## Installation Task Overview

This table lists the tasks to perform for switch installation. Before you begin, answer these questions:

- Are you installing one switch or two switches?
- Are you orienting the switches with power supplies on the cold aisle or with data connectors on the cold aisle?
- Is the installation into a Telco form factor rack?

How you answer these questions identifies variances from a standardized installation, and these differences are addressed in the installation procedures.

## Management Connection Overview

The switch is managed at the management console, which is either a 10/100 Ethernet connection at the NET MGT port or a serial device attached to the SER MGT port.

The NET MGT connection is the default means of communicating with the SP. The SP has a DHCP client in operation and requires the Ethernet network to have a DHCP server. The DHCP server must be configured with the MAC address of the SP, so the server can provide an IP address to the SP upon booting. If a DHCP server is not available, then the SER MGT connection is used.

The advantage of the NET MGT connection over the SER MGT connection is that administration of the gateway can happen from anywhere on the network. There is no cable length constraint for the network management route because of the re-amplification, filtering, and processing that happens at each hub or switch within the Ethernet network. No network management cable should be any longer than 100 meters.

The SER MGT connection requires a serial connection to a serial device management console. The serial device management console can be a serial terminal, a terminal server, or a serial connection running on a system or laptop.

If no DHCP server is available on the management network, the SER MGT port must be used to configure the NET MGT port. See [“Configure Network Management From the CLI \(SER MGT\)” on page 63](#). Because of the nature of the serial signal, a serial management cable cannot be used reliably if it is more than 10 meters long.

## NET MGT Port

The NET MGT port is a 100BASE-T Ethernet RJ45 connector that provides access to the SEFOS and Oracle ILOM CLI and web interfaces running on the SP. The port is located at the upper left corner of the switch rear panel. See [“Front Panel Components” on page 3](#).

The figure and table describe the pinouts of the NET MGT port.

# SER MGT Port

The SER MGT port is an RJ45 connector that provides RS-232 access to the SEFOS and Oracle ILOM CLI interfaces running on the SP. The port is located at the lower left corner of the switch rear panel. See [“Front Panel Components” on page 3](#).

The serial device must be configured to these parameters:

- 9600 baud (default, can be set to any standard rate up to 57600)
- 8N1: eight data bits, no parity, one stop bit
- Software flow control (XON/XOFF) disabled

The figure and table describe the pinouts of the SER MGT connector.

Pin	Signal Description

2	Data Terminal Ready (DTR)
3	Transmit Data (TXD)
4	Ground
5	Ground
6	Receive Data (RXD)

## Power Cord Specifications

The power supplies are in an N+N redundancy. Line power is provided from two sources, A and B.

The switch accessory kit should contain two power cords that are specific to your country or application. This table describes the power cords available.

# SFP+ Data Cable Overview

The switch's SFP+ ports support the following types of cables:

- 10 Gbyte/1 Gbyte dual speed fiber (300m)
- 10 Gbps direct attach copper (5m or 10m)

A passive copper data cable is a single-part unit. The cable and the connectors are a single combined assembly.

An active fiber SFP+ data cable is a three-part unit, where the cable and the optical transceivers are separate components. You must assemble this type of cable before connecting it. See ["Assemble an SFP+ Data Cable"](#) on page 26.

# 10GBASE-T Data Cable Overview

Modulation in the host ports uses frequencies of up to 500 MHz to achieve 10Gbps transmission over copper twisted-pair cabling. This modulation requires suppression of both external and internal noise up to 500 MHz.

The 10GBASE-T ports on the switch support the following types of twisted-pair copper cables:

- Category 7, shielded (100m)
- Category 6A, shielded and unshielded (100m)
- Category 6, shielded and unshielded (55m)
- Category 5e, shielded and unshielded (55m)

# Data Cable Cautions

---

**Caution** – Data cables with laser transceivers *must* be Class I.

---

Do not step on the cable or connectors. Plan cable paths away from foot traffic or rolling loads.

Do not pull the cable out of the shipping box, through any opening, or around any corners. Unroll the cable as you lay it down and move it through turns.

Do not bend the cables to a radius tighter than 85 mm (3.4 inches). Ensure that cable turns are as wide as possible.

Do not pack the cable to fit a tight space. Use an alternative cable route.

---

Do not drop the cable or connectors from any height. Gently set the cable down, resting the cable connectors on a stable surface.

Do not drag the cable or its connectors over any surface. Carry the entire cable to and from the points of connection.

Do not force the cable connector into the receptacle by pushing on the cable. Apply connection or disconnection forces at the connector only.

## Data Cable Guidelines

Proper data cable installation requires the following:

1. Plan the cable routes and cable length needs.  
See [“SFP+ Data Cable Overview” on page 15](#) and [“10GBASE-T Data Cable Overview” on page 15](#).
2. Ensure that cable route turns are larger than 85 mm (3.4 inches) radius for optical cables.  
Find alternative routes for turns that are tighter.
3. Secure the cable to hard points and bundle it with soft, hook-and-loop fasteners.

4. Mediate the slack between securing points to maintain minimal cable tension and proper support.
5. Label the ends of cables to identify their routes.
6. Rest the cable connectors on a stable surface when they are not connected.

## Single-Switch Location Guidelines

In a single-switch configuration, a switch and a filler are installed side-by-side. Before you install a single switch, you must determine if the switch is to be on the left side or right side of the rack.

---

**Note** – The single switch can be installed on either the left or the right. For procedures and illustrations in this document, the switch is installed on the right side.

---

- The single-switch installation procedure entails many steps that are left- or right-biased. After installation, swapping the left and right mounting is not trivial. Determine your long-term mounting side before installing.
- Determine what other components in the rack must interconnect with the switch. Are the cable paths and connectors left- or right-biased?
- Some racks have cable management hardware to one side. Would it be advantageous to mount the switch on that side of the rack?

## ESD Precautions

A grounded antistatic wrist strap is shipped with the switch. Electronic equipment is susceptible to damage by static electricity. Use a grounded antistatic wrist strap, foot strap, or equivalent safety equipment to prevent ESD when you install or service the switch.

---

**Caution** – To protect electronic components from electrostatic damage, which can permanently disable the switch or require repair by service technicians, place components on an antistatic surface, such as an antistatic discharge mat, an antistatic bag, or a disposable antistatic mat. Wear an antistatic grounding strap connected to a metal surface on the switch when you work on switch components.

## Tools Needed for Installation

To install the switch, you must have these tools:

- No. 2 Phillips screwdriver

- ASCII terminal
- Workstation or laptop with serial port
- Terminal server
- Patch panel connected to a terminal server

The serial device needs serial cables, null modems, and appropriate adapters for operation.

## ▼ Power On the Switch

1. **Identify the prerequisite and subsequent installation tasks that you must perform in conjunction with this procedure.**  
See [“Installation Task Overview” on page 1](#).
2. **Perform one or both of the following to energize the power supplies.**
  - Plug the power cords into the line power receptacles.
  - Energize the circuit breakers so that the line power receptacles are live.

**3. Verify that the status LEDs for each power supply indicate normal operation.**

The AC LED lights and in a moment, the OK LED should light. The Attention LED should be unlit.

---

**Note** – At this time, power is being supplied to the SP. The SP is effectively on and booting up. You might see the boot sequence on the management console.

---

**4. Verify that the fans are spinning.**

You should feel air at the fan module, and the fan Attention LEDs should be unlit.

**5. Verify that the switch System OK LED lights.**

**6. Access the SP.**

## Oracle ILOM Overview

Oracle ILOM enables you to actively manage the switch, providing the same administrative look and feel found on Oracle servers. Oracle ILOM enables you to:

- Connect to SEFOS.
- View the current status of sensors and indicators on the system.
- Determine the hardware configuration of your system.
- Receive generated alerts about system events in advance by using IPMI PETs or SNMP traps.
- Manage SEFOS users.
- Upgrade firmware for all components on the switch through either CLI or web interface.
- Configure standard Oracle ILOM services, such as:
  - Clock/NTP
  - Serial port
  - Network
  - Syslog
  - SNMP

- SMTP
- Email alert notification
- Web server
- SSH
- IPMI
- CLI

---

**Note** – For details on how to configure these services, refer to the *Oracle Integrated Lights Out Manager (ILOM) 3.0 Daily Management – CLI Procedures Guide* at: <http://www.oracle.com/pls/topic/lookup?ctx=ilom30>

---

Oracle ILOM does not support the following features on the switch.

- Advanced user account management features:
  - Active directory
- Server-oriented features, such as:
  - Power management
  - Storage redirection
  - Remote console

## ▼ Verify the DHCP-Assigned IP Address and Host Name

---

**Note** – By default, the switch is configured to use DHCP to automatically obtain an IP address.

---

---

**Note** – You must configure an externally accessible IP address on the switch to use SNMP. Refer to the following documentation for more information on using SNMP with the switch: *Sun Integrated Lights Out Manager (ILOM) 3.0 Management Protocols Reference Guide* and *Oracle Switch ES1-24 Configuration Guide*.

---

1. **Log into the DHCP server and obtain the IP address assigned to the switch.**
2. **Consider your next step.**
  - Log into the Oracle ILOM web interface.  
See “Log Into the Oracle ILOM Web (NET MGT)” on page 65.
  - Log into the Oracle ILOM CLI.  
See “Log Into the Oracle ILOM CLI (NET MGT)” on page 66.

## ▼ Configure Network Management From the CLI (SER MGT)

1. **Log into the Oracle ILOM CLI.**  
See “Log Into the Oracle ILOM CLI (SER MGT)” on page 67.
2. **Change to the network directory.**

```
-> cd SP/network
```

3. **(Optional) Change to static IP discovery mode.**

---

**Note** – By default, the switch uses DHCP as the IP discovery mode. To use `static` as the IP discovery mode, use the following command.

---

```
-> set ipdiscovery = static
```

4. **Configure an externally accessible IP address on the switch.**

a. Set the pending service processor IP address.

```
-> set pendingipaddress=IP_address  
Set 'pendingipaddress' to 'IP_address'
```

b. Set the pending gateway IP address.

```
-> set pendingipgateway=IP_address  
Set 'pendingipgateway' to 'IP_address'
```

c. Set the pending IP netmask.

```
-> set pendingipnetmask=netmask  
Set 'pendingipnetmask' to 'n.n.n.n'
```

d. Commit the changes.

```
-> set commitpending=true  
Set 'commitpending' to 'true'
```

e. Verify that the state is enabled.

```
-> set state=enabled  
Set 'state' to 'enabled'
```

5. Verify the configuration information that you entered.

The show command information about the switch, including its IP address.

For example:

```
-> show  
  
/SP/network  
  Targets:  
  
  Properties:  
    type = Network Configuration  
    commitpending = (Cannot show property)  
    ipaddress = 10.7.59.97  
    ipdiscovery = static  
    ipgateway = 10.7.59.254  
    ipnetmask = 255.255.255.0  
    macaddress = 00:14:4f:6C:5D:E8  
    pendingipaddress = 10.7.59.97  
    pendingipdiscovery = static
```

```
pendingipgateway = 10.7.59.254
pendingipnetmask = 255.255.255.0
state = enabled
```

Commands:

```
cd
set
show
```

->

**6. When you are done, exit Oracle ILOM.**
