Where Do I Look?

Important Note for Students in Training Classes

This guide is a source book for online helps, training classes, and user reference. Training classes may not cover all the topics contained here.

About this Guide

This guide provides overviews, illustrations, procedures, and examples for release A7.3 of J.D. Edwards software. Forms (screens and windows) shown are only examples. If your company operates at a different software level, you might find discrepancies between what is shown in this guide and what you see on your screen.

This guide includes examples to help you understand how to use the system. You can access all of the information about a task using either the guide or the online help.

Before using this guide, you should have a fundamental understanding of the system, user defined codes, and category codes. You should also know how to:

Use the menus

Enter information in fields

Add, change, and delete information

Create and run report versions

Access online documentation

Audience

This guide is intended primarily for the following audiences:

Users

Classroom instructors

Client Services personnel

Consultants and implementation team members

Organization

This guide is divided into sections for each major function. Sections contain chapters for each task or group of related tasks. Each chapter contains the information you need to accomplish the task, run the program, or print the report. Chapters normally include an overview, form or report samples, and procedures.

When it is appropriate, chapters also might explain automatic accounting instructions, processing options, and warnings or error situations. Some chapters include self-tests for your use outside the classroom.

This guide has a detailed table of contents and an index to help you locate information quickly.

Conventions Used in this Guide

The following terms have specific meanings when used in this guide:

Form refers to a screen or a window.

Table generally means "file."

We assume an "implied completion" at the end of a series of steps. That is, to complete the procedure described in the series of steps, either press Enter or click OK, except where noted.

Application Development Cycle

World CASE covers the entire spectrum of the application development life cycle, including design tools, code generation, automatic documentation generation, prototyping, repositories and other productivity improvement tools for the development, operation and maintenance of flexible, business application software.

The Application Development Cycle (A/D Cycle) can be discussed in three levels as follows:

Level 1

The Application Platform which represents the *Technical Foundation* class.

Level 2

The Design Platform which represents the *Advanced Programming Concepts and Skills* class.

Level 3

The Development Platform which represents the CASE class.

Universal Building Blocks of J.D. Edwards Software

World CASE covers the entire spectrum of the application development life cycle, including:

Design tools Code generation Automatic documentation generation Prototyping Repositories Other productivity improvement tools

Separate Modules that Contribute to the Functioning of a J.D. Edwards Program

J.D. Edwards Training Environment

The Student Library Setup

To help you to understand the Training Environment that has been setup for your learning experience. The following is a list of signon naming conventions, library naming conventions, what that library contains and what files are shared among you and your classmates.

Signon Naming Conventions

Your signon depends upon where you are located.

For example: In the Denver Headquarters Office, we have several classroom numbers, so the structure of signons are as follows:

Library Naming Conventions

Your library names depends upon where you are located.

For example: In the Denver Headquarters Office, we have several classroom numbers and those libraries are structured for that classroom. You will also have your own student library, that library will take on the naming conventions of your student number. Other libraries that are contained in your library list are libraries which are standard to all J.D. Edwards class environments.

Name	Contents
QTEMP	IBM temporary library
COMMON	Common library for training. Used for all J.D. Edwards Training Environments. It contains files that all training classes can share.
	For example: Help Files, Message Files, Field Reference Files
STxxyyOBJ (xx=classrm #) (yy=student #)	Students object library. Used for the student to compile custom objects into. It will only contain programs that a student may have had to modify in a class exercise.
JDFOBJ	Common object library for training. Contains all of J.D. Edwards execution programs. All J.D. Edwards training environments use this library.
STxxyyDTA (xx=classrm #) (yy=student #)	Students data library. Used for the students custom data files. It will only contain files that a student may have had to modify in a class exercise.
xxSHARE (xx=classrm #)	Classroom shared library. Is shared for that particular classroom environment. It contains files that the students will all share. For example: Data Dictionary File
TRNSHARE	Shared library for all training. Used for all J.D. Edwards Training Environments. It contains files that all training classes can share. For example: Word Search Files
STxxyySRC (xx=classrm #) (yy=student #)	Students Source Library. Used for the student to write custom source programs into. It will only contain programs that a student may have had to modify in a class exercise.
JDFSRC	Common Source Library for Training. Contains all of J.D. Edwards source code programs. All J.D. Edwards training environments use this library.
QGPL	IBM general purpose library

The library list at a J.D. Edwards facility will appear as follows:

Name	Contents
QTEMP	IBM temporary library
STUDSHARE	Contains files that will be shared for all students in class
STUDENT <i>x</i> D (<i>x</i> =student 1–6)	Contains files that will not be shared. Files are unique for each student.
STUDENTxO (x=student 1–6)	Contains any programs or objects that the student modifies in class (custom objects)
STUDENT <i>x</i> S (<i>x</i> =student 1–6)	Contains any source code that the student modifies in class (custom source)
JDETRAIN	Contains all J.D. Edwards execution programs
QGPL	IBM general purpose library

The library list at an on-site location will appear as follows:

Classes

Classes consist of lecture and hands—on experiences. The hands-on experiences are in the form of exercises. While each exercise is a separate task, they ultimately build upon each other to create a new program. It is imperative, therefore, that each student fully understand each exercise before continuing. At the end of the class, there will be Case Studies which will further enforce what you have learned by having you, the student, apply the information from this class to specific programming situations.

Features

Advanced Programming Concepts & Skills (APCS) focuses on the following *World CASE* features:

Data Dictionary Repository Project Management (Software Action Request System) **CASE** Profiles SAR Log Inquiry Creating a Development Environment Software Versions Repository Data Modeling File Design Aid Screen Design Aid Report Design Aid J.D. Edwards Programming Standards File Servers and Functional Servers User Spaces and User Indexes Group Jobs **Programming Modifications** Source Debugger Programming Impacts from Software Upgrades

Version Control

Objectives

- To create a development environment
- To work with program management
- To create libraries
- To copy data files to the development environment

About Version Control

Use the J.D. Edwards Version Control system to manage the movement of software between various environments, such as ones you have set up for software development, testing, and production.

The Version Control system works with the Software Action Request (SAR) system and the SAR logging system. It performs three general functions:

Groups source code members (such as RPG and CL programs, and physical and logical tables) and control file data (such as data dictionary and menus) together as a project

Defines a promotion path, which specifies library information about the project's current environment and the environment to which it will be moved

Promotes the project from the current environment to the target environment as defined by the promotion path

The following diagram shows how the version control process divides the tasks.

To set up a software development project for development and promotion, you must:

Create the SARs that you want to promote, and define promotion paths

Link the project to the SARs that are associated with it, and assign a promotion path to it
All additions or changes you make to programs and control file data are logged in the SAR Log (F9810). Use this log to update the SARs, which are in the Work Order Detail table (F4802).

After you finish developing the software, you promote the software from the Project Elements form to the next environment.

Work with the following areas:

- Ursion Control
- Programming Tools
- Programming Standards
- Group Jobs
- Universal File Converter

About Development Environments

A development environment contains objects and data being tested and edited. It is different from your production environment because it should not contain any of your live data files.

Rules for Creating Development Environments

When creating development libraries, J.D. Edwards has some rules to follow.

Do not begin library names with Q, JDF, or JDE because of the upgrade process.

Create custom libraries for custom modifications.

Library names should be a maximum of 9 characters in length because of the upgrade process.

Do not use JDFDATA for your own test data or for your live data because of the upgrade process.

Do not include JDFDATA in a live user's library list.

To create a Development Environment complete the following tasks:

Create Libraries

Define Access for User Profiles

Copy Data to Your Development Environment

About Creating Libraries

J.D. Edwards Libraries

Five libraries are delivered with J.D. Edwards software. They are:

Source Library (JDFSRC)

The source library that contains source code. Within the JDFSRC library, J.D. Edwards has three multi-member source files.

Source code for:

- RPG Programs
- Printer files
- Display files
- CL Programs
- DDS for logical files
- DS for physical files

Source code for common subroutines

Pre-compiler commands

Used to compile J.D. Edwards programs

Object Library (JDFOBJ)

The object library that contains executable objects for your J.D. Edwards software

- RPG programs
- CL programs
- Display files
- Report files

Data Library (JDFDATA)

The data library that contains data files for your J.D. Edwards software (files in this library contain test data provided by J.D. Edwards).

Install Library (JDEINSTAL)

The install library used to install programs and software to upgrade J.D. Edwards software

Plans Library (JDFINS)

The library used to plan upgrading J.D. Edwards software

Security Library (CLTSEC)

You may create a Security library that will be shared across all environments. The benefit of having a security library is that a user profile will only have to be entered once to have access to any environment. The following files must exist in the security library:

User library list (F0092) Library list control (F0093) Library list master (F0094) User Preference (F00921)

In addition, all logical files associated with the above files must also exist in the security library.

Production and Development Examples

There are many ways to set up a production and development environment. The following are some examples.

Basic Production Environment

Library	Description	
QTEMP	IBM Temporary data files	
CLTOBJ	Client's objects	
JDFOBJ	J.D. Edwards objects	
CLTCOM	Client's common files	
CLTDTA	Client's data files	
CLTSEC	Client's security files	
QGPL	IBM general public library	

Basic Development Environment

Library	Explanation	
QTEMP	IBM Temporary data files	
DEVOBJ	Development objects	
CLTOBJ	Client's objects	
JDFOBJ	J.D. Edwards objects	
DEVCOM	Development common files	
DEVDTA	Development data files	
CLTSEC	Client's security files	
DEVSRC	Development source files	
CLTSRC	Client's source files	
JDFSRC	J.D. Edwards source files	
QGPL	IBM general public library	

All modifications and tests are performed in the Development Environment with the program's object and source residing in DEVOBJ and DEVSRC. After the testing is completed the program's object is moved from DEVOBJ to CLTOBJ and source is moved from DEVSRC to CLTSRC. It is necessary to create a separate data and common library (DEVDTA & DEVCOM) in order to assure that any data changes during testing in the Development Environment does not affect live data in the Production Environment.

Library	brary Explanation	
QTEMP	IBM Temporary data files	
CLTOBJ	Client's objects	
JDFOBJ	J.D. Edwards objects	
CLTCOM	Client's common files	
COMMON	Common unchanged files	
CLTDTA	Client's data files	
CLTSEC	Client's security files	
QGPL	IBM general public library	

No Source in Production Environment and a Common Shared Library

Basic Development Environment with a Shared Common

Library	Explanation
QTEMP	IBM Temporary data files
DEVOBJ	Development objects
CLTOBJ	Client's objects
JDFOBJ	J.D. Edwards objects
DEVCOM	Development common files
COMMON	Common unchanged files
DEVDTA	Development data files
CLTSEC	Client's security files
DEVSRC	Development source files
CLTSRC	Client's source files
JDFSRC	J.D. Edwards source files
QGPL	IBM general public library

No source libraries exist in the Production Environment since source is not necessary to run J.D. Edwards programs. This makes the Production Environment easier to maintain. The only consideration is that users in the Production Environment would not be able to view source code. Another difference is that a third shared common library (COMMON) has been added to the environments. This library contains common files whose data **will not** be changed during the testing process (Ex. F98HELP). By having this type of common library not only are the environments easy to maintain, but a considerable amount of machine resource will be saved.

Library	Explanation
QTEMP	IBM Temporary data files
CLTMOD	Client's source and objects under modification
CLTOBJ	Client's objects
JDFOBJ	J.D. Edwards objects
DEVCOM	Development common files
COMMON	Common unchanged files
DEVDTA	Development data files
CLTSEC	Client's security files
CLTSRC	Client's source files
JDFSRC	J.D. Edwards source files
QGPL	IBM general public library

One Development Source and Object Library

DEVOBJ and DEVSRC have been combined into one library called CLTMOD. This library will contain both source and objects for programs while they are being modified and tested. After testing, the program objects will be moved to CLTOBJ and source will be moved to CLTSRC. The purpose of having one object/source library like CLTMOD is to simplify the development library list by having one place where all modifications and testing takes place.

Creating Libraries

Create the following libraries:

Common libraries

Development object libraries

Development source libraries

If you created a common library (DEVCOM), be sure to specify it each time you create the other development libraries. If you do not specify the common library each time, the files will be created in your development library.

Your common library should contain files with data that does not change because of development activities (ex. Help Instructions Master). If there is a possibility of the data changing, the file should be placed into your test data library (DEVDTA). By doing this you are insulating the end users from the changes done in the development environment.

See Appendix A for a list of common files and production files.

Creating Common and Data Libraries

Create the libraries that are going to contain common data files (DEVCOM).

Create the libraries that are going to contain test data files (DEVDTA).

To create common and data libraries

1. You can perform both of these steps from the Data Base Management menu by selecting Data Libraries.

98312	Create User Dat	a Libraries	Form ID P98102 Version ZJDE0001
Create Production En This job has various press ENTER to contin	vironment options described nue.	below. Enter	the desired values and
to be copied from (rary where data is e.g JDFDATA).	_	JDFDATA
you are creating fil	les (e.g. PRODLIB).	_	DEVDTA
are creating common : If you do not enter a all common files will Production Library.	files (e.g. COMMON) a Common library l be created in the	_	DEVCOM
	F5=Printer Over	rides	

Field	Explanation
FROM Library field	The library containing the data to be copied.
TO Production	Because you are creating development libraries, type the development library name.
TO Common Library	If you want to create a common library, you must specify the common library name. If you leave this field blank, the system creates the common files in the development Library you specified in the above step.

2. Complete the Create User Data Libraries form

Once you correctly complete the form and press enter, the job (J98102) is submitted to batch.

3. Repeat the above step for each of the development data libraries you have.

The program automatically:

Creates your libraries

Creates the physical and logical files that should be maintained in your common library

Creates the physical and logical files necessary for operations control in your development library

Creates the physical and logical files for various applications in your development library

Generates reports to identify all the physical, logical, and join files created and to identify where they were created

Generates a report to identify all the optional files. The report explains why the files are optional so that you can determine if they should be deleted

Creating Development Object Libraries

To create your development object library (DEVOBJ)

Type the command Create Library (CRTLIB) and press F4.

(
	Type choices, press Enter. Library	Create 	Library (CRTL] <u>DEVOBJ</u> <u>*TEST</u> <u>*BLANK</u>	IB) Name *PROD, *TEST		
	F3=Exit F4=Prompt F5=Ref F13=How to use this display	fresh	F10=Additional F24=More keys	parameters	F12=Cance	Bottom 1

Field	Explanation
Library Your development object library name	
Library Type	*PROD or *TEST
Text Description	The description of your library

Understanding Development Source Libraries

The development source library contains the Program Source File (JDESRC). All J.D. Edwards source programs are located in the JDESRC file.

To create the development source library:

Create a source environment (library)

Create a source physical file (JDESRC)

There are two possible methods to create the JDESRC file. You must determine if you have the J.D. Edwards Program Generator and then choose the appropriate method.

Creating a Development Source Library

To create a development source library (DEVSRC)

1. Type the command create library (CRTLIB) and press F4.

/				
	Crea Type choices, press Enter. Library	brary (CRTLI) <u>EVSRC</u> I <u>EST</u> SLANK	B) Name *PROD, *TEST	
				Bottom
	F3=EXIL F4=Prompt F5=Refresh F13=How to use this display	24=More keys	parameters	F12=Cancel

Field	Explanation
Library	Your development object library name
Library Type	*PROD or *TEST
Text Description	The description of your library

Creating JDESRC with J.D. Edwards Program Generator

When a program is moved into production at J.D. Edwards, the record length is 92 bytes. If you have J.D. Edward's Program Generator product, the program source file format must be 142 bytes long to allow for the Program Generator Serial Number and additional required data.

To create JDESRC with J.D. Edwards Program Generator

1. Type the Copy File command (CPYF) and press F4 to copy an existing file with the correct format (F93002).

Cor Type choices, press Enter. From file To file Library From member To member or label Replace or add records Print format	by File (CPYF) F93002 Name *LIBL Name, *LIBL, *CURLIB JDESRC Name, *PRINT DEVSRC Name, *LIBL, *CURLIB *FIRST Name, generic*, *FIRST, *ALL *FIRST Name, *FIRST, *FROMBR *NONE *NONE, *ADD, *REPLACE *YES *NO, *YES *CHAR *CHAR, *HEX
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	Bottom F10=Additional parameters F12=Cancel F24=More keys

Field	Explanation
From file	The file and library containing the data to be copied. The file is F93002 and the library can default to *LIBL.
To file	The name of the source file and your development source library. Generally, the file is JDESRC and the library is DEVSRC.
From member	The member name that will be the beginning of the copy process. Generally, this value is *FIRST.
To member or label	The member name that will be the beginning of the receiving process. Generally, this value is *FIRST.

Field	Explanation	
Replace or add records	Specifies whether the records copied should replace or be added to the records in the <i>To</i> file. In this case since the <i>To</i> file does not exist, this value is *NONE.	
Create file	Specifies whether the <i>To</i> file does not exist and needs to be created. This value is *YES.	
Print format	Specifies whether the characters are printed in character or character and hexadecimal format. This option only applies if the <i>To</i> file is *PRINT.	

2. Type the Remove Member command (RMVM) and press F4 to remove the empty member copied from JDESRC.

Type choices, press Enter. Data base file Library Member	Remove Member (RMVM) · · <u>JDESRC</u> N · · <u>DEVSRC</u> N · · <u>F93002</u> N	ame ame, *LIBL, *CURLIB ame, generic*, *ALL
F3=Exit F4=Prompt F5=Ref F24=More keys	resh F12=Cancel F1	Bottom 3=How to use this display

Field	Explanation
Data base file	Type the source file and your development source library that contains the record to be removed. Generally, this file is JDESRC and the library is DEVSRC.
Member	Type the name of the record that is to be removed. This is F93002.

Creating JDESRC Without the Program Generator

If you *do not* have J.D. Edward's Program Generator product, the program source file format may remain at 92 bytes long, as it is when a program is moved into production at J.D. Edwards. To create the JDESRC file with a 92 byte record format, you can execute the Create Source Physical File command (CRTSRCPF).

To create JDESRC without the Program Generator

1. Type the Create Source Physical File command (CRTSRCPF) and press F4.

Create Source I Type choices, press Enter. File	Physical File <u>JDESRC</u> <u>DEVSRC</u> 92 *NONE *BLANK	(CRTSRCPF) Name Name, *CURLIB Number Name, *NONE,	*FILE	
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	F10=Additiona F24=More keys	l parameters	Botto F12=Cancel	om

Field	Explanation
File	The source file and your development source library that contains the record to be removed. Generally, this file is JDESRC and the library is DEVSRC.
Record Length	The number of bytes in the length of the records to be stored in the source file. This value is 92.
Member, if desired	The member to be added to the source file. Generally, this member is left to *NONE.
Text Description	The description of your source file.

About User Profiles

You must create profiles that allow users to have access to new environments.

There are two separate methods to defining access to an environment. The method you choose depends upon whether the User Profile accesses J.D. Edwards software using J98INITA or J98INIT.

Defining Access for a User Profile using J98INITA

If you are allowing access to your Development Environment for a User Profile that is using J98INITA, you must define a Development Environment Library List name. In addition, the User Signon List must contain the Development Environment Library List name.

To define access for a user profile using J98INITA

1. From the Library List Control menu (G944), select Library List Revisions.

/									
	0094 Action Code.		<u> </u>	Library L	ist Revi:	sions			
	Library List Description. Menu Program	Name	<u>TEST</u> <u>Technical</u> POOMENU	Training 1	<u>Example</u>				
Ļ	Library List JDFSRC QGPL		QTEMP DEV	10BJ CLTOB	J JDFOBJ	DEVDTA	DEVCOM DEVS	SRC CLTSRC	
-									-
						-			
		F21=Pri	Int Library	List	F9=L1Dra	ary Seai	rcn		

2. Select User Signon List Revisions from the Library List Control menu (G944), to assign the library list to each user.

0093			User Signon List Revisions
Action (Code <u>I</u> FR	AZZINI	
Seq	Library	Sign-on	
Number	List	Menu	Description
5.00	PRISTINE	<u>A92</u>	MASTER PRISTINE DATA LIBL
10.00	A52DEV	<u>A92</u>	_ A5.2 Case Cert & G Development
11.00	PGMGEN	A92	_ Testing A52 Program Generator
20.00	TECPROG	<u>A92</u> 792	_ ^ LISE NAME NOT IN MASLER FILE Testing A52 Tesh Foundations

		-	
		-	
		-	
		-	
			—

Defining Access for a User Profile Using J98INIT

If you are allowing access to your development environment for a User Profile that is using J98INIT, you must define a new library list.

To define access for a User Profile using J98INIT

1. From the Security Officer menu (G94), select User Information (User Keys).

0092 User ID Library List DEVSRC CLTSRC JDFSRC SP - -	User Information <u>TEACH</u> <u>OTEMP</u> <u>SCURITY OGPL</u>	Action Code <u>I</u> DEVOBJ CLTOBJ JDFOBJ DEVDTA DEVCOM
User Security: User Key Initial Menu to H Initial Program t Menu Level User Type User Class/Group Batch Job Queue Job Scheduling Priori Logging(level/severit Output Queue Optional Printer File Current Library Employee Address Numh Set Attention Program F6=Display/Lang Pref	<u>A</u> <u>J</u> <u>K</u> Execute <u>A</u> <u>Co</u> Execute <u>A</u> <u>Co</u> Execute <u>COBATCH</u> <u>Co</u> <u>Co</u> <u>Co</u> <u>Co</u> <u>Co</u> <u>Co</u> <u>Co</u> <u>Co</u>	DP F Allow Command Entry (Y/N). Allow Menu Traveling (Y/N) Allow Fast Path (Y/N) *NOLIST F21=Print Lib List F24=More

Each user profile for the J.D. Edwards software must have an IBM profile. To define an IBM profile, use the command, Create User Profile (CRTUSRPRF).

Copying Data to Your Development Environment

There are several methods to copy data to your Development Environment. The method you choose should depend upon how much data you need to copy to your Development Environment. You may copy the following:

Libraries

Files

Records

JDE Record Types

Copying a Library

If you need to duplicate several files in your Development Environment you can copy one or more libraries.

To copy a library

1. Type the Copy Library command (CPYLIB) and press F4 to display the parameters.

	Сору	Library (CPYL	IB)
Type choices, press Enter.			
Existing library		<u>*YES</u>	Name Name *NO, *YES
		<	

If you use CPYLIB your access paths will need to be rebuilt. Any files that are in use will not be copied.

Field	Explanation
Existing Library	The library to be copied in your Production Environment.
New Library	The new library that will be used in your Development Environment
Create Library	Specifies whether the New Library does not exist and needs to be created.

Copying a File

If you need to copy specific files from a library in your Production Environment to a library in your Development Environment, you use the J.D. Edwards copy file utility.

To copy a file

- 1. From the Data Base Management menu (G9645), select Copy Data files.
- 2. Enter the system code, the library to copy the data from, and the library to copy the data to.
- 3. Then type a 1 next to the files you wish to copy.

(
	98	101		Copy Data Files
	Ent	er System C	ode <u>01</u>	Address Book
	Lib	rary Name:	From <u>JI</u>	DFDATA To <u>PROD</u>
	<u>Sel</u> <u>1</u> <u>1</u> <u>1</u> <u>1</u> <u>-</u> - - - - - -	File Name F0070 F009101 F0101A F0101XX F0101Z1 F01090 F01092 F01094 F0111 F0114 F0114 F0116 F01800	File Type PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL PHYSICAL	Description Country Constants Master File Word Search Occurrence Master Address Book Master Address Book Master Address Book - Batch File Supplemental Data Base - CORE Supplemental Data Base - Code Supplemental Data Base - Narrative User Sequence Preference Address Book - Who's Who Address Book Memo/Text Information WF - Memo Information Work File Address Book Locations Address Book Word Search Master
			C	Opt: 1=Copy Data File

All records in those specified files will be copied.

When using this utility, be sure to copy all related files.

Copying a Record

If you wish to copy a file with only selected records, use the Copy File command (CPYF).

To copy a record

1. Type the Copy File command (CPYF).

Copy	y File (CPYF)	
Type choices, press Enter.		
From file	F0101 CLTDTA F0101 DEVDTA *FIRST *FROMMBR *ADD *NO *CHAR onal	Name Name, *LIBL, *CURLIB Name, *PRINT Name, *LIBL, *CURLIB Name, generic*, *FIRST, *ALL Name, *FIRST, *FROMMBR *NONE, *ADD, *REPLACE *NO, *YES *CHAR, *HEX
Which records to print	*NONE	*NONE, *EXCLD, *COPIED
Record format of logical file . Copy from record number	*ONLY 365	Name, *ONLY, *ALL Number, *START More
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	F10=Additional F24=More keys	l parameters F12=Cancel

2. Press F10 to display additional parameters.

Field	Explanation	
From file	The file and library containing the data to be copied.	
To file	The name of the file and your development library the data will be copied to.	
From member	The member name that will be the beginning of the copy process.	
To member or label	The member name that will be the beginning of the receiving process.	
Replace or add records	Specifies whether the records copied should replace or be added to the records in the <i>To</i> file.	
Create file	Specifies whether the <i>To</i> file does not exist and needs to be created.	

Field	Explanation
Print format	Specifies whether the characters are printed in character or character and hexadecimal format. This option only applies if the <i>To</i> file is *PRINT.
Copy from record number	Specifies the record number from which to start the copy.

3. Scroll up and enter the record number of the record you wish to copy to.

The Copy to record number is the field in which you specify the record number of the last record to be copied.

	Cor	py File (CPYF)	
Type choices, press H	inter.		
Copy to record number		365	Number, *END
Number of key field Key value	ls	<u>*NONE</u>	Number, *NONE, *BLDKEY
+ for	more values		
F3=Exit F4=Prompt F24=More keys	F5=Refresh	F12=Cancel	More F13=How to use this display

Field	Explanation	
Copy to Record Number	Specifies the record number of the last record to be copied.	
Copy from Record Key	Only applies when copying a file with keyed fields.	

Copying J.D. Edwards Record Types

You may copy any of the following record types:

Vocabulary Overrides Data Dictionary Software Inventory Revisions User Defined Code DREAM Writer Menu Generic Rate/Msg

To copy a J.D. Edwards record type

From the Developer's Workbench menu (G9362) or Repository Services select Copy DD,VO,DW,UDC,SVR,Menus.

/		
	99630	Copy DD, VO, DW, UDC, SVR, Menus
	From Library <u>CLTCOM</u>	To Library <u>DEVCOM</u>
	Dictionary Item <u>AN8</u>	Language Appl Ovr
	Vocabulary Overrides	Language
	DREAM Writer Form	Language
	User Def Codes Sys Type	Language
	Software Versions Rep	
	Menu Identification	Language
	Generic Rate/Msg Sys Type	
	F2-	4=More

Field	Explanation
From Library	The library containing the data to be copied.
To Library	The library in your Development Environment to receive the data.

Field	Explanation
Dictionary Item	The name of the Data Dictionary item to be copied.
Vocabulary Overrides	The name of the screen or report record to be copied. All records for soft coding will be copied.
DREAM Writer Form	The name of the DREAM Writer Form ID to be copied. All versions of the specified form will be copied.
User Defined Codes	The system code and type of the table to be copied. All values for the specified table will be copied.
Software Versions Rep.	The record of the Software Versions Repository member to be copied.
Menu Identification/ Language/Appl Ovr.	The menu ID and the display language of the record to be copied.

Only one item may be entered and copied at a time. If the item exists in the To Library, it will be replaced.

About Project Management

To manage projects you may use Work Order Processing. Perform the following tasks:

- Understand Work Order Processing
- Create Work Orders
- Understand and access the Scheduling Workbench
- Add or change record types

Understanding Work Order Processing

The Software Action Request System (SAR) is shipped to clients under the name of Work Order Processing.

The Work Order system allows you to:

Create and classify work orders with simple budgets or estimates

Schedule and expedite work orders

Perform cost accounting by specific work orders or family of work orders.

Unlike jobs which are often preplanned and thoroughly budgeted, work orders are often completed without the prior knowledge of the accounting department. Work orders are typically spontaneous and of short duration.

If clients have purchased system 48 (Work Order Processing), they will have all of the programs associated with Work Orders (SARs). If clients have not purchased the Work Order Processing system, they will only have the programs from the Work Order Processing system that are defined as being part of the General Back Office System (00).

Creating Work Orders

There are only three required fields when creating a new work order

Work Order Number (can be assigned by next numbers)

If you do not provide a work order number, the system assigns one automatically.

Description (short)

Charge to Business Unit

To create work orders

Select Single Task Details from the Simple Project Management menu (G4812).

48014	Single Task Details	
Action Code Description Status Comment Search X-Ref . Est. Hours Est. Amount Phase Type Tax Expl Code. What You Should Know About

Accessing the W.O. Detail form	To access the W.O. Detail form, choose More Description.
Searching for address	To search for address numbers for the Customer Number and
numbers	Manager fields, choose More Keys, then Exit to Name Search

Field	Explanation	
Parent W.O. No	Through parent work order number, you can group work orders together based on one parent work order, such as the installation of a computer and its associated electrical wiring, which may involve more than one customer or manager.	
Action Code	One character field used to indicate the action that the user wants to take on the record requested.	
	Inquire on a record before you attempt to change it.	
Work Order Number (req)	The work order identification number.	
Description (req)	A name or brief description.	
Status Comment	This line allows status comments or further description of the work.	
Charge to BU (req)	The business unit that is responsible for charges incurred.	
	Must be a valid business unit setup in the Business Unit Master file (F0006).	
Search X–Ref	Any number or characters that will be used to cross-reference work orders.	
Cost Code	The subsidiary account responsible for incurred charges.	
Est. Hours	Total number of hours estimated for the work order.	
Est. Amount	The estimated cost of the work order.	
Start Date	The initial date the work is scheduled to begin.	
	Will default from system date or you can enter a date.	
Planned Comp	The date the work is scheduled to be completed.	
Phase	A user defined code describing a stage or category in the development of a project.	
Completed	The date the work order was completed.	
Туре	User defined code describing the work order type.	
Priority	A user defined code used to assign the priority of the work order: for example, high, medium, or low.	
Status	A user defined code used to describe the current state of affair of the work order: for example, planned, started, or completed.	
Customer No	The Address Number of the customer.	
	Must be a valid number in the Address Book Master file (F0101).	
Manager	The Address Number of the manager in charge of the work order.	
	Must be a valid number in the Address Book Master File (F0101).	

Field	Explanation
Transaction	The date the work order was entered.
	Defaults from system date or you can enter a date.
Date Assigned	Date the work was assigned to a person to begin work.
Tax Expl Code	A code attached to a customer/vendor that controls how tax is distributed to the GL revenue and expense accounts.
Tax Rate/Area	A code explaining the tax of a specific rate or an area. For example: state, county, city, luxury. Must be a valid code in the Tax Area Master file (F4008)
Subledger Inact.	A code indicating the status of a subledger, active or inactive. For example: jobs that are closed, assets that have been disposed of.

Processing Options

There are processing options associated with the Single Task Details program that allow you to default the value for the Type, Priority, Status, Phase, Category Code 2, Category Code 3, and Manager fields. To see the processing options, type the selection number for Single Task Details and press F18.

Function Keys from Single Task Details

F5 – Detailed Specifications

F5

Allows user to enter additional detailed information about their work order. Each detail screen is based on Record Type. Record Type A provides room for more description to be entered. Other Record Types may be customized to fit your requirements. The steps to add and change Record Types are discussed later in this chapter.

4802 Action Code Order Number	W.O. Detail En Full Description of . <u>C</u> . <u>289</u> Tech for Pro	try Red Request grammers Class	cord Type

Field	Explanation
W.O. Number	The work order identification number. This value defaults from the Single Task Details.
W.O. Flash Message	A highlighted message that will be attached to the work order.
Phase	A user-defined code describing a stage or category in the development of a project. This value defaults from the Single Task Details.
Category 02–10	Category Codes that are user defined values associated with the work order.
Originator	Address Number of the person who entered the work order. Must be valid in F0101.
Supervisor	Address Number of the work order supervisor. Must be in F0101.
Std. Desc.	A user defined code describing instructional information. Must be valid in F0101.
Search X–Ref	Any number or characters that will be used to cross–reference work orders. This value will default from the Single Task Defaults screen.

F9 – Name Search

Allows the user to search for a specific address book number.

F15 – Work Order Search Window

Allows user to search for work order descriptions. It will only return the description.

F15

F21 – Print Work Order

Allows user to print the work order, including all of the associated record types.

Understanding the Scheduling Workbench

The Scheduling Workbench program allows you to review and update work orders. You can retrieve information about work orders in multiple ways. After retrieving the work orders that meet your search criteria, you can update selected fields in those work orders directly from the Scheduling Workbench form.

Accessing the Scheduling Workbench

To access the Scheduling Workbench

From the Simple Project Management menu select Scheduling Workbench

48201	Scheduling Workbench Flr Rem Cat T P M
Action Code <u>I</u> Job or BU Originator Customer Number	
Supervisor	Parent W.O. No Type Model Cost Code Prior CC2 CC3 CC4CC5 _ Srv Ski Exp CC0
0 Number Description	<u>X-Ref No.</u> <u>Status Comment</u> <u>T</u> <u>P</u>
_ 289 APCS Class	<u> </u>
Opt: 1=W.O Entry 4=Return	w/# F4=Detail F10=Eq. Workbench F24=More Keys

Field	Explanation
Category Codes	User Defined Code fields. Can define whatever 10 categories are important to your business: for instance, the work order's phase, status, type, priority, and whether you want to display model work orders.
Job or BU	The Business Unit responsible for charges incurred
Originator	The Address Number of the originator of the work order must be a valid number in the Address Book Master File (F0101)
Customer	The Address Number of the customer must be a valid number in the Address Book Master File

Field	Explanation
Manager	The Address Number of the manager assigned to the work order must be a valid number in the Address Book Master File (F0101)
Supervisor	The Address Number of the supervisor assigned to the work order must be a valid number in the Address Book Master File (F0101)
Parent W.O. No	The parent work order number which groups work orders together in a "family"
Туре	A User Defined Code describing Work Order/ECO Type
Model	Determines whether model work orders will be displayed on the screen
Search X–Ref	The cross reference or secondary reference number, typically the customer order or job number, used in selecting work orders
Cost Code	The subsidiary account responsible for incurred charges
Number	The work order identification number
Description	The name or brief description of the work order
X–Ref No	The cross reference or secondary reference number, typically the customer order or job number
ST	A user defined code describing the status of the work order
Status Comment	Allows for further description of the work or the addition of any comments
Туре	A User Defined Code describing the work order type
Prior	A User Defined Code defining the priority of the work order: for example, high, medium, or low

F4 – More Detail

Displays additional information concerning each work order that is hidden in the Fold Area.

48201	Scheduling Workbench	<u>Pha Cat Cat T P M</u>
Action Code <u>I</u> Job or BU Originator Customer Number	1001 Work Orders in Progres	ss
Manager Supervisor Status W.O. Date Range Compl. Date Range	Parent W.O. No Thru Search X-Ref Thru. Thru.	
Supervisor Search X-Ref Category Codes Ph St	Parent W.O. No Cost Code. . s. CC2. CC3. CC4. a. Srv. Ski. Exp.	Type Model Prior CC5 _ CC0
<u>O Number Descrip</u>	tion X-Ref No. St	Status Comment <u>T</u> P
_ 1347 Subcontracto Planned Comp Start Date .	rs <u>10</u> Hours Scheduled H <u>05/26/92</u> W.O. Flash Message. V	Est. Hours . W.O. Date <u>05/26/93</u>
_ 289 APCS Class Planned Comp Start Date .	<u>10</u> <u>12/31/94</u> Hours Scheduled <u>01/03/94</u> W.O. Flash Message	Student SAR 2 H Est. Hours. 40 W.O. Date 11/12/93
Opt: 1=W.O Entry 4	=Return w/# F4=Detail F10=Eq. W	Workbench F24=More Keys

Field	Explanation
Planned Comp	The date the work is scheduled to be completed
Hours Scheduled	The hours of work that has been scheduled
Est. Hours	Total number of hours estimated for the work
Start Date	The initial date the work is scheduled to begin
W.O. Flash Message	Causes a flash message to appear on the Work Order Entry screen
W.O. Date	The date the work order was entered.

Selection Exits from the Scheduling Workbench

Selection 1 — Work Order Entry

Takes the user to the Work Order Entry screen and automatically inquires on the selected work order

Processing Options

There are some processing options associated with the Scheduling Workbench program that allow you to default a Work Order Status Range and a Work Order Type. In addition, you may choose to call either Project Task Details (P48014) or the Equipment Work Orders (P48011) when the W.O. Entry option is selected. Be aware that Equipment Work Orders (P48011) is part of the Work Order Processing system (48). To see the processing options, type the selection number for Scheduling Workbench and press F18.

Adding Record Types

To add a record type

1. Select Detail Spec. Types from the Misc Additional Features menu (G4841).

(
	00051		Detail	Spec.	Types				
				-	Ins	stall	System Cod	le	00
	Detion Code	т			Use	er De	fined Codes	5	RT
	Action code	· · · · · <u>+</u>			Wor	.p 10 °k Or	der Detail	Specs	
	01 Character	r				01	dor boodrr	Speed.	
	Code	De	scription						
	<u>A</u>	<u>Full Descr</u>	<u>iption of F</u>	<u>leques</u>	<u>t</u>				
	C	Tool and E	quipment Tr	<u>llarks</u> 1struc	t.				
	D	Safety Pro	<u>visions</u>	100100	<u>.</u>				
	<u>E</u>	<u>Plan and D</u>	rawing Refe	erence					
	<u>F</u> .	Equipment	Down Time						
	F5=Code Types	F14=Memo	F15=Where	Used	F18=Langu	age	F21=Print	F24=More	Keys
\langle									

2. Add your specified record type and description to the table.

Changing Record Types

You may want to change the format of your record type.

- To change a record type
 - 1. Select Detail Spec. Over Titles from the Misc Additional Features menu (G4841).

(
	48002	Detail Spec.	Over Titles
	Action Code <u>I</u> Record Type <u>F</u>		
	<u>Sub-Title 1</u> Equipment _Number	<u>Sub-Title 2</u> <u>Production</u> _Time Out_	<u>Sub-Title 3</u> <u>Production</u> <u>Time In</u>
		F24=More	Keys

2. Enter the heading text of each column you wish to add to the format of your Record Type.

Work Order (SAR) file is F4801

Detail Record Type file is F4802

Method of tracking programming projects

This is a brief overview of the Work Order Processing system. For more information, consult the J.D. Edwards User Guide entitled Work Orders.

kercises

See the exercises for this chapter.

About SAR System Setup

To set up a project, you must assign SARs and promotion paths to it. You create the SARs and define promotion paths first because the version control process uses the definitions.

After you set up your SAR system, you can develop the software. The SAR logging program keeps track of your changes as you have specified. While you develop the software, you also can define promotion paths and projects, and attach SARs to projects.

After you finish developing the software, you must update the SARs by using the SAR log before you promote the SAR.

Complete the following tasks:

- Create record type codes
- Define record type titles

Before You Begin

☐ The SAR system uses the Work Order files (F4801 and F4802). If your production environment uses these files, and if the F4802 file has different record types than what version control needs, define a separate library that contains these files for version control purposes only.

See Also

Defining a Promotion Path

Creating Record Type Codes

The Work Order Instructions table (F4802) has an essential role in the version control process. It identifies and captures, for promotion purposes, all the source code members and control table data associated with a SAR. The Version Control system assigns a record type code to each source code member or control table data item, which classifies it for promotion. You must create record type codes that your Work Order Instructions table does not have currently.

To create record type codes

- 1. From the Version Control menu (G9261), choose Record Type Codes.
- 2. On User Defined Code Revisions

00051	User Defined Code	Revisions System Code <u>00</u> User Defined Codes
Action Code.	<u>I</u>	Skip To Code <u></u> Work Order Detail Specs.
01 Character <u>Code</u> A	r <u>Description</u> Original Request	
F5=Code Types	F14=Memo F15=Where Used	F21=Print F18=Translate F24=More

Enter the following character codes and descriptions:

Character Code	Description
Α	Original Request
С	Members Affected
D	Menu Modifications
Ε	Automatic Accounting Instructions
F	Software Inventory Record Updates
G	Processing Options/DREAM Writer
Н	Vocabulary Override Changes

Ι	Database Changes
J	Constants Data File Changes
K	User Defined Code Changes
М	Connected SAR Numbers
Ν	Generic Rate/Message Type Changes
0	Connected SAR Numbers
Q	Generic Rate/Message Type Changes
S	Status History
U	Post-Installation Instructions
W	Pre-Compiler Commands
Z	First Included in PTF
3	Next Number Changes

Defining Record Type Titles

For each record type code you create, you also must define record type titles, which appear as column headings on the W.O. Detail Entry form.

Before You Begin

Create record type codes before you define record type titles. See *Creating Record Type Codes.*

To define record type titles

From the Version Control menu (G9261), choose Record Type Titles.

On Record Type Titles

TITLE	SUB-TITLE 1	SUB-TITLE 2	SUB-TITLE 3
А			
С		Source Library_	Object Library_
D	Menu Name	Option Number	Job_To Execute_
E	AAI	Company No	
F	CL_Program	Program	Video/Rpt_
G	Form ID	_Version No	
Н	Scr/Rpt_ Name		
I			
J			
K	Help Start	Help Stop	
М	Sys Code	DTAI Name	
N	Sys Code	Rec Type	
0	SAR No	SAR No	SAR No
Q	Sys Code	Rec Type	
S			
U	Reference_ ID/Code	Attachment Needed-Y/N	
W	Program_ Name		
Z	ReleaseID	PTF Number	Date _Included_
3	System Code	Line Number	Action Code

For each record type you created, complete the following fields with the information in the chart that follows:

What You Should Know About

Verifying the record type	After you define the record type titles, you can view them to
titles	verify their accuracy. On Single Task Details, choose More
	Description. On W.O. Detail Entry, locate a record type you
	want to view by using the Record Type field.

To access Single Task Details, see Creating SARs.

A master directory of all files, programs, screens, reports, and copy modules.

Stores the member locations for each member master record.

Working with Software Versions Repository (SVR)

One of the Software Versions Repository's primary purposes is to indicate what environments a requested member is located in and whether the environment is a production or development environment. The file is used extensively for documentation and plays an important role in J.D. Edwards Design and Development tools.

The Software Versions Repository is the natural starting point for all programming and software inquiry functions. It provides exits to the following features:

SEU

Repository Master

SAR (Software Action Request) Detail Entry

Screen Design Aid

Report Design Aid

File Design Aid

The Program Generator

Precompiler Commands

Repository Services

Data Dictionary

Menus

Vocabulary Overrides

Function Key Definitions

DREAM Writer Versions

Processing Options

User Defined Codes

Edit System Helps

CASE Profiles

SAR Log Inquiry

Copy DD, VO, DW, UDC, SVR, Menus

Optional Files Feature

Programmer Checklists

Where Used Facility

Flowchart Programs/Illustrate File Models

Source Modifications Editor

In addition, it provides access to the following functions:

Copy Source Print Source Submit Creation of Object Generate Program Source and Help Edit Help Instructions Delete Source Print Help Instructions

Accessing the Software Versions Repository

The Software Versions Repository serves as the front-end for all J.D. Edwards design aids and programming utilities. You may also utilize this screen as your own inventory file.

To access the Software Versions Repository

From the Computer Assisted Design menu, select Software Versions Repository.

9801		Softwar	e Versions	Repositor	сy		
Action Code. Member ID Description. Function Cod Function Use	· · _ · · e						
Reporting Sy Base Member Maint/RSTDSP Copy Data (Y	stem Name Or /N) Or	mit Option. ptional Fil	F G eC	ile Prefix eneration ommon File	sev . Sev .		
Reporting Sy Base Member Maint/RSTDSF Copy Data (Y O Source P Library	stem Name (N) Object 	mit Option. ptional Fil Source File	F G e C SAR _ <u>Number</u>	ile Prefix eneration ommon File Version ID	Sev . Sev . S D <u>C P</u> _	User ID	Date Modified
Reporting Sy Base Member Maint/RSTDSF Copy Data (Y O Source P Library 	stem Name /N)O Object 	mit Option. ptional Fil Source File	F Ge G SAR _ <u>Number</u> 	ile Prefix eneration ommon File Version ID	2 Sev . S D <u>S D</u> <u>C P</u> 	User ID	Date Modified

The top portion of the screen identifies the member and its attributes. This information is stored in the Software Versions Repository master file (F9801).

Member Identifiers

The first two	fields	identify	the	member.
---------------	--------	----------	-----	---------

Field	Explanation
Member ID	Unique ID for a particular member.
Description	Identifying information of the member, such as Trial Balance by Business Unit. Associated programs, screens, and reports should share the same description.
	The description associated with each member is used to further identify the purpose of the member.
	Physical files should have a description that explains the purpose of the file.
	Screens, reports, and CL programs should have the same description as the associated RPG program.
	Logical files should be designated as follows: <i>LF</i> – <i>fldname</i> , <i>fldname</i> , <i>fldname</i> ; where fldname is a key field.
	Join files should be designated as follows: JF – filename/filename/filename – fldname, fldname; where filename is a file over which the join is built and fldname is the key field joining the files.
	Work files should be designated as follows: WF – filename; where filename is the file that the work file accesses.
	Copy modules carry their own unique descriptions.
	File Server programs should be designated as follows:
	<i>File Server – filename</i> ; where filename is the file being served.

Field	Explanation
Function Code	Designates the object type such as display file, physical and logical file. Use F1 in the field to view available types.
Function Use	Indicates how the member is being used.
System Code	Designates the system number associated with the member. The configuration of installation media and the install process itself are driven by this install system code. Use F1 in the field to view valid codes.
Reporting System	Designates the system number for reporting purposes. This rarely differs from the Install System. Exceptions occur for data files used by more than one system.

Type, Use, and Associated Systems

Field	Explanation
Base Member Name	This field simply allows for logical grouping of members.
	For screens, reports, RPG programs and CL jobs, this name is usually the RPG program name associated with a particular member.
	For logical files, this name is the physical file it is based on and is required.
Omit Option	Designates items in the Software Versions Repository file that would be bypassed for a new release. These codes are as follows H - Held from all releases X - Omit from all releases
	S — Omit Source from all releases O — Omit Execution Object from all releases
Generation Severity	Allows the user to designate a severity level when compiling a member.
	Because some J.D. Edwards programs contain messages that appear in the compile listing as a severity level 10 error, it is suggested that you override the IBM default of a severity level 9 to a level 20 for all programs. To do this, enter the following on any command line:
	CHGCMDDFT CMD(CRTRPGPGM) NEW DFT('GENLVL(20)')
	For those specific programs that must override the new default severity level of 20, you can enter the override value in the <i>Generation Severity</i> field.
Maint/RSTDSP	Either designates the type of maintenance on a logical file or how a screen will be processed.

Member Relationship and Compiling Information

Maintenance on a Logical File

Value	Description
0	No maintenance; or the logical is created dynamically
1	Logical will be immediately updated when physical is updated.
2	Logical update will be delayed until the next time it is opened. — USE WITH CAUTION

Value	Field Values	Description		
1	RSTDSP = *NO (Restore Display)	Use with OVERLAY. Do not use with PUTOVR/OVRDTA		
	DFRWRT = *YES (Defer Write)	All writes to the video field file/formats will be collected and written at one time		
А	RSTDSP = *NO	Overlay		
	DFRWRT = *NO	Each write statement will be written to the screen		
В	RSTDST = *YES DFRWRT = *NO	Use with PUTOVER to clear and write screen at field level		
S		 Used when compiling SQL, RPG, and PL1 programs. For example, if SQL statements exist within an RPG program, the compiler: Executes a create SQL program statement Executes the SQL statements (converts them to calls) Comments them out Executes a create RPG program statement and continues as normal 		

Processing a Screen

File Information

Field	Explanation
File Prefix	This field indicates the prefix associated with a file. Use F1 to display all file prefixes in use. Each physical file should have a unique file prefix.
Copy Data (Y/N)	Used to indicate when a database file must be copied with or without data.
	The Create User Data Libraries (2/A9645) utility accesses this field to determine if the file copied will be copied with data.
Optional File	Indicates the file may be optional in your production environment. F8 provides a list of optional files.

Field	Explanation
Common File	Indicates when a file should exist in the common library or user production library. The Create User Data Libraries (2/A9645) utility accesses this field to determine if the file should be placed in the specified common library or production library.

Where Are Members Maintained?

The bottom half of the screen lists the libraries in which the member is maintained. This information is stored in the Software Versions Repository Detail file (F9802).

Field	Explanation
Source Library	The source library where the source file for the object is maintained.
	This library is usually JDFSRC (for J.D. Edwards) or CLTSRC (for the client) for production and DEVSRC for development.
Object Library	The library where the compiled object resides. For program, display file, and printer file objects, the library location is the same (usually JDFOBJ for J.D. Edwards and, CLTOBJ, or DEVOBJ for the client). For all physical and logical files, the object library is the data file library (usually JDFDATA for J.D. Edwards and, CLTDTA or DEVDTA for the client).
	Leave the object library name blank for copy modules since they are not compiled objects.

Field	Explanation
Source File	The source file containing the source member. At J.D. Edwards, three source files reside inside of JDFSRC library.
	They are:
	JDECPY for copy modules
	JDESRC for other source code
	F98CKTCMD for precompiler commands.
SAR Number	The most recent Software Action Request (SAR)/Work Order number associated with the member. This number must be valid, and if the status of the SAR number is complete, you should enter a new SAR to perform additional development work on the member. A basic version of the Work Order system is sent to clients who have purchased the Computer Assisted Design (CAD) system and serves as a means for the client to keep track of their projects.
	If a PPAT number is specified on the User Information screen (F0092 file), that number will show as the default for the window that comes up when F1 is pressed on this field.
	The edit for this field is controlled by the SAR information entered in CASE Profiles.
Version ID	Identifies the release level of the member in the designated environment.
	Validated against User Defined Codes 98/RL.
SC	Status Code
	 Indicates the status of the software, that is, whether it is in production or development. These codes are as follows: 1 – Production/Pristine 2 – Development 3 – Test Version 4 – Custom
DP	Development Progress Code.
	Indicates the progress of modifications done to the member.
User ID	User ID that last modified the member (automatically updated).
Date-Modified	The date the member was last updated (automatically updated).

Each subfile line represents a record in the Software Versions Repository detail file (F9802).

Keying 'D' in the Action Code will delete the member from:

Software Versions Repository Master file (F9801) Software Versions Repository Detail file (F9802) Source and Object, if applicable Data Dictionary (F9200, F9203, F9816, F98163) Vocabulary Overrides (F9220) Function Key Definition (F9601,F9611) DREAM Writer forms (F98301, F9831, F98311, F98312) Cursor Sensitive Helps (F9620, F9621) Processing Options (F98302) Program Generator, if applicable

Naming Conventions

The following forms show how the report and CL program share the same Description and Base Member as the program name. The same convention is true for the CL program and the special form.

9801	Software Versions Repository

A coded naming structure identifies and describes major components of J.D. Edwards & Company software. The first character of the name indicates the type of component, such as program or data file. The second and third characters denote the system and are referred to extensively throughout the software. The fourth, fifth, and sixth characters represent the component group type, such as the function to be performed by the indicated component. The seventh through the tenth characters identify component versions. File names vary from four to eight characters in length, while all other component names are at least six characters long. The following diagram illustrates this naming structure.

The Naming Conventions for Objects

ХХ XXX Х First digit — Component С — Common subroutine I — Data structure; record formats J — CL program P — **RPG** program R — Report S — Special form т — Temporary work files V — Video screen display file Х— Scrub and Edit Server XF — Input/Output File Server XS — Input only/Caching Server Second and third digits — System Code For a complete list 00 — World Foundation Environment of system 01 — Address Book codes, see 03 — Accounts Receivable User Defined -Codes, 55 — Reserved for clients system 98. Fourth, Fifth, and Sixth Digits — Group Type record type SY 000 to 099 — File maintenance 100 to 199 — Transaction processing Inquiry only 200 to 299 — 300 to 399 — Input registers and journals **Operating reports** 400 to 499 — Special purpose reports 500 to 599 — Standard management reports 600 to 799 — 800 to 999 — Housekeeping DS Data structure Other Window designations

Use the following chart as your guide when naming objects.

The CL program, RPG program and Display / Printer file may have identical names with different prefixes.

For example: P01051, J01051, V01051 (Address Book Revisions)

The Naming Conventions for Files

Maintenance program	The maintenance program for a file has the same name with a different prefix.	
	For example, F9220 is P9220 or F9601 is P9601.	
Logical files	For logical files over one physical, the logical file has the same name as the physical followed by an L, followed by A thru Z.	
	For example, F0101 has logicals F0101LA, F0101LB, F0101LC, and F0101LD.	
Join logical files	Join Logical files have the same name as the principal based-on file, a suffix of J followed by A thru Z.	
	For example, the system names the join of F0006 and F0911 as F0006JA	
Temporary files	Batch jobs use T files doing a CRTDUPOBJ. The job then removes the object after completion.	
	Usually Physical Files	
	Begin with T	
	Found in JDFOBJ	
Dynamic work files	Dynamic work files are usually FASTR processing requirements. Dynamic work files create and delete after the job is complete.	
	Usually logical files Have same name as program	
	nave sume name as program	

The following shows the names for different types of programs and files.

The J.D. Edwards System Codes

Г

When used in menus, the system code follows the letter in the menu name. Shown below are the system codes for the standard AS/400 systems:

Optional Files Workbench

The Optional Files Workbench provides better access to optional files. When you delete optional files they are logged. If you reinstall, those files are not put back into the system. Each file has an explanation about the circumstances that make it optional.

If you need the deleted files you can remove them from the logged optional files and copy them from JDFDATA.

Logical Files

The Member ID for logical files ends with Lx, where x is the next available letter in alpha sequence.

The Object Library is usually JDFDATA.

The Description should list the key fields for the view.

The Maint/RSTDSP is 1 for permanent system logicals.

The Base Member Name is the physical file the logical view is over.

Navigation Functions

The following Function keys facilitate navigating within the Software Versions Repository.

F6 – Access Repository Services

You can access the Repository Services window using F6. This window provides access to the other repository services within J.D. Edwards.

9801 Soft	ware Versions Repository
Action Code <u>I</u> Member ID <u>P01051</u> Description <u>Address Book</u> Function Code <u>RPG</u> RPG Pro Function Use 111 File	Information ograms Maintenance

	Opt: 1=Select F12=Previous
Opt: 1=Browse 2=Edit 3=Copy	5=SAR 8=Print 9=Dlt 10=Design 14=Crt F24=More

Use selection 1 to select the available services.

F9 – Automatic Reinquiry

Once the system has accepted the changes you made to a member and cleared the screen, you can automatically inquire on that member by pressing F9.

F17 – Position Cursor to Action Code

When you inquire on a member, the system positions the cursor in the subfile for the screen. To reposition your cursor in the *Action Code* field, press F17.

F19 – Previous Member

To access the member stored before the current member, press F19.

F20 – Next Member

To access the member stored after the currently displayed member, press F20.

Other Function Keys

F2 – J.D. Edwards Command Line

To access a command line in order to enter a J.D. Edwards or IBM command without having to exit to Command Entry or a menu.

Calls a J.D. Edwards program and not the IBM Command Entry.

If you are secured out of Command Entry or Menu Traveling, you will still receive this command line but you will *not* be able to execute commands or menu travel.

F8 – Optional Files

The system displays the optional files.

F10 – Checklists

Displays a user defined checklist. Opt 1 – displays additional job information.

F13 – Member Category Codes

Displays additional category code information for each member. The category code values can be cross-referenced to the Software Versions Search program (23/G91).

F14 – Member Parameter/Key List

Identifies the access path for keyed files. For future use with the Everest CASE tool.

F15 – Where Used Facility

You can access the Where Used facility using Function key 15. Use this facility to determine every location that a particular member is used.

Below is an example form displaying every program that uses the Business Unit Master form:

```
980014
                                   Cross Reference

_____P0006
               Business Unit Master Revisions - Single
                                                                                       Y
Opt: 1=SVR 2=Create Object 3=Field Explanation F21=Print F16=Regenerate
```

To use this facility, you must run the Cross Reference Rebuild.(6/G9642)

F23 – Flow Programs / Illustrate File Models

To display a flowchart if the member is a program or a Data Model if the member is a file.

Only functional for programs and files.

Selection Exits from the Software Versions Repository

Option	Description
1	Browse SEU member
	Displays the SEU Member in browse mode.
2	Edit using SEU
	Displays the SEU Member in update mode.
3	Copy/Add entry/source member
	Copies the source member to another member.
	Adds master and detail record for the member being copied to if they do not already exist.
	Copies pre-compiler commands and Vocabulary Overrides. Copies program generator specifications if requested.
5	Work with SAR detail
	Displays the SAR/Work Order Detail Entry screen, defaulting to the members affected portion of the SAR/Work Order.
8	Print source
	Prints a spooled file of the member.
9	Delete/ remove source
	Deletes the detail record and removes the source member from the source file.
	The same IBM authority that applies to the command RMVM applies to this function.
	Will delete the object if requested by the user. If you do not remove the source member, you will not be allowed to delete the object.
10	Exit to design aid
	Determines what type of member you are accessing and then exits to the correct J.D. Edwards design tool; that is, SDA/RDA/FDA/Program Generator.

Option	Description
11	Precompiler commands for J.D. Edwards compiler.
	Accesses the source code for the precompiler commands associated with a program.
	A highlighted message, <i>Precompiler Commands Exist</i> , indicates when they exist for the member.
	Contains information for steps that need to be completed prior to compiling the program.
	Example: P09101.
	NOTE: Only one person can view the same pre-compiler commands.
14	Submit object creation
	Compiles the member and generates an object.
15	Generate program source and help
	Submits the member to the program generator in order to generate source and related helps.
	Only applicable to CASE users.
17	Edit help instructions
	Accesses the help instructions for a particular program in update mode utilizing SEU.
18	Generate & rebuild help instructions
	Submits the helps for generation and rebuilds them into their final form once they have been entered.
20	Browse SDA/RDA
	Accesses SDA or RDA in browse mode.
21	Print help
	Prints the help instructions for the member.
25	Print illustration
	Prints an illustration of printer files, display files, or data base files.
30	Source modifications editor
	Allows you to view the source modifications made to the member through SEU after source was generated. Stored in the F93002 file.
	Only applicable to CASE users.

About CASE Profiles

CASE profiles are user defined values that can pertain to individual users or to one *PUBLIC user profile.

Information is stored in the CASE profiles file (F98009).

These profiles are used to define the overall CASE operating environment.

Various processing control parameters are defined by the user including:

Default development libraries

Compile job queue

Program Generator source generation job queue

Compile print options

SAR logging options

The user should immediately update the record for User ID *PUBLIC.

When entering information for *PUBLIC, all fields are required.

Default CASE Profile values are maintained in a record with the User ID *PUBLIC. CASE Profile values for individual users should be entered only if overrides to the *PUBLIC values are needed.

When entering values for individual users, all fields may be left blank except for the specific values being overridden.

Accessing CASE Profiles

To access CASE Profiles

Select one of the following two methods to access CASE Profiles:

From menu G92 select CASE Profiles

From the Repository Services window select CASE Profiles.

9801 S Action Code.	oftware Versions Repository
System Code.	985001Repository Services <u>"1" Available Services</u> Data Dictionary pt
Opt: 1=Browse 2=Edit 3=Co	

The new CASE Profiles screen appears. The program will attempt to automatically inquire on your User ID. If your ID is not set up, an error will occur. You may inquire on *PUBLIC.

/

	Miscellaneous Source Gen Opt (Future) _ Helps Maint Opt(Future) _		C k	SEU	
		F24 = M	More	Keys	

Field	Explanation
Source File	The default source file name where source is to be stored within the source library.
	Must reside within the source library specified.
Source Library	The default library where source will be stored.
	The source file specified above must reside within this library.
Object Library	The default library where compiled objects will be stored.
CL Source File	The default library where source for CL programs will be stored.
	The value specified must reside within the source library specified.
Data File Library	Used to specify the test (or development) library for physical and logical files.
	Used as the default object library for the Software Versions Repository when copying source code for physical or logical files.
SAR Number	An abbreviation for software action request (SAR). *NONE = the SAR number will not be validated in any of the CAD/CAP programs and can be left blank. If a SAR number is entered, it is used in conjunction with the SAR Delivery Type of *DFT (default).
Version ID	The software version number to be defaulted in the Software Versions Repository file.
Status Code	Determines the status of the software as well as where it resides in production.
	It will specify that the software is in production, in development, or in a release.

Default Development Environment

If you create anything custom put 2, 3, or 4 in user defined codes. If you have "1" (production) the system will think it is a J.D. Edwards file and write over it during the Software Version Repository Merge in an upgrade.

Field	Explanation			
Compile Job Queue	Specifies which job queue will be used when submitting programs to compile.			
	Used for programs with a function code of RPG, CBL, PLI, C, and SYSC.			
Program Generator Job Queue	Specifies which job queue will be used when submitting jobs for the Program Generator.			
	These jobs include the source code generation and the source code monitor from SEU.			
Compile Target Release	Used by various AS/400 compilers (RPG, CLP, COBOL, C) to compile an object compatible with a specified IBM target release.			
	A value of *CURRENT compiles an object compatible to the release of the machine at compile time.			
	A value of *PRV compiles an object compatible with both one release back and the current release.			
Print Option	Used to designate whether or not a report will be generated when an object is compiled.			
	0 = no print.			
	1 = print.			
	2 = print and hold spool file.			
	3 = print only – does not generate an execution object (applies to COBOL and RPG only).			
	4 = print when creation or compile fails.			
Cross–Reference Listing	Specifies whether a cross–reference listing will be generated for variables and fields in a program's compile listing.			

Program Creation Options

Make sure you have a job queue called COMPILE for COMPILE JOB QUEUE to compile programs or use a valid job queue.

SAR Options

Field	Explanation	
SAR File Library	Specifies the library where the Software Action Request (SA file for software development exists. If left blank, the user's library list will be used. You can specify *NONE in the SAR number field in you do not want any SAR number editing.	
SAR Delivery Type	Associated with SAR logging. SAR logging is a feature which tracks all activities related to modifying J.D. Edwards' software. *NONE = no logging. *LOG = log to SAR #00000000 (no SAR number is used for logging). *DFT = log to a default SAR number (specified in the SAR Number field). *PROMPT = log and prompt the user for the SAR number to be used and allow the user to enter the revision notes.	

Miscellaneous

Field	Explanation
Source Gen Opt	For future use.
Helps Maint Opt	For future use.

Function Key Exits From the CASE Profiles Program

F6 – Access Repository Services

This window provides access to the other repository services, except for CASE profiles.

F9 – Previous Profile

Allows the user to re-inquire on the last record updated.

Summary of CASE Profiles

The CASE Profiles file is F98009.

The user will need to update the *PUBLIC record as well as add any additional individual records desired.

The user cannot delete the *PUBLIC record.

When entering information for the *PUBLIC record, all fields are required.

The record for User ID *PUBLIC contains the values that will be used as the defaults for all users unless individual user profiles have been set up.

When entering values for individual profiles, all fields are left blank EXCEPT for the specific values being overridden on the *PUBLIC profile.

SAR Number and SAR Delivery type work together to determine what type of SAR logging should occur.

*NONE = no SAR logging at all.

*LOG = no SAR number will be included as part of the SAR logging.

*DFT = the SAR number specified will be used for the SAR logging.

*PROMPT = the user will be prompted for a SAR number and revision notes when an entry is about to be made to the SAR log.

Exercises

See the exercises for this chapter.

About SAR Log

After you create the SARs, you must activate SAR logging, which automatically keeps track of the SARs as you develop the software.

The SAR Log Inquiry program allows you to review information in the SAR Log file (F9810).

You can also change the SAR Number and Revision Notes for individual log records.

Complete the following tasks:

- Set up user input options for SAR logging
- Select types of SAR information to log
- Access SAR Log Inquiry

Before You Begin

Create SARs before you activate SAR logging.

From the Version Control menu (G9261), choose CASE Profiles.

Setting Up User Input Options for SAR Logging

To set up user input options for SAR logging

On CASE Profiles

/			
	98009	CASE	Profiles

M	iscellaneous Source Gen Opt (Future) _ Helps Maint Opt(Future) _	S	EU
	F24:	=More	Keys

1. Complete the following fields:

SAR File Library

SAR Delivery Type

The SAR file library contains the Work Order system files (F4801 and F4802). If you currently use these files, and if the F4802 file has different record types than what version control needs, you must create a library that contains new F4801 and F4802 files for version control purposes only. Specify this new library name in the SAR File Library field.

2. Complete the following optional field:

SAR Number

What You Should Know About

SAR number and delivery type combinations	The information you provide for the SAR Number and SAR Delivery Type fields affects how the system handles SAR logging.
	If you do not provide a SAR number, and set the SAR Delivery Type field to *PROMPT, the Maintain User Default SAR Information form prompts you for the SAR number whenever you change a source code member or control table.
	If you provide a SAR number, and set the SAR Delivery Type field to *DFT, the system creates SAR log entries automatically without your input.
	If you provide a SAR number, and set the SAR Delivery Type field to *PROMPT, the Maintain User Default SAR Information form prompts you to change the SAR number, if necessary, whenever you change a source code member or control table.
Invalid SAR delivery types	*LOG and *NONE are not valid for the SAR Delivery Type field when you use the Version Control system.

If you set the SAR Delivery Type field to *PROMPT, the Maintain User Default SAR Information form appears whenever you change a source code member or control table.

```
9812 Maintain User Default SAR Info
Action. . . C
Repository Rec. P9242
SAR Number. . _____ Transfer. . . <u>0</u>
Revision Note . ______
Enter=Continue F24=More
```

If you provided a SAR number on CASE Profiles, it appears on this form. If you did not provide a SAR number, provide one on this form.

If the Transfer field on Maintain User Default SAR Information is set to 1, the Version Control system can promote the change. If it is set to 0, the system cannot promote the change.

Selecting Types of SAR Information to Log

To select types of SAR information to log

In addition to setting up user input options for SAR logging, select the types of SAR information you want to log.

- 1. From the Version Control menu (G9261), access the processing options for Edit and Promote.
- 2. Make the following changes:

SAR Logging (1)	Specify Y if you want to track SARs that are associated with J.D. Edwards source code and control file development only. Specify N if you want to track SARs that are associated with all software development. Leave this processing option blank to disable SAR logging and, therefore, version control.
	If you specify Y, the SAR log keeps track of development automatically. It tracks changes to menus that start with 'A' or 'G' only. For DREAM Writer, it tracks changes to XJDE or ZJDE versions only. When you transfer these versions, the user ID associated with them changes to DEMO.
	In addition, the SAR logging program runs a double-byte analysis against your RPG programs if you set this processing option to Y.
	If you specify Y, you also must indicate the name of the library that contains your SAR files. The default library name is JDCOMDATA.
DREAM Writer Copy (2)	Specify Y to track changes to DREAM Writer versions (XJDE and ZJDE versions only). Specify N to not track these changes. If you track changes, the user ID changes

to DEMO automatically when you transfer the versions.

Accessing SAR Log Inquiry

The SAR Log Inquiry includes several functions:

Inquiry by user ID or SAR number with date range Exit to a maintenance program for the record type

Exit to SAR detail

Print option that allows for DREAM Writer selection

There are two ways to access the SAR Log Inquiry.

To access the SAR Log Inquiry

1. Select one of the following methods to access the SAR Log Inquiry.

Select SAR Inquiry from Menu G9362

Select SAR Log Inquiry from the Repository Services window

9362 r Pro	J.D. Edwar Developer	ds & Co	ompany JDED

2. Complete one or more of the following:

User ID

SAR number

Date range

Records matching the search criteria will then be displayed.

Field	Explanation
AC (Action)	The action that was taken on this record.
	The standard action code values apply.
Ty (Record Type)	The type of record that was updated.
	Use F1 to display all valid record types stored in User Defined Code 98/RT.
Item	The identification number (program number, file number, report number) assigned to any element of the software. These items are the members that reside in the Software Versions Repository or other repositories such as the Data Dictionary, Vocabulary Overrides etc.
SAR Number	The SAR number under which this change was made.
	This field can be updated on this video.
Revision Note	A user defined description field to further clarify the change made.
	This field can be updated on this video.
Time	The time at which the change was made.
Date	The date on which the change was made.
User	The user who made the change.

Selection Exits from the SAR Log Inquiry

Exit	Explanation
2– Edit	Allows for maintenance of the record type.
	What program is accessed is based on the record type. For example, if the record type is 'DD', this exit will take the user to the Data Dictionary program.
5 – Work SAR	Exits to the SAR associated with the SAR log entry.
9 –Delete	Allows the user to delete entries from the SAR log.

If the user entered this program from the Repository Services window from the Software Versions Repository program, a selection exit 2 will not function with record types 'SV' or 'PG' as these record types attempt to call the Software Versions Repository which causes a recursive call error.

Function Key Exits from the SAR Log Inquiry

F5 – ASI Entry

Exits to Application Specific Instructions for use during a software upgrade You need the F0098 file to do this.

F6 – Access Repository Services

This window provides access to the other repository services, except for SAR Log Inquiry

F21 – Print

Allows the user to print a SAR log report.

Exits to a DREAM Writer versions list.

Summary of the SAR Log Inquiry

Uses the file F9810.

If the user does not want to use the SAR Logging feature at all, they need to specify *NONE in the *SAR Delivery Type* field for all CASE Profile records.

To use the SAR Logging feature, the user must specify a value of *LOG, *DFT, or *PROMPT in the *SAR Delivery Type* field for all CASE Profile records.

The SAR Logging feature will record any changes that the user makes to the Data Dictionary, Vocabulary Overrides, User Defined Codes, etc.

The SAR Log Inquiry program allows the user to see what changes they made to any of the above.

The SAR Log Inquiry program has Function Keys and Selection Exits which allow the user to change the SAR Log records in the SAR Log file (F9810) or to exit to the maintenance program for the change they made.

For example: Exit to the Data Dictionary program if the record indicates a Data Dictionary item was added/updated.

Working with Promotion Paths and Projects

A promotion path defines how a project's source code members and control file data will move from one environment to another. An environment consists of source code members and control file data. For source code members, the environment consists of:

A source file

A source library

An object library

For control file data, the environment consists of a data library.

Perform the following tasks:

- Understand promotion paths
- Define a promotion path
- Define a project
- Assign promotion paths
- Assign project SARs
- Promote a project

Understanding Promotion Paths

A promotion path specifies the current locations of source code members and control file data and where they will be moved. For example, promoting a project's source code members and control file data from a development environment to a test environment could look similar to the following illustrations.

Development Environment					Eı	Test nvironme	nt	
Code	2	Source	Source	Object		Source	Source	Object
Member	rs	File	Library	Library		File	Library	Library
CLP		JDECLSRC	DEVSRC	DEVOBJ)	JDESRC	TSTSRC	TSTOBJ
RPG		JDESRC	DEVSRC	DEVOBJ)	JDESRC	TSTSRC	TSTOBJ

Each move between two environments requires that you define a unique promotion path.

A project, is a collection of software and data you want to group together for promotion. A project is defined by the following characteristics:

SARs that are associated with the project

Promotion paths that determine the movement of the project software and data between environments

Other projects that are attached to the project

Before You Begin

- □ Verify that the SARs and promotion paths you want to associate with a project have been set up.
- ☐ The SAR system uses the Work Order files (F4801 and F4802). If your production environment uses these files, and if the F4802 file has different record types than what version control needs, define a separate library that contains these files for version control purposes only.

Defining a Promotion Path

Several steps are involved in defining promotion paths. Complete the following tasks:

Locate a promotion path

Add a promotion path

Define a promotion path for source code members

Define a promotion path for control tables

From the Version Control menu (G9261), select Manage Promotion Paths.

92403	Manage Prom	otion Paths	Code 1

To locate a promotion path

Select one of the following methods to locate a promotion path:

On a blank Manage Promotion Paths form, press Enter.

The screen displays a complete list of promotion paths.

On Manage Promotion Paths enter the path name in the Promotion Path field.

The screen displays the path name. If the promotion path does not exist, the screen displays the path name that is closest alphabetically.

To add a promotion path

1. Press F5 (Add Path) on the Manage Promotion Paths form.

(
	9240	Promotion P	ath
	Action Code <u>I</u>		
	Promotion Path Description Release		
	Code 1 Code 2 Code 3 Code 4 Code 5 		
	F9=Redisplay F10=M	lembers F11=Ctl Files	F24=More Keys

- 2. Complete the Promotion Path form.
 - Add a new path name, a path description, and a release level.
 - Use the Code 1–5 fields for additional classifications.
 - Code 1–5 fields are user defined in system 92, types E1, E2, E3, E4, and E5.
 - Specify the status of the promotion path in the Code 4 field.
 - Field-sensitive help (function key F1) provides valid values for the Code 4 and 5 fields.
 - Specify the type of promotion environment in the Code 5 field.

To define a promotion path for source code members

- 1. Locate Promotion Path Members using one of the following methods:
 - From the Manage Promotion Paths form, locate the promotion path you want to define.
 - Then enter 2 (Members) in the OP (Option) field next to the promotion path name.
 - From the Promotion Path form, press F10 (Members).

2401			Promotion Pa	th Members

The From Environment area on the Promotion Path Members form shows the current locations of the source and object code. The To Environment area shows the locations to which the code will be moved.

2. Specify source files and library names for each member type you list on this screen.

To display valid member types and their descriptions, press F1 while your cursor is in a Mbr Type field. The member types are defined in the Function Codes user defined code table (98/FN).

To copy source file and library names from one member type to another, type 1 (Copy) in the OP (Option) field next to the member type you want to copy. Type 2 (Target) in the OP fields next to the member types you want the information copied to, and press Enter. You can specify multiple targets.

The following chart shows some of the function keys available on this screen.

KEY	RESULT
F9	Redisplays the record for the previously-changed path.
F11	Displays the Promotion Path Control Files screen.
F13	Displays the CASE Profiles screen.
F14	Retrieves the source file, source library, and object library from your CASE profile and fills in the From environment. This overwrites any information currently in the fields.
F15	Duplicates the source file and library names from the first member type to the remaining member types.

What You Should Know About

Copying an existing promotion path	If you copy an existing promotion path to create a new path, be sure that the source files and library names for the members are correct for the new path.
Changing library names	To change library names, enter the new library names over the current ones.

To define a promotion path for control tables

1. Locate the Promotion Path Control Files using one of the following methods:

From Manage Promotion Paths, locate the promotion path you want to define and enter 3 (Ctl Files) in the OP (Option) field next to the promotion path name.

From the Promotion Path screen, press F11 (Ctl Files).

From the Promotion Path Members screen, press F11 (Ctrl Files).

2402	Promotion Path Control Files	
ction Code romotion Path .	<u>I</u> JDF73 Transfer to JDF73	
Rec From Typ Data Libr C JDFCTL73 D PGFDTA73 F JDFCTL73 G PGFDTA73 H PGFDTA73 M JDFCTL73 N PGFDTA73 W JDFCTL73 -	To <u>Control Lib</u> <u>Record Type Description</u> <u>JDFTEM71</u> Members Affected <u>JDFCTL73</u> Menu Modifications <u>JDFCTL73</u> Software Inventory Records <u>JDFCTL73</u> DREAM Writer/Processing Option <u>JDFCTL73</u> Vocabulary Overrides <u>JDFTEM71</u> Data Dictionary <u>JDFCTL73</u> User Defined Codes <u>JDFTEM71</u> Pre-Compiler Commands	Control File F9801 F9801 F98301 F9220 F9200 F92005 F98CRTCMD

The From Data Libr column on the Promotion Path Control Files form shows the current location of the data records. The To Control Lib column shows the location to which the data records will be moved.

2. Specify library names for each record type listed on this form.

The following chart shows some of the function keys available on this form.

KEY	RESULT
F9	Redisplays the record for the previously-changed project.
F10	Displays the Promotion Path Members screen.
F13	Displays the CASE Profiles screen.

KEY	RESULT
F14	Retrieves the data library from your CASE profile and fills in the first From Data Libr field. This overwrites any information currently in the field.
F15	Duplicates the library names from the first record type to the remaining record types.

To copy library names from one record type to another, type 1 (Copy) in the OP (Option) field next to the record type you want to copy. Type 2 (Target) in the OP fields next to the record types you want the information copied to, and press Enter. You can specify multiple targets.

Guidelines

If you copy an existing promotion path to create a new path, be sure the library names for the control files are correct for the new path.

To change library names, enter the new library names over the current ones.

Defining a Project

Complete the following tasks:

Locate a project

Add a project

Assign promotion paths

Assign project SARs

From the Version Control menu (G9261), choose Manage Projects.

92413 Manage	Projects
Project Client Originator Assigned To	Code 1 .

The Software Development Project form appears.

- 2. Complete the Software Development Project form.
 - Enter a new project name.
 - Enter a project description.
 - Enter any other information you want to associate with the project.
 - Complete the Code 1–5 fields for additional classifications.
 - The Code 1–5 fields are user defined in system 92, types P1, P2, P3, P4, and P5.
- 3. If you want to attach this project to a parent project, specify the parent project name in the Parent Project field.

KEY	RESULT	
F9	Redisplays the record for the previously-changed project.	
F10	Displays the Project Promotion Paths screen.	
F11	Displays the Project Elements screen.	
F14	Displays the generic text associated with this project, and gives you access to text model selections.	

The following chart shows some of the function keys available on this form.

You must assign promotion paths and SARs to the project you set up here. The following sections explain how to assign them.

To assign promotion paths

- 1. Locate the project to which you want to assign promotion paths using one of the following methods.
 - On Manage Projects locate the project to which you want to assign promotion paths.
 - Enter 2 (Paths) in the OP (Option) field next to the project name.
 - On Software Development Project, press F10 (Promotion Paths).

92411	Project Promo	tion Paths

2. Specify the promotion paths you want to assign to this project.

To display the available promotion paths, press F1 (Help) while the cursor is in a Promotion Path field.

The following chart shows some of the function keys available on this screen.

KEY	RESULT
F9	Redisplays the record for the previously-changed project.
F11	Displays the Project Elements screen.

The following chart shows options available on this screen.

OPTIO N	DESCRIPTION
1	Edit the promotion path details.
2	Edit the promotion path members.
3	Edit the promotion path control files.

To assign project SARs

SARs are elements of a project, and other projects can also be elements of a project.

- 1. Access the Project Elements form using one of the following methods:
 - From the Version Control, choose Edit and Promote.
 - From the Manage Projects, locate the project to which you want to assign elements.
 - Then enter 3 (SARs) in the OP (Option) field next to the project name.
 - From the Software Development Project screen, press F11 (Project SARs).
 - From the Project Promotion Paths screen, press F11 (Project SARs).

The Project Elements screen displays the elements (usually SARs) assigned to the project.

- 2. Specify the elements (usually SARs) you want to assign to this project. You can also assign projects, which have SARs associated with them, as elements on this screen.
 - In the TY (Type) fields, specify the corresponding element types (S for SARs, and P for projects). The following chart shows some of the function keys available on this screen.

KEY	RESULT
F9	Redisplays the record for the previously-changed project.
F10	Displays the Project Promotion Paths screen.

The following chart shows options available on this screen.

OPTION	DESCRIPTION
1	Display or edit the SAR detail.
2	Display or edit the SAR log. The SAR Log Transfer screen appears, which lets you edit the SAR log and update the project SARs. For more information about updating the SARs by using this log, see <i>Update the SARs</i> in this publication. For information about the SAR log, refer to the <i>Computer Assisted Design</i> <i>Reference Guide</i> .
3	Display the Pre-Promotion Edit History screen. For information about this function, see <i>Promote a SAR</i> in this publication.
4	Promote a project. For information about this function, see <i>Promote a SAR</i> in this publication.
5	Display the promotion history of a SAR ('Z' record).
6	Display or edit notes associated with a SAR (for J.D. Edwards environments only; ** record).

Promoting a Project

After you create a project, link promotion paths and SARs to it, and complete project development, you are ready to begin the promotion process. The promotion process has three parts.

Complete the following tasks:

- Update the SARs (F4802) by using the SAR log
- □ Validate the SAR for promotion by performing a pre-promotion edit
- Promote the SAR

Before You Begin

☐ The SAR system uses the Work Order files (F4801 and F4802). If your production environment uses these files, and if the F4802 file has different record types than what version control needs, define a separate library that contains these files for version control purposes only.

To update the SARs

The SARs, which are contained in the Work Order Header file (F4801), have detailed information in the Work Order Detail file (F4802). You must update the information in the SARs to reflect software developments that are recorded in the SAR log.

When you developed the software, the changes were recorded in the SAR log automatically. You now must update the F4802 file.

- 1. From the Edit and Promote screen, inquire on the project you want to promote.
- 2. In the OP (Option) field next to the project SAR you want to update, enter 2 (SAR Log).

The SAR Log Transfer screen appears, which lists all added or changed records logged in the SAR log (F9810) according to record type. The SAR Detail Sts field shows whether the record has been updated in the F4802 file.

                                             JDFCTL73
  Opt: 1=Details
                   9=Delete
                              F5=Add
                                       F10=Update SAR
                                                        F24=More Keys
```

If this screen lists many SAR log records, you can narrow your search by entering information in the Record Type and the and/or Member fields.

NOTE: If you want to view the details of a SAR log item, enter 1 (Details) in the OP (Option) field next to the item. From the screen that appears, you can edit the SAR details. If the SAR logging system does not log an item that you want to include, press F5 (Add) from the SAR Log Transfer screen to add it.

3. To update the F4802 file, press F10 (Update SAR).

IMPORTANT: Before you update a SAR, verify that each SAR log record should be transferred with the SAR. Change or delete those that are associated incorrectly with the SAR. To display all records with data that can be transferred (TR field value is 1) or with test data (TR field value is 0), press F16 (Display Update Capable/All Items). Update only those records that should be transferred with this SAR.

The system creates or updates the records in the SAR file that is located in the SAR library you indicated in the Edit and Promote processing options (not the SAR library appearing in your library list).

Validating a Promotion Path

Before you promote a SAR, you must perform a pre-promotion edit, or validation, against the promotion path that will be used for this SAR.

- 1. From the Edit and Promote screen, inquire on the project you want to promote.
- 2. In the Promotion Path field, type the name of the promotion path you want to use for your project.
- 3. In the OP (Option) field next to the project SAR you want to update, enter 3 (Edit).

NOTE: If you did not choose a promotion path for the project, the Project Promotion Paths window lists all promotion paths defined for the project.

92411W	Project Promotion Paths
Project <u>TEC</u>	Tech Foundation Corre
O Path Name D A62CUM T A62PC000TI U A71CUM T JDF62 T JDF62TEC T JDF71 T JDF71TEC T	escription ransfer to current A62 Cum ser based pricing ransfer to current A71 Cum ransfer to current A72 Cum ransfer to JDF62 ransfer to JDF62-SECURE ransfer to JDF71 ransfer to JDF71-SECURE

In the O (Option) field next to the promotion path you will use to promote the project, enter 4 (Select). If you have run pre-promotion edits previously for this SAR, the Pre-Promotion Edit History screen lists them. Otherwise, this screen is blank.

NOTE: To view the errors associated with a pre-promotion edit, enter 1 (Details) in the OP (Option) field next to the desired history record.

/			
	92431	Pre Promotion Edit Details	
	Project TEC SAR Number 1079777 Promotion Path . JDF73 Date of Edit 01/22/96 Time of Edit 9:17:28	Tech Foundation Corrections Multiple Jobs Submitted Transfer to JDF73

	Opt: 1=Error Details	F24=More Keys	

- 4. From the Pre-Promotion Edit History screen, press F5 (Perform Edit) to perform the pre-promotion edit.
- 5. Correct any errors and perform the edit until no errors occur. You do not need to resolve warnings that may occur.

The following table shows a partial list of errors and how to resolve them.

Error Code	Cause and Resolution
0020	Cause: A'From' library you entered does not exist or you are not authorized to use it.
	Resolution: Either correct the library name, create the library, or get authorization to use it.
0092	Cause: A database table or member could not be opened because it did not exist, a conflicting lock state held by another job exists, or you are not authorized to open it.
	Resolution: Check your job log messages.
1046	Cause: An XJDE or ZJDE version was expected but not found.
	Resolution: If an XJDE or ZJDE version should exist, create it. If not, then change the processing option for form ID P926304.
1370	Cause: A 'From' table you entered does not exist or you are not authorized to use it.
	Resolution: Review the 'From' library for the promotion path control table. Either correct the library name or create the table.
1371	Cause: A 'To' table you entered does not exist or you are not authorized to use it.
	Resolution: Review the 'To' library for the promotion path control table. Either correct the library name or create the table.
1372	Cause: A key you wanted to copy from the 'From' library does not exist.
	Resolution: Review the 'From' library for the promotion path control table. Either correct the library name or re-enter the data record.
2892	Cause: A 'From' library name is the same as the corresponding 'To' library name.
	Resolution: Review the 'From' and 'To' libraries for the promotion path control table. Make the appropriate changes.

4395	Cause: No records exist in the Promotion Path Members table (F92401) for the promotion path you specified.
	Resolution: Complete the Promotion Path Members form for the promotion path.
4396	Cause: No records exist in the Promotion Path Members table (F92401) for the promotion path you specified.
	Resolution: Complete the Promotion Path Control Files form for the promotion path.
4397	Cause: No records exist in the SAR Log table (F9810) for the project you specified.
	Resolution: In the project master record, change the based-on table for the Pre-Promotion Edit to the SAR Detail table (F4802), then manually update the SAR Detail records for the members and control table records updated by this project.
4400	Cause: No record exists in the Promotion Path Members table (F92401) for the function code of the member you want to promote.
	Resolution: For the specified promotion path, enter the environment for the function code of the member.
4402	Cause: No record exists in the Promotion Path Control Files table (F92402) for the control table you want to promote.
	Resolution: For the specified promotion path, enter the environment for the control table of the record.
4439	Cause: An error occurred while you attempted to copy a source code member.
	Resolution: Check for valid library, table, and member names, as well as options in the CPYF command. Check the job log for the error message ID.

Promoting a Project

The promotion process involves transferring members and copying control file data.

Before You Begin

- ☐ Before you promote the project, be sure you have edited all items that appear on the SAR Log Transfer screen. Otherwise, the SAR Log Transfer screen appears when you attempt to promote the project.
- You must update all SAR log records associated with the SAR before you promote it.
- ☐ You also must resolve all errors (not warnings) before you promote the SAR.

To promote a project

- 1. From the Promote a Project screen, inquire on the project you want to promote.
- 2. In the OP (Option) fields next to the project elements you want to promote, enter 4 (Promote).

NOTE: Press F14 to select all project elements automatically for promotion.

The Project Promotion Paths window appears.

3. In the O (Option) field next to the promotion path you want to use, enter 4 (Select).

Project SAR Number	TEC	Tech F 77 Multin	oundation C	orrections

D Member D J924147 P92402 P924124 P924127 P924127 P924147 V92402	Fr JDECLSRC JDESRC JDESRC JDESRC JDESRC JDESRC JDESRC	om Environm Src Libr PGFSRC73 PGFSRC73 PGFSRC73 PGFSRC73 PGFSRC73 PGRSRC73	ent Obj Libr PGFOBJ73 PGFOBJ73 PGFOBJ73 PGFOBJ73 PGFOBJ73 PGFOBJ73	Src File JDESRC JDESRC JDESRC JDESRC JDESRC JDESRC	De Environme <u>Src Libr</u> JDFSRC73 JDFSRC73 JDFSRC73 JDFSRC73 JDFSRC73 JDFSRC73	ent <u>Obj Libr</u> JDFOBJ73 JDFOBJ73 JDFOBJ73 JDFOBJ73 JDFOBJ73 JDFOBJ73
Opt: 1=Src	: & Obj 2=Sr	c 3=0bj F4=	More F5=Ctl	Files F6=C)verride F15	=Edit Hist

4. In the OP (Option) fields next to the member IDs, specify whether to transfer:

Both source and object code (option 1) Source code only (option 2), or

Object code only (option 3)

NOTE: To override the From Environment and To Environment object libraries before you transfer the members, press F6 before you enter options 1, 2, or 3. Enter the names of the object libraries to which you want the members transferred.

The system transfers the members you selected to the target environment.

NOTE: You can review the batch job that was submitted by this transfer program from the J.D. Edwards command line. To display the command line, press F2.

If your promotion is successful, the system deletes all SAR log records for transferred items. It also creates a new SAR log record for each transferred item and associates it with the target library.

5. To copy control file data, press F5 (Control Files) from the Software Transfer screen.

```
    924127

6. In the OP (Option) fields next to the items you want to copy, enter 1 (Copy to target library).

NOTE: Press F13 to select all items automatically for copying.

The system copies the items you selected to the target environment.

Promoting Project Updates

The version control process for project updates includes the following general steps.

Create the transfer library Prepare the SAR system Define promotion paths Define a project Update the SARs Validate the promotion path Promote a SAR Save the transfer library to tape (or to a save file for a network) Restore the transfer library from tape (or from the save file) Print the transfer library report Load the transfer library

Creating the Transfer Library

- To create the transfer library
- 1. From the Software Install menu (G9262), choose Build Transfer Library.

	MADAT	NCLL			
specify a l software t All data	WARNI library that a transfer libra a and objects	lng!!! lready exis ry it will in that lib	ts on you s be cleared rary will }	system to be prior to us pe lost.	e used se.
library you	a specify does	not exit i	t will be o	created for	you.
	(F6 – E	Execute)			
	specify a l software t All data library you	WARNI specify a library that a software transfer libra All data and objects library you specify does (F6 - F	WARNING!!! specify a library that already exis software transfer library it will All data and objects in that lib library you specify does not exit i (F6 - Execute)	WARNING!!! specify a library that already exists on you s software transfer library it will be cleared All data and objects in that library will b library you specify does not exit it will be c (F6 - Execute)	WARNING!!! specify a library that already exists on you system to be software transfer library it will be cleared prior to us All data and objects in that library will be lost. library you specify does not exit it will be created for (F6 - Execute)

2. After you read the warning message, press F6 (Execute).

/					
	98312	Build Transfe	r Libra:	ry	Form ID P92414
	Build Skeleton Transfer L	ibrary			Display Level. 4

	F	5=Printer Over	rides		

3. In the processing option field, enter a name for the transfer library you want to create.

To prepare the SAR system

To prepare your SAR system, see *Prepare the SAR System* in this publication.

To define a promotion path

From the Version Control menu (G9261), choose Manage Promotion Paths. Use the project update library name as your promotion path name. For information about defining a promotion path, see *Define Promotion Paths* in this publication.

To define a project

To define a project, see *Define a Project* in this publication.

To update the SARs

From the Software Install menu (G9262), choose Edit and Promote. For information about updating a SAR, see *Update the SARs* in *Promote a SAR* in this publication.

To validate the promotion path

From the Software Install menu (G9262), choose Edit and Promote. For information about validating a promotion path, see *Validate the Promotion Path* in *Promote a SAR* in this publication.

To promote the project

From the Software Install menu (G9262), choose Edit and Promote. For information about promoting a SAR, see *Promote the Project* in *Promote a SAR* in this publication.

Saving the Transfer Library to Tape

• To save the transfer library to tape

1. From the Software Install menu (G9262), choose Save Library to Tape.

```
      Save Library (SAVLIB)

      Type choices, press Enter.

      Library .......
      MYLIERARY Name, *NONSYS, *ALLUSR, *IBM

      + for more values
      TAP01

      Device .....
      .....

      + for more values
      TAP01

      Name, *SAVF
      Save Save

      F3=Exit
      F4=Prompt
      F5=Refresh

      F13=How to use this display
      F10=Additional parameters
      F12=Cancel
```

- 2. In the Library field, type the name of your transfer library.
- 3. In the Device field, enter the name of your tape device.

Restoring the Transfer Library from Tape

- To restore the transfer library from tape
- 1. From the Software Install menu (G9262), choose Restore Library from Tape.

Restore	Library (RSTL	IB)	
Type choices, press Enter.			
Saved library	MYLIBRARY TAP01	Name, *NONSYS Name, *SAVF	, *ALLUSR, *IBM
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	F10=Additiona F24=More keys	l parameters	Bottom F12=Cancel

- 2. In the Saved Library field, type the name of your transfer library.
- 3. In the Device field, enter the name of your tape device.

Printing the Transfer Library Report

To print the transfer library report

1. From the Software Install menu (G9262), choose Print Transfer Report.

A processing options screen appears. Use the roll keys to display additional processing options.

98312	Print Transfer report	Form ID P924143
Control File Changes to be	e Installed	Display Level. 4
This job has various optic press ENTER to continue.	ons described below. En	ter the desired values and
Enter name of Transfer Lib	orary.	MYLIBRARY
Print UDCs	1=Yes, 0=No.	1

Loading the Transfer Library

Before You Begin

Before you load the transfer library, you must create new target libraries for the objects, source code, and data files you will transfer. In your target source library, you must create the following multi-member source files:

JDESRC

JDECPY

F98CRTCMD

To load the transfer library

Load the contents of your transfer library into your target libraries. The process merges control file records into your library files. You also can transfer control file records individually. For more information, see *Transfer Individual Control File Records* following this procedure.

1. From the Software Install menu (G9262), choose Load Transferred Library.

```
WARNING!!!

This program will transfer source code, objects and new data files into the

libraries you name in the processing options. It will also add to or

replace data in the control files in your current library list.

It is recommended that you first run the 'Print Transfer Report' to view

control file changes.

( F6 - Execute )
```

2. After you read the warning message, press F6 (Execute).

A processing options screen appears. Use the roll keys to display additional processing options.

/		
	98312 Load Transferred Library	Form ID P924147 Version ZIDE0001
	Load Transfer Software	Display Level. 4
	This job has various options described below. Entpress ENTER to continue.	ter the desired values and
	Enter name of Transfer Library or blank for no transfer.	MYLIBRARY
	Enter name of Target Object Library or blank for no transfer.	MYOBJ
	Enter Name of Target Source Library or blank for no transfer.	MYSRC
	EnterName of Target New Files Library or blank for no transfer.	MYDATA
	More	+
	F5=Printer Overrides	

98312	Load Transferred Library	Form ID P924147
Load Transfer Software		Display Level. 4
This job has various opt press ENTER to continue.	ions described below. Enter	the desired values and

Transfer SVR	1=Yes, 0=No	0	
Transfer DREAMWriter	1=Yes, 0=No	0	
	Bottom.		
	F5=Printer Overrides		

- 3. In the first processing option field, specify the name of your transfer library.
- 4. In the next three fields, specify the libraries you created for the source code, objects, and data files you will transfer.
- 5. In the remaining fields, select the control files you want the system to transfer.
- 6. To begin the transfer, press Enter.

IMPORTANT: The system merges the control files into the target data library. For non-control files, the system adds the file if it currently does not exist in the target data library. If the file does exist in the target data library, the system does not transfer the file or any data. After the transfer process completes, you must change these files manually based on information in the Print Install Records report (P924143).

NOTE: Even though you can include next numbers in the transfer library and display information about them in the Print Install Records report, the system will not transfer them automatically. This protects your next number tables. After the transfer process completes, you must change them manually based on information in the report.

Transferring Individual Control Table Records

- To transfer individual control table records
 - 1. From the Software Install menu (G9262), choose Copy DD,VO,DW,UDC,SVR,Menus.

99630 Сору	DD, VO, DW, UDC, SVR, Menus
From Library <u>MYLIBRARY</u>	To Library <u>MYDATA</u>

Vocabulary Overrides .	Language Appl Ovr
DREAM Writer Form	Language
User Def Codes Sys Type	Language
Software Versions Rep	
Menu Identification	
Generic Rate/Msg Sys Type	
F24=Mo	re

- 2. In the From Library, type the name of your transfer library.
- 3. In the To Library, type the name of the target data file library.
- 4. In the appropriate fields, enter information that is specific to the control file record you want to transfer.

Programming Tools

Objectives

To work with data modeling To understand the Software Versions Repository To set up user defined values To retrieve information To create data description specifications To design and maintain display forms To design reports

About Programming Tools

Perform the following tasks:

- U Work with Data Modeling
- Work with Software Versions Repository
- Work with the Object Cross–Reference Repository
- Work with Data Dictionary
- U Work with Data File Design Aid
- Work with Screen Design Aid
- Work with Report Design Aid

Working with Data Modeling

The Data Modeling feature provides graphic representation of the relationships of different files. The important aspects of J.D. Edwards Data Modeling feature are:

It is graphical in its presentation.

It allows you to narrow the amount of information you view so you can better analyze the file and data relationships.

It is integrated back to the data dictionary and other cross reference tools.

Because data models only display files for those systems you have installed at your location, the examples in this section may vary from the ones at your company.

In order to create a data model, you must run the Data Model rebuild.

Accessing Data Modeling

There are two ways to access Data Modeling.

To access data modeling

1. Use one of the following two methods to access Data Modeling.

Inquire on the file through the Software Versions Repository and then press F23

Select Data Modeling from Model Relations

The Data Model Diagrammer displays models from Base Files stored The Data Model Diagrammer displays models from Base Files stored in the Entity Relationship Tracking file (F9804). When using the Data Model Diagrammer for the first time, rebuild the Cross Reference Index of the menu G9642. This rebuild will create data in the Entity Relationship Tracking file and allow file relationships to be built. (F6 - Execute)

A menu message screen appears suggesting the sample data you can use to view a supplied data model.

2. Press F6 to continue.

98042	Data Modeling	Max Levels . 08
Base File	2404 104022119	Function Use <u>230</u> Display Dupl <u>1</u> In Sys <u>00 09 03 04</u>
Opt: 1=Move Top	5=Display 7=Where Used 8=F	ields F11=Install/Reporting

The Data Modeling screen appears with the cursor positioned in the field where the user enters a file name.

3. To view the Data Model, enter a file name and press Enter.

Field	Explanation
Max Levels	Determines what level of detail you want to view in terms of file relationships. Level 1 represents the highest level and level 10 represents the lowest level. The default value is level 08. Level 01 shows only those files that are directly related to the data model file.
Function Use	Displays the files that either match or have a function use less than the specified function use you specify.
Display Dupl	Determines whether you want to display duplicate relationships or not. The valid values are: 1 – no duplicates (default value) 2 – first logical only 3 – all files
In Sys	Limits your model to only those files from the specified install or reporting system codes. To toggle to reporting system codes, you press F11, Install/Reporting.

4. To narrow the amount of file information displayed specify values in the four fields appearing in the upper right of the screen.

(
	980	042				Dat	a Modelin	g	Max Levels . <u>08</u> Function Use 230

Detailed Explanation of a Line

Business Unit Master is the primary file (F0006)

Company Constants is the secondary file (F0010)

 $<\!\!\mathrm{m}\!:\!|\!>$ – There is a many to one, two way direction relation between the files

Field	Explanation
Quantifier	The quantifier notation indicates the following: M:1 – many to one 1:M – one to many M:M – many to many M:N – many to zero or many N:M – zero or many to many 1:N – one to zero or many 1:1 – one to one
Direction	The three direction notation are as follows -> refers to <- referred to <-> two way relation
Туре	Used to distinguish between prototype and permanent files
Subfile portion of screen	Displays the key fields that relate these two files together

Function Key Exits from Data Modeling

Install/Reporting

Allows the user to toggle between displaying install or reporting system codes.

Rebuild A File Relationship

To rebuild a data model.

Exits to a DREAM Writer versions list.

The rebuild is fundamentally based upon the program finding a connection between data items.

For example:

If you create new data items in the Data Dictionary and use those data items when creating a new file, you will *not* get a graphic representation for that file because the data items do not exist in any other file. In order to create and present file relationships, there must be at least one data item in the primary file that also resides in some other file as well.

Selection Exits from Data Modeling

Selection 1 – Move Top

To select a file in the current data model and move it to the top to view its data model.

Selection 5 – Display

To view the file relationships

The Define a File Relationship screen appears displaying the relationship detail for the two files.

Selection 7 – Where Used

Exits to the Object Cross Reference Repository and displays all the programs that access the particular file.

980014	Cross Reference

Working with the Object Cross Reference Repository

The Object Cross-Reference Repository locates all the objects associated with a particular member or object. When you add a new member to the Software Versions Repository, run the Rebuild Cross-Reference job to have the new member included in the display. You must have source on your machine to run this rebuild and display this option.

Complete the following tasks:

Access the Object Cross–Reference Repository

Conduct an Object Cross–Reference Repository search

Accessing the Object Cross–Reference Repository

To access the Object Cross–Reference Repository

Select one of the following methods.

From the Master Directory, select the Technical and Advanced Operations menu. From the Technical and Advanced Operations menu (G9), select Documentation Services. From the Documentation Services menu (G91), select Object Cross Reference Repository.

From Software Version Repository use F15 to access the Object Cross Reference Repository.

Example

The screen below displays all programs using the file F0006.

The first four fields on this screen relate to the object being cross-referenced. The remainder of the screen lists the members found during the cross-reference search.

980014 Object: Name Type To D Func	Object Cross Ref. Repository <u>F0006</u> Business Unit Master <u>F</u> All programs using fil- isplay <u>P</u> t Cd	e
O Name P	Description Business Unit Master Conversion Report - Payroll Check Register Report - Certified Payroll Register Tip Credit Generation with Interim Check Sales Allocation Report STAR - Columnar Spreadsheet Submit Network Job Texas 250 Report Gas Balancing - Entitlement Extract Gas Balancing - Entitlement Explosion to Gas Balancing Statement by Sales Point	Field Attr T Start Upd <u>Len Dec</u> Y <u>Loc Y/N</u> Y N N N N N N N N N N N N N
_ P26119	Gas Balancing Master Subfile Display 2=Create Object 3=Field Expl F21=Print	N F16=Regenerate

Conducting a Search

All members of the Software Versions Repository are cross-referenced, and you can search for these relationships in different ways.

From the Documentation Services menu (G91), select Object Cross Ref. Repository.

The following screen displays the statistics for program P0006.

								_		
980	014		Objec	t (Cross Ref. Rep	ository				
Obj	ect: Name Type To D Func	isplay t Cd .	<u>P0006</u> <u>P</u> #	1	Business Unit Statistics for	Master R program	Revision: N	s - S	ingle	
O P	Name	Des	scription				Field Len	Attr Dec	T Start Y Loc	Upd Y/N
		Total	Statements	in	RPG II					
_	1,259	Total	Statements	as	Comments					
	1,313	Total	Statements	in	RPG III					
_	3,993	Total	Statements	in	Program					

1. To conduct an object cross-reference repository search, enter an object Name, Type code and To Display code. To narrow the search, enter a Funct Cd.

If you are unfamiliar with the Cross-Reference Relationships codes, type an asterisk (*) in the Type field, as shown below. Press Enter.

The window opens, and the Cross Reference Relationships codes appear.

Object: Name Type To D Funct	F0006 <u>*</u> isplay _ Cd	Business Unit Master	
O Name	Description		Field Attr T Start Upd Len Dec Y Loc Y/N
<u>)</u>			<u>Len</u> <u>Dec</u> Y <u>Loc Y/N</u>

About the Data Dictionary Repository

The Data Dictionary is singularly the most powerful element in all of J.D. Edwards' software offerings. We define all data items used by J.D. Edwards programs in the Data Dictionary. By requiring this up-front definition, the Data Dictionary enforces uniformity, consistency, and accuracy across all J.D. Edwards applications.

The Data Dictionary represents a centralized glossary of all:

Field definitions Program error messages, both interactive and batch Menu messages Work fields User Defined Help instructions Program and field descriptions accessed by the Help facility Complete the following tasks:

- Understand the Data Dictionary structure
- Locate a data item name
- Work with the Data Dictionary
- Work with data item alias revisions
- Work with Data Dictionary glossary
- Work with user defined help instructions
- Work with data field descriptions
- Work with the next numbers facility
- Locate the field reference rebuild

Understanding the Data Dictionary Structure

Eight separate files comprise the Data Dictionary Repository.

The following diagram illustrates the relationships between these files.

Data Item Master (F9200)

This is the master file for the Data Dictionary. Every data item has a record in this file.

Data Field Specifications (F9201)

This file contains database fields, which is a glossary group of "D" or "S," work fields, glossary group "U," and categories, glossary group "C." This file contains the base display/validation rules for all file and data items.

Data Field Display Text (F9202)

This file lets you define multiple row descriptions and column titles for each data item, based upon language and/or reporting system — application override. You may add a language value for each language translation required for the row description and column title. The reporting system code allows the entry of jargon or company terminology.

Data Item Alpha Descriptions (F9203)

This file contains the alpha and compressed descriptions for all data items. This allows users to perform a Data Dictionary search by description. You may also specify separate alpha descriptions by language preference and reporting system. Every data item has a record in this file.

Data Item Aliases (F9204)

This file only contains database fields, which is a glossary group of "D" or "S". This file contains multiple aliases for both a COBOL alias and a C alias for each data item.

Error Message Program ID (F9205)

This file contains error messages that have a program, video, or report ID attached to them. The user exits to this program, video, or report when he/she receives the error. For example, if a user receives a user defined code error, he/she could exit to User Defined Code Revisions program to modify a value.

Glossary Text File (F9816)

This file contains the glossary text for every data item. Each line of text in the glossary is one record.

Key Index File (F98163)

This file contains key information to link the data items to their glossary and to specific items.

Locating A Data Item Name

The system uses data items to define the parameters of a field or message. For example, AT1 defines the field Search Type. The system maintains each data item used in a file or retrieved for a form or report based on a data item name, such as AT1. To work with the Data Dictionary functions you need to know this name.

To locate a data item name

The J.D. Edwards field-level help displays data item names.

Position the cursor on any field and press F1.

For example, position the cursor in the Search Type field on the Address Book Revisions form and press F1. The User Defined Codes form displays for the Search Type field. In the upper right corner of this form is the data item name for the Search Type field, which is AT1.

01051	Address Book Revisi L	ons ong Addr No.	÷+
Action Code Address Number	·	esp. Bus. on.	IL
Alpha Name	·		Search Type
81QM User 01 ST Skip To Code _ A _ C _ C _ F _ F _ I _ J _ J _ M _ O	Defined Codes Window AT1 Search Type Applicants Customers Employees Facilities Investors Jobs Mail Distribution List Company		Receivable Y/N Employee Y/N User Code Subldgr Inact
_ P _ Q Opt: 4=Selec	Prospects Participants t F9=Glossary F14=Memo	· ·	
		13=Add'l 1	Info F24=More

The data item name is always in the upper right corner of the help form, no matter which help form displays, such as the User Defined Codes form or the field explanation form.
Working with the Data Dictionary

The Data Dictionary provides many useful abilities. You can create data item aliases for other programming languages, work with the glossary, add or change user defined help instructions, and locate data field descriptions.

To work with the Data Dictionary

From menu G92, choose Data Dictionary. The Data Dictionary form displays.

9201 Action Code Data Item	Data Dictionary	Rls Last Chg Item Parent.
Glossary Group 	General Information -	
Reporting System System Code Data Item Class	Type Size Item Occurrences	Data File Decimals Display Decimals
Row Description Column Title	Descriptions -	
Default Value Data Display Rules _ Data Edit Rules	Default and Display/Edit Rules	Justify
Search Program Next Nbr System	Next Number Index	
F4=Search F8=UDC	F9=Prev F10=Glossary F11=Descri	ptions F15=Where Used

You will find the Data Dictionary selection on several J.D. Edwards menus and repository services.

Also display Data Dictionary by entering the mnemonic DD in the Selection line of any J.D. Edwards menu.

Use the following fields where applicable:

Field	Explanation
Release Number	The release number as defined in the Software Versions Repository file.
Data Field – Parent	A data item which becomes the template from which other data items are created. For example: AC (Category Codes) is the parent to AC01.

Field	Explanation	
Data Item	The RPG data name. This data field has been set up as a 10-byte field for future use. Currently, it is restricted to 4 bytes so that, when preceded by a 2–byte table prefix, the RPG data name will not exceed 6 bytes.	
	Within the Data Dictionary, all data items are referenced by this 4–byte data name. As they are used in database tables, a 2–character prefix is added to create unique data names in each table specification (DDS). Special characters are not allowed as part of the data item name, with the exception of #, @, \$.	
	You can create protected data names by using \$xxx and @xxx, where you define xxx.	
Glossary Group	A code which designates a type of data used to select data dictionary terms for printing. See User Defined Codes, system code '98', record type 'GG'.	
	The data item names for error messages are assigned automatically.	
	The data item name for a non-database field (used on a video or report but not in a file – glossary group U) must begin with a #.	
Description–Alpha	Categorizes data item names. Enter text in upper and lower case. The system uses this field to search for similar data items. To enter an alpha description, follow these conventions: Dates – Begin all Date fields with Date - Amounts – Begin all Amount fields with Amount - Units – Begin all Unit, Quantity, and Volume fields with Units - Name – Begin all 30-byte description fields with Name - Prompt – Begin any Y/N prompting field with Prompt - Address Number – Begin all address numbers (employee, customer, owner) with Address Number	
System Code/Reporting	A code that designates the system number for reporting and jargon purposes. See UDC 98/SY.	
System Code	A user defined code (98/SY) that identifies a J.D. Edwards system.	
Data Item Type	The type of data. The data item types are defined in User Defined Codes, system code '98', record type 'DT'. Note: All amount fields should be entered as 15 bytes, 0 decimals, and data item type should be P (packed).	
Data Item Size	The field size of the data item.	
	NOTE: All amount fields should be entered as 15 bytes, 0 decimals, and the data item type should be P (packed).	
Data File Decimals	The number of positions to the right of the decimal of the data item.	

Field	Explanation		
Data Item Class	Data item class. A class defines the essential attributes and characteristics of a data item. Informational only.		
Number of Array Elements	In setting up a data item in the data dictionary, you may specify a number of array elements. This will cause the automatic creation of one additional data item for each array element.		
	The array data item names are restricted to certain lengths depending on the number of array elements: 3 bytes – 1 to 9 elements 2 bytes – 10 to 99 elements 1 byte – 100 to 999 elements		
Data Display Decimals	Use this parameter to designate the number of decimals in the currency, amount, or quantity fields the system displays. For example, U.S. Dollars would be 2 decimals, Japanese Yen would be no decimals, and Cameroon Francs would be 3 decimals.		
Row Description	Creates the title on text and reports. It is used in a manner similar to the column description in the query facility. It should be less than 35 characters. Use abbreviations whenever possible. For example: U/M Units of measure YTD Year-to-date MTD Month-to-date PYE Prior year end QTY Quantity G/L General ledger A/P Accounts payable DEPR Depreciation		
Column Title 1 – XREF build	The first line of description that will be used in column headings on a report or form. This description should be no larger than the data item size, if possible. If the column heading is only one line, it should be placed in this column. Use the second line of the Column Title when one is not clear.		
Value for Entry – Default	Used as the initial value on the data entry screen for the associated data item. The value entered must be the exact same length as the data item size. Place single quotes around the value if it contains any embedded blanks. The keywords *BLANKS and *ZEROS can be used as the default value. When entering a numeric data item with default values, the redisplay of the data item suppresses all leading zeros.		
	CAUTION: If a blank entry is allowed, default values should not be used.		

Field	Explanation
Data Display Rules	Keywords which decribe a formatting technique applied when data is displayed.
	The developer can override these rules at the time of program creation.
	The current list of these rules is kept in the User Defined Codes table 98/DR.
Data Edit Rules	Keywords which decribe an editing technique applied when data is entered. Validation applied to the data after Enter is pressed.
	The rule will be applied as specified in the F9207 table at the screen/report and/or the action code as desired.
	The developer can override these rules at the time of program creation.
	The current list of these rules is kept in the User Defined Codes at SYSTEM = 98 and RECORD TYPE = ER.
Help Text Program	The Help Text Program field is used to call a program when the function key - F1 is pressed on its Data Item. When F1 is pressed, the program entered in this field will be executed. If this field is left blank, the glossary will be used. If you wish the User Defined Code window to appear when F1 is pressed, enter '*UDC' in this field (this is the default when 'UDC' is entered in the Data Edit Rules field). If you do not want the UDC window to appear and you have 'UDC' in the Data Edit Rules field, change this field to be blank.
	Program Requirements: For your text program to work correctly, you must allow it to accept three standard parameters: PARM 1 Field Name, size 10, type alpha PARM 2 Return Value, size 30, type alpha PARM 3 Return Description, size 30, type alpha
System Code – Next Numbers	Designates the system number for the Next Number retrieval. See User Defined Codes, system code '98', record type 'SY'.
Next Numbering Index Number	The array element number retrieved in the Next Number Revisions program. For example, the next voucher number is array element '02' of system '04'.

What You Should Know About

Data Dictionary Security	Once a system is operational, you must be particularly careful to secure the integrity of the Data Dictionary. Two facilities are provided to aid you with the security:
	 Operational systems coding — System numbers and names are defined in User Defined Codes, system code 98, record type SY. If you place an X in the second line of description for a particular system, it will be designated as operational. Once a system has been set up as operational, all data fields coded to this system are protected from modifications. This control, however, can be violated by removing the X in User Defined Codes. Action Code Security — A more prudent form of control is to assign change/delete authority to only one individual, the database administrator. If you choose to use this control, you should restrict access to the Data Dictionary program (P9201) in Action Code Security. See <i>Working with Action Code Security</i>. All users must be set up with add authority only. The database administrator would be set up with add/change/delete authority.

The Function Keys for the Data Dictionary

The following function keys are available from the Data Dictionary form.

F4 — A data item search facility. If you are a double-byte user, you must provide a search description for each data item you create or change in order for the search facility to function properly. Enter the search text in the Search Description field on the Data Dictionary screen.

- F6 Repository Services
- F8 User Defined Code Tables
- F9 Automatic Reinquiry
- F15 A data item cross reference

Working with Data Item Alias Revisions

Use the Data Item Alias form to assign alias names to a data item that other programming languages will use. When adding a data item of glossary group "D" or "S," you must enter an alias for that field. This window automatically appears on an Add function when the alias is not unique. The alias defaults from the alpha description.

To work with data item alias revisions

From Data Dictionary Repository

1. Press F5. The Data Field Alias form displays.

9201	Data Dictionary Repository Rls Last Chg Item Parent.	·)
Action Code <u>AT1</u> Data Item <u>AT1</u> Glossary Group . D Alpha Desc <u>Sear</u> Reporting System <u>01</u> System Code Data Item Class Row Description <u>Sear</u> Column Title <u>S</u> T	9204 Data Field Alias Action Code I Data Item <u>AT1</u> Search Type Alias Type <u>Alias</u> <u>1 ADDRESS TYPE 1</u> <u>2 Address Type1</u> <u></u>	 imals als
Default Value Data Display Rules Data Edit Rules <u>UDC</u> Search Program Next Nbr System		Justify
F4=Search F8=UDC F9=1	Prev F10=Glossary F11=Descriptions F15=W	here Used

2. Enter an alias type and name.

An alias name must be unique to the system or the system will not let you exit from the Data Field Alias form.

Current alias types required:

1 = PL1 or COBOL

2 = C language

An alias needs to adhere to J.D. Edwards' syntax rules of the 'C' language.

Working with the Data Dictionary Glossary

What are the Data Dictionary Glossary Groups?

The Data Dictionary consists of several glossary groupings that define the data item in the J.D. Edwards software. All glossary groups typically have associated text. The glossary stores this text. The major glossary groups follow:

Ε	J.D. Edwards interactive error messages
	J.D. Edwards defines interactive error messages with numbers less than 5000 and with numbers from 000A to 999Z. For example, 0001 or 595C Client defines interactive error messages with numbers
	from 5001 to 9999
М	Menu Messages
	J.D. Edwards defines menu message data items as MENUMSGxxx, where xxx represents a number. For example, MENUMSG044
	Client defines menu message data items as MENUCLTxxx, where xxx represents a number
J	J.D. Edwards batch error messages
	J.D. Edwards defines batch error messages with JDExxxx, where xxxx represents a number less than 7000. For example, JDE0001 or JDE5000
	Client defines batch error messages with JDExxxx, where xxxx represents a number greater than 7000 and less than 9000
	The QJDEMSG message file contains batch error messages
	A J.D. Edwards program found on Rebuilds and Global Updates (G9642) must build the batch error messages files QJDEMSG
С	Data Item Functions Categories
	Groups common data elements
	For example, CURRENCY

D or S	Primary or Secondary Data Items
	Used for validations Text on Videos Text on Reports Field Reference Files – F98FRFA–Z \$ and @ For example, AC for a D data item; AC01 for an S data
	item
F	Files
G	General Narrative — use to add information about a specific data item
Н	User Defined program Helps
	Client use only for adding custom helps for J.D. Edwards programs For example, U00MENU
L	Report Messages — messages or warnings for certain procedures, or letters written and produced through DREAM Writer
Ν	Program Notes
	Used by programmers to type notes about a program in the system Add the notes to the glossary in the Data Dictionary
	Create notes to the grossilly in the Data Dictionary Create notes for a program, add a data item with an "N' as a prefix in front of the program name. For example, N01051 for program notes about Address Book Revisions View the notes using F9 off the Help Task List form for the Address Book Revisions form
Р	Program Purposes
	Used in the general summary help instructions Used for the Program Generator Product For example, P01051
R	Report Data Elements — the majority of these data items are letters produced through DREAM Writer

 T Terms
 These data items are definitions of commonly used terms The prefix of the data item name is "TERM." For example, the AAI definition is in the glossary under the data item TERMAAI.
 U For work fields that a program utilizes Begin with # For example, #AA

To work with the glossary

1. From Data Dictionary, press F10. The Data Item Glossary Revisions form displays.

If your glossary group is E, H, J, or M, this form automatically displays when you press Enter on the main Data Dictionary form.

92001 Data Item Glossary Revisions Language Applic Override Scrn/Rpt Action Code <u>AT1</u> Desc Search Type

2. Do the following that applies:

Use the Language, Applic Override, and Scrn/Rpt fields for jargon. See About Language and Jargon for details.

Use Roll keys to see additional text lines.

When entering an "E" glossary group item, which is an interactive error message, use F5 to define a program, video, or report to reference when the system displays the error message.

On double-byte machines, this form displays the Search Desc field. To ensure the data item search facility will function properly, you must enter a search description for each data item you create or change. You can enter it on this form or on the Data Dictionary form.

3. Always leave the last two character positions of each text line blank.

Field	Explanation
Data Item	If you are adding an error message, this field must be left blank. The system assigns the error message number using next numbers. The name appears on a successful add. You should assign interactive error message numbers greater than 5000.
Glossary Group	NOTE: If you need to assign your own error message numbers, use 4 digit numbers greater than '5000'.
	For help text (glossary group H), the data dictionary "Inquiry/Revision Program" field may be used to specify the name of a follow-on item.
	To create your own messages for the IBM message file (glossary group J), begin the data item name with your own three characters (e.g., CLT0001).

Working with User Defined Help Instructions

The easiest way to modify help instructions is to utilize the User Defined Instructions in Data Dictionary.

To work with user defined help instructions

From Data Item Glossary Revisions

2. Enter specific jargon or language descriptions for each data item. See *About Language and Jargon* in *Technical Foundation* for details.

Working with the Next Numbers Facility

The Next Number facility controls the automatic numbering for such items as new G/L account numbers, voucher numbers, address numbers. It allows you to specify what numbering system you want to use and gives you a method of incrementing numbers to reduce transpositions and keying errors.

Complete the following tasks:

Locate the Next Numbers facility

Work with Next Numbers by company and fiscal year

To locate the Next Numbers facility

From menu G00, choose Next Numbers.

0002	Next Numbers
Action Co System Co	de <u>D</u> de <u>D9</u> General Accounting
	Use Next Number Check Digit
	Next Account ID 21831 Journal Entries 1946 Consol Accounts 90000214
CAUTION: Changing previous duplicat	g the data on this screen may make it impossible to retrieve sly added addresses and may result in attempts to assign se numbers.
	F8=Next Numbers by Co/FY F24=More Keys

What You Should Know About

Next Numbers	The next numbers file is F0002
	10 element array 1 record per system Modulus 11 check optional
	Once set, don't change
	Has an impact on system performance Will not duplicate numbers. When it reaches max, starts over Cannot change position of user or add new entry without programming modifications
	Ties with the Data Dictionary
	Data Item in Data Dictionary points to the Next Number System. For example, System Code 09 AID Data Item

To work with Next Numbers by company and fiscal year

1. From Next Numbers, press F8.

2. Set the Next Number constant field to maintain next numbers by

Company

Company and Fiscal Year

Use Next Number by Company for these original documents:

Journal Entries

Accounts Payable Vouchers

Accounts Receivable Invoices

Sales Orders

Purchase Orders

About the Field Reference File

What is the Field Reference File?

The Field Reference File contains the specifications for each data item in the J.D. Edwards Data Dictionary. Because the J.D. Edwards Data Dictionary is different from the standard IBM data dictionary, each data item record needs to be translated from the J.D. Edwards standard to the IBM standard.

When building the Field Reference File, J.D. Edwards groups the data items. Items that begin with "A" are translated into the IBM-readable format and stored in file F98FRFA. Data items that begin with "B" are in F98FRFB. Each letter of the alphabet has a corresponding F98FRF file. Client data items are stored in F98FRF\$ and F98FRF@. You can rebuild one file at a time. You can also build the message file in alternate languages.

What Happens with the Rebuild?

The system does the following:

Rebuilds F98FRFA-Z, \$, and @

Picks up Data Dictionary data item glossary groups D and S

Rebuilds the message file (QJDEMSG) in QGPL. Uses a processing option — Form ID J98DDMSGF to determine which library to build the QJDEMSG file. The default is QGPL

Does not rebuild the J.D. Edwards message file if entering a single field reference file to be built

Builds a separate message file for each language installed. Enter ** for all languages installed on the system.

Always rebuild the files in the same library as previously built.

About the J.D. Edwards Message File

What is the J.D. Edwards Message File?

The J.D. Edwards Message (QJDEMSG) file contains all the messages that are coded Glossary Group J. The programs access the messages from this file. If a client adds messages with Glossary Group J, a rebuild is necessary to correctly add the new messages to the J.D. Edwards Message (QJDEMSG) file.

What Happens When Only Rebuilding the J.D. Edwards Message File?

The system does the following:

Rebuilds the message file (QJDEMSG) in QGPL. Uses a processing option — Form ID J98DDMSGF to determine which library to build the QJDEMSG file. The default is QGPL

Picks up Data Dictionary data item glossary group J

Enter a value from UDC table 01/LP to generate a message file for a single language. Enter '**' for all languages installed on the system.

Locating the Rebuild FRF and JDE Msg File Form

To locate the Rebuild FRF and JDE Msg File form

From menu G9642, choose Rebuild FRF & JDE Msg File

98FRF Rebuild FRF & JDE Msg File The Field Reference Files are facsimiles of the J. D. Edwards Data Dictionary and are vital for the creation of all data base files. The version of the Data Dictionary upon which they are based determines the type and characteristics of all application data elements. This procedure will recreate these files based upon the Data Dictionary files found in the library specified, placing the DDS source in the JDESRC source file the Source Library selected, with the Field Reference Files being created in the Data Library selected. Base Field Ref Files on Data Dictionary in Library Create Field Ref source in Source Library Create Field Ref Files in Data Library Single field ref(\$, @, A-Z or blank=all) Language for message file (** for all) . NOTE: Generation of Field Reference and Message File is submitted to batch. No data files may be created during this generation process. Press Enter to Rebuild Field Reference Files F3=Exit without Rebuild

About the Data File Design Aid

J.D. Edward Data File Design Aid provides a simple mechanism for creating Data Description Specifications (DDS) for physical and logical files.

J.D. Edwards does not allow any file changes through SEU in order to enforce standards. Changes must be done through File Design Aid.

What You Should Know About

Enforced Prefixes	Throughout the Data Dictionary, J.D. Edwards makes extensive use of the data item name. Within files, these data item names are qualified with a prefix to make them unique. Every data file in J.D. Edwards software is assigned a two-character prefix. For example:
	Business Unit Master file is MC Address Book Master is AB
	The data name MCU in the Business Unit Master file is MCMCU
	The data name in the Address Book file is ABMCU
	Use of prefixes ensure that data item names are both consistent and unique.
Enforced naming conventions	At J.D. Edwards, file names begin with an F prefix and the format within that file begins with an I prefix.
Data Dictionary validation	All data fields defined in files are verified against the Data Dictionary. Programmers cannot enter data names without first creating and documenting them in the Data Dictionary. Prefixes of \$ and @ are reserved for client use.

Automatic reference to Field Reference Files	J.D. Edwards uses IBM's Field Reference File (FRF) technology for all files. When creating the DDS for a file, you need to enter the Data Dictionary data item name. Data File Design Aid automatically enters the correct keywords for referring to the FRFs.If data items are added to the Data Dictionary, the user needs to run the rebuild for the Field Reference Files before using Data File Design Aid.
Resequencing	A sequence number allows you to rearrange data items within a file while you are designing.

About Assigning the File Prefix

File prefixes are assigned through the Software Versions Repository.

0.001	Coftware Margiang Depository
Action Code Member ID Description Function Code Function Use	I F92801 SDM Item Master File PF 210
System Code Reporting System Base Member Name Maint/RSTDSP Copy Data (Y/N). O Source Obj P Library Lik	92 92 92
Opt: 1=Browse	2=Edit 3=Copy 5=SAR 8=Print 9=Dlt 10=Design 14=Crt F24=More

The Q series is reserved for clients.

If creating a new logical, the prefix will default from the based on physical.

To view all file prefixes currently in use, press F1 on the File Prefix field. Note that a file prefix may display in this list more than once if it is attached to more than one file.

F10 from this window will display all file prefixes that should not be used.

F10 – User Defined Code Window

F10

Displays the User Defined Code Window to see which prefixes you should not use.

Field	Explanation
File Description	Description of the file. Defaults in from the Software Versions Repository.

The information in this window comes from a logical file built over the Software Versions Repository.

The information in this window is updated automatically whenever the user adds/updates/deletes software version repository record(s) for files.

Programmers are responsible for not assigning the same prefix to files that may be used in the same program.

Entering Data File Design Aid

You must have access to the source file to enter FDA.

- 1. Inquire on a physical file.
- 2. Copy the production source down to a development environment.
- 3. Select Option 10 to take you to the appropriate Design Aid screen based on the members Function Code value.

A PF or LF value will take you to File Design Aid.

Field	Explanation
File Description	Description of the file. Defaults in from the Software Versions Repository.
Unique Keys (Y/N)	Specifies if the data file contains unique keys.If you say yes, Data File Design Aid puts the unique keyword in the DDS. As a result, no two records may have duplicate keys.If you say no, Data File Design Aid leaves the UNIQUE keyword out of the file DDS.
Member ID	The name assigned to the file. Defaults in from the Software Versions Repository.
File Prefix	The prefix assigned to the file. Defaults in from the Software Versions Repository.
Src Library	The library where the source for the data file resides. Defaults in from the Software Versions Repository.
Source File Name	The name of the file within the source library that contains the source member. Defaults in from the Software Versions Repository.
Based on File	Designates the physical file on which a logical file is based. Defaults in from the Software Versions Repository and only displays for logical files.

Field	Explanation
Data Item	The Data Dictionary name of the field or the record format name. The file prefix is added to create unique data names in each file specification if a data item is entered in this field. The record format line is automatically defaulted in.
Data Field Desc	The description of the data item entered in the previous field. Comes from the Row Description field in the Data Dictionary.
K/S (Key/Select)	Identifies the DDS Type indicating whether the field is a format name, key field, select logic field or omit logic field. It may be used in conjunction with information that appears in the Function Specifications field.
Function Specifications	Used with the DDS Type specified in the K/S column. If it is a record format name: It is blank for physical files Contains the PFILE(Filename) statement for a logical file and you enter: <i>JFILE</i> (Filename Filename) statement for join files listing all the files involved in the join. Right below the JFILE statement, you use the <i>JFLD</i> (Field Field) statement to list the fields that are used to construct the join. If you are defining a normal data item and you want the FRF field designation pulled in, you leave it blank. If you are defining Select/Omit logic on a field, you enter the logic itself. If you are defining a key data item, you may leave the Function Specifications field blank or you may enter any valid DDS function keyword (DESCEND, RENAME, SIGNED, ZONE, etc.)
Seq No	Determines the order of the fields in the file.

There is a fold area which includes additional information: data item type, data item size, and number of display decimals.

Sample — Logical File

J.D. Edwards logicals contain all fields from the PF, only keys are specified.

Creating Join Files and Work Files

To create a join file or a work file, you should use the Source Edit Utility.

Function Keys From File Design Aid

F1 – Field Help on Data Item

Using F1 in the Data Item field takes you to the Data Item Search screen.

F2 – J.D. Edwards Command Line

Access command line in order to enter a J.D. Edwards or IBM command without having to exit to Command Entry or a menu. If the user is secured out of Command Entry or Menu Traveling, the user will still get this command line but they will *not* be able to execute commands or menu travel.

F3 – Exiting Data File Design Aid

When the user presses F3 to exit Data File Design Aid, the following screen appears.

From this screen, the user can choose to:

Exit without saving the changes made.

Exit and save the changes made.

Save the changes made and return to the design aid screen.

F6 – Access Repository Services

This window provides access to other repository services within J.D. Edwards.

F16 – Search by File

Accesses the File Field Description window to view file formats and field descriptions for any file on the system.

Field	Explanation
Unique Keys	If a file can be organized so the key will uniquely identify only one specific record, define the Unique Keys field. Uniqueness can be specified for physical and logical files.
	Most J.D. Edwards physical files in the past have been defined as sequential and logicals were used for creating keyed sequences. More recently, however, physical files have been keyed.
File Description	 The description associated with each file is used to further identify the relation of the file and its purpose. It should match the Description in Software Versions Repository. Physical files should have a description that explains the purpose of the file. Logical files should be designated as follows: <i>LF – fldname, fldname, fldname</i>, where <i>fldname</i> is equal to a key field. Join files should be designated as follows: <i>JF – filename/filename/filename – fldname, fldname</i>, where filename is a file over which the join is built and fldname is the key field that joins the files. Work files should be designated as follows: <i>WF – filename</i> where <i>filename</i> is the file that the work file accesses.
Based On File	For physical and logical files, the Based on File is the same as the physical file.
	For join files, the Based on File is the name of the first physical that the join is built over.
Recompiling	When recompiling a physical, you need to delete any logicals or joins from the data file library and then recompile them after the physical has been recompiled.
Record Format	It is a J.D. Edwards standard that only one record format is defined for each physical and logical file. Joins may contain more. Record format names begin with I followed by the physical file number.
Ordering of Fields	When designing a physical, list the component fields in descending order of their importance to the file. Keyed items must always be last in sequence number within the Data File Design Aid program itself.
Field Reference Files	Used in all file creations to retrieve field descriptions.
L 1 E'1	Logical filos include all fields, we do not define specific fields

What Are the Data File Design Aid Standards?

Merge Functions for PTFs and Reinstalls

The reinstall or PTF install does the following:

In a PTF install, prints a report that identifies all files that are in the PTF library but were not installed in the client's production libraries. The user must add the new files manually into the appropriate libraries.

In a reinstall, the client prints a report to add new files into appropriate libraries.

Updates JDFDATA in a PTF install; replaces JDFDATA in a reinstall.

Adds new keys to both logical and physical files.

Changes the file formats of logical and physical files.

Data Models displays relational models of the major files within each J.D. Edwards product.

Data File Design Aid Summary

Has direct ties to the Data Dictionary and the Field Reference Files.

Attaches a two-character prefix to each data item to create a unique field within the file.

A record format must be defined for all files with a K/S value of R. This is the default record format.

PFILE keyword will automatically be pulled in for logical files.

Logical files must have a *Based on File* designated in the Software Versions Repository which will carry over to the design screen.

You must enter the data item names from the Data Dictionary.

File Design Aid will add the two-character prefix.

Steps for creating a new file.

Data items must reside in the Data Dictionary.

Must rebuild the FRF files if new data items were added (from the Rebuilds menu, G9642).

Must have a file prefix specified on the Software Versions Repository record.

Field Reference Files

Contain all the definitions for creating fields.

28 in all (F98FRFA-F98FRFZ, F98FRF\$, and F98FRF@).

Each field reference file contains all the data items beginning with the same character as the field reference file

For example: F98FRFA contains all Data Dictionary data items beginning with the letter A.

Exercises

See the exercises for this chapter.

About Screen Design Aid

Screen Design Aid (SDA) is an interactive feature to design and maintain display screens. This full-screen editor validates against the Data Dictionary and adds records to Vocabulary Overrides. You can work with multiple record formats simultaneously and you can move fields from one format to another.

Features

Design is conducted in a safe work environment. If you make a mistake you can exit without changing a screen's DDS.

Screen specifications are stored in data structures in the QRECOVERY library. Much like the IBM recovery of SEU.

You can create a screen in normal mode (80 columns by 24 rows) or wide mode (132 columns by 27 rows). You can also design wide screens on 80 column devices using a windowing facility.

Answering initial yes/no options allows you to create a basic screen skeleton for a subfile, non-subfile or window-style screen.

SDA is fully integrated with the Data Dictionary and Vocabulary Override files. You can place fields on the screen by referring to a Data Dictionary name and override default attributes, if necessary. You can place Vocabulary Override fields on the screen and, if desired, modify their contents through the full screen.

SDA is fully integrated with the system database. You can select fields from the system database, create a pick list and then reorder fields in the pick list. You can place fields on the screen individually or in mass by pinpointing locations on the full screen with an ampersand (&) or asterisk (*).

SDA has full screen capability. You can add, change, move or delete fields by entering control characters directly on the screen.

Unlike the IBM SDA, the JDE SDA allows you to work with multiple record formats at one time. You can display and change any combination of formats simultaneously (as long as they do not overlap). You can also move fields from one format to another.

SDA allows you to simulate a screen at program execution time. You can run the simulation for any set of conditioning indicators to represent a particular error condition or other program functions.

Editing Commands

Command	Explanation
*DEL	Delete field(s) (used in Field Definition window)
d (cannot be uppercase D)	Delete field(s) (used in Field Definition window)
<<,>>>	Shift field(s) to the left or right
(xxxx) 'xxxx'	Literals (use apostrophes)
_	Move from position.
=	Move to position.
	Move block from position
=	Move block to position.
F7	Restore the screen if you accidently press Field Exit or a power failure knocks you off.

Do not use the INSERT or DELETE keys while in the actual design portion of SDA.

Automatically assigns Editing Indicators.

Indicators 40 to 79 are reserved for editing.

Indicator 40 is reserved for the Action Code field.

Indicator 41 is reserved for the key fields.

If all available indicators have been used, an error message is issued.

Indicator 37 is used in subfile videos to highlight all fields on the last line of the subfile to indicate that no more records exist.

Prefix Standards

Prefix	Explanation
VD	Video display fields.
	being used for the video and may be used to enter database information.
	Default size is the size specified in the Data Dictionary for the data item being displayed.
	Reside in the based on file and can be input/output.
SF	Subfile fields.
	Same as VD fields, but they are in a subfile.
	Default size is the size specified in the Data Dictionary for the data item being displayed plus editing characters.
SH	Subfile Hidden fields.
	SH fields store data that is not displayed on a screen.

Field Name Standards

Field	Standard		
VC0 – Video constants	VC0 fields display definitions and/or descriptions for a single piece of data or for a group of data.		
	VC0 fields are always output fields and the description that will be loaded into the VC0 field is obtained from a separate file		
	For example, if creating a video using the Item Master file (F92801), the user will need to take the <i>Item</i> <i>Master Business Unit</i> field and chain out to the Business Unit Master file (F0006) to get the description for that Business Unit. User enters *VC0 for the <i>Field Name</i> field in the Field Definition Window when adding a new constant/description field. The default size for VC0 fields is 30.		
VTX – Video text	These fields display the row description or column headings from the Data Dictionary. The text that displays in the VTX fields is stored in the Vocabulary Overrides file (F9220). Can key directly over Vocabulary Override fields in SDA.		
	User enters *VTX for the <i>Field Name</i> field in the Field Definition Window when adding a new text field. The default size for VTX fields is 16.		
Line 24 is always VDL24	Cannot change the text for Line 24 by using the Field Definition window because it is too large.		
	Key over the text in Line 24 to change it.		
TTL@	Uses the default title from Vocabulary Overrides if the video is called from another video.		
	Uses the menu selection text if the video is called from a menu.		
ACTION	Action Code field. The name assigned by SDA. The default cursor keyword is assigned to the action code field.		
*LITER – Literal fields	Literals are added by placing apostrophes around the text on the screen and pressing Enter. (e.g. 'V928011').		

Field	Explanation
* – Field Definition Window	Allows the user to update existing fields and add new fields without using the Pick List feature. Place the * one space to the left of the first character of the requested field to display the Field Definition Window.
	To add a field, the user places an asterisk (*) on the SDA design area where they want to add the field. To update a field, the user places an asterisk in the attribute character of the field they want to update.
	The user can pull in the video field, the Row Description/ Column Headings (VTX), and a 30 character description field (VC0) all at the same time by making special entries in the field definition window (*BOTH and *ALL).
& – Field Selection Window	Allows the user to add new fields using the Pick List feature
	Causes the Field Selection window to display.
	To place a field on the screen from the user's Pick List, place an ampersand (&) on the SDA design area where you want to place the first character of the field.
	Allows the user to pull in one or all of the following at the same time:
	The Row Description/Column Headings (VTX)
	The video field
	A description field (VC0)

Updating/Adding Fields through SDA

Working with Screen Design Aid

To work with Screen Design Aid you must have access to the source file

To work with Screen Design Aid

- 1. Inquire on a video in SVR
- Copy the production source down to a development environment using selection 3.
- 3. Select option 10 to access the appropriate Design Aid form based on the members' Function Code value.

Function Key Exits

F12

F12 – Return to Previous Panel

Will exit you out of the current window or utility and return to the screen you were previously on.

Use instead of F3

When calling another program outside of SDA (for example: F13, F24), you must use F3 to return to SDA.

Updating an Existing Field

Place an asterisk (*) in front of the field (in the attribute character).

VTX004 0 R	Quantity On Hand UM OOCOCOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOOO
	Lower Case OVRDTA OVRATR	Change Duplicate Field Cond	- 	ND

Field	Explanation	
Dict Name	Identifies the four-byte data item name from the Data Dictionary.	
	This is the only required field for most data items, the rest will default.	
Text	Describes the Dictionary Name.	
	On VTX fields contains soft coded description that updates F9220.	
Data Type	S Numeric data items.A Alphanumeric.	
	Blank w/decimal position blank defaults to A.	
	Blank w/decimal position defined defaults to an S.	
	All J.D. Edwards fields are defined as A.	

Field	Explanation	
Field Name	Identifies a screen field name. *VTX (VTX001–VTX200) automatically assigns next available. *VC0 (VC0001–VC0200) automatically assigns next available. *LITER literal fields. *BOTH or *ALL to bring in video (VD), VC0, and VTX fields.	
Row/Column	Two 3–digit fields that define the row and column location of field.	
Field Use	How the data is to be used on the screen.Iinput only.Ooutput only.BBoth input and output.HHidden field.MIBM Message field.	
Size	Two fields identify the length of the data item and for numeric fields, the decimal places. If left blank, automatically fills.	
Text Form	 For VTX fields, identifies the field from the Data Dictionary that is used for headings. R Row Description. C Column Heading 1. D Column Heading 1 and 2. 	
Dft Cursor	Starting cursor position on a data entry screen, Y or N.	
Edited	Should the field be checked for error conditions, Y or N. Will assign an indicator for error handling and default Condition Indicator information. Assigns error indicators 40–79. Key fields, K. Assigns indicator 41.	
Lower Case	To allow lowercase, Y or N.	
Change	CHANGE keyword is in effect, Y or N. The indicator will be seton whenever the value in this field is changed.	
OVERDTA	OVRDTA keyword is in effect, Y or N. Used with PUTOVR to override data that is in a field already on the video.	

All input capable fields should be edited ('Y' or 'K' in Edited field).
Field	Explanation	
Duplicate	Duplicate the data. Only valid for an SFL format. Puts the DUP keyword in the video/report DDS but the Program Generator does not generate any code to enable this.	
OVRATR	OVRATR keyword is in effect, Y or N. Used with PUTOVR to override display attributes of a field on the video.	
Field Cond	Field Conditioning Indicators. Determines if the user can see the field or not.	
Condition Indicators	To set a condition indicator on a field, enter a Y in the first blank to the right of the desired condition. You have the option of entering up to 3 indicators to be associated with the condition. Three spaces are provided to allow an N prior to the two digit indicator to create a negative condition. The allowed conditions are: RI Reverse Image HI Highlight UL Underline ND Nondisplay BL Blink PR Protect PC Place Cursor A blank or N will deactivate the condition.	
Color	F8 toggles to display the color attributes for the field. The first blank to the right of each color controls the order that multiple colors will appear in the DDS $(1-7)$. If multiple colors are defined, the first enabled color appears and the remaining colors are ignored. A blank or N disables the color. The color values default based on whether you selected JDE or SAA colors in QJDF.	

Accessing Fast Path Create for a New Form

When you design the format for a new screen, you have the option to use Fast Path Create.

To access Fast Path Create for a new form

1. Locate your video and enter selection 10

If SDA cannot find the existing DDS for your screen, the following screen will appear:

Field	Explanation			
Text Description	Description of your screen.			
Fast Path Create	Automatically create record formats, fields, file, and record level parameters.			
Action Code	Automatically create an Action Code field.			
Window	Video is a window.			
Wide Screen	Video is in wide format (132 columns by 27 rows) or normal format (80 columns by 24 rows).			
Subfile	Create subfile format.			
Subfile Fold	Create a fold area in the subfile using SFLDROP and SFLFOLD keywords.			

Field	Explanation	
Subfile Clear	Use SFLCLR (Y) or SFLINZ (N).	
Selection Exits	Create selection exits to allow the user to exit the program using selection codes.	
PUTOVR	The video record format uses the PUTOVR keyword. Causes the video to be erased and redisplayed when a window is displayed.	
OVERLAY	The video record format uses the OVERLAY keyword. Will not erase and redisplay wideo when a window is displayed. Most J.D. Edwards videos use OVERLAY.	

2. Press Enter and SDA begins the creation of your video based on what you specified.

Example – Video with Action Code and No Subfile

92700	Item Maintenance	
Action Code B		
	F24=More Keys

When the field definition window appears:

- 2. Enter the data dictionary item name in the Dict Name field.
- 3. Specify *VTX in the Field Name field.

The system will assign the next available VTX number.

- 4. Enter a value in the Text Form field to indicate whether the row description or a column heading from the Data Dictionary should be used as the text.
 - R Row Description.
 - C Column Heading 1.
 - D Column Heading 2.

Default is R Description.

Text will default from the Data Dictionary based upon the Text Form value.

5. Enter a value in the Size field only if you want to override the default length of 16 for the Row Description that will be brought in.

Start your fields in column two (unless selection exits exist). This allows you to place an asterisk to the left of the first field in column one.

To add a Data Base Video Field (VD)

1. Place an * on the SDA design area where you want the field to be placed.

Fiel	d Definition	Format: V92801	.11-
Text Field Name		Cond Ind	4
Field Use	B	RI	<u> </u>
Text Form	_	HI

Dupiicate		RT	
L'IOLA ('ODA			
	Fiel Text Field Name Field Use Text Form Edited Change Duplicate	Field Definition Text Field Name Field Use <u>B</u> Text Form Edited Change Duplicate	Field DefinitionFormat: V92801 Text Field Name

When the field definition window appears:

- 2. Enter the data dictionary item name in the *Dict Name* field.
- 3. Specify a field use.

The default for field use is O for output.

Editing indicators are not assigned for output fields.

4. Enter the Data Type, Size, and Text defaults from the Data Dictionary.

To add a Video Constant Field (VCO)

1. Place an * on the SDA design area where you want the description/constant field to be placed.

220011	Thom	Mastan Tufarmatian	
28011	Item	Master information	
Action Code <u>B</u>			
		*	
creen: V928011 Dict Name	Fiel Text	d Definition	Format: V9280111-

Dft Cursor _ Lower Case	Edited	_	UL
OVRDTA	Duplicate		BL
OVRATR	Field Cond		PR
			DC
-F3=Exit F12=Prev	Screen F17=Di	ctionary	PC

When the field definition window appears:

2. Specify *VC0 in the Field Name field.

The system will assign the next available VC0 number.

3. Enter a value in the Size field only if you want to override the default length of 30.

Adding a Literal Field

To add a literal field

Enter the literal text on the SDA Design area, enclose the text within single quotes, and press Enter.

'928011'	Item Master Information	

J.D. Edwards standard is that the only literal on a video is the program ID in the top left corner.

Using the *BOTH and *ALL Features

The field definition window (* window) allows for some special keywords to be entered in the Field Name field. Two of these special keywords are *BOTH and *ALL.

This feature provides for placement of multiple fields with a single entry.

Using *BOTH

If you use the keyword *BOTH with a valid data dictionary item, screen design will place a VTX field and a video (VD) field on the screen.

To use the ***BOTH** feature

On Field Definition type "*BOTH" in the Field Name

	928011	Item 1	Master Information	
	Action Code <u>B</u>			
	Item ID <u>BBBBBBBB</u> Business Unit <u>BBBBBBBBBBB</u>	Item 3 0000	Desc <u>BBBBBB</u> 0000000000000000000000000000000	<u>BBBBBBBBBBBBBBBBBBBBBBBBBB</u> 000000

Screen Design Standards and Tips

Title

Screen title is limited to 30 characters and should match the F9801 file (Software Versions Repository). The title entered in SDA updates the Vocabulary Overrides record for the video. Be aware that if a user accesses the screen using a menu selection, the menu selection name overrides the screen title. If a user accesses the screen using a selection option or function key, the vocabulary overrides title is used.

Line 24

All function keys should be documented on the right side of line 24 and options should be documented on the left side.

List both the options and function keys in numeric order.

F24 should always appear and should say MORE KEYS or MORE.

F4 should always read MORE DETAIL or DETAIL.

Do not include standard exits of F3, F7, F22, Help, Rollup, Rolldown.

Line 24 should be in reverse image during error condition except on windows. Line 24 is conditioned to appear in reverse image on screens based on indicator 93.

If *SAME is specified for the field Error Text for Line 24 in Vocabulary Overrides, then the text that will display is the same as the text specified for the normal Line 24.

Windows

Within a window, line 24 should include F3 and F24 when the window is initially displayed. When designing windows in SDA, fill in unused line space with literal fields to prevent data on the calling screen from showing through on the window. The literal fields can be added as blanks with a single quote on each end or through the Field Definition Window.

<pre>/ 4038 Allen, Ray Jr. _ 4039 Allen, Marilyn _ 4037 Allen, Cindy _ 4036 Allen, Marilyn _ 4036 Allen, Cindy _ 4037 Allen, Cindy _ 4037 Allen, Ray Jr. _ 4037 Allen, Cindy _ 4039 Allen, Marilyn</pre>	08DBDDep/Ben Addition & Review Action Code. Opt:1=Single Assignment	2=Add/Rev D/B F4=Detail F21=Print F24=More Keys	

Default Cursor

The default cursor attribute should always be set for Action Code or the input field closest to the upper-left corner of the screen.

Fold Area

Keep the number of Fold Area lines to no more than two lines to avoid excessive use of the Roll keys when the Fold Area is open.

Description Fields

Define all description input fields to allow for upper and lower case letters. Use VC0 descriptions when a field's value has no obvious meaning and a description can be retrieved from a master file or User Defined Codes.

Alpha Fields

Because of the dynamic nature of international currency, you must define every field as alpha. The only exception is that hidden fields can be numeric. J.D. Edwards scrubbing routines handle the two-way conversion between numeric file data and alpha screen fields.

General Aesthetics

Alignment

Line up fields vertically. This includes row descriptions, input fields and description fields. Fields on the left side of the screen should be in column space 2 (column 1 is needed for the attribute byte).

Use periods to Line u equalize length of input to row descriptions	p Line up Tields VC0 fields of row descriptions
-	
08332	Single D/B Relation Entry
Action Code. Employee Number Plan ID Dependent/Beneficiary No Effective From	I
Relationship Data: Dependent or Beneficiary . Relationship Dep/Ben Type Percent Allocated	D C Child Primary Beneficiary
Dependent/Beneficiary Data: Social Security Number Date Of Birth Dep/Ben Status	<u>524-58-5113</u> 04/01/72
Memo/Address Info	2525 E. 11th Avenue Denver, Colorado 80206
F5=D/B Relationships	F21=Print F24=More Keys

Grouping Fields

When entering a description heading to group related fields, use up to 40 characters for the description (or as long as space will permit). Highlight the heading and end it with a colon. Underneath the heading, indent the group of fields one space to the right.

08332	Single D/B Relation Entry
Action Code	 Name Thru
Relationship Data: Dependent or Beneficiary . Relationship Dep/Ben Type Percent Allocated	_ _
Dependent/Beneficiary Data: Social Security Number Date Of Birth Dep/Ben Status	
Memo/Address Info

_							

This video is used to select database fields and maintain record formats, record types, fast path files, and record format keywords.

Field	Explanation	
Opt	 Enter appropriate number to indicate you want to select one the following values: 1 File/field pick list of ampersand functions. 2 File/field pick list for fast path function. 3 List of defined fields in the format. 4 Delete format. 5 Record format keywords. 	e of

Field	Explanation
Format Name	Screen record format.
	The format name will be the video ID followed by a specificformat suffix value. Typically, the suffix values are:Csubfile control formatSsubfile format1record format
	If additional formats are required, each format name must be unique so new format suffix values must be assigned.
Туре	Record format type. See types listed below.
Fast Path File	The data base file you want to select fields from
Start/End Lines	Specifies the line number range of the format.
Related Record	Field that ties a subfile to a control record format. Required in all SFLCTL record formats.
# Fields Selected	The number of data base fields that have been selected for use on the format.
Fld Pfx	Screen field prefix to be used for the video fields: VD, SF

About Record Formats

Four Record Format Types are valid for videos:

SFLCTL – Subfile control

Present in all subfile videos. Contains all of the fields in the header or top portion of the video, include the subfile column headings.

928200	Item Search
Business Unit. <u>BBBBBBBBB</u> BBBBBBBBBBBBBBBBBBBBBBBBBBB	<u>BB</u> 00000000000000000000000000000000000
0 Item <u>P Number Descripti</u>	<u>Ship</u> on <u>Date</u> <u>Quantity On Hand</u> UM

Contains all of the fields in the subfile potion of the video, including the fold area if applicable.

RECORD

Present in all videos. In subfile videos, contains VDL24 (line 24 text). In non-subfile videos, may contain all fields on the video, including VDL24.

V9282001 (RECORD)

SFLMSG - Subfile Message

Display error message text. J.D. Edwards does not use this format because errors are handled through RPG programs.

Selecting Database Fields

There are two methods of selecting database fields for placement on the screen:

With Fast Path

Without Fast Path

Method	Explanation				
Fast Path	Type 1 next to the format on which you want to place the fields and enter a file name under the Fast Path File column.				
File Selection List	Type 1 next to the format on which you want to place the fields but do <i>not</i> enter a file name.				
	Will access a file selection video where you can specify multiple files and libraries from which to select database fields.				

To select a database field using Fast Path

- 1. Enter a Fast Path File for the specified format on the Record Formats List form.
- 2. Selection option 1 for database field selection.

0010011							
<u>Opt</u>	Format Name	<u>Type</u>	Fast Path File	Start / End Lines	Related Record	# Fields <u>Selected</u>	Flo <u>Pfx</u>
	V928200C V928200S V9282001	SFLCTL SFL RECORD	F92801	001 006 007 022 024 024 	<u>V928200S</u>		VD SF VD

The Field Selection List appears.

9252 Repo	4 rt: V928200	Field Selection List		Format	: V928	82000	
Seq <u>No</u>	Field Name	Description	<u>DT</u>	Size	HDG	<u>D</u>	Us
	QXXIT K01 QXXDS QXXTY QXXDT QXXCC QXXQT QXXUM QXX001 QXX001 QXX002 QXX003 QXX004 QXX005	Item ID.	S A A S A A A A A A A	8 30 2 6 12 15 2 3 3 3 3 3 3 3 3	0 0 0		
	F3=Exit	F12=Prev Screen F21=Select All					

Field	Explanation				
Seq No	Sequence Number to indicate which data items you want on the video you are creating and what order you want them to be displayed in the Pick List window accessed from SDA				
Field Name	The name of the field in the file				
Description	The Data Dictionary row description				
DT	Data Item Type				
DS	Data Item Size				
HDG	 Which heading to use from the Data Dictionary R Row Description. C Column 1 heading. D Column 1 and 2 heading. 				
D	Used to indicate whether a 30 character VC field should be brought for constant information to be loaded into.				
Use	Specifies how the data field is to be used on the video:IInput only.OOutput only (default).BBoth input and output.MIBM Message field.				

Understanding the Select All Function Key

Select All

You can select all fields for the file instead of selecting them individually by pressing F21 from this screen.

Based on which record format the Field Selection List is being used for, the following information will default in:

For a subfile control record format, an R will default for the type of heading to use and the Use will default to B for input/output.

For a subfile record format, a D will default for the type of heading to use and the Use will default to B for input/output.

For a non-subfile video, the row description will default for the type of heading to Use and the use will default to B for input/output.

For a report, a D will default for the type of heading to use and the Use will default to O for output.

To select database fields without Fast Path

1. Select option '1' but do not specify a file.

92520 Scree	n: V928200		Record For	rmats List			
			Fast Path	Start / End	Related	# Fields	Flc
<u>Opt</u>	Format Name	Туре	File	Lines	Record	Selected	<u>Pfx</u>

_							
_							
_							
-				<u></u>			—
-							
_							_
_							
-							
_							
Opt.	1-DP Field C	alogtion	2-Field Tigt		o E-Format	Kouworda	

The File Selection List appears.

92522 Screen: V92	8200	File	Selection List	Format: V928200C
File Name	Library	<u>File Type</u>	Descrip	tion
F92801	JDFDATA	PF	SDM Item Master File	
		F3=Exit	F12=Prev Screen	

2. Enter the files from which you want to select fields.

92524 Screen: V928200		Field Selection List			Format: V928200C			
Seq <u>No</u>	Field Name	Description	DT	Size	<u>HDG</u>	<u>D</u>	Us	
	QXXIT K01 QXXDS QXXTY QXXDT QXXCC QXXQT QXXUM QXX001 QXX002 QXX002 QXX003 QXX004 QXX005	Item ID	S A A S A A A A A A	8 0 30 6 0 12 0 2 3 3 3 3 3 3 3				
	F3=Exit	F12=Prev Screen F21=Select All						

Fields for files requested will be displayed through the Field Selection List video.

3. Select fields using the same techniques as in the Fast Path method.

If you select a key field, that field will be edited as the key of the screen. An edit indicator of 41 will be assigned.

Placing Fields on a Form Using a Pick List

To place fields on a form using a Pick List

On the Item Master Information form

928011	Item Master Information	
Action Code	. <u>B</u>	
δ. δ.		
Screen: V928200 Seq Fields to <u>No Field Name</u> <u>1 QxSXIT 01</u> <u>2 QxSXCC</u>	Field Selection List Format: V select Row Desc Leng Description DT Size Item ID. Size 8 Business Unit. A 12	928200C th <u>_10</u> <u>HDG D Use</u> <u>R _ B</u> <u>R D B</u>
F3=Exit	F10=Formats F12=Prev Screen F16=Field List	

1. Type either one or multiple ampersands (&) on the screen where you want to place the fields from the pick list you created.

If you place more than one &, make sure that you allow room for all of the fields that will be returned to the screen, so that you do not overlap fields.

2. When the Field Selection window appears, verify the information that will be brought back to the screen (VTX field – HDG, 30-character description – D, and field Use – USE), as well as the order that they will be brought back (the sequence number).

Adding a Fold Area to a Subfile

Place an asterisk (*) or ampersand (&) on the second line in the subfile format of your video to add a Fold Area. If a second line in the Fold Area is needed, you can place an asterisk (*) or ampersand (&) on the third line of the subfile format. HDG should be 'R' when adding to the fold!

Exercises

See the exercises for this chapter.

Function Key Exits from Screen Design Aid

F2 – J.D. Edwards Command Line

F2

F5

Access a command line in order to enter a J.D. Edwards or IBM command without having to exit to Command Entry or a menu.

If the user is secured out of Command Entry or Menu Traveling, he/she will still get this command line, but will not be able to execute commands or menu travel.

F5 – Format Display Control Window

	Opt:I=Item Master Information F	5=Item Maintenance F24=More Keys

Field	Explanation
Selection	Controls the display of record formats. 1 Format is active. Blank Not to display.
Format	Lists the DDS format names for the video screen.
	All names begin with Video name Subfile control formats end with C. Subfile formats end with S. Record (non–subfile) formats end with 1.
Туре	Describes the DDS format name.
Boundaries	Two 3-digit numbers that define the range (rows) for the DDS.
Window	Allows access to fields outside the boundaries.
Browse (Y/N)	Allows user to enable/disable the browse mode and view the screen as it would appear when executed. Cannot change or access any item while in browse mode.

F4 – Subfile Drop (while in browse mode)

Toggle between displaying the Fold Area or not for a subfile video Must set Browse in Format Display Control Window (F5)

F6 – Access Repository Services

This window provides access to other repository services within J.D. Edwards.

F8 – Toggle Monochrome/Color Display

Will display your screen in monochrome or color

If accessing the Field Definition window, will toggle between Condition Indicators and Color Attributes

F10 – Option 5 — Format Keyword Maintenance

92537 Screen: V928200	Format Keyword Maint	Format: V92820
	General Keywords	
	PUTOVR (Y/N) <u>N</u>	
	OVERLAY (Y/N)	
-		
	Subfile Keywords	
	Subfile Fold \underline{Y} Type (A/F) <u>F</u>	
	Subfile Clear \underline{Y}	
	Subfile Next Change \underline{Y}	
	Subfile Page	<u>30</u>

Field	Explanation
PUTOVR	Erases video and rewrites when an action is taken; for example, when a window is displayed
OVERLAY	Displays an action; for example, displaying a window, without erasing the video. Most J.D. Edwards videos use OVERLAY.
Subfile Fold	Indicates whether the screen will have a fold area.
	Uses the SFLDROP keyword.
Type (A/F)	 Further identifies subfile fold area: A Will lose modified data in the subfile when you press F4. F Data is retained.
Subfile Clear	Whether or not to use SFLCLR or SFLINZ:YSFLCLR (clears subfile)NSFLINZ (clears and initializes subfile to blank)
Subfile Next Change	Whether or not to use SFLNXTCHG (Y/N). Will require the user to correct any errors in the subfile before further execution of program.
Subfile Page	Identifies number of records on one subfile page, with the fold area open if applicable. 1 to 27, inclusive

Used to define the function keys for the screen Function Key Definition files (F9601 and F9611)

Field	Explanation	
Line 24	Identifies the function key exits and options exits.	
Include	Whether or not to include the function key or option on the screen.	
Description	Describes the function or option exit.	
	Cannot exceed 40 characters	
Key/Opt	Identifies the function key number or option.	
	Special values: HL Helps. RU Roll up. RD Roll down.	
Field	Identifies the name of the function or option exit.	
	Values always begin with a # (pound sign).

F17

To define VTX fields other than row and column headings on the screen. Row and column headings are protected here. Specify whether you want to use the Data Dictionary row description, column heading 1 or column heading 2.

Can specify the literal text that will be loaded into a *VC0 field.

You must save your video at least once in order to be able to update vocabulary overrides and/or function key definitions by this method. This is because when you are first defining a video, the vocabulary override record and function key definition record are not created until you save the video.

After changing the size of a VTX field, you should execute the Rebuild Vocabulary Override Field Lengths program (11/G9642). This displays the correct VTX field lengths in the Field Size field in Vocabulary Overrides.

F19 – Window left

F20 – Window right

Only applicable when designing wide screens (132 by 27 rows) on 80 column terminal.
Changing Subfile Boundaries

Be careful when changing the size of a subfile through SDA. Consider using these processes to make such changes easier and less confusing.

You can make a subfile smaller or larger.

To make a subfile smaller

- 1. Press F10 to access the Record Formats List video.
- 2. Change the starting line number for the subfile format (VxxxxS).
- 3. Press Enter to return to SDA.
- 4. Press F10 to access the Record Formats List video again.
- 5. Change the ending line number for the control format (VxxxxC).
- 6. Press Enter to return to SDA.
- 7. Move or add headings.

To make a subfile larger

The above steps are reversed if you want to make the subfile larger. You must move the control format fields up before changing the starting line number for the subfile format.

- 1. Move headings.
- 2. Press F10 to access the Record Formats List video.
- 3. Change the ending line number for the control format (VxxxxC).
- 4. Press Enter to return to SDA.
- 5. Press F10 to access the Record Formats List video again.
- 6. Change the starting line number for the subfile format (VxxxxS).
- 7. Press Enter to return to SDA.
- 8. Press F10 and enter 5 on control format.

Change subfile page size if desired.

When the subfile is changed, the subfile page and subfile size must be changed to correctly reflect the size of the new subfile.

Process Overview – Placing Selected Fields

Once you've established your field pick list, use the ampersand (&) to specify where you want to locate the filed.

Item Master Information

The ampersand (&) calls up the pick list in the Field Selection window where you can order the fields and further define their specifications.

Screen: V928200	Field Selection List Format: V928200C
Seq Fields to	select Row Desc Length <u>10</u>
No Field Name	Description DT _Size HDG D Use
<u>1 Qx\$xIT 01</u>	<u>Item ID S _ 8 0 R _ B</u>
2 <u>Qx\$xCC</u>	<u>Business Unit</u> <u>A</u> <u>12</u> <u>R</u> <u>D</u> <u>B</u>
F3=Exit	F10=Formats F12=Prev Screen F16=Field List

Options

Override Row Description length

Resequence fields in list

Select headings (Row, Column headings) *VTX

Description Field (*VC0)

Usage (O=Output, B=Both Input and Output)

Once you have sequenced the fields, they are retrieved from the file and placed on the design area.

Process Overview – Revising the Field Definition

Process Overview – Revising Vocabulary and Function Keys

Function Keys for Screen and Display Format Control

Summary of Screen Design Aid

Editing options

d, *DEL <<, >> xx...xx -, = --, = * and &

You should not use the INSERT and DELETE keys while in SDA.

F7 will restore a video if Field Exit is accidently pressed.

Standard prefixes

VD, SF, SH

Special Fields

*VTX, *VC0, *LITER, *DATE, *TIME

ACTION

VDL24

TTL@

Error indicators 40 to 79 are automatically assigned to VD and SF fields that are defined as input or input/output

Update fields by using *

Two methods of adding fields to a screen

* (non-pick list method)

& (pick list method)

You can pull in VTX, VC, and the video data base fields all at the same time for one database field

Two methods of selecting data base fields

Fast Path

Non-Fast Path — Accesses File Selection screen

If changing subfile boundaries, should use the outlined processes to make this process easier

You must save a video at least once before updating Vocabulary Overrides or Function Key Definitions since the exit from SDA creates these records

Hidden fields are added from the List of Defined Fields video which is accessed by pressing F16 from SDA

You can only add hidden fields one at a time

Must enter a selection exit 5 to actually add the field

About Report Design Aid

The Report Design Aid (RDA) is a powerful and versatile tool for designing reports.

It uses the same process as the Screen Design Aid (SDA), except:

It extends to column 227

Has windowing capability

You only need to identify field names, field lengths, and field positions on the report.

J.D. Edwards reports are externally defined, which means that all the DDS specifications are created and compiled as a printer file, separate from the program object. Report Design Aid automatically generates the DDS specifications. It also incorporates the report information into the documentation and adds it to the cross reference facilities. You can print illustrations of each report.

RDA differs from SDA in that its parameters are targeted for print-based output, which includes page skipping, line skipping and relative positioning.

Perform the following tasks:

Access Report Design Aid

- Update Report Fields
- Compile the Report

Illustrative Example – RDA and DREAM Writer

Report Design Aid vs. Screen Design Aid – Field Definition Window

DICL Name	ŞXDS	Iext	Description	
Data Type	<u>A</u>	Field Name	<u>SF\$XDS</u>	<u>Cond</u> Ind
Row/Column	8 13	Field Use	B	RI <u>Y 44</u>
Size		Text Form		HI Y 44
Dft Cursor	_	Edited	<u>Y 44</u>	UL <u>Y</u> <u>N44</u>
Lower Case	Y	Change		ND
OVRDTA		Duplicate		BL
OVRATR		Field Cond		PR
				PC

Dict Name	<u>\$xDS</u>	Text	<u>Descriptio</u>	1	<u></u>
Data Type	A	Field Name	<u>RR\$xDS</u>		Cond Ind
Row/Column	9 89	Field Use	<u>0</u>	Highlight	
Size	12	Text Form	_	Underline	
	Lines Co	nd Ind		Field Cond	
Space Befor	е			Char per Inch	
Space After				Edit Code	
Skip Before				Asterisk Fill	_
Skip After				Float Symbol	

	FIELD POSITIONING	FIELD CONDITIONING
RDA	Row positions are relative to other field, not fixed. Location on the report is determined by Space and Skip designations. Column positions are fixed.	A field can optionally appear in bold face, be underlined, etc. J.D. Edwards does not typically use these features because they impact printer performance.
SDA	Both row and column positions are fixed. Field will appear on the screen exactly where Row/Column field specify.	A field can appear highlighted, underlined, in reverse image, etc. J.D. Edwards makes use of these attribute for marking fields in error.

Cover Page Fields

Name	Description
VC0CO	Name of company 00000
TTL@	Line 1 of DREAM Writer Version ID if it exists, otherwise it is blank
TXT2	Line 2 of DREAM Writer Version ID, or blank
TXT3	Line 3 of DREAM Writer Version ID, or blank

Report Header Fields

Name	Description
VC0CO	Name of company 00000
RRTTL@	Line 1 of DREAM Writer Version ID if it exists, otherwise it is blank
RRTXT2	Line 2 of DREAM Writer Version ID, or blank
RRTXT3	Line 3 of DREAM Writer Version ID, or blank

What Are the Report Formats?

The first step in designing a new report is laying out the formats. All lines of information of the report should be accounted for in order to correctly define the formats needed and their size.

FORMAT	FIELD	DESCRIPTION
Any format	*VTX	Assigns the first available VTX name to the field and will pull in a description from the Data Dictionary that can be overridden.
	*VC0	Assigns the first available VC0 field and assigns a default size of thirty.
HEADING1 – contains the standard fields to be printed on the top of	VTX001	The default VTX field which prints the row description, Page –.
every page	*PAGE	The default special field that inserts the DDS keyword PAGNBR in the source and retrieves the current page number on the report.
	VTX002	The default VTX field which prints the row description, Date –.
	*DATE	Special field that retrieves today's date.
	VC0CO	The name of the default company 000, it appears on the first line of each page.
	RRTTL@	Line 1 of DREAM Writer Version ID if it exists, otherwise it is blank.
	RRTXT2 & RRTXT3	DREAM Writer overrides that correspond to the second and third header lines of the report.
HEADING2 – contains the subheading fields used to describe	VC0ROW	Data Dictionary row description of the level break field.
the level break detail that is to follow	VC0KEY	The value of the level break field.
	VC0DSC	The description of the value of the level break field.
DETAIL1 – contains the data line fields	RRxxxx	The value of the data for this field

FORMAT	FIELD	DESCRIPTION
TOTAL1 – contains the total line fields	VC1ROW	Data Dictionary row description of the level break field
	VC1KEY	The value of the level break field
	VC1DSC	The description of the level break field
	\$\$XXX	Value on total line.

You may have as many formats as you can fit on one RDA screen. Just remember to increment the suffix number for each format added as well as any VC fields you may be using.

Certain fields are used in RDA when generating reports that will contain subheadings or dynamic (hierarchical) totaling. The following illustrates how these fields are used within a report.

What Are the Report Design Standards?

RDA Features

Normal Design range of 132 – 198 Character Reports To validate against Data Dictionary To automatically add records to the Vocabulary Overrides File

J.D. Edwards Standards/Record Formats

Prefix standards

RR for output fields

\$\$ for total fields

General Aesthetics

When possible, design your reports using the following set of rules:

Column Headings

Column headings should not be wider than the length of the data that appear below them.

Alignment

Begin fields in column space 2 and do not extend fields beyond column 132 unless necessary.

Spacing

Use the following as your guides when spacing different report elements:

Separate column headings by one space

Use both column headings when one heading isn't clear enough

Special Effects

Always use dashes below column headings instead of underlines. Underlines can impact the performance of printers. Dashes are entered as literal fields.

Do not use highlight as it will print a line three times to achieve the highlighted (or boldface) effect, again impacting performance.

Format

In order to avoid overflow, limit the number of lines in any detail or total format to six or less.

Line and Page Skipping

To be consistent with other report programs use SPACEB and SKIPB instead of SPACEA and SKIPA.

About Designing the Report

DDS is being created as you design the report

SPACEB and SPACEA are entered and removed as you add and move fields around.

Multiple formats are relative to each other.

Function	What to use
Changing the Report Title	TTL@
Adding a New Field	*, &
Updating Existing Fields	*
Deleting an Existing Field	*DEL on field definition window, d.
Format Name	Displayed in upper right hand corner of window.
Field positions	Represent starting positions.

Accessing Report Design Aid

You must have access to the source file to enter RDA.

To access Report Design Aid

From the the Software Versions Repository

9801	Software Versions Repository

Enter "*" in the field you wish to update.

Field	Explanation
Space Before	Specifies the number of lines a printer device is to space before printing the next line(s)
Space After	Specifies the number of lines a printer device is to space after printing the next line(s)
Skip Before	Specifies that the printer device is to skip to a specific line number before it prints the next line(s).
Skip After	Specifies that the printer device is to skip to a specific line after it prints the next line(s).
Field Cond	Indicates whether the field conditioning (to print this field or not) is in effect.

Field	Explanation
Char per Inch	Specifies the horizontal printing density.
	J.D. Edwards specifies this at the report level and this field is not used.
Edit Code	Used to specify output formatting of numeric data.
	Used in conjunction with *DATE, *TIME, *PAGE.
Asterisk Fill	Optionally specify asterisk fill for edit codes 1–4, A–D, and J–M.
	An asterisk will print for each zero suppressed in the edited field.
Float Symbol	Specify a currency symbol (corresponding to the system value QCURSYM) that will be printed immediately to the left of the left–most digit of an edited field.
	Valid for a numeric field that has an edit code of 1–4, A–D, or J–M.

928400		00000000000000000000000000000000000000

Understanding the Report Design Aid Function Keys

Field	Explanation
Sel	Selection.
	Controls the display of record formats.
Format	Lists the DDS format names.
	Valid format names are: HEADING1 HEADING2 DETAIL1 TOTAL1
Туре	Describes the DDS format type. Always REPORT or SFORMS in RDA.
Boundaries	Two 3–digit numbers that define the range (rows) for the DDS. HEADING1 is rows 1 to 8 DETAIL1 is row 9 TOTAL1 is rows 10 to 11
Window	Allows you to access fields outside the boundaries.
Browse (Y/N)	Indicator that allows you to enable/disable the browse mode.

RDA may automatically adjust displayed formats with those formats that are not displayed.

F6 – Repository Services F6 928400 Inventory by Business Unit Business It Ту Description Unit Description 985001----Repository-Services-<u>"1" Available Services</u> Data Dictionary Menus Vocabulary Overrides _ Function Key Definitions Dream Writer Versions _ _ Processing Options _ User Defined Codes _ Edit System Helps _ CASE Profiles _ _____SAR Log Inquiry ____Copy DD,VO,DW,UDC,SI,Menus -Sel:--~~1"=Select-----F12=Previous-F10 – Record Formats List F10 92520 Record Formats List Report: R928400 Start Fast Path Related # Fields Fld / End Lines <u>Opt</u> Format Name Type File Record Selected Pfx REPORT 000 HEADING1 001 008 RR 1 DETAIL1 REPORT F92801 009 009 000 RR 000 TOTAL1 REPORT 010 011 <u>\$\$</u> _ _ _____ _ _ ____ _ ____ _ _ _ _ _ Opt: 1=DB Field Selection 3=Field List 4=Delete 5=Format Keywords

Field	Explanation
Opt	Selection, combined with the Fast Path file name, accesses the Field Selection List.
Format Name	Specifies the format name. HEADINGx DETAILx TOTALx
Туре	Specifies the type format. REPORT Record formats that do not use line numbers in the DDS. Instead, they use relative positioning. Default for all report formats. SFORMS Record formats that use line numbers in the DDS. These formats exist in special forms (example: checks, mailing labels)
Fast Path File	Specifies the file you are working with.
Start/End Lines	The beginning line of the format. RDA automatically assigns the end number and adjust when needed
Related Record	Used for SDA only.
Fld Pfx	Defaults to RR for HEADING and DETAIL formats. Defaults to \$\$ for TOTAL formats.

The Record Formats establish the arrangement of fields on your report and in what segment of the page they are to print.

There should be no gaps between the end line of one format and the start line of the next format. If you make changes to the positioning of a format and leave a gap between formats, RDA will automatically adjust the end lines for you.

Changing Compile Option Defaults for Reports

Reports must be compiled through the J.D. Edwards compiler by this method so that R98COVER and R98RPTH are pulled in for the cover page and help instructions.

Compiling through PDM or some other method will not bring this information in automatically.

To change compile option defaults for reports

Change the Data Dictionary defaults for the following data items:

#FLN– Forms Length
WDTH– Forms Width
LPI– Lines Per Inch
#CPI – Characters Per Inch
#OVF– Overflow Line Number
#ALN – Alignment (Y/N)
#FTY– Form Type

#CPY – Number of Copies

#SPG – Number of Separator Pages

Some severity level 10 errors may occur when your report compiles because of R98COVER (DREAM Writer cover page) and R98RPTH (DREAM Writer help instructions). These are only warning errors.

Exercises See the exercises for this chapter.

Programming Standards

Objectives

To understand and use J.D. Edwards programming standards

Programming Standards

The Program Generator serves as the primary enforcer of J.D. Edwards programming standards. Because all J.D. Edwards programs are created through the Program Generator, J.D. Edwards programming standards are enforced throughout the software. These standards include subroutines and consistent formats that ease the maintenance process. The following areas are covered in the programming standards.

- Program Specifications
- Program Overview
- Program Structure
- Performance Issues
- User Spaces
- User Indexes
- File Servers
- **Functional Servers**
- Group Jobs
- J.D. Edwards Source Debugger

About Program Specifications

As described in IBM's *Languages: RPG/400 User's Guide*, there are several kinds of RPG/400 specifications. When your source program is compiled, these specifications are arranged in the following sequence:

Control specifications (H Specs)

File description specifications (F Specs)

Extension specifications (E Specs)

Input specifications (I Specs)

Calculation specifications (C Specs)

Output specifications (O Specs)

An RPG/400 program does not have to use all specifications. A typical J.D. Edwards program will contain control, file description, extension, input, calculation, and output specifications. The following descriptions were pulled from the manual, *Languages: RPG*/400 *User's Guide*, and are repeated here for your convenience.

What Are Control Specifications?

The control specification includes the name of the program.

The first line identifies the program, P55011X, including its description, Item Information Update.

The next fourteen lines are comments that are included in J.D. Edwards programs for copyright purposes and reproduction restrictions.

SEU==>> P55(011X

What are File Description Specifications?

File description specifications describe all the files that your program uses. The information for each file includes:

Name of the file

How the file is used (for example, input)

Size of records in the file for internal files or an external designation

Whether or not the file is keyed

Input or output device used for the file

If the file will have records added to it

When the Program Generator generates a program, it arranges the included files in alphabetical order within the F Specs.

When a program runs, it opens the files in bottom-to-top order. As a general rule:

Place the files that have the most I/Os at the bottom of the F specs.

Place any small usage files or files that are closed after first use at the top of the F specs.

Place the display or print files at the bottom of the list.

What Are Extension Specifications?

Extension specifications describe all record address files, table files, and array files used in the program. The information includes:

Name of the file, table or array

Number of entries in a table or array input record

Length of the table or array entry

Optional comment text

Lines 44 through 47 are used in this program to facilitate error handling and field editing.

The first line defines an array called EMK which has a maximum of 64 entries, each with a length of 4 characters.

Line 52 requests that the compiler program copy in a specific set of E Specs.

The E Specs, E0001, are used in any program that executes the common subroutine, C0001.

What Are Input Specifications?

Input specifications describe the records, fields, data structures, and named constants used by the program. The information in the input specifications includes:

Name of the file

Sequence of record types

Whether record-identifying indicators, control-level indicators, field-record relation indicators, or field indicators are used

Whether data structures, look-ahead fields, record identification codes, or match fields are used

Type of each file (alphanumeric or numeric; packed-decimal, zoned decimal, or binary format)

Location of each field in the record

Name of each field in the record

Named constants

Lines 73 through 83 are used to define some of the vocabulary overrides that appear on this screen.

The lengths change from program to program, and the program retrieves the values for each field at the time it executes the housekeeping subroutine, S999.

What Are Calculation Specifications?

Calculation specifications describe the calculation to be done on the data and the order of the calculations. Calculation specifications can also be used to control certain input and output operations. The information includes:

Control-level and conditioning indicators for the operation specified (generally not used in J.D. Edwards)

Fields or constants to be used in the operation

The operation to be processed

Whether resulting indicators are set after the operation is processed

The C Specs are the heart of the processing of a program. J.D. Edwards programs are designed with a MAINLINE portion which is a select set of C Specs that call other subroutines.
What Are Output Specifications?

Output specifications describe the records and fields in the output files and the conditions under which output operations are processed. They include information such as:

Name of the file

Type of record to be written

Spacing and skipping instructions of Printer files

Output indicators that condition when the record is to be written

Name of each field in the output record

Location of each field in the output record

Edit codes and edit words

Constants to be written

Format name for a workstation file

J.D. Edwards utilizes the RPG EXCPT operation to release locks on data records. This O Spec informs the program which record format is to be released when the EXCPT UNLOCK calculation is performed. Additional formats can be identified with a name such as UNLCKA or UNLCKB.

Typically, J.D. Edwards does not perform reporting functions using O Specs.

The Opcode "UNLCK" can be used instead of EXCPT/O-SPECS.

About the Program Overview

The program overview provides a basic overview of the standards used in a program, including:

Subroutines

Error Handling

Indicator Usage

Documentation

Miscellaneous Items

Subroutines

The Program Generator uses two categories of subroutines:

Standard Subroutines

Common Subroutines

About Standard Subroutines

The Program Generator includes the required standard routines in the Calculation Specifications at the time it generates a program. It arranges them in alphanumeric order.

If you must enter your own standard subroutine, name it in such a way that it will be executed in the necessary order. For example, if you need your subroutine to be executed after the scrub and edit subroutine (S005) but before the update files subroutine (S010), begin the name with an S and then use a three to four character suffix that fits in logically, such as S005A or S006.

Standard subroutine code lines are identified in positions 7 and 8 with SR. Their name always begins with an S. Subroutines are separated by a single line of asterisks. Major blocks of code within a subroutine are separated by a single line of dashes.

.870.00	CSR	MOVE *BLANK HRJBCD	
1872 00	CSR	MOVE *BLANK HRUBSI MOVE *BLANK HRRVW	
1873.00	CSR	END	
1874.00	C*		
1875.00	CSR	END001 ENDSR	
1876.00	C****	* * * * * * * * * * * * * * * * * * * *	*****
1877.00	C*		
1878.00	C*	SUBROUTINE S003 - Edit Key	
1879 00	C*		
-0,,,,00			

Place an END tag on the ENDSR statement. The TAG name should start with END. The subroutine name is added as a suffix. For example, END001 would be the used for subroutine S001. Do not use the end tag for anything else. Use a T tag if the code needs to be executed prior to the ENDSR statement. For example, T001 would be used for subroutine S001 if the tag is used in the middle of the subroutine.

About Common Subroutines

Common subroutines are maintained outside the program and are included at the appropriate times using the COPY statement. Common subroutines are also referred to as copy modules for that reason. J.D. Edwards stores all common subroutines in the file JDECPY.

At compile time, the compiler copies in code for all instances of the COPY statement. The included code appears only once and then can be called from anywhere within the program.

The statement that instructs the compiler to copy in the source code is shown below. Single lines of asterisks separate common subroutines.

0731.00	C*************************************
0732.00	C*
0733.00	C* Copy Common Subroutine - Right Justify Numeric Fields
0734.00	C* 11
0735.00	C/COPY JDECPY, C0012
0736 00	*************************************

This example shows how the COPY statement in the source (above) brings in additional code to the compiled source (below).

J.D. Edwards has devised an efficient means of handling errors by way of arrays.

The EMK array holds the four byte data dictionary name of every error that could occur in this program. Loaded in Housekeeping (S999).

The @MK array maintains a flag setting for each error identified in EMK. If one of the errors occurs, the flag is set on.

The @ER array loads the related error messages when the user presses F7 to view the errors that actually occurred.

A program may have up to 64 errors.

Columns . SEU==>>	:	1 71	Browse		DEVSRC/JDESRC P55011X

The call to the error message handling program is shown below.

If any error flag is set to one, then the program moves the corresponding data item from the array of all possible errors (EMK) into the array of the errors that have actually occurred (@ER). P0000E is called to display the errors when the function key is pressed.

The next example of code shows how a flag is set in the @MK array.

Indicator Usage

There are 99 indicators available for use. They are grouped by purpose. The chart on the next page lists the available indicators and their description.

Indicator	Explanation
01	Causes the Invalid Function Key Pressed message to appear
02	Dictates the color palette to be used
15	Indicates a function key was pressed.
20	Handles the clear screen action code
21	Handles the add action code
22	Handles the change action code
23	Handles the delete action code
24	Handles the inquire action code
25	Handles the inquire action code 'P' for print (payroll)
31	Used in conjunction with subfile processing to initiate the INVITE or SFLCLR keyword. Using INVITE will slow processing
32	Used in conjunction with subfile processing initiating the keyword SFLNXTCHG
37	Used in conjunction with subfile processing to avoid display of an empty subfile (used only with inquiry subfiles)
38	Used in conjunction with subfile processing to highlight the last record in the display (keyword SFLDSP) and avoid display of an empty subfile
40–79	Used for error processing to indicate which fields are in error and need to be highlighted
40	Reserved for errors in the Action Code field
41	Reserved for errors in the key fields
80–89	General reusable one-time indicators. Use them as needed.
93	Global error indicator that highlights line 24
98	Indicates a chain or read failure
99	Indicates a record is in use or file error
OF	Indicates overflow for report processing
LR	Indicates that the last record has been read and the program should end normally
RT	Indicates that a temporary or final halt in the program should take place. Returns to calling program leaving files open.

Documentation

In the F specifications the program contains several comment lines that are to serve as the program revisions log. The log should list all programmers who have revised the program, the date the revisions were made and the SAR outlining the change that was made.

0016.00	F*					
0017.00	F*	PROGRAM REVISI	ON LOG			
0018.00	F*					
0019.00	F*					
0020.00	F*	Date	Programmer	Nature of Revis	ion	
0021.00	F*					
0022.00	AUTHRF*	03/18/93	MARTIN	SAR # 00000005	(AS/400	A/G)
0023.00	F*	05/01/93	RIPPEY	SAR # 00167542		

When entering comment lines, use the following conventions.

An asterisk in column seven specifies that the line is a comment line only.

The asterisk should be followed by four blank spaces before the comment begins.

Precede and follow the comment lines with a blank line.

Notice in the example below how these conventions are observed.

Guidelines

Common sense should be your guide when documenting your programs. Be thorough and descriptive. Put yourself in the place of the next programmer who will inherit your work. Use English and not "programmerese" to specify the action occurring. For example, for the code shown below:

0130.00	C*				
0131.00	С	\$998	CASEO' '	S998	
0132.00	C*				
0133.00	C		END		

DON'T WRITE: If \$998 is blank, execute \$998.

INSTEAD WRITE: Load data field dictionary parameters (one cycle only).

Notice that the good example gives more detail than can be inferred from the actual code.

Include a line of dashes beneath any line of code that branches to another line of code (CASxx, CABxx, GOTO, EXSR, CALL, BEGSR). The receiving tag statement should also be followed by a line of dashes as shown in the example below.

0275.00	C* C	EXSE S999	
0277.00	C*		

Miscellaneous Items

The following represent miscellaneous items of note that you should keep in mind when writing your own code.

Naming Conventions

Use the following first character to distinguish different item names:

- @ Array names
- Program created field names (flags and work fields)
- # Fields defined in common subroutines

Key List (KLIST)

Key lists should all be defined in the housekeeping subroutine.

Begin the key list name with the data file prefix. For example, the Address Book Master file prefix is AB, so the key list would be ABKY01.

The Program Generator creates key lists using the following naming conventions:

XXKY01 for physical files where XX = the file prefix

For example: ABKY01

When a physical needs to have more than one key list in a program, the successive files are noted in the last character space. For example, for three key lists for the physical F0101, the key lists would be: ABKY01, ABKY02, and ABKY03.

XXKY0x for logical files where XX is equal to the file prefix and x is equal to the last letter of the logical file name.

For example: ABKY0A for F0101LA, ABKY0B for F0101LB.

When a logical needs to have more than one key list in a program, the successive files are noted in the second to last character space. For example for three key lists for the logical F0101LA the key lists would be: ABKY0A, ABKY1A, and ABKY2A.

Work Fields

Define work fields only once within a program. The use of the *LIKE DEFN command is highly recommended for defining work fields when their attributes are directly tied to those of data base fields.

For example, if the work field needs to have the same attributes as a field that exists in a file:

MOVE ABANS \$\$ANS,

then define \$\$ANS as follows:

*LIKE DEFN ABANS \$\$ANS

The advantage of this method is that the work field and data base field will retain the same attributes even if the data base field changes.

When using work fields as a flag, you should assign them the prefix \$ and have the remainder of the name be descriptive. In the example below, the work field name is \$GLOBL. This name is more descriptive than a field name such as \$G.

)831.00)832.00)833.00	C* C* C*	If F6 pressed, Global Update by Percent or Amount.	
)834.00)835.00	C*	@@ATD TEEO #F03	
836.00	CSR	MOVE '1' \$GLOBL 1	
30.00	CBR		

Optional Files

If a program uses files which are dependent upon your particular setup, you should designate those files as user control open (UC) in the file specifications and then write the program such that they are opened, if needed, in the Housekeeping subroutine. This eliminates the need to open files unnecessarily and conserves resources.

FF085201 UF	Е	K DISK	UC
FF08501LAIF	Е	K DISK	UC

The lines that perform the open are shown below.

Columns SEU==>>	:	1 71	Browse			JDFSRC/JDESRC P08320

3835.00	CSR		MOVE '1'	\$PENS2	1	
3836.00	CSR		END			

If you are doing a user–controlled open for a file that is part of another system, you will also need to provide pre–compiler commands in the event the user hasn't purchased that system. The example below illustrates the necessary pre–compiler commands designed to address just such a situation.

In the example, if a Payroll client has not purchased Human Resources, the code specifies a file override and then substitutes an empty file (identified with the suffix E) which all Payroll clients receive.

*	**************************************	ng of data **********************************
001.00	OVERDEF	FILE(FU82UUIB) TOFILE(FU82UUIE)
002.00	OVERDBE	FILE (F08005B) TOFILE (F08005E)
*	**************************************	data ***********************************

The user–controlled opens in the program allow the program to run in the absence of certain files, whereas the precompiler commands allow the program to be compiled in the absence of those files.

About Program Structure

There are several types of subroutines used in the J.D. Edwards program structure, including the following:

Internal RPG Subroutines within J.D. Edward programs

Subfile program with selection exits

Interactive non-subfile program

Report program without subheadings

Report program with subheadings

Maintenance program without a subfile

Internal RPG Subroutines Within J.D. Edwards Programs

Standard names make program maintenance easier.

Called primarily from Mainline.

The table below describes internal RPG subroutines within J.D. Edwards programs:

Field	Explanation
SOOEX	Processes all function key exits.
	Calls P9601H if F24 was pressed
	Calls X96CCX if F1 was pressed
	Calls subroutine S00VL if F1 was pressed after
	X96CCX was called
	Calls P0000E if F7 was pressed
	Calls P00HELP if the HELP key was pressed
	Calls subroutine S001 if F22 was pressed
	Calls all programs to process all user defined function
	keys
S00VL	Values returned with Cursor Sensitive Help.
	Is called from the subroutine S00EX after the program
	X96CCX is called
S00OP	Subfile Selection Exits (Options).

Field	Explanation
S001	Clears all database and video fields. Usually only clears key fields and VC0 fields if F22 (Clear) is pressed
S002	Checks for level breaks for reports. Turns on level break flags. Retrieves total line description
S003	Validates the key fields.
	Calls S998 subroutine if auto inquire was invoked
	Sets the file pointer. Performs a SETLL or CHAIN if a single record maintenance program Performs a SETLL for subfile programs
	Calls a subroutine S004 to load video/report fields
	Monitors for no subfile records loaded if a subfile
	Loads unused subfile records with blanks
S004	Display/load video/report fields.
S005	Scrubs and edits video/report fields. Moves video data to database fields Turns on error indicators if a field is in error Updates/writes records to the database file if a subfile Updates the subfile
S010	For reports with level breaks it: Prints the total Clears the level break totals Prints the grand total (if it has reached the end of the file) Prints the detail Adds to the new level break totals
	Calls subroutine S020 if it is a report with subheadings
	If it is <i>not</i> a report, it updates, adds, or deletes records from the database file Turns on F22 (Clear) to force S001 to be executed to clear the buffer before reading another record.
S020	Print Report Subheadings.
S998	Loads Data Dictionary values. (One time only) Retrieves row description for level breaks and subheadings, if applicable

Field	Explanation
S999	Housekeeping. (One time only)
	Sets auto inquiry
	Defines key lists
	Retrieves processing options and level breaks, if applicable
	Retrieves vocabulary overrides
	Loads error messages
	Performs file opens
	Current date retrieval
	Work fields defined using *LIKE
	Prints cover page and Helps in a report
	This cover page and helps in a report

Interactive Non-Subfile Program

Subfile Program With Selection Exits

Report Program Without Subheadings

Report Program With Subheadings

Release A7.3 (June 1996)

Review an RPG Program's Source

The following pages illustrate a maintenance program without a subfile.

Some of the more important areas and commonly used fields are highlighted and explained.

69.00	I* Data Structure to Load Video Screen Text

About User Spaces

User spaces are objects managed by Application Program Interfaces (APIs) to store data. User object APIs create, manipulate, and delete user spaces and indexes. An API provides you:

A faster way of retrieving information

A means of dynamically modifying sizes

A means of manipulating user objects

You should place your user spaces in library QTEMP so that it will be deleted automatically when you sign off. In this chapter you will learn the following about user spaces:

What are they?

What are the advantages of using them?

How do they function?

To work with user spaces perform the following tasks:

Create a user space

Write to a user space

Read from a user space

What is a User Space?

A user space is:

An object made up of a collection of bytes that are used for storing any user-defined information.

When you use a user space, there is no key to use to retrieve the information placed in the space. Therefore, the information in the user space is in the order that it was entered. A user space can store up to 16 megabytes of information.

To see the contents of a User Space, enter the command DMPOBJ (Dump Object) from any command line after the space has been loaded.

What Are the Advantages of Using a User Space?

The main advantage of using a user space is its speed.

Because a user space consists of bytes instead of elements like an array, you can write and retrieve records faster using a user space than an array.

In addition to speed, a user space provides you with more flexibility.

A user space does not have a fixed record length. When you write a record to a user space, you define the length of that record. Therefore, each record you write to your user space can be a different size. In addition, it is possible to dynamically increase the size of your user space by calling the Enter User Space program (X00SPC) after creating the user space.

For example: @EX 999 30

The array @EX has a fixed record length of 30, therefore no record smaller or larger than 30 bytes can be written to this array.

User spaces are also used when communicating between two programs. The space can carry information loaded in one program to another program for retrieval.

For example: Program A creates the user space and loads information into a user space. Then Program A calls Program B and passes the name of the user space to it. Program B can retrieve information from the user space that was loaded by Program A.

How Does a User Space Function?

Remember that a user space is nothing more than a collection of bytes used to store information:

You write information to a user space, as well as retrieve information from it. Since there is no key associated with a user space, the information contained in a user space is in a user-defined order. The order is based on program controlled offset and length values

Creating a User Space

To create a User Space

1. Determine if a user space already exists by using the J.D. Edwards program J98CKOBJ.

For example:	CALL	'J98CKOBJ'	81
	PARM	PSOBJ	
	PARM	PSLIB	
	PARM	PSTYPE	
	PARM	PSMID	
	PARM	PSAUT	
	PARM	PSERR	

PARM (Length)	Description
PSOBJ (10)	The name of your user space.
PSLIB (10)	The name of the library in which you wish to check for the existence of the user space. Generally, this is *LIBL to check all of the libraries in the library list.
PSTYPE (8)	The type of object you are checking for. Generally, this is *USRSPC for a user space.
PSMID (10)	The member ID if you are checking for a database file. Generally, this is *NONE.
PSAUT (10)	The authority or authorization list to be checked for the user. Generally, this is *NONE.

PARM (Length)	Description
PSERR (1)	The error parameter that will indicate an error while checking your object. Generally, this is *BLANK.
	0 - No authority
	1 – Not found
	3 – No library
	4 – Member not found
	5 – No authority to library
	6 – Cannot assign library

- 2. If a user space does exist you should clear it and write your new information over the old.
- 3. If the user space did **not** exist and no errors occurred, you can create your user space. To create a user space, use the QUSCRTUS (Create User Space) command.

For example:	CALL	'QUSCRTUS'	81
	PARM	#SPNAM	
	PARM	#SPATT	
	PARM	#SPSIZ	
	PARM	#SPVAL	
	PARM	#SPAUT	
	PARM	#SPTXT	

PARM (Length)	Explanation
#SPNAM (20)	The first 10 characters contain your user space name, and the second 10 characters contain the name of the library where your user space is located. Remember, place your user space in library QTEMP to automatically delete your space when you sign off.
#SPATT (10)	The extended attribute of your user space. You may use this field to classify your user space. For example, JDE uses this field to label all of the user spaces with JDE.
#SPSIZ (4 binary)	The initial size of your user space. Any value from 1 byte to 16 megabytes.
#SPVAL (1)	The initial value of all bytes in the user space. Generally, this is *BLANK.
#SPAUT (10)	The authority you give users to your user space. Generally, this is *ALL.

PARM (Length)	Explanation
#SPTXT (50)	The text description of your user space.

4. To dynamically increase the size of your user space when maximum allocation is reached, call the Enlarge User Space program (X00SPC).

CALL	'X00SPC'	81
PARM	#XSPCN	
PARM	#XRQSZ	
PARM	#XERR	
	CALL PARM PARM PARM	CALL 'X00SPC' PARM #XSPCN PARM #XRQSZ PARM #XERR

PARM (Length)	Explanation
#XSPCN (20)	The first 10 characters contain your user space name, and the second 10 characters contain the name of the library where your user space is located. Remember to place your user space in library QTEMP to automatically delete your space when you sign off.
#XRQSZ (15,0)	The requested size to increase your space.
#XERR (1)	An error flag:
	1 – Space not found
	2 – Not authorized
	3 – Error

Writing to a User Space

To write to a User Space

Use either the QUSCHGUS or the X98CHGUS (Change User Space) command.

For example:	CALL	'QUSCHGUS'	81
	PARM	#SPNAM	
	PARM	#SPPOS	
	PARM	#SPLGH	
	PARM	#SPVAL	
	PARM	#SPAUX	

PARM (Length)	Explanation	
#SPNAM (20)	The first 10 characters contain your user space name, and the second 10 characters contain the name of the library where your user space is located. Remember to place your user space in library QTEMP to automatically delete your space when you sign off.	
#SPPOS (4 binary)	The starting position in your user space where the information will begin. It must be the first byte and must have a value greater than 0.	
#SPLGH (4 binary)	The length of the information that is being written to your user space. This field is user-defined, but it must be greater than 0.	
#SPVAL (* user defined)	The actual information to be written to your user space. The field must be at least as long as the length parameter.	
#SPAUX (1)	Used to force changes made to your user space to auxiliary storage, such as a disk. The valid values are:	
	0 – do not force changes	
	1 – write changes	
	2 – write changes immediately	

The X98CHGUS program, JDE's version of the IBM command QUSCHGUS, will perform a transfer control to QUSCHGUS.

Tracking Information if Writing Variable Length Records

Method 1

During the process of writing information to your user space, you should keep track of a pointer. This will ensure that you will not overwrite information or retrieve incorrect information.

One way to do this is to initialize your pointer to 1 and after you write information to your user space, add the length of the information to your pointer. The pointer is now set at the next starting point and ready for you to enter new information.

If the information you are writing to your user space contains various lengths, you should maintain the length of each piece of information in save fields. You can use the save fields when you wish to retrieve the information from your user space.

Method 2

You can also reserve the first 2 or 3 bytes of every record for the size of that record. Then you would only have to load that part of the record with its length. When you read the record from the user space, the first 2 or 3 bytes will tell you how long the record is.

Reading from a User Space

Once you have loaded information into your user space, you are ready to retrieve it. Do not forget that your pointer must be set to the proper starting position to ensure the correct information is retrieved.

To read from a User Space

Use the QUSRTVUS (Retrieve User Space) command.

For example:	CALL	'QUSRTVUS'	81
	PARM	#SPNAM	
	PARM	#SPPOS	
	PARM	#SPLGH	
	PARM	#SPREC	

PARM (Length))	Description
#SPNAM (20)	The first 10 characters contain your user space name, and the second 10 characters contain the name of the library where your user space is located. Remember to place your user space in library QTEMP to automatically delete your space when you sign off.
#SPPOS (4 binary)	The starting position in your user space where the information will begin. It must be the first byte and must have a value greater than 0.
#SPLGH (4 binary)	The length of the information that is being retrieved to your user space. This field is user-defined, it must not be larger than the variable that will receive the information, and it must be greater than 0.
#SPREC (* user defined)	The variable that will receive the information from your user space.

About User Indexes

A user index is an object that will:

Store data

Allow search functions

Automatically sort data based on its value

When you use a user index you must have a key to retrieve the information placed in the index.

The key must be unique.

You can only retrieve data using the key in ascending or descending order.

Data entered into a user index is placed in order according to its value.

A user index can store up to 4 gigabytes of information.

Each key and record within a user index can be 1 to 999 bytes long.

To see the contents of a user index, enter the command DMPOBJ (Dump Object) from any command line after the index has been loaded.

You should place your user indexes in library QTEMP so that it will be deleted automatically when you sign off.

To work with user indexes perform the following tasks:

- Create a User Index
- U Write to a User Index
- □ Retrieve from a User Index

What Are the Advantages of Using a User Index?

When you load data into your user index, it is automatically sorted for you. Based on your key for the index, the information is arranged according to its value.

This will help streamline table searches, cross-referencing, and the ordering of data.

The size flexibility of a user index is much better than an array because arrays have a fixed size.

A user index is only as big as the information it contains at one time. User indexes expand as you add data to them.

For example: @EX 999 30

The array @EX has a fixed size of approximately 3 kilobytes. Each record must be 30 bytes long and up to 999 records can be loaded. If you have 300 records loaded into @EX, you will waste approximately 2 kilobytes. On the other hand, if you have 1500 records to load, the program will error when record number 1000 is loaded. A user index would be able to accommodate both situations.

A user index is able to retrieve records faster than an array.

Although a user index may expand to hold more records, it will not contract when records are removed. If you load 100 records into a user index and then remove 50 of them, the user index will remain at the 100 record level size.

You may retrieve data from a user index in ascending order or descending order.

When data is loaded into a user index, it is loaded in ascending order. This does not restrict you to retrieving it in this order.

How Does a User Index Function?

A user index stores data and allows you to retrieve it by a key, which must be unique. The data it stores is made up of a data structure that consists of several fields that you wish to store. A user index is capable of expanding when you add data to it.

J.D. Edwards leaves the first byte in the user index blank for clearing purposes.

◀ -	 Key	 ◀ Data ►

When using a user index you can create it, add data to it, remove data from it, and delete it.

User indexes, like user spaces, should be created in your QTEMP library so you do not have to worry about deleting it.

Creating a User Index

Before you actually create a user index, check to see if one already exists using the JDE program J98CKOBJ.

For example:	CALL	'J98CKOBJ'	81
	PARM	PSOBJ	
	PARM	PSLIB	
	PARM	PSTYPE	
	PARM	PSMID	
	PARM	PSAUT	
	PARM	PSERR	

PARM (Length))	Explanation
PSOBJ (10)	The name of your user index.
PSLIB (10)	The name of the library in which you wish to check for the existence of the user index. Generally, this is *LIBL to check all of the libraries in the library list.
PSTYPE (8)	The type of object you are checking for. Generally, this is *USRIDX for a user index.
PSMID (10)	The member if you are checking for a database file. Generally, this is *NONE.
PSAUT (10)	The authority or authorization list to be checked for the user. Generally, this is *NONE.
PSERR (1)	The error parameter that will indicate an error while checking your object. Generally, this is *BLANK.
	0 - No authority
	1 - Not found
	3 – No library
	4 – Member not found
	5 – No authority to library
	6 – Cannot assign library

CALL	'X00IDX'	81
PARM		#0XNAM
PARM	'D'	#0XACT
PARM	'EQ'	#0XRUL
PARM	'1'	#0XKLN
PARM	*BLANK	#0XKEY
PARM		#0XRLN
PARM		#0XREC
PARM		#0XSTA
	CALL PARM PARM PARM PARM PARM PARM PARM PARM	CALL 'X00IDX' PARM 'D' PARM 'D' PARM 'EQ' PARM '1' PARM *BLANK PARM PARM PARM

If a user index exists, clear it and write your new information over the old.

If the user index did not exist, you can now create your user index.

Use the QUSCRTUI (Create User Index) command.

For example:	CALL	'QUSCRTUI'	81
	PARM	#IDNAM	
	PARM	#IDATT	
	PARM	#IDENT	
	PARM	#IDLEN	
	PARM	#IDINS	
	PARM	#IDKEY	
	PARM	#IDUPD	
	PARM	#IDOPT	
	PARM	#IDAUT	
	PARM	#IDTXT	

PARM (Length))	Explanation
#IDNAM (20)	The first 10 characters contain your user index name, and the second 10 characters contain the name of the library where your user index is located. Remember to place your user index in library QTEMP to automatically delete your index when you sign off.

PARM (Length))	Explanation
#IDATT (10)	The extended attribute of your user index. You may use this field to classify your user index. For example, JDE uses this field to label all of the user indexes with JDE.
#IDENT (1)	Whether the records you are loading into your user index are Fixed–length (F) or Variable–length (V). Generally, this is set to 'F'.
#IDLEN (4 binary)	The length of the records to be entered into your user index. For fixed–length records valid values are 1 to 999. For variable–length records, enter 0 for a key length of 1 to 120, or 1 for a key length of 1 to 999.
#IDINS (1)	Whether you are loading your user index by a key or not. Generally, this is set to 1 to load your index by a key. A value of 0 means you are not loading your index by a key.
#IDKEY (4 binary)	The length of your key. The first byte in your record must be the beginning of your key. The values are 1 to 999 or 0 for no key.
#IDUPD (1)	Whether or not the data in your user index will be immediately updated. Each data change to your index is written to auxiliary storage. The values are 0 for no immediate update or 1 for immediate update. Generally, this is 0.
#IDOPT (1)	The type of access in which to optimize your index. The values are 0 to optimize for random references or 1 to optimize for sequential references. Generally, this is 1.
#SPAUT (10)	The authority you give users to your user index. Generally, this is *ALL.
#SPTXT (50)	The text description of your user index.

You may want to define data structures containing some of the information required for the parameters to avoid having to enter values. The user index name, record length, key length, and user index text are good examples.

Writing to a User Index

To write to a User Index

J.D. Edwards provides an external program called User Index Server (X00IDX) to manipulate data for user index entries.

For example:	CALL	'X00IDX'	81
	PARM	#0XNAM	
	PARM	#0XACT	
	PARM	#0XRUL	
	PARM	#0XKLN	
	PARM	#0XKEY	
	PARM	#0XRLN	
	PARM	#0XREC	
	PARM	#0XSTA	

PARM (Length))	Explanation
#0XNAM (20)	The first 10 characters contain your user index name, and the second 10 characters contain the name of the library where your user index is located. Remember to place your user index in library QTEMP to automatically delete you index when you sign off.
#0XACT (1)	The action you want to perform on your user index. The valid values are:
	I – Inquire
	A – Add
	C – Change
	D – Delete
#0XRUL (2)	The rule used to search your user index using the record. The valid values are:
	EQ – Equal to
	GT – Greater than
	LT – Less than
	GE – Greater than or Equal to
	LE – Less than or Equal to

PARM (Length))	Explanation
#0XKLN (3,0)	The length of your key. The first byte in your record must be the beginning of your key. The values are 1 to 999 or 0 for no key.
#0XKEY (120)	The fields that make up the key to your user index. *FIRST (first record) and *LAST (last record) are allowed.
#0XRLN (3,0)	The length of your record. The values are 1 to 999.
#0XREC (120)	The record you are entering or deleting from your user index. This parameter will also receive the record when you inquire on your user index.
#0XSTA (1)	The error status of the manipulation. The possible values are:
	0 – Record found
	1 – Record not found, not authorized
	8 – Rule invalid
	9 – Error on action
Appearance of Records

The records added to your user index will appear in ascending order.

For example: You created a user index to keep track of your ice cream sales. Each record within your user index contains the total sales amount, item, item description, and cost center. The key for your user index consists of total sales amount and item (remember the key must be unique).

The following records are to be loaded into your user index:

Total	Sales Item	Description	Cost Center
\$ 500.00	CHO	Chocolate	Denver
\$ 250.00	STR	Strawberry	Denver
\$ 750.00	C&C	Cookies & Cream	Denver
\$1200.00	VAN	Vanilla	Denver
\$ 400.00	ROC	Rocky Road	Denver

Because the key to your user index is total sales amount and item, the records will be entered into your index in ascending order by total sales amount first, then item. So your user index will look like this:

Ice Cream Sales Index

Total	Sales Item	Description	Cost Center
\$ 250.00	STR	Strawberry	Denver
\$ 400.00	ROC	Rocky Road	Denver
\$ 500.00	СНО	Chocolate	Denver
\$ 750.00	C&C	Cookies & Cream	Denver
\$1200.00	VAN	Vanilla	Denver

Retrieving Data from a User Index

You can retrieve data in ascending or descending order.

To retrieve data in Ascending Order

- 1. Use the User Index Server (X00IDX).
- 2. Set the Action parm to inquire (I)
- 3. Set Rule to Equal to (EQ)

For

4. Set the Key to the first record (*FIRST)

example:	CALL	'X00IDX'	81
	PARM		#0XNAM 20
	PARM	ʻI'	#0XACT 1
	PARM	'EQ'	#0XRUL 2
	PARM		#0XKLN 30
	PARM	'*FIRST'	#0XKEY120
	PARM		#0XRLN 30
	PARM		#0XREC120
	PARM		#0XSTA 1

5. To retrieve the next record, load the key with the current record's values and change your rule to 'GT'.

For example:	CALL	'X00IDX'	81
	PARM		#0XNAM 20
	PARM	ʻI'	#0XACT 1
	PARM	'GT'	#0XRUL 2
	PARM		#0XKLN 30
	PARM		#0XKEY120
	PARM		#0XRLN 30
	PARM		#0XREC120
	PARM		#0XSTA 1

To retrieve data in descending order

- 1. Use the User Index Server (X00IDX)
- 2. Set the Action parm to inquire (I)
- 3. Set Rule to Equal to (EQ)
- 4. Set the Key to the first record (*LAST)

For example:	CALL	'X00IDX'	81
	PARM		#0XNAM 20
	PARM	ʻI'	#0XACT 1
	PARM	'EQ'	#0XRUL 2
	PARM		#0XKLN 30
	PARM	'*LAST'	#0XKEY120
	PARM		#0XRLN 30
	PARM		#0XREC120
	PARM		#0XSTA 1

5. To retrieve the next record, load the key with the current record's values and change your rule to 'LT'.

For example:	CALL	'X00IDX'	81
	PARM		#0XNAM 20
	PARM	ʻI'	#0XACT 1
	PARM	'LT'	#0XRUL 2
	PARM		#0XKLN 30
	PARM		#0XKEY120
	PARM		#0XRLN 30
	PARM		#0XREC120
	PARM		#0XSTA 1

About File Servers

File servers (sometimes called I/O servers) allow you to enhance the processing time of your program. In addition, they ease the maintenance of your programs by making your system more modular. There should be no reason to bypass the use of a server. Eventually, every program should perform database functions using either a file server or a functional server. Note that all logical files are accessed through servers by their based-on file. Embedded in one server, there may be many access paths available.

To understand File Servers you should know:

What are file servers?

What are the advantages of using them?

How do they function?

What is a File Server?

A file server, or I/O server, is:

A server that performs all RPG database operation codes.

This type of server has no effect on program logic, but it isolates the actual database from the application program. Once you implement a file server into a program, the file specification is no longer required.

Types of File Servers

There are three types of file servers you can use:

XS____Input-Only/Caching Servers

They should be used when you would otherwise use a simple CHAIN operation for input only. You may request descriptions only, or the entire record. They provide caching logic to decrease physical I/O for duplicate requests.

XF____Input/Output File Servers

They will allow you to replace all RPG database operation codes for a given file with program calls. They can read, chain, setll, etc. to a file.

X_____Special Scrub & Edit Servers

They can accept the cost center or account numbers in any valid data entry or file format, convert them to any format, validate the existence of the master record, and optionally pass the master record back to the calling program.

What are the Advantages of Using a File Server?

Minimizing maintenance of your software

The ability to change a physical file without having to make changes to application programs that use the file, or even having to recompile them

Using versions in future releases to allowing programs from a previous release to run against a changed database

The transition from an old database to a new database will be smoother. Instead of applying all new programs, you will only have to apply a new set of file servers.

Ability to implement one file server at a time without affecting the rest of your system

What are the Disadvantages of Using a File Server?

A file server is minutely slower because you are performing an external call to the server from your program.

File server programs tend to be large.

File servers are designed to perform all database functions that can be performed directly.

How Does a File Server Function?

A file server performs all the interfaces between a program and file. First you will load the **control parameters**, which contain information about the record you are retrieving. The file server converts the control parameters and retrieve a record back to the program.

If you plan on using any of the file server programs and you are asking them to return the database record, you must use the record image /COPY member that the corresponding I/O server uses. The /COPY member has the following naming convention:

I(file name) (release level).

For example: The copy member for the F0101 record image should appear as:

I/COPY JDECPY, I010171

Some technical file servers (X9800E, X0005) have a /COPY member with the naming convention:

I(file name)(special character)

I/COPY JDECPY, I0005U

A file server is called with two parameters:

For example:	CALL	'XF0101'	81
	PARM	PS@@1	
	PARM	I0101	

PARM	Explanation
PS@@1	Contains all of the control parameters. It is contained in copy module I00XFSRV, and it is common to all file servers.
I(file name)	Contains the record image for updates and writes specific for each I/O server. It is an exact duplicate of the record image. It is contained in the copy module I(file name) (release level).

What Are Control Parameters?

The parameter PS@@1 contains all the control parameters for the file server. All control parameters, except the format name, are cleared every time the server returns control to the calling program. You must set the parameter values every time the server is called unless you are satisfied with the default values.

PARM (Length)	Explanation		
@ @ACCS (1)	The type of access to the file. The valid values are K for Keyed access (default), R for relative record number access and S for sequential access (DREAM Writer).		
@ @ OPER (10)	The operation to presented below	be performed to the file. The valid values are	
	Operation	Description	
	CHAIN	Chain by key list or RRN	
	CLOSE	Close the access path	
	DELET	Delete current record or by key or RRN	
	EXIST	Test existence of record by key	
	OPEN	Open access path (optional)	
	READ	Read next record	
	READE	Read next equal key	
	READP	Read previous record	
	REDPE	Read previous equal key	
	SETGT	Set greater than key	
	SETHV	Set greater than with *HIVAL	
	SETLL	Set lower limit by key	
	SETLV	Set lower limit with *LOVAL	
	UPDAT	Update locked record	
	UPDATC	Update current record	
	WRITE	Write new record	
	UNLCK	Unlock current record	
@ @LOCK (1)	Whether you do values are Y to I record. Note: This I opera You s	or do not want to lock the record. The valid lock the record (default) or N to not lock the parameter is only valid for chain and read tions, and is ignored for all other operations. hould set it to N when reading records not to	

PARM (Length)	Explanation	
@@CHGR (1)	 Servers allow records to be read without lock and then be updated (UPDATC). In this situation, the record will be re-read before it is updated and if it has changed since it was last read, action will have to be taken. This parameter determines what that action will be. The valid values are: N- Do not update the record. A return code (RC) is returned and it comes up to the program to determine what action to take. (default) O- Overlay the changed record with the values you are currently updating. This will cause the changes made by the other user to be lost. W- Call the Changed Record Window (P0000U) that will prompt you for what action to take. Use this option with interactive programs only. 	
@@KLST (10)	The key list that will be used for access. The calling program does not specify a logical file so that the application program is isolated from any database changes. A value must be specified unless you are accessing the file by relative record number or sequentially (@@ACCS = R or S). Note: The server maintains status information for each access path, so multiple paths can be accessed through the server in one program. The @@KLST parameter determines which access path is affected	
@ @ KNUM (5,0)	Specifies how many key fields in the list will be used for the current operation. This allows you to perform a read equal by a partial key. The valid values are 1 through the number of fields in the key, and blank for operations not requiring a key.	
@ @FMT (10)	Specifies the release level the program is expecting. This field does not get cleared upon returning from the server, so it can be set once in \$999.	
@@#RRN(9,0)	The relative record number for RRN access.	
I (file name)	Record image for updates and writes. This parameter is optional for OPEN, CLOSE, DELET, SETHV, SETLV, and UNLCK operations.	

Access paths are opened automatically when the first operation is performed. Therefore, it is not necessary to call the server with the OPEN operation.

A server normally remains active as long as the calling program is active. If you know you will need a server for only a limited period of time and do not want it taking up space in the PAG, you can call the server the @@OPER parameter blank, this causes the server to return and end.

What Are Returned Parameters?

When the file server returns the record to the program, there are several parameters associated with it.

PARM (Length)	Explanation
@@ <i>IOR</i>	The I/O return code.
	The possible values are: blank –No errors NF – Record not found NE – Not equal for a READE operation EOF – End of file EQ – Equal for a SETLL operation BOF – Beginning of file RL – Record Locked, could not read RC – Record changed YES –Record found NO – Record not found ERR – Error, check error fields for explanation
@ @ ERR (10)	Short description of the cause of the problem (invalid, reclock, error, required, deleted, chgrec).
@ @ ERRS (10)	The subject causing the error. The value could be a parameter (KLST), an operation (OPEN), or a file name (Fxxxx). Used in combination with @ERR gives a good idea of what happened. The application program will generally only use @@IOR. @@ERR and @@ERRS are most useful for debugging purposes.
@ @ #RRN (9,0)	Returns the relative record number of the record just read (both input and output).
I (filename)	Returns an exact duplicate of the record image (both input and output).

Implementing a File Server

Implementing a File Server

The following are generally the steps needed to set up a file server in a program. Some programs may differ.

- 1. Remove F–spec line for file being accessed through the server, and replace it with a comment mentioning access through the server.
- 2. Add clear statement in S999 (CLEAR PS@@1). You may optionally set @@FMT to 'A71' so it does not have to be set on every call.
- 3. Copy in I-spec copy module I00XFSRV.
- 4. Copy in I–spec copy module for the required server, following the naming convention: I(file name) (release level). Example: I010171
- 5. Code call to server for each database access. Naming convention for server is X(file name). For example, XF0101 for F0101 and any of its logicals.

Load control parameters

Load record image if a write or update

Call the server

Check the return code

- 6. Remove any open statements and key lists for this file from S999.
- 7. Remove any output specifications dealing with EXCPT unlock statements at the bottom of the program. The server will handle all of the unlock/lock operations.

When reading sequentially (@@ACCS = S) through the physical file or through a DREAM Writer based—on file that is overridden to the physical, some operations are not available. Do not use: CHAIN, EXIST, READE, REDPE, UPDATC, SETLL, SETGT, SETHV, SETLV. Since UPDATC is not available and you are going to update a record, you need to read with lock.

If the file you are accessing though the server is the DREAM Writer based on file, the Open Query Options on the DREAM Writer Additional Parameters screen need to be changed. Change all of the "Open for xxxxx" parameters to "Y".

Searching for Key Lists

When converting programs to use the file servers, make note of what logical files are being accessed, and what mode (update/input) and what each of the defined key lists for those access paths represent.

To search for Key Lists

- 1. Look up the corresponding server key list name using P93KL (fast path, KL).
- 2. Search for the format name for files that are accessed in the program.
- 3. Replace each instance of file access code with a call to the server with the correct parameters.

Tips When Using File Servers

When converting a program to use the file servers, always set the @@LOCK parameter to N when reading records through an access path that the program uses to open for input only.

The reason for this is that all access paths are open for update in the server. This can cause record lock problems when a program opens multiple paths into the same file. Correct use of the @@LOCK parameter solves these problems.

Some programs may be doing a CHAIN or EXCPT to unlock a record. Instead of replacing it with a CHAIN through the server, take advantage of the UNLCK operation. Performing an UNLCK on a file that does not have a record locked does not produce an error.

Some programs perform a SETLL to validate that a record exists. The new operation EXIST is provided to handle this function. It returns a YES or NO in return code (@@IOR).

There is only one instance in which a particular file server is active in your job at one time, so if one program calls another program that accesses the file through the same access path, they are actually sharing the same open data path. If it is possible that a call to another program could relocate a file pointer that could mess up the program, it would be a good idea to save the keys and reset the pointer (CHAIN or SETLL) upon returning.

File Server Examples

About Functional Servers

A functional server allows you to enhance the processing and maintenance of your application programs. Functional servers provide a central location for standard business rules about entering documents, such as vouchers, invoices, and journal entries. These business rules establish the following:

Data dictionary default values

Field edits and valid values

Error processing

Relationships between fields or applications

To work with functional servers you should understand:

What functional servers are

What the advantages of using them are

How to set up the business rules

How they function

What Are Functional Servers?

A functional server is:

A server that performs all transaction validation and database updates.

This type of server is designed to relieve application programs from the burden of performing edit and update operations. This functionality is removed from the application program and placed into a server.

A functional server is a called program. The application program calling the server must tell the server what action is to be performed for every transaction. In turn, the functional server will return error messages, record error flags, and record update flags to the application program to use when determining the result of a call to a server. Functional Servers have the following naming convention:

XT (file name) (server version)

For example: The function server for the F0411 file should appear as:

XT0411Z1

The following diagram depicts the flow of a typical program using a functional server:

What are the Advantages of Using a Functional Server?

Minimizes maintenance and versioning of your software.

Data editing routines and actual file updates can be isolated.

Provide greater flexibility. Multiple programs can use the same functional server.

The transition from an old database to a new database will be smoother. Instead of applying all new programs, you will only have to apply a new set of functional servers.

Ability to implement one functional server at a time without affecting the rest of your system.

What are the Disadvantages of Using a Functional Server?

A functional server is minutely slower because you are performing an external call to the server from your program.

Functional server programs tend to be large.

Setting Up Business Rules for an Entry Program

To set up business rules for an entry program

- 1. Create a DREAM Writer version for a specific functional server program (for example, XT0411Z1 for voucher entry).
- 2. Set the processing options within the version according to your company requirements.
- 3. Specify the version you want the entry program to use in the processing options for that entry program.

You can have all your entry programs use the same DREAM Writer version (and thus, use the same rules) or you can set up different DREAM Writer versions. J.D. Edwards provides DREAM Writer version ZJDE0001 as the default functional server version for your entry programs.

Only the person responsible for system-wide setup should make changes to the functional server version. For more information about how to set up DREAM Writer versions, see the *Technical Foundation Guide*.

How Does a Functional Server Function?

When a functional server is called, an entire transaction will be processed.

Generally, once a functional server is called, it will receive the data entered by you and load it into a user space.

It will then perform its functionality on the data.

Finally, it will return the requested data back to the calling program via the user space. If any errors occur, they will be loaded into a user index.

Three interfaces are used to communicate with the functional server. They are:

The call parameters The control fields within each user space line The error index

Functional Server Highlights

Provides all editing for a transaction Provides field default values Provides all database updates Performs inquiry for an entire transaction

Runs interactively or in batch

Supports a multitude of user interfaces

Basic Accounting Transactions

In the Financial System there are five basic transactions:

Journal Entries A/P Voucher Entry

A/P Checks

A/R Invoice Entry

A/R Cash Receipts

J.D. Edwards uses one program for each part or transaction of the system.

Example: Voucher Processing Functional Server

The following graphic shows the programs that use the voucher processing functional server. J.D. Edwards provides two demo versions of the functional server, ZJDE0001 and ZJDE0002.

Program Example – Traditional Architecture

Each program contains both the User Interface Logic and the Data Integrity Logic. You would access this one program to interface with the database.

User Interface Logic

Screen format

Skip to and section

Fill screen

Field formatting

Help functions

Error message display

Touch and feel

Data Integrity Logic

Field editing

Multi-field editing

Transaction editing

Default logic

Error message selection

Tax processing

Currency processing

Database update

Example – Traditional Architecture Alternative Method of Entry

If a user wanted the screen to look different, the User Interface Logic would have to change. The Data Integrity Logic remained the same as it was duplicated.

Example – Traditional Architecture Various Entry Methods

Several users each wanted their own User Integrity logic. The Data Integrity Logic remained the same and was duplicated too many times.

Example – JDE Open Application Architecture Various Entry Methods

The creation of a Functional Server allows you to maintain the Data Integrity Logic in one common program. The Functional Server becomes separated from each User Integrity Logic program. All of the User Integrity Logic programs access one Functional Server to interface with the database. This concept is called an **Open Application Architecture**.

Open Application Architecture

In the Open Application Architecture, the database is separated from each User Integrity Logic program by the Functional Server. The advantages of the Open Application Architecture are:

> Standard Entry Programs External Open Application Architecture PC Input Application Customer Input Application PC-AS/400 Interface Batch Input Processor

Internal Open Application Architecture (Functional Servers)

Database

Automatic Consistency Reduced Maintenance Burden Stability of Custom Code Separation of Development Efforts Performance Enhancements

Functional Server Interface

A Functional Server must handle two basic components:

Data

Error messages

Functional Server Transaction Data

Arithmetic:

- 1) Full transaction passed to server at one time
- 2) A single transaction can have more than 1,000 lines
- 3) Each line from 500 to 1,000 characters long

= A lot of space

Story Problem:

How can program A pass program B a one thousand line transaction without using a 1–meg parameter?

Functional Server Error Messages

Arithmetic:

1)	Each field can have an error				
2)	Each line can have 150 or more fields				
<u>3)</u>	Each transaction can have hundreds of lines				
	= A lot of space				
Story Problem:					

How can program A pass program B a one thousand line transaction without using a 1–meg parameter?

Answers

- #1. User Space
- #2 User Index

Functional Server Interface

A Functional Server can interact with a User Space and a User Index by passing and receiving parameters.

Functional Server Parameters

Single data structure defined in /COPY module

Two sections: fixed and application specific

- Fixed parameters
 - Action code (edit, update, inquire)
 - Number of lines in transactions
 - DREAM Writer version of Functional Server
- Application specific parameters
 - Contains header information for a transaction
 - Document number of transaction
 - Total amount of transaction
 - Batch number of transaction

Functional Server User Space

- One big data area
- Maximum of 16 meg
- Beginning 100 bytes of user space reserved
- Data portion of user space contains formatted lines
 - User space lines defined by /COPY module
 - Each line contains three sections

Control section

Application specific section

Record format section

Functional Server User Index

- One big keyed data area
- Used to pass error messages back to application
- User index entry defined using a /COPY module
- Each user index entry contains two sections
 - Key

Application ID

Line number (assigned by application program)

Data item in error

Error code

• Data – value of erroneous data

Functional Server /COPY Modules

- All User Space and User Index formats contained in /COPY modules
- All database record formats contained in /COPY modules
- /COPY module I00FS@@ contains generic data structures and constants
- Each Functional Server has its own I00FSxx /COPY module to define application specific data structures

Creating User Space and User Index

- OS/400 APIs
- X00991
 - Called once for each Functional Server an application program intends to use
 - Creates user space and user index for each Functional Server
 - Returns name and library where user space exists
 - Returns the length each user space line should be

Accessing the User Space

- Writing to the user space X98CHGUS
 - .J.D. Edwards version of QUSCHGUS API
 - Updates a user space beginning at offset x for length
 - Similar to CHGDTAARA command
- Reading from the user space QUSRTVUS
 - API
 - Retrieves data from a user space beginning at offset x for length
 - Similar to RTVDTAARA command
- Application responsibilities
 - Remember number of lines written to user space
 - Increment user space offset

Accessing the User Index

- User Index written to by Functional Server
- Reading from the User Index
 - C00RIX/COPY module reads the User Index
 - C00RIX returns formatted error message defined by /COPY module
 - First execution of C00RIX reads first entry in User Index
 - Subsequent executions of COORIX do read nexts
 - Uses X00IDX under the covers
- Application responsibilities
 - Remember the value of your Application ID (typically program name)
 - Set flag for initial read of User Index by COORIX
 - Use the data item name and line number in error to set on screen indicators

Interactive Program Cycle Using a Functional Server

- Mainline no change
- S001 no change
- S003
 - No change for add, change, or delete
 - Call Functional Server to perform an inquiry
- S004 Retrieve records from User Space for display on screen

Interactive Program Cycle Using a Functional Server

- S005:
 - Application program performs "scrubs" only
 - Write data records to User Space
 - Call Functional Server to perform edits
 - Read each line from User Space to redisplay defaulted information
 - Execute COORIX to determine each data item in error so that screen error indicators may be set ON
- S010 call Functional Server to perform an update

The Call Parameters for the Functional Server

The call parameters provide commands to the functional server which apply to all transaction lines in the input user space.

PARM (Length)	Explanation		
#PFUNC(1)	Specifies a function code. The valid values are:		
	0 Edit and Update		
	1 Edit only		
	2 Update only		
	I Inquire		
#PVERS (3) (10 as of A6)	The DREAM Writer version number you are executing. This parameter uses the version number to retrieve processing options for the server. The default version number will be 001. This allows global processing options to be set at the server level, instead of for each program.		
#PSPCN (20)	The name of the user space which the program has used. The user space contains the modified database records. Characters 1–10 contain the space name, and characters 11–20 contain the library name.		
#PSPCB (9,0)	The byte position within the user space where the application data begins. Characters in the space prior to this position contain header information used by the functional server.		
#PNBRL (5,0)	The number of lines in the input user space which the application program has loaded. When inquiring, this contains the number of lines output to the user space.		
#PWARN (1)	This parameter contains a code explaining how you want warnings to be handled. The valid values are:		
	0 Normal warning processing		
	1 Treat warnings as errors		
	2 Ignore warnings		
#PCYCL(1)	This parameter is only used if the #PWARN parameterspecifies normal warning processing. The valid values are:0No cycle, all cycle processing ignored1First cycle, all warning messages are sent to the program2Second cycle, only warning messages not previously sent are sent to the program		
#PDFTC (1)	Specifies how you want field values to be defaulted. 0 will default field values for add lines only and 1 will default field values for change or add lines.		
#PXATP (3)	The application specific transaction type.		

PARM (Length)	Explanation
#PLVL (1)	The transaction level. 0 implies that each detail record to be updated or added has been sent in the input user space. 1 applies only to changes or deletions because only one record is sent in the input user space and the server will change or delete all other records for that transaction.
#PPROG (10)	The name of the calling program. This is used by the server to update the program name field in the updated database records.
#PAPPL (10)	The application ID value used for writing entries to the error index. Generally, this may be the same value as the calling program.
#PFLDS (4,0)	The number of fields which have been loaded to the Field Names Array parameter.
#PFMT (10)	The record format identifier the application program has used. This is used for versioning, allowing the database to change without the need for recompiling the application program.
#PEDIT (1)	Indicates the overall result of edits performed against all transaction lines. 0 implies that the edits went OK, 1 means there were some warnings, 2 is errors occurred.
#PUPDT (5,0)	The number of database updates which occurred. This will allow the program to know whether any updates actually occurred.
#PERR (4)	Specifies any errors that occurred within the server. A non–blank value indicates a fatal error occurred.
#PFERR (4)	Contains the first error message found during editing.
#PFDTA (4)	Contains the data item of the first field which had an error during editing.
#P#MDE (1)	For currency translations, this contains the mode of entry. If this value is passed as blank, the server will output the default mode of entry.
#PCRCD (3)	For currency translations, this contains the currency code of entry. If this value is passed as blank, the server will output the default currency code.
#PCRR (15,7)	For currency translations, this contains the currency exchange rate of entry. If this value is passed as zero, the server will output the default currency rate.
#PIDXN (20)	The name of the user index which the functional server will use to return error messages to the program. Characters 1–10 contain the index name, and characters 11–20 contain the library name.
#PSPCL (5,0)	The total length of each user space record. This includes both the user space control fields and the database record format.

PARM (Length)	Explanation
#0SPSPEC (100)	This is a data structure which is redefined by each server. Generally, this will contain the key fields which a specific server uses.
VariableVary	An array of field names which the program has used. Only fields in this array will be updated in the database. If the first element contains *ALL, then all fields will be used. The number of field names parameter should contain the number of entries loaded into this array.

Control Fields within the User Space

PARM (Length)	Explanation
#SPCAC (1)	The line action code. The valid values are: A Add the record D Delete the record C Change the record U Change the record if it already exists, otherwise add the record V Void the record
#SPCID (15,0)	Used by the program to uniquely identify each line in the user space. (optional)
#SPCER(1)	The line error code. X = the line is OK 1 = some warnings 2 = errors.
#SPCUP (1)	The line update code. 0 = the line was not updated 1 = updated.
#SPCRR (9,0)	Contains the database relative record number which corresponds to this user space record. For adds, this is only loaded following an update operation. For changes and deletes, this is updated following an edit operation.
#SPCMN (2,0)	Contains the database physical file member number which corresponds to this user space record. For adds, this is only loaded following an update operation. For changes and deletes, this is updated following an edit operation.
#SPCPG (12)	Allows the program to store up to 12 bytes of information with each user space record.
#SPCAP (100)	Any application specific information which must be passed to the server for each transaction line, but is not contained within the transaction record format.
VariableVary	Externally described record format for the transaction record.

The input user space can contain multiple lines for each control field.

Error Message Index Line (C00RIX)

The output error message index contains warning and error messages issued for each line in the user space. The structure of the message index line is as follows:

Field (Length)	Explanation
#IDXAP (10)	The application identifier from the input parameter. Allows a program to access only its error messages.
#IDXID (15,0)	The line identifier from the input user space.
#IDXFN (10)	The data item portion of the field name.
#IDXER (4)	Contains the data dictionary error message code.
#IDXMD (88)	Contains the error message substitution data. Generally, this is the value of the field which caused the error.

Interactive programs using a functional server must include a call to P0000EX (in addition to P0000E) in S00EX when the F7 (Display Errors) key is pressed. P0000EX will retrieve and display the error messages contained in the Error Message Index (C00RIX).

About Source Debugger

There are two types of programs that can be executed under the J.D. Edwards Source Debugger — interactive and batch. The only difference when running the Source Debugger on an Interactive program compared to a Batch program, is the initial execution statements. Once the Source Debugger has begun, all of the features are the same for both interactive and batch programs.

The J.D. Edwards Source Debugger is a tool designed to help you determine where a bug exists in your program. You can apply the Source Debugger to any program, whether it is in production or development. Since the Source Debugger displays source code, *you must have source on installed on your machine*.

The source code you see while running the Source Debugger is displayed in SEU Browse mode, so you can not change a line within the program. However, you may display and/or change the value of any field, variable, or indicator within the program. In addition, you can add or remove a breakpoint anywhere in the program.

Before You Begin

☐ If you are **not** accessing the J.D. Edwards training machine, you must recompile programs into your student object library or your client object library, CLTOBJ or DEVOBJ before executing JDEDBG.

This ensures that the program is observable and therefore, accessible to the Source Debugger.

☐ If you are accessing the J.D. Edwards training machine, you may execute the JDEDBG command on any of the following programs: P92801, P928011, P928200, P01051, J928401, and P928401. You may also recompile any desired program in JDFOBJ to run in the Source Debugger.

Using Debugger With an Interactive Program

The program may exist in your production environment, your development environment, or both. To use Debugger complete the following tasks:

Determine the program environment

Initiate the J.D. Edwards Source Debugger

Execute the program being debugged

To determine the program environment

1. From the Computer Assisted Design menu (G92), select Software Versions Repository.

2. Locate the program that you want to run the Source Debugger on, to determine what environments the program exists in.

If the program exists in several environments (production and development), you must determine which program environment to run the Source Debugger against.

To initiate the J.D. Edwards Source Debugger

1. Type the J.D. Edwards debug command (JDEDBG) and press F4.

Type choices, press Enter.	
Program Name:	<u>P01051</u> Name <u>JDESRC</u> Name, *OBJECT, *SPLF <u>JDFSRC</u> Name
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	Bottom F10=Additional parameters F12=Cancel F24=More keys

Field	Description
Program Name	Type your program name
Source File	Type the file name that contains the source code of your program. Generally, this is JDESRC.
Library	Type the name of the library that contains the source file. Generally, this is JDFSRC for your production environment or DEVSRC for your development environment.

2. Enter the correct values in the proper fields and press Enter to start the Source Debugger.

Now, any time the program being debugged is executed, the source code will display in *debug mode*, until you end the Source Debugger.

To execute the program being debugged

Since it is an interactive program, you can either call the program from a command line or select the menu option that will execute the program.

Call program name ('parameters')

Selection/Menu

After you have executed the program, the first thing you will see is the program source code.

The source code is displayed in browse mode, so you cannot edit or change any code.
Using Debugger with a Batch Program

The program may exist in your production environment, your development environment, or both.

To use Debugger with a batch program you should complete the following tasks:

Determine the program environment Initiate the J.D. Edwards Source Debugger Execute the program Set the break point Continue execution

To determine the program environment

This step is the same as the first one for an interactive program.

1. Go to the Software Versions Repository and inquire on your program, to determine which environment the Source Debugger will be run against.

To initiate the J.D. Edwards Source Debugger

This step is similar to debugging an interactive program. The difference is that you must enter the debug command **twice**.

The first time you initiate in J.D. Edwards Source Debugger (JDEDBG — F4), the *Program Name* will be the CL Program.

1. Enter the correct values in the proper fields on the Debug Program form and press Enter.

Debug Type choices, press Enter. Program Name:	Program (JDEDBG) <u>J928400</u> Name <u>JDESRC</u> Name, *OBJECT <u>JDFSRC</u> Name	, *SPLF
F3=Exit F4=Prompt F5=Refresh	F10=Additional parameters	Bottom
F13=How to use this display	F24=More keys	F12=Cancel

2. Enter the J.D. Edwards Source Debugger command (JDEDBG–F4) again, but this time change the *Program Name* will be the RPG Program Name.

The reason for this is, you cannot run the Source Debugger on a program that is submitted and executed in a subsystem. You must "trick" the Source Debugger into thinking that your batch program is actually an interactive program.

Debug	Program (JDEDBG)	
Type choices, press Enter.		
Program Name:	<u>P928400</u> Name <u>JDESRC</u> Name, *OBJECT <u>JDFSRC</u> Name	, *SPLF
F3=Exit F4=Prompt F5=Refresh F13=How to use this display	F10=Additional parameters F24=More keys	Bottom F12=Cancel

To execute the program

Since you are executing a batch program interactively, you must call the CL Program from a command line.

call CL program ('program name' 'version')

The CL Program source code appears.

The source code is displayed in browse mode, so you cannot edit or change any code.

To set the break point

Set a break point on the line testing the job type in order to change a variable in the CL. The variable &JOBTYPE normally edits against a batch program being executed by calling it from a command line.

1. Find the line of code that contains the variable &JOBTYPE.

```
93701
                                             JDE Visual Debug
                                                                               JDESRC
                                                                                              JDFSRC
  Scan:
                                                                                              J928401
            Current Breakpoint:

```

2. Press F5 anywhere on the line containing &JOBTYPE to set the breakpoint.

The line will highlight, indicating that a breakpoint has been set on that line.

To continue execution

1. Allow your program to continue executing. Press F3 to continue to a breakpoint.

The line that you set the breakpoint on will display in reverse image. This indicates that the program has reached this point in the CL program and is ready to execute this line.

You must change the value of &JOBTYPE to something other than 1, and other than the value specified in the CL program.

2. To change the value of &JOBTYPE, press F8 to access the Change Program Variable form.

Change Program Variable (CHGPGMVAR)	
Type choices, press Enter.	
Program variables: Program variable <u>`&JOETYPE'</u> Basing pointer variable + for more values New value	

3. Complete the Change Program Variable form and press enter.

The value of &JOBTYPE is now changed to your specified value.

4. Press F3 to allow the CL program to continue processing.

The RPG program source is displayed next.

Features of the J.D. Edwards Source Debugger

F2 – J.D. Edwards Command Line Window

To display a J.D. Edwards command line window, press F2.

F3 – Continue processing

Once the program hits a breakpoint or when you first enter the source, F3 will allow the program to continue processing.

F5 – Add breakpoint

Position the cursor on an executable line and press F5 to add a breakpoint. You **cannot** add breakpoints to a comment line, only to executable lines. Once the breakpoint is set, the line will be highlighted. If the program executes a line with a breakpoint set on it, the line will appear in reverse image and the program will pause **before** executing the line.

F6 – Add breakpoint with prompt

Position the cursor on an executable line and press F6 to add a breakpoint with a prompt. You **cannot** add breakpoints to a comment line, only to executable lines. Once the breakpoint is set, the line will highlight. If the program executes a line with a breakpoint set on it, the line will reverse image and the program will pause **before** executing the line.

Add Bre	eakpoint (ADDBKP)	
Type choices, press Enter.

                                                                       ' 0 ·
Press Enter to continue.
F3=Exit
                 F12=Cancel
```

F15 – Scan Backward

Type in a value on the *Scan Line* at the top of the screen and press F15 to scan backward from the point you are at to the end of the source code. If a match is found, the line containing the matching value will be displayed. To continue scanning backward, press F15 again.

F16 – Scan Forward

Type in a value on the *Scan Line* at the top of the screen and press F16 to scan forward from the point you are at to the beginning of the source code. If a match is found, the line containing the matching value will be displayed. To continue scanning forward, press F16 again.

F21 – Command Line Window

To display a command line, press F21.

ENDDBG End Debug

To stop the J.D. Edwards Source Debugger, enter ENDDBG from a command line. You can not enter ENDDBG while displaying the source code of a program in debug. This command will end debug mode for all programs in the Debugger at that point.

F21

You can remove a single program from debug mode by using the RMVPGM (remove program) command.

Exercises

See the exercises for this chapter.

About Software Scan and Replace

The Software Scan and Replace feature lets you scan source members to accomplish the following:

Scan for a particular item and replace it with a new item

Produce a list of all members that meet the search criteria

Scan for a particular item and insert a source file after each occurrence

Because you can potentially replace source code across all systems, this job is submitted to batch and held in the job queue until you release it.

To Work with Software Scan and Replace

1. From the Computer Assisted Programming menu, select Developer's Workbench. From the Developer's Workbench menu, select Software Scan and Replace.

98810	Software Scan & Replace	
System code <u>55</u> Function code <u>RP</u> Specific object File ID <u>JD</u> Source library <u>DE</u> Scan argument:	(Blank = all) (Blank = all) (Blank = all) (SRC (Defaults to source libr in member master)	
IOOSC		
(lt search argument c	ntains imbedded blanks enclose argument with >.)	
Replacement argument:		
IOORSC		
(If argument contains	imbedded blanks enclose argument with >.)	
Column replacement: Beg	nning column Ending column	
Replacement Overflow Co	e	
Insert Source From: Fil	Libr Member	

The previous screen illustrates how you replace the copy module I00SC with the copy module I00RSC for all RPG members coded to install system code 55.

2. Complete the form and press Enter.

The job submits to batch and a message displays. The job is held on the job queue.

3. When you are ready to process the job, go to the Work with Submitted Jobs form (hidden selection 33) and release the job.

Report

When the job completes, it produces a report that indicates those objects where the scan and replace occurred.

DEEDIX	- Item Mainten	ance - Gregg			1 at (at	010200
FJJUIA	- Item Informa	tion Undate			lst (at	010200

Guidelines

If you leave the Replacement argument field blank, the utility produces a listing of all source members that meet the search criteria.

Because this job could be used to update all code across systems and could severely impact processing, it is automatically held.

Use this job to replace a copy module across systems or determine a listing of members that meet certain criteria. Use with caution.

About Performance Issues

Following are some performance issues you should consider when executing J.D. Edwards software, changing current J.D. Edwards programs or writing new programs:

Purge your files on a regular basis to avoid excess, unnecessary records existing in files.

Minimize the number of open files in a program. If a file may not be used, define it as a User Controlled Open file.

Use User Spaces and User Indexes wherever possible.

Use File Servers and Functional Servers wherever possible.

Minimize the number of subroutine calls within your program.

Weigh the advantages of inter–program calls. Although this method is very modular in design, you should consider the effect on performance.

Substitute the comparison of a literal with the comparison of a variable.

For example: Use *ON and *OFF to set an indicator on and off rather that a 1 and 0.

Consider flexibility vs. performance when using User Defined Codes, Vocabulary Overrides, and loading Data Dictionary values extensively

Group Jobs

Objectives

Work with the J.D. Edwards Group Job Window

Work with J.D. Edwards group jobs

Work with non-J.D. Edwards group jobs

Work with the J.D. Edwards Attention MENU Window

Use IBM Pass-Through with group jobs

About Group Jobs

The Group Jobs window allows you to perform a number of tasks from a single window, saving you both time and effort. You can perform the following functions from this window:

Run up to 16 jobs under a single signon

Execute (or run) CL and fast path commands from a single command line

Execute (or run) J.D. Edwards Hidden Selections

In addition to the added convenience, the Group Jobs function keeps the files for each of the jobs selected opened, whether they are currently active or not.

Perform the following tasks:

Access the .J.D. Edwards Group Job Window

- Create New Group Jobs
- Activate Suspended Group Jobs
- Terminate Job Groups
- Change to Non–Group Mode
- Sign Off with Suspended Group Jobs

Release A7.3 (June 1996)

About Working with the J.D. Edwards Group Job Window

You can perform several operations using the J.D. Edwards Group Jobs Window, including:

Create new group jobs Activate suspended group jobs Terminate group jobs Change to non-group mode Sign off with suspended group jobs

Before You Begin

In order for a user to access the J.D. Edwards Group Job Window at any time, the ATTN key program should be set to call the J. D. Edwards Group Job Window program (P98GRP).

To set the ATTN key program

1. Select User Information from the Security Officer Menu

0092	User Information	Action Code <u>I</u>
User ID Library List		TEACH OTEMP JDFOBJ COMMON PRODDATA JDFSRC OGPL
User Security: User Key Initial Menu to Initial Program Menu Level User Type User Class/Group . Y Allow Fast Path (Y/N). Y TEACHER OBATCH 5 5 4 00 *NOLIST P4B P98GRP uiry F21=Print Lib List F24=More Keys

2. Enter the J.D. Edwards Group Job Window program ID (P98GRP) in the *Set Attention Program* field.

Accessing the J.D. Edwards Group Job Window

After the ATTN Key program has been set up in the J.D. Edwards software you can access the Group Job Window.

To access the J.D. Edwards Group Job Window

- 1. Sign off and sign back on to reset the ATTN key program within the J.D. Edwards Menu Driver.
- 2. Press the ATTN key and the following will be displayed.

GO	J.D. Edwards & Company General Business Systems
 GENERAL BUSINESS SYSTE Address Book General Accounting Accounts Payable Accounts Receivable Financial Reporting Modeling & Allocatio Fixed Asset Payroll Human Resources Electronic Mail 	98GRPGroup JobsE 0 Description - Group Job - GROUP01 - Active - - - - - - - - - - - - - - - - - - - - - - - - - - - - - -
Selection or command	

Creating New Group Jobs

To create new group jobs

- 1. Press F4 on the Group Jobs form for New Job.
- 2. When the J.D. Edwards Menu Driver is displayed, press the ATTN key and the following will be displayed.

G0 G	J.D. Edwards & Company eneral Business Systems
 GENERAL BUSINESS SYSTM Address Book General Accounting Accounts Payable Accounts Receivable Financial Reporting Modeling & Allocatio Fixed Asset Payroll Human Resources Electronic Mail 	98GRPGroup JobsE 0 Description - GROUP02 - GROUP01 Suspended - - -
Selection or command	

The new group job GROUP02 is now in process. The group job GROUP01 was suspended when the function key F5 was pressed.

If you are set up to access J.D. Edwards software by J98INITA, your library list selection list will appear. Select an environment and then you will be able to display the J.D. Edwards Group Job Window.

Activating Suspended Group Jobs

To activate suspended group jobs

Press the ATTN key to display the J.D. Edwards Group Job Window and enter option 4 next the the job you want to activate.

All suspended group jobs will be displayed in the window.

Any suspended group job can be activated, as illustrated below.

G0 G	J.D. Edwards & Company General Business Systems
 GENERAL BUSINESS SYSTM 2. Address Book 3. General Accounting 4. Accounts Payable 5. Accounts Receivable 6. Financial Reporting 7. Modeling & Allocatio 8. Fixed Asset 9. Payroll 10. Human Resources 11. Electronic Mail 	98GRPGroup Jobs 0 Description - GROUP02 4 GROUP01 Suspended - - -
Selection or command ===>>	 Cmd/HS: Opt: 4=Sel 9=End F3=Exit F4=Prompt F5=New Jo

Terminating Group Jobs

Any group job, active or suspended, may be terminated from the J.D. Edwards Group Job Window.

To terminate group jobs

Enter option 9 next to the group job you want to terminate.

GO	J.D. Edwards & Company eneral Business Systems
 GENERAL BUSINESS SYST 2. Address Book 3. General Accounting 4. Accounts Payable 5. Accounts Receivable 6. Financial Reporting 7. Modeling & Allocatio 8. Fixed Asset 9. Payroll 10. electi ==>> _	on or command	

Signing Off With Suspended Group Jobs

You may use two different methods to sign off with suspended group jobs.

Select one of the following methods:

Press F18 within the J.D. Edwards Group Job Window. Enter SIGNOFF, 90, or '..' on any J.D. Edwards Menu.

Since group jobs are created under one signon, all group jobs are terminated when the signoff command is executed.

Work with Non-J.D. Edwards Group Jobs

To work with non-J.D. Edwards group jobs

To create group jobs that call a program outside the J.D. Edwards software, the J.D. Edwards Group Job Window allows an external program to be executed. In addition, the ATTN Key can be pressed within the external program and still allow access to the J.D. Edwards group jobs.

1. Press F11 within the J.D. Edwards Group Job Window to call an external program.

The following illustrates what will be displayed when F11 is pressed.

```
Change Library List (CHGLIBL)
     Type choices, press Enter.
     Libraries for current job . . . > QTEMP
                                                        Name, *SAME, *NONE
                                        > TCA3020BJ
                                       > JDFOBJ
                                        > TCA302DTA
                                        > A3SHARE
                                        > TRNSHARE
                                        > TCA302SRC
                                        > JDFSRC
                                        > <u>VAPAY2JLIB</u>
                                        >
                                          VBPAY2JLIB
                                        > <u>VCPAY2JLIB</u>
                                        > VPAYLIB
                                        > <u>QPRT5225</u>
                    + for more values > <u>QGPL</u>
     Current library . . . . . . .
                                                        Name, *SAME, *CRTDFT
                                          *SAME
Bottom
  F3=Exit
           F4=Prompt F5=Refresh F12=Cancel F13=How to use this display
     F24=More keys
```

2. Complete the Change Library List form.

You may enter libraries related to the external program. Libraries currently in the library list can be removed if desired. However, the following libraries *must* be left in the library list in order to retain the link to the J.D. Edwards group jobs:

QTEMP

Library containing F9220 (J.D. Edwards Group Job Window Vocabulary Overrides)

Library containing F0090 (J.D. Edwards Hidden Selections)

Library containing F0092 (J.D. Edwards User Information)

Library containing J.D. Edwards Objects (i.e. RPG, CL, DSPF)

After the CHGLIBL command has been executed, the CALL command prompt is displayed.

3. Enter the external program.

The following illustrates the CALL command prompt.

Call Program (CALL) Type choices, press Enter. Program
Type choices, press Enter. Program Name Library <u>*LIBL</u> Name, *LIBL, *CURLIB
Program
Parameters
+ for more values
Bottom F3=Exit F4=Prompt F5=Refresh F12=Cancel F13=How to use this display F24=More keys

When the CALL command is executed, the external program will be executed.

To work with a J.D. Edwards group job, the ATTN Key can be pressed to display the J.D. Edwards Group Job Window.

Any suspended group job can be activated from the J.D. Edwards Group Job Window.

Advanced Functions of the J.D. Edwards Group Job Window

J.D. Edwards Hidden Selections

Most J.D. Edwards Hidden Selections (31+) can be executed from the command line at the bottom of the J.D. Edwards Group Job Window.

The J.D. Edwards Hidden Selection Window (HS) can be used to display and execute hidden selections.

J.D. Edwards Hidden Selection Security is used when users execute hidden selections.

No J.D. Edwards Menus or J.D. Edwards Hidden Selection related to menus are allowed.

Entering Commands

Any command can be entered on the command line at the bottom of the J.D. Edwards Group Job Window.

F4 can be used to prompt a command.

A '?' can be placed in front of a command to prompt.

F9 can be used to retrieve previous commands.

Parameters entered while in prompt mode will not be retrieved.

The last 10 previous commands are saved.

Only successfully executed commands are saved.

Previous commands are lost when user exits window F3.

J.D. Edwards Fast Path Commands from User Defined Code 00/FP can be executed. F13 to display all Fast Path Commands.

To retain *all* commands entered and retrieve parameters entered in prompt mode, access the IBM Command Entry Screen from the J.D. Edwards Group Job Window (i.e. J.D. Edwards Hidden Selection 36) and enter commands.

Commands can only be executed if there is a value of 'Y' or '' in the *Allow Command Entry* (Y/N) field defined in the J.D. Edwards User Information option found on A94.

J.D. Edwards Group Job Window Summary

The program allows you to:

Create up to 16 jobs per signon

Execute commands, J.D. Edwards hidden selections, J.D. Edwards Fast Path Command, and J.D. Edwards Fast Path Menu Execution

Available Function Keys

- F3 = Exit the J.D. Edwards Group Job Window
- F4 = Prompt a command
- F5 = Create a new J.D. Edwards group job
- F6 = Submit job to batch
- F8 = J.D. Edwards Menu Word Search
- F9 = Retrieve previous command
- F11 = Create a new Non–J.D. Edwards group job
- F13 = Display all fast path commands
- F18 = SIGNOFF all group jobs

Available Selection Exits

4 = Activate a suspended group job

9 = End a group job

J.D. Edwards Group Job Window is not accessible when using

SysReq (Source Machine Only)

A program that has reset the ATTN Key program (i.e. OFFICE/400)

About the Attention MENU Window

The J.D. Edwards Attention Menu Window program is a generic program that allows you to access up to 15 predefined programs via the ATTN Key. The 15 predefined programs are associated with options on a J.D. Edwards Menu.

Each user can be assigned a different J.D. Edwards Menu

The program was available in Release A4.1 PTF001

Before You Begin

To access the J.D. Edwards Attention Menu Window at any time, the ATTN Key program should be set to call some other J.D. Edwards Menu. For example G92.

The following illustrates how the ATTN Key program is set in the J.D. Edwards software. The User Information screen can be accessed from the Security Officers Menu).

0092	User Information	Action Code <u>I</u>
User ID		TEACH
User Security: User Key Initial Menu to Initial Program Menu Level User Type User Class/Group . Batch Job Queue Job Scheduling Prior Logging(level/severi Output Queue Optional Printer Fil Current Library Employee Address Num Set Attention Program	Execute to Execute ity ty/messages) e Library ber (PPAT)	A J K DP F <u>A</u> Allow Command Entry (Y/N). Y <u>Allow Menu Traveling (Y/N) Y</u> Allow Fast Path (Y/N) Y <u>TEACHER</u> <u>OBATCH</u> <u>5 5</u> <u>4 00 *NOLIST</u> <u>P4B</u> <u>G92</u>
F6=Display/Lang Pref	F9=Library Inqu	uiry F21=Print Lib List F24=More Keys

An *(asterisk) must precede the menu name.

Accessing the J.D. Edwards Attention Menu Window

After the ATTN Key program has been setup for you the J.D. Edwards software you can access the J.D. Edwards attention menu window.

To access the J.D. Edwards attention menu window

1. Sign off and sign back on to reset the ATTN key program within the J.D. Edwards Menu Driver.

SETATNPGM PGM(P00AMNU) SET(*ON).

2. Press the ATTN key and the menu options for the menu will be displayed as follows.

G0	J.D. Edwards & Company General Business Systems	
<pre> GENERAL BUSINESS SYST 2. Address Book 3. General Accounting 4. Accounts Payable 5. Accounts Receivable 6. Financial Reporting 7. Modeling & Allocatic 8. Fixed Asset 9. Payroll 10. Human Resources 11. Electronic Mail Selection or command ===>></pre>	EMS 00AMNUGroup Jobs <u>0</u> Description Original Job _ Software Versions Repository _ Data Dictionary _ CASE Profiles _ Function Key Definitions _ Vocabulary Overrides _ Processing Options _ Help Instructions	JDED <u>Status</u> Active
	Cmd/HS: Opt: 4=Sel 9=End F3=Exit	F24=More Keys

Original Job refers to the current job that has been converted to a group job. The remaining jobs refer to the first 15 interactive programs on the menu which the user is authorized to.

Summary of J.D. Edwards Attention Menu Window Functions

The program allows you to:

Access 15 predefined programs via the ATTN Key

Execute commands, J.D. Edwards Hidden Selections, J.D. Edwards Fast Path Commands, and J.D. Edwards Fast Path Menu Executions

Available Function Keys

F3 = Exit the J.D. Edwards Attention Menu Window

F4 = Prompt a command

F6 = Submit a job to batch

F8 = J.D. Edwards Menu Word Search

F9 = Retrieve previous command

F13 = Display all fast path commands

F18 = SIGNOFF all group jobs

Available Selection Exits

4 = Activate a group job

9 = End a group job

J.D. Edwards Attention Menu is not accessible while using

SysReq (Source Machine Only)

a program that has reset the ATTN Key program (i.e. OFFICE/400)

About Working with IBM Pass–Through

To create group jobs on remote locations and still retain a link to the group jobs created on the source machine, use IBM Pass-Through. Perform the following tasks:

Set up access to remote locations

Use IBM Pass-Through with Group Jobs

Setting Up Access to Remote Locations

To setup access to remote locations

1. To setup access to remote locations, go to the DREAM Writer versions list for Form ID P98GRP5.

Skip to Vers	sion:

The processing options for each version provides setup on exactly how to access the remote location. The following illustrates the processing options.

98312 Denver	Processing Options Revisions Form ID P98GRP5 Version 0002
This jo press B	bb has various options described below. Enter the desired values and ENTER to continue.
Destina	ation Virtual Control Unit <u>V5251</u>
Enter (DNE of the following:
1) I	Destination Location: JDEC (If APPN routing can be used.)
2) <i>P</i>	APPC Device(s): Communication Device 1: Communication Device 2:
((If S/38's are involved, an APPN cannot be used.)
	Bottom +
	F5=Printer Overrides

Option	Description
Destination Virtual Control Unit	This is the control unit that the user will connect to at the remote location.
	The first available device on the control unit will be selected.
Destination Location (Used in AS/400 Environment)	This is the APPN network name for the remote location.
APPC Device(s) (Used in S/38 Environment)	These are the APPC devices that identify the route to the remote location. Only one intermediate node is supported.

Using IBM Pass–Through with Group Jobs

To use IBM Pass–Through with Group Jobs

- 1. Use the J.D. Edwards menu B98P to start an IBM Pass–Through session to a remote machine.
- 2. Use the J.D. Edwards Menu Design Aid (G92) to attach your user defined DREAM Writer Form ID P98GRP5 versions to menu B98P.

When an option is selected on the menu, the IBM Start Pass–Through command will be executed to the remote machine, and still retain a link to the source machine group jobs.

```

```

The mechanism used to attach remote locations to the J.D. Edwards Group Job Window on the source machine is a parameter on the STRPASTHR (Start Pass-Through) command. The following illustrates the link to the source machine.

Start Pas	s-Through (STF	PASTHR)
Type choices, press Enter.			
Remote location	*LOC	Name, Name,	*CNNDEV *LOC
Virtual controller	<u>*NONE</u> *NONE	Name, Name,	*NONE *NONE
Mode	*NETATR *LOC *LOC *SRQMNU	Name, Name, Name, Name, Name,	*NETATR *LOC, *NETATR *LOC, *NETATR, *NONE *SRQMNU *LIBL, *CURLIB
F3=Exit F4=Prompt F5=Refresh	F10=Additiona	al para	Bottom meters F12=Cancel
F13=How to use this display	F24=More keys	ar puru	

The SRQ10PGM (SysReq 10) parameter allows a program to be called on the source machine from the remote location. By entering the J.D. Edwards Group Job Window program (P98GRP) in this parameter, the J.D. Edwards Group Job Window can be displayed on the remote location by pressing SysReq 10, NOT the ATTN Key.

This allows access to **all** suspended group jobs on the source machine and other remote locations.

Universal File Converter

Objectives

Initially convert existing client files to J.D. Edwards data files

Create recurring interfaces or bridges between J.D. Edwards and non-J.D. Edwards application systems

About Universal File Converter

There is constant change in data processing. For example, when you upgrade your J.D. Edwards software, you are changing several pieces of the software. Your data files may be greatly impacted when you upgrade. J.D. Edwards Universal File Converter will assist you in converting your data files.

Universal File Converter allows you to store conversion information for future conversions. It automatically matches data fields to be converted together.

From one file to another file

From one file to multiple files

From multiple files to a single file

The instruction file defines the association between two files and includes data field information.

Step 1

You specify *From* files and *To* files through DREAM Writer processing options. You can specify up to four To files. If you require multiple From files, specify a join logical as the From file in the DREAM Writer "based on" file. The system returns file field information and pre-loads the Cross-Over Rules file with field name, length, size, type and reference (data dictionary name). The system pre-loads information in the Cross-Over Rules file for all fields that have the same reference (data dictionary field name) as the From file.

Step 2

You must manually associate the fields that were not automatically loaded in the Cross-Over Rules file. If you need special calculations for a field, you can specify special processing key words in the Conversion Rule field. You can also add the calculations into an external program that can be called from the converter program. The external program needs several parameters that are sent and passed back to the converter program. These parameters are: data, error, From field name, To field name, and number of To file records. You must specify the external program in the Conversion Rule field in the Cross-Over Rules file.

Step 3

In this step you specify the form ID and the version you selected in the first step. The From and To files should be the same (or exact equivalent) as the files specified in Step 1. The converter program accesses the cross-over instructions for the "From/to" combination and loads the information to arrays. The system then processes the arrays for each field that has an association. Finally, the system transfers the value in the From file to the To file.

Special Processing

Special processing procedures are available to help you in the conversion of one field to another.

To execute any of the special processing procedures listed below, you must type the appropriate key word into the From or To Conversion Rule field. This is explained in *Detail Cross Over Rules*, later in this guide. There are special keywords for the following.

Dates	The converter uses a keyword to decide what date translation is necessary.
Numeric Fields	The converter translates non-packed numeric data to packed data or vice versa, depending on your need. It also maintains decimal alignment, performing rounding or zero padding if required. Alphanumeric representations of numeric fields can be translated to numeric fields. Numeric fields can be translated into alphanumeric fields.
Business Unit	The converter processes the field through the Business Unit scrub routine. This routine right adjusts and fills the field with blanks.
Data Dictionary Default	The converter uses the reference field in the To file to access the data dictionary and retrieve the default value for the field.
Initialization	Fields in the To file are initialized to blanks for alphanumerics and zeros for numerics if no fields are defined to map to them.
Next Number	You can specify to have a next number value assigned to a field.
Check Data Dictionary	You can specify to have the value of the field validated against the data dictionary values, ranges, and user defined codes.
User Defined Code Lookup	Use the fields in the From file to look up a user defined code (UDC) and return the associated value in the Description 1 field as the To field value.

Default Constant Specify constant value, up to six characters, for the To field value.

Database Considerations

The system creates new records in the Cross-Over Rules file for each version of cross-over rules you specify. This file contains information explaining the fields in the From file and the To file and how the two files are associated.

If the field lengths or characteristics of the files that the cross-over rules have been built upon change, you must redefine the cross-over rules. Otherwise, the rules are based on the erroneous descriptions.

The system handles extra calculations through called programs specified in the Cross-Over Rules file for each field.

User Responsibilities

You are responsible for developing and maintaining the cross-over instruction rules. If the From file or To file definition of the cross-over instructions changes, you must revise the Cross-Over Rules.

Perform the following tasks:

- Set Up Universal File Converter
- Work with Crossover Rules
- Work with File Conversion
- Print a Report
- Create Conversion Forms
- Work with the Data Dictionary Glossary by File

About Setting Up Universal File Converter

If you have more than one file to convert, you can set up a separate version for each type of conversion required. The Universal File Conversion Setup program loads information to the Crossover Rules file (F0031) about the fields in the files you are converting.

The system uses the information in the Crossover Rules file to transfer the data from a field in one file to a field in another file, or to a field in multiple files.

This program also has processing options that let you convert data from both J.D. Edwards and non-J.D. Edwards files.

Before You Begin

Before you run the setup procedure make sure the To files exist.

Do not attempt to use the Universal File Converter on a file that contains "double byte" data. The converter program may corrupt the integrity of the bracketing "shift in" and "shift out" characters that are automatically inserted by double byte terminals.

Understanding the Universal File Converter Setup

The setup program is the first part of a three-part conversion process. Specify a From file and a To file through the DREAM Writer processing options. You can specify up to four To files. If you require multiple From files, specify a join logical as the From file. This join logical is over all the files you select for the From file. Use the name of the join logical in the first processing option.

The program retrieves field information for all fields in the From file and loads this information to the Crossover Rules file.

The program then retrieves field information for the To files. If the Reference (data dictionary) field in the To file matches the From file Reference field, the program makes an association between the two fields. The system writes information for the To file to the record in the Crossover Rules file associated with the From file field.

**FILLER conversions are automatically generated for From file fields with no corresponding To file fields and for To file fields with no corresponding From file fields. You can override a **FILLER entry with the appropriate field name, position, and characteristics if the field exists in the file but has a different field name.

If there are any other associations you need, do them manually using the Crossover Rules selection on the menu.

Setting Up Universal File Converter

To access Versions Setup

1. From the Universal File Converter menu (G9841), select Versions Setup.

98300	Versions Setup	Form <u>P00120</u>
Skip to Vers	ion:	
0 <u>Version</u> _ XJDE0001 _ XJDE0002 -	<u>Description</u> Generate Crossover Instruction - F0101 - Data Requirements - A7.1	Sample DEMO 07/23/93 DEMO 07/20/93
_		
_		
_		
_		
- Opt: 1=Run	2=Chg 3=Add 4=Rpt Dist 5=Cove	r 6=Prt Ovr 8=Repair 9=Dlt

The Versions Setup form appears. The examples shown are for illustrative purposes only.

This program loads information into the Crossover Rules File (F0031) about the fields in the files you are converting. The system uses the information in the Crossover Rules File to transfer the data from a field in one file to a field in another file or to a field in multiple files.

- 2. Add your own version from a Demo version and go to the processing options of your new version.
- 3. Once you have displayed the processing options, you must specify a *From* file and a *To* file. You can specify up to four *To* files. If you require multiple *From* files, specify a join logical as the *based on* file for your version. The join logical will encompass all the files you wish to use for the *From* file.

The Crossover Rules form lets you add, change, and delete crossover rules used in the Universal File Converter process. Use this form to set up or maintain associations between fields in the From file and The To file.

Using filler fields you can view From file fields with no corresponding To field fields. You can also view To file fields with no corresponding From file fields.

Working with the Crossover Rules Form

To work with the Crossover Rules form

1. From the Universal File converter menu, select Crossover Rules.

0031 Action Code. Form Id Version To File Name Skip to	 From	<u>I</u> P00120 0001 F4011Z	Cros _ From _ _ To	sover Rules File F4001Z	
From File Field T Name	Begin Pos 1 1 1 1 1 1 1 1 1 1 1 54=Det	Field <u>Bytes</u> Dig <u>1</u> 00 <u>1</u> 00	Dec 00 00 00 00 00 00 00 00 00 0	To File Field T Begin Field Name _ Pos Bytes Dig Dec	0

The screen above displays illustrative data only. The From files appear on the left. The To files display on the right.

2. Complete the Crossover Rules form.

F8 and F9 are toggles. Press them to suppress or activate the display of the **FILLER fields in the From and To files.

F14 is cursor-sensitive. If you are on a From file field, press F14 to enter text for that field. When the cursor is on a To file field name, press F14 and the Generic Text Window opens for that To file field name. You can also enter text for the From file and To file by placing the cursor on the appropriate field. The field name is highlighted on V0031 if generic text exists. For additional information refer to the *Advanced Functions Reference Guide*.

Press F4 to display detail information in the fold area.

Field	Explanation
Form Id	Type the DREAM Writer Form Id you specified in the initial setup. Defaults to P00120.
Version	The Form Id version. Required for an inquiry.
To File Name	Type name of the file you are converting data to. This field defaults if you have a successful inquire.
Skip to (From/To)	Allows you to skip to a field in either the <i>From</i> file or the <i>To</i> file. Pressing F1 in one of these two fields will display the File Field Descriptions Window.

0031 Action Code <u>I</u> Form Id <u>P00120</u> Version <u>APCS</u> To File Name <u>F92801U</u> Skip to FromT	Crossover Rules From File F92801 Fo

Field	Explanation
Field Name	The name of the field the data is being transferred from or to.
T (Type)	The data dictionary data type.
Begin Pos (Beginning Position)	The number of the beginning position of the field.
Field Bytes	Number of bytes in the field.
Field Dig (Field Digits)	Actual number of digits in the field. In a non–packed field, this number is the same as the number of bytes.
Field Dec (Field Decimals)	Number of decimal positions in the field. (Future Use)
O (Option)	Option $9 =$ delete the line.
Desc (Description)	The description of the file field.
Conv Rule (Conversion Rule)	Allows you to specify a keyword or external program used for special calculations to the <i>from</i> file before transfer of data to the <i>to</i> file.
	You must type keywords into both the <i>from</i> and <i>to</i> file <i>Conversion Rule</i> field. F1 will display a list of valid keywords: Dates – *MDY, *DMY, *YMD, *JUL, *SYSVAL Business Unit – *RAB Initialize – *ZEROES, *BLANKS Data Dictionary Default – *DEF User Defined Code Lookup – *UDC (System) (code type) Default Constant – *DFT (constant) Next Number – *NN(system)(number) Check Data Dictionary – CHK, will edit field for DD values/ranges Alpha Translation – *TRAN (language to translate to)
	In addition to the predefined keywords, user-developed programs can be specified. These external programs will be discussed later in this chapter.
Key Pos (Key Position)	Specifies the position in the key list for the key list for the field in the file. (Future Use)
Ref (Reference)	The field name in the file with the prefix removed. The system uses this field to automatically pre–load the associations between the <i>from</i> and <i>to</i> file fields. You can also use this field for the *DEF keyword for the Data Dictionary defaults.
Array	Designates the field as part of an array. (Future Use)

Field T Begin Field Name Pos Bytes Dig Dec **FILLER A 1 1 00 00 Desc FILLER Conv Rule Array N Key Pos Ref FILLER Array N	Field T Begin Field O <u>Name Pos Bytes Dig Dec SZACOM A 988 1 00 00 -</u> Desc <u>Apply Comm Conv Rule</u> Key Pos <u>00</u> Ref <u>ACOM</u> Array N
The left side of the screen conta	ins information about the From file

The right side of the form contains information about the To file fields. If the setup program made associations with the To file fields, they display in the right columns when you inquire on a Form ID. Otherwise, these columns contain **FILLER information.

What You Should Know About

To review a specific set of crossover rules, enter the DREAM Writer version you used to create the rules.

To update information on Crossover Rules form, enter the To file field, type, beginning position, number of bytes, and number of digits and decimals, if applicable. Required information is name, type, beginning position and number of bytes.

Two "skip to" capabilities are available on this form. You can skip to a field in either the From file or the To file.

Displaying Field Descriptions

• To display field descriptions

1. Press F13 in the Field Name column for the From or To file.

The File Field Descriptions window appears, as shown below.

98FFD	File Field Descriptions S/FMT
File and	Libr: <u>F4011Z</u> <u>PGFDTA71</u> PF
I4011Z	– Batch Receiver File – Order De

_ SZEDDT	EDI - Transmission D S 6 0 40
Opt: 2=Di	ctionary 4=Sel F15=Resequence F3=Return
-	

When you use option 4 to select a field from the window, the program returns the name, type, number of bytes, number of decimals, number of digits, description, reference, and key position to the appropriate fields on the screen. For Crossovers on the File Field Descriptions window, refer to the *Computed Assisted Design Reference Guide*.

For details on the Data Dictionary Repository screen, the Glossary screen, and the Cross Reference options on the File Field Description window, refer to the *Advanced Functions Reference Guide*.

2. Enter 4 in the option field. The program returns the field description to the associated field as shown in this example.

Adding Fields

To add a field

1. Press F6 to open the Add Crossover Instructions window.

00312	Add Crossover Instructions From File. F4001Z Field Name
	Field Description Conversion Rule
	F3=Exit

- 2. With the cursor in the Field Name field, press F13 to open the File Field Descriptions window.
 - After you press Enter, the program returns field information to the Field Name when you exit the window.
 - The required fields for adding a field are:
 - From field name, type, number of bytes, and beginning position
 - To field name, type, number of bytes, and beginning position

The add function is available to associate a single field in the From file with multiple fields in the To file and to break apart a From field into multiple fields.

A field can exist in the To file and have nothing associated with it in the From file. In this case, the To file field is initialized as described in the section *Special Processing* in the *Introduction* of this guide.

Deleting Records

To delete a record

Select option 9 to delete records from the Crossover Rules file.

This cancels the From/To relationship so that no conversion takes place.

If you blank out the To file field name, the program does not delete the record from the Crossover Rules file, but only clears the To file field information. The converter program looks only at records that have both a From and To file field name.

NOTE: You do not need to delete lines with blank (**FILLER) To file field names, they are automatically omitted.

Keywords

Keywords in the Conversion Rule field (in the fold area) trigger special processing for a field before the data is transferred. Following are the keywords that are available and a brief explanation of what processing they trigger.

With the exception of the date keywords listed below, specify conversion rules for either From field or To field, never for both.

Dates – *MDY, *DMY, *YMD, *JUL, *SYSVAL	These keywords activate a date conversion between the From file field and the To file field. You must type keywords into both the From file Conversion Rule field and the To file Conversion Rule field. Each keyword on the From field specifies how the field is stored in the From file. The keyword on the To field conveys the output format on the To field. NOTE: This does not work on packed fields.
Business Unit – *RAB.	This keyword activates the business unit scrub of right adjust/blank fill to the From file field before moving it to the To field.
Initialize – *ZEROES, *BLANKS	These keywords move either zeroes or blanks to the From file field before it is transferred. With the initialization rules, these keywords are not required unless you want to initialize an alphanumeric field to zeroes.

Data Dictionary Default – *DEF	This keyword retrieves the Data Dictionary default for the To file field, using the Reference field in the Data Dictionary, and loads it to the From file field before it is transferred.
User Defined Code Looiup – *UDCsssrr	This keyword retrieves the definition of the user defined code used in a specific system and loads it to the To field. When typing your request, <i>ssss</i> is the system and <i>rr</i> is the user defined code.
Default Constant - *DFTcccccc	This keyword loads a default constant to the To field. When typing your request, <i>cccccc</i> is the default constant.
Terminal ID – *TID	This keyword loads the terminal ID to the To field.
Next Number - *NNssssxx.	This keyword computes a next number and loads it to the To field. When typing your request, <i>ssss</i> is the system and xx is the number.
Check Data Dictionary - *CHK.	This keyword lets you edit a field against Data Dictionary values and ranges. The results of the edit print on the File Conversion report whenever any errors are detected.

About the Conversion Rule Program

Besides specifying the use of keywords in the conversion rule, you can specify an external program that runs before the data is transferred to the To file field. You must name the external program beginning with an X. For example, use an "X" program to determine a range of valid values in a From file field, excluding records based on a given field. Other examples include writing multiple To file records based on a single From file record, or manipulating the data before it is transferred.

The external program requires five parameters:

First parameter	Must be 50 bytes and contains the value of the field being processed. Use it to pass back the value to the converter program when the "X" program is done with it.
Second parameter	One-byte error flag. If the error flag returns blank, the data in parameter 1 from the "X" program is placed in the To file.
	If the error flag returns with 2, the <i>data</i> in parameter 1 is not transferred to the To file. Use this error if you are writing multiple To file records and different From file fields are used for a single field in the To file. If the error flag returns with 3, a <i>record</i> will not be written to the To file. Use this error if you do not want to write a record when the value of a certain field in parameter 1 is blank, zero, or not valid for your purposes.
Third parameter	Four-byte alphanumeric field for the number of the To file records. The field always has numeric characters and is zero-filled. This lets your "X" program know which record the converter program will write when you are writing multiple To file records.
Fourth parameter	Ten-byte field for the From file field name. This lets your "X" program know which field you are processing if multiple fields in the From file are updating a single To file field.
Fifth parameter	Ten-byte field for the To file field name. This lets your "X" program know which field you are processing if multiple fields in the From file are updating a single To file field.

Available Functions and Options

F6 – Add Instructions

To add fields to be converted, press F6 to access the Add Cross Over Instructions Window. The required fields for adding a field are *Field Name*, *Field Data Type*, *Field Beginning Position*, and *Number of Bytes*.

0031 Action Code Form Id 00312 Version To File Name Skip to From From File Field T Begi Name Pos	Crossover Rules Add Cross Over Instructions From File Field Name Field Data Type Field Begin Pos Number of Digits Field Dec Pos Field Dec ription Conversion Rule Field Name Field Name Field Begin Pos Number of Digits Field Dec Pos	eld 0 <u>Dig Dec</u> _ — — — — — — — —
OPT:	Field Description Conversion Rule F3=Exit	- = = = = = = = = = = = = = = = = = = =

F8 – Suppress From **FILLER Fields

Will not display those lines with **FILLER values in the From field

F9 – Suppress To **FILLER Fields

Will not display those lines with **FILLER values in the To field

F13 – File Field Description

Place cursor on any *Field Name* field and press F13 to display the File Field Description window.

F14

F14 – User Defined Text

This allows text to be entered about information on this screen. The field will highlight to indicate that there is generic text associated with this field.

Press F14 in the top area of the screen to enter text about the conversion.

Press F14 in the *From Field* area (left side of the screen) to enter text describing the *From Field*.

Press F14 in the *To Field* area (right side of the screen) to obtain text describing the *To Field*.

The field will highlight to indicate that there is generic text associated with this field.

Option 9 – Delete Records

To delete records so that no conversion takes place, enter Option 9. If you blank out the *To File* Field Name, the program does not delete the record from the Cross Over Rules file (F0031), but only clears the *To File* Field information. The converter program will only look at records that have both a *from* and *to file* field name.

Working with File Conversion

The File Conversion program accesses the Crossover Rules file (F0031) and transfers data fields from one file to another, from one file to multiple files, or from multiple files to one file.

To run File Conversion

1. From the Universal File Converter menu (G9841), select File Conversion.

G9841	J.D. Edwards & Company Universal File Converter	
DATA FILE C 2. Version Se 3. Crossover 4. File Conve 5. Report	CONVERSION Etup Rules ersion	
Selection or comma	nd	

When creating an execution form, be sure the Based on File and the Format Name fields contain your *From File* name. In addition, the Data Selection and Data Sequence screens should display fields from your *From File*.

2. Add your own version from a Demo version and go to the processing options of your new version.

Option	Explanation
Enter the name of the Form ID and version containing the Initial Setup step.	Type your Form ID and version from the conversion specifications.
Enter the name and library of "from" file, if different than the Form ID and version specified.	Type the name of the From file and library, if it is different than the From file and library in the Form ID and version specified above.

98312	Processing Options Revisions Form ID P00111

TO FILE FORMAT: 6. Enter the number records to be cr "from" file recor a single "to" fi created for each File 1 File 2 File 2	of "to" file reated for each ord. If left blank, le record will be "from" file record.	_		
File 4	Bottom	_		+
<	F5=Printer Override:	5		

Option	Explanation	
Enter a '1' to clear the file data is being transferred to.	Enter '1' to clear the <i>To</i> file. The <i>To</i> file will be filled only with converted records. If this field is left blank, the converted data records are added to the <i>To</i> file.	
Enter the number of to file records to be created for each from file record.	Enter the number of <i>To</i> file records you want to create for each <i>From</i> file record. If this field is left blank, only a single <i>To</i> file record will be created for each <i>From</i> file record.	

If you are using multiple *From* file(s), remember to create a join logical over all the *From* files you wish to use.

When adding a new version, you should check to see that the format name under Additional Parameters is correct for the based on file.

3. Enter the correct values on Processing Options and submit your version to complete the conversion process.

What You Should Know About

If you are using multiple From files, remember to create a join logical over all the From files you want to use.

When adding a new version , check to see that the format name for the based–on file is correct for the file. The default is lxxxx and may not be appropriate.

The From file name and the To file names should be the same as used to set up the conversion rules in Step 1.

You can use DREAM Writer data selection to specify which record sin the Fro file are to be converted. For example, convert one branch or one company only.

A printed report lists error conditions detected by *CHK keyword and lists the total number of records read and number of records converted. The report lists the description of the errors. Depending on the error condition, you may need to correct the values in the incoming data and rerun the conversion.

Printing a Report

You can print a report that displays the Cross Over Rules and any associated generic text.

To print a report

1. From Universal File Converter select Report

98300				Repor	t			Form <u>P00</u>)31P1
Skip t	o Versi	.on:							
0 <u>Ver</u> XJDE	<u>sion</u> 0001	<u> Desc</u> File Co	<u>ription</u> nverter	Report		U	lser)	<u>Chg Date</u> 10/25/93

_									
Opt:	1=Run	2=Chg	3=Add	4=Rpt Dist	5=Cover	6=Prt Ovr	8=Re <u>r</u>	pair 9=Dlt	

The screen may list different versions of the File Converter Report. The example shown is for illustrative purposes only.

2. Specify your Form ID and version on the Data Selection form.

3. Select one of the following print options.

Field	Explanation
Enter a '1' to print Data Dictionary Glossary for each item.	Prints Data Dictionary Glossary for each To field.
Enter '1' to print File Specific Glossary for each item.	Prints file specific glossary from Generic Text file (F00163) for each <i>To</i> file.
Enter '1' to print generic text instructions for each item	Prints any generic text associated with either <i>To</i> fields or <i>From</i> fields.

Creating Conversion Forms

The Universal File Converter helps you create conversion forms that you may want to use for planning purposes when you convert your non-JDE files into JDE files.

Start by creating a form that specifies the major file in the "Convert to" file. The name of the file you convert from is intentionally left blank. This lets you create a blank set of conversion rules which you can print using the Report selection.

JDE supplies a special data dictionary glossary relating to specific fields in specific files in your JDE data dictionary text. You can also create new field descriptions that better correspond to your system by pressing F14 for generic text in the crossover rules revisions.

If you decide to use the blank version (described above) for actual file conversion, type the From file specifications corresponding to the appropriate To field using the Crossover Rules. Be sure to override the From file before you execute the conversion program.

Creating Conversion Forms

1. From the Universal File Converter menu, select either Versions Setup or Report.

98312 Processing Options Revisions Generate Cross Over Instruction - Sample	s Form ID <u>P00120</u> Version <u>XJDE0001</u> Display Level. <u>9</u>
This job has various options described below. Enter press ENTER to continue.	er the desired values and
<pre>FILE SPECIFICATION: 1. Enter the name of the file to convert the data from. JDE File? 2. Enter the name of the file OR files to convert the data to. File 1 JDE File? File 2 JDE File? File 3 JDE File? File 4 JDE File?</pre>	 <u>F92801U</u> <u>Y</u>
F5=Printer Overrides	

2. Complete the Processing Options Revisions form

If you selected Versions Setup, be sure to leave the first processing option blank under File Conversion.

In the second option, type the name of the files you want to convert, and then Y if they are JDE files or N if they are not.

If you select Report, type 1 next to all three options as shown above.

About Working with the Data Dictionary Glossary by File

When using the Universal File Converter, small details often differ for each file. Keeping these details clear, especially when the conversion form might be used by another department, is a potential problem. To remedy this, J.D. Edwards has made it possible to attach data dictionary glossary text to each data item that explains the details particular to that specific file.

To work with the Data Dictionary Glossary by file perform the following tasks:

- Access the Data Dictionary Glossary by file
- Add a file specific glossary item
- Print the Data Dictionary Glossary information

Accessing the Data Dictionary Glossary by File

To access the Data Dictionary Glossary by file

1. From the Universal File Converter menu, type DD and press Enter.

The Data Dictionary Repository screen appears.

Use the Data Item Glossary Revisions form to change the glossary text for a Data Dictionary item or to add a File-Specific glossary item.

Adding a File Specific Glossary Item

To add a File Specific glossary item

- 1. Type A in the Action Code field.
- 2. Type the file name in the Scrn/Rpt field.
- 3. Type the new text and press Enter.

Printing the Data Dictionary Glossary Information

- 1. Select Report.
- 2. Complete the Processing Options Revisions form.

Type 1 next to all three options to print the Data Dictionary glossary.

Option 2 prints the File-Specific glossary text.

Appendices

This appendix lists the files that are automatically created in the common and production libraries during the installation process.

Chart A – Common Library Files Automatically Created by J.D. Edwards Build Programs

The following chart contains files automatically generated as a result of a build program that J.D. Edwards offers from a menu. It is recommended that these files be maintained in your common library.

File Name	File Description	System Code
F98FRF@	Field Reference – '@' Data Items	98
F98FRF\$	Field Reference – '\$' Data Items	98
F98FRFA thru	Field Reference – 'A' Data Items through	98
F98FRFZ	Field Reference – 'Z' Data Items	98

Chart B – Physical and Logical Files Created in a Common Library

The following chart shows the physical and the logical files that were created in a Common Library if one was specified for the Create User Data Libraries selection on menu A9645. Logical Files contain no data. Therefore, data copied is N.

J.D. Edwards provides you access to several complementary products. If you have customized J.D. Edwards source code, the following products will help you upgrade your source code.

S/Compare

Overall, S/Compare is a valuable aid used to:

Identify differences between any two programs

Simplify the task of documenting program changes

Simplify the task of consolidating your custom changes into new releases of programs

Identify differences between the names of the programs in two different files to quickly locate added or deleted programs in the new release

The S/Compare utility is specifically designed to compare two versions of source code. It will locate inserted, deleted, changed, or moved records in a source program. Processing options are provided to include or exclude comment lines, blank lines, and formatting differences. S/Compare's output clearly identifies differences between two source members on a composite list of both programs. An option allows the records that are the same in the programs to be omitted from the listing to produce a report of only the differences between the files. This option allows a given number of matching records on each side of a mismatch to be listed to help in identifying the section of source code.

Features of S/Compare

Some of the features and capabilities of S/Compare are:

Flags are used in the composite listing to clearly mark statements or blocks of statements that have been inserted, deleted, or moved.

Records that are moved from one location in the original file to another in the new program are indicated by source and target locations.

Printing large blocks of identical code can be eliminated by a processing option. Only the differences will be printed and you can control the number of matching lines that are listed before and after each block of mismatched code.

Differences between your program and the new program can be listed in an edit program.

There is a processing option that can eliminate mismatches being printed because of spacing between words.

Harmonizer

Harmonizer adds to the capabilities of S/Compare by allowing the comparison of 3 to 16 program versions. Like S/Compare, the comparison results are written in a format that clearly depicts the differences between source members. In addition, Harmonizer has the capability of merging program versions to generate a composite source member. You can control what is written to the composite source member when potential conflicts are found.

Features and Capabilities of Harmonizer

Some of the features and capabilities of Harmonizer are:

The comparison of 3 to 16 versions of a program.

Two report formats are available. The MULTI–Compare report compares 3 to 16 programs. The TRI–Compare report is specifically designed for 3 programs.

Statements from the original file that have been replaced, inserted, or deleted are noted on the comparison reports.

All of the features of S/Compare are supported by Harmonizer when 3 programs are being compared, except the creation of an edit program which has been replaced by the creation a composite output program.

The composite program may be compiled immediately or it may be edited. The ScmpEdit utility can be used to remove specified code in the composite program.

The HARMONIZER command can be used to execute S/Compare and Harmonizer making the utilities easier to use.

Harmonizer Added to S/Compare

You can incorporate your program changes into new releases easier. Harmonizer can compare the J.D. Edwards original program, the J.D. Edwards new release, and your customized program to produce a composite source file and a composite report. The composite report notifies you of discrepancies in the replacement, insertion, or deletion of code.

The Source File Synopsis report produces a comparison of the program names in the J.D. Edwards original source file, the J.D. Edwards new source file, and your source file to determine any additions or deletions of programs.

You can merge the development work of several programmers working on the same program.

About Harmonizer Plus

Harmonizer Plus adds to the capabilities of S/Compare and Harmonizer by helping you manage the ENTIRE process of building a new software release.

About the Project Manager Feature

The Project Manager feature will display an up-to-the-minute status of every program in your upgrade project. It shows:

Which merged objects need a programmer review due to conflicts between local changes and vendor changes.

Modified objects that are already created and ones that need to be created.

Objects that are ready for production.

Unmodified objects that must be recreated because they are dependent on modified objects.

Objects that must be present before the object you are working with can be created.

Additional Functions

Harmonizer Plus provides a workbench for programmers to perform a variety of functions. Given the proper authority, a programmer can:

Directly access SEU for editing programs.

Mass compile entire groups of programs.

Selectively compile individual programs.

Selectively create all objects dependent on a modified object.

Add or delete programs from the new production version.

Harmonizer Plus identifies unchanged modules that must be recompiled due to changes in prerequisite objects. For example, if you have modified DDS, Harmonizer Plus can identify programs that reference the related files. It can then recompile those programs. All you need to do is test and move the new libraries into production.

Glossary

Glossary

This glossary defines terms in the context of your use of J.D. Edwards systems and the accompanying user guide.

AAI. See Automatic Accounting Instructions.

access. To get to the information or functions provided by the system through menus, screens, and reports.

activity levels. The activity level of a storage pool is the number of jobs that can run at the same time in a storage pool. The machine manages the control of this level. Often during processing in a job, a program waits for a system resource or a response from a work station user. During such waits, a job gives up its use of the storage pools in order that another job that is ready to be processed can take its place.

A/D Cycle. Application Development Cycle.

advanced operating system. A single integrated operating system which contains: relational database, display manager, storage manager, communication manager, work manager, security manager and other managers.

AEC. Architectural, Engineering and Construction group.

allocating pools. If the system cannot allocate all the requested storage, it allocates as much storage as is available and allocates all the other as storage becomes available.

alphabetic character. Represents data by using letters and other symbols from the keyboard (such as *&#). Contrast with *numeric character*.

alphanumeric character. Represents data in a combination of letters, numbers, and other symbols (such as *&#).

ANSI. American National Standards Institute.

answers. Remember the online education system on the AS/400. All you need to remember is the command, *GO SUPPORT*.

AP. Accounts Payable.

APD. Application Program Driver.

API. An application programming interface describes the means by which a programmer can access the features provided by the interfaced object.

APPC. Advanced Program to Program Communications.

application. A collection of computer programs that allows you to perform specific business tasks. Some examples of applications are accounts payable, inventory, and order processing. Synonymous with *system*.

APPN. Advanced Peer-to-Peer Networking.

AS/400. Application System/400.

AS/400 Office. An IBM word processing program.

ASCII. American Standard Code for Information Interchange.

ASPs. Auxiliary Storage Pools.

attributes. To regard as belonging.

attribute byte. First character on a display field. This character controls how the field is displayed.

audit trail. The detailed, verifiable history of a processed transaction. The history consists of the original documents, transaction entries, and posting of records, and usually concludes with a report.

authority. The right to do some thing on the system or to use an object in the system, such as a file or a program.

automatic accounting instruction (AAI). A code that points to an account in the chart of accounts. AAIs define rules for programs that automatically generate journal entries. This includes interfaces between Accounts Payable, Accounts Receivable, and Financial Reporting and the General Accounting system. Each

system that interfaces with the General Accounting system has AAIs. For example, AAIs can direct the Post to General Ledger program to post a debit to a certain expense account and an automatic credit to a certain accounts payable account.

autostart job entry. A job is automatically started each time the subsystem is started.

ATC. Area Training Coordinator.

AR. Accounts Receivable.

backup copy. A copy of original data preserved on a magnetic tape or diskette as protection against destruction or loss.

BAPR. Approved Budget Field Description.

BASIC. Beginners Application Software Introduction Class.

batch. A group of like records or transactions that the computer treats as a single unit during processing. For identification purposes, the system usually assigns each batch a unique identifier, known as a "batch number."

batch header. Information the computer uses as identification and control for a group of transactions or records in a batch.

batch job. A task or group of tasks you submit for processing that the system treats as a single unit during processing, for example, printing reports and purging files. The computer performs these tasks with little or no user interaction.

batch processing. A method by which the computer selects jobs from the job queue, processes them, and writes output to the outqueue. Contrast with *interactive processing*.

batch type. A code that designates which J.D. Edwards system the associated transactions pertain to, thus controlling what records are selected for processing. For example, in the Post General Journal process, only unposted transaction batches with a batch type of G for General Accounting are selected for posting.

bit. Binary digit. Either a zero or a one at the MI level.

Bomb. Fail.

Boolean logic operand. In J.D. Edwards DREAM Writer, the parameter of the Relationship field. The Boolean logic operand tells the system to perform a mathematical calculation on certain records or parameters. Available operands are:

- EQ = Equal To
- LT = Less Than
- LE = Less Than or Equal To
- GT = Greater Than
- GE = Greater Than or Equal To
- NE = Not Equal To
- NL = Not Less Than
- NG = Not Greater Than

BORG. Original/Beginning Budget Field BPC *v*. Budget Pattern Code.

BREQ. Requested Budget Field Description.

B/**S.** Balance Sheet.

buffer. A reserved memory area used for performing input/output operations.

business unit. Formerly cost center.

Caching. Refers to the use of a technique to locally store the results of input and output operations to minimize the use of slower accesses to disk drives and other storage devices.

CAD/CAP. Computer Assisted Design/ Computer Assisted Programming. A set of automated programming tools for designing and developing applications. These tools automate system design, generate source code and documentation, enforce design standards, and help to ensure consistency throughout all J.D. Edwards systems.

category code. In user defined codes, a temporary title for an undefined category. For example, if you are adding a code that designates different sales regions, you could change *category code 4* to *Sales Region*, and define E (East), W (West), N (North), and S (South) as the valid codes. Category codes were formerly known as *reporting codes*.

CC. Cost center. *Now known as Business Unit.*

CC.OBJ.SUB. Cost Center.Object.Subsidiary (J.D. Edwards Account Code Structure).

character. Any letter, number, or other symbol that a computer can read, write, and store.

character, special. Representation of data in symbols that are neither letters nor numbers. Some examples are: *&#/.

CLONE. Crazy Logic Only Nerds Enjoy. (Old term for the Program Generator.)

COBOL. Common Business Oriented Language.

Column. *See field.*

command. A character, word, phrase, or combination of keys you use to tell the computer to perform a defined activity.

compile. To change source code into computer readable code.

constants. Parameters or codes that rarely change. The computer uses constants to standardize information processing by an associated system. Some examples of constants are allowing or disallowing out-of-balance postings and having the system perform currency conversions on all amounts. Once you set constants such as these, the system follows these rules until you change the constants.

Core. The central and foundational systems of J.D. Edwards software, including General Accounting, Accounts Payable, Accounts Receivable, Address Book, Financial Reporting, Financial Modeling and Allocations, and Back Office. Now called Financials.

CPG. Complementary Products Group.

CRP. Capacity Requirements Planning.

CRP. Conference Room Pilot. A simulation of the client's business in a conference room environment.

CUA. Common User Access. IBM's specification of a user interface definition across applications.

CUM. A representation of changes to J.D. Edwards software, which your organization receives on magnetic tapes or diskettes.

current library. Specifies a single library that is searched before any other user libraries in the library list. A current library is optional and can be different for each user or job. On displays, the current library is represented by the value *CURLIB.

cursor. The blinking underscore or rectangle on your screen that indicates where the next keystroke appears.

cursor sensitive help. See *field help*.

data. Numbers, letters, or symbols that represent facts, definitions, conditions, and situations, that a computer can read, write, and store.

data item. A code which represents a field, file, program, menu message, error message or help text stored in the data dictionary. Each piece of information within the database is defined by a data item. Data item name definition is limited to four characters in the J.D. Edwards systems to allow for program manipulation of the item.

database. A continuously updated collection of all information a system uses and stores. Databases make it possible to create, store, index, and cross-reference information online.

data character. A pattern of 8 bits.

data dictionary. A database file consisting of the definitions, structures, and guidelines for the usage of fields, messages, and help text. The data dictionary file does not contain the actual data itself.

data field. A collection of data characters.

data Integrity. Refers to checking the relationships between data items (fields) and being sure that values correlate correctly.

data validation. Determining if data is correct when compared to a set of conditions.

DDE. Dynamic Data Exchange.

DDM. Distributed Data Management.

DDP. Distributed Data Processing.

DDS. Data Description Specifications.

default. A code, number, or parameter the system supplies when you do not enter one. For example, if an input field's default is N and the you do not enter something in that field, the system supplies an N.

descriptive title. See user defined code.

detail. The individual pieces of information and data that make up a record or transaction. Contrast with *summary*.

DFU. Data File Utility. An IBM product.

DIF. Data Interchange Format.

display. (1) To cause the computer to show information on a terminal's screen. (2) A specific set of fields and information that a J.D. Edwards system might show on a screen. Some screens can show more than one display when you press a specified function key.

display field. A field of information on a screen that contains a system-provided code or parameter that you cannot change. Contrast with *input field*.

DMA. Direct Memory Access.

DNS. Do Not Spread.

DOS. Disk Operating System.

DREAM Writer. Data Record Extraction And Management Writer. A flexible data manipulator and cataloging tool. You use this tool to select and sequence the data that is to appear on a programmed report.

DRP. Distribution Requirements Planning.

Dynamic. Is constantly changing.

DASD. Data Auxiliary Storage Device.

ECS. Electronic Customer Support.

edit. (1) To make changes to a file by adding, changing, or removing information. (2) The program function of highlighting fields into which you have entered inadequate or incorrect data.

EDI. Electronic Data Interchange. The transmission of business documents among computers of independent organizations.

EFT. Electronic Fund Transfer.

ElS. Executive Information System.

Engagement letter. A letter identifying the mutual understandings and initial expectation of the client and J.D. Edwards.

environment. The list of files required by a user to perform certain tasks. For example, a programmer has access to a test environment and an environment which includes live data. Each environment utilizes a different set of files.

execute. See *run*.

exit. (1) To interrupt or leave a computer program by pressing a specific key or a sequence of keys. (2) An option or function key displayed on a screen that allows you to access another screen.

facility. A collection of computer language statements or programs that provides a specialized function throughout a system or throughout all integrated systems. Some examples DREAM Writer and FASTR.

Fast Path Mnemonics. A method of using a UDC to define execution to a J.D. Edwards program.

FASTR. Financial Analysis Spreadsheet Tool and Report Writer. A report writer that lets you design your own report specifications using the general ledger database.

FDA. File Design Aid. A J.D. Edwards design tool.

field. (1) An area on a screen where you type in data, values, or characters. (2) A defined area, usually within a record, which can contain a specific piece of information such as name, document type or amount. For example, a vendor record consists of the fields Vendor Name, Vendor Address and Telephone Number. The field Vendor Name contains only the name of the vendor. See *input field* and *display field*. *Also known as column*. **field help.** J.D. Edwards online Help function, which lets you view a description of a field, its purpose and, when applicable, a list of the valid codes that you can enter. You access this information by pressing F1 with the cursor positioned in the field.

file. A collection of related data records organized for a specific use and electronically stored by the computer. *Also known as table.*

financial systems. The central and foundational systems of J.D. Edwards software, including General Accounting, Accounts Payable, Accounts Receivable, Address Book, Financial Reporting, Financial Modeling and Allocations, and Back Office. *Previously known as core*.

fold area. An area of a screen, accessed by pressing F4, that displays additional information associated with the records or data items displayed on the screen.

function. A separate feature within a facility that allows you to perform a specific task, for example, the field help function.

function key. A key you press to perform a system operation or action. For example, you press F4 to have the system display the fold area of a screen.

Form. One World term for video.

glossary. The collection of text related to specific data items. The glossary contains help text and message text.

- GL. General Ledger.
- GA. General Accounting.
- **GST.** Goods & Service Tax.
- GUI. Graphical User Interface.

hard code. Program instructions which can only be altered by a programmer. The altered instructions must then recompiled so the computer can understand them.

hard copy. A presentation of computer information printed on paper. Synonymous with *printout*.

header. Information at the beginning of a file. This information is used to identify or provide control information for the group of records that follows.

help instructions. Online documentation or explanations of fields that you access by pressing the Help key or by pressing F1 with your cursor in a particular field.

helps. See help instructions.

hidden selections. Menu selections you cannot see until you enter HS in a menu's Selection field. Although you cannot see these selections, they are available from any menu. They include such items as Display Submitted Jobs (33), Display User Job Queue (42), and Display User Print Queue (43). The Hidden Selections window displays three categories of selections: user tools, operator tools, and programmer tools.

HMC. Horizontal Microcode.

HS. J.D. Edwards Hidden Selections.

ICCC. InterCompany Cost Center. *Now known as business unit.*

ICF. Intersystem Communication Function.

ICH. InterCompany Hub.

IDDU. Interactive Data Definition Utility – IBM Product.

IMP. Internal Microprogram Load.

IMPI. Internal Microprogramming Interface.

Implementation Methodology. Nine steps to provide J.D. Edwards consulting staff with a guide for implementing the software in a thorough and consistent manner.

input. Information you enter in the input fields on a screen or that the computer enters from other programs, then edits and stores in files.

input field. An area on a screen, distinguished by underscores (__), where you type data, values, or characters. A field represents a specific type of information such as name, document type, or amount. Contrast with *display field*.

install system code. The four–character identifier of a J.D. Edwards system. For example, 01 for the Address Book system, 04 for the Accounts Payable system, and 09 for the General Accounting system. *Now known as system code.*

integrity. Soundness, completeness.

interactive job. An interactive job starts when **a** user signs on **a** display station and ends when the user signs off. During the job, the user interacts with the system.

interactive processing. A job the computer performs in response to commands you enter from a terminal. During interactive processing, you are in direct communication with the computer, and it might prompt you for additional information during the processing of your request. See *online*. Contrast with *batch processing*.

interface. A link between two or more J.D. Edwards systems that allows these systems to send information to and receive information from one another.

I/O. Input/Output.

IPL. Initial Program Load.

ITF. Interactive Terminal Facility.

JDE. Jack, Dan and Ed. Founders of JD Edwards & Co.

jargon. A J.D. Edwards term for system-specific text. You base your jargon help text on a specific reporting code you designate in the Data Dictionary Glossary. You can display this text as part of online help. You create your jargon text descriptions and titles for data items through the Data Dictionary, menu and vocabulary overrides record using a reporting system code. Jargon text descriptions and titles for data items display on screens as field names. **job.** A single identifiable set of processing actions you tell the computer to perform. You start jobs by choosing menu selections, entering commands, or pressing designated function keys. An example of a computer job is check printing in the Accounts Payable system.

job description. An object consisting of a set of specifications about a computer job and its executing environment.

job log. A job log is a record of requests (such as commands) submitted by the system by a job, the messages related to the requirements and the actions performed by the system on the job.

job queue. A group of jobs waiting to enter a subsystem.

Join logical file. Presents composite records consisting of fields extracted from two or more physical records from two or more physical files.

justify. To shift information you enter in an input field to the right or left side of the field. Many of the facilities within J.D. Edwards systems justify information. The system does this only after you press Enter.

KBG. Knowledge-Based Generator. See *program generator*.

key field. A series of identifying or controlling characters a computer uses to retrieve related information tied to the key. An employee number, for example, is a key field consisting of references to other files in the system that contain information about the given employee.

Key General Ledger Account (Key

G/L). See automatic accounting instructions.

LAN. Local Area Network.

leading zeros. A series of zeros that certain facilities in J.D. Edwards systems place in front of a value you enter. This normally occurs when you enter a value that is smaller than the specified length of the field. For example, if you enter 4567 in a field that accommodates
eight numbers, the facility places four zeros in front of the four numbers you enter. The result would look like this: 00004567.

level check. A mechanism of the OS/400 that assures that a file version and program using that file are in sync with one another.

level of detail. (1) The degree of difficulty of a menu in J.D. Edwards software. The levels of detail for menus are as follows:

A=Major Product Directories B=Product Groups 1=Daily Operations 2=Periodic Operations 3=Adv/Tech Operations 4=Computer Operations 5=Programmers 6=Advanced Programmers Also known as *menu levels*. (2) The degree to which account information in the General

which account information in the General Accounting system is summarized. The highest level of detail is 1 (least detailed) and the lowest level of detail is 9 (most detailed).

library. A library groups objects. A library is an object itself. Similar to directory on a PC.

library list. An ordered list of libraries used for locating objects. Similar to path on a PC.

LIOM. Line Input/Output Manager.

LOD. Level of Detail.

logical file. Contains no data, but provides a view of one or more physical files upon which it is based.

master file. A computer file that a system uses to store data and information which is permanent and necessary to the system's operation. Master files might contain data or information such as paid tax amounts and vendor names and addresses.

MDA. Menu Design Aid. A J.D. Edwards design tool.

menu. A screen that displays numbered selections. Each of these selections represents a program. To access a selection from a menu, type the selection number and then press Enter.

menu levels. See *level of detail*.

menu masking. A security feature of J.D. Edwards systems that allows you to prevent individual users from accessing specified menus or menu selections. When this security is in effect for a user, the selections that have been secured do not appear on the screen.

menu message. Text that appears on a screen after you make a menu selection. It displays a warning, caution, or information about the requested selection.

menu traveling. A method of moving between menus by typing the menu identifier in the selection field of the screen.

MI. Machine Interface.

MRP. Manufacturing Resource Planning.

MRPx. J.D. Edwards Manufacturing Software.

MVS. Multiple Virtual Storage.

next number facility. A J.D. Edwards software facility you use to control the automatic numbering of such items as new G/L accounts, vouchers, and addresses. It lets you specify your desired numbering system and provides a method to increment numbers to reduce transposition and typing errors.

non-join logical file. Presents records that are composed of fields extracted from just one physical record, but can effectively merge two or more physical files.

numeric character. Represents data using the numbers 0 through 9. Contrast with *alphabetic character* and *alphanumeric character*.

object. A discrete entity.

object existence. The right to delete an object from the system.

object management. The right to change the name or library of an object, for physical files, the right to create a logical file over it.

object operational. The right to display the description of an object and the right to the general use of that object.

object orientation. Everything on the AS\400 system that can be stored or retrieved is contained in an object.

offline. Computer functions that are not under the continuous control of the system. For example, if you were to run a certain job on a personal computer and then transfer the results to a host computer, that job would be considered an offline function. Contrast with *online*.

One Step Install. A method developed to make our software easier to install.

online. Computer functions over which the system has continuous control. Each time you work with a J.D. Edwards system-provided screen, you are online with the system. Contrast with *offline*. See *interactive processing*.

online information. Information the system retrieves, usually at your request, and immediately displays on the screen. This information includes items such as database information, documentation, and messages.

Open Application Architecture. An

architectures that uses a functional server to allow the various blocks of user interface logic to **access** the same block of data integrity logic.

operand. See Boolean logic operand.

option. A numbered selection from a J.D. Edwards screen that performs a particular function or task. To select an option, you enter its number in the Option field next to the item you want the function performed on. When available, for example, option 4 lets you return to a prior screen with a value from the current screen.

OS/400. Operating system for the AS/400.

OS/2. Operating system for the IBM personal computer.

OSI. Open Systems Interconnection.

output. Information the computer transfers from internal storage to an external device, such as a printer or a computer screen.

output queue. A group of spool files waiting to be attached to a writer.

override. The process of entering a code or parameter other than the one provided by the system. Many J.D. Edwards systems offer screens that provide default field values when they appear. By typing a new value over the default code, you can *override* the default. See *default*.

PACO. Posted After Cutoff.

parameter. A number, code, or character string you specify in association with a command or program. The computer uses parameters as additional input or to control the actions of the command or program.

password. A unique group of characters that you enter when you sign on to the system that the computer uses to identify you as a valid user.

PBCO. Posted Before Cutoff.

PC. Personal computer.

PDM. Program Development Manager. IBM design tool.

PDM. Product Data Management – a module of J.D. Edwards software.

physical file. A file that contains actual data records. Mas a maximum record length of 32K, maximum fields per record is 8000.

Plug-&-Go. A 2/18/92 announcement where J.D. Edwards selects PROGRESS to develop client applications for the AS/400. The plug-&-go format offers clients the J.D. Edwards Core financial solutions on the IBM AS/400 E series model.

PPAT. People, Places and Things.

printout. A presentation of computer information printed on paper. Synonymous with *hard copy*.

print queue. A group of items waiting to be printed. See *output queue*.

processing options. A feature of the J.D. Edwards DREAM Writer that lets you supply parameters to direct the functions of a program. For example, processing options allow you to specify defaults for certain screen displays, control the format in which information gets printed on reports, change the way a screen displays information, and enter "as of" dates.

product library. A library containing programs and related data needed for IBM licensed programs that are installed on your system.

production library. A production library is a library you create to contain your live J.D. Edwards data files.

production environment. A list of libraries that contains "live" programs and data.

program. A collection of computer statements that tells the computer to perform a specific task or group of tasks.

Progress. A software corporation that is a partner with J.D. Edwards. They are a leading supplier of 4th generation application development systems.

program generator. The World CASE system of programs which create a new program based upon user specifications.

program help. J.D. Edwards online facility which displays information about a program's use and functionality.

program-specific help text. Glossary text written to describe the function of a field within the context of the program.

prompt. (1) A reminder or request for information displayed by the system. When a prompt appears, you must respond in order to proceed. (2) A list of codes or parameters or a request for information provided by the system as a reminder of the type of information you should enter or action you should take.

PTF. See CUM.

purge. The process of removing records or data from a file.

PYEB. Post Year End Balance.

P&L. Profit and Loss Statements.

PG. Program Generator.

QA. Quality Assurance.

QJDF data area. A space within the system to hold the system values information for the J.D. Edwards software. This area is referenced at sign-on and during installs and reinstalls for critical system information, such as security codes and initial libraries.

QSECOFR. The security officer of the AS/400.

query. A fast means to select and display (or print) information from a database. An IBM utility for databases.

queue. A list of things to be used in an order. See *job queue, output queue*, and *print queue*.

RAID. Redundant Array of inexpensive disks.

RAM. Random Access Memory.

RDA. Report Design Aid. A J.D. Edwards design tool.

read only. A type of access to data that allows it to be read but not copied, printed or modified.

rebuild. The process of sequencing files, integrating recently added data.

record. A collection of related, consecutive fields of data the system treats as a single unit of information. For example, a vendor record consists of information such as the vendor's name, address, and telephone number. *Also known as row.*

record format. The definition of how data is structured in the records contained in a file.

record level locking. Prevents two people from simultaneously updating the same data base information.

REP. Rapidly, Economically and Predictably.

reply list. A system wide automatic message handler for the system.

recursive. In DREAM Writer, the ability to create a unique version from the original, process the new version and delete it, leaving the original intact.

re–engineering modules. Programs written for the purpose of changing many existing programs in mass.

reporting system code. The four-character identifier of a J.D. Edwards system that uses an object for reporting.

REQIO. Request Input/Output.

reverse image. Screen text that displays in the opposite color combination of characters and background from what the screen typically displays (for example, black on green instead of green on black).

RIBA. Ricevuta Bancaria Elettronica — common way for vendors to receive payments from their customers in Italy.

ROM. Read Only Memory.

ROW. See record.

RPG. Report Program Generator. A programming language developed by IBM.

Rumba. A PC Emulator for the AS/400.

run. To cause the computer to perform a routine, process a batch of transactions, or carry out computer program instructions.

SAA. Systems Application Architecture.

SAR. See Software Action Request.

server. A program that speeds the flow of data between screens, reports and the data files. These programs can also be used to edit data fields.

scroll. To use the roll keys to move screen information up or down a screen at a time. When you press the Rollup key, for instance, the system replaces the currently displayed text with the next screen of text if more text is available.

SDA. Screen Design Aid Utility. An IBM product.

selection. Found on J.D. Edwards menus, selections represent functions that you can access from a given menu. To make a selection, you type its associated number in the Selection field and press Enter.

SEU. Source Entry Utility.

SIC. Standard Industry Code.

SIOM. Station Input/Output Manager.

Ski Slope. Reflects the analogy between the diverse nature of a ski slope and the diverse nature of our software. S levels: Basic, Intermediate, Advanced, Computer Operations and Program Modifications.

SNA. Systems Network Architecture.

SNADS. Systems Network Architecture Distribution Services.

Sleeper. A subsystem which activates jobs set to run during off-peak hours.

softcoding. A J.D. Edwards term that describes an entire family of features that lets you customize and adapt J.D. Edwards software to your business environment. These features lessen the need for you to use computer programmers when your data processing needs change.

software. The operating system and application programs that tell the computer how and what tasks to perform.

Software Action Request. A record which identifies an activity, such as the development of a new program or maintenance of an existing program.

Software Security Code. A code that restricts user access to software.

special character. Representation of data in symbols that are neither letters nor numbers. Some examples are * & # /.

spool. Simultaneous Peripheral Operations On Line. The function by which the system puts generated output into a storage area to await printing or processing.

spooled file. A holding file for output data waiting to be printed or input data waiting to be processed.

SQL. Structure Query Language.

STAR. Spreadsheet Tool for Asset Reporting.

subfile. An area on the screen where the system displays detailed information related to the header information at the top of the screen. Subfiles might contain more information than the screen can display in the subfile area. If so, use the roll keys to display the next screen of information. See *scroll*.

submit. See run.

subsystem. An operating environment where jobs are run.

summary. The presentation of data or information in a cumulative or totaled manner in which most of the details have been removed. Many of the J.D. Edwards systems offer screens and reports that are summaries of the information stored in certain files.

SVR. Software Versions Repository.

system. A collection of computer programs that lets you perform a specific business function, such as Accounts Payable, Inventory, or Order Processing. Synonymous with *application*.

system library. Lists libraries containing objects, such as user profiles, that are used by the system. This part of a library list is defined by the system value QSYSLIBL and is usually the same for all jobs.

Simplified Install. J.D. Edwards new way to install J.D. Edwards software. Also called one step Install.

SME. Subject Matter Expert.

T/B. Trial Balance.

Table. One World term for a file.

UNIX. A multi-user, multi-tasking operating system.

Unscheduled PTF. A form of PTF that includes fixed for a particular system.

UPS. Uninterruptible power source.

user class/group. Place to enter group profiles associated with J.D. Edwards Users.

user defined code. The individual codes you create and define within a user defined code type. Code types are used by programs to edit

data and allow only defined codes. These codes might consist of a single character or a set of characters that represents a word, phrase, or definition. These characters can be alphabetic, alphanumeric, or numeric. For example, in the user defined code type table ST (Search Type), a few codes are C for Customers, E for Employees, and V for Vendors.

user defined code (type). The identifier for a table of codes with a meaning you define for the system (for example, ST for the Search Type codes table in Address Book). J.D. Edwards systems provide a number of these tables and allow you to create and define tables of your own. User defined codes were formerly known as *descriptive titles*.

user index. An object that stores data, allows search functions, and automatically sorts data based upon a key value.

user identification (user ID). The unique name you enter when you sign on to a J.D. Edwards system to identify yourself to the system. This ID can be up to 10 characters long and can consist of alphabetic, alphanumeric, and numeric characters.

user library. A libraries that contains objects, such as files and programs used by the user.

user profile. A file of information which identifies the user to the J.D. Edwards system. This file is used to validate the users authority within the system.

user space. An object made up of a collection of bytes used for storing user-defined information.

user type. A code which identifies a list of files which remain open while the user is signed on to the system.

valid codes. The allowed codes, amounts, or types of data that you can enter in a specific input field. The system checks, or edits, user defined code fields for accuracy against the list of valid codes.

version. A specific release of software. Usually numbered in ascending order.

VCS. Version Control System.

Vertex. Callable routines and tables that calculate US PIR taxes.

video. The display of information on your monitor screen. Normally referred to as the *screen*.

VM. Virtual Machine.

VMC. Vertical Microcode.

vocabulary overrides. A J.D. Edwards facility that lets you override field, row, or column title text on a screen-by-screen or report- by-report basis.

WACO. Way After Cutoff.

WAN. Wide Area Network.

window. A software feature that allows a part of your screen to function as if it were a screen in itself. Windows serve a dedicated purpose within a facility, such as searching for a specific valid code for a field.

writer. A J.D. Edwards printer attached to an outqueue.

World Vision. A complementary product that converts graphical user interfaces to J.D. Edwards business applications for the AS400.

World VISTA. A windows–based direct access to J.D. Edwards data on the AS/400.

WW. World Writer. A J.D. Edwards software product.

XREF. Cross reference tool for J.D. Edwards software.

YTD. Year to Date.
