Introduction

The purpose of this document is to document the Oracle Tuxedo Application Runtime for CICS configuration, describing the configuration files, the environment variables and the server configuration including CLOPT options.

In addition this document includes information about the Oracle Tuxedo Application Runtime for CICS Preprocessor. Although the CICS Runtime Preprocessor is not a Runtime tool, it is used on an ongoing basis on the target platform when compiling COBOL programs for use with CICS Runtime.

The document includes the following chapters:

- CICS Runtime Concepts
- CICS Runtime Servers
- CICS Runtime Configuration Files
- VSAM Configuration File
- Cics Runtime Integration with Non-3270s Terminal
- Environment Variables
- Server Configuration
- Security Configuration
- CICS Commands and Parameters Coverage
- System Commands and Transactions
- CICS Runtime Server Build Tool
- CICS Runtime Preprocessor
- CICS Runtime Messages
- Configuring Oracle Tuxedo XA Connection to DB2 Using DB2 Connect
CICS Runtime Concepts

Purpose

There are different approaches to migrating CICS applications to a UNIX/Linux environment. The purpose of this section is to give an understanding not only of what CICS Runtime is and what it does, but also what it is not and what it does not do. Particularly the aim is to explain that CICS Runtime is not an emulation of the CICS application environment on a UNIX/Linux system. CICS Runtime keeps the application logic contained in the COBOL programs but is totally compatible with the Tuxedo client/server architecture for the execution of that logic. CICS Runtime provides a middleware between the CICS coding in the programs and the Tuxedo OLTP system, UNIX/Linux OS and Oracle database responsible for executing transactions and providing persistence.

CICS Runtime Goals

The first aim of CICS Runtime is to preserve the considerable investment already made in CICS applications by allowing migrated programs to run unchanged (except for a syntactic adaptation) by using an API emulation runtime on top of native Tuxedo features. This means the impact of migration is limited on:

- 3270 screens and BMS management; there is no impact on application end-users.
- EXEC CICS calls; there is no impact on developers.

At the same time, CICS Runtime is run entirely on a robust production environment based on Tuxedo that protects and guarantees application functionality.

In fact, CICS Runtime gives customers the benefits of Tuxedo distributed architecture without impacting application APIs. It allows the key strengths of Tuxedo to be leveraged and allows routes to the future including SOA to be opened.
CICS Runtime Architecture

Software Development Perspective

The following diagram shows the software bricks used to create the application environment on the migration source and target platforms.

Figure 2-1 Migration Software Environments

Except for the top and bottom bricks, there is little else that changes for the software developer.

Programmatic Interface

CICS Runtime offers a library of CICS API reproducing the functionality of the z/OS CICS API and offering equivalent services to the migrated CICS applications, and in addition it offers BMS capabilities with support for 3270 screens.

In a CICS application on a z/OS platform all interactions with resources are done thru the EXEC CICS API (with the exception of DB2).

The CICS Preprocessor (on Z/OS) transforms these EXEC CICS into calls to the CICS library.

On the target platform, the same philosophy is used; an CICS Runtime Preprocessor (an CICS Runtime compile-time tool) transforms these EXEC CICS into calls to the CICS Runtime library.

For the software developer, there is little that changes. The CICS Runtime preprocessor automatically changes the CICS API that is called. There are some limitations in the command that can be used; these are described in CICS Commands and Parameters Coverage.
System Administration Perspective

For a software administrator, there is little that remains the same. There are the same applications to be executed and end-users still access applications using the same 3270 terminals. Apart from that, everything else is different and relies on a native Tuxedo architecture to manage transactions with the aid of CICS Runtime to provide an API between the COBOL programs and Tuxedo.

Figure 2-2  CICS Runtime Architecture

CICS Runtime provides the run-time support to allow converted CICS applications to run in a robust production ready environment based on TUXEDO /T, while offering applications functionally equivalent behavior.

In term of deployment, the system is distributable on one or multiple machines in a single TUXEDO domain, or several domains communicating through a TUXEDO domain.

In term of administration, the administration is native TUXEDO, with all tuxedo administration tools being normally usable, plus a few administration tables for CICS only concepts, like terminal definitions, and Transaction - First Program table.

z/OS CICS Concepts in a CICS Runtime Environment

Developers and administrators used to working in a z/OS CICS environment naturally want to know how concepts familiar on the source platform are implemented on the target platform. Table 2-1 gives an overview of how the source platform notions have an equivalent on the target platform.
Administrative Tasks

Most of this guide describes how to administer resources for CICS application running with CICS Runtime on a Tuxedo system. CICS Runtime uses Tuxedo natively with the addition of a few extra resource files and servers.

This provides all the robust characteristics of Tuxedo including:

- Load balancing, priority management, Dynamic routing,
- Supervision, automatic restart of servers,
- Transparent distribution on multiple machines,
- Server migration from one machine to another,
- The distribution of the load of a new machine is very simple.
  - Declare the machine in the UBBCONFIG

Launch a few servers offering transactions on this machine

**CICS Runtime Cobol**

ART CICS Runtime runs in Cobol Micro Focus or Cobol IT. Micro Focus Cobol is still a reference. The Micro Focus features not supported by Cobol IT cannot be included in this product.

To keep compatible with ART CICS runtime, Cobol IT should be version 3.3.12 and later; CICS programs are required to be recompiled if once compiled by Cobol IT in previous version before.

BDB files can be used with Cobol IT only in XA mode.

**Subprogram Calls and Link Level in Micro Focus Cobol**

Subprogram working storage is initialized when the subprogram is called for the first time in a link level. After the return link, the working storage is initialized again when the subprogram is called for the first time in a new link at the same level.

For example:

```
LINK (level 1)+
   SP1 first call -(working initialized)
   RETURN
LINK (lev 1)
   SP1 first call -(working initialized)
```

Working storage is not initialized when subprogram is called in lower link levels.

For example:

```
LINK (lev 1)
   SP1 first call -(working initialized)
LINK (Lev 2)
   SP1 first call -(working not initialized)
```

This behavior is specific to Micro Focus Cobol and not applicable to Cobol IT. On Cobol IT, there is no initialization no matter in which links level subprograms are called.
CICS Runtime Concepts

CICS Runtime C

ART CICS Runtime C support is still COBOL depended. All CICS C programs are required to be complied with COBOL/cob complier and are executed in COBOL runtime. Therefore, COBOL installer is mandatory and currently only Microfocus COBOL is supported.

For more information about CICS Runtime C, please refer to CICS Runtime C Program Support.
CICS Runtime Servers

The CICS Runtime Servers

This section describes the different servers and the role they play in the overall handling of transactions. The configuration of the servers is described in Server Configuration.

3270 Terminals and User Session Management (ARTTCPL/ARTTCPH)

Description

The role of these servers is to accept and manage user connections made thru a 3270 terminal emulator and manage the resulting user session and related 3270 inputs and outputs until the end of the user session.

Functionally, this role resembles the one played by the Terminal Owning Region in a CICS MRO configuration.

These 3270 user session management tasks are managed by a couple of server types: ARTTCPL and ARTTCPH, where the final ‘L’ stands for listener and the final ‘H’ stands for handler.

- ARTTCPL — Performs the role of a listener server. ARTTCPL listens to a public address – the address to which users wanting to connect to this application with a 3270 emulator will connect – then for each incoming connection request, it transmits this connection to one of its handler processes.

- ARTTCPH — Each handler process manages multiple connections including terminal I/O, user authentication, and calling the requested transactions on behalf of the user.

It is the role of the ARTTCPL to launch and manage the requested number of handler processes (ARTTCPH).

Each time a user requests a transaction, ARTTCPH transmits (via tpconnect) this transaction request to the transaction server.
This functionality resembles that provided by T.O.R. in a CICS MRO configuration when it routes a transaction to an A.O.R (Application owning Region).

**Connection Server (ARTCNX)**

This server offers technical services needed by terminal handlers during user connection and disconnection phases.

The technical services are offered using internal message oriented services like `connect` and `disconnect`:

- `connect` performs various initialization tasks such as attributing the user Session ID and Terminal ID.
- `disconnect` manages final tasks during disconnection.

The connection server also provides a few classical CICS transactions:

- CESN: the Sign on transaction
- CESF: the Sign off transaction
- CSGM: the Good Morning transaction (default Good Morning transaction)

Specifically, ARTCNX handles the request from ARTTCPH and ARTSTRN/ARTSTR1, LUNAME validation check, and TER MID/LUNAME assignment. All services that ARTCNX publishes and their functionalities are listed as below.

- `gensess` generates a session ID for each terminal; the session ID is maintained internally in ART CICS.
- `delsess` frees session ID when its terminal terminates.
- `connect` generates a locally unique (unique in each CICS region) TER M ID and a globally unique LUNAME (unique in all CICS regions) for auto-install terminal, checks LUNAME validation for the LUNAME specified terminal, and changes TERM status to ACQUIRED.
- `disconnect` frees TER MID and LUNAME, and change TERM status to RELEASED.
- `inquire` handles INQUIRE NETNAME/TER M ID request from ARTSTRN.
- `update` handles SET TERMINAL request from ARTSTRN.
- `authfail` outputs the error message in terminal if CESN logon fails.
- CESN specifies the Sign on transaction
• CESF specifies the Sign off transaction

• CSGM specifies the Good Morning transaction (default Good Morning transaction)

Note: If ISC_ENABLE=YES is set, gensess and delsess will be published by ARTLOGN instead. See “Authentication Transactions” in System Commands and Transactions for more information.

Logon Server (ARTLOGN)

This server offers technical services needed by terminal handlers when users log on ART CICS.

This server offers the following services:

ART_LOGON sends the "ART runtime welcome" panel and asks for APPLID input.

gensess generates a globally unique session ID (unique in all CICS regions) with 16 characters for each terminal.

delsess removes the session ID when the corresponding terminal disconnects.

Note: ARTLOGN should be only configured when ISC_ENABLE=YES is specified; otherwise, the server will not boot.

System and Resource Management Server (ARTSRM)

This server centralizes the management of ART runtime information, which is generated and queried by applications.

Note:

• ARTSRM for the same region must be configured in the same tuxedo group.

• ARTSRM for the same region can be only configured on one host in MP environment.

• To get correct running time information, ARTSRM must be configured and started when Oracle Tuxedo is booted.

Synchronous Transaction Servers (ARTSTRN/ARTSTR1)

Description

The task of these servers (ARTSTRN and ARTSTR1) is to offer application transactions and process the corresponding programs.
This server provides a similar functionality to that provided by an Application Owning Region in a CICS MRO configuration. ARTSTRN/ARTSTR1 servers present application transactions as Tuxedo services and when receiving a transaction request execute the corresponding programs. These servers are conversational in order to be able to manage true conversational CICS transactions.

**Processing**

1. When starting, a ARTSTRN/ARTSTR1 server publishes one service per transaction it offers.

2. When a user transmits a transaction request, the ARTTCPH performs a tpconnect to the corresponding transaction (service).

3. One ARTSTRN/ARTSTR1 server offering this service receives the request with the associated commarea and screen, then processes the transaction.

4. Then:
   - In the case of a normal pseudo-conversational CICS transaction; on the RETURN \{TRANSID\} the server replies to the client, finishing the conversation by a tpreturn() returning the new 3270 screen, and the commarea.

**Non Concurrent Synchronous Transaction Servers (MAXACTIVE = 1 (ARTSTR1))**

- **On CICS:**
  - Transactions that are defined as belonging to a transaction class are subject to scheduling constraints before they are allowed to execute.
  - If transactions belonging to an active transaction class are already running, any new transactions are queued.
  - The MAXACTIVE attribute is used to specify the maximum number of transactions that you want to run.
  - By putting your transactions into transaction classes, you can control how CICS dispatches tasks.

- **In CICS Runtime:**
  - The scheduling of transactions and the affectations of resources to group of transactions is performed differently. The number of servers offering transactions determines the scheduling of transactions, and the relative amount of resources affected to a group of transactions.
– The special case of `MAXACTIVE 1`:
  * This case is very specific, because it impacts the functional characteristics of the application.
  * It ensures that two transactions of the same class will never execute concurrently. It defines a mutually exclusive behavior that is preserved on the target platform to guarantee correct behavior of the application.

The transactions belonging to a tranclass with a maxactive = 1, will not be offered by ARTSTRN servers, because several such servers can automatically be started to manage parallel processing. Instead, a dedicated type of server—ARTSTR1—is allocated to this role. An ARTSTR1 server publishes the transactions belonging to one TRANCCLASS with `MAXACTIVE = 1`, guaranteeing that two transactions of the same tranclass with maxactive = 1, will not execute concurrently. In Tuxedo terms, guaranteeing than two such transactions are not published by two different servers.

To summarize the differences:

- **ARTSTR1**: Publishes only once transactions belonging to a `MAXACTIVE 1` tranclass.
- **ARTSTRN**: Publish as many times as needed, transactions with `MAXACTIVE > 1`.

### Temporary Storage Queue Management (ARTTSQ)

#### Description

The role of the ARTTSQ servers is to centralise the management the TS Queue operations which are requested by applications. These tasks are managed by ARTTSQ servers. Depending on the workload expected on the TS queue, a single server or many ARTTSQ servers are configured.

ARTTSQ servers publish technical services:

- **TSQUEUE** to service operations on queues not matching any TS Queue Model.
- **{MODEL}_TSQUEUE** to service operations on queues matching a specific model, one such service must be published using one ARTTSQ server for each model.

In a simple configuration, a single ARTTSQ server will treat all the TS operations, offering the `TSQUEUE` service, and all `{MODEL}_TSQUEUE` services.

In a more complex configuration, one ARTTSQ server may offer the `TSQUEUE` and some `{MODEL}_TSQUEUE` services, while other ARTTSQ servers will each offer different `{MODEL}_TSQUEUE` services.
Tuxedo 12c EM pack monitors ARTTSQ, detailed TSQ properties, and statistics information can be retrieved via EM.

**Transient Data Queue Management (ARTTDQ)**

**Description**

The role of the ARTTDQ servers is to centralise the management the TD Queue operations which are requested by applications. These tasks are managed by one ARTTDQ server.

A single ARTTDQ server publishes one service per declared queue in the configuration file and will treat all the CICS TD operations, offering the TD QUEUE service for each queue.

Tuxedo 12c EM pack monitors ARTTDQ, detailed TDQ properties, and statistics information can be retrieved via EM.

**DPL Servers (ARTDPL)**

In complex configurations an application may need to make distributed program calls. In this case another kind of server is needed to manage DPL. These tasks are managed by ARTDPL servers.

ARTDPL servers publish programs that are callable by EXCI interface as services, and manage the execution of these services.

Following are the services ARTDPL publishes:

- `<applid>_info`: Submits transactions to the CICS region associated with `<applid>`.
- `default_info`: This service is called if `<applid>` is not specified in EXCI interface by the client.
- `<sysid>_<program>`: This service is advertised as service name.
- `<applid>_CSMI`: This service is called if `<transid>` is not specified but `<applid>` is specified in EXCI interface by the client.
- `CSMI`: This service is called if both `<applid>` and `<transid>` are not specified in EXCI interface by the client.
- `<applid>_MIRROR_<transid>`: This service is called if both `<applid>` and `<transid>` are specified in EXCI interface by the client.
- `MIRROR_<transid>`: This service is called if `<applid>` is not specified but `<transid>` is specified in EXCI interface by the client.
The CICS Runtime Servers

Note:

- `<applid>_CSMI, CSMI, <applid>_MIRROR_<transid>, and MIRROR_<transid>` are new services introduced since ART CICS rolling patch 015.
- The old services, `<applid>_info, default_info, and <sysid>_<program>`, are not routed if the user client is based on ART CICS rolling patch 015.

Asynchronous Transaction Servers (ARTATRN/ARTATR1)

An application may request an asynchronous transaction launch using `EXEC CICS START TRANSID`. In this case, the request needs to be treated asynchronously by another server. These tasks are managed by ARTATRN/ARTATR1.

Note: A request using the `EXEC CICS START TRANSID` command `TERMID` option is managed by ARTSTRN/ARTSTR1.

These servers publish transactions callable by `EXEC CICS START TRANSID` as services named `ASYNC_{Transaction_Name}`, and manage execution of these services.

Conversation Server (ARTCTRNR/ARTCTR1)

An application may request a conversation launch using `EXEC CICS CONVERSE` requests. In this case the request needs to be treated by another server. These tasks are managed by ARTCTRNR/ARTCTR1 servers.

These servers publish transactions callable by `EXEC CICS CONVERSE` as services named `{SysId}_{Transaction_Name}`, and manage execution of these services.

Synchronous Transactions Servers for Non-3270s Terminal Of Tuxedo ATMI Base (ARTWTRN/ARTWTR1)

Description

- Client Description

The non-3270s terminal is different from common 3270 terminal emulator which should follow the 3270 protocol; The non-3270s terminal could be a native Tuxedo client, Java client, and Web UI based on Tuxedo ATMI and should be implemented by customer themselves or 3rd-party.

- Server Description
The task of servers of ARTWTRN/ARTWTR1 is to offer application transactions and process the corresponding programs.

These severs provide a similar functionality to ARTSTRN/ARTSTR1 and present application transactions as Tuxedo services when receiving a transaction request from non-3270s terminals.

These servers are non-conversational and thus can manage pseudo-conversational CICS transactions.

**Processing**

When the server boots, it will advertise each transaction defined in transactions.desc as a Tuxedo service. When ARTWTRN/ARTWTR1 receives the request from non-3270s terminals, the server loads corresponding CICS program located at directory $COBPATH  
($COB_LIBRARY_PATH For COBOL-IT), reorganizes the application data received from FML buffer according to related COPYBOOK, and passes data to loaded CICS program for processing. When CICS program returns by invoking CICS RETURN, the server will insert application data into FML buffer and treturn to clients.

**Delayed Asynchronous Transaction (/Q Part)**

Asynchronous transactions are launched using 'EXEC CICS START TRANSID' requests that may also be launched with a delay set to an interval or to a fixed time.

In this case the transaction request is deposited into a Tuxedo /Q Queue, and when the time is ready, the transaction will be automatically invoked.

For this feature to be available, a few extra components must be activated:

- A Tuxedo /Q Queue Space named ASYNC_QSPACE must be created.
- A Tuxedo /Q Queue named ASYNC_QUEUE must be created in the queue space.
- A TMQFORWARD server must be configured to receive messages from this queue and invoke the application transaction corresponding to the request.

**Tip:** TMQFORWARD will always call the same technical transaction called ASYNC_QUEUE (the name of the queue). This transaction will extract the field CX_TRANSID, which will contain the name of the real application transaction to call and will perform a TPACALL(NOREPLY) of this transaction and treturn immediately.
Administration Server (ARTADM)

The administration server is responsible for the administration of CICS resources. It provides the following functionalities:

- Takes charge of loading the resource definitions used by other servers.
- Offers the services used by artadmin (ART administration console) for dynamic administration of CICS resources and propagates the dynamic configuration requests from artadmin to all the appropriate servers in the system.
- Propagates the resource definition files to the slave machines from the central configuration repository when configured on each node in a distributed environment.

The configuration files only need to be configured on the master node, and the administration servers propagate the configuration files to each slave node.
CICS Runtime Configuration Files

Overview

The administration of CICS Runtime is based on Tuxedo native tools with the addition of a limited number of configuration tables for features that are specific to CICS. In CICS configurations, resources are nowadays defined in the CSD when previously they were defined as independent tables. This latter approach is the one used with CICS Runtime.

Each resource configuration table describes a resource of a particular type: transaction, transaction class, program, file, TS Queue model, etc. Each table contains the specific parameters relevant to the resource.

Shared Responsibilities Between Tuxedo and Resource Files

A CICS resource like a transaction with all its characteristics (first program, restartable, …) is described in resource configuration files. The Tuxedo configuration elements, like how many servers of which group on which machine will offer this transaction is described in the Tuxedo configuration file UBBCONFIG.

This way the responsibilities are clearly distributed:

- Configuration of the resources guaranties the functional behavior of a CICS application.
- Configuration of the Tuxedo system guaranties optimal performance and robustness in production.

Resource Definition Directory

All resource configuration files are stored in a common directory indicated by a well known environment variable: ${KIXCONFIG}.

Each table describing CICS type of information is stored in a file read by servers at start time.
Presentation of Configuration Files

General Content

Each resource configuration table describes a resource type: transaction, transaction class, program, files, TS Queue, …, with all the specific parameters relevant to this resource.

The central file defines the lists of resource groups. When configuring a ART CICS server, the administrator specifies which lists to load. A single list may contain a few tens of resource groups that include hundreds or thousands of individual resources.

Structure

Each resource table contains three columns of parameters:

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name of the parameter in the table.</td>
<td>The data type of the field.</td>
<td>When specific values are required they are listed here.</td>
<td>Description of the purpose of the field, and its usage</td>
</tr>
</tbody>
</table>

The rest of this section describes in detail each of these configuration files:

- List of Groups Configuration File
- Transaction Configuration File
- Tranclasses Configuration File
- Programs Configuration File
- TS Queue Model Configuration File
- ENQ-Model Configuration File
- TD Queue Extra Partition Configuration File
- TD Queue Intra Partition Configuration File
- Mapset Configuration File
- System Configuration File
List of Groups Configuration File

Table 4-1 defines the lists of resource groups that may be loaded by application servers. The filename is `list_of_groups.desc`.

The format of a `list_of_groups.desc` definition is:

```
List_name;group_name
List_name;group_name
... ...
List_name;group_name
```

For example,

```
LIST1;SIMPAPP
LIST1;SIMPAPP1
```

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST</td>
<td>X(10)</td>
<td>Mandatory</td>
<td>Name of the list. Referred by -L options of the application servers</td>
</tr>
<tr>
<td>GROUP</td>
<td>X(10)</td>
<td>Mandatory</td>
<td>Name of the group to be included in the list. This table contains one line per group to in a list. The same group may present in more than one list.</td>
</tr>
</tbody>
</table>
### Transaction Configuration File

Table 4-2 lists the transactions available to application users, with their characteristics.

The filename is `transactions.desc`.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANSACTION</td>
<td>X(4)</td>
<td>Mandatory</td>
<td>Name of the transaction.</td>
</tr>
<tr>
<td>GROUP</td>
<td>X(10)</td>
<td>Mandatory</td>
<td>The group notion of CICS allowing a group of related resources to be declared and instantiated or not by a CICS system when starting.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>X(60)</td>
<td>Optional</td>
<td>A small textual comment zone for description of the resource.</td>
</tr>
<tr>
<td>PROGRAM</td>
<td>X(30)</td>
<td>Mandatory</td>
<td>Name of the first program to be called for this transaction.</td>
</tr>
<tr>
<td>ALIAS</td>
<td>X(4)</td>
<td>Optional</td>
<td>Reserved for future use. Used to define an alias for the transaction (usually lower case).</td>
</tr>
<tr>
<td>CMDSEC</td>
<td>Bool</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>
<td>CONFDATA</td>
<td>Bool</td>
<td>N</td>
<td>Y</td>
</tr>
</tbody>
</table>
Transaction Configuration File

Table 4-2 Transaction Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PRIORITY</td>
<td>9(3)</td>
<td>l</td>
<td>n</td>
</tr>
<tr>
<td>RESSEC</td>
<td>Bool</td>
<td>N</td>
<td>Y</td>
</tr>
<tr>

<td>X(10)</td>
<td>ENABLED</td>
<td>DISABLED</td>
</tr>
<tr>
<td>TASKDATAKEY</td>
<td>X(5)</td>
<td>USER</td>
<td>CICS</td>
</tr>
</tbody>
</table>
Each transaction is advertised as an Oracle Tuxedo service by CICS Runtime servers, e.g. ARTSTRN, ARTATRN…. You can divide the transactions into different groups and assign the groups to different servers using option “-l”, so that each server just advertise its own services.

### Table 4-2 Transaction Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TPNAME</td>
<td>X(64)</td>
<td>Optional</td>
<td>Reserved for future use. Specifies the name of the transaction that may be used by an APPC partner, if the 4-character length limitation of the TRANSACTION attribute is too restrictive. This name can be up to 64 characters in length.</td>
</tr>
<tr>
<td>TRACE</td>
<td>Bool</td>
<td>Y</td>
<td>N</td>
</tr>
<tr>
<td>TRANCLASS</td>
<td>X(8)</td>
<td>Optional</td>
<td>Specifies the name of the transaction class to which the transaction belongs. Transactions belonging to a transaction class are subject to scheduling constraints before they are allowed to execute. See Tranclasses Configuration File for more information on the usage of this parameter on the target platform. A Transaction with no tranclass defined will have no other scheduling constraints than the number of servers offering it.</td>
</tr>
<tr>
<td>TWASIZE</td>
<td>Short int</td>
<td>Optional</td>
<td>Specifies the size (in bytes) of the transaction work area to be acquired for this transaction. Specify a 1-to 5-digit decimal value in the range 0 through 32767. The default value is 0.</td>
</tr>
<tr>
<td>REMOTESYSTEM</td>
<td>X(4)</td>
<td>Optional</td>
<td>Specifies the name that identifies the intercommunication link on which the transaction attach request is sent.</td>
</tr>
</tbody>
</table>
Note: It is not recommended to define all transactions to one group, as it causes every service to be advertised by every server and results in enormous consumption of Oracle Tuxedo services.

Tranclasses Configuration File

Table 4-3 lists and defines tranclasses available to regulate parallel transactions activities.

The filename is tranclasses.desc.

Table 4-3 Tranclass Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TRANCLASS</td>
<td>X(8)</td>
<td>Mandator</td>
<td>Name of the transaction class. A tranclass defines a category of transactions, which should not be running in parallel, probably because they use some resources in a non-serializable way.</td>
</tr>
<tr>
<td>GROUP</td>
<td>X(10)</td>
<td>Mandator</td>
<td>The group notion of CICS allowing a group of related resources to be declared and instantiated or not by a CICS system when starting.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>X(60)</td>
<td>Optional</td>
<td>A small textual comment zone for description of the resource.</td>
</tr>
<tr>
<td>MAXACTIVE</td>
<td>short</td>
<td>0 - 999</td>
<td>Defines the degree of parallelism of execution. The only value for which we do a special processing is value 1, see below for more information.</td>
</tr>
</tbody>
</table>

Semantic Information

Native Source CICS Definition

Transactions that are defined as belonging to a transaction class are subject to scheduling constraints before they are allowed to execute. If transactions belonging to an active transaction class are already running, any new transactions are queued. Use the MAXACTIVE attribute to
specify the maximum number of transactions that you want to run. To limit the size of the queue, you can use the **PURGETHRESH** attribute.

By putting your transactions into transaction classes, you can control how CICS dispatches tasks.

**Mapping to Target Platform Concepts**

On Tuxedo, the scheduling of transactions and the affectation of resources to groups of transactions is performed differently; it is the number of servers offering given transactions which manages the scheduling of transactions, and the relative amount of resources affected to a group of transactions.

**The Special Case of MAXACTIVE 1**

This case is very specific, because it impacts the functional characteristics of the application. It ensures that two transactions of this class will never execute concurrently. It defines a mutually exclusive behavior that is preserved on the target platform to guarantee the correct behavior of the application.

A single server ARTSTR1 will offer the transactions belonging to one TRANCLASS with MAXACTIVE = 1.

**Programs Configuration File**

**Table 4-4** lists and defines programs available to be referenced either as first program of a transaction, or being invoked by EXEC CICS LINK and XCTL.

The filename is `programs.desc`.

<table>
<thead>
<tr>
<th>Field Name</th>

### TD Queue Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DESCRIPTION</td>
<td>X(60)</td>
<td>Optional</td>
<td>A small textual zone for description of the resource.</td>
</tr>
<tr>
<td>DDNAME</td>
<td>X(8)</td>
<td>Mandatory</td>
<td>Specifies a 1-to 8-character value that may refer to a data set defined in the startup JCL.</td>
</tr>
<tr>
<td>DISPOSITION</td>
<td>X(3)</td>
<td>Optional</td>
<td>Specifies the disposition of the data set.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• MOD: ART-CICS first assumes that the data set exists. For an existing sequential data set, MOD causes the read/write mechanism to be positioned after the last record in the data set. The read/write mechanism is positioned after the last record each time the data set is opened for output. If ART-CICS cannot find volume information for the data set:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>– On the DD statement.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>A data set allocated dynamically in this way is deleted when the queue is closed, and all records are lost. For a new data set, MOD causes the read/write mechanism to be positioned at the beginning of the data set.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• OLD: The data set existed before this job step.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• SHR: The data set existed before this job step and can be read by other concurrent jobs.</td>
</tr>
<tr>
<td>ERRORPTION</td>
<td>X(1)</td>
<td>I</td>
<td>S</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>Specifies the action to be taken if an I/O error occurs. This can be one of the following:</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• I = IGNORE: The block that caused the error is accepted.</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• S = SKIP: The block that caused the error is skipped.</td>
</tr>
</tbody>
</table>
Specifies the initial status of the data set. The initial status can be one of the following:

- **D = DEFERRED**: The data set remains closed until you indicate that you want to open it by using the CEMT INQUIRE|SET TDQUEUE command.
- **I = INITIAL**: The data set is to be opened at install time. However, if the DSNAME attribute is not specified, and the data set name is not specified in the DD statement in the startup JCL, the transient data queue is allocated to JES during CICS startup.

Specifies the record format of the data set.

- **F = FIXED**: Fixed records. If you specify RECORDFORMAT FIXED, you must also specify a block format.
- **V = VARIABLE**: Variable records. If you specify RECORDFORMAT VARIABLE you must also specify a block format.

Specifies the control characters to be used. There is no default. If you allow RECORDFORMAT to default to blank, you cannot specify anything in the PRINTCONTROL field. The control characters that can be used are:

- **A = ASA**: ASA control characters.
- **blank**: No control characters are to be used.

Specifies the record length in bytes, in the range 0 through 32767.

Specifies the type of data set the queue is to be associated with:

- **INPUT**: An input data set.
- **OUTPUT**: An output data set.

<tr>
<td>DESCRIPTION</td>
<td>X(60)</td>
<td>Optional</td>
<td>A small textual zone for description of the resource.</td>
</tr>
</tbody>
</table>
| RECOVSTATUS  | X(8) | NO | LOGICAL | Specifies if the queue is logically recoverable or not.  
If a queue is logically recoverable, its elements will be written to tuxedo /Q in the context of the transaction and will be rolled back with the rest of the transaction in case of a rollback.  
If the queue is non-recoverable, then each enqueue in the /Q queue will be permanent and not rolled back in case of a rollback or abort. |
| TRANSID      | X(4) | Optional | Specifies the name of the transaction that is to be automatically initiated when the trigger level is reached. Transactions are initiated in this way to read records from the queue. If the TRANSID attribute is not specified (or if TRIGGERLEVEL(0) is specified), you must use another method to schedule transactions to read records from transient data queues. |
Table 4-8 TD Queue Parameters

</tr>
</tbody>
</table>

Mapset Configuration File

Table 4-9 lists and defines mapsets available to be referenced by the CICS application. For more information, see `tcxmapgen(1)` in System Commands and Transactions.

The filename is `mapsets.desc`.

The format of a MAPSET definition is:

```
[mapset]
<field_name_1>=<field_value_1>
<field_name_2>=<field_value_2>
... ...
<field_name_n>=<field_value_n>
```

For example,

```
[mapset]
name=ABANNER
filename=abanner.mpdef
```

Table 4-9  Mapset Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>X(8)</td>
<td>Mandatory</td>
<td>Name of the mapset.</td>
</tr>
<tr>
<td>DESCRIPTION</td>
<td>X(60)</td>
<td>Optional</td>
<td>A small textual comment zone for description of the resource.</td>
</tr>
</tbody>
</table>
System Configuration File

Table 4-10 lists and defines system available to the CICS application.

The filename is `system.desc`.

The format of a `system.desc` definition is:
```
[SYSIDNT]
<field_name_1>=<field_value_1>
<field_name_2>=<field_value_2>
...
```

### Table 4-10: System Configuration File

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>FILENAME</td>
<td>X(79)</td>
<td>Mandatory</td>
<td>This specifies the physical (binary) file name of the mapset, which is generated by the <code>tcxmapgen</code> tool. It will be searched in directories defined by the <code>KIX_MAP_PATH</code> environment variable if the absolute path is not specified. If this field is not specified, the default mapset binary file name <code>&lt;MAPSET_name&gt;.mpdef</code> will be used, in which the <code>&lt;MAPSET_name&gt;</code> is the MAPSET name parameter specified in CICS MAP related APIs</td>
</tr>
<tr>
<td>RESIDENT</td>
<td>Bool</td>
<td>NO</td>
<td>YES</td>
</tr>
<tr>
<td>swastatus</td>
<td>X(10)</td>
<td>ENABLED</td>
<td>DISABLED</td>
</tr>
<tr>
<td>Usage</td>
<td>X(10)</td>
<td>NORMAL</td>
<td>TRANSIENT</td>
</tr>
</tbody>
</table>
For example,

[KIXA]
APPLID = DBDCKIXA
INITPARM=(DBCONNA='instance1, database1, artuser1, abc123')

[KIXB]
APPLID = DBDCKIXB
INITPARM=(DBCONNA='instance2, database2, artuser2, 123abc')

Notes: Blank lines and comment lines are supported. You can use an asterisk in column 1 to code comments, or to remove temporarily an initialization parameter from a particular execution of CICS.

Using a “\”, you can continue parameters on another line. Oracle Tuxedo Application Runtime for CICS concatenates the operands, omitting the remaining blanks after “\” in the current line. In this usage, only blank characters can appear after “\” in the current line; otherwise, “\” will be treated as a backslash.

To load and/or discover the defined system initialization parameters, CLOPT “-s” is required to specify.

For example,

```
ARTSTRN
  CLOPT="-- -s KIXA"
```

In this example, ARTSTRN will only load the system section named KIXA (KIXB will not be loaded).

To define APPLID of current CICS region, you can either specify CLOPT “-a” (Listing 4-1) or specify APPLID parameters in system.desc (Listing 4-2).

Listing 4-1   Example to Specify CLOPT "-a"

```
*SERVERS
CLOPT="-- -a abcdefgh"
```
Listing 4-2  Example to Specify APPLID

[KIXR]

APPLID=1234567a

Oracle Tuxedo Application Runtime for CICS will firstly check whether CLOPT “-a” is specified. If it is, its value will be used as JOBNAME; otherwise, the value of APPLID set in system.desc file will be used as JOBNAME. If neither “-a” nor APPLID in system.desc is set, default value DBDCCICS will be used.

In either ways, if the value is more than 8 characters, it will be truncated to contain only the first 8 characters; if the value is less than 8 characters, APPLID will be padded spaces afterwards to be just 8 characters.

Table 4-10  System Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
</table>
| SYSIDNT    | X(4) | Mandatory | Name of a system section to define a CICS region. The length of name is 1 - 4 characters. The default name is CICS. The name of a system section and that of the defined CICS region should be the same.

**Note:** If more than one sections share a same SYSIDNT, the final configuration for this CICS region will possess all the parameters defined in these sections. If a parameter is defined more than once in these sections, only the last one will make sense.

| APPLID    | X(8) | DBDCCICS|a pplid, Optional | Identifies the CICS region in the VTAM network. The length of name is 1 - 8 characters. The default value is DBDCCICS. |
INITPARM

X(60) Mandatory

Specifies initialization parameters in system initialization table (SIT) for each CICS application program that invokes ASSIGN INITPARM.

The INITPARM format is

INITPARM=(pgmname_1='parmstring_1'[, ..., pgmname_n='parmstring_n']). We now support at most 255 sets of program='parmstring'.

The value of program should consist of 1 - 8 alphanumeric characters and will be truncated if exceeding the length limit.

The value of parmstring should be at most 60 characters and will be truncated if exceeding the length limit. Parameter string should be enclosed by single quotes; any quotes imbedded in the string must be duplicated.

Note: In each section, if INITPARM parameters are specified more than one time, only the last definition will take effect.

LGNMSG

Bool NO | YES, Optional

A system initialization parameter which specifies whether logon data is available to an application program.

GMTRAN

X(4) Optional

A system initialization parameter which specifies the name of the transaction that is initiated by ATI when terminals are logged on to ART CICS. The GMTRAN format is

GMTRAN={CSGM|CESN|transaction-id}, where the default value is CSGM.

Note: To enable GMTRAN, it's also required to specify LOGONMSG=YES in typeterms.desc; however, if LOGONMSG is specified to NO, the screen will be cleared.

<table>

</table>
| BMS        | X(60)| DDS|NODDS, Optional | Specifies whether to enable DDS (Device Dependent Support). The default value is DDS, meaning DDS is enabled. With DDS, BMS uses the following rules to select a physical map:  
• BMS appends the suffix specified in ALTSUFFIX to map set names if the screen size being used is the same as the alternate screen size. In other word, if a transaction has SCRSIZE(ALTERNATE) specified in the TYPETERM definition, or if the default screen has the same size as the alternate screen, BMS map selection routines try to load the map set with the suffix specified in ALTSUFFIX.  
• If there is no such map set found, BMS tries to load an unsuffixed map set version. |
| TYPE       | X(8)| ARTCICS | TMASNA         | Optional. The default value is ARTCICS.                                  |

Note: Section names and keys are case-insensitive; however, values are case-sensitive. The max length of each key is 64 characters and that of each value is 32767 characters.

Terminal Configuration File

Table 4-11 lists and defines terminal available to the CICS application.

The filename is terminals.desc.

The format of a terminal definition is:

[terminal]
<field_name_1>=<field_value_1>
<field_name_2>=<field_value_2>
...

For example,

[terminal]
name=0001
netname=CICS0001
katakana=YES
[terminal]
name=0002
netname=CICS0002
katakana=YES

ART CICS stores all the terminal runtime status by using Tuxedo /Q. For more information about configuring and using Tuxedo /Q, please see Implementing Asynchronous CICS Delayed Transactions.

Table 4-11  Terminal Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALTSUFFIX</td>
<td>X(1)</td>
<td>0-9</td>
<td>a-z</td>
</tr>
<tr>
<td>KATAKANA</td>
<td>x (3)</td>
<td>NO</td>
<td>YES, Optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>NO: Default value. KATAKANA function is disabled.</td>
<td>YES: KATAKANA function is enabled.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Other values: Invalid values. System will automatically search KATAKANA in typeterms.desc.</td>
<td></td>
</tr>
<tr>
<td>GROUP</td>
<td>X(10)</td>
<td>Mandatory</td>
<td>The group notion of CICS allowing a group of related resources to be declared and instantiated or not by a CICS system when starting.</td>
</tr>
<tr>

<td>The default value is <strong>YES</strong>. If this field is defined to neither of above</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>values, it is treated as <strong>YES</strong>.</td>
</tr>
</tbody>
</table>
Optional Specify whether or not the terminal is available for use by transactions that are automatically initiated from within CICS.

**YES**: The terminal is available for use by transactions that are automatically initiated from within CICS.

**NO**: The terminal is not available for use by transactions that are automatically initiated from within CICS.

If this field is defined to neither of above values, it is treated as **UNKNOWN**. However, in the event that the same field in `typeterms.desc` is defined to **UNKNOWN** as well, the final value of this field is **YES**.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
</table>
| ATI        | X(3) | NO | YES, Optional | Specify whether or not the terminal is available for use by transactions that are automatically initiated from within CICS.  
**YES**: The terminal is available for use by transactions that are automatically initiated from within CICS.  
**NO**: The terminal is not available for use by transactions that are automatically initiated from within CICS.  
If this field is defined to neither of above values, it is treated as **UNKNOWN**. However, in the event that the same field in `typeterms.desc` is defined to **UNKNOWN** as well, the final value of this field is **YES**. |
### Table 4-11 Terminal Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TTI</td>
<td>X(3)</td>
<td>NO</td>
<td>YES</td>
</tr>
</tbody>
</table>

Specifies whether transactions can be initiated at the terminal by a user.

**YES:**
Transactions can be initiated at the terminal by a user. If you also specify ATI(YES), transactions can also be initiated automatically. In this case, the automatic transaction initiation, either by transient data control or interval control, sets a condition in an appropriate terminal control table terminal entry. If both ATI and TTI are specified as YES, and if there is no transaction at the terminal, terminal control initiates the user-defined task. This task is expected to send messages to the terminal.

For a terminal used in the processing of transactions such as inquiries or order entries, specify TTI(YES) and ATI(NO). This also applies to a display station or hard-copy terminal to which no messages are sent without a terminal request and through which transactions are entered. Note that this is the only specification allowed for 3790 inquiry logical units.

**NO:**
Transactions cannot be initiated at the terminal by a user. If you specify NO, specify ATI(YES) to allow transactions to be initiated automatically. An example of this type of terminal is one that is located in a remote location, such as a warehouse, and is unattended but may receive messages.

If this field is defined to neither of above values, it is treated as UNKNOWN. However, in the event that the same field in typeterms.desc is defined to UNKNOWN as well, the final value of this field is YES.

### Notes:
The section name must be set to "terminal"; all keywords are case-insensitive.

ART CICS reserves "."; users can use it neither in NAME nor in NETNAME when defining terminals.desc.
Typeterm Configuration File

Table 4-12 lists and defines Typeterms supported by ARTTCP.

The filename is `typeterms.desc`.

The format of a typeterm definition is:

```
[typeterm]
<field_name_1>=<field_value_1>
<field_name_2>=<field_value_2>
... ...
<field_name_n>=<field_value_n>
```

For example,

```
[typeterm]
name=IBM-3278-2
userarealen=255
katakana=YES
```

**Note:** You can either set KATAKANA in terminals.desc or typeterms.desc; however, only if KATAKANA in terminals.desc is not specified to YES or NO, KATAKANA specified in typeterms.desc will take effect.
### Typeterm Parameters

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
</table>
| ATI        | X(3) | NO | YES, Optional | Specifies whether transactions can start at the terminal by automatic transaction initiation.  
YES: Transactions can start at the terminal by automatic transaction initiation.  
NO: Transactions cannot start at the terminal by automatic transaction initiation.  
ATI(YES) allows transactions to be started at the terminal by transient data control or by an EXEC CICS START command issued by another transaction. If there is already a transaction at the terminal, the ATI transaction is held until it ends. If you specify ATI(YES), you must specify an IOAREALEN of at least one byte, except for DEVICE(APPC) when ATI and IOAREALEN have forced default values of YES and 0.  
If ATI is specified as YES and CREATESESS is specified as YES, and if a transaction is initiated when the terminal is not ACQUIRED, it is automatically acquired.  
If this field is defined to neither of above values, it is treated as YES. |
Connection Configuration File

</table>
| NEWCPY     | string   | N | Y | Optional | Specifies the type of copybook:  
• Yes or Y: The copybook is generated by viewc32.  
• N or Not specified: The copybook is old. |
| TRANSACTION | string | N | Y | Optional | Specifies the service to support or not support the transaction. If this field is not specified, the service does not support the transaction. |
VSAM Configuration File

Overview

VSAM configuration file specifies the VSAM accessor and related attribute of each VSAM file used in ART CICS runtime. VSAM configuration file is generated by Oracle Tuxedo Application rehosting Workbench and should not be modified.

ART CICS runtime will find VSAM configuration file through the environment variable $DD_VSAMFILE, which could be exported or defined in the envfile and used to indicate the location of VSAM configuration file.

VSAM Configuration Parameters

Table 5-1 lists and defines VSAM file configuration parameters available to be referenced by the CICS application.

The filename is desc.vsam.

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>X(8)</td>

<td>1 - 256</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Note: The file status, after CICS Runtime is booted up, is ENABLESTATUS(ENABLED) and OPENSTATUS(OPEN).
Cics Runtime Integration with Non-3270s Terminal

Interface
Non-3270s terminal should submit request and get response through Tuxedo ATMI `tpcall()`. The service name of `tpcall()` should follow the convention described in the following section; in addition, data buffer type exchanged with server ARTWTRN/ARTWTR1 could only be Tuxedo FML32. The detailed FML32 fields and each data structure will be described in the following section.

Service Name Convention
In order to distinguish the service invoked by non-3270s clients from the service invoked by TN3270 terminal, ARTWTRN/ARTWTR1 sever advertises each CICS transaction as a Tuxedo service with the name prefix `WEB_`. When client submits the request to ARTWTRN/ARTWTR1, the service name of tpcall must follow the convention.

FML32 Buffer Definition
The interface between non-3270s client and ARTWTRN/ARTWTR1 could only be Tuxedo FML32 buffer. All the application data and some terminal control information will be encapsulated in the FML32 buffer.
Table 5-2 lists all FML32 FIELDs, which will be published in $KIXDIR/include/msgflds32.

<table>
<thead>
<tr>

</tr>
</tbody>
</table>
CX_WEB_APPDATA

Outbound / Inbound

CARRAY

Depends on Copybook

The application data requiring to be displayed in the Client’s UI or processed by transaction. This field will be added/changed/read by both ARTWTRN/1 and Client.

When Client receives the FML buffer, it needs to get the application data from this field and split into each map field according to Copybook.

Client could also re-organize latest application data according to Copybook and send it to ARTWTRN/1. When receiving the FML buffer, ARTWTRN/1 will get the application data from this field and pass the data to transaction for processing.

CX_WEB_CTRL_CHAR

Outbound

CARRAY 12

The terminal control characters of the command “CICS SEND”, “CICS SEND MAP”, “CICS SEND TEXT”, and “CICS SEND CONTROL”.

At times, CICS APIs above will be invoked with some control options, such as FREEKB, ALARM, ERASE, ERASEUP, CURSOR, etc; therefore, these control options should be inserted to this FML field.

The field will be added/changed by ARTWTRN/1. Client can get the control options from this field and handle them accordingly.

Table 5-2 FML 32 Buffer Definition for CICS Runtime Integration with Non-3270s Terminal

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Tuxedo Buffer Type</th>

</tr>
</tbody>
</table>
Mainframe CICS provides a utility to generate the Copybook from the Mapset file. The Copybook is used to define the structure of the application data when transaction invokes CICS SEND/RECEIVE MAP.

At ART CICS runtime, we also provide a corresponding utility tcxmapgen, which generates the Copybook from Mapset file; regarding that the structure of Copybook generated by tcxmapgen is almost the same as the one generated in Mainframe CICS, application data exchanged between the Client and ARTWTRN/1 must follow the definition in the Copybook of each Mapset.

### Table 5-2 FML 32 Buffer Definition for CICS Runtime Integration with Non-3270s Terminal

<table>
<thead>
<tr>
<th>Field Name</th>
<th>Type</th>
<th>Tuxedo Buffer Type</th>
<th>Length</th>
<th>Comments</th>
</tr>
</thead>
<tbody>
<tr>
<td>CX_WEB_AID</td>
<td>Inbound</td>
<td>CARRAY</td>
<td>3</td>
<td>The attention ID and cursor position when doing “CICS RECEIVE” and “CICS RECEIVE MAP”. When 3270 terminal sends the application data to the CICS runtime, it will always contain the AID and current cursor position of the screen; therefore, this field will be added/changed by Client. ARTWTRN/1 will get data from this field and pass the data to transaction for processing.</td>
</tr>
<tr>
<td>CX_SESSIONID</td>
<td>Outbound / Inbound</td>
<td>STRING</td>
<td>16</td>
<td>The session ID of client. If it’s not filled in client side, ARTWTRN/1 will generate one randomly.</td>
</tr>
<tr>
<td>CX_TERMID</td>
<td>Outbound / Inbound</td>
<td>CARRAY</td>
<td>4</td>
<td>The term ID of client. If it’s not filled in client side, ARTWTRN/1 will generate one by randomly.</td>
</tr>
<tr>
<td>CX_USERID</td>
<td>Outbound / Inbound</td>
<td>CARRAY</td>
<td>8</td>
<td>The user ID of client. If it’s not filled in client side, ARTWTRN/1 will fill it with “WEBGUEST”.</td>
</tr>
</tbody>
</table>

**Note:** Outbound means the field is only included in the FML buffer from ARTWTRN/1 to Client; Inbound means the field is only included in the FML buffer from Client to ARTWTRN/1.
For **CICS SEND/RECEIVE** and **CICS SEND TEXT**, **ARTWTRN/1** and Client just need to insert the plain textual characters into the field **CX_WEB_APPDATA**.

The head file might not match the copybook generated from BMS file by **ART CICS offline utility tcxmapgen** at runtime due to data structure alignment on open system. It might need customers to adjust copybook by padding appropriate **FILLER**.

**CX_WEB_CTRL_CHAR**

In Mainframe CICS, an outbound data stream is a data stream sent from the application program to the terminal with the following format:

```
| Command | Write Control Character | Indicate Cursor | Orders | Data | Orders | Data | ...
```

CMD defines the function to be performed by the terminal. **ARTWTRN/1** will support **W** and **EW**. It’s a one byte.

**WCC** instructs how to perform the CMD function. It’s a one byte with the following format:

```
| 0 | 1 | 2/3 | 4 | 5 | 6 | 7 |
| * | Reset | Printout | Start | Sound | Keyboard | Reset |
```

If **SEND MAP/TEXT** command sets cursor option, IC should be inserted into the header of 3270 data stream with the following format in the case of **SEND** command without cursor option. If this command sets option **ERASE**, the cursor will set to the upper left corner of the screen.

```
| SBA | ROW | COL | IC |
```

Besides CMD, WCC, and IC described above, other control characters could be also contained in the header of 3270 data stream, such as **EUA**.

At **ART CICS runtime**, we define a FML field **CX_WEB_CTRL_CHAR**, a CARRAY with 12 bytes, to store these control characters; however, in this release, we plan to support CMD, WCC, and IC, all of which are mostly used. The data sequence of this field is as below:

```
| CMD | WCC | SBA | ROW | COL | IC | ...
```

Only the first 6 characters will be used in this field, the rest 6 characters will be reserved with X’00’, and the code of these characters will be set as **EBCDIC**, not **ASCII**. **SBA, ROW, COL, and IC** will be set with X’00’ in the buffer if there is no need to set cursor; If **IC** is
not set via the option cursor of CICS commands, but set in MAPSET/MAP file, no IC will be set in this field and customers need to handle IC themselves.

**CX_WEB_AID**

In Mainframe CICS, an inbound data stream is sent from the terminal to the application program and contains an attention identifier (AID) followed by cursor or by data directly. The AID describes the action that caused the transmission of the inbound data stream with the following format:

| AID | ROW | COL |

At ART CICS runtime, we defined a FML field CX_WEB_AID to store these three characters and AID will always be function key of the keyboard, such as Enter, Clear, F01~F24, etc. ROW and COL mean the current cursor position when terminal sends the inbound data stream to application program. The code of these characters will be set as EBCDIC, not ASCII.
Environment Variables

CICS Runtime Environment Variables

Two important Tuxedo environment variables are **MANDATORY**.

- **TUXDIR** – must be set to indicate the directory in which Tuxedo is installed.
- **APPDIR** – must be set to indicate the directory where the application server binaries are installed.

**Note:** For CICS Runtime, **APPDIR** must be set to the directory containing the CICS Runtime server binaries.

CICS Runtime Specific Environment Variables

**KIXDIR**

*KIXDIR* is a mandatory environment variable that indicates the directory where the CICS Runtime product is installed.

Usually, the Tuxedo environment variable **APPDIR** should be set to `${KIXDIR}/bin`.

**KIXCONFIG**

*KIXCONFIG* is a mandatory environment variable that indicates the directory where resource configuration files are located.

**KIX_TS_DIR**

*KIX_TS_DIR* is a mandatory environment variable that indicates the directory where files corresponding to non-recoverable TS are located. It can be differentiated for each tsq server by setting it differently in the server envfile (see the Tuxedo documentation).
**Environment Variables**

**KIX_TD_DIR**

*KIX_TD_DIR* is a mandatory environment variable that indicates the directory where files corresponding to the extra partition TDQueues are located.

**KIX_TD_QSPACE_DEVICE**

*KIX_TD_QSPACE_DEVICE* is a mandatory environment variable for *TD QUEUE(INTRA)*. It indicates the Tuxedo QSPACE needed by the tdq_srv server.

**KIX_TD_QSPACE_NAME**

*KIX_TD_QSPACE_NAME* is a mandatory environment variable for *TD QUEUE(INTRA)*. It indicates the Tuxedo QSPACE name needed by the tdq server.

**KIX_TD_QSPACE_IPCKEY**

*KIX_TD_QSPACE_IPCKEY* is a mandatory environment variable for *TD QUEUE(INTRA)*. It indicates the Tuxedo QSPACE ipckey needed by the tdq server.

**KIX_TECH_DIR**

*KIX_TECH_DIR* is a mandatory environment variable that indicates the directory where technical files used internally by ART CICS, for example to manage named DELAYS and CANCELS (through the REQID option) or ENQ/DEQ are written. It should be the same for each server until one wants to reproduce the source limitation, where a named DELAY submitted on one CICS region, could not be canceled easily in another region.

**KIX_CWA_SIZE**

This environment variable is optional.

On the source platform, the Common Work Area (CWA) is shared by all the Programs executing inside a single CICS Region. The size of this CICS zone can vary from 0 to 32765 bytes, 0 indicating that no CWA is defined.

On the target platform, the *KIX_CWA_SIZE* variable also indicates the size of the CWA, ranging from 0 to 32765 bytes. If this environment variable is not set, the value defaults to 0. A value of zero (either explicit or implicit) indicates that no CWA is defined.
**KIX_CWA_IPCKEY**
The Common Work Area (CWA), when defined (see KIX_CWA_SIZE), is implemented on each machine by a shared memory segment. The KIX_CWA_IPCKEY variable indicates the IPCKEY (the identifier) of the shared memory segment. The value must be defined in the range from 1 to 99 999 999.

**Note:** This variable is mandatory when KIX_CWA_SIZE is set to a value greater than zero.

**KIX_QSPACE_IPCKEY**
This mandatory variable is used to create the Tuxedo qspace named ASYNC_QSPACE utilized by ARTATRN for delayed asynchronous transactions.

The value for the IPC key should be picked so as not to conflict with your other requirements for IPC resources. It should be a value greater than 32 768 and less than 262 143.

**KIX_TRACE_LEVEL**
This optional variable allows the administrator to get traces for the system activities.

It can be set from 0 to 9, 0 represents no trace, 9 represents maximum trace. The default value is 0 when the variable is not defined. The most relevant trace levels are:

- 0 – servers startup and fatal errors information
- 1 – transaction / command audit information
- 2 – loading resources and advertising services information
- 3 – informations exchanged with the terminal
- 5 – SPOOL (CICS SPOOL) function traces
- 7 – CICS function traces (KIX__)
- 9 – traces for support team

Other levels are reserved for support team. The higher level covers all traces delivered by lower level.

**KIX_USER_TRACE**
This optional variable defines the type of traces, one trace file per connection or all traces in the same file.
**Environment Variables**

*KIX_USER_TRACE=SID* represents one trace file per connection. The other value is *STD*, in this case traces will be in each stdout of server, if the variable is not set to STD is assumed.

When you want to use transaction / command audit tool against multiple homonymous ART servers, *SID* should be used.

**KIX_TRACE_PATH**

If *KIX_USER_TRACE* is set to *SID*, *KIX_TRACE_PATH* variable must be set. It defines the directory containing the trace files (the file name is ended by ".trc").

This variable is not used to store other files.

**KIX_MAP_PATH**

This optional variable defines the path (the list of directories) in which the physical file of the mapset will be searched, in case the absolute path is not specified in the *FILENAME* field of Mapset in the Typeterm configuration file.

**KIX_SPOOL_OUTPUT_DIR**

This is a mandatory environment variable used for SPOOL functions. It indicates the directory where the CICS Runtime writes the spool files named `<spool_token>.<sever_pid>.<time_in_microseconds>.<occurrence_number>`.

**KIX_SPOOL_JOB_SUBMIT**

This is a mandatory environment variable used for SPOOL functions. It indicates the command line for the spool files submission. The command line should contain the first mandatory %s symbol that refers to the spool file name and the second facultative %s symbol that refers to the CLASS.

For example: *KIX_SPOOL_JOB_SUBMIT=/my_path/my_shell_script -f %s -c %s*

Note: This script should be run in the batch execution environment. You can use “nohup” and “&” command to keep running the script in the background after you have logged out.

**KIX_SPOOL_JOB_AUTO_SUBMIT**

This is an optional environment variable for SPOOL functions. Only if *KIX_SPOOL_JOB_SUBMIT* is not set, *KIX_SPOOL_JOB_AUTO_SUBMIT* submits the spool files automatically when it is set to *YES* or *yes*.

For example: *KIX_SPOOL_JOB_AUTO_SUBMIT=yes*
**COB_ENABLE_XA**

This is a mandatory environment variable when using COBOL-IT with ART CICS Runtime. It indicates VSAM file support with COBOL-IT/BDB under XA environment is enabled. It should be set to 1.

**DD_VSAMFILE**

DD_VSAMFILE is a mandatory environment variable that indicates the location of VSAM configuration file "desc.vsam" generated by ART Workbench, if the CICS program contains some VSAM operations.

**ISC_ENABLE**

ISC_ENABLE is an optional environment variable. Set ISC_ENABLE=Yes to enable the following ISC related features:

- **ASSIGN**
  - ABDUMP/ABPROGRAM/ASRAINTRPT/ASRAKEY/ASRASPN/ASRAREGS/ASRASPC/ASRASTG/INITPARM/INITPARMLEN/KATAKANA/NETNAME/SOSI/USERNAME
- **CANCEL**
- **INQUIRE/SET FILE**
- **INQUIRE PROGRAM RESCOUNT**
- **INQUIRE SYSTEM JOBNAME**
- **INQUIRE TERMINAL ALTSUFFIX/USERID**
- **INQUIRE TRANSACTION PROGRAM**
- **INQUIRE TERMINAL/NETNAME ACQSTATUS CREATESESS**
- **ISSUE DISCONNECT**
- **ISSUE PASS and EXTRACT LOGONMSG**
- **SEND LAST**
- **SET/INQUIRE TERMINAL**
- **SET TERMINAL ACQSTATUS CREATE ACQUIRED RELEASED**
- **START TRANSID with <ANY> TERMID**
- **START TRANSID TERMID AFTER**
- **START TARNSID REQID**
Environment Variables

- START TRANSID SYSID
- Configurable default transaction - GMTRAN (Good morning transaction)
- 3270 printer support

Note:

- When ISC_ENABLE=YES, ART CICS cannot validate LUNAME across multi-CICS regions. Users must ensure LUNAME is unique across different CICS regions.
- The validation is completed after users log on a CICS region (that is when users pass LOGON screen).
Server Configuration

CICS Runtime Servers References

About Generic Tuxedo Server Configuration

All Tuxedo servers configured in the Tuxedo UBBCONFIG configuration file use standard arguments common to all servers. CICS Runtime servers benefit automatically from this flexibility.

The required arguments are SVRGRP and SVRID.

Other common arguments like MIN, MAX, SEQUENCE, CONV etc. are also available.

For precise information about the use of Tuxedo server configuration, consult the Tuxedo documentation, specifically the SERVERS section of UBBCONFIG(5).

One of the most useful of these optional arguments is the CLOPT (Command Line OPTions) argument. The CLOPT option is a string of command-line options that is passed to Tuxedo servers when they are booted.

This command line option is divided in two parts:

- A generic part, common to every Tuxedo server, common server options are:
  
  ```
  [-e stderr_file] [-o stdout_file]
  ```

  directing standard output and errors to specific files.

- A server specific part containing options referenced as uargs in Tuxedo documentation.

  For precise information about using CLOPT options see the Tuxedo documentation, more specifically the servopts section.

  The description of CICS Runtime specific servers systematically includes the two mandatory server arguments SVRGRP & SVRID, plus only the arguments needed specifically by the server type.
Generic CLOPT Options of CICS Runtime Servers

This section describes the options common to all CICS Runtime servers. These options are documented in this section only.

CICS SYSID Argument

This argument defines the name of the CICS system.

**Synopsis**

```
-s TEST
```

**Description**

Sets the value returned to programs by `EXEC CICS ASSIGN SYSID`.

Character, 1-256, A-Za-z0-9[/-].

The system identifier (CICS SYSID) is limited to four characters.

**Exclusion**

This option does not apply to ARTTCPL servers and connection servers.

CICS Application ID Argument

This argument defines the APPLID name of the CICS system.

**Synopsis**

```
-a INVOICE
```

**Description**

Sets the value returned to programs by `EXEC CICS ASSIGN APPLID`.

Character, 1-256, A-Za-z0-9[/-].

The application id (CICS APPLID) is limited to eight characters.

**Exclusion**

This option does not apply to ARTTCPL servers and connection servers.
Dynamic List of Groups Argument
This argument defines the lists of resource groups to be loaded by this server.

**Synopsis**
-L LIST1:LIST2:...

**Description**
Enables a dynamic change of the groups in a list for a running server. The lists refered by the -L argument should be defined in the `list_of_groups` configuration file. This argument replaces the -l option which is deprecated now.

Lists in the resources configuration files are defined by 10 character strings. A server only loads in memory resources belonging to one of the groups included in one of the lists.

As a facility for tests or generic servers, it is possible to remove the filtering by using -L '*' to allow a server to load all the lists defined in the `list_of_groups` configuration file. A group can be loaded by a server specifying -L '*' only if it is included in at least one list.

**Exclusion**
This option does not apply to ARTTCPL servers and connection servers.

Static List of Groups Argument
This argument is now deprecated and replaced by -L argument. It is still supported in this release but will be removed in future releases.

This argument lists the resource groups to be considered by the server when loading resources.

The list of groups defined statically in the CLOPT cannot be dynamically modified. For implementing a dynamic change of the list, use -L option instead.

**Synopsis**
-l group1:group2:...:groupn

**Description**
Groups in the resources configuration files are defined by 10 character strings. A server only loads in memory resources belonging to one of these groups.

As a facility for tests or generic servers, it is possible to remove the filtering by using -l '*' to allow a server to load all the resources defined in the configuration file.
Exclusion
This option does not apply to ARTTCPL servers and connection servers.

Configuration Reference of CICS Runtime Servers

ARTTCPL/ARTTCPH Configuration

Server Name
ARTTCPL – Terminal Control Program Listener.

Synopsis

Description
The terminal control program (ARTTCP) is a group of Tuxedo servers that manage the connections of 3270 terminal emulators to CICS Runtime. When you run programs, the ARTTCP connects terminal emulators to the network ports assigned to ARTTCP. ARTTCP communicates with the emulator using a Telnet protocol.

The ARTTCP server is composed of two types of servers: a single ARTTCP listener (ARTTCPL) process and one or more ARTTCP handler (ARTTCPH) processes. The ARTTCPL process establishes a well-known listening port address to which terminal emulators may connect. The ARTTCPH process listens on this port and accepts incoming connection requests. The ARTTCPH process establishes your user session for the connection and handles all subsequent screen I/O for the terminal emulator. As a performance enhancement, each ARTTCPH process can manage multiple sessions simultaneously. When you disconnect the emulator from the port, the ARTTCPH terminates the session.

To join 3270 terminal to ART Runtime, you must specify the MAXWSCLIENTS parameter in the MACHINES section of the UBBCONFIG file. MAXWSCLIENTS is the only parameter that has special significance for ARTTCPL. MAXWSCLIENTS tells the Oracle ART at boot time how many accessor slots to reserve exclusively for 3270 terminals.
For **MAXWSCLIENTS**, specify the maximum number of 3270 terminal that may connect to a node. The default is 0. If not specified, terminal may not connect to the machine being described. The syntax is **MAXWSCLIENTS=number**.

**Parameters**

The following CLOPT run-time parameters are recognized:

**-n netaddr**

This address specifies where TN3270 terminal emulators connect to ARTTCPL. The address is a string in standard internet URL format. For example:

```
//computer:4000 designates port 4000 on machine computer.
```

Character, 1-256, A-Za-z0-9[/:-]. Mandatory option if option -S is not specified.

**-S ssladdr**

This address specifies where TN3270 terminal emulators connect to ARTTCPL via SSL. The address is a string in standard internet URL format. For example:

```
//computer:5000 designates port 5000 on machine computer.
```

Character, 1-256, A-Za-z0-9[/:-]. Mandatory option if option -n is not specified.

ARTTCPL shares the same SSL related configuration with Tuxedo, so the following attributes should be configured in the RESOURCES section of Tuxedo UBBCONFIG configuration file: **SEC_PRINCIPAL_NAME**, **SEC_PRINCIPAL_LOCATION**, **SEC_PRINCIPAL_PASSVAR**. Please refer to the corresponding Tuxedo documentation for details.

Information (including password) exchanged between TN3270 terminal emulator and ARTTCP server is vulnerable unless SSL is enabled.

**-L pnetaddr**

This address is used by the system internally between ARTTCPL and ARTTCPH. The address is a string in standard internet URL format. For example:

```
//computer1:4001 designates port 4000 on machine computer.
```

Character, 1-256, A-Za-z0-9[/:-]. Mandatory option.

**[-m minh]**

The minimum number of handler processes that will be started by ARTTCPL. The actual number of handler processes will always be between the minh and maxh based on system load.
Server Configuration

Numeric, 1-4096. Default value is 1.

[M maxh]
The maximum number of handler processes that will be started by ARTTCPL. The actual number of handler processes will always be between the minh and maxh based on system load.

Numeric, 1-4096. Default value is 4096.

[x session-per-handler]
The number of sessions a ARTTCPH can maintain concurrently.

Numeric, 1-255. Default value is 32.

[p profile-name]
The default security profile file name. Please refer to Security configuration for details.

String. The default value is ~/.tuxAppProfile.

[z minencryptbits]
The minimum level of encryption required when a network link is being established between a TN3270 terminal emulator and ARTTCP. 0 means no encryption, while 40, 56, 128, and 256 specify the length (in bits) of the encryption key. If this minimum level of encryption cannot be met, link establishment fails.

Numeric. Default value is 0. This option will be ignored if -S option is not specified.

[Z maxencryptbits]
The maximum level of encryption required when a network link is being established between a TN3270 terminal emulator and ARTTCP. 0 means no encryption, while 40, 56, 128, and 256 specify the length (in bits) of the encryption key.

Numeric. Default value is 256. This option will be ignored if -S option is not specified.

[D ]
Enable Debug.

[H trace-level]
Specify the trace level:
-1: trace off.
0: trace for all ARTTCPH.
n (n>0): trace the first n ARTTCPH.
Examples
*MACHINES
DEFAULT:
MAXWSCLIENTS = 20
...
*SERVERS ARTTCPL SRVGRP="TCPGRP" SRVID=1000 RESTART=Y GRACE=0
CLOPT="-- -n //hostname:4000 -L //hostname:4002 -m1 -M110 "

ARTSTRN Configuration

Server Name
ARTSTRN – CICS Runtime main server for synchronous terminal oriented transactions with
MAXACTIVE > 1.

Synopsis
ARTSTRN SRVGRP="identifier" SRVID="number" CONV=Y MIN=minn MAX=maxn
RQADDR=queueaddr REPLYQ=Y CLOPT="[servopts] -- -s System_ID -a
Application_ID -L list1:list2"

Description
ARTSTRN servers present application transactions as Tuxedo services and, when receiving a
transaction request, execute the corresponding programs.
These servers are conversational in order to manage true conversational CICS transactions.

1. When starting, an ARTSTRN server publishes one service per transaction it offers.
2. When a user transmits a transaction request, the ARTTCPH managing the user performs a
tpconnect to the corresponding transaction (service).
3. One ARTSTRN server offering this service receives the request with the associated commarea
and screen and then processes the transaction.
4. After processing the transaction, the ARTSTRN server:
   • In the case of a Normal Pseudo-Conversational CICS transaction: On the RETURN
     {TRANSID} a reply is sent to the client, finishing the conversation by a tpreturn() returning the new 3270 screen, and the commarea.
● In the case of a Conversational CICS transaction with loop of SEND & RECEIVE:
  – On the RECEIVE the ARTSTRN server transmits the prepared 3270 stream via tpSend(), then waits for a tpReceive, for the next user input to complete the RECEIVE
  – On the RETURN (TRANSID) the ARTSTRN server replies to the client, finishing the conversation by a tpReturn() returning the new 3270 screen, and the commarea.

Only transactions belonging to no tranclass, or to a tranclass with maxactive >1 are advertised by these servers.

**Parameters**

**CONV**
The generic parameter CONV is mandatory for this server type, and must be defined as CONV=Y, because ARTSTRN is non-transactional.

**minn and maxn**
Specify respectively the initial and maximum number of servers with this configuration to start. For more information see the UBBCONFIG section of the Tuxedo documentation.

**CLOPT options**
The following CLOPT run-time parameters are recognized:

- *s SystemID*
  Mandatory argument, see CICS SYSID Argument.

- *l GroupList*
  Mandatory option, see Static List of Groups Argument.

- *a Application_ID*
  Optional argument, see CICS Application ID Argument.

- *L List_name(s)*
  Mandatory argument, see Dynamic List of Groups Argument.

**Environment Variables Used**

- KIXCONFIG
- KIX_CWA_IPCKEY
- KIX_TRACE_LEVEL
Examples

*SERVERS
ARTSTRN SRVGRP="TCPGRP" SRVID=1000 RESTART=Y GRACE=0
CONV=Y MIN=2 MAX=3 RQADDR=QKIX1000 REPLYQ=Y
CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTSTR1 Configuration

Server Name
ARTSTR1 – CICS Runtime main server for synchronous terminal oriented transactions with MAXACTIVE = 1.

Synopsis
ARTSTR1 SRVGRP="identifier" SRVID="number" CONV=Y MIN=1 MAX=1
CLOPT="[servopts] -- -s System_ID -a Application_ID-L list1:list2,..."

Description
Theses servers are a specialized version of ARTSTRN servers presenting only transactions with MAXACTIVE = 1; While ARTSTRN servers present only transactions with MAXACTIVE > 1.

It is critical and verified by STR1 servers at boot time that MIN and MAX number of servers are set to 1. The goal of these servers being to guarantee the parallel processing of only one transaction in a group (with MAXACTIVE = 1), to start or let Tuxedo start a few servers offering the same transactions will be self-defeating for STR1 Servers.

Since MIN and MAX are set to 1 the Tuxedo argument RQADDR, become unnecessary, and should be avoided for simplicity.

The rest of the configuration and behavior of STR1 servers are exactly the same a STRN servers.

Examples

*SERVERS
ARTSTR1 SRVGRP="TCPGRP" SRVID=1000 RESTART=Y GRACE=0
CONV=Y MIN=1 MAX=1
CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

**ARTTSQ Configuration**

**Server Name**

ARTTSQ – CICS Runtime Temporary Storage Queue Server

**Synopsis**

ARTTSQ SRVGRP="identifier" SRVID="number" MIN=1 MAX=1
CLOPT"[servopts] -- -L list1:list2"

**Description**

ARTTSQ manages temporary storage queues, it serves the functionalities required by EXEC CICS: WRITEQ TS, READQ TS and DELETEQ TS.

ARTTSQ publishes two main kinds of services:

- **TSQUEUE**: This service is published only once when the first ARTTSQ starts. TSQUEUE processes TSQ requests for queues matching no TSMODEL.

- **{TSMODEL}_TSQUEUE**: One of those services is published for each TSMODEL. The server publishing this service will accomplish all the operations needed on the queues matching this TSMODEL.

One server will publish the TSMODELs belonging to the resource groups assigned to this server thru the -l option.

A group of resources must be assigned to a single tsq server to avoid trying to publish the same service twice. This is checked at boot time and will generate error messages during the boot phase when not respected, but no action will be taken.

It is critical, and verified by TSQ servers at boot time, that MIN and MAX number of servers are set to 1.

It is critical that the same server which created one queue (first write) also serves all other read/write delete requests to this queue. This is the reason why each service, either generic or corresponding to a specific model, must be advertised by a single server.

This unicity is verified when services are published.
The auxiliary TSQ data is lost after the server is down (e.g. stop or crash).

**Parameters**

**ARTTSQ**

The following CLOPT run-time parameters are recognized:

- **-L ListName(s)**

  Mandatory argument, see Dynamic List of Groups Argument for more information.

**DBMS Constraints**

SRVGRP must be a Tuxedo group with an Oracle Resource Manager configured with TMSNAME and OPENINFO.

The DBMS user indicated in the OPENINFO of the group containing the server, must have access to the TS_QCONTENT table; either directly (objects created in this schema) or thru a DBLINK.

On this pre-existing table it must have select, insert, update, delete permissions.

The script to create the table for Oracle is listed below:

---

**Listing 8-1  TS_QCONTENT Creation**

```sql
drop table TS_Q_CONTENT purge;
cREATE TABLE TS_Q_CONTENT
  ( TS_QUEUE CHAR(16) NOT NULL,
    TS_ITEM NUMBER(8) NOT NULL,
    TS_LENGTH NUMBER(8),
    TS_RAW LONG RAW,
    PRIMARY KEY (TS_QUEUE, TS_ITEM)
  );
```

---
Environment Variables Used

- KIXCONFIG
- KIX_TS_DIR
- KIX_TRACE_LEVEL
- KIX_MAP_PATH
- KIX_TECH_DIR

Examples

*SERVERS

ARTTDQ SRVGRP="GRP02" SRVID=30 RESTART=Y GRACE=0
  MIN=1 MAX=1 CLOPT=" -- -L list1:list2"

ARTTDQ Configuration

Server Name
ARTTDQ – CICS Runtime Transient Data Queue Server

Synopsis
ARTTDQ SRVGRP="identifier" SRVID="number" MIN=1 MAX=1
  CLOPT"[servopts] -- -L list1:list2:"

Description
ARTTDQ manages transient data storage queues, it serves the functionalities required by EXEC
CICS: WRITEQ TD, READQ TD and DELETEQ TD.

ARTTDQ publishes one service per declared queue as the name of the TDQueue suffixed by
"_TDQ":

A group of resources must be assigned to a single ARTTDQ server to avoid trying to publish
the same service twice. This is checked at boot time and will generate error messages
during the boot phase when not respected, but no action will be taken.

It is critical, and verified by TDQ server at boot time, that MIN and MAX number of
servers are set to 1.
The extra partition TDQ data is lost after this server is down (e.g. stop or crash).

**Parameters**

**ARTTDQ**

The following CLOPT run-time parameters are recognized:

- **-L ListName(s)**
  Mandatory argument, see Dynamic List of Groups Argument for more information.

**Environment Variables Used**

- KIXCONFIG
- KIX_TS_DIR
- KIX_TRACE_LEVEL
- KIX_TECH_DIR

**Examples**

*SERVERS*

```
ARTTDQ SRVGRP="GRP02" SRVID=30 RESTART=Y GRACE=0
  MIN=1 MAX=1 CLOPT=" -- -s PROW -l group1:group2"
```

**ARTDPL Configuration**

**Server Name**

ARTDPL – CICS Runtime server for distributed program link execution.

**Synopsis**

```
ARTDPL SRVGRP="identifier" SRVID="number" MIN=minn MAX=maxn
  CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2"
```

**Description**

Theses servers present application programs restricted to DPL subsets as tuxedo services and when receiving a DPL service request execute the corresponding program.

These programs are screenless programs which cannot interact directly with terminal users.
Theses servers do not need to (cannot) address the principal facility (the user terminal) and so do not need to be conversational. They are pure RPC mode servers.

When a program requests a LINK, if the requested program is configured as DPL then the link is not resolved as usual by a call, but by a `tpcall`, which will be served by one of the DPL servers offering this service (this DPL program).

Only programs with the attribute `REOMESTSYSTEM(sysid)` positioned to DPL, will be advertised by DPL servers, and only by servers with this sysid as system indicated thru the `-S` option.

**Parameters**

**minn and maxn**

Specify respectively the initial and maximum number of servers to start. For more information see the UBBCONFIG section of the Tuxedo documentation.

**CLOPT options**

The following CLOPT run-time parameters are recognized:

- `-s SystemID`
  Mandatory option, see CICS SYSID Argument.

- `-a Application_ID`
  Optional argument, see CICS Application ID Argument.

**Note:** You must configure at least one ARTDPL for each CICS region.

- `-L List_name(s)`
  Mandatory argument, see Dynamic List of Groups Argument.

- `-l GroupList`
  Mandatory option, see Dynamic List of Groups Argument.

**Note:** For both `-l` and `-L` options, if there are multiple ARTDPL in one ART CICS region and `-s` is configured in such region, please set the same value for all `-l` specified in this region, and set the same value for all `-L` specified in this region. For more information about `-L` configurations, please refer to List of Groups Configuration File.

- `-S`
  Optional argument. ARTDPL servers can receive service requests from Tuxedo client, such as JCA client. In the Tuxedo client, you just need to add the `COMMAREA` data to the FML field `CXMW_MESSAGE`, and then `TPCALL` the corresponding program which is published as a service by ARTDPL. After receiving the service request, ARTDPL executes the corresponding program and finally `TPRETURN` the `COMMAREA` data returned by program with FML field `CXMW_MESSAGE`. 
Sometimes, the length of the COMMAREA data returned by program is larger than the length of the COMMAREA data initialized in Tuxedo client. In this case, you need to add one more FML field CXMW_COMMAREAINLENGTH before TPCALL to the Tuxedo client. The CXMW_COMMAREAINLENGTH must be specified the total length of COMMAREA which is initialized in Tuxedo client, and its data type is long. In this way, ARTDPL can TPRETURN COMMAREA data with the total length CXMW_COMMAREAINLENGTH which is definitely larger than the length of the data filled in COMMAREA.

When the length of COMMAREA data returned by program is smaller than the total length CXMW_COMMAREAINLENGTH, ARTPD normal adds X'00' (null padding character) at the end in the return FML field CXMW_MESSAGE. If you want to strip the NULL padding characters to reduce the data communications between the Tuxedo client and ARTDPL and improve the performance, add “-s” in the CLOPT options of ARTDPL. ARTDPL server will strip the padding characters and then TPRETURN the COMMAREA data with FML field CXMW_MESSAGE.

Environment Variables Used

- KIXCONFIG
- KIX_CWA_SIZE
- KIX_CWA_IPCKEY
- KIX_TRACE_LEVEL
- KIX_TECH_DIR

Examples

*SERVERS
ARTDPL SRVGRP="GRP02" SRVID=60 RESTART=Y GRACE=0
MIN=1 MAX=1
CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTATRN Configuration

Server Name

ARTATRN – CICS Runtime server for asynchronous oriented transactions with MAXACTIVE > 1.
Server Configuration

Synopsis

ARTATRN SRVGRP="identifier" SRVID="number" CONV=N MIN=minn MAX=maxn
RQADDR=KIXATR REPLYQ=Y CLOPT="[servopts] -- -s System_ID -a Application_ID
-L list1:list2:..."

Description

ARTATRN servers present application transactions as Tuxedo services and when receiving a transaction request, execute the corresponding programs.

These programs are screenless programs which cannot interact directly with the terminal user.

In contrast to ARTSTRN servers, these servers are transactional in order to manage true CICS transactions. They are only called from other servers (START TRANSID) and never directly from terminals or clients.

When starting, an ARTATRN server publishes one service per transaction it offers. These transactions are named "ASYNC_\{transaction_name\}".

This server also publishes an internal transaction called ASYNC_QUEUE.

1. When a user program calls a transaction, the KIX__START_TRANSID function makes a tpacall to the corresponding transaction (service).
2. One ARTATRN offering this service receives the request with the associated message, then processes the transaction.
3. The transactions ends without returning a message to the caller.

Only transactions belonging to no tranclasses, or to a tranclass with maxactive >1 are advertised by these servers.

Parameters

CONV

The generic parameter CONV is optional for this server type, if you use it, it must be defined as CONV=N, because the ARTATRN is non conversational.

minn and maxn

Specify the initial and maximum number of servers to be used to start with this configuration. For more information, see the UBBCONFIG section of the Tuxedo documentation.
CLOPT
A string of command-line options that is passed to the ARTATRN when it is booted. The following run-time parameters are recognized:

-\(s\) SystemID
  Mandatory argument, see CICS SYSID Argument.

-\(a\) Application_ID
  Optional argument, see CICS Application ID Argument.

-\(L\) List_name(s)
  Mandatory argument, see Dynamic List of Groups Argument.

*SERVERS
ARTATRN SRVGRP="TCPGRP" SRVID=2000 RESTART=Y GRACE=0
  CONV=N MIN=2 MAX=3 RQADDR=QKIXATR REPLYQ=Y
  CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTATR1 Configuration
Server Name
ARTATR1 - CICS Runtime main server for asynchronous oriented transactions with MAXACTIVE = 1.
Server Configuration

**Synopsis**

ARTATR1 SRVGRP="identifier" SRVID="number" CONV=N MIN=1 MAX=1
CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2:..."

**Description**

ARTATR1 servers are a specialized version of ARTATRN servers presenting only transactions with MAXACTIVE = 1, whereas ARTATRN servers present transactions with MAXACTIVE > 1.

It is critical, and verified by ATR1 servers at boot time, that MIN and MAX number of servers are set to 1. The goal of these servers is to guarantee the parallel processing of only one transaction in a group (with MAXACTIVE =1). To permit Tuxedo to start several servers offering the same transactions would be self-defeating for ATR1 Servers.

Since MIN and MAX are set to 1, the Tuxedo argument RQADDR, becomes unnecessary, and should be avoided for simplicity.

The rest of the configuration and behavior of ATR1 servers are exactly the same as ATRN servers.

**Examples**

*SERVERS

 ARTATR1 SRVGRP="TCPGRP" SRVID=2000 RESTART=Y GRACE=0
 CONV=N MIN=1 MAX=1
 CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

**ARTCTRN Configuration**

**Server Name**

ARTCTRN – CICS Runtime server for conversation oriented transactions with MAXACTIVE > 1.

**Synopsis**

ARTCTRN SRVGRP="identifier" SRVID="number" CONV=Y MIN=minn MAX=maxn
RQADDR=QKIXCTR REPLYQ=Y CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2:..."
Description

ARTCTRN servers present application transactions as Tuxedo services and when receiving a transaction request, execute the corresponding programs.

These programs are screenless programs which cannot interact directly with the terminal user. In contrast to ARTSTRN servers, these servers are transactional in order to manage true CICS transactions. They are only called from other servers (CONVERSE) and never directly from terminals or clients.

When starting, a ARTCTRN server publishes one service per transaction it offers. These transactions are named {SysId}_{transaction_name}.

The {SysId} is the name of this region defined in the -s parameter.

1. When a user program calls a transaction, the KIX__CONVERSE function makes a tpacall to the corresponding transaction (service).
2. One ARTCTRN offering this service receives the request with the associated message, then processes the transaction.
3. The transactions ends and the server returns a message to the caller.

Only transactions belonging to no tranclasses, or to a tranclass with maxactive >1 are advertised by these servers.

Parameters

CONV

The generic parameter CONV is mandatory to be set as Y for this server type.

minn and maxn

Specify the initial and maximum number of servers to be used to start with this configuration.

Note: If it's required to invoke multiple sessions simultaneously, users should both configure MAXIMUM in connections.desc and configure multiple ARTCTRN servers using ARTCTRN minn and maxn parameters in UBB. For more information, please refer to UBBCONFIG.

CLOPT

A string of command-line options that is passed to the ARTCTRN when it is booted. The following run-time parameters are recognized:
-s SystemID
   Mandatory argument, see CICS SYSID Argument.

-l GroupList
   Mandatory option, see Static List of Groups Argument.

-a Application_ID
   Optional argument, see CICS Application ID Argument.

-L List_name(s)
   Mandatory argument, see Dynamic List of Groups Argument.

   CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTCTR1 Configuration

Server Name
ARTCTR1 – CICS Runtime main server for conversation oriented transactions with MAXACTIVE=1.

Synopsis
ARTCTR1 SRVgrp="identifier" SRVID="number" CONV=Y MIN=1 MAX=1
   CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2:..."
Description

ARTCTR1 servers are a specialized version of ARTCTRN servers presenting only transactions with MAXACTIVE = 1, whereas ARTCTRN servers present transactions with MAXACTIVE > 1.

It is critical, and verified by ARTCTR1 servers at boot time, that MIN and MAX number of servers are set to 1. The goal of these servers is to guarantee the parallel processing of only one transaction in a group (with MAXACTIVE = 1). To permit Tuxedo to start several servers offering the same transactions would be self-defeating for ARTCTR1 servers.

Since MIN and MAX are set to 1, the Tuxedo argument RQADDR, becomes unnecessary, and should be avoided for simplicity.

The rest of the configuration and behavior of ARTCTR1 servers are exactly the same as ARTCTRN servers.

Examples

*SERVERS

ARTCTR SRVGRP="TCPGRP" SRVID=2000 RESTART=Y GRACE=0
  CONV=Y MIN=1 MAX=1
  CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTWTRN Configuration

Server Name

ARTWTRN – CICS Runtime application server for synchronous non-3270s clients oriented transactions with MAXACTIVE > 1.

Synopsis

ARTWTRN SRVGRP="identifier" SRVID="number" CONV=N MIN=minn MAX=maxn
  CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2"

Description

ARTWTRN servers present application transactions as Tuxedo services and, when receiving a transaction request, execute the corresponding programs.

These servers are non-conversational in order to support pseudo-conversational CICS transactions.
1. When starting, an ARWTRN server publishes one service per transaction it offers.

2. Non-3270s clients submit the request to ARTWTRN via tpcall and then ARTWTRN/1 will receive the request.

3. One ARTWTRN server offering this service receives the request with the associated application data from FML buffer and then processes the transaction.

4. After processing the transaction, on the RETURN {TRANSID}, a reply is sent to the client and the ARTWTRN server finishes the conversation by a tpreturn() to return the application data and TRANSID with FML buffer.

5. If users change the application data and re-submit it to transaction, Non-3270s clients could submit the request to ARTWTRN according the TRANSID received in step 4. Only transactions belonging to no tranclass or to a tranclass with MAXACTIVE > 1 are advertised by these servers.

**Parameters**

**CONV**

The generic parameter CONV is an option for this server type; however, it must be defined as CONV = N because ARTWTRN is non-conversational.

**minn and maxn**

Specify the initial and maximum number of servers, respectively. For more information, see UBBCONFIG section of the Tuxedo documentation.

**CLOPT options**

The following CLOPT run-time parameters are recognized:

- `-s SystemID`  
  Mandatory argument, see CICS SYSID Argument.

- `-l GroupList`  
  Mandatory option, see Dynamic List of Groups Argument.

- `-a Application_ID`  
  Optional argument, see CICS Application ID Argument.

- `-L List_name(s)`  
  Mandatory argument, see Dynamic List of Groups Argument.

**Environment Variables Used**

ARTWTR1 Configuration

Server Name

ARTWTR1 – CICS Runtime application server for synchronous non-3270s clients oriented transactions with MAXACTIVE = 1.

Synopsis

ARTWTR1 SRVGRP="identifier" SRVID="number" CONV=N MIN=1 MAX=1
CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2,..."

Description

Theses servers are a specialized version of ARTWTRN servers presenting only transactions with MAXACTIVE = 1; by contrast, ARTWTRN servers present only transactions with MAXACTIVE > 1.

It is critical and verified by WTR1 servers at boot time that MIN and MAX number of servers are set to 1. The goal of these servers being to guarantee the parallel processing of only one transaction in a group (with MAXACTIVE = 1), to start or let Tuxedo start a few servers offering the same transactions will be self-defeating for WTR1 Servers.

The rest of the configuration and behavior of WTR1 servers are exactly the same as WTRN servers.

Examples

*SERVERS
Server Configuration

ARTWTR1 SRVGRP="TCPGRP" SRVID=1000 RESTART=Y GRACE=0
MIN=1 MAX=1
CLOPT=" -- -s PROW -a INVOICE -L list1:list2"

ARTCNX Configuration

Server Name
ARTCNX — CICS Runtime connection server for user connection management.

Synopsis
ARTCNX SRVGRP="identifier" SRVID="number" CONV=Y MIN=1 MAX=1 RQADDR=QKIX110
REPLYQ=Y CLOPT="[servopts]"

Description
This server offers internal services needed by terminal handlers during user connection and disconnection phases.

It offers internal message oriented services such as connect and disconnect:

- connect is in charge of various initialization tasks such as attributing the user Session ID and Terminal_ID.
- disconnect manages the disconnection final tasks.

It also offers a few classical CICS transactions:

- CESN: the Sign oN transaction
- CESF: the Sign ofF transaction
- CSGM: the Good Morning transaction (default Good Morning transaction)

It also publishes an internal transaction, authfail used by the handler in case of authentication error.

Theses servers are conversational in order to manage CICS transactions CESN, CESF.

This server must be unique in a CICS Runtime system.
Parameters

**CONV**

The generic parameter CONV is mandatory for this server type, and must be defined as CONV=Y, because ARTSTRN is conversational.

**minn and maxn**

Must be set to 1. This will still be true in the next release, where each server will be allocated a range of terminal identifiers (see CLOPT for more details).

**CLOPT**

- **t**

A string of command-line options that is unique in global scope for ARTCNX and is passed to the ARTCNX when it is booted. The following run-time parameter is recognized:

\[-t\] (x is included in these ranges, "0 to 9", "A to Z" or "a to z").

Optional parameter used for determine the terminals number (TRMID).

If the parameter is not set you can start only one ARTCNX server (this restriction is checked at start), in this case the terminals number is between 0 to 25,411,680 (0000 to zzzz in base 71).

If you use this parameter, you can start up to 62 ARTCNX servers, each server has up to 357,911 terminals numbers, between 0 to 357,910 (000 to zzz in base 71), in this case the TRMID is composed as follow: x000 to xzzz (x is the character in \-t parameter).

At the startup the server cannot check if you have set the same character in the \-t parameter in many servers. It is your responsibility to not start several servers with the same parameter, or you risk having duplicated terminal numbers.

**Notes:**

- ARTCNX will check whether \-t is unique in global scope when booting; if it is not, ARTCNX fails to boot.

- You can use \-t to change the auto-assigned TERMID prefix, but make sure the auto-assigned TERMID is not same as the one defined in terminals.desc.

- **s**

Specifies the SYSID of a CICS region (the region which ARTCNX belongs to). The SYSID is limited to 4 characters and must be unique in each CICS region.

- **a**

Specifies the APPLID of a CICS region (the region which ARTCNX belongs to). The APPLID is limited to 8 characters.
**Server Configuration**

**Note:** Users must set either `-s` or `-a` to configure at least one ARTCNX for each CICS region to associate the initialization parameters which are defined in `system.desc`; otherwise, if users set `-s` together with `-a`, warning messages will occur in `ULOG`, only `-s` will take effect, and `-a` will be ignored.

**-l:**

Specifies the resource group where ARTCNX should install. The resource is always terminals.

**-L:**

Specifies the list of resource groups where ARTCNX should install.

**Note:** For both `-l` and `-L` options, if there are multiple ARTCNX in one ART CICS region and `-s` is configured in such region, please set the same value for all `-l` specified in this region, and set the same value for all `-L` specified in this region. For more information about `-L` configurations, please refer to List of Groups Configuration File.

**Environment Variables Used**

*KIX_TRACE_LEVEL*

**Examples**

*SERVERS*

ARTCNX SRVGRP="TCPGRP" SRVID=1000 CONV=Y MIN=1 MAX=1

**ARTLOGN Configuration**

**Server Name**

ARTLOGN – CICS Runtime Logon Server

**Synopsis**

ARTLOGN SRVGRP="identifier" SRVID="number" CONV=Y MIN=1 MAX=1
RQADDR=QKIX110 REPLYQ=Y CLOPT="[servopts]"

**Description**

This server offers the following technical services needed by terminal handlers when users log on ART CICS.
ART_LOGON sends the "ART runtime welcome" panel and asks for APPLID input.

gensess generates a globally unique session ID (unique in all CICS regions) with 16 characters for each terminal.

delsess removes the session ID when the corresponding terminal disconnects.

Notes:
- ARTLOGN must be unique in a CICS Runtime system.
- ARTLOGN should be only configured when ISC_ENABLE=YES is specified; otherwise, the server will not boot.

Parameters

CONV
The generic parameter CONV is mandatory for this server type, and must be defined as CONV=Y, because ARTLOGN is conversational.

Environment Variables Used

ISC_ENABLE

ARTADM Configuration

Server Name

ARTADM — Administration Server

Synopsis

ARTADM SRVGRP="identifier" SRVID="number" SEQUENCE=1

Description

This server is responsible for the administration of CICS resource. It provides the following functionalities:

- Takes charge of loading the resource definitions used by other servers.
- Offers the services used by artadmin (ART administration console) for dynamic administration of CICS resources and propagates the dynamic configuration requests from artadmin to all the concerned servers in the system.
Server Configuration

- Propagates the dynamic configuration requests submitted by artadmin to all the concerned servers in the system.

- Propagates the resource definition files to the slave machines from the central configuration repository when configured on each node in a distributed environment.
  
  The configuration files only need to be configured on the master node, and the administration servers propagate the configuration files to each slave node.

It is now compulsory to configure an ARTADM server on each machine (master or slave) of the system. The ARTADM server must be started up before other ART servers. The ARTADM server on the master machine must be started up before others on the slave machines. To ensure this sequence, it is necessary to make the following configurations using SEQUENCE:

- For a single machine, configure the ARTADM with SEQUENCE=1.

- For multiple machines, configure the ARTADM on each node:
  - On the master machine, set SEQUENCE=1.
  - On the slave machines, set SEQUENCE=2.

**WARNING:** Do not use SEQUENCE for other servers, or in any case set with greater numbers.

**Environment Variables Used**

- KIXCONFIG
- KIX_TRACE_LEVEL

**Examples**

*SERVERS

    ARTADM SRVGRP="ADMGRP" SRVID=1000 RESTART=Y SEQUENCE=1

**ARTCKTI Configuration**

**Server Name**

ARTCKTI — ART CICS Transaction Trigger Monitor
Synopsis

ARTCKTI SRVGRP="identifier" SRVID="number" CLOPT="[servopts options] -- [-i trigger_interval] [-s retry_interval] [-m queue_manager_name] -q queue_name1,queue_name2,...”

Description

The ART CICS Transaction Trigger Monitor (ARTCKTI) behaves the same as the CICS CKTI transaction. It listens on one or multiple WebSphere MQ initiation queues, gets the trigger message when trigger event occurs, and then forward the trigger message to the target transaction for further operations.

ARTCKTI server accepts the following parameters for the ubbconfig file.

-`i trigger_interval`
  Specifies the maximum time (in milliseconds) that the ARTCKTI server waits for a message to arrive on the initiation queue within each MQGET call.
  
  Numeric, 0-2147483647. Default value is 5000.

-`s retry_interval`
  Specifies the retry interval (in seconds) for ARTCKTI to reconnect to the WebSphere MQ queue manager or to reopen the WebSphere MQ initiation queue upon failure.
  
  Numeric, 0-2147483647. Default value is 5.

-`m queue_manager_name`
  Specifies the name of the WebSphere MQ queue manager to be monitored. Only one WebSphere MQ queue manager can be specified for one ARTCKTI server. The default queue manager is used when this parameter is not specified.

-`q queue_name1,queue_name2,...`
  Specifies the names of the initiation queue to be monitored. Multiple WebSphere MQ initiation queues in a WebSphere MQ queue manager can be monitored by one ARTCKTI server.

Server Connection Parameters

ARTCKTI server acts as a WebSphere MQ client, so the channel info for MQ client is needed for ARTCKTI to connect to the WebSphere MQ queue manager.

Generally there are two ways to do this. One is to specify it in the client configuration file, and the other one is to specify it with the environment variable MQSERVER.
The channel info should contain the location of the WebSphere MQ server and the communication method to be used. It is a string of the format ChannelName/TransportType/ConnectionName.

ConnectionName must be a fully-qualified network name. ChannelName cannot contain the forward slash (/) character because this character is used to separate the channel name, transport type, and connection name.

ARTCKTI server requires WebSphere MQ multi-threaded library.
For details, please refer to Websphere MQ Client document.

Build ARTCKTI Server
Object files are also provided for users who want to build their own ARTCKTI server based on a different version of WebSphere MQ.

To build the ARTCKTI server, execute the following command as the Tuxedo administrator with write permission for the $KIXDIR/bin directory:

```
buidserver -o $KIXDIR/bin/ARTCKTI -t -f "$KIXDIR/objs/ARTCKTI.o $KIXDIR/objs/list.o" -l "-L/$MQM/lib64 -lmqic_r"
```

$MQM is the path that WebSphere MQ has been installed.

ARTSRM Configuration

Server Name
ARTSRM — CICS System and Resource Management Server.

Synopsis
ARTSRM SRVGRP="identifier" SRVID="number" MIN=minn MAX=maxn RQADDR=QKIX110 REPLYQ=Y CLOPT="[servopts] -- -s System_ID -a Application_ID -L list1:list2:... -l GroupList"

Description
ARTSRM centralizes the management ART runtime information, which is generated and queried by applications. This server is also used for time control options for delaying the start of a transaction.

ARTSRM for the same region must be configured in the same tuxedo group.
If the server is rebooted, runtime information will be lost.

Two system servers must be configured in the UBBCONFIG file before ARTSRM can work correctly:

- **TMUSREVt**
  This server is used to support updating terminals attributes.
  When a terminal updates another terminal attribute, ARTSRM publishes the event to notify the terminal that being updated.

- **TMSYSEVT**
  This server is used to release the file resource.
  When some servers die, ARTSRM releases the dead server acquired file resource.

### Parameters

**CLOPT options**

The following CLOPT run-time parameters are recognized:

- **-s SystemID**
  Mandatory argument, see CICS SYSID Argument.

- **-l GroupList**
  Mandatory option, see Static List of Groups Argument.

- **-a Application_ID**
  Optional argument, see CICS Application ID Argument.

- **-L List_name(s)**
  Mandatory argument, see Dynamic List of Groups Argument.

### Related Features

It is required to set ARTSRM to enable the following related features.

- **ASSIGN**
  ABDUMP/ABPROGRAM/ASRAINTRPT/ASRAKEY/ASRAPSIN/ASRAREGS/ASRASPC/ASRASTG/INITPARM/INITPARMLEN/KATAKANA/NETNAME/SOSI/USERNAME

- **CANCEL**

- SEND LAST
- SET/INQUIRE TERMINAL
- SET TERMINAL ACQSTATUS CREATE ACQUIRED RELEASED
- START TRANSID with <ANY> TERMID
- START TRANSID TERMID AFTER
- START TARSND REQID
- START TRANSID SYSID

- Configurable default transaction - GMTRAN (Good morning transaction)

- 3270 printer support
Security Configuration

Authentication Configuration

CICS provides two system transactions for authentication purposes:

- CESN is the sign on transaction;
- CESF is the sign off transaction;

ARTTCP implements a similar authentication function leveraging Tuxedo's security mechanisms. Two Tuxedo system services CESN and CESF are provided by CICS Runtime to emulate the CESN and CESF transactions in CICS.

When a terminal connects to ARTTCP, ARTTCP creates a 3270 session and the session joins Tuxedo with the default security profile. The user name defined in the default security profile has the similar role as the CICS default user CICSUSER. The authentication process is then as follows:

1. The operator calls the CESN transaction to sign on to Tuxedo CICS Runtime.
2. CESN sends a sign-on MAP to ask for username and password.
3. The username and password are entered from the terminal.
4. ARTTCP re-joins Tuxedo using the username and password entered from the terminal.
5. If the authentication:
   - succeeds, a success message is returned to the terminal.
   - fails, an error message is returned to the terminal.
6. When completing the operations, the operator calls service CESF to sign off from Tuxedo CICS Runtime.
Tuxedo Security Mechanisms

ARTTCP supports three types of Tuxedo security mechanisms: application password (APP_PW), user-level authentication (USER_AUTH), and access control list (ACL and MANDATORY_ACL).

The application password security mechanism requires that every client provide an application password as part of the process of joining the Tuxedo ATMI application. The administrator defines a single password for the entire Tuxedo ATMI application and gives the password only to authorized users. For more information on how to configure Tuxedo application password, please refer to Tuxedo documentation.

The user-level authentication security mechanism requires that in addition to the application password, each client must provide a valid username and password to join the Tuxedo ATMI application. The per-user password must match the password associated with the user name stored in a file named tpusr. Client name is not used. The checking of per-user password against the password and user name in tpusr is carried out by the Tuxedo authentication service AUTHSVCS, which is provided by the Tuxedo authentication server AUTHSVR. For more information on how to configure Tuxedo user-level authentication, please refer to Tuxedo documentation.

When Tuxedo security is enabled, a default security profile, which includes the default USER_AUTH username and password and/or the APP_PW password, is required to allow users to join the Tuxedo domain before calling the CESN service. A security profile generator tool is introduced to generate the default security profile. Please refer to Security Profile Generator for details.

In the case of APP_PW, the Tuxedo application password must be created in Tuxedo configuration.

In the case of USER_AUTH, the Tuxedo application password, a Tuxedo username and password must be created in the Tuxedo configuration.

In both cases, the password (and username for USER_AUTH) must be specified in the default security profile file that is specified in the command line option (-p profile-name) of the Tuxedo ARTTCPL server. The password (and username for USER_AUTH) will be used as parameters of tpinit() when ARTTCP server joins Tuxedo.

Integration with the External Security Manager

CICS Runtime offers a security framework which allows a customer to choose integration with an external security manager. The Tuxedo application key (appkey) is used as the credential to be passed to an external security manager. The appkey is 32 bits long, Tuxedo user identifier is in the low order 17 bits and the Tuxedo group identifier is in the next 14 bits (the high order bit
is reserved for administrative keys). For more information, please refer to Tuxedo documentation.

The **appkey** is passed in **AUTH-GROUPID**.

An authorisation function is available for customization by the integration team. This function is called by CICS Runtime each time a resource authorization should be checked for a given resource.

A default function that always returns an ok status is provided. It can be replaced by a project specific version by the integration team, for a project where CICS resource authorization must be activated in addition to transaction authorization.

### Listing 9-1  COBOL CICS Resource Authorization Interface

```cobol
01 ret-code                   usage int.
   LINKAGE SECTION.
01 AUTH-USERID     PIC X(30)  .
01 AUTH-GROUPID     PIC X(256) .
01 AUTH-RSRCE-TYPE  PIC X(256) .
01 AUTH-RSRCE-NAME  PIC X(512) .
01 AUTH-ACCESS-TYPE PIC X(6) .
PROCEDURE DIVISION USING LK-AUTH-USERID LK-AUTH-GROUPID
   LK-AUTH-RSRCE-TYPE  LK-AUTH-RSRCE-NAME
   LK-AUTH-ACCESS-TYPE .
```

### Accepting

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AUTH-USERID</strong></td>
<td>Connection name of the user limited to 8 characters</td>

The resources types are codified as in a native CICS/RACF environment: XTST for Temporary Storage resources, XFCT for files, …

See native CICS documentation for more information. The default version of this function provided with CICS Runtime always returns 0.

**TDI_TRIGGER command**

**Synopsis**

```
TDI_TRIGGER [[-d </Q space_name> -q </Q queue_name>] | [-t <transaction_name>]] [-p <profile>];
```

**Parameters**

- **space_name**
  
  Specifies the /Q QSPACE name.

- **queue_name**
  
  Specifies the /Q QUEUE name.

- **transaction_name**
  
  Specifies the transaction to be triggered. If -d and -q are specified, -t is ignored.

- **profile**
  
  The name of the profile file to use for authentication; this file must have been created with genappprofile. When not provided it defaults to ~/.TDappProfile.
Security Profile Generator

When Tuxedo security is enabled, a default security profile, which includes the APP_PW password and the default USER_AUTH username and password, is required to allow the user to join the Tuxedo domain before calling the CESN service.

A security profile generator tool is introduced to generate the default security profile for TCP.

**genappprofile (1)**

**Name**

*genappprofile* — Security Profile Generator

**Synopsis**

*genappprofile* [-f <output_file>]

**Description**

This utility generates the security profile for Tuxedo applications. When the utility is launched, you are prompted to enter the Tuxedo application password, user name and user password. The output is a security profile file which contains the user name and encrypted passwords. The generated security profile file can be used by CICS Runtime ARTTCPL server to login to the Tuxedo domain.

**Options**

The command option is:

[-f <output_file>]

The location of the generated security profile file. If this option is not specified, the default value is ~/.tuxAppProfile.

**cpy2view32(1)**

**Name**
cpy2view32—Generates Oracle Tuxedo VIEW32 definition file from COBOL copybook file.

**Synopsis**
cpy2view32 [OPTION...] FILE

**Description**
This utility parses the COBOL copybook file and generates the corresponding Oracle Tuxedo VIEW32 definition files.

It supports the following options:
-n  Specifies the source copybook is in "normal" format (i.e., copybook contains sequence
number area (columns 1 through 6 is the sequence number area, followed by the indicator
area)).

-e  Specifies the source copybook is in "exceptional" format (i.e., copybook does not contain
a sequence number area (the first column is the indicator area)).

-o  Specifies the output file name, followed parameter is the output file name. If this
parameter is not specified, the output file name changes the suffix of the input file name
to .v. For example, abc.cbl is converted to abc.v.

This utility supports the following annotation in the source copybook:

* @binary: by default, copybook data types without the following qualifiers are converted to
string: BINARY, COMP, COMP-1, COMP-2, COMP-3, COMP-4, COMP-5, PACKED-DECIMAL.
With the * @binary=true annotation, the copybook data types without those qualifiers are
converted to CARRAY.* @binary=false changes the conversion rule back to the default. When
this annotation is defined on a group, all subordinates in the group are affected.

Environment Variables

PATH

The cpy2view32 utility is written in Java. You must install JDK 1.6 or above and add the
Java command "java" to the PATH environment variable.

Example(s)

1. The following example converts normal copybook file abc_orig.cbl to view file
   abc_orig.v:
   
   cpy2view32 /home/abc_orig.cbl

2. The following example converts exceptional copybook file abc.cbl to view file abc.v:
   
   cpy2view32 -e /home/abc.cbl

3. The following example converts normal copybook file abc_orig.cbl and outputs to view
   file xyz.v:
   
   cpy2view32 -o xyz.v /home/abc_orig.cbl

4. Listing 10-1 through Listing 10-4 provide Copybook and view file output examples:

END

Limitations
The following are general cpy2view32 limitations:

1. This tool does not parse REDEFINES clause, REDEFINES clause and their subordinate items are skipped.
2. POINTER phrase, FUNCTION-POINTER phrase and PROCEDURE-POINTER phrase are skipped in the conversion.
3. VALUE clause is skipped in the conversion.
4. SYNCHRONIZED clause is skipped in the conversion.
5. JUSTIFIED clause is skipped in the conversion.
6. BINARY, COMP, and COMP-4 are synonyms, they are converted to CARRAY in view file.

Mif2View32(1)

Name
Mif2View32—Generates VIEW32 definition file according to the metadata input file and updates the given FML32 definition file.

Synopsis
Mif2View32 -i miffile -o viewfile -f fml32file -w webservice.desc [-v]
Description

Mif2View32 generates VIEW32 definition file according to the metadata input file and updates the given FML32 definition file. The generated nest VIEW32 definition file keeps the same structure with MIF; therefore, we can map the C structure to an FML32 structure.

Options

Mif2View32 supports the following options.

- **-i miffile**
  Specifies the metadata input file name.

- **-o viewfile**
  Specifies the output View32 definition file name.

- **-f fml32file**
  Specifies the updated FML32 definition file.

- **-w webservice.desc**
  Specifies webservice.desc configuration file.

- **-v**
  Indicates whether to output details or not.

Example(s)

1. Listing 10-5 provides an MIF example.

Listing 10-5  MIF Example

**tcxcsdcvt (1)**

**Name**

tcxcsdcvt -- translates RDO file to all z/OS resource configuration files.

**Synopsis**

tcxcsdcvt [-option] [Filename]
Description

tcxcsdcvt translates RDO files to all z/OS resource configuration files. The generated resource configuration files by default are found in the current directory where this tool is run.

tcxcsdcvt supports the following options:

- **-h**
  Display help information for this tool.

- **-d <directory>**
  Specifies the target directory for generated configuration files.

- **-D**
  Generate log file in case there is error information during conversion.

Example(s)
To convert the RDO file "lirgao.cicsb.dfhcbsd", enter following command:

tcxcsdcvt lirgao.cicsb.dfhcbsd

**tcxmapgen(1)**

Name
tcxmapgen — CICS Runtime MAPSET Generator.

Synopsis

tcxmapgen [-options] <file>

Description
CICS Runtime provides a mapset generator to compile BMS macro source files, to produce a physical (binary) file and a symbolic (copybook) file. There is also an option to produce a listing file. During execution, the mapset generator validates the syntax and level of support for each BMS macro statement.

The generated physical (binary) file should be used in the MAPSET configuration file. See “Mapset Configuration File” in CICS Runtime Configuration Files.

The generated symbolic (copybook) file should be included when you compile the CICS/COBOL program which uses the MAP in this MAPSET
Options
The command options are:

[-c]
   Specifies that only COBOL copybook (.cpy) output file is generated.

[-l]
   Specifies a listing output file (.lst) is produced.

[-m]
   Specifies that only binary mapset file (.mpdef) is produced.

[-o file]
   Specifies the name used for the generated output files. The compiler uses the file name
   with an appended extension when creating the output file names.

[-u]
   Specifies that the output fields are not sorted but kept in the defined order. Without
   specifying this option, all fields in a map are sorted according to their positions by default.

Example(s)
To compile the BMS source file file.map, use the following command:

   $ tcxmapgen -o file file.map

The resulting binary mapset file is file.mpdef.

artadmin (1)

Name
artadmin — ART CICS Runtime administration.

Synopsis
artadmin [-p <profile>]

Parameter

Profile
The name of the profile file used for authentication. This parameter is useful for secure Oracle
Tuxedo configuration. The profile file must be created with genappprofile. If no file name is
provided, it defaults to ~/.ADMINappProfile.
**Description**

In some cases it is necessary to modify the configuration while the system is running. Normally, configuration changes which are relative to performances are managed by Oracle Tuxedo or the RDBMS level using commands (for example, `tmadmin`) or Oracle TSAM for Oracle Tuxedo dynamic configuration.

However, if the requirement is more functional (for example, needing to put some transactions online, installing a hot fix for some programs and screens, or changing some resource configurations), you must use `artadmin`.

`artadmin` is useful when making hot configuration changes in the CICS resources of a running ART CICS system. It allows the administrator to:

- request all or partial servers to take in changes to the CICS resources configuration files.
- transmit a New Copy request to do a hot fix of some modified programs or maps.

`artadmin` is launched interactively (similar to `tmadmin`). When the `artadmin` is launched and connects to Oracle Tuxedo successfully, it returns a prompt requiring you to enter the commands.

**artadmin commands**

Commands can be entered either by full name or abbreviation (as given in the parentheses), followed by any appropriate arguments. Arguments appearing in the square brackets `[ ]` are optional, and those in curly braces `{}` indicate a selection from mutually exclusive options.

To let a set of commands be executed together, the administration commands entered are kept in the buffer and performed only when the administrator enters a perform command.

The commands with their abbreviation and options are described below.

- **clear (cl)**
  Resets the commands buffer.

- **config_update (cu) [on|off] (default is on)**
  Propagates the configuration changes and requests the application servers to take in the changes in the configuration.

- **help (h) [command]**
  Without extra argument: prints a list of all the commands.
  With a command argument: prints the synopsis of the command.
list (l)
Displays the commands buffer.
If the buffer is empty, the message " WARNING: No command in buffer." is displayed.

newcopy (n) {p|s} object_name 1 object_name2 ...
Enters a newcopy command for screen or program object types.

perform (p)
Performs the commands submitted to the server and clears the commands buffer.
If the buffer is not empty, the buffer container is displayed and a confirmation is required.
If the submission fails, the message " Perform cancelled." is displayed, and the error is logged into the USERLOG.

quit (q)
Quits this session.
If the buffer is not empty, the buffer container is displayed and a confirmation is required.

sysid (s) {*:SSSS}
By default, the administration commands are transmitted to all servers in the ART CICS system. The configuration is global. For the newcopy, you may want to limit it to some specific servers. The sysid command is used to limit the command effect to the servers with a specific SYSID.

Limitations
- The resources which are taken in account on a dynamic reloading operation are limited to transactions, programs, and mapsets.
- The transactions.des TRANCLASS parameter cannot be changed dynamically.

kixrpt (1)

Name
kixrpt.sh — ARTKIX transaction/command report utility.

Synopsis
kixrpt.sh [-d "YYYY/MM/DD[hh:mm:ss]" ] [-D "YYYY/MM/DD[hh:mm:ss]" ] [-c] trace
Description

`kixrpt` reports transaction/command timing statistics information, including total number of transactions/commands running in specified time slot, total time cost, the average running time, etc. For each transaction/command, such tool reports the details of running information: total number, total time cost, average time cost, failure count, etc.

`kixrpt` analyzes the standard output of `ARTKIX` servers to provide a summary of transaction/command processing time within the servers. The report shows the number of times dispatched and average elapsed time in milliseconds of each transaction/command in the covered period.

`kixrpt` takes its input from the `ARTKIX` trace file or a directory (like `KIX_TRACE_PATH`) including trace files. The traces are valid by being set as below:

```
KIX_TRACE_LEVEL=1 (or higher level)
```

Options

`kixrpt` supports the following options:

- `-d "YYYY/MM/DD[ hh:mm:ss]"
  Limits the start time. The default is no limitation.
- `-D "YYYY/MM/DD[ hh:mm:ss]"
  Limits the end time. The default is no limitation.
- `-c
  Generates the clear trace output instead of statistics report.

Example

1. Set following environment variables before `ARTKIX` system is started:

   ```
   KIX_TRACE_LEVEL=1
   TP_USER_TRACE=SID
   TRACE_PATH=${APPHOME}/LOGS/traces
   ```

2. After running some time, the statistic tool, `kixrpt.sh`, can be used to generate the report with given time slot.

   ```
   $ kixrpt.sh -d 2012/06/21 -D 2012/06/22 $TRACE_PATH
   ```

3. Listing 10-7 provides the output example:
Listing 10-7  kixrpt Output Example

-------------------------------------------------------------
totals(10000) totalTime(1047970) avgTime(104)
System Transactions

Authentication Transactions

**CESN**

The CESN transaction uses MAPSET CSIGNON. The following MAPSET definition must be added to the MAPSET configuration file \${KIXCONFIG}/mapsets.desc if CESN transaction is required:

```
[mapset]
name=CSIGNON
filename="\${KIXDIR}/sysmap/csignon.mpdef"
```

Using this default MAPSET definition, CESN supports a maximum eight-character password. If the following MAPSET definition is added to the MAPSET configuration file, CESN allows a maximum 32-characters password.

```
[mapset]
name=LSIGNON
filename="\${KIXDIR}/sysmap/lsignin.mpdef"
```

If two MAPSET definitions are both added to the MAPSET configuration file, the default MAPSET definition CSIGNON is used. CESN, in this case, allows a maximum eight-character password.

The CESN transaction ignores the UCTRAN setting in the TYPETERM configuration file. The username and password entered from terminal are always case-sensitive, no matter which UCTRAN value is set.

**CESF**

No special configuration is required for CESF transaction.

**CSGM**

Oracle Tuxedo Application Runtime for CICS provides a default "Good Morning" transaction CSGM, which can be added to the Transaction configuration file \${KIXCONFIG}/transactions.desc.

The default CSGM transaction uses MAPSET ABANNER. So the following MAPSET definition must be added to the MAPSET configuration file if the default CSGM transaction is configured:
System Commands and Transactions

[mapset]
name=ABANNER
filename="${KIXDIR}/sysmap/abanner.mpdef"
CICS Runtime Server Build Tool

Overview

Definition

CICS Runtime server build tool constructs one or more Oracle ART CICS server(s) load module. All supported servers which can be built by this build tool are listed in Table 10-1. With a set of prefixes for the server names, Oracle Tuxedo Application Runtime for CICS now allows users to customize server names started with these prefixes. The asterisk (*) character is a wildcard character that can be replaced with zero or more characters. Each prefix stands for one class of servers with special functions as shown on Table 10-1. For example, you can build a server named “ARTSTRN_UDB”.

Table 10-1  Servers Need to be Built by CICS Server Build Tool

<table>
<thead>
<tr>
<th>Server Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>ARTSTR1*</td>
<td>The task of these servers is to offer application transactions and process the corresponding programs.</td>
</tr>
<tr>
<td>ARTSTRN*</td>
<td></td>
</tr>
<tr>
<td>ARTTSQ*</td>
<td>The role of these servers is to centralize the management of the TS Queue operations which are requested by applications.</td>
</tr>
<tr>
<td>ARTDPL*</td>
<td>ARTDPL servers publish programs that are callable by EXEC CICS LINK as services and manage the execution of these services.</td>
</tr>
</tbody>
</table>
To make this tool work correctly, several environment variables must be set firstly as shown in Table 10-2.

**Table 10-2 Required Environment Variables**

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TUXDIR</td>
<td>Mandatory. Install directory of Tuxedo. If it is not set, the tool will stop with a clear error message.</td>
</tr>
<tr>
<td>KIXDIR</td>
<td>Mandatory. Install directory of ART CICS Runtime. It’s <code>&lt;ART_INSTALL_DIR&gt;/Cics_RT</code>. If it is not set, the tool will stop with a clear error message. Besides, “$KIXDIR/bin” must be included in “$PATH” to execute buildartcics.</td>
</tr>
<tr>
<td>COBDIR</td>
<td>COBOLITDIR</td>
</tr>
</tbody>
</table>
Notes:

- To use COBOL-IT compiler, please make a copy or create a symbol link of "$COBOLITDIR/bin/cobmf" as "$COBOLITDIR/bin/cob". For example, you can use following command: `ln -s $COBOLITDIR/bin/cobmf $COBOLITDIR/bin/cob`.

- For Solaris platform, please make sure that $LD_LIBRARY_PATH includes library path for 64-bit "libc*" libraries, which are located in `<SUN_STUDIO_INSTALL_DIR>/lib/v9`.

- To build ARTTSQ with UDB, please make sure the table "TS_Q_CONTENT" already exists in the Database; if not, you can run "<ARTINSTALL_DIR>/Cics_RT/tools/crtstable_UDB" after all required environment variables are set correctly.
buildartcics

All servers can be built by following synopsis of this tool, except for ARTTSQ that does not support multiple RMs. If “-M” is specified when ARTTSQ is built, a warning message will be displayed and only the first “-r” will be taken as the resource manager.

Name
buildartcics – Constructs one or more Oracle ART CICS server(s) load module.

Synopsis
buildartcics [-v] [-M] [-r rmname] -o svrname

Description
buildartcics is used to construct one or more Oracle ART CICS server(s) load module. This command invokes “buildserver” to build the specified ART CICS server(s).

-v
Specifies that buildartcics should work in verbose mode. In particular, it writes the compilation command to its standard output.

-o svrname
Specifies the name of the server to load. This option is mandatory. If “svrname” is a standalone filename without any “/” character, the server will be generated to $KIXDIR/bin by default.

-M
Specifies multiple resource managers associated with this server. This option is mandatory if you want to associate your service with multiple XA complaint resource managers. If this option is not specified and you try to boot a server with a configuration file, in which this server is specified in a non-multiple resource manager server group, a warning message will be printed in the user log; in addition, the server will revert to a general server associated with one resource manager if the "-r" option is specified when buildserver command is executed.

-r rmname
Specifies the resource manager associated with this server. Multiple “-r rmname” can be specified if “-M” is used. The value rmname must appear in the resource manager table located in $TUXDIR/udataobj/RM.
Note: Currently, supported resource managers include Oracle_XA*, UDB_XA*, BERKELEY-DB*, and MQSeries_XA_RMI*; therefore, the "rmname" must use one of these four strings as a prefix.

Specially, for ARTTSQ* servers, only RMs provided by Oracle or DB2 UDB are supported. If other RMs are specified when ARTTSQ* servers is built, the TSQ data may not be stored correctly. Besides, to build ARTTSQ* servers with "TMS_UDB" RM, please make sure that table "TS_Q_CONTENT" exists in the DB2 Database; if this table doesn't exist, you can create it by running "$KIXDIR/tools/crtstable_UDB".

Example

buildartcics -M -r Oracle_XA -r BERKELEY-DB -o ARTSTRN
CICS Commands and Parameters Coverage

Supported CICS Commands

The following tables describe the CICS commands and parameters that are supported by Oracle Tuxedo ART for CICS.

Note: Commands and parameters not listed in Table 12-1 and Table 12-2 are not supported.
### CICS Command and Parameter Support Table

Table 12-1  CICS Command (COBOL Support)

</tbody>
</table>

Note:

- For each command, if none of its listed "command parameters" is mandatory to set originally, ART CICS supports users to code none of them.
- RESP, RESP2, and NOHANDLE are supported on all commands.
- Recognized parameters are processed by the pre-processor and have no effect on the behavior of CICS Runtime.

External Interface for Write Operator

The "WRITE OPERATOR" function calls a "stub" named ExternWriteOperator.

ExternWriteOperator receives all parameters of the WRITE OPERATOR and simply returns zero in the return code and nothing else.

It can be replaced by a customer function that respects the interface described below.

The WRITE OPERATOR passes the following parameters and expects a return code in signed int format.

Listing 12-1  WRITE OPERATOR Parameters

<table>
<thead>
<tr>
<th>TEXT</th>
<th>pic x(1024).</th>
</tr>
</thead>
<tbody>
<tr>
<td>TEXTLENGTH</td>
<td>PIC S9(9) COMP-5.</td>
</tr>
<tr>
<td>ROUTECODES</td>
<td>pic x(1024).</td>
</tr>
<tr>
<td>NUMROUTES</td>
<td>PIC S9(9) COMP-5.</td>
</tr>
<tr>
<td>ACTION</td>
<td>PIC X(2).</td>
</tr>
<tr>
<td>REPLY</td>
<td>pic x(1024).</td>
</tr>
<tr>
<td>MAXLENGTH</td>
<td>PIC S9(9) COMP-5.</td>
</tr>
<tr>
<td>REPLYLENGTH</td>
<td>PIC S9(9) COMP-5.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>PIC S9(9) COMP-5.</td>
</tr>
</tbody>
</table>

S9(9) COMP-5 is equivalent to a signed int.
The parameters `REPLY` and `REPLYLENGTH` may be returned to the `WRITE OPERATOR` function if requested, that is to say, if `MAXLENGTH > zero`.

**Example COBOL Code for ExternWriteOperator**

Listing 12-2  Example ExternWriteOperator.cbl Code

```
IDENTIFICATION DIVISION.
PROGRAM-ID. "ExternWriteOperator".

  if LK-MAXLENGTH > zero
  * move "........." to LK-REPLY
  * move 15 to LK-REPLYLENGTH
  end-if

move zero to ret-code
* return code
* 0 = OK
* -1 = operation failed (INVREC will returned to the user program)
* -9 = time out occurred before the operators's reply was received

GOBACK returning ret-code.

External Interface for Query Security

The "QUERY SECURITY" function calls a "stub" named ExternQuerySecurity.
The delivered ExternQuerySecurity stub receives all parameters of the QUERY SECURITY, it always allows access to the resources and returns zero in the return code. It can be replaced by a customer function that respects the interface described below.

The QUERY SECURITY passes the following parameters:

### Listing 12-3  Query Security Extern Interface

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>restype</td>
<td>pic x(7).</td>
</tr>
<tr>
<td>restype-data-value</td>
<td>pic x(12).</td>
</tr>
<tr>
<td>resclass</td>
<td>pic x(8).</td>
</tr>
<tr>
<td>resclass-data-value</td>
<td>pic x(8).</td>
</tr>
<tr>
<td>residlength</td>
<td>pic x(11).</td>
</tr>
<tr>
<td>residlength-data-value</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>resid</td>
<td>pic x(5).</td>
</tr>
<tr>
<td>resid-data-value</td>
<td>pic x(246).</td>
</tr>
<tr>
<td>logmessage</td>
<td>pic x(10).</td>
</tr>
<tr>
<td>logmessage-cvda</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>read</td>
<td>pic x(10).</td>
</tr>
<tr>
<td>read-cvda</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>update</td>
<td>pic x(10).</td>
</tr>
<tr>
<td>update-cvda</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>control</td>
<td>pic x(10).</td>
</tr>
<tr>
<td>control-cvda</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>alter</td>
<td>pic x(10).</td>
</tr>
<tr>
<td>alter-cvda</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>resp</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>resp2</td>
<td>pic s9(8) comp-5.</td>
</tr>
<tr>
<td>userid</td>
<td>pic x(8).</td>
</tr>
</tbody>
</table>
All parameters are passed to ExternQuerySecurity, only the following parameters are expected in return:

- `read-cvda` pic s9(8) comp-5.
- `update-cvda` pic s9(8) comp-5.
- `control-cvda` pic s9(8) comp-5.
- `alter-cvda` pic s9(8) comp-5.
- `resp` pic s9(8) comp-5.
- `resp2` pic s9(8) comp-5.

If "read" is fulfilled with "READ", read-cvda is expected.
If "update" is fulfilled with "READ", update-cvda is expected.
If "control" is fulfilled with "READ", control-cvda is expected.
If "alter" is fulfilled with "READ", alter-cvda is expected.

"resp" and "resp2" are always expected.

**Note:**

Each interface field is ended by a binary zero, it easier if you want write the "ExternQuerySecurity" in C.

The cvda values for "read" are:

- **READABLE** 35.
- **NOTREADABLE** 36.

The cvda values for "update" are:

- **UPDATABLE** 37.
- **NOTUPDATABLE** 38.

The cvda values for "control" are:

- **CTRLABLE** 56.
- **NOTCTRLABLE** 57.

The cvda values for "alter" are:

- **ALTERABLE** 52.
- **NOTALTERABLE** 53.
For more details, see cvda values in IBM documentation.
S9(9) COMP-5 is equivalent to a signed int.

Developing the ExternQuerySecurity in C

1. Use this interface:

   ```c
   int ExternQuerySecurity(char *restype, char *restype_data_value, char *resclass, char
   *resclass_data_value, char *residlength, int *residlength_data_value, char *resid, char
   *resid_data_value, char *logmessage, int *logmessage_cvda, char *read, int *read_cvda, char
   *update, int *update_cvda, char *control, int *control_cvda, char *alter, int
   *alter_cvda, int *resp, int *resp2, char *userid);
   ```

2. Generate an "ExternQuerySecurity.o", and link it in ART servers (STRN, STR1, ATRN,
   ATR1, CTRN, CTR1).

3. In the makefile_intg (Cics_Rt/tools), add the "ExternQuerySecurity.o" in object variables
   for each server (STRN_OBJS, STR1_OBJS, ATRN_OBJS, ATR1_OBJS, CTRN_OBJS,
   CTR1_OBJS)

4. Execute the makefile to rebuild these servers.

**Supported ECI C API Parameters**

The following table describes the ECI C API parameters that are supported by Oracle Tuxedo ART for CICS.
Notes: Only ECI v1 API CICS_ExternalCall (ECI_Parms) is supported.

Table 12-4  ECI C API Parameters

<table>
<thead>
<tr>

CICS Runtime Messages

Messages

CICS Runtime Messages provide the following information:

- Description: The meaning and context of the message.
- Action: What steps you can take to correct any problems identified.
- See Also: A pointer to related information (not specified for all messages).

Preprocessor Messages

Error Messages

Invalid CICS Messages

Error messages are printed whenever an invalid CICS instruction is found, using the following format:

- Error summary.
- Text of the CICS statement (without margins).
- More detailed explanations, if necessary.

Summaries may contain "Instruction invalid" (in the case of IGNORE and HANDLE instructions), "No rules matching the following instruction", "Several rules matching the following instruction".

**IGNORE** and **HANDLE** instructions messages are quite straightforward:

"**IGNORE** should be constructed with **CONDITION**"

When no rules match a CICS instruction, the error message lists, for all commands starting by the same keyword, why this command does not fit.

- `<command>` expects one of `<keyword list>`, but none is present.
CICS Runtime Messages

- `<command>` expects `<keyword>`, but could not find it.
- `<command>` does not know about `<keyword>`.
- In `<command>`, `<keyword>` expects either: ... `<keyword>` (one of `<keyword list>`), ... but none of them were found.
- In `<command>`, `<keyword>` is present and not `<keyword>` even if they must be used at the same time.
- In `<command>`, `<keyword>` and `<keyword>` cannot be used at the same time.
- Default value of `<keyword>` is supposed to be computed with value of `<keyword>`, but its value `<value>` is not a charstring.

If several commands match, the preprocessor lists them all. This will not actually happen, as the preprocessor checks the commands for ambiguity before translation.

Other Error Messages
The following error messages occur naturally if the preprocessor is used with the wrong options:

- Cannot open file `<file name>` means that the CICS instruction file is not present or not readable.
- Cannot open `$dir/KIX--***.cpy` means that the preprocessor was asked to generate copies in a wrong place (nonexistent or read-only directory…).

Maintenance Messages
These messages are encountered if your CICS instruction file is corrupted.

- `<keyword>` defined as `<Pic clause 1>` and `<Pic clause 2>` in same group.
- `<keyword>` defined twice in same rule.
- A part of a () construct has no required keyword.
- Instruction `<instruction name>` uses `<nb1>` keyword(s) but describes `<nb2>` keyword(s).
- Keyword `<keyword>` in instruction `<instruction name>` is not described.
- Instructions `<instruction name 1>` and `<instruction name 2>` share all their required keywords.
- Line not recognized.
ARTDPL Messages

Abend messages

When abend occurs, following message is logged:

Abend <abend code> detected in transaction <transaction name> program <program name>

The abend code is assigned to URCODE. The first character of abend code is assigned to highest byte of URCODE, the second character is assigned to the second high byte, the third character is assigned to the third byte, and the last character of abend code is assigned to least byte of URCODE. The abend code is also filled in the field CX_ABENDCODE of FML buffer.
CICS Runtime Preprocessor

This chapter contains the following sections:

- Overview
- prepro-cics.pl
- prepro-cics-C.pl

**Overview**

The CICS Runtime Preprocessor prepares COBOL and C programs to execute under Oracle Tuxedo Application Runtime for CICS.

**prepro-cics.pl**

**Pre-Requisites**

The programs handled by the CICS preprocessor must respect the following conditions, or else run the risk of producing errors at compile- or -run-time.

**Note:** These conditions are ensured by the COBOL translator for programs migrated from the original source platform, but you have to enforce them yourself for maintained or newly-developed programs.

1. CICS Runtime must be installed. Some technical copy files used by prepro-cics.pl are delivered under cpylib CICS Runtime module.

2. The environment variable COBCPY, which indicates to the Micro Focus COBOL Compiler-or Cobol IT compiler where copybooks are stored, must be correctly set to include CICS Runtime copy files (cpylib) during compilation time.

3. The following copy files must be inserted in the Working-Storage Section or the Local-Storage Section:
   - `KIX--INDICS` and `KIX--ALL-ARGS`, always;
The following copy files must be inserted in the Linkage Section:
- DFHEIBLK

The program must take exactly two parameters, DFHEIBLK (defined by the copy file of the same name) and DFHCOMMAREA, defined as suitable for the application PROCEDURE DIVISION. In other words, the program must look like this:

```
LINKAGE SECTION.
COPY DFHEIBLK.
01 DFHCOMMAREA.
...
```

PROCEDURE DIVISION USING DFHEIBLK DFHCOMMAREA.

The case of programs compiled with the NOLINKAGE option of the IBM CICS preprocessor is not (yet) supported by ART and the CICS Runtime preprocessor.

**Name**

prepro-cics.pl — A function that reads a Cobol program file from standard input, and outputs it with CICS instructions translated on standard output.

**Synopsis**

```
prepro-cics.pl [-type_output <output type>] [-notrec <notrec behavior>]
```

**Description**

prepro-cics.pl takes a COBOL program as input, reads it line by line, and output a file with CICS instructions translated.

prepro-cics.pl performs only one pass and processes lines one by one. That is, it reads a line from the standard input, outputs one or several lines (it may output none depending on the output type), and then reads the next input line. This behavior enables it to be compatible for use as a preprocessor inside a compiler, but prohibits using the same file as input and output. Note that it will output lines at the end of the input file.
The preprocessor expects the input COBOL program to have a 6-column left-margin. The output is in fixed format, or an error message should appear.

**Options**

**notrec**

*notrec* specifies the way instructions that are not fully supported are processed. (Some options of the instruction are not recognized, hence the "notrec"). There are two possibilities:

- **Stop** – (default) means that if the instruction contains non-supported options, then the whole instruction is considered as not supported and translation will fail.
- **Warn** – means that the instruction is processed normally, but the generated call sets up a flag to signal some options may not be supported.

In both cases, a message is displayed on the error output.

**type_output**

*type_output* determines the way that output is printed; recognized values are:

- **debug**
  
  Prints every line with its status (untouched, modified, deleted, created). Always outputs at least one line for every line read.

- **orig**
  
  Prints every line, deleted lines are printed as comments. Always outputs at least one line for every line read.

- **normal** (default)
  
  Prints every line, except deleted ones. Does not always output at least one line for every line read.

Any other value will be considered as "normal".

**Restrictions**

- The preprocessor expects the input COBOL program to be in fixed format.
- The preprocessor ignores copies. Any CICS inside a copy will not be translated.
- The two words **EXEC** and **CICS** must be on the same line for a CICS instruction to be recognized.
In order to support the feature “TSAM call path for CICS and DB”, the preprocessor is asked to be executed ahead of “procob” (for Oracle DB) or “db2 prep” (for IBM UDB) commands when compiling CICS programs containing “EXEC SQL” statements.

Error Messages

Invalid CICS Messages
Error messages printed whenever an Invalid CICS instruction is found use the following format:

- Error summary
- Text of the CICS statement (without margins)
- More detailed explanations, if necessary

Summaries may be:

- Instruction invalid (IGNORE and HANDLE instructions),
- No rules matching the following instruction,
- Several rules matching the following instruction.

IGNORE and HANDLE instructions messages are quite straightforward:

IGNORE should be constructed with CONDITION.

When no rules match a CICS instruction, the error message explains, for all commands starting by the same keyword, why this command does not fit.

- <command> expects one of <keyword list>, but none is present.
- <command> expects <keyword>, but couldn't find it.
- <command> does not know about <keyword>.
- In <command>, <keyword> expects either: ... <keyword> (one of <keyword list>), ... but none of them was found.
- In <command>, <keyword> is present and not <keyword> even if they must be used at the same time.
- In <command>, <keyword> and <keyword> cannot be used at the same time.
- Default value of <keyword> is supposed to be computed with value of <keyword>, but its value (<value>) is not a charstring.
If several commands match, the preprocessor lists them all. This will not actually happen, as the preprocessor checks the commands for ambiguity before translation.

**Non Supported Error Messages**

If a CICS instruction is unknown, or registered as "non supported", or "obsolete", an error message:

```
Instruction non supported
```

is generated.

The same error message is printed if there are some non-recognized keywords in an instruction, when the option notrec is set with value `stop`.

**prepro-cics-C.pl**

**Pre-Requisites**

The programs handled by the CICS preprocessor must respect the following conditions, or else run the risk of producing errors at compile or Runtime.

1. CICS Runtime must be installed. Some technical header files used by `prepro-cics-C.pl` are delivered under `include` directory in CICS Runtime module.

2. `prepro-cics-C.pl` does not support "TSAM call path for CICS and DB" functions.

3. If the program contains "EXEC SQL" statements, the preprocessor is asked to be executed ahead of db pre-complier commands (db2 prep for IBM UDB or pro*C for Oracle DB).

**Name**

`prepro-cics-C.pl` — A function that reads a C program file specified by `source_file`, and outputs the C program file with CICS instructions translated on `output file`.

**Synopsis**

```
```
Description

prepro-cics-C.pl takes a C program as input, reads it line by line, and outputs a file with CICS instructions translated.

prepro-cics-C.pl performs only one pass and processes lines one by one. That is, it reads a line from source_file, outputs one or several lines, and then reads the next input line. This behavior enables it to be compatible for use as a preprocessor inside a compiler, but prohibits using the same file as input and output.

Options

-help
help shows the usage of prepro-cics-C.pl.

-source_format
source_format specifies the source format of C program. There are two possibilities:
- fixed - (default) means that each line of a C program should be in fixed format.
- free - specifies free style of C program.

Note: Only fixed format is supported currently.

-o
o specifies output file name and path.

-B
B specifies that the source is an EXCI program.

Restrictions

- /**/ is used for single line comments. Do not put a comment in the middle of an EXEC CICS command.
- Keep EXEC CICS as a whole in one line.
- Keep multiple CICS commands in one line is not support.
• `#pragma` will be automatically translated to comments.

• The preprocessor expects the inputted C program to be in fixed format.

• Keep C `main()` function, its parameter list, and parenthesis in one line. For example,
  ```c
  void main(int argc, char **argv)
  ```

**Error Messages**

`prepro-cics-C.pl` may print the following error messages:

• Cannot open `source_file`

• Errors occurred while CICS C code is translated

• `PROGRAM` should be constructed with `EXCI LINK`

• `LENGTH` should be constructed with `COMMAREA` in `EXCI LINK`

• `DATALENGTH` should be constructed with `COMMAREA` in `EXCI LINK`

• `RETCODE` should be constructed with `EXCI LINK`

• No rules match the following instructions:
  
  – Instruction `rulename` non supported
  
  – Instruction `rulename` is obsolete
Prerequisite

Before you start to configure Tuxedo XA connection to DB2 running on mainframe using DB2 Connect, you need to:

- Install DB2 Connect for Universal System on the machine running Tuxedo.
- Configure TCP/IP communication on both mainframe and the machine running Tuxedo.

DB2 Connect Configuration

This section describes the steps required to configure DB2 Connect on open system to connect to DB2 server running on mainframe. These steps must be performed by users who have the necessary system privileges and special expertise, such as your network or system administrator, or your DB2 administrator.
DB2 Instance Creation

This chapter describes how to use db2icrt to create DB2 instance which will be used to connect to database residing on mainframe. The db2icrt command creates DB2 instances in the instance owner's home directory.

Note: The DB2 DB2ICRT command is not available for a non-root installation of DB2 database products on Linux and UNIX operating system.

On Linux or UNIX operating systems, this utility is located in the DB2DIR/instance directory, where DB2DIR represents the location where the DB2 Connect is installed. On Windows operating system, this utility is located under the DB2PATH\bin directory where DB2PATH is the location where the DB2 Connect is installed.

- Command Syntax:
  
  db2icrt -[ h, d, p, a, s, u ] Instname
  
  Example:
  
  $DB2DIR/instance/db2icrt -u db2art db2art

The db2icrt command takes the following parameters:

-h | -?
  Displays the usage information.

-d
  Turns debug mode on. Use this option only when instructed by DB2 database support.

-a AuthType
  Specifies the authentication type (SERVER, CLIENT or SERVER_ENCRYPT) for the instance. The default is SERVER.

-p PortName
  Specifies the port name or number used by the instance. This option does not apply to client instances.

-s InstType
  Specifies the type of instance to create. Use the -s option only when you are creating an instance other than the default associated with the installed product from which you are running db2icrt. Valid values are: Client, standalone, ese or wse.

-u Fenced ID
  Specifies the name of the user ID under which fenced user-defined functions and fenced stored procedures will run. The -u option is required if you are not creating a client instance.
InstName

Specifies the name of the instance which is also the name of an existing user in the operating system. This has to be the last argument of the db2icrt command.

**DB2 Instance Configuration**

This section describes how to use CATALOG command to setup the connection to DB2 server residing on mainframe. You can also use DB2 Client Configuration Assistant (CCA), a graphic user interface tool instead, but it is not covered in this section.

**DB2 CATALOG**

DB2 maintains a set of tables that contain information about the data that DB2 controls. These tables are collectively known as the catalog.

The catalog tables contain information about DB2 objects such as tables, views, and indexes. When you create, alter, or drop an object, DB2 inserts, updates, or deletes rows of the catalog that describe the object.

The DB2 catalog consists of tables of data about everything defined to the DB2 system, including table spaces, indexes, tables, copies of table spaces and indexes, and storage groups. The system database DSNDDB06 contains the DB2 catalog.

Before starting this step, you need to check:

- Whether the DB2 server on mainframe is started, and TCP/IP communication is up or not.
- Assign an unused TCP port for the DB2 instance listener and add it into your local configuration "/etc/services" like this:
  
  `db2c_db2art    60000/tcp`

Next, use **CATALOG TCP/IP NODE**, **CATALOG DCS DATABASE** and **CATALOG DATABASE** step by step to finish the connection setup.

**CATALOG TCP/IP NODE**

The **CATALOG TCP/IP NODE** command syntax is as follows:

```
catalog [ ADMIN ] [ TCP/IP protocol ] node [ Node-name ] remote [ Hostname ] server [ Service-name ] with [ comment-string ]
```

Example:

```
db2 catalog tcpip node wasa-host remote wasa server 4001 with "catalog remote host wasa:4001 to local alias wasa-host"
```
CATALOG TCP/IP NODE takes the following parameters:

**ADMIN**
Specifies that a TCP/IP administration server node is to be cataloged. This parameter cannot be specified if the SECURITY SOCKS parameter is specified.

**TCP/IP Protocol**
Specifies TCP/IP protocol used, could be: TCPIP, TCPIP4, TCPIP6

**Node-name**
The nodename of the TCPIP, TCPIP4, or TCPIP6 node represents a local nickname you can set for the machine that contains the database you want to catalog. Only specify TCPIP4 when specifying an IPv4 IP address, and only specify TCPIP6 when specifying an IPv6 IP address.

**Hostname**
The hostname or the IP address of the node where the target database resides. IP address can be an IPv4 or IPv6 address. The hostname is the name of the node that is known to the TCP/IP network. The maximum length of the hostname is 255 characters.

**Service-name**
Specifies the service name or the port number of the server database manager instance. The maximum length is 14 characters. This parameter is case sensitive.

If a service name is specified, the services file on the client is used to map the service name to a port number. A service name is specified in the server's database manager configuration file, and the services file on the server is used to map this service name to a port number. The port number on the client and the server must match.

A port number, instead of a service name, can be specified in the database manager configuration file on the server, but this is not recommended. If a port number is specified, no service name needs to be specified in the local services file.

**CATALOG DCS DATABASE**
This command stores information about remote host (z/OS or OS/390) or iSeries (OS/400) databases in the Database Connection Services (DCS) directory. These databases are accessed through an Application Requester (AR), such as DB2 Connect. Having a DCS directory entry with a database name matching a database name in the system database directory invokes the specified AR to forward SQL requests to the remote server where the database resides.

**Note:** If you just need access the data residing on universal system, such as UNIX, Linux, you could use `CATALOG DATABASE` only.

The `CATALOG DCS DATABASE` command syntax is as follows:
catalog dcs database [ Database-name ] as [ Target-database-name ] with [comment-string ]

Example:

db2 catalog dcs database db2wasa as qwa1 with "catalog the remote host
database qwa1 to local db2wasa"

CATALOG DCS DATABASE takes the following parameters:

Database-name
   Specifies the alias of the target database to catalog. This name should match the name of
   an entry in the database directory that is associated with the remote node.

Target-database-name
   Specifies the name of the target host or iSeries database to catalog.

DB2 CATALOG DATABASE

This command stores database location information in the system database directory. The
database can be located either on the local workstation or on a remote database partition server.

Note:  If you need access the data residing on local or remote universal system, such as UNIX,
        Linux, you could use it.

The DB2 CATALOG DATABASE command syntax is as follows:

catalog database [ Database-name ] as [ Alias ] at node [ Node-name ]
   authentication [ Authentication-type ] with [ comment-string ]

Example:

db2 catalog database db2wasa at node wasa-host authentication dcs with
   "catalog the local db2wasa with dcs authentication type"

DB2 CATALOG DATABASE takes the following parameters:

Database-name
   Specifies the name of the database to catalog.

Alias
   Specifies an alias as an alternate name for the database being cataloged. If an alias is not
   specified, the database manager uses database-name as the alias.

Node-name
   Specifies the name of the database partition server where the database being cataloged
   resides. This name should match the name of an entry in the node directory. If the node
   name specified does not exist in the node directory, a warning is returned, but the database
is cataloged in the system database directory. The node name should be cataloged in the
node directory if a connection to the cataloged database is desired.

Authentication-type
The authentication value is stored for remote databases (it appears in the output from the
LIST DATABASE DIRECTORY command) but it is not stored for local databases.

**DB2 START UP**
After all the steps of CATALOG, you need to update some database manager configuration and
start DB2 Connect.

- Update the SVCENAME of your DB2 instance to the listener added into "/etc/services"
  before.
  
  ```
  db2 update dbm cfg using SVCENAME db2c_db2art
  ```

- Set the communication protocol to TCP/IP.

  ```
  db2set DB2COMM=tcpip
  ```

- Configure the auto start and start DB2.

  ```
  db2set DB2AUTOSTART=yes
  db2start
  ```

**Oracle Tuxedo Configuration**
What follows is the description of the process to configure Oracle Tuxedo for accessing the
database residing on mainframe with DB2 Connect. There are some differences based on whether
Tuxedo is working with a 64-bit instance of DB2 Database or a 32-bit instance of DB2.

- Set the DB2INSTANCE environment variable to reference the instance that contains the
databases that you want Tuxedo to use. Set the PATH variable to include the DB2 Connect
directories. Confirm the User ID and Password that can connect to the DB2 databases, you
could find some example below:

  ```
  export DB2INSTANCE=db2art
  export DB2DIR=/opt/ibm/db2_connect/V9.1
  ```

- Update some database manager configuration parameters accordingly.

  ```
  Update the tp_mon_name database manager configuration parameter
  with the value TUXEDO. This parameter identifies the name of the transaction
  processing (TP) monitor product being used.
  ```
Valid value includes CICS, MQ, CB, SF, TUXDEO, TOPEND, WAS, blank or some other value.

```
db2 update dbm cfg using tp_mon_name TUXEDO
```

- Update the `spm_name` database manager configuration parameter with the hostname of the machine has DB2 Connect installed. This parameter identifies the name of the sync point manager (SPM) instance to the database manager.

Valid value applies to:

- Database server with local and remote clients
- Database server with local clients
- Partitioned database server with local and remote clients

```
db2 update dbm cfg using spm_name bjaix ("bjaix" is the hostname of the machine which installs and configures DB2 Connect)
```

- Update the `max_connections` to be greater than `max_coordagents` to activate the XA Concentrator. DB2 Connect's connection concentrator technology allows DB2 Connect Enterprise Edition servers to provide support to thousands of users simultaneously executing business transactions, while drastically reducing resources required on the S/390 host or AS/400 database servers.

**Note:** If the application is accessing data residing on DB2 for z/OS and OS/390(R), DB2 for iSeries, or DB2 for VM&VSE, the DB2 Connect XA concentrator should be required.

You can activate the concentrator feature by setting the value of `MAX_CONNECTIONS` to any number greater than the default. The default value for `MAX_CONNECTIONS` is equivalent to the value of `MAX_COORDAGENTS`. Because each application will have one logical agent, `MAX_CONNECTIONS` actually controls the number of applications that can be connected to the database instance, while `MAX_COORDAGENTS` controls the number of inbound connections that can be active at any time. `MAX_CONNECTIONS` will take a numeric range from `MAX_COORDAGENTS` up to 64,000. The default number of logical agents is equal to `MAX_COORDAGENTS`.

```
db2 update dbm cfg using max_connections 500
db2 update dbm cfg using max_coordagents 200
```

- Add a definition for DB2 Connect to the Tuxedo resource manager definition file (`$TUXDIR/udataobj/RM`). In the examples that follow, `UDB_XA` is the locally-defined Tuxedo resource manager name for DB2 Connect, and `db2xa_switch_std` is the DB2-defined name for a structure of type `xa_switch_t`. 
Configuring Oracle Tuxedo XA Connection to DB2 Using DB2 Connect

# DB2 UDB
UDB_XA:db2xa_switch_std:-L${DB2DIR}/lib -ldb2

- Build the Tuxedo transaction monitor server (TMS) for DB2:
  
  ```
  ${TUXDIR}/bin/buildtms -r UDB_XA -o ${TUXDIR}/bin/TMS_UDB
  ```

- Write your own application servers which accesses the DB2 database residing on mainframe, and you can follow the examples below. The -r option specifies the resource manager name, the -f option specifies the files that contain the application business logic, the -s option specifies the application service names for this server, and the -o option specifies the output server file name.

  ```
  ${TUXDIR}/bin/buildserver -r UDB_XA -f svcfile.o -s SVC1,SVC2 -o UDBserver
  ```

- Set up the Tuxedo configuration file to reference the DB2 server. In the *GROUPS section of the UBBCONFIG file, add an entry similar to:

  ```
  UDB_GRP   LMD=simp GRPNO=3
  TMSNAME=TMS_UDB TMSCOUNT=2
  OPENINFO="UDB_XA:db=sample,uid=username,pwd=password,tpm=tuxedo"
  ```

  Where the TMSNAME parameter specifies the transaction monitor server that you built previously, and the OPENINFO parameter specifies the resource manager name. This is followed by the database name, and the DB2 database user ID and password, which are used for authentication.

  The application servers that you built previously are referenced in the *SERVERS section of the Tuxedo configuration file.

- Start Tuxedo application.

  ```
  tmboot -y
  ```

Summary

This chapter summarizes all the steps needed and provides methods to check the connection and error detection.

1. Firstly, let's recap the step-by-step procedures:

  ```
  db2icrt -a server -u db2art db2art
db2 catalog tcpip node wasa-host remote wasa server 4001
db2 catalog dcs database db2wasa at node wasa-host authentication dcs
  ```
2. And then, let's check whether the connection is reachable:

```
export DB2INSTANCE=db2art
export DB2BASE=db2wasa
db2 connect to $DB2BASE user user-name using password
```

3. And check the output, if the screen shows some database connection information as below, it means you are able to access the database residing on mainframe, and you can create table or insert data as you required. If screen shows some errors with error code, maybe there are some failures there. Please find the most common errors and its correction in the APPENDIX.

```
Database Connection Information
Database server= DB2 OS/390 9.1.5
SQL authorization ID= BEAUSR1
Local database alias= DB2QWA1
```

4. Finally, let's configure the Tuxedo application and start it up.

```
export TUXDIR=/home/db2art/tuxedo11gR1
export DB2INSTANCE=db2art
export DB2DIR=/opt/ibm/db2_connect/V9.1
db2 update dbm cfg using tp_mon_name TUXEDO
db2 update dbm cfg using spm_name bjaix
db2 update dbm cfg using max_connections 500
db2 update dbm cfg using max_coordagents 200
Add "UDB_XA:db2xa_switch_std:-L${DB2DIR}/lib -ldb2" into
$TUXDIR/udataobj/RM
${TUXDIR}/bin/buildtms -r UDB_XA -o ${TUXDIR}/bin/TMS_UDB
${TUXDIR}/bin/buildserver -r UDB_XA -f svcfile.o -s SVC1,SVC2 -o UDBserver
Configure OPENINFO in ubbconfig:
OPENINFO="UDB_XA:db=sample,uid=username,pwd=password,tpm=tuxedo"
tmboot -y
```
Trouble Shooting

This section lists the most common symptoms of connection problems encountered when using DB2 Connect. In each case, you are provided with:

- A combination of a message number and a return code (or protocol specific return code) associated with that message. Each message and return code combination has a separate heading, and the headings are ordered by message number, and then by return code.
- A symptom is provided, usually in the form of a sample message listing.
- A suggested solution is provided, indicating the probable cause of the error. In some cases more than one suggested solution may be provided.

SQL1403N
Symptom: SQL1403N The username and/or password supplied is incorrect.

Solution: User fails to authenticate at the DB2 Connect workstation. Determine whether the user is supposed to be authenticated at the DB2 Connect workstation.

If yes, make sure that the correct password is provided on the CONNECT statement if necessary.

If no, the system database directory entry must have been incorrectly cataloged using AUTHENTICATION SERVER (this is the default if AUTHENTICATION is not specified explicitly). If this is the case, then re-catalog the entry using AUTHENTICATION DCS or CLIENT.

Password is not available to send to the target server database. If the system database directory entry is cataloged using AUTHENTICATION DCS, then a password has to be flowed from the DB2 Client to the target server database. On certain platforms, for example AIX, the password can only be obtained if it is provided on the CONNECT statement.

SQL5043N
Symptom: Support for one or more communications protocols failed to start successfully. However, core database manager functionality started successfully.

Perhaps the TCP/IP protocol is not started on the DB2 Connect gateway. There may have been a successful client connection previously.

Solution: This warning is a symptom which signals that DB2 Connect, acting as a gateway for remote clients, is having trouble handling one or more client communication protocols. These protocols can be TCP/IP, APPC and others, and usually the message indicates that one of the communications protocols defined to DB2 Connect is not configured properly.
Often the cause may be that the DB2COMM profile variable is not defined, or is defined incorrectly. Generally, the problem is the result of a mismatch between the DB2COMM variable and names defined in the database manager configuration (for example, svcname or tpname).

One possible scenario is having a previously successful connection, then getting the SQL5043 error message, while none of the configuration has changed. This could occur using the TCP/IP protocol, when the remote system abnormally terminates the connection for some reason. When this happens, a connection may still appear to exist on the client, and it may become possible to restore the connection without further intervention by issuing the commands shown below.

Most likely, one of the clients connecting to the gateway still has a handle on the TCP/IP port. On each client machine that is connected to the gateway.

**SQL30061**

**Symptom:** Connecting to the wrong host or AS/400 database server location - no target database can be found.

**Solution:** The wrong server database name may be specified in the DCS directory entry. When this occurs, SQLCODE -30061 is returned to the application.

Check the DB2 node, database, and DCS directory entries. The target database name field in the DCS directory entry must correspond to the name of the database based on the platform.

**SQL30081 with Return Code 79**

**Symptom:** SQL30081N  A communication error has been detected.

**Communication protocol being used:** "TCP/IP".  **Communication API being used:** "SOCKETS".

**Location where the error was detected:** "".  **Communication function detecting the error:** "connect".  Protocol specific error code(s): "79", "*", "*".  SQLSTATE=08001

**Solution:** This error can occur in the case of a remote client failing to connect to a DB2 Connect gateway. It can also occur when connecting from the DB2 Connect gateway to a host.

The DB2COMM profile variable may set incorrectly on the DB2 Connect gateway. Check this. For example, the command `db2set db2comm=tcpip` should appear in `sqlib/db2profile` when running DB2 Extended Enterprise Edition on AIX.
There may be a mismatch between the TCP/IP service name and/or port number specifications at the DB2 client and the DB2 Connect gateway. Verify the entries in the TCP/IP services files on both machines.
