PeopleTools 8.53: PeopleSoft Search Technology

February 2013
Trademark Notice

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

License Restrictions Warranty/Consequential Damages Disclaimer

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

Warranty Disclaimer

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

Restricted Rights Notice

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are “commercial computer software” pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

Hazardous Applications Notice

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Third Party Content, Products, and Services Disclaimer

This software or hardware and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

Understanding the PeopleSoft Online Help and PeopleBooks

The PeopleSoft Online Help is a website that enables you to view all help content for PeopleSoft Applications and PeopleTools. The help provides standard navigation and full-text searching, as well as context-sensitive online help for PeopleSoft users.

PeopleSoft Hosted Documentation

You access the PeopleSoft Online Help on Oracle’s PeopleSoft Hosted Documentation website, which enables you to access the full help website and context-sensitive help directly from an Oracle hosted server. The hosted documentation is updated on a regular schedule, ensuring that you have access to the most current documentation. This reduces the need to view separate documentation posts for application maintenance on My Oracle Support, because that documentation is now incorporated into the hosted website content. The Hosted Documentation website is available in English only.

Locally Installed Help

If your organization has firewall restrictions that prevent you from using the Hosted Documentation website, you can install the PeopleSoft Online Help locally. If you install the help locally, you have more control over which documents users can access and you can include links to your organization’s custom documentation on help pages.

In addition, if you locally install the PeopleSoft Online Help, you can use any search engine for full-text searching. Your installation documentation includes instructions about how to set up Oracle Secure Enterprise Search for full-text searching.

See PeopleTools 8.53 Installation for your database platform, ”Installing PeopleSoft Online Help.” If you do not use Secure Enterprise Search, see the documentation for your chosen search engine.

Note: Before users can access the search engine on a locally installed help website, you must enable the Search portlet and link. Click the Help link on any page in the PeopleSoft Online Help for instructions.

Downloadable PeopleBook PDF Files

You can access downloadable PDF versions of the help content in the traditional PeopleBook format. The content in the PeopleBook PDFs is the same as the content in the PeopleSoft Online Help, but it has a different structure and it does not include the interactive navigation features that are available in the online help.

Common Help Documentation

Common help documentation contains information that applies to multiple applications. The two main types of common help are:

- Application Fundamentals
• Using PeopleSoft Applications

Most product lines provide a set of application fundamentals help topics that discuss essential information about the setup and design of your system. This information applies to many or all applications in the PeopleSoft product line. Whether you are implementing a single application, some combination of applications within the product line, or the entire product line, you should be familiar with the contents of the appropriate application fundamentals help. They provide the starting points for fundamental implementation tasks.

In addition, the PeopleTools: PeopleSoft Applications User's Guide introduces you to the various elements of the PeopleSoft Pure Internet Architecture. It also explains how to use the navigational hierarchy, components, and pages to perform basic functions as you navigate through the system. While your application or implementation may differ, the topics in this user’s guide provide general information about using PeopleSoft Applications.

Typographical Conventions

The following table describes the typographical conventions that are used in the online help.

<table>
<thead>
<tr>
<th>Typographical Convention</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Bold</strong></td>
<td>Highlights PeopleCode function names, business function names, event names, system function names, method names, language constructs, and PeopleCode reserved words that must be included literally in the function call.</td>
</tr>
<tr>
<td><em>Italics</em></td>
<td>Highlights field values, emphasis, and PeopleSoft or other book-length publication titles. In PeopleCode syntax, italic items are placeholders for arguments that your program must supply.</td>
</tr>
<tr>
<td></td>
<td>Italics also highlight references to words or letters, as in the following example: Enter the letter O.</td>
</tr>
<tr>
<td><strong>Key+Key</strong></td>
<td>Indicates a key combination action. For example, a plus sign (+) between keys means that you must hold down the first key while you press the second key. For Alt+W, hold down the Alt key while you press the W key.</td>
</tr>
<tr>
<td><strong>Monospace font</strong></td>
<td>Highlights a PeopleCode program or other code example.</td>
</tr>
<tr>
<td>. . . (ellipses)</td>
<td>Indicate that the preceding item or series can be repeated any number of times in PeopleCode syntax.</td>
</tr>
<tr>
<td>{ } (curly braces)</td>
<td>Indicate a choice between two options in PeopleCode syntax. Options are separated by a pipe (</td>
</tr>
<tr>
<td>[ ] (square brackets)</td>
<td>Indicate optional items in PeopleCode syntax.</td>
</tr>
</tbody>
</table>
Typographical Convention | Description
--- | ---
& (ampersand) | When placed before a parameter in PeopleCode syntax, an ampersand indicates that the parameter is an already instantiated object. Ampersands also precede all PeopleCode variables.
⇒ | This continuation character has been inserted at the end of a line of code that has been wrapped at the page margin. The code should be viewed or entered as a single, continuous line of code without the continuation character.

ISO Country and Currency Codes

PeopleSoft Online Help topics use International Organization for Standardization (ISO) country and currency codes to identify country-specific information and monetary amounts.

ISO country codes may appear as country identifiers, and ISO currency codes may appear as currency identifiers in your PeopleSoft documentation. Reference to an ISO country code in your documentation does not imply that your application includes every ISO country code. The following example is a country-specific heading: "(FRA) Hiring an Employee."

The PeopleSoft Currency Code table (CURRENCY_CD_TBL) contains sample currency code data. The Currency Code table is based on ISO Standard 4217, "Codes for the representation of currencies," and also relies on ISO country codes in the Country table (COUNTRY_TBL). The navigation to the pages where you maintain currency code and country information depends on which PeopleSoft applications you are using. To access the pages for maintaining the Currency Code and Country tables, consult the online help for your applications for more information.

Region and Industry Identifiers

Information that applies only to a specific region or industry is preceded by a standard identifier in parentheses. This identifier typically appears at the beginning of a section heading, but it may also appear at the beginning of a note or other text.

Example of a region-specific heading: "(Latin America) Setting Up Depreciation"

Region Identifiers

Regions are identified by the region name. The following region identifiers may appear in the PeopleSoft Online Help:

- Asia Pacific
- Europe
- Latin America
- North America
Industry Identifiers

Industries are identified by the industry name or by an abbreviation for that industry. The following industry identifiers may appear in the PeopleSoft Online Help:

- USF (U.S. Federal)
- E&G (Education and Government)

Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Using and Managing the PeopleSoft Online Help

Click the Help link in the universal navigation header of any page in the PeopleSoft Online Help to see information on the following topics:

- What’s new in the PeopleSoft Online Help.
- PeopleSoft Online Help accessibility.
- Accessing, navigating, and searching the PeopleSoft Online Help.
- Managing a locally installed PeopleSoft Online Help website.

Understanding PeopleSoft Search Technology

This document describes the administration of the Search Framework as well as the development tasks associated with enabling and implementing PeopleSoft Search features. These features are provided by PeopleTools and are designed to run against the Oracle Secure Enterprise Search server (SES).

Chapter 1

Getting Started PeopleSoft Search Technology

Getting Started with PeopleSoft Search Technology

This topic provides an overview of the contents of this book, and discusses the various technologies that comprise the PeopleSoft Search Framework.

PeopleSoft Search Technology Overview

The PeopleSoft Search Framework provides a standard, declarative method for creating, deploying, and maintaining search indexes for all of your PeopleSoft applications. Oracle Secure Enterprise Search (SES) is the search engine on which the PeopleSoft Search Framework relies.

The PeopleSoft Search Framework enables you to generate SES-based search indexes using these source types:

• PeopleSoft Query and Connected Query: this option provides a familiar and intuitive way to declare the fields relevant for end user searches. With PeopleSoft Query you define your search meta data attributes. You use the Search Framework Designer to map query fields to meta data attributes, save the search definition to the database, and create search categories.

• Web source: this option enables you to index content deployed on a website that you want to make available for end user searches.

• File source: this option enables you to index files, such as reports, residing in your file system.

After designing search definitions, the Search Framework Administration interface enables you to establish integration with Oracle Secure Enterprise Search (by way of Integration Broker), deploy the search definitions and search categories, build indexes, and manage crawling.

Note: The PeopleSoft Search Framework can be configured to run only against Oracle SES. Currently, any other search engine, including Verity, cannot be configured to use with the PeopleSoft Search Framework.

Implementing PeopleSoft Search Framework

The PeopleSoft Search Framework involves the proper configuration and use of the following systems, tools, and technology. To administer or develop applications using the PeopleSoft Search Framework, a working knowledge of these systems is recommended.
<table>

Chapter 2

Understanding PeopleSoft Search Framework

This section discusses:

• PeopleSoft Search Framework features.
• Search Framework verses Verity.
• Search Framework definitions.
• Search documents.
• PeopleSoft Search Framework Architecture.
• Implementation process flow.
• PeopleSoft Search.

PeopleSoft Search Framework Features

In previous PeopleTools releases, search functionality was provided in a non-declarative fashion where search engine indexes were built using custom PeopleCode and Application Engine programs. Each PeopleSoft application used a unique method for creating and maintaining search artifacts like collections and indexes—all of which required search engine-specific calls, commands, syntax, and so on.

The PeopleSoft Search Framework enables application developers and implementation teams, to create search artifacts in a consistent, declarative manner and to deploy and maintain search indexes, using one standard interface, regardless of PeopleSoft application.

The PeopleSoft Search Framework consists of PeopleSoft components (pages and records provided by PeopleTools), which provide a centralized interface for configuring PeopleSoft integration with the search engine, creating search artifacts like search definitions, search categories, and building and maintaining search indexes.

Important! Currently the PeopleSoft Search Framework supports only Oracle Secure Enterprise Search (SES) as the back-end search engine.

Some of the key features include:
• Search Administration interface provides a familiar PeopleSoft browser interface enabling you to: configure search engine connectivity, deploy search definitions, schedule index creation and maintenance, and run incremental index updates.

• Search Designer interface, provides a familiar PeopleSoft browser interface enabling you to: create search definitions, create search categories, define title and summary result display (similar to Google search results).

• Flexible security: indexes can be created with source-level security, document-level security, or no security. Oracle SES allows for fully authenticated and authorized search queries.

• Search Query API enabling rich display options, such as filtering.

PeopleSoft Search Framework Verses Verity Search Engine

Whether or not you use Oracle SES or the Verity search engine depends on which PeopleSoft application version you implement. This topic describes the options for PeopleSoft application versions.

PeopleSoft Application Version 9.1x and Prior

If you are running a PeopleSoft application with a version 9.1x or earlier, you can continue to use Verity as a search engine. If you are running at least PeopleTools 8.52, you have the option of also implementing the PeopleSoft Search Framework. Some PeopleSoft 9.1x application feature packs have delivered search features based on the PeopleSoft Search Framework. Refer to the documentation for your application for details.

While PeopleSoft applications 9.1x and prior continue to support the use of the Verity search engine, the PeopleSoft Search Framework and any of the features based upon the PeopleSoft Search Framework are not available unless you configure Oracle Secure Enterprise Search for use with PeopleSoft. If you elect not to implement the Search Framework, you may continue to use the Verity search features as they have been delivered and used in previous PeopleTools releases.

For example, if you intend to use Verity as your only search engine, you cannot use or implement the features of the SES-based PeopleSoft Search Framework, such as Global Search, Search Pages, Faceted Navigation, and so on. Verity and the SES-based PeopleSoft Search Framework can coexist within a PeopleSoft implementation, however, the two search engines do not interact. Existing Verity implementations can be ported manually into the PeopleSoft Search Framework to take advantage of its features, if desired.

PeopleSoft Application Version 9.2 and Beyond

For PeopleSoft applications 9.2 and later, configuring the PeopleSoft Search Framework and installing and configuring Oracle SES is required. Using Verity is no longer supported beginning with PeopleSoft application versions 9.2.

Search Framework Definitions

The Search Framework is based on these PeopleSoft definitions:
<table>
<thead>
<tr>
<th><strong>Definition</strong></th>
<th><strong>Description</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Definition</td>
<td>Created in the Search Framework designer interface, a search definition maps the PeopleSoft Query fields, web source, or file source, to searchable attributes in the SES search engine. [Note: A search definition in the PeopleSoft Search Framework becomes a &quot;source&quot; on the SES server, and the system also creates an index schedule on SES for that source.]</td>
</tr>
<tr>
<td></td>
<td>The search definition also enables you to attach security attributes to restrict access to the search results. The search definition provides the information required by the framework to enable the system to create search results (search documents).</td>
</tr>
<tr>
<td>Search Category</td>
<td>Also created in the Search Framework designer interface, search categories enable you to group search definitions logically. A search definition must belong to at least one search category. End users run searches against search categories, not individual search definitions. It is a requirement that at least one search category exists with exactly the same name as the search definition. [Note: A search category in the PeopleSoft Search Framework becomes a &quot;source group&quot; on the SES server.]</td>
</tr>
</tbody>
</table>

**Search Documents**

Search documents describe the format of search results.

The main elements of a PeopleSoft search document are:

- **URL**
- **Title**
- **Summary**

In some cases, search documents are non-structured documents, such as a Microsoft Word document or the text in a website. In a PeopleSoft application, the majority of information is structured, (as in, a Purchase Order). PeopleSoft information resides in a relational database where the document attributes constituting the search document are well known, such as Employee Name, Customer Name, Product ID, and so on. While most of the PeopleSoft information can be displayed in the form of structured documents, the system also stores unstructured data in the form of attachments.
When a user runs a search based on a set of known attributes, the search returns “hits” in the form of search documents, or search results. The user then analyzes the content of the search result to determine relevancy and uses the associated URL to navigate to the desired application page.

**PeopleSoft Search Framework Architecture**

The server topology uses the essential elements of the PeopleSoft Internet Architecture, with the addition of SES server.

*Image: PeopleSoft server architecture with Oracle SES*

The following illustration depicts the PeopleSoft server architecture connected to Oracle Secure Enterprise Search using Integration Broker.

The web server and application server (the PeopleSoft Internet Architecture) provide the interface for the design, administration, and end user. The PeopleSoft database stores the PeopleSoft queries that define the search data as well as the search definition meta data. Oracle Secure Enterprise Search stores the deployed search definitions and performs the typical search engine tasks, such as building indexes, crawling for updates, maintaining indexes, and servicing end-user search requests.
The following diagram depicts the relationships between all of the separate elements that are involved with the PeopleSoft Search Framework.

**Image: PeopleTools elements and Oracle SES elements**

The following illustration depicts the PeopleTools elements and the Oracle SES elements interacting to enable the PeopleSoft Search Framework features.

<table>
<thead>
<tr>
<th>PeopleTools Element</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PeopleSoft Internet Architecture</td>
<td>Enables access to all aspects of the PeopleSoft Search Framework, including development, administrative, and end user interfaces.</td>

<tr>
<td>PeopleSoft Integration Broker</td>
<td>Facilitates the integration between PeopleTools elements and the search engine (SES).</td>
</tr>
</tbody>
</table>

The following table describes the Oracle SES elements.
### SES Element | Description
--- | ---
Security Plug-in | This module gets invoked from Search Engine side for a user who initiates a search from an application. Search security framework is responsible for authentication, search user validation and authorization of search query request. Search Engine passes user credentials to PeopleSoft Security Service (Web service) which authorizes the users and get security attribute for that user. Search Results are filtered based on this security attribute. Security Plug-In a part of SES Search Engine and is written in Java. SES comes with built-in plug-ins specifically for PeopleSoft. There are two security plug-ins: PeopleSoft Identity Plug-in and PeopleSoft Authorization Plug-in. PeopleSoft Identity plug-in is responsible for authenticating search users. PeopleSoft Authorization Plug-in is responsible for getting security attributes for search users and filtering search results based on them.

Crawler Plug-in | Crawler plug-in is part of SES search engine. The Crawler plug-in is responsible for extracting documents for a source and indexing them. The PeopleSoft crawler-plug-in extracts documents from PSQUERY (each returned row is a document). The Crawler plug-in indexes document search attributes like Title, Summary, search fields (fields to index), and so on. It can also index document-level security attributes if document-level security is being used.

Administrative Web Service API | Exposes various SES configuration settings and administrative commands to the PeopleSoft system.

Query Web Service API | Query Plug-in works in conjunction with the PeopleCode Search API for application developers to compose search queries and execute them. Query Plug-in exposes various search features like filtering, sorting, grouping, restricting search scope, pagination, and so on.

Search Engine | Search Framework works with Oracle Secure Search Enterprise, Oracle's search engine software. SES runs against an Oracle database and is installed into Oracle Middleware. The PeopleSoft Application Server integrates with SES using the PeopleSoft Search Framework.

---

**Implementation Process Flow**

The following diagram illustrates the general process flow when implementing the PeopleSoft Search Framework and deploying search definitions. You first identify the business data you want to expose...
to text searches and create queries using PeopleSoft Query that select the appropriate data from your transaction tables. In the Search Designer you map the query fields to the search metadata attributes and map the search definition to a search category. In the Search Administration interface you deploy the search definitions and categories, schedule index builds, and schedule index crawling so that the index can be updated as needed to reflect the current business data.

**Image: PeopleSoft Search Framework process flow**

The following illustration depicts the Search Framework implementation, beginning with PeopleSoft Query and Connected Query, moving to the Search Designer for creating search definitions and categories, then moving to Search Administration for deploying search definitions and defining index builds.
PeopleSoft Search Features

Once Search Framework is configured and search definitions have been deployed and tested, you can enable these PeopleSoft Search features for your end users:

- Global Search.
- Search Pages.

Global Search

With Global Search enabled, the Global Search bar displays in the header of the application. Beside the keyword edit box, the Global Search bar provides a dropdown list for selecting a specific search category against which to run a search.

Image: Global Search menu bar

This example illustrates the fields and controls on the Global Search bar. You can find definitions for the fields and controls later on this page.

Search Pages

If you’ve enabled the Search Pages features for Search Framework by mapping a component to a search definition, the Keyword Search tab appears amongst the search pages the end user encounters when navigating into a component. The Keyword Search page enables users to execute a deeper, more free-form search to access application data. For example, the Find an Existing Value tab is limited to level
0 data, where the Keyword Search tab lets the users enter custom keywords and the system will search indexed data from level 0-3.

**Image: Keyword Search page**

This example illustrates the fields and controls on the Keyword Search page. You can find definitions for the fields and controls later on this page.

**Note:** The Find and Existing Value search page is equivalent to the component search pages in previous versions of PeopleSoft applications.
Chapter 3

Defining Search Definition Queries

This section contains an overview and describes:

- Defining search definition queries with PeopleSoft Query.
- Defining search definition queries with Connected Query.
- Defining a deletion query.
- Working with attachments.

Understanding Search Definition Queries

To define the PeopleSoft application data that end users can run their searches against, you use these standard PeopleSoft query design tools:

- PeopleSoft Query
- Connected Query

Using these tools provides a familiar interface for PeopleSoft implementation teams and a standard means of defining searchable data amongst all PeopleSoft applications. You will also need to make sure that the data you want to expose to Query is authorized by way of the Query Security Manager.

**Note:** If you are creating a search definition of the source type File Source or Web Source, you do not create a query or connected query to define the information to be indexed.

The data returned by the query you use serves as the source data that the Oracle SES system crawls to create the search index. If you want a particular field available for end user searches, you want to make sure that field is included in the list of fields of your query. Likewise, if you do not think a particular field is appropriate or useful to expose for end user searches, then you can make sure that field is not included in the list of fields for your query. This enables you to declare the scope of the search index and manage its size, as well.

You do not need to create new queries solely for creating search definitions. You can re-purpose existing queries in PeopleSoft Query or connect multiple existing queries using Connected Query. Except for a handful of requirements for the Search Framework, queries used for creating search definitions are created exactly as you would any other query.

Queries need the following items defined for use with the Search Framework:

- List of fields to index from authorized records.
• "Last Updated" record field.
• Drilling URL.
• Prompt against the "Last Updated" field.
• Criteria for the "Last Updated" field.

This section describes the requirements and guidelines to follow when defining queries for use with the Search Framework. The PeopleSoft Query and Connected Query documentation is not duplicated within this guide. It is assumed that you have a working knowledge of those products.

Defining Search Definition Queries with PeopleSoft Query

This section discusses:
• Preparing records.
• Specifying a list of fields to index.
• Setting up a "Last Updated" Field.
• Creating a Drilling URL.
• Creating a Prompt for the "Last Updated" Field.
• Defining Prompt Criteria.
• Testing the query.

Adding a “Last Updated” Field to Records

The application data to be indexed must exist in a record containing a column that tracks the update history of the data. This column is referred to as the "Last Updated" field. The Last Updated field is a datetime field that captures when the set of data to be indexed has been changed. Keeping track of the data updates is critical for enabling incremental indexing. Rather than recreating the entire index each time the index needs to be updated, incremental indexing enables the system to gather only the information that has changed since the last time the index generation process has run.

The system keeps track of when the index generation process last ran, and compares that time to the Last Updated field value in the underlying record structure. Based on the comparison between those time values, the system can isolate only the data that has undergone a change since the last index generation process run. Once the system creates the initial full index, only those rows that have been updated or added since the last index process run will be collected and added to the existing index. Using incremental index updates improves performance and decreases system overhead.

If the query being used for the search definition only runs against a single record, then that record must contain a datetime field to capture data update date and time values. If the data exists within a hierarchy
of tables (grand parent, parent, and child, for example), only one of the records within the hierarchy requires the existence of the datetime field.

**Important!** The Last Updated field *must* be of the type datetime. An example of this field is the LASTUPDTTM field, which can be found in many delivered PeopleSoft applications. Whether you intend to implement an incremental indexing system or not, it is still a requirement to have a "last updated" field within the record

**Note:** Many PeopleSoft application tables come with a LASTUPDTTM field in place, especially those for which the application has provided search definitions. For any custom tables or tables that do not already track date and time updates, you need to ensure the field exists in the record or record hierarchy.

**Note:** For any search definitions delivered with your PeopleSoft applications, the underlying records will be configured to include the required datetime field as well as the program logic to ensure that the value of the datetime field is collected. For any custom applications, you will need to add the datetime field manually, alter the underlying SQL table, and include program logic to ensure the value of the datetime field is collected and updated accurately. For example, using SavePreChange PeopleCode you can test IsComponentChanged and if so, then update the LASTUPDTTM field accordingly.

**Specifying a List of Fields to Index**

The query defines which fields will comprise the index for a search definition. When working in the query, use the Fields tab to determine if your list is complete. Keep in mind that fields in the index can be used for different purposes. While some fields are the ideal field against which end users would intuitively search (Customer Number, Order Date, and so on), others can be included for different reasons.

For example, some fields are used as metadata to help describe the data contained in the row (resume, invoice, sales order, and so on). Other fields are useful for security in restricting the viewing of the data only to users that have access to a certain type or level of data.

Because the underlying records require the existence of a datetime field to track the "last updated" value, the query must also contain the corresponding query field in the fields list.

**Note:** All search keys and alternate search keys must be indexed. Select additional fields to be indexed as required by your business processes. Also keep in mind that some fields are codes and might need to be translated to their description for searching.

**Important!** When saving the query, make sure it is of type Public.

**Creating a Drilling URL**

The drilling URL defines the URL, the target, for the search result. The drilling URL enables the end user to click the link in the search result to display the appropriate PeopleSoft application page, with the appropriate data populated in the page.

To create a drilling URL for Search Framework:

1. In PeopleSoft Query Manager, select the Expressions tab.
2. Click Add Expression.
3. On the Edit Expressions Properties dialog box, select Drilling URL from the Expression Type drop-down list.

4. Click the Component URL link.

5. On the Select a Component page, provide the navigation to the appropriate page.

6. Click Search Keys to define which key(s) needs to be passed to launch the page to display the unique information automatically for a particular search result.

   For example, Field Name = CUSTOMER ID and Key Value = A.CUSTOMER_ID.

   **Note:** If you do not specify the correct search keys, the system will launch the page you have specified, but the user would still need to add the keys manually to view the information associated with a search result, which is not the desired behavior.

7. Click OK.
8. Click the Use as Field button to associate the Drilling URL as a field in the Query.

**Image: Edit Expression Properties dialog box**

This example illustrates the fields and controls on the Edit Expression Properties dialog box. You can find definitions for the fields and controls later on this page.

When your expression is complete, click the Use as Field link in the Drilling URL grid on the Expressions tab. You should also name the field with a valid field name, such as `DRILL_URL`.

**Creating a Prompt for the Last Modified Field**

You need to create a prompt for your query so that the system can use the last update date and time for enabling incremental index updates. This is required by the Search Framework even if you do not intend to implement incremental index updates. The Application Engine program performing incremental index
Defining Search Definition Queries

Chapter 3

updates requires the valid prompt data. Use the prompt tab in Query Manager to create your prompt. On the Edit Prompt Properties dialog box, select the "last updated" from the Field Name drop-down list.

**Image: Edit Prompt Properties dialog box**

This example illustrates the fields and controls on the Edit Prompt Properties dialog box. You can find definitions for the fields and controls later on this page.

![Edit Prompt Properties dialog box](image)

**Defining Prompt Criteria**

So that the prompt identifies the correct rows for incremental updates, you must also add query criteria based on the “last updated” field. Use the Criteria tab in Query Manager, and click Add Criteria. Set the criteria as described in the following table.

<table>
<thead>
<tr>
<th><strong>Item</strong></th>
<th><strong>Value Selected</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Expression 1</td>
<td>• Field.</td>
</tr>
<tr>
<td></td>
<td>• Your “last updated” field.</td>
</tr>
<tr>
<td>Condition Type</td>
<td>• <em>not less than</em>(recommended)</td>
</tr>
<tr>
<td></td>
<td>• greater than</td>
</tr>
</tbody>
</table>
**Item** | **Value Selected**
--- | ---
Expression 2 | • Prompt  
• Your prompt

For example:

**Image: Edit Criteria Properties dialog box**

This example illustrates the fields and controls on the Edit Criteria Properties dialog box. You can find definitions for the fields and controls later on this page.

---

### Defining Search Definition Queries with Connected Query

You can also use Connected Query to develop your queries for Search Framework. Connected Query enables you to connect multiple queries together in a parent-child relationship, where the child queries filter results for the parent queries. Using Connected Query lets you connect numerous simpler queries, rather than writing one more complicated query. The smaller more modular queries can be reused in different queries.

When using Connected Query, only the top-level (or root) parent query needs to have the requirements described in this topic. The child queries do not require these elements. For example, only the parent query requires a Drilling URL defined.
Defining a Deletion Query

In many cases, you may want to consider also writing a deletion, or pruning, query to keep the index and the transactional tables in sync with regard to rows that have been deleted from the transactional tables.

For example, assume a row exists in the transactional table for Big Company, and that row has been included in the search query criteria and indexed by the Search Framework crawler. Now, suppose that row gets deleted from the transactional table because Big Company went out of business and no longer exists. Because the row no longer exists in the transactional table, you do not want the previously indexed data to appear in a user’s search results. In a search definition, you associate a deletion query for an index on the Advanced tab in the Define Query to Delete SBO section. There you specify the query name and the Drilling URL field for the deletion query.

The Delete query generates a feed containing only the records that need to be deleted from the index or those documents/records that are marked for deletion from the index. One method of capturing the deleted rows is to create an audit record on the transactional table in which a record of all deleted rows gets inserted into the audit table. The delete query would then capture the rows in the audit table and remove from the index the document entries matching those rows. The delete query also needs a datetime prompt which returns rows deleted after that datetime value.

Working with Attachments

An attachment is a special type of Drilling URL, which is also specified in the query as an expression. You associate the Attachment URL with a URL Identifier which will tell SES where to look for the data.
You must have previously set up a URL pointing to the location of the data, which could be a record with the database or a secure file location such as an FTP site.

**Image: Edit Expression Properties dialog for attachments**

This example illustrates the fields and controls on the Edit Expression Properties dialog for attachments. You can find definitions for the fields and controls later on this page.

To create an attachment URL for Search Framework:

1. In PeopleSoft Query Manager, select the Expressions tab.
2. Click Add Expression.
3. On the Edit Expressions Properties dialog box, select Drilling URL from the Expression Type dropdown list.
4. Click the Attachment URL link.
5. On the Enter an Attachment URL dialog box, provide the previously created PeopleTools URL and identify a field within the Query which designate the correct attachment file.
6. Click OK.
7. Click the Use as Field button to associate the Attachment URL as a field in the Query.

**Related Links**

"URL Maintenance (PeopleTools 8.53: System and Server Administration)"
Testing Your Search Definition Query

After you have defined your query in Query Manager with all the correct fields included along with the Search Framework requirements, you can test the query using the Run tab. This runs the query outside of the Search Framework, making sure the query is valid prior to incorporating it into a search definition.

This enables you to determine a variety of items, including:

- The correct rows are being returned by your query.
- The Drilling URL displays the appropriate page and data when clicked.
- You can open any associated attachments (if you can’t open it from the query test results, then neither can SES and the PeopleSoft Search Framework).

To test your query with the Run tab:

1. In Query Manager, with your query open, click the Run tab.
2. At the prompt, enter a valid value to run against the Last Modified field.
   For example:
   
   01/01/1900 0:0
3. View the results and click the Drilling URL and/or attachment links.

**Image: Query Manager Run tab**

This example illustrates the fields and controls on the Query Manager Run tab. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>ID</th>
<th>Ext Date</th>
<th>Name</th>

This example illustrates the fields and controls on the PeopleSoft application page (Drilling URL target). You can find definitions for the fields and controls later on this page.
Creating Query and Connected Query Search Definitions

Creating Query and Connected Query Search Definitions

This section discusses:

- Specifying general settings.
- Mapping search attributes.
- Managing search definition security.
- Working with advanced settings.
- Mapping components to search definitions.

Creating Search Definitions

To create a search definition:

1. Select PeopleTools, Search Framework, Designer, Search Definition
2. Click Add a New Value.
3. On the Add New Search Definition page, enter the in the Search Definition field.
4. Select the appropriate value from the Source Type drop-down list.
   - *Query/Connected Query*: requires an existing PeopleSoft query/connected query that defines the scope of the application data to be indexed.
   - *File Source*: enables you to index files stored within an accessible file system.
   - *Web Source*: enables you to index content within the structure of a website.
5. Click Add.
6. Complete the required settings for the search definition source type, and save the search definition.
Specifying General Settings

Access the General page, by selecting PeopleTools, Search Framework, Designer, Search Definition.

**Image: General page**

This example illustrates the fields and controls on the General page. You can find definitions for the fields and controls later on this page.

**General Settings**

<table>
<thead>
<tr>
<th>Field</th>

</tr>
<tr>
<td><strong>Source Name</strong></td>
<td>Select the name of the base Query or Connected Query.</td>
</tr>
<tr>
<td><strong>View</strong></td>
<td>Click to view the underlying query or connected query in either Query Manager or Connected Query Manager, respectively. This helps you to better understand the data being indexed by the search definition. When viewing the query or connected query from the PeopleSoft Search Framework, keep these items in mind:</td>
</tr>
<tr>
<td></td>
<td>• To view the query or connected query, you must have the appropriate security permissions in place.</td>
</tr>
<tr>
<td></td>
<td>• You cannot make changes to the query or connected query when accessing it from the PeopleSoft Search Framework. The View button is intended for informational purposes only.</td>
</tr>
<tr>
<td><strong>Last Modified Date Time</strong></td>
<td>Select the field specified in the query that determines the underlying record's update date and time. For example, LASTUPDDTTM.</td>
</tr>
<tr>
<td><strong>URL Link</strong></td>
<td>Select the query field containing the drilling URL defined for the query.</td>
</tr>
<tr>
<td><strong>Title</strong></td>
<td>Define the title of the search result document. This is the bold, first line of the search result. You can add text and bind variables to the title by clicking the *Title button. You cannot add text to the edit box directly.</td>
</tr>
<tr>
<td><strong>Summary</strong></td>
<td>Define the summary, or body, of the search result text. This is the text that appears below the title in a search result document. You can add text and bind variables to the summary by clicking the *Summary button. You cannot add text to the edit box directly.</td>
</tr>
</tbody>
</table>
Adding Text for the Title and Summary

In the Title\Summary dialog box you can insert custom text and bind variables, or a combination of the text and bind variables to accurately express the content of the search result document.

**Image: Title and Summary edit box**

This example illustrates the fields and controls on the Title and Summary edit box. You can find definitions for the fields and controls later on this page.

**Insert Bind Variables**

Click to launch the Insert Bind Variables dialog box and insert bind variables of the following types:

- Query fields
- Message catalog entries
- System variables

**Inserting Bind Variables into Title\Summary Text**

When inserting bind variables into the title or summary text, you use the icon at the top left corner to open the Insert Bind Variables dialog box, enabling you to select the bind variable type and the specific bind
variable. You can insert multiple bind variables and bind variable types within the title\summary text, as needed.

**Image: Insert Bind Variables dialog box**

This example illustrates the fields and controls on the Insert Bind Variables dialog box. You can find definitions for the fields and controls later on this page.

![Insert Bind Variables dialog box](image)

<table>
<thead>
<tr>
<th>Query Fields</th>
<th>Use the Query Fields drop-down list to select the desired fields from the underlying query of the search definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Message Catalog</td>
<td>Specify the Message Set and Message Number to identify the specific message to display. To determine the text that displays use these options:</td>
</tr>
<tr>
<td>System Variables</td>
<td>Use the System Variables drop-down list to select the desired variable to display.</td>
</tr>
</tbody>
</table>

**Mapping Search Attributes**

Access the Map Search Attributes page, by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting the Map Search Attributes tab.
The Map Search Attributes page displays all of the query fields of the query or connected query associated with the search definition.

**Image: Map Search Attributes page**

This example illustrates the fields and controls on the Map Search Attributes page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Field to Index</th>
<th>Attribute Name</th>
<th>Attribute Display Name</th>
<th>Attachment Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>Select the fields that you want to be indexed by the search engine. These fields would be those that you intend the end users would include in search queries intuitively. Fields that you do not select are not indexed. The remaining columns in the grid become enabled only after selecting the Field to Index check box for a particular row.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Displays the pre-defined attribute name that identifies the query field in the SES system.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Determines how the attribute will display to the end user in the search results.</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Select the check box if the field contains an attachment URL.</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

**Note:** The display name comes from the field labels associated with the Query Field Name. It cannot be entered manually. If the wording of the display name is not appropriate, you need to add a new field label. If you select a field that is not the default field label, the Attribute Name will change to reflect your choice.

**Note:** When creating search definitions be careful not to use the same Attribute Display Names that are used by search record key, alt keys, and list box items, unless their attribute name also matches the search record field name. Using the same display names affects how (if) fields appear to the end user on the Advanced search page.
**Is Faceted**

Select to make this field a facet field, meaning that this field can be used to categorize and narrow down search results based on its value.

Defining a field as a facet requires some consideration. Facets cannot be blank, so if a field is not required, then the query needs to be structured so that there are not any blank values. You can use defaults on the record, or build COALESCE statements on a view to populate a field with a default (such as ‘None’, ‘NA’ or “Blank”) if it contains a blank value.

Only string-type attributes can become facets. Number or date data types are not supported for facets.

**Note:** Currently, SES does not allow dates to be facets.

**Note:** Facets based on XLAT fields should be changed to use XLAT Long/Short in the query.

**Note:** SES has a data size limit of 2000 characters for faceted fields. The system truncates anything beyond 2000 characters.

**Define Hierarchy**

(Appears only for Connected Query.) Allows you to concatenate multiple fields into one SES attribute. If the attribute has hierarchical data, specify the hierarchy accordingly using the Define Hierarchy icon. When this icon is selected, you will see a Hierarchy Path subpage.

**Hierarchy Path**

(Appears only for Connected Query.) Displays the hierarchy path for a Connected Query, indicating where in the hierarchy of connected queries a particular query field resides. When defining a hierarchy, you start with the highest level (most general) field at the top and sequentially list more granular fields, with the most granular being at the bottom.

**Note:** This is mainly used for hierarchical facets. The label in the user interface is determined by the field on which the hierarchy is defined.
**Example: Define Hierarchy Path**

This is an example of defining a hierarchy path.

**Image: Define Hierarchy Path page**

This example illustrates the fields and controls on the Define Hierarchy Path page. You can find definitions for the fields and controls later on this page.

![Define Hierarchy Path](image)

This definition is then displayed in the Hierarchy Path column of the Fields Included in the Index grid.

**Image: Example: Hierarchy Path**

This example illustrates the fields and controls on the Example: Hierarchy Path. You can find definitions for the fields and controls later on this page.

```
A.COUNTRY_NAME/A.STATE_NAME/A.CITY
```

---

**Working with Attachment Properties**

Access the Attachments page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting the Attachment Properties tab.
You use the Attachments page to select options related to the attachments that will be indexed as part of your search definition.

**Image: Attachment Properties page**

This example illustrates the fields and controls on the Attachment Properties page. You can find definitions for the fields and controls later on this page.

### Attachments

The Attachments grid contains attachments you specify to be indexed as part of your search definition. These are the types of attachments supported:

- Attachment URL:
- Static URLID:
- Dynamic URLID:

The options for each attachment type are described later in this topic where each attachment type is discussed.

See [Specifying Attachment URL Properties](#), [Specifying Static URLID Attachment Properties](#), [Specifying Dynamic URL ID Attachment Properties](#).

**Edit**

Click to edit the properties of a previously entered attachment.

**Add Attachment**

Click to add a new attachment to the Attachments grid.

---

**Important!** If the attachment URL properties or the URL of the attachment storage location changes, the PeopleSoft Search Framework recognizes the changes, and during the next index build or index update, the system will update the deployed search definitions to reflect the updated attachment properties and URL information.

---

**Related Links**

- [Creating the Attachment URL ID List](#)

---

**Specifying Attachment URL Properties**

An Attachment URL type of attachment refers to attachments that are linked to the search definition by way of an Attachment URL type of drilling URL, specified on the Expression tab of PeopleSoft Query.

When using the Attachment URL type of attachment, the system uses the call-back credentials, defined for the SES instance, to access the location of the attachment files. For example, if your attachments are
stored in an FTP server, the FTP server needs to have the SES call-back credentials configured as a valid user.

**Note:** The drilling URLs are different depending on the attachment repository type (database, FTP, and so on), but in all cases the system uses call-back user credentials to access the files.

Access the properties for this type of attachment by clicking the Add Attachment or Edit button on the Attachments page.

**Image: Define Attachment Properties: Attachment URL**

This example illustrates the fields and controls for setting Attachment URL properties. You can find definitions for the fields and controls later on this page.

**Define Attachment properties**

<table>
<thead>
<tr>
<th>Attachment Type</th>
<th>Attachment URL</th>
<th>URL ID</th>
</tr>
</thead>
</table>

**Query Name**

CT_CUSTOMER

**Attachment URL**

Attachment URL

Select if the attachment is linked to the search definition through a drilling URL in the underlying query as specified on the Expression tab in PeopleSoft Query.

**Query Name**

Select the query in which the Attachment URL drilling URL is defined.

**Attachment URL**

Select the query field in which the drilling URL query expression exists.

### Specifying Static URL ID Attachment Properties

A Static URL ID type of attachment refers to an attachment that is associated with a URL ID that is static, or unlikely to change. You select the URL ID from the URL list defined by the Attachment URL ID List (PeopleTools, Search Framework, Administration, Attachment URL ID List). For a Static URL ID type,
the URL is generated from a URL ID (static) and a constant file reference path. This makes the URL always constant, and the file name changes based on the value received from the query field.

**Image: Define Attachment Properties - Static URL**

This example illustrates the fields and controls for a Static URL. You can find definitions for the fields and controls later on this page.

**Define Attachment properties**

<table>
<thead>
<tr>
<th>Attachment Type</th>
<th>URL ID Type</th>
<th>URL Identifier</th>
<th>File Reference Path</th>
<th>File Name Query Field</th>
</tr>
</thead>
<tbody>
<tr>
<td>[ ] Attachment URL</td>
<td>Static</td>
<td>QE_SES_ATTACHURL_FTP</td>
<td></td>
<td>A.REPORTS_TO SPONSOR</td>
</tr>
</tbody>
</table>

**URL ID**

Select if your attachment is associated with a URL ID, not an Attachment URL expression defined in PeopleSoft Query.

**Query Name**

Select the query name in which this attachment is referenced.

**URL ID Type**

If the URL ID is constant and unlikely to change, select *Static*.

**URL Identifier**

Select the URL Identifier from the drop-down list. This list is populated by the list defined by the Attachment URL ID List (PeopleTools, Search Framework, Administration, Attachment URL ID List). These URLs are a subset of the URLs defined in the PeopleSoft database, and this subset are those URLs identified to be used with the PeopleSoft Search Framework.

**File Reference Path**

(Optional) Enter a file reference path for mapping a dynamic file path.

**File Name Query Field**

Select the query field that will contain the name of the attached file.
Specifying Dynamic URL ID Attachment Properties

With a dynamic attachment type, all the components of a URL are generated from the value in query field. With a dynamic attachment type, much of the information related to the attachment is unknown prior to the transaction occurring.

For example, with a static attachment type, it is known beforehand what the URLID will be, so it can be specified when the attachment properties are set. With a dynamic attachment type, the values of the attachment properties are determined at the transaction time, and the property values, such as URLID, file reference path, and attachment file name, are stored in the row of data associated with the attachment. The attachment property values can vary between rows.

Image: Define Attachment Properties - Dynamic URL

This example illustrates the fields and controls for a Dynamic URL. You can find definitions for the fields and controls later on this page.

**Define Attachment properties**

**Query Name**  CT_CUSTOMER

**URL Id Type**

- Attachment URL
- URL Id

**URLID**

- URL Id Type: Dynamic
- URLID Query Field: 
- File Path Query Field: 
- File Name Query Field: A.REPORTS_TO_SPONSOR

**Query Name**

Select the query name in which this attachment is referenced.

**URL Id Type**

If the URL ID is not constant and likely to change, select Dynamic.

**URLID Query Field**

Select the field in the query that will hold the URL ID of the attachment storage location.

**File Path Query Field**

Select the field in the query that will hold the URL ID of the attachment file reference path.
File Name Query Field

Select the query field that will contain the name of the attached file.

---

Managing Search Definition Security

**Image: Security page**

This example illustrates the fields and controls on the Security page. You can find definitions for the fields and controls later on this page.

The Security page enables you to restrict access to search results generated by a search definition. Depending on the sensitivity of the search results, you can set these degrees of security:

**No Security**

Select to define no security restriction for a search definition's search results. Anyone with access to the application can view the search results for a search definition set to No Security. That is, the search results are public to all users.

**Source Level Security**

Select to allow or restrict access to the entire search definition as per the specified user or role. That is, only specified users and roles are able to view search results for that search definition.

**Document Level Security**

Select to restrict access to specific search results (documents) generated by a search definition. That is, with document level security, users can view search results generated by that search definition, but only the documents to which they have access.

**Note:** This is generally referred to as row-level security in PeopleSoft applications.
Setting Source Level Security

Access the source-level security settings by selecting the Source Level Security radio button.

Image: Security page: Source Level Security options

This example illustrates the fields and controls on the Security page: Source Level Security options. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Type</th>
<th>Name</th>
<th>Privilege</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 Role</td>
<td>QF_CECLRK_ROLE</td>
<td>Allow</td>
</tr>
<tr>
<td>2 User</td>
<td>QETSTR</td>
<td>Allow</td>
</tr>
</tbody>
</table>

**Type**

Select *Role* or *User* depending on the scope of your intended access restriction.

Selecting *Role* restricts access to a specific PeopleSoft role.

Selecting *User* restricts access to a specific PeopleSoft user.

**Name**

Select the user or role name.

**Privilege**

Define the access privilege or restriction.

- **Allow.** The specified role or user is allowed to view search results for this search definition.
- **Deny.** The specified role or user is not allowed to view search results for this search definition.

**Note:** Source-level security applies to every document within that search definition (SES data source).

Setting Document Level Security

Access the document-level security settings by selecting the Document Level Security radio button.

Document-level security can also be thought of as attribute-based security.

With document-level security, one or more PeopleSoft Query columns act as the security attribute. You can then specify an application class (AppClass) that returns a list of values for the selected security
attributes. When the user submits the search request, SES compiles a list of values returned from the application class associated with that specific user to build the security filter.

**Image: Security page: Document Level Security options**

This example illustrates the fields and controls on the Security page: Document Level Security options. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Query Name</th>
<th>Source Field</th>
<th>Attribute Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>HR_SRCH_CP</td>
<td>A:EMPLID</td>
<td>ENPLID</td>
</tr>
</tbody>
</table>

**Document Level**

**Query Name**

Select the name of the query or connected query containing the fields you want to use to restrict access.

**Source Field**

Select the field which will identify security values which will determine access.

The source field(s) selected becomes the security attribute having the specified privilege. At indexing time, when the crawler inserts application data into the index, the values populating the selected source field(s) will carry the specified privilege.

**Privilege**

Define the access privilege or restriction.

- **Allow.** The value specified in the Source Field is allowed access to the data for this row in the search results.
- **Deny.** The value specified in the Source field cannot see the data for this row in the search results.
Note: The privilege of Deny is useful in situations where there are too many values for the security attribute if Allow were selected. For example, rather than enabling access to nine out of ten field values, it is more efficient to deny access only to the one you want to restrict.

Note: If multiple attributes appear in the grid the system effectively inserts an AND clause between the items in the grid.

Document Filter App Class

The application class specified in the Document Filter App Class section creates a list of values for the security attribute at query time. The application class enables you to define and run additional filters and logic against the application data contained in the indexed source fields.

As needed, PeopleSoft applications will provide filtering App Classes for delivered search definitions. For any custom search definitions, or additional filtering requirements, you will need to create or modify the filtering App Classes.

Package Name
Select the name of the appropriate App Package.

Path
Select the path pointing to the App Class.

Class ID
Select the class ID for the App Class.

For example, assume you want to compile a list of valid SETIDs to which the user may have access. You define an application package that would contain a method called evaluateAttrValues. This passes the search definition name (sboName), the name of the security attribute field that was identified in the search definition, and the user who will access the data. The application method would then build a list of valid values for that user and return it to SES for comparison against the data to see if the attribute value on the data matches.

```java
method evaluateAttrValues
  /+ &sboName as String, +/
  /+ &secAttr as String, +/
  /+ &srchUser as String +/
  /+ Returns Array of String +/
  /+ Extends/implements PTSF_SECURITY:SearchAuthnQueryFilter.evaluateAttrValues +/
Local array of string &secValues;
Local string &Role, &userPref, &csFullAccess, &csAdminAccess, &OnBehalfOf,
&docOwner, &BU_Security, &Security_Type, &SID_Security, &PermList;
Local SQL &sqlRoles, &sqlUserPrefs, &sqlDocOwners;
&secValues = CreateArrayRept("", 0);
  /*&BU_Security, &Security_Type, &SID_Security*/
  SQLExec("Select SETID_SECURITY, SECURITY_TYPE
from PS_INSTALLATION_FS ", &SID_Security,
&Security_Type);
  If &SID_Security = "N" Then
    &secValues.Push("A:ALL");
  Else
    Evaluate &Security_Type
    When "N"
      &secValues.Push("A:ALL");
    When "O"
      &secValues.Push("U:" | &srchUser);
    When "C"
      SQLExec("Select OPRCLASS from PSOPRDEFN where OPRID = :1",
```

Copyright © 1988, 2013, Oracle and/or its affiliates. All rights reserved.
&srchUser, &PermList);
&secValues.Push("P:" | &PermList);
End-Evaluate;
End-If;
End-method;

**Note:** Concatenating multiple attribute values using a separator, you can achieve an OR clause between attributes. For example, in the this sample "A:ALL" and "U:" | &srchUser are two different attributes merged into a single attribute to achieve the OR clause.

**Note:** To achieve improved performance, the security attribute should be chosen in such a way that no more than 50 values are returned per user per attribute.
Working With Advanced Settings

Access the Advanced page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting the Advanced tab.

**Image: Advanced page**

This example illustrates the fields and controls on the Advanced page. You can find definitions for the fields and controls later on this page.

### Advanced Properties

Alternate search keywords

#### Define Query to Delete SBO

**Query Name**

Select the query that you’ve defined to remove orphaned search documents. This is your deletion query.
For example, for rows of data that have been deleted from the database, you would want to ensure that those rows of data (or search result documents) no longer appear in the search index.

**Note:** Even though this query is defined the same way as the source type query is defined, the difference is that the result of the query is used for deleting the already indexed documents from SES. The Drilling URL field acts as the primary identifier to locate the documents to be deleted. This means the drilling URL must be identical to the drilling URL built for the original query.

Delete SBO Query will not be executed during the first index build of a search definition. It only becomes active after the initial index is populated.

See Defining a Deletion Query.

**URL Link Field**

Select the drilling URL field for the query selected.

**Encode Search Attributes**

Use the encode option in place of setting up custom lexers for applications that have indexed code-based fields for search attributes. Encoding these values enables the system to process the codes when generating the feed for the search index without requiring staging tables or a pre-processor Application Engine program. Encoding keeps words intact for indexing and searching that otherwise might be split during the parsing process of search index generation.

For example, a code-based search field, expects the end user to enter a code, known to the application users, that may not be interpreted as a single value by SES. In which case, SES may index the code as multiple values, losing the meaning of the code. For example, perhaps there is a product version represented by the code "M-2000". If SES indexes this code as two separate values, "M" and "2000" rather than "M-2000," the code loses its meaning and it no longer serves as a useful search attribute. In this case, if added to the Encode Search Attributes grid, PeopleSoft Search Framework encodes the "M-2000" value (to Mx2000 for example) so that it is indexed as a single value. While the value may be encoded for SES, the end user enters the code when searching as normal, requiring no knowledge of how the code is represented for SES indexing purposes.

If encoding search attributes, keep these items in mind:

- Encoded attributes are not exposed to the end user. The system uses encoded values only for programmatic operation.

- SES has a token limit of 64 bytes, so fields with more than 30 characters cannot be encoded. In a hierarchical value, use a word separator character to ensure the end value does not exceed 64 bytes.

- For these values, the system encodes the search string using EncodeSearchCode PeopleCode before passing the filters to the search API.

- For indexes containing encoded values, there can be slight overhead related to index size and query performance.
Pre Processing AE Library

Before an index build is run, data can be manipulated to perform additional tasks. For example, it may be required to search through subqueries to determine if one or more subquery might have changed and to update the last updated datetime value on the parent so that the change is recognized. Another use might be to calculate or summarize a value to be indexed. Another common case for pre processing occurs when a query is created based on staging tables. In this case the pre processing Application Engine program can be used to populate the staging tables. This is useful when the data cannot be retrieved using a simple query (such as hierarchal or computed data).

You can define an Application Engine routine to perform these tasks.

Note: Pre and post processing adds to the overall indexing time, and it is recommended not to use this in scenarios where it can be avoided.

Note: Application Engine programs used for pre or post processing should be defined as type Library.

<table>
<thead>
<tr>
<th>AE Library</th>
<th>To call additional processing logic from Application Engine, specify the correct AE Library (Application Engine program) to run.</th>
</tr>
</thead>
<tbody>
<tr>
<td>AE Section</td>
<td>Specify the Application Engine program section to run.</td>
</tr>
</tbody>
</table>

Post Processing AE Library

After an index is built, certain clean-up functions might need to be performed, such as removing the records in your delete query, or cleaning up staging tables. Use the post processing Application Engine routine to perform these functions.

<table>
<thead>
<tr>
<th>AE Library</th>
<th>To call additional processing logic from Application Engine, specify the correct AE Library (Application Engine program) to run.</th>
</tr>
</thead>
<tbody>
<tr>
<td>AE Section</td>
<td>Specify the Application Engine program section to run.</td>
</tr>
</tbody>
</table>

Alternate Search Keywords

<table>
<thead>
<tr>
<th>Alternate search keywords</th>
<th>Enter any alternate search keywords that users are likely to submit when running search requests. For example, rather than submitting the more official &quot;purchase order&quot; phrase, a user may be more likely to search on &quot;PO&quot; instead.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>This field is translatable. If supporting multiple languages, the keywords need to be translated.</td>
</tr>
</tbody>
</table>
Mapping Components to Search Definitions

Access the Component Mapping page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting the Component Mapping tab. The Component Mapping page enables you to map a component to a specific search definition to enable SES integration with Search Pages.

Mapping a component to a search definition effectively assigns component level security to the search definition. For this reason, if the Search Definition is assigned to a component, document level security is turned on by default.

**Note:** Multiple components can be mapped to the same search definition. When a component is mapped, the security type is changed to document level security, and a user having access to any one of the components will be able to search inside the search index. The security type cannot be changed, but you can add more security attributes to extend the security.

**Important!** Search definitions mapped to a component must use document level security.

**Image: Component Mapping page**

This example illustrates the fields and controls on the Component Mapping page. You can find definitions for the fields and controls later on this page.

**Market**
Select the Market for the component.

**Component Name**
Select the component.

**Search Criteria**
Enter any additional custom search criteria to be added automatically to the SES search query during a Search Pages keyword search.

The search criteria should take the form `ATTRIBUTENAME:VALUE` and can use keywords and brackets. For example:

```
PTSF_SBO_NAME:EP_AP_VENDOR & (-STATUS:PND)
```
Creating Query and Connected Query Search Definitions

Note: The system appends additional search criteria as is to the search query. The Search Criteria field is "free text." The Search Framework performs no validation or parsing during design time or run time.

Viewing Search Attributes

Access the Search Attributes page by selecting PeopleTools, Search Framework, Designer, View Search Attributes and selecting the Display Fields tab. Search attributes are used for creating aliases of the actual search query fields from PeopleSoft Query or Connected Query in the Oracle RSS feeds.

SES supports only three data types:

- String
- Number
- Date

PeopleTools maps the PeopleSoft data types to SES data types. The Search Attributes page displays a search attributes mapped SES data type.

Image: Search Attributes page

This example illustrates the fields and controls on the Search Attributes page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Search Attribute</th>
<th>Field Name</th>
<th>Attribute Display Name</th>
<th>Data Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>ABSENCE_REASON</td>
<td>ABSENCE_REASON</td>
<td>Absence Reason</td>
</tr>
<tr>
<td>2</td>
<td>ABSENCE_REASON</td>
<td>ABSENCE_REASON</td>
<td>Reason String</td>
</tr>
<tr>
<td>3</td>
<td>ABSENCE_TYPE</td>
<td>ABSENCE_TYPE</td>
<td>Absence Type String</td>
</tr>
<tr>
<td>4</td>
<td>ACTION</td>
<td>ACTION</td>
<td>Action String</td>
</tr>
<tr>
<td>5</td>
<td>ACTION_DESCRSHORT</td>
<td>ACTION_DESCRSHORT</td>
<td>Short Description String</td>
</tr>
<tr>
<td>6</td>
<td>ACTION_DESCRSHORT</td>
<td>ACTION_DESCRSHORT</td>
<td>Action String</td>
</tr>
<tr>
<td>7</td>
<td>ACTION_DTTM</td>
<td>ACTION_DTTM</td>
<td>Override Date Time Date</td>
</tr>
</tbody>
</table>

The search attributes page is read-only and provides a quick view of all attributes currently authorized for sending to SES. Every time a field is mapped in a Search Definition, the system adds an entry to this grid for the field. Because a field can exist on more than one search definition, it is not generally removed from this grid.

Search attributes are retained separately from a search definition and this enables:

- Reusability. You can reuse the same search attributes amongst multiple search definitions.
- Increased usability. Search attributes enable you to modify the attribute name or query field name from the end user, who will see the attribute display name. For example, adding the display value of "Employee ID" is more readable and understandable than displaying the field name EMPLID.
• Quick Access. You can view and sort all search attributes in the system and check their datatypes without having to open SES or Application Designer.
Chapter 5

Creating File Source Search Definitions

This section contains an overview, and discusses:

- Setting source details.
- Specifying document types.

Understanding File Source Search Definitions

File source definitions enable you to specify the location where external files reside in an accessible file system that you want to make available to the Oracle SES crawling mechanism so that end users can search the content of these files to support PeopleSoft applications. Examples of external file types that can be indexed include Microsoft Word and Excel documents, plain text documents, HTML files, and so on.

Specifying File Source General Settings

Access General Settings page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting a Source Type of *File Source.*
Use the General Settings page to specify the location of the files to be indexed as well as the crawler settings.

**Image: File Source — General Settings page**

This example illustrates the fields and controls on the File Source — General Settings page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Description</th>
<th>Add a brief description to help identify the purpose of the search definition.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Source Type</td>
<td>Displays the type of search definition, such as Query, Web, File, and so on.</td>
</tr>
<tr>
<td>Starting URLs</td>
<td>In the Starting URLs grid enter the location(s) in your file system where the files reside that you want to expose to the Search Framework crawling process. For each different location, add a new row to the grid.</td>
</tr>
</tbody>
</table>

**Note:** The starting URL is not case sensitive.

**Note:** For the SES crawler to access the URL, the file starting URL must be fully qualified, as in file://localhost/.

On UNIX the starting URL format is:
• To crawl local files use file://localhost/<directory structure>. For example:

    file://localhost/recruitment/resume/

• To crawl from mounted file systems use file://localhost//<mounted_dir_path>. For example:

    file://localhost//dfs/recruitment/resume/

On Windows the starting URL format is:

• To crawl local files use file://localhost/<Directory_Path>. For example:

    file://localhost/D:/recruitment/resume/

• To crawl from a mapped drive use file://localhost//<machinename>/<shared_folder_path>/ . For example:

    file://localhost//RTDC78067TLSBLD/recruitment/resume/

SES can crawl files on directories located on the server where SES is installed or network file paths accessible by the SES Server. When SES crawls files from a network drive, then the Oracle process/service should be started as a user who has access to the network drive, which you can accomplish by modifying the logon account of OracleServiceSID and OracleSIDTNSListener services to match the domain administrator and restart both services.

**Crawler Timeout**

Indicates the maximum allowed time to retrieve a file for crawling.

**Max Document Size**

The maximum document size in megabytes that the system will crawl. Larger documents are not crawled.

**Enable Language Detection**

By Enabling Language Detection, SES automatically identifies the language of the document content and assigns the language code automatically.

If the SES crawler cannot determine a perfect match, it finds a best match from the trained set of languages and assigns. Otherwise the default language in the crawler configurations will be assigned.

SES supports numerous languages with automatic language detection, including Chinese, Japanese, Korean, Danish, Dutch, English, French, German, Italian, Portuguese, and Spanish. Consult your Oracle SES documentation for a complete language support information.

**File URL Prefix**

The part of the access URL the system will not display in the search results due to security reasons.
This is an optional feature where there is a need to hide the actual URL used for indexing. If a File URL Prefix is specified it is mandatory to have the Display URL Prefix set.

**Display URL Prefix**

The URL the system displays instead of the actual URL. For example, if the file URL is:

```
file://localhost/home/operation/doc/file.doc
```

and you want the display URL to appear as:

```
https://webhost/client/doc/file.doc
```

then specify the File URL Prefix as:

```
file://localhost/home/operation
```

and the Display URL Prefix as:

```
https://webhost/client
```

If you select Display URL Prefix, make sure that the files are reachable using the specified URL. The SES Crawler replaces the URL string specified for the File URL Prefix with the Display URL Prefix.

If a Display URL Prefix is not mentioned, SES redirects the documents through the SES server for displaying the documents. If a file URL is to be used "as is" (without going through Oracle SES to retrieve the file), then "file" in the Display URL Prefix should be upper case. For example:

```
FILE://localhost/....
```

*As is* means that when a user clicks the link of the search result, the browser tries to use the specified file URL on the client computer to retrieve the file. Without that, SES uses the file URL on the server computer and sends the document through HTTP to the client computer.

---

**Specifying Document Types**

Access the Document Types page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting a Source Type of *File Source*. Then click the Document Types tab.
Use the Document Types page to specify the document types, expressed as MIME types, of the documents to be crawled.

**Image: File Source — Document Types page**

This example illustrates the fields and controls on the File Source — Document Types page. You can find definitions for the fields and controls later on this page.

### Document Types to Crawl

**Include default types**  
Crawl only on the default document types, as defined by Oracle SES.

The Oracle SES default document types for crawling are:

- PDF
- HTML
• TXT (plain text)
• Microsoft Word
• Microsoft Excel
• Microsoft PowerPoint

If no other document types are added to the Select grid, then SES considers only the default document types.

Include all types
Crawl all document types supported by Oracle SES.

To see this list of supported document types, expressed as MIME types, select either the Add these types or Exclude these types radio button and click the lookup button for the Document Type column.

Add these types
In addition to the default document types, the system also crawls any document type added to the Document Type grid, with Add these types selected.

Exclude these types
Excludes specific document types added to the Document Type grid.

Assume the majority of the document types supported by Oracle SES crawler apply to your configuration, except for a small number of document types. In this case you can specifically include those document types in the Document Type grid. When Oracle SES crawls the file location, Oracle SES crawls all document types on the supported MIME list, except for those document types included in the Document Type grid, with Exclude these types selected.

URL Boundary Rules

Inclusion Rules
Specify an inclusion rule that a URL must contain. For example:

*ses_xml*

In this case, Oracle SES crawls all documents with ses_xml in the name.

Specify an inclusion rule that URL must start with. For example:

file://localhost/ds1/product/SES_ADD/ses_doc*

In this case, SES crawls all files starting with file://localhost/ds1/product/SES_ADD/ses_doc.

Exclusion Rules
Specify an exclusion rule that a URL can't contain. For example:

*.xml
In this case, Oracle SES does not crawl anything with a .xml extension.

URL boundary rules limit the crawling scope. When you add boundary rules, the crawler is restricted to URLs that match only the rules you specify. Inclusion and Exclusion rules can be formed to filter documents with patterns of begins with, ends with, contains or regular expressions. Rules with regular expression should start with the character R.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begins With: <code>file://localhost/example*</code></td>
<td>In this case, SES considers URLs starting with <code>file://localhost/example</code>.</td>
</tr>
<tr>
<td>Ends With: <code>*.doc</code></td>
<td>In this case, SES considers URLs ending with <code>.doc</code>.</td>
</tr>
<tr>
<td>Contains: <code>*contacts*</code></td>
<td>In this case, SES considers URLs containing string <code>contacts</code>.</td>
</tr>
<tr>
<td>Regular Expression: <code>R.*ses_html_lvl[1-9].html</code></td>
<td>In this case, SES considers URLs ending with numbers varying from 1 to 9 with file names ending with <code>ses_html_lvl</code>.</td>
</tr>
</tbody>
</table>

When working with these rules, keep in mind:

- Exclusion rules always override inclusion rules.
- Multiple inclusion and exclusion rules can be separated by a space or in a new line.
- Use an asterisk to represent a wildcard.
- Inclusion and exclusion rules are case-insensitive.

---

**Working with Default Exclusion Rules for Non-Textual Document Types**

By default, the Oracle SES crawler contains built-in exclusion rules to exclude non-textual files, such as graphic files. To crawl a file with these extensions, you need to modify the following section in the Oracle SES crawler.dat file:

```
# default file name suffix exclusion list
```

The crawler.dat file is located in:

```
SES ORACLE_HOME/search/data/config/
```

For example:

```
D:\oracle\product\11.1.2.2.0\ses\seshome\search\data\config
```

Remove any file type suffix from the exclusion list that you want Oracle SES to crawl.
<table>
<thead>
<tr>
<th>Document Type</th>
<th>Extensions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Image</td>
<td>jpg, gif, tif, bmp, png</td>
</tr>
<tr>
<td>Audio</td>
<td>wav, mp3, wma</td>
</tr>
<tr>
<td>Video</td>
<td>avi, mpg, mpeg, wmv</td>
</tr>
<tr>
<td>Binary</td>
<td>bin, exe, so, dll, iso, jar, war, ear, tar, wmv, scm, cab, dmp</td>
</tr>
</tbody>
</table>

**Note:** Oracle SES only indexes the file name when crawling multimedia files, unless you implemented a crawler plug-in that provides a richer set of attributes, such as the Image Document Service plug-in.
Chapter 6

Creating Web Source Search Definitions

This section contains an overview, and discusses:

• Specifying Web Source general settings.
• Specifying document types.

Understanding Web Source Search Definitions

Web source definitions enable you to make the content of internal or external websites available for Oracle SES crawling and inclusion in the Search Framework end user searches. For example, if there is a website on your company's intranet that describes specific business processes for your end users, they can instigate a search against this web content from within the PeopleSoft application.

Specifying Web Source General Settings

Access the General Settings page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting a Source Type of Web Source.
Use the General Settings page to specify the location of the files to be indexed as well as the crawler settings.

**Image: Web Source — General Settings page**

This example illustrates the fields and controls on the Web Source — General Settings page. You can find definitions for the fields and controls later on this page.

### General Settings

- **Search Definition**: QE_WEB_SD
- **Description**: Web SD
- **Source Type**: Web
- **Object Owner ID**: PeopleTools

#### Starting URLs

- **Starting URL**:

#### Crawler Settings

- **Crawler Timeout (Seconds)**: 30
- **Crawl Depth**: 0
- **Max Document Size (MB)**: 10
- **Honor Robots Exclusion**: Yes
- **Index Dynamic Pages**: Yes

**Save**

### Description

Add a brief description to help identify the purpose of the search definition.

### Source Type

Displays the type of search definition, such as Query, Web, File, and so on.

### Starting URLs

Contains the URL of the web address. Oracle SES uses the URL as an entry point for starting to crawl a website.

---

**Important!** Only HTTP URLs are supported. The starting URL's mentioned should be accessible without any user credentials. SES Crawler will ignore web sites requiring login.

### Index All

This will index all the URLs which are allowed to access by the SES Crawler. This will not limit crawling in to a specific domain or host. As the number of URLs to index increases, time required to complete indexing also increases.
**Stay in Host**  
This will limit the indexing only to the specified host. For example, if you are indexing www.oracle.com and you select this option, you can index documents on www.oracle.com, but not on www.1.oracle.com.

**Important!** If neither option is selected, then the system switches to **Stay in Domain** mode. In this mode, indexing will be limited to a single domain. For example if you are indexing www.oracle.com it will consider all URLs with in this domain, including www.1.oracle.com, but URLs from a different domain, such as www.yahoo.com, would not be indexed.

**Crawler Timeout**  
Indicates the maximum allowed time to retrieve a file for crawling.

**Crawl Depth**  
The number of nested links the crawler follows, with the initial URL, or home page, residing at a depth of 0.

With a crawling depth of 1, the crawler also fetches any document linked to from the starting URL.

With the crawling depth set to 2, the crawler fetches any document linked to from the starting URL (depth of 0), and also fetches any document linked to from the depth of 1, and so on.

By adding a value for Crawl Depth, the system uses that value to enforce the crawling limit. If you enter no value, leaving the Crawl Depth blank, the system considers the crawling depth to be unlimited. As you increase the crawl depth, the content to be indexed can increase exponentially, which results in longer crawling durations.

**Max Document Size**  
The maximum document size in megabytes that the system will crawl. Larger documents are not crawled.

**Honor Robots Exclusion**  
Robot exclusion policies are set at web server and the web page level. The Honor Robots Exclusion setting controls whether Oracle SES recognizes or ignores the robot exclusion settings.

- **Yes.** The Oracle SES crawler traverses the pages based on the access policy specified in the web server robots.txt file. The crawler also respects the page-level robot exclusion specified in HTML meta tags.

- **No.** The crawler ignores any specified robot policy defined on the web server.

**Index Dynamic Pages**  
Controls whether Oracle SES crawls and indexes dynamic pages. Typically, database applications serve dynamic pages, and the pages have a URL containing a question mark (?). Oracle SES considers URLs containing question marks dynamic pages.

- **Yes.** Oracle SES crawls dynamic pages.
• No. Oracle SES does not crawl dynamic pages.

---

**Specifying Document Types**

Access the Document Types page by selecting PeopleTools, Search Framework, Designer, Search Definition and selecting a Source Type of *Web Source*. Then click the Document Types tab.

Use the Document Types page to specify the document types of the documents to be crawled. Document types are expressed as MIME types.

**Image: Web Source — Document Types page**

This example illustrates the fields and controls on the Web Source — Document Types page. You can find definitions for the fields and controls later on this page.

**Document Types to Crawl**

**Include default types**

Crawl only on the default document types, as defined by Oracle SES.

The Oracle SES default document types for crawling are:
- PDF
- HTML
- TXT (plain text)
- Microsoft Word
- Microsoft Excel
- Microsoft PowerPoint

**Note:** When you select this option, notice that you cannot add or remove items from the Document Type grid.

**Note:** Exclusion rules take precedence. For example, if you enter *.doc in the Exclusion Rules edit box, none of the Microsoft Word documents will be processed.

**Include all types**

Crawl all document types supported by Oracle SES.

To see this list of supported document types, expressed as MIME types, select either the Add these types or Exclude these types radio button and click the lookup button for the Document Type column.

**Note:** When you select this option, notice that you cannot add or remove items from the Document Type grid.

**Add document types**

In addition to the mandatory document types, which are HTML and TXT files, the system also crawls any document type added to the Document Type grid.

**Exclude document types**

Excludes specific document types added to the Document Type grid.

Assume the majority of the document types supported by Oracle SES crawler apply to your configuration, except for a small number of document types. In this case you can specifically include those document types in the Document Type grid. When Oracle SES crawls the file location, Oracle SES crawls all document types on the supported MIME list, except for those document types included in the Document Type grid.

**URL Boundary Rules**

**Inclusion Rules**

Specify an inclusion rule that a URL must contain. For example:

`www.*.example.com`

In this case, SES crawls all content within www.*.example.com.

**Exclusion Rules**

Specify an exclusion rule that a URL can't contain. For example:
www.*.uk.example.com

In this case, SES does not crawl anything within www.*.uk.example.com.

URL boundary rules limit the crawling scope. When you add boundary rules, the crawler is restricted to URLs that match only the rules you specify. Inclusion and Exclusion rules can be formed to filter documents with patterns of begins with, ends with, contains or regular expressions. Rules with regular expression should start with the character R.

<table>
<thead>
<tr>
<th>Rule</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Begins With: <a href="http://www.uk.example.com">http://www.uk.example.com</a>*</td>
<td>In this case, SES considers URLs starting with <a href="http://www.uk.example.com">www.uk.example.com</a>.</td>
</tr>
<tr>
<td>Ends With: *.xml</td>
<td>In this case, SES considers URLs ending with .xml.</td>
</tr>
<tr>
<td>Contains: <em>contacts</em></td>
<td>In this case, SES considers URLs containing string contacts.</td>
</tr>
<tr>
<td>Regular Expression: R^<a href="http://www.example.com/code.*.version%5B1-9%5D.html$">http://www.example.com/code.*.version[1-9].html$</a></td>
<td>In this case, SES considers URLs from example.com with sites starting with string code, and has versions numbered from 1 to 9 and ends as .html.</td>
</tr>
</tbody>
</table>

When working with these rules, keep in mind:

• Exclusion rules always override inclusion rules.
• Multiple inclusion and exclusion rules can be separated by a space or in a new line.
• Use an asterisk to represent a wildcard.
• Inclusion and exclusion rules are case-insensitive.
Creating Search Categories

This section contains an overview, and discusses:

• Specifying general search category settings.
• Selecting advanced search field settings.
• Selecting facet settings.
• Identifying custom search pages.
• Working with display fields.

Understanding Search Categories

Search Categories are essential for the Search Framework. Search categories:

• Organize search definitions into manageable, logical groups of data.
• Are required for searches. Search queries run only against search categories, not search definitions. A search definition must be a member of a search category before it can be searched.
• Enables users to focus searches to help refine results and restrict searches to a particular set of search indexes. For example, users can run searches against categories like Customers, Purchase Orders, or Products, rather than running a search against all indexes in the search engine.
• Allow users to search across several different groups of data simultaneously. For example if you were looking for a particular Item ID, with a Search category containing multiple Search Definitions, you can search across purchase order, sales orders and inventory at one time.
• Provide improved search performance and results by limiting the number of indexes searched.

Note: Search queries cannot be run directly against search definitions. Search queries can only be run against search categories.
Specifying General Search Category Settings

Access the General page by selecting PeopleTools, Search Framework, Designer, Search Categories.

Image: General page

This example illustrates the fields and controls on the General page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>General</th>
<th>Advanced Search Fields</th>
<th>Facets</th>
<th>Custom Search Page</th>
<th>Display Fields</th>
</tr>
</thead>
</table>

**General Settings**

| Search Category Name | PTPORTALREGISTRY
---|---
| *Description | Menu
| Duplicates | Use API ▼ □ Search Group
| Object Owner ID | PeopleTools ▼ □ |

<table>
<thead>
<tr>
<th>*Search Definition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PTPORTALREGISTRY</td>
<td>Menu</td>
</tr>
</tbody>
</table>

**Search Category Name**

Displays the search category name.

*Important!* Though any number of search definitions can be mapped to a search category, for each and every search definition, a search category of the *same* name must exist, and the search definition must belong to that search category. You can create search categories of a different name that are not associated with a single search definition. A search definition may belong to more than one search category, but it *must* belong to one with the same name.

For example, search definition XYZ must belong to search category XYZ, but search definition XYZ can also belong to search category ABC. Search category ABC does *not* require a corresponding search definition of the same name, and it can contain multiple search definitions.

**Description**

Add any additional information to distinguish search categories.

*Note:* If this search category becomes exposed through Global Search, then the description you enter may appear in the Global Search Bar. The description must be appropriate for end user viewing. Make the description as informative, concise, and intuitive as possible.
Duplicates

Identify how you want the system to handle the possibility of duplicate search results. A search category with multiple, similar search definitions may generate duplicate entries in the Oracle SES search index, which will display duplicate search results.

The Duplicates setting applies only at the individual search category level, and the system considers the Duplicates setting only when a search runs against a single search category. For example, the "All" search invoked from the Global Search bar will display all the search results across all deployed search categories, including duplicates, regardless of the Duplicates setting for individual search categories.

The Duplicates option enables you to:

• **Allow Duplicates.** The system displays all duplicate search results to the end user.

• **Suppress Duplicates.** The system does not display duplicate search results to the end user. In the event of duplicate search results, the system displays only one result from the set of duplicates.

• **Use API.** The handling of duplicates will be set in the search request object based on the value set by the application, honoring any values produced by the application PeopleCode.

Search Group

Select to enable this search category to be available for context searching within Global Search.

Search Definition

Add all search definitions that belong to this search category.

---

Selecting Advanced Search Field Settings

Access the Advanced Search Fields page by selecting PeopleTools, Search Framework, Designer, Search Categories and selecting the Advanced Search Fields tab.

The Advanced Search Fields page enables you to view and modify attributes to show on the advanced search page during end user searches to add more criteria to the basic search mode.

When working with the advanced search page attributes, keep these items in mind:

• This configured list can be programmatically retrieved from the SearchCategory App Class in the PT_SEARCH Application Package using method GetConfiguredFilterAttributes.

• All the attributes associated with this category can be retrieved using the same App Class with the method GetAllAttributes.
Attributes not appearing on the Advanced Search Fields page can be retrieved using GetNonConfiguredFilterAttributes. This method will provide a list of attributes defined in the related search definitions which have not been configured here.

**Image: Advanced Search Fields page**

This example illustrates the fields and controls on the Advanced Search Fields page. You can find definitions for the fields and controls later on this page.

### Auto detect common fields

When selected, this flag will gather all fields which are common to all search definitions listed on the General page. This will allow for searching across all search definitions in the category.

Select to avoid manually listing the common fields from the joined records. (default)

Deselect to delete some or to add additional attributes which are not common to all search definitions.

**Note:** When you select the Auto Detect flag, you must save the search category before the common fields will be properly displayed in the grid.

### Sequence

Control the sequence in which the search attributes appear in the advanced search interface.
Selecting Facet Settings

Access the Facets page by selecting PeopleTools, Search Framework, Designer, Search Categories and selecting the Facets tab.

**Image: Facets page**

This example illustrates the fields and controls on the Facets page. You can find definitions for the fields and controls later on this page.

---

**Auto detect facets**

Select to detect common facets for all the search definitions belonging to the search category. When you save the search category, any facets that are common to all search definitions are displayed. This saves you from needing to discover which facets can be used to filter across all search definitions.

Deselect this option if you wish to remove some facets or add ones that are not common to all search definitions (not recommended as this may distort facet counts).

**Sequence**

Control the sequence in which the faceted fields display for narrowing search results in an intuitive fashion for users.

For example, perhaps you might want to ensure that these faceted fields display in this order: Country, State, County, City.

**Description**

Displays the value of the Attribute Display Name column in the grid on the Map Search Attributes page for the search definition.

**Is Associated**

Select if you intend to create a user-specific association with the facet.

---

**Note:** Creating associated facets applies only to certain situations and expects additional requirements to be in place.

For more information, refer to the topic below, “Creating Associated Facets.”
**Facet Association**

Select how the value to which the facet should be associated will be determined. Options are:

- **Application Class**: When selected, the Associated Value App Class group box appears below the Facets grid on the Facets page, enabling you to specify the application package that will determine the facet association.

- **Employee ID**: Associates the facet value with the employee ID value (%EmployeeID).

- **User ID**: Associates the facet value with the currently signed on user (%UserID).

**Change facet sorting**

Click to launch a secondary page, enabling you to apply sorting rules to the faceted display. Refer to the Changing Facet Sorting section for details.

Keep in mind that this configured list of facets can be programmatically retrieved using the GetFacetFilters method in the SearchCategory App Class in the PT_SEARCH Application Package. The result, which is an array of PT_SEARCH:FacetFilter, can be passed to the PT_SEARCH:SearchQuery class to get facet nodes in the search results.

**Creating Associated Facets**

An associated facet is a facet that is associated with a specific field value, such as an employee ID or the current user ID. This enables that associated facet value to be filtered automatically by the facet association value. These facets appear in the facet pane within a separate facet node entitled “My Association” for example (default). All other facets in the facet pane behave normally, and the My Association facet node appears only if search results associated to the current user exist for the current search request.

For example, consider users accessing a component where job postings are created and managed. A hiring manager may want to have a facet category containing only search results associated with her, which might contain only those job postings she created. Likewise, a recruiter may want to have a facet category containing results associated only with him, such as the job openings for which he is the recruiter.

If you intend to implement associated facets for custom search categories, it is recommended that you examine the associated facets in your delivered PeopleSoft application search definitions and search categories to see examples. The following list provides general recommendations:

- You need to ensure that the facet association value is available in your table structure, your query or connected query, and that the value is indexed. Or, you can reference an application class, which will determine the association value programmatically.

- Only hierarchical search attributes can be associated facets. Define a hierarchy-based faceted attribute in the search definition, where the first level acts as the key for the facet association, for example user ID or employee ID, and the second level being the association, such as A.OPRID/HRS_ASSOCIATION_CD. It is recommended that at the association level, you reference a translate value (XLAT), such as hiring manager, recruiter, and so on.

- In cases, where the first level of the facet association is not user ID or employee ID, which PeopleTools populates, the PeopleSoft application delivers an application class to determine this
value. If you are creating custom search definitions and categories, you will need to create the application class.

**Changing Facet Sorting**

To modify the facet sorting order, select PeopleTools, Search Framework, Designer, Search Categories and selecting the Facets tab, and clicking the Change facet sorting link.

By default, facet values are sorted by count, meaning that the system displays the facet value containing the most search results first, or at the top of the list. While this may be desirable in many situations, in some situations it may provide a better user experience if the facets are sorted based on criteria other than just the number of search results.

For example, if the facet is a date field, it may make more sense to sort the facet values by the actual year, in a sequential order, (2013, 2012, 2011, and so on) as opposed to the number of search results with in each year. Likewise, in another situation, it may be more intuitive to sort a faceted Customer field alphabetically, regardless of search result count.

**Image: Change facet sorting page**

This example illustrates the fields and controls on the Change facet sorting page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Facet Name</th>
<th>COUNTRY</th>
</tr>
</thead>
</table>

**Level**

In the case of a nested facet, you can add additional rows to the sort order grid, and set different sort options at each level. The Level column indicates the level to which the sort options apply (1, 2, 3, and so on).

**Sort as**

Select one of these options to specify how the facet should be treated:

- *Count.* While the default sort order is to sort facet values by search result count in a descending order, the Count option enables you to apply an ascending order, for example.
- *Number.* Apply the number data type to the facet value.
- *String.* Apply the string, or character, data type to the facet value.

**Sort order**

Specify the sort order that best suits your selected Sort as option and how users expect to see the values displayed.
Identifying Custom Search Pages

Oracle provides default search pages to use with most application purposes. If you need to do something more than this, then you must create custom search pages for custom applications or to provide additional search features.

To indicate for the system to use these custom pages when doing a Global Search, then you should specify that search page, as well as any custom search result or advanced search pages.

**Note:** This functionality is only available for Global Search, not keyword component-level search.

Access the Custom Search Page page by selecting PeopleTools, Search Framework, Designer, Search Categories and selecting the Custom Search Page tab.

**Image: Custom Search Page page**

This example illustrates the fields and controls on the Custom Search Page page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Menu Name</th>
<th>Select the menu to which the search page belongs.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Component Name</td>
<td>Select the search page’s component name.</td>
</tr>
<tr>
<td>Market</td>
<td>Select the appropriate market.</td>
</tr>
<tr>
<td>Search results page</td>
<td>Select the search results page to use.</td>
</tr>
<tr>
<td>Advanced search page</td>
<td>Select the advanced search page to use.</td>
</tr>
</tbody>
</table>
Working With Display Fields

Access the Display Fields page by selecting PeopleTools, Search Framework, Designer, Search Categories and selecting the Display Fields tab.

**Image: Display Fields page**

This example illustrates the fields and controls on the Display Fields page. You can find definitions for the fields and controls later on this page.

**Sequence**
Use the Sequence edit box to specify the order in which the display fields appear.

**Search Attribute**
Select the search attribute from the drop-down list.
Chapter 8

Administering PeopleSoft Search Framework

Administering PeopleSoft Search Framework

This topic provides an overview and discusses:

- Working with Search Instances.
- Administering Search Definitions and Search Categories.
- Managing Search Context.
- Importing Remote Search Groups.
- Working with Search Indexes.
- Working with Search Framework Definitions During Upgrades.

Understanding PeopleSoft Search Framework Administration

While the system administration related to the Search Framework architecture can include tasks involving SES, Integration Broker, application server domains, and so on, this section focuses only on the administration tasks that are included in the Search Framework administration interface, specifically under the menu, PeopleTools, Search Framework, Administration.

Working With Search Instances

A search instance in the PeopleSoft Search Framework represents a single instance of the search engine. The search instance(s) created using the PeopleSoft Search Framework define the instances that will be used by the PeopleSoft applications to provide end user search.

The search instance definition specifies connectivity and other administration settings required for:

- running queries against the search server.
- administrative tasks.
Creating Search Instances

To define a search instance, access the Search Instance Properties page by selecting PeopleTools, Search Framework, Administration, Search Instance.

Image: Search Instance Properties page

This example illustrates the fields and controls on the Search Instance Properties page. You can find definitions for the fields and controls later on this page.

Search Instance Properties

Search Engine Details

To enable connectivity between your PeopleSoft system and SES, you need to provide these search engine values.

SSL Option

Select one of these options for SSL:

- DISABLE. Select if you do not have SSL configured between SES and your PeopleSoft system.
- ENABLE. Select if you do have SSL configured between SES and your PeopleSoft system and you want all communication between the servers SSL secured.
Host Name

Enter the server name of the host where SES is running, including the domain. The host name value can be a DNS name or an IP address.

For example:

server1.mycompany.com

or

123.111.4.168.mycompany.com

To specify the host, you may use the host name or an IP address.

Port

Enter the port on which SES listens for requests.

Ping

Click to make sure your host name and port are correct and that the SES server is available. A positive result displays the following message:

Ping Test Result: Success. Oracle Secure Enterprise Search Admin Service Version 11.1.2.2.0 (262,613)

Note: The Ping button appears only after you have entered your values on the Search Instance Properties page and saved them.

Admin Service Credentials

Specify the SES administrative credentials so that your PeopleSoft system has the appropriate access to connect to the SES server and invoke searches and various administrative tasks, such as deploying search objects, building indexes, scheduling crawling, and so on.

User Name

Enter the user name for logging into the Secure Enterprise Search Administration GUI.

Password\Confirm Password

Enter the password associated with the administrative user name, and confirm it in the edit box below.

Test Login

Click to test the credentials you have specified against the selected SES server. A positive result displays the following message:

Login Success. (262, 615)

Note: The Test Login button appears only after you have entered your values on the Search Instance Properties page and saved them.

Query Service Credentials

Proxy Name

Enter a trusted entity from the list on the Federation Trusted Entities page in the SES Administration interface. (Global Settings, Federation Trusted Entities)
This enables the PeopleSoft system to log into SES using a proxy identity to run a query. In SES, this proxy account is a Trusted Entity. You may need to contact your SES administrator to obtain Trusted Entity credentials or to have those credentials created for the Search Framework query service.

**Important!** Even though the Search Framework is authenticated by SES as the Trusted Entity, SES uses the identity of the currently signed on PeopleSoft user for query authorization.

### Password/Confirm Password
Enter and confirm the password associated with the trusted entity.

### Proxy Login
Click to test the credentials you have specified against the selected SES server. A positive result displays the following message:

*Proxy login success (262,1319)*

**Note:** The Proxy Login button appears only after you have entered your values on the Search Instance Properties page and saved them.

## Call Back Properties
At times, SES will need to call back to the PeopleSoft system to access services, such as authentication services, so you need to provide the URL and password for this access.

### URL
Enter the URL for the PeopleSoft system listening connector, using the following syntax:

```
http://<server>:<port./PSIGW/
PeopleSoftServiceListeningConnector/<node>
```

### User Name
Enter the PeopleSoft user name granted the permission list PTPT3300 with the role Search Server.

**Note:** This user name must exist as an active user profile on the PeopleSoft system listed in the URL specified. This is generally a system user as opposed to an interactive user. In addition, if you have attachments on an FTP server that will be accessed by SES, this user must also be authorized to access the FTP site.

### Password/Confirm Password
Enter and confirm the password associated with the PeopleSoft user name.

### Validate
Click to validate the URL and the credentials you have entered. A positive result displays the following message:

*Call back properties validated successfully (262,1312)*

### Update deployed definitions
Click this link to invoke a bulk update for all definitions currently deployed to the SES server.
If you have changed any of the callback properties (URL, username, or password), all currently deployed search definitions need to be updated with the new callback values to continue successful interaction with the Search Framework.

Modifying Search Instances

You can modify any of the search instance values if the information changes for the specified server. That is, if the server receives a new IP address or a new DNS name, if the port for the search services changes, or if any credentials change, then the values can be updated as needed.

**Important!** You may not reuse a search instance entry for an entirely new instance of a search server. For example, if an existing search instance is no longer available, do not reuse the same PeopleSoft Search Instance entry for a new server. This causes unintended and undesired results.

Sharing an Oracle SES Instance Among Multiple PeopleSoft Application Systems

If you have multiple PeopleSoft applications, you can share a single Oracle SES instance among the PeopleSoft systems. When sharing an Oracle SES instance, keep these items in mind:

- Single signon needs to be implemented among all of the PeopleSoft systems sharing the Oracle SES instance.
- On the Oracle SES Global Settings, Identity Management Setup page, the PeopleSoft Identity Plug-in only needs to refer to one of the systems sharing the Oracle SES instance.

For example, while other systems will have different HTTP ports and node names, as long as the following URL points to a system involved in the single signon network, it can be used for all systems as the Call Back Properties URL on the Search Instance Properties page.

http://FASTHOST.bigcompany.com:8080/PSIGW/PeopleSoftServiceListeningConnector/HCM_01

- While you do not need to synchronize user profiles among multiple PeopleSoft systems, if the same user ID exists on multiple systems, it must be associated with the same, individual user. That is, a user ID must be unique for all of the systems sharing the Oracle SES instance, not just a single PeopleSoft application.

Deleting Search Instances

Deleting a saved search instance is not supported.

Administering Search Definitions and Search Categories

This section contains an overview and discusses:

- Working with search definitions.
• Working with search categories.

Understanding Search Definition Administration

You create search definitions using the Search Framework Designer interface after the data is identified using PeopleSoft Query and Connected Query. You use the Search Framework Administration interface to deploying the search definitions and manage the search definitions on the SES server.

Before end users can run searches against the search indexes, the search definitions need to be deployed to the SES search engine so that SES can create the structure of the search index based on the search definition, crawl the defined search criteria, and populate the index with the results of the search definition query. When your search definitions are deployed on SES, they become an SES source that you can view under the Sources tab in the SES administrative interface.

Once the search definitions are deployed to SES, you use the Search Framework administration interface to manage them by sorting them in search categories, updating them, undeploying them, or deleting them as needed.

Working with Search Definitions

To manage search definitions, access the Search Definitions page by selecting PeopleTools, Search Framework, Administration, Deploy/Delete Object.

Image: Deploy Search Definition page

This example illustrates the fields and controls on the Deploy Search Definition page. You can find definitions for the fields and controls later on this page.

Search Category Name

Use to display only those search definitions associated with a particular search category.

Filter by name

Use to enter full or partial definition names to reduce the list of search definitions appearing in the grid.

Note: The values are case-sensitive.

Deploy Search Definition (grid)

Displays all existing search definitions defined in the Search Framework. Columns in the grid are:
• Definition. Displays the name of the search definitions you've created. Deployable search definitions are having a data source created in Query or Connected Query, as well as being defined in the Search Framework Designer interface.

• Description. Displays your search definition description.

• Deploy Status. Displays the state of search definition deployment: A search Definition is either Deployed or Undeployed.

• Crawl Status. Displays the status of the index build process for a search definition (Success, Fail, Not Crawled).

• Run Date/Time. Displays the date and time of the most recent index build process run.

• User/Run Control ID. Displays the user ID and the run control ID used to run the index build process.

• Update Status. After running the Report Sync Issues audit, the results appear in this column indicating any required updates.

• Audit Status. After clicking Audit for a selected search definition, the Audit Status column appears displaying the result (Success, Fail).

• Audit Report. If the Audit Status is Fail, the Audit Report column appears providing a link to the audit report for review.

Select All Click to select all the rows within the grid.

Note: If all rows in the grid have been selected, the button title changes to Deselect All.

Report Sync Issues

Runs an audit checking routine which reports where properties for a search definition differ between PeopleSoft and SES. If you have updated a deployed search definition it will no longer be synchronized with the representation on SES. Results of this check appear in the Update Status column (which, in the case of differences between the corresponding definitions becomes the View Report column). This applies only to deployed definitions.

Audit

Click to run a series of audits on the selected search definitions to ensure they have all requirements in place.

After running the audit process, these additional columns appear in the Deploy Search Definition grid: Audit Status and Audit Report. The Audit Status column will indicate Success or Fail. If the result is Fail, then the Audit Report column appears, displaying an Audit Report link, which you can click to review the audit results and correct the reported issues.
See the section below: “Running the Search Definition Audit Process.”

**Deploy**

Deploy the PeopleSoft search definitions selected to the search engine (SES), where it becomes a searchable data source.

*Note:* You can deploy multiple search definitions at a time by selecting the corresponding check box in the first column of the grid and then choosing Deploy.

*Note:* When you deploy a search definition, the search category of the same name is automatically deployed.

**Undeploy**

Click to remove the representation of the selected search definitions from the search engine (SES).

*Note:* You can undeploy multiple search definitions at a time by selecting the corresponding check box in the first column of the grid and then choosing undeploy.

*Note:* When you undeploy a search definition, the search category of the same name is automatically undeployed.

*Note:* The undeployed search definition will be removed from SES but it will still exist within the PeopleSoft system.

*Note:* For large indexes, it is recommended to undeploy them during the non-peak hours for performance reasons. While the status displays undeployed, the actual deletion occurs on SES asynchronously, and undeploying a larger index requires additional time on SES.

**Update**

Click to update the representation of the search definition on SES. If you have modified a deployed search definition, the PeopleSoft version and the version on SES will no longer match. Definitions that need to be updated will appear in the synchronization report. Clicking Update synchronizes the SES representation of the definition to match the PeopleSoft version.

**Delete**

Deletes the search definition from the Search Framework. This removes the search definition from the search definition list and from the search categories to which it is mapped. The underlying query and connected query are unaffected.

**Running the Synchronization Report Process**

In the event of differences found between the two systems, Search Framework prepares a Search Definition Compare Report, which you access by clicking the View Report link in the View Report column. Depending on the status of your search definitions in both the PeopleSoft system and the SES
system, the results of the synchronization report will vary. This table describes some likely scenarios and the recommended action.

<table>
<thead>
<tr>
<th>Update Status</th>
<th>Recommended Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>No update required for the definition.</td>
<td>No action is required. The definitions are identical between the two systems.</td>
</tr>
<tr>
<td>Update required definition out of sync.</td>
<td>Click the View Report link in the View Report column, and examine the reported differences. Resolve the differences as needed between the two systems, or click Update.</td>
</tr>
<tr>
<td>Definition unavailable in server.</td>
<td>Click the Reset Definition for Deploy link in the View Report column. This removes the previous definition on SES or any remaining settings related to it, making it available to be deployed again.</td>
</tr>
<tr>
<td>Undeployed definition. Choose a deployed definition.</td>
<td>Ignore the report if the definition is purposely undeployed, or deploy the definition.</td>
</tr>
</tbody>
</table>

When you select View Report, you may see a screen similar to this:

**Image: Search Definition Compare Report page**

This example illustrates the fields and controls on the Search Definition Compare Report page. You can find definitions for the fields and controls later on this page.

### Property Type

Displays properties that have found to differ between the two systems. The values appearing in this column can be numerous, representing all the possible settings for a search definition, such as user ID, category, call back URL, and so on.

### PeopleSoft

Displays the value defined for the search definition within the PeopleSoft system.

### Search Server

Displays the value stored for the property on the search server.

### OK

Click OK to leave the report and return to the previous page.
Running the Search Definition Audit Process

After selecting a search definition and clicking Audit, the system runs a series of audits on the search definition. The types of audits include checking to make sure:

- The underlying query or connected query exists.
- The user has permission to the query and the referenced records.
- The indexed fields exist in the query or connected query.
- The security App Class exists (if referenced in search definition).
- The pre processing AE library exists (if referenced in search definition).
- The post processing AE library exists (if referenced in search definition).
- The delete query exists (if referenced in search definition) and the user has permission to open the delete query.
- A search category with the same name as the search definition exists.
- The search definition belongs to at least one search category.

If the audit process finds no issues, the Audit Status column indicates Success. If the audit process does find issues, the system displays the Audit Report column containing a link to the audit report.

**Image: Search Definition audit report columns**

This example illustrates the audit related columns that appear after clicking Audit for a selected search definition.

<table>
<thead>
<tr>
<th>Audit Status</th>
<th>Audit Report</th>
</tr>
</thead>
<tbody>
<tr>
<td>Fail</td>
<td>Audit Report</td>
</tr>
<tr>
<td>Success</td>
<td></td>
</tr>
</tbody>
</table>

If the audit discovers issues, the audit status gets set to *Fail*, and the Audit Report column appears. To review the issues on the Search Definition Audit Report page, click the Audit Report link.

**Image: Search Definition Audit Report page**

This example illustrates the fields and controls on the Search Definition Audit Report page.
**Updating Definitions**

In the event of updates being required, clicking Update makes the version of the search definition on the search server match the properties for that definition stored within the PeopleSoft system. After the process runs, you should see in the Update Status column the following message:

Updated definition <definition name>

**Working with Search Categories**

Search categories enable you to group search definitions within logical, manageable groups. You define search categories within the Search Framework Designer interface.

To manage search categories, access the Deploy Search Categories page by selecting PeopleTools, Search Framework, Administration, Deploy/Delete Object, Deploy Search Category.

**Image: Deploy Search Category page**

This example illustrates the fields and controls on the Deploy Search Category page. You can find definitions for the fields and controls later on this page.

**Filter by name**

Use to enter full or partial definition names to reduce the list of search categories appearing in the grid.

**Deploy Search Category (grid)**

Displays all existing search categories defined in the Search Framework. Columns in the grid are:

- Deployable Definition Name. Displays the name of the search categories you've created. Deployable search categories are those having been defined in the Search Framework Designer interface.
- **Description.** Displays your search category description.

- **Search Instance Name.** Displays the search instance to which a search category is deployed.

- **Deploy Related Search Definition.** Click to display the Deploy Search Definition page with the grid populated only with search definitions within the selected search category.

- **Status.** Displays these states of search object deployment: Deployed, Undeployed or Auto Deployed. Search categories will be automatically deployed (Auto Deployed) if a search definition with the same name is deployed. You need to deploy search categories covering multiple search definitions manually.

- **Update Status.** If you run a Report Sync Issues process from the Deploy Search Definition page, the process populates this column too if there are any differences between search categories on the two systems (PeopleSoft and SES).

<table>
<thead>
<tr>
<th>Select All</th>
<th>Click to select all the rows within the grid.</th>
</tr>
</thead>
</table>

*Note:* If all rows in the grid have been selected, the button label changes to Deselect All.

<table>
<thead>
<tr>
<th>Deploy</th>
<th>Deploy the PeopleSoft search category to the search engine.</th>
</tr>
</thead>
</table>

*Note:* You can deploy multiple search categories at a time by selecting the corresponding check box in the first column of the grid and then choosing Deploy.

**Important!** You must first deploy all the search definitions within a search category before deploying a search category. A search category cannot be empty on the search engine.

<table>
<thead>
<tr>
<th>Undeploy</th>
<th>Click to remove the search category from the search engine.</th>
</tr>
</thead>
</table>

*Note:* The search category will be removed from SES, but it will still exist within the PeopleSoft system.

*Note:* This does not undeploy the search definitions associated with a search category.

<table>
<thead>
<tr>
<th>Delete</th>
<th>Deletes the search category from the Search Framework.</th>
</tr>
</thead>
</table>

*Note:* This does not delete the search definitions associated with a search category.
Managing Search Context

This section provides an overview and discusses:

- Defining Search Context
- Viewing Search Contexts

Understanding Search Contexts

Use search contexts to define which search groups appear in the search group drop-down Global Search Bar, depending on the context of the user. That is, depending on where users are in the interface, which determines their context, you can control what appears in the drop-down.

A search group is a search category that you enable for the purpose of setting up search contexts. Search groups can fall into these three search contexts:

- **Home Page**: These are set of search groups available to select when the user is viewing the home page.

- **Portal Node**: These are the search groups available if the user is accessing content from a particular node. There can be more than one search group for the same node.

- **Work Center**: These are the search groups available when the user is accessing content that is part of a WorkCenter template. When in a WorkCenter template, search groups associated with the underlying node will not be part of the search group drop down.

At each of these levels, a default search group can be selected. It is not required to have a default search group for any level.
Defining Search Contexts

Access the Define Search Context page by selecting PeopleTools, Search Framework, Administration, Define Search Context and choosing the appropriate context type (homepage, portal node, or work center).

Image: Define Search Context page

This example illustrates the fields and controls on the Define Search Context page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Define Search Context</th>
</tr>
</thead>
<tbody>
<tr>
<td>Add search groups which can be displayed for this context.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Context Type</th>
<th>Portal Node</th>
<th>Node Name</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td>QIE_LOCAL</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Default</th>
<th>Sequence</th>
<th>Search Category Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>1</td>
<td>PTPORTALREGISTRY</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Menu</td>
</tr>
<tr>
<td>2</td>
<td>2</td>
<td>EMPLOYEE2_GSAWER_852</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Employee information</td>
</tr>
</tbody>
</table>

Use the plus and minus buttons to add and remove the search categories to and from the search context.

**Default**

Select for the category that should be the default if the end user does not select a particular category.

Only one default search category can be selected for a search context.

**Note:** If no categories are added to the grid, then "all" will be the default, which means users can search across all search groups to which they have access.

**Sequence**

Specify a numerical sequence to define the order in which the search categories will appear in the Global Search Bar drop-down list.

**Search Category Name**

Select the search category to include for this search context.
Viewing Search Contexts

To view your defined search contexts, access the View Search Contexts page by selecting PeopleTools, Search Framework, Administration, View Search Contexts.

Image: View Search Context page

This example illustrates the fields and controls on the View Search Context page. You can find definitions for the fields and controls later on this page.

Filter Contexts

Use the Filter Context controls to customize and narrow the contexts displayed.

- **Context Type**
  - Select the context type you wish to view.

- **Node Name/Workcenter ID**
  - Enter a specific node name or work center.

- **Clear**
  - Click to clear the previous filter criteria.

Search Contexts

The Search Contexts section displays the search contexts that meet the criteria specified in the Filter Contexts section.

- **Edit Context**
  - Click to modify the search context definition. The link opens the Define Search Context page with the selected search context open.
Importing Remote Search Groups

You can share search groups between databases to enable seamless navigation between systems. However, the nodes and the search groups need to be known to all systems involved. The imported search groups are treated as local search groups, and need to be modified as such. For example, imported groups need to be included in the search contexts to become available.

When you import search groups, you import them from a remote node, as defined in your Integration Broker configuration. When importing search groups, keep the following items in mind:

- Both the local and remote systems need to point to the same SES server instance. That is, both systems need to have the same SES instance defined on the Search Instance Properties page.
- Both systems need to have unique Default Local Node names.
- Both systems need to have a unique database name.
- The remote node needs to be in the IB Network of the local system.
- The remote system needs to trust the local system. That is, single signon must be set up between the two systems, and they must share common PeopleSoft user profiles. If you need users to be able to search both indexes, the users must exist and be authorized in both systems.
- The remote node Portal URI Text and Content URI Text values need to be specified on the Portal tab of the node definition.

To import search groups from other systems, access the Remote Search Groups page by selecting PeopleTools, Search Framework, Administration, Remote Search Groups.

Note: Importing remote search groups retrieves all the search groups defined in that content system along with all related search categories, associated search definitions, and the list of faceted attributes.

Image: Remote Search Groups

This example illustrates the fields and controls on the Remote Search Groups. You can find definitions for the fields and controls later on this page.

Content Provider

Select the remote node defined in your system from which you want to import search groups.

Content providers must be defined as nodes known to your system using Integration Broker.
Import\n\nClick to invoke the import process. This will import all search groups from the selected node.

Delete\n\nClick to remove any unnecessary or obsolete search groups from your system.

"Setting Portal Nodes (PeopleTools 8.53: Portal Technology)"

Working with Search Indexes

This section contains an overview and discusses:

• Building search indexes.
• Viewing index build process details.

Understanding the Index Build Process

Before end users can submit search requests against the Search Framework deployed objects, the search indexes must first be built on the search engine. Prior to the index being built, a deployed search definition is an empty shell, containing no searchable data. A search index needs to be built for each individual search definition.

An Application Engine program, PTSF_GENFEED, builds the search index and makes it available for SES.

Creating a search index with the Search Framework involves the following technologies:

• Search Framework
• Application Engine
• Process Scheduler
• Feeds Framework
• Integration Broker
• SES Crawler

Once you invoke a search index build from the Build Search Index page, the system automatically completes these general steps:

1. The Schedule Search Index page initiates the PTSF_GENFEED Application Engine program.
2. The Pre Processing Application Engine program defined for the search definition runs.
3. PTSF_GENFEED Application Engine program runs the query (PeopleSoft Query or Connected Query) associated with the search definition.
4. The output of the query becomes a data source for the Feeds Framework.

5. The Feeds Framework converts the query output to an Oracle RSS Schema format and writes the SES Feed to the Integration Broker queue, and the Deletion query defined for the Search Definition runs.

6. The Search Framework then creates an SES Schedule for the SES source associated with the search definition and sets the schedule disposition to "CRAWL immediately."

7. The Post Processing Application Engine program defined for the search definition runs.

8. The SES Crawler, using the URL of the Integration Broker queue where the SES Feed is located, initiates the crawling of the SES Feed.

Building Search Indexes

Access the Build Search Index page. (Select PeopleTools, Search Framework, Administration, Schedule Search Index.)

**Image: Build Search Index**

This example illustrates the fields and controls on the Build Search Index. You can find definitions for the fields and controls later on this page.

To build a Search Framework search index:

1. Select PeopleTools, Search Framework, Administration, Schedule Search Index.

2. Enter a run control ID.

3. On the Build Search Index page, select the appropriate options.

   **Search Definition**

   Select the search definition for which you are building the search index.

   **Note:** Each search definition needs its own index build scheduled individually. Once the Run Control is executed, the page becomes read-only. To change any parameters of the page, you need to create a new run control.

   **Indexing Type**

   Select one of the following:

   - *Full index.* Crawls all transactional data specified by the query criteria and rebuilds the entire index. This option
requires the most time. This option must be selected the first time an index is built.

- **Incremental index.** Updates the existing index and adds only documents associated with rows that have been added or updated since the last index build or update. The system determines the required updates based on a comparison between the timestamp of the index and the “last updated” field for the data row.

**Note:** It is recommended to create one run control for incremental indexing, scheduled to run very frequently, and create another run control for full index rebuilding set to run less frequently. For example, incremental indexing might run daily, where a full index rebuild may be set to run every six months.

**Language Options**

Select one of the following:

- **All Languages.** Builds an index for each language enabled on the database.
- **Base Language.** Builds an index only for the base language defined for the database.

Your selection depends on the languages enabled for your database and the languages through which you anticipate end users using to perform searches.

4. Click Run.

5. Use Process Monitor to verify program completion and success.

**Note:** Consider setting up separate run controls for full index builds and incremental index builds.

**Note:** Once the Run Control is executed, the page becomes read-only. To change any parameters of the page, you need to create a new run control.

### Viewing Search Index Build Process Details

After the PTSF_GENFEED program begins to run, you can view the details regarding that program run, which display on the Build Search Index page for that run control ID.
**Note:** The Details section shows the results of the most recent feed generation for this Search Definition. It may not be the same run control ID as the one you selected. If the run control ID differs from the one you selected, it will be highlighted.

**Image: Previous schedule details**

This example illustrates the fields and controls on the Previous schedule details. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Previous schedule status</th>
<th>Success</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>AE Status</strong></td>
<td>Schedule success</td>
</tr>
</tbody>
</table>

**Details**

- **Feed generation status**: Done
- **Process Instance**: 95
- **Run Control ID**: employee_3_full
- **User ID**: QEDMO
- **Indexing type**: Full index
- **Language Option**: Base Language
- **Generated segment count**: 1
- **Segments returned to crawler**: 1
- **Datetime prompt value**: 01/01/1900 12:00:00.000000AM

<table>
<thead>
<tr>
<th>Language Code</th>
<th>View data feed</th>
</tr>
</thead>
<tbody>
<tr>
<td>English</td>
<td>View data feed</td>
</tr>
</tbody>
</table>

**Previous schedule status** Displays the status of the most recently executed index build process.

**AE Status** Indicates whether the most recently executed PTSF_GENFEED Application Program ran to completion.

If the index build fails, this field displays the step where the process failed.

**Resume Schedule** Appears in the case where the index build failed. If the index build fails, review the Crawler Log Files in the SES administration console. After determining and fixing the root cause, you can set the index build to:

- **Restart SES Crawl**: Re-starts the SES crawl process on the previously generated feed.
- **Rebuild Index**: Regenerates the search feed.
Feed generation status  Indicates whether the system successfully created the feed output, required to populate the index.

User ID  Displays the User ID who ran the run control, which may be a different user ID than the user who created the run control.

Language Option  Displays the language options selected for the index build process (All Languages or Base Language).

Indexing Type  Displays the index type (Full Index or Incremental Index).

Generated segment count  A segment is a chunk of XML which is complete in and of itself. A segment size is determined by the PeopleTools Options setting "Maximum Message Size." The number of segments is roughly equivalent to the size of the data divided by the Maximum Message Size setting.

See "Understanding the PeopleTools Utilities (PeopleTools 8.53: System and Server Administration)".

Segments returned to crawler  This is the number of segments sent to the crawler for indexing. This information may be useful in debugging issues where the feed generated does not equal the number of indexed segments.

Datetime prompt value  Displays the datetime prompt value for your underlying search query. If this is the first time running the process for a search index, the system uses 01/01/1900 to gather all possible data. For the incremental index, the data displayed represent the datetime that the last index was built. This date will be used for the next run to determine the incremental data that should be included.

View data feed  Click to view the extracted date that has been applied to the search index on the SES system. The data is in XML format.

A row appears in the grid for each language for which the system included in the index build. The link takes you to the Integration Broker Service Operations Monitor, Asynchronous Details page.

Note: To view the feed in the Integration Broker Monitor, you need security access to those pages.

Viewing Search Index Feed XML

You may need to view the source XML for the search index to ensure the system is capturing the data you want populating your index or for other troubleshooting tasks.

To view the source XML feed data:

1. Select PeopleTools, Search Framework, Administration, Schedule Search Index.

2. Enter the appropriate run control ID.
3. Expand the Details section for the search index build run.

4. Click the View data feed link in the Language Code grid.

   This takes you to the Integration Broker Service Operations Monitor, Asynchronous Details page.

5. On the Asynchronous Details, click Download XML.

**Image: Source XML Feed data**

This example illustrates the fields and controls on the Source XML Feed data. You can find definitions for the fields and controls later on this page.

---

**Creating the Attachment URL ID List**

Access the Attachment URL ID List page by selecting PeopleTools, Search Framework, Administration, Attachment URL ID List.

Use the Attachment URL ID List page to define a list of URL IDs to be used specifically for attachments within the PeopleSoft Search Framework. URL definitions are created using the URL Maintenance page
(PeopleTools, Utilities, Administration, URLs), and using the Attachment URL ID List page you identify a subset of these URL definitions to be recognized by the PeopleSoft Search Framework.

**Image: Attachment URL ID List page**

This example illustrates the fields and controls on the Attachment URL ID List page. You can find definitions for the fields and controls later on this page.

### URL ID List

This grid contains the subset of previously defined URL definitions that you want the PeopleSoft Search Framework to recognize as attachment storage locations.

### URL Identifier

From the drop-down list, select the URL Identifier to add to the URL ID list. The drop-down list prompts against the list of URLs defined on the URL Maintenance page.

**Note:** If you need to use multiple user credentials for a single FTP server, create separate URLID's for each user. The URL definition allows only one user credential for each URLID.

**Related Links**

"URL Maintenance (PeopleTools 8.53: System and Server Administration)"

---

**Working with Search Framework Definitions During Upgrades**

These Search Framework definitions are managed objects, meaning they can be upgraded, added to projects, compared, copied, and so on:

- search attributes
- search definitions
- search categories
- search contexts
Chapter 9

Working with PeopleSoft Search Framework Utilities

This topic discusses these Search Framework tasks:

- Using the Search Test Page.
- Downloading search data.
- Running diagnostics.

Using the Search Test Page

This section contains an overview and discusses:

- Testing search categories.
- Testing custom search attributes.
- Testing filter settings.
- Testing Facet Requests.
- Testing Grouping and Sorting Options
- Testing Additional Parameters

Understanding the Search Test Page

The search test page enables you to test an index independent of any existing PeopleSoft application PeopleCode or additional APIs. Using the Search Test page, you can isolate various search features and view the behavior, without signing on to the PeopleSoft application or SES. Also, by observing the underlying PeopleCode, the Search Test page can be a useful tool when studying the use and behavior of the query API. If you do not enter any criteria on the Search Test page, and click Search, the system will return all documents indexed in the search engine. Using the criteria on this page, you can test how you anticipate search results to display for your application.
Access the Search Test page by selecting PeopleTools, Search Framework, Utilities, Search Test Page.

**Image: Search Test page**

This example illustrates the fields and controls on the Search Test page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Search Text</strong></td>
<td>Enter the free text search request string to test.</td>
</tr>
<tr>
<td><strong>Search</strong></td>
<td>Click to initiate the search request against SES.</td>
</tr>
<tr>
<td><strong>Start Index</strong></td>
<td>Enables you control which result document displays first. For example, if you set it to 10, the system displays the 10th search result at the top of the search result list.</td>
</tr>
<tr>
<td><strong>Docs Requested</strong></td>
<td>Enables you to control the number of search results displayed on the Results tab.</td>
</tr>
<tr>
<td><strong>Language</strong></td>
<td>Select the language for which you want to test the search index. Select blank to run against all languages.</td>
</tr>
<tr>
<td><strong>Clear Security Cache</strong></td>
<td>Click to clear the cached security credentials stored on Oracle SES to ensure a clean testing environment.</td>
</tr>
<tr>
<td><strong>Duplicates</strong></td>
<td>Enables you to control how duplicates are displayed:</td>
</tr>
<tr>
<td></td>
<td>• Remove. Duplicates are not displayed.</td>
</tr>
<tr>
<td></td>
<td>• Mark. Duplicates are displayed, but they are marked to indicate the duplicates.</td>
</tr>
</tbody>
</table>

**Important!** To emulate the current default PeopleSoft Search Framework behavior, clear both *Remove* and *Mark* in the Duplicates group box.
Testing Search Categories

The Search Category to Search in group box enables you to narrow the search only to a specific search category or set of search categories. Add search categories to the grid as needed to increase the scope of the search.

Testing Custom Search Attributes

The Custom Search Attributes group box enables you to identify specific search attributes and display the actual values for a search document in the search results. That is, in addition to the URL and summary in the search results, the results will also display the values for the fields you add to the Custom Search Attributes grid. The search attributes must be indexed fields in the search definition.

Testing Filter Settings

The Filter Settings group box enables you to search specific values of your attributes using the available operators.

If you have multiple attributes in the grid, use Match Any to return results that match any of the filters, and use Match All to display results that meet the criteria for all of the filters.

Note: The operators displayed for testing filter settings on the Search Test page represent all possible operators that can be utilized by way of the delivered PeopleCode API. However, depending on the application’s usage of the PeopleCode API and the data type of the field itself, end users will see varying display of the possible operators when defining search criteria. For example, Equal To applies only to number data types, while Contains Phrase applies only to character data types, and the appearance of the Between operator depends on the application’s usage of the delivered PeopleCode. Refer to the PeopleSoft Search Framework PeopleCode documentation for more information.

Testing Facet Requests

The Facet Request group box enables you to test and isolate specific facets. For example, you can find those that contain no search results in certain scenarios, or compare facet counts to attribute counts.

<table>
<thead>
<tr>
<th>Minimum Doc Count</th>
<th>Enables you to control the facets that display based on their count. For example, you can display facets that contain zero results, or only those who contain at least 10.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Maximum Facet Children</td>
<td>This applies to all facet requests. This determines the maximum number of facet nodes (facet values) returned by the API. The default is -1 where in all the children will be displayed.</td>
</tr>
<tr>
<td>Facet Name</td>
<td>Select the name of the facet you want to test.</td>
</tr>
<tr>
<td>Facet Path</td>
<td>This applies to all facet requests. The results will be filtered by the facet values specified in the path. In the case of hierarchical facets, the path can have the hierarchy information. For example, United States/CA/Pleasanton</td>
</tr>
</tbody>
</table>
Return Count

Select to display the number of documents the facet contains.

Sort By

You can sort facets alphabetically or by count in ascending or descending order.

Testing Grouping and Sorting Options

The grouping and sorting options are not implemented in current release. These options are reserved for future use.

Testing Additional Parameters

The additional parameters options are not implemented in current release. These options are reserved for future use.

Download Search Data

If you need to share search definition information with Oracle Global Customer Support (GCS) related to search definitions you are troubleshooting, use the Download Search Data page. The output from this process is encrypted such that it can be decrypted only by internal GCS or development resources.

Image: Download Search Data page

This example illustrates the fields and controls on the Download Search Data page. You can find definitions for the fields and controls later on this page.

To download encrypted search data:

1. PeopleTools, Search Framework, Utilities, Download search data.
2. Enter a run control ID.
3. On the Download Search Data page, select the appropriate value from the Search Definition drop-down list.
4. Click Run.
6. Retrieve the encrypted output from PS_CFG_HOME\appserv\pres\<Process Scheduler domain name>\files\sesfeeds\<search_definition_name_date_time>\<segment_number>.xml.

The encrypted file will appear similar to this example:

Image: Encrypted search data

This example illustrates the fields and controls on the Encrypted search data. You can find definitions for the fields and controls later on this page.

Running Diagnostics

This section discusses:

- Performing a round-trip test.
- Viewing event logs.

Performing a Round-Trip Test

Access the Round-Trip Test page by selecting PeopleTools, Search Framework, Utilities, Diagnostics, Round-Trip Test.
The round-trip test performs a set of diagnostic steps using a test search definition, delivered with PeopleTools named RNTRPTST. It provides end-to-end diagnostic tests to verify and troubleshoot the PeopleSoft and SES integration.

**Image: Round-Trip Test page**

This example illustrates the fields and controls on the Round-Trip Test page. You can find definitions for the fields and controls later on this page.

**Search Instance**

Select the appropriate search instance defined for this PeopleSoft system.

**Test Steps**

The Test Steps grid contains a series of links that are ordered in a typical troubleshooting sequence. Only one link is active at a time, and each link becomes active only after the previous step has completed successfully.

1. Ping Test: Runs a ping test against the SES server instance defined for your system.

2. Deploy: Deploys the RNTRPTST search definition and associated category to the SES server.

3. Crawl: Runs a test crawl using the RNTRPTST definition.

4. Search: Runs a sample search based on the index populated by the RNTRPTST search definition.

5. Cleanup: Click to remove the deployment of the RNTRPTST search definition and run any related cleanup tasks.
Test Log
Indicates whether the system successfully created the feed output, required to populate the index.

Viewing Event Logs

View event logs on the Events Log page by selecting PeopleTools, Search Framework, Utilities, Diagnostics, Events Log.

Image: Events Log page
This example illustrates the fields and controls on the Events Log page. You can find definitions for the fields and controls later on this page.

Event Name
Select the name of the event by which to filter the logs.

Event Severity
Narrow the event display focus by selecting one of these severity levels:

- All: Displays all types of even logs (Error, Message, Warning).
- Error: Displays only error messages.
- Message: Displays the typical status messages the system records after each event.
- Warning: Displays only warning messages.

View Events
Click to display the events meeting your criteria in the Events grid based on Time Period settings. For example, after selecting
a time period, click View Events to display only the logs that fall within that period.

**Purge Logs**

After selecting a time period, click Purge Logs to remove from the system the logs from that time period. Click View Events to refresh the events list.

This can help to keep the stored log information at a manageable size.

**Time Period**

Specify the specific time period for which you seek event log information.
Chapter 10

Working with PeopleSoft Search Framework Security Features

This section contains an overview and discusses:

- Applying PeopleSoft Permissions.
- Setting up authentication and authorization.
- Configuring SSL between PeopleSoft and SES.
- Setting up role-based search group access.

Understanding Search Framework Security

By default, both the Search Framework and Oracle SES possess innate security features designed to protect all of the data and processes within the systems. This section describes security topics that pertain solely to the integration between Search Framework and SES.

Applying PeopleSoft Permissions

The implementation, maintenance, and use of the Search Framework involve these user types:

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Delivered PeopleTools Permission List</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Administrator</td>
<td>Responsible for managing the deployment of search definitions and search categories, scheduling index builds, monitoring indexes, and establishing connectivity between Search Framework and SES.</td>
<td>PTPT3100</td>
</tr>
</tbody>
</table>

**Note:** This user needs to have access to all the queries (records) on which the search definition is based on in order to schedule the index generation.
<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Delivered PeopleTools Permission List</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search Developer</td>
<td>Responsible for creating search queries, search definitions and search categories.</td>
<td>PTPT3200</td>
</tr>
<tr>
<td>Search Server</td>
<td>SES search instance requiring access to the Search Framework service operations.</td>
<td>PTPT3300</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> This is the call back ID configured in the search instance page.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This user ID needs to have access to all the queries (records) on all search definitions in order for SES to download data.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The Search Server role is required to be able to download attachments.</td>
<td></td>
</tr>
<tr>
<td>End User</td>
<td>Runs search queries while using PeopleSoft applications, using Global Search or Search Pages.</td>
<td>None specific to Search Framework. Restrictions to search results can be implemented by user profile or role.</td>
</tr>
</tbody>
</table>

**Note:** Search Administrator, Search Developer, and Search Server are roles delivered by PeopleTools.

---

**Working with Authentication and Authorization**

Search Framework handles various security related tasks, including:

- Authenticating users (development, administration, and end users).
- Authenticating systems requesting access to service operations.
- Authorizing end user search requests.

When managing search requests with Search Framework, it is important to distinguish between *authentication* and *authorization*.

*Authentication* determines if a user is a legitimate user, who can access the system. Authentication is configured using PeopleSoft user profiles, roles, and permission lists.

*Authorization* determines the access level for an authenticated user. Once a user is authenticated, the system invokes the authorization rules. You define authorization (access controls) per search definition on the Security tab. For some instances, applying No Security is a valid option. However, for other situations, you need to apply stricter control over what users can and cannot see. You can restrict access by the source (search definition) or by the document (search result).
Source-level security applies to all the documents in the data source. Setting source-level security is useful when you want to prevent global visibility of data source content. When defining a source-level security you specify the users and roles that can view the search results for that search definition. When a user searches the associated index, the system verifies the user’s access level prior to displaying any search results.

Document-level security restricts access to specific search results. The document-level authorization using SES uses security attributes. The attributes are defined using PeopleSoft Query or Connected Query during design time and are used to evaluate access during runtime. While defining a search definition, some of the fields chosen for the query may not be used necessarily for searching, but mainly as security attributes. For example, Department ID or Business Unit are examples of attributes that users may not necessarily search on, but their values can be used in the authorization process to evaluate if a user can view search results for a specific Department ID or Business Unit.

If applying any level of security, you should define an application class for every search definition. The application class is responsible for fetching a list of runtime values based on the security attributes. You associate the application class with a search definition on the Security tab of the search definition.

The following diagram illustrates the elements involved with authorization and authentication and the interaction between them.

**Image: PeopleTools and SES interacting to authenticate users and authorize user access to search results**

This example illustrates the fields and controls on the PeopleTools and SES interacting to authenticate users and authorize user access to search results. You can find definitions for the fields and controls later on this page.
### Configuring SSL between PeopleSoft and SES

You can configure SSL connections between your PeopleSoft system and SES. When you have SSL configured, you then need to set the SSL Option field on the Search Instance Properties page to ENABLE.

To set up SSL, use the instructions provided with PeopleTools PeopleBooks for setting up SSL on PeopleSoft Internet Architecture. Also, refer to the instructions for setting up SSL on SES provided with your Oracle SES documentation.

### Setting Up Role-Based Search Group Access

Global Search displays search groups in the Global Search Bar based on the user's role. If a search group assigned to a context belongs to the permissions for a role to which that user belongs, then the search
group will appear in the search group drop-down list for that user. You configure search group access by selecting PeopleTools, Security, Permissions & Roles, Permission Lists, Search Groups.

**Image: PeopleTools Permission Lists: Search Groups page**

This example illustrates the fields and controls on the PeopleTools Permission Lists: Search Groups page. You can find definitions for the fields and controls later on this page.

<table>
<thead>
<tr>
<th>Query</th>
<th>Mass Change</th>
<th>Links</th>
<th>Audit</th>
<th>ADS</th>
<th>Search Groups</th>
<th>Permission List Queries</th>
</tr>
</thead>
</table>

**Permission List:** PTPT1000  
**Description:** PeopleSoft User

<table>
<thead>
<tr>
<th>Search Groups</th>
<th>Personalize</th>
<th>Find</th>
<th>Fnt</th>
<th>First</th>
<th>Last</th>
<th>1 of 2</th>
</tr>
</thead>
<tbody>
<tr>
<td>*Search Group Name</td>
<td></td>
<td></td>
<td></td>
<td>1</td>
<td>2</td>
<td></td>
</tr>
<tr>
<td>EMPLOYEE2_GSAWYER_852803</td>
<td></td>
<td></td>
<td>+</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>PTFORTALREGISTRY</td>
<td></td>
<td></td>
<td>+</td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Use the Search Groups grid to add search groups to which you want to add access. Search groups are those search categories that have the Search Group check box selected on the General tab of the search category definition.

**Note:** This does not define the security, this only gives a mechanism to control what is displayed in the Global Search Bar for a given user.

Working with Global Search
Working with PeopleSoft Search

This section contains an overview and discusses:

- Working with search pages.
- Working with Global Search.
- Working with search results.

Understanding PeopleSoft Search

PeopleSoft Search refers to the set of features that PeopleSoft application end users access to submit search requests against the SES search server. The PeopleSoft Search interfaces depend on:

- the Search Framework being completely configured.
- the PeopleSoft search definitions and categories deployed to the SES instance.
- the search indexes are populated.

Important! The PeopleSoft Search features discussed in this document do not support the use of the Verity search engine. These features work only with the Search Framework and the SES search engine.

These are the PeopleSoft Search features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Global Search</td>
<td>Provides users a search edit box, called Global Search Bar, appearing in the PeopleSoft browser session. From the Global Search Bar, users can select relevant search categories against which to run searches.</td>
</tr>
</tbody>
</table>
PeopleSoft Search Framework features that are key to enhancing user experience are:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Facets</td>
<td>Facets filter and narrow search results by ordering search results by categories, which are the fields you have selected to be facets in the search definition. These are similar to Google’s left-hand, navigational search facets, for example.</td>
</tr>
<tr>
<td>Search Groups</td>
<td>Search groups enable you to specify search categories to become available for display in the Global Search Bar, depending on the defined search contexts. (Applies only to Global Search).</td>
</tr>
<tr>
<td>Search Contexts</td>
<td>Search contexts enable you to configure when a search group is available in the Global Search Bar. That is, depending the context (where the user is in the system) only selected context (where the user is in the system) only selected search groups are available. For example, you may only want search groups relevant to a particular portal node to appear when that node is being accessed, or only those search groups applicable to a specific WorkCenter to appear when that WorkCenter is being accessed. (Applies only to Global Search).</td>
</tr>
</tbody>
</table>

**Working with Search Pages**

This section provides an overview and discusses:

- Understanding Search Pages.
- Enabling Keyword search.
Understanding Search Pages

The traditional search pages for PeopleSoft application components provided these options:

- Find an Existing Value.
- Add a New Value.

**Image: Classic PeopleSoft Application Component Search**

This example illustrates the fields and controls on the Classic PeopleSoft Application Component Search. You can find definitions for the fields and controls later on this page.

While the Find an Existing Value tab enables end users to find the rows of data they need to view or modify, it is limited to running searches only across level 0 fields. The Find an Existing Value search runs against the live data tables, the component search record, not an SES index. The Find an Existing Value tab works in conjunction with the Keyword search, and it can be effective to provide both options to end users.

Using the Keyword search page, which you enable through the Search Framework, end users can perform a deeper, more free-form search against the data. The Keyword search runs across the indexed values stored on the SES server, which contains fields across all scroll levels.
Note: The Keyword Search tab only appears if a search index has been associated with the component in a search definition. Because the keyword search runs against the indexed data, depending on the frequency of index builds, the indexed data may not entirely match the Find an Existing Value search results.

Image: Find an Existing Value and Keyword Search pages

This example illustrates the fields and controls on the Find an Existing Value and Keyword Search pages. You can find definitions for the fields and controls later on this page.

The search pages that display after you’ve enabled Keyword search for a component are:

- **Find an Existing Value Search**: This is the same interface as the Find an Existing Value page, that you see for previous PeopleSoft releases.

- **Keyword Search**: This page enables the user to run free-text searches using the Keywords edit box. Implementation teams can index any attributes that they would like the end user to be able to search.

- **Add a New Value**: This is the same interface as the Add a New Value page used in previous PeopleSoft releases, which enables you to add new rows to PeopleSoft tables.

### Enabling Keyword Search

To enable Keyword Search display when users access a component, you use the Component Mapping page in the Search Definition component for the Search Framework Designer. The Component Mapping page enables you to map a component to a specific search definition to enable SES integration with Search Pages.

Note: Search definitions mapped to a component use document level security. This is enforced by the Search Designer interface.

For components that have been added to the grid on the Component Mapping page for a search definition, the search page for that component displays both the classic search options and the Search Framework search options. That is, users can initiate a Find an Existing Value search against level 0 values, using the default PeopleTools search capabilities run directly against the database, and, they can also take advantage of the Keyword search page.
The keyword Search Framework feature enables the user to search deeper (level 0-3) by running a free-formed search against crawled and indexed values in the search engine. The keyword search is powerful because it allows you to search across all fields in an index rather than just inside a specific set of fields defined in the search record.

When the search definition is deployed, the system updates the component meta data to indicate the search category to which the component is mapped. When the system renders the page, it displays the keyword search tab for that component.

**Note:** Multiple components can be mapped to the same search definition.

To enable search pages for a component:

1. Select PeopleTools, Search Framework, Designer, Search Definition, and open the desired search definition.
2. Select the Component Mapping tab.
3. Add the desired component to the grid.
4. Update the security restrictions and access appropriately.
5. Save the search definition.
6. Deploy or update the search definition to SES.
7. Navigate to the component and verify that you see the Keyword search page.

- Setting Document Level Security

**Developing for Search Pages**

This section describes these items to consider while implementing Search Pages.

- Setting component properties for search pages.
- Working with Find and Existing Value and Keyword Search behavior differences.
- Working with Keyword Search data currency.
- Maintaining a consistent user experience.

**Setting Component Properties for Search Pages**

You configure properties for your search pages in the Component Properties dialog box in PeopleSoft Application Designer. On the Internet tab, in the Search Page group box there are numerous settings related to your application search pages. These settings apply specifically to the Keyword search page:

**Primary Action (Keyword Search)** Enables you to set the primary action of the component to display the Keyword Search page.
Default Search/Lookup Type
(Keyword Only) Enables you to set the default look up type to be the Keyword Search page.

Link to Realtime Search Page Specifies the message set and number that stores the text displayed for the Find an Existing Value link in the Add a New Value tab and Keyword Search tab if Keyword Search is enabled.

Link to Keyword Search Page Specifies the message set and number that stores the text displayed on the Add a New Value tab and Find an Existing Value tab if Keyword Search is enabled.

Note: The Link to Keyword Search Page value only applies if Keyword Search is enabled for that component.
The Link to Realtime Search Page value applies to all components that use the PeopleTools search page, even if Keyword Search is not enabled.

Note: The term, Realtime, is used to differentiate between the currency of the data between the Find and Existing Value search and the Keyword search. While the Find an Existing Value search displays search results that are always a current reflection of the data in the database, the Keyword Search is only as current as the last index build or incremental index update.

When implementing the Keyword search feature, make sure to adjust these settings accordingly. The general concepts surrounding these settings, along with other component properties, are discussed in the PeopleSoft Application Designer documentation.

See "Setting Internet Properties (PeopleTools 8.53: PeopleSoft Application Designer Developer's Guide)".

Working with Find an Existing Value and Keyword Search Behavior

For a component that has a search index associated with it, the user can perform these types of searches, Find and Existing Value and Keyword. Both search types will have the same, general look and feel, however, these differences and features should be noted:

• With the Find an Existing Value search, the end user selects values based on the underlying record search keys and clicks Search. Results are rendered in a standard grid format, as seen in all previous PeopleSoft versions.
• With the Keyword search, the end user enters values into the Keywords edit box and clicks Search. The end user can also enter a combination of keywords in addition to using the provided search keys. The system runs this search against the SES index. Results can be displayed in either a grid or a list format.
• The Keyword search will show facets, where the Find an Existing Value search cannot.
• When switching between Find an Existing Value and Keyword search, the system replicates any text you've entered in one tab to the other.
• Search operators are different between the Find and Existing Value search and Keyword search. For example, the typical Keyword search operators include contains, =, not =, where as the Find an Existing Value search operators include more, such as begins with, contains, =, not =, greater than, less than, between, in, and so on.
Keyword search fields do not contain prompts or drop-down lists. Search text needs to be added in a free-form manner, using wild cards as needed.

**Note:** In the Find an Existing Value tab you specify a wild card using "\%", while in Keyword search you specify a "\*".

### Working with Keyword Search Data Currency

The Keyword search can display only search results that are included in the index. The index is only as current as the last incremental index update or the last full build date and time. As such, the Keyword search results will not always contain the most current reflection of the transactional data.

For example, assume that an organization has the incremental index update process schedule to run once every 3 days. If a salesperson adds a new customer to the system just after the incremental update occurred, that customer information will not appear in the Keyword Search results until the next incremental index update process has completed. Likewise, if a customer has been deleted from the system just after an incremental index update, the search results for the Keyword Search will continue to include that customer information until the next incremental index update process has completed.

The Keyword Search page displays a message indicating how fresh the search results are. For example:

*Note:* Keyword Search will return data updated over 18 hours ago (2011-06-22-16.25.48.000000)

*Note:* The date format will appear according to the user's personalization setting for date display.

### Maintaining a Consistent User Experience

Since both types of searches, Find an Existing Value and Keyword, form the same component search interface, these requirements ensure a consistent user experience:

- All the search keys shown on the search page must be indexed attributes.
- Only the fields marked as List Box items on the component search record will be shown in both cases.

*Note:* This is true when showing the results in the grid format for the keyword search. If you switch to list format, you can display additional fields that are indexed but not marked as List Box or search keys.

- All List Box item fields must be indexed attributes.

*Note:* Grid-based view of the keyword search results is based on the List Box item configuration on the associated search record.

### Working with Keyword Search Modes

The Keyword search page has these modes:

- Keyword-only
- Basic
- Advanced
Working with Keyword-Only Mode

The keyword-only mode can be selected in the Component Properties dialog box, and if selected only the Keywords edit box will appear as the default search mode when an end user accesses the component.

Working with Basic Mode

In basic mode, the Keywords edit box displays with an additional 'Search by' option with a drop-down list box to select a search record field to use for as search criteria.

Working with Advanced Mode

The advanced mode displays all search criteria:

- Keywords.
- Search record fields.
- Search fields defined for the Search Framework search category on the Advanced Search Fields tab.

Image: Advanced mode search options

The following illustration depicts the controls on the advanced search page and their association.
Note: The system does not display in the Advanced Search Fields list any search fields that are also displayed in the search record search field list.

Note: All search record fields (Key, Alt Key, and List box fields) must be part of the index. If any of the fields have translate values, those translate fields must also be part of the SES index.

Note: The search criteria that appears depends on the application’s usage of the search filter PeopleCode and the type of data. For example, contains phrase is applicable to a character field, but not to a number field.

Working with Global Search

This section discusses:

- Enabling Global Search.
- Working with Search Groups and Search Contexts.
- Working with Portal Menu search.

Understanding Global Search

Global Search provides a way for a user to search across all search indexes or a specific group of search indexes. End users submit a Global Search using the Global Search Bar, which is available in the Portal header throughout the user's session irrespective of the content the user is accessing in the target frame. The Global Search feature allows the user to search and drill down to a specific row of data or transaction from the search results, all without navigating through a menu structure to the classic component search page and entering search criteria there. In a Portal environment, Global Search can search across indexes from multiple content systems.

Image: Global Search Bar

This example illustrates the fields and controls on the Global Search Bar. You can find definitions for the fields and controls later on this page.

The Global Search Bar in the Portal header consists of:

- drop-down list for selecting a specific search group, containing the desired indexes.
- free text search edit box.
- Advanced Search link.
- Last Search Results link (which displays persistent search results).

Related Links

Working with Persistent Search Controls
Working with Search Pages
Enabling Global Search

When Global Search is enabled, the Global Search Bar appears in the portal header. You enable Global Search on the Portal, General Settings page.

To enable Global Search:

2. In the Portal Search Options group box, select Display global search in header.
3. Click Save.

Note: If a user does not have access to any search groups by way of their permissions lists, they will not see the Global Search Bar.

Working with Search Groups and Search Contexts

When implementing Global Search, it is highly recommended to employ search contexts and search groups. These constructs work together to refine the user interaction with the Global Search Bar drop-down list.

A search group is a type of search category that is exposed to Global Search to help manage search definitions deployed to the search engine. Search groups provide a way to show relevant categories based on the context the user is in on the target frame. A search definition can belong to multiple search groups. You manage search groups in the Search Framework Administration interface. In a Portal installation, for example, search groups can be formed to include search definitions deployed across content systems.

Using search contexts, you can configure search groups such that based on the context in the target frame, only a subset of all possible search groups are available to the user in the Global Search Bar. For example, if the end user is accessing content from a PeopleSoft Financial application, then only search groups relevant to that application will be available. Likewise if a user is accessing content from a PeopleSoft Human Capital Management application, then only search groups related to that application will be available.

At any given time, end users have these types of search groups available:

- All: This search group will always be available and is a group of search categories that span across all the indexes that have been deployed and made searchable for a PeopleSoft application.

- Component Specific: This type of search group will match the component the user is currently viewing in the target frame. For example, if a user is viewing an expense report, then the Expense Report component would be the search group that is available, if the component is indexed, and it does not apply already to the Home Page context.

- Context Specific Set: These are a set of search groups configured to be shown based on specific content in the target frame.

The system follows the end users through the system, recording context as they navigate through the interface to show only relevant search groups. While a particular search group can be defined as the default, for search groups defined at the WorkCenter template or node level, the system follows these rules to determine the search groups to display:
Template level: If the current transaction is in a WorkCenter or Home Page template all search groups associated to that template will show. Also, if a default search group is defined for that template it will display.

Node level: If the current transaction is not on a WorkCenter or Home Page all search groups relevant to the node associated with that transaction will show. If a default search group is defined for that node it will display.

**Note:** Each of these levels can have multiple search groups. For improved user experience, the number of search groups at each level should be limited to a reasonable number, such as five.

**Note:** If a search context is only defined for the Home Page, then the Global Search Bar drop-down list defaults to displaying search groups associated with the Home Page for WorkCenter page or node-level transaction.

Global Search shows search groups in the Global Search Bar based on a user's role. To set up permissions to search groups, you use PeopleTools Security permission lists. Setting up role-based search group access is discussed in the Security topics in this document.

**Related Links**
- Setting Up Role-Based Search Group Access
- Managing Search Context
- Specifying General Search Category Settings

### Working With the Portal Registry Search

This section contains an overview and describes how to set up the portal registry search.

**Understanding the Portal Registry Search**

PeopleTools provides the search definition, PTPORTALREGISTRY, which enables you to index the content references registered in the portal menu registry. If you deploy this search definition and build the index (just as you would any search definition), end users can search for content references and menu items using the free-text edit boxes and navigate to the underlying pages using the search results, rather than navigating the menu structure manually. This can provide an extremely efficient means of accessing application content.

**Note:** The PTPORTALREGISTRY search definition provides a similar option as the portal registry search that has been available with the Verity search engine for previous application releases.

If you run the search from the menu pagelet or drop-down navigation Search Menu edit box, the search request only goes against the current portal. For example, if the user is currently logged into the EMPLOYEE portal, the search will be specific to content references defined within the EMPLOYEE portal only.

If you run the search from the Global Search Bar, the search request goes against *all* the portals defined in the local portal registry.

The PTPORTALREGISTRY search definition is based on the delivered PTPORTALREGISTRY query, which verifies the "Valid From" and "Valid To" dates for content references.
Note: For more accurate search results, it is recommended that you schedule running your index updates based on how often the content references in your system change effective dates and expire dates.

Setting Up the Portal Registry Search

Enabling Portal Menu Search is similar to enabling Global Search in that both are triggered by the Display global search in header option, which is set in the Portal, General Settings page. That setting indicates to the system that Oracle SES is being used.

To enable Portal Menu Search:

1. Deploy the PTPORTALREGISTRY search definition and category.
2. Build the index.
4. In the Portal Search Options group box, select Display global search in header.

There are some additional options that can be added as well:

- To add "Auto suggest," add permission using PeopleTools, Security to this web library: WEBLIB_PORTAL.PORTAL_SEARCH_PB.FieldFormula.IScript_SESPortalQry. This enables the system for anticipating the uses desired search based on the partial input.

- To add the Portal Menu index to Global Search, use PeopleTools, Security, Permissions & Roles, Permission Lists, Search Groups, and add the search category, PTPORTALREGISTRY, to the Search Groups grid.

- To enable the Menu category to display in the Global Search drop-down list, select PeopleTools, Search Framework, Administration, View Search Contexts. Click on the Edit Context link and add PTPORTALREGISTRY to the context type Homepage.
Working with the Search Results

After running a search using the Keyword Search or from the Global Search Bar, the system presents the search results in an intuitive display, enabling interactive filtering and further navigation.

Image: Search Results

This example illustrates the fields and controls on the Search Results. You can find definitions for the fields and controls later on this page.

Filter by

This is the facet pane, which is the area to the left of the search results. Using the facets defined for the current search definition, the end user can filter the search results and drill down closer to the desired information.

If searching the All category, you initially see the various search categories represented in the search results.

By drilling into the category, you view the facets associated with attributes in the search index.

Title

The title, which is the clickable link, enables the user to identify the search result and navigate to the associated component. The title is defined using the Title edit box on the General tab of the Search Framework, Designer, Search Definition component.

Summary

Displays a general overview of the target data.
The summary is defined using the Summary edit box on the General tab of the Search Framework, Designer, Search Definition component.

**Related Actions Indicator**

If the search definition is mapped to a component, and if there are any defined related actions associated with that component, the related actions indicator appears to the right of the search result. Clicking the related actions indicator displays a popup containing the defined related actions.

### Working With Facets

A facet is an attribute that may be part of one or more search definitions. It provides an alternate representation of the list of values for a given attribute. Facets are attributes used to filter and narrow down a set of search results.

**Image: Filter by: Facets**

This example illustrates the fields and controls on the Filter by: Facets. You can find definitions for the fields and controls later on this page.

**Filter by**

**Location**

- NY (59)
- CA (53)
- OR (7)
- TX (6)
- AZ (5)
- More...

Facets:

- Show search results across each index.
- When clicked show only results in that index related to that facet value.
- Can further narrow results using sub-facets in that index.

For example, assume the Customer component has a faceted attribute of Customer Level with values of L1, L2, and L3. By selecting the L1 facet link, L2 and L3 values will be removed from the search results list, leaving only the L1 for viewing.

For component Keyword search, the system determines facets associated with the search category to which the component is associated and renders them accordingly.

For Global Search, because the search results might span across multiple indexes that are not related to each other, each search definition within a specific search category should have common attributes marked as facets. These attributes should be generic so search results can be classified under one of these
attributes. If non-common attributes are marked as facets in the search category, results not having that attribute will not be displayed.

When working with facets, keep these items in mind:

• Facets on date and number are not supported. Only strings can be facets.

• If an attribute is marked as a facet, and if for a given search document that facet attribute does not have a value, then that document gets dropped from the result set.

Facets display five values, by default. If a particular facet has results for more than five facets, More.... appears at the bottom of the list.

**Image: Facet displaying More... control**

This example illustrates the More... control used to reveal more facet values.

<table>
<thead>
<tr>
<th>City</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alamo (1)</td>
</tr>
<tr>
<td>Antioch (1)</td>
</tr>
<tr>
<td>Buttonville (1)</td>
</tr>
<tr>
<td>Canora (1)</td>
</tr>
<tr>
<td>Concord (3)</td>
</tr>
<tr>
<td>More...</td>
</tr>
</tbody>
</table>

Click More... to expand the list.

**Image: Facet displaying Less... control**

This example illustrates the Less... control used to reduce the facet values displayed.

Once the entire list of facet values is expanded, click Less... to collapse the list, showing only five again.

<table>
<thead>
<tr>
<th>City</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alamo (1)</td>
</tr>
<tr>
<td>Antioch (1)</td>
</tr>
<tr>
<td>Buttonville (1)</td>
</tr>
<tr>
<td>Canora (1)</td>
</tr>
<tr>
<td>Concord (3)</td>
</tr>
<tr>
<td>Danville (4)</td>
</tr>
<tr>
<td>Lafayette (1)</td>
</tr>
<tr>
<td>Martinez (2)</td>
</tr>
<tr>
<td>Moraga (1)</td>
</tr>
<tr>
<td>Palm Springs (5)</td>
</tr>
<tr>
<td>Pleasanton (2)</td>
</tr>
<tr>
<td>Sacramento (1)</td>
</tr>
<tr>
<td>San Francisco (2)</td>
</tr>
<tr>
<td>San Ramon (1)</td>
</tr>
<tr>
<td>Santa Monica (1)</td>
</tr>
<tr>
<td>Walnut Creek (62)</td>
</tr>
<tr>
<td>Less...</td>
</tr>
</tbody>
</table>
As you drill into a set of facets, your path is expressed in the form of facet breadcrumbs.

**Image: Facet filter breadcrumbs**

This example illustrates the fields and controls on the Facet filter breadcrumbs. You can find definitions for the fields and controls later on this page.

![Search Results](image)

You can deselect the check box for a filter to remove its effect on the search results, or to reverse the direction of your filtering and expand the results.

Click Clear all filters to remove all applied filters, returning the search results to the state prior to faceted filtering.

**Viewing Search Results With Grid Format and List Format**

Use the View As control to toggle between the grid format and the list format for viewing search results.

![View as:](image)

Enables you to switch the view of the search results between list format and grid format. The icon representing the current view is greyed out.

**Working with the Grid Format**

The following example displays the grid format:

**Image: Search Results in grid format**

This example illustrates the fields and controls on the Search Results in grid format. You can find definitions for the fields and controls later on this page.

This student is a DEV from Palm Springs, CA.

To navigate to the PIA page loading the desired data, click the Title line of the search result.

The Related Actions link appears only for search results in the list format.

Note: The default search result display format for Global Search is the list format.

Working with Related Actions

For components mapped to search definitions, end users can navigate to related actions defined for that component from search results without accessing the main result document. For every search result that has related actions defined for it, you see a related actions indicator to the right of the search result. The related actions indicator is a grey bar with a white triangle within it pointing to the search result.
Note: The related actions indicator appears only for component-level related actions. It does not appear for page-level related actions or for related content. Also, end users will only view related actions to which they have access. If there are none for that search result, the related actions indicator does not display.

Image: Related actions indicator

This example illustrates the fields and controls on the Related actions indicator. You can find definitions for the fields and controls later on this page.

Note: The related action indicator appears only in Global Search results and in Keyword Search results when viewing the list format.

By clicking on the related actions indicator, a related actions popup appears, showing the possible related actions for that user, according to security access.

Image: Related action indicator popup

This example illustrates the fields and controls on the Related action indicator popup. You can find definitions for the fields and controls later on this page.
After clicking a related action, the system displays the target related action as configured by the application (as in, in a modal window, a new browser window, and so on). The system displays the related action interface with the information associated with the search result displayed.

**Image: Related action from a search result**

This example illustrates the user accessing the related action from the search result, with no navigation.

---

**Working with Persistent Search Controls**

The term persistent search refers to the system saving the most recent set of search results so that you can return to them, as needed, while completing a transaction, rather than having to redo your search criteria to access each row of similar data. The persistent search result set can be accessed until the end user runs the next keyword or global search request.

If you need to return to your most recent search results, you can use these persistent search controls:

- **Last Search Results icon**: Appears next to the Global Search Bar to the right of the Advanced Search control.
- **Recent Search Results icon**: Appears at the end of the breadcrumb navigation.
• Keyword breadcrumb: Appears as a breadcrumb within the breadcrumb navigation in the form of the current keyword search text.

**Image: Persistent Search links**

This example illustrates the persistent search controls mentioned in the previous list.

**Using the Last Search Results Icon**

When you click the Last Search Results icon next to the Global Search Bar, it displays your last set of search results within the Last Search Results dialog.

**Image: Last Search Results page**

This example illustrates the fields and controls on the Last Search Results page.

When using the Last Search Results icon, keep these items in mind:

• Click Refine Search to return to the search interface to reapply criteria or filtering.

• The results displayed in the popup page use the same view format as the previous search result. That is, if the user views the search results in list format, the popup page displays the list format.

• When you click the icon control, the system displays your most recent set of search results, retaining any filtering you had previously applied.

• The popup page can be dragged to a more convenient location if needed.
• The Return to Search button on a page behaves differently, depending on how you access a row of data. When using the persistent search controls, and you click on a row in the Recent Search Results or Last Search Results popup and then click Return to Search, the Search Results list shows only that one row with the search criteria reflecting that row. However, when you select a row from the Search Result list and then press Return to Search, the Search Result list shows all the rows from the greater search result set.

Note: The Last Search Results icon in the Global Search Bar is available for both Global Search and Keyword Search on the component.

Using the Recent Search Results Icon

The Recent Search Results icon that appears after the breadcrumb navigation is not exclusive to the Search Framework search results. It also appears if persistent search is configured in general for a PeopleSoft system. Similar to the Last Search Results icon the Recent Search Results icon displays the most recent set of search results. However, the Recent Search Results icon only appears if:

• Keyword Search is setup for the component when using drop-down navigation.

• you have enabled persistent search by setting the Recent Search Results options on the Caching tab for the web profile.

See "Configuring Caching (PeopleTools 8.53: Portal Technology)."

When you click the Recent Search Results icon, it displays your last set of search results within the Recent Search Results dialog.

Image: Recent Search Results

This example illustrates the fields and controls on the Recent Search Results page.
The usage of the Recent Search Results page is identical to the Last Search Results page.

**Using the Keyword Breadcrumb**

If you navigate away from search results, you can click the keyword search text breadcrumb, and the system re-displays the initial search results based on that keyword.
