power consumption.
LRC	<i>Legacy Reservations Changed</i>	
	0	The legacy reservations held by the drive for the SMC logical unit have not changed since the last time the REPORT LEGACY RESERVATIONS command was successfully reported on this I_T nexus.
	1	The legacy reservations held by the drive for the SMC logical unit have changed since the last time the REPORT LEGACY RESERVATIONS command was successfully processed by this I_T nexus.
PRC	<i>Persistent Reservations Changed</i>	
	0	The persistent reservations held by the drive for the remote SMC logical unit have not changed since the last time the REPORT PERSISTENT RESERVATIONS command was successfully reported on this I_T nexus.
	1	The persistent reservations held by the drive for the remote SMC logical unit have changed since the last time the REPORT PERSISTENT RESERVATIONS command was successfully reported on this I_T nexus.
PAMRC	<i>Prevent Allow Medium Removal Changed</i>	
	0T	The prevent allow medium removal settings held by the drive for the remote SMC logical unit have not changed since the last time the REPORT PREVENT MEDIUM REMOVAL command was successfully reported on this I_T nexus.
	1	The prevent allow medium removal settings held by the drive for the remote SMC logical unit have changed since the last time the REPORT PREVENT MEDIUM REMOVAL command was successfully reported on this I_T nexus.

VU multi-initiator conflict warning (*only available in some variants*)

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code (8020h) _____ (LSB)							
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (12h)							
4	(MSB) _____							
11	Host Name 1 (previous) _____ (LSB)							
12	(MSB) _____							
19	Host Name 2 (latest) _____ (LSB)							
20	Operation Code							
21	Reserved (0)				Service Action			

When the device server processes a hard reset condition, **Host Name 1**, **Host Name 2**, **Operation Code**, and **Service Action** are set to zero.

If a potential multi-initiator conflict has occurred:

Host Name 1 contains the name of the previous host that initiated media access command while no reservation was set.

Host Name 2 contains the name of the most recent host that initiated a media access command while no reservation was set.

Operation Code contains the media access SCSI Operation Code executed by Host Name 2.

Service Action contains the service action of the media access command executed by Host Name 2. If the media access command did contain a service action this file is set to 00h.

VU failover status

Parameter Code	Description
A101h	Fibre Channel port A failover status
A102h	Fibre Channel port B failover status

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code _____ (LSB)							
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (4h)							
4	Reserved (0)							Active
5	Reserved (0)				Failover Trigger			
6-7	Reserved (0)							

Active	0	The specified port is not active.
	1	The specified port is active or was the port requested to be active by the automation application client. If data path port failover is enabled, then only one port failover status data log parameter will report an Active bit set to one. If the drive could not successfully activate any primary ports enabled for use with data path failover, no ports will have the Active bit set to one.
Failover Trigger	If the Active bit is set to one, Failover Trigger must be set to zero. If the Active bit is set to zero, Failover Trigger contains a code to identify the most recent data path port failover trigger that was detected on this port:	
	0000b	No failover trigger has been detected.
	0001b	A signal loss failover trigger was detected.
	0010b	A link error threshold exceeded trigger was detected.
	0011b	A command transport error threshold exceeded trigger was detected.
	0100b-1111b	Reserved

TapeAlert Response log page

The TapeAlert Response log page is page 12h. There is only 1 parameter, which contains 64 flags. For a list of supported flags, see ["TapeAlert log page" \(page 87\)](#).

	7	6	5	4	3	2	1	0
0	Page Code (12h)							
1	Reserved (0)							

	7	6	5	4	3	2	1	0
2	(MSB) _____							
3	Page Length (000Ch) _____ (LSB)							
4	(MSB) _____							
5	Parameter Code (0000h) _____ (LSB)							
6	DU (1)	Obsolete (0)	TSD (1)	ETC (0)	TMC (0)	Format and Linking (11b)		
7	Parameter Length (08h)							
8	Flag 01h	Flag 02h	Flag 03h	Flag 04h	Flag 05h	Flag 06h	Flag 07h	Flag 08h
9	Flag 09h	Flag 0Ah	Flag 0Bh	Flag 0Ch	Flag 0Dh	Flag 0Eh	Flag 0Fh	Flag 10h
10	Flag 11h	Flag 12h	Flag 13h	Flag 14h	Flag 15h	Flag 16h	Flag 17h	Flag 18h
11	Flag 19h	Flag 1Ah	Flag 1Bh	Flag 1Ch	Flag 1Dh	Flag 1Eh	Flag 1Fh	Flag 20h
12	Flag 21h	Flag 22h	Flag 23h	Flag 24h	Flag 25h	Flag 26h	Flag 27h	Flag 28h
13	Flag 29h	Flag 2Ah	Flag 2Bh	Flag 2Ch	Flag 2Dh	Flag 2Eh	Flag 2Fh	Flag 30h
14	Flag 31h	Flag 32h	Flag 33h	Flag 34h	Flag 35h	Flag 36h	Flag 37h	Flag 38h
15	Flag 39h	Flag 3Ah	Flag 3Bh	Flag 3Ch	Flag 3Dh	Flag 3Eh	Flag 3Fh	Flag 40h

Each flag is either zero to indicate the corresponding condition is deactivated or one to indicate that the corresponding condition has been activated.

Flags are *not* cleared when the log is read. The log is cleared at power-on or on a reset condition. Specific flags may be cleared when corrective action has removed the condition that caused the flag to be activated.

Requested Recovery log page

The Requested Recovery log page is 13h. One parameter is supported:

Parameter	Description
0000h	Recovery procedures
0001h–FFFFh	Reserved

Recovery procedures

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code (0000h) _____ (LSB)							
2	DU (1)	Obsolete	TSD (1)	ETC (0)	TMC (0)	Format & Linking (11b)		
3	Parameter Length (1h)							
4	Recovery Procedure							

Recovery Procedure	The recovery procedures that can be requested by HP tape drives are as follows:	
00h	No recovery requested	
0Dh	Request creation of a DT device error log	

	0Eh	Retrieve a DT device error log
	0Fh	Modify the configuration to allow microcode update

Device Statistics log page

This log provides information about the use of the tape device.

	7	6	5	4	3	2	1	0
0	DS (0)	SPF (0)	Page Code (14h)

2	(MSB)	Page Length						(LSB)
3								
4	Device Statistics log parameter (first)							
:	:							
m	Device Statistics log parameter (last)							

Device Statistics log parameters

The supported log parameters include those shown below; more parameters are expected to be added as development progresses.

Parameter Code	Description	Length (bytes)	Type
0000h	Lifetime volume loads	4	Counter
0001h	Lifetime cleaning operations	4	Counter
0002h	Lifetime power-on hours	4	Counter
0003h	Lifetime media motion (head) hours	4	Counter
0004h	Lifetime meters of tape processed	4	Counter
0005h	Lifetime medium motion (head) hours when an incompatible volume was last loaded	4	Counter
0006h	Lifetime power-on hours when the last temperature condition occurred (TapeAlert code 24h)	4	Counter
0007h	Lifetime power-on hours when the last power consumption condition occurred (TapeAlert code 1Ch)	4	Counter
0008h	Medium motion (head) hours since the last successful cleaning operation	4	Counter
0009h	Medium motion (head) hours since the second to last successful cleaning operation	4	Counter
000Ah	Medium motion (head) hours since the third to last successful cleaning operation	4	Counter
000Bh	Lifetime power-on hours when the last operator-initiated forced reset or emergency eject occurred	4	Counter
000Ch	Lifetime power cycles	4	Counter
000Dh	Volume loads since last parameter reset	4	Counter
000Eh	Hard write errors	4	Counter
000Fh	Hard read errors	4	Counter

Parameter Code	Description	Length (bytes)	Type
0010h	Duty cycle sample time (time in milliseconds since last hard reset)	8	Counter
0011h	Read duty cycle (percentage of duty cycle spent processing read-type commands)	2	Counter
0012h	Write duty cycle (percentage of duty cycle spent processing write-type commands)	2	Counter
0013h	Activity duty cycle (percentage of duty cycle spent processing commands that move the medium)	2	Counter
0014h	Volume not present duty cycle (percentage of duty cycle when there is no volume present)	2	Counter
0015h	Ready duty cycle (percentage of the duty cycle sample time when the drive is in the ready state)	2	Counter
0016h	MB transferred from the application client in the duty cycle sample time (MB=10 ⁶ bytes)	8	Counter
0017h	MB transferred to the application client in the duty cycle sample time (MB=10 ⁶ bytes)	8	Counter
0040h	Drive manufacturer's serial number	See Inquiry page B1h	String
0041h	Drive serial number	See Inquiry page 80h	String
0080h	Medium removal prevented	2	Counter
0081h	Max recommended mechanism temperature exceeded	2	Counter
1000h	Medium motion (head) hours for each medium type	48	Medium

Device statistics data counter log parameter

Most of the log parameters are counters, and are formatted as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
	Parameter Code							
1	_____ (LSB)							
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11 b)	
3	Parameter Length (n-3)							
4-n	Device Statistics Data Counter							

Device statistics medium type log parameter

	7	6	5	4	3	2	1	0
0	(MSB) _____							
	Parameter Code							
1	_____ (LSB)							
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11 b)	
3	Parameter Length (n-3)							
4-n	Device Statistics Medium Type Log Descriptors							

This log parameter will report six descriptors (one per supported density code/medium type combination) of the following format:

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Density Code							
3	Medium Type							
4-7	Medium Motion Hours							

Device statistics string data log parameter

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code _____ (LSB)							
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (n-3)							
4-n	String Data							

Service Buffers Information Log page

Two service buffers are supported by HP LTO-6 drives:

Parameter Code	Description
0000h	DT Device Error log
0003h	Health and Error log
other values	Reserved

DT Device Error Log service buffer

The Error Log service buffer contains firmware trace logs that may be useful for the diagnosis of a drive failure. The parameter format is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code (0000h) _____ (LSB)							
2	DU (0)	Obsolete	TSD (1)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (18h)							
4	Buffer ID (41h)							
5	Reserved (0)			TU	NMP (0)	NMM (0)	Offline (0)	PD (0)
6	Reserved (0)				Code Set (01h)			
7	Reserved (0)							
8	Service Buffer Title ("DT Device Error Log")							
27								

TU	<i>Temporarily Unavailable</i>							
	1	The service buffer identified by the contents of the Buffer ID field is temporarily unavailable for retrieval from the device server, either because the buffer has not been initialized or because it is in the process of being filled with log data.						

Health and Error Log service buffer

The Health and Error Log service buffer contains information that may be useful for determining the overall health of the drive. It also contains firmware trace logs that may be useful for the diagnosis of a drive failure. The parameter format is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Parameter Code (0003h) _____ (LSB)							
1								
2	DU (0)	Obsolete	TSD (1)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (18h)							
4	Buffer ID (44h)							
5	Reserved (0)			TU	NMP (0)	NMM (0)	Offline (0)	PD (0)
6	Reserved (0)				Code Set (01h)			
7	Reserved (0)							
8	Service Buffer Title ("Health & Error Log")							
27								

TU	As above.
-----------	-----------

Tape Diagnostic log page

The Tape Diagnostic Data log page provides a number of error-event records using the list parameter format. Each error-event record contains diagnostic information for a single error type encountered by the device including data counters associated with the error event, sense data, operation code/service action, and medium type with associated media motion hours, and so on.

It only includes parameter entries for commands that terminated with CHECK CONDITION and a sense key of MEDIUM ERROR, HARDWARE ERROR or ABORTED COMMAND.

The parameter code value associated with an error-event indicates the relative time at which a command terminated with a CHECK CONDITION status. A lower parameter code indicates that the command terminated with CHECK CONDITION at a more recent time. The parameter code values returned are numbered consecutively from 0000h (the most recent) up to n , where n is the number of current parameter entries.

The number of supported parameter entries is 60; 30 non-volatile entries and 30 volatile entries.

	7	6	5	4	3	2	1	0
0	DS (0)	SPF (0)	Page Code (16h)

Volume statistics data counter log parameter

Most of the log parameters are counters, and are formatted as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code						_____ (LSB)	
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (n-3)							
4-n	Volume Statistics Data Counter							

Volume statistics partition record log parameter

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Parameter Code						_____ (LSB)	
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11b)	
3	Parameter Length (n-3)							
4-n	Volume Statistics Partition Record Descriptors							

This log parameter will report one descriptor of the following format:

	7	6	5	4	3	2	1	0
0	Partition Descriptor Length (<i>n</i>)							
1	Reserved (0)							
2-3	Partition Number							
4- <i>n</i>	Partition Record Data Counter							

Volume statistics string data log parameter

	7	6	5	4	3	2	1	0
0	(MSB) _____ Parameter Code _____ (LSB)							
1								
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11 b)	
3	Parameter Length (<i>n</i> -3)							
4- <i>n</i>	String Data							

Volume statistics mount history log parameter

	7	6	5	4	3	2	1	0
0	(MSB) _____ Parameter Code _____ (LSB)							
1								
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC (0)		Format and Linking (11 b)	
3	Parameter Length (<i>n</i> -3)							
4- <i>n</i>	Volume statistics mount history descriptors							

Volume statistics mount history descriptor

	7	6	5	4	3	2	1	0
0	Mount History Descriptor Length (<i>n</i>)							
1	Reserved (0)							
2	Mount History Index [0..3]							
3								
4	Mount History Vendor ID							
11								
12	Mount History Unit Serial Number							
<i>n</i>								

Protocol-Specific Port Log page (SAS drives only)

The basic structure of the page is as follows:

	7	6	5	4	3	2	1	0
0	DS (0)	SPF (0)	Page Code (18h)					
1	Subpage Code (00h)							
2	(MSB)	Page Length (78h)						(LSB)
3								
4	Protocol-Specific Log Parameter 0							
63								
64								
64	Protocol-Specific Log Parameter 1							
123								

Protocol-specific log parameters

	7	6	5	4	3	2	1	0
0	(MSB)	Parameter Code [0,1]						(LSB)
1								
2	DU (0)	Obsolete (0)	TSD (0)	ETC (0)	TMC(0)		Format and Linking (3h)	
3	Parameter Length (38h)							
4	Reserved (0)			Protocol Identifier (6h)				
5	Reserved (0)							
6	Generation Code							
7	Number of Phys (1)							
8	Reserved (0)							
9	PHY Identifier [0,1]							
10	Reserved (0)							
11	SAS PHY Log Descriptor Length (30h)							
12	Rsvd (0)	Attached Device Type			Attached Reason			
13	Reason (0)			Negotiated Physical Link Rate				
14	Reserved (0)			Attached SSP Initiator Port	Attached STP Initiator Port	Attached SMP Initiator Port	Rsvd (0)	
15	Reserved (0)			Attached SSP Target Port	Attached STP Target Port	Attached SMP Target Port	Rsvd (0)	
16	(MSB)	SAS Address (8 bytes)						(LSB)
23								
24	(MSB)	Attached SAS Address (8 bytes)						(LSB)
31								
32	Attached PHY Identifier							

	7	6	5	4	3	2	1	0	
33–39	Reserved (0) (7 bytes)								
40	(MSB)	Invalid DWORD Count (4 bytes)							
43								(LSB)	
44	(MSB)	Running Disparity Error Count (4 bytes)							
47								(LSB)	
48	(MSB)	Loss of DWORD Synchronization Count (4 bytes)							
51								(LSB)	
52	(MSB)	PHY Reset Problem Counts (4 bytes)							
55								(LSB)	
56–57	Reserved (0) (2 bytes)								
58	PHY Event Descriptor Length (0)								
59	Number of PHY Event Descriptors (0)								

Parameter Code	The relative port identifier
Generation Code	A one-byte counter that is incremented each time the values in either the PHY Control and Discover mode page or the Enhanced PHY Control mode page change. This counter wraps from FFh to 01h as a value of 00h means unknown. The counter is used to correlate PHY settings across mode and log pages.
PHY Identifier	The same value as the Parameter Code
Invalid DWORD Count	Number of invalid DWORDS received outside of PHY reset sequences.
Running Disparity Error Count	Number of DWORDS containing running disparity errors received outside the PHY reset sequences.
Loss of DWORD synchronization	Number of times the PHY restarted the link reset sequence because it lost DWORD synchronization.
PHY Reset Problem Count	Number of times the PHY did not obtain DWORD synchronization during the final SAS speed negotiation window.

NOTE: The counters are the only fields affected by a LOG SELECT command or the value of the PC field in the LOG SENSE command.

Data Compression log page

The Data Compression log page code is 1Bh.

The supported parameters are listed below. This data relates to the most recently mounted volume, and is cleared at the start of tape load.

Parameter	Description
0000h	Read compression ratio
0001h	Write compression ratio
0002h	Megabytes transferred to host
0003h	Bytes transferred to host
0004h	Megabytes read from tape

Parameter	Description
0005h	Bytes read from tape
0006h	Megabytes transferred from host
0007h	Bytes transferred from host
0008h	Megabytes written to tape
0009h	Bytes written to tape
0010h	Dara compression enabled

The format of a data compression counter log parameter is as follows:

	7	6	5	4	3	2	1	0
0	Parameter Code							
1								
4	DU (0)	Obsolete	TSD (0)	ETC (0)	TMC (0)	Format & Linking (11b)		
63	Parameter Length (n-3)							
4	Data Compression Counter							
n								

TapeAlert log page

NOTE: Reading the TapeAlert log clears the flags, as stipulated in the TapeAlert specification.

The TapeAlert log page is page 2Eh. There are 64 parameters numbered from 1 through 64. Only parameters 1 through 18, 20 through 23, 29 through 39 and 55 have definitions for tape drives without attached loaders. The remaining parameters are always zero.

The Parameter Control Byte value for each parameter is 40h.

All parameters are one byte long. Each parameter is either zero to indicate the corresponding condition has not occurred or one to indicate that the corresponding condition has occurred. All log parameters are cleared when the log is read. The Log is also cleared at power on, on a reset condition and by a LOG SELECT command. Specific flags may be cleared when corrective action has removed the condition that caused the flag to be set.

The supported parameters are as follows. The Set column indicates if the flag can be set by drives. The other flags are supported but never set.

Parameter	Description	Type	Set
1	Read Warning	Warning	Yes
2	Write Warning	Warning	Yes
3	Hard Error	Warning	Yes
4	Medium	Critical	Yes
5	Read Failure	Critical	Yes
6	Write Failure	Critical	Yes
7	Medium Life	Warning	Yes
9	Write-Protect	Critical	Yes

Parameter	Description	Type	Set
10	Volume Removal Prevented	Information	Yes
11	Cleaning Volume	Information	Yes
12	Unsupported Format	Information	Yes
13	Recoverable Mechanical Cartridge Failure	Critical	Yes
14	Unrecoverable Mechanical Cartridge Failure	Critical	Yes
15	Memory Chip in Cartridge Failure	Warning	Yes
16	Forced Eject	Critical	Yes
17	Read-Only Format	Warning	Yes
18	Tape Directory Corrupted on Load	Warning	Yes
19	Nearing Medium Life	Information	Yes
20	Cleaning Required	Critical	Yes
21	Cleaning Requested	Warning	Yes
22	Expired Cleaning Volume	Critical	Yes
23	Invalid Cleaning Volume	Critical	Yes
24	Retention Requested	Warning	
25	Multi-port Interface Error on Primary Port	Warning

Tape Usage log page

The Tape Usage log page code is 30h. There are nine parameters. These are all read directly from the LTO-CM Tape Usage Log.

This data relates to the current tape and can be neither reset nor written.

Parm.	Description	Length	Updated When
1	Thread Count	4	Tape threaded
2	Total Data Sets Written	8	Data set physically written
3	Total Write Retries	4	Data set physically written
4	Total Unrecovered Write Errors	2	Data set physically written
5	Total Suspended Writes	2	Data set physically written
6	Total Fatal Suspended Writes	2	Data set physically written
7	Total Data Sets Read	8	Data set physically written
8	Total Read Retries	4	Data set physically written
9	Total Unrecovered Read Errors	2	Data set physically written

Tape Capacity log page

The Tape Capacity log page code is 31h. The Page Length is 20h. There are eight parameters, 1 through 8, each 4 bytes long. They relate to the current tape. All parameters are in megabytes (1,048,576 bytes) and assume no compression. The data can neither be reset nor written with LOG SELECT.

The supported parameters are as follows:

Parm.	Description	Control Byte	Length	Updated When
1	Partition 0 Remaining Capacity	60h	4	Data set physically written
2	Partition 1 Remaining Capacity	60h	4	Data set physically written
3	Partition 0 Maximum Capacity	60h	4	SET CAPACITY executes successfully. The tape is formatted.
4	Partition 1 Maximum Capacity	60h	4	SET CAPACITY executes successfully. The tape is formatted.
5	Partition 2 Remaining Capacity	60h	4	Data set physically written
6	Partition 3 Remaining Capacity	60h	4	Data set physically written
7	Partition 2 Maximum Capacity	60h	4	SET CAPACITY executes successfully. The tape is formatted.
8	Partition 3 Maximum Capacity	60h	4	SET CAPACITY executes successfully. The tape is formatted.

Data Compression (HP-only) log page

The Data Compression (HP-only) log page code is 32h and the page length is 4Ch. There are ten parameters, 0 through 9. Parameters 0 and 1 are two bytes long. Parameters 2 through 9 are each 4 bytes long.

The supported fields are listed below. Parameters 2 through 9 occur as pairs that represent a large number of bytes transferred. The first four-byte parameter represents the number of whole megabytes transferred, rounded to the nearest megabyte. The second four-byte parameter represents the difference between this number of megabytes and the actual number of bytes. This may be a signed quantity.

This data relates to the current tape and is cleared at the start of tape load. It may not be written.

Parameter	Description	Length	Updated When
0	Read compression ratio x100	2	Data set logically read
1	Write compression ratio x100	2	Data set logically written
2	Megabytes transferred to host	4	Data set logically read
3	Bytes transferred to host	4	Data set logically read
4	Megabytes read from tape	4	Data set logically read
5	Bytes read from tape	4	Data set logically read
6	Megabytes transferred from host	4	Data set logically written
7	Bytes transferred from host	4	Data set logically written
8	Megabytes written to tape	4	Data set logically written
9	Bytes written to tape	4	Data set logically written

Device Wellness Log page

The Device Wellness Log page has page code 33h and consists of a FIFO parameter code list of the last 16 drive error conditions caused by various sense keys.

However, to enable connectivity to the peripheral management tools only, the page structure has been implemented, but all parameter values returned by the drive will be zero.

	7	6	5	4	3	2	1	0
0	Page Code (33h)							
1	Reserved (0)							
2	(MSB)	Parameter Code (0100h)						(LSB)
3								
4+(16n)	Parameter Code n ($n = 0$ through 15)							
5+(16n)								
6+(16n)	DU (0)	DS (1)	TSD (1)	ETC (0)	TMC (0)	LBIN (0)	LP (1)	
7+(16n)	Reserved (0)							
8+(16n)	(MSB)	Time Stamp						(LSB)
11+(16n)								
12+(16n)	(MSB)	Media Signature						(LSB)
15+(16n)								

	7	6	5	4	3	2	1	0
16+(16n)	Sense Key							
17+(16n)	Additional Sense Code							
18+(16n)	Additional Sense Qualifier							
19+(16n)	Additional Error Information							

Performance Data log page

The Performance Data log page is 34h. This log is intended to report data of interest to a user/application on how efficiently the drive is being used.

Parameter	Description	Length	Updated
0	Repositions per 100 MB	2	After each 100 MB has been physically written
1	Data rate into buffer	2	After each data set has been logically written
2	Maximum data rate	2	After each data set has been logically written
3	Current data rate	2	After each data set has been logically written
4	Native data rate	2	When the tape is loaded or unloaded

The Parameter Control Byte is 60h for all the parameters.

All the parameters relate to the current tape. They are all cleared at the start of tape load, except Parameter 4, which is never cleared. All data will be reset when the log page is reset. The parameters are as follows.

Repositions per 100 MB	Number of tape direction changes per 100 MB written. The higher the figure the more wear occurs.		
Data rate into buffer	Rate at which data is entering the buffer (after data compression), given in units of 100 KB/s. This is the true 'tape' data rate.		
Maximum data rate	Given the compressibility of the data that has been sent to the drive, this is the maximum data rate that could be achieved, given in units of 100 KB/s. The figure is calculated based on the compressibility of each dataset received, and datasets that have a compressibility greater than the compression bandwidth of the drive will be 'capped'.		
Current data rate	Rate at which data is being accepted by the drive <i>before</i> compression, given in units of 100 KB/s.		
Native data rate	The native rate (that is, without using compression) at which the drive writes data to tape, given in units of 100 KB/s:		
	Drive	Value	Native Data Rate
	LTO-4	4B0h	120 MB/s
	LTO-5	578h	140 MB/s
	LTO-6 or no tape loaded	640h	160 MB/s

DT Device Error log page

The DT Device Error log page defines log information relating to hardware and media errors reported by the DT Device via the drive's front panel, where applicable, and/or the Interface Manager VHF data fields HARDWARE ERROR and MEDIA ERROR.

	7	6	5	4	3	2	1	0
0	DS (0)	SPF (0)	Page Code (35h)					
1	Subpage Code (00h)							
2	(MSB)	Page Length (n-3h)						(LSB)
3								
4	DT Device Error Log Parameters							
n								

DT Device Error Log Parameters	Code	Description
	0000h	Hardware Error data (see below)
	0001h	Media Error data
	0002h-7FFFh	Reserved
	8000h-FFFFh	Vendor-specific

Hardware Error data log parameter

	7	6	5	4	3	2	1	0
0	(MSB)	Parameter Code (0000h)						(LSB)
1								
2	DU (0)	Obsolete	TSD (0)	ETC (0)	TMC (0)	Format & Linking (11b)		
3	Parameter Length (16h)							
4	Reserved (0)				Sense Key			
5	Additional Sense Code							
6	Additional Sense Code Qualifier							
7	(MSB)	Hardware Error						(LSB)
8								
9	(MSB)	Host Identification						(LSB)
16								
17	(MSB)	Power-on Count						(LSB)
18								
19	(MSB)	Power-on Time of Error						(LSB)
22								
23	(MSB)	Library Time of Error						(LSB)
25								

Hardware Error	The last hardware error reported by the drive. Set to zero if no hardware error has been reported.	
Host Identification	The NAA-format World Wide Name of the host that initiated the command that resulted in the hardware error, if known to the DT Device. If the DT Device does not know the host identification, the field is treated as reserved.	
Power-on Count	The number of times the drive has been powered on before the hardware error occurred.	
Power-on Time of Error	The length of time (in seconds) the DT Device had been powered on when the hardware error occurred.	
Library Time of Error	The time the hardware error occurred. The time is expressed in hours, minutes and seconds using the Library Time, which may be set using the Device Time mode page (3Ch).	
	Byte 0	Hours
	Byte 1	Minutes
	Byte 2	Seconds

Device Status log page

The Device Status log page is 3Eh, with a page length of 28h. There are five supported parameters, all of which are four bytes long. In the table, PCB = Parameter Control Byte.

Parameter	Name	Description	PCB
0	Device Type	Obsolete. Set to all zeros.	40h
1	Device Status Bits	Used to provide remote status of selected monitoring points on the drive. See below for the format.	40h
2	Total Number of Loads	Number of loads/unloads over the life of the device.	60h
3	Cleaning Cartridge Status	Accumulated number of uses of the <i>last</i> cleaning cartridge. Updated after the tape is loaded and a cleaning event attempted. If there is no value, FFFFFFFFh is returned.	40h
4	Product Number	Unique number that identifies the product	40h

Device Status Bits

The parameter has the following format:

	7	6	5	4	3	2	1	0
0	Reserved (0)					CRQ	CR	ECT
1	Reserved (0)				Temperature		Device Status	
2	Reserved (0)						Medium Status	
5	Reserved (0)							

CRQ	Cleaning Required flag	
CR	Cleaning Requested flag	
ECT	Exhausted Cleaning Tape flag	
Temperature	00b	Field not supported

	01b	Temperature OK	
	10b	Temperature degraded	
	11b	Temperature failed	
Device Status	The overall status of the drive:		
	00b	Field not supported	
	01b	Device status OK	
	10b	Device status degraded	
	11b	Device status failed	
Medium Status	The overall status of the tape cartridge:		
	00b	Field not supported	
	01b	Medium status OK	
	10b	Medium status degraded	
	11b	Medium status failed	
Product Number	Product		Product Number
	LTO-6 full-height FC standalone		0109022Ch
	LTO-6 full-height FC automation		0109022Dh
	LTO-6 full-height SAS standalone		0109022Eh
	LTO-6 full-height SAS automation		0109022Fh
	LTO-6 half-height FC standalone		01090230h
	LTO-6 half-height FC automation		01090231h
	LTO-6 half-height SAS standalone		01090232h
LTO-6 half-height SAS automation		01090233h	

Triggers for changes in the Device Status and Medium Status fields

The following table summarizes the triggers that cause the Device Status and Medium Status fields to be set to different values:

Event	Fault Drive	Fault Drive Unrecoverable	Fault Tape	Fault Tape Unrecoverable	Device Status	Medium Status
Power-on self-test failure	1	1	0	0	Failed	Good
Mechanism interface hardware error	1	0	0	0	Degraded	Good
Snapped tape	0	0	1	0	Good	Degraded
Unrecoverable snapped tape	1	1	1	1	Failed	Failed
Load failure for drive error with MediaFault bit set in error code	0	0	1	0	Good	Degraded
Load failure for drive error with DriveFault bit set in error code	1	0	0	0	Degraded	Good
Unrecoverable unload failure	0	1	0	0	Failed	Good
Unload failure error with MediaFault bit set in error code	0	0	1	0	Good	Degraded
Unload failure error with DriveFault bit set in error code	1	0	0	0	Degraded	Good

Event	Fault Drive	Fault Drive Unrecoverable	Fault Tape	Fault Tape Unrecoverable	Device Status	Medium Status
Read, write or search tape error	0	0	1	0	Good	Degraded
Read, write or search drive error	1	0	0	0	Degraded	Good
Cleaning tape error	0	0	1	0	Good	Degraded
Cleaning drive error	1	0	0	0	Degraded	
Cleaning tape expired	0	0	1	0	Good	Degraded
Mechanism failure	1	0	0	0	Degraded	
Cartridge Memory read/write failure	0	0	1	0	Good	Degraded
Firmware upgrade via tape with checksum or incompatible image	0	0	1	0	Good	Degraded
Load failure due to unsupported format	0	0	1	0	Good	Degraded
Load failure with invalid cleaning media	0	0	1	0	Good	Degraded
Rewind failure for drive error with the MediaFault bit set	0	0	1	0	Good	Degraded
Rewind failure for drive error with the DriveFault bit set	1	0	0	0	Degraded	Good
Media life expired	0	0	1	0	Good	Degraded
Media EOD invalid	0	0	1	0	Good	Degraded

MANAGEMENT ARM SELF-TEST A3h (1Fh)

The MANAGEMENT ARM SELF-TEST command allows an application client to initiate a specific Management ARM self-test.

NOTE: Executing this command requires the Network Interface to be re-initialized to return it to an operational state.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

A valid Test ID must be provided, otherwise the device server terminates the command with CHECK CONDITION, a sense key of HARDWARE ERROR and additional sense of 4400h (internal target failure), and reports drive error 1879h.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)							
1	Ignored			Service Action (1Fh)				
2	Service Action Qualifier (14h)							
3	Test ID							

	7	6	5	4	3	2	1	0
4	Reserved (0)							
8								
9	Allocation Length							
10	Reserved (0)							
11	Control							

CDB fields

Test ID	A valid TESTID must be provided. If an invalid TESTID is specified the device server will terminate the command with CHECK CONDITION, a sense key of HARDWARE ERROR, additional sense data to 4400h (internal target failure), and report drive error 1879h.	
	00h	All tests
	01h	Test FB1
	02h	Test FB2
	03h	Test FB3
	04h	Test FB4
	05h	MAC reg1
	06h	MAC reg2
	07h	MAC reg3
	08h	PHY reg1
	09h	PHY reg2
	0Ah	PHY reg3
	0Bh	VIC
	0Ch	Timer
	0Dh	DRAM
0Eh	Tracepoint	
0Fh	RTC	
Allocation Length	The length in bytes allocated for the parameter data. The actual number of bytes returned will be the lesser of the length of the actual parameter list and the allocation length specified in the command.	

MANAGEMENT ARM SELF-TEST returned data

The command returns 1 byte of result data during the data-out phase to indicate test completion status:

	7	6	5	4	3	2	1	0
0	Completion Status							

Completion Status	0Ah	Success
	0Bh	Failure

MODE SELECT 15h/55h

MODE SELECT is used to send configuration data to the drive. Both 6-byte and 10-byte versions of the command are supported.

The Mode Select parameter list is transferred from the host to the drive during the data-out phase. It contains zero or more bytes of information. If any information is sent, it should consist of a Mode Parameter Header followed by zero or more mode select pages. Internal parameters are set according to the values specified in the header and pages. Fields in the parameter list are checked and the operation will terminate if an error is found.

NOTE: The drive does not check that the parameter list is correct before modifying internal parameters. The list is checked as the operation proceeds, so if there is an error in the list, all parameters up to that point will be set to their new values, but the parameter in error and later parameters will not be updated.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention

NOTE: Failure to flush write-behind data will be reported as a Deferred Error.

The parameter list length must be such that only “entire” parts of a parameter list are sent. It is illegal to send a partial mode parameter header, a partial mode block descriptor or a partial mode page. If this happens, then CHECK CONDITION status is reported. The sense key is set to ILLEGAL REQUEST. The additional sense is set to 1A00h (parameter list length error).

Extra checks may be performed on the data, see the descriptions for the parameter list for more details.

Command descriptor block (6–byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (15h)							
1	Reserved (0)			PF	Reserved (0)			SP (0)
2–3	Reserved (0)							
4	Parameter List Length							
5	Control							

Command descriptor block (10–byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (55h)							
1	Reserved (0)			PF	Reserved (0)			SP (0)
2–6	Reserved (0)							
7	(MSB)	Parameter List Length						(LSB)
8								
9	Control							

CDB fields

PF	Page Format	
	0	The MODE SELECT parameter data is not SCSI-2 mode page compatible. Only the parameter header and block descriptor may be sent.
	1	The parameter data is SCSI-2 mode-page compatible.
SP	Save Pages	
	0	This bit is not supported and must be zero.
Parameter List Length	0	No data is transferred.
	>0	The length in bytes of the MODE SELECT parameter list to be transferred.

MODE SELECT specific status

Following a successful Mode Select command, Unit Attention status is posted to all initiators other than the initiator of the Mode Select command. The sense key is set to UNIT ATTENTION. Additional sense is set to 2A01h (mode parameters changed).

Mode parameter pages

Mode data is recovered from the drive by means of a MODE SENSE command. After modification, it is returned to the drive via a MODE SELECT command. In real-life, many hosts do not use MODE SENSE and return whatever MODE SELECT data suits them into the drive.

Mode page representation

Certain conventions are used in the following Mode Parameter pages in order to describe the nature of the parameters. Most parameters are given by name, followed by a number in brackets. The brackets have the following meanings:

Square brackets []	<p>Square brackets indicate that the parameter may be modified. The number inside the brackets is the default value for the field—in other words, the power-up or reset value.</p> <ul style="list-style-type: none"> • MODE SELECT may modify this value by sending the page with a new value in the field. • MODE SENSE (current values) will return the current value of the parameter. • MODE SENSE (default values) will return the value in brackets []. • MODE SENSE (changeable values) will return a value of all ones.
Round brackets ()	<p>Round brackets indicate that the parameter is fixed. The number inside the brackets is the fixed value for the field.</p> <ul style="list-style-type: none"> • MODE SELECT must set the parameter to this value, otherwise CHECK CONDITION will be reported with a sense key of ILLEGAL REQUEST. • MODE SENSE (default values) will return the fixed value. • MODE SENSE (changeable values) will return a value of all zeros.

Mode data format

Mode data consists of a 4-byte header, optionally followed by block descriptor and Mode Parameter pages:

	7	6	5	4	3	2	1	0
1	(MSB)							
3	Mode Parameter Header							(LSB)

	7	6	5	4	3	2	1	0	
4	(MSB) _____								
	Mode Block Descriptor								
11									(LSB)
12	(MSB) _____								
	Mode Parameter Pages								
<i>n</i>									(LSB)

Mode parameter pages

HP LTO Ultrium drives support the following mode pages:

- 01h “Read-Write Error Recovery mode page” (page 101)
- 02h “Disconnect-Reconnect page” (page 102)
- 0Ah “Control mode page” (page 103)
- 0Fh “Data Compression Characteristics page” (page 105)
- 10h “Device Configuration page” (page 105)
- 11h “Medium Partitions mode page” (page 108)
- 18h “Fibre Channel Logical Unit Control mode page” (page 112)
- 18h “SAS Logical Unit Control mode page” (page 112)
- 19h *FC drives*: “Fibre Channel Port Control mode page” (page 113)
- 19h *SAS drives*: “SAS Port Control mode page” (page 114)
- 1Ah “Power Condition mode page” (page 119)
- 1Ch “Information Exceptions Control mode page” (page 119)
- 1Dh “Medium Configuration mode page” (page 121)
- 3Bh “Serial Number Override vendor-unique mode page” (page 121)
- 3Ch “Device Time mode page” (page 122)
- 3Dh “Extended Reset vendor-unique mode page” (page 124)
- 3Eh *OBDR FW variants only*: “CD-ROM Emulation mode page” (page 124)
- Return all pages (page 3Fh) — for MODE SENSE only

Mode parameter header

The Mode Parameter header must always be sent at the start of Mode Select data. It is always returned at the start of Mode Sense data.

6-byte header

The 6-byte Mode Parameter header has the following format:

	7	6	5	4	3	2	1	0
0	Mode Data Length							
1	Medium Type [00h or 01h if WORM media is loaded or 80h if in CD-ROM mode]							
2	WP	Buffered Mode [001b]			Speed (0)			
3	Block Descriptor Length							

10-byte header

The 10-byte Mode Parameter header has the following format:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Mode Data Length _____ (LSB)							
1								
2	Medium Type [00h or 01h if WORM media is loaded (FC drives) or 80h if in CD-ROM mode]							
3	WP	Buffered Mode [001b]			Speed (0)			
4–5	Reserved (0)							
6	(MSB) _____ Block Descriptor Length _____ (LSB)							
7								

Header fields

Mode Data Length	<i>MODE SELECT:</i>	Mode Data Length field must be zero.
	<i>MODE SENSE:</i>	Mode Data Length field is set to the number of bytes of data available to return excluding itself (in other words, the number of actual bytes available is mode data length + 1 for 6-byte MODE SENSE or +2 for 10-byte MODE SENSE). <i>Note:</i> The actual amount returned may be truncated to the allocation length for the command.
Medium Type	00h	The usual medium type when the drive is in normal tape drive mode.
	01h	WORM media is loaded.
	80h	The tape drive is in CD-ROM emulation mode for OBDR.
WP	<i>Write Protect.</i> Ignored for MODE SELECT.	
	0	MODE SENSE: The tape is write-enabled
	1	MODE SENSE: The tape is write-protected
Buffered Mode	0	The drive will not report GOOD status on Write and Write Filemarks commands until all data (blocks and filemarks) has been successfully written to tape.
	1	The drive will report GOOD status for Write and Write Filemarks commands as soon as all the data or marks specified in the command have been transferred to the data buffer. Data for multiple commands from different initiators may be buffered. This is the default value. <i>NOTE:</i> It is strongly recommended that this field is set to 1, otherwise there will be significant performance penalties. A method of flushing the buffer to tape without changing logical position is available with the Write Filemarks command.
	2	The drive will report GOOD status for Write and Write Filemarks commands as soon as all the data or marks specified in the command have been transferred to the data buffer <i>and</i> all buffered data from different initiators has been successfully written to the tape.
Speed	0	The Speed field is not used and should be zero.
Block Descriptor Length	Only the values 0 and 8 are valid. Any value other than 0 or 8, CHECK CONDITION status is reported. See the Parameter List check for details of the sense data generated.	
	0	No block descriptor is being transferred.
	8	The Mode Parameter header must be followed by the 8-byte block descriptor described in the next section.

Mode block descriptor

The format of the Mode Parameter block descriptor is as follows:

	7	6	5	4	3	2	1	0
0	Density Code							
1	(MSB)	Number of Blocks (0)						(LSB)
3								
4	Reserved (0)							
5	(MSB)	Block Length [0 or 800h]						(LSB)
7								

Mode Parameter block descriptor fields

Density Code	This specifies the format of the media loaded in the drive. See “REPORT DENSITY SUPPORT 44h” (page 171) for details.	
Block Length	0	The drive is in variable block size mode.
	>0	The drive is in fixed block size mode, and this field specifies the block size. If the drive is in CD-ROM mode, the value will be 0800h.

Read-Write Error Recovery mode page

The Read-Write Error Recovery mode page has the following format:

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {01h}					
1	Additional Page Length {0Ah}							
2	Reserved (0)		TB (0)	Res (0)	EER (1)	PER [0]	DTE (0)	DCR (0)
3	Read Retry Count							
4–7	Reserved (0)							
8	Write Retry Count							
9–11	Reserved (0)							

Read-Write Error Recovery page fields

TB	<i>Transfer Block</i>	
	0	Always set to 0, meaning that an unrecoverable data block will not be transferred to the host.
EER	<i>Enable Early Recovery</i>	
	1	The drive should attempt error correction before performing retries.
PER	Post Error. Although this bit is changeable, the drive’s internal behavior always corresponds to PER=0.	
	0	The drive does not report CHECK CONDITION for recovered errors. The DTE bit must also be zero.

	1	The drive reports CHECK CONDITION for recovered errors.
DTE	<i>Disable Transfer on Error</i>	
	0	Always set to 0, meaning that the drive will not terminate the transfer for errors recovered within the limits established by the read-write error parameters.
DCR	<i>Disable Correction</i>	
	0	Always set to 0, meaning that the use of error correction codes for error recovery is allowed.
Read Retry Count	The number of times the drive will attempt its recovery algorithm during a read operation before reporting an unrecoverable error.	
	0	The drive will not use its recovery algorithm during read operations.
	15h	The drive will attempt 21 retries.
Write Retry Count	The number of times the drive will attempt its recovery algorithm during a write operation before reporting an unrecoverable error.	
	0	The drive will not use its recovery algorithm during write operations.
	0Ah	The value for all LTO Ultrium drives, giving 10 retries.

Disconnect-Reconnect page

The Disconnect-Reconnect page has the following format:

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {02h}					
1	Additional Page Length {0Eh}							
2	Buffer Full Ratio (0)							
3	Buffer Empty Ratio (0)							
4	(MSB)	Bus Inactivity Limit (0)						(LSB)
5								
6	(MSB)	Disconnect Time Limit [0]						(LSB)
7								
8	(MSB)	Connect Time Limit (0)						(LSB)
9								
10	(MSB)	Maximum Burst Size [0]						(LSB)
11								
12	EMDP (0)	Fair Arbitration (0)			DIMM (0)	DTDC (0)		
13–15	Reserved (0)							

Disconnect-Reconnect page fields

Buffer Full/Empty Ratio	0	Buffer management is controlled by the drive, so these should always be zero.
Bus Inactivity Limit	0	This parameter is not supported and should be zero.
Disconnect/ Connect Time Limit	0	This parameter is not supported and should be zero.

Maximum Burst Size	>0	The maximum amount of data that the target port will transfer during a single data transfer operation, in units of 512 bytes. For FC, the maximum burst size is 4096 blocks, which gives a maximum burst of 2 MB.
	0	The drive may send bursts of any size. This is the default value.
	For maximum performance, it is recommended that the value is left at the default of zero.	

Control mode page

The Control mode page is defined as follows:

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (0)	Page Code (0Ah)					
1	Page Length {0Ah}							
2	TST			TMF_ONLY (0)	Rsvd (0)	D_SENSE	GLTSD(0)	RLEC (0)
3	Queue Algorithm Modifier (0)				Rsvd (0)	QErr (0)		Obsolete
4	Rsvd (0)	RAC (0)	UA Interlock Cntrl (0)	SWP (0)	Obsolete			
5	ATO (0)	TAS (1)	Reserved (0)			Autoload Mode		
6-7	Obsolete							
8	(MSB)							
9	Busy Timeout Period (0)							
10	(MSB)							
11	Extended Self-Test Completion Time (0)							
	(LSB)							

Control mode page fields

D_SENSE	0	Fixed format sense data will be returned in the auto-sense sense data.
	1	Descriptor format sense data will be returned in auto-sense sense data.
TST	1	The Task Set Type.
Autoload Mode	0	If a cartridge is inserted, the drive pulls it in and threads the tape so that primary access is allowed.
	1 or 2	When a cartridge is inserted, the drive pulls it in but does <i>not</i> thread the tape. In this position, only the Cartridge Memory is accessible.
	All other values are invalid.	

Control Extension sub-page

	7	6	5	4	3	2	1	0

5	Reserved (0)		Logical Block Protection Information Length					
	LBP_W	LBP_R	RBDP (0)	Reserved (0)				
6	Reserved (0)							

Logical Block Protection Method	0	Logical block protection is disabled, and LBP_W and LBP_R must be set to 0.						
	1	Logical block protection (Reed-Solomon CRC) is enabled.						
Logical Block Protection Information Length	If Logical Block Protection Method is set to 1, this field must be set to 4.							
LBP_W	<i>Logical Block Protected during Write</i>							
	0	Protection information is not included with logical blocks transferred when writing.						
	1	Protection information is included with logical blocks transferred during WRITE commands.						
LBP_R	<i>Logical Block Protected during Read.</i> This bit is also used to enable Logical Block Protection checks for the VERIFY command, though no data is transferred in this case.							
	0	Protection information is not included with logical blocks transferred when reading.						
	1	Protection information is included with logical blocks transferred during READ commands.						

Data Compression mode page

The Data Compression mode page is defined as follows:

	7	6	5	4	3	2	1	0
0	Page Code {0Fh}							
1	Page Length {0Eh}							
2	DCE [1]	DCC (1)	Reserved (0)					
3	DDE (1)	RED (0)	Reserved (0)					
4	(MSB) _____							
7	Compression Algorithm (1) _____ (LSB)							
8	(MSB) _____							
11	Decompression Algorithm (1) _____ (LSB)							
12	Reserved (0)							
15								

Data Compression mode page fields

DCE	<p><i>Data Compression Enable</i>. This bit controls whether the drive uses compression when writing. The value has no meaning when reading, that is, if the tape contains compressed data, decompression will occur regardless of the setting of this bit. The bit is analogous to the Select Data Compression Algorithm field on the Device Configuration mode page (see “Changeable parameters” (page 106)).</p> <table border="1"> <tr> <td>0</td> <td>Compression is disabled</td> </tr> <tr> <td>1</td> <td>Compression is enabled</td> </tr> </table>	0	Compression is disabled	1	Compression is enabled
0	Compression is disabled				
1	Compression is enabled				
DCC	<i>Data Compression Capable</i> : Read only. It will have the value of 1, indicating that compression is supported.				
DDE	<i>Data Decompression Enable</i> : Read only. It will have the value of 1, indicating that compression is enabled.				
RED	<i>Report Exception on Decompression</i> : Read only. It will have the value 0, meaning that the drive returns CHECK CONDITION status when it encounters data that cannot be decompressed. This applies when data has been compressed with an unknown or unsupported compression algorithm.				
Compression Algorithm	This indicates which compression algorithm will be used to process data from the host when the DCE bit is set to one. If the host selects an algorithm which the drive does not support, CHECK CONDITION is returned, with a sense key of ILLEGAL REQUEST. Only the default algorithm (ID 1) is supported.				
Decompression Algorithm	This will also always be 1, indicating that the default decompression algorithm should be used.				

Device Configuration page

The drive supports the Device Configuration page, which has the following format:

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {10h}					
1	Additional Page Length (0Eh)							
2	Rsvd(0)	Obsolete	CAF (0)	Active Format (0)				

	7	6	5	4	3	2	1	0
3	Active Partition							
4	Write Buffer Full Ratio (0)							
5	Read Buffer Empty Ratio (0)							
6	(MSB) _____

10	EOD Defined (000)			EEG (1)	SEW [0]	SWP (0)	BAML (0)	BAM (0)
11	(MSB) _____							
13	Buffer Size at Early Warning (0) _____ (LSB)							
14	Select Data Compression Algorithm [1]							
15	WTRE [0]		OIR [0]	Rewind on Reset [0]		ASOCWP (0)	PERSWP (0)	PRMWP (0)

Pre-execution checks

The only check made when this page is sent in Mode Select data is Parameter List.

Changeable parameters

Active Partition	The partition in which the current logical position lies.	
Write Delay Time	0	The drive will never flush buffered data to tape as a result of a time-out.
	>0	The time in 100 ms increments that the drive should wait with unwritten data in the buffer and no activity on the interface before forcing data to tape. The delay is timed from the completion of the preceding Write or Write Filemarks command. The default value is 12Ch, which translates to a write delay of 30s.
SEW	<i>Synchronize at Early Warning flag</i>	
	0	Do not synchronize at Early Warning (default)—the drive may buffer all logical objects when positioned between EW and EOT.
	1	Synchronize at Early Warning—the drive flushes all logical objects to tape before returning status when positioned between EW and EOT.
Select Data Compression Algorithm	0	Use Scheme 2 of the LTO-DC algorithm (pass-through mode). <i>Note that clearing this parameter is not advised.</i>
	1	Use the default compression scheme. This is the default.
WTRE	<i>WORM Tampered Read Enable</i>	
	00b	Same as 10b.
	01b	The device server will complete a valid locate, read, space, or verify operation with GOOD status even if the device server detects compromised data stored on the WORM tape.
	10b	The device server returns CHECK CONDITION in response to a locate, read, space, or verify operation if the device detects compromised data on the WORM tape. The sense key is MEDIUM ERROR, with additional sense of 300Dh (WORM medium—integrity check failed). This has no effect on the completion of a valid locate, read, space, or verify operation when the device contains a non-WORM tape.
	11b	Reserved.

OIR	1	The device server only processes commands from an I_T nexus if the logical unit holds a (persistent) reservation. If it is not reserved, the command returns CHECK CONDITION with a sense key of ILLEGAL REQUEST and additional sense of 2C 0Bh (not reserved). Note that some commands are always allowed.
Rewind on Reset	The Rewind on Reset functionality is defined as positioning to BOP in Partition 0, regardless of the partition active at the time that the reset occurred.	
	00b	A Logical Unit Reset does not alter the logical position.
	01b	A Logical Unit Reset will cause the tape to be rewound to BOP for Partition 0.
	10b	A Logical Unit Reset does not alter the logical position.
	11b	Reserved

Unchangeable parameters

PS	0	
CAF	0	The Change Active Format flag should be zero since changing formats is not supported.
Active Format	0	Changing formats is not supported.
Write Buffer Full Ratio	0	Buffer management is done by the drive.
Read Buffer Empty Ratio	0	Buffer management is done by the drive.
OBR	0	The Object Buffer Recovery flag should be clear since this feature is not supported.
LOIS	1	The Logical Object Identifiers Supported flag should be set since logical object identifiers are supported.
Rsmk	0	The Report Set Marks flag should be clear since this feature is not supported.
AVC	1	The Automatic Velocity Control flag should be clear since velocity control is managed by the drive.
SOCF	0	The Stop On Consecutive Filemarks flag should be clear since this feature is not supported.
RBO	0	The Recover Buffer Order flag should be clear since this feature is not supported.
REW	0	The Report Early Warning on read flag should be clear since this feature is not supported.
Gap Size	0	There is no concept of inter-block gaps in the format.
EOC Defined	0	
EEG	0	The Enable EOD Generation flag should be set since EOD generation is always enabled.
Buffer Size at Early Warning	0	The Buffer Size at Early Warning field should be zero as this cannot be set.

Device Configuration Extension mode page subpage

5	Write Mode (0)				Short Erase Mode (02h)			

	7	6	5	4	3	2	1	0
6	Reserved (0)							
31								

TARPF	<i>TapeAlert Respect Parameter Fields</i>							
	0	The device server ignores the PPC and Parameter Pointer fields and all TapeAlert parameters are reported.						
	1	The device server reports parameter values using the value specified in the PPC and Parameter Pointer fields of the LOG SENSE command for the TapeAlert log page.						
TASER	<i>TapeAlert Select Exception Reporting</i>							
	0	Activation of a TapeAlert flag results in an informational exception condition.						
	1	Activation of a TapeAlert flag does not result in an informational exception condition.						
TARPC	<i>TapeAlert Respect Page Control</i>							
	0	The PC field is ignored and the values returned will always be the cumulative values.						
	1	The device server reports parameter values using the value specified in the PC field of the LOG SENSE command for the TapeAlert log page.						
TAPLSD	<i>TapeAlert Prevent Log Sense Deactivation</i>							
	0	Processing of a LOG SENSE command for the TapeAlert log page will clear all TapeAlert flags.						
	1	TapeAlert flags will not be cleared.						
Rsmk	<i>TapeAlert Prevent Log Sense Deactivation</i>							
	0	Processing a LOG SENSE command for the TapeAlert log page clears all TapeAlert flags.						
	1	The flags are not cleared.						
Write Mode	0h	Append-only mode is disabled (overwriting data is allowed).						
Short Erase Mode	Specifies the action to be taken when receiving an ERASE command with the Long bit set to zero.							
	02h	The device server records an EOD indication at the specified location on the medium.						

Medium Partitions mode page

NOTE: Partitioning is supported from LTO-5 cartridges onwards.

The Medium Partitions mode page has the following format.

Values that were sent in the last MODE SELECT command will be reported instead of the current ones, until a FORMAT MEDIUM is successfully executed, the cartridge is unloaded, or a Logical Unit Reset task management function is received.

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (0)	Page Code (11h)					
1	Page Length							
2	Maximum Additional Partitions							
3	Additional Partitions Defined							
4	FDP	SDP	IDP	PSUM (11b)		POFM (1)	CLEAR (0)	ADDP (0)
5	Medium Format Recognition (3)							

	7	6	5	4	3	2	1	0
6	Reserved (0)				Partition Units			
7	Reserved (0)							
8	(MSB)							
9	Partition Size							
:	(LSB)							
:	:							
(n-1) – n	Partition Size							

Page Length	The minimum value is 08h. It reflects how many Partition Size descriptors are specified. Partition-incapable cartridges will report only one Partition Size descriptor.	
Maximum Additional Partitions	0	For partition-incapable cartridges. Otherwise, it is set to the maximum number of additional partitions supported by the drive-cartridge combination. For LTO-6 cartridges, it is set to 03h
	1	For LTO-5 cartridges, which can support two partitions in an LTO-6 drive.
	3	For LTO-6 cartridges, which can support four partitions in an LTO-6 drive.
Additional Partitions Defined	For MODE SELECT, the number of additional partitions to be created. For MODE SENSE, the number of additional partitions in the cartridge. See “Specifying partition sizes” below.	
FDP	<i>Fixed Data Partitions.</i> Partitions will be created according to the drive's default values. If this bit is set, then SDP and IDP must be 0. See “Specifying partition sizes” below.	
SDP	<i>Select Data Partition.</i> Partitions are created up to the number specified in the Additional Partitions Defined field. Their sizes are chosen by the drive. If this bit is set, FDP and IDP must be 0. See “Specifying partition sizes” below.	
IDP	<i>Initiator-defined Data Partitions.</i> Partitions are created up to the number specified in the Additional Partitions Defined field. The partition sizes are specified in the Partition Size descriptors. If this bit is set, then FDP and SDP must be 0. This bit is always set for MODE SENSE after a FORMAT MEDIUM command has been executed successfully. See “Specifying partition sizes” below.	
PSUM	3	Partition Size Unit of Measure: The value of 11b indicates that the units of measure for the Partition Size descriptor are defined by the Partitions Units field: $10^{(\text{Partitions Units})}$ bytes.
Medium Format recognition	3	This indicates that the drive is capable of format and partition recognition.
Partitions Units	9	This defines the units of the Partition Size field as 10^9 bytes, in other words in gigabytes. For MODE SELECT, units other than GB are also accepted.
Partition Size	For MODE SELECT, the value in this field must be multiple of 37.5 GB. If FFFFh is received for one partition, the maximum remaining capacity is assigned to that partition after allocating the specified capacity for any other partitions, if there is any. See “Specifying partition sizes” below. NOTE: There must be a physical gap between partitions, a “guard area”, where no writing/reading is allowed. This amounts to a loss of 37.5 GB in total capacity. As a result, the sum of the values specified in the Partition Size descriptors plus 37.5 is roughly equal to the maximum capacity of the cartridge. For MODE SENSE, the following are some of the values that may be returned.	

	NOTE: The partition sizes will be scaled appropriately if a SET CAPACITY command executed previously.	
	Partition Size	Tape Type
	<800	LTO-4 tape loaded
	<1500	LTO-5 tape loaded (for a single partition)
	2500	LTO-6 tape loaded
2500	Default value. No data cartridge present	

Specifying partition sizes

There are three methods for specifying the partition sizes, using the FDP, SDP or IDP bits (which are all mutually exclusive). The resulting configurations for each method are shown in the tables below, assuming a total capacity of 2.55 TB and 136 wraps, which corresponds to a nominal capacity of 37.5 GB per two wraps.

NOTE: The capacity figures in the table assume that the medium capacity has not been reduced using the SET CAPACITY command; otherwise they need to be scaled accordingly. The figures are only nominal, and should be treated as guidelines rather than precise guarantees of how much data may be stored in each partition.

The first case is where the partition sizes are specified using the FDP and SDP bits, with the drive using the parameters to derive (fixed) partition sizes. The partition size descriptors are ignored on MODE SELECT with FDP=1 or SDP=1.

FDP	SDP	IDP	Additional Partitions Defined	Resulting Partition			
				0	1	2	3
1	0	0	Ignored	2475 GB (132 wraps)	37.5 GB (2 wraps)	0 (nonexistent)	0 (nonexistent)
0	1	0	0	2550 GB (136 wraps)	0 (non-existent)	0 (nonexistent)	0 (nonexistent)
			1	1275 GB (68 wraps)	1237.5 GB (66 wraps)	0 (nonexistent)	0 (nonexistent)
			2	825 GB (44 wraps)	825 GB (44 wraps)	825 GB (44 wraps)	0 (nonexistent)
			3	637.5 GB (34 wraps)	600 GB (32 wraps)	600 GB (32 wraps)	600 GB (32 wraps)

If you require more fine-grained control of partition sizes, set the IDP bit (with FDP=0 and SDP=0). In this case, the partition size descriptors indicate the desired partition sizes. If one Partition Size field is set to FFFFh, the corresponding partition will occupy whatever capacity remains after satisfying the specified size for the other partitions. At most one partition size may be set to FFFFh. If the IDP bit is set to 1 and no Partition Size field is set to FFFFh, the sum of the specified partition sizes must not exceed the total available capacity. Partition sizes are specified in GB (10⁹ bytes),

and the drive will always round up the parameters to the nearest multiple-of-two wraps as illustrated in the following table:

Value	Resulting Partition Size
0	0 (non-existent)
1–37	37.5 GB (two wraps)
38–75	75 GB (four wraps)
76–112	112.5 GB (six wraps)
:	:

NOTE:

The lowest-numbered partitions always take precedence, and are calculated first. The remaining capacity is allocated to the highest-numbered partition (or to the partition whose size has been specified as FFFFh).

The size constraints are dictated by the format, which requires an even number of wraps (each nominally 18.75 GB) for a partition. When a volume is partitioned, there is some capacity lost due to the overhead of the two Guard Wraps between partitions.

The following table shows the resulting partition layout when IDP=1 and FDP=SDP=0.

Additional Partitions Defined	Partition Size Descriptors				Resulting Partitions			
	First	Second	Third	Fourth	0	1	2	3
00h	FFFFh	0	0	0	2550 GB	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>
	0 to 09F6h (2550d)	0	0	0	2550 GB	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>
01h	FFFFh	0	0	0	(2550–s'–37.5) GB	s' GB	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>
	r	FFFFh	0	0	r' GB	(2550–r'–37.5) GB	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>
	r	s	0	0	r' GB	(2550–r'–37.5) GB	0 <i>(nonexistent)</i>	0 <i>(nonexistent)</i>
02h	FFFFh	s	t	0	(2550–s'–t'–75) GB	s' GB	t' GB	0 <i>(nonexistent)</i>
	r	FFFFh	t	0	r' GB	(2550–r'–t'–75) GB	t' GB	0 <i>(nonexistent)</i>
	r	s	FFFFh	0	r' GB	s' GB	(2550–r'–s'–75) GB	0 <i>(nonexistent)</i>
	r	s	t	0	r' GB	s' GB	(2550–r'–s'–75) GB	0 <i>(nonexistent)</i>
03h	FFFFh	s	t	u	(2550–s'–t'–u'–112.5) GB	s'' GB	t' GB	u' GB
	r	FFFFh	t	u	r' GB	(2550–r'–t'–u'–112.5) GB	t' GB	u' GB
	r	s	FFFFh	u	r' GB	s' GB	(2550–r'–s'–u'–112.5) GB	u' GB

Additional Partitions Defined	Partition Size Descriptors				Resulting Partitions			
	First	Second	Third	Fourth	0	1	2	3
	<i>r</i>	<i>s</i>	<i>t</i>	FFFFh	<i>r'</i> GB	<i>s'</i> GB	<i>t'</i> GB	(2550- <i>r'</i> - <i>s'</i> - <i>t'</i> -112.5) GB
	<i>r</i>	<i>s</i>	<i>t</i>	<i>u</i>	<i>r'</i> GB	<i>s'</i> GB	<i>t'</i> GB	(2550- <i>r'</i> - <i>s'</i> - <i>t'</i> -112.5) GB

A partition size specified as *x* results in a partition size labelled as *x'* denoting the size after rounding has been applied.

NOTE: Regardless of which method was used to specify partition sizes (FDP, SDP or IDP bits), once a FORMAT MEDIUM command has completed, a MODE SENSE command will always report IDP=1. The drive will not retain information on how the partitions were specified.

Fibre Channel Logical Unit Control mode page

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {18h}					
1	Page Length {06h}							
2	Reserved (0)							
3	Reserved (0)							EPDC[1]
4-7	Reserved (0)							

EPDC		
	0	The target does not use the precise delivery function and ignores the contents of the CRN field in the Fibre Channel Extended Link Service FCP_CNTL. HP LTO Ultrium drives support this feature by default.
	1	The logical unit uses the precise delivery function defined in the FCP-2 standard. It makes use of the CRN field.

SAS Logical Unit Control mode page

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (0)	Page Code (18h)					
1	Page Length {06h}							
2	Reserved (0)			TLR (0)	Protocol Identifier (6h)			
3-7	Reserved (0)							

TLR		
	<i>Transport Layer Retries</i>	
	0	Transport layer retries are disabled.
	1	The target port supports transport layer retries for XFER_RDY and DATA frames for the logical unit.
Protocol Identifier	6	The protocol to which this mode page applies is SAS.

Fibre Channel Port Control mode page

For FC drives, the Protocol-Specific Port Control page allows you to set the initialization and addressing behavior of the Fibre Channel interface.

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {19h}					
1	Page Length {06h}							
2	Reserved (0)				Protocol Identifier (FCP=0)			
3	DTFD (0)	PLPB(0)	DDIS(0)	DLM(1)	RHA(0)	ALWLI(0)	DTIPE(0)	DTOLI(0)
4-5	Reserved (0)							
6	Reserved (0)					RR_TOV Units (3)		
7	Resource Recovery Time-Out Value—RR_TOV (F0h, that is, 24s)							

DTFD	<i>Disable Target Fabric Discovery.</i> If the drive is not attached to an arbitrated loop, the DTFD bit is ignored.	
	0	When attached by an arbitrated loop, the drive will discover a fabric loop port if one is present on the loop and perform public loop functions.
	1	When attached by an arbitrated loop, the drive will not recognize the presence of a fabric loop port on the loop. The drive performs only the private loop functions.
PLPB	<i>Prevent Loop Port Bypass</i>	
	0	The drive allows the Loop Port Bypass (LPB) and Loop Port Enable (PBE) primitive sequences to control the port bypass circuit.
	1	The drive ignores any Loop Port Bypass (LPB) and Loop Port Enable (LPE) primitive sequences. The loop port remains enabled. When the PLPB bit is zero, the drive allows the LPB and PBE primitive sequences to control the port bypass circuit. <i>Note:</i> If the PLPB bit is set to 1, the DTIPE bit must be set to 0.
DDIS	<i>Disable Discovery</i>	
	0	The drive must wait to receive an Address Discovery Link Service (ADISC) or Port Discovery Link Service (PDISC) before it resumes processing tasks for the initiator.
	1	The drive does not require receipt of Address or Port Discovery following loop initialization. The drive resumes processing of tasks on completion of loop initialization.
DLM	<i>Disable Loop Master.</i>	
	0	The drive may become loop master during the loop initialization process.
	1	The drive will never attempt to be a loop master; it only repeats LISM frames it receives. This allows the initiator to be loop master during loop initialization.
RHA	<i>Require Hard Address.</i> If the drive is not attached to an arbitrated loop, the RHA bit is ignored.	
	0	The drive follows the normal initialization procedure, including the possibility of obtaining a soft address during the loop initialization process.
	1	When attached to an arbitrated loop, the drive will only attempt to obtain its hard address (available via the device address jumpers) during loop initialization. The drive will not attempt to obtain an address during the LISA phase of initialization. If there is a conflict for the hard address selection during loop initialization or it does not have a valid hard address available, the drive will enter the non-participating state. If the drive detects loop initialization while in the non-participating state, it will again attempt to get its hard address. If the hard address has not changed from the address obtained in a previous successful loop initialization, the drive will attempt to obtain the address in the LIFA phase if a valid Fabric Login exists or in the LIPA

		phase of loop initialization. If the hard address has changed, the target will attempt to obtain the new address in the LIHA phase.
ALWLI	<i>Allow Login Without Loop Initialization</i>	
	0	The drive is required to verify its address through the loop initialization process before a login is accepted.
	1	The drive uses the hard address available in the SCA connector or device address jumpers and accepts logins without verifying the address with loop initialization.
DTIPE	<i>Disable Target Initiated Port Enable</i>	
	0	The drive enables its port into the loop without waiting for a Loop Port Enable primitive.
	1	The drive waits for an initiator to send the Loop Port Enable primitive before inserting itself into the loop. The drive uses the hard address available in the SCA connector or device address jumpers to determine if primitives are addressed to it. A Loop Port Enable primitive with the broadcast address will also cause the drive to insert itself into the loop. <i>Note:</i> If the DTIPE bit is set to 1, the PLPB bit must be set to 0.
DTOLI	<i>Disable Target Originated Loop Initialization</i>	
	0	The drive generates the Initializing LIP after it enables a port into a loop.
	1	The drive does not generate the Initializing LIP following insertion into a loop. It will respond to an Initializing LIP when it is received. It will generate the Loop Failure LIP at its input and the Initializing LIP when the loop failure is corrected.
RR_TOV Units	<i>Resource Recovery Time-Out Value Unit.</i> The field specifies the unit of measure as follows:	
	000b	No timer specified
	001b	0.001s
	011b	0.1s, units used by HP LTO Ultrium drives
	101b	10s
RR_TOV	The number of time units specified by the RR_TOV Units field that are used by the timer that performs the RR_TOV time-out functions.	
	F0h	240 x 0.1s units = 24 seconds

SAS Port Control mode page

In addition to the Protocol-Specific Port mode page (ie. when SPF = 0), the following subpages are also supported:

Subpage	Description
01h	PHY Control and Discover mode page
02h	Shared Port Control mode page
03h	Enhanced PHY Control mode page
all others	

When the SubPage Format bit (SPF) is 0, page code 19h represents the Protocol-Specific Port mode page:

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (0)	Page Code (19h)					
1	Page Length (0Eh)							

	7	6	5	4	3	2	1	0
2	Reserved (0)	Continue AWT (0)	Broadcast Asynchronous Event (0)	Ready LED Meaning (0)	Protocol Identifier (6h)			
3	Reserved (0)							
4	I_T Nexus Loss Time [07 D0h]							
5								
6–7	Initiator Response Timeout [03 E8h]							
8	Reject to Open Limit [0]							
9								
10–15	Reserved (0)							

I_T Nexus Loss Time	The time for which the target port will retry connection requests to an initiator port that are rejected with responses indicating the initiator port may no longer be present before recognizing an I_T nexus loss. Values are as follows:	
	0000h	Vendor specific amount of time
	0001h–FFFEh	Time in milliseconds. The default value of 07D0h falls within this range, so the drive will retry request for 2 seconds, that is, 07D0h (2000) milliseconds.
	FFFFh	Retry requests forever.
Initiator Response Timeout	The time in milliseconds for which the drive will wait for an initiator to starting sending write data frames after it has acknowledged a XFER_RDY frame, before aborting the command associated with this transfer. A value of zero means that the drive will wait forever.	
Reject to Open Limit	The minimum time in 10 μ s increments that the target port will wait to establish a connection request with an initiator port on an I_T nexus after receiving and OPEN_REJECT (RETRY), OPEN_REJECT (RESERVED CONTINUE 0), or OPEN_REJECT (RESERVED CONTINUE 1). This value may be rounded as defined in SPC-4. A Reject to Open Limit field set to 0000h indicates that the minimum time is vendor-specific. This minimum time is enforced by the port layer.	

PHY Control and Discover sub-page (*SAS drives only*)

The sub-page consists of a page header followed two PHY mode descriptors.

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (1)	Page Code (19h)					
1	Sub-Page Code (01h)							
2	Page Length (0064h)							
3								
4	Reserved (0)							
5	Reserved (0)				Protocol Identifier (6h)			
6	Generation Code							
7	Number of PHYs (2)							
<i>SAS PHY Mode Descriptors</i>								
8	First SAS PHY Mode Descriptor (48 bytes)							
55								

	7	6	5	4	3	2	1	0
56	Second SAS PHY Mode Descriptor (48 bytes)							
103								

Generation Code	A one-byte counter that is incremented by one by the device server every time the values in this mode page or the Enhanced PHY Control mode page are changed. When the counter reaches its maximum value of FFh, the next increment wraps it back to 01h. The Generation Code field is also contained in the Enhanced PHY Control mode page and the Protocol-Specific Port log page, and may be used to correlate PHY settings across mode page and log page accesses.							
	00h	The generation code is unknown.						

Each SAS mode descriptor is defined as follows:

	7	6	5	4	3	2	1	0
+0	Reserved (0)							
+1	PHY Identifier [0,1]							
+2-3	Reserved (0)							
+4	Rsvd (0)	Attached Device Type			Attached Reason			
+5	Reason (0)			Negotiated Logical Link Rate				
+6	Reserved (0)			Attached SSP Initiator Port	Attached STP Initiator Port	Attached SMP Initiator Port	Rsvd (0)	
+7	Reserved (0)			Attached SSP Target Port	Attached STP Target Port	Attached SMP Target Port	Rsvd (0)	
+8	(MSB)	SAS Address						(LSB)
+15								
+16	(MSB)	Attached SAS Address						(LSB)
+23								
+24	Attached PHY Identifier							
+25-31	Reserved (0)							
+32	Programmed Min Phys. Link Rate [8h]				Hardware Min Physical Link Rate (8h)			
+33	Programmed Max Phys. Link Rate [Ah]				Hardware Max Physical Link Rate (Ah)			
+34-41	Reserved (0)							
+42	(MSB)	Vendor Specific [0000h]						(LSB)
+43								
+44-47	Reserved (0)							

PHY Identifier	Associates this SAS Mode Descriptor with a particular PHY within the tape drive.	
Attached Device Type	The type of SAS device connected to this PHY:	
	000b	No device
	001b	End device
	010b	Edge expander device
	011b	Fanout expander device

	110b–111b	Reserved	
Negotiated Logical Link Rate	The link rate negotiated during the last link reset. This may be less than the Programmed Minimum Physical Link Rate or greater than the Programmed Maximum Physical Link Rate if they have been changed since the last link reset. Values appropriate for this device are as follows:		
	0h	UNKNOWN	PHY is enabled. Unknown physical link rate.
	1h	DISABLED	PHY is disabled.
	8h	G1	PHY is enabled— 1.5 Gb/s
	9h	G2	PHY is enabled— 3.0 Gb/s
	Ah	G3	PHY is enabled— 6.0 Gb/s
Attached SSP/STP/SMP Initiator Port	1	The attached PHY is capable behaving as a SSP/STP/SMP initiator.	
SAS Address	The WWN of this PHY.		
Attached SAS Address	The WWN of the PHY connected to this PHY.		
Attached PHY Identifier	The PHY identifier for the attached PHY.		
Programmed Minimum Physical Link Rate	The minimum link rate that will be negotiated for during the next link reset sequence.		
Programmed Maximum Physical Link Rate	The maximum link rate that will be negotiated for during the next link reset sequence.		

Share Port Control mode sub-page

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (1)	Page Code (19h)					
1	Sub-Page Code (02h)							
2	Page Length (000Ch)							
3								
4	Reserved (0)							
5	Reserved (0)				Protocol Identifier (6h)			
6	Power Loss Timeout (0000h)							
7								
8–15	Reserved (0)							

NOTE: Although Power Loss Timeout is not support, the page can still be retrieved.

Enhanced PHY Control mode sub-page

This page consists of a page header followed by two Enhanced PHY Control mode descriptors.

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (1)	Page Code (19h)					
1	Sub-Page Code (03h)							
2	Page Length (002Ch)							

	7	6	5	4	3	2	1	0
3								
4	Reserved (0)							
5	Reserved (0)				Protocol Identifier (6h)			
6	Generation Code							
7	Number of PHYs (2)							
<i>Enhanced PHY Control mode descriptors</i>								
8	First Enhanced PHY Control mode descriptor (20 bytes)							
27								
28	Second Enhanced PHY Control mode descriptor (20 bytes)							
47								

Generation Code	A one-byte counter that is incremented by one by the device server every time the values in this page or the PHY Control and Discover mode sub-page are changed. When the counter reaches its maximum value of FFh, the next increment wraps it back to 01h. The Generation Code field is also contained in the Enhanced PHY Control mode page and the Protocol-Specific Port log page, and may be used to correlate PHY settings across mode page and log page accesses.	
	00h	The generation code is unknown.

Each Enhanced PHY Control mode descriptor is defined as follows:

	7	6	5	4	3	2	1	0	
+0	Reserved (0)								
+1	PHY Identifier [0-1]								
+2	Descriptor Length (0010h)								
+3									
+4	Programmed PHY Capabilities								
+7									
+8	Current PHY Capabilities								
+11									
+12	Attached PHY Capabilities								
+15									
+16–17	Reserved (0)								
+18	Reserved (0)			Negotiated SSC		Negotiated Physical Link Rate			
+19	Reserved (0)							Hardware Muxing Supported	

Power Condition mode page

The Power Condition mode page controls the power condition transitions (idle or standby) of a logical unit:

	7	6	5	4	3	2	1	0
0	PS (0)	SPF (0)	Page Code {1Ah}					
1	Page Length (26h)							
2	PM_BG Precedence (01b)		Reserved (0)				Standby Y (0)	
3	Reserved (0)				Idle C (0)	Idle B (0)	Idle A [0]	Standby Z (0)
4	(MSB)	Idle A Condition Timer						(LSB)
7								
8	(MSB)	Standby Z Condition Timer						(LSB)
11								
12	(MSB)	Idle B Condition Timer						(LSB)
15								
16	(MSB)	Idle C Condition Timer						(LSB)
19								
20	(MSB)	Standby Y Condition Timer						(LSB)
23								
24-38	Reserved (0)							
39	FIDCPC (0)		FSBCP (0)		FSTCPC (0)		Reserved (0)	

PM_BG_Precedence	Set to 01b. If the drive is performing background functions and a power condition timer expires, the drive will finish the background functions before changing to the power condition.
Idle_A	If set to 1, the drive will transition to Idle mode as soon as all media-related background activities are finished (in other words, media is not loaded). NOTE: Idle mode equates to a lower power consumption state.
Idle_A Condition Timer	If Idle_A is set, this field must be 0. Otherwise this field is ignored.

The rest of the Idle and Standby bits are not changeable. Because they are set to 0, their Timers are ignored.

Information Exceptions Control mode page

The Information Exceptions Control mode page is used to control exception reporting through the “Requested Recovery log page” (page 76):

	7	6	5	4	3	2	1	0
0	PS (0)	Rsvd (0)	Page Code {1Ch}					
1	Page Length {0Ah}							
2	Perf (0)	Reserved (0)			DExcpt	Test	Rsvd (0)	LogErr (0)
3	Reserved (0)				MRIE (3h)			

	7	6	5	4	3	2	1	0
4	(MSB)	Interval Timer (0)						(LSB)
7								
8	(MSB)	Report Count/Test Flag Number						(LSB)
11								

Perf	0	Informational exception operations that cause delays are acceptable.
DExcpt	<i>Disable Exception Control</i>	
	0	Information exception operations (such as TapeAlert flags being activated, depending on the value of the TASER bit in the Device Configuration Extension mode page) are enabled. The reporting of information exception conditions is determined from the MRIE field.
	1	Default. A DExcpt bit of one indicates the target will disable all information exception operations. The method of reporting informational exceptions field is ignored when DExcpt is set to one. The Test bit must not be set at the same time.
Test	0	If the Test flag is clear the next command will be processed normally.
	1	A test bit of one will generate false informational exception conditions. As a result, the next SCSI command after the Mode Select will return CHECK CONDITION with a sense key of RECOVERED ERROR and additional sense of 5DFFh (failure prediction threshold exceeded - false). The DExcpt bit must not be set at the same time.
	The Test bit will never be read as 1 when performing a Mode Sense command. This is not an indication that the drive is in test mode. For example, using the Test bit and Test Flag Number, it may be possible to set a flag with the DExcpt bit set to 1. When the DExcpt bit is next set, the drive will report CHECK CONDITION with a sense key of RECOVERED ERROR and additional sense of 5DFFh (failure prediction threshold exceeded - false). In order to set the DExcpt bit again, note that the Test bit must still be set during the Mode Select command.	
LogErr	0	<i>Log Errors bit.</i> This bit must be zero, indicating that the logging of informational exception conditions within the drive is vendor-specific.
MRIE	<i>Method of Reporting Informational Exceptions</i>	
	3h	This field indicates the method used by the target to report informational exception conditions and must be set to 3. The target will report informational exception conditions by returning a CHECK CONDITION status on any command. The sense key will be set to RECOVERED ERROR with additional sense of 5D00h (failure prediction threshold exceeded). The command that has the CHECK CONDITION will complete without error before any informational exception condition may be reported.
Interval Timer	0	Must be zero, indicating that the drive only reports an informational exception condition once.
Report Count/Test Flag Number	0	If the Test bit is also zero, there is no limit on the number of times the drive can report an informational exception condition. Treat this case with <i>caution</i> ; only a hard reset or power-cycle will clear this condition.
	n	If the Test bit is zero, this field is the Report Count, and indicates the number of times the device server will report an informational exception condition (subject to the DExcpt bit). If the Test bit is one, this field is the Test Flag Number, that is, the number of a supported TapeAlert flag. The target will generate a test informational exception condition. As a result, the next SCSI command after MODE SELECT will return CHECK CONDITION with a sense key of RECOVERED ERROR and additional sense of 5DFFh (failure prediction threshold exceeded - false). The following are valid settings:
	1 through 64	This sets the TapeAlert flag with this number in the Log page.

		-1 through -64 (FFFFFFFh-FFFFFFC0h)	This clears the TapeAlert flag indicated by the absolute value of the Test Flag Number.
		32767 (7FFFFh)	This sets all the TapeAlert flags supported by the target in the Log page.

Note that if an attempt is made to set or clear a flag that is not supported by the drive, CHECK CONDITION will be reported with a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).

Medium Configuration mode page

The Medium Configuration mode page is used to specify special restrictions when the device server is processing commands that access the tape.

	7	6	5	4	3	2	1	0
0	PS (0)	SBF (0)	Page Code (1Dh)					
1	Page Length (1Eh)							
2	Reserved (0)							WORMM
3	Reserved (0)							
4	WORM Mode Label Restrictions (01h)							
5	WORM Mode Filemark Restrictions (02h)							
6-31	Reserved (0)							

WORMM	WORM Mode is set to 1 when there is a WORM tape loaded in the drive. Default is 0. Not changeable by a MODE SELECT command.	
WORM Mode Label Restrictions	01h	The device server does not allow some types of format labels to be overwritten.
WORM Mode FileMark Restrictions	02h	The device server allows any number of filemarks immediately preceding EOD to be overwritten except the filemark closest to BOP.

Serial Number Override vendor-unique mode page

NOTE: This page is not available on all variants.

The Serial Number Override mode page provides a means to override the drive's serial number. The page is support by the SSC/RMC Device (Logical Unit 0), and so is accessible via ACI/ADI and the primary port. This provides a common method for changing the drive serial number.

	7	6	5	4	3	2	1	0
0	PS (0)	SBF (0)	Page Code (3Bh)					
1	Page Length (0Eh)							
2	Reserved (0)							MSN
3-5	Reserved (0)							
6	(MSB)	Serial Number						
15								(LSB)

	MODE SENSE		MODE SELECT
MSN	00b	Not reported	This is a NO-OP. The drive's serial number remains unchanged and the Serial Number field is ignored.
	01b	The Serial Number field contains the Drive Serial Number being used by the drive and it is the manufacturer's default value.	Sets the Drive Serial Number back to the manufacturer's default value. The Serial Number field is ignored.
	10b	Not reported	Same as 00b
	11b	The Serial Number field contains the Drive Serial Number being used by the drive and it is not the default value.	The Drive Serial number will be set to the value supplied in the Serial Number field.
Serial Number	An ASCII serial number. MODE SELECT data will be check to ensure that this field contains only ASCII values in the range 20h–7Fh.		

The Mode Page policy for this page is shared amongst all initiators on all ports, so if the Drive Serial number is modified via MODE SELECT, all initiators, apart from the issuer of the MODE SELECT command, on all ports will received UNIT ATTENTION—Mode Parameters Changed.

Similarly, the VPD inquiry pages 80h (Unit Serial Number) and 83h (Device Identification) supported by the SSC/RMC device (LUN 0) will return the same Drive Serial number regardless of which port the INQUIRY command is issued.

For example, if the Drive Serial number is modified using an ACI MODE SELECT command, subsequent INQUIRY commands for pages 80h or 83h issued via the primary port or ADT port will report the same modified serial number.

Device Time mode page

The Device Time mode page consists of the following page header followed by three Timebase descriptors:

	7	6	5	4	3	2	1	0
0	PS (0)	SBF (0)	Page Code (3Ch)					
1	Page Length (22h)							
2	Reserved (0)					LT	WT	PT
3	Reserved (0)							

Power-on time descriptor

	7	6	5	4	3	2	1	0
4	Timebase Identifier (00h)							
5	Timebase Field Length (06h)							
6	(MSB)	Current Power-on Count						(LSB)
7								
8	(MSB)	Power-on Time						(LSB)
11								

World time descriptor

	7	6	5	4	3	2	1	0	
12	Timebase Identifier (01h)								
13	Timebase Field Length (06h)								
14	Reserved (0)						UTC	NTP	
15	Reserved (0)								
16	(MSB)	World Time						(LSB)	
19									

Library time descriptor

	7	6	5	4	3	2	1	0
20	Timebase Identifier (10h)							
21	Timebase Field Length (06h)							
22	Reserved (0)							
23	Library Time (hrs)							
24	Library Time (mins)							
25	Library Time (secs)							
26–27	Reserved (0)							

Cumulative power-on time descriptor

	7	6	5	4	3	2	1	0	
28	Timebase Identifier (18h)								
29	Timebase Field Length (06h)								
30–31	Reserved (0)								
32	(MSB)	Cumulative Power-on Time						(LSB)	
35									

Field descriptions

	MODE SENSE		MODE SELECT
LT	0	Library time is invalid.	1 to set Library time (ignored if the target port is not ADT)
	1	Library time is valid.	
WT	0	World time is invalid.	1 to set world time
	1	World time is valid.	
PT	0	Power-on time is invalid.	Ignored
	1	Power-on time is valid.	
Current Power-on Count	The number of times the drive has been powered on.		Ignored

	MODE SENSE		MODE SELECT
Power-on Time	The number of seconds since the drive has been powered on.		Ignored
UTC	0	The local timezone has been used.	Ignored if WT is 0.
	1h	World Time is UTC.	Set to 1 if UTC World Time is being used.
NTP	0	Unsure if NTP-synced.	Ignored if WT is 0.
	1h	World Time is set from NTP source.	Set to 1 if World time is NTP-synced.
World Time	The number of seconds from 00:00:00 on January 1, 1970		Ignored if WT = 0.
Library Time	The time in hrs:mins:secs set by the automation controller.		Ignored if the target port is not ADT.
Cumulative Power-on Time	The number of seconds since the drive was powered on for the very first time.		Ignored

Extended Reset vendor-unique mode page

	7	6	5	4	3	2	1	0
0	Page Code {3Dh}							
1	Page Length {02h}							
2	Reserved (0)						Reset Behavior	
3	Reserved (0)							

Reset Behavior	Controls the behavior of the drive when it detects a target or LUN reset message.							
00b	Normal reset behavior (this is the default value).							
01b	The drive will flush and position itself at BOT upon: <ul style="list-style-type: none"> • <i>FC drives</i>: a Logical Unit Reset or Target Reset. • <i>SAS drives</i>: a Logical Unit Reset task management function. 							
10b	No automatic flush. Logical position is maintained.							
11b	Reserved							

CD-ROM Emulation mode page

This page can be used irrespective of whether the drive is acting as a tape or a CD device.

	7	6	5	4	3	2	1	0
0	Page Code {3Eh}							
1	Page Length {02h}							
2	Reserved (0)						Non-Auto	CDmode
3	Reserved (0)							

CD-ROM Emulation/Disaster Recovery mode page fields

Non-Auto	When a system restarts after booting off tape, the drive detects the SCSI resets issued during reboot and, in conjunction with knowing that more than 100 blocks have been read in CD-ROM emulation mode, will revert back to behaving as a tape device. This is the standard method by which the drive
-----------------	---

	<p>automatically reverts to being a tape drive in order that a backup application can do file system recovery. The method of reversion involves a firmware reboot, so the drive might become unavailable for a few seconds during its “power-on” following the SCSI reset. (Note that normal SCSI reset response does not involve a firmware reboot).</p> <p>Setting this flag to 1 inhibits this automatic return to tape drive behavior; the drive will remain in CD-ROM mode irrespective of blocks read and SCSI resets.</p>		
CDmode	<i>MODE SENSE</i>	0	The drive is in tape drive mode.
		1	The drive is in CD-ROM emulation mode.
	<i>MODE SELECT</i>	<p>This flag can be used to switch the drive between normal operation and CD-ROM emulation mode:</p> <ul style="list-style-type: none"> • If this bit is set to its existing value, there is no change. • If this bit is changed from 0 to 1, the drive will enter CD-emulation mode. It will change its Inquiry and Mode data appropriately and cache the first 250 KB of the CD image off tape. CD-ROM support commands will be enabled. This transition is primarily present to support automated functional testing. If the bit is changed from 1 to 0, the drive leaves CD-ROM emulation mode and reverts to normal tape drive mode. • If this bit is changed from 1 to 0, the drive will leave CD-emulation mode. The Inquiry and Mode data will revert to that for a tape drive and CD-ROM command support will stop. The tape will be reloaded and the logical position will be BOP. Backup applications can use this transition to switch to a normal mode of operation for file system recovery off tape. Note that operating systems that pre-load class drivers at boot might not be prepared to talk to the erstwhile CD-ROM drive 	

MODE SENSE 1Ah/5Ah

MODE SENSE allows the drive to return its current configuration and report which configuration parameters can be changed through MODE SELECT.

The mode sense header, block descriptor (optional), and zero or more of the are sent to the host. Mode pages contain drive configuration parameters. Some of these parameters are fixed, others are configurable (through the MODE SELECT command). The host should use MODE SENSE to determine which drive parameters are configurable and what their current values are before using mode select to alter them.

NOTE: See “MODE SELECT 15h/55h” (page 97) for full descriptions of the Mode Parameters. If a MODE SENSE command is issued whilst an immediate reported Load command is executing or close to completing then the values of some parameters in some mode pages which depend on the results of the load may be undefined. Similarly, the write-protect field in the Mode Parameter Header will be unstable unless a cartridge is present and medium removal is prevented.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention

The page code field must contain a valid mode page code or the value 0 or the value 3Fh. If it does not then CHECK CONDITION status is reported. Sense data will be as described in the Illegal Field Checks.

Command descriptor block (6–byte version)

	7	6	5	4	3	2	1	0

7	(MSB)	Allocation Length						(LSB)
8								
9	Control							

CDB fields

DBD	Disable Block Descriptors flag		
	0	Allows the drive to return the MODE SELECT block descriptor.	
	1	Prevents the drive from returning the MODE SELECT block descriptor.	
PC	<i>Page Control</i> —Indicates the type of page parameter values to be returned to the host, as shown in the following table:		
	7	6	Description
	0	0	<i>Report Current Values</i> : the current values of the parameters are returned.
	0	1	<i>Report Changeable Values</i> : the page returned has its non-changeable parameter fields cleared to 0. The fields that are changeable are set to all 1's.
	1	0/1	<i>Report Default Values</i> : the page returned contains the power-on/reset/bus-device-reset values of the mode parameters.
Page Code	This allows the host to select any specific page, or all the pages supported by the drive.		
	0	The drive returns no mode pages, so only the header and block descriptor are returned.	
	Any mode page code	The drive returns that page.	
	3Fh	The drive returns all mode pages.	
Sub Page Code	The sub-page code of the page code for data to be returned. If there are no sub-pages, it should be set to 0.		
Allocation Length	Specifies the number of bytes that the host has allocated for returned MODE SENSE data.		

	0	No data transfer will occur. This is not considered an error.
	<i>n</i>	The maximum number of bytes which the drive should return in its data-out phase. Either the entire mode page or allocation length bytes of the page are returned, whichever is least.

PERSISTENT RESERVE IN 5Eh

PERSISTENT RESERVE IN is used to obtain information about persistent reservations and reservation keys that are active within a tape drive logical unit.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (5Eh)							
1	Reserved (0)			Service Action				
2	Reserved (0)							
6								
7	(MSB)	Allocation Length						(LSB)
8								
9	Control							

CDB fields

Service Action	The service action types that are supported are:		
	00h	Read Keys	Returns all registered reservation keys
	01h	Read Reservation	Returns information on any current persistent reservation
	02h	Report Capabilities	Returns details of the persistent reservation features supported
	03h	Report Full Status	Returns registration and reservation status fore each registered I_T nexus.
Allocation Length	The maximum amount of data (in bytes) that should be returned to the host. The drive will return all of the requested information or allocation length bytes, whichever is least.		

PERSISTENT RESERVE IN returned data for service actions

Read Keys service action

The drive will return a parameter list containing an 8-byte header and list of the reservation keys for each currently registered I_T nexus. Each key is 8 bytes long. The format of the returned data is as follows:

	7	6	5	4	3	2	1	0
0	(MSB)	PR Generation						(LSB)
3								
4	Additional Length (<i>n</i> -7)							

	7	6	5	4	3	2	1	0
7	First Reservation Key							
8								
15								
:	:							
$n-7$	Last Reservation Key							
n								

PR Generation	A 32-bit counter that is maintained by the drive and incremented every time a PERSISTENT RESERVE OUT command requests a Register, Register and Ignore Existing Key, Clear, Preempt, or Preempt and Abort service action.
----------------------	--

Read Reservation service action

The drive returns a parameter list containing an 8-byte header and the persistent reservation, if any, that is present in the drive. If no persistent reservation is present, Additional Length is 0 and no reservation data is returned. If a persistent reservation is present, Additional Length is 10h and 16 bytes of reservation data are returned as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
3	PR Generation _____ (LSB)							
4	Additional Length (0 or 10h)							
7								
8	Reservation Key							
15								
17	Obsolete (0)							
19								
20	Reserved (0)							
21	Scope (0)				Type			
22	Obsolete (0)							
23								

PR Generation	As for "Read Keys service action" (page 127).	
Reservation Key	The key under which the persistent reservation is held.	
Scope	0	Indicates LU_SCOPE.
Type	The characteristics of the persistent reservation currently held. Persistent reservation types supported by the drive are:	
	3h	Exclusive access
	6h	Exclusive access, registrants only
	8h	Exclusive access, all registrants
	See PERSISTENT RESERVE OUT for more information and also the appropriate standards.	

Report Capabilities service action

This provides a mechanism for the drive to report which features of Persistent Reservation are implemented. The format of the data returned is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Length (0008h) _____ (LSB)							
1								
2	Reserved (0)			CRH (1)	SIP_C (1)	ATP_C(0)	Rsvd (0)	PTPL_C (1)
3	TMV (1)	Reserved (0)						PTPL_A
4	WR_EX_AR (0)	EX_AC_RO (1)	WR_EX_RO (0)	Rsvd (0)	EX_AC (1)	Rsvd (0)	WE_EXC (0)	Rsvd (0)
5	Reserved (0)							EX_AC_AR(1)
6	Reserved (0)							
7								

PTPL_A	0	1
	0	Persist Through Power Loss has not been activated
	1	The most recent successfully completed PERSISTENT RESERVE OUT command with <i>Register or Register and Ignore Existing Key</i> service action had the APTPL bit set to one in the parameter data.

All the other fields are fixed. Refer to the description of PERSISTENT RESERVE OUT or the appropriate standards for more information.

Report Full Status service action

This provides a mechanism for the drive to report a description of the registration and persistent reservation status of each currently registered I_T nexus. The format of the data returned is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ PR Generation _____ (LSB)							
3								
4	(MSB) _____ Additional Length (n-7) _____ (LSB)							
7								
:	:							
...	Last Full Status Descriptor							
n								

The format of a Full Status descriptor is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Reservation Key _____ (LSB)							
7								
8	Reserved (0)							

	7	6	5	4	3	2	1	0
11								
12							ALL_TG_PT(0)	R_Holder
13	Scope (0)				Type			
14	Reserved (0)							
17								
18								
19	Relative Target Port Identifier							
20	Additional Descriptor Length ($n-23$)							
23								
24								
n	Transport ID							

R_Holder	1	The I_T nexus is a Persistent Reservation holder.
Transport ID	See details in PERSISTENT RESERVE OUT.	

PERSISTENT RESERVE OUT 5Fh

PERSISTENT RESERVE OUT is used to request service actions that create a persistent reservation in a logical unit within the tape drive for the exclusive or shared use of a particular I_T nexus. The command uses other service actions to manage and remove such persistent reservations.

An I_T nexus performing Persistent Reserve Out service actions is identified by a reservation key.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention

Command descriptor block

CDB fields

Service Action	00b	Register	Registers or unregisters a reservation key with the device server.
	01b	Reserve	Creates the persistent reservation.
	02b	Release	Releases the persistent reservation.

	03h	Clear	Clears all reservation keys and the persistent reservation.
	04h	Preempt	Pre-empts the persistent reservation and/or remove registrations.
	05h	Preempt and Abort	Pre-empts the persistent reservation and/or remove registrations, and aborts all tasks for all pre-empted I_T nexuses.
	06h	Register and Ignore Existing Key	Registers or unregisters a reservation key with the device server.
	07h	Register and Move	Registers a reservation key for another T_T nexus and moves the persistent reservation to that I_T nexus
Scope	0	Indicates LU_SCOPE.	
Type	The characteristics of the persistent reservation currently held. Persistent reservation types supported by the drive are:		
	3h	Exclusive access	
	6h	Exclusive access, registrants only	
	8h	Exclusive access, all registrants	
Parameter List Length	The amount of data (in bytes) that should be sent to the drive from the host in parameter list data. If the SPEC_I_PT bit in the parameter data is 0, this field is set to 18h. If SPEC_I_PT is 1, this field specifies the number of bytes of parameter data (minimum is 18h).		

PERSISTENT RESERVE OUT parameter data

NOTE: The Register and Move service action has its own specific Register and Move parameter data—see “Parameter data for the Register and Move service action” (page 133).

	7	6	5	4	3	2	1	0
0	(MSB) _____							
7	Reservation Key							(LSB)
8	(MSB) _____							
15	Service Action Reservation Key							(LSB)

20	Reserved (0)			SPEC_I_PT	ALL_TG_PT	Rsvd(0)	APTPL	
21	Reserved (0)							
22	Obsolete (0)							
23	Obsolete (0)							
24	(MSB) _____							
<i>n</i>	Additional Parameter Data							(LSB)

Reservation Key	<p>Identifies the I_T nexus that sent the command. The value must match the registered reservation key for the I_T nexus except for:</p> <ul style="list-style-type: none"> • The <i>Register and Ignore Existing Key</i> service action, where this field is ignored. • The <i>Register</i> service action for an unregistered I_T nexus, where this field is 0.
------------------------	---

	If the Reservation Key does not match with the one registered in the device server for the I_T nexus, the device server returns Reservation Conflict.	
Service Action Reservation Key	Information needed for the following service actions: <i>Register</i> , <i>Register and Ignore Existing Key</i> , <i>Preempt</i> , and <i>Preempt and Abort</i> . For the <i>Register</i> and <i>Register and Ignore Existing Key</i> service actions:	
	0	Unregisters the registered reservation key specified in the Reservation Key field.
	<i>n</i>	The new reservation key to replace the existing one as specified in the Reservation Key field for the I_T nexus.
	For the <i>Preempt</i> and <i>Preempt and Abort</i> service actions, this field contains:	
	<i>n</i>	The reservation key of registrations to be removed or, if this field also identifies a persistent reservation holder, the persistent reservation to be pre-empted.
	For the <i>Register and Move</i> service action, this field contains:	
<i>n</i>	The reservation key to be registered on the specified I_T nexus.	
SPEC_I_PT	Valid only for the <i>Register</i> and <i>Register and Ignore Existing Key</i> service actions.	
	0	The Additional Parameter Data is ignored and the registration is applied only to the I_T nexus that sent the command.
	1	The Additional Parameter Data includes a list of transport IDs and the device server applies the registration to the I_T nexus for every initiator port specified in the transport list.
ALL_TG_PT	Not supported and ignored.	
APTPL	Only valid for the <i>Register</i> , <i>Register and Ignore Existing Key</i> and <i>Register and Move</i> service actions.	
	1	The logical unit preserves any persistent reservation and all registrations if power is lost and later returned. If the EEPROM (non-volatile memory) is unable to store data anymore, the device server returns CHECK CONDITION.

This is a summary of the field validity in the parameter data:

Service Action	Scope	Type	Reservation Key	Service Actions Reservation Key	APTPL	SPEC_I_PT
Register	ignored	ignored	valid	valid	valid	valid
Register and Ignore Existing Key	ignored	ignored	ignored	valid	valid	invalid
Reserve	LU_SCOPE	valid	valid	ignored	ignored	ignored
Release	LU_SCOPE	valid	valid	ignored	ignored	ignored
Clear	ignored	ignored	valid	ignored	ignored	ignored
Preempt	LU_SCOPE	valid	valid	valid	ignored	ignored
Preempt and Abort	LU_SCOPE	valid	valid	valid	ignored	ignored
Register and Move	LU_SCOPE	valid	valid	valid	valid	n/a

PREVENT/ALLOW MEDIUM REMOVAL 1Eh

PREVENT/ALLOW MEDIUM REMOVAL tells the drive to enable or disable the removal of the cartridge.

When cartridge removal is prevented, the front panel eject button is completely disabled (though a 'forced eject' will still work). An Unload command issued by a host will result in CHECK CONDITION. The sense key will be ILLEGAL REQUEST or MEDIUM REMOVAL PREVENTED.

When cartridge removal is enabled, pressing the front panel eject button or sending an Unload command from a host will cause the media to be unloaded and ejected.

Removal prevention is on a per-host basis. All the hosts have to allow media removal for any of them to do so.

NOTE: If a firmware upgrade is initiated over any interface, the cartridge will be ejected from the drive regardless of the state of this command.

Pre-execution checks

	01b	Media removal is prohibited for the drive
	10b, 11b	Invalid

READ 08h

READ transfers zero or more data blocks to the host starting at the current logical position.

Pre-execution checks

Illegal Field	Fixed Bit	Reservation	Deferred Error
Unit Attention	Media Access	Diagnostic Status	

If both the SILL and Fixed bits are set, CHECK CONDITION status is reported. Sense data is as described in the Illegal Field Checks. The field pointers indicate the Fixed bit field.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (08h)							
1	Reserved(0)						SILL	Fixed
2	(MSB)	Transfer Length						(LSB)
4								
5	Control							

CDB fields

If the Fixed flag is clear and Transfer Length is not zero, then a single block of the length in Transfer Length is to be transferred. If the next block on tape is of this length or shorter it is transferred to the initiator. If the next block is longer than this length, only the length requested is returned and the logical position is set to after the record. If the length of the block was the same as the Transfer Length field, GOOD status is returned. If the length of the block was not the same as in Transfer Length and the Suppress Illegal Length Indicator (SILL) flag was clear, CHECK CONDITION status is returned, ILL will be reported as described below. If the length of the block was not the same as in Transfer Length and the Suppress Illegal Length Indicator (SILL) flag was set, Good status is returned.

If the fixed flag is set and the Transfer Length field is not zero and the Suppress Illegal Length Indicator (SILL) flag is clear, a sequence of blocks of the currently configured block length is to be returned, the number of blocks being indicated in the Transfer Length field. If there is a sequence of blocks of this length on the tape, they are returned to the initiator with GOOD status. If a block that is longer than the configured length is encountered before the sequence is complete, the blocks up to that block are returned followed by the configured length from the record that was too long and CHECK CONDITION status (ILL will be reported as described below). If a block that is shorter than the configured length is encountered before the sequence is complete, the blocks up to that block are returned followed by all of that block and CHECK CONDITION status (ILL will be reported

as described below). The current position is set after the last block that was returned or partially returned

SILI	<i>Suppress Incorrect Length Indicator</i>	
	0	The read operation is terminated when the length of a block (on the tape) differs from the Transfer Length. Transfer Length bytes of data will have been transferred. The logical tape position will be the EOM side of the illegal sized block.
	1	The drive will not report CHECK CONDITION status if the only error is that the Transfer Length is not equal to the actual block length recorded on the media.
Fixed	0	<p>The Transfer Length field specifies the length of the transfer in bytes. A single block of the length in Transfer Length is to be transferred.</p> <ul style="list-style-type: none"> • If the next block on tape is of Transfer Length, it is transferred to the initiator and GOOD status is returned. • If the next block on tape is not of Transfer Length: <ul style="list-style-type: none"> • If it is shorter, the whole block is transferred to the initiator. • If it is longer, only the length requested is returned and the logical position is set to after the record. • If SILI = 0, CHECK CONDITION status is returned. ILI is reported as described below. • If SILI = 1, GOOD status is returned.
	1	<p>The Transfer Length field specifies the length of the transfer in blocks. The size of each block (in bytes) is specified by the current block length specified in the Mode Parameter block descriptor. If SILI = 0, a sequence of blocks of the currently configured block length is to be returned, the number of blocks being indicated in the Transfer Length field.</p> <ul style="list-style-type: none"> • If there is a sequence of blocks of this length on the tape, they are returned to the initiator with GOOD status. • If a block that is shorter than the configured length is encountered before the sequence is complete, the blocks up to that block are returned followed by all of that block and CHECK CONDITION status (ILI will be reported as described below). The current position is set after the last block that was returned. • If a block that is longer than the configured length is encountered before the sequence is complete, the blocks up to that block are returned followed by the configured length from the record that was too long and CHECK CONDITION status (ILI will be reported as described below). The current position is set after the last block that was partially returned.
Transfer Length	0	No data is transferred. This is not considered an error and the current logical position will be unchanged.
	>0	The amount of data to be transferred, in bytes or blocks as specified by the Fixed field.

READ specific status

Event	Status	Key	Notes
SILI error	CHECK COND'N	NO SENSE	<p>ILI and Valid bits are set. The information bytes will be set as follows:</p> <p><i>Variable Block Mode:</i> The difference between the requested Transfer Length and the actual block size. If the block size is bigger than the Transfer Length, this will be negative (twos complement).</p> <p><i>Fixed Block Mode:</i> The difference between the requested number of records and the number of whole good records transferred. If the last record was under length, it is considered "whole good" for the purposes of this calculation.</p>
Filemark encountered during a read	CHECK COND'N	NO SENSE	The Mark bit is set. Logical position will be on the EOM side of the filemark. Additional sense is 0001h (filemark

Event	Status	Key	Notes
			detected). The logical position will be on the EOM side of the filemark. Residue information is as described below.
EOD encountered during a read	CHECK COND'N	BLANK CHECK	Additional sense is set to 0005h (EOD detected). Residue information is as described below.
EOP/M encountered during a read	CHECK COND'N	MEDIUM ERROR	The EOM bit is set. Additional sense is set to 0002h (EOP/M detected). Residue information is as described below.
Failure to read data through media error or non-fatal drive error	CHECK COND'N	MEDIUM ERROR	Additional sense is set to 1100h (unrecovered read error) or 3B00h (sequential positioning error). Residue information is as described below.
Corrupt data format	CHECK COND'N	MEDIUM ERROR	Additional sense set to 3002h (can't read media).
Blank media encountered during a read	CHECK COND'N	BLANK CHECK	Caused by an attempt to read an unformatted tape. Additional sense is set to 5000h (EOD not found). Residue information is as shown below.

NOTE: Early warning end of medium information is not reported on reads.

READ residue information

The Valid bit will be set. The information bytes will be as follows:

Variable Block Mode	The requested transfer length (in bytes).
Fixed Block Mode	The difference (in blocks) between the requested transfer size and the actual number of blocks transferred. A partially transferred block is not counted, so for example, if 3.5 out of 10 blocks have been transferred the residue will be 7. If the last block is an illegal length block, it is not counted among those transferred. For example, if 4 legal length blocks and 1 illegal length block have been transferred out of a total of 10, the residue will be 6.

READ 6 (CD-ROM mode) 08h

Transfer Length blocks of data are transferred to the host, starting from the current logical position specified by Logical Block Address. Any spacing performed to locate to the specified block address is performed with mark counting disabled.

Requests falling within the first 250 kilobytes of data on tape will be performed with very little delay (less than 2 seconds) because the drive caches this data at load time.

Pre-execution checks

Illegal Field	Fixed Bit	Bad LUN	Reservation
Deferred Error	Unit Attention	Media Access	Diagnostic Status

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (08h)							
1	(MSB)	Logical Block Address						(LSB)
3								
4	Transfer Length							
5	Control							

CDB fields

Logical Block Address	Specifies the block address from which to read. The tape drive will space to this block before reading data.
Transfer Length	The number of blocks of data to return. Each CD-ROM block is 2048 bytes in size. This size is automatically set in the mode data's fixed block length while in CD-ROM mode.

READ 6 specific status

See the "READ specific status" (page 136).

READ residue information

See the "READ residue information" (page 137) for the normal Read command.

READ 10 (CD-ROM mode) 28h

Transfer Length blocks of data are transferred to the host, starting from the current logical position specified by Logical Block Address. Any spacing performed to locate to the specified block address is performed with mark counting disabled.

Requests falling within the first 250 kilobytes of data on tape will be performed with very little delay (less than 2 seconds) because the drive caches this data at load time.

Pre-execution checks

CDB fields

Logical Block Address	Specifies the block address from which to read. The tape drive will space to this block before reading data.
Transfer Length	The number of blocks of data to return. Each CD-ROM block is 2048 bytes in size. This size is automatically set in the mode data's fixed block length while in CD-ROM mode.

READ 10 specific status

See the "READ specific status" (page 136).

READ 10 residue information

See the “READ residue information” (page 137) for the normal Read command.

READ ATTRIBUTE 8Ch

The READ ATTRIBUTE command allows an application client to read attribute values to MAM (Medium Auxiliary Memory). It should be executed before sending a WRITE ATTRIBUTE command.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention Media Access

In order to execute a READ ATTRIBUTE command, there must be a cartridge in the drive, even if it is only partially loaded, so that the MAM can be read. If there is no cartridge in the drive, the command is terminated with CHECK CONDITION, a sense key of NOT READY and additional sense of 3A00h (medium not present).

If there is no cartridge in the drive, the Cache bit is set to 1, and no cartridge has been loaded since the drive was power-cycled, the command is terminated with CHECK CONDITION, a sense key of NOT READY and additional sense of 3A00h (medium not present).

If the Volume Number or Partition Number values are invalid, CHECK CONDITION is reported. Sense data will be as described in the Illegal Field Checks.

The Service Action and the First Attribute ID fields must match one of the supported Service Actions and Attribute IDs. If they do not, CHECK CONDITION is reported. Sense data will be as described in the Illegal Field Checks.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (8Ch)							
1	Reserved (0)			Service Action				
2–4	Reserved (0)							
5	Volume Number (0)							
6	Reserved (0)							
7	Partition Number							
8	(MSB)	First Attribute ID						(LSB)
9								
10	(MSB)	Allocation Length						(LSB)
13								
14	Reserved (0)							Cache
15	Control							

CDB fields

Service Action	Service actions are defined as follows. The data returned for each Service Action is described below.		
	Code	Name	Description
	00h	Attribute Values	Returns the attribute values.

	01h	Attribute List	Returns a list of available attribute IDs (read-only state or read/write state IDs).
	02h	Volume List	Returns a list of known volume numbers. For LTO Ultrium drives, there is only a single volume, Volume 0.
	03h	Partition List	Returns a list of known partition numbers. For LTO-1 to LTO-4 products there is only one partition, whose value is 0. For LTO-5 products there can be up to 2 partitions. For LTO-6 products there can be up to 4 partitions.
	04h	Reserved	
	05h	Supported Attributes	Returns a list of supported attribute IDs (read-only state, read/write state IDs, or non-existent state). NOTE: The first host-type vendor-unique attribute (1400h) is always reported even if it does not exist. Other host-type vendor-unique attributes will only be reported as supported if they exist.
	06h–1Fh	Reserved	
Partition Number	A partition in the volume, where the first partition is 00h. Only attributes corresponding the partition number will be returned.		
First Attribute ID	The identifier of the first attribute to be returned. If it does not exist in MAM, but there are more attributes available after this one, the data returned will contain the values of those attributes. Otherwise CHECK CONDITION is returned with ILLEGAL REQUEST sense.		
Allocation Length	The maximum amount of data (in bytes) that will be returned to the host. The drive will return the entire list of values or Allocation Length bytes, whichever is the lesser.		
Cache	If set to 1, attribute information from the most recently mounted cartridge is reported. This may not be the complete set of attribute information. If a cartridge is mounted this bit is ignored.		

READ ATTRIBUTE returned data for service actions

Attribute Values service action

This service reads the values of attributes for the specified volume and partition, starting at the First Attribute ID. The attributes are returned in ascending numerical order. The format of the returned data is as follows:

	7	6	5	4	3	2	1	0
0	(MSB)							
3	Available Data ($n-3$)							(LSB)
4	First Attribute ID							
m								
:	:							
:	Attribute ID x							
n								

The Available Data field contains the number of bytes of attribute values returned. Even if the data returned has to be truncated because the Allocation Length is too small, the contents of the Available Data field remain the same.

For details of the available attributes and the format of the data returned for each, see “MAM attribute data” (page 142).

Attribute List service action

This service action is used to retrieve the identifiers of all the attributes that are supported and exist. The First Attribute ID field in the CDB is ignored. The attribute identifiers are returned in ascending numerical order. The format of the returned data is as follows:

	7	6	5	4	3	2	1	0	
0	(MSB)		Available Data ($n-3$)						(LSB)
3									
4	Attribute ID 0								
5									
:	:								
$n-1$	Attribute ID x								
n									

The Available Data field specifies the number of bytes of attribute ID data returned. Even if the data returned has to be truncated because the Allocation Length is too small, the contents of the Available Data field remain the same.

A two-byte Attribute ID is returned for each attribute available on MAM. See [“Attribute ID values” \(page 143\)](#) for a description of the Attribute ID values.

Partition List service action

The Partition List service action is used to report the number of partitions supported in the specified volume. The First Attribute ID field in the CDB is ignored. The information returned is as follows:

	7	6	5	4	3	2	1	0	
0	(MSB)		Available Data (2)						(LSB)
1									
2	First Partition Number (0)								
3	Number of Partitions Available								

The First Partition Number is the first partition available on the specified volume.

The Number of Partitions Available indicates the number of partitions available on the specified volume (1–4 for LTO-6 tape).

Volume List service action

The Volume List service action is used to report the number of volumes that the device server supports, which in the case of LTO Ultrium drives is 1. The Volume Number, Partition Number and Attribute fields in the CDB are ignored. The information returned is as follows:

	7	6	5	4	3	2	1	0	
0	(MSB)		Available Data (2)						(LSB)
1									
2	First Volume Number (0)								
3	Number of Volumes Available (1)								

The Available Data field contains the length in bytes of the data that follows. Even if the data returned is truncated as a result of insufficient allocation length, the contents of the Available Data field are not altered.

READ ATTRIBUTE specific status

The command will be terminated and will return CHECK CONDITION under the following circumstances:

Description	Sense Key	Additional Sense	
There is no cartridge present in the drive, not even partially loaded.	NOT READY	3A00h	(medium not present)
The MAM is not accessible even though there is a tape in the drive.	MEDIUM ERROR	0410h	(MAM not accessible)
The MAM has failed (for example from a bad checksum).	MEDIUM ERROR	1112h	(MAM read error)
The combination of Volume Number and Partition Number is not valid.	ILLEGAL REQUEST	2400h	(invalid field in CDB)
The Service Action field does not match a supported Service Action ID.	ILLEGAL REQUEST	2400h	(invalid field in CDB)
The First Attribute ID field does not match a supported First Attribute ID.	ILLEGAL REQUEST	2400h	(invalid field in CDB)

MAM attribute data

Attribute data sent with a WRITE ATTRIBUTE command or returned in response to a READ ATTRIBUTE command has the following format:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
1	Attribute Identifier							(LSB)
2	Read-Only	Reserved (0)					Format	
3	(MSB) _____							
4	Attribute Length (n-4)							(LSB)
5	(MSB) _____							
n	Attribute Value							(LSB)

The format implies nothing about the physical representation of the data in the Medium Auxiliary Memory.

Attribute Identifier	The binary identifier for a single attribute. See "Attribute ID values" below.	
Read-Only	Specifies whether an attribute is read-only. The bit is ignored by the READ ATTRIBUTE command.	
	0	The attribute may be changed by the WRITE ATTRIBUTE command.
	1	The attribute is read-only and cannot be changed by WRITE ATTRIBUTE.
Format	Specifies the data format of the Attribute Value field. The possible values are:	
	Value	Description
	00b	Binary. The Attribute Value field contains binary data.

	01b	ASCII. The Attribute Value field contains only graphic codes (20h–7Eh). It must be left-aligned and contain 20h (ASCII space) in any unused bytes.
	10b	Text. The Attribute Value field contains textual data. The character set is as described in the Text Localization Identifier attribute in “Standard host type attributes” (page 147).
	11b	Reserved.
Attribute Length	The length in bytes of the Attribute Value field.	

Attribute ID values

Attributes can be Standard or Vendor-Unique. There are three groups of attributes: Device, Medium and Host attributes. Each group has a list of attributes, which characterize the group:

Attribute ID	Attribute Type	Standard/Vendor-Unique	Read-Only
0000h–03FFh	Device	Standard	Yes
0400h–07FFh	Medium	Standard	Yes
0800h–0BFFh	Host	Standard	No
0C00h–0FFFh	Device	Vendor-Unique	Yes
1000h–13FFh	Medium	Vendor-Unique	n/a
1400h–17FFh	Host	Vendor-Unique	No
1800h–FFFFh	Reserved		

WRITE ATTRIBUTE commands are only accepted for Host type attributes (either Standard or Vendor-Unique).

Trying to read or write Device or Medium type vendor-unique attributes will fail and CHECK CONDITION status is reported. Sense data will be as described in the Illegal Field Checks.

Attribute states

Attribute Type	Attribute State	Description
Medium or Device	Read-only	An application client may read the contents of the MAM attribute with the READ ATTRIBUTE command, but an attempt to clear or change the MAM attribute using the WRITE ATTRIBUTE command results in the command being terminated with CHECK CONDITION status. When the Read-Only bit is one, the attribute is in the read-only state.
	Unsupported	The device server does not support the MAM attribute and will not return it in response to a READ ATTRIBUTE command.
	Unavailable	The MAM attribute exists but it is not available at this time. The device server will not return it in response to a READ ATTRIBUTE command.
Host	Non-existent	A host attribute does not exist in the MAM until a WRITE ATTRIBUTE command creates it.
	Read/Write	The MAM attribute has been created using the WRITE ATTRIBUTE command. After the MAM attribute has been created, the contents may be altered using subsequent WRITE ATTRIBUTE commands. A read/write MAM attribute may be returned to the non-existent state using a WRITE ATTRIBUTE command with the attribute length set to zero. When the Read-Only bit is zero, the MAM attribute is in the read/write state.
	Unsupported	The device server does not support the MAM attribute and will not return it in response to a READ ATTRIBUTE command.

Remaining capacity in partition and Maximum capacity in partition	Native capacities in MB, assuming no data compression.								
TapeAlert flags	1 bit per flag (MSB = flag 1, LSB = flag 64). Bits specify flags set during previous load.								
Load count	The number of times this tape has been fully loaded. It is never reset.								
MAM space remaining	The space currently free in the MAM. The total MAM capacity is reported in the MAM Capacity attribute defined in “ Standard medium type attributes ” (page 147). Note that it may not always be possible to use all the free space in a given MAM implementation. Depending on the internal organization of the memory and the software that controls it, fragmentation issues may mean that certain attribute sizes might not be fully accommodated as the MAM nears its maximum capacity.								
Assigning organization	The Vendor ID of the organization that will define attribute 0006h. It contains the string “LTO-CVE”.								
Formatted density code	The medium density code.								
Initialization count	0	The tape is not initialized.							
	1	In other cases.							
Volume identifier	Set and reset by the SET MEDIUM ATTRIBUTE ADC command.								
Volume change reference	Indicates changes in the state of the medium related to logical objects.								
Device make/serial number at last load and Device make/ serial number at load –n		7	6	5	4	3	2	1	0
	0	(MSB) Vendor Identification							(LSB)
	7								
	8	(MSB) Product Serial Number							(LSB)
	39								
	Vendor Identification		The same value as is returned in the SCSI INQUIRY command by the device server, padded with ASCII spaces (20h).						
	Product Serial Number		Vendor-assigned serial number, padded with ASCII spaces (20h).						
Total MB written in medium life and Total MB read in medium life	The total number of data bytes written to or read from the tape (after any data compression has been applied) over the entire tape life. These figures are cumulative and will never be reset.								
Total MB written in current/last load and Total MB read in current/last load	These are similar to the attributes above but apply to the current load (if the tape is currently loaded) or the last load (if the tape is currently unloaded). The device server should reset these attributes to zero when the tape is loaded.								
Logical position of first encrypted block	Logical address on tape of the first encrypted block on tape. If there are no encrypted blocks, set to FFFF FFFF FFFF FFFFh. If it is unknown whether there are any encrypted blocks, then set to FFFF FFFF FFFF FFFEh.								
Logical position of first unencrypted block after the first encrypted block	Logical address on tape of the first unencrypted block on tape that follows the first encrypted block on tape. The attribute value is set to FFFF FFFF FFFF FFFFh if the logical position of first encrypted block attribute is set to: <ul style="list-style-type: none"> • FFFF FFFF FFFF FFFFh; or • any value other than FFFF FFFF FFFF FFFFh or FFFF FFFF FFFF FFFEh and no block after the first encrypted block contains unencrypted data. 								

	<p>The attribute value is set to FFFF FFFF FFFF FFFEh if the logical position of first encrypted block attribute is set to:</p> <ul style="list-style-type: none"> • FFFF FFFF FFFF FFFFh; or • any value other than FFFF FFFF FFFF FFFFh or FFFF FFFF FFFF FFFEh and it is unknown whether any block after the first encrypted block contains unencrypted data.

Standard medium type attributes

ID	Attribute	Size (bytes)	Format	Description
0400h	Medium manufacturer	8	ASCII	The name of the manufacturer.
0401h	Medium serial number	32	ASCII	The serial number, left-aligned and padded with ASCII spaces (20h).
0402h	Medium length	4	Binary	The length of the tape in meters. A value of 0 means the length is undefined.
0403h	Medium width	4	Binary	127 The width of the tape in tenths of a mm
0404h	Assigning organization	8	ASCII	Contains the string "LTO-CVE".
0405h	Medium density code	1	Binary	The tape density code.
0406h	Medium manufacturer date	8	ASCII	The date of manufacture in the format YYYYMMDD.
0407h	MAM capacity	8	Binary	The total capacity of the MAM, not its free space.
0408h	Medium type	1	Binary	The type of tape:
				0 Data cartridge
				1 Cleaning cartridge
80h WORM cartridge				
				Other values are reserved.
0409h	Medium type information	2	Binary	Only meaningful for a cleaning cartridge, where it gives the maximum number of cleaning cycles permitted.
040Ah – 07FFh	Reserved			

Standard host type attributes

These only exist if they are initialized by an application:

ID	Attribute	Size (bytes)	Format	Description
0800h	Application vendor	8	ASCII	
0801h	Application name	32	ASCII	
0802h	Application version	8	ASCII	
0803h	User medium text label	160	Text	The user level identifier for the tape.
0804h	Data and time last written	12	ASCII	Format is YYYYMMDDHHMM (0–24 hours)
0805h	Text localization identifier	1	Binary	Defines the character set for the attributes defined as "text". See the table below.
0806h	Barcode	32	ASCII	The barcode associated with the medium in the MAM.
0807h	Owning host textual name	80	Text	The host server from which the User Medium Text Label originates.
0808h	Media pool	160	Text	Indicates the media pool to which this tape belongs.
0809h	Partition user text label	16	ASCII	Identifier for the partition specified in the CDB.

ID	Attribute	Size (bytes)	Format	Description	
080Ah	Load/unload at partition	1	Binary	0	The load or unload occurs at the beginning of the tape. This is the default setting if the attribute does not exist.
				1	Loads and unloads at the partition specified in the CDB are allowed
080Bh	Application format version	16	ASCII		
080Ch	Volume coherency information	23–n	Binary	Contains information used to maintain coherency of information on a volume. It may be used to identify whether the volume contents have changed since the last time this attribute was written to MAM.	
080Dh–BFFh	Reserved				

Vendor-unique medium type attributes

Attribute ID	Name	Attribute Length	Format	Description		
				Bytes		
1000h	Unique Cartridge Identity (<i>not applicable to cleaning cartridges</i>)	28	Binary	0–3	LTO CM Serial Number	4 bytes
				4–11	Tape pancake identification field from the Manufacturer's Word	8 bytes
				12–19	Manufacturer's Name field from the Manufacturer's Word	8 bytes
				20–23	The LPOS value at LP1 (deduced from the tape, or extracted from the Initialization Data page in the CM)	4 bytes
				24–25	Cartridge Type field from the Cartridge Manufacturer's Page in the LTO CM	2 bytes
				26–27	Reserved (set to zero)	2 bytes
1001h	Alternative Unique Cartridge Identity	24	Binary	0–3	LTO CM Serial Number	4 bytes
				4–11	Tape pancake identification field from the Manufacturer's Word	8 bytes
				12–21	Cartridge Serial Number	10 bytes
				22–23	Cartridge Type field from the Cartridge Manufacturer's Page in the LTO CM	2 bytes

Text localization identifiers

The Text Localization Identifier defines the character set used for attributes with a text format:

ID	Format
00h	No code specified (ASCII)
01h	ISO/IEC 8859-1 (Europe, Latin America)
02h	ISO/IEC 8859-2 (Eastern Europe)
03h	ISO/IEC 8859-3 (SE Europe/miscellaneous)
04h	ISO/IEC 8859-4 (Scandinavia/Baltic)
05h	ISO/IEC 8859-5 (Cyrillic)
06h	ISO/IEC 8859-6 (Arabic)
07h	ISO/IEC 8859-7 (Greek)
08h	ISO/IEC 8859-8 (Hebrew)
09h	ISO/IEC 8859-9 (Latin 5)
0Ah	ISO/IEC 8859-10 (Latin 6)
0Bh–7Fh	Reserved
80h	ISO/IEC 10646 (Unicode)
81h	ISO/IEC 10646 -1, Amendment no. 2 (UTF-8)
82h–FFh	Reserved

READ BLOCK LIMITS 05h

READ BLOCK LIMITS tells the drive to return data defining the maximum block size that it can support. Note that this is the maximum supportable, not the fixed block size.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (05h)							
1–4	Reserved (0)							
5	Control							

Read Block Limits data

	7	6	5	4	3	2	1	0
0	00h							
1	(MSB)	Maximum Block Length						(LSB)
3								
4	(MSB)	Minimum Block Length (0001h)						(LSB)
5								

Maximum Block Length	If Logical Block Protection is enabled (see the “Control_Data_Protection_sub-page” (page 104)), then this value is set to $2^{24}-1-4$ (FFFFFBh). Otherwise it is set to FFFFFFFh.
-----------------------------	--

READ BUFFER 3Ch

READ BUFFER reads data from the memory on the drive and sends it to the initiator. The value of the Mode field determines whether only the 4-byte descriptor is returned, only the data is returned, or whether both are returned.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention

If any of the following rules are broken then CHECK CONDITION status is reported. Sense data will be as described in Illegal Field Checks.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (3Ch)							
1	Reserved (0)			Mode				
2	Buffer ID							
3	(MSB)	Buffer Offset						(LSB)
5								
6	(MSB)	Allocation Length						(LSB)
8								
9	Control							

CDB fields

Mode	00000b	A 4-byte descriptor is returned, followed by (<i>Allocation Length</i> – 4) bytes of data. The data is read from the buffer identified by the Buffer ID, starting from offset zero in the buffer. The Buffer ID and Buffer Offset must both be 00h.		
	00010b	The drive returns Allocation Length bytes of data which is read from the buffer identified by the Buffer ID, starting from Buffer Offset bytes from the start of the buffer. There are no restrictions on the value of Buffer ID and Buffer Offset, except that the Buffer Offset must be kept within the buffer size.		
	00011b	The drive returns a 4-byte descriptor for the buffer identified by the Buffer ID field. Invalid buffer IDs will return a buffer descriptor of all zeros. The Buffer Offset field must be zero.		
	01010b	The drive returns data from the Echo Buffer. The Buffer ID and Offset are ignored.		
	01011b	The drive returns the Echo Buffer descriptor. The Buffer ID and Offset are ignored.		
Buffer ID	The Buffer ID indicates which buffer is to be read. The buffers are defined as follows. NOTE: Processor memory (Buffer ID 01h) is not accessible.			
	Buffer ID	Memory Area	Category	Offset Boundary
	00h	Main buffer memory	RAM	4 byte

02h	Burst buffer	RAM	4 bytes

Buffer Offset	The Buffer Offset field may be set to any address in the buffer, but must obey the specified Offset Boundary.				
Allocation Length	The amount of data to return. Allocation Length + Buffer Offset must be within the buffer size.				

Memory sizes

Main Buffer Memory	Size: 512 MB, reported size FFFFFFFh. Because the buffer is greater than 16 MB, additional buffer IDs have been defined to allow the buffer to be accessed in 16 MB segments. These are as follows:																										
	<table border="1"><thead><tr><th>Buffer ID</th><th>Address</th></tr></thead><tbody><tr><td>20h</td><td>00000000h + Buffer Offset (same as Buffer ID 00h)</td></tr><tr><td>21h</td><td>01000000h + Buffer Offset (in other words, +16 MB)</td></tr><tr><td>22h</td><td>02000000h + Buffer Offset (in other words, +32 MB)</td></tr><tr><td>23h</td><td>03000000h + Buffer Offset (in other words, +48 MB)</td></tr><tr><td>24h</td><td>04000000h + Buffer Offset (in other words, +64 MB)</td></tr><tr><td>25h</td><td>05000000h + Buffer Offset (in other words, +80 MB)</td></tr><tr><td>26h</td><td>06000000h + Buffer Offset (in other words, +96 MB)</td></tr><tr><td>27h</td><td>07000000h + Buffer Offset (in other words, +112 MB)</td></tr><tr><td>28h</td><td>08000000h + Buffer Offset (in other words, +128 MB)</td></tr><tr><td>29h</td><td>09000000h + Buffer Offset (in other words, +144 MB)</td></tr><tr><td>2Ah</td><td>0A000000h + Buffer Offset (in other words, +160 MB)</td></tr><tr><td>2Bh</td><td>0B000000h + Buffer Offset (in other words, +176 MB)</td></tr></tbody></table>	Buffer ID	Address	20h	00000000h + Buffer Offset (same as Buffer ID 00h)	21h	01000000h + Buffer Offset (in other words, +16 MB)	22h	02000000h + Buffer Offset (in other words, +32 MB)	23h	03000000h + Buffer Offset (in other words, +48 MB)	24h	04000000h + Buffer Offset (in other words, +64 MB)	25h	05000000h + Buffer Offset (in other words, +80 MB)	26h	06000000h + Buffer Offset (in other words, +96 MB)	27h	07000000h + Buffer Offset (in other words, +112 MB)	28h	08000000h + Buffer Offset (in other words, +128 MB)	29h	09000000h + Buffer Offset (in other words, +144 MB)	2Ah	0A000000h + Buffer Offset (in other words, +160 MB)	2Bh	0B000000h + Buffer Offset (in other words, +176 MB)

PCA EEPROM	Size = 8000h bytes	

READ BUFFER returned data:

The format of the 4-byte descriptor for Mode 00000b is as follows:

	7	6	5	4	3	2	1	0	
0	Reserved (0)								
1	(MSB)	Buffer Capacity							
3								(LSB)	

The format of the 4-byte descriptor for Mode 00011 b is as follows:

	7	6	5	4	3	2	1	0	
0	Buffer Offset Boundary								
1	(MSB)	Buffer Capacity							
3								(LSB)	

The format of the 4-byte Echo buffer descriptor for Mode 01011 b is as follows:

	7	6	5	4	3	2	1	0
0	Reserved (0)							EBOS (1)
1	(MSB)	Echo Buffer Size (1000h)						
3								(LSB)

Reading the Snapshot data buffer

You can use the READ BUFFER command with Buffer ID 40h to retrieve the latest Snapshot log. The main advantage of this over using the READ SNAPSHOT LOG command to retrieve the most recent Snapshot log, is that the data can be retrieved over a number of commands, making the data more manageable in library systems. However the Snapshot data buffer has neither a fixed location nor size, so you must create a Snapshot log before you can access the Snapshot data buffer. Consequently, using READ BUFFER commands to access the Snapshot data buffer requires special handling and consideration, as described below.

1. To determine the length of the Snapshot data buffer, execute a READ BUFFER command with Mode set to Descriptor (03h) and Buffer ID set to 40h.
2. Retrieve the buffer contents by executing a READ BUFFER command with Mode set to Data (02h) and Buffer ID set to 40h.

So that the contents of the Snapshot data buffer are preserved during retrieval using a READ BUFFER command, they are locked from the moment the first byte of the buffer is retrieved, and remain locked until the last byte has been retrieved. This allows you to retrieve the contents of the buffer using multiple READ BUFFER commands. The contents cannot be retrieved using READ BUFFER until the buffer has been locked; it is therefore necessary to start retrieval from Buffer Offset 000000h. You do not need to read the entire buffer contents to unlock the buffer; only to read the last byte. The buffer is also unlocked when a FORCE SNAPSHOT command is executed.

- If a Snapshot log has not been created, the READ BUFFER command terminates with CHECK CONDITION status, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If a Snapshot log is being created, or the Snapshot command set is being updated, the command terminates with CHECK CONDITION status, a sense key of NO SENSE and additional sense of 0016h (operation in progress).
- If another initiator is retrieving the most recent Snapshot log using either a READ SNAPSHOT LOG or READ BUFFER command, the READ BUFFER command terminates with CHECK CONDITION status, a sense key of NO SENSE and additional sense of 0016h.

READ CAPACITY (CD-ROM mode) 25h

READ capacity transfers Read Capacity data to the host.

Pre-execution checks

Illegal Field	Fixed Bit	Bad LUN
Reservation	Deferred Error	Unit Attention

If the drive is not in CD-ROM mode, the request will return CHECK CONDITION status with a sense key Illegal Command.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (25h)							
1	Logical Unit Number			Reserved (0)				RelAdr(0)
2	(MSB)	Logical Block Address (0)						(LSB)
5	Reserved (0)							
6	Reserved (0)							
7	Reserved (0)							
8	Reserved (0)						PMI	
9	Control							

CDB fields

Logical Block Address	This flag is ignored. It is recommended that it should be zero.
PMI	This flag is ignored. It is recommended that it should be zero.

Read Capacity data

The following data is always returned

	7	6	5	4	3	2	1	0
0	(MSB)	Returned Logical Block Address (0004B000h)						(LSB)
3	Reserved (0)							
4	(MSB)	Block Length in bytes (00000800h)						(LSB)
7	Reserved (0)							

READ FIRMWARE TRACE LOG A3h (1Fh)

READ FIRMWARE TRACE LOG allows an application client to retrieve a list of supported firmware trace logs and retrieve drive firmware trace logs. Each firmware subsystem's trace logs consist of one or more trace log banks, which need to be extracted individually using separate READ FIRMWARE TRACE LOG commands.

If the Trace Log and Trace Bank fields are set to zero, the command reports a list of supported trace logs. In order to extract all trace logs an application client should retrieve the list of supported firmware trace logs and then retrieve all the logs in the order they are reported in the list. Trace log banks should be retrieved in numerical order; bank zero should always be retrieved first.

Pre-execution checks

Illegal Field	Reservation	Deferred Error	Unit Attention

3	Trace Log							
4	Trace Bank							
5	Reserved (0)							
6	Allocation Length							
9								
10	Reserved (0)							
11	Control							

CDB fields

Trace Log	Specifies the firmware subsystem trace log to return:	
	00h	Supported list of trace logs
	01h	System ARM Trace Log
	02h	Host ARM Trace Log
	03h	Management ARM Trace Log
	04h	Orion ARM Trace Log
	05h–FFh	Reserved
Trace Bank	Which trace bank to return of the firmware subsystem specified in the Trace Log field. The first trace log in any firmware subsystem is Bank 0. The Trace Bank field can take values in the range 0 through to the number of trace banks minus one.	
Allocation Length	The length in bytes allocated for the parameter data. The actual number of bytes returned will be the lesser of the length of the actual parameter list and the allocation length specified in the command.	

READ FIRMWARE TRACE LOG returned data

The format of firmware trace logs depends on the subsystem dependant and not defined here.

The format of the parameter data when reporting the list of supported trace logs (both the Trace Log and Trace Bank fields set to 0) is as follows:

	7	6	5	4	3	2	1	0
0	(MSB)							
3	Data Length ($n-3$)							(LSB)
<i>Trace Log Descriptor List</i>								
4 : 11	Trace Log Descriptor (first)							

	7	6	5	4	3	2	1	0
:	:							
n-7 : n	Trace Log Descriptor (last)							

Trace Log Descriptors:

	7	6	5	4	3	2	1	0
0	Trace Log							
1	Trace Banks							
2-3	Reserved (0)							
4-7	Maximum Trace Log Size							

Trace Log	As above, in the Command Descriptor Block field.
Trace Banks	The number of trace log banks supported by the firmware subsystem specified in Trace Log.
Maximum Trace Log Size	The maximum length in bytes of the each trace log bank indicated in the Trace Log field.

READ LOGGED-IN HOST TABLE A3h (1Fh)

The READ LOGGED-IN HOST TABLE command reports the hosts currently logged in to the drive.

Pre-execution checks

Unit Attention

Illegal Field

Reservation

Deferred Error

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)

4-5	Reserved (0)							
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved (0)							
11	Control							

CDB fields

Report Type	Determines the contents of the returned data:	
	00h	Return a logged-in host descriptor for all hosts
	01h	Only return a descriptor for the host that issued this command

	02h-0Fh	Reserved
Allocation Length	The number of bytes allocated for the returned parameter data. The actual number returned will be the lesser of the length of the actual parameter list and the allocation length.	

READ LOGGED_IN HOST TABLE returned data

The format of the READ LOGGED-IN HOST TABLE parameter list is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____							
3	Parameter List Length (n-3)							(LSB)
4	Host Descriptor							
n								

Host Descriptors are defined as follows:

	7	6	5	4	3	2	1	0
0	World-Wide Node Name (8 bytes)							
7								
8	World-Wide Port Name (8 bytes)							
15								
16	Source ID (4 bytes)							
19								
20	Port Log-In Time (6 bytes)							
25								
26	Reserved (0)	ME	Reserved (0)			PHY Port		
27	Host ID							
28								
29	Relative Port Index							
30-31	Reserved (0)							

World-Wide Node Name	The logged-in host's Node WWN identifier	
World-Wide Port Name	The logged-in host's Port WWN identifier.	
Source ID	On Fibre Channel drives, the logged-in host's source identifier from the fabric switch. On SAS drives, the field is zero.	
Port Log-In Time	The time-stamp of when the host completed its PLOGI process.	
ME	1	The information reported in this descriptor corresponds to the initiator that sent the command.
PHY Port	The physical target port this host is connected to:	
	00b	Port A
	01b	Port B
	10b-11b	Reserved

Host ID	The logged-in host's index in the Logged-In Host Table (in the range 0–511).	
Primary Port Index	The primary port index value for the port the host is logged-in on:	
	00h	Reserved
	01h	Primary Fibre Channel/SAS Port A
	02h	Primary Fibre Channel/SAS Port B
	03h	Primary Fibre Channel NPIV Port A
	04h	Primary Fibre Channel NPIV Port B
	05h–FFh	Reserved

READ MEDIA SERIAL NUMBER ABh (01h)

READ MEDIA SERIAL NUMBER provides a method for the host application to read the serial number of the cartridge currently loaded in the drive.

Pre-execution checks

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (ABh)							
1	Reserved(0)			Service Action (01h)				
2	Reserved (0)							
8								
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved(0)							
11	Control							

CDB fields

Allocation Length	The maximum amount of data (in bytes) to be returned to the host. The drive will return the entire serial number string or allocation length bytes, whichever is least.
--------------------------	---

If there is no cartridge in the drive, the command is terminated with CHECK CONDITION status. The sense key is set to NOT READY with additional sense of 3A00h (medium not present).

READ MEDIA SERIAL NUMBER returned data

The data returned depends on whether a barcode number has been stored in the LTO-CM using the WRITE ATTRIBUTE command. Storing this is the responsibility of the automation controller or host application.

No barcode stored

	7	6	5	4	3	2	1	0
0	(MSB)	Serial Number Length (0Ch)						(LSB)
3								
4	(MSB)	Cartridge Serial Number						(LSB)
13								
14	(MSB)	ASCII NUL characters (00h)						(LSB)
15								

Cartridge Serial Number	The serial number of 10 ASCII characters stored in the LTO-CM Cartridge Manufacturer's Information page.
--------------------------------	--

Barcode stored

	7	6	5	4	3	2	1	0
0	(MSB)	Serial Number Length (2Ch)						(LSB)
3								
4	(MSB)	Cartridge Serial Number						(LSB)
13								
14	(MSB)	ASCII Space characters (20h)						(LSB)
15								
16	(MSB)	Barcode Number						(LSB)
47								

Barcode Number	The barcode number of 32 ASCII characters stored in the LTO-CM Application Specific page.
-----------------------	---

READ POSITION 34h

The READ POSITION command returns data representing the current logical position to the host. The position is the count of all marks and blocks between BOM and the current logical position. The first block is block 0.

The command causes no tape movement.

19								

READ POSITION returned data fields—short block form

BOP	0	The current logical position is <i>not</i> at BOM (beginning of media).
	1	The current logical position is at BOM.
EOP	1	The current logical position is within the EW-EOM region.
LOCU	1	The number of blocks in the buffer is unknown.
BYCU	1	The number of bytes in the buffer is unknown.
LOLU	0	The Partition Number, First Block Location and Last Block Location fields are valid.
Partition Number	The partition number for the current logical position.	

First Block Location	The number of blocks and filemarks from BOM to the current position. Counting starts at zero, so BOM is block location 0. If this field is not large enough to be able to represent the current logical position, the command will fail with CHECK CONDITION, sense key of DATA PROTECT, and additional sense of 3B1Ch (too many logical objects on partition to support operation).
Last Block Location	Always set to the value of the First Block Location.

Data file header

Byte	Description
0–3	Signature (DECAFBADh)
4–7	Header Length (00A0h)
8–9	Version (0000h)
10–11	Timestamp Type (0005h)
12–19	Timestamp
20–51	Library Model
52–83	Library Serial Number
84–87	Generator (0005h)
88–91	Subject Device Category
92–123	Subject Product ID
124–155	Subject Serial Number
156–159	Number of Dataset

Signature	Used for identification. Must be set to DECAFBADh.	
Header Length	The size of the data file header. Must be set to 000Ah (160).	
Version	The version number for the datafile header structure. Must be set to 0000h.	
Timestamp Type	The timestamp format.	
	5	Power-on time.
Timestamp	The time from power-on at which the Snapshot log was created, in units of 16 μ S.	
Library Model	The model name of the library from which data has been acquired. Filled with ASCII space characters (20h).	
Library Serial Number	The serial number of the library from which data has been acquired. Filled with ASCII space characters (20h).	
Generator	05h	Indicates an LTO drive created the data file.
Subject Device Category	The drive type that created the data file:	

	400000Dh	HP LTO Ultrium 4 full-height SCSI
	400000Eh	HP LTO Ultrium 4 full-height SAS
	400000Fh	HP LTO Ultrium 4 full-height FC
	4000001Ch	Cerf SAS
	4000001Dh	HP LTO Ultrium 4 half-height SCSI
	4000001Eh	HP LTO Ultrium 4 half-height SAS
	4000001Fh	HP LTO Ultrium 4 half-height FC
	40000020h	HP LTO Ultrium 5 full-height SAS
	40000021h	HP LTO Ultrium 5 full-height FC
	40000022h	HP LTO Ultrium 5 half-height FC
	40000023h	HP LTO Ultrium 5 half-height SAS
	40000028h	HP LTO Ultrium 6 full-height SAS
	40000029h	HP LTO Ultrium 6 full-height FC
	4000002Ah	HP LTO Ultrium 6 half-height FC
	4000002B	HP LTO Ultrium 6 half-height SAS
Subject Project ID	The Product ID of the device from which the data has been acquired, taken from the standard INQUIRY data left-aligned and space-padded, for example: "Ultrium-6 FC"	
Subject Serial Number	The serial number of the device from which the data has been acquired.	
Number of Dataset	The total number of datasets available in this data file.	

Dataset descriptor

Byte	Description
0–127	Dataset Header
128– <i>n</i>	Dataset Payload

Dataset Header	<i>See below.</i>
Dataset Payload	<p>If Error Number (in the Dataset Header) = 0000h, the payload is any SCSI data IN captured when the SCSI command in the CDB field was executed.</p> <p>If Error Number = 0849h, the payload is any SCSI sense data captured when the SCSI command in the CDB field was executed.</p>

Dataset header

Byte	Description
0–3	Aquisition Mode (00000001h)
4–7	Timestamp
8–23	CDB
24–27	Payload Offset
28–31	Payload Length
32–35	Byte Order (0)

36–39	Compression Algorithm (0)
40–71	Dataset Identifier
72	IS Stale Flag (0)
73–76	Error Number
77–127	Protocol Specific Area (0)

Timestamp	The last 4 bytes of the 6-byte timestamp indicating the time the dataset was created.	
CDB	The Command Descriptor Block of the command that generated the dataset.	
Payload Offset	An absolute offset from the start of the data file to the Dataset Payload field for this dataset.	
Byte Order	0000h	Order is Big-Endian.
Compression Algorithm	00000000h	No compression.
Dataset Identifier	The identifier for the dataset.	
Error Number	0000h	The SCSI command in the CDB field completed with GOOD status. Any SCSI data from the command is in the Dataset Payload field.
	0849h	The SCSI command in the CDB field completed with non-GOOD status. Any SCSI sense data from the command is in the Dataset Payload field.

READ SNAPSHOT LOG specific status

Event	Status	Key	Additional Sense
The Snapshot log specified in the Snapshot Number field is not available for retrieval, or no Snapshot log is available for retrieval.	CHECK CONDN	ILLEGAL REQUEST	2400h (invalid field in CDB)
The Snapshot log is in the process of being created.	CHECK CONDN	NO SENSE	0016h (operation in progress)

READ STTF LOG A3h (1Fh)

The READ STTF LOG command retrieves a Snapshot log from non-volatile flash memory.

Pre-execution checks

5								
6	Allocation Length							

	7	6	5	4	3	2	1	0
8								
9-10	Reserved (0)							
11	Control							

CDB fields

Retrieval Option	Specifies how the Relative Log Index is used to specify which STTF log to retrieve:	
	00b	The Relative Log Index field is relative to all STTF logs regardless of the section in which they are stored, and whether they are protected.
	01b	The Relative Log Index field is relative to logs stored in section 1 only.
	10b	The Relative Log Index field is relative to logs stored in section 2 only.
	11b	The Relative Log Index field is relative to protected STTF logs regardless of the section in which they are stored.
Relative Log Index	Which STTF log to read, relative to the most recently captured STTF log within the section specified by the Retrieval Option field:	
	00h	Retrieve the most recently captured Snapshot log.
	01h	Retrieve the previous Snapshot log.
	02h-FFh	Retrieve earlier Snapshot logs, 02h retrieving the last but two log, and so on.
Allocation Length	The drive will return up to this number of bytes, truncating any parameter data as necessary.	

If a Snapshot log to be saved to flash, is in the process of being created, the device server terminates the command with CHECK CONDITION, a sense key of NO SENSE and additional sense of 0016h (operation in progress).

If the specified STTF log is not available for retrieval, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).

The retrieved STTF log data is returned in the same format as the READ SNAPSHOT LOG parameter data format (see page “[READ SNAPSHOT LOG returned data](#)” (page 164)

READ TOC (CD-ROM mode) 43h

READ TOC transfers the Table of Contents data to the host.

Pre-execution checks

Illegal Field	Fixed Bit	Bad LUN	Reservation
Deferred Error	Unit Attention	Media Access	Diagnostic Status

If the drive is not in CD-ROM mode, the request will return CHECK CONDITION status with a sense key Illegal Command.

The Track/Session Number must be set to 0 or 1. Any other value will result in CHECK CONDITION status with sense data as described in Illegal Field Checks.

Command descriptor block

	0	The device server will return parameter data based on the diagnostic page with the same page code as that specified in the most recent SEND DIAGNOSTIC command). The device server will return CHECK-CONDITION with sense key ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB) in any of the following circumstances: <ul style="list-style-type: none"> The most recent SEND DIAGNOSTIC command did not define parameter data to return. No SEND DIAGNOSTIC command defining parameter data to return has been processed since power on, hard reset, or logical unit reset. The most recent SEND DIAGNOSTIC command was not for this I_T nexus.
	1	The device server will return the diagnostic page specified in the Page Code field.
Page Code	Identifier for the diagnostic information page to be returned. 70h returns the Self-Test page.	
Allocation Length	0	No data will be returned. This is not considered an error.
	>0	The number of bytes which the host has allocated for returned diagnostic data. The drive will return allocation length bytes or the amount of data that is available, whichever is least.

RECEIVE DIAGNOSTIC RESULTS specific status

If the drive is not connected to a compatible enclosure, a RECEIVE DIAGNOSTIC command with an Enclosure Services page number (01h to 0Fh) will return a CHECK CONDITION with sense key of NOT READY and additional sense of 3502h (enclosure services unavailable).

If other invalid pages are requested, CHECK CONDITION will result with status of ILLEGAL REQUEST and additional sense of 2601h (parameter not supported).

RECEIVE DIAGNOSTIC RESULTS returned data

Page code 70h — Self-Test (Read/Write)

Page Format for Write:

	7	6	5	4	3	2	1	0	
0	Page Code (70h)								
1	Reserved (0)								
2	(MSB)	Parameter List Length (0)							
3								(LSB)	

No parameters are needed. Sending this page is equivalent to a Send Diagnostic command with both the SelfTest and UnitOfI bits set.

Page format for Read:

	7	6	5	4	3	2	1	0	
0	Page Code (70h)								
1	Reserved (0)								
2	(MSB)	Parameter List Length (4)							
3								(LSB)	
4	(MSB)	Error Code							
7								(LSB)	

RELEASE UNIT 17h/57h

RELEASE UNIT enables the host to release any reservation it may have on the drive. Reserving a device is a way of ensuring exclusive access to that device from a single initiator for the period of the reservation. The drive may be reserved using a RESERVE command. The 10-byte RELEASE UNIT command is supported by all drives. Its functionality is the same as for the 6-byte command, but it also supports third-party reservation.

Pre-execution checks

Illegal Field

Deferred Error

Unit Attention

Command descriptor block (6-byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (17h)							
1	Reserved (0)			3rd Pty	Third-Party Device ID			Rsvd(0)
2	Reserved (0)							
4								
5	Control							

3rdPty	This bit is always zero because third-party reservation is not supported.
Third-Party Device ID	This bit is always zero because third-party reservation is not supported.

Command descriptor block (10-byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (57h)							
1	Reserved (0)			3rd Pty	Reserved (0)		LongID	Rsvd(0)
2	Reserved (0)							
3	Third-Party Device ID							
4	Reserved (0)							
6								
7	(MSB)	Parameter List Length						(LSB)
8								
9	Control							

3rd Pty	0	Third-party release is not requested.
	1	The initiator requests third-party release. The value in the Third-Party Device ID field is valid.
LongID	This is always zero because device IDs greater than 255 are not supported.	
Third-Party Device ID	<p>This is required and used only when the 3rd Pty bit is set. The device will perform the release operation only if the initiator ID, the 3rd Pty bit and the Third-Party Device ID are identical to those in the RESERVE UNIT command that established the reservation.</p> <p>The drive ignores any attempt to release the reservation made by any other initiator, including the initiator for which the reservation was made. If an initiator reserved the drive using a third-party reservation over itself, a non-third-party RELEASE UNIT command could also release the reservation.</p>	

RELEASE UNIT specific status

Status is returned as follows:

- If the drive is not reserved, GOOD status is reported.
- If the drive is reserved by another host, GOOD status is reported.
- If the drive is reserved by this host for this host, the reservation status is cleared.

REPORT DENSITY SUPPORT 44h

The Report Density Support command returns details about the tape formats supported by the drive. The data is returned as a header and a series of density descriptor blocks or medium type descriptor blocks.

Pre-execution checks

Illegal Field

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (44h)							
1	Reserved (0)						Medium Type	Media
2-6	Reserved (0)							

	7	6	5	4	3	2	1	0	
7	(MSB)	Allocation Length							
8								(LSB)	
9	Control								

CDB fields

Medium Type	0	The drive reports density descriptor blocks.
	1	The drive reports medium type descriptor blocks.
Media	0	One descriptor block is returned for each format supported by the drive. The Capacity field in the descriptor block indicates the capacity of the current media.
	1	One descriptor block is returned with the data for the currently loaded tape. The Capacity field indicates the maximum for the format. If there is no tape inserted in the drive, the drive will return CHECK CONDITION with a sense key of NOT READY and additional sense of 3A00h (medium not present).
Allocation Length	This specifies the maximum number of bytes which the drive should return in its data-out phase. Either the entire available data or allocation length bytes of the page are returned, whichever is least.	
	0	No data transfer will occur. This is not considered an error.

REPORT DENSITY SUPPORT header

	7	6	5	4	3	2	1	0	
0	(MSB)	Available Density Descriptor Length							
1								(LSB)	
2	Reserved (0)								
3	Reserved (0)								

The available length gives the total amount of data available to be returned.

Density Support descriptor blocks

If the Medium Type field is set to 1, the header is followed by one or more Density Support descriptor blocks with the following format:

	7	6	5	4	3	2	1	0	
0	Primary Density Code								
1	Secondary Density Code								
2	WRTOK	DUP (0)	DEFLT	Reserved (0)				DLV (0)	
3-4	Reserved (0)								
5	(MSB)	Bits per mm							
7								(LSB)	
8	(MSB)	Media Width							
9								(LSB)	
10	(MSB)	Tracks							
11								(LSB)	

	7	6	5	4	3	2	1	0
12	(MSB)	Capacity (MB)						(LSB)
15								(LSB)
16	(MSB)	Assigning Organization (LTO-CVE)						(LSB)
23								(LSB)
24	(MSB)	Density Name (8 bytes)						(LSB)
31								(LSB)
32	(MSB)	Description (20 bytes)						(LSB)
51								(LSB)

The values reported for Ultrium 6 format tapes are as follows:

Primary Density Code	5Ah	This is reported via the MODE SENSE command.
Secondary Density Code	5Ah	Not used
WR TOK	The Write OK flag indicates whether the drive supports writing to this format.	
DUP	The Duplicate flag will be set to zero for every descriptor block indicating that each density is only reported once.	
DEFLT	The Default flag will be set to 1 if it specifies the drive's default density code.	
Bits per mm	15142	
Media Width	127	Tape width is 1/2" or 12.65 mm. The value in this field is in tenths of millimeters rounded to the nearest 0.1 mm.
Track	2176	
Capacity	2 500 000	The approximate maximum capacity for the format (or the capacity of the media if the Media bit is set), in MB
Assigning Organization	LTO-CVE	The CVE assigns these codes.
Density Name	U-616	The format of this is: [U/A] - [Format Generation: 1,2...] [No of Tracks: 4,8,16...]
Description	Ultrium 6/16T	A longer version of the above

If this command is sent to the HP LTO Ultrium 6 drive with the Media bit set to 0, three descriptor blocks will be returned, with the following values:

	Ultrium 4	Ultrium 5	Ultrium 6
Primary Density Code	46h	58h	5Ah
Secondary Density Code	46h	58h	5Ah
WR TOK	1	1	1
DEFLT	0	0	1
Bits per mm	12725	15142	15142
Media width (0.1 mm)	127	127	127
Tracks	896	1280	2176

	Ultrium 4	Ultrium 5	Ultrium 6
Capacity (Million Bytes)	Approx. 800,000	Approx. 1,500,000	Approx. 2,500,000
Assigning Organisation	LTO-CVE	LTO-CVE	LTO-CVE
Density Name	U-416	U-516	U-616
Description	Ultrium 4/16T	Ultrium 5/16T	Ultrium 6/16T

Density Code	WRTOK	DEFLT	Capacity
46h	1	0	C3500h = 800 (GB)
58h	1	0	16E360h = 1500 (GB)
5Ah	1	1	2625A0h = 2500 (GB)

Medium Type descriptor blocks

If the Medium Type field is cleared to 0, the header is followed by one or more Medium Type descriptor blocks with the following format:

	7	6	5	4	3	2	1	0
0	Medium Type							
1	Reserved (0)							
2	(MSB)	Descriptor Length (34h)						(LSB)
3								
4	Number of Density Codes (01h)							
5	Primary Density Code							
6	Reserved (0)							
13								
14	(MSB)	Media Width						(LSB)
15								
16	(MSB)	Media Length						(LSB)
17								
18–19	Reserved (0)							
20	(MSB)	Assigning Organization						(LSB)
27								
28	(MSB)	Medium Type Name (8 bytes)						(LSB)
35								
36	(MSB)	Description (20 bytes)						(LSB)
55								

Medium Type		
	00h	The tape is a data tape.
	01h	The tape is WORM.
	80h	The drive is in CD-ROM mode.

For the other fields, values are returned as in the following table:

Field	Ultrium 4	Ultrium 5	Ultrium 6	Ultrium 4 WORM	Ultrium 5 WORM	Ultrium 6 WORM
Medium Type	00h	00h	00h	01h	01h	01h
Primary Density Support	46h	58h	5Ah	46h	58h	5Ah
Media width (0.1 mm)	127	127	127	127	127	127
Medium Length (m)	820	846	846	820	846	846
Assigning Organization	HP	HP	HP	HP	HP	HP
Medium Type Name	Data	Data	Data	WORM	WORM	WORM
Description	Ultrium 4 Data Tape	Ultrium 5 Data Tape	Ultrium 6 Data Tape	Ultrium 4 WORM Tape	Ultrium 5 WORM Tape	Ultrium 6 WORM Tape

NOTE: If OBDR is supported, the CD-ROM Medium Type descriptors are the same as Data Medium Type descriptors but with the Medium Type field set to 80h.

REPORT DEVICE IDENTIFIER A3h (05h)

The REPORT DEVICE IDENTIFIER command returns the identifier of the current device to the initiator.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)							
1	Reserved (0)			Service Action (05h)				
2	Reserved (0)							
5								
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved (0)							
11	Control							

CDB fields

Allocation Length	The number of bytes that have been allocated for the Device Identifier. The actual number returned will be the lower of the stored Device Identifier length and the allocation length specified in this command.
--------------------------	--

REPORT DEVICE IDENTIFIER returned data

The returned Parameter Data is as follows:

	7	6	5	4	3	2	1	0
0	(MSB) _____ Identifier Length ($n-3$) _____ (LSB)							
3								
4	Identifier							
n								

REPORT IP CONFIGURATION A3h (1Fh)

The REPORT IP CONFIGURATION command is used by an application client to retrieve the drive's current Ethernet port configuration.

NOTE: The device server will not report iADT-DISC multicast addresses (see ADT-2).

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)							
1	Ignored			Service Action (1Fh)				
2	Service Action Qualifier (12h)							
3-5	Reserved (0)							
6	Allocation Length							
9								
10	Reserved (0)							
11	Control							

Allocation Length

The drive will return up to this number of bytes, truncating any parameter data as necessary.

REPORT IP CONFIGURATION parameter data

The format of the parameter data for the REPORT IP CONFIGURATION and SET IP CONFIGURATION commands is as follows:

IP configuration parameter List format

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Parameter List Length ($n-3$)							
3								
<i>IP Configuration descriptors</i>								
4	First IP Configuration Descriptor							

	7	6	5	4	3	2	1	0
4+m								
:								
n-m	Last IP Configuration Descriptor							
n								

IP configuration descriptor format

	7	6	5	4	3	2	1	0
0	IP Configuration Descriptor Type							
1-2	Reserved (0)							
3	Descriptor Length ($m-3$)							
4	Descriptor Value							
m								

IP Configuration Descriptor Type	The parameter data contains all descriptors for the following default addresses (those stored in non-volatile memory):			
	Value	Description	Report ^a	Set ^b
	00h	Control	X	X
	01h	MAC address	X	X
	02h	MTU size	X	X
	03h	IPv4 default static address (see <i>IPv4 address descriptor</i> below)	X	X
	04h	IPv4 default subnet address (see <i>IPv4 address descriptor</i> below)	X	X
	05h	IPv4 default gateway address (see <i>IPv4 address descriptor</i> below)	X	X
	06h	IPv4 default preferred DNS server address (see <i>IPv4 address descriptor</i> below)	X	X
	07h	IPv4 default alternate DNS server address (see <i>IPv4 address descriptor</i> below)	X	X
	08h	IPv6 default preferred DNS server address (see <i>IPv6 address descriptor</i> below)	X	X
	09h	IPv6 default alternate DNS server address (see <i>IPv6 address descriptor</i> below)	X	X
	0Ah	IPv6 default static address (see <i>IPv6 address descriptor</i> below)	X ^d	X ^d
	0Bh-0Fh	Reserved		
	10h	IPv4 assigned address	X ^c	
	11h-1Fh	Reserved		
	20h	IPv6 link-local address	X ^c	
	21h	IPv6 global address	X ^c	
	22h	IPv6 preferred DNS server address	X	

	23h	IPv6 alternate DNS server address	X	X
	24h–FFh	Reserved		
	^a Descriptor may be reported in the REPORT IP CONFIGURATION command parameter data. ^b Descriptor may be set in SET IP CONFIGURATION command parameter data. ^c Descriptor is not reported before the completion of address acquisition. ^d Descriptor may not be supported in all products.			
Descriptor Length	The length of the descriptor data to follow. If the descriptor is truncated because of the Allocation Length, this field is not affected.			
Descriptor Value	With the exception of the fields noted below, all DESCRIPTOR VALUE fields shall contain either an IPv4 or an IPv6 address.			

Descriptor types

IPv4 Address descriptor

	7	6	5	4	3	2	1	0
0	IPv4 Address—byte 1							
1	IPv4 Address—byte 2							
2	IPv4 Address—byte 3							
4	IPv4 Address—byte 4							

IPv6 Address descriptor

	7	6	5	4	3	2	1	0
0	IPv6 Address—byte 1 (MSB)							
:	:							
15	IPv6 Address—byte 16 (LSB)							
16–18	Reserved (0)							
19	Prefix							

Prefix	The global routing prefix size for the address. For example, the IPv6 address FE80::21E:68FF:FE37:BC53/64 will contain the bytes FEh, 80h, 00h, ..., FEh, 37h, BC h, 53h, 00h, 00h, 00h, 40h.
---------------	---

Descriptor type 0: Control

	7	6	5	4	3	2	1	0
0	Reserved (0)						IADT-Disc	Disable
1	IPV4ACQ				IPV6ACQ			
2–3	Reserved (0)							

IADT-Disc	0	iADT Discovery protocol is disabled.
	1	iADT Discovery protocol is enabled.
Disable	0	The Ethernet port is enabled.

	1	The Ethernet port is disabled.
IPV4ACQ	The sequence in which IPv4 address acquisition methods are attempted. If the field is set to 2h and the default static IPv4 address is set to zero, the device server will terminate the command with CHECK CONDITION status, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).	
	0h	Reserved
	1h	Attempt address acquisition in the order: 1. DHCPv4 2. AutoIP 3. Static
	2h	Attempt address acquisition in the order: 1. AutoIP 2. Static
	3h	Attempt address acquisition in the order: 1. DHCPv4 2. Static
	4h	Use static IP Address
	5h–Fh	Reserved
IPV6ACQ	Settings of the IPv6 address acquisition values in EEPROM. If the IPV6ACQ field is set to 3h and the default static IPv6 address is set to zero the device server will terminate the command with CHECK CONDITION status, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).	
	0h	Reserved
	1h	SLAAC/ND (Reference: RFC2461, 2462, 4861, 4862, 4311)
	2h	DHCPv6 (Reference: RFC 3315)
	3h ^a	Use static IPv6 address
	4h–Fh	Reserved
^a Code is treated as reserved in products that do not support IP Configuration Descriptor type 0Ah.		

Descriptor type 1: MAC Address

The MAC identifier of the drive.

	7	6	5	4	3	2	1	0
0	MAC Identifier (byte 1)							
:	:							
5	MAC Identifier (last byte)							

Example: If the MAC Address of the device is 00306E:B4B8FE, byte 0 of the descriptor will be 00h and byte 5 will be FEh.

Descriptor type 2: MTU Size

The Maximum Transmission Unit size.

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Maximum Transmission Unit Size							
3								

If the value in the Maximum Transmission Unit Size field is less than 64 or larger than 1,500, the device server will terminate the command with CHECK CONDITION status, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list). The value saved in non-volatile storage is not modified.

REPORT LUNS A0h

The Report LUNS command allows the host to retrieve information about what logical units the drive supports. The standard drive only has a single SSC LUN, whereas a drive operating within a library and communicating over ADI may have one or two additional LUNs. However, the ADC LUN will only be reported to an initiator on the primary interface in the REPORT LUNS response if the ADC Logical Unit ENABLE mode parameter is set to one in the ADC Device Server Configuration mode sub-page. An SMC LUN will be reported if the automation controller has enabled bridging.

Pre-execution checks

Illegal Field

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A0h)							
1	Reserved (0)							
2	Select Report							
3	Reserved (0)							
5								
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved (0)							
12	Control							

CDB fields

Select Report	The type of logical unit address that will be reported. Allowable values:	
	00h/02h	Report all logical units accessible by the initiator through the address target port.
	01h	No logical unit descriptors are returned because there are no well-known logical units.
	03h-FFh	Reserved. CHECK CONDITION returned.
Allocation Length	Must be at least 16 bytes. If not, the drive will return CHECK CONDITION status and provide a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).	

Data returned

	7	6	5	4	3	2	1	0
0	(MSB)	LUN List Length (08h or 0h/10h/18h if the drive is operating within a library and communicating over ADI)						(LSB)
3								
4–7		Reserved (0)						
		<i>List of LUNs</i>						
8	(MSB)	LUN 0 (00 00 00 00 00 00 00 00h)						(LSB)
15								
		<i>If the drive is operating within an ADI library and has bridging enabled...</i>						
16	(MSB)	LUN 1 (00 01 00 00 00 00 00 00h)						(LSB)
23								
		<i>If the drive is operating within an ADI library and the ADC Logical unit ENABLE parameter is set to one in the ADC Device Server Configuration mode sub-page...</i>						
24	(MSB)	LUN 7 (00 07 00 00 00 00 00 00h)						(LSB)
30								

REPORT NETWORK STATISTICS A3h (1Fh)

The REPORT NETWORK STATISTICS command allows an application client to retrieve information about the current state of network statistics counters for various protocols supported by the Network Interface.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)							
1	Ignored			Service Action (1Fh)

184–187	InEchoReps (number of ECHO REPLYs received)							
188–191	OutEchoReps (number of ECHO REPLYs sent)							
192–195	InTimestamps (number of TIMESTAMPs received)							
196–199	OutTimestamps (number of TIMESTAMPs sent)							
200–203	InTimestampReps (number of TIMESTAMP REPLYs received)							
204–207	OutTimestampReps (number of TIMESTAMP REPLYs sent)							
208–211	InAddrMasks (number of ADDRESS MASKs received)							
212–215	OutAddrMasks (number of ADDRESS MASKs sent)							

ICMPv6 statistics

	7	6	5	4	3	2	1	0
216–223	InMsgs (messages received)							
224–231	OutMsgs (messages sent)							
232–239	InErrors (input errors)							
240–247	OutErrors (output errors)							
248–255	InMLDReports (not supported)							
256–263	OutMLDReports (not supported)							
264–271	InMLDDones (not supported)							
272–279	OutMLDDones (not supported)							
280–287	InRouterSolicits (router solicitations received)							
288–295	OutRouterSolicits (router solicitation sent)							
296–303	InNeighborSolicits (neighbour solicitations received)							
304–311	OutNeighborSolicits (neighbour solicitations sent)							

TCP statistics

	7	6	5	4	3	2	1	0
312–315	ActiveOpens							
316–319	PassiveOpens							
320–323	AttemptFails (failed connection attempts)							
324–327	EstabResets (reset connections)							
328–331	CurrEstab (current connections)							
332–335	InSegs (segments received)							
336–339	OutSegs (segments sent)							
340–343	RetransSegs (segments retransmitted)							

UDP statistics

	7	6	5	4	3	2	1	0
344–347	InDatagrams (total delivered datagrams)							
348–351	NoPorts (undelivered datagrams: unused port)							
352–355	InErrors (undelivered datagrams: other reasons)							
356–359	OutDatagrams (successfully sent datagrams)							

REPORT SNAPSHOT COMMANDS A3h (1Fh)

READ SNAPSHOT LOG retrieves the current Snapshot command set. You can use this in a similar way to LOG SENSE/LOG SELECT to report the command set, after which you can alter any commands and then use SET SNAPSHOT COMMANDS to alter the drive's command set.

7									

8	(MSB)	Timestamp (6 bytes)	
13			(LSB)
Log Number		The reference number of the Snapshot log, which must be specified in the READ SNAPSHOT LOG command.	
Log Trigger		The event that caused the Snapshot log to be created:	
	Value	Description	
	00h	Unload failure	
	01h	Successful unload	
	02h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status and a sense key of Media Error (03h) or Hardware Error (04h).	
	03h	SCSI FORCE SNAPSHOT command or READ BUFFER command with a Service Buffer ID.	
	04h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status for a configured drive error, or an error specified in the STTF On Drive Error descriptor.	
	05h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status for a configured sense key, ASC and ASCQ, or sense data specified in the STTF On Sense Data descriptor.	
	06h	Load failure	
	07h	Catastrophic servo error	
	08h	Forced eject	
	09h	Drive created a Fault Log entry with an error code specified in an STTF On Fault Descriptor.	
	0Ah	Drive created a System ARM trace log entry with a Trace Point ID specified in an STTF On Trace Point Descriptor.	
	0Bh	12 Volt power failure.	
	0Ch	Drive responded to a SCSI command from a host on an ADT port with CHECK CONDITION status and a drive error specified in an STTF On ADT Reported Error Descriptor.	
	0Dh–FFh	Reserved	
Log Length		The size of the Snapshot log.	
Timestamp		The time at which the Snapshot log was created.	

REPORT STTF AVAILABLE A3h (1Fh)

The SET STTF AVAILABLE command is used to retrieve the attributes of STTF logs that can be retrieved using the READ STTF LOG command.

	5	(MSB) _____							
	7	STTF Log Length							(LSB)
	8	(MSB) _____							
	Timestamp (4 bytes)							_____	

11	(LSB)	
Relative Log Index	The relative order of when an STTF log was captured. The most recently captured STTF log has a Relative Log Index of 00h. The penultimate STTF log captured has an index of 01h, the STTF log captured before that 02h, and so on. Available STTF Log descriptors are reported in ascending Relative Log Index order in the Available STTF log Descriptor list.	
Protected	0	The drive may overwrite the STTF log.
	1	The STTF log cannot be overwritten by another STTF log or cleared by changing the STTF configuration.
Log Trigger	The event that caused the STTF log to be created:	
	Value	Description
	00h	Unload failure
	01h	Successful unload
	02h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status and a sense key of MEDIA ERROR or HARDWARE ERROR).
	03h	SCSI FORCE SNAPSHOT command or READ BUFFER command with a Service Buffer ID.
	04h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status for a configured drive error, or an error specified in the STTF On Drive Error descriptor.
	05h	Drive responded to a SCSI command from a host on the primary port with CHECK CONDITION status for a configured sense key, ASC and ASCQ, or sense data specified in the STTF On Sense Data descriptor.
	06h	Load failure
	07h	Catastrophic servo error
	08h	Forced eject
	09h	Drive created a Fault Log entry with an error code specified in an STTF On Fault Descriptor.
	0Ah	Drive created a System ARM trace log entry with a Trace Point ID specified in an STTF On Trace Point Descriptor.
	0Bh	12V power failure.
	0Ch	Drive responded to a SCSI command from a host on an ADT port with CHECK CONDITION status and a drive error specified in an STTF On ADT Reported Error Descriptor.
0Dh	Assert Reset.	
0Eh–FFh	Reserved	
Log Identifier	A unique identifier for the STTF log. It is used in the CLEAR PROTECTED STTF LOG command to specify that this specific protected STTF log can be overwritten	
STTF Log Length	The length of the STTF log in bytes.	
Timestamp	The lifetime power-on time of the drive at which the STTF log was created, in seconds.

5								
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved (0)							
11	Control							

CDB fields

RCTD	<i>Return Command Timeouts Descriptor</i>	
	1	A Timeouts descriptor will be included in the parameter data.
Reporting Options	000b	Requests the Device Server to return a list of supported operations and service actions from the port through which the REPORT SUPPORTED OPCODES command was received. The parameter data has the "all-commands" format.
	001b	Requests the Device Server to return support data for the OpCode specified in Requested Operation Code field from the port through which the REPORT SUPPORTED OPCODES command was received. The parameter data has the "one-command" format. If the OpCode has Service Actions associated, the command will fail with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
	010b	Requests the Device Server to return support data for the OpCode specified by the Requested Operation Code and Requested Service Action fields from the port through which the REPORT SUPPORTED OPCODES command was received. The parameter data has the "one-command" format. If the OpCode has Service Actions associated, the command will fail with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
Requested Operation Code	Ignored for Reporting Option 000b.	
Requested Service Action	Ignored for Reporting Options 000b and 001b.	
Allocation Length	The number of bytes allocated for the returned parameter data.	

REPORT SUPPORTED OPCODES returned data

All-commands format

The returned Parameter Data contains a 4-byte header followed by one or more command descriptors:

	7	6	5	4	3	2	1	0	
0	(MSB) _____							Command Data Length	
3								(LSB)	

Command Data Length	The amount of Parameter Data available for return minus the size of the header.
----------------------------	---

Each command descriptor contains either a supported Operation Code or an Operation Code/Service Action combination. The format of each descriptor is as follows:

	7	6	5	4	3	2	1	0	
0	Operation Code								
1	Reserved (0)								
2	(MSB) _____							Service Action	
3								(LSB)	
4	Reserved (0)								
5	Reserved (0)						CPTD	ServActv	
6	(MSB) _____							CDB Length	

	7	6	5	4	3	2	1	0
7	(LSB)							
8	Timeouts Descriptor (if any) — 12 bytes							
19								

Operation Code	The operation code of the supported command.	
Service Action	A supported service action of the operation code. If no service actions are supported this field will be 00h.	
ServActv	0	No service actions are supported and the Service Action field should be ignored.
	1	This operation code supports service actions and the Service Action field contains a valid service actions.
CTPD	1	The command timeout descriptor is included. If the RCTD bit is set, this bit must be set.
CDB Length	The length of the CDB for this operation code or operation code/service action command.	

One-command format

One-command format

	7	6	5	4	3	2	1	0
0	Reserved (0)							
1	CTPD	Reserved (0)				Support		
2	CDB size ($n-3$)							
3								
4	CDB Usage Data							
n								
$n+1$	Timeouts Descriptor (if any) — 12 bytes							
$n+12$								

Support	001b	The device server does not support the requested command. All data after byte 1 is undefined.
	011b	The device server supports the requested command in conformance with a SCSI standard.
	101b	The device server supports the requested command in a vendor-specific manner.
CDB Usage Data	The first byte is the OpCode being queried. If the OpCode has a Service Action associated, this will be located in the second byte, in the correct location. All other CDB bytes contain a usage map. Byte by byte, the Device Server must place a one in the corresponding bit position of the CDB that the Device Server supports as a parameter field. Any CDB fields that are ignored by the device server, or are reserved, contain a zero.	

Timeouts descriptor

	7	6	5	4	3	2	1	0
0	Descriptor Length (0Ah)							
1								
2	Reserved (0)							

	7	6	5	4	3	2	1	0
3	Command Specific (0)							
4	Nominal Command Processing TimeOut (00h)							
7								
8								
11	Recommended Command TimeOut							

Recommended Command TimeOut	The time in seconds the application should wait before timing out the command. If 00h is reported, then no timeout is reported.
------------------------------------	---

REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS A3h (0Dh)

The REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS command returns information about which task management functions are supported by the logical unit that is addressed.

2-5	Reserved (0)							
6	(MSB)	Allocation Length						(LSB)
9								
10	Reserved (0)							
11	Control							

CDB field

Allocation Length	The number of bytes that have been allocated for the returned parameter data. This value must be at least four.
--------------------------	---

REPORT SUPPORTED TASK MANAGEMENT FUNCTIONS returned data

The returned Parameter Data is as follows:

	7	6	5	4	3	2	1	0
0	ATS	ATSS	CACAS	CTSS	LURS	QTS	TRS	WakeS
1	Reserved (0)					QAES	QTSS	ITNRS
2-3	Reserved (0)							

ATS	0	<i>FC drives:</i> The Abort Task task management function is not supported.
	1	<i>SAS drives:</i> The Abort Task task management function is supported.
ATSS	1	The Abort Task Set task management function is supported.
CACAS	0	The Clear ACA task management function is not supported.
CTSS	1	The Clear Task Set task management function is supported.
LURS	1	The Logical Unit Reset task management function is supported.
QTS	0	<i>FC drives:</i> The Query Task task management function is not supported.
	1	<i>SAS drives:</i> The Query Task task management function is supported.
TRS	0	<i>SAS drives:</i> The Target Reset task management function is not supported.
	1	<i>FC drives:</i> The Target Reset task management function is supported.
WakeS	0	The Wakeup task management function is not supported.
QAES	1	<i>(Fibre Channel)</i> The QUERY ASYNCHRONOUS EVENT management function is supported.
	0	Otherwise.
QTSS	1	<i>(Fibre Channel)</i> The QUERY TASK SET management function is supported.
	0	Otherwise.
ITNRS	0	Zero as the I_T NEXUS RESET management function is not supported.

REPORT TARGET PORT GROUPS A3h

The REPORT TARGET PORT GROUPS command returns information about target port groups from which the addressed logical unit allows access.

Pre-execution checks

11								

Relative Port Identifier	01h	Port 0
	02h	Port 1

REPORT TIMESTAMP A3h (0Fh)

The REPORT TIMESTAMP command requests the device server to return the value of the logical unit's timestamp.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (A3h)							
1	Reserved (0)			Service Action (0Fh)				
2-5	Reserved (0)							
6	Allocation Length							
9								
10	Reserved (0)							
11	Control							

CDB fields

Allocation Length	The drive will return up to this number of bytes, truncating any parameter data as necessary.
--------------------------	---

REPORT TIMESTAMP parameter data

	7	6	5	4	3	2	1	0
0	Timestamp Parameter Data Length (0Ah)							
1								
2	Reserved (0)				Timestamp Origin			
3	Reserved (0)							
4	Timestamp							
9								
10–11	Reserved (0)							

Timestamp Parameter Data Length	The drive will return up to this number of bytes, truncating any parameter data as necessary.	
Timestamp Origin	000b	Timestamp initialized to zero at power-on as the result of a hard reset.
	001b	Reserved
	010b	Timestamp initialized by the SET TIMESTAMP command.
	011b	Timestamp initialized by the Device Time mode page (3Ch).
	100b–111b	Reserved
Timestamp	The current value of the timestamp (the number of milliseconds that have elapsed since midnight, 1 January 1970 UT).	

REQUEST SENSE 03h

The REQUEST SENSE command transfers sense data held within the drive to the host during a data-in phase. The data is valid in the following circumstances:

- After reporting CHECK CONDITION status to the host.
- After a command has terminated unexpectedly.
- Immediately after the following commands that cause tape motion:

READ	SPACE	VERIFY
WRITE	WRITE FILEMARKS	REWIND

Positional sense data is valid whenever media is present and loaded and no higher priority sense data is present. An unsolicited request sense (that is, one with no preceding CHECK CONDITION) will result in sense data with no valid data, which will be all zeros.

NOTE: The drive maintains valid positional information for normal read and write commands only (READ, WRITE, SPACE, WRITE FILEMARKS, REWIND). If abnormal commands (such as WRITE BUFFER) are received this positional sense information is lost. See [“Sense data management” \(page 204\)](#).

The drive clears sense data for the host following execution of the REQUEST SENSE command for that host, unless the data is positional sense data.

Pre-execution checks

Only Illegal Field Check is performed before execution of the command.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (03h)							
1	LUN			Reserved (0)				DESC
2-3	Reserved (0)							
4	Allocation Length							
5	Control							

CDB fields

LUN	This field is ignored.	
DESC	0	Fixed Format sense data will be returned.
	1	Descriptor Format sense data will be returned.
Allocation Length	0	No data is transferred to the host.
	>0	The maximum amount of sense data in bytes that should be transferred to the host. The drive returns up to Allocation Length bytes of data; any extra sense data is lost.

REQUEST SENSE data

Sense data is recovered from the drive by means of a REQUEST SENSE command following the reporting of CHECK CONDITION by the drive. There are two formats in which the data can be returned: Fixed and Descriptor.

Fixed format

The Fixed format of the returned data is as follows:

	7	6	5	4	3	2	1	0
0	Valid	Error Code						
1	Segment Number (0)							
2	Mark	EOM	ILI	Rsvd(0)	Sense Key			
3	(MSB)	Information Bytes						(LSB)
6	Additional Sense Length (10h)							
8	(MSB)	Command Specific Information Bytes						(LSB)
11	Additional Sense Code							
12	Additional Sense Code Qualifier							
13	Field Replaceable Unit Code							
14	SKSV	C/D	Reserved (0)		BPV	Bit Pointer		
15	(MSB)	Field Pointer/Drive Error Code						(LSB)
16								

	7	6	5	4	3	2	1	0
17	(LSB)							
18–20	Reserved (0)							
21	Reserved (0)				CLN	Reserved (0)		
22	Pad bytes (0)							
23								

Returned Sense data fields

Valid	1	Indicates that the information bytes contain valid information as defined in the SCSI specification.
Error Code	70h	Indicates that the error is <i>current</i> , that is, it is associated with the command for which CHECK CONDITION status has been reported.
	71h	Indicates that the error is <i>deferred</i> . A deferred error occurs when there is a failure for an operation that has already been terminated with a GOOD status, or when failure occurs in “cleanup” activity following an operation that was terminated by BUS RELEASE. The command for which CHECK CONDITION status was reported is therefore unlikely to be the cause of the deferred error. It simply gives the drive the opportunity to report CHECK CONDITION status for an error that already exists.
Segment Number	This field is cleared to zero.	
Mark	1	The Mark bit is set to 1 if a SPACE, READ or VERIFY command did not complete because a filemark was read. This bit may only be set if the sense key is NO SENSE.
EOM	1	The End of Medium flag is set if a WRITE or WRITE FILEMARKS command completed in the early warning area. If no other error occurred, the sense code will be set to NO SENSE with additional sense of 0002h (EOT). If another error occurred, the sense code and additional sense will reflect that error. It is also set if BOP is encountered while spacing over blocks or filemarks in the reverse direction.
ILI	1	Indicates that the requested block length did not match the actual block length. Only READ and VERIFY can cause this bit to be set.
Sense Key	See “Sense keys” (page 206) for details of sense keys that can be returned.	
Information Bytes	The Information Bytes field is only valid if the Valid bit is set. It contains residue information following the failure of either a READ, WRITE, WRITE FILEMARKS or SPACE command. The field can take a negative value, expressed in 2’s complement notation for the SPACE command. See the description of the command that failed for the contents of the field.	
Additional Sense Length	10h	Specifies the number of additional sense bytes to follow. It is never truncated to reflect the actual Transfer Length.
Command Specific Information Bytes	0	Provides additional information specific to the failing command. The field is normally set to 0.
Additional Sense Code and Qualifier	These two bytes provide additional information about the cause of the CHECK CONDITION, or the current tape position when the REQUEST SENSE is unsolicited. See “Additional Sense codes” (page 207).	
SKSV	0	The Sense Key Specific Bytes (bytes 15 through 17) are invalid. The C/D, BPV and Bit pointer fields will be zero. The top byte of the Field Pointer will be zero, and the bottom byte will contain a product-specific error code.
	1	The Sense Key Specific Bytes are valid. This will only happen when the bytes assume the role of Field Pointer Bytes as defined by ANSI. This occurs when an Illegal Field check detects an error in a Command Descriptor Block or a Parameter List check detects an error in a command parameter list.
C/D	Command Data. Only valid if the SKSV flag is set.	
	0	The Field Pointer information applies to the parameter list for the command.

	1	The Field Pointer information applies to the Command Descriptor Block.
BPV	<i>Bit Pointer Valid</i>	
	0	The Bit Pointer field is invalid.
	1	The Bit Pointer field is valid. If the SKSV bit is set then the BPV bit must be set as well.
Bit Pointer	Identifies the bit position of the field in error, whether it is a command descriptor or a command parameter list field. When a multi-bit field is in error, this will point to the most significant bit of that field. Only valid when the SKSV flag is set.	
Field Pointer /Drive Error Code	<p>If $SKSV = 1$, the interpretation of this field depends on the sense key reported. For Sense Key = 5 (ILLEGAL REQUEST), this field represents the Field Pointer, identifying in which byte of the command descriptor or parameter list an error was detected.</p> <p>Note that the drive scans from byte 0 bit 7 of a command or parameter list through to byte n bit 0. The field and bit pointers are set to point to the most significant bit of the field that is in error. See the illegal field check and the parameter list check.</p> <p>For Sense Key = 0 (NO SENSE) or 2 (NOT READY), this field represents the Progress Indication, where the returned value is a numerator that has 65536 (10000h) as its denominator. This reflects the progress being made through the total operation.</p> <p>If $SKSV = 0$, this field represents the Drive Error Code. The top byte of this field will be zero. The bottom byte contains the drive error code associated with the failure of the previous command, or zero in the case of no failure and no appropriate error code. If the drive's power-on self-test failed then, in the absence of an error code associated with the most recent command, this byte will be set to the error code generated by the failing test.</p> <p><i>Note:</i> Drive error codes are provided for information only; they are intended to assist in product integration and fault diagnosis. The codes should <i>not</i> be relied on by "generic" host drivers, since these are specific to the product. For a list of codes, see Chapter 10 of the <i>Hardware Integration Guide</i>, Volume 1 of the HP LTO Ultrium Technical Reference Manual.</p>	
CLN	0	The drive is OK.
	1	The drive requires cleaning. The front panel LEDs will be displaying a "clean me" sequence or message. This bit is cleared to zero after a cleaning cartridge has been used.

Descriptor format

The Descriptor format of the returned data is as follows:

	7	6	5	4	3	2	1	0
0	Valid	Response Code						
1	Reserved(0)				Sense Key			
2	Additional Sense Code							
3	Additional Sense Code Qualifier							
4–6	Reserved (0)							
7	Additional Sense Length ($n-7$)							
8	(MSB)	Sense Data Descriptor 0						(LSB)
:								
:	:							
n	Sense Data Descriptor X							

Returned Sense data fields

Response Code	72h	The error is <i>current</i> , that is, it is associated with the command for which CHECK CONDITION status has been reported.
	73h	The error is <i>deferred</i> . A deferred error occurs when there is a failure for an operation that has already been terminated with a GOOD status, or when failure occurs in “cleanup” activity following an operation that was terminated by BUS RELEASE. The command for which CHECK CONDITION status was reported is therefore unlikely to be the cause of the deferred error. It simply gives the drive the opportunity to report CHECK CONDITION status for an error that already exists.
Additional Sense Length	The number of additional sense bytes to follow, ≤ 244 . It is never truncated to reflect the actual Transfer Length.	
Additional Sense Code and Qualifier	Additional information about the cause of the CHECK CONDITION, or the current tape position when the REQUEST SENSE is unsolicited. See “Additional Sense codes” (page 207).	
Sense Data Descriptor	At least one descriptor is sent (Drive Error Code), the others may or may not be sent depending on the nature of the CHECK CONDITION.	

Information Sense data descriptor

	7	6	5	4	3	2	1	0
0	Descriptor Type (00h)							
1	Additional Length (0Ah)							
2	Valid (1)	Reserved (0)						
3	Reserved (0)							
4	Information Bytes							
11								

Sense Key Specific Sense data descriptor

Only one of these is reported: Field Pointer or Progress Indication.

Field Pointer

The Sense Key is set to Illegal Request.

	7	6	5	4	3	2	1	0
0	Descriptor Type (02h)							
1	Additional Length (06h)							
2–3	Reserved (0)							
4	SKSV (1)	C/D	Reserved (0)			BPV	Bit Pointer	
5	Field Pointer							
6								
7	Reserved (0)							

Progress Indication

The Sense Key is set to No Sense or Not Ready.

	7	6	5	4	3	2	1	0
0	Descriptor Type (02h)							
1	Additional Length (06h)							
2-3	Reserved (0)							
4	SKSV (1)	Reserved (0)						
5	Progress Indication							
6								
7	Reserved (0)							

Process Indication	The percent complete indication in which the returned value is a numerator that has 65,536 (10000h) as its denominator. The progress indication is based on the total operation.
---------------------------	--

4	Reserved (0)							

Sense data management

The drive maintains three sets of sense data for every initiator that has logged in. For a single host the following sense data is maintained:

- Current sense
- UNIT ATTENTION sense
- DEFERRED ERROR sense

Unless otherwise stated, all the following descriptions apply to the sense data for a single host whose command is being executed.

Current sense

Current sense is the data that is returned in response to a REQUEST SENSE command. It is modified or updated in the following circumstances:

- It is cleared in response to the arrival of any command other than REQUEST SENSE or INQUIRY.
- It is cleared following execution of a REQUEST SENSE command.
- If the current command fails, sense is set according to the failure and CHECK CONDITION is reported to the host that sent the command.
- If the command fails its pre-execution check for Unit Attention, UNIT ATTENTION sense is copied to the Current sense, and CHECK CONDITION is reported to the host that sent the command.
- If the command fails its pre-execution check for Deferred Error, DEFERRED ERROR sense is copied to the Current sense, and CHECK CONDITION is reported to the host that sent the command.

Clearing current sense

Clearing the Current sense involves setting sense fields as follows:

```
Valid = 0
error code = 0x70
segment number = 0
ILI = 0
sense key = 0
information bytes = 0
command specific information = 0
fru code = 0
SKSV = 0
```

UNIT ATTENTION sense

UNIT ATTENTION sense is set when one of the following Unit Attention conditions occur:

- *FC drives*: Power On, Target Reset, Logical Unit Reset, Process Login (PRLI)
- *SAS drives*: Power On, SCSI Reset, (HARD_RESET primitive), Logical Unit Reset
- Media inserted
- A load command executed by a third party
- Mode Sense parameters changed by another initiator
- Drive firmware has been updated

UNIT ATTENTION sense will persist for a host until the host sends a command that has Unit Attention as part of its pre-execution checks. When the Unit Attention pre-execution check fails, the UNIT ATTENTION sense is copied to the Current sense and CHECK CONDITION status is reported to

the host. The UNIT ATTENTION sense is cleared. The host is then expected to issue a REQUEST SENSE command to recover the UNIT ATTENTION sense (which is now the new Current sense).

It is possible for multiple UNIT ATTENTION conditions to arise (for example, after a power-on followed by a tape load), such that the initiator does not read one condition before the next occurs. In this case a prioritizing scheme is used. If a UNIT ATTENTION condition exists and a new one occurs, then the UNIT ATTENTION sense will be overwritten by the new sense only if the new sense has a higher priority.

The order of priority is as follows:

Power-on, Reset	<i>highest priority</i>
Tape Loaded	
Mode Parameters Changed	
Microcode Downloaded	<i>lowest priority</i>

UNIT ATTENTION sense that arises as a result of a command executing will not be posted to the sending initiator, but will be set for the other initiators.

DEFERRED ERROR sense

DEFERRED ERROR sense is generated when an operation fails and CHECK CONDITION status cannot be reported to the host for one of the following reasons:

- The operation had immediate-report on (for example, REWIND with the Immed bit set, or LOAD).
- The operation was a write that was immediate-reported on after its data was successfully placed in the write-behind queue.
- The operation was abandoned without status (that is, an SAS or FC connection was closed) after what the drive perceived was a catastrophic error or when an error occurred following the drive's honoring of an ABORT message. Following the closure of the connection, the drive performed "cleanup" activity that failed. The Deferred Error refers to the reason for this failure.

When any one of the above occurs, the sense generated will be DEFERRED ERROR sense. This sense persists until the host sends a command that has Deferred Error as part of its pre-execution checks. When the Deferred Error pre-execution check fails, the DEFERRED ERROR sense is moved to the Current sense and CHECK CONDITION status is reported to the host. The host is then expected to issue a REQUEST SENSE command to recover the new Current sense data, otherwise the data will be lost.

Write-behind deferred errors

If the Buffered Mode field of the MODE SELECT parameter header is not zero, data buffering is enabled. If an error occurs in flushing the write-behind data, DEFERRED ERROR sense is set for all hosts that the drive thinks have write-behind data in the buffer. For each of these hosts, the following occurs when its next command is to be executed:

- If the command is WRITE or WRITE FILEMARKS the DEFERRED ERROR sense is copied to Current sense and the error is changed to a Current error (the Error Code field is set to 70h). The information bytes will contain residue information reflecting the size of the write-behind queue plus the transfer size of the current command. CHECK CONDITION is reported. When the host reads sense data with a REQUEST SENSE, it will see an error for the WRITE with residue information indicating data lost for that write and previous writes.
- If the command is not a write command and the Deferred Error check is performed as part of the pre-execution checks, CHECK CONDITION status is reported. The DEFERRED ERROR sense is copied to Current sense. The DEFERRED ERROR sense is cleared. The host is expected to retrieve the sense by sending a REQUEST SENSE, otherwise the data will be lost.

Deferred errors reported after abandoned operations

If a read or write type of operation is abandoned before status is sent by the drive (for example, a SAS or FC connection was closed, or the initiator decided to abort the operation), it is possible that there may be data being transferred between the drive's buffers. This is order to update the logical position, which will be established on the BOP side of the block that was being transferred or received. If an error subsequently occurs while performing the internal data transfer, the sense generated is a DEFERRED ERROR. It is therefore possible to have DEFERRED ERROR sense flagged for a command without immediate report.

Sense keys

The following table lists the sense keys that may be returned by HP LTO Ultrium drives. SCSI sense keys are 4-bit codes returned in the sense data. They indicate in what general area the problem that has just been experienced falls. For a clearer indication of the nature of the problem, refer to the additional sense code.

Code	Name	Description	ASC/Qs
0h	NO SENSE	There is no real problem. The sense information is probably indicating some condition (such as encountering a filemark).	0000h, 0001h, 0002h, 0004h, 0016h, 0018h, 0019h, 001Ah, 5E01h, 8282h
1h	RECOVERED ERROR	Returned if a Mode Select parameter is truncated or if a TapeAlert event is being reported.	3700h, 5D00h, 5DFFh
2h	NOT READY	The drive is not in a state to be able to execute the request. See also the Media Access check.	0400h–0402h, 0404h, 0407h, 0409h, 040Ch, 0412h, 0B01h, 3003h, 3A00h, 3A04h, 3E00h
3h	MEDIUM ERROR	The command failed, believed to be caused by a problem with the tape.	0002h, 0C00h, 1100h, 1112h, 1400h, 1403h, 3000h–3002h, 3004h, 3007h, 300Dh, 3100h, 3B00h, 5000h, 5200h, 5300h, 5304h
4h	HARDWARE ERROR	The command failed, believed to be caused by a problem with the drive hardware. The FRU in the sense data should indicate which part of the hardware is faulty.	40XXh, 4400h, 5301h, 8283h
5h	ILLEGAL REQUEST	The last command sent to the drive or the data associated with the command violated conditions imposed by the drive on its acceptance. See also the Illegal Command, Illegal Field, Fixed Bit, Reservation and Parameter List pre-execution checks.	1A00h, 2000h, 2400h, 2500h, 2600h, 2604h, 2C00h, 2C0Bh, 3006h, 3B0Ch, 5302h–5504h, 5506h, 7421h
6h	UNIT ATTENTION	Indicates some condition of which the host needs to be made aware. See also the Unit Attention check.	2800h, 2901h–2904h, 2907h, 2A01h–2A05h, 2A0Dh, 2A10h–2A12h, 2A15h, 2C07h–2C09h, 3F01h, 3F05h, 3F0Eh

Code	Name	Description	ASC/Qs
7h	DATA PROTECT	A request has been made to modify the media despite the media being write-protected. See also the Media Write check.	2601h, 2700h, 2708h, 2A13h, 3000h, 3005h, 300Ch, 300Dh, 3B1Ch, 7400h–7405h, 7409h, 740Ah, 740Bh, 7461h–7464h, 746Eh, 746Fh, 7480h
8h	BLANK CHECK	The drive tried to read unwritten tape.	0005h, 1403h
9h	VENDOR SPECIFIC	Never returned by HP tape drives	
Ah	COPY ABORTED	Never returned by HP tape drives	
Bh	ABORTED COMMAND	The SCSI command has terminated abnormally. This could be due to a problem related to the SCSI bus or Fibre Channel link. For example, it is reported if a target or LUN receives a second command from the same host before the previous command from that host has completed.	0800h, 2F00h, 3F0Fh, 4700h, 4701h, 4703h, 4800h, 4900h, 4A00h, 4B00h, 4B02h, 4B05h, 4B06h, 4D00h, 4E00h, 7408h
Ch	EQUAL	Never returned by HP tape drives	
Dh	VOLUME OVERFLOW	Data could not be written to tape because of insufficient space. See the WRITE and WRITE FILEMARKS commands.	0002h
Eh	MISCOMPARE	Never returned by HP tape drives	
Fh	RESERVED	Never returned by HP tape drives	

Additional Sense codes

This section contains a list of all the additional sense codes that an HP LTO Ultrium drive can return, in numerical order. The Sense Keys under which each code could appear are also listed. The ASCQ bytes are present at bytes 12 and 13 of the sense data.

Code	Description	Explanation
00 00h	No additional sense	The drive has no additional sense information for the host. The flags in the sense data indicate the reason for failure.
00 01h	Filemark detected	This indicates one of the following: <ul style="list-style-type: none"> A READ or SPACE command was terminated early because a filemark was encountered. Unsolicited Positional Sense has been set to indicate “at a filemark”. The Mark bit in the sense data will be set.
00 02h	End of Tape detected	A media-access command (such as READ, SPACE, WRITE, WRITE FILEMARKS, and so on) found EOT unexpectedly, or the drive could not locate to the specified position on tape because it does not exist or the block count is too great. The EOM flag in the sense data will be set.
00 04h	Beginning of Tape detected	BOT was encountered during a space command.
00 05h	End of Data detected	A READ or SPACE command terminated early because it encountered EOD.
00 16h	Operation in progress	A command is in progress and has not yet completed. This could be because another host initiated the command, or the command was sent in immediate mode. The Sense Key Specific Value field in the
00 18h	Erase operation in progress	

Code	Description	Explanation
00 19h	Locate operation in progress	sense data will give some indication of how far the operation has progressed.
00 1Ah	Rewind operation in progress	
04 00h	LUN not ready, cause not reportable	This is set if an unload is executing with immediate report on, or initiated through the front panel, or a different host initiated the command. It is present for the duration of the unload or eject, after which the additional sense changes to 3A 00h (medium not present) or 0402h (logical unit not ready, initializing command required).
04 01h	LUN in process of becoming ready	A media access command has been received while a load is occurring with immediate report on, or initiated through the front panel, or a different host initiated the command.
04 02h	LUN not ready, Initializing command required	A cartridge is present in the drive but is not logically loaded. A LOAD command is required.
04 04h	LUN not ready, format in progress	A FORMAT MEDIUM command with the Immed bit set to one is currently executing.
04 07h	Command in progress	The tape drive is currently executing an immediate mode command (such as UNLOAD).
04 09h	LUN not ready, self-test in progress	The drive is currently in "maintenance" mode (such as running special diagnostic tests).
04 0Ch	LUN not accessible, port in unavailable state	The command is not available on the specified logical unit when sent to the drive through the specified port.
04 12h	Logical unit offline	The command cannot be executed because the specified logical unit has not yet been configured via the appropriate port.
08 00h	Logical unit communication failure	The ADT interface aborted a command due to a communication failure.
0B 00h	Warning	This is not generated by the drive, it is reported by the automation controller via the drive.
0B 01h	Thermal limit exceeded	There has been a failure due to the drive temperature being outside the acceptable range.
0C 00h	Write error	The drive has failed to write data or filemarks to tape. This is probably due to bad media, but may be hardware-related. Residue information will normally be supplied.
0E 01h	Information unit too short	There was an ADT protocol error.
0E 02h	Information unit too long	There was an ADT protocol error.
0E 03h	SK Illegal Request	<i>FC drives:</i> Invalid field In command information unit an FCP_CMD request with (rd,wr=11b) or (rd,wr=00b and FCP_DL!=0).
10 01h	Logical block guard check failed	The drive has encountered a CRC error whilst reading, writing or verifying data.
11 00h	Unrecovered read error	A read operation failed. This is probably due to bad media but may be hardware related.
11 12h	Media Auxiliary Memory read error	An error has occurred while attempting to write to MAM. The cartridge should not be used for further backups but should be able to be used for restoring data.
14 00h	Recorded entity not found	A SPACE or LOCATE command failed because of the drive could not find the target of the operation because of a format violation.
14 03h	End of Data not found	A read-type operation failed because a format violation related to a missing EOD data set, or there was an attempt to read a brand new tape.

Code	Description	Explanation
1A 00h	Parameter list length error	The amount of data (such as mode page, or log page) sent by the initiator may not match the length specified in the CDB (or too much or not enough data was sent).
20 00h	Invalid command operation code	The drive does not recognize the opcode of the command it has received.
24 00h	Invalid field in Command Descriptor Block	The drive has detected an invalid field in a Command Descriptor Block.
25 00h	LUN not supported	The command was addressed to a logical unit number that does not exist.
26 00h	Invalid field in parameter list	The drive detected an invalid field in the command parameter data sent by the initiator.
26 01h	Parameter not supported	A mode parameter is not supported.
26 02h	Parameter value invalid	A mode parameter value is invalid (for example, a partition size in the Medium Partitions mode page).
26 04h	Invalid release of persistent reservation	The Persistent Reservation holder has tried to release the persistent reservation using the PERSISTENT RESERVE OUT command, but the Scope or Type supplied was invalid.
26 10h	Data decryption key fail limit reached	A SECURITY PROTOCOL OUT command has failed because an incorrect key was sent to the drive followed by a READ command, and this cycle has been repeated ten consecutive times.
26 80h	Invalid CA certificate	The certificate provided is not valid.
27 00h	Write-protected	This is set if a write operation (such as WRITE, WRITE FILEMARKS, ERASE, or SET CAPACITY) is requested for a write-protected cartridge.
27 08h	Too many logical objects on partition to support operation	At least one field in the command data is not large enough to represent its full value (for example, the current logical position may be larger than the maximum value of a 32-bit field).
28 00h	Not ready to ready transition, medium may have changed	A tape has been loaded successfully into the drive and is now ready to be accessed.
29 01h	Power-on reset	The drive has powered on since the host last accessed it.
29 02h	SCSI bus reset	The drive will set the interface data transfer parameters to default. Therefore renegotiation may be needed. Commands in progress will be aborted.
29 03h	Bus device reset	The drive will set the interface data transfer parameters to default. Therefore renegotiation may be needed. Commands in progress will be aborted. The initiator may choose to reset the drive on a per LUN basis.
29 04h	Internal firmware reboot	The drive has reset itself.
29 07h	I_T nexus loss occurred	The drive has lost the connection with the initiator (host server).
2A 01h	Mode parameters changed	The Mode parameters for the drive have been changed by a host other than the one issuing the command. UNIT ATTENTION is set for all hosts following a MODE SELECT command, apart from the host that issued the command. This code will only be returned in a multi-host environment.
2A 02h	Log parameters changed	The Log parameters for the drive have been changed by an initiator other than the one issuing the command.
2A 03h	Reservations pre-empted	A PERSISTENT RESERVE OUT command with the Clear service action removed all reservations and the persistent reservation.

Code	Description	Explanation
2A 04h	Reservations released	After PERSISTENT RESERVE OUT command was executed, the original persistent reservation has been replaced with another of a different type or has been removed completely.
2A 05h	Registrations pre-empted	After a PERSISTENT RESERVE OUT command was executed all registrations were removed.
2A 06h	Asymmetric access state changed	This is not generated by the drive, it is reported by the automation controller via the drive.
2A 07h	Asymmetric access state transition failed	This is not generated by the drive, it is reported by the automation controller via the drive.
2A 08h	Priority changed	This is not generated by the drive, it is reported by the automation controller via the drive.
2A 0Dh	Data encryption capabilities changed	There is a new external entity controlling when the encryption parameter may be changed (for example, a tape library may have given up the control of encryption parameters).
2A 10h	Timestamp changed	A SET TIMESTAMP command has been successful.
2A 11h	Data encryption parameters changed by another initiator	The encryption parameters that this initiator was using have been modified or removed by another initiator.
2A 12h	Data encryption parameters changed by a vendor-specific event	The encryption parameters that this initiator was using have been modified or deleted because of a vendor specific event (such as tape unload or reservation released).
2A 13h	Data Encryption Key Instance Counter has changed	The drive received a WRITE command from an initiator that had locked its encryption parameters to a specific Key Instance Counter, whose value has now changed.
2A 14h	SA creation capabilities data has changed	
2A 15h	Medium removal prevention pre-empted	The prevention of medium removal condition has been preempted. All initiators affected except the one that sent the command will be notified by means of this UNIT ATTENTION condition.
2A 80h	Security configuration changed	
2C 00h	Command sequence invalid	The sequence of SCSI commands is invalid. <i>Example 1:</i> The use of the echo buffer was in valid. A WRITE BUFFER command is necessary before a READ BUFFER command. <i>Example 2:</i> Another initiator has already started a firmware download process.
2C 07h	Previous busy status	This is not generated by the drive, it is reported by the automation controller via the drive.
2C 08h	Previous task set full status	This is not generated by the drive, it is reported by the automation controller via the drive.
2C 09h	Previous reservation conflict status	This is not generated by the drive, it is reported by the automation controller via the drive.
2C 0Bh	Not reserved	If the "Only If Reserved" bit is set in the Device Configuration mode page, and the drive does not hold a reservation or persistent reservation, some commands will not be allowed to execute. In other words, some commands can only be executed if the drive is reserved.
2F 00h	Commands cleared by another initiator	Another initiator has already started a firmware download sequence.
30 00h	Incompatible medium installed	A write-type operation could not be executed because it is not supported on the type of tape that is loaded.

Code	Description	Explanation
30 01h	Cannot read media, unknown format	A LOCATE or SPACE command has found the tape is in a format not supported by the drive.
30 02h	Cannot read media: incompatible format	A READ command could not be completed because the logical format is not correct.
30 03h	Cleaning cartridge installed	A medium-access command has been sent to the drive while a cleaning cartridge was loaded.
30 04h	Cannot write medium	The tape's Cartridge Memory is bad so that the tape is unusable.
30 05h	Cannot write medium, incompatible format	For example, a WRITE command was received but the LTO tape generation currently loaded cannot be written to.
30 06h	Cannot format, incompatible medium	A format operation was requested, but the tape inserted in the drive does not support this operation.
30 07h	Cleaning failure	A cleaning operation was attempted but could not be completed for some reason.
30 0Ch	WORM medium—overwrite attempted	A write operation could not be executed because an overwrite has been attempted on a WORM cartridge. This may be because an overwrite backup was specified instead of an appended backup.
30 0Dh	WORM medium—integrity check failed	The drive has detected an inconsistency when performing an integrity check on a WORM cartridge. The cartridge may have been tampered with.
31 00h	Medium format corrupted	Data could not be read because the format on tape is not valid, although it is in a known format.
37 00h	Rounded parameter	The drive needs to round off the value of a parameter sent by MODE SELECT because it cannot store it to the degree of accuracy sent by the command.
3A 00h	Medium not present	A medium-access command has been received when no cartridge is in the drive.
3A 04h	Medium not present, Media Auxiliary Memory accessible	A media access command has been received when the tape has been loaded but not threaded. This will be reported if the hold bit of the LOAD CDB was set or the Autoload field in the Control mode page is non-zero.
3B 00h	Sequential positioning error	The drive has failed to read data off tape. There are two possibilities: <ul style="list-style-type: none"> • The current command (such as READ, SPACE, REWIND, or WRITE) failed to complete successfully. • The logical position has been lost.
3B 0Ch	Position past BOM	A SET CAPACITY command was received when the logical position was not BOT, a necessary condition for this command.
3B 1Ch	Too many logical objects on partition to support operation.	First Block Location field on READ POSITION Short Form Block ID is not large enough to be able to represent the current logical position.
3E 00h	Logical unit has not self-configured yet	This is set during power-up when it is not possible to send medium-access commands to the drive because mechanism tests are being executed. When the tests are complete, the additional sense changes to 3A 00h, 04 01h or 04 02h depending on whether a cartridge was present at power-on.
3F 01h	Microcode has been changed	The firmware in the drive has just been changed by a WRITE BUFFER or MAINTENANCE OUT command, or a Firmware Update cartridge.
3F 03h	Inquiry data has changed	This is not generated by the drive, it is reported by the automation controller via the drive.
3F 05h	Device identifier changed	A SET DEVICE IDENTIFIER command has been successful.

Code	Description	Explanation
3F 0Eh	Reported LUNs data has changed	Reported LUNs data has changed.
3F 0Fh	Echo buffer overwritten	A READ BUFFER command has been received with Echo Buffer mode set, but the echo buffer has been overwritten by a different host.
40 XXh	Diagnostic failure on component XX	A self-test command has detected an error, or a command is prohibited from execution due to failure of a previous diagnostic. "XX" is a vendor-specific code indicating the failing component.
43 00h	Message error	A message could not be sent or received because of excessive transmission errors.
44 00h	Internal target failure	This code is used to report hardware and firmware related hard errors that occur when the drive encounters an "impossible" situation.
45 00h	Selection/reselection failure	An attempt to reselect an initiator in order to complete the command has failed.
47 00h	SCSI parity error	A command failed due to an excessive number of parity errors on the SCSI interface.
48 00h	Initiator Detected Error message received	An Initiator Detected Error primitive has been received from the host. This may indicate there was a CRC error on the data transmitted through the link.
49 00h	Invalid message	An invalid or unsupported Task Management Function has been received, or there has been an ADT service delivery failure.
4B 00h	Data phase error	The ACI received more raw data than expected.
4B 02h	Too much write data	The ADT interface received more SCSI data than permitted within a burst.
4B 03h	ACK/NAK timeout	There have been protocol issues on the FC or SAS link.
4B 04h	NAK received	There have been protocol issues on the FC or SAS link.
4B 05h	Data offset error	The ADT interface received data unexpectedly or with an offset outside the current burst.
4B 06h	Initiator response timeout	<i>SAS only:</i> The host has not responded to the request within the established time limit. Any SCSI command currently being executed will be aborted.
4D 00h	Tagged overlapped command	A host has selected and sent a new command to the drive even though the drive is already processing a command with the same tag from this host to the same LUN.
4E 00h	Overlapped commands	A host has selected and sent a new command to the drive even though the drive is already processing a command from this host to the same LUN.
50 00h	Write append error	A write-type command failed because the point at which to append data was unreadable. This was probably caused by a powerfail, or Fibre Channel/SAS link reset, preventing the drive from completing a write operation properly and appending an EOD.
52 00h	Cartridge fault	A command could not be completed because of a fault in the tape cartridge.
53 00h	Media load or eject failed	An attempt to load or eject the tape failed because of a problem with the tape.
53 01h	Unload tape failure	The tape unload failed because it cannot be physically completed at this time.
53 02h	Medium removal prevented	An unload command has failed to eject the tape because medium removal has been prevented.

Code	Description	Explanation
53 03h	Insufficient resources	The drive is unable to hold any more information specific to the command sent by the initiator. This may be because an internal memory buffer has reached its full capacity.
53 04h	Medium thread or unthread failure	The threading or unthreading operation failed.
55 04h	Insufficient registration resources	<i>FC drives:</i> FC interface only: Up to 32 initiators may register using the PERSISTENT RESERVE OUT command. A 33rd attempt to register is rejected.
		<i>SAS drives:</i> Not applicable
55 06h	Media Auxiliary Memory full	There is insufficient space in the Host Attribute area in MAM to fit attributes that need to be written.
5B 01h	Threshold condition met	This is not generated by the drive, it is reported by the automation controller via the drive.
5D 00h	Failure prediction threshold exceeded	Failure Prediction thresholds have been exceeded indicating that TapeAlert flags have been activated.
5D FFh	Failure prediction threshold exceeded (false)	The Informational Exceptions Mode page has been sent with the Test field set to 1 and the DExcpt field to 0, causing the drive to generate a false informational exception condition (a false device failure).
5E 01h	Idle condition activated by timer	The drive has entered power-saving mode. This code is only reported in response to a REQUEST SENSE command.
74 00h	Security error	Generic security (encryption/decryption) error. For example, the Decryption mode is set to RAW and the drive has been asked to read, but this Decryption mode is not allowed on the current block (as was specified when it was written to tape).
74 01h	Unable to decrypt data	The drive encountered encrypted data while reading, but decryption mode is not enabled.
74 02h	Unencrypted data encountered while decrypting	The decryption mode is enabled but the drive encountered non-encrypted data while reading.
74 03h	Incorrect data encryption key	The drive read into a block of data which could not be decrypted with the current decryption key.
74 04h	Cryptographic integrity validation failed	The next block failed the integrity validation process while the drive was attempting to read it.
74 05h	Key-associated data descriptors changed.	The key-associated data descriptor values have changed compared with the values in the last recorded read.
74 08h	Digital signature validation failure	An attempt to download a new firmware image has failed because the image contains an incorrect digital signature. As a result, the firmware image could not be authenticated.
74 09h	Encryption mode mismatch on read	The drive tried to read a block written in EXTERNAL encryption mode, but the drive is set only to read blocks written in ENCRYPT encryption mode, or vice versa.
74 0Ah	Encrypted block not RAW read-enabled	The decryption mode is set to RAW but the block on tape is marked as disabled for reads in RAW mode.
74 0Bh	Incorrect encryption parameters	Incorrect KAD descriptors were supplied (decryption mode set to RAW only)
74 21h	Data encryption configuration prevented	Encryption settings are controlled by an external device, such as a tape library, so encryption parameters cannot be currently changed.
74 40h	Authentication failed	The authentication data on the parameter data cannot be verified with any of the initiators' public keys that are stored in the drive.
74 61h	External data encryption Key Manager access error	The external Key Manager experienced an unrecoverable error and could not provide the encryption key requested by the drive.

Code	Description	Explanation
74 62h	External data encryption Key Manager error	The external Key Manager experienced an error whilst trying to retrieve an encryption key after a requested from the drive.
74 63h	External data encryption management—key not found	The external Key Manager did not find the encryption key in the database after a request from the drive.
74 64h	External data encryption management—request not authorized	The external Key Manager did not provide the requested encryption key because authorization failed.
74 6Eh	External data encryption control time-out	The external Key Manager did not provide the encryption key requested by the drive within the specified time limit.
74 6Fh	External data encryption control unknown error	The external Key Manager experienced an unspecified error and could not provide the encryption key requested by the drive.
74 71h	Logical Unit access not authorized	The automation application did not provide a cryptographic key to the device within the specified period or the key manager did not provide a cryptographic key to the automation application, which terminated the command.
74 80h	KAD changed	An Encryption AAD, an Encryption UAD, or an Encryption Key Signature mismatch was detected while in RAW read mode.
74 82h	Crypto KAD in CM failure	
82 82h	Drive requires cleaning	The drive has detected that the heads need to be cleaned to maintain good operation.
82 83h	Bad microcode detected	The data transferred to the drive during a firmware upgrade is corrupt or incompatible with the drive hardware.

Error codes

The error codes that can be reported in bytes 16 and 17 are listed in Chapter 10 of the *Hardware Integration Guide*, Volume 1 of the HP LTO Ultrium Technical Reference Manual.

RESERVE UNIT 16h/56h

This command enables the host to reserve the drive. Reserving a device is a way of ensuring exclusive access to that device from a single initiator for the period of the reservation.

Once reserved, the drive will execute commands received from the reserving initiator or from the third-party initiator if the 3rd-Pty option has been selected. Commands from other initiators will have RESERVATION CONFLICT status reported for them, apart from INQUIRY, LOG SENSE, READ BLOCK LIMITS, READ MEDIA SERIAL NUMBER, RELEASE UNIT, REPORT DENSITY SUPPORT, REPORT DEVICE IDENTIFIER, REPORT LUNS, REPORT TARGET PORT GROUPS and REQUEST SENSE.

The INQUIRY, LOG SENSE, READ BLOCK LIMITS, READ MEDIA SERIAL NUMBER, RELEASE UNIT, REPORT DENSITY SUPPORT, REPORT LUNS, and REQUEST SENSE commands, and all commands with opcode A3h are immune to the effects of a reservation and will continue to execute for all hosts. The RELEASE UNIT command will have GOOD status reported for other hosts, but will have no effect on the reservation.

The 10-byte RESERVE UNIT command is supported by all drives. Its functionality is the same as for the 6-byte command, but it also supports third-party reservation.

The reservation will stay in effect until:

- The reserving host sends another RESERVE UNIT command.
- The reserving host sends a RELEASE UNIT command, clearing the reservation.
- A power-on, firmware upgrade or forced eject.

Pre-execution checks

Illegal Field

Deferred Error

Unit Attention

If the drive is reserved by some other host then reservation conflict status is reported to the host.

Command descriptor block (6–byte version)

	7	6	5	4	3	2	1	0
0	Operation Code (16h)							
1	Reserved (0)			3rd Pty(0)	Third-Party Device ID (0)			Rsvd(0)
2	Reserved (0)							
4								
5	Control							

3rdPty	This is always zero because third-party reservation is not supported.
Third-Party Device ID	This is always zero because third-party reservation is not supported.

Command descriptor block (10–byte version)

	7	6	5	4	3	2	1	0	
0	Operation Code (56h)								
1	Reserved (0)			3rd Pty (0)	Reserved (0)		LongID(0)	Rsvd(0)	
2	Reserved (0)								
3	Third-Party Device ID (0)								
4–6	Reserved (0)								
7	(MSB)	Parameter List Length						(LSB)	
8									
9	Control								

3rd Pty	0	Third-party reservation is not requested. (Third-party reservation is only possible in pSCSI.)
LongID	This is always zero because device IDs greater than 255 are not supported.	
Third-Party Device ID	Third-party reservation is only possible in pSCSI, so this field is set to 0.	

REWIND 01h

REWIND causes the drive to write all buffered logical objects to tape and then positions the tape at BOP (beginning of partition). Once a rewind is started, it will complete even if the SCSI operation is aborted.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Media Access

Diagnostic Status

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (01h)							
1	Reserved (0)							Immed
2-4	Reserved (0)							
5	Control							

CDB fields

Immed		
0		Status is returned after the rewind has completed.
1		The drive first writes any unwritten buffered data to tape. It then returns GOOD status to the host before beginning the actual rewind operation.

REWIND specific status

If the rewind is successful, unsolicited positional sense will indicate that the tape is at BOM by the EOD bit being set and an additional sense code of 0004h (BOP).

SECURITY PROTOCOL IN A2h

The SECURITY PROTOCOL IN command returns information about the security data for the I_T nexus in the device server and on the tape.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0

CDB fields

Security Protocol		
	00h	Security protocol information
	20h	Tape Data Encryption security protocol

Security Protocol Specific	The contents of this field depend on the protocol specified by the Security Protocol field. See below.
Allocation Length	The number of bytes allocated for the returned parameter data

SECURITY PROTOCOL IN returned data

Security protocol information

When the Security Protocol field is 00h, the only supported values for the Security Protocol Specific field are as follows:

Code	Description
0000h	Supported security protocol list
0001h	Certificate data

Supported security protocol list:

	7	6	5	4	3	2	1	0
0-5	Reserved (0)							
6	Supported Security Protocol List Length (02h)							
7								
8	First Supported Security Protocol (00h)							
9	Last Supported Security Protocol (20h)							

Certificate data:

	7	6	5	4	3	2	1	0
0-1	Reserved (0)							
2	Certificate length (n-3)							
3								
4	Certificate							
n								

If the device does not have a certificate installed, the device server does not have a certificate to transfer either, so the Certificate Length is set to 00h.

Tape Data Encryption security protocol

When the Security Protocol field is 20h, the following table specifies the pages that are supported (specified in the Security Protocol Specific field). They must be requested individually.

Code	Description
0000h	Tape Data Encryption In Support page
0001h	Tape Data Encryption Out Support page
0010h	Data Encryption Capabilities page
0011h	Supported Key Formats page

Code	Description

24	Key-Associated Data Descriptors List							
n								

Key Instance Counter	This field is relative to the key indicated by the Key Scope field value. One key instance counter is kept for each key the device server is managing. It is cleared to zero only after a power-on condition. Any event that sets, clears or changes one of the parameters in a set of security parameters will increment this value. The counter can roll over.	
Parameters Control	001b	Data encryption parameters are not exclusively controlled by external data encryption control.
	010b	Data encryption parameters are exclusively controlled by the SSC device server.
	011b	Data encryption parameters are exclusively controlled by the ADC device server.
	100b	Data encryption parameters are exclusively controlled by a management interface.
VCELB	The <i>Volume Contains Encrypted Magical Blocks</i> field is set to one when a tape is loaded and contains at least one encrypted logical block. Otherwise set to zero.	
CEEMS	The <i>Check External Encryption Mode Status</i> field contains the value from the check external encryption mode parameter value saved for the I_T nexus on which the command was received.	

RDMD	The <i>RAW Decryption Mode Disabled</i> bit is set to one if the drive is configured to mark each encrypted block as disabled for RAW read operations based on the RAW decryption mode disable parameter value saved for the L_T nexus on which the command was received.
Encryption Parameters KAD Format	The KAD_format value stored as part of the initiator's encryption parameters. : .
ASDK_Count	<i>Available Supplemental Decryption Key Count</i>

[Next Block Encryption Status page](#)

This page will perform Media Access Checks.

	7	6	5	4	3	2	1	0

13	Algorithm Index (01h)							
14	Reserved (0)						EMES	RDMS
15	Next Block KAD Format							
16	Key-Associated Data Descriptors List							
n								

Compression Status	Only 0h is supported.	
	0h	Unable to determine if the block is compressed.
Encryption Status	00h	Unable to determine if the block is encrypted.
	01h	Capable of determining if the block is encrypted, but not at this time (because of EOD, read error, or similar).
	02h	The block number does not correspond to a logical block.
	03h	The block is not encrypted.
	04h	The block is encrypted but not by the encryption algorithm supported in the device. KAD descriptors are returned if available. The Algorithm Index field is ignored.
	05h	The block is encrypted by a supported encryption algorithm. KAD descriptors are returned.
	06h	The block is encrypted by a supported encryption algorithm, but the drive cannot decrypt the block, or does not have the correct key or nonce value.
EMES	The <i>Encryption Mode External Status</i> bit is set to one if the Encryption Status field is set to either 5h or 6h, and the next block is marked as having been written to the medium while the encryption mode was set to EXTERNAL. It is set to zero otherwise.	

RDMDS	The <i>RAW Decryption Mode Disabled Status</i> bit is set to one if the Encryption Status field is set to either 5h or 6h, and the next block is marked as disabled for RAW decryption mode operations. It is set to zero otherwise.
Next Block KAD Format	The KAD_format value stored within the next logical block on tape.

51								
52	Key-Associated Data Descriptors List							
<i>n</i>								

Scope	0h	Public	All fields in the Set Data Encryption page other than Scope and Lock fields are ignored. The I_T nexus will use shared data encryption parameters. If no I_T nexuses are sharing data encryption parameters, the drive will use the default parameters.
	1h	Local	Data Encryption parameters are not shared, but are unique to this I_T nexus.
	2h	All I_T Nexus	Data encryption parameters will be shared with all I_T nexuses whose scope is Public.
Lock	1		<p>The I_T nexus will be associated (and locked) to the set of data encryption parameters established after processing the SECURITY PROTOCOL OUT command, <i>and</i> the current Key Instance Counter. Only a hard reset or another SECURITY PROTOCOL OUT from the same I_T nexus can clear this bit.</p> <p>If the device processes a Write command and the Key Instance Counter has changed since the last time it was locked, the Write command (and any subsequent Write commands) will be terminated with CHECK CONDITION, sense key of DATA PROTECT and additional sense of 2A13h (data encryption key instance counter has changed). Only a hard reset or a SECURITY PROTOCOL OUT from the same I_T nexus will clear this condition.</p>
CEEM	<i>Check External Encryption Mode.</i> If this field is set to either 10b or 11b, and the decryption mode is set to DISABLE, SECURITY PROTOCOL OUT is terminated with CHECK CONDITION, with addition sense of set to 2600h (invalid field in parameter list).		
	00b	Same as 10b.	
	01b	Do not check the encryption mode used to write the block.	
	10b	On read and verify commands, check the encryption mode used to write the block. Decryption Mode is set to DECRYPT or MIXED. Report an error if the block was written in EXTERNAL mode. The sense key is set to DATA PROTECT with additional sense of 7409h (encryption mode mismatch on read).	
	11b	On read and verify commands, check the encryption mode used to write the block. Decryption Mode is set to DECRYPT or MIXED. Report an error if the block was written in ENCRYPT mode. The sense key is set to DATA PROTECT with additional sense of 7409h (encryption mode mismatch on read).	
RDMC	<i>RAW Decryption Mode Control.</i> This field specifies if the drive should mark each encrypted block it writes to tape as disabled for read operations with the decryption mode set to RAW. The field is ignored if the Encryption Mode field is not set to ENCRYPT.		
	00b	The drive marks each encrypted block according to the RDMC_C flag setting on the Data Encryption Capabilities page (see page “Data Encryption Capabilities page” (page 219)).	
	01b	Reserved.	
	10b	The drive marks each encrypted block it writes as enabled for RAW decryption mode operations.	
	11b	The drive marks each encrypted block it writes as disabled for RAW decryption mode operations.	
CKOD	<i>Clear Key On Demount</i>		
	1	Data Encryption parameters are switched to the default values upon tape unload.	
CKORP	<i>Clear Key On Reservation Pre-empted</i>		

	1	Data Encryption parameters are switched to the default values upon pre-emption of the current persistent reservation.	
CKORL	<i>Clear Key On Reservation Loss</i>		
	1	Data Encryption parameters are switched to the default values upon reservation loss.	
Encryption Mode	0h	Disable	No data encryption will be performed.
	1h	External	Data sent via WRITE commands has been already encrypted by a supported encryption algorithm.
	2h	Encrypt	Data from WRITE commands will be encrypted with the specified key.
Decryption Mode	0h	Disable	The data on the tape is not encrypted, so no decryption will be performed.
	1h	RAW	Data is encrypted on tape, but no decryption will be performed. The data is passed directly to the host.
	2h	Decrypt	Data is encrypted on tape and decryption will be performed.
	3h	Mixed	There is both encrypted and non-encrypted data on tape. The device will decrypt or not accordingly.
KAD Format	Identifies the format of the data stored in the U-KAD and/or A-KAD.		
	00h	Unspecified	
	01h	Binary key name	
	02h	ASCII key name	
	03–FFh	Reserved	
Key-Associated Data Descriptors	These descriptors may or may not be sent by the application. If the Encryption Mode is set to Encrypt, the drive will save the KAD descriptors. They are associated with every block that is encrypted with the specified key. The descriptors are specified in increasing numeric order. See below for the format of the descriptors.		

Key Descriptor format when Key Format field is 00h

	7	6	5	4	3	2	1	0
0	Key Descriptor Type							
1	Reserved (0)					Authenticated		
2	Key Descriptor Length (n-3)							
3								
4	Key Descriptor							
n								

Key Descriptor Type	0h	Unauthenticated key-associated data
	1h	Authenticated key-associated data
	2h	Nonce value (not supported)
	3h	Security meta-data key-associated data
Authenticated	0h	Reserved. This is always the case if KAD descriptors are included.
	1h	The descriptor is not covered by the authentication
	2h	No attempt has been made to authenticate the descriptor

	<p>In the Set Data Encryption page and in the Data Encryption Status page (SECURITY PROTOCOL IN), if KAD descriptors are included the Authenticated field is always reserved.</p> <p>In the Next Block Encryption Status page (SECURITY PROTOCOL IN), if KAD descriptors are included the Authenticated field will have the following values:</p> <p style="margin-left: 40px;">01h if U-KAD</p> <p style="margin-left: 40px;">02h if A-KAD</p> <p style="margin-left: 40px;">02h if S-KAD</p>
--	---

Set Data Encryption page for Key Format = Wrapped key (02h)

$m+1$	Signature Length ($z-(m+2)$)							
$m+2$								
$m+3$								
z	Signature							

Label	Is available, contains Wrapped Key descriptors. They contain public information associated with the logical block encryption key.
Wrapped Key	The logical block encryption key that has been encrypted with the device server's public key using an RSA 2048 algorithm.
Signature	If available, Signature is checked in order to verify that the key was wrapped and signed by a valid key management server. The signature is created by applying an RSA algorithm over the wrapped key using the wrapping entity's private key. This operation adds integrity to both the Label and the Key.

Wrapped Key descriptors

	7	6	5	4	3	2	1	0
0	Wrapped Key Descriptor Type							
1	Reserved (0)							
2	Wrapped Key Descriptor Length ($n-3$)							
3								
4								
n	Wrapped Key Descriptor							

Key Descriptor Type	Code	Name	Description
	0h	Device server identification	Contains the logical unit name for the device server (as returned in the Device Identifier Inquiry page)
	1h	Key wrapping entity identification	The contents are ignored.
	2h	Wrapped key information	The contents are ignored.
	3h	Wrapped key identification	The contents are ignored.
	4h	Wrapped key length	Length of the wrapped key in bytes.

SECURITY PROTOCOL OUT specific status

- If the drive processes a WRITE command and the Key Instance Counter has changed since the last time it was locked, the WRITE command (and any subsequent WRITE commands) will be terminated with CHECK CONDITION, a sense key of DATA PROTECT and additional sense of 2A13h (data encryption key instance counter changed). Only a hard reset or a SECURITY PROTOCOL OUT from the same I_T nexus will clear this condition. If the CKOD bit

is set and there is no tape loaded, the command will be terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).

- If the decryption mode is set to RAW and an attempt is made to read or verify an encrypted block that was disabled for RAW decryption mode operations, the drive terminates the command with CHECK CONDITION. The sense key is set to DATA PROTECT with additional sense of 740Ah (encrypted block not RAW read-enabled).
- If the CKOD bit is set and there is no tape loaded, the command will be terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If the CKORP bit is set and there is no persistent reservation in place for the I_T nexus,, the command will be terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If the CKORL bit is set and there is no reservation in place for the I_T nexus, the command will be terminated with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If the Encryption Mode is set to Encrypt and the Key Length is zero, the command will terminate with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).
- If the Decryption Mode is set to Decrypt or Mixed and the Key Length is zero, the command will terminate with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).
- If the decryption mode is set to RAW and an attempt is made to read or verify an encrypted block that was disabled for raw decryption mode operations, the drive will terminate the command with CHECK CONDITION, a sense key of DATA PROTECT, and additional sense of 740Ah (encrypted block not RAW read-enabled).

SEEK (CD-ROM mode) 2Bh

SEEK is executed for 2Bh when the drive is in CD-ROM mode. When out of CD-ROM, the LOCATE command, which shares the opcode, is executed.

Assuming the pre-execution checks are passed, GOOD status is always reported.

Pre-execution checks

Illegal Field	Bad LUN	Reservation	Deferred Error
Unit Attention	Media Access	Diagnostic Status	

Command descriptor block

	7	6	5	4	3	2	1	0

CDB fields

Logical Block Address	This field is ignored.
------------------------------	------------------------

SEND DIAGNOSTIC 1Dh

SEND DIAGNOSTIC tells the drive to perform either its standard self-test, or diagnostics specified in the parameter list on itself. The parameter list is transferred to the drive in a series of data-out phases; each 8-byte data-out phase specifies a diagnostic to be performed by the drive. It is not an error to set Self-Test = 0 and to have a zero-length parameter list.

The test results can be retrieved with the RECEIVE DIAGNOSTIC RESULTS command.

Pre-execution checks

Illegal Field Reservation Deferred Error Unit Attention

- If Self-Test = 0, the UntOffl bit is ignored.
- If Self-Test = 1, the Parameter List Length field must be zero. Otherwise CHECK CONDITION is reported. Sense data will be as described in Illegal Field Checks.
- It is not an error to set all fields in the CDB to zero, and to have a zero-length parameter list.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (1Dh)							
1	Reserved (0)			PF (1)	Rsvd(0)	Self-Test	DevOffl(0)	UnitOffl
2	Reserved (0)							
3	(MSB)	Parameter List Length						(LSB)
4								
5	Control							

CDB fields

PF	<i>Page Format.</i> Specifies that the accompanying data follows the SCSI-3 Diagnostic Page format. It must be set to 1.	
Self-Test	0	Perform the diagnostics specified in the parameter list. The UnitOffl bit must be set, otherwise CHECK CONDITION is reported. The drive reports status when the command has been completed.
	1	Perform the standard self-test depending on the value of UnitOffl (see above). The Parameter List Length must be 0 otherwise CHECK CONDITION is reported. The drive will report GOOD status following the pre-execution checks and before executing the command.
DevOffl	<i>Device Offline bit.</i> Must be cleared to zero.	
UnitOffl	<i>Unit Offline bit</i>	
	0	Indicates that the host is not prepared for the drive to perform tests that could affect logical position.
	1	Indicates that the host is prepared for the drive to perform tests that could affect logical position, modify the tape or modify cartridge status. This bit must be set if the Self-Test bit is 0.
Parameter List Length	Indicates how many bytes of diagnostic parameter data are to be sent to the drive. The length of the data phase for SEND DIAGNOSTIC is limited to 4 bytes of header plus 34 parameters,	

		each of which is 4 bytes long. This gives an upper limit for the parameter list length of 136 bytes.
--	--	--

SEND DIAGNOSTIC data required

No data is required if the standard self-test is to be performed. Otherwise, a single diagnostic page must be provided as a parameter.

SEND DIAGNOSTIC specific status

Any Send Diagnostic command received with a Enclosure Services page number (01h to 0Fh) will generate CHECK CONDITION with sense key of ILLEGAL REQUEST and additional sense of 3501h (unsupported enclosure function).

The drive reports GOOD status if the diagnostics pass. It will report CHECK CONDITION if the diagnostics fail, with a sense key of HARDWARE ERROR and additional sense of 4000h.

More detailed results can then be recovered using the Receive Diagnostic Results page.

Standard self-test

With a tape inserted:

If Self-Test = 1 and UntOffl = 0, a test is performed that does not affect the contents of the tape. This test is a more extensive set of the tests carried out at power-on.

If UntOffl = 1, the tape contents can be overwritten and will be undefined after the test. A user can re-use the tape after the test.

With no tape in the drive:

The same self-test will be executed regardless of the setting of UntOffl.

The results of any self-test (power on or not) can be determined by reading the Self-Test diagnostic page before executing a diagnostic (which will overwrite the result).

SET CAPACITY 0Bh

This provides a means of changing the logical length of the currently-loaded media. The primary use envisaged is for testing purposes, although it may also be used in other circumstances where a shortened tape may be beneficial.

Note that all data currently on the media will be lost following successful execution of this command. The command is only accepted when the media is positioned at Beginning of Media (BOM).

With WORM cartridges, the command is only accepted and executed if the cartridge has not been initialized, that is, it has never been written to. Otherwise the cartridge is rejected with CHECK CONDITION, sense key of Data Protect and additional sense of 300Ch (WORM media—overwrite attempted). TapeAlert flags 3Ch (WORM media—overwrite attempted) and 09h (write-protect) are set.

The SET CAPACITY command will return the tape to a single partition of the size specified. If the command is used to limit the apparent size of the tape, then the capacity available to a future partition will also be limited until another SET CAPACITY command is executed to restore the original size.

Pre-execution checks

Illegal Field	Reservation	Deferred Error
Unit Attention	Media Access	Media Write

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (0Bh)							
1	Reserved (0)							Immed
2	Reserved (0)							
3	(MSB)	Capacity Proportion Value						(LSB)
4								
5	Control							

CDB fields

Immed	0	Status will not be returned until the SET CAPACITY operation has completed.
	1	Status will be returned as soon as the CDB has been parsed.
Capacity Proportion Value	The portion of the total volume capacity to be made available for use. The value given here is the numerator of a fraction with a denominator of 65,535. The resulting available capacity will be (total volume capacity x capacity proportion value)/65535.	

Note that the LTO format enforces a minimum tape length. A value that would result in a tape length below this minimum will be silently rounded up to the minimum permitted length.

The following table gives the minimum acceptable Capacity Proportion Values and the approximate capacity they will give:

Cartridge	Min. capacity proportion value	Resultant approx. min. capacity	Max. capacity
LTO-5	0FDFh	92 GB	1500 GB
LTO-6	0FDFh	154 GB	2500 GB

NOTE: Capacities are approximate and can be affected by defects that reduce the actual capacity of the tape. Other factors, such as compression and block packing, may also affect capacity.

SET DEVICE IDENTIFIER A4h (06h)

SET DEVICE IDENTIFIER allows a initiator to set the Device ID information to that supplied in the Parameter List. This information can be later retrieved by the REPORT DEVICE IDENTIFIER command.

Upon successful completion the command will post sense key UNIT ATTENTION with additional sense of 3F05h (device identifier changed) to all initiators except the one that issued the command. Once set the Device Identifier will only be cleared by a successful Set Device Identifier command or a drive reset.

Service Action Qualifier	This must be 0Ah.	
RTD	<i>Reset To Default</i>	
	0	The User-Defined Command Set is set to the Command Set specified in the parameter list.
	1	The User-Defined Command Set is restored to its manufacturing default configuration. <ul style="list-style-type: none"> If the RTD bit is set to one and the SCS bit set to zero the volatile User-Defined Command Set is restored to its manufacturing default value. If the RTD bit is set to one and the SCS bit set to one the volatile and non-volatile User-Defined Command Set is restored to its manufacturing default value.
SCS	<i>Save Command Set</i>	
	0	The specified Command Set is stored in volatile memory.

		The volatile User-Defined Command Set is set to the manufacturing default setting after a reset condition. The non-volatile User-Defined Command Set is set to the manufacturing default setting after successfully processing a SET STTF CONFIG command with the RMD bit set to one.
	1	The specified Command Set is stored in non-volatile memory.
STB	<i>Switch Trace Banks</i>	
	0	The Snapshot sub-system will not switch System ARM trace banks before executing the specified User-Defined Command Set.
Parameter List Length	The length in bytes of the parameter list to be transferred.	

SET SNAPSHOT COMMANDS specific status

- If tape drive is in the process of creating a Snapshot log the device server will terminate SET SNAPSHOT COMMANDS with CHECK-CONDITION, a sense key of NO SENSE and additional sense of 0016h (operation in progress).
- If tape drive is in the process of reading the Snapshot Command Set the device server will terminate SET SNAPSHOT COMMANDS with CHECK-CONDITION, a sense key of NO SENSE and additional sense of 0016h (operation in progress).
- If the RTD bit is set to one and the Parameter List Length field is *not* set to zero, the device server will terminate SET SNAPSHOT COMMANDS with CHECK-CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If the SCS bit is set to one and the Parameter List Length field is set to zero and RTD bit is set to zero, the device server will terminate SET SNAPSHOT COMMANDS with CHECK-CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).
- If the STB bit is set to one and the Parameter List Length field is set to zero, the device server will terminate SET SNAPSHOT COMMANDS with CHECK-CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2400h (invalid field in CDB).

SET SNAPSHOT COMMANDS parameter data

The format of the parameter data is as follows:

	7	6	5	4	3	2	1	0
	<i>Command Descriptor List</i>							
0	Command Descriptor (first)							
:	:							
<i>n</i>	Command Descriptor (last)							

The Command Descriptor list identifies the SCSI commands and the order in which they are executed when generating Snapshot logs.

Command descriptor

	7	6	5	4	3	2	1	0
0	Reserved (0)							DIV
1	SCSI Data Length (<i>n</i> -49)							
2	(MSB)	Dataset Identifier						

	7	6	5	4	3	2	1	0
33								(LSB)
34	(MSB)	CDB						
49								(LSB)
50	(MSB)	SCSI Data						
<i>n</i>								(LSB)

DIV	<i>Dataset Identifier Valid</i>	
	0	The Dataset Identifier field is ignored and any SCSI data or status produced from the execution of the SCSI command defined in the CDB field is not recorded in any Snapshot log produced from the Snapshot command set specified by this command.
	1	The Dataset Identifier field identifies any SCSI data and status in the Snapshot log produced when the command specified in the CDB field is executed.
SCSI Data Length	The number of bytes in the SCSI Data field.	
Dataset Identifier	The dataset identifier used to identify the Snapshot data produced when this command is executed.	
CDB	The SCSI command control block of the command to execute when the Snapshot log is generated. The contents of the CDB field are not validated until the command is executed when generating the Snapshot logs.	
SCSI Data	The SCSI data out bytes for the SCSI command specified in the CDB field. The length of this field is given by the value of the SCSI Data Length field. The number of SCSI Data bytes and the contents are not validated with the CDB field contents until the command defined in the CDB field is executed.	

SET SNAPSHOT COMMANDS specific status

Event	Status	Key	Additional Sense
The tape drive is in the process of creating a Snapshot log the device server.	CHECK CONDITION	NO SENSE	0016h (operation in progress)
The tape drive is in the process of reading the Snapshot command set.	CHECK CONDITION	NO SENSE	0016h (operation in progress)

SET SNAPSHOT CONFIGURATION A4h (1Fh)

SET SNAPSHOT CONFIGURATION is used to configure the events that trigger the creation of Snapshot logs, to set the maximum size of Snapshot logs created, and to clear all Snapshot logs stored in the drive.

NOTE: The MMLL field is not supported in LTO-6 drives. With LTO-5 drives you could configure the size of snapshot logs in volatile memory with the MMLL field but not the size or number of (STTF) logs when they are stored in non-volatile memory. Changing the snapshot log length would therefore result in either truncated STTF logs or very inefficient use of the flash memory. To overcome this, LTO-6 drives allow the size of two sections of non-volatile memory to be configured to store drive health STTF logs (taken on every unload) and debug/combined STTF logs, which are five times larger, more efficiently. The size of snapshot logs in LTO-6 drives is the same as the size of the larger of the max STTF log size in the two configurable sections.

	1	The drive initiates the creation of a new Snapshot log when the drive unloads media, except: <ul style="list-style-type: none"> if the drive is already in the process of creating a Snapshot log, or if the snapshot commands are in the process of being set. 						
SOCC	<i>Snapshot On Check Condition</i>							
	1	The drive initiates the creation of a new Snapshot log after reporting CHECK CONDITION to a command that failed during execution for a media error or hardware error, except: <ul style="list-style-type: none"> if the drive is already in the process of creating a Snapshot log, or if the snapshot commands are in the process of being set. 						
Maximum Log Length	The maximum length of Snapshot logs created by the drive. The field is ignored in s SET SNAPSHOT CONFIGURATION command.							

SET Enhanced SNAPSHOT CONFIGURATION A4h (1Fh)

The SET Enhanced SNAPSHOT CONFIGURATION command is used to:

- configure the events that trigger the creation of Snapshot logs
- save traces to flash
- set the maximum size of Snapshot logs created
- clear all Snapshot logs stored in the drive

This command is supported in LTO-5 products onwards. It specifies trigger conditions for creating Snapshot logs and Save Trace To Flash (STTF) logs, which are Snapshot logs stored in non-volatile flash memory. However, the tape drive will not create a Snapshot log when a trigger condition occurs in any of the following circumstances:

- The tape drive is already in the process of creating a Snapshot log.
- If the snapshot commands are in the process of being set.
- A Snapshot log has been created within the last fifteen minutes.

11								

STP	<i>Save Trigger Parameters</i>	
	0	The specified snapshot configuration is volatile and will return to the previous non-volatile snapshot configuration on a drive reset event.
	1	The tape drive will save the SOCC, SOU, SODEC, SOSD, STTF, Sense Key, Additional Sense Code, Additional Sense Code Qualifier and Drive Error Code field values in non-volatile memory. Setting the STP bit to one overwrites the Manufacturing Default Configuration values.
STTF	<i>Save Trace To Flash</i>	
	0	The tape drive will not save Snapshot logs to non-volatile memory, even if the STTF bit is set to one in the FORCE SNAPSHOT command.
	1	The tape drive will save Snapshot logs to non-volatile flash memory after they have been created in volatile memory following a Snapshot On trigger condition (SOCC, SOU, SODEC and SOSD), except in the following circumstances: <ul style="list-style-type: none"> • A Snapshot log in flash (STTF log) is being written to or read from. • The last Snapshot log saved to flash was created for the same error condition or a related error condition. When STTF is set to 1, the FORCE SNAPSHOT command can save Snapshot logs to flash.
SOSD	<i>Snapshot On Sense Data</i>	
	0	The drive ignores the contents of the Sense Key, Additional Sense Code, and Additional Sense Code Qualifier fields.
	1	The drive initiates creation of a new Snapshot log when a device server returns CHECK CONDITION status to a command, or an unload operation fails with the sense data specified in the Sense Key, Additional Sense Code, and Additional Sense Code Qualifier fields.
SODEC	<i>Snapshot On Drive Error Code</i>	
	0	The drive ignores the contents of the Drive Error Code field.
	1	The drive initiates creation of a new Snapshot log when a device server returns CHECK CONDITION status to a command, or an unload operation fails with the sense data specified in the Drive Error Code field.
SOU	If the <i>Snapshot on Unload</i> bit is set to one the tape drive will initiate the creation of a new Snapshot log when the tape drive unloads media except in the following circumstances: <ul style="list-style-type: none"> • The tape drive is already in the process of creating a Snapshot log. • The snapshot commands are in the process of being set. 	
SOCC	If the <i>Snapshot on CHECK CONDITION</i> bit is set to one the tape drive will initiate the creation of a new Snapshot log when the tape drive reported CHECK CONDITION status to a command that failed during execution for a media error or hardware error, except in the following circumstances: <ul style="list-style-type: none"> • The tape drive is already in the process of creating a Snapshot log. • The snapshot commands are in the process of being set. 	
Max Log Length	Specifies the maximum log length of Snapshot logs created by the drive. For the SET Enhanced SNAPSHOT CONFIGURATION command, it is ignored.	

SET Enhanced SNAPSHOT CONFIGURATION specific status

- If the Sense Key, Additional Sense Code, and Additional Sense Code Qualifier fields are set to 00h, the device server will terminate the command with CHECK-CONDITION, a sense key of ILLEGAL REQUEST and additional sense 2400h (invalid field in CDB).
- If the Drive Error Code field is set to 00h, the device server will terminate the command with CHECK-CONDITION, a sense key of ILLEGAL REQUEST and additional sense 2400h (invalid field in CDB).

SET STTF CONFIGURATION A4h (1Fh)

SET STTF CONFIGURATION is used to configure the events that trigger the creation of STTF logs, to set the maximum size and number of logs created and reset the Snapshot sub-system back to its manufacturing default configuration.

The command specifies the trigger conditions for creating Snapshot logs that are subsequently stored in non-volatile flash memory. However, Snapshot logs will not be created in any of the following circumstances:

- The Snapshot sub-system is already in the process of creating a snapshot log.
- The snapshot commands are in the process of being set.
- An STTF log has been created within the STTF Free Period.

<i>STTF Configuration List</i>								
4	First STTF Configuration Descriptor							
<i>n</i>								
:	:							
	Last STTF Configuration Descriptor							
<i>m</i>								

Data Length	The length in bytes of the data available to be transferred (excluding the number of bytes in the Data Length field). The field must be set to 0000h in a SET STTF CONFIGURATION command		
STP	<i>Save Trigger Parameters</i>		
	0	The specified STTF configuration is volatile and will return to the previous non-volatile configuration on a drive reset event.	
	1	The drive saves the STTF configuration specified in the parameter list in non-volatile memory, overwriting the current STTF configuration.	
RMD	0	The configuration contained in the STTF configuration list will be applied. The RMD bit must be set to zero in a REPORT STTF CONFIGURATION response.	
	1	If the STTF configuration list contains no descriptors, the STTF configuration will be reset to the manufacturing default values, including the default User-Defined Command Set.	
STTF Configuration Descriptor	The STTF Configuration list contains the descriptors that define the user configurable STTF trigger conditions for creating a snapshot log, the Command Set used to create the log and whether the non-volatile log can be overwritten. The SET STTF CONFIG command overwrites all pre-existing user-configurable STTF trigger conditions stored in volatile memory and, if the STP bit is set to one, in non-volatile memory as well.		
	The following table shows which snapshot configuration descriptors are supported and the number of times each descriptor can appear in the same parameter list. Details of each descriptor are given below.		
	Code	Description	Max
	00h	STTF Control	1
	01h	STTF Flash Management	1
	02h	STTF On Load Failure	1
	03h	STTF On Unload Failure	1
	04h	STTF On Forced Eject	1
	05h	STTF On Unload	1
	06h	STTF On Check Condition Status	1
	07h	STTF On Reported Drive Error	4
	08h	STTF On Reported Sense Data	4
	09h	STTF On Fault Log Error Code	4
	0Ah	STTF On Trace Point	4
0Bh	STTF On ADT Reported Error	4	

STTF Control descriptor

The STTF Control descriptor allows an application to modify snapshot sub-module features that are not specific to trigger events. The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (00h)							
1	Descriptor Length (04h)							
2-3	Reserved (0)							
4	STTF Free Period							
5								

STTF Free Period	The minimum period after an STTF Log has been saved before another can be saved, in seconds.
-------------------------	--

STTF Flash Management descriptor

The STTF Flash Management descriptor allows an application to specify the size of two regions used to store STTF logs, how many STTF logs can be stored in each of the regions, and which section STTF logs are stored in.

STTF logs are stored in two equally-sized regions of flash that are not contiguous. A log cannot span across the two physical regions. The size of each of the two physical flash regions is defined by the system parameter `STTF_MAX_SIZE`. The two regions can be configured into two logical sections. The combined size of the two logical sections is limited by the amount of physical flash available ($2 \times \text{STTF_MAX_SIZE}$), but one section can be larger than `STTF_MAX_SIZE`. Each of the logical flash sections can be independently sub-divided to store multiple STTF logs to allow one section to store STTF logs from a number of specified Command Sets, and the other section to store STTF logs from all other Command Sets. This allows for efficient use of the flash, because STTF logs created using the Drive Health Command Set are significantly smaller than those created using the Debug Command Set. If only one command set is used, or all STTF logs are expected to be of similar size, then the size of flash section 2 may be set to zero. Take care to ensure that the available flash space is used efficiently by defining the appropriate section sizes for the number of STTF logs in each section, because an STTF log cannot span both physical flash regions.

The format of the descriptor is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (01h)							
1	Descriptor Length (08h)							
2-3	Physical Flash Size							
4	Flash Section 2 Size							
5								
6	Max STTF Logs Section 1							
7	Max STTF Logs Section 2							
8	Reserved (0)				CCS	DHCS	DCS	UDCS
9	Reserved (0)							

The UDCS bit, DCS bit, DHCS bit, and CSS bit specify a mapping between the command set used to create snapshot logs and the logical flash section in which those logs will be saved.

Physical Flash Size	The number of 65536 byte segments of physical flash space available for storing STTF logs in a REPORT STTF CONFIGURATION command parameter list. The Physical Flash Size will be set to 00h in a SET STTF CONFIGURATION command	
Flash Section 2 Size	The size of logical flash section 2, in 65536 byte segments. The value must be less than the Physical Flash Size field value reported in a REPORT STTF CONFIGURATION command parameter list.	
Max STTF Logs Section n	The maximum number of STTF logs that may be stored in each logical flash section. The maximum sum total of STTF logs that may be stored in both flash sections is defined by the system parameter NV_MAX_STTF_LOGS. The values must be multiples of 2.	
UDCS	<i>User-Defined Command Set</i>	
	0	Any subsequent STTF log created using the Default/User-Defined Command Set will be stored in logical flash section 1.
	1	Any subsequent STTF log created using the Default/User-Defined Command Set will be stored in logical flash section 2.
DCS	<i>Debug Command Set</i>	
	0	Any subsequent STTF log created using the Debug Command Set will be stored in logical flash section 1.
	1	Any subsequent STTF log created using the Debug Command Set will be stored in logical flash section 2.
DHCS	<i>Drive Health Command Set</i>	
	0	Any subsequent STTF log created using the Drive Health Command Set will be stored in logical flash section 1.
	1	Any subsequent STTF log created using the Drive Health Command Set will be stored in logical flash section 2.
CCS	<i>Combined Command Set</i>	
	0	Any subsequent STTF log created using the Combined Command Set will be stored in logical flash section 1.
	1	Any subsequent STTF log created using the Combined Command Set will be stored in logical flash section 2.

STTF On Load Failure descriptor

This descriptor defines the Command Set used to create the STTF log when the drive completes an unsuccessful load operation.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (02h)							
1	Descriptor Length (02h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							

Protect	0	STTF logs resulting from the trigger condition defined in this descriptor may be overwritten by another STTF log, or cleared.
	1	STTF logs resulting from the trigger condition defined in this descriptor will not be overwritten by another STTF log.
AMPL	<i>Allow Multiple Protected Logs.</i> Determines whether the drive can store multiple protected STTF logs for the trigger conditions specified in this descriptor.	
	0	The drive may continue to create STTF logs but they will not be protected if the drive has already stored a protected STTF log for the trigger condition specified in this descriptor. The AMPL bit must be set to zero when the Protect bit is set to zero.
	1	The drive may continue to create protected STTF logs after one has already been stored for the trigger condition specified in this descriptor.
ACT	<i>Allow Consecutive Triggers.</i> Determines whether the drive can create consecutive STTF logs for the same trigger condition specified in this descriptor.	
	0	The drive cannot create consecutive STTF logs for the same trigger condition.
	1	The drive can create consecutive STTF logs for the same trigger condition.
NSFP	<i>No STTF Free Period.</i> Determines whether the drive can create STTF logs for the trigger condition specified in this descriptor during the STTF Free Period.	
	0	The drive cannot create an STTF log for a trigger condition specified in this descriptor during the STTF Free Period
	1	The drive can create an STTF log for a trigger condition specified in this descriptor during the STTF Free Period.

STTF On Unload Failure descriptor

This descriptor defines the Command Set used to create the STTF log when the drive completes an unsuccessful unload operation.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (03h)							
1	Descriptor Length (02h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							

The field are the same as in the “STTF On Load Failure descriptor” (page 243).

STTF On Forced Eject descriptor

This descriptor defines the Command Set used to create the STTF log when the drive completes an Forced Eject operation.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (04h)							
1	Descriptor Length (02h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							

The fields are the same as in the “STTF On Load Failure descriptor” (page 243).

STTF On Unload descriptor

This descriptor defines the trigger conditions for creating STTF logs on successful unload events. It also defines the Command Set used to create the STTF log.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (05h)							
1	Descriptor Length (02h)							
2	Reserved (0)		ACT	NSFP	Command Set			
3	Reserved (0)						Full Unload	Partial Unload

ACT and NSFP fields are the same as in the “STTF On Load Failure descriptor” (page 243).

Full Unload	0	When a full unload operation is successful, the drive does not create an STTF log.
	1	When a full unload operation is successful, the drive initiates the creation of an STTF log, using the Command Set specified in the Command Set field.
Partial Unload	0	When a partial unload operation is successful, the drive does not create an STTF log.
	1	When a partial unload operation is successful, the drive initiates the creation of an STTF log, using the Command Set specified in the Command Set field.

STTF On Check Condition descriptor

This descriptor defines the Command Set used to create the STTF log when the drive terminates a command from a host on the primary port, with CHECK CONDITION status and a sense key of MEDIA ERROR (03h) or HARDWARE ERROR (04h).

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (06h)							
1	Descriptor Length (02h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							

The fields are the same as in the “STTF On Load Failure descriptor” (page 243).

STTF On Drive Error descriptor

This descriptor defines the Command Set used to create the STTF log when the drive terminates a command from a host on the primary port, with CHECK CONDITION status and the specified drive error code.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (07h)							
1	Descriptor Length (04h)							

	7	6	5	4	3	2	1	0
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							
4	Drive Error Code							
5								

The Protect, AMPL, ACT, NSFP and Command Set fields are the same as in the “STTF On Load Failure descriptor” (page 243).

Drive Error Code	The drive error code that will trigger the creation of a snapshot log when reported to a host on the primary port.
-------------------------	--

STTF On Sense Data descriptor

This descriptor defines the Command Set used to create the STTF log when the drive terminates a command from a host on the primary port, with CHECK CONDITION status and the specified sense data.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (08h)							
1	Descriptor Length (04h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Sense Key							
4	Additional Sense Code							
5	Additional Sense Code Qualifier							

The Protect, AMPL, ACT, NSFP and Command Set fields are the same as in the “STTF On Load Failure descriptor” (page 243).

The Sense Key, Additional Sense Code, and Additional Sense Code Qualifier fields specify the sense data that will trigger the creation of a snapshot log when reported to a host on the primary port.

STTF On Fault Log descriptor

This descriptor defines the Command Set used to create the STTF log when the drive adds the specified drive error code into the Fault log.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (09h)							
1	Descriptor Length (04h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							
4	Fault Error Code							
5								

The Protect, AMPL, ACT, NSFP and Command Set fields are the same as in the “STTF On Load Failure descriptor” (page 243).

Fault Error Code	The short-form drive error code that will trigger the creation of an STTF log when entered into the Fault log.
-------------------------	--

STTF On Trace Point descriptor

This descriptor defines the Command Set used to create the STTF log when the drive adds the specified Trace Point identifier into the System ARM log.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (0Ah)							
1	Descriptor Length (04h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	Reserved (0)							
4	Trace Point ID							
5								

The Protect, AMPL, ACT, NSFP and Command Set fields are the same as in the “STTF On Load Failure descriptor” (page 243).

Trace Point ID	The Trace Point identifier that will trigger the creation of an STTF log when entered into the System ARM log.
-----------------------	--

STTF On ADT Reported Error descriptor

This descriptor defines the Command Set used to create the STTF log when the drive terminates a command from a host on the specified ADT port, with CHECK CONDITION status and the specified drive error code.

The format is as follows:

	7	6	5	4	3	2	1	0
0	Descriptor Type (0Bh)							
1	Descriptor Length (04h)							
2	Protect	AMPL	ACT	NSFP	Command Set			
3	ADT Port Identifier							
4	Drive Error Code							
5								

The Protect, AMPL, ACT, NSFP and Command Set fields are the same as in the “STTF On Load Failure descriptor” (page 243).

ADT Port Identifier	00h	ADI port
	01h	AMI port
	02h	DTI port

	03h	iADT port
	04h	iAMI pot
	05h	iADI-TLS port
	06h	iAMI-TLS port
	07h	iDTI-A port
	08h	iDTI-B port
	09h	iDTI-C port
	0Ah–FFh	Reserved
Drive Error Code	The drive error code that will trigger the creation of a snapshot log when reported to the ADT port specified in the ADT Port Identifier field.	

SET STTF CONFIGURATION *specific status*

- If the RMD bit is set to one, and one or more snapshot configuration descriptors are specified in the parameter data, the device server will terminate the SET STTF CONFIGURATION command with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense of 2600h (invalid field in parameter list).
- If the Physical Flash Size field in the STTF Flash Management descriptor is not set to 00h in a SET STTF CONFIGURATION command, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST and additional sense data of 2600h (invalid field in parameter list).
- If the Flash Section2 Size field in the STTF Flash Management descriptor is set to a value equal to or greater than the total amount of physical flash in a SET STTF CONFIGURATION command parameter list, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2600h (invalid field in parameter list).
- If the Max STTF Logs Section 2 field is set to a value greater than the Flash Section 2 Size field value, or is not a multiple of Flash Section 2 Size, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2600h (invalid field in parameter list).
- If the Max STTF Logs Section 1 field is set to a value greater than the number of 65536 byte segments in section 1, or is not a multiple of two, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2600h (invalid field in parameter list).
- In a SET STTF CONFIGURATION command parameter list, if Flash Section 2 Size is set to 00h and the Max STTF Logs Section 2, UDACS, DCS, DHCS and CCS fields are not set to 0, the device server will terminate the command with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2600h (invalid field in parameter list).
- In the STTF On Load Failure descriptor, if the Protect bit is set to zero and the AMPL bit is set to one, the device server will terminate with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2600h (invalid field in parameter list).

SET TIMESTAMP A3h (1Fh)

The SET TIMESTAMP command requests the device server to initialize the timestamp, if the SCSIP bit is set to one or the TCMOS bit is set to one in the [“Control Extension sub-page” \(page 103\)](#). If the SCSIP bit is set to zero, the SET TIMESTAMP command will terminate with CHECK CONDITION, a sense key of ILLEGAL REQUEST, and additional sense of 2400h (invalid field in CDB).

When a SET TIMESTAMP command completes successfully, the device server will generate UNIT ATTENTION for the initiator port associated with every L_T nexus except the L_T nexus on which the SET TIMESTAMP command was received (see SAM-4), with additional sense of 2A10h (timestamp changed).

CDB fields

Parameter List Length	The length in bytes of the parameters to be transferred from the application client to the device server. A length of zero indicates no data will be transferred, and the timestamp will remain unchanged.
------------------------------	--

SET STTF CONFIGURATION A4h (1Fh)

The SET STTF CONFIGURATION command is used to configure the events that trigger the creation of STTF logs, to set the maximum size and number of logs created and reset the Snapshot sub-system back to its manufacturing default configuration.

The command specifies trigger conditions for creating Snapshot logs that are subsequently stored in non-volatile flash memory. The Snapshot sub-system will not create a snapshot logs when a trigger condition occurs in any of the following circumstances:

1. The Snapshot sub-system is already in the process of creating a snapshot log.
2. The snapshot commands are in the process of being set.
3. An STTF log has been created within the STTF Free Period.

The STTF Configuration list contains the descriptors that define the user configurable STTF trigger conditions for creating a Snapshot log, the Command Set used to create the log and whether the non-volatile log can be overwritten. The SET STTF CONFIGURATION command overwrites all pre-existing user configurable STTF trigger conditions stored in volatile memory and, if the STP bit is set to one, overwrites all pre-existing user configurable STTF trigger conditions stored in non-volatile memory.

Pre-execution checks

	0Bh	STTF On Trace Point	4
		STTF On ADT Reported Error	4

SPACE 11h/91h

SPACE provides a variety of positioning functions that are determined by Code and Count fields in the Command Descriptor Block. Both forward (towards EOM) and reverse (towards BOM) positioning are provided.

Any unwritten data in the buffer is flushed to tape before the space is started. The logical media position is then modified according to the Code and Count fields. Once the space has started, it will complete even if the SCSI operation is aborted for some reason (for example, the host selects and sends an abort message).

Pre-execution checks

Illegal Field

	7	6	5	4	3	2	1	0	
12	(MSB) _____							_____	
13	Parameter Length							(LSB)	
14	Reserved (0)								
15	Control								

CDB fields

Code	The Code field indicates what is to be spaced to:	
	000	Blocks —The number of blocks crossed is dictated by Count.
	001	Filemarks —The number of filemarks crossed is dictated by Count.
	011	EOD —Space to the end of data in the current active partition.
Count	<ul style="list-style-type: none"> When spacing over <i>blocks</i> or <i>filemarks</i> this field indicates how many blocks or marks should be crossed. Spacing is forward (towards EOM) unless Count is negative (twos complement) when the spacing is towards BOM. When spacing to <i>EOD</i> the Count field is ignored. When not spacing to EOD, if Count is zero, the SPACE command is treated as a null operation. The logical position remains unchanged, and unwritten data is not flushed to tape. 	
Parameter Length	0	Explicit block mode is not supported.

SPACE specific status

If the drive fails to space either from a medium error or from some sort of non-fatal drive error, CHECK CONDITION status is reported. The sense key will be set to MEDIUM ERROR. Additional sense depends on the nature of the error. The two most common additional sense code and qualifiers in this case will be: 1100h (unrecovered read error) and 3B00h (sequential positioning error).

The drive implements the following priority scheme when a tape position point is encountered:

<i>Lowest priority</i>	Blocks	
	Filemarks	If the drive meets a filemark while spacing to a block CHECK CONDITION is reported. The Mark bit in the sense data is set, and the sense key is NO SENSE. Additional sense is 0001h (filemark encountered). The final position will be before or after the filemark depending on whether the space was reverse or forward.
	EOD	If the drive meets EOD while spacing to a block or mark, CHECK CONDITION is reported. The EOM bit in the sense data is set. The sense key is BLANK CHECK and additional sense is 0005h (EOD encountered).
	BOM	If the drive meets BOM while spacing, CHECK CONDITION is reported. The EOM bit and Valid bit in the sense data are set to 1 and the information bytes set to the total number of blocks or filemarks that remain to be spaced over (in other words, the requested number minus the number that have been spaced over). The sense key is NO SENSE and additional sense is 0004h (BOT detected).
<i>Highest priority</i>	EOM	If the drive meets EOM while spacing, CHECK CONDITION is reported. The EOM bit in the sense data is set. The sense key is MEDIUM ERROR and additional sense is 0002h (EOP/M detected).

- If “blank media” is encountered during a space (in other words, the drive attempted to space on an unformatted tape), the drive behaves as if EOD was at BOM. It will then respond with

GOOD status to a request to space to EOD, and with CHECK CONDITION to any other forward spacing request. Additional sense is set to 1403h (End of data not found).

- Early warning end of medium information is not reported.
- If a space records or space filemarks command fails then the sense data information bytes will be set to the absolute value of the difference between the requested number of marks/records and the actual number of marks/records spaced over and the Valid bit set. The residue for a prematurely terminated Space towards BOM will always be a positive value. *NOTE:* This value will only be accurate if the sense key is NO SENSE.
- If the format of the data on tape is corrupt then CHECK CONDITION status is reported. The sense key will be set to MEDIUM ERROR. Additional sense will be set to 3001h (unknown format).
- If the drive fails to read data from tape due to either a MEDIUM ERROR or some sort of non fatal drive error then CHECK CONDITION status is reported. The sense key will be set to HARDWARE ERROR. Additional sense will be set to 3B00h (sequential positioning error).

START/STOP (CD-ROM mode) 1Bh

START/STOP is executed for 1Bh when the drive is in CD-ROM mode. When out of CD-ROM mode, the LOAD/UNLOAD command, which shares the opcode, is executed.

Assuming that the pre-execution checks are passed, GOOD status is always reported.

Pre-execution checks

Illegal Field	Bad LUN	Reservation
Deferred Error	Unit Attention	

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (1Bh)							
1	Logical Unit Number			Reserved (0)				Immed

Immed	This flag is ignored.
LoEj	Load/Eject. This flag is ignored.
Start	This flag is ignored.

TEST UNIT READY 00h

TEST UNIT READY checks if the drive is ready for commands that access the tape. This is done by the pre-execution Media Access check; it is not a request for a self-test. If the drive has a tape loaded, the command returns a GOOD status. Otherwise, CHECK CONDITION is reported and the sense key is NOT READY.

5	Control							

TEST UNIT READY specific status

If all the pre-execution checks pass, GOOD status is reported.

VERIFY 13h

VERIFY verifies one or more blocks beginning with the next block on the tape. The verification is media verification only. It reads data from the tape as it would for a read but then immediately discards it. No data is transferred between the host and drive.

The command is identical to the READ command in most respects. The pre-execution checks are identical. Sense data reporting on errors/exceptions is identical. The only differences are:

- No data phases occur during verification.
- The Verify command has no SILL bit. When an illegal length record is encountered, Verify behaves like READ with the SILL bit clear.

NOTE: Verify will not complete until all data has been read. It does not support the ANSI "byte compare" or "Immed" options (see the ANSI SCSI specification).

BCmp	0	The Byte compare option is not supported, so this bit must be 0.

Fixed	0	The Verification Length field specifies the length of the data to be verified in bytes.
	1	The Verification field specifies the length of the data to be verified in blocks. The size of each block (in bytes) is specified by the current block length specified in the Mode Parameter block descriptor.
Verification Length	0	No data is verified. This is not considered an error and the current logical position will be unchanged.
	>0	The amount of data to be verified, in bytes or blocks as specified by the Fixed field.

WRITE 0Ah

Zero or more blocks of data are transferred from the host to tape starting at the current logical position.

It is recommended that the Buffered Mode field of the MODE SELECT Parameter is set to either 1 or 2 so that Immediate reporting is enabled; upon a write command the drive will report GOOD status once the data is successfully transferred to the data buffer (but not necessarily to tape).

Data held in the buffer is flushed to tape in the following circumstances:

- A SCSI command is received that forces a flush:

ERASE	LOAD	LOCATE	LOG SELECT	MODE SELECT	READ
REWIND	SEND DIAGNOSTIC	SPACE	VERIFY	WRITE BUFFER	

- Buffered mode is not enabled. If buffered mode has not been set to 1 or 2, the buffer is flushed before the command completes.
- The write delay time is exceeded. This is defined by the Write Delay field of the Device Configuration Mode Select page. If the drive is idle for longer than this (no operations that access the tape have been performed), any data in the buffer is flushed to tape.

Pre-execution checks

Illegal Field	Fixed Bit	Reservation	Deferred Error
Unit Attention	Media Access	Media Write	Diagnostic Status

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (0Ah)							
1	Reserved (0)							Fixed
2	(MSB)	Transfer Length						(LSB)
4								
5	Control							

CDB fields

Fixed	0	The Transfer Length field specifies the length of the transfer in bytes.
	1	The Transfer Length field specifies the length of the transfer in blocks. The size of each block (in bytes) is determined by the current Block Length given in the Mode Select Parameter block descriptor.

Transfer Length	0	No data is transferred. The current logical position will be unchanged.
	>0	The amount of data to be transferred, in bytes or blocks as determined by the Fixed field.

WRITE specific status

See also the “Additional Sense codes” (page 207) for a variety of possible hard errors.

An attempt to write to a write-protected cartridge will produce a CHECK CONDITION with a sense key of DATA PROTECT and additional sense of 2700h (write-protected).

An attempt to write to a cartridge whose Cartridge Memory has failed will produce a CHECK CONDITION with a sense key of MEDIUM ERROR and additional sense of 3004h (cannot write medium). If, however, the tape is not positioned at BOT, the drive will respond with sense data as if the tape is write-protected. The WP flag in the Mode Parameter Header will also be set.

If EOM (end of medium) is encountered during a write, CHECK CONDITION status is reported. The EOM flag will be set. The sense key will be set to VOLUME OVERFLOW with additional sense of 0002h (EOT). Residue information will be as below. The logical position will be EOD.

Subsequent Request Sense commands will, however, give tape position as EOP/M. It may still be possible to write a smaller quantity of information (such as filemarks or a smaller block). This is because logical position after failure to write a block returns to the start of the unwritten block.

Early Warning EOM information is reported only if a write operation is successful. This is done by reporting CHECK CONDITION status with a sense key of NO SENSE and additional sense of 0002h (EOT). Residue information is valid and indicates zero blocks/bytes.

Residue information

Residue information depends on two variables:

- Fixed or Variable block mode
- Immediate or Non-Immediate Report (Buffered mode)

Block Mode	Buffered Mode	Residue
Variable	0	Number of unwritten bytes
Fixed	0	Number of unwritten blocks
Variable	not 0	Total number of unwritten bytes and marks (including those buffered before the command was received). The size can be greater than the command operation size.
	specifically 1	Contains residues of all initiators with data in the buffer.
Fixed	not 0	Total number of unwritten blocks and marks (including those buffered before the command was received). The size can be greater than the command operation size.
	specifically 1	Contains residues of all initiators with data in the buffer.

Residue information is set in the sense data byte, with the Valid bit set and the information bytes set to the residue.

WRITE ATTRIBUTE 8Dh

The WRITE ATTRIBUTE command allows an application client to write attribute values to MAM (Medium Auxiliary Memory). Application clients should issue READ ATTRIBUTE commands before using this command to discover what support the device server has for MAM.

Pre-execution checks

Illegal Field

Deferred Error

Unit Attention

Media Access

For this command to be executed, there must be a tape in the drive, even if it is only partially loaded.

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (8Dh)							
1–4	Reserved (0)							
5	Volume Number (0)							
6	Reserved (0)							
7	Partition Number							
8–9	Reserved (0)							
10	(MSB)	Parameter List Length						(LSB)
13	Reserved (0)							
14	Reserved (0)							
15	Control							

CDB fields

Volume Number	The number of the volume within the MAM. The number of volumes of the MAM must be equal to that of the tape. In the case of LTO Ultrium, the only has a single volume, so this field is set to 0.	
Partition Number	The number of the partition within the MAM. The number of partitions of the MAM must be equal to that of the tape.	
Parameter List Length	The length in bytes of the parameter list contained in the Data-Out buffer.	
	0	The Data-Out buffer is empty. This condition is not be considered an error.
	<i>n</i>	The length in bytes of the parameter list contained in the Data-Out buffer.

WRITE ATTRIBUTE parameter list format

The parameter list has the following format. The attributes should be sent in ascending numerical order. For details of attribute data see “MAM attribute data” (page 142).

	7	6	5	4	3	2	1	0
0	(MSB)	Parameter Data Length (<i>n</i> –3)						(LSB)
3								
4	Attribute 1							
<i>a</i>								
:	:							
<i>m</i>	Attribute <i>x</i>							
<i>n</i>								

Parameter Data Length	This is not mandatory and will be ignored by the device server because it duplicates the Parameter List Length.
------------------------------	---

If the parameter data contains an attribute with an Attribute Length of zero, one of the following actions will occur:

- If the attribute is read-only or unsupported, no attributes are changes. The command fails, returning CHECK CONDITION with ILLEGAL REQUEST sense and additional sense of 2600h (invalid field in parameter list).
- If the attribute can be written to, it is deleted and will not be returned after a subsequent READ ATTRIBUTE command.
- If the attribute does not exist, the command cannot affect it. This is not considered an error.

WRITE ATTRIBUTE specific status

The command will be terminated and will return CHECK CONDITION under the following circumstances:

Description	Sense Key	Additional Sense	
There is no cartridge present in the drive, not even partially loaded.	NOT READY	3A00h	(medium not present)
The Parameter List Length results in the truncation of an attribute.	ILLEGAL REQUEST	1A00h	(parameter list length error)
The combination of Volume Number and Partition Number is not valid.	ILLEGAL REQUEST	2400h	(invalid field in CDB)
The parameter data attempts to change a read-only attribute, that is, one that has the Read-Only bit (see “MAM attribute data” (page 142)) set to one when read with the READ ATTRIBUTE command. None of the attributes are changed.	ILLEGAL REQUEST	2600h	(invalid field in parameter list)
The parameter data contains an attribute with an incorrect Attribute Length field value. None of the attributes are changed.	ILLEGAL REQUEST	2600h	(invalid field in parameter list)
The parameter data contains an attribute with an unsupported Attribute Value field value. None of the attributes are changed.	ILLEGAL REQUEST	2600h	(invalid field in parameter list)
The attributes are not in ascending order in the Parameter List. None of the attributes are changed.	ILLEGAL REQUEST	2600h	(invalid field in parameter list)
There is not enough space to write all the attributes to the MAM. None of the attributes are changed.	ILLEGAL REQUEST	5506h	(MAM full)

WRITE BUFFER 3Bh

Write Buffer is used to transfer data into memory on the drive for the purposes of diagnostics, tests or firmware upgrade. The data is placed into one of the drive buffers depending on the Mode and Buffer ID fields of the command.

- ⚠ CAUTION:** Do not attempt to use the buffer modifying functions of this command unless you really know what you are doing. The buffer modifying functions are intended as a diagnostic aid to be used in conjunction with the READ BUFFER command. It is not possible to modify data in the buffer so that it subsequently written to media because all host data is flushed before executing the command.

The firmware download functions are intended for use by manufacturing and by customers using upgrade utilities supplied by HP.

Pre-execution checks

Illegal Field

Reservation

Deferred Error

Unit Attention

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (3Bh)							
1	Reserved (0)			Mode				
2	Buffer ID							
3	(MSB)	Buffer Offset						(LSB)
5	(LSB)							
6	(MSB)	Parameter List Length						(LSB)
8	(LSB)							
9	Control							

CDB fields

Mode	This field can be set to one of the following values:	
	00h	The drive transfers a 4-byte header from the host (which should be set to zeros), followed by (<i>allocation length</i> – 4) bytes of data. The data is written into the buffer identified by the Buffer ID, starting from offset zero in the buffer. The Buffer ID and Buffer Offset must both be zero. Allocation Length must not exceed (<i>buffer size</i> + 4).
	02h	The drive transfers allocation length bytes of data from the host, bytes of data which is placed in the buffer indicated by Buffer ID, starting from Buffer Offset from the start of the buffer. No header is sent. The Buffer Offset and Allocation Length must be kept within the buffer size, and the Buffer ID must to set to one of the valid values.
	04h	This mode is used to transfer new firmware to the drive. The drive receives Allocation Length bytes of data from the host. The data is stored in the drive's buffer. The location in the buffer at which the data is written is determined by the firmware. The firmware image is divided into a number of blocks of data which are sent to the drive using multiple Write Buffer commands. All the firmware image data should be transferred using this mode. The Buffer ID and Buffer Offset are ignored.
	05h	This mode is used to indicate that the complete firmware image has been sent to the drive. This is the signal for entering the FLASH reprogramming stage of the firmware upgrade process. Once this command has been received, and the associated data stored in the buffer, the resident firmware checks the validity of the image that has been received. If this seems to be correct, the Firmware Upgrade operation will commence. If any faults are detected in the format of the image, the drive will report CHECK CONDITION to the host. The sense key is ABORTED COMMAND, and the additional sense is set to 2600h (invalid field in parameter list). CAUTION: Once this command has been sent and completed, the drive's power supply must not be interrupted until the drive has completed the firmware upgrade. The Buffer ID and Buffer Offset are ignored.
	0Ah/1Ah	This mode is used to write to the Echo Buffer, which is 4096 bytes in size. The Buffer ID and Offset are ignored.
Buffer ID	Specifies which buffer to read. NOTE: Processor memory (Buffer ID 01h) is not accessible.	

	00h	Main buffer (RAM) Offset Boundary: 1 byte
	02h	FC burst buffer (RAM) Offset Boundary: 512 bytes, or SCSI burst buffer (RAM) Offset Boundary: 4 bytes
	13h	PCA EEPROM Offset Boundary: 1 byte
	20h—3Fh	Main buffer segments 0–31 (RAM) — see below for description
Buffer Offset	Where in the buffer the data should be written. This must be smaller than the size of the buffer and must obey the specified offset boundary. When downloading new firmware, this field is ignored.	
Parameter List Length	The amount of data. This must be smaller than the difference between the Buffer Offset field and the size of the buffer.	

Memory sizes

Main buffer memory

The Main Buffer memory is 512 MB.

Areas of the Main Buffer memory are used by the firmware. These should not be written to and should not be expected to retain values that are written to them. Any Write and Read Buffer tests should be performed while the drive is idle. If the drive is reading or writing, the data being written or read can be corrupted.

Since the drive has more than 16 MB of Main Buffer memory, additional buffer IDs have been defined to allow the whole buffer to be accessed in 16 MB segments. These are defined as follows:

Buffer ID	Address
20h	00000000h + Buffer Offset (same as Buffer ID 00h)
21h	01000000h + Buffer Offset (that is, +16 MB)
22h	02000000h + Buffer Offset (that is, +32 MB)
23h	03000000h + Buffer Offset (that is, +48 MB)
24h	04000000h + Buffer Offset (that is, +64 MB)
25h	05000000h + Buffer Offset (that is, +80 MB)
26h	06000000h + Buffer Offset (that is, +96 MB)
27h	07000000h + Buffer Offset (that is, +112 MB)
28h	08000000h + Buffer Offset (that is, +128 MB)
29h	09000000h + Buffer Offset (that is, +144 MB)
2Ah	0A000000h + Buffer Offset (that is, +160 MB)
2Bh	0B000000h + Buffer Offset (that is, +176 MB)
2Ch	0C000000h + Buffer Offset (that is, +192 MB)
2Dh	0D000000h + Buffer Offset (that is, +208 MB)
2Eh	0E000000h + Buffer Offset (that is, +224 MB)
2Fh	0F000000h + Buffer Offset (that is, +240 MB)
30h	10000000h + Buffer Offset (that is, +256 MB)
31h	11000000h + Buffer Offset (that is, +272 MB)
32h	12000000h + Buffer Offset (that is, +288 MB)
33h	13000000h + Buffer Offset (that is, +304 MB)

Buffer ID	Address
34h	14000000h + Buffer Offset (that is, +320 MB)
35h	15000000h + Buffer Offset (that is, +336 MB)
36h	16000000h + Buffer Offset (that is, +352 MB)
37h	17000000h + Buffer Offset (that is, +368 MB)
38h	18000000h + Buffer Offset (that is, +384 MB)
39h	19000000h + Buffer Offset (that is, +400 MB)
3Ah	1A000000h + Buffer Offset (that is, +416 MB)
3Bh	1B000000h + Buffer Offset (that is, +432 MB)
3Ch	1C000000h + Buffer Offset (that is, +448 MB)
3Dh	1D000000h + Buffer Offset (that is, +464 MB)
3Eh	1E000000h + Buffer Offset (that is, +480 MB)
3Fh	1F000000h + Buffer Offset (that is, +496 MB)

SCSI burst buffer

200000h bytes.

PCA EEPROM

The write range is limited to 400h bytes, starting at 60h (TapeTools area).

WRITE FILEMARKS 10h

WRITE FILEMARKS causes the specified number of filemarks to be written beginning at the current logical position on tape.

If the Immed bit is set, GOOD status may be reported and the marks left in the data buffer. Otherwise, all buffered data and marks are written before status is reported.

If zero filemarks are to be written, the Immed bit must be zero. The drive writes any buffered data and marks to tape before reporting. This is the recommended way for a host to flush the buffer.

Pre-execution checks

Illegal Field	Reservation	Deferred Error	Unit Attention
Media Access	Media Write	Diagnostic Status	

Command descriptor block

	7	6	5	4	3	2	1	0
0	Operation Code (10h)							
1	Reserved (0)						WSmk	Immed
2	(MSB)	Number of Filemarks						(LSB)
4								
5	Control							

CDB fields

Immed	0	Status will not be returned until the operation is complete.
	1	The drive returns GOOD status following the pre-execution checks (that is, before the command starts executing).
WSmk	0	This bit is not supported and must be set to zero.
Number of Marks	0	Zero is valid only when immediate report is disabled.
	>0	This number of filemarks is to be written.

WRITE FILEMARKS specific status

Write Filemark sense is identical to status for the Write command.

Glossary

algorithm	A rigorous set of rules for a procedure. In the context of data compression, the rules are for transforming the way data is represented.
ANSI	American National Standards Institute, which sets standards for, amongst other things, SCSI and the safety of electrical devices.
BOM	Beginning Of Media. The first point on the tape that can be accessed by the drive.
checksum	The sum of a series of bytes written to the tape, which can be checked against the sum of the same series of bytes when the tape is read in order to identify errors.
compression	A procedure in which data is transformed by the removal of redundant information in order to reduce the number of bits required to represent the data.
compression ratio	A measure of how much compression has occurred, defined as the ratio of the amount of uncompressed data to the amount of compressed data into which it is transformed. The LTO-DC algorithm can typically achieve a compression ratio of between 2:1 and 4:1 depending on the nature of the data.
data set	A fixed-size block of compressed host information.
decompression	A procedure in which the original data is generated from compressed data.
DSIT	Data Set Information Table. Part of the data set that describes its contents.
ECMA	European Computer Manufacturers Association. The European equivalent of ANSI.
enhanced commands	SCSI commands that are vendor-unique and not part of the common SCSI set.
EOD	End Of Data. An area that signifies the end of the valid data. If new data is written over a larger quantity of old data, it is possible for data to exist after EOD, but because it is after EOD, this old data is no longer valid.
EOM	End Of Media format. The last usable point on the tape.
EW-EOM	Early Warning End Of Media. A physical mark or a device-computed position on the tape that tells the drive that it is approaching EOM.
filemark count	The number of filemarks written since the beginning of the current tape up to and including the current group.
filemark	A mark written by the host. It does not necessarily separate files; it is up to the host to assign a meaning to the mark.
FRU	Field Replaceable Unit, an assembly or group of components that is replaced in its entirety by Service Engineers when it contains a fault.
host	The host computer system acting as controller for the drive.
immediate mode	A mode of responding to SCSI commands where the drive or other peripheral does not wait until the command has finished before returning status information back to the host. For writing filemarks, Immediate mode can significantly improve the performance of systems that do not set the Immediate bit when sending a SCSI Write Filemarks command. On the other hand, data is not flushed to tape in response to a filemark command.
load	The process in which the drive takes in an inserted cartridge and goes online.
LUN	Logical Unit Number, by which different logical units within a particular device can be addressed individually. Each logical unit contains a device server. The drive provides a SSC device server, typically at LUN 0, and an ADC device server, typically at LUN 7. Both may be reassigned, for example the ADI automation controller may reassign the ADC LUN by using the ADC Device Server configuration mode sub-page. Finally, the drive also provides optional SMC LUN(s), which may be assigned by an ADI automation controller at the time of enablement, typically at LUN 1.
RAW	see read-after-write
read-after-write	RAW improves data integrity by reading data immediately after it is written and writing the data again if an error is found.
reserved	Not generally available for use with the drive. A reserved field should contain all zero bits.

sense data	Data returned after the execution of a SCSI command, telling the host whether the transaction was successful, and if not, what went wrong.
sequential access	Sequential access devices store data sequentially in the order in which it is received. Tape devices are the most common sequential access devices. Devices such as disk drives are direct access devices, where data is stored in blocks, not necessarily sequentially. Direct access allows for speed of retrieval, but is significantly more costly.
spacing	Spacing is moving along the tape over a specified number of blocks or filemarks, or to EOD, in order to find data quickly.
sub-data set	One sixteenth of a data set .
TapeAlert	A set of 64 flags is held in the TapeAlert log that indicate faults or predicted faults with the drive or the media. By reading this log, host software can inform the user of existing or impending conditions, and can, for example, advise the user to change the tape.
vendor-unique	The addition of commands to SCSI that are not included in the standard.
