Important Note for Students in Training Classes

This guide is a source book for online helps, training classes, and user reference. Training classes may not cover all the topics contained here.
Welcome

About this Guide

This guide provides overviews, illustrations, procedures, and examples for the current release of J.D. Edwards software. Forms (screens and windows) shown are only examples. If your company operates at a different software level, you might find discrepancies between what is shown in this guide and what you see on your screen.

This guide includes examples to help you understand how to use the system. You can access all of the information about a task using either the guide or the online help.

Before using this guide, you should have a fundamental understanding of the system, user defined codes, and category codes. You should also know how to:

- Use the menus
- Enter information in fields
- Add, change, and delete information
- Create and run report versions
- Access online documentation

Audience

This guide is intended primarily for the following audiences:

- Users
- Classroom instructors
- Client Services personnel
- Consultants and implementation team members

Organization

This guide is divided into sections for each major function. Sections contain chapters for each task or group of related tasks. Each chapter contains the information you need to accomplish the task, run the program, or print the
report. Chapters normally include an overview, form or report samples, and procedures.

When it is appropriate, chapters also might explain automatic accounting instructions, processing options, and warnings or error situations. Some chapters include self-tests for your use outside the classroom.

This guide has a detailed table of contents and an index to help you locate information quickly.

**Conventions Used in this Guide**

The following terms have specific meanings when used in this guide:

- *Form* refers to a screen or a window.
- *Table* generally means “file.”

We assume an “implied completion” at the end of a series of steps. That is, to complete the procedure described in the series of steps, either press Enter or click OK, except where noted.
# Table of Contents

## System Overview

- System Integration .................................................. 1–1
- Features ....................................................................... 1–3
- Process Flow ............................................................... 1–7
- Tables for Shop Floor Control .......................................... 1–8
- Types of Manufacturing .................................................. 1–10
- Enterprise Requirements Planning and Execution System ...... 1–10
- Sales Order Management System ....................................... 1–12

Glossary

Index
System Overview
System Overview

The J.D. Edwards Shop Floor Control system implements the material plan by managing the flow of materials inside the plant. An effectively managed Shop Floor Control system serves as a mediator between production control and the shop floor. It allows you to manage and track manufacturing work orders, processes, and rate schedules. It utilizes data from the shop floor to maintain and communicate status information regarding materials, work centers, routings, and end operations required to complete the production requests.

System Integration

The Shop Floor Control system integrates with other J.D. Edwards systems to take advantage of single entries, information sharing, and data consistency across systems.

Shop Floor Control

- Product Data Management
- DRP/MPS/MRP
- Procurement
- Quality Management
- Payroll
- Capacity Requirements Planning
- Inventory Management
- Warehouse Management
- Sales Order Management

DPS = Distribution Requirements Planning
MPS = Master Production Schedule
MRP = Material Requirements Planning
• The Product Data Management system provides information about bills of material, work centers, and routings.

• The Inventory Management system allows you to track materials between inventory or storage locations and the shop floor. You can perform inventory issues, commitments, and completions, and track order quantities throughout the production process.

• The Sales Order Management system allows you to generate work orders when you enter a sales order and updates sales information from within the Shop Floor Control system.

• The Capacity Requirements Planning system reads the routings for work orders and rate schedules and monitors the load on the work centers involved. This allows you to effectively manage the loads on your work centers to maximize production and meet scheduled demand.

• The Payroll system interface allows single entry of employees’ hours. You can record hours and quantities per work request or per employee to accommodate both piece-rate and hourly rate employees.

• The Procurement system allows you to automatically generate purchase orders for subcontracted operations on your routings.

• The Distribution Requirements Planning, Master Production Scheduling, and Material Requirements Planning systems provide suggested purchase and manufacturing orders required to maintain a valid production schedule.

• The Warehouse Management system allows you to originate picking requests through Manufacturing systems, which further enhances the automated method of tracking inventory movement within a warehouse.
Features

The following graphic illustrates the features available to you in the Shop Floor Control system. These features are described in detail following this graphic.

**Hours and Quantities Tracking**

- Enter and track time and quantities completed and scrapped by work order and by employee
- Allocate and track resource usage by work center per calendar month
- Review and analyze reports of work orders with detail by operation of standard versus actual for:
  - Setup, labor, and machine time
  - Quantity complete and scrapped
  - Charge actual hours and quantities to a work order as each manufacturing step is completed

**Process or Routing Instructions**

- Generate a routing automatically when a work order is processed
- Use master routings or non-standard routings for items and indicate when to use each item
- Change the work centers and procedures for each operation on the routing
- Modify the sequence and status of each operation on the routing
- Make real-time modifications to routings instructions
- Display quantity ordered, completed, and scrapped for each operation

**Work Order and Rate Creation**

- Enter work orders and rates manually
- Create work orders and rates automatically from Material Requirements Planning (MRP) by answering action messages, or from sales order entry and select kits for assemble-to-order environments
- Generate shop floor paperwork automatically, including standard parts lists and routing instructions
- Differentiate work orders and rates by type, priority, and status
- Group work orders by a parent number (a useful feature for job numbers that contain many work order numbers)
- Automatically generate purchase orders for sub-contracted operations on the routing for work orders and rates
Blending, Filling, and Packaging

- Produce and track work orders for the filling and packaging of lube oil finished goods when:
  - Blending products requires more than one co- or by-product
  - Blending and filling on the same work order
  - A flushing step is required that produces a by-product
  - Using Sup Backflush to complete products in separate steps

Production Scheduling and Tracking

- Schedule work center production for rate schedules, work orders, or both
- Track and compare planned production schedules against actual schedules
- Use the online scheduling workbench to review, dispatch, and update production scheduling information in real-time
- Calculate start and complete dates for each work order by operation from the Shop Floor Control Routing Instructions table (F3112)
- Maintain the rate schedule after using rate based MRP

Manufacturing Accounting

- Plan and track costs for setup, labor, material, and overhead
- Compare planned costs against actual costs and calculate a variance amount
- Use feature cost percent for co-/by-product costing
- Create journal entries to charge actual and variance costs to a work order or rate schedule in the general ledger
Material Tracking

- Create a parts list automatically when you process a work order
- Display the quantity on order, on hand, and available for each part
- Access detailed information about supply and demand quantities
- Check the availability of the components required to manufacture a parent item and generate a shortage list
- Issue the parts to a work order using a manual, preflush, or backflush method
- Backflush both quantities of components issued to a work order and the labor expended with pay point operations
- Enter and track completions to inventory when parent items are completed
- Attach the parts list and routing instructions to the work order and print shop floor paperwork
- Track where lots are used, and split and trace where lots come from with advanced lot control
- Maintain and monitor work orders created from the Configuration Management system for configured items
- Process work orders that produce co-products or by-products and process the necessary transactions
- Generate an inventory shortage list by work order and item
- Enter issue transactions for inventory items associated with a work order
- Generate a picking request in the Warehouse Management system to select a location and move the inventory (this occurs after the Manufacturing system creates a parts list without a work center attached, and checks availability)

Reporting

- Run reports that compare actual values with planned values and indicate the variance between the two
- Run shortage reports by item or work order to identify potential manufacturing constraints due to a lack of availability of required components
- Print shop floor paperwork, such as work orders, parts lists, and routings for items
- Review daily shop work lists to monitor job status, identify queue problems at work centers, and flag other areas, such as engineering changes or lost material
**Process Flow**

The following graphic illustrates all of the processes involved in the Shop Floor Control system. The arrows show the flow from process to process, beginning with a work order and ending with an inventory completion.

1. **Work Orders**
2. **and Rates**
3. **Attach**
4. **Routing Instructions**
5. **Parts List**
6. **Perform Commitments**
7. **Availability**
8. **Pick/Issues**
9. **Schedule Work**
10. **Record Hours and Quantities**
11. **Payroll (optional)**
12. **Post**
13. **Completion to Inventory**
14. **Super Backflushing**
**Tables for Shop Floor Control**

The following is a list of the tables used throughout the Shop Floor Control system.

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Business Unit Master</strong> (F0006)</td>
<td>Identifies branch, plant, warehouse, and business unit (entity) information, such as company, description (name), and category codes assigned to that entity.</td>
</tr>
<tr>
<td><strong>Generic Message/Rate</strong> (F00191)</td>
<td>Contains codes that correspond to a text message. In the Shop Floor Control system, this is used for routing text on a work order.</td>
</tr>
<tr>
<td><strong>Account Master (F0901)</strong></td>
<td>Maintains the account data for the general ledger.</td>
</tr>
<tr>
<td><strong>Account Ledger (F0911)</strong></td>
<td>Stores the transaction records for the general ledger.</td>
</tr>
<tr>
<td><strong>Work Center Master</strong> (F30006)</td>
<td>Contains detail data about all defined work centers.</td>
</tr>
<tr>
<td><strong>Bill of Materials Master</strong> (F3002)</td>
<td>Defines and maintains warehouse (plant level) information about bills of materials, such as quantities of components, as well as features, options, and levels of detail for each bill.</td>
</tr>
<tr>
<td><strong>Item Cost Component Add-Ons</strong> (F30026)</td>
<td>Contains frozen standard costs for journal entry creation for work orders.</td>
</tr>
<tr>
<td><strong>Routing Master</strong> (F3003)</td>
<td>Stores routing information, including operation sequences, and work centers, as well as run, setup, and machine time.</td>
</tr>
<tr>
<td><strong>Job Shop Manufacturing Constants</strong> (F3009)</td>
<td>Contains general branch/plant information.</td>
</tr>
<tr>
<td><strong>Kanban Master</strong> (F3016)</td>
<td>Contains the set of kanban cards associated with an item. Each kanban defines the supplying location, consuming location, quantity, and unit of measure. The system uses next numbers to control the kanban identification number. If the system pulls the item from an external source, the supplier's number is included.</td>
</tr>
<tr>
<td><strong>Work Order Variance</strong> (F3102)</td>
<td>Stores the work order variance that shows the difference in costs from when the standards were set at the beginning of the accounting period.</td>
</tr>
<tr>
<td>Database Table Name</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>Work Order Serial Numbers (F3105)</td>
<td>Contains the fields that identify work order assemblies with lot serial numbers.</td>
</tr>
<tr>
<td>Item/Line Relationship Master (F3109)</td>
<td>Stores the relationships between items and production lines. The system uses one of the records as the default rate generation rule.</td>
</tr>
<tr>
<td>Schedule Quantity Detail (F31091)</td>
<td>Contains the daily quantities making up a work order or a rate. The system uses this file for scheduling and sequencing production lines and work centers.</td>
</tr>
<tr>
<td>Shop Floor Control Parts List (F3111)</td>
<td>Contains the components used on a work order.</td>
</tr>
<tr>
<td>Shop Floor Control Routing Instructions (F3112)</td>
<td>Contains the specific instructions for manufacturing work orders.</td>
</tr>
<tr>
<td>Work Order Time Transactions (F31122)</td>
<td>Stores the labor transactions reported on a work order.</td>
</tr>
<tr>
<td>Shortage Maintenance Master (F3118)</td>
<td>Contains component shortages for work orders.</td>
</tr>
<tr>
<td>MPS/MRP/DRP Message (F3411)</td>
<td>Contains the source of gross requirements that are posted to items from parent items.</td>
</tr>
<tr>
<td>Forecast (F3460)</td>
<td>Contains the forecast data that Resource Requirements Planning (RRP) validates. It is then used as input to MPS/MRP/DRP.</td>
</tr>
<tr>
<td>Inventory Constants (F41001)</td>
<td>Used to control day-to-day transactions that occur within the Inventory Management system. Directs the nature of certain integrated operations between Inventory Management and other systems, such as Sales Order Management, Procurement, and General Accounting.</td>
</tr>
<tr>
<td>Item Master (F4101)</td>
<td>Stores basic information about each item defined for inventory, such as description, search name, and units of measure.</td>
</tr>
<tr>
<td>Item Branch (F4102)</td>
<td>Defines and maintains warehouse or plant level information, such as costs, quantities, category codes, and physical locations.</td>
</tr>
<tr>
<td>Item Location (F41021)</td>
<td>Specifies all inventory locations for an item.</td>
</tr>
</tbody>
</table>
Item Cross Reference (F4104) Enables you to relate item numbers for a specific purpose.

Lot Master (F4108) Defines the actual potency of a lot.

Item Ledger (F4111) Stores the transaction history for all items.

Item History (F4115) Stores usage data for items optional in some Shop Floor Control system transaction programs.

Warehouse Requests (F4600) Stores putaway, picking, and replenishment movement requests.

Warehouse Suggestions (F4611) Contains the warehouse requests after they have been processed by putaway, picking, or replenishment.

Work Order Master (F4801) Stores the work order information, such as item numbers, quantities, and dates.

Work Order Instruction/Disposition (F4802) Contains text and instructions specific to work orders that are identified by different record types.

Types of Manufacturing

Depending on the type of product being produced, almost all manufacturing can be defined in one of two ways:

- Discrete
- Process

Both discrete and process manufacturing use bills of material and routings. The bills of material contain individual parts or components, such as a nut, bolt, wire, plastic, or metal part of a fixed or variable quantity. Products can be broken down into subassemblies that go into various larger assemblies.

Enterprise Requirements Planning and Execution System

Shop Floor Control is one of the many systems that make up the Enterprise Requirements Planning and Execution (ERPx) system. The ERPx system enables you to coordinate your inventory, raw material, and labor resources to deliver products according to a managed schedule. ERPx is fully integrated and ensures that information is kept current and accurate across all your business
operations. It is a closed-loop manufacturing system that formalizes the activities of company and operations planning, as well as the execution of those plans.

The following systems make up the J.D. Edwards ERPx product group.
Sales Order Management System

Order entry is a process of accepting and translating what the customer wants into terms used by the manufacturer or distributor. Sales order entry is the main input to tracking the accuracy of the master production schedule.

There are three levels of sales order entry:

- **Basic** — create shipping documents for make-to-stock finished goods
- **Advanced** — create assembly orders for assemble-to-order products stocked at lower levels
- **Complex** — create design project orders to develop, prototype, and test engineer-to-order products

Sales order entry has operational guidelines in which it must:

- Produce output corresponding to items in inventory or parents in the bill of material
- Be used on an as-occurring basis in order to properly reflect available-to-promise

Depending on the nature of a business, you might want to generate an actual manufacturing work order from a sales order. Before you can do this, however, you need to address some setup issues in sales orders that relate to manufacturing. These issues are:

- **Order Line Types** — These are all of the various line types in the Sales Order Management system. The last column, WO, indicates whether a work order is to be generated for line type W on the sales order.
- **Non-Kit Work Orders** — For items that are not kits, you enter the sales order in the normal manner. If the processing option is not set to enter line type W, you must do this in the detail form after entering the item number and quantity but before accepting the data.
- **Kit Work Orders** — For these items, the stocking type on the Branch/Plant form must be set to K for Kits.

After you complete these tasks, you can view the manufacturing work order. The sales order number is entered in the Reference field and associated sales order fields of the Manufacturing Work Order form. The Sales Order Management system does not automatically attach the parts list and routing to the work order. You do this in the Shop Floor Control system.
Features of Sales Order Management

The main features of Sales Order Management can be divided into three categories: simplicity, flexibility, and adaptability.

**Simplicity**

- Automatic order numbering
- Automatic, multiple choices of costing
- Automatic, flexible pricing, including specials and contracts
- Automatic online credit check with order hold online
- Online order summary and total with tax calculation
- Efficient customer billing

**Flexibility**

- Kit processing (bills of materials)
- User defined order types, transaction types, and transaction flow
- User controlled format and functions of order entry form
- Messages for specifications and instructions
- Multiple customer, bill-to, and ship-to addresses
- Back order control and online back order release
- Hold order processing and online release
- Individual or batch order printing
- Online or batch printing
- Serial number tracking

**Adaptability**

- Item substitutions and replacements
- Multiple shipments and invoices per order
- Credit processing for returned goods
- Comprehensive sales and tax data collection
- Direct ship
- Transfer orders to create purchase and sales orders
- Direct interfaces to Address Book, Accounts Receivable, Inventory Management, and General Ledger systems
# Tables for Sales Order Management

The major tables for the Sales Order Management system are:

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Billing Instructions (F4205)</td>
<td>Maintains default values for customer-specific delivery and billing information.</td>
</tr>
<tr>
<td>Price by Item (F4207)</td>
<td>Defines specific price breaks for inventory items or groups of items.</td>
</tr>
<tr>
<td>Price by Customer (F4208)</td>
<td>Relates specific customers or customer groupings to inventory pricing rules or contract prices.</td>
</tr>
<tr>
<td>Order Hold Constants (F42008)</td>
<td>Provides user defined codes and release passwords for credit, margin, and other needed order hold codes.</td>
</tr>
</tbody>
</table>

The transaction tables for the Sales Order Management system are:

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales Order Header (F4201)</td>
<td>Maintains the billing instructions and addressing and delivery information for a customer's order.</td>
</tr>
<tr>
<td>Sales Order Detail (F4211)</td>
<td>Contains complete information for each line of each sales order.</td>
</tr>
<tr>
<td>Sales Order History (F42119)</td>
<td>History table for the detail line of sales order activity.</td>
</tr>
<tr>
<td>Held Orders (F4209)</td>
<td>Contains one detail record per order (line) per hold code in effect.</td>
</tr>
<tr>
<td>Sales Summary History (F4229)</td>
<td>Provides item, customer, and category information used for sales analysis reporting.</td>
</tr>
</tbody>
</table>
The supporting tables for the Sales Order Management system are:

**Address Book (F0101)**
Contains customer addressing, receivables, and category information. Used in conjunction with Billing Instructions to create a Sales Order Header record.

**Business Unit Master (F0006)**
Identifies branch, plant, warehouse, and business unit (entity) information, such as company, description (name), and category codes assigned to that entity.

**Account Master (F0901)**
Maintains the account data for the general ledger.

**Account Ledger (F0911)**
Stores the transaction records for the general ledger.

**General Constants (F0009)**
Defines company processing for general accounting.

**Automatic Accounting Instructions Master (F0012)**
Used to define the interfaces between various J.D. Edwards systems and the General Accounting system.

**Item Master (F4101)**
Stores basic information about each item defined for inventory, such as description, search name, and units of measure.

**Item Branch (F4102)**
Defines and maintains warehouse or plant level information, such as costs, quantities, category codes, and physical locations.

**Bill of Materials Master (F3002)**
Defines and maintains warehouse (plant level) information about bills of materials, such as cost and quantities of components, as well as features, options, and levels of detail for each bill.

**Tax Areas (F4008)**
Stores definitions of geographic locales, their taxing authorities, and tax rates.

**Inventory Constants (F41001)**
Used to control day-to-day transactions that occur within the Inventory Management system. Directs the nature of certain integrated operations between Inventory Management and other systems, such as Sales Order Management, Procurement, and General Accounting.
Procurement System

Purchasing is the execution of the internal schedule through the acquisition of material or services from an external source. You use the Procurement system to obtain the best quality parts at the most reasonable rates at the correct time. After you enter a purchase order and its detail information, you can record the receipt of an order line.

Features of Procurement

The main features of purchasing can be divided into three categories: simplicity, flexibility, and adaptability.

Simplicity

- Automatic order numbering.
- Shared tables with the Inventory Management system for automatic costing of purchase orders. Tracks number of orders placed, leadtime, and unit costs. Quantities on order are reflected in inventory inquiries.
- Online order summary and total.
- Standard form formats for entry programs provide ease of learning.

Flexibility

- Combined inventory and non-inventory purchasing. This allows purchase order lines to send receipt costs to inventory or to a general ledger account or a project.
- Budget checking for general ledger account purchases. You can use one of three budget checking methods against user-selected budget ledger type.
- Requisition management. This permits an order to flow through an online requisition process prior to the actual approval of the order for purchase.
- User defined order types, transaction types, and transaction flows. This gives wide-ranging flexibility for setup and customization without programming changes.
- Unit or extended receipt costing. The system can calculate the correct extended amount or unit cost, depending upon your usage.
- Ease of data changes for order line delivery. You can also make data changes for multiple orders at the same time.
Adaptability

- Multiple receipts, or receipt with a cancel remaining, or open order line cancel allowed, as required
- Fully integrated with other J.D. Edwards systems, including Inventory Management, Accounts Payable, General Accounting, and Address Book systems
- A matching function in Accounts Payable and Procurement receipts provides for changes to purchase order cost based upon customer invoice
- Buyers’ reports and forms display purchase order quantities based on item-specific reorder point and economic order quantity
- Purchase Order Generator to simplify purchase order creation, including online view of economic order quantity, re-order point, and days stock available
- Change order controls, which furnish detail records of changes
- Model purchase orders and blanket orders providing easy duplication and release of prior orders without additional order entry keying

Tables for Procurement

The major tables for the Procurement system are:

**Customer Purchasing Instructions (F4305)** Maintains default values for customer-specific delivery and billing information.

**Price by Item (F4207)** Defines specific price breaks for inventory items or groups of items.

**Price by Customer (F4208)** Relates specific customer or customer groupings to inventory pricing rules or contract prices.

**Order Hold Constants (F42008)** Provides user defined codes and release passwords for quantity holds and needed order hold codes.
The transaction tables for the Procurement system are:

<table>
<thead>
<tr>
<th>Table Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Purchase Order Header (F4301)</strong></td>
<td>Maintains the customer instructions, and addressing and delivery information for a purchase order.</td>
</tr>
<tr>
<td><strong>Purchase Order Detail (F4311)</strong></td>
<td>Contains complete information for each line of each purchase order.</td>
</tr>
<tr>
<td><strong>Purchase Order Receiver (F4312)</strong></td>
<td>Contains complete information for each purchase order line received.</td>
</tr>
<tr>
<td><strong>Purchase Order Detail Ledger (F43199)</strong></td>
<td>History table for purchase order detail line activity. Format can be user defined.</td>
</tr>
</tbody>
</table>

The supporting tables for the Procurement system are:

<table>

Process Manufacturing
Process Manufacturing

Objectives

- To understand the structure of a work order
- To understand co-products, by-products, and intermediates
- To understand the different ways you can reclassify an item
- To understand how availability is calculated
- To understand how to blend and split lots
- To understand the difference between backflush and super backflush
- To prioritize work at each work center or cell
- To understand how the Shop Floor Control system interfaces with the Payroll system
- To learn how to record completions and release backorders

About Process Manufacturing

Process manufacturing produces products, such as liquids, fibers, powders, or gasses. Pharmaceuticals, foodstuffs, and beverages are typical examples of process products and represent a significant share of the manufacturing market. Products such as these are usually manufactured by a two-step process:

- Mixing or blending
- Filling or packaging

Intermediate steps, such as curing, baking, or additional preparation, can also occur.

Process manufacturing uses recipes or formulas and resources or ingredients. These resources can either be consumed or produced during the manufacturing process. The products that the process produces are called co-products and by-products. In a process recipe or formula, the quantity of a component can vary according to its grade or potency.

The different types of processing in process manufacturing are:

- Batch
- Continuous
In batch processing, a product is usually made in a standard run or lot size determined by vessel size, line rates, or standard run length. Items made this way are typically scheduled in short production runs due to the life cycle of the product after its completion. Typical items might be pharmaceuticals, foods, inks, glues, oil or chemical products, or paints. Co-products and by-products might be generated during batch processing.

In the continuous or flow environment, production is typically of an extended period, utilizing dedicated equipment that produces one product or product line with slight variations. This method of manufacture is characterized by the difficulty of planning and controlling quantity and quality yield variances. Typical items might be petroleum-based products or distilled sea water. Co-products and by-products are generally more prevalent in continuous processing than in batch processing.

In addition, strategies similar to discrete manufacturing, such as repetitive or any of the “to-orders,” might be employed to drive the process. Usually, both batch and continuous processing methods require extensive record keeping and recording of quality and tolerance values during the process, as well as strict adherence to lot tracing and tracking.

Process manufacturing consists of the following:

- Understanding work orders
- Creating work orders
- Processing work orders
- Understanding commitments
- Working with commitments
- Understanding grade and potency
- Understanding lot processing
- Entering lot information
- Working with lot availability
- Viewing lot transactions
- Reclassifying lots (optional)
- Reviewing availability and shortages (optional)
- Understanding issue transactions
- Issuing ingredients
Scheduling work orders
Working with hours and quantities
Completing work orders
Revising the status of a work order
Reviewing information (optional)
Processing kanbans (optional)
Printing ingredient and operation reports (optional)

Blending, Filling, and Packaging

J.D. Edwards has enhanced the Manufacturing systems to manage the manufacturing of bulk blended and filled products. These enhancements include accounting for gains and losses, recording ambient and standard quantity variations, and the reconciliation of bulk products in tanks.

How Are Units of Measure Used?

Not all processes are planned, scheduled, or produced in their primary unit of measure. To accommodate this, full unit of measure capabilities are allowed throughout the Shop Floor Control system.

Most entry programs have a unit of measure next to the quantity fields, and the unit of measure is stored in the database tables, along with the quantities. The system uses three fields in the Item Master table, Component Unit of Measure, Production Unit of Measure, and Primary Unit of Measure, throughout shop floor as defaults in entry forms. The Primary Unit of Measure must be the smallest of the three units of measure. In addition, if intermediates exist for an operation, the intermediate can be any valid unit of measure as long as the conversion is set up.
Transactions in Shop Floor Control

The following graphic illustrates the transactions throughout the Shop Floor Control system. You will see this graphic throughout this guide, with different areas highlighted, to indicate where you are in the process.
**Understand Work Orders**

**About Work Orders**

Work orders consist of a work order header, an ingredients list, routing instructions, and a co-/by-products list. The work order header specifies the quantity of the process or item requested and the date it is required. The ingredients list and routing instructions specify the ingredients, operations, and resources required to complete the work order. The co-/by-products list identifies the products produced during the process.

You create a work order header using one of three methods:

- MRP
- Manually
- Work Order from Sales Order

You then attach the ingredients list, routing instructions, and co-/by-products list either manually or using a batch program. This batch program also allows you to process multiple work orders, which includes:

- Updating the status of each work order
- Supplying the date to use for effectivity checking
- Issuing inventory
- Printing shop paperwork
- Calculating standard costs for configured items
- Allowing substitute ingredients to be used

Usually, you enter all of the work order headers and then attach the ingredients list, routing instructions, and co-/by-products together, to create the work order, using the batch program (Order Processing). However, if you need to change an ingredient on the work order ingredients list, or specify substitutes, you must attach these manually, or manually change them after you run the batch program.

When you manually attach routing instructions to your work order, you can identify the percent of run time a sequence can overlap the previous operation.
The following graphic illustrates the work order structure.

Regardless of the method you use to attach the ingredients list, routing instructions, and co-/by-products, you can define the unit of measure to be used for back scheduling the work order. To do so, you use the processing options for both the Enter/Change Order and the Order Processing programs.
After you determine the resources required to produce the process requested, you can schedule the work order and begin the work. As you complete items on the work order, you report:

- Items completed
- Ingredients used
- Quantities scrapped
- Hours of machine and personnel time expended

You can report completions by operation so you can track work order activity as it progresses. Using the feature cost percent for configured items and the resource percent for process items, you can also calculate costs by operation and track inventory throughout the production process.

What Happens When You Attach an Ingredients List?

You attach the ingredients list after you enter a work order header. An ingredients list is a list of the ingredients and their quantities required to complete the work order. You can attach the ingredients list:

- Manually
- By setting a processing option in order entry automatically attach it after the routing is attached
- Automatically, using Order Processing

You attach an ingredients list using the batch program the same way as attaching an ingredients list manually (non-batch). For batch bills and routings, the system determines which ingredients list to use by matching the work order quantity for the bill type specified on the work order header. If the system does not find a batch size that matches, it looks in the following order until a match is found:

- Specified bill type with a zero batch quantity
- Type M bill with the specified quantity
- Type M bill with a zero batch quantity

If no match is found, no ingredients list is attached, and you must attach the ingredients list manually.

Ingredients are included in or excluded from the ingredients list for a work order based on their effectivity dates. The quantity of each ingredient is increased by its scrap factor and operation scrap, if applicable.
The following table illustrates several scenarios pertaining to shrink, scrap, and operational yield.

<table>

**Intermediate Items**

The Material Requirements Planning (MRP) system does not plan to produce intermediate items, but will take their existence into account. The Shop Floor Control system includes lower-level ingredients of intermediates when you attach an ingredients list. Intermediate items:

- Are not planned by MRP
- Can be any lower-level ingredient or intermediate within the process for a co-product (parent item)
- Can be used to define a sub-recipe within a parent process when the intermediate item is not stocked in inventory or planned by MRP, but is consumed into the parent process

In the following example, “patties” are shown as intermediate items. Although patties are not recognized as an item in this data, you could define them as an intermediate. They are an intermediate item not stocked in inventory, but consumed into the process for the co-product hash browns, item 2221.
The system calculates ingredient quantities according to the order quantity on the work order if they are variable quantity items. If you activate the rounding feature in the Item Master table (F4101), the system rounds up the extended quantity value to a whole number if it has a decimal value greater than or equal to .01.

If sufficient inventory is not available to cover the ingredients list requirements for the work order, the system highlights the Quantity Ordered field for the item that is short.

The system uses the leadtime offset for each ingredient to determine that ingredient’s requested date. If an ingredient does not have a leadtime offset, its requested date will be the start date of the work order, or the start date of the associated operation sequence on the routing. An ingredient can have a negative leadtime offset, indicating that it is required before the start date of the work order. Examples are items that need processing or inspection before they can be used in an assembly. If the calculated requested date for an ingredient falls beyond the order completion date, the system enters the order completion date for the item by default.

If you define a shrink factor on the Branch/Plant Manufacturing Data form for the item, the system increases the component requirements by the percentage to cover the loss and displays the increased order quantity in the Order with Shrink field. The system includes shrink adjustments, if applicable, when it calculates ingredients list quantities and routing instructions for the order.
When Do You Attach Routing Instructions?

You attach the routing instructions after you enter a work order header. A routing instruction is a list of the operations and resources that are required to complete a process requested from the shop floor. You can attach the routing instructions:

- Manually
- By setting a processing option in order entry to automatically attach it after the parts list is attached
- Automatically, using Order Processing

Regardless of whether you manually attach the routing instructions or use the batch program, you should attach it at the same time that you attach the ingredients list. The system uses the routing to verify information about each ingredient on the ingredients list.

Outside Operations

You might have steps on your routing that are completed by outside operations. In this case, you need to identify those steps and run order processing to create purchase orders for the steps. When you record the receipt, a window automatically displays for you to update the routing quantities and status as necessary.
You can also track costs for the outside operations. To do so, set up the outside operation as an item in the Item Master, by using the following item number structure as the item number before you process the order:

```
 XXXXXXXXX *OP YYY
```

- **operation number**
- **constant**
- **work order item number**

You can then assign a unit cost to the item in cost revisions. The unit cost will be accumulated into the total parent item cost when you run Cost Rollup.

If you do not set up the outside operation as an item in the Item Master, the system generates an item number for the operation using the above structure and enters it on the purchase order. System-generated item numbers for outside operations do not have unit costs defined. Therefore, if you do not define outside operations as items, they will carry a zero unit cost when you perform a Cost Rollup for the parent item.

The new item’s quantity on purchase order and the supplier instructions are updated with the current information.

The system indicates *NO PO in the Related Order field if it cannot create a purchase order for the following reasons:

- No Item Master or Item Branch record was found for the parent item on the routing that has an outside operation.
- The processing options in the purchasing order activity rules were not set up for line type, document type, and status.
When Do You Attach Co-/By-Products and Intermediates?

You attach co- and by-products and intermediates after you enter a work order header. The co-/by-products list identifies the items that result from the process, whether they are planned or not. Intermediates are items that result from a step in the process and used in the following step of the same process.

You can attach co-/by-products:

- Manually
- By setting a processing option in order entry to automatically attach them after the header is entered
- By setting a processing option to automatically attach them using the Material Requirements Planning (MRP) system

You can attach intermediates manually.

How Does the System Calculate the Start Date?

The system uses level leadtime or leadtime per unit to calculate the start dates of work orders from the due dates.

Fixed Leadtime

If the process on the work order has a fixed leadtime, the system uses the level leadtime to backschedule to determine the start date.

For example:

- Work order due date = 10/15/98
- Level leadtime = three days
- Start date = 10/12/98

The system calculates the start date for the work order by subtracting the level leadtime or leadtime per unit, depending on the fixed or variable leadtime flag, from the required date. The system displays an error message if one of the following occurs:

- The start date differs from the date of the first operation sequence on the item’s routing.
- The operation sequence dates could not be calculated using backscheduling.
**Variable Leadtime**

If the process on the work order has a variable leadtime, the system uses the leadtime per unit to backschedule to determine the start date. The system uses the following calculation:

\[
\text{Variable Leadtime} = \frac{\text{Leadtime per unit} \times \text{order quantity}}{\text{TIMB (item balance)}} + \text{setup} + \text{queue}
\]

Work hours per day

For example:

- Work order due date = 10/15/98
- Leadtime per unit = 32 hours
- Work order quantity = 1000
- Setup = 1 hour
- Queue = 9 hours

The system calculates the start date by counting back two working days on the shop floor calendar from the due date. The work order start date is 10/13/98.

**See Also**

- *Appendix C — Leadtimes*

**What Is Shop Paperwork?**

Shop paperwork consists of the following printouts:

- Work orders with or without the ingredients list or routing information
- Shop packet summary
- Ingredients list shortages

Shop paperwork can be generated when you process the work order using the batch program, or by running the batch program in print only mode.
What Is Backscheduling?

To meet the MRP required date for an order, the Shop Floor Control system assigns a completion date for the work order routing that is one day prior to the MRP required date.

Then, the system assigns the start and requested dates to each operation in the routing for the work order. Assigning the start and requested dates for each operation is called backscheduling.

Backscheduling ensures that the material is out of production and available on the required date. For example, a work order routing completion date of February 15 ensures that the process will be out of production and available for shipping or sale on the MRP required date of February 16.
After you have defined your work order routing, the system:

- Retrieves the resource units for the work center of the routing operation. Resource units are factored (that is, increased or decreased) by the resource unit efficiency and utilization percentages.
- Consumes the hours (queue, run, then move hours), using the calculations for either fixed or variable leadtime.
- Scales the work center's remaining units proportionate to the previous operation's remaining units. For example, if 25% of the previous work center's units remain available, the current work center's units available to schedule for the same day will equal 25% of its daily total. This assumes that all work centers have consumed 50% of available units by the middle of the calendar work day.

**Blending, Filling, and Packaging**

Use Process Manufacturing to produce and track work orders for the following lube oil manufacturing scenarios:

- When blending products requires more than one co- or by-product.
- When blending and filling on the same work order. Since the blend would produce a bulk product and the fill would produce a finished packaged product.
- When a flushing step is required that produces a by-product.
- When using Super Backflush to complete products in separate steps.

Create Work Orders

Creating Work Orders

A work order is a request to produce a certain quantity of an item by a given date. Creating work orders includes the following tasks:

- Entering work order headers
- Attaching the ingredients list interactively (optional)
- Attaching the routing instructions interactively (optional)
- Attaching co-products and by-products (optional)
- Attaching the intermediate items (optional)
- Assigning serial numbers (optional)

Entering Work Order Headers

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Enter/Change Order

To enter a work order header, you identify the process or item, its branch/plant and quantity, and the requested date for the work order. You may, optionally, enter other information not required at order entry, such as the revision level for the bill of material or associated sales information.

The system calculates the start date based on the requested date that you enter. If the requested date is before the current date or is not defined as a work day, a warning message appears. The system cannot calculate the start date for the work order if the requested date is in error.

J.D. Edwards recommends that you use different document types to identify the different types of work orders, such as rework, repair, or prototypes.

Use Engineering Change Order (ECO) Revision to create a work order against a prior revision level by:

- Selecting a revision level to attach to the work order
- Manually entering a different revision level
Entering work order headers include the following tasks:

- Entering identifying information
- Entering scheduling information
- Entering descriptive information (optional)
- Entering planning information (optional)
- Entering responsible persons (optional)
- Entering sold to information (optional)
- Entering accounting information (optional)
- Entering a revision level (optional)

**Before You Begin**

☐ Use the processing options for order entry to control how the system processes information on the order and to access associated information, such as the order's parts list and routing instructions.

☐ Set up the shop floor calendar for the work days and months that the order activity will span, including leadtimes. See *Setting Up the Shop Floor Calendar*.

☐ Set up the document types that you use to identify different work order types in the following places:

  - User Defined Codes (00/DT) table
  - Processing options of the Supply/Demand Inclusion Rules program, if the new document types are to be used in other parts of the Manufacturing system

☐ Enter the unit of measure in the processing options that you want the system to use for backscheduling the routing operations for the process.

☐ Check the availability of the ingredients that are needed to complete a work order before you create the work order. See *Reviewing Availability and Shortages*.

☐ Set up valid work center locations. See *Setting Up Work Centers*.

☐ Use the processing options to initiate Warehouse Management system integration. See *Advanced Warehouse Management Guide* for information about setting up Warehouse Management.
## What You Should Know About

<table>
<thead>
<tr>
<th>Locating related sales order information</th>
<th>You can access Order Address Information if you need the address of the customer on the sales order related to your work order. Blank fields appear when there is no sales order associated with your work order.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locating description details</td>
<td>You can access Work Order Detail Entry to add detail to the work order description.</td>
</tr>
<tr>
<td>Manufacturing Accounting system</td>
<td>If you use summarized journal entries in Manufacturing Accounting, the system creates a new work order number for the batch of work orders being summarized. However, you cannot locate this new work order number on Enter/Change Order.</td>
</tr>
<tr>
<td>See Reviewing Summarized Work Orders in the Product Costing and Manufacturing Accounting Guide.</td>
<td></td>
</tr>
<tr>
<td>Blending, filling, and packaging</td>
<td>Use a processing option for the Enter/Change Order program for the blending and filling processes. You specify the program ID of the Formula Optimization routine the system calls when you select to optimize the formula from the ingredients list.</td>
</tr>
<tr>
<td></td>
<td>When you generate a work order ingredients list the system checks the allowed products matrix for an incompatibility between the ingredients list and the blending tank. The incompatibilities appear as errors.</td>
</tr>
<tr>
<td>See Bulk Stock Management Guide.</td>
<td></td>
</tr>
<tr>
<td>Quality Management test results</td>
<td>As you create a work order, you can:                                                                jsp;</td>
</tr>
<tr>
<td></td>
<td>• Use preference Profiles to maintain tests for the parent item.</td>
</tr>
<tr>
<td></td>
<td>• Maintain generic text to indicate when to test materials, and with which test.</td>
</tr>
<tr>

<tr>
<td>See Working with Test Results in the Quality Management Guide for more information.</td>
<td></td>
</tr>
</tbody>
</table>
To enter identifying information

On Enter/Change Order

Complete the following fields:

- Process/Item
- Branch/Plant

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item Number – Unknown Format Entered</td>
<td>A number that the system assigns to an item. It can be in short, long, or 3rd item number format.</td>
</tr>
</tbody>
</table>
### Field | Explanation
---|---
Branch | A code that represents a high-level business unit. It can be used to reference a branch or plant that might have departments or jobs, which represent lower-level business units (data item MCU), subordinate to it. For example:
- Branch/Plant (MMCU)
- Dept A (MCU)
- Dept B (MCU)
- Job 123 (MCU)

Business unit security is based on the higher-level business unit.

#### Form-specific information

For Shop Floor Control and Manufacturing Accounting:
This field identifies the branch/plant in which the item resides.

---

### To enter scheduling information

If a scheduling problem exists on your work order, an error message appears. This message indicates that there is a difference between the work order start date and one or both of the following:

- The start date of the first routing operation
- The calculated start date for the work order, which indicates difficulty in backscheduling

On Enter/Change Order

Complete the following fields:

- Requested
- Quantity Ordered
### Field | Explanation
--- | ---
Date – Requested | The date that an item is to arrive or that an action is to be complete.

*Form-specific information*

For Shop Floor Control

When you change the requested date:
- The system calculates a new start date based on the new requested date if you delete the date in the Start Date field before you enter the new requested date. If you do not delete the start date, the system does not recalculate or change it.
- The system recalculates the operation start and complete dates according to the scheduling rules defined.

#### To enter descriptive information

Descriptive information further identifies the work order, such as, its classification, priority, lot identification, parent item, and the revision level of its bill of material.

On Enter/Change Order

1. Complete the following optional fields:
   - Type
   - Priority
   - Remarks
   - Lot Number
   - Parent Work Order Number
   - Revision Level
2. Choose Work Order Detail Entry.

3. On Work Order Detail Entry, complete the following field to add detail text regarding the work order:
   - Description

4. Choose Work Order Record Types.
5. On Work Order Record Types, complete the following fields to identify up to three additional headings for the detail form:
   - Subtitle I
   - Subtitle II
   - Subtitle III

6. Choose Work Order Category Codes.

7. On Work Order Category Codes, complete the following optional fields:
   - Phase (Category Code 1)
   - Category Code 2
   - Category Code 3
   - Category Code 4
   - Category Code 5
   - Status
   - Service Type
   - Skill Type
   - Experience Level
   - Category Code 10
   - Originator
- Supervisor
- Standard Description
- Search Cross Reference

<table>
<thead>
<tr>
<th>Field</th>

After you set up the default values and the processing option, the information displays automatically on any work orders you create if the category code criterion is met. You can either accept or override the default value.</td>
</tr>
<tr>
<td>Std. Desc. . . . BBB</td>
<td>A user defined code (system 48, type SN) that is assigned to a standard note, message, or general narrative explanation. You can use this code to add instructional information to a work order. You set up codes for this field on Standard Description.</td>
</tr>
<tr>
<td></td>
<td>....... Form-specific information .......</td>
</tr>
<tr>
<td></td>
<td>For Equipment/Plant Maintenance users:</td>
</tr>
<tr>
<td></td>
<td>You can use this code to assign narrative text for a standard procedure. The information appears on the Item PM schedule and the work order routing.</td>
</tr>
<tr>
<td>Search X-Ref</td>
<td>An alphanumeric value used as a cross-reference or secondary reference number. Typically, this is the customer number, supplier number, or job number.</td>
</tr>
</tbody>
</table>
To enter planning information

You can identify where the work order is in the process and if it has been frozen.

On Enter/Change Order

Complete the following optional fields:

- Status Comment
- Status
- Freeze Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status Comment</td>
<td>A brief description to explain the status of the work order.</td>
</tr>
<tr>
<td>Status</td>
<td>A user defined code (00/SS) that describes the status of a work order or engineering change order. Any status change from 90 thru 99 automatically updates the date completed.</td>
</tr>
</tbody>
</table>

Form-specific information

For Shop Floor Control:

A processing option for order entry lets you enter a default value for this field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Freeze Code</td>
<td>A code that indicates if the order is frozen. MPS/MRP will not plan for frozen orders.</td>
</tr>
</tbody>
</table>

Valid codes are:

Y Yes, freeze the order
N No, do not freeze the order (Default)
To enter responsible persons

You can identify the persons associated with the work order.

On Enter/Change Order

Complete the following optional fields:

- Planner
- Supervisor
- Customer

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Number –</td>
<td>The address book number of a manager or planner.</td>
</tr>
<tr>
<td>Manager</td>
<td>NOTE: A processing option for some forms lets you enter a default value for this field based on values for Category Codes 1 (Phase), 2, and 3. Set up the default values on the Default Managers and Supervisors form. After you set up the default values and the processing option, the information displays automatically on any work orders you create if the category code criterion is met. (You can either accept or override the default value.)</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>For Shop Floor Control:</td>
</tr>
<tr>
<td></td>
<td>If you leave this field blank, the system uses the planner for the item in the Branch/Plant table.</td>
</tr>
<tr>
<td>Address Number</td>
<td>A number that identifies an entry in the Address Book system. Use this number to identify employees, applicants, participants, customers, suppliers, tenants, and any other Address Book members.</td>
</tr>
</tbody>
</table>
To enter sold to information

You can identify sales associated information for the work order.

On Enter/Change Order

Complete the following optional fields:

- Reference
- Customer
- Associated Sales Order

The fields listed above will contain default information if there is a sales order associated with this work order.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Related PO/SO/WO Number</td>
<td>A number that identifies a secondary purchase order, sales order, or work order associated with the original order. This is for information only.</td>
</tr>
</tbody>
</table>

To enter accounting information

You can identify the business unit to be charged and its account.

On Enter/Change Order

Complete the following optional fields:

- Charge to Cost Center
- Cost Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Subsidiary</td>
<td>A subdivision of an object account. Subsidiary accounts include more detailed records of the accounting activity for an object account.</td>
</tr>
</tbody>
</table>

Form-specific information

For Shop Floor Control and Manufacturing Accounting:

If a value is not entered in the AAI table for subsidiary account, the system uses this value as a default in journal entries.
To enter a revision level

On Enter/Change Order

1. Do one of the following:
   - Complete the following field:
     - Revision Level
   - Access the list of revision levels from which you can select for the work order by pressing F1.

2. On Revision Level, select the revision level to be placed on the work order header.

   The system closes the Revision Level window.

3. On Enter/Change Order, add the revision level to the work order header by pressing Enter.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill Revision Level</td>
<td>Indicates the revision level of a bill of material. It is usually used in conjunction with an engineering change notice or order (ECN or ECO). The revision level of the bill of material should match the revision level of its associated routing (data item RREV), although the system does not check this. This value is defined and maintained by the user.</td>
</tr>
</tbody>
</table>

Processing Options for Manufacturing Work Order Entry

BACKSCHEDULING INFORMATION:
1. Enter the Unit of Measure Code

RECALCULATION OPTIONS:
2. Enter a ‘1’ to automatically recalculate Parts List and Routing
dates, hours and quantities.

ITEM LOCATION VALIDATION:
3. Enter a ‘1’ to validate for existing Branch/Item record.
4. Enter a ‘1’ to protect the lot number on the parts list. If left blank, the lot number will remain input capable.

CHARGE TO BUSINESS UNIT DEFAULT:
5. Enter a ‘1’ to default the Charge to Business Unit from the Job number in the Business Unit Master file (F0006). If left blank, the Branch/Plant will be used.

BILL AVAILABILITY:
6. Enter the version of Bill Availability to be called. Default is ZJDE0001.

DEFAULT PROCESSING:
7. Enter defaults for the following:
   a. Document Type (Default is ‘WO’)
   b. Type (Optional)
   c. Priority (Optional)
   d. Beginning Status (Optional)
   e. Category Code 1 (Optional)
   f. Category Code 2 (Optional)
   g. Category Code 3 (Optional)
   Or enter Item Branch Class Code fields to retrieve default values.
   h. Category Code 1 (Optional)
   i. Category Code 2 (Optional)
   j. Category Code 3 (Optional)

SALES ORDER HOLD CODE:
8. Enter the Hold Code for the related sales order if the work order quantity or date changes. Blanks will not update the sales order.

PURCHASE ORDER HOLD CODE:
9. Enter the Hold Code for the related purchase order if the work order quantity or date changes. Blanks will not update the purchase order. Note- The purchase order will be updated only if the work order routings are recalculated.

FIELD DISPLAY:
10. Enter a ‘1’ by the following fields to activate them:
   a. Bill Type
   b. Routing Type

PROCESS MANUFACTURING PROCESSING:
11. Enter a ‘1’ to create the Resource List records for Co-/By-Products when a process work order is entered. If left blank, the
Co-/By-Product resource list records will be created when the ingredients list is created.

INTERACTIVE BILL/ROUTING ATTACHMENT:
12. Enter a ‘1’ to automatically create the WO Routing Instructions when creating the WO Parts List on-line.
13. Enter a ‘1’ to automatically create the WO Parts List when creating the WO Routing Instructions on-line.

COMMITMENT AND SUBSTITUTE PROCESSING:
14. Enter commitment option for creating the WO Parts List on-line.
   Blank  Commit to primary location
   1    – Commit per Commitment Control in Mfg Constants (P3009)
   2    – Same as ‘1’, but use substitutes for shortages
   3    – Same as ‘1’, but display substitute availability window when substitute qty available can cover shortage

ECO PROCESSING:
15. Enter the version of the ECO header to call from Revisions Window (P30BREV). If left blank, version ZJDE0001 will be used.

SERIAL NUMBER PROCESSING:
16. Enter the version of Assign Serial Numbers to call. If left blank, version ZJDE0001 will be used.

PRIOR REVISIONS:
17. Enter a ‘1’ to permit attaching parts lists at prior revision levels. If left blank, prior revision levels will not be used.

WAREHOUSE PROCESSING:
18. Enter the request processing mode
   ‘ ’ = No pick requests
   ‘1’ = Generate requests only
   ‘2’ = Generate requests and process using the subsystem

19. If processing pick requests using the subsystem, enter the DREAM Writer version to use. If blank, XJDE0002 is used. (See Form ID P46171)

20. Enter the default staging location for moving goods out of the warehouse. The parts picked from the warehouse are staged at this location prior to use within manufacturing. (F1=Location Window)

21. Enter a ‘1’ if the default staging location should be checked for
availability. If the part is available at the staging location a request will NOT be generated. This option only applies to parts without work center locations.

**GENERIC TEXT COPY OPTIONS:**

22. Enter a ‘1’ to copy component generic text to the parts list.
23. Enter a ‘1’ to copy the operation’s generic text to the work order routing.

**OBsolete ITEMS:**

24. Enter the cross reference code for retrieving item replacements for obsolete items.

**ECS PROCESSING:**

25. Enter the program ID of the Formula Optimization routine to be called when the function key to Optimize the formula is selected from the Ingredients List Program (P3111).

### What You Should Know About Processing Options

**Obsolete Items (24)** When you enter an order that contains an item that will be obsolete for your work order time frame, the system allows you to specify a replacement item if you set the processing option to R.

### Attaching the Ingredients List Interactively

**From Shop Floor Control (G31), choose Process Daily Order Preparation**

**From Daily Order Preparation - Process (G3113), choose Enter/Change Order**

After you enter your work order header, you attach an ingredients list to it. You can attach ingredients lists:

- Interactively, using a function key
- Manually, entering the ingredients
- In batch mode, using the Order Processing program

If a bill of material already exists in the system for the process, you can copy the bill of material information into the ingredients list. You can then attach this ingredients list to your work order header. You attach the ingredients list interactively using function keys.
After you interactively attach the ingredients list, you can:

- Specify or change a substitute item or quantities from different locations
- Choose substitute items and their quantities on hand when an ingredient shortage is encountered

Use a processing option for Enter/Change Order to specify the substitute processing that you want to use:

- Commit using the commitment control set in Manufacturing Constants
- Commit using the commitment control set in Manufacturing Constants, but use substitutes for shortages
- Commit using the commitment control set in Manufacturing Constants, but use substitutes if the quantity available can cover the shortage
- Commit using the commitment control set in Manufacturing Constants, but display substitute availability when substitute quantity available can cover the shortage

Attaching the ingredients list interactively includes the following tasks:

- Attaching the ingredients list
- Entering substitutions (optional)
- Choosing substitute items (optional)
- Entering multiple locations (optional)

What You Should Know About

**Attaching the ingredients list manually**

Use the manual method to change an ingredient on the bill of material or attach different substitutes. Or, you can changes these ingredients after interactive or batch attachment.

*See Processing Work Orders.*

**Attaching the ingredients list using the batch program**

Use the Order Processing program, and the appropriate processing option, to attach the ingredients list to the work order header.

*See Processing Work Orders.*
Copying an ingredients list from one work order to another

You can copy the ingredients list of a previously entered work order and attach it to a new work order. To do so:

- Locate the ingredients list of the existing work order
- Change the order number to the new work order
- Add the record

Using the generic text window

Access Work Order Component Master Text to create a separate generic text entry for each work order. This window enables you to provide more information and specific instructions per order. Any modifications you make to the text will not impact the text that was originally attached to the bill of material.

You can also access the User Information and Text Model Selection windows to view user and date updates, as well as model selections.

Warehouse Management interface

If you use Warehouse Management and generate a parts list, the system searches for inventory in the staging or work center location. If you did not define a staging or work center location or inventory is not located, the system generates a pick request. The pick request notifies you of the need for materials from the warehouse.

After the system creates the pick request, the Warehouse Management system processes instructions and creates suggestions for you to confirm. Then, the system updates the parts list and increases the quantity on hand for the To location and decreases the quantity on hand for the From location.

When you recreate the ingredients list and the items are in warehouse two things can occur:

- Order Processing (P31415) prints In Warehouse for all items with the proper material status code
- Order Processing (P31410) prints a message indicating warehouse pick request exists, ingredients list not generated
To attach the ingredients list

On Enter/Change Order

1. Choose Work Order Ingredients List.

2. On Work Order Ingredients List, use the appropriate function key to copy the bill of material.

3. Add the bill of material to the ingredients list.

4. Review the following fields:
   - Process/Item
   - Quantity Ordered
   - Description
   - Quantity Ordered Unit of Measure
   - Line Type

5. Access the detail area.
6. Review the following fields:
   - Revision Level
   - Material Status
   - Location
   - Lot
   - Operations Sequence
   - Requested
   - Fixed/Variable
   - Issue Type Code
   - Branch/Plant
   - From Potency
   - Through Potency
   - From Grade
   - Through Grade
   - Supplier
   - Issue and Receipts
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| LT    | A code that controls how the system processes lines on a transaction. It controls the systems with which the transaction interfaces (General Ledger, Job Cost, Accounts Payable, Accounts Receivable, and Inventory Management). It also specifies the conditions under which a line prints on reports and is included in calculations. Codes include:  
S Stock item  
J Job cost  
N Non-stock item  
F Freight  
T Text information  
M Miscellaneous charges and credits  
W Work order |
| UM    | A user defined code (system 00/type UM) that identifies the unit of measurement for an amount or quantity. For example, it can represent a barrel, box, cubic yard, gallon, an hour, and so on.  
.............. Form-specific information ..............  
If you leave this field blank for an existing component, the system uses the value in the Bill of Material Master table. If you leave this field blank for a new component, the system uses the component unit of measure from the Item Master table. For both of these situations, the system updates the quantities in the Item Location table in primary unit of measure. |
| Location | A code that identifies inventory locations in a branch/plant. You define the format of the location identifier by branch/plant. |
| Operations Seq | In routings, this number is used to sequence the fabrication or assembly steps in the manufacture of an item. You can track costs and charge time by operation.  
In bills of material, this number designates the routing step in the fabrication or assembly process that requires a specified component part. You define the operation sequence after you create the routing for the item. The Shop Floor Control system uses this field in the backflush/preflush by operation process.  
In engineering change orders, this number is used to sequence the assembly steps for the engineering change.  
Skip To fields allow you to enter an operation sequence that you want to begin the display of information.  
You can use decimals to add steps between existing steps. For example, use 12.5 to add a step between steps 12 and 13. |

</thead>
<tbody>
<tr>
<td>Revision Level</td>
<td>The current revision level of a component on the bill of material. It is usually used with an engineering change notice or order (ECN or ECO).</td>
</tr>
<tr>
<td>Material Status</td>
<td>A code (table 31/MS) that identifies the current status of a particular component on the work order.</td>
</tr>
</tbody>
</table>
| Fixed/Variable        | Indicates if the quantity per assembly for an item on the bill of material varies according to the quantity of the parent item produced or is fixed regardless of the parent quantity. This value also determines if the component quantity is a percent of the parent quantity. Valid values are:  
  F Fixed Quantity  
  V Variable Quantity (Default)  
  % Quantities are expressed as a percentage and must total 100%  
  For fixed quantity components, the Work Order and MRP systems do not extend the component’s quantity per assembly value by the order quantity.  
  For Process Manufacturing, the system stores percent components. Therefore, the system treats zero batch sizes like variable quantity components, and treats batch sizes greater than zero like fixed quantity components. |
| Issue Type Code       | A code that defines how the system issues each component in the bill of material from stock. In shop floor control, it indicates how the system issues a part to a work order. Valid codes are:  
  I Manual issue (default)  
  F Floor stock (no issue)  
  B Backflush (when part is reported as complete)  
  P Preflush (when parts list is generated)  
  U Super backflush (at pay-point operation)  
  S Sub-contract item (send to supplier)  
  Blank Shippable end item  
  You can issue a component in more than one way within a specific branch/plant by using a different code on the bill of material and work order parts list. The bill of material code overrides the branch/plant value. |
<p>| Potency               | A code that indicates the potency of the lot, which is expressed as a percentage of active or useful material (for example, the percentage of alcohol in a solution). The actual potency of a lot is defined in the Lot Master table (F4108). |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Grade</td>
<td>This field contains the grade of a lot expressed as an alphanumeric code. The grade is used to indicate the quality of the lot. For example:</td>
</tr>
<tr>
<td></td>
<td>A1   Premium grade</td>
</tr>
<tr>
<td></td>
<td>A2   Secondary grade</td>
</tr>
<tr>
<td></td>
<td>The grade for a lot is stored in Lot Master table (F4108).</td>
</tr>
<tr>
<td>From Potency</td>
<td>A number that indicates the minimum potency, or percentage of active ingredients, acceptable for an item.</td>
</tr>
<tr>
<td></td>
<td>The system displays a warning message if you try to purchase or issue items that do not meet the minimum acceptable potency. The system does not allow you to sell items that do not meet the minimum acceptable potency.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>The From Potency field and the Through Potency field define the allowable percent of active ingredients for an item. The From Potency value should be less than the Through Potency value. These values are also used to determine the potency requirements of a component in a bill of material or an item in a purchase or sales order.</td>
</tr>
<tr>
<td></td>
<td>For example, the value of the From Potency equals 70.000%, and the value of the Through Potency equals 80.000%. In this case, inventory allocations for this item are made for lots for which the potency is greater than or equal to 70.000%, and less than or equal to 80.000%.</td>
</tr>
<tr>
<td>From Grade</td>
<td>A code (system 40, type LG) that indicates the minimum grade that is acceptable for an item.</td>
</tr>
<tr>
<td></td>
<td>The system displays a warning message if you try to purchase or issue items with grades that do not meet the minimum grade acceptable. The system does not allow you to sell items with grades that do not meet the minimum acceptable level.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>The From Grade and the Through Grade fields define the allowable grades for an item. The From Grade should be less than the Through Grade. These values are also used to determine the grade requirements of a component in a bill of material or an item in a purchase or sales order.</td>
</tr>
<tr>
<td></td>
<td>For example, the value of the From Grade equals A01, and the value of the Through Grade equals A05. In this case, inventory allocations for this item will be made for lots for which the grade is greater than or equal to A01, and less than or equal to A05.</td>
</tr>
</tbody>
</table>
### Shop Floor Control Process Manufacturing

<table>

<td>Purchases will be paid when issued to the plant floor.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Address Number – Input (Mode Unknown)</th>
<th>The address number you want to retrieve. You can use the short format, the long format, or the tax ID (preceded by the indicators listed in the Address Book constants).</th>
</tr>
</thead>
</table>

| Oper Scrap %                         | The system uses this value to increase or decrease the amount of materials to account for loss within the operation. The system updates this value on Enter/Change Bill of Material when you run the Planned Yield Update program. The system calculates this value by compounding the yield percentages from the last operation to the first operation. Use a processing option in Enter/Change Routing to enable the system to calculate the component scrap percent. |

#### To enter substitutions

You can specify substitutions for the ingredients. To do this, enter the substitute quantities in the Component Item Substitutions form. If there is no quantity available, no information appears on this form.

**On Enter/Change Order**

1. Choose Work Order Ingredients List.
2. On Work Order Ingredients List, choose Component Item Substitutions.
3. On Component Item Substitutions, complete the following field:
   - Quantity

4. Review the following default information:
   - Quantity Substituted
   - Unit of Measure
   - Item Number
   - Unit of Measure
   - Description
   - Quantity Available
### Field | Explanation
--- | ---
Unit of Measure as Input | The basic measurement used to designate the quantity of an inventory item. Examples are:
  - BA: bale
  - LB: pound
  - BG: bag
  - MB: per thousand pieces
  - BU: bundle
  - MF: per thousand feet
  - BX: box
  - MW: per thousand weight
  - CB: per hundred pieces
  - PC: piece
  - CF: per hundred feet
  - PR: pair
  - CS: per hundred square feet
  - RL: roll
  - CW: per hundred weight
  - SF: square feet
  - DM: drum
  - SK: skein
  - DZ: dozen
  - TN: ton
  - EA: each
  - FT: feet

Quantity on Hand – Primary units | The number of units that are physically in stock. The quantity on-hand displays in the primary unit of measure.

### To choose substitute items

When the system encounters an ingredient shortage, you can choose the available substitutes and quantity. After you enter the information, the system adds the selected items and quantities to the ingredients list and deducts the equivalent quantity from the component. You cannot access this form unless there is at least one quantity available.

On Enter/Change Order

1. Choose Work Order Ingredients List.
2. On Work Order Ingredients List, choose Substitute Availability.
3. On Substitute Availability, review the following information:
   - Quantity
   - Item
   - Quantity on Hand
   - Quantity Available
4. Change the following field as needed:
   - Quantity
5. Select the record to place the equivalent quantity for the component in the ingredients list.

The system calculates this quantity using the substitute item setup values (fixed or variable, partial, and so on).

▶ To enter multiple locations

You can specify more than one commitment location for the ingredient. However, if you select a location that is not the primary location specified on the parts list, the system hard commits the item.

On Enter/Change Order

1. Choose Work Order Ingredients List.
2. On Work Order Ingredients List, choose Select Multiple Locations.
3. On Select Multiple Locations, complete the following fields:
   - Quantity
   - Location
   - Lot
   - Branch/Plant

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Location</td>
<td>A code that identifies inventory locations in a branch/plant. You define the format of the location identifier by branch/plant.</td>
</tr>
<tr>
<td></td>
<td>..........................  Form-specific information  .........................</td>
</tr>
<tr>
<td></td>
<td>If you select a location that is not the primary location specified on the parts list for a specific item, the system hard commits that item.</td>
</tr>
<tr>
<td>Quantity Available</td>
<td>The quantity available can be the on-hand balance minus commitments, reservations, and backorders. Availability is user defined and can be set up in branch/plant constants.</td>
</tr>
</tbody>
</table>
Attaching the Routing Instructions Interactively

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Enter/Change Order

After you enter your work order header, you attach the routing instructions to it. You can attach the routing instructions:

- Interactively, using a function key
- Manually, entering the routing instructions
- In batch mode, using the Order Processing program

You can copy the routing instructions from an existing work order and attach it to another work order. You do this using function keys.

Before You Begin

☐ Verify that a record for the parent item exists in the Item Master and Item Branch tables

☐ Enter the document type, line type, and status code for the purchase order in the processing options for Order Processing

What You Should Know About

<table>
<thead>
<tr>
<th>Attaching the routing instructions manually</th>
<th>Use the manual method to change a step in the operation that the Order Processing program assigns, or you can change a step after interactive or batch attachment.</th>
</tr>
</thead>
<tbody>
<tr>
<td>See Processing Work Orders.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Attaching the routing instructions using the batch program</th>
<th>Use the Order Processing program and the appropriate processing option, to attach the routing instructions to the work order header.</th>
</tr>
</thead>
<tbody>
<tr>
<td>See Processing Work Orders.</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Creating a purchase order for outside operations</th>
<th>You must create a purchase order for any step in the routing instructions that involves a subcontractor, using the Enter/Change Routing program. After you enter purchase order information, supplier, type of operation, purchase order, and cost type, you must run the Order Processing batch program to create the purchase order.</th>
</tr>
</thead>
</table>
Locating a routing
When you locate a routing, the system displays the operations that are effective at the start date of the work order and those that are standard instructions or text lines. If a routing is not attached to the work order, no values appear in the fields.

Changing the status of a routing operation
If you change the status of a routing operation, the system can create duplicate purchase orders for that operation.

Deleting an outside operation for a routing
If you delete an outside operation with an associated purchase order, the system deletes the purchase order if the original status of the routing operation remains unchanged. When the system deletes the purchase order, it updates the quantity on purchase order value for the primary location and the open amount in the supplier instructions.

Item records
A record for the item in the work order must exist in the Item Branch table (F4102). If the system does not find the record, it creates one in the table.

Using the generic text window
Access the Work Order Routing Operation Master Text window to create a separate generic text entry for each work order. This window enables you to provide more information and specific instructions per order. Any modifications you make to the text will not affect the text that was originally attached to the item's routing.

You can also access the User Information and Text Model Selection windows to view user and date updates, as well as model selections.

Using the Warehouse Management system
If you set up the work center as a valid location, the system checks the work center for availability before you use Warehouse Management.

See Also

- *Processing Work Orders* (P31410) for instructions on running the Order Processing batch program
To attach the routing instructions interactively

On Enter/Change Order

1. Choose Routing Revisions.

2. On Routing Revisions, choose the selection option to copy the routing.

3. Add the routing to the routing revisions.

4. Add the routing to your work order header.

5. Review the following fields:
   - Work Center
   - Operation Sequence Number
   - Description
   - Machine Run Hours
   - Labor Run Hours
   - Consumed/Produced/Both

6. Access the detail area.
7. Review the following fields:

- Equipment
- Instruct Number
- Start
- Requested
- Type Operation
- Pay Point
- Crew
- Setup Hours
- Queue Hours
- Move Hours

<td>If you leave this field blank, the system uses the value in the Enter/Change Routing table.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Crew</td>
<td>The number of people who work in the specified work center or routing operation. The system multiplies the Run Labor value in the Routing Master table (F3003) by crew size during costing to generate total labor dollars. If the Prime Load Code is L or B, the system uses the total labor hours for backscheduling. If the Prime Load Code is C or M, the system uses the total machine hours for backscheduling without modification by crew size.</td>
</tr>
<tr>
<td>% of Overlap</td>
<td>The overlapping of successive operations. The actual overlap percentage entered for the operation sequence is the percent by which that operation overlaps the prior operation. For example, if you enter 80%, this indicates that work can begin on the overlapped operation when 20% of the prior operation is completed. Notes: 1. Overlapping has no effect on move and queue calculations. 2. The percent entered must be less than or equal to 100%. Enter percents as whole numbers: 5% as 5.00 Form-specific information. If you leave this field blank, the system uses the value in the Routing table.</td>
</tr>
<tr>
<td>Unit or Tag Number</td>
<td>A 12-character alphanumeric code used as an alternate identification number for an asset. This number is not required, nor does the system assign a number if you leave the field blank when you add an asset. If you use this number, it must be unique. For equipment, this is typically the number stenciled on the equipment.</td>
</tr>
<tr>
<td>Time Basis</td>
<td>A user defined code (system 30, type TB) that identifies the time basis or rate for machine or labor hours entered for any routing step. You can set rates per unit, per 10, per 1000, and so on. The system uses the values in the Description-2 field on the User Defined Codes form for costing and scheduling calculations. The description is what the code represents, but is not used in calculations.</td>
</tr>
<tr>
<td>Setup Hours</td>
<td>The standard setup hours you expect to incur in the normal completion of this item.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>-----------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Queue Hours</td>
<td>The total time (in hours) that an order is expected to be in queue at work centers and moving between work centers. The system stores this value in the Item Branch table (F4102). You can calculate this value using the Leadtime Rollup program or you can enter it manually. When you run the Leadtime Rollup program, the system overrides manual entries with calculated values.</td>
</tr>
<tr>
<td>Primary / Last Supplier Number</td>
<td>The address book number of the preferred provider of this item. You can enter the number for the supplier or you can have the system enter it each time that you receive the item from a supplier. You specify whether the system enters the supplier using processing options for Enter Receipts.</td>
</tr>
</tbody>
</table>
| Purchase Order (Y/N) | Determines if the Work Order Generation program (P31410) creates a purchase order for a subcontracted operation within a routing. Valid values are:  
Y Yes, create a purchase order.  
N No, do not create a purchase order. |
| Cost Component        | This code designates each element of cost for an item. An example of the coding structure is:  
A1 Purchased raw material  
B1 Direct labor routing sheet rollup  
B2 Setup labor routing sheet rollup  
C1 Variable burden routing sheet rollup  
C2 Fixed burden routing sheet rollup  
Dx Usually used for outside processing routing sheet rollup  
Xx Usually used for extra add-ons, such as electricity, water, and so forth  
The optional add-on computations usually operate with the type “X” extra add-ons. This cost structure allows you to use an unlimited number of cost components to calculate alternative cost rollups. The system then associates these cost components with one of six user defined summary cost buckets. |
Attaching Co-Products and By-Products

After you enter a work order header, you attach co-products and by-products to the work order. To attach co-products and by-products, you can:

- Use a selection from the Enter/Change Order program.
- Set a processing option to automatically create records when you create the work order header.
- Copy a bill of material, which automatically creates co-product and by-product records.
- Copy a routing, which automatically creates co-product and by-product records.
- Set a processing option to automatically create co-product and by-product records when you create work orders by answering detail messages in the Material Requirements Planning system.

You need to identify the percentage of the ingredients that the system issues to a specific co-product and by-product. Co-products and by-products exist at the final operation, their resource percent must equal 100 for the system to issue all ingredients.

Attaching the co-products and by-products includes the following tasks:

- Setting the resource percent for the co-products and by-products
- Attaching the co-products and by-products

What You Should Know About

Blending, filling, and packaging  You can use Process Resource Revisions to add ingredients associated with an individual step in a process. The system allows a percent bill to be added to 100% and additional quantities to include fixed or variable definitions. The system also verifies the blending tank’s or fill line’s associated allowed product matrix is compatible with the work order’s ingredients list, and displays any errors.

See Bulk Stock Management Guide.
Create Work Orders

Example: Feature Cost Percent

<table>
<thead>
<tr>
<th>OP</th>
<th>Co-Product &amp; By-Product</th>

</tr>
</tbody>
</table>

To set the resource percent for the co-products and by-products

On Enter/Change Process

1. Choose Co/By-Product Revisions.

2. On Process Resource Revisions, access the detail area.
3. Complete the following optional field:
   - Resource Percent

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Co/By-Product/Intermediate</td>
<td>Distinguishes standard components or ingredients from co-products, by-products and intermediates. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>C    Co-products are (concurrent) end items as the result of a process.</td>
</tr>
<tr>
<td></td>
<td>B    By-products are items that can be produced at any step of a process, but were not planned for.</td>
</tr>
<tr>
<td></td>
<td>I    Intermediate products are items that are defined as a result of a step but are automatically consumed in the following step. Generally, intermediates are non-stock items and are only defined steps with a pay-point for reporting purposes.</td>
</tr>
<tr>
<td></td>
<td>blank Standard components (Discrete Manufacturing) or ingredients (Process) consumed during the production process.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Output Qty</td>
<td>The quantity of finished units that you expect this bill of material or routing to produce. This field allows you to specify varying quantities of components based on the amount of finished goods produced. For example, 1 ounce of solvent is required per unit up to 100 units of finished product. However, if 200 units of finished product is produced, 2 ounces of solvent are required per finished unit. In this example, you would set up batch quantities for 100 and 200 units of finished product specifying the proper amount of solvent per unit.</td>
</tr>
<tr>
<td>Feat Cost %</td>
<td>A percentage used by the Simulate Cost Rollup program to calculate the cost of a feature or option item as a percentage of the total cost of the parent. Enter the percentage as a whole number: 5% as 5.0</td>
</tr>
<tr>
<td>Resource %</td>
<td>If this option is chosen, this value indicates what percent of the ingredients should be issued separately to co-products and by-products. This is used to issue ingredients separately to co-/by-products at work order completion, rather than a total issue for each ingredient. For co-/by-products at the final operation, their resource percent must equal 100 to issue all ingredients.</td>
</tr>
</tbody>
</table>

Form-specific information

This value specifies the quantity of each co-/by-product that the process produces. If you use batch bills, this is the quantity that the batch produces.
To attach the co-products and by-products

You can attach the co-products and by-products to the work order in one of two ways:

- When the work order header is created, if you set the processing option to do so
- When the ingredients list is attached to the work order header

On Enter/Change Order

1. Choose C/B Products.

2. On Co/By Product Revisions, review the following fields:
   - Code
   - Co/By Product
   - Description
   - Output Quantity
   - Unit of Measure

3. Access the detail area.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Co–Products/By–Products/Intermediate | Distinguishes standard components or ingredients from co–products, by–products and intermediates. Valid values are:  
C  Co–products are (concurrent) end items as the result of a process.  
B  By–products are items that can be produced at any step of a process, but were not planned for.  
I  Intermediate products are items that are defined as a result of a step but are automatically consumed in the following step. Generally, intermediates are non-stock items and are only defined steps with a pay-point for reporting purposes.  
blank  Standard components (Discrete Manufacturing) or ingredients (Process) consumed during the production process. |
| Units – Order/Transaction Quantity | The quantity of units affected by this transaction.                                      |
Attaching the Intermediate Items

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Enter/Change Order

Use intermediates to track the quantity of output of any operation in a work center at a specific time. You can define intermediates in different units of measure and quantities. You set up one intermediate per operation. However, you cannot define an intermediate for the last operation.

An example of an intermediate is fermented liquid. The liquid ferments for an extended period of time before being distilled. The resulting liquid is not a finished product, but it proceeds to the next operation (similar to a phantom item).

You can attach intermediate records in a variety of ways:

- Copy a bill of material, which automatically creates intermediate records.
- Copy a routing, which automatically creates intermediate records.
- Manually enter the intermediate items on the routing instructions or ingredients list.
- Set a processing option to automatically create a parts list when you create work orders by answering detail messages in the Material Requirements Planning system. The intermediate records are automatically created as well.

To attach the intermediate items

On Enter/Change Order

1. Choose Ingredients List.
3. On Intermediate Product Revisions, complete the following fields:
   - Item
   - Quantity Ordered
   - Unit of Measure
4. Access the detail area.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Units – Order/Transaction Quantity</td>
<td>The quantity of units affected by this transaction.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>The quantity of the intermediate produced at this operation.</td>
</tr>
<tr>
<td>Unit of Measure</td>
<td>A user defined code (system 00/type UM) that identifies the unit of measurement for an amount or quantity. For example, it can represent a barrel, box, cubic yard, gallon, an hour, and so on.</td>
</tr>
</tbody>
</table>
Assigning Serial Numbers

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Enter/Change Order

Alternatively, you can choose Assembly Serial Numbers from the Daily Order Preparation – Discrete menu (G3111). However, if you access Assembly Serial Numbers from the menu, you can use it only to locate existing serial numbers. You cannot update or add serial numbers when you access this program from the menu.

You assign serial numbers to your work orders to track serialized items within lots. You can assign serial numbers to work orders at any time. When you enter serial numbers, the system creates Serial Number Master records, as well as Work Order Lot/Serial Numbers (LSNs). The system does not validate any serial number that you enter until you complete the work order. If you do not assign a serial number to a serialized assembly, the system requires a number before you can complete the work order. After you complete a work order, you cannot modify any serial numbers that are assigned to the assemblies.

You can assign serial numbers to specific assemblies at any time prior to completing the work order using Assign Work Order LSN. You can also assign serial numbers to specific assemblies at the time of work order completions using Associate Issued Item LSN’s. You can associate serialized components to a specific assembly either at inventory issues or work order completions. You must issue serialized components in their respective primary unit of measure to allow for association.

Assembly Serial Numbers assume a quantity of one in the unit of measure on the work order. For serialized assemblies, this will be the primary unit of measure. You cannot enter more serial numbers than the quantity on the work order.

Before You Begin

☑ Set the Lot Process Type and Serial Number Required fields on the Item Master Information form for serial number processing

What You Should Know About

Deleting serial numbers You can only delete serial numbers if there is no activity detected for the number.
To assign serial numbers

On Enter/Change Order

1. To locate the work order you want to assign serial numbers to, complete the following field:
   - Order Number

2. Choose Assign Serial Numbers.

3. On Assign Work Order LSN’s, choose Generate Serial Numbers to assign serial numbers to your work order.

4. To view the serial numbers that were assigned, relocate your order number.
Process Work Orders

Processing Work Orders

After you enter a work order header, and attach an ingredients list, routing instructions, co-/by-products, and intermediates, you use the Order Processing batch program to generate shop paperwork for each work order header. The program’s processing options allow you to perform a wide range of functions. You can:

- Choose to generate an ingredients list, the routing instructions, a co-/by-products list, or all three
- Indicate the date to use for effectivity checking
- Change the status code of the work orders processed
- Choose to print various information about the work order, such as the ingredients list, routing, sales order text, and so forth, for the work order
- Print a shop packet summary that lists processed work orders
- Enter the unit of measure for backscheduling
- Issue inventory automatically through a batch program
- Choose to generate a shortage report for the work orders
- Indicate which versions of associated programs you want to access
- Enter sales order information for kit processing and print the text lines of sales orders
- Create work orders against prior revision levels
- Record activities using bar code capabilities when printing the pick list or the exception report

You can organize and separate these functions by setting up several reporting feature versions with different data selection and processing option values to accomplish different tasks. For example, you could set up one version to generate the ingredients lists and routings for work orders, another version to print shop paperwork, and one version to perform batch inventory issues.

Complete the following tasks:

- Run order processing
- Print a summary of process orders (optional)
Before You Begin

☐ Determine which processing options to use before running this program.

☐ Set up valid work center locations. See Setting Up Work Centers.

☐ Use the processing options to initiate Warehouse Management system integration. See Advanced Warehouse Management Guide for information about setting up Warehouse Management.

What You Should Know About

Consolidating a parts list

Use a processing option to print a consolidated parts list which provides you with a means to pick inventory needed for the manufacturing process. You may process many work orders in a single run.

The items are consolidated based on item name, location, lot, unit of measure, and branch/plant. The system prints each branch/plant encountered on a separate page and prints each occurrence of an item that is in a different location, lot, or unit of measure on a separate line.

Regenerating the ingredients list

When you run Order Processing, the system deletes any previously generated or manually entered ingredients list that is attached to the work order. You can manually enter changes to the system-generated ingredients list. If you add ingredients to the list, the system commits them from the primary location in the Item Location program.

You should not regenerate the ingredients list if any ingredient on the list has been issued to the work order. If you regenerate the ingredients list after ingredients have been issued, you must manually adjust the list to prevent duplication of ingredient quantities.
Regenerating the routing instructions

When you run Order Processing, the system deletes any previously generated or manually entered routing. You should not regenerate the routing instructions for the work order if hours and quantities are recorded against any of its operations.

You can set the processing options of order entry to update the routing if you change the work order. The system recalculates the run labor and run machine hours based on the quantity ordered on the work order.

If the system finds an error in calculating the date for an operation sequence, it enters the work order start and requested dates for that operation.

Processing assembly inclusion rules

Use Order Processing to process assembly inclusion rules and generate a parts list and routing, if they do not already exist.

Use rule type Q for components that the system will write only to the Shop Floor Control Parts List table (F3111). The system uses the Issue Type Code and Operations Sequence fields from the Assembly Inclusion Rules table (F5293) in this processing.

Use rule type P to:

- Print components on the sales order as separate line items
- Display different levels for configured components during Sales Order Entry

The system generates a parts list as follows:

- Using data from the Sales Order Detail table (F4211) generated from the parts list rules during Sales Order Entry to create records in the Shop Floor Control Parts List (F3111)
- Processing rule type Q for components to write additional components to the parts list

The system generates a routing by processing the related routing rules.

Blending, filling, and packaging

The system checks for any incompatibility between blending tank’s or fill line’s associated allowed product matrix and the work orders ingredients list, and displays any errors.

See Bulk Stock Management Guide.
Warehouse Management Interface

If you use Warehouse Management and process a work order, the system does not search for inventory. Instead, the system generates a pick request. The pick request notifies you of the need for materials from the warehouse.

After the system creates the pick request, the Warehouse Management system processes instructions and creates suggestions for you to confirm. Then, the system updates the parts list and increases the quantity on hand for the To location and decreases the quantity on hand for the From location.

You can specify in the processing options if you want a consolidated picklist for multiple work orders to be printed, as well as the individual picklists.

Sales Order Processing Work Orders

If you create a work order for a kit during sales order entry, the parent item can be built and stocked in inventory after you process and complete the work order. The system subtracts the components from the on-hand quantity in inventory when you create the work order, and the system adds the parent item into on-hand quantity in inventory after you complete the work order.

You must specify a T line type for all components in the processing options of the Order Processing program. This line type must be set up as a text to avoid writing journal entries for cost of goods sold and inventory for the components at the time of sales update. This also ensures that the system does not subtract components again during shipment confirmation or sales update.

See Working with Kits and Configured Items in the Sales Order Management Guide.

Quality Management Test Results

As you process work orders, you can use processing options to set values for the status of the work order and operation lot if the tests fail.

See Working with Test Results in the Quality Management Guide for more information.

See Also

- Appendix C — Leadtimes for an explanation of the calculation of fixed and variable leadtimes
Run Order Processing

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Order Processing

When you run Order Processing, the system creates the engineering variance in the Work Order Variance table (F3102). The variance shows the difference in costs from when the standards were set at the beginning of the accounting period.

When you use Order Processing to generate ingredients lists or routing instructions for your work orders, the system replaces any ingredients lists or routings that were previously attached to the work orders.

When you run Order Processing the system generates an exception report if:

- The system previously created pick requests but did not re-generate a parts list
- The system did not create a pick request because “Warehouse Control” was not set to Y

Processing Options for Order Processing

GENERATION INFORMATION:
1. Enter one of the following:                     ____________
   1 – Parts List only
   2 – Routing only
   3 – Both Parts List and Routing
      If left blank, neither Parts List
      nor Routing will be generated.

2. Enter a ’1’ to use the W.O. Date                ____________
   for Effectivity checking.  (Default
   is the W.O. Start Date.)

UPDATE INFORMATION:
3. Enter the new Status Code for the               ____________
   Work Order Header.  If left blank,
   status will not be changed.

WORK ORDER PRINT INFORMATION:
4. Enter a ’1’ to print Work Orders.               ____________
   If printing Work Orders:

PARTS LIST PRINT INFORMATION:
5. Enter a ’1’ to print Parts List                 ____________
6. Enter a ’1’ to print the 2nd line of           ____________
   information, which is scrap and
   related work center.
7. Enter a ’1’ to print Parts List on a            ____________
   new page.
8. Enter the DREAM Writer Version of              ____________
   the Parts List to print.  If left
   blank, XJDE0001 is used.
9. Enter a '1' to print a consolidated Parts List.

ROUTING INSTRUCTIONS PRINT INFO:
10. Enter a '1' to print Routing
11. Enter a '1' to print Routing on a new page.
12. Enter the DREAM Writer Version to be executed for the desired sequencing of the Routing. If left blank, the operation sequence is used.
(See Form ID P314151.)

BACKSCHEDULING INFORMATION:
13. Enter the Unit of Measure for backscheduling.

SHOP PACKET SUMMARY INFORMATION:
14. Enter a '1' to print the Shop Packet Summary.

SHORTAGE REPORT INFORMATION:
15. Enter the DREAM Writer Version of the Shortage Report to execute. If left blank, no shortage report will be printed. (See Form ID P31418.)

BAR CODE INFORMATION:
16. Enter the DREAM Writer Version to be executed for the desired print overrides for Bar Coding.
(See Form ID P31413.)

INVENTORY ISSUE INFORMATION:
17. Enter the DREAM Writer Version of Batch Inventory Issues to execute. If left blank, the Inventory Issues program will not be called.
(See Form ID P31420)

PURCHASE ORDER INFORMATION:
(Used for Sub-Contract Routings)
18. Enter the Document Type
19. Enter the Line Type
20. Enter the Beginning Status
21. Enter a '1' to default the tax area from the 'Ship-To' address book number. If left blank, the tax area will default from the Supplier address book number.

SALES ORDER INFORMATION:
22. Enter the new Line Type for kit and configured components. This is used to avoid issuing inventory from Sales Order processing. The Line Type used should be inventory interface 'N'. If left blank, Line Type will not be changed.

23. Enter the Next Status for Sales Order kit and configured component lines. (This is used to bypass the normal flow of the order, i.e.,
24. Enter a ‘1’ to print Sales Order Text lines.

CONFIGURED ITEM COSTS:
25. Enter one of the following options for calculating the standard cost for configured items in the WO Variance file (F3102).
   1 - Always calculate the standard cost.
   2 - Only calculate the standard cost if it has not already been done (no variance records exist.)
   If left blank, standard cost will not be calculated.

BOM SUBSTITUTES:
26. Enter ‘1’ to allow the use of Bill of Material substitutes in case of a shortage.

PURCHASING JOURNAL ENTRIES:
27. Enter a ‘1’ to load the Work Order Number into the Subledger field of the purchasing J/E’s.

BLANKET/QUOTE PROCESSING:
28. Enter a ‘1’ for automatic blanket order release processing.

BUILD AGAINST PRIOR REVISIONS:
29. Enter a ‘1’ to permit building work orders against prior revision levels. The revision level in the work order header (F4801) will be used to select the parts list to attach to the work order. If left blank, prior revision level bills will not be selected.

WAREHOUSE PROCESSING:
30. Enter the request processing mode:
   1 - Generate requests only
   2 - Generate requests and process using the subsystem.
   If left blank, requests will not be generated.

31. If processing pick requests using the subsystem, enter the DREAM Writer version to use. If left blank, XJDE0002 will be used. (see Form ID P46171)

32. Enter the default staging location for moving goods out of the warehouse. The parts picked from the warehouse are staged at this location prior to use within manufacturing. (F1=Location Window)

33. Enter a ‘1’ if the default staging
location should be checked for availability. If the part is available at the staging location a request will NOT be generated. This option only applies to parts without work center locations.

GENERIC TEXT PRINT OPTIONS:
35. Enter a ‘1’ to print component generic text on the Parts List.
36. Enter a ‘1’ to print operation generic text on the Routing.
37. Enter a ‘1’ to update parts list and routing if order quantity or dates have changed.
38. Enter which symbology to use when using bar codes.
   ‘1’= Code 3 of 9 (Code 39)
   ‘2’= Code 128
   ‘ ’= Not print bar codes
39. Enter a ‘1’ to prevent commitments for rates.

What You Should Know About Processing Options

Ingredients list print information (5, 6, 7, and 8)
If you set the Warehouse Management picking interface on, the Work Order Print Parts List program prints “In Warehouse” in the location field for all parts with the proper material status code.

Generic Text Print Options (38)
Select which bar code symbology to print:
- Code 39 (code 3 of 9)
- Code 128

When you use reports with bar codes, ensure that no printer file overrides exist. Use an Intelligent Printer Data Stream printer.
### Printing a Summary of Process Orders

From Shop Floor Control (G31), choose Process Periodic Functions.

From Periodic Functions – Process (G3122), choose Process Order Summary.

From the Periodic Functions – Process menu (G3122), choose Process Order Summary.

The Process Order Summary report lists selected work orders in the Work Order Master table (F4801). Use this report to review work orders in your system. The report shows the planner ID, item number, order quantity, completed quantity, and start and due dates.

Understand Commitments

About Commitments

A commitment is a reservation for the ingredients that are needed on a work order. You can define commitments by branch or work center. You can change commitments manually or through a reporting feature program.

When you attach an ingredients list to a work order header, the system creates commitments for the required quantity of each component. The commitment reserves the material for a particular work order.

The J.D. Edwards system allows you to use hard commitments or soft commitments in a work order, or let the system change the commitment from soft to hard when you process the work order. You can also set up the system to place a soft commitment at the inception of the work order, and change it to a hard commitment as the start date of the work order approaches.

If, at any time, the location specified on the parts list is not the primary location, the system hard commits that line item.

Inventory remains committed until the system records the issues. Then, the system reduces the on-hand quantity and the committed quantities.

If you use lot processing, the system creates commitments based on the lot expiration dates, and grade and potency ranges for the lot numbers.

The ingredients list for the work order might specify a range of grade or potency values that can be used on the order. The system commits the lot of the grade or potency within the range you defined for the ingredient. The system can also search inventory that you need for the order in a certain sequence. For example, you might want to specify a lot number, grade, or potency.
Use the following table to identify the processing options available for both the Enter/Change Order and Order Processing programs.

**Order Processing**

Specify:
- Either the work order effective date or start date for effectivity checking

Automatically:
- Use substitutes for items out of stock and blanket order release processing
- Generate the parts list, or routing instructions, or both

**Enter/Change Order**

Automatically:
- Generate routing instructions when you create the parts list online
- Generate parts list when you create the routing instructions online

**What Is a Soft Commitment?**

A soft commitment allows you to tentatively commit the inventory to a work request, although the inventory is not physically set aside and might be used for another work order. Soft commitments also enable you to compare ingredients that are needed for current work requests to available inventory.

**What Is a Hard Commitment?**

A hard commitment physically designates inventory in a specific location to a particular work order.
Where in the Process Do You Commit Inventory?

- Work Orders and Rates
- Attach
- Ingredients List
- Routing Instructions
- Perform Commitments
- Availability
- Pick/Issues
- Schedule Work
- Payroll (optional)
- Record Hours and Quantities
- Post
- Super Backflushing
- Completion to Inventory

- Understanding Grade and Potency
Work with Commitments

Working with Commitments

When an ingredients list is attached to a work order header, either manually or using the batch program, the system automatically creates commitments for each ingredient.

When you define commitments, you set up the parameters that determine how the commitment is made. If you are using lot control, you also manage commitments by grade and potency. Repost commitments when you need to clear commitments and reassign quantities to other work orders.

Working with commitments includes the following tasks:

- Defining commitment rules
- Defining commitments at a work center location
- Managing commitments for grade and potency controlled items (optional)
- Creating commitments for potent units (optional)
- Reposting work order commitments

What You Should Know About

Activating substitution checking

When the system creates commitments, either manually or using the batch program, you can activate a processing option to verify if substitutes exist for an ingredient. When you create commitments manually, the item number is highlighted during the attachment process.
Defining Commitment Rules

When you create a commitment manually or using the batch program, you must define the following commitment rules for the work order:

- Defining the commitment method for the item
- Defining the commitment control and type of commitment

To define the commitment method for the item

From the Inventory Master/Transactions menu (G4111), choose Item Branch/Plant Information.

You can define the method that the system uses when creating a commitment. These methods are by location, lot number, or lot expiration date.

On Item Branch/Plant Information

![Item Branch/Plant Information Window]

Complete the following field:

- Commitment Method
### Field | Explanation
--- | ---
Commitment Method | A code that indicates the method that the system uses to commit lot items from inventory. Valid codes are:
1. The normal commitment method for inventory (default). The system commits inventory from the primary location and then from secondary locations. The system commits inventory from the locations with the most inventory before committing inventory from locations with the least. The system commits backorders to the primary location.
2. The inventory commitment method by lot number. The system commits inventory by lot number, starting with the lowest lot number and committing orders to available lots.
3. The inventory commitment method by lot expiration date. The system commits inventory from the locations with the earliest expiration date first. The system considers only locations with expiration dates greater than or equal to the sales order or parts list requested date.

## To define the commitment control and type of commitment

From the Shop Floor Control Setup menu (G3141), choose Manufacturing Constants.

You can define the commitment control method and type for the work order. The control determines how the system commits inventory to a work order, and limits the inventory location to which commitments are made. The type specifies whether the commitment is soft, hard, or starts out soft and later becomes hard.

On Manufacturing Constants
Complete the following fields:

- Commitment Control
- Hard/Soft Commit
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commitment Control</td>
<td>Determines how the system commits inventory to a work order, and limits the inventory location to which commitments are made. The system activates this field only when you create hard commitments. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1. Make commitments to the primary location in the branch/plant where the work order originates.</td>
</tr>
<tr>
<td></td>
<td>2. Split the parts list and commitments to fill any component shortages. The system can cross branch boundaries to fill requirements. In this case, the system uses the next alphabetical branch/plant listed in the table that occurs after the branch/plant on the work order header. For example:</td>
</tr>

Defining Commitments at a Work Center Location

Defining commitments at a work center consists of:

- Defining the location at the work center
- Defining the work center in the item’s routing
- Defining the ingredients for a process
- Defining how the system commits inventory during backflush

▶ To define the location at the work center

From the Daily PDM Discrete menu (G3011), choose Enter/Change Work Center.

On Enter/Change Work Center

![Enter/Change Work Center](image)

Complete the following fields:

- Work Center
- Location – Issue
To define the work center and location in the items routing

From the Daily PDM Process menu (G3012), choose Enter/Change Process.

On Enter/Change Process

Review the following field:

- Work Center
- Replenishment Location

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Location  | A code that identifies inventory locations in a branch/plant. You define the format of the location identifier by branch/plant. 

............. Form-specific information .............

This field overrides the location defined in the work center master, which allows for multiple work center locations.

To define the ingredients for a process

From the Daily PDM Process menu (G3012), choose Enter/Change Process.

On Enter/Change Process
5. Complete the following fields:
   - Branch/Plant
   - Parent Item

6. Access the detail area.

7. Complete the following field:
   - Operation Sequence

8. Choose BOM Component Master Text.
9. Create a separate generic text entry for a component item of the parent item.

This window enables you to provide more information and specific instructions per component. You can also use the User Information and Text Model Selection windows to view user and date updates, as well as model selections.

**What You Should Know About**

**Attaching notes**

Access the Notes window to create a separate generic text entry for each operation sequence of the routing. This window enables you to provide more information and specific instructions per step. You can also access the User Audit Information and Select Notes Template windows to view user and date updates, as well as templates.

**Blending, filling, and packaging**

Use the Enter/Change Process program to add ingredients associated with a manufacturing product. The system allows a percent bill to be added to 100% and additional quantities to include fixed or variable definitions.

*See Bulk Stock Management Guide.*
To define how the system commits inventory during backflush

From the Shop Floor Control Setup menu (G3141), choose Manufacturing Constants.

On Manufacturing Constants

Complete the following field:

- Backflush Options

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backflush Options</td>
<td>Determines how the system performs commitment and release of inventory during the backflush process. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1. Create a standard parts list based on the value in the Commitment Control field in the Manufacturing Constants table (F3009).</td>
</tr>
<tr>
<td></td>
<td>2. Create a parts list, committing to the location indicated in the Work Center Master table (F30006). The Operation Sequence field in the</td>
</tr>
<tr>
<td></td>
<td>Bill of Material table (F3002) determines the work center that is used.</td>
</tr>
</tbody>
</table>

NOTE: You must create the work order routing before the parts list. If you are running work order generation, the work order routing and the parts list must be created at the same time.
Managing Commitments for Grade and Potency Controlled Items

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Order Preparation - Process (G3113), choose Enter/Change Order

On Enter/Change Order, choose Ingredients List.

Grade and potency controlled items must be lot controlled. When the system creates commitments for grade and potency controlled items, it moves the grade and potency range to the ingredients list. Only those lots within the range are eligible for commitments.

For example:

<table>
<thead>
<tr>
<th>Location</th>
<th>Exp. Date</th>
<th>Grade</th>
<th>Hand</th>
<th>Commit</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>08/31</td>
<td>A01</td>
<td>50</td>
<td>50</td>
</tr>
<tr>
<td>S 9406220000</td>
<td>08/15</td>
<td>A02</td>
<td>300</td>
<td>300</td>
</tr>
<tr>
<td>S 9406240000</td>
<td>12/12</td>
<td>A03</td>
<td>400</td>
<td>400</td>
</tr>
<tr>
<td>S 9406250000</td>
<td>09/01</td>
<td>A04</td>
<td>5</td>
<td></td>
</tr>
<tr>
<td>S 9406260000</td>
<td>09/01</td>
<td>A05</td>
<td>5000</td>
<td></td>
</tr>
</tbody>
</table>

In the above example, the work order quantity required is 800, and the grade range is A01–A03. The system makes the commitments in date sequence.

The system commits the quantities using the primary unit of measure. If all of the commitments cannot be made against specified lots in the range, the system commits the remainder to the primary location at standard grade or potency.

See Also

- Understanding Grade and Potency
Creating Commitments for Potent Units

When you define a unit of measure as a potent unit of measure, and the system creates commitments, the system converts the quantity to the primary unit of measure. For example, if the primary unit of measure is GA (gallons), the component unit of measure is GP (potent gallons), and the standard potency is 70%, the ingredients list requires 500 GP.

<table>
<thead>
<tr>
<th>location</th>
<th>potency</th>
<th>On hand</th>
<th>Potent units</th>
<th>Commit at standard &amp; 70%</th>
</tr>
</thead>
<tbody>
<tr>
<td>P</td>
<td>9406220000</td>
<td>80%</td>
<td>50</td>
<td>40</td>
</tr>
<tr>
<td>S</td>
<td>9406230000</td>
<td>90%</td>
<td>300</td>
<td>270</td>
</tr>
<tr>
<td>S</td>
<td>9406240000</td>
<td>40%</td>
<td>400</td>
<td>160</td>
</tr>
</tbody>
</table>

In the above ingredients list example, only the equivalent of 470 GPs are available. The remaining 30 GPs are committed back to primary (30 GP/.7 = 43 GA).

Using the above example, if the primary unit of measure was GP, the potency associated with it in the Lot Master table (F4108) is only for conversion purposes. Potent units of measure are assumed to be 100% potent.

Also, a lot that consists of 100 potent units with a potency of 75% means that it is the equivalent of 133.3333... physical gallons (100/75). It is important for those companies that store in potent units to know the physical size of the inventory.

The system issues a warning message when it changes the standard value for grade or potency on the branch/plant record. Commitments can be brought out of balance if the primary unit of measure for an item is non-potent and commitments exist from a sales order or work order in a potent unit of measure. The reverse is true as well. You can correct this by running a repost for the sales order and work order. J.D. Edwards recommends that you run sales order reports, and repost the purchase order, after you repost the work order.

Creating commitments for potent units consists of:

- Defining potent units
- Setting up a unit of measure conversion

To define potent units

From the General Systems menu (G00), choose General User Defined Codes.
On General User Defined Codes

1. Access the detail area.

2. Complete the following field:
   - Special Handling Code
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Special Handling Code – User Def Codes</td>
<td>A code that indicates special processing requirements for certain user defined code values. The particular value you enter in this field is unique for each user defined code record type.</td>
</tr>
<tr>
<td></td>
<td>The system uses the special handling code in many ways. For example, special handling codes defined for Language Preference specify if the language is double-byte or if the language does not have uppercase characters. Programming is required to activate this field.</td>
</tr>
<tr>
<td></td>
<td>........................ Form-specific information ........................</td>
</tr>
<tr>
<td></td>
<td>If a “P” is in the second position, the system identifies that unit of measure as a potent unit of measure.</td>
</tr>
</tbody>
</table>

**To set up a unit of measure conversion**

From the Inventory System Setup menu (G4141), choose Standard Units of Measure.

You set up a unit of measure conversion for potent units so that the system can:

- Convert potent units of measure to physical units of measure
- Convert physical units of measure to potent units of measure

On Standard Units of Measure
Complete the following fields:

- Unit of Measure
- Quantity
- Unit of Measure

**Processing Options for User Defined Codes**

**Defaults**

Enter the desired System Code:

Enter the desired Record Type:

**Reposting Work Order Commitments**

From Shop Floor Control (G31), enter 27

From Advanced Shop Floor Control (G3131), choose Repost Open Quantities

After you set up commitments, run the Repost Open Quantities batch program to:

- Clear outdated or invalid commitments
- Repost the commitments and on-order quantities specified in your work order to current requirements

Processing options allow you to limit the repost process to those work orders below a certain status.

**Before You Begin**

- Verify that the Item Branch table (F4102) is not in use.
- Indicate whether you want inventory hard or soft committed at each branch. See Defining Commitment Rules.

**What You Should Know About**

**Inventory interfaces**

The system does not repost bulk items and lines that do not have an inventory interface.
Reposting open and on-order quantities

When you repost open and on-order quantities on your work orders, the system:

- Clears (sets to zero) all quantity and quantity committed values in the Item Branch table (F4102).
- Reposts the quantity value in the Item Branch table for the parent item. The system uses the information from the Work Order Master table (F4801) and the following calculation: quantity ordered − (quantity completed + quantity scrapped)
- Reposts the quantity committed value for components in the Item Branch table for the location specified on the work order parts list for the item. The system uses the information from the Shop Floor Control Parts List table (F3111) and the following calculation: quantity required − quantity issued

Processing Options for Repost Open Quantities

WORK ORDER STATUS INFORMATION:
1. Enter the work order status for update. Any order with a status less than the status input, will be reposted. If left blank, the status will default to ‘99’.
Test Yourself: Committing Inventory

1. What is the difference between a hard and soft commitment?

2. List the three fields that control how commitments are performed for a branch.

3. Can you commit inventory to a work center?
4. What is the Repost Open Quantities program?

Mark the following statements true or false. For those statements that are false, change them to make them true.

5. At the branch level, you can commit inventory by lot number or lot expiration date. True / False
6. Hard commits remain in effect until inventory is relieved. True / False
7. Using the normal inventory commitment method, inventory is committed from the primary location only. True / False
8. The Commitment Control field is only active when you are creating hard commitments. True / False
9. You can change commitments for a work order. True / False
10. When the Commitment Method field is set to 2 or 3, the Hard/Soft Commit field must be set to either 1 or 2. True / False

The answers to this Test Yourself are in Appendix B.
Understand Grade and Potency

About Grade and Potency

Manufacturers in the process industry need full control over the quality of products they make or buy. Examples are the food, chemical, and pharmaceutical industries. Grade and potency qualifications allow you to categorize your products more specifically and trace their movement through the manufacturing/distribution process.

In J.D. Edwards systems, grade and potency are mutually exclusive. You can only use one or the other to categorize an item. All items that are grade or potency controlled must also be tracked by lot number. Grades and potencies divide items by their specific makeup or characteristics without changing item numbers. Lots identify a specific group of items with the same item number.

For grade and potency controlled items, you can enter a standard (preferred) value for each item. You can also enter a range of acceptable values that allow you to continue operations with grades or potencies that are outside the standard value, but still acceptable for your use. This helps to establish and maintain quality levels in your products, but is flexible enough to keep your operations running when the standard level of product is not available.

The grade or potency for each lot is used by programs that calculate on-hand and available quantities. All items that are grade or potency controlled must be lot controlled.

Grade identifies an item’s particular specification makeup, and allows the system to separate one lot from other production lots without changing the item number. Examples are diamonds, lumber, and raw turquoise.

You can use grades to classify items by their characteristics, such as quality, strength, or integrity. If you activate grade control, certain functions edit for grades and will not perform transactions if the items involved do not meet the grade parameters.

Potency refers to the percentage of active ingredient within a solution, for example, 40% solution of hydrochloric acid, 3.2 beer versus standard percentages of alcohol, and coffee with varying strengths of caffeine.
Only items that meet the grade or potency range requirements stated in the bill of material are issued to the shop floor for production. Components outside the range will not show as available or on-hand in the Shop Floor Control material inquiries.

The system records grade or potency and lot transfer transactions in the item ledger and the general ledger, so that accounting is incorporated into the tracking.

You can order only a certain grade or potency of an item. Sales order and purchase order systems accommodate grade and potency standards and ranges.

**Grade and Potency Control**

The following are grade or potency control fields on the Manufacturing Data form:

- Grade/Potency Pricing — determines how to price grade or potency controlled items in Sales Order Management.
- Grade Control — identifies whether the item is grade controlled.
- Potency Control — identifies whether the item is potency controlled.
- Standard Grade — identifies the standard grade of the item, for example, premium or average. The value entered here provides the default for several forms in manufacturing.
- Standard Potency — identifies the standard percentage of active ingredients normally found in an item. The value entered here provides the default for several forms in manufacturing. The potency standard is used for the potent unit of measure conversion, in certain cases.
- From and Through Grade — defines the allowable grade ranges for an item.
- From and Through Potency — defines the allowable potency ranges for an item.

The system uses these values when you create a branch/plant record for the item.

You define grades in the user defined code list 40/LG.

Define the user defined codes for the potent units of measure in the user defined code list 00/UM. For each potent unit of measure that you define, you must enter P in the second space of the Special Handling Code field, located in the detail area of the User Defined Code form.
Define a conversion for each potent unit of measure to a physical unit of measure in the Unit of Measure Conversions form. For example, 100 gallons of a solution at 80% potency = 80 potent gallons, 80 potent gallons of a solution at 80% = 100 gallons.

**Lot Control Items**

Use the Item Branch/Plant Information form to identify the item as a lot controlled item. Grade and potency controlled items must be lot controlled. Define one of the following values as the Lot Process Type:

- **Blank** = Lot assignment is optional. Numbers must be manually assigned. Quantity can be greater than one.
- **1** = Lot assignment is used. Numbers are assigned by the system using the system date in YYMMD format. Quantity can be greater than one.
- **2** = Lot assignment is used. Numbers are assigned in ascending sequence using the next number convention. Quantity can be greater than one.
- **3** = Lot assignment is required. Numbers must be manually assigned. Quantity can be greater than one.

![Item Branch/Plant Information form](image)

When you attach an ingredients list to a work order header, commitments are created for the components. How these commitments are created depends on the parameters of Commitment Method, Commitment Control, and Hard or Soft Commit. After you set up these parameters, commitments can be created in the same manner using both the Enter/Change Order or Order Processing programs.
When an item is defined as lot controlled, the system moves the grade or potency range to the ingredients list and allows only those lots within the range eligible for commitments. Any remaining quantities are committed to the primary location.
About Lot Processing

Lot processing allows you to manage and maintain information about groups of items. For example, you can have the system assign lot numbers to groups of perishable items based on receipt dates to identify the items that you must sell first. You can view current information about each lot, such as the quantity of available items, and the transactions that have affected the lot.

Lot control is beneficial for identifying groups of items that are components of a final product. For example, if you assign lot numbers to both bicycle tires and bicycles assembled from the tires, you can:

- Identify the lot number for the tires that were used to build a specific bicycle
- Identify all bicycles that were assembled from a specific lot of tires

If you later find that a particular lot of tires is defective, you can immediately identify and recall all bicycles that were assembled from the defective tires.

A lot usually contains one type of item, but you can set up system constants to allow different types of items in the same lot. If a lot contains different items, the system maintains lot information for each lot number and item. You can also set up system constants to restrict a lot to one type of item and still allow that lot to exist in multiple warehouses.

In manufacturing, you can complete items to multiple lots in inventory from a single work order. When you report multiple lot completions, the system links materials issued to the work order to the completed items by lot number, by work order number, or by both. If you do not enter the lot number of the end item at the time of issue, the system only uses the work order number to link the the component to the end item.

Process manufacturing industries generally operate in a lot-controlled environment, and many of the ingredients produced or consumed must be used before their expiration dates. Because ingredients cannot be used after their expiration dates, planning cannot use the unconsumed balance. Companies do not want to acquire unusable ingredients at any point in their operations.

Expiration planning considers the expiration dates of lots while calculating the quantity on-hand and consumes the lot quantities in the order of expiration dates. That is, lots with the most current expiration dates are consumed first.
This is the first-in, first-out (FIFO) method. For example, when milk is delivered to a store, it is placed in the front of the shelf and continuously rotated so that the oldest product is sold to the customer first.

Expiration planning is important because whoever in the chain has the product when it expires, incurs the loss. Accurate planning, forecasting, and adherence to schedules are important to expiration planning because products must make it through the entire chain from the supplier and finally to the customer before the expiration date. If any party in the chain does not adhere to the schedule, at least one party incurs a loss.

When you set the appropriate processing options, J.D. Edwards manufacturing planning systems:

- Deduct expired quantities of items from the on-hand values
- Send a warning message that is recorded in the MPS/MRP/DRP Message table (F3411)
- Adjust the time series to reflect the expired product's effect

There are several methods you can use to assign lot number to items. You can:

- Have the system assign lot numbers
- Assign your own lot numbers
- Assign supplier lot numbers

Each time you create a lot, the system adds a record to the Lot Master table (F4108).

**Creating Lots**

You can create lots automatically when you:

- Create purchase order receipts
- Complete work orders
- Adjust inventory

You can create lots manually:

- On the Lot Master Revisions form
- During work order entry

The actual grade and potency of a lot is defined in the Lot Master table (F4108). You also use the Lot Master Revisions program to specify a reason code for a grade or potency change, and, through the processing options, protect a grade or potency from update.
Lot master information also includes the lot’s status and expiration date. You can assign up to ten category codes to the lot for reporting purposes. The system stores all information about lots in the Lot Master table (F4108).

Lot Status

A lot’s status determines whether it is available to be processed by the system. When a lot is on hold for any reason, the system does not process it unless a processing option to allow processing of held lots is available.

You set up lot status codes to identify reasons that a lot can be put on hold. After you set up the codes, you can assign them to items and lots through item master information, branch/plant information, purchase order receipts, and lot master revisions. You cannot process items out of lots on hold.

You can assign different status codes to a single lot based on the different locations in which the lot resides. Working with status codes involves:

- Setting up lot status codes
- Assigning status codes to different lot locations

You can run Lot Status Update to place expired lots on hold. If you run the program in proof mode, you can produce a report showing all lots that will be put on hold. If you run the program in final mode, you can produce a report showing all lots that have been put on hold. Set up lot status codes in the user defined code list 41/L.

You assign lot statuses when:

- You use the Lot Master Revisions form to enter a new lot. If you do not enter a status at this time, the system uses the lot status from the item’s branch information in the Item Branch table (F4102).
- You set up a new location for an item using the Item Branch/Plant Information form.

You assign lot statuses using:

- The lot status code from that lot’s record in the Lot Master table (F4108).
- The default status from the Item Branch table (F4102) if no lot status exists.

You can assign lot statuses to different lot locations using the Location Lot Status Change window from the Lot Master Revisions program. The system assigns statuses when you create a lot through transfer from another location. The system uses the status code of the From location. You can assign status codes to locations without using lots. Whether the system processes items out of locations on hold depends on how you set the processing options.
Use the following tables to determine a lot's status for newly created Lot Master records and Item Location records.

**Lot Master (F4108)**
If you enter a lot status on the Lot Master Revisions form, the system uses that lot status.

If you do not enter a lot status, the system uses the default lot status from the Item Branch table (F4102).

**Item Location (F41021)**
If you enter a lot status on the Lot Master Revisions form, the system uses that lot status.

If you are moving a lot from another location:
- The system uses the default lot status from the From location.
- If a lot number exists, the system uses the lot status from the Lot Master record.
- If no lot number exists, the system uses the default lot status from the Item Branch table (F4102).

**See Also**

- *Defining System Constants (P4009W)* in the *Inventory Management Guide* for information about allowing different types of items in the same lot.
Enter Lot Information

Entering Lot Information

You can group items and monitor them through your inventory system by assigning them to lots. To work with lots, you must define:

- Lot information for items
- Information for lots

When you enter lot information for an item, you specify whether a lot number is mandatory, how the system assigns the number, and so forth. When you enter information for a lot, you specify the type of item that is contained in the lot, the expiration date for the lot, and so on.

Complete the following tasks:

- Enter lot information for items
- Enter information for lots

Entering Lot Information for Items

From Inventory Management (G41), choose Inventory Master/Transactions

From Inventory Master/Transactions (G4111), choose Item Master Information

When you enter master information or branch/plant information for an item, you can specify:

- Whether the item requires a lot number at the time of receipt
- Whether the system commits the item's inventory based on lot numbers

You can also specify:

- The method by which lot numbers are assigned to the item
- The number of days that the item can remain in inventory before expiring

You can further specify lots by assigning serial numbers to items within the lots.
To enter lot information for items

On Item Master Information

Complete the following fields:

- Lot Status Code
- Lot Process Type
- Commitment Method
- Shelf Life Days
- Serial No. Required
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lot Status Code</td>
<td>Indicates the status of the lot, such as if the lot is approved and available for usage (blank lot status) or is held. The system stores the lot status at both the lot master level (F4108) and the item location level (F41021). This means that a lot can be available at the lot level (lot master), while a specific location where this lot is stored can be put on hold (item location). The system checks the lot status at the item location level for availability, not at the lot master level. The lot status in the Item Branch table (F4102) is for default purposes only. The system places the lot status in the lot master when you create a new lot without specifying the lot status. The system uses the lot status from the lot master in the item location when you create new item location records for the lot. Form-specific information The default value for the lots to which you assign this item.</td>
</tr>
<tr>

<td>Serial number assignment is required. You must manually assign numbers. Quantity must not exceed one.</td>
</tr>
</tbody>
</table>

Form-specific information

Use codes 4 through 7 for advanced serial number processing. In Purchase Management, you add serial numbers using the Lot field on Purchase Order Detail. Each item must have a unique serial number.

For items requiring serial numbers as well as lot assignments, use the Lot Process Type field in conjunction with the Serial No Required field. Codes 3 through 5 for the Serial No Required field indicate the setup requirements necessary for these items.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commitment Method</td>
<td>A code that indicates the method that the system uses to commit lot items from inventory. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1 The normal commitment method for inventory (default). The system commits inventory from the primary location and then from secondary locations. The system commits inventory from the locations with the most inventory before committing inventory from locations with the least. The system commits backorders to the primary location.</td>
</tr>
<tr>
<td></td>
<td>2 The inventory commitment method by lot number. The system commits inventory by lot number, starting with the lowest lot number and committing orders to available lots.</td>
</tr>
<tr>
<td></td>
<td>3 The inventory commitment method by lot expiration date. The system commits inventory from the locations with the earliest expiration date first. The system considers only locations with expiration dates greater than or equal to the sales order or parts list requested date.</td>
</tr>
<tr>
<td>Shelf Life Days</td>
<td>The number of days that an item can remain in inventory before it expires. The system adds this number to the date that the item is received to determine the expiration date for the item. If you do not enter a value here, you must enter an expiration date each time you receive the lot item.</td>
</tr>
</tbody>
</table>
**Entering Information for Lots**

After you assign a new lot number to an item, the system creates a lot. You can enter information for the new lot on Lot Master Revisions.

You might create a lot for items that you expect to receive in the future. You can create a lot manually by entering the lot number and specifying lot information on Lot Master Revisions.

Lot information can include the expiration date, grade and potency values, supplier information, and so forth. You can also assign up to ten category codes to each lot for reporting purposes.

The system maintains separate lot information for each type of item in a lot. For example, if Lot 1 contains Item A and Item B, you can enter separate lot information for each item. A lot can contain multiple items only if you set up system constants to allow more than one type of item in a lot.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Serial No. Required</td>
<td>A code that indicates whether you must attach a serial number to this item at the time of receipt or sale for basic serial number processing, or if memo lot information is required for advanced serial number processing. You can use basic serial number processing for informational purposes only. For example, you can add a serial number for an item, and review the number later. For basic serial number processing, valid values are: Y Yes, the system requires a serial number for all transactions pertaining to this item in related inventory, sales, and purchase order programs N No, the system does not require a serial number. The system does not use this information if you use advanced serial number processing. Advanced serial number processing allows you to track an item through purchasing and sales based on a serial number. To specify serial number requirements, you must use the Lot Process Type field on Item Master Information. Values 3 through 5 indicate whether lot assignment is required for items with serial numbers. You can require assignment of up to three lot numbers, including Supplier Lot, Memo Lot 1, and Memo Lot 2. To specify lots for items with serial numbers, you must use the following values: 3 Supplier lot number required (purchasing only) 4 Supplier lot number required (purchasing only), and Memo Lot 1 required 5 Supplier lot number required (purchasing only), Memo Lot 1 required, and Memo Lot 2 required.</td>
</tr>
</tbody>
</table>
Also, you can set up system constants to process a lot that contains only one item, yet those quantities are located in multiple warehouses. For example, Lot 234 consists of one item, bicycle tires. In addition, Warehouse A represents the bulk warehouse, where the majority of the tires are stored. However, Warehouses B and C receive partial quantities of the same item so that Warehouse A has adequate space. When you receive the tires at Warehouses B and C, you can assign them to Lot 234 and track them through the unique lot number.

Complete the following tasks:

- Create a lot
- Enter lot control information
- Enter supplier information

### What You Should Know About

<table>
<thead>
<tr>
<th>Assigning new lot numbers to items</th>
<th>You can assign new lot numbers to items when you receive purchase order receipts, adjust inventory, and complete work orders. You can also assign new lot numbers for items on Item/Location Information.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigning grades or potencies to lots</td>
<td>If you do not specify a grade or potency for items that require this information, the system uses the standard grade or potency from Item Master Information or Item Branch Information.</td>
</tr>
<tr>
<td>Item/Lot Ledger</td>
<td>You can track changes to lot status, grade, and potency on the Item/Lot Ledger form.</td>
</tr>
</tbody>
</table>

### See Also

- Working with Item Locations (P41024) in the Inventory Management Guide for information about adding new lots to item locations
- Entering Item Grade and Potency Information (P41013) in the Inventory Management Guide for information about item grades and potencies
- Locating On-Hand Quantity Information (P4111) in the Inventory Management Guide for information about viewing the Item/Lot Ledger
- Defining System Constants (P4009W) in the Inventory Management Guide for information about allowing duplicate lots
To create a lot

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

Complete the following fields:

- Branch/Plant
- Lot/SN
- Item Number
- Lot Expiration

Lot Dates and Quantities appears, where you can enter availability information.

<table>
<thead>
<tr>
<th>Field</th>

Enter Lot Information

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date – Layer Expiration</td>
<td>The date that this lot of inventory will expire. In the Sales Order Management, Manufacturing, and Warehouse Management systems, this date is used in conjunction with the inventory commitment method (see data item CMGL). The system will commit the inventory using the oldest lot first, based on the requested date of the sales or work order. During the commitment process, inventory in the lot is considered good through the expiration date.</td>
</tr>
</tbody>
</table>

Form-specific information

Although you can change this date, the system automatically updates this field based on how you set up the user defined code (system 40, table LD).

To enter lot control information

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

Complete the following fields:

- Lot Description
- Lot Status Code
- Lot Potency
- Lot Grade
- Status Change Reason
- Potency Change Reason
- Grade Change Reason

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lot Description</td>
<td>You can use this field to further describe a specific lot of inventory within a stocking location.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Lot Status Code</td>
<td>Indicates the status of the lot, such as if the lot is approved and available for usage (blank lot status) or is held. The system stores the lot status at both the lot master level (F4108) and the item location level (F41021). This means that a lot can be available at the lot level (lot master), while a specific location where this lot is stored can be put on hold (item location). The system checks the lot status at the item location level for availability, not at the lot master level. The lot status in the Item Branch table (F4102) is for default purposes only. The system places the lot status in the lot master when you create a new lot without specifying the lot status. The system uses the lot status from the lot master in the item location when you create new item location records for the lot.</td>
</tr>
<tr>
<td>Lot Potency</td>
<td>A code that indicates the potency of the lot, which is expressed as a percentage of active or usable material (for example, the percentage of alcohol in a solution). The actual potency of a lot is defined in the Lot Master table (F4108).</td>
</tr>
</tbody>
</table>
| Lot Grade           | This field contains the grade of a lot expressed as an alphanumeric code. The grade is used to indicate the quality of the lot. For example:  
A1  Premium grade  
A2  Secondary grade  
The grade for a lot is stored in Lot Master table (F4108).                                                                 |
| Status Change Reason| A code (system 42, type RC) that indicates the reason for a change in the status of a lot, such as goods that are damaged in shipment or goods that are placed in quarantine.                                                                 |
| Potency Change Reason| A code (system 42, type RC) that indicates the reason for a potency change to a lot. For example, you might change the lot potency because the actual potency of the items was lower than expected or because the potency was affected by evaporation.                                                                 |
| Grade Change Reason | A code (system 42, type RC) that indicates the reason for a grade change to a lot. For example, you might change the grade because either the actual grade was lower than expected or the lot was downgraded because of aging.                                                                 |
To enter supplier information

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

Complete the following fields:

Processing Options for Lot Master Revisions

PROCESS CONTROL:
1. Enter a ’1’ to update the lot status for all lot locations when updating the lot status or a ’2’ to display all lot locations and indicate for which locations the lot status needs to be updated. If left blank, only the lot master lot status will be updated.

2. Enter a ’1’ to protect the lot status from being updated.

3. Enter a ’1’ to protect the lot grade from being updated.

4. Enter a ’1’ to protect the lot potency from being updated.

DEFAULT PROCESSING:
5. Enter the document type to be used when updating the lot grade. If left blank, the default document type ’CG’ will be used.

6. Enter the document type to be used when updating the lot potency. If left blank, the default document type ’CP’ will be used.
Work with Lot Availability

Working with Lot Availability

You can view the availability of items in a lot, as well as the activity dates, item quantities, and hold statuses that pertain to the lot. Activity dates and item quantities reflect receipts, issues, sales, and so forth for items in a lot.

To work with lot availability, you can:

- View lot availability
- Work with lot quantities
- Work with lot activity dates
- Work with lot statuses

Viewing Lot Availability

From Inventory Management (G41), choose Lot Control

From Lot Control (G4113), choose Lot Availability

You can view availability for:

- All items in a lot
- All lots that contain the item you specify

You can choose to display only those items or lots for which there are on-hand balances.
To view lot availability

On Lot Availability

1. Complete the following fields for the item or lot that you want to view:
   - Branch/Plant
   - History (Y/N)
   - Grade (from)
   - Grade (thru)
   - Potency (From)
   - Potency (Thru)
   - Lot/SN
   - Item Number

2. Review the following fields:
   - Status (Lot Status Code)
   - Reason (Status Change Reason)
   - Expires (Expiration Date)
   - Quantity on Hand/Held
   - Available

3. Press F1 in the Lot/SN field to access the Lot Information form.
4. Review the following fields:

- Lot Description
- Lot Expiration Date
- Lot Status Code
- Lot Potency
- Lot Grade

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| History (Y/N) | A code that determines whether to display information for all locations and lots or only for those with on-hand balances. Valid codes are:  
N    Display only locations and lots with on-hand balances  
Y    Display all locations and lots |
| Grade       | A code (system 40, type LG) that indicates the minimum grade that is acceptable for an item.  
The system displays a warning message if you try to purchase or issue items with grades that do not meet the minimum grade acceptable. The system does not allow you to sell items with grades that do not meet the minimum acceptable level. |
| Thru Grade  | A code (system 40, type LG) that indicates the maximum grade that is acceptable for an item.  
The system displays a warning message if you try to purchase or issue items with grades that exceed the maximum grade acceptable. The system does not allow you to sell items with grades that exceed the maximum grade acceptable. |
| Potency     | A number that indicates the minimum potency, or percentage of active ingredients, acceptable for an item.  
The system displays a warning message if you try to purchase or issue items that do not meet the minimum acceptable potency. The system does not allow you to sell items that do not meet the minimum acceptable potency.

Working with Lot Quantities

You can view the on-hand quantity, the available quantity, and the quantity held for each lot. You can also view up to six other quantity types, which you set up on user defined code table 40/LQ. These quantity types might reflect the quantity of items:

- Received
- Issued
- Adjusted
- Completed
- Approved
- Sold

You set up user defined code table 40/LQ to indicate for which document types the system tracks lot quantities. You must associate each document type with one of the quantity type categories that appear on Lot Master Revisions.

For example, you specify the Received category for the document type OP (purchase orders). Then, each time you receive items on a purchase order, the system records the quantity to the Received category for the lot.
Complete the following tasks:

- Reviewing lot quantities
- Setting up the system to track lot quantities

To review lot quantities

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

1. To view quantities for a particular lot, complete the following fields:
   - Branch/Plant
   - Lot/SN
   - Item Number

2. Review the following fields:
   - Quantity on Hand
   - Available
   - Quantity Held
   - Quantities Received
   - Quantities Issued
   - Quantities Adjusted
- Quantities Completed
- Quantities Approved
- Quantities Sold

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received</td>
<td>A type of quantity. This field represents quantity category 1. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items received in this lot.</td>
</tr>
<tr>
<td>Issued</td>
<td>A type of quantity. This field represents quantity category 2. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items issued from this lot.</td>
</tr>
<tr>
<td>Adjusted</td>
<td>A type of quantity. This field represents quantity category 3. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items adjusted to this lot.</td>
</tr>
<tr>
<td>Completed</td>
<td>A type of quantity. This field represents quantity category 4. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items completed and assigned to this lot.</td>
</tr>
<tr>
<td>Approved</td>
<td>A type of quantity. This field represents quantity category 5. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items approved in this lot.</td>
</tr>
</tbody>
</table>
### Field | Explanation
--- | ---
Sold | A type of quantity. This field represents quantity category 6. You specify the document types that update this category on user defined code table 40/LQ. The system updates user defined quantities when it writes Cardex information (F4111). Form-specific information The quantity of items sold from this lot.

#### To set up the system to track lot quantities

From the Lot Control menu (G4113), choose Lot Quantities.

On Lot Quantities

![Lot Quantities screen](image)

1. Complete the following fields for each document type:
   - 02 Character Code
   - Description

2. Assign one of the following categories to each document type by entering the number in parentheses in the Description-2 field:
   - Received (1)
   - Issued (2)
   - Adjusted (3)
• Completed (4)
• Approved (5)
• Sold (6)

Assigning grades or potencies to lots If you do not specify a grade or potency for items that require this information, the system uses the standard grade or potency from Item Master Information or Item Branch Information.

Working with Lot Activity Dates

You can view up to six activity dates for a lot. You determine the activity dates that display by setting up user defined code list 40/LD. These activity dates might reflect the last time that an item was:

• Received or Created
• Issued
• Recalibrated
• Completed
• Approved
• Sold

You set up user defined code table 40/LQ to indicate for which document types the system tracks lot activity dates. You must associate each document type with one of the date categories above.

For example, you specify the Sold category for the document type SO (sales orders). Then, each time you confirm shipments for a sales order, the system records the date to the Sold category for the lot.

You can also enter lot activity dates manually instead of having the system track them for you.

Complete the following tasks:

• Change activity dates for a single lot
• Change activity dates for multiple lots
• Set up the system to track lot dates
To change activity dates for a single lot

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

1. To view dates for a specific lot, complete the following fields:
   - Branch/Plant
   - Lot/SN
   - Item Number

2. Change the following dates for the appropriate lots, if necessary:
   - Date Received/Created
   - Date Issued
   - Date Recalibrated
   - Date Completed
   - Date Approved
   - Date Sold
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Received/Created</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, receipts). This field represents date category 1. You specify the document types that update this category in user defined codes (system 40, type LD).</td>
</tr>
<tr>
<td>Issued</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, issues to work orders). This field represents date category 2. You specify the document types that update this category in user defined codes (system 40, type LD).</td>
</tr>
<tr>
<td>Recalibrated</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, recalibration dates). This field represents date category 3. You specify the document types that update this category in user defined codes (system 40, type LD).</td>
</tr>
</tbody>
</table>

Note: The last date that items were created or received in the lot.

Although you can change this date, the system automatically updates this field based on how you set up the user defined code (system 40, type LD).
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Completed</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, inventory completions). This field represents date category 4. You specify the document types that update this category in user defined codes (system 40, type LD). Form-specific information The last date that inventory completions were made to this lot. Although you can change this date, the system automatically updates this field based on how you set up the user defined code (system 40, type LD).</td>
</tr>
<tr>
<td>Approved</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, lot status approvals). This field represents date category 5. You specify the document types that update this category in user defined codes (system 40, type LD). Form-specific information The date that the lot was approved. Although you can change this date, the system automatically updates this field based on how you set up the user defined code (system 40, type LD).</td>
</tr>
<tr>
<td>Sold</td>
<td>The last date that a particular activity occurred. You determine the type of activity that the category represents (for example, sales). This field represents date category 6. You specify the document types that update this category in user defined codes (system 40, type LD). Form-specific information The last date that items were sold from this lot. Although you can change this date, the system automatically updates this field based on how you set up the user defined code (system 40, type LD).</td>
</tr>
</tbody>
</table>
To change activity dates for multiple lots

From the Lot Control menu (G4113), choose Speed Lot Update.

On Speed Lot Update

1. Complete the following fields:
   - Branch/Plant
   - History (Y/N)
   - Item Number
   - Supplier Lot

2. Change the following dates for the appropriate lots, if necessary:
   - Date Received
   - Date Issued
   - Date Tested (or recalibrated)
   - Date Complete
To set up the system to track lot dates

From the Lot Control menu (G4113), choose Lot Dates.

On Lot Dates

1. Complete the following fields for each document type:
   - 02 Character Code
   - Description

2. Assign one of the following categories to each document type by entering the number in parentheses in the Description-2 field:
   - Date Received/Created (1)
   - Date Issued (2)
   - Date Recalibrated (3)
   - Date Completed (4)
   - Date Approved (5)
   - Date Sold (6)
Work with Lot Availability

Working With Lot Statuses

You set up lot status codes to identify the reasons that a lot is on hold. After you set up the codes, you can assign them to items and lots on Item Master Information, Branch/Plant Information, Lot Master Revisions, Enter Receipts, and so forth. You cannot process items from lots on hold.

You can assign different status codes to a single lot based on the different locations in which the lot resides. Complete the following tasks:

- Set up lot status codes
- Assign status codes to different lots

You can run the Lot Status Update DREAM Writer program to place expired lots on hold. You can preview a list of all lots that will be placed on hold by running the program in proof mode.

</tbody>
</table>
To set up lot status codes

From the Lot Control menu (G4113), choose Lot Status Codes.

On Lot Status Codes

![Lot Status Codes](image)

Complete the following fields for each status code:

- 01 Character Code
- Description

To assign status codes to different lots

From the Lot Control menu (G4113), choose Lot Master Revisions.

On Lot Master Revisions

1. Locate the appropriate lot and item.

   Location Lot Status Change appears.
2. On Location Lot Status Change, complete the following fields for each location for which you want to change the status code:

- New (New Lot Status)
- Reason (Reason for Changing Lot Status)

**What You Should Know About**

**Assigning status codes to locations**

You can assign status codes to locations as well as lots. The system verifies that a lot is on hold before verifying that the location is on hold.

The system might process items out of locations on hold depending on the program in which you are working and the way that processing options are set.
View Lot Transactions

Viewing Lot Transactions

You might want to view the transactions that have affected a lot, such as:

- The receipts, inventory issues, and so on, that were generated as a result of assigning items to the lot
- The inventory issues, work order completions, sales, and so on, that were generated as a result of removing items from the lot

Use Lot Tracing to view the transactions in which items were assigned to the lot. If the lot contains kit or assembled items, you can identify the parts that were used to assemble items in the lot and the lots from which the parts came.

![Diagram of LOT C and LOT D](image1)

You use lot tracking to view the transactions in which items were removed from the lot. You can identify items that have been assembled using parts from the lot, and the lots to which the assembled items were assigned.
You provide information about how you want the system to trace and track lots. For example, you specify the document types that the system monitors to trace and track lots. You also specify whether you want to view transactions for assembled items or non-assembled items by specifying a trace/track mode.

The system traces and tracks a lot by linking corresponding transactions, such as a receipt, an issue, a completion, and a sales order. If the link is incomplete, the system stops tracing and tracking. For example, if you do not include the completion document type in inclusion rules, the system stops tracking at the completion transaction.

Viewing lot transactions involves:

- Print trace and track reports
- Review trace and track information
- Set up trace and track inclusion rules
## Printing Trace and Track Reports

From Inventory Management (G41), choose Lot Control

From Lot Control (G4113), choose Trace/Track Print

You can print a report that provides trace and track information, such as the level by which the system traces or tracks lots.

### Lot Tracing Report

Reviewing Trace and Track Information

From Inventory Management (G41), choose Lot Control
From Lot Control (G4113), choose Trace/Track Inquiry

You can review trace and track information online. You determine whether the report displays tracing or tracking information by using processing options for the Trace/Track Inquiry program.

To review trace and track information

On Lot Tracing or Lot Tracking

1. Complete the following fields for the lot that you want to trace or track:
   - Mode
   - Lot/SN
   
   Depending on how you have set the Allow Duplicate Lots field in system constants, you might have to enter an item number and branch/plant.

2. Review the following fields, as necessary:
   - Level
   - Serial Number
   - Item Number
- Quantity
- Transaction Date
- Explanation (Transaction Explanation)

3. Access the detail area.

4. Review the following fields, as necessary:
   - Order
   - Branch/Plant
   - Lot Grade
   - Lot Potency
   - Sup Lot (Supplier Lot)
   - Customer/Supplier

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mode</td>
<td>A code that indicates how you want the system to display lot trace and track information. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1 Single level trace/track</td>
</tr>
<tr>
<td></td>
<td>2 No intermediate levels (displays only top or bottom levels)</td>
</tr>
<tr>
<td></td>
<td>3 Multi-level trace/track</td>
</tr>
<tr>
<td></td>
<td>4 Multi-level indented trace/track</td>
</tr>
<tr>
<td>Level of Indentation</td>
<td>A number indicating the level of a child in the relationship to its parent in a hierarchy.</td>
</tr>
</tbody>

<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date – Order/Transaction</td>
<td>The date that an order was entered into the system. This date determines which effective level that the system uses for inventory pricing.</td>
</tr>
<tr>
<td>Explanation – Transaction</td>
<td>This text identifies the reason that a transaction occurred.</td>
</tr>
</tbody>
</table>

What You Should Know About

**Reviewing detailed lot information**

Access the Lot Information window by pressing F1 in the Lot/SN field on Lot Tracing or Lot Tracking. This window displays the item that belongs to the lot, the branch/plant to which the lot is assigned, the lot expiration date, the lot status, and so on.

*See Viewing Lot Availability for more information.*

Processing Options for Lot Tracing Inquiry

Enter a ‘1’ to track lot usage. Default is to trace lot usage.

Setting up Trace and Track Inclusion Rules

Before you use lot tracing and lot tracking, you must set up trace and track inclusion rules. These rules let you specify the document types that the system monitors to trace and track lots. You must specify whether each document type applies to lot tracing, lot tracking, or both.

For example, if you use the Purchase Management system, you would specify that document type OP (purchase orders) applies to lot tracing. Then, each time you receive a lot item, the receipt transaction displays on Lot Tracing.

**To set up trace and track inclusion rules**

Enter UDC on the command line from any J.D. Edwards menu.

On General User Defined Codes
1. Access user defined code table 40/DC.

2. Complete the following fields for each document type:
   - 02 Character Code
   - Description

3. Assign one of the following values to each document type in the Description-2 field:
   - B (for bottom level, or tracing transactions)
   - C (for completion level, or tracking transactions)
   - Blank (for intermediate level transactions, which apply to both tracing and tracking)
   - I (for issue transactions)
   - M (for work order completions)

**What You Should Know About**

**Issue transactions** You must include the issues document type (IM) in inclusion rules if you perform multi-level tracing and tracking. You must also assign the issues document type a value of I (issue transactions).

**Receipt, adjustment, and sales transactions** Receipt and adjustment transactions cannot have a value of C (completion) on Trace/Track Inclusion rules. Sales transactions cannot have a value of B (bottom level). A sale is the last transaction that can occur for lot tracking.
**How the system traces and tracks lot transactions**

The system traces and tracks a lot by associating together corresponding transactions, such as a receipt, an issue, a completion, and a sales order. If the association is terminated, the system stops tracing and tracking. For example, if you do not include the completion document type in inclusion rules, the system stops tracking at the completion transaction.
Reclassify Lots

Reclassifying Lots

From Inventory Management (G41), choose Inventory Master/Transactions

From Inventory Master/Transactions (G4111), choose Reclassifications

You can reclassify an item and any associated lot when the item's properties change. When you reclassify, you create new item numbers and combine or split existing lots within locations.

You also may be able to create new lots if you have set the Inventory Lot Creation (Y/N) field in the branch/plant constants to allow you to do so.

For example, property changes that occur over time in technical grade sulphuric acid can result in a less potent grade of acid. You can create a new lot from this acid by specifying a different potency and grade.

In a similar example, if you blend several lots of sulphuric acid together and dilute them with water, you can create a new lot with a new potency and grade.

You can change a lot and any of the associated items as follows:

- Change the item number, location, lot, and lot status
- Create a new lot from an existing lot
- Combine several lots into a single lot
- Split one lot into several lots
- Combine several lots and create several new lots
Example: Types of Reclassifications

The following graphic illustrates how you can combine, blend, and split lots.

![Diagram of Combining Lots, Lot Blending, and Lot Splitting]

After you reclassify an item and lot, the system adjusts inventory balances and performs related tracking and accounting tasks.

The system updates the following tables with item and lot change information:

- Item Ledger (F4111)
- Account Ledger (F0911)
- Item Location (F41021)
- Warehouse Location (F4602) — (only if you are using the Advanced Warehouse Management system with the Inventory Management system)

You can view detailed or summarized journal entries for these transactions on the Journal Entries and the Item Ledger Inquiry forms.

Before You Begin

- Verify that you have set up the general ledger accounts in the Account Master table (F0901)
- Verify that you have set up the automatic accounting instructions (AAIs) for distribution
- Review uncommitted quantity information for the item and related lot that you are reclassifying on Item Availability

Use the Item/Lot Change Transactions program only for reclassifying items and lots. Using any of these programs to reclassify items or lots can adversely affect information throughout the Sales Order Management and Procurement systems.
What You Should Know About

| **Reviewing lot information** | You can review item and location information for a lot by accessing Lot Information. This form also displays the lot expiration date, the lot status, and so on. See *Viewing Lot Availability* for more information. |
| **Correcting errors** | You can correct a reclassification made in error by entering a reversing entry. Because the system stores records of each reclassification for accounting purposes, you cannot delete the record. The system reverses the item in the same document number and batch as the original reclassification. |
| **Recording document numbers** | After you enter a reclassification, the system displays the document type, batch number, and document number for the transaction. Record the document number for locating the transaction. |
| **Grouping reclassifications** | After you enter several reclassifications, you can group them together for processing. After you group transactions, the system assigns the same number to each transaction in the group and processes all of the From and To lines with the same transaction number. Depending on how the processing options are set, the system validates that the From and To quantities balance. |
| **Reclassifying uncommitted quantities of items** | You can reclassify only uncommitted quantities of items and lots. See *Item and Quantity Information* in the *Inventory Management Guide* for information about how to determine uncommitted quantities for an item. |
| **Assigning items with multiple lot or serial numbers to a location** | When you reclassify inventory, you might be able to assign items with multiple lot or serial numbers to a location. See *Assigning an Item to a Branch/Plant* in the *Inventory Management Guide* for more information. |
| **Reclassify bulk inventory** | You cannot use the Item/Lot Change Transactions program to reclassify bulk inventory. Instead, use the Bulk Stock Movement program to reclassify bulk inventory. |
To reclassify lots

On Reclassifications

1. To enter reclassification information, complete the following fields:
   - From Branch/Plant
   - To Branch/Plant (BU for Account Duplication)
   - Transaction Date
   - Document Number
   - Document Type
   - Explanation
   - G/L Date

2. Access the detail area.
3. Complete the following fields for each branch/plant in which the item is stored:
   - From/To
   - Item Number
   - Quantity
   - Unit of Measure
   - Location
   - Reason Code
   - Unit Cost
   - Extended Cost
   - Transaction Line Number

4. To create a new location and record for the lot, complete the following fields:
   - Lot
   - Grade
   - Potency
   - Lot Description
   - Lot Expires
   - Lot Status

The system processes the transaction and displays a document number, document type, and the batch number for the transaction.
### Processing Options for Reclassifications

#### DEFAULT VALUES:
1. Document type for item change.

#### PROCESS CONTROL:
2. Method for assigning expiration date to newly created lots.
   (If left blank, method 1 will be used.)
   
   1 = Assign manually.
   2 = Newest From Expiration Date.
   3 = Oldest From Expiration Date.
   4 = Transaction date + shelf life.

#### DREAM WRITER VERSIONS
Enter the version of each program to be used. If left blank, ZJDE0001 will be used.

3. Journal Entries (P09101)
4. G/L Functional Server (XT0911Z1)
5. Item Search (P41200)
6. Item Ledger (P4111)
7. Warehouse Requests (P46100)

#### PROCESSING CONTROL:
8. Enter a ‘1’ to protect costs or a ‘2’ to make costs non-display.
   If left blank, the update of costs is allowed.
9. Enter a '1' to protect Lot Number, Lot Expiration Date, and Lot Status. If left blank, the fields will remain input capable.

10. Enter a '1' to run in summary mode. G/L accounts will be summarized within each document number. If run in detail, G/L accounts will be produced for each line.

11. Enter a '1' to allow transfers from held lots.

12. Enter a '1' to allow transfers greater than quantity available.

13. Method of quantity validation for from and to quantities within a transaction.
   ' ' – No validation performed.
   '1' – Warning if out of balance.
   '2' – Error if out of balance.

14. Enter which item search screen is to be used to return items.

   1 = Item Search Window allowing the return of multiple items.

   2 = Full item search screen with query capability.

   (If left blank the item search screen allowing the return of multiple items will be used.)

Exercises

See the exercises for this chapter.
Test Yourself: Changing Item Classification

1. List the three functions of the Item Change Transactions program.

2. To reclassify an item, can you split one existing location/lot into multiple locations/lots? Explain.

3. How do you reverse an item reclassification?

4. List two methods for assigning an expiration date for newly created lots.

The answers to this Test Yourself are in Appendix B.
Review Availability and Shortages

Reviewing Availability and Shortages

Shop floor management includes the coordination of ingredient handling, ingredient availability, setup and tooling availability, and operator skills so that a job can be done in the most cost-effective manner. You can use availability and shortage tracking programs to determine what inventory you have and what inventory you need.

You should check the availability of the ingredients needed to complete a work order before you create the work order, or when the work order has been processed and is ready for release to the shop floor. You can check availability against a work order after the work order has been created. You can also check availability against a bill of material for a rate schedule, or before creating a work order for an ingredient. You can choose to print shortages for specified ingredients or print all shortages as well.

Reviewing availability and shortages includes the following tasks:

- Defining availability calculations for a branch
- Reviewing availability (optional)
- Managing shortage information (optional)
- Printing shortages (optional)

What You Should Know About

Entering shortages

You can choose Order Item Shortage to enter a quantity short for an item associated with a work order. You can also specify how to fill the shortage. However, you should use the Shortage Maintenance program to maintain quantity shortages.
Defining Availability Calculations for a Branch

From Inventory Management (G41), enter 29

From Inventory System Setup (G4141), choose Branch/Plant Constants

The system uses the quantities defined for each branch in the Inventory Management system to calculate availability. Therefore, you indicate the quantities you want the system to add or subtract from the on-hand balance when the system calculates availability at that branch. If you leave any field blank, the system excludes that quantity from the calculation.

To define availability calculations for a branch/plant

On Branch/Plant Constants

1. Choose Item Availability.

2. On Item Availability Definition, review the following default information:
   - Branch/Plant
3. To subtract a quantity, complete the following optional fields:
   - Quantity Soft Committed to SO & WO
   - Quantity Hard Committed to SO
   - Quantity Future Committed to SO
   - Quantity Hard Committed to WO
   - Other Quantity 1 SO
   - Other Quantity 2 SO
   - Quantity on Hold
   - Safety Stock

4. To add a quantity, complete the following optional fields:
   - Quantity on Purchase Order Receipts
   - Quantity on PO – Other 1
   - Quantity on Work Order Receipts
   - Quantity in Transit
   - Quantity in Inspection
   - Quantity in Operation 1
   - Quantity in Operation 2

The system uses the quantities defined for each branch in the Inventory Management system to calculate availability. Therefore, you indicate the quantities you want the system to add or subtract from the on-hand balance when the system calculates availability at that branch. If you leave any field blank, the system excludes that quantity from the calculation.

**Reviewing Availability**

You should check the availability of the ingredients required to make a certain quantity of a parent item before you create a work order or rate schedule. You can check the availability of an ingredient or the availability of an ingredients list.

Reviewing availability consists of:

- Reviewing ingredient availability
- Reviewing ingredients list availability
To review ingredient availability

From the Daily Order Preparation – Process menu (G3113), choose Ingredient Availability.

On Ingredient Availability

1. Complete the following fields:
   - Branch/Plant
   - Process

2. Complete the following optional field:
   - Requested Quantity

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Requested Quantity</td>
<td>The number of parent items you want to process. The system calculates lower-level values in quantity per the number of parent items requested. For example, if 3 components are needed for a parent item, and the requested quantity is 10, the system plans for 30 components.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>-----------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Required</td>
<td>The number of units to which the system applies the transaction.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>For Shop Floor Control: The quantity of the component required.</td>
</tr>
<tr>
<td>Available</td>
<td>The quantity available can be the on-hand balance minus commitments, reservations, and backorders. Availability is user defined and can be set up in branch/plant constants.</td>
</tr>
</tbody>
</table>

**To review ingredients list availability**

From the Daily Order Preparation – Process menu (G3113), choose Ingredient List Inquiry.

You can review the availability of ingredients required to complete the quantity of the product indicated on a work order.

If you created a soft commitment for the ingredient, the quantities displayed indicate the ingredient’s availability at all locations. If you created a hard commitment for the ingredient, only quantities from the hard-committed locations display. You can also display the quantities of each ingredient that have hard and soft commitments to work orders and sales orders.

On Ingredient List Inquiry
1. Complete the following field:
   - Order Number
2. Access the detail area

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required</td>
<td>The total quantity requested.</td>
</tr>
<tr>
<td>WO Hard Commit</td>
<td>The number of units hard committed to work orders in the primary unit of measure.</td>
</tr>
<tr>
<td>SO Hard Commit</td>
<td>The number of units committed to a specific location and lot.</td>
</tr>
<tr>
<td>WO/SO Soft Commit</td>
<td>The number of units that are soft-committed to sales orders or work orders in the primary units of measure.</td>
</tr>
<tr>
<td>Quantity On-Order</td>
<td>The number of units specified on the purchase order, in primary units of measure.</td>
</tr>
</tbody>
</table>
Processing Options for Ingredient Availability

SAFETY STOCK:
1. Enter a '1' if Safety Stock is to be subtracted from the Quantity on Hand.

DISPLAY OPTIONS:
2. Enter the default Bill Type. If left blank, 'M' will default.
3. Enter a '1' to prevent displaying phantom items when exploding the Bill of Materials.
4. Enter the default mode for Inquiry:
   1- Single Level Bill (All Items)
   2- Multi Level Bill (All Items)
   3- Single Level Bill (Negative Items)
   4- Multi Level Bill (Negative Items)

Processing Options for Ingredient List Inquiry

DREAM WRITER VERSIONS:
1. Enter the version of Purchase Order Inquiry to execute. If blank, version 'ZJDE0001' will be used.
2. Enter the version of Supply/Demand Inquiry to execute. If blank, version 'ZJDE0001' will be used.

Managing Shortage Information

Shortages occur when you do not have enough of the required ingredients to complete the quantity of the product requested on a work order. When you check for availability of ingredients against a bill of material or a work order, the system displays short ingredients with a negative available quantity.

You track shortage information for:

- Purchased ingredients that you obtain from a single source
- Purchased ingredients that are difficult to obtain
- Ingredients that have a long leadtime
- Ingredients whose absence will stop the production line
- Ingredients that are expensive to purchase or manufacture
- Ingredients that require close monitoring
Manage shortage information includes the following tasks:

- Locating shortages
- Changing shortage information

**To locate shortages**

From the Daily Order Preparation – Process menu (G3113), choose Shortage Workbench.

You can locate shortage information for an ingredient that is associated with one or more work orders using the shortage workbench. Use the workbench to determine the amount of a shortage and how the shortage will be filled. You can locate ingredient shortages by:

- Branch/plant and ingredient
- By branch/plant, ingredient, order number, and order type
- By order number and order type
- Order type

On Shortage Workbench

![Shortage Workbench](image)

Complete the following fields:

- Branch/Plant
- Ingredient
To change shortage information

From the Daily Order Preparation – Process menu (G3113), choose Shortage Maintenance.

You can change ingredient shortage information by ingredient, work order, branch/plant, and work order type, or any combination of these. You can also review information that indicates how shortages will be filled, as well as change this information.

There are several forms you can use to manage shortage information. You specify in the processing options which versions of the shortage programs that the system uses and the default order type that the system displays.

On Shortage Maintenance

1. Complete the following fields:
   - Branch/Plant
   - Ingredient
   - Order Number

2. Complete the following default information:
   - Due Date
   - Short Quantity
   - Deliver to Work Center

3. Access the detail area.
4. Review the following default information:
   - From Order
   - Due

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Date – Requested (Julian)</td>
<td>The requested date for a Purchase Order created thru Direct Ship or Transfer Order entry. If you leave this field blank, the system uses today's date, which can be overridden at any time.</td>
</tr>
</tbody>
</table>

   . . . . . . . . . . Form-specific information . . . . . . . . . .

   The date that the component is needed. If you leave this field blank, the system uses the date in the work order parts list.
Processing Options for Shortage Workbench

OPEN WORK ORDERS:
1. Enter the DREAMWriter version of 'Open Work Orders' to be called. If blank, 'ZJDE0001' will be used.

OPEN PURCHASE ORDERS:
2. Enter the DREAMWriter version of 'Open Purchase Orders' to be called. If blank, 'ZJDE0001' will be used.

SHORTAGE WORKBENCH:
3. Enter the DREAMWriter version of 'Shortage Workbench' to be called. If blank, 'ZJDE0001' will be used.

WORK ORDER TYPE:
4. Enter the default work order type. If left blank, 'WO' will be used.

Processing Options for Shortage Maintenance

OPEN WORK ORDERS:
1. Enter the DREAMWriter version of 'Open Work Orders' to be called. If blank, 'ZJDE0001' will be used.

OPEN PURCHASE ORDERS:
2. Enter the DREAMWriter version of 'Open Purchase Orders' to be called. If blank, 'ZJDE0001' will be used.

SHORTAGE WORKBENCH:
3. Enter the DREAMWriter version of 'Shortage Workbench' to be called. If blank, 'ZJDE0001' will be used.

WORK ORDER TYPE:
4. Enter the default work order type. If left blank, 'WO' will be used.

Printing Shortages

You can choose to print shortage information using two reporting feature programs. You can:

- Print ingredient shortages
- Print all shortages
What You Should Know About

**Warehouse Management Interface**

If you are using Warehouse Management, the system does not include ingredients that have a status of In Warehouse in the Ingredient Shortages report.

**Printing Ingredient Shortages**

From the Periodic Functions – Process menu (G3122), choose Ingredient Shortages.

The Ingredient Shortages report lists the ingredients required to complete a work order and indicates their current availability. The report includes:

- Quantities available
- Quantities on order
- Quantities required
- Quantities short

Use the processing option to print only ingredients that are short. If a short ingredient is on more than one order, a shortage only prints when the on-hand quantity plus on-order quantity minus the required quantity is negative.

You can also generate this report as part of the shop paperwork when you run Order Processing.

### Work Order Component Shortage List

### Processing Options for Ingredient Shortages

**SHORTAGE LIST PRINT INFORMATION:**
1. Enter a ‘1’ to Print only parts with a shortage. If left blank, all selected items will be printed.

### Printing All Shortages

From the Periodic Functions – Process menu (G3122), choose All Shortages.

The All Shortages report lists shortage details for ingredients in the Shortage Maintenance Master table (F3118). Processing options control whether the report contains one or two lines of detail information about each short ingredient. You can set your reporting feature selections to sort and total the information.

Test Yourself: Availability and Shortages

Short Answers

1. What is the main difference between the ingredient availability and the ingredient list inquiries?

2. Where do you define item availability?

3. How do you exclude soft-committed items from being included in the quantity available?

4. From the Ingredients List Inquiry, how do you access the Order Item Shortage window?

True/False

Mark the following statements true or false. For those statements that are false, change them to make them true.

5. The Ingredient Availability form allows you to check availability against the ingredients for a process. True / False

6. The ingredients list displays the ingredients required to complete all processes for a product. True / False

7. Both the Ingredient Availability form and Ingredients List form show the on-hand, required, and available quantities. True / False

8. Quantities in safety stock are always considered on hand. True / False

9. The shortage workbench allows you to locate shortage information for items associated with a work order. True / False

The answers to this Test Yourself are in Appendix B.
Understand Issue Transactions

About Issue Transactions

Regardless of whether you use work orders or rate schedules for processes you produce, you must send the required ingredients sent to the shop floor for production. You must also deduct the quantities that are issued to the shop floor from inventory through an issue transaction. The Shop Floor Control and Manufacturing Accounting systems use issue transactions to determine the actual quantities of ingredients that are used in the production process according to the routing instructions for the work order or rate schedule.

When Do You Issue Inventory?

You do not have to generate an issue transactions at the same time that inventory is physically moved. The J.D. Edwards Shop Floor Control system allows you to choose at what point in the production process you want to generate issue transactions. In other words, you can choose when you want your inventory records to reflect the issue of the ingredients to the work order or rate schedule.

For example, in the case of a short production cycle, you might want to deduct the issued inventory and receive the completed product into inventory at the same time, when you report full completions against the work order or rate schedule. For longer processes, you might need to generate issue transactions at various operations within the routing to minimize the discrepancies between ingredients actually on the shop floor and ingredients for which the inventory lists as being on the shop floor.
How Do You Issue Inventory?

You can choose any of the following methods to issue inventory:

**Manual issues**  
The system deducts ingredients from inventory when you enter the issue transactions on the Issues form.

*See Issuing Ingredients Manually.*

**Preflushing**  
The system automatically deducts ingredients from inventory when you process a work order using the Order Processing program.

*See Issuing Ingredients by Preflushing.*

**Backflushing**  
The system deducts materials from inventory when you report co- and by-products on the work order as complete. This can occur when you report partial completions at points throughout the process or when you report full completions at the last routing operation.

*See Completing a Work Order through Backflush.*

**Super Backflushing**  
The system automatically deducts ingredients from inventory at operations defined as pay points throughout the routing. Super backflush allows you to backflush ingredients and labor hours and report co- and by-products complete at the same time.

*See Processing a Work Order through Super Backflush.*

All of these methods are available when you use work orders. If you are using rate schedules, backflushing is the only method that J.D. Edwards recommends.

The issue transaction forms are similar for work orders and rate schedules. Issue transactions for work orders are conducted on the Issues form. Issue transactions for rate schedules are conducted on the Rate Base Inventory Issues form.

Some issue methods allow you to issue materials without having to display the Issues form. Other methods display the issue transaction for your review before the system records it.

You can perform partial issues by setting up the rate for the week and issuing a backflush daily. For example, if your rate for the week is 10,000, and your daily backflush is 2,000, you can perform a partial issue of 2,000 for five days. On the fifth day, your rate schedule is completed.
The transaction date for issue transactions is the current system date. You can enter a different date. If you issue too much of one ingredient, the system displays an error message. You can either adjust the issue quantity or accept the issue.

Processing options control whether the Operation Sequence and Date Requested fields allow you to enter an issue type code to restrict the items listed for issue.

**From Where Is Inventory Issued?**

Inventory is issued from the location at which it is committed. You can change the commitment location for an ingredient, so that it will be issued from a different location.

If you are issuing a grade or potency controlled item from a lot, and the lot grade or potency rating isn't within the desired range, the system displays a warning message.
What Tables Store Data when Issuing Ingredients?

The following graphic shows the tables that the system updates when you issue inventory.

Shop Floor Control
  Work Order
  Inventory Issues
    (P31113)

  Inventory Management
    Relieve Inventory
    Item Location
      (F41021)

- *Understanding Grade and Potency* for information on issuing ingredients that are grade or potency controlled
Issue Ingredients

Issuing Ingredients

You can issue ingredients without recording a completion to a work order. You can also record scrapped component quantities and the reason for the scrap.

If you have repeated items in the bill of material, make sure that the operation sequence numbers for those lines are unique for the bill of material.

Complete the following tasks:

☐ Issue ingredients by preflushing
☐ Issue ingredients manually (optional)
☐ Record ingredient scrap (optional)

What You Should Know About

Warehouse Management Interface

If you are using Warehouse Management and issuing materials to a work order, the system does not issue any part with a status of In Warehouse. You need to update the status to Out of Warehouse by pick confirmation before the system issues the part.

See Advanced Warehouse Management Guide for information on how to confirm a pick request.
### Blending, filling, and packaging

Work order issues allow you to enter ambient quantities and current temperature and/or density information. The system calculates and stores the standard quantity and weight accordingly.

When you issue inventory to a blending/filling location the system checks the allowed products matrix for an incompatibility between the allowed product from the blending tank and the ingredients list at the time of issue.

The system calls Bulk Products for each item issued that is a bulk product.

When you issue inventory the system allows you to access the Dip Volume Calculator/Meter Readings program to enter readings.

See *Bulk Stock Management Guide*.

### See Also

- *Understanding Grade and Potency* for information on issuing material that is grade or potency controlled
- *About Work Orders in Accounting* in the *Product Costing and Manufacturing Accounting Guide*
Issuing Ingredients by Preflushing

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Order Processing

Preflushing is recording issue transactions for all ingredients required for a process when you process the work order using the Order Processing batch program. This includes ingredients that are not required until the last operation in the routing, which could occur weeks or months in the future. These items are issued at the start date of the work order when you use the Order Processing program, as well.

J.D. Edwards recommends that you do not use the prefushing method unless your process cycle time is short enough to ensure that ingredients are physically moved to the shop floor within the same day that the issue transaction is recorded. If your cycle time is longer than a day, a discrepancy will appear in your inventory records because the ingredients have been deducted from inventory records, but not physically removed from inventory stock.

Before You Begin

☐ Set the issue type code on the ingredients list

What You Should Know About

Issuing prefush items only

You can set a processing option in the Automatic Batch Issue program to issue only prefush items. If you leave this processing options blank, the system prefushes all ingredients associated with the work order.

See Also

• Processing Work Orders for the processing options for Order Processing

What You Should Know About Processing Options

Inventory Issue Information (17)

Specify the DREAM Writer version of batch inventory issues to execute. If you leave this option blank, the system does not call the Inventory Issues program.
Issuing Ingredients Manually

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Inventory Issues

You can issue ingredients manually either from one location or from multiple locations, if you specify ingredient quantities to be used from several locations. You use the Inventory Issues form to issue ingredients associated only with a work order. To issue material associated with a rate schedule, you use the Rate Base Inventory Issues form. The steps for working with both forms is the same.

You can also use the Inventory Issues program to change the commitments that the system recorded. When you change commitments, the system displays an error message if the quantities do not add up to the total quantity required. It also adjusts the available balance for any locations in which you changed the quantity committed.

Complete the following tasks to manually issue ingredients:

- Issue ingredients from a single location
- Issue ingredients from multiple locations (optional)

What You Should Know About

Issuing ingredients for a process quantity

Use the Issue Ingredients For field to issue ingredients for a parent quantity, which indicates how many sets of parts are needed. The Quantity Issued field indicates the quantity of each ingredient that the system deducted from inventory.

Reversing an issue transaction

To reverse an issue transaction, change the ingredient quantity that you want to reverse to a negative number. The system decreases the amount in the Quantity Issued field for the ingredient by the amount of the reversal.

Closing out ingredients

To close out ingredients that you no longer need, change the ingredient using the Close Out selection. “Closed” appears in the Issues field for any ingredient you close out.

Assigning serial numbers

If you did not assign a serial number to any of the assemblies on your work order at order entry, you can assign them during inventory issues.
**Associating components**  You can associate components to a specific serialized assembly during inventory issues. If you do not know the assembly number, choose Retrieve Work Order LSNs to view numbers previously assigned to work order assemblies.

**To issue ingredients from a single location**

On Inventory Issues

![Inventory Issues](image)

1. Complete the following fields:
   - Order Number
   - Branch/Plant
2. Complete the following optional fields:
   - Status
   - Issues
3. Review the following default information:
   - Unit of Measure
4. Access the detail area.
5. Review the following default information:
   - Location
   - Lot

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit of Measure</td>
<td>A user defined code (system 00/type UM) that identifies the unit of measurement for an amount or quantity. For example, it can represent a barrel, box, cubic yard, gallon, an hour, and so on.</td>
</tr>
</tbody>
</table>

   *Form-specific information*

   If you leave this field blank, the system uses the value from the Parts List table and updates the quantities in the Item Location table in the primary unit of measure.
To issue ingredients from multiple locations

This task is only necessary to issue ingredients from different locations than what is listed on the Inventory Issues form.

On Inventory Issues

1. Complete the following field:
   - Order Number
2. Choose Select Multiple Locations.

3. On Select Multiple Locations, review the following default information:
   - Quantity
   - Location
   - Lot
   - Branch/Plant

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quantity Available</td>
<td>The quantity available can be the on-hand balance minus commitments, reservations, and backorders. Availability is user defined and can be set up in branch/plant constants.</td>
</tr>
</tbody>
</table>
UPDATE INFORMATION:
1. Enter the Document Type associated with an Inventory Issue.
2. Enter the Status Code for update to the Work Order Header. If left blank, the header will not be updated.
3. Enter the default value for the Material Status Code. If left blank, Material Status will not be updated.
4. Enter the Status Code beyond which Issues cannot be made.

INQUIRY INFORMATION:
5. Enter a 1 to display only valid Issue Type Codes. If left blank, all Parts List items will be displayed.
6. Enter a 1 to preload all screen detail lines with the Process Issue selection option value.

OPERATION SEQUENCE & DATE INQUIRY:
7. Enter a 1 to display operations that ‘Equal’ the entered Operation Sequence only. If left blank, the value will be used as a ‘Skip To’.
8. Enter a 1 to display operations that ‘Equal’ the entered Requested Date only. If left blank, the value will be used as a ‘Skip To’.

EDIT INFORMATION:
9. Enter a 1 to give an error if the quantity on hand is negative. (Blanks will not give an error.)

ITEM SALES HISTORY INFORMATION:
10. Enter a 1 to update Item Sales History (F4115).

HOLD CODE TO ISSUE:
11. Enter the lot hold codes (up to 5) that are acceptable for inventory issues, or enter a * to allow issues to all held lots. Blanks will not allow issues to held lots.

VERSION CONTROL:
12. Enter the Version of Shortage Maintenance to be called. If left blank, version ‘ZJDE0001’ will be used.

UNPLANNED ISSUES:
13. Enter 1 to allow for unplanned issues.

LOT NUMBER:
14. Enter 1 to protect the lot number.
from entry.

PROCUREMENT INFORMATION:
14. Enter the document type for purchase orders. (Default is ‘OP’)
15. Enter the version of the Open Purchase Order program (P430301) to call. If left blank, version ‘JDE0007’ will be used.
16. Enter the default route type to be used to search for a receipt route. (Default is ‘OT’)

RECEIPT ROUTINGS:
17. Enter the value of the default route to be used for items without a receipt routing.
18. Enter the version of Receipt by PO/Item/Account to call. If left blank, version ‘ZJDE0008’ will be used.
19. Enter the version of Move and Disposition to call. If left blank, version ‘ZJDE0002’ will be used.

Recording Ingredient Scrap

From Shop Floor Control (G31), choose Process Daily Order Preparation
From Daily Order Preparation - Process (G3113), choose Ingredient Scrap

Use the Ingredient Scrap program to record scrapped quantities of ingredients in the Item Ledger (The CARDEX) table and the Shop Floor Control Parts List table (F3111). The Item Ledger provides an audit trail of the quantity scrapped and the reason for the scrap transaction.

When you use the Ingredient Scrap program, note the following important information:

- You cannot scrap ingredients unless they have been issued to a work order.
- The total quantity scrapped for an ingredient cannot exceed the total quantity issued to the work order.
- Negative transactions are allowed unless the transaction quantity would cause a negative issue.
- You can enter scrap transactions in any unit of measure. The scrapped quantity is converted to the unit of measure of the
ingredients list and rounded to one whole unit of measure when the system updates the Shop Floor Control Parts List table (F3111).

What You Should Know About

**Resources**

The header information displayed is from the Work Order Master table (F4801). The subfile information displayed is from the Shop Floor Control Parts List table (F3111).

**Display formats**

Use a processing option to specify which format the system displays:

- Order number format displays all ingredients for the specified work order.
- Ingredient format displays all work orders that the ingredient is associated with.

► To record ingredient scrap

On Ingredient Scrap

1. Complete the following fields:
   - Item Number
   - Branch/Plant

2. Access the detail area.
3. Complete the following optional fields:
   - Reason Code
   - Explanation
   - Date

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reason Code</td>
<td>A user defined code (system 42/type RC) that explains the purpose for a transaction. For example, you can indicate the reason that you are returning items, such as the goods were damaged in shipment or too many goods were shipped.</td>
</tr>
<tr>
<td>Explanation – Transaction</td>
<td>This text identifies the reason that a transaction occurred.</td>
</tr>
</tbody>
</table>
Processing Options for Ingredient Scrap

DEFAULT FORMAT:
1. Enter a ‘1’ for Item Number entry. Blanks will default to Work Order Number entry.

DEFAULT VALUES:
2. Item Ledger Transaction date. (Blanks will default to the current date).

4. Enter the document type associated with the Component Scrap Transaction.

SERIAL NUMBER PROCESSING:
5. Enter the Document type used for Serial Number Issues. If left blank ‘IM’ will default.

Exercises
See the exercises for this chapter.
Schedule Work Orders

Scheduling Work Orders

As part of your scheduling activities, you can monitor work order progress, manage work order releases, and update the status of any order to keep your material planning schedule valid. When you work with schedules, you can display manufacturing work orders by item, planner, customer, parent work order, status, type, and priority, or a combination of these. You can also display work orders by start date or requested date and you can enable the system to sort them by either start date or requested date. You can set these defaults for the form in the processing options.

Processing options also determine the default values for various fields and control which versions of associated programs are used when you access them. You can also access related information, such as work orders, sales orders, purchase orders, ingredients lists, and routing instructions.

After a work order is on the shop floor, you must review the order and check capacity at each work center that the order is scheduled to go through. You might need to change a schedule to keep the Material Requirements Planning and Master Production Scheduling schedules valid.

Scheduling work orders includes the following tasks:

- Reviewing work order information

- Revising work order information (optional)

- Printing scheduling information for a work center (optional)

See Also

- Appendix C — Leadtimes for information on how the system calculates leadtime for a work order

11. **Completion to Inventory**
12. **Super Backflushing**
13. **Payroll (optional)**
Reviewing Work Order Information

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Shop Floor Workbench

After a work order is on the shop floor, you must review the order and check capacity at each work center that the order is scheduled to go through. When you review a work order, you can change the status, type, priority rating, freeze code designation, or type of flash message.

To review work order information

On Shop Floor Workbench

1. Complete the following field:
   - Branch/Plant
2. Complete the following optional fields:
   - Document Type
   - Phase/Matter Code
   - Category Code 2
   - Category Code 3
   - Work Order/ECO Type
   - Work Order Priority
   - Branch/Plant
   - Process/Item
   - Planner
   - Customer
   - Parent Work Order Number
   - Status From
   - Status Through
   - Search Cross Reference

3. Access the detail area.

4. Complete the following optional fields:
   - Freeze Code Designation
   - Type of Flash Message
Schedule Work Orders

<table>
<thead>
<tr>
<th>Field</th>

</tr>
</tbody>
</table>

Revising Work Order Information

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Shop Floor Workbench

After you review work order information, you might need to revise some of the information.
To revise work order information

On Shop Floor Workbench

1. Complete the following optional fields:
   - Status
   - Work Order/ECO Type
   - Work Order Priority

2. Access the detail area.

3. Complete the following optional fields:
   - Freeze Code Designation
   - Type of Flash Message

You can use the selection exit to access the work order and make any additional changes.

Processing Options for Shop Floor Workbench

DREAM WRITER VERSIONS
Enter the Dream Writer version to use when calling each program listed. If left blank, version ‘ZJDE0001’ will be used.

1. Sales Order Inquiry (P42045) ____________
2. Purchase Order Inquiry (P430301) ____________
3. Work Order Completions (P31114) ____________
4. Work Order Entry (P48013) ____________
5. Sales Order Entry (P4211) ____________
6. Purchase Order Entry (P43111) ____________

DISPLAY OPTIONS:
7. Enter a ‘1’ to display Requested Date or enter a ‘2’ to display Start Date. (Default is ‘1’).

8. Enter a ‘1’ to sequence the records by Requested date. Enter a ‘2’ to sequence the records by Start date. If left blank, the sequence will be based on values for the Customer, Parent Work Order Number, Cross Reference, Item or Planner fields.

SCREEN DEFAULTS:
9. Enter defaults for the following:
   a. Category Code 1 ____________
   b. Category Code 2 ____________
   c. Category Code 3 ____________
   d. Type ____________
   e. Priority ____________
   f. Planner Number ____________
   g. From Status ____________
   h. Thru Status ____________
i. Item Number
j. Customer Number
k. Search Cross Reference

Work with Hours and Quantities

As you work to produce the process on a work request, you need to record the hours spent on production and the number of co-/by-products completed in that time. This allows you to monitor progress and actual costs and compare them against the standard hours and quantities you estimated for the job.

If your estimates are fairly accurate, you can have the system automatically enter the standard values for you at various points in the routing. Or, you can have all of your employees individually enter their time and quantities completed.

The Shop Floor Control system interfaces with the J.D. Edwards Payroll system so that you only have to enter an employee’s hours and quantities produced once. The single entry saves time and reduces the risk of data entry error, while ensuring that data across your systems is consistent.

The information is recorded in the Payroll system as well as against a work order in the Manufacturing system. The hours and quantities can be applied to a specific work order so you can maintain accurate manufacturing accounting and costing data. You can record hours and quantities per work order or per employee, to accommodate both piece-work and hourly rate employees.

The Shop Floor Control system manages hour and quantity information in the same whether you enter it on the Hours and Quantities Entry form or the Payroll Time Entry form. If you want to interface with the Payroll system, you should use the Payroll Time Entry form to enter hours and quantities information.

After you enter hours and quantities, either manually or through payroll time entry, you can review and revise them before you post them to the Manufacturing system for further tracking and cost accounting. You can review the hours and quantities either online or using a report.

Working with hours and quantities includes the following tasks:

- Entering hours and quantities manually
- Entering hours and quantities through payroll time entry (optional)
- Updating hours and quantities
- Reviewing hours and quantities transactions (optional)
What You Should Know About

Changing the status
When you change the status of a routing operation, the change does not take effect until you run the Hours and Quantities Update to update the Shop Floor Control Routing Instructions table (F3112).

Resources
The header information comes from the Work Order Master table (F4801). The detail information is stored in the Work Order Time Transactions table (F31122).

Quality Management test results
As you record actual hours and quantities to a work order, you can:

- Access the Test Results Entry form for completed items that require testing.
- Access generic text for the parent item.
- Set processing options for default lot, work order and operation statuses.

See Working with Test Results in the Quality Management Guide for more information.

See Also

- About Work Orders in Accounting in the Product Costing and Manufacturing Accounting Guide
Where in the Process Do You Enter Hours and Quantities

1. Work Orders and Rates
2. Attach Rates
3. Routing Instructions and Ingredients List
4. Perform Commitments
5. Availability
6. Pick/Issues
7. Schedule Work
8. Record Hours and Quantities
9. Payroll (optional)
10. Post
11. Completion to Inventory
12. Super Backflushing
Entering Hours and Quantities Manually

From Shop Floor Control (G31), choose Process Daily Order Reporting.

From Daily Order Reporting – Process (G3114), choose Hours & Quantities Entry.

Use the Hours and Quantities program to charge actual hours and quantities to a work order. You can use the processing options to display the information in order number format or employee number format. Use these formats to record time and quantities for employees against work order routing steps or work order routing steps against employees.

Note the following important information about entering hours and quantities:

- Enter the quantity completed only once per operation sequence number. Entering it for each type of hours will cause a variance amount.
- Enter the hours using begin and end times for each entry or the actual hours up to 2 decimal places.
- To reverse completed or scrapped quantities you have entered, enter the quantity you want to reverse as a negative quantity.

To enter hours and quantities manually

On Hours and Quantities – Order Number format
1. Complete the following fields:
   - Work Date
   - Shift
   - Order Number
   - Operation Sequence Number
   - Type of Hours
   - Hours
   - Quantity
   - Unit of Measure
   - Status

2. Access the detail area.

3. Complete the following optional fields:
   - Miscellaneous Dollars
   - Employee Rate
   - Equipment Rate
   - Reason Code
   - Explanation
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Date</td>
<td>A date that identifies the financial period to which the transaction is to be posted. The general accounting constants specify the date range for each financial period. You can have up to 14 periods. Generally, period 14 is for audit adjustments. The system edits this field for PBCO (posted before cutoff), PYEB (prior year ending balance), and so on.</td>
</tr>
</tbody>
</table>
| Op Seq    | In routings, this number is used to sequence the fabrication or assembly steps in the manufacture of an item. You can track costs and charge time by operation. In bills of material, this number designates the routing step in the fabrication or assembly process that requires a specified component part. You define the operation sequence after you create the routing for the item. The Shop Floor Control system uses this field in the backflush/preflush by operation process. In engineering change orders, this number is used to sequence the assembly steps for the engineering change. Skip To fields allow you to enter an operation sequence that you want to begin the display of information. You can use decimals to add steps between existing steps. For example, use 12.5 to add a step between steps 12 and 13.  

\[\textit{Form-specific information}\]  
This is the sequence number of the routing step on the work order. You must enter this number. |
| T H       | A code to indicate the type of time entered. Valid codes are:  
1. Run Labor Hours  
2. Setup Labor Hours  
3. Machine Hours  
4. Quantities Completed  
5. Quantities Scrapped  
6. Miscellaneous (piece rate bonus and so forth) |
<p>| Hours     | The number of hours associated with each transaction. |
| Misc. Dollars | The actual gross pay amount for an employee. This is to be distinguished from the distributed gross pay amount used for labor distribution. See data item DPAY. When using Work Order Time Entry, use this field to record miscellaneous pay for an employee, such as piece rate bonus. The employee's insurable gross pay for the listed pay period. |</p>
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Rate</td>
<td>A code that represents the amount you want to charge the job. Each piece of equipment can have numerous billing rates based on the rate code. The equipment billing rate can be composed of up to ten different rates. For example: Billing Rate = 200 100 Rate 1 (Ownership Component) 25 Rate 2 (Operating Component) 50 Rate 3 (Maintenance Component) 25 Rate 4 (Other Costs Component) When you post time entries to the General Accounting system, the system recognizes credits in revenue accounts for each of the rate components. This allows you to separate portions of the equipment billing by type of cost. NOTE: You are not required to use rate components.</td>
</tr>
<tr>
<td>Explanation</td>

</table>

**Processing Options for Hours & Quantities**

**DISPLAY INFORMATION:**
1. Enter a ‘1’ for the screen to be displayed in Order Number format. If left blank, the screen will be displayed in Employee format.

**UPDATE INFORMATION:**
2. Enter the Document Type associated with Shop Floor Activity.

**EDIT INFORMATION:**
3. Enter the Status Code beyond which Shop Floor Activity cannot be entered.
4. Enter a ‘1’ to verify that, for a given operation, the total of the quantity completed plus scrapped does not exceed Quantity At Operation.
5. Enter a ‘1’ to prevent employee rate from being written to screen.

**QUALITY MANAGEMENT:**
6. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ZJDE0002 will be used.
Entering Hours and Quantities through Payroll Time Entry

From Shop Floor Control (G31), choose Process Daily Order Reporting

From Daily Order Reporting – Process (G3114), choose Payroll Time Entry

The manufacturing interface to the Payroll Time Entry form lets you enter payroll information plus additional manufacturing information that appears on the Hours and Quantities Entry form. On the Payroll Time Entry form, you can:

- Designate hours as setup, labor, or machine related, and record them against a specific routing operation for the process
- Record the quantity of pieces completed and scrapped by the employee against a specific routing operation for the process
- Update the status of a routing operation for a process

You can use processing options to enter:

- A work order status code beyond which entries to the work order cannot be made
- The document type associated with shop floor activity
- The version of the Hours and Quantities form to access

The system concurrently enters the entries you make on the Payroll Time entry form on the Hours and Quantities form. After you have entered the data into the Payroll system, you can process it.

Before You Begin

☐ Verify that your J.D. Edwards Payroll system is set up and running

What You Should Know About

Processing hours and quantities

To process the information into the Manufacturing system, you must run the Hours and Quantities Update. This updates the Shop Floor Control Routing Instructions table (F3112) and supplies the manufacturing accounting programs with the current data. After you run this program, you will not be able to locate the data on Hours and Quantities. Before the data is updated, you can locate it and change it on either entry form, as necessary.
To enter hours and quantities through payroll time entry

On Payroll Time Entry

![Payroll Time Entry screenshot]

Complete the following fields:

- Employee
- Date
- Order Number
- Operation Sequence Number
- Type
- Beginning Hours
- Ending Hours
- Units
- Unit of Measure
- Status
- Hourly Rate

Processing Options for Payroll Time Entry

1. Enter ‘E’ to use the Employee Occupational Pay Rate Table or Enter ‘U’ to use the Union Rate Table. If neither ‘E’ nor ‘U’ is
entered, blank is the default and
the Employee Master hourly rate will
be used.

2. If the Union Table is selected, Enter
the Pay Type to be used for each of
the following categories. If the
Occupational Table is selected, only
enter the Pay Type for “Regular”.
  Regular    - Blank
  Overtime   - A
  Doubletime - B
  Tripletime - C
  Holiday    - D

3. Enter ‘1’ to have batch numbers
automatically assigned. (F13=Invalid)

4. Enter ‘1’ to have heading date and
batch to be loaded from the first
subfile record.

5. Enter ‘1’ to display batch statistics
on request.

6. Enter ‘1’ to prevent changes and
deletes to records locked to another
user.

7. Enter ‘1’ to edit Pay Type from
Classification/Pay X-Ref.

8. Enter ‘1’ to use Zero Billing Rate.

9. Enter ‘1’ to load Pay Type Desc.
   into Explanation field (YTEXR).

------MANUFACTURING INFORMATION------

10. Enter the Document Type associated
    with Shop Floor Activity.

11. Enter the Status Code beyond which
    Shop Floor Activity cannot be
    entered.

12. Enter the Version of Shop Floor
    Hours and Quantity Entry to call.
    (Default is version ZJDE0001)

13. Enter a ‘1’ to use the Employee Pay
    Instructions Table – P06106. If left
    blank, the Employee Master hourly
    rate will be used.

14. Enter a ‘1’ for HH:MM:SS format. If
    left blank, decimal format will be
    used (HH.MM).

------ BILLING RATE SELECTION ---------

15. Leave Blank if special currency
    logic is not to be used in the
    billing rate retrieval.
Work with Hours and Quantities

Enter a ‘1’ to use the Cost Plus Markup Table to retrieve the billing rate. If no billing rate is found an error message will be issued.

Enter a ‘2’ to use the Cost Plus Markup Table to retrieve the billing rate. If no billing rate is found, for the domestic currency only, use the Payroll Billing Rate Tables to retrieve the billing rate.

***Note***
An error message will be issued if a billing rate is not found.

Updating Hours and Quantities

To process the hours and quantities into the Manufacturing system, you must run the Hours and Quantities Update batch program. This updates the Shop Floor Control Routing Instructions table (F3112) and supplies the manufacturing accounting programs with the current data. After you run this program, you cannot locate the data on the Hours and Quantities form. Before the data is updated, you can locate it and change it as necessary.

You can post hours and quantities transactions in the Manufacturing system by:

- Running the Hours and Quantities Update batch program from the menu
- Selecting the online update from the Hours and Quantities form

The method of posting you use depends on how you enter the transaction data.

- If you use Super Backflush to enter hours and quantities, the quantities transactions are posted real time. However, you must run the update to post the hours. Super Backflush enters the transactions for you at the point in the routing that you specify.
- If you enter the data on the Payroll Time Entry form, or run Super Backflush, you must either run the update or locate the data on the Hours and Quantities Entry form, and then use the online update selection.
- If you enter the transaction data on the Hours and Quantities Entry form, you can use the menu selection or the online update selection to run the update.

Complete the following tasks:

- Update hours and quantities manually
- Update hours and quantities by batch
Before You Begin

- Enter the hours and quantities transaction data

What You Should Know About

Using quantities at operation for intermediates

For the Hours and Quantities Update program, when the system updates the quantity completed or scrapped for an operation in the routing table, the system deducts the quantity from the operation and adds it to the next operation. If the next operation has an intermediate, the system converts the quantity added to the intermediate unit of measure.

To update hours and quantities manually

From the Daily Order Reporting – Process menu (G3114), choose Hours & Quantities Entry.

On Hours and Quantities

Complete the following field:

- Order Number/Employee Number
The system only posts the records that are in the current entry session. Therefore, if you exited the form after you entered the transaction data or entered it on the Payroll Time Entry form, you must locate the data on the Hours and Quantities form, and change the records to make them current to the system.

The update takes the hours and quantities recorded against work order operations and updates them to their matching fields in the Shop Floor Control Routing Instructions table (F3112). After the update, the form clears and the records that were processed no longer appear. The system enters a P in the Processed Code field for each entry it updates so that the record cannot be updated again.

To update hours and quantities by batch

From the Daily Order Reporting – Process menu (G3114), choose Hours & Quantities Update.

You should only update those records that have not yet been posted. Records that have not been posted have a blank Processed Code field. Run the reporting version to post the transactions.
Reviewing Hours and Quantities Transactions

After you enter hours and quantities, either manually or through payroll time entry, you can review and revise them before you post them to the Manufacturing system for further tracking and cost accounting. You can review the hours and quantities either online or using a report.

Complete the following tasks:

- Review the status of hours, quantities, and operation quantities
- Review the hours and quantities report

To review the status of hours, quantities, and operation quantities

From the Daily Order Reporting – Process menu (G3114), choose Production Status.

The Production Status program allows you to review the status of all work orders by work center, item number, or order number within status and date ranges. This program displays historical and work remaining information.

On Production Status

1. Complete the following fields:
   - Work Center/Line
   - Item Number
   - Branch/Plant

2. Complete the following optional fields:
   - Order Number
   - Status
   - Date Range

3. Access the detail area.
To review the hours and quantities report

From the Daily Order Reporting – Process menu (G3114), choose Hours & Quantities Proof.

The Hours and Quantities Proof report lists all labor hours and completed quantities recorded against a work order. You can total the hours and quantities in various ways, such as by employee, work order, item, operation, and so forth.

Using the Hours and Quantities Proof, you can print the hours and quantities transactions that have been entered and review them before you post them to the system. Before they are posted, the transactions can be changed and updated. After you post them, they cannot be changed.
Complete Work Orders

Completing Work Orders

When you finish production of a process on the shop floor, you need to record the completions to inventory in the system. The completion transactions that you enter in the Shop Floor Control system update the ingredient quantity records in the Inventory Management system.

You use the Super Backflush or Completion programs to record completions. Use these programs to perform one of two functions:

- Report all co-products and by-products as complete after the entire work order is complete
- Report partial completions as they occur throughout the production process

When you choose to report completions depends on the process, the co-products and by-products it produces, and your cycle time. Depending on the nature of the manufactured item, you can report partial completions or report total completions in one transaction. Reporting partial completions also can indicate the stage or progress that is being made on an order in production, and identify any delays in the production process.

When you use the Completions program to complete more than the quantity ordered, the system highlights the Completed Quantity field and warns you that completing the quantity you designated will generate an overcompletion.

If a previous completion exists for a work order, the system displays information in the lot, grade or potency, and status fields. Also, if you enter a quantity, the system adds inventory to the lot at the grade or potency and the current status.
The following graphic displays the tables updated after completions.
Completing work orders includes the following tasks:

- Completing work orders without backflushing  
- Completing a work order through backflush (optional)  
- Completing partial quantities on a work order (optional)  
- Processing work orders through super backflush (optional)  
- Processing a work order using quantity at operation (optional)  
- Completing a work order with serialized components (optional)

**What You Should Know About**

**Lot processing**  
If lot processing is used, the system assigns the lot number according to the rules set up for lot control.

*See Understanding Lot Processing.*

If grade and potency is used, this data item displays and the standard from the Item Branch table. The standard can be overridden.

**Blending, filling, and packaging**  
When you complete a work order to a blending, holding, or storage tank, the system checks the tank capacity and displays an error if the completion would exceed the tank's capacity.

When you complete a work order with co-/by-products with lube oil blending, the system verifies the blending tank contains the correct product group. The system uses the completion location from the Work Center Master file (F30006). The system also displays the bulk information format specified in the ECS (Energy Chemical Systems) constants.

When you complete inventory the system allows you to access the Dip Volume Calculator/Meter Readings program to enter readings.

Work order completions allow you to enter ambient quantities and current temperature and/or density information. The system calculates and stores the standard quantity and weight accordingly.

*See Bulk Stock Management Guide.*
If you process transactions for a branch/plant that uses warehouse control, the Location Detail window appears when you enter backflush transactions and a second location detail information record is created. In this case, you select Location Detail Information records for processing. To ensure that the quantities in the Location Detail Information table (F4602) are consistent, you should make a selection from the window.

The original quantity being processed through this transaction program, using the Location Detail window, displays in the top of the Super Backflush window.

If the item being processed has a unit of measure structure or storage containers, the system enters them in the detail area of the Location Detail window. Although you can override these values, the system performs the following edits:

- The primary unit of measure in the structure and the last level specified are valid based upon unit of measure conversions in Item Master.
- The units of measure display from largest to smallest.
- The structure must result in whole number conversions between units of measure.
- Each unit of measure can only contain one partial quantity for that unit of measure.
- You can only overfill pallet type units of measure as defined in the Unit of Measure Definition by Item or by Item Group.

The system always displays this window when adding inventory to the branch/plant, except in the following case:

- Removal of inventory and only one location detail record is in the location. The removal is automatically performed to the single location detail.
Quality Management test results

As you enter work order completions, including quantity completed and quantity scrapped, you can:

- Access Test Results Entry for any items requiring testing upon completion.
- Review work order generic text.
- Set processing options for default lot, work order and operation statuses.

As you backflush labor and ingredients for a work order, you can:

- Access Test Results Entry for any items that require testing.
- Access generic text for the parent item and operations.

See Working with Test Results in the Quality Management Guide for more information.

See Also

- Understanding Lot Processing
- Quality Management Guide

Completing Work Orders without Backflushing

From Shop Floor Control (G31), choose Process Daily Order Reporting.

From Daily Order Reporting – Process (G3114), choose Partial Completion.

You can use the Completion program to record completed quantities for a work order, without backflushing the ingredients, in one of two ways:

- Full completion allows you to complete all quantities for all ingredients on a work order.
- Partial completion allows you to complete parts of the quantity ordered for a work order.

The form displays completed and scrapped quantities and percent complete information for a work order.
To complete work orders without backflushing

On Partial Completion

1. Complete the following fields:
   - Order Number
   - Quantity Complete
   - Quantity Scrapped
   - Date Complete
   - Status
   - Lot Status

2. Complete the following fields if you are completing to a location other than the primary location:
   - Location
   - Lot

The Co-/By-Products Completions form appears.
3. On Co/By Product Completions, complete the following fields:
   - Completed Quantity
   - Scrapped Quantity

### Processing Options for Work Order Inventory Completion

**INVENTORY INTERFACE:**
1. Enter the Document Type associated with an Inventory Completion.
2. Enter the Document Type associated with an Inventory Scrap.

**WORK ORDER ISSUES:**
3. Enter a ‘1’ to call the Work Order Issues program after a successful inventory completion execution.
4. Enter the DREAM Writer version of Work Order Issues to be called. If left blank, version ‘ZJDE0001’ will be used.

**WORK ORDER HEADER:**
5. Enter the status code for update to
the work order header. (optional)

EDIT INFORMATION:
6. Enter the status code beyond which completions may not be made.

LOT HOLD CODES:
7. Enter the lot hold codes (up to 5) to allow completions to, or enter a ‘*’ to allow completions to all held lots. If left blank, completions will not be allowed to held lots.

SALES ORDER OPTIONS:
8. Select one of the following:
   1 – Sales Order Number will default to the Work Order Completion Lot.
   2 – Sales Order Number will default to the Work Order Completion Location and the Sales Order Line Number will default to the Work Order Completion Lot.
   3 – Work Order Number will Default to the Work Order Completion Lot.
9. Enter a ‘1’ to update the Sales Detail fields (Lot Number & Location) as defined in Option 8. If left blank, Sales Detail will not be updated.
   NOTE: Processing Option 9 must be used in conjunction with Processing Option 8. If Option 8 is blank, Option 9 must also be blank.

10. Enter an override Sales Order Next Status or leave blank to use the Sales Order Next Status from the Order Activity Rules.
11. Enter a ‘1’ to update the Sales Next Status Code on the related sales order.

12. Enter a ‘1’ to display the Back-Order Release screen for completed backordered items. If left blank, backordered sales orders will not be displayed.

13. Enter the DREAM Writer version of Backorder Release (P42117) to be called. If left blank, version ‘ZJDE0001’ will be used.

SHORTAGE WORKBENCH:
14. Enter the DREAM Writer version of Shortage Workbench to be called. If left blank, version ‘ZJDE0001’ will be used.

RECEIPT ROUTING:
15. Enter a ‘1’ to initiate the receipt routing process. If left blank, all items will be completed.
directly into stock.

LOT/SERIAL NUMBER OPTIONS:
16. a. Enter a '1' to allow overriding the Lot/SN upon completion.
   b. Enter a '1' to protect the Lot/SN from entry. If left blank, the Lot/SN will remain input capable.

WORK ORDER ENTRY:
17. Enter the DREAM Writer version of Work Order Entry to be called.
   If left blank, version 'ZJDE0001' will be used.

PROCESS MANUFACTURING OPTIONS:
18. Enter a '1' to allow unplanned co- and by-product completions.
19. Enter '1' to issue ingredients for each co- or by-product separately. If left blank, ingredient issues will be consolidated for the process.

WAREHOUSE PROCESSING:
20. Enter the Directed Putaway mode:
   Blank – No Directed Putaway Requests
   1 – Request Putaway only
   2 – Request Putaway and process using the subsystem
21. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used.
   If left blank, ZJDE0001 is used.
   (See Form ID P46171).

SERIAL NUMBER PROCESSING:
22. Enter a '1' to allow a completion to a serial number that exists in the system with a zero quantity.
23. Enter a '1' to default to multiple associations format window. If left blank, single format will default.
24. Enter the Document Type used for Serial Number Issues. If left blank, 'IM' will default.

QUALITY MANAGEMENT:
25. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ZJDE0002 will be used.

BRANCH/PLANT CONTROL:
28. Enter a '1' to display the completion Branch/Plant field.
Completing a Work Order through Backflush

Use the Completion with Backflush program to record full or partial completions while backflushing the ingredients. Running this program completes the quantity to stock.

You use backflushing to report the issue transactions for ingredients you use in a process after the co-products and by-products of the process are produced. Therefore, backflush issue transactions occur when you report partial or full completions of co-products and by-products on a work order.

You must identify the percentage of the ingredients that the system issues to a specific co-/by-product. If there are co-/by-products at the final operation, their resource percent must equal 100 for the system to issue all ingredients.

Example: Feature Cost Percent

In the following example:

- Cumulative cost = cost this operation + cost of previous operation – cost of the co-/by-product produced in the previous operation.
- The total of all percentages at an operation cannot exceed 100%.
- The total of all percentages at the last operation must equal 100%.

<table>
<thead>
<tr>
<th>Operation</th>
<th>Co-/By-Product</th>
<th>%</th>
<th>Cost This Operation</th>
<th>Cumulative Cost</th>
<th>Co-/By-Product Cost</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>

Completing a work order through backflush consists of:

- Setting the resource percent for the co- and by-products
- Completing a work order
- Releasing sales backorders during completions (optional)
- Managing completions using receipts routing (optional)
Before You Begin

- Set the appropriate processing options to access the Inventory Issues program and to identify the version to use

- Before you release backorders during completion, set processing options to enable the backordered sales orders to appear and to identify the version of the Backorder Release program to use

- Before you can manage completions using Receipts Routing, set a processing option to initiate the receipt routing process

- Set the appropriate processing options to issue ingredients for each co-product and by-product separately, and allow completion of unplanned co-products and by-products

To set the resource percent for the co- and by-products

From the Daily PDM Process menu (G3012), choose Enter/Change Process.

On Enter/Change Process

1. Choose Co/By-Product Revisions.

2. On Process Resource Revisions, access the detail area.
3. Complete the following optional field:
   - Resource Percent

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Co/By-Product/Intermediate</td>

</tr>
<tr>
<td></td>
<td>This value specifies the quantity of each co-/by-product that the process produces. If you use batch bills, this is the quantity that the batch produces.</td>
</tr>
<tr>
<td>Feat Cost %</td>
<td>A percentage used by the Simulate Cost Rollup program to calculate the cost of a feature or option item as a percentage of the total cost of the parent. Enter the percentage as a whole number: 5% as 5.0</td>
</tr>
<tr>
<td></td>
<td><strong>Form-specific information</strong></td>
</tr>
<tr>
<td></td>
<td>This value is used in Cost Rollup to calculate what percent of the cost, up to and including the operation, that the co-/by-product comes out of, is apportioned to the co-/by-products at that step. The total of all percentages at an operation cannot exceed 100%. The total of all percentages at the last operation must equal 100%.</td>
</tr>
<tr>
<td>Resource %</td>
<td>If this option is chosen, this value indicates what percent of the ingredients should be issued separately to co-products and by-products.</td>
</tr>
<tr>
<td></td>
<td><strong>Form-specific information</strong></td>
</tr>
<tr>
<td></td>
<td>This is used to issue ingredients separately to co-/by-products at work order completion, rather than a total issue for each ingredient. For co-/by-products at the final operation, their resource percent must equal 100 to issue all ingredients.</td>
</tr>
</tbody>
</table>
To complete a work order

From the Daily Order Reporting – Process menu (G3114), choose Completion with Backflush.

On Completion with Backflush

1. Complete the following fields:
   - Order Number
   - Quantity Complete
   - Quantity Scrapped
   - Date Complete
   - Status
   - Lot Status

2. Complete the following fields if you are completing to a location other than the primary location:
   - Location
   - Lot

The Co-/By-Products Completions form appears.
3. On Co/By-Product Completions, make any necessary changes in the following fields:
   - Completed Quantity
   - Scrapped Quantity

4. Access the detail area.

5. Review the following field:
   - Resource Percent

   The resource percent is the percentage of the ingredients to be issued to the co-/by-product you identified on the Process Resource Revisions form.

   If you are using lot processing, the system assigns the lot number according to the rules set up for lot control. If you are using grade or potency, the system displays the data item using the standard from the branch/plan. However, you can override this value. After you enter the appropriate changes, the system re-displays them for you.
After you accept the record, the system updates the on-hand inventory for the co-/by-products. The Inventory Issues form appears, for each co-/by-product, to issue the ingredients separately to each co-/by-product, if you set the processing option on the Completions program.
<table>
<thead>
<tr>

<tr>
<td></td>
<td>The system displays the value from the Process Resource Revisions window (P3002P). If there are co-/by-products at the final operation, their resource percent must equal 100 to issue all ingredients.</td>
</tr>
</tbody>
</table>
To release sales backorders during completions

From the Daily Order Reporting – Process menu (G3114), choose Completion with Backflush.

The J.D. Edwards Sales Order Management system identifies items that are being manufactured as backordered items. When you complete the items in the Shop Floor Control system using the Completions program, you can release the sales order backorders.

On Completion with Backflush

1. Complete the work order by accepting the records displayed.

   The Back Order Release form appears.

2. On Back Order Release, review the following default information:
   - Order Number
   - Order Type
   - Item Number
   - Quantity Backordered
   - Quantity To Ship

If the available quantity plus the amount being received is enough to fill any or all of the backorders, the system enters the amount for that order in the Quantity to Ship field on the Back Order Release form.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Units – Qty Backordered/Held</td>
<td>The number of units backordered in Sales Order Management or in Work Order Processing, using either the entered or the primary unit of measure defined for this item.</td>
</tr>
</tbody>
</table>

#### To manage completions using receipts routing

From the Receipt Routing menu (G43A14), choose Routing/Analysis Revisions.

You set up a receipt route in the Procurement system by specifying a unique receipts routing code name in the user defined code table 43/RC and an operation name in table 43/OC. You enter a Y in any of the update fields on the Receipt Routing Definition form to have the system update the appropriate field in the Item Location table when an item arrives at the operation.

The system considers items on-hand and eligible for payment only at the end of a receipt route. You must enter a Y (Yes) in the On-Hand column for the system to assign the last operation to a route. The system assigns a Y in the Pay field on the operation to which a Y is assigned in the On-Hand column.

You enter disposition information for a route in the Procurement system when you use the Disposition Setup program. This information includes whether items dispositioned out of a receipt route are eligible for payment. If you classify a category as eligible for payment, the system creates journal entries when it dispositions items in the category. The code in the General Ledger Category field determines which account the system debits. The system credits the Received Not Vouchered account.

For the system to direct items through a receipt route, you must assign a route to each item. You assign receipt routes to items based on item/supplier relationships, using the Supplier/Item Information program.

For manufactured items, the supplier must be #WO.
On Routing/Analysis Revisions

Complete the following fields:

- Normal Route
- Effective From
- Effective Through

**What You Should Know About**

**Completing unplanned co-products and by-products**

An unplanned completion can be necessary due to a condition that caused the process to produce another item when it normally would not, for example, temperature or humidity. Set the appropriate processing option in the Completion program to allow the system to complete these co-products and by-products.

To enter an unplanned completion, enter the part number, branch, and sequence number on the Co-/By-Product Completions window.
Issuing ingredients from locations not listed on the ingredients list

After you complete the work order by accepting the records shown on Completion with Backflush, do the following:

- Access Multiple Location
- Move commitments
- Issue the ingredients

For co-products and by-products, you can change a location by using a selection option to access Multiple Locations from Co-/By-Products Completions.

Locating the status of the receipts routing

Use the Status Inquiry form to locate the status of the receipts routing. You can access the Operation Movement Detail form to view the details of a step. You can set a processing option in the Completions program to initiate receipts routing.

Processing Options for Back Order Release

STATUS CODES:

1. Next Status to Select (Optional) ____________
2. Override Next Status (Optional) ____________

DISPLAY OPTIONS:

3. If inquiring by Item Number, enter a ‘1’ to only display those Backorders that can be completely filled.
4. If inquiring by Item Number, enter a ‘1’ to sequence by Priority Code. If left blank, sequence will be by Promised Ship Date.

5. Enter a ’1’ to display kit component lines. If left blank, kit component lines will not display.
6. Enter a ’1’ to add back in the Quantity on Backorder in Quantity Available calculations. If left blank, the Quantity on Backorder will not be added in.
7. Enter a ’1’ to display Customer Information. If left blank, Item Information will display.
8. Enter a ’1’ to display orders on
hold. If left blank, orders on hold will not display.

RELEASING OPTIONS:
9. Enter a ‘1’ to only soft commit Released Backorders. If left blank, Released Backorders will be hard committed.
10. Enter a ‘1’ to allow Backorders to be released when Quantity to Ship is greater than Quantity on Backorder.
11. Enter a ‘1’ to allow Backorders to be released when Quantity on Hand is zero. If left blank, Backorders will not release when Quantity on Hand is zero.
12. Enter a ‘1’ to update Released Backorders with the most current cost of the item. If left blank the original cost of the item on the Sales Order will be used.

CREDIT PROCESSING:
13. Enter a code for credit checking. If left blank, no credit checking will be done.

ORDER HOLD PROCESSING:
14. Enter the partial order hold code that will be released when an order is completely filled.

AUTOMATIC PROCESSING:
15. Enter a ‘1’ to print pickslips or a ‘2’ to print invoices through the subsystem.

VERSION OPTIONS:
Enter the version for each program.
If left blank, ZJDE0001 will be used.

16. Sales Order Entry (P4211)
17. Customer Service Inquiry (P42045)
18. Item Availability (P41202)

WAREHOUSE PROCESSING:
19. Enter the request processing mode:
’ ’ = No pick requests
’1’ = Generate requests only
’2’ = Generate requests and process using the subsystem

20. If processing pick requests using the subsystem, enter the DREAM Writer version to use. If blank, XJDE0002 is used.
(See Form ID P46171.)

21. Enter an override next status for sales order lines for which requests have been generated.
Completing Partial Quantities on a Work Order

From Shop Floor Control (G31), choose Process Daily Order Reporting

From Daily Order Reporting – Process (G3114), choose Partial Completion

You can use the Partial Completion program to record complete parts of the quantity ordered for a work order. The form displays completed and scrapped quantities and percent complete information for a work order.

Complete the following tasks:

- Complete partial quantities on a work order
- Complete a work order for multiple locations (optional)

**To complete partial quantities on a work order**

On Partial Completion

1. Complete the following fields:
   - Order Number
   - Completed Quantities
   - Scrapped Quantities

2. Complete the following optional field:
   - Date Complete
3. Complete the following field if you did not set it in the processing options:
   - Status

4. Complete the following fields if you are not completing to the primary location:
   - Location
   - Lot
   - Lot Status

▶ To complete a work order for multiple locations

On Partial Completion

1. Complete the following fields:
   - Order Number
   - Completed Quantities
   - Scrapped Quantities

2. Complete the following optional field:
   - Date Complete

3. If you did not set the status in the processing options, complete the following field:
   - Status
4. Press Enter.

The system displays Co/By-Product Completions.

5. Complete the following field:
   - Quantity

6. Choose Select Multiple Locations.

7. On Select Multiple Locations, complete the following fields:
   - Quantity Completed
   - Location
   - Lot
8. Review the following default information:
   - Branch/Plant

9. Press Enter to accept the data and close Select Multiple Locations.

10. Press Enter to accept the data and close Co/By-Product Completions.

What You Should Know About

Completing a full work order

Use the Full Completion menu selection to complete all quantities for all ingredients on a work order.

Processing Work Orders through Super Backflush

From Shop Floor Control (G31), choose Process Daily Order Reporting

From Daily Order Reporting – Process (G314), choose Super Backflush

Super Backflush is a DREAM Writer batch program that creates backflush transactions against a work order or rate schedule at pay points defined in the routing. Super backflushing allows you to relieve inventory at strategic points throughout the manufacturing process.

You can enter completed and scrapped quantities by operation and employee. The system completes the work order or rate schedule, or you can review and revise the transactions. The backflush procedure can perform the following transactions by operation:

- Issue ingredients to the work order or rate schedule
- Record hours and quantities against the work order or rate schedule at standard values
- Record inventory completions

The system records the transactions from the pay point you indicate in the routing back to the first operation or the previous pay point, if one has been defined.

You can set the processing options for the Super Backflush program to:

- Indicate the versions of associated programs to access
- Select document types to be used when creating transactions
- Select update status codes for operations and the work order or rate header
Complete Work Orders

- Indicate a status code beyond which entries to work orders or rates cannot be made
- Store hours and quantities in related tables for later processing by manufacturing accounting
- Either access a specified version of the following programs or automatically execute the process without the form displaying:
  - Hours and Quantities
  - Material Issues
  - Work Order Completions

**To process work orders through super backflush**

On Super Backflush

![Super Backflush](image)

1. Complete the following fields:
   - Order Number
   - Shift
   - Transaction Date
   - Employee
   - Quantity Complete
   - Status

2. Access the detail area.
3. Complete the following optional field:
   - Pay Point Status

   The Co/By-Product Completions window appears.

4. Press Enter.

   The Work Order Inventory Issues form appears.
On Work Order Inventory Issues, the system automatically provides values in the following fields:

- Status
- Issues
- Unit of Measure
- Branch/Plant
- Location

5. Process all transaction forms and the system processes the information according to the issue type code and pay point type assigned to each operation.

If an operation is defined as a pay point, and the pay point is set up to issue material and report labor, when the operation is recorded as complete, the system issues the ingredients and backflushes labor from the last defined pay point up to the previous pay point.
The W.O. Time Entry form appears.

6. On W.O. Time Entry, review the following fields:

- Employee Number
- Operation Sequence Number
- Type of Hours
- Beginning Hours
- Ending Hours
- Hours
- Quantity
- Unit of Measure
- Status
- Employee Name

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pay Point Status</td>
<td>A code that indicates whether the operation should be taken to complete or partially complete status. Valid codes are: Blank Not reported P Partially complete C Completed</td>
</tr>
<tr>

<td>Explanation</td>
</tr>
<tr>
<td>---------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Unit of Measure</td>
<td>A user defined code (system 00/type UM) that identifies the unit of measurement for an amount or quantity. For example, it can represent a barrel, box, cubic yard, gallon, an hour, and so on.</td>
</tr>
<tr>
<td></td>
<td>* ................... Form-specific information .................*</td>
</tr>
<tr>
<td></td>
<td>If you leave this field blank, the system uses the Work Order Header table to update the quantities in the Item Location table in the primary unit of measure.</td>
</tr>
<tr>
<td>Units – Quantity at Operation</td>
<td>The quantity that is physically at the step at the work center at that time.</td>
</tr>
<tr>
<td></td>
<td>* ................... Form-specific information .................*</td>
</tr>
<tr>
<td></td>
<td>The quantity at operation is displayed in the intermediate unit of measure, if one exists for the operation. In addition, if an operation has an intermediate, the quantity can be entered at any valid unit of measure for the intermediate item. When the quantity is completed, it is deducted from the operation and added to the next operation.</td>
</tr>
</tbody>
</table>

**What You Should Know About**

**Resources**

The information in the detail area of the form is from the Shop Floor Control Routing Instructions table (F5112). The information in the form header is from the Work Order Master table (F4801).

**Operation numbers**

Operation numbers defined as pay points appear in reverse image on the form.

**Using quantity at operation for intermediates**

If there is an intermediate for the operation, all form quantities are displayed in the unit of measure defined for the intermediate. When the system completes the quantity, it is deducted from the operation and added to the next operation.
**Blending, filling, and packaging**

When you use the Super Backflush program with bulk products the system:

- Updates the previous product on the Work Center Master
- Updates the current or previous product on the Tank Master
- Writes a bulk item ledger record along with the Item Cardex.

*See Bulk Stock Management Guide.*

---

**See Also**

- *Reviewing Hours and Quantities Transactions*

---

**Processing Options for Super Backflush**

**STATUS CODES DEFAULTS:**

NOTE – Blanks will not update the Status Code.

1. Enter the default Operation Status Code for Partial Completions.

2. Enter the default Operation Status Code for Full Completions.

3. Enter the Status Code for update to the Work Order Header.

4. Enter the default Material Status Code for Issues.

**SHOP FLOOR ACTIVITY INFORMATION:**

5. Enter the Version of the Hours and Quantity Program to call.
   If left blank, a blind Hours and Quantities execution will be performed.

**BLIND HOURS AND QUANTITIES ENTRY:**

6. Enter the Document Type associated with Shop Floor Activity.

**WORK ORDER ISSUES INFORMATION:**

7. Enter the Version of the Material Issues Program to call.
   If left blank, a blind execution of Work Order Inventory Issues will be performed.

**BLIND WORK ORDER ISSUES:**

8. Enter the Document Type associated with a Work Order Issue.

9. Enter the acceptable lot hold codes (up to 5) for inventory issues, or
enter '*' for issues to all held lots. Blanks will not allow issues.

WORK ORDER COMPLETION INFORMATION:
10. Enter the Version of the Work Order Completions Program to call.
   If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
11. Enter the Document Type associated with an Inventory Completion.
12. Enter the Document Type associated with an Inventory Scrap.

EDIT INFORMATION:
13. Enter the Status Code beyond which Backflushing cannot be performed.

ITEM SALES HISTORY INFORMATION:
14. Enter a '1' if you wish blind issues to effect Item Sales History (F4115).

WAREHOUSE PROCESSING:
15. Enter the Directed Putaway mode.
   ' ' – No Directed Putaway requests
   '1' – Request Putaway only
   '2' – Request Putaway and process using the subsystem
16. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used.
   If blank, ZJDE0001 is used.
   (See Form ID P46171)

QUANTITY COMPLETION CONTROL:
17. Enter a '1' to verify that, for a given operation, the total of the quantity completed plus scrapped does not exceed the 'Quantity At Operation.' If left blank, the verification is not performed.

QUALITY MANAGEMENT:
18. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ZJDE0002 will be used.
Processing Options for Hours & Quantities Entry

DISPLAY INFORMATION:
1. Enter a ‘1’ for the screen to be displayed in Order Number format. If left blank, the screen will be displayed in Employee format.

UPDATE INFORMATION:
2. Enter the Document Type associated with Shop Floor Activity.

EDIT INFORMATION:
3. Enter the Status Code beyond which Shop Floor Activity cannot be entered.
4. Enter a ‘1’ to verify that, for a given operation, the total of the quantity completed plus scrapped does not exceed Quantity At Operation.
5. Enter a ‘1’ to prevent employee rate from being written to screen.

QUALITY MANAGEMENT:
6. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ZJDE0002 will be used.

Processing a Work Order Using Quantity at Operation

From Shop Floor Control (G31), choose Process Daily Order Reporting
From Daily Order Reporting – Process (G3114), choose Super Backflush

You report quantities against work order operations using either Hours and Quantities or Super Backflush. These programs differ in the following ways:

- Hours and Quantities allows entry of different types of hours worked, in addition to quantities.
- Super Backflush allows entry of quantities only.
- Hours and Quantities runs in batch mode. After you enter hours and quantities, you can review and revise these hours and quantities until you update the work order routing.
- You update Super Backflush quantities online.
You can enter completed and scrapped quantities by operation and employee. The system completes the work order if the last operation is defined as a pay point, or you can review and revise the transactions. However, quantities completed at a given operation cannot exceed the quantity completed at the preceding operation. For example, Super Backflush totals the entries for quantity completed and scrapped for the operation and compares that to the quantity at operation. If the total exceeds the quantity at operation, the system highlights the fields and displays an error message.

When you use Hours and Quantities entry, before the update process, the system verifies the quantity at operation as though the transactions were updated in the Work Order Routing table. The system uses the previously entered data to verify the quantity at operation. This only occurs for data entered on the current day or previous to the current day.

You can set a processing option for the Super Backflush program to indicate whether the system verifies, for a given operation, that the total quantity completed plus scrapped does not exceed the quantity at operation.

To process a work order using quantity at operation

On Super Backflush
1. Complete the following fields:
   - Order Number
   - Transaction Date
   - Shift
   - Employee
   - Quantity Complete
   - Status
2. Access the detail area.

3. Complete the following field:
   - Pay Point Status
The Work Order Time Entry form appears.

4. Review the following fields:
   - Employee Number
   - Operation Sequence Number
   - Type of Hours
   - Beginning Hours
   - Ending Hours
   - Hours
   - Quantity
   - Unit of Measure
   - Status
   - Employee Name

What You Should Know About

Non-pay points  Super Backflush only allows entry for pay points. To handle non-pay points, Super Backflush considers the quantity at operation for a given operation to be the total of the quantity at operation at that operation plus the quantity at operation for all previous non-pay points since the last pay point.
Completing a Work Order with Serialized Components

From Shop Floor Control (G31), choose Process Daily Order Reporting

From Daily Order Reporting – Process (G3114), choose Partial Completion

When you record a completion for serialized components, the system accesses the Associate Issued Item LSN’s program. The associations form is only accessible if you are associating serial number controlled components to serial number assemblies. The system displays the pre-assigned serial numbers and any memo lot information.

You can use one of two display modes of the Associate Issued Item LSN’s program:

- Associate components with a single assembly
- Display all components and associates to multiple LSNs

After you generate serial numbers for your work order, you associate your serialized components to a serialized assembly. To associate a serialized component to a serialized assembly, enter the associating quantity.

In addition, the Completion program allows you to enter a memo lot number that is used when both lot and serial numbers are required for tracking assemblies. The system verifies the memo lot number and serial number if you set the Serial Number Required field on the Item Branch/Plant Information form appropriately.

If you set the appropriate processing options in the Completion program, the system allows you to complete multiple items using the same serial number.

What You Should Know About

**Completing non-serialized components**
If you complete work orders with non-serialized components you cannot assign serial numbers to the assemblies at completion.
To complete a work order with serialized components

On Partial Completion

1. Complete the following fields to locate your order:
   - Order Number
   - Branch/Plant

2. Complete the following field to record a completed quantity:
   - Completed Quantity
The system displays Associate Issued Component LSN.

3. On Associate Issued Component LSN, Choose Issued LSNs.

4. On Serialized Items Issued, select the components you want to associate to the serialized assembly.

   The system closes the Serialized Items Issued window.

5. On Associate Issued Component LSN, accept the record.
6. On Full Completion, accept the record.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lot/SN</td>
<td>A number that identifies a lot or a serial number. A lot is a group of items with similar characteristics.</td>
</tr>
<tr>
<td>Memo Lot 1</td>
<td>A higher classification or grouping of serial number or lot processed items, maintained within the lot master (F4108).</td>
</tr>
<tr>
<td>Memo Lot 2</td>
<td>A higher classification or grouping of memo lot 1 maintained within the lot master (F4108).</td>
</tr>
</tbody>
</table>

**Exercises**

See the exercises for this chapter.
Revising the Status of a Work Order

You might want to remove from the system any work orders that are no longer active or that have been completed. In order to maintain records of the work orders and its progress, you should close the order before you delete it. This ensures that quantity information in the Inventory Management system and manufacturing accounting information is traceable after you delete the work order.

You can remove work orders that you no longer use in one of the following ways:

**Change the status of work orders to “closed”**

When you change the status of a work order to “closed”, the system identifies the order as inactive, but does not delete it. This is the recommended way to de-activate a work order. This method enables you to keep complete historical records on the work order and its associated costing and accounting transactions.

**Delete work orders**

When you delete a work order, the order is removed from the system entirely. You should complete the work order before deleting it to ensure that manufacturing accounting and inventory information is updated. If you delete the work order before completing it, these records might not be in place.

If the quantity completed on the work order is less than the quantity ordered, the system removes the remaining quantity from the Quantity on Work Order field in the Item Branch table (F4102) when you delete the order.

**Purge work orders**

When you purge work orders, the system deletes the orders based on their status code. You can choose to save the purged records in a separate file. Saving purged records lets you determine whether they contain information you want to retain after you delete the work order.

You can also delete an Lot Serial Number master record when a work order for a serialized parent is purged.
Revising the status of a work order consists of:

- Changing the status of a work order to “closed”
- Purging a work order

**What You Should Know About**

**Reporting quantities**  
If an order is in process, J.D. Edwards recommends that you report completed and scrapped quantities against it before you delete it.

**Deleting an order**  
Before you can delete an order from the system, you must first delete the parts list and routing instructions attached to the work order.

You cannot delete a work order if:

- The order number is used as a subledger number in the Account Ledger table (F0911).
- The work order is a parent order to other work orders.
- Ingredients have been issued to the work order.
- Labor has been reported against the work order.
Changing the Status of a Work Order to “Closed”

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Enter/Change Order

To close a work order without deleting it from the system, you change the status of the order.

To change the status of a work order

On Enter/Change Order

![Image of Enter/Change Order interface]

Complete the following fields:

- Order Number
- Status

Processing Options for Enter/Change Order

BACKSCHEDULING INFORMATION:
1. Enter the Unit of Measure Code

RECALCULATION OPTIONS:
2. Enter a ‘1’ to automatically recalculate Parts List and Routing dates, hours and quantities.

ITEM LOCATION VALIDATION:
3. Enter a ‘1’ to validate for existing Branch/Item record.

4. Enter a ‘1’ to protect the lot number on the parts list. If left blank, the lot number will remain input capable.

CHARGE TO BUSINESS UNIT DEFAULT:
5. Enter a ‘1’ to default the Charge to Business Unit from the Job number in the Business Unit Master file (F0006). If left blank, the Branch/Plant will be used.

BILL AVAILABILITY:
6. Enter the version of Bill Availability to be called. Default is ZJDE0001.

DEFAULT PROCESSING:
7. Enter defaults for the following:
   a. Document Type (Default is ‘WO’)
   b. Type (Optional)
   c. Priority (Optional)
   d. Beginning Status (Optional)
   e. Category Code 1 (Optional)
   f. Category Code 2 (Optional)
   g. Category Code 3 (Optional)
   h. Category Code 1 (Optional)
   i. Category Code 2 (Optional)
   j. Category Code 3 (Optional)
Or enter Item Branch Class Code fields to retrieve default values.

SALES ORDER HOLD CODE:
8. Enter the Hold Code for the related sales order if the work order quantity or date changes. Blanks will not update the sales order.

PURCHASE ORDER HOLD CODE:
9. Enter the Hold Code for the related purchase order if the work order quantity or date changes. Blanks will not update the purchase order. Note—The purchase order will be updated only if the work order routings are recalculated.

FIELD DISPLAY:
10. Enter a ‘1’ by the following fields to activate them:
    a. Bill Type
    b. Routing Type

PROCESS MANUFACTURING PROCESSING:
11. Enter a ‘1’ to create the Resource List records for Co-/By-Products when a process work order is entered. If left blank, the Co-/By-Product resource list records will be created when the ingredients list is created.
INTERACTIVE BILL/ROUTING ATTACHMENT:
12. Enter a '1' to automatically create the WO Routing Instructions when creating the WO Parts List on-line.

13. Enter a '1' to automatically create the WO Parts List when creating the WO Routing Instructions on-line.

COMMITMENT AND SUBSTITUTE PROCESSING:
14. Enter commitment option for creating the WO Parts List on-line.
   Blank  Commit to primary location
   1    - Commit per Commitment Control in Mfg Constants (P3009)
   2    - Same as '1', but use substitutes for shortages
   3    - Same as '1', but display substitute availability window when substitute qty available can cover shortage

ECO PROCESSING:
15. Enter the version of the ECO header to call from Revisions Window (P30BREV). If left blank, version ZJDE0001 will be used.

SERIAL NUMBER PROCESSING:
16. Enter the version of Assign Serial Numbers to call. If left blank, version ZJDE0001 will be used.

PRIOR REVISIONS:
17. Enter a '1' to permit attaching parts lists at prior revision levels. If left blank, prior revision levels will not be used.

WAREHOUSE PROCESSING:
18. Enter the request processing mode
   ' ' = No pick requests
   '1' = Generate requests only
   '2' = Generate requests and process using the subsystem

19. If processing pick requests using the subsystem, enter the DREAM Writer version to use. If blank, XJDE0002 is used.
   (See Form ID P46171)

20. Enter the default staging location for moving goods out of the warehouse. The parts picked from the warehouse are staged at this location prior to use within manufacturing. (F1=Location Window)

21. Enter a '1' if the default staging location should be checked for availability. If the part is available at the staging location a request will NOT be generated.
This option only applies to parts without work center locations.

**GENERIC TEXT COPY OPTIONS:**
22. Enter a ‘1’ to copy component generic text to the parts list.
23. Enter a ‘1’ to copy the operation’s generic text to the work order routing.

**OBSOLETE ITEMS:**
24. Enter the cross reference code for retrieving item replacements for obsolete items.

**ECS PROCESSING:**
25. Enter the program ID of the Formula Optimization routine to be called when the function key to Optimize the formula is selected from the Ingredients List Program (P3111).

**Purging a Work Order**

**From Shop Floor Control (G31), enter 27**

**From Advanced Shop Floor Control (G3131), choose Purge Orders**

Work Order Purge is a batch program that deletes selected work orders from your system. The system purges the selected work orders and their associated information from the following tables:

- Work Order Master (F4801)
- Work Order Instruction/Disposition (F4802)
- Work Order Parts List (F3111)
- Work Order Routing (F311)
- Work Order Time Transactions (F31122)

When you purge work orders, you can:

- Purge unlimited work orders based on their status codes
- Automatically delete associated parts lists and routings
- Save the work order information in a special purge file
Before You Begin

☐ Complete the accounting for the work orders you intend to purge before you purge them from the system. See Working with Work Orders in Accounting in the Product Costing and Manufacturing Accounting Guide for information on how to complete the accounting.

What You Should Know About

Naming saved purged records
Set the processing options to save the records you purge in a special purge library. The system names this library JDE followed by the current system date (without separators). For example, if you purge the records on January 1, 1998, the purge library is named JDE010198. The system creates a physical file with the same name within that library. If you purge the same file multiple times on the same day, the system adds the purged records to the records already in the purge file for that day.

Reorganizing files
Set the processing options to reorganize your files after the purge is complete. Reorganizing the files redistributes the remaining data so that your disk space is more efficiently used. The files you want to reorganize cannot be in use elsewhere on your system, but must be exclusively allocated to the job performing the purge.

If you submitted a reporting feature version of the purge program using a logical file build rather than OPNQRYF, the logical file built over the purged file is included in the reorganization. This might increase the time required to perform the file reorganization.

Using OPNQRYF
If you use OPNQRYF to select records to be purged, you must specify at least one field in data sequencing and set the Delete field in additional parameters to Y for the reporting feature version that you use.

Processing Options for Purge Orders

Enter a ’1’ to save the purged records to a special purge library. (Default of blanks will NOT save any purged records.)

Enter a ’1’ to reorganize the purged file. (Default of blanks will NOT reorganize the file.)
Test Yourself: Revising Statuses

1. List the three ways to remove an order from the system that is not to be used.

2. List the three steps involved in deleting a work order.

3. Can you delete a rate schedule that has completions entered against it?

4. How can you determine if a rate schedule has completions entered against it?

5. How do you close a rate schedule?

6. What is the significance of reorganizing your files after the purge program is complete?

7. What factors will prevent you from deleting an order?

The answers to this Test Yourself are in Appendix B.
Review Information

Reviewing Information

You can review information for ingredients, such as useability, availability, supply and demand, or intermediates. You can review all ingredient transactions in the system. And, you can review all work orders that make up the load at a particular work center. Also, you can view the ingredients and quantities of two ingredients lists or view only the differences.

Complete the following tasks:

- Review ingredient information (optional)
- Review cost information (optional)
- Review work order status (optional)
- Review process orders (optional)
- Review ingredient comparison (optional)

See Also

- Reviewing Availability (P30205)
- Reviewing Availability (P3121)
- Managing Shortage Information (P3118)
- Reviewing Hours and Quantities Transactions
Reviewing Ingredient Information

You can choose from three different programs to review information:

- Ingredient Useability
- Summary Availability
- Supply/Demand

Use the Ingredient Useability program to display all processes that use an ingredient and where the ingredient is used in each bill of material. The system calculates the quantity of the process/item that can be produced based on the quantity of the ingredient. You can create a work order directly from the Ingredient Useability form by typing the appropriate option number next to the process/item that you want to produce.

You can change formats to display the bill of material in either single-level or multi-level format. You can also display all ingredients, or only those ingredients with a negative quantity available, by changing the display mode. You can view data about processes and their ingredients as of a specific effectivity date or view all ingredients regardless of effectivity date.

There are five formats for this form. You define which format you want to use in the processing options. These formats are:

- Single level where used
- Multi-level where used
- Indented where used
- All co-/by-products for a process
- Ingredient Useability

If this processing option is left blank, the Single Level Where Used format is displayed.

Use the Summary Availability program to check the availability of a specific item. You can display the data in detail or summary mode, and for one branch or all of your branches.

Processing options allow you to omit item records that have a zero quantity available and control which versions of associated programs are used when you access them. In addition, you can use the processing options and certain fields to display availability by grade or potency ranges.

Use the Supply/Demand Inquiry program to display the demand, supply, and available quantities for an item in your inventory. Quantities are categorized by on-hand inventory, safety stock, sales orders, purchase orders, work orders, forecasts, and rate schedules.
Use the processing options in this program to:

- Include both supply and demand planned orders from the MPS/MRP/DRP Message table (F3411).
- Include forecast demand from the Forecast table (F3460).
- Display an Available to Promise line that calculates the units available for sale or distribution before the arrival of future supplies.
- Display a Cumulative Available to Promise line that calculates the running total of Available to Promise.
- Specify which version of associated reporting feature programs are used when you access the programs. You should use the same program version for each Distribution Requirements Planning generation you run to ensure that your data is consistent between systems.
- Set up different versions of inclusion rules to include the document type, line type, and status for each purchase order, sales order, or work order. This program's processing option for the Supply/Demand Inclusion Rules must contain a valid version of inclusion rules from the MPS/MRP Resource Rules table (F34004). You should set this option to use the same version that you use in your Distribution Requirements Planning generation in order to facilitate tracking among the systems.

Reviewing ingredient information consists of:

- Reviewing ingredient usability
- Reviewing summary availability
- Reviewing supply and demand information
- Printing supply and demand

**Before You Begin**

- Set up the Ingredient Useability selection from the processing options before you review ingredient usability

**See Also**

- *Manufacturing and Distribution Planning Guide* for more information about facilitating the tracking among systems
To review ingredient useability

From the Daily Order Preparation – Process menu (G3113), choose Ingredient Useability.

On Ingredient Useability

1. Complete the following fields:
   - Ingredient
   - Ingredient Branch
2. Access the detail area.
To review summary availability

From the Daily Order Preparation – Process menu (G3113), choose Summary Availability.

On Summary Availability

1. Complete the following field:
   - Item Number
2. Access the detail area.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Primary Location (P/S)       | A value that indicates if this is the primary or secondary location for this item within this stocking location.  
                                | Valid values are:
                                | P  Primary storage location
                                | S  Secondary storage location                                                                                                           |
|                              | NOTE: You can only have one storage area within each branch or warehouse marked as primary. In some cases, the system uses the primary storage area as the default. |
| Quantity Committed –         | The total quantity committed to a specific location. The total is calculated from the following fields:                                    |
| Total                        | - Soft Committed to Sales Orders                                                                                                          |
|                              | - Hard Committed to Sales Orders                                                                                                          |
|                              | - Soft Committed to Work Orders                                                                                                          |
|                              | - Hard Committed to Work Orders                                                                                                          |
| Quantity Receipts –          | The total quantity on receipt for a specified location. The total is calculated from the following fields:                               |
| Total                        | - Quantity on Purchase Order Receipts                                                                                                     |
|                              | - Quantity on Work Order Receipts                                                                                                         |

**To review supply and demand information**

From the Daily Order Preparation – Process menu (G3113), choose Supply/Demand Inquiry.
On Supply/Demand Inquiry

1. Complete the following fields:
   - Branch/Plant
   - Item Number
2. Access the detail area.
What You Should Know About

Demand quantities  The demand quantities are shown by date and can include safety stock, quantities on sales orders, work order parts lists, lower level planned order demand, and interplant and forecasted demand.

Supply quantities  The supply quantities are shown by date and can include on-hand inventory and quantities on purchase orders, manufacturing work orders, planned orders, and rate schedules. Supply quantities shown without a date or order information represent current availability by branch/plant storage location.

To print supply and demand

From the Periodic Functions – Process menu (G3122), choose Supply/Demand.

The Supply and Demand report shows the supply, demand, and available quantities for an ingredient. The report can include quantities of ingredients in:

- On-hand inventory
- Safety stock
- Sales orders
- Purchase orders
- Work orders
- MPS/MRP planned orders
- Forecasts
- MPS rate schedules

The information on this report and the processing options used to generate it are the same as on the Supply/Demand Inquiry form.

**Processing Options for Ingredient Useability**

**VERSIONS TO EXECUTE:**
1. Enter the version of Item Search (P41200) to execute. If left blank, version 'ZJDE0001' will be used.

2. Enter the version of Material Where Used Print (P30420) to execute. If left blank, version 'ZJDE0001' will be used.

**TYPE OF INQUIRY DEFAULT:**
3. Select one of the following:
   1 = Single Level Where Used
   2 = Multi-Level Where Used
   3 = Indented Where Used
   4 = All Co-/By-Products for a Process
   5 = Part/Ingredient Useability (If left blank, Single Level Where Used will default.)

**PART USEABILITY OPTIONS:**
Enter the version to be used for each program. If left blank, ZJDE0001 is used.
4. Work Order Entry (P48013)
5. Item Availability (P30205)

**SCREEN DEFAULTS:**
6. Enter the default Bill Type to be used. If left blank, '**' will be used for all Bill Types.
FORMAT CONTROL:
Where Used Detail  (P13226)
1. Enter a ‘1’ to display the Equipment screen format. Leave blank (default) to display the Work Order format screen. (NOTE: This option is only valid if system 13 (Equipment) is available.)

Processing Options for Summary Availability

PROCESS CONTROL:
1. Enter a ’1’ to omit locations with no quantity available. If left blank, all locations will display.

DREAM WRITER VERSIONS:
Enter the version for each program. If left blank, ZJDE0001 will be used.
2. Item Master          (P4101 )
3. Text Message Code Review (P40010 )
4. Item Search          (P41200 )
5. Purchase Order Inquiry (P430301)
6. Customer Service Inquiry (P42045 )
7. Open Work Orders      (P31225 )
8. Supply and Demand    (P4021 )
9. Bill of Materials     (P30200 )
10. Lot Availability     (P41280 )

Enter the version for each program. If left blank, ZJDE0001 will be used.
11. Item Ledger          (P4111 )
12. Branch/Plant Item Info.  (P41026)
13. Availability by Location (P4190 )
14. Item / Location Information (P41024)

GRADE AND POTENCY:
15. Enter a ’1’ to display the grade range. If left blank, no grade will display for selection.
16. Enter a ’1’ to display the potency range. If left blank, no potency will display for selection.

Processing Options for Supply/Demand Inquiry

DISPLAY OPTIONS:
1. Enter a ’1’ to deduct Safety Stock from Availability.

2. Enter a ’1’ by the following Routing Quantities to be considered on hand. Any quantity not included will be displayed on the appropriate date.
   1 - Quantity in Transit
   2 - Quantity in Inspection
3 - User Defined Quantity 1                   ____________
4 - User Defined Quantity 2                   ____________

3. Enter a '1' to summarize all In Receipt Routing steps into one line.

DISPLAY OPTIONS (cont.):
4. Enter a '1' to summarize Item Location records.

5. Enter one of the following:
   ' ' = No Available to Promise Line
   '1' = Available to Promise Line
   '2' = Cumulative ATP Line

6. Enter the version of Supply/Demand Inclusion Rules to be used.

7. Enter a '1' to display the window format if called from another program.

DREAM WRITER VERSIONS:
Enter the Dream Writer version to use for each program listed. If left blank, version ZJDE0001 will be used.

8. Purchase Order Entry      (P4311)                   ____________
9. Purchase Order Inquiry    (P430301)                  ____________
10. Sales Order Entry         (P4211)                    ____________
11. Sales Order Inquiry       (P42045)                   ____________
12. Scheduling Workbench      (P31225)                   ____________
13. MPS/MRP/DRP Pegging Inq.  (P3412)                   ____________
14. MPS/MRP/DRP Time Series   (P3413)                   ____________
15. MPS/MRP/DRP Message Detail(3411)                    ____________

OPTIONAL RECORDS:
16. Enter a '1' to include Planned Orders from MPS/MRP/DRP generations. If left blank, Planned Orders will not be displayed.

17. Enter the Forecast Type to include
    a. Forecast Type                   ____________
    b. Forecast Type                   ____________
    c. Forecast Type                   ____________
    d. Forecast Type                   ____________
    e. Forecast Type                   ____________

OPTIONAL RECORDS (cont.):
18. Enter the number of days (+/-) from today's date that you wish to begin including Forecast records. A blank will use today's date to begin including Forecast records.

19. Enter a '1' to omit 'Bulk' Stocking Type records from screen. If left blank, 'Bulk' items will be included.

OPTIONAL RECORDS (cont.):
20. Enter the rate based Schedule Type to use. If left blank, no rate based schedules will be displayed.
POTENCY:

LOT EXPIRATION:
22. Enter ‘1’ to reduce Quantity available due to lot expiration.
(Note: This option will not work with ATP. If you use this option, option 5 must be set to blank or 2.)

Reviewing Cost Information

From Shop Floor Control (G31), choose Process Periodic Functions

From Periodic Functions – Process (G3122), choose Item Ledger

Use the Item Ledger program to display a detailed history of the transactions that have occurred for an item. The transactions include:

- Inventory issues, adjustments, and transfers
- Sales posted after sales update
- Purchase receipts
- Manufacturing completions and issues
- Physical inventory updates

You can limit the data displayed by entering values in any of the header fields. You can toggle between transaction dates (running balance) and general ledger dates for items and set a default display in the processing options.

Because the dates in the item ledger and running balance might differ for an item, the values displayed might also differ. Also, the system displays balance forward quantities in their primary unit of measure.

There are five formats for this form. You define which format you want to display in the processing options. If this processing option is left blank, the system displays the cost item ledger format. The formats are:

- Running quantity balance
- Running amount balance
- Cost item ledger
- Location item ledger
- Lot status/grade/potency item ledger
Transactions resulting from manufacturing completions and issues do not display in the running balance format unless they have been processed through Manufacturing Accounting.

Transactions resulting from shipment confirmation do not display in the running balance format unless they have been processed through Sales Order Update.

Reviewing item ledger information includes the following tasks:

- Reviewing cost information
- Reviewing quantity information in running balance format
- Reviewing cost information in running balance format

**What You Should Know About**

**Using the running balance format**

In the running balance format:

- You must enter a valid From date.
- The balance forward is a cumulative amount up to the From date you enter. The system retrieves the As Of records for the specified item, branch, location, and lot you enter. After the balance forward is calculated, the system displays item ledger records with a general ledger date from the From date forward, in ascending order.
- You can toggle between quantities and costs.
- Transactions resulting from manufacturing completions and issues do not display unless they have been processed through manufacturing accounting.

If you have not run As Of Generation program to create records in the Item As Of table (F41112), or a balance forward record does not exist for your item, it might take additional time to accumulate the item ledger records to create a balance forward.
To review cost information

On Item Ledger (The CARDEX)

Complete the following fields:

- Item Number
- Branch/Plant
- Location
- Lot
- Date From
- Date Through
To review quantity information in running balance format

On Item Ledger (The CARDEX)

Change the format to running balance.
To review cost information in running balance format

On Item Ledger (The CARDEX)

Select the Amount/Quantity format.

Processing Options for Item Ledger Inquiry

DISPLAY OPTIONS:
1. Enter the format to be displayed:
   1 = Running Quantity Balance format.
   2 = Running Dollar Balance format.
   3 = Cost Item Ledger format.
   4 = Location Item Ledger format.
   5 = Lot Status/Grade/Potency Item Ledger format.
   If left blank, the Cost Item Ledger format will be displayed.

DEFAULT VALUES:
2. Enter the default document type upon entering the video. If left blank, a '*' will default for all document types.

3. Enter a '1' to display Item Ledger entries in ascending date and time order. If left blank, the entries will be displayed in descending date and time order. (This option does NOT apply to Running Balance formats.)
Reviewing Work Order Status

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Production Status

Use Production Status to view the status of all orders by work center, production line, and item, within the status and date ranges. The system shows historical information as well as open rates.

From the Production Status form you can access the Production Transaction History form, where you can view a record for each entry of completions and scrap at an operation.

To review production status

On Production Status
1. Complete the following fields:
   - Work Center/Line
   - Item Number
   - Branch/Plant

2. To view the various transactions reported against a rate, choose Production History.
Reviewing Process Orders

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation – Process (G3113), choose Process Order Inquiry

Use the Process Order Inquiry program to display each operation of the process, the ingredients lists, co-products and by-products, and existing intermediates of a work order, one operation at a time.

This program allows you to:

- Display the Item Availability Summary program
- Display and update the Enter/Change Order program
- Display the intermediate for a specific operation, using the unit of measure defined for the intermediate, instead of the primary unit of measure
- Display intermediates for all operations
- Display and update the Enter/Change Bill program

To review process orders

On Process Order Inquiry
1. Complete the following field:
   - Order Number

2. Review the following fields:
   - Work Center
   - Operation Sequence Number
   - Operation Status
   - Machine Hours
   - Labor Hours
   - Setup Hours
   - Time Basis Code
   - Quantity at Operation
   - Quantity Completed
   - Ingredients
   - Co/By Products

**Reviewing Ingredient Comparison**

From Shop Floor Control (G31), choose Process Daily Order Preparation

From Daily Order Preparation - Process (G3113), choose Ingredient Comparison

Use Ingredient Comparison to view the different ingredients and quantities of two ingredients lists. You can display all ingredients for two ingredients lists or only the differences. In addition, you can limit displayed data to a specified work center or dispatch group.

**Before You Begin**

☑ Attach the ingredients to an operation on the routing to view these ingredients
What You Should Know About

Modes of display

This program has two modes of display you can use to locate information:

1. Display all components
2. Display only differences between the two ingredients lists

If you leave the mode blank, the mode of display is the differences between the two ingredients lists.

Printing a report

Use the appropriate selection to print the ingredient comparison in report form. Use the processing options to specify work orders, the mode to print, and a work center, a dispatch group, or both.

To review ingredient comparison

Complete the following fields to locate all ingredients of your work orders:

- Work Order 1
- Work Order 2
Processing Options for Ingredient Comparison

VIDEO SELECTIONS:
1. Enter a ‘D’ to list records with a Difference, or ‘A’ to list All. If left blank, ‘A’ will be used.

SUBMITTED REPORTS:
2. Enter the Dream Writer Version for the Work Order Comparison Report (P31417). If left blank version XJDE0001 will be used.
Process Kanbans

Processing Kanbans

While requirements for material is driven by demand, movement is controlled by visual cues called kanbans. Kanbans are predetermined quantities of components at specified locations on the production line. They are designed to minimize work-in-process inventories. Two programs manage the electronically implemented kanbans. Processing kanbans includes the following tasks:

- Processing kanban consumption by item
- Processing kanban supply by item

Use the consumption program to access kanbans at a consuming location, and the supply program to access kanbans at a supplying location, by specifying one or any two of the following criteria:

- Item
- Location
- Supplier
- Kanban identification

You process kanbans in one of two modes:

- One-Phase
- Two-Phase
**One-Phase**

One-phase assumes the completion and transfer to the consuming location are performed in one step, in which you complete the quantity directly to the consuming location and change the kanban status to checked-in (1).

![One-phase diagram]

**Two-Phase**

Two-phase assumes the completion and transfer are reported separately. You complete the quantity to the supplying location and change the kanban status to completed (3). After the quantity has physically been received at the consuming location, a transfer from the supplying location to the consuming location occurs, and the kanban status is changed to checked-in (1).

If you check in a kanban quantity from the supplier, the system can initiate a receipt transaction if the kanban master flag is on.

![Two-phase diagram]
You can process kanbans for items that are:

- Inventoried
- Manufactured (sub-assemblies/phantoms)
- Externally supplied

**Inventoried Items Processing**

When you check out a kanban that is inventoried, the kanban status is changed. The supplying location replenishes the kanban quantity. You then complete and check in the kanban, which results in an inventory transfer transaction.

**Manufactured Processing**

When you check out a kanban that is manufactured, the program either creates a work order, or looks for an existing rate. It bases its action on the items’ order policy code. (If the system does not find a rate, it creates one.) When the system creates a rate, it automatically attaches the ingredients list and routing. When you check in the kanban, you complete the work order or rate, issue ingredients, enter hours and quantities, and transfer the parent item to the consuming location.

**Manufactured Processing — Phantom Item**

When you check out a kanban supplied by a work center/production line, and the item is a phantom, no transactions outside of inventory transfers occur. There are no work orders or rates to process; the item is simply replenished by the producing line and the kanban is completed and checked in. This results in an inventory transfer transaction, from the supplying location to the consuming location.

**Externally Supplied Processing**

When you check out kanbans from an external supplier, the system may create a new purchase order, or use an existing one. However, there must be an open purchase order for the item. In addition, when you check out the kanban, the system may also initiate an Electronic Data Interchange (EDI) transaction. When you check in kanbans from an external supplier, the system may optionally perform a receipt against the purchase order.
Processing Kanban Consumption by Item

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Kanban Consumption

Kanban Consumption allows you to access all kanbans at a given consuming location. After you locate your items, depending on the status of each item, you can make one of the following status changes at a consuming location:

- Checked-in (1)
- Checked-out (2)

To process kanban consumption by item

On Kanban Consumption

![Kanban Consumption Interface]

1. Complete the following fields:
   - Item Number
   - Branch/Plant

2. Complete the following field to check-in a kanban that was supplied by the production line and a rate or work order was created:
   - Employee Number
   - Shift
3. Access the detail area.

4. To check in the item, enter a 1 in the following field next to the item number:
   - Option

5. To check out the item enter a 2 in the following field next to the item number:
   - Option

**Processing Options for Kanban Consumption**

**RATE BASED INFORMATION:**
1. Enter the version of rate schedule revision (P3109) to be used
   (Default is ZJDE0001)

**WORK ORDER INFORMATION:**
2. Document type (Default is ‘WO’)
3. Beginning Status
4. Enter a ‘1’ to attach part list and routing
5. Enter the version of for J31410
   (Default is ZJDE0001)
6. Close Status for rate or work order

**PURCHASE ORDER INFORMATION:**
7. Enter the document type for purchase order (Default is ‘OP’)
8. Enter a ‘1’ to trigger EDI862 transaction
9. Enter the version of Purchase Orders Print (P43500) to be called to generate EDI 862 transaction
   (Default is XJDE0008)
10. Enter the version of open purchase orders (P430301) to be called.
   (Default is ZJDE0007)

11. Enter the default route type to be used to search for a receipt route.

12. Enter the value of the default route to be used for items without a receipt route setup.

13. Enter the version of Receipt by PO/Item/Account to call. If left blank, will default to 'ZJDE0008'.

14. Enter a '1' to create purchase order

15. Enter the beginning line status

SHOP FLOOR ACTIVITY INFORMATION:
16. Enter the version of the Hours and Quantity Program to call
   If left blank, a blind Hours and Quantity execution will be performed

BLIND HOURS AND QUANTITIES ENTRY:
17. Enter the Document Type associated with Shop Floor Activity.
   (Default is 'IH')

WORK ORDER ISSUES INFORMATION:
18. Enter the Version of the Material Issues Program to call.
   If left blank, a blind execution of Work Order Inventory Issues will be performed.

BLIND WORK ORDER ISSUES:
19. Enter the Document Type associated with a Work Order Issue.

WORK ORDER COMPLETION INFORMATION:
20. Enter the Version of the Work Order Completions Program to call.
    If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
21. Enter the Document Type associated with an Inventory Completion.

22. Enter the Document Type associated with an Inventory Scrap.

STATUS CODES DEFAULTS:
23. Enter the default Operation Status Code for Partial Completions.

24. Enter the default Operation Status Code for Full Completions.
25. Enter the Status Code for update to the Work Order Header.

26. Enter the default Material Status Code for issues.

INVENTORY TRANSFER:
27. Enter the Version of the Inventory Transfer Program to call.
   If left blank, a blind Inventory Transfer execution will be performed.

BLIND INVENTORY TRANSFER:
28. Enter the Document Type associated with an Inventory Transfer.

DEFAULT VALUES:
29. Enter the default value for Item Number.

30. Enter the default value for location.

WAREHOUSE PROCESSING:
31. Enter the Directed Putaway mode.
   ' ' : No Directed Putaway requests
   '1' : Request Putaway only.
   '2' : Request Putaway and process using the subsystem.

32. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used.
   If blank, ZJDE0001 is used.
   (See Form ID P46171)

Transaction Confirmation
33. Enter '1' to be prompted to confirm transaction
Processing Kanban Supply by Item

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing - Repetitive (G3115), choose Kanban Supply

Kanban Supply allows you to access all kanbans that need replenishment for items stored or produced at a given supplying location. After you locate your items, depending on the status of each item, you can make one of the following status changes at a supplying location:

- Checked-in (1)
- Completed (3)

Inventory and statuses are affected as follows:

- One-phase — inventory is immediately received and available at the consuming location, and the status is changed to checked-in (1).
- Two-phase — the completion and transfer are reported separately:
  - The quantity is completed to the supplying location, the kanban status is changed to a complete (3).
  - After the quantity has physically been received at the consuming location, a transfer is performed from the supply location to the consuming location and the kanban status is changed to checked-in (1).
To process kanban supply by item

On Kanban Supply

1. Complete the following fields:
   - Item Number
   - Branch/Plant
2. Complete the following field to check in a kanban that was supplied by the production line and a rate or work order was created:
   - Employee Number
   - Shift
3. Access the detail area.
4. To check in the item, enter a 1 in the following field next to the item number:
   - Option
5. To complete the item, enter a 3 in the following field next to the item number:
   - Option

**Processing Options for Kanban Supply**

**RATE BASED INFORMATION:**
1. Enter the version of rate schedule revision (P3109) to be used
   (Default is ZJDE0001)

**WORK ORDER INFORMATION:**
2. Enter the document type for work orders (Default is ‘WO’)
3. Close Status for rate or work order

**PURCHASE ORDER INFORMATION:**
4. Enter the document type for purchase order (Default is ‘OP’)
5. Enter the default route type to be used to search for a receipt route.
6. Enter the value of the default rout to be used for items without a receipt route setup.
7. Enter the version of Receipt by PO/Item/Account to call. If left blank, will default to ‘ZJDE0008’.
SHOP FLOOR ACTIVITY INFORMATION:
8. Enter the version of the Hours and Quantity Program to call.
   If left blank, a blind Hours and Quantity execution will be performed.

BLIND HOURS AND QUANTITIES ENTRY:
9. Enter the Document Type associated with Shop Floor Activity.
   (Default is 'IH')

WORK ORDER ISSUES INFORMATION:
10. Enter the Version of the Material Issues Program to call.
    If left blank, a blind execution of Work Order Inventory Issues will be performed.

BLIND WORK ORDER ISSUES:
11. Enter the Document Type associated with a Work Order Issue.

WORK ORDER COMPLETION INFORMATION:
12. Enter the Version of the Work Order Completions Program to call.
    If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
13. Enter the Document Type associated with an Inventory Completion.
14. Enter the Document Type associated with an Inventory Scrap.

STATUS CODES DEFAULTS:
15. Enter the default Operation Status Code for Partial Completions.
16. Enter the default Operation Status Code for Full Completions.
17. Enter the Status Code for update to the Work Order Header.
18. Enter the default Material Status Code for Issues.

INVENTORY TRANSFER:
19. Enter the Version of the Inventory Transfer Program to call.
    If left blank, a blind Inventory Transfer execution will be performed.

BLIND INVENTORY TRANSFER:
20. Enter the Document Type associated with an Inventory Transfer.

DEFAULT VALUES:
21. Enter the default value for Item Number.
22. Enter the default value for location.

WAREHOUSE PROCESSING:
23. Enter the Directed Putaway mode.
   ‘’ : No Directed Putaway requests
   ‘1’ : Request Putaway only.
   ‘2’ : Request Putaway and process using the subsystem.

24. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used. If blank, ZJDE0001 is used. (See Form ID P46171)

Transaction Confirmation
25. Enter ‘1’ to be prompted to confirm transaction
Print Ingredient and Operation Reports

Printing Ingredient and Operation Reports

Print ingredient and operation reports to effectively manage your work order and rate schedule information. Two types of process manufacturing reports are available:

**Ingredients reports**
- Process Order Summary
- Ingredient Shortages
- All Shortages
- Supply and Demand

**Operations reports**
- Dispatch List
- Hours and Quantities Proof

You can use process manufacturing reports to identify all:

- Work orders in your system
- Ingredients that are required to complete a work order and their availability
- Ingredient shortages
- Supply, demand, and available quantities for an ingredient

The system uses information in the following tables to produce reports:

**Process Order Summary**
- Work Order Master table (F4801)

**All Shortages**
- Shortage Maintenance Master table (F3118)
What You Should Know About

**Kanban implementation** You can implement a kanban system to simplify inventory control in a discrete manufacturing environment as well as a repetitive manufacturing environment.

See *Process Kanbans* for instructions on using kanbans.

- *Reviewing the Hours and Quantities Report*
Repetitive Manufacturing
Repetitive Manufacturing

Objectives

- To develop a workbench to schedule production
- To support production capacity and load using units per hour as well as hours per unit
- To define shop floor calendars by shift and production line
- To allow multiple replenishment points for a production line
- To allow electronic kanban control at consuming and supplying locations

About Repetitive Manufacturing

Repetitive manufacturing dedicates entire production lines to a family of products. These product families share similar components and routings. Generally these products are manufactured in a continuous process which requires less inventory movement to and from the production line. Work center setup and changeover times between related products are kept to a minimum.

Repetitive environments define production in terms of units per hour. The time spent at the operational level might or might not be important. Therefore, the ability to set up line capacity and define routings in units per hour is necessary. The fundamental basis for backscheduling and capacity planning is hours. To view information in units, the system uses a conversion factor defined at the work center level.

The driving force for repetitive manufacturing is demand. Scheduling production lines requires tools to schedule, sequence, and balance production based on the capacity for each production line.

While requirements for material is driven by demand, movement is controlled by visual cues called kanbans. Kanbans are predetermined quantities of components at specified locations on the production line. They are designed to minimize work-in-process inventories.
Complete the following tasks:

- Enter rates
- Schedule rates
- Complete rates
- Review information
- Process kanbans
- Close rates

- *Procurement Guide* for information about purchase orders
Enter Rates

Entering Rates

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing - Repetitive (G3115), choose Enter/Change Rate Schedule

Repetitive manufacturing is designed for items that you produce in a continuous process on a dedicated production line. A rate schedule is a request to complete a given quantity of an item over a period of time on a specific production line.

Rate schedules consist of a header, ingredients list, and routing instructions. The rate header specifies the quantity of the item requested, the required date, and the production line. The ingredients list and routing instructions specify the ingredients, operations, and resources required to complete the rate.

Use the Enter/Change Rate Schedule program to add a rate schedule. When you add a rate, the system verifies:

- Line against the Line/Item Relationship Master
- Dates against the appropriate shop floor calendar
- Effective date ranges against the defined period

Before You Begin

☐ Set up the processing options to automatically attach the ingredients list and routing when you enter a rate
To add rate schedules

On Enter/Change Rate Schedule

1. Complete the following fields:
   - Item Number
   - Branch/Plant
   - Rate Quantity
   - Effective From
   - Effective Through
   - Line

2. Complete the following optional fields:
   - Period
   - Shift

3. Access the detail area.
4. Complete the following optional fields and press Enter:

- Status
- Freeze Code
- Category 1
- Category 2
- Category 3
- Bill Type
- Routing Type

<table>
<thead>

<td>Explanation</td>
</tr>
<tr>
<td>-------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Shift Code</td>
<td>A user defined code (00/SH) that identifies daily work shifts. In payroll systems, you can use a shift code to add a percent or amount to the hourly rate on a timecard.  For payroll and time entry:  If an employee always works a shift for which a shift rate differential is applicable, enter that shift code on the employee's master record. When you enter the shift on the employee's master record, you do not need to enter the code on the timecard when you enter time.  If an employee occasionally works a different shift, you enter the shift code on each applicable timecard to override the default.</td>
</tr>
<tr>
<td>Status</td>
<td>A user defined code (00/SS) that describes the status of a work order or engineering change order. Any status change from 90 thru 99 automatically updates the date completed.</td>
</tr>
<tr>
<td>Freeze Code</td>
<td>A code that indicates if the order is frozen. MPS/MRP will not plan for frozen orders.  Valid codes are:  Y Yes, freeze the order  N No, do not freeze the order (Default)</td>
</tr>
<tr>
<td>Category 1</td>
<td>A user defined code (00/W1) that indicates the current stage or phase of development for a work order. You can assign a work order to only one phase code at a time.  NOTE: Certain forms contain a processing option that allows you to enter a default value for this field. If you enter a default value on a form for which you have set this processing option, the system displays the value in the appropriate fields on any work orders that you create. The system also displays the value on the Project Setup form. You can either accept or override the default value.</td>
</tr>
<tr>
<td>Category 2</td>
<td>User defined code system 00, type W2, which indicates the type or category of a work order.  Note: A processing option for some forms lets you enter a default value for this field. The value then displays automatically in the appropriate fields on any work orders you create on those forms and on the Project Setup form. (You can either accept or override the default value.)</td>
</tr>
<tr>
<td>Category 3</td>
<td>User defined code system 00, type W3, which indicates the type or category of a work order.  Note: A processing option for some forms lets you enter a default value for this field. The value then displays automatically in the appropriate fields on any work orders you create on those forms and on the Project Setup form. (You can either accept or override the default value.)</td>
</tr>
</tbody>
</table>
### Field | Explanation
--- | ---
**Bill Type** | A user defined code (system 40, type TB), that designates the type of bill of material. You can define different types of bills of material for different uses. For example:  
- M  (Default) Standard manufacturing bill  
- RWK  Rework bill  
- SPR  Spare parts bill  
The system enters bill type M in the work order header when you create a work order, unless you specify another bill type. The system reads the bill type code on the work order header to know which bill of material to use to create the work order parts list. MRP uses the bill type code to identify the bill of material to use when it attaches MRP messages. Batch bills of material must be type M for shop floor control, product costing, and MRP processing.

**Routing Type** | User defined code (system 40, type TR) that designates the type of routing. You can define different types of routing instructions for different uses.  
For example:  
- M  Standard Manufacturing Routing  
- RWK  Rework Routing  
- RSH  Rush Routing  
You define the routing type on the work order header. The specific type of routing defined will then be used in the work order routing.  
Product Costing and Capacity Planning systems use only M type routings.

### What You Should Know About

**Production lines** | To increase plant capacity, manufacturers run production lines for more than one shift, as well as run different lines of production on different days of the week. You specify these shifts and lines on the shop floor calendar.

You can identify up to six shifts for the production line using Manufacturing Constants, then identify all shifts for the production line by work center. After you set up the shift and line calendars, the Line Scheduling Workbench and Line Sequencing Workbench use these calendars to schedule production accordingly.

See Setting Up the Shop Floor Calendar.
**Line/item relationship**  
Before you enter a rate, you can create a relationship between a line and an item.

*See Setting Up Line and Item Relationships.*

**See Also**

- *Creating Work Orders* for information about attaching the ingredients list and routing instructions interactively

**Processing Options for Enter/Change Rate Schedule**

**DEFAULT PROCESSING:**

1. Enter defaults for the following:
   a. Rate Type (Default is ‘AC’)
   b. Beginning Status (Optional)
   c. Period (Optional)

**SCREEN FILTERS:**

2. Enter a ‘1’ to only display open schedules.

3. Enter the status code beyond which the rate is considered closed.  
   (Default is ‘99’)

**CATEGORY CODES:**

4. Enter defaults for the following:
   a. Category Code 1 (Optional)
   b. Category Code 2 (Optional)
   c. Category Code 3 (Optional)

   OR enter Item Branch Class Code (F4102) fields to retrieve default values:
   d. Category Code 1 (Optional)
   e. Category Code 2 (Optional)
   f. Category Code 3 (Optional)

**DREAM WRITER VERSIONS:**

Enter the DREAM Writer version to use for each program listed. If left blank, version ‘ZJDE0001’ will be used.

5. Routing Revisions (P3003)
6. Rate Schedule Workbench (P3119)
7. MPS/MRP/DRP Time Series (P3413)
8. Bill Availability (P30205)
9. ECO Revisions (P48020)
10. Assign Serial Numbers (P3105)
11. Lot Master Revisions (P4108)
12. Bill of Materials Revisions (P3002)

**PARTS LIST/ROUTING CREATION:**

13. Enter the method to attach a Parts List and Routing:
   1 - Interactively
   2 - Submit to Batch

   *NOTE: If left blank, Parts List and Routing will not be attached.*
14. Enter the DREAM Writer version for P31410. If left blank, version ZJDE0001 will be used.

BACK SCHEDULING INFORMATION:
15. Enter the Unit of Measure to use for scheduling.

BILL/ROUTING RECALCULATION:
16. Enter the DREAM Writer version to use for P31410, if this program should update Parts List and Routing when dates or quantities are changed in the Rate header. If left blank, no recalculation will be performed.

COMMITMENT AND SUBSTITUTION:
17. Commitment option for creating the Parts List manually.
   1 - Commit per Commitment Control in Manufacturing Constants.
   2 - Same as '1', but use substitutes for shortages.
   3 - Same as '1', but display substitute availability window when substitute qty available can cover shortage.
   9 - Do not commit.

NOTE: If left blank, commitment will be made to replenishing location in routing.

PRIOR REVISIONS:
18. Enter a '1' to allow attaching parts lists at prior revision levels. If left blank, prior revision levels will not be used.

ITEM LOCATION VALIDATION:
19. Enter a '1' to validate for existing Branch/Item record.

PURCHASE ORDER HOLD CODE:
20. Enter the Hold Code for the related purchase order if the work order quantity or date changes. If left blank, purchase order will not be updated.

NOTE: The purchase order will be updated only if the rate header is updated manually.

WAREHOUSE MANAGEMENT:
21. Request processing mode for attached parts list.
   1 - Generate requests only.
   2 - Generate requests and process using the subsystem.

NOTE: If left blank, no pick requests will be created.

22. If processing pick requests using the subsystem, enter the version to use. If left blank, XJDE0002
will be used. (see Form ID P46171)

23. Enter the default staging location for moving goods out of the warehouse. The parts picked from the warehouse are staged at this location prior to use within manufacturing. (F1=Location Window)

24. Enter a ‘1’ if the default staging location should be checked for availability. If the part is available at the staging location, a request will NOT be generated. This option only applies to parts without work center locations.

GENERIC TEXT COPY OPTIONS:
25. Enter a ‘1’ to copy component’s generic text to the Parts List.

26. Enter a ‘1’ to copy the operation’s generic text to the Routing.

OBSOLETE ITEMS:
27. Enter the Cross Reference code for retrieving item replacements for obsolete items.

CHARGE TO COST CENTER:
28. Enter a ‘1’ to default the branch/plant. If left blank, the production line will be used.
Schedule Rates

Scheduling Rates

The driving force for repetitive manufacturing is demand. Scheduling production lines requires tools to schedule, sequence, and balance production based on the capacity for each production line. Scheduling rates includes the following tasks:

- Scheduling items on a production line
- Sequencing rates by classification scheme or manually
- Reviewing production across lines

What You Should Know About

Quality Management test results

When you manage rate based information and complete quantities to inventory, you can access Test Results Entry for items that require testing.

See Working with Test Results in the Quality Management Guide for more information.
Scheduling Items on a Production Line

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Line Scheduling Workbench

Use the Line Scheduling Workbench to schedule rates and work orders for the family of items produced on a production line. This workbench shows information about both firmed and planned rates and work orders, in daily buckets. After you manually manipulate the scheduled quantities, you can firm the schedule using a function key. Use start and through dates to show the work days for the production line within the date range. When you create a rate or work order, or the system creates a rate through planning, the system spreads the quantities evenly over the work days within the specified date range. From the workbench you can access:

- Alternate Line Selection
- Split Lines
- Production Status
- Item Availability
- Rate Master Schedule

Use Split lines to move scheduled quantities from one line to another by:

- Splitting production among two lines, which may create a rate on the new line
- Consolidating production from two lines to one line
- Transferring production from one line to another

Use Alternate Line Selection to view all lines for which line/item relationships exist for the item.
To schedule items on a production line

On Line Scheduling Workbench

1. Complete the following fields:
   - Line
   - Branch/Plant

2. Complete the following optional fields:
   - Start Date
   - Through Date

3. Change any scheduled quantity as needed.

   If you change the total quantity and update the schedule, the system shows a soft error and then spreads the new quantity evenly across the date range. You must update the schedule using a function key before the system changes the record.

4. Enter a 2 next to the appropriate item.
5. On Alternate Line Selection, review the following fields:
   - Item
   - Revision

6. Enter a 2 in the following field next to the appropriate line:
   - Option

7. On Split Lines, complete the following fields to move scheduled quantities from one line to another:
   - Line
   - Quantity
   - Shift

**Processing Options for Line Scheduling Workbench**

**SCREEN DEFAULTS:**
1. Enter defaults for the following:
   a. Status for FIRM Rates and Work Orders
   b. Document Type
   c. Shift

**PLANNED ORDERS:**
2. Enter a ‘1’ to display PLANNED Rates and Work Orders.
DREAM WRITER VERSIONS:

Enter the Dream Writer version to use when calling each program listed. If left blank, version ‘ZJDE0001’ will be used.

3. Production Status (P31226)  
4. Line Sequencing Workbench (P3156)  
5. Split Lines Window (P3156W)  
6. Part Availability (P30205)  
7. Rate Header Maintenance (P3109)  
8. Supply/Demand Inquiry (P4021)  
9. Message File Revisions (P3411)  
10. Line Balancing Review (P3152)

**Sequencing Rates by Classification Scheme or Manually**

**From Shop Floor Control (G31), choose Repetitive Daily Processing**

**From Daily Processing – Repetitive (G3115), choose Line Sequencing Workbench**

Use the Line Sequencing Workbench to sequence the rates after you schedule production. This workbench only shows information about actual rates, in daily buckets. Set the processing options if you want the system to sequence quantities across shifts, or across both shifts and days. You must update the schedule using a function key before the system changes the record. You can sequence the rates, using function keys, by:

- Category code
- Sequence number

To sequence the rates by the items’ category codes, you use a function key. (The category code values are determined by the setup in the processing options for the Enter/Change Rate Schedule.) Beginning with the first shift and day, you forward schedule the quantities, which consumes the available capacity. You use the processing options to control whether these quantities are pulled forward or pushed back in time across shifts only, or both shifts and days. This process places the scheduled quantities which exceed the capacity available, within the date range selected, in the last shift of the last day.

To sequence the rates by sequence number, you use a different function key. Again, beginning with the first shift and day, you forward schedule the quantities, which consumes the available capacity. When created, a new rate has an initial sequence number of all nines. This causes it to be sequenced last for the shift, therefore placing it after any previously sequenced rates. This default sequence may then be overridden manually, if desired. You do this by changing the sequence number value. After manipulating the sequence, you can update the schedule as is, or use the function key to forward schedule again.
To sequence rates by classification scheme or manually

On Line Sequencing Workbench

1. Complete the following fields:
   - Line/Cell
   - Branch/Plant
2. Complete the following optional fields and press Enter:
   - From Date
   - Through Date
3. To change the sequence of the rate, complete the following fields as needed:
   - Sequence
   - Shift
Processing Options for Line Sequencing Workbench

PROCESSING DEFAULTS:
1. Enter a ‘1’ to allow scheduling across shifts. ____________

2. Enter a ‘1’ to allow scheduling across days. If left blank and scheduling across shifts is allowed, remaining hours for a day will be applied to the last shift for the day.
   NOTE: If option 1 is left blank, option 2 is set to blank in the program.

DATE RANGE SELECTION:
3. Enter a ‘1’ to default the From Date to the current date when the From Date is left blank. ____________

4. Enter the number of days to add to the From Date when defaulting the Thru Date. If left blank, the From Date value is used as the default value for the Thru Date. ____________

Reviewing Production Across Lines

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Schedule Review

Use Schedule Review to view the schedule of the production lines for the family of items produced. If items are produced on multiple production lines, use this workbench to view production across lines while staying within each line’s capacity. You can toggle the information shown between an item and all items:

- Item mode — the load column represents the capacity consumed by rates for that item.
- All items mode — the load column represents the capacity consumed by the mix of items’ rates in effect.
To review production across lines

On Schedule Review

1. Complete the following fields:
   - Line/Cell
   - Branch
2. Complete the following optional fields and press Enter:
   - Date From
   - Date Through
3. Review the information.

Processing Options for Schedule Review

SCREEN DEFAULTS:
1. Enter defaults for the following:
   a. Document Type (Default is ‘AC’)
   b. Shift

DREAM WRITER VERSIONS:
2. Enter the version of Rate Revisions (P3109) to call. If left blank, version ‘ZJDE0001’ will be used.
Complete Rates

Completing Rates

From Shop Floor Control (G31), choose Process Daily Processing

From Daily Processing – Process (G3115), choose Completions Workbench

Use Completions Workbench to record rate or work order completions, issue ingredients, and record hours and quantities for the rate or work order. Depending on how you set the processing options, the Inventory Issues and Hours and Quantities forms appear as you complete rates or work orders.

When you perform a completion, the system records the inventory as received and updates all required Inventory Management system tables. The system adds the quantity that is completed to the quantity on hand for the location that you indicate.

Before You Begin

☐ Set the processing options to access the Issues and Hours and Quantities programs

What You Should Know About

Quality Management test results When you manage rate based information and complete quantities to inventory, you can access Test Results Entry for items that require testing.

See Working with Test Results in the Quality Management Guide for more information.
To complete rates

On Completions Workbench

1. Complete the following fields:
   - Branch/Plant
   - Document Type
   - Item Number
   - Quantities Completed
   - Quantities Scrapped
   - Date Complete
   - Shift

2. Access the detail area.
3. Complete the following field:
   - Employee Number

4. Complete the following optional fields and press Enter:
   - Location
   - Lot/Serial Number
   - Employee
   - Status
5. On Super Backflush, and press Enter.

6. On Inventory Issues, and press Enter.

7. On Hours & Quantities Entry, complete the following fields:
   • Employee
   • Completed
   • Scrapped
   • Unit of Measure

8. Revise the following fields as needed:
   • Actual Setup
   • Actual Labor
   • Actual Machine

### Processing Options for Completions Workbench

**SCREEN DEFAULTS:**
1. Enter defaults for the following:
   a. Schedule Type (Default is ‘AC’)  ____________
   b. Employee Number  ____________
   c. Production Line  ____________
   d. Effective From  ____________
   e. Effective Thru  ____________
   f. Status From  ____________
   g. Status Thru  ____________
DREAM WRITER VERSIONS:
Enter the Dream Writer version to use when calling each program listed. If left blank, version ZJDE0001 will be used.

2. Super Backflush (P31123)
3. Hours and Quantities (P311221)
4. Material Issues (P31113)
5. Rate Revisions (P3109)
6. Item Ledger Inquiry (P4111)
7. Line Balancing Review (P3152)
8. Schedule History Inquiry (P31226)
9. Completions (P31114)
10. Lot Master Revisions (P4108)
11. Hours and Quantities Update (P31422)

HOURS & QUANTITIES:
12. Enter a ‘1’ to automatically process hours & quantities using the dream writer version for P31422. If left blank, P31422 should be submitted manually.

CLOSING RATES:
13. Enter the status code to use when closing rates. (Default is ‘99’)

LOT NUMBER:
14. Enter ‘1’ to protect the lot number from input.

QUALITY MANAGEMENT:
15. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ‘ZJDE0002’ will be used.

Processing Options for Super Backflush

STATUS CODES DEFAULTS:
NOTE – Blanks will not update the Status Code.

1. Enter the default Operation Status Code for Partial Completions.
2. Enter the default Operation Status Code for Full Completions.
3. Enter the Status Code for update to the Work Order Header.
4. Enter the default Material Status Code for Issues.

SHOP FLOOR ACTIVITY INFORMATION:
5. Enter the Version of the Hours and Quantity Program to call. If left blank, a blind Hours and Quantities execution will be performed.

BLIND HOURS AND QUANTITIES ENTRY:
6. Enter the Document Type associated with Shop Floor Activity.

WORK ORDER ISSUES INFORMATION:
7. Enter the Version of the Material Issues Program to call.
   If left blank, a blind execution of Work Order Inventory Issues will be performed.

BLIND WORK ORDER ISSUES:
8. Enter the Document Type associated with a Work Order Issue.
9. Enter the acceptable lot hold codes (up to 5) for inventory issues, or enter '*' for issues to all held lots. Blanks will not allow issues.

WORK ORDER COMPLETION INFORMATION:
10. Enter the Version of the Work Order Completions Program to call.
    If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
11. Enter the Document Type associated with an Inventory Completion.
12. Enter the Document Type associated with an Inventory Scrap.

EDIT INFORMATION:
13. Enter the Status Code beyond which Backflushing cannot be performed.

ITEM SALES HISTORY INFORMATION:
14. Enter a '1' if you wish blind issues to effect Item Sales History (F4115).

WAREHOUSE PROCESSING:
15. Enter the Directed Putaway mode.
    ' ' - No Directed Putaway requests
    '1' - Request Putaway only.
    '2' - Request Putaway and process using the subsystem.
16. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used.
    If blank, ZJDE0001 is used.
    (See Form ID P46171)

QUANTITY COMPLETION CONTROL:
17. Enter a '1' to verify that, for a given operation, the total of the quantity completed plus scrapped does not exceed the 'Quantity At Operation.' If left blank, the verification is not performed.

QUALITY MANAGEMENT:
18. Enter the version of Test Results Revisions (P3711) to call. If left
Processing Options for Hours and Quantities Entry

DISPLAY INFORMATION:
1. Enter a '1' for the screen to be displayed in Order Number format. If left blank, the screen will be displayed in Employee format.

UPDATE INFORMATION:
2. Enter the Document Type associated with Shop Floor Activity.

EDIT INFORMATION:
3. Enter the Status Code beyond which Shop Floor Activity cannot be entered.
4. Enter a '1' to verify that, for a given operation, the total of the quantity completed plus scrapped does not exceed Quantity At Operation.
5. Enter a '1' to prevent employee rate from being written to screen.

QUALITY MANAGEMENT:
6. Enter the version of Test Results Revisions (P3711) to call. If left blank, version ZJDE0002 will be used.
Review Information

You can review the status of rates and work orders, records for entries of completion and scrap at an operation, and planned and remaining quantities for all items scheduled through a particular production line. Reviewing information consists of the following:

- Review production status
- Review production history
- Review line dispatch list

Reviewing Production Status

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Production Status

Use Production Status to view the status of all rates and work orders by work center/line, work order, rate schedule number or item number as qualified by the status and date ranges. The program shows historical information as well as open rates and work orders.

From Production Status you can access Production Transaction History, where you can view the transactions for each entry of completions and scrap at an operation. The history program shows all transactions that made up the scrapped quantities and the details of these past transactions.
To review production status

On Production Status

1. Complete one or a combination of any two of the following fields:
   - Work Center/Line
   - Item
   - Order Number

2. Complete the following field and press Enter:
   - Branch/Plant

3. Review the information.

Processing Options for Production Status

SCREEN DEFAULTS:
1. Enter defaults for the following:
   a. From Status
   b. Thru Status
   c. The number of days prior to today’s date for the From Date.
   d. The number of days after today’s date for the Thru Date.
Reviewing Production History

From Shop Floor Control (G31), choose Repetitive Daily Processing
From Daily Processing – Repetitive (G3115), choose Production History

To review production history

On Production History

1. Complete one or a combination of any two of the following fields:
   - Work Center/Line
   - Item Number
   - Order Number
2. Complete the following field and press Enter:
   - Branch/Plant
3. Review the information.
Processing Options for Production History

SCREEN DEFAULTS:
1. Enter defaults for the following:
   a. Operation Sequence ______________________
   b. Shift ______________________
   c. The number of days prior to today’s date for the From Date. ______________________
   d. The number of days after today’s date for the Thru Date. ______________________

Reviewing Line Dispatch List

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Line Dispatch List

Use Line Dispatch List to view the planned and remaining quantities for all items scheduled through a particular production line.

To review line dispatch list

On Line Dispatch List

1. Complete the following fields and press Enter:
   - Line/Cell
   - Branch/Plant
2. Review the information.

3. Access the detail area.

4. Review the information.

**Processing Options for Line Dispatch List**

SCREEN DEFAULTS:
1. Enter defaults for the following:
   a. The number of days prior to today's date for the From Date.
   b. The number of days after today's date for the Thru Date.
   c. Shift
   d. From Status
   e. Thru Status
Process Kanbans

Processing Kanbans

While requirements for material is driven by demand, movement is controlled by visual cues called kanbans. Kanbans are predetermined quantities of components at specified locations on the production line. They are designed to minimize work-in-process inventories. Two programs manage the electronically implemented kanbans. Processing kanbans includes the following tasks:

- Processing kanban consumption by item
- Processing kanban supply by item

Use the consumption program to access kanbans at a consuming location, and the supply program to access kanbans at a supplying location, by specifying one or any two of the following criteria:

- Item
- Location
- Supplier
- Kanban identification

You process kanbans in one of two modes:

- One-Phase
- Two-Phase
One-Phase

One-phase assumes the completion and transfer to the consuming location are performed in one step, in which you complete the quantity directly to the consuming location and change the kanban status to checked-in (1).

Check-in (1)  Check-in (1)

Check-out (2)  Check-out (2)

Two-Phase

Two-phase assumes the completion and transfer are reported separately. You complete the quantity to the supplying location and change the kanban status to completed (3). After the quantity has physically been received at the consuming location, a transfer from the supplying location to the consuming location occurs, and the kanban status is changed to checked-in (1).

If you check in a kanban quantity from the supplier, the system can initiate a receipt transaction if the kanban master flag is on.

Check-in (1)  Check-in (1)

Completed (3)  Completed (3)

Check-out (2)  Check-out (2)
You can process kanbans for items that are:

- Inventoried
- Manufactured (sub-assemblies/phantoms)
- Externally supplied

**Inventoried Items Processing**

When you check out a kanban that is inventoried, the kanban status is changed. The supplying location replenishes the kanban quantity. You then complete and check in the kanban, which results in an inventory transfer transaction.

**Manufactured Processing**

When you check out a kanban that is manufactured, the program either creates a work order, or looks for an existing rate. It bases its action on the items’ order policy code. (If the system does not find a rate, it creates one.) When the system creates a rate, it automatically attaches the ingredients list and routing. When you check in the kanban, you complete the work order or rate, issue ingredients, enter hours and quantities, and transfer the parent item to the consuming location.

**Manufactured Processing — Phantom Item**

When you check out a kanban supplied by a work center/production line, and the item is a phantom, no transactions outside of inventory transfers occur. There are no work orders or rates to process; the item is simply replenished by the producing line and the kanban is completed and checked in. This results in an inventory transfer transaction, from the supplying location to the consuming location.

**Externally Supplied Processing**

When you check out kanbans from an external supplier, the system may create a new purchase order, or use an existing one. However, there must be an open purchase order for the item. In addition, when you check out the kanban, the system may also initiate an Electronic Data Interchange (EDI) transaction. When you check in kanbans from an external supplier, the system may optionally perform a receipt against the purchase order.
Processing Kanban Consumption by Item

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Kanban Consumption

Kanban Consumption allows you to access all kanbans at a given consuming location. After you locate your items, depending on the status of each item, you can make one of the following status changes at a consuming location:

- Checked-in (1)
- Checked-out (2)

To process kanban consumption by item

On Kanban Consumption

1. Complete the following fields:
   - Item Number
   - Branch/Plant

2. Complete the following fields to check in a kanban that was supplied by the production line and a rate or work order was created:
   - Employee Number
   - Shift
3. Access the detail area.

4. To check in the item, enter a 1 in the following field next to the item number:
   - Option

5. To check out the item, enter a 2 in the following field next to the item number:
   - Option

**Processing Options for Kanban Consumption**

**RATE BASED INFORMATION:**
1. Enter the version of rate schedule revision (P3109) to be used (Default is ZJDE0001)

**WORK ORDER INFORMATION:**
2. Document type (Default is ‘WO’)
3. Beginning Status
4. Enter a ‘1’ to attach part list and routing
5. Enter the version of for J31410 (Default is ZJDE0001)
6. Close Status for rate or work order

**PURCHASE ORDER INFORMATION:**
7. Enter the document type for purchase order (Default is ‘OP’)
8. Enter a ‘1’ to trigger EDI862 transaction
9. Enter the version of Purchase Orders Print (P43500) to be called to generate EDI 862 transaction (Default is XJDE0008)
10. Enter the version of open purchase orders (P430301) to be called. (Default is ZJDE0007)

11. Enter the default route type to be used to search for a receipt route.

12. Enter the value of the default route to be used for items without a receipt route setup.

13. Enter the version of Receipt by PO/Item/Account to call. If left blank, will default to ‘ZJDE0008’.

14. Enter a ’1’ to create purchase order

15. Enter the beginning line status

SHOP FLOOR ACTIVITY INFORMATION:
16. Enter the version of the Hours and Quantity Program to call
   If left blank, a blind Hours and Quantity execution will be performed

BLIND HOURS AND QUANTITIES ENTRY:
17. Enter the Document Type associated with Shop Floor Activity.
   (Default is ’IH’)

WORK ORDER ISSUES INFORMATION:
18. Enter the Version of the Material Issues Program to call.
    If left blank, a blind execution of Work Order Inventory Issues will be performed.

BLIND WORK ORDER ISSUES:
19. Enter the Document Type associated with a Work Order Issue.

WORK ORDER COMPLETION INFORMATION:
20. Enter the Version of the Work Order Completions Program to call.
    If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
21. Enter the Document Type associated with an Inventory Completion.

22. Enter the Document Type associated with an Inventory Scrap.

STATUS CODES DEFAULTS:
23. Enter the default Operation Status Code for Partial Completions.

24. Enter the default Operation Status Code for Full Completions.
25. Enter the Status Code for update to the Work Order Header.

INVENTORY TRANSFER:
27. Enter the Version of the Inventory Transfer Program to call. If left blank, a blind Inventory Transfer execution will be performed.

BLIND INVENTORY TRANSFER:
28. Enter the Document Type associated with an Inventory Transfer.

DEFAULT VALUES:
29. Enter the default value for Item Number.
30. Enter the default value for location.

WAREHOUSE PROCESSING:
31. Enter the Directed Putaway mode. ' ' : No Directed Putaway requests '1' : Request Putaway only. '2' : Request Putaway and process using the subsystem.
32. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used. If blank, ZJDE0001 is used. (See Form ID P46171)

Transaction Confirmation
33. Enter '1' to be prompted to confirm transaction
**Processing Kanban Supply by Item**

From Shop Floor Control (G31), choose Repetitive Daily Processing

From Daily Processing – Repetitive (G3115), choose Kanban Supply

Kanban Supply allows you to access all kanbans that need replenishment for items stored or produced at a given supplying location. After you locate your items, depending on the status of each item, you can make one of the following status changes at a supplying location:

- Checked-in (1)
- Completed (3)

Inventory and statuses are affected as follows:

- One-phase — inventory is immediately received and available at the consuming location, and the status is changed to checked-in (1).
- Two-phase — the completion and transfer are reported separately:
  - The quantity is completed to the supplying location, the kanban status is changed to a complete (3).
  - After the quantity has physically been received at the consuming location, a transfer is performed from the supply location to the consuming location and the kanban status is then changed to checked-in (1).
To process kanban supply by item

On Kanban Supply

1. Complete the following fields:
   - Item Number
   - Branch/Plant

2. Complete the following fields to check in a kanban that was supplied by the production line and a rate or work order was created:
   - Employee Number
   - Shift

3. Access the detail area.
4. To check in the item, enter a 1 in the following field next to the item number:
   - Option

5. To complete the item, enter a 3 in the following field next to the item number:
   - Option

**Processing Options for Kanban Supply**

**RATE BASED INFORMATION:**
1. Enter the version of rate schedule revision (P3109) to be used (Default is ZJDE0001)

**WORK ORDER INFORMATION:**
2. Enter the document type for work orders (Default is ‘WO’)
3. Close Status for rate or work order

**PURCHASE ORDER INFORMATION:**
4. Enter the document type for purchase order (Default is ‘OP’)
5. Enter the default route type to be used to search for a receipt route.
6. Enter the value of the default route to be used for items without a receipt route setup.
7. Enter the version of Receipt by PO/Item/Account to call. If left blank, will default to ‘ZJDE0008’.
SHOP FLOOR ACTIVITY INFORMATION:
8. Enter the version of the Hours and Quantity Program to call.
   If left blank, a blind Hours and Quantity execution will be performed.

BLIND HOURS AND QUANTITIES ENTRY:
9. Enter the Document Type associated with Shop Floor Activity.
   (Default is 'IH')

WORK ORDER ISSUES INFORMATION:
10. Enter the Version of the Material Issues Program to call.
    If left blank, a blind execution of Work Order Inventory Issues will be performed.

BLIND WORK ORDER ISSUES:
11. Enter the Document Type associated with a Work Order Issue.

WORK ORDER COMPLETION INFORMATION:
12. Enter the Version of the Work Order Completions Program to call.
    If left blank, a blind Work Order Completions execution will be performed.

BLIND WORK ORDER COMPLETIONS:
13. Enter the Document Type associated with an Inventory Completion.
14. Enter the Document Type associated with an Inventory Scrap.

STATUS CODES DEFAULTS:
15. Enter the default Operation Status Code for Partial Completions.
16. Enter the default Operation Status Code for Full Completions.
17. Enter the Status Code for update to the Work Order Header.
18. Enter the default Material Status Code for Issues.

INVENTORY TRANSFER:
19. Enter the Version of the Inventory Transfer Program to call.
    If left blank, a blind Inventory Transfer execution will be performed.

BLIND INVENTORY TRANSFER:
20. Enter the Document Type associated with an Inventory Transfer.

DEFAULT VALUES:
21. Enter the default value for Item Number.
22. Enter the default value for location.

WAREHOUSE PROCESSING:

23. Enter the Directed Putaway mode.
   ' ' : No Directed Putaway requests
   '1' : Request Putaway only.
   '2' : Request Putaway and process using the subsystem.

24. If processing putaway requests through the subsystem, enter the DREAM Writer version to be used. If blank, ZJDE0001 is used. (See Form ID P46171)

Transaction Confirmation

25. Enter '1' to be prompted to confirm transaction
Close Rates

Closing Rates

From Shop Floor Control (G31), enter 27

From Advanced Shop Floor Control (G3131), choose Close Rates

Use the Close Rates program to close rate schedules if the:

- Status is greater than or equal to the value specified in the processing options
- Effective through date is less than or equal to the date specified in the processing options

When you close rates, the system:

- Purges the rate schedule data from the Quantity Detail table
- De-commits any quantities for the applicable rates

See Also

- Purge Work Orders for information about purging data

Processing Options for Batch Rate Close

PROCESSING DATE:
1. Enter the date to compare to the Rate Effective Through date. All rates for which the Through Date is less than this date will be closed. If left blank, no rates will be closed.

WORK ORDER STATUS:
2. Enter the status for closed rates. If left blank, ‘99’ will be used.

DREAM WRITER VERSIONS:
3. Enter the version of Rate Schedule Revisions (P3109) to call to determine whether or not rates are to be decommitted. If left blank, version ‘ZJDE0001’ will be used.
What You Should Know About Processing Options

**Work Order Status (2)**

When you set the status to 3, the system no longer allows you to process Manufacturing Accounting for that rate.
System Setup
System Setup

Objectives

- To set up the required data in the Shop Floor Control system
- To understand how the system uses the data

About System Setup

Shop Floor Control requires some setup prior to using the system. Setup for Shop Floor Control includes codes needed for work orders, such as priority, status, and category codes. As well as, information needed for process and repetitive manufacturing, such as employee labor rates, shop floor calendar, and work centers.

To set up your Shop Floor Control system, complete the following tasks:

- Set up work order codes
- Set up manufacturing information

Before You Begin

- Set up the following records in the Inventory Management system:
  - Item Master
  - Branch/Plant

See Also

- *Technical Foundation Guide* for information on defining user defined codes
- *Inventory Management Guide* for information on setting up the Item Master, Branch/Plant, and Lot Master records
Set Up Work Order Codes

Setting Up Work Order Codes

You need to define certain user defined codes for your manufacturing work orders. Complete the following tasks:

- Set up type codes
- Set up priority codes
- Set up status codes
- Set up phase codes
- Set up category codes
- Set up operation status codes
- Set up document type codes

To set up type codes

From the Shop Floor Control Setup menu (G3141), choose Type.

Work order type codes (00/TY) indicate the type classification of a work order. For example, a rework order might be type R and a design order might be type D.

On Type
Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
- Description-2

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Code</td>
<td>A user defined code (98/SY) that identifies a J.D. Edwards system.</td>
</tr>
<tr>
<td>User Defined Codes</td>
<td>Identifies the table that contains user defined codes. The table is also referred to as a code type.</td>
</tr>
<tr>
<td>Code</td>
<td>This column contains a list of valid codes for a specific user defined code list. The number of characters that a code can contain appears in the column title.</td>
</tr>
<tr>
<td>Description</td>
<td>A user defined name or remark.</td>
</tr>
<tr>
<td>Description 02</td>
<td>Additional text that further describes or clarifies a field in J.D. Edwards systems.</td>
</tr>
</tbody>
</table>
To set up priority codes

From the Shop Floor Control Setup menu (G3141), choose Priority.

Work order priority codes (00/PR) indicate the priority of a work order in relation to other work orders. These codes are for reference only and do not affect the scheduling or planning of work. They should not be used as your formal work priority system.

On Priority

Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
To set up status codes

From the Shop Floor Control Setup menu (G3141), choose Status.

Work order status codes (00/SS) describe the status or the current step in the process of implementing a work order. You can prevent certain transactions from occurring based on the status of a work order. For instance, the system can hold work orders whose status indicates they are pending approval or quality inspection, and release work orders that have a status code indicating they have been approved or passed quality inspection. In addition, you can set the system to automatically update the work order status code when you enter issue and completion transactions.

On Status

![Status set up]

Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
To set up phase codes

From the Shop Floor Control Setup menu (G3141), choose Phase.

Work order phase codes (00/W1) indicate the implementation phase of the work order. You can use phase codes to group families of orders for project management, cost accounting, and inquiry purposes. For example, if inspection on the internal parts of a product is not possible beyond a certain point in its production, you can divide the routing into phases. You can then use the phase code to indicate availability of the product for the next level of inspection.

On Phase

Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
To set up category codes

From the Shop Floor Control Setup menu (G3141), choose Category Code 02.

Work order category codes 02 and 03 can represent any category or description by which you want to group work orders for project management, cost accounting, or inquiries. For example, you can set up one category code to represent types of problems encountered in the work order implementation, such as improper startup or inadequate maintenance, and another code to represent locations where the work is taking place.

On Category Code 02

![Image of Category Code 02 window]

Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
To set up operation status codes

From the Shop Floor Control Setup menu (G3141), choose Operation Status.

Work order operation status codes (31/OS) indicate the progress or status of an order during the steps followed in a particular operation. For example, you can set up codes to indicate if materials have been received or work begun at a particular operation. This allows management to monitor the progress of operations that have longer run times, or shop floor personnel to indicate when items are ready to move to the next operation.

On Operation Status

Complete the following fields:

- System Code
- User Defined Code
- Character Code
- Description
To set up document type codes

From any Shop Floor Control menu, enter UDC.

You can categorize your work orders by document type using user defined codes (00/DT). For example, you can define document type codes to indicate rework orders, prototype orders, or repair orders. If you do not specify a document type on a new work order, the system enters a document type of WO (Firm Work Order).

Document types are used to categorize information across your J.D. Edwards systems. You can specify up to 12 document types to be used for work orders and rates in supply/demand calculations by entering them in the processing options for the Supply/Demand Inclusion Rules in the Manufacturing Planning system. The Manufacturing Accounting system uses the document type to match the document types defined in your automatic accounting instructions (AAIs) when you post journal entries to the general ledger.

On General User Defined Codes

1. Complete the following fields to locate the document types:
   - System Code
   - User Defined Code

2. Complete the following fields to set up new document type codes:
   - Character Code
   - Description
See Also

- Creating Work Orders (P48013)

Processing Options for User Defined Codes

DEFAULT CODE/TYPEx
1. Enter the desired Install System Code.

2. Enter the desired Record Type.
Set Up Manufacturing Information

Setting Up Manufacturing Information

Set up the information that is needed for process and repetitive manufacturing, such as user defined codes, work day calendars, and constants. Complete the following tasks:

- Set up standard procedures
- Set up employee labor rates
- Set up the shop floor calendar
- Set up manufacturing constants
- Set up work centers
- Set up resource units
- Set up line and item relationships
- Set up kanban controlled items
- Generate kanbans

Setting Up Standard Procedures

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Standard Procedures

You can set up generic messages (48/SN) that represent procedural or message text for your company. Use them to describe a standard procedure for each step in a routing.

The description you define for the code prints on shop floor documents and appears in online inquiries that access data on Enter/Change Routing.

To set up standard procedures

On Standard Procedures
1. Complete the following fields:
   - Character Code
   - Description

2. Choose General Message.
3. On General Message, complete the following fields to add a message to the code you selected:
   - Message Number
   - Message

**What You Should Know About**

**Indicating the procedure to use for routings**

After you define standard procedure codes, you can enter them in the Standard Description field on Enter/Change Routing to indicate the procedure to use for each routing operation.

**Processing Options for Standard Procedures**

USER DEFINED CODES:
1. Enter the desired System Code.                      ____________
2. Enter the desired Record Type.                      ____________

DISPLAY INFORMATION
3. Enter an '1' to display Rate Text or
   Enter an '2' to display Message Text            ____________
4. If displaying Message Text,
   Enter an '1' for 60 column display or
   Enter an '2' for 80 column display          ____________
Setting Up Employee Labor Rates

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Employee Labor Rates

Employee labor rate codes are generic rates (31/ER) that represent hourly labor rates for your employees. The rate that you define for each employee appears in the Employee Rate field on the Hours and Quantities Entry form when the employee enters time transactions. For each code, you can define the name or type of employee that the code represents and the hourly labor rate for the employee or job category.

To set up employee labor rates

On Employee Labor Rates

Complete the following fields:

- Character Code
- Description
- Rate
### Processing Options for Employee Labor Rates

**USER DEFINED CODES:**
1. Enter the desired System Code.
2. Enter the desired Record Type.

**DISPLAY INFORMATION**
3. Enter an ‘1’ to display Rate Text or Enter an ‘2’ to display Message Text
4. If displaying Message Text, Enter an ‘1’ for 60 column display or Enter an ‘2’ for 80 column display

### Setting Up the Shop Floor Calendar

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Shop Floor Calendar

You can define the work days by month and year for each branch or all branches in your system in the Shop Floor Calendar. The system uses this calendar to determine manufacturing schedules.

You can also define calendars by shift and name. The system uses these calendars for line sequencing by shift in repetitive manufacturing.

To increase plant capacity, manufacturers run production lines for more than one shift, as well as run different lines of production on different days of the week. You specify these shifts and lines on the Shop Floor Calendar.
To set up the shop floor calendar

You set up a calendar month by locating the month, year, and branch, and entering any different day types.

On Shop Floor Calendar

Complete the following fields:

- Branch
- Calendar Year
- Calendar Month
- Shift (for repetitive manufacturing)
- Line (for repetitive manufacturing)
- Type of Day

The calendar on the left shows the actual calendar days for the month and year that you requested. The calendar on the right shows the workdays and non-workdays that you define.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Branch        | A code that represents a high-level business unit. It can be used to reference a branch or plant that might have departments or jobs, which represent lower-level business units (data item MCU), subordinate to it. For example:  
  - Branch/Plant (MMCU)  
  - Dept A (MCU)  
  - Dept B (MCU)  
  - Job 123 (MCU)  
  Business unit security is based on the higher-level business unit.  
  Form-specific information  
  This value identifies the branch or plant in which the calendar resides. It must be a valid business unit. |
| Calendar Year | The calendar year.                                                                                                                                 |
| Calendar Month| The calendar month.                                                                                                                                 |
| Shift Code    | A user defined code (07/SH) that identifies daily work shifts. In payroll systems, you can use a shift code to add a percent or amount to the hourly rate on a timecard.  
  For payroll and time entry:  
  If an employee always works a shift for which a shift rate differential is applicable, enter that shift code on the employee’s master record. When you enter the shift on the employee’s master record, you do not need to enter the code on the timecard when you enter time.  
  If an employee occasionally works a different shift, you enter the shift code on each applicable timecard to override the default. |
### What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Unit</td>
<td>An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant. You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department. Security for this field can prevent you from locating business units for which you have no authority. Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table.</td>
</tr>
<tr>
<td><strong>Form-specific information</strong></td>
<td>For repetitive manufacturing, this field provides the link to the Work Center Master, which allows the system to create calendars for that production line. You must also identify all shifts for the production line. The Line Scheduling Workbench and Line Sequencing Workbench programs use these shift and line specific calendars to schedule production accordingly.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Deleting a branch calendar</th>
<th>If you delete a branch calendar for a month and year, the calendar record no longer exists. However, if you locate a month and year that does not exist, it appears with default values. You can then add the record.</th>
</tr>
</thead>
<tbody>
<tr>
<td>System defaults</td>
<td>If the shop calendar for the branch, month, and year are not yet defined, the system preloads default work days (Monday through Friday) and weekends (Saturday and Sunday). Holidays are always user defined.</td>
</tr>
<tr>
<td>Shift calendars</td>
<td>Shift calendars are not used for DRP/MPS/MRP.</td>
</tr>
</tbody>
</table>
Setting Up Manufacturing Constants

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Manufacturing Constants

You set up manufacturing constants to maintain general branch or plant information that affects processing throughout the Manufacturing system, such as:

- When inventory is committed and backflushed
- Which overhead costs calculations are used
- Whether work center efficiency is considered when calculating direct labor and overhead
- Whether an audit trail tracks all changes made to bills of material
- Whether the system validates bills of material online as you enter them

Information that you define for manufacturing constants affects all areas of the J.D. Edwards Manufacturing system, so you should make your choices carefully.

Complete the following tasks:

- Set up engineering manufacturing constants
- Set up production manufacturing constants (optional)
- Set up accounting manufacturing constants
To set up engineering manufacturing constants

On Manufacturing Constants

1. Complete the following field:
   - On-Line BOM Validation

2. Complete the following optional fields:
   - Log Bill of Material Changes
   - Master Routings
   - Percent Bill Validation

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Log Bill of Material Changes</td>
<td>This field determines whether changes to the bill of material are recorded in the Bill of Material Change table (F3011). Valid values are: Y Yes, log changes. N No, do not log changes. Blank will assume an N. When you log bill of material changes, the system saves the old bill of material and the new changed bill of material.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>------------------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>On-Line BOM Validation (Y/N)</td>
<td>Determines whether the system performs an online component/parent validation and low-level code assignment when you revise a bill of material.</td>
</tr>
<tr>
<td></td>
<td>Valid values are:</td>
</tr>
<tr>
<td>Y</td>
<td>Yes, validate items online.</td>
</tr>
<tr>
<td>N</td>
<td>No, do not validate items online.</td>
</tr>
<tr>
<td></td>
<td>Note: J.D. Edwards recommends that you validate items online (enter Y) unless your bills of material are extremely large.</td>
</tr>
<tr>
<td></td>
<td>Important: If you enter N, you must validate the items in batch. Run the Print Integrity Analysis program (P30601) after bill of material updates and before you run the Frozen Cost Update program (P30835) or perform a DRP/MPS/MRP generation (P3482).</td>
</tr>
<tr>
<td>Master Routings (Y/N)</td>
<td>This field controls whether the system uses the master routing for an item or a routing defined for the parent item. Both routings are retrieved from the Routing Master table (F5003). Valid values are:</td>
</tr>
<tr>
<td></td>
<td>Y Yes, use the master routing for an item, if one exists. The Shop Floor Control system will check the Item Cross Reference table (F4104), Cross Reference Type MR, for the parent item. If it finds a cross-reference, the system uses the master routing from the Routing Master table (F5003). If it does not find a cross-reference, the system uses the routing defined for the parent item.</td>
</tr>
<tr>
<td></td>
<td>N No, do not check for a master routing for the item. The system will always use the parent item's routing from the Routing Master table (F5003).</td>
</tr>
<tr>
<td>Percent Bill Validation</td>
<td>This flag designates whether percent bills are allowed to contain fixed or variable components in addition to the 100% formula. If left blank, only percent components will be allowed and it must total 100%.</td>
</tr>
</tbody>
</table>
To set up production manufacturing constants

On Manufacturing Constants

Complete the following optional fields:

- Backflush Option
- Commitment Control
- Hard/Soft Commit
- Hours
- Shift Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Backflush Options</td>
<td>Determines how the system performs commitment and release of inventory during the backflush process. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1 Create a standard parts list based on the value in the Commitment Control field in the Manufacturing Constants table (F3009).</td>
</tr>
<tr>
<td></td>
<td>2 Create a parts list, committing to the location indicated in the Work Center Master table (F30006). The Operation Sequence field in the Bill of Material table (F3002) determines the work center that is used.</td>
</tr>
</tbody>
</table>

NOTE: You must create the work order routing before the parts list. If you are running work order generation, the work order routing and the parts list must be created at the same time.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commitment Control</td>
<td>Determines how the system commits inventory to a work order, and limits the inventory location to which commitments are made. The system activates this field only when you create hard commitments. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1 Make commitments to the primary location in the branch/plant where the work order originates.</td>
</tr>
<tr>
<td></td>
<td>2 Split the parts list and commitments to fill any component shortages. The system can cross branch boundaries to fill requirements. In this case, the system uses the next alphabetical branch/plant listed in the table that occurs after the branch/plant on the work order header. For example:</td>
</tr>
<tr>
<td></td>
<td>CAL</td>
</tr>
<tr>
<td></td>
<td>CHI</td>
</tr>
<tr>
<td></td>
<td>CLE</td>
</tr>
<tr>
<td></td>
<td>HOU</td>
</tr>
<tr>
<td></td>
<td>If the system starts committing inventory at branch/plant CHI, it accesses CLE as the next branch/plant. If inventory is low in all locations, the system makes the remaining commitments to the primary location of the branch/plant on the work order header.</td>
</tr>
<tr>
<td></td>
<td>3 Same as 2, but the system cannot cross branch boundaries.</td>
</tr>
<tr>
<td></td>
<td>When you set the Commitment Method field in the Item Branch/Plant table to 2 or 3 (lot number or expiration date control), you must set this field to 3.</td>
</tr>
<tr>
<td>Hard/Soft Commit</td>
<td>Determines how the Shop Floor Control system commits inventory. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>1 The system performs a hard commitment at the creation of the parts list. The hard commitment remains in effect until inventory is relieved.</td>
</tr>
<tr>
<td></td>
<td>2 The system performs a soft commitment at the creation of the parts list. Changed to a hard commitment during the pick list print process for the work order. The hard commitment remains in effect until inventory is relieved.</td>
</tr>
<tr>
<td></td>
<td>3 The system performs a soft commitment at creation of the parts list. The soft commitment remains in effect until inventory is relieved.</td>
</tr>
<tr>
<td></td>
<td>For World: When the hard/soft commit option is set to 2 or 3, any line item in the parts list may be hard committed prior to printing or relieving the inventory.</td>
</tr>
<tr>
<td></td>
<td>NOTE: When you set the Commitment Method field in the Branch/Plant Constants form to 2 or 3, you must use 1 or 2 for this field because a hard commitment must be performed.</td>
</tr>

<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| Hours – Work Hours Per Day | The number of work hours that the manufacturing plant operates per day.  

  Form-specific information

For repetitive manufacturing, identify the number of work hours per shift for the specified branch. The Resource Generation program uses the corresponding shift hours to calculate the available resource units for each shift, and the total for the day.

Since the shift hours may apply to different days of the week, the system uses the total of the first three hours to define the work hours per day value. |
| Shift Code    | A user defined code (07/SH) that identifies daily work shifts. In payroll systems, you can use a shift code to add a percent or amount to the hourly rate on a timecard.  

For payroll and time entry:  

If an employee always works a shift for which a shift rate differential is applicable, enter that shift code on the employee's master record. When you enter the shift on the employee's master record, you do not need to enter the code on the timecard when you enter time.  

If an employee occasionally works a different shift, you enter the shift code on each applicable timecard to override the default.  

  Form-specific information

For repetitive manufacturing, use the six corresponding shift fields to identify all production line shifts for the specified branch. The Resource Generation program uses the corresponding shift hours to calculate the available resource units for each shift, and the total for the day. |
To set up accounting manufacturing constants

On Manufacturing Constants

1. Complete the following fields:
   - Modify Cost by Work Center Efficiency
   - Include Efficiency in Overhead
   - Include Variable Labor Overhead in Cost
   - Calculate Variable on Direct Labor
   - Calculate Variable on Setup Labor
   - Include Fixed Labor Overhead in Cost
   - Calculate Fixed on Direct Labor
   - Calculate Fixed on Setup Labor
   - Include Variable Machine Overhead in Cost
   - Include Fixed Machine Overhead in Cost

2. Complete the following optional field:
   - Overheads as Percents or Rates

<table>
<thead>
<tr>

- Setting Up Manufacturing Constants in Product Data Management Process Manufacturing Guide

Setting Up Work Centers

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Enter/Change Work Centers

You can maintain general information about a work center, such as pay points, prime load codes, number of machines and workers, crew size, and backflush locations.

Before You Begin

☐ Set up your work centers and dispatch groups as valid business units on the Single Business Unit Revisions form.

To set up work centers

On Enter/Change Work Center

1. To locate your work center record, complete the following field:
   - Work Center
2. Complete the following optional fields:

- Dispatch Group
- Work Center Type (for repetitive manufacturing)
- Calendar (for repetitive manufacturing)
- Crew Size
- Queue Hours
- Move Hours
- Replenishment Hours
- Location – Issue
- Location Branch
- Capacity Standard (for repetitive manufacturing)
- Capacity Unit of Measure (for repetitive manufacturing)
- Capacity Minimum (for repetitive manufacturing)
- Capacity Maximum (for repetitive manufacturing)
- Hours (for repetitive manufacturing)

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Center</td>
<td>An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant. You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department. Security for this field can prevent you from locating business units for which you have no authority. Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table.</td>
</tr>
<tr>
<td>Dispatch Group</td>
<td>A super category code to group work centers within an overall business unit. For example, you can group like machines operating out of several work centers that report to one business unit under a dispatch group.</td>
</tr>
<tr>
<td><strong>Field</strong></td>
<td><strong>Explanation</strong></td>
</tr>
<tr>
<td>----------------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Crew Size</td>
<td>The number of people who work in the specified work center or routing operation. The system multiplies the Run Labor value in the Routing Master table (F3003) by crew size during costing to generate total labor dollars. If the Prime Load Code is L or B, the system uses the total labor hours for backscheduling. If the Prime Load Code is C or M, the system uses the total machine hours for backscheduling without modification by crew size.</td>
</tr>
<tr>
<td>Move Hours</td>
<td>The planned time in hours that is required to move the order from this operation to the next operation in the same work center. If the Routing Master values are blank, the default value comes from the work order routing. However, the system uses these values only for backscheduling variable leadtime items.</td>
</tr>
<tr>
<td>Replenishment Hours</td>
<td>The time required before a consuming work center will have a replacement container of goods available from this supplying work center. This value is used only for KANBAN card processing in Shop Floor Control.</td>
</tr>
<tr>
<td>Work Center Type</td>
<td>Defines the type of work center. Possible values are: Blank Stand alone work center 1 Production line in a repetitive environment 2 Reporting work station within a production line</td>
</tr>
<tr>
<td>Calendar</td>
<td>Enter the value of the calendar which corresponds to the calendar type. For example, if the calendar type is ROUTE, enter a valid route code to display the calendar for a particular route.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Hours</td>
<td>The number of work hours that the manufacturing plant operates per day.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>For repetitive manufacturing, identify the number of work hours per shift for the specified work center. Use the six corresponding shift fields to identify all production line shifts for the specified work center.</td>
</tr>
<tr>
<td>Capacity Std</td>
<td>The standard capacity level at which a production line usually operates.</td>
</tr>
<tr>
<td>Capacity UOM</td>
<td>Production unit of measure used to express the capacity of a production line. For example Stamps, injections, etc.</td>
</tr>
<tr>
<td>Capacity Min</td>
<td>The lower limit capacity beyond which the production line should not operate. This value is decided by management based on efficiencies, costs, etc.</td>
</tr>
<tr>
<td>Capacity Max</td>
<td>The upper limit capacity beyond which a production line can not produce.</td>
</tr>
<tr>
<td>Shift Code / Description</td>
<td>The number of work hours that the manufacturing plant operates per day. Form-specific information For repetitive manufacturing, identify the number of work hours per shift for the specified work center. Use the six corresponding shift fields to identify all production line shifts for the specified work center.</td>
</tr>
</tbody>
</table>

**What You Should Know About**

**System calculations**
If you set the Modify Cost by Work Center Efficiency field to Y on Manufacturing Constants, the system multiplies the Efficiency field value by the direct labor cost to create a B4 cost type (labor efficiency) in the Item Cost Component Add-Ons table.

**Warehouse Management interface**
If you use Warehouse Management and do not set up valid work center locations, the system interfaces with Warehouse Management when you attach an ingredients list to a work order. If you do set up valid work center locations before you attach an ingredients list, but the quantity exceeds the quantity you have in the work center, the system uses Warehouse Management to create a pick request for the remaining quantity to fill the work order request.
Maintaining rates for your work center

From Enter/Change Work Center, you can access Work Center Rate Revisions to maintain both simulated and frozen values for machine and labor hours. You can update the simulated rates, but not the frozen values. The system updates frozen values when you run the Frozen Cost Update program.

Other J.D. Edwards manufacturing programs use these values, including Costed Routings, Labor Rate Variance reports, Direct Labor Efficiency reports, and Cost Rollup reports.

Maintaining business units and tracking costs

From Enter/Change Work Center, you can access Business Unit Information to maintain business units and track costs.

Setting Up Resource Units

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Enter/Change Resource Units

Resource unit information indicates the capacity of a work center on a given day. The system uses this information to backschedule work orders in shop floor control and to calculate available hours for capacity planning.

Before You Begin

☐ Define workdays for the branch or plant in the shop floor calendar
To set up resource units

The Work With Resource Units form shows the work hours available each day of a specified month for a work center.

On Enter/Change Resource Units

1. Complete the following fields:
   - Branch
   - Unit of Measure
   - Work Center
   - Calendar Month/Year
   - Resource Unit

2. Complete the following optional fields:
   - Shift (for repetitive manufacturing)
   - Efficiency
   - Utilization

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unit of Measure</td>
<td>A user defined code (system 00/type UM) that identifies the unit of measurement for an amount or quantity. For example, it can represent a barrel, box, cubic yard, gallon, an hour, and so on.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Work Center</td>
<td>An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant. You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department. Security for this field can prevent you from locating business units for which you have no authority. Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table. Form-specific information This value identifies the available capacity for the work center.</td>
</tr>
<tr>
<td>Efficiency</td>
<td>A user defined value that indicates how efficiently a work center operates. This value usually refers to people efficiency. When you enter a value in this field, and the Modify Cost by Work Center Efficiency field in the Job Shop Manufacturing Constants table (F3009) is set to Y, the system creates a new cost component (B4) from the cost calculated from the direct labor cost (B1). The system also uses this value to calculate rated capacity. Example: If the constant is set to Y, the value of this field is 80%, and the direct labor cost is 10, the system creates a B4 cost component for 2 in the Item Cost Component Add-Ons table (F30026). Enter percents as whole numbers, for example, enter 80% as 80.00.</td>
</tr>
<tr>
<td>Total Resource Units</td>
<td>The total resource units for the month.</td>
</tr>
<tr>
<td>Utilization</td>
<td>A percentage that indicates how intensively a work center is being used. This value usually refers to machine use. It is the ratio of the direct time charged for production activities to the planned hours. This value is also used to calculate rated capacity. Enter percents as whole numbers, for example, enter 80% as 80.00.</td>
</tr>
</tbody>
</table>
### Field | Explanation
--- | ---
Shift Code | A user defined code (07/SH) that identifies daily work shifts. In payroll systems, you can use a shift code to add a percent or amount to the hourly rate on a timecard.

For payroll and time entry:

If an employee always works a shift for which a shift rate differential is applicable, enter that shift code on the employee’s master record. When you enter the shift on the employee’s master record, you do not need to enter the code on the timecard when you enter time.

If an employee occasionally works a different shift, you enter the shift code on each applicable timecard to override the default.

Form-specific information

You can view the total resources available for a given day by entering an asterisk (*) in this field.

For repetitive manufacturing, enter a 1–6 to allow the system to display a specific shift’s units, or enter a * to view the total resource availability for the specified time period. While this program displays the total units for the shift/day for work centers defined with a standard capacity and unit of measure in those units, the system stores the data in hours.

---

## What You Should Know About

### Generating resource units

You can manually change the values to account for scheduled or unscheduled downtime, additional shifts, or vacation time. However, each time you run Refresh Resource Units, the system recalculates the form values based on information in the Work Center Revisions, Shop Floor Calendar, and Manufacturing Constants tables and overwrites your manual changes.

You cannot manually change the values if the shift value is an * to show total hours on Enter/Change Work Centers.
**Refreshing information**  
Refresh Resource Units is a DREAM Writer program that recalculates the work center hours and updates them on the Enter/Change Resource Units form. The system recalculates the resource units for a work center based on information in the Enter/Change Work Center form, Shop Floor Calendar form, and Job Shop Manufacturing Constants table. You can create versions to recalculate the labor, setup, or machine hours and set the processing options to update different dates and branches. Any manual changes that you make to the hours on the Enter/Change Resource Units form is overwritten when you run the refresh process.

The system multiplies the number of machines or employees from the Enter/Change Work Centers form by the work hours per day from the Job Shop Manufacturing Constants table for each work day defined on the Shop Floor Calendar for the branch.

Resource unit calculations for machine and labor related hours are:

**Machine related hours** (prime load code = C or M)

\[
\text{Number of machines} \times \text{Work hours per day}
\]

**Labor related hours** (prime load code = L or B)

\[
\text{Number of employees} \times \text{Work hours per day}
\]

**Processing Options for Work Center Resource Units Revisions**

**DEFAULT PROCESSING:**

1. Unit of Measure
Setting Up Line and Item Relationships

From Shop Floor Control (G31), enter 29

From Shop Floor Control Setup (G3141), choose Line Item Relationships

The Line/Item Relationships program allows you to add, change, and delete data stored in the Line/Item Relationships table. These relationships include lines where an item is produced and the amount of resources consumed by an item on each line. Planning uses the record flagged as the default when the system creates rates. The specification for shift and period is only valid for the default line.

To set up line and item relationships

On Line/Item Relationships
Complete the following fields:

- Branch/Plant
- Item Number
- Line/Cell
- Capacity Units
- Default
- Shift
- Period

### Field | Explanation
--- | ---
Line/Cell Identifier | Defines a production line or cell. Detailed work center operations can be defined inside the line or cell. For rate based manufacturing to use this value for reporting, this value must match the line cell in the header.

Resource units consumed | Indicates how many of the line’s resource units are needed to produce one item.

Shift Code | A user defined code (07/SH) that identifies daily work shifts. In payroll systems, you can use a shift code to add a percent or amount to the hourly rate on a timecard.

For payroll and time entry:

If an employee always works a shift for which a shift rate differential is applicable, enter that shift code on the employee’s master record. When you enter the shift on the employee’s master record, you do not need to enter the code on the timecard when you enter time.

If an employee occasionally works a different shift, you enter the shift code on each applicable timecard to override the default.

Month/Week/Day/Shift | A code that determines the frequency of the schedule.
Valid codes are:
1 Monthly
2 Weekly
3 Daily
4 Per Shift
Set Up Kanban Controlled Items

From Product Data Management (G30), enter 29

From Product Data Management Setup (G3041), choose Kanban Master Revisions

You must set up an item on the Kanban Master Revisions program before it is kanban controlled. You define kanbans at the item, branch/plant, and consuming location level. After you define kanban controlled items, use Kanban Calculation to size the kanban, depending on the amount of inventory available. However, if you set the override flag on, the system does not update the record when you run the calculation program.

To set up kanban controlled items

On Kanban Master Revisions

1. Complete the following fields:
   - Item
   - Branch/Plant
   - Consuming Location
   - Supplying Location
2. Complete the following optional fields:
   - Kanban Quantity
   - Replenishment Lead Time
   - Source Type
   - Phase

3. Access the detail area.

4. Complete the following optional fields:
   - Kanban ID 1
   - Kanban ID 2
   - Supplier
   - Item
   - Supplying Location Branch/Plant
   - Line/Cell
   - Container Quantity
   - Number of Cards
   - Override Flag
   - Receipts
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplier</td>
<td>A number that identifies an entry in the Address Book system. Use this number to identify employees, applicants, participants, customers, suppliers, tenants, and any other Address Book members.</td>
</tr>
</tbody>
</table>
| Replenish Lead Time | The time required before a consuming work center will have a replacement kanban available from its supplying location.  
This value is used only for kanban card processing in Shop Floor Control. |
| Container Quantity  | The capacity of a container in a kanban controlled environment.                                                                             |
| Override Flag       | This flag can be used to lock the kanban size and quantity to prevent changes by the Kanban Calculation program.                             |
| Quantity            | The total size of the kanban.                                                                                                               |
| Receipts            | Flag used to indicate the receipts process will be executed at kanban check in time.                                                       |
| Phase               | This field indicates the method used to transfer completed units from the supplying to the consuming location:  
1 One phase transfer. The completion is done directly to the consuming location.  
2 Two phase transfer. The completion is performed against the supplying location. A subsequent receipt of inventory is needed at the consuming location. |
| Kanban ID           | Unique identifier for the first kanban assigned to an item in a specified branch/plant, consuming location, or supplying location.         |
| Kanban ID 2         | Unique identifier for the second kanban assigned to an item in a specified branch/plant, consuming location, or supplying location.         |
| Line/Cell           | Defines a production line or cell. Detailed work center operations can be defined inside the line or cell. For rate based manufacturing to use this value for reporting.  
.. Form-Specific Information ..  
When the source type is a 1 (work center), this field identifies the production line producing the kanban item. |
| Supplying Location  | A code that identifies the location in a branch/plant from which inventory is supplied.                                                      |
### Generating Kanbans

**From Product Data Management (G30), enter 29**

**From Product Data Management Setup (G3041), choose Kanban Calculation**

After you set up the item on Kanban Master Revisions, you can use the Kanban Calculation program to generate and print a kanban per item. However, you can set the override flag on Kanban Master Revisions, to prevent the system from updating the master record.

Use the processing options to:

- Run the program in proof mode
- Print the calculation report
- Update the Kanban Master
- Specify a safety stock other than what is defined in the Item Branch
- Control what percentage the system can change the size of the kanban
- Specify the source for the demand
- Specify a customized calculation program
Processing Options for Kanban Size Calculation

PRINT SELECTIONS:
1. Enter ‘1’ to print KANBAN cards
2. Enter ‘1’ to print the calculation report.

OPERATION MODE:
3. Enter ‘1’ to create/update Kanban Master records.

SAFETY STOCK:
4. Enter the desired safety stock expressed as a percentage of daily production. (‘15’ = 15%)

FILTER CONTROL:
5. Enter the range, expressed as a percentage, above or below which the Kanban should not be changed. (‘15’ = plus or minus 15%)

KANBAN AVERAGE DAILY DEMAND:
6. Enter a ‘1’ to select summation of the MPS/MPR demands desired, or enter a ‘2’ to select greater of MPS/MPR demands desired. If no demands are selected, the Planning Time Fence Rule for the item will be used.
   a. Forecasts
   b. Sales Orders
   c. Firm Work Orders
   d. Planned Work Orders
   e. Rate Schedule
   f. Purchase Orders

CALCULATION:
7. Enter number of hours equivalent to one day. (Default is 8)
8. Enter the date range to use for the average daily demand calculation.
   a. Beginning Date (Required)
   b. Ending Date (Required)

EXTERNAL PROGRAM
9. Enter a ‘1’ to call external kanban size calculation program (P304501).

10. Enter version for P304501. (Default is ZJDE0001)
Appendices
Committing Inventory

1. A hard commitment physically ties inventory to an order or rate schedule. A soft commitment is a tentative commitment of inventory and can be issued to another order or rate schedule.

2. – Commitment Method
   – Commitment Control
   – Hard/Soft Commit

3. Yes, you can set the system to commit inventory from a location related to a work center.

4. A program that clears outdated or invalid commitments and reposts the commitments and on-order quantities on your process orders to current requirements.

5. False – At the item level, you can commit inventory by lot number or lot expiration date.

6. True

7. False – Using the normal inventory commitment method, inventory is committed from the primary location, then secondary locations using those locations with the greatest quantity first.

8. True

9. True

10. True

Changing Item Classification

1. – Reclassify Items
   – Group Reclassifications
   – Reverse Reclassifications

2. No – This is just one option.

3. Locate the transaction you want to reverse, change the action code to C, and enter a 2 in the Option field of the line to be reversed.

4. – Assign Manually
   – Newest From Expiration Date
   – Oldest From Expiration Date
   – Transaction Date Plus Shelf Life
Availability and Shortages

1. Ingredient Availability is for a process and Ingredient List is for an order.
2. In the Branch/Plant Constants.
3. Place a minus sign (−) next to quantity that is soft committed to SO & WO.
4. Enter a 3 in the Option field next to the ingredient you are entering the shortage for.
5. True
6. False – The ingredients list displays the ingredients required to complete the quantity of the product indicated on a work order.
7. True
8. False – Quantities in safety stock can be considered on hand.
9. True

Revising Statuses

1. – Close it out
   – Delete it
   – Purge it
2. – Delete the ingredients list
   – Delete the routing
   – Delete the header
3. No.
4. A number is displayed in the Document field.
5. Inquire on it, then enter a 9 in the Option field.
6. Redistributes the remaining data so that your disk space is used more efficiently.
7. – Order number is used as a subledger number in the Account Ledger table (F0911).
   – The order is a parent to the other orders.
   – Parts or ingredients have been issued to the order.
Appendix B — Leadtimes

Determining leadtime is an essential part of any manufacturing or scheduling process. For any product that you purchase or manufacture, you encounter a time lag between when you order or start it and when you receive or finish it. To account for the lag, you must estimate the extra time and allow for it in your planning.

Cumulative leadtime is the total amount of time that is required to produce a product. In process manufacturing, it is the time required to complete an entire process. The Shop Floor Control system uses the requested date of the order and, based on the level leadtime for the product, calculates the appropriate order start date.

Leadtimes include:

- Work order start dates
- Operation start and due dates
- Overlapping operations
- Overlapping and concurrent operations
- Calculating leadtimes

Many factors can influence your company’s leadtime policy, including:

- Manufacturing environment (assemble-to-order, make-to-order)
- Fixed or variable quantities
- Serial or overlap operations
- Fixed or variable time
- Number of shifts and operators
- Factoring by efficiency
- Protection
For any manufactured product, the system calculates four types of leadtime:

- Level
- Manufacturing
- Cumulative
- Per unit

The Shop Floor Control system uses the following data in its calculation of leadtimes:

- Serial or overlap operations
- Fixed or variable leadtime indicator
- Routing labor, setup, queue, move, and machine run hours
- Work center prime load code
- Number of employees or machines per work center
- Hours per work day

The system:

- Uses the information that you set up for each item on Plant Manufacturing Data in the Inventory Management system
- Coordinates the information with routing and work center information you enter in the Product Data Management (PDM) system
- Determines leadtimes for all parent and component items

At any point in your planning and scheduling process, you can change leadtime values manually through Manufacturing Data.

You can use fixed or variable leadtimes for ingredients. The system subtracts fixed leadtimes directly from the requested date on the work request to calculate the start date of production. Fixed leadtime remains the same regardless of the quantity produced. However, variable leadtime adjusts according to the quantity produced.

The following explains important leadtime concepts you need to understand.

**Machine hours**

The number of machine hours required to produce the amount from the time basis code.

**Labor hours**

The number of labor hours required to produce the amount from the time basis code.
**Setup hours**

The number of hours required to prepare machinery to run a specific item, regardless of quantity.

**Move hours**

The number of hours that a manufacturing work order is in transit from the completion of one operation to the beginning of the next.

**Queue hours**

The number of hours that a job waits at a work center before setup or work is performed on the job. This value is the sum of the move hours and the queue hours.

**Time basis code**

Indicates how machine or labor hours are expressed for a product. Time basis codes identify the time basis or rate to be used for machine or labor hours entered for every routing step, for example, 25 hours per 1,000 pieces or 15 hours per 10,000 pieces. You can maintain the time basis codes on Time Basis Codes. Time basis codes are user defined codes (30/TB).

**Resource units**

Shows the available amount of capacity in a work center for the months in the calendar. For leadtime purposes, as the system calculates the operation start and due dates, the system uses the available hours to calculate the operation start dates. You can maintain the resource units in Work Center Resource Units.

**Prime load code**

Determines whether a work center is labor or machine intensive. The prime load code also determines whether the system uses the number of employees or number of machines to determine the daily resource units in the Resource Units table. You can maintain the prime load codes on Work Center Revisions. For calculating leadtimes, the following prime load code values are important:

- L = run labor hours
- M = machine labor hours
- B = run and setup hours
- C = machine and setup hours

**Purchased parts**

You specify the level leadtime, which is equal to the cumulative leadtime. By default, the manufacturing leadtime, leadtime per unit, total queue/move hours, and setup times for purchased parts are zero.
Work Order Start Dates

The system uses the level leadtime or leadtime per unit for an item defined on the Manufacturing Data form to calculate the start date of a work order based on the order’s due date.

Fixed Leadtime

When an item has a fixed leadtime, the system uses its level leadtime value in backscheduling to find the work order start date.

For example, the system generates a planned order for product 101 with a requested date of 10/15/98. The level leadtime is 3 days for this product, so the system calculates the start date by counting back 3 working days on the shop floor calendar from (but not including) the requested date. The system assigns the order a start date of 10/12/98.

Variable Leadtime

When an item has a variable leadtime, the system uses the following calculation to determine the leadtime days:

\[
\frac{(\text{Leadtime per unit x order quantity} / \text{TIMB*}) + \text{setup} + \text{total queue/move}}{\text{Work hours per day}}
\]

* The system reads the Time Basis Code from the Item Branch file (F4102).

For example, to determine the start date, the system counts back the leadtime days from the due date of planned orders. The system backschedules the due date, 10/15, 2 days to determine the start date of 10/13.

\[
(32 \times 1000 / 10,000) + 1 + 9) / 8
\]

\[
(3.2 + 10) / 8 = 2 \text{ days}
\]
The following table shows the values used in this example.

<table>
<thead>
<tr>
<th>Due date</th>
<th>10/15</th>
</tr>
</thead>
<tbody>
<tr>
<td>Leadtime per unit</td>
<td>32 hours</td>
</tr>
<tr>
<td>Order quantity</td>
<td>1000</td>
</tr>
<tr>
<td>Setup</td>
<td>1 hour</td>
</tr>
<tr>
<td>Total queue/move</td>
<td>9 hours</td>
</tr>
</tbody>
</table>

**Operation Start and Due Dates**

The system calculates the operation start and due dates with the average number of hours per operation.

**Fixed Leadtime**

The system calculates the operation hours for a fixed leadtime using the following information:

- Level leadtime
- Hours per work day
- Number of employees per machine
- Number of operations

You must schedule the hours per operation according to the resource units within the entire level leadtime. This ensures that the start date of the first operation is the same as the start date of the work order. When the job moves to a different work center in the same day, the system decreases the resource units available by the percentage of the work day remaining. The system doesn’t use resource units on the due date of the work order. Instead, it assumes the order was completed at the end of the previous day.

For each operation, the system then schedules this average time into the appropriate work center based on the available hours from the Work Center Resource Units table.

The system schedules the last operation due date on the day before the work order due date.
Calculation

The system uses the following formula to calculate average time per operation:

leadtime level days x work hours per day (F3009) x employees or machine
number of operation sequences (blank operation sequence codes only) = average time
per operation

The following table shows the values used in this example.

<table>
<thead>
<tr>
<th>Work order due date</th>
<th>Average time per operation</th>
</tr>
</thead>
<tbody>
<tr>
<td>05/01/98</td>
<td>25 hours</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Operations in the routing</th>
<th>WC Resource Units 200-204</th>
<th>8</th>
</tr>
</thead>
<tbody>
<tr>
<td>OP40</td>
<td>WC 200-204</td>
<td>due 4/30  start 4/27</td>
</tr>
<tr>
<td>OP30</td>
<td>WC 200-101</td>
<td>due 4/27  start 4/24</td>
</tr>
<tr>
<td>OP20</td>
<td>WC 200-204</td>
<td>due 4/24  start 4/21</td>
</tr>
<tr>
<td>OP10</td>
<td>WC 200-101</td>
<td>due 4/21  start 4/17</td>
</tr>
</tbody>
</table>

Variable Leadtime

To determine variable leadtimes, the system schedules the actual hours from the work order routing instructions according to the same resource units rules for variable leadtime.

The system uses the prime load code to determine what hours to use. The hours are then applied to the resource units table, similar to fixed leadtime. The system applies queue time from the work order routing at the beginning of an operation, and applies move time at the end of an operation.
Overlapping Operations

One method to compress leadtimes is to overlap operations. Overlapping operations are two or more operations in a routing that process at the same time. The percent of overlap is the amount of time that these operations can process concurrently. You can define at what point a second operation can begin before the first operation is complete. Because of setup, move, and queue times, the actual overlap in run time might be less than the percent of overlap defined.

In the following example, Operation B has a percent of overlap of 80%. This means that Operation B can begin when 80% of Operation A remains to be finished, or when Operation A is 20% complete. Operations A and B are both active as they overlap.

If the percent of overlap causes an operation to end later than the last operation in the routing, the system issues an error message and enters the work order start and requested dates into each operation.
Overlapping and Concurrent Operations

If a percentage of overlap is specified in the Routing detail area, the work order routing includes specified operations that overlap. For example, an overlap percentage of 80% for an operation means that the next operation can start when 20% of the previous operation is complete.

<table>
<thead>
<tr>
<th>Work order complete date</th>
<th>05/01/98</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last operation 20</td>
<td>24 hours</td>
</tr>
<tr>
<td>First operation 10</td>
<td>24 hours</td>
</tr>
<tr>
<td>Resource hours per day-per work center</td>
<td>8 hours</td>
</tr>
<tr>
<td>Operation overlap on 20</td>
<td>75%</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Operation 10</th>
<th>without overlap</th>
<th>with overlap</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>04/27/98</td>
<td>04/27/98</td>
</tr>
<tr>
<td>complete</td>
<td>04/29/98</td>
<td>04/29/98</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Operation 20</th>
<th>without overlap</th>
<th>with overlap</th>
</tr>
</thead>
<tbody>
<tr>
<td>start</td>
<td>04/30/98</td>
<td>04/27/98</td>
</tr>
<tr>
<td>complete</td>
<td>05/02/98</td>
<td>04/30/98</td>
</tr>
</tbody>
</table>

Using the data from the above tables, the system advances the complete date of the previous operation by 75% of 24 or 18 hours. The system then recalculates the start date using the normal backscheduling rules. As a result, operations 10 and 20 overlap and will take 24 hours to complete. The following diagram illustrates this concept.
Calculating Leadtimes

The Leadtime Rollup program calculation updates the following within the Plant Manufacturing Data program:

- Level leadtime (if using manufacturing leadtime quantity)
- Manufacturing leadtime
- Cumulative leadtime
- Per unit leadtime
- Total queue/move hours
- Setup hours

Level Leadtime

For a manufactured product, level leadtime is the number of workdays required to complete the product once all items are available. Level leadtime for a purchased item is the number of calendar days required for you to receive the item after the supplier receives your purchase order.

Calculation

The system uses the following formula to calculate level leadtime:

\[
\sum \left( \frac{(M \text{ or } L) / (E \text{ or } M) \times MLQ}{TIMB} \right) + \text{setup + total queue/move hours}
\]

Work hours per day from Constants table

* The system reads the Time Basis Code from the Routing Master file (F3003).
The following table defines the values used in the formula.

<table>
<thead>
<tr>
<th>(M or L)</th>
<th>Machine or labor hours based on the prime load code</th>
</tr>
</thead>
<tbody>
<tr>
<td>L or B</td>
<td>Labor hours</td>
</tr>
<tr>
<td>M or C</td>
<td>Machine hours</td>
</tr>
<tr>
<td>SUM</td>
<td>Sum of all operations</td>
</tr>
<tr>
<td>TIMB</td>
<td>Time basis</td>
</tr>
<tr>
<td>MLQ</td>
<td>Manufacturing leadtime quantity</td>
</tr>
<tr>
<td>E</td>
<td>Number of employees in the work center</td>
</tr>
<tr>
<td>M</td>
<td>Number of machines in the work center</td>
</tr>
</tbody>
</table>

For example:

\[
\frac{\frac{8}{(1)} \times 2,000}{10,000} + \frac{\frac{12}{(1)} \times 2,000}{10,000} + \frac{\frac{12}{(1)} \times 2,000}{10,000} = \frac{1 + 9}{8}
\]

\[
(1.6 + 2.4 + 2.4 + 1 + 9) / 8 = 16.4 / 8 = 3 \text{ days level leadtime}
\]

**Manufacturing Leadtime**

Manufacturing leadtime is the total number of workdays required to complete a product, from its lowest-level items to the final item, assuming all purchased items are in house, which includes:

- Order preparation time
- Queue time
- Setup time
- Run time
- Move time
- Inspection time
- Putaway time

And, it is the total of the level leadtime for a product plus the longest manufacturing leadtime of any of its items.
Lead times for purchased items are not included in manufacturing leadtime calculations. The manufacturing leadtime for a purchased item is its level leadtime.

**Calculation**

The system uses the following formula to calculate manufacturing leadtime.

- **Item A**
  - Level LT = 2
  - Mfg LT = 2 + 8 = 10

- **Item B**
  - Level LT = 7
  - Mfg LT = 7 + 0 = 7

- **Item C**
  - Level LT = 4
  - Mfg LT = 4 + 4 = 8

- **Item D**
  - Level LT = 4
  - Mfg LT = 4 + 0 = 4

- **Item E**
  - Level LT = 3
  - Mfg LT = 3 + 0 = 3

- **Item F**
  - Level LT = 1

- **Item G**
  - Level LT = 3

Items A, B, C, D, and E are manufactured items. Items F and G are purchased items.
Cumulative Leadtime

Cumulative leadtime is the number of workdays that are required to acquire items and complete a product, from its lowest-level items to the final item, which is the level leadtime for a product plus the longest cumulative leadtime of any of its items. Unlike manufacturing leadtime, cumulative leadtime includes the leadtimes for purchased items. It covers both the time to acquire purchased items and the time to complete the product. The cumulative leadtime for a purchased item is its level leadtime.

![Cumulative Leadtime Diagram]

Calculation

The system uses the following formula to calculate cumulative leadtime.

Item F
Level LT = 1
Cume LT = 2 + 10 = 12

Item G
Level LT = 3
Cume LT = 3 + 3 = 6

Item D
Level LT = 4
Cume LT = 4 + 1 = 5

Item E
Level LT = 3
Cume LT = 3 + 3 = 6

Item B
Level LT = 7
Cume LT = 7 + 0 = 7

Item C
Level LT = 4
Cume LT = 4 + 6 = 10

Items A, B, C, D, and E are manufactured items. Items F and G are purchased items.
Per Unit Leadtime

Per unit leadtime is the sum of the run times, as defined by the prime load codes for the work centers, factored by the routing time basis and converted to the leadtime per unit. The per unit leadtime sets valid start dates for orders planned in other than normal planned order quantity. When you run the leadtime rollup program, the system measures the per unit leadtime in hours.

Calculation

The system uses the following formula to calculate per unit leadtime.

\[
\sum \left( \frac{(M \text{ or } L)}{(E \text{ or } M)} \times \text{TIMB} \right) \times \text{TIMB} *
\]

For example:

\[
\frac{(8 / 1) \times 10,000}{10,000} + \frac{(12 / 1) \times 10,000}{10,000} + \frac{(12 / 1) \times 10,000}{10,000} = 8 + 12 + 12 = 32 \text{ hours per unit leadtime}
\]

* The system reads the Time Basis Code from the Routing Master file (F3003).

The following table defines the values used in the formula.

<table>
<thead>
<tr>
<th>M or L</th>
<th>Machine or labor hours based on the prime load code</th>
</tr>
</thead>
<tbody>
<tr>
<td>L or B</td>
<td>Labor hours</td>
</tr>
<tr>
<td>M or C</td>
<td>Machine hours</td>
</tr>
<tr>
<td>SUM</td>
<td>Sum of all operations</td>
</tr>
<tr>
<td>TIMB</td>
<td>Time basis</td>
</tr>
<tr>
<td>M1Q</td>
<td>Manufacturing leadtime quantity</td>
</tr>
<tr>
<td>E</td>
<td>Number of employees in the work center</td>
</tr>
<tr>
<td>M</td>
<td>Number of machines in work center</td>
</tr>
</tbody>
</table>
Total Queue/Move Hours

Total queue/move hours is the sum of the move hours per routing and the queue hours per routing.

\[
(1 + 2) \quad (2 + 4) \quad (0 + 0) = 9
\]

OP 30 \quad OP 60 \quad OP 80

Setup Hours

Setup hours is the sum of the setup hours for each routing divided by the employees or machines. This ensures consistency during the back scheduling routing because the resource units for the work center are created based on those numbers.

\[
\frac{1}{1} + \frac{0}{1} + \frac{0}{1} = 9
\]

OP 30 \quad OP 60 \quad OP 80
Appendix C — Functional Servers

Several J.D. Edwards programs access functional servers. The purpose of functional servers is to provide a central location for standard business rules about entering documents, such as vouchers, invoices, and journal entries. These business rules establish the following:

- Data dictionary default values
- Field edits and valid values
- Error processing
- Relationships between fields or applications

The advantages of a functional server are:

- It reduces maintenance of entry programs because edit rules reside in one central location.
- You can standardize documents across all applications because you create them using the same business rules.
- Generally, the user interface (appearance and interaction) of a form is now separate from how a program works.

The steps for setting up business rules for an entry program are:

1. Create a DREAM Writer version for a specific functional server program (for example, XT0411Z1 for voucher entry).
2. Set the processing options within the version according to your company requirements.
3. Specify the version you want the entry program to use in the processing options for that entry program.

You can have all your entry programs use the same DREAM Writer version (and thus, use the same rules) or you can set up different DREAM Writer versions. J.D. Edwards provides DREAM Writer version ZJDE0001 as the default functional server version for your entry programs.

Only the person responsible for system-wide setup should make changes to the functional server version. For more information about how to set up DREAM Writer versions, see the Technical Foundation Guide.
Example: Voucher Processing Functional Server

The following graphic shows the programs that use the voucher processing functional server. J.D. Edwards provides two demo versions of the functional server, ZJDE0001 and ZJDE0002.
Glossary
Glossary

This glossary defines terms in the context of your use of J.D. Edwards systems and the accompanying documentation.

**AAI.** See *automatic accounting instruction.*

**access.** To locate the information or functions provided by the system through menus, forms, and reports.

**aggregate leadtime.** See *cumulative leadtime.*

**alphabetic character.** Represents data by using letters and other symbols from the keyboard (such as @, &, and #). Contrast with *alphanumeric character* and numeric character.

**alphanumeric character.** Represents data in a combination of letters, numbers, and other symbols (such as @, &, and #). Contrast with *alphabetic character.*

**alternate operation.** Replacement for a normal operation in the manufacturing process or routing for an item.

**alternate routing.** A routing, usually less preferred than the primary routing, but resulting in an identical item.

**assemble-to-order.** A product for which key components (bulk, semi-finished, intermediate, subassembly, fabricated, purchased, packaging, and so on) used in the assembly or finishing process are planned and stocked in anticipation of a customer order. Receipt of an order initiates assembly of the finished product. This is useful when a large number of finished products can be assembled from common components. Contrast with *make-to-order.*

**assembly.** A group of items or subassemblies that are put together and constitute an end item.

**assembly inclusion rule.** A logic statement that specifies under which conditions to use a part, adjust the price or cost, perform a calculation, or use a routing operation for configured items.

**associated service type.** See *linked service type.*

**audit trail.** The detailed, verifiable history of a processed transaction. The history typically shows all additions, changes, and deletions of records.

**automatic accounting instruction (AAI).** A code that refers to an account in the chart of accounts. AAs define rules for programs that automatically generate journal entries. This includes interfaces between Accounts Payable, Accounts Receivable, Financial Reporting, and the General Accounting system. Each system that interfaces with the General Accounting system has AAs. For example, AAs can direct the Post General Journal program to post a debit to a specific expense account and an automatic credit to a specific accounts payable account.

**backflush.** The deduction from inventory records of the components or ingredients as a result of the production process. See also *super backflush.*

**backscheduling.** A technique for calculating operation start dates and due dates. The schedule is computed starting with the due date for the order and working backward to determine the required start date and due dates for each operation.

**batch.** A group of like records or transactions that the computer treats as a single unit during processing. For identification purposes, the system usually assigns each batch a unique identifier, known as a “batch number.”
batch bill of material. A recipe or formula in which the statement of quantity per is based on the standard batch quantity of the parent.

batch header. Information the system uses as identification and control for a group of transactions or records in a batch.

batch job. A task or group of tasks you submit for processing that the system treats as a single unit during processing, for example, printing reports and purging files. The system performs these tasks with little or no user interaction.

batch processing. A method by which the system selects jobs from the job queue, processes them, and sends output to the outqueue.

batch type. A code that designates to which J.D. Edwards system the associated transactions pertain, thus controlling which records are selected for processing. For example, the Post General Journal program selects for posting only unposted transaction batches with a batch type of 0.

bill of material (BOM). A listing of all the subassemblies and raw materials that go into a parent assembly showing the quantity of each required to make the assembly. The BOM is used with the master production schedule to determine the items for which purchase requisitions and production orders must be released. There are a variety of display formats for bills of material, including: single level, multi-level, indented, planning, and costed.

Boolean logic operand. In J.D. Edwards’ reporting program, the parameter of the Relationship field. The Boolean logic operand tells the system to perform a comparison between certain records or parameters. Available operands are:

- EQ = Equal To
- LT = Less Than
- LE = Less Than or Equal To
- GT = Greater Than
- GE = Greater Than or Equal To

NE = Not Equal To
NL = Not Less Than
NG = Not Greater Than

bucketed system. An MRP, DRP, or other time-phased system in which all time-phased data is accumulated into time periods or “buckets.” If the period of accumulation is one week, then the system is said to have weekly buckets.

bucketless system. An MRP, DRP, or other time-phased system in which all time-phased data is processed, stored, and usually displayed using dated records rather than defined time periods or “buckets.”

bulk issue. Items issued from stores to work-in-process inventory, but not based on a job order, such as miscellaneous fasteners. They are issued in quantities estimated to cover requirements of individual work centers and production lines. The issue may be used to cover a period of time or to fill a fixed-size container.

business unit. See facility.

by-product. A material of positive or negative value produced as a residual of or incidental to the production process. The ratio of by-product to primary product is usually predictable. By-products may be discarded, sold as is, or used for other purposes.

capacity requirements planning (CRP). The function of establishing, measuring, and adjusting limits or levels of capacity. It is the process of determining in detail how much labor and machine resources are required to accomplish the tasks of production. Open shop orders and planned orders in the MRP system are input to CRP, which “translates” these orders into hours of work by work center and by time period.

category code. In user defined codes, a temporary title for an undefined category. For example, if you are adding a code that designates different sales regions, you could
change category code 4 to *Sales Region*, and define E (East), W (West), N (North), and S (South) as the valid codes. Syn: *reporting code.*

**Certificate of Analysis.** A document which includes all of the tests performed and resulting test data for an item lot sold to a customer.

**Character.** Any letter, number, or other symbol that a computer can read, write, and store. See also *alphabetic character, alphanumeric character, numeric character.*

**Closed-loop MRP.** A system built around material planning that includes the additional planning functions of sales and operations (production planning, master production scheduling, and capacity requirements planning). After this planning phase is complete and the plans have been accepted as realistic and attainable, the execution functions come into play. These include the manufacturing control functions of input-output (capacity) measurement, detailed scheduling and dispatching, as well as anticipated delay reports from both the plant and supplier. The term “closed-loop” implies that not only are each of these elements included in the overall system, but also that feedback is provided by the execution functions so that the planning can be kept valid at all times.

**Committed Material.** Material on hand or on order that is assigned to specific future production or customer orders. Syn: *reserved material.*

**Co-product.** An end item produced as the result of a process. There are usually two or more co-products. See also *end item.*

**Component.** Raw material, ingredient or subassembly that goes into a higher level assembly, process, or other item. This term may also include packaging materials for finished items.

**Component Availability.** The availability of component inventory for the manufacture of a specific parent order or group of orders or schedules.

**Component Changeout.** See *component swap.*

**Component Swap.** In Equipment/Plant Management, the substitution of an operable component for one that requires maintenance. Typically, you swap components to minimize equipment downtime while servicing one of the components. When you perform a component swap, you can update the parent and component relationship for each component, as well as the status of each component.

**Composite Leadtime.** See *cumulative leadtime.*

**Configuration Management.** A rules-based method of ordering assemble-to-order or make-to-order products. Characteristics of the product are defined as part of the Sales Order Entry process. Characteristics are edited using Boolean logic and then translated into the required components and routing steps. The resulting configuration is also priced and costed based on characteristics defined.

**Configured Item Segment.** A conceptual characteristic of a configured item defined during sales order entry. For example, when ordering a configured personal computer, the customer may specify what type of hard drive is required by simply stating the number of megabytes of capacity, rather than a part number for the hard drive.

**Constants.** Parameters or codes that rarely change. The system uses constants to standardize information processing by an associated system. Some examples of constants are: validating bills of material online and including fixed labor overhead in costing.
**consuming location.** The point on the production line where a component or subassembly is used in the production process. Used in kanban processing.

**corrective maintenance.** Any maintenance work that falls outside the scope of preventive or predictive maintenance. Corrective maintenance can be planned, unplanned, or emergency. Examples of corrective maintenance include emergency repairs and maintenance performed to respond to equipment failure. Contrast with preventive maintenance and predictive maintenance.

**corrective work order.** In Equipment/Plant Management, a work order that is used to formally request and schedule corrective maintenance and other unscheduled maintenance, such as emergency repairs. Corrective work orders are not generated by the preventive maintenance system. You use corrective work orders to record and communicate all details pertaining to the corrective maintenance task.

**cost component.** An element of an item’s cost, for example, material, labor, or overhead.

**costed bill of material.** A type of bill of material that extends the quantity per of every component in the bill by the cost of the components. See also bill of material.

**cost rollup.** A simulated scenario in which work center rates, material and labor costs are used to determine the total cost of an item.

**crew size.** The number of people required to perform an operation. The associated standard time should represent the total time for all crew members to perform the operation.

**critical path leadtime.** See cumulative leadtime.

**cross segment edit.** A logic statement that establishes the relationship between configured item segments. These edits are used to prevent ordering of configurations which cannot be produced.

**CRP.** See capacity requirements planning.

**cumulative leadtime.** The longest planned length of time involved to accomplish the activity in question. For any item planned through MRP, cumulative leadtime is found by reviewing the leadtime for each bill of material path below the item. Whichever path adds up to the greatest number defines cumulative leadtime. Syn: aggregate leadtime, composite leadtime, and critical path leadtime.

**current cost.** The cost associated with an item at the time a parts list and routing are attached to a work order or rate. Cost is based on the latest bill of material and routing for the item.

**data dictionary.** A database table consisting of the definitions, structures, and guidelines for the use of fields, messages, and help text. The data dictionary table does not contain the actual data itself.

**date pattern.** A period of time set for each period in standard and 52-period accounting.

**demand.** A need for a particular product or component. The demand could come from any number of sources, such as customer order, forecast, an interplant requirement, or a request from a branch warehouse for a service item.

**dependent demand.** Demand that is directly related to or derived from the bill of material structure for other items or end products. Such demands are calculated and should not be forecast. A given inventory item may have both dependent and independent demand at any given time. For example, an item may simultaneously be the component of an assembly and also sold as a service item.
**direct labor.** Labor that is specifically applied to the product being manufactured.

**direct material.** Material that becomes a part of the final product in measurable quantities.

**discrete manufacturing.** Production of distinct items such as cars, appliances, or computers.

**dispatch list.** A list of sequenced manufacturing orders or rates. The dispatch list contains detailed information on location, quantity, and capacity requirements. Dispatch lists are usually generated daily and are oriented by work center or line.

**DREAM Writer.** Data Record Extraction And Management Writer. A flexible data manipulator and cataloging tool. You use this tool to select and sequence the data that is to appear on a programmed report.

**effective date.** See *effectivity date.*

**effectivity date.** The date on which a component or an operation is to be added or removed from a bill of material or an assembly process. Effectivity dates are used in the explosion process to create demands for the correct items. Normally, bills of material and routings provide for an effectivity “start date” (from) and “stop date” (through), signifying the beginning and end of a particular relationship. Syn: *effective date.*

**efficiency.** A measure (as a percentage) of the actual output to the standard output expected. Efficiency measures how well something is performing relative to expectations; it does not measure output relative to any input. For example, if there is a standard of 100 pieces per hour and 780 units are produced in one eight-hour shift, the efficiency is 780 divided by 800, then multiplied by 100% or 97.5%.

**electronic commerce.** See *electronic data interchange (EDI).*

**electronic data interchange (EDI).** The paperless (electronic) exchange of trading documents, such as purchase orders, shipment authorizations, advanced shipment notices, and invoices, using standardized document formats. Syn: *electronic commerce.*

**end item.** A product sold as a completed item or repair item. Any item subject to a customer order or sales forecast. Syn: *parent item, finished good, and co-product.*

**engineering change order (ECO).** A work order used to implement and track a change in a manufactured product. This can be a change in design, quantity of items required, assembly or production process, and so forth.

**engineer-to-order.** Products whose customer specifications require unique engineering design or significant customization. Each customer order results in a unique set of item numbers, bills of material, and routings.

**enterprise resource planning (ERP).** A closed-loop, integrated system that enables manufactures and distributors to coordinate all of the activities necessary to ultimately fulfill customer demand. This includes activities associated with suppliers, customer, inventory, shop floor, product costing and accounting, forecasting, and planning and scheduling.

**expedite.** To rush production or purchase orders that are needed in less than the normal leadtime. To take extraordinary action because of an increase in relative priority.

**explosion.** The process of calculating the demand for the components of a parent item by multiplying the parent item requirements by the quantity per specified in the bill of material. Syn: *requirements explosion.* Contrast with *implosion.*

**explosion level.** See *low-level code.*
exponential smoothing. A type of weighted moving average forecasting technique in which past observations are geometrically discounted according to their age. The heaviest weight is assigned to the most recent data. The smoothing is termed “exponential” because data points are weighted in accordance with an exponential function of their age.

facility. Identifies a separate entity within a business for which you want to track costs. For example, a facility might be a warehouse location, job, project, work center, or branch/Plant. Syn: business unit.

family. See master planning family.

feature. A characteristic of a product or service, such as an option, accessory, or attachment.

FIFO. See first in, first out.

finished good. See end item.

firm planned order (FPO). A planned order that can be frozen in quantity and time. The system is not allowed to automatically change it; this is the responsibility of the planner in charge of the item that is being planned. This technique can help planners respond to material and capacity problems by firming up selected planned orders. Additionally, firm planned orders are the normal method of stating the master production schedule.

first in, first out (FIFO). A method of inventory valuation for accounting purposes, based on the assumption that oldest inventory (first in) is the first to be used (first out). There is no relationship with the actual physical movement of specific items.

fixed cost. An expense that does not vary with the production volume, for example, setup cost.

fixed order quantity. A lot-sizing technique in MRP or inventory management that always causes planned or actual orders to be generated for a predetermined fixed quantity, or multiples thereof, if net requirements for the period exceed the fixed order quantity.

fixed quantity. Indicates that the amount of a component or ingredient used in the manufacturing process of an end item remains the same, regardless of the quantity of the end item produced. Contrast with variable quantity.

fixed overhead. Manufacturing costs other than direct labor and direct materials, that continue even if products are not produced. Although fixed overhead is necessary to produce the product, it cannot be directly traced to the final product.

forecast. An estimate of future demand. A forecast can be determined by 1) mathematical means using historical data, 2) subjective estimates from informal sources, or 3) a combination of both techniques.

forecast consumption. In Manufacturing and Distribution Planning, forecast consumption occurs when forecast demand is reduced by actual sales orders received or shipped, up to the forecast quantity.

FPO. See firm planned order.

frozen cost. After a frozen update, the cost of an item, operation, or process, as used by the Manufacturing Accounting system.

frozen update. A program that freezes the current simulated costs, thereby finalizing them for use by the Manufacturing Accounting system.

Gantt chart. A control chart designed to show graphically the relationship between planned performance and actual performance.

grade. Identifies a rating for an item which is based on how well the item meets required specifications.

header. Information at the beginning of a table. This information is used to identify or provide control information for the group of records that follows.
**hidden selections.** Menu selections you cannot see until you enter HS in a menu’s Selection field. They include items such as Display Submitted Jobs (33), Display User Job Queue (42), and Display User Print Queue (43). The Hidden Selections window displays three categories of selections: user tools, operator tools, and programmer tools.

**implosion.** The process of determining the where-used relationship for a given component. Implosion can be single level (showing only the parents on the next higher level) or multi-level (showing the ultimate top-level parent). Syn: *where-used.* Contrast with *explosion.*

**indented bill of material.** A form of multi-level bill of material that lists the highest level parent items at the left margin and all the components going into these parents indented to the right of the margin. All subsequent levels of components are indented farther to the right. If a component is used in more than one parent within a given product structure, it will appear under every subassembly in which it is used.

**indented where-used.** A type of bill of material listing for one component every parent item and subassembly, and the respective quantities required. Each of these parent items calls for the given component item in a bill of material table. The component item is shown closest to the left margin of the listing in the bill, with each parent indented to the right, and each of their respective parents indented even further to the right.

**indirect costs.** Costs that are not directly incurred by a particular job or operation. Certain utility costs, such as plant heating, are often indirect. An indirect cost is typically distributed to the product through the overhead rates.

**indirect labor.** Work required to support production in general without being related to a specific product, for example, administrative work.

**indirect materials.** Items that become part of the final product, or substances that are consumed in the manufacture of a product that have a negligible value relative to the value of the final product or the use of which cannot effectively be determined. Examples of indirect materials include masking tape, rags, and oils. These components might or might not be included in the bill of material.

**ingredient.** In process manufacturing industries, the raw material or component of a recipe or formula.

**in-process inventory.** See *work-in-process (WIP).*

**intermediate.** Material processed beyond raw material and used in higher level items. Intermediates are not stocked in inventory, sold to customers, or planned by MRP.

**issue.** The physical movement of items from a stocking location and, often, the transaction reporting of this activity.

**item.** Any unique manufactured or purchased part, material, intermediate, subassembly, or product, based on form, fit, or function.

**item master.** A record for an item. This record contains descriptive data and control values (leadtimes, lot sizes, and so on), and might contain data on inventory status, requirements, planned orders, and costs. Item records are linked together by product structure records that define the bill of material for an item.

**Just-in-Time (JIT).** A type of manufacturing based on planned elimination of all waste and continuous improvement of productivity. The primary elements of Just-in-Time manufacturing are to have only the required inventory when needed; to improve quality to zero defects; to reduce leadtimes by reducing setup times, queue lengths, and lot sizes; to revise incrementally the operations themselves; and to keep costs to a minimum.
kanban. Information cards attached to a group or bin of items that travel in and out of a work center. Kanbans indicate to producing work centers what has been consumed and what needs to be produced next. Some companies use various shapes, sizes, and colors of cards for each recognition and to indicate an item’s priority.

kit. The components of a parent item that have been pulled from stock and readied for movement to a production area.

labor cost. The dollar amount of added value due to labor performed during manufacturing.

last in, first out (LIFO). Method of inventory valuation for accounting purposes, based on the assumption that the most recently received (last in) is the first to be used or sold (first out). There is no relationship with the actual physical movement of specific items.

leadtime. 1) A span of time required to perform a process (or series of operations). 2) In a distribution context, the time between recognition of the need for an order and the receipt of goods. Individual components of leadtime can include order preparation time, queue time, move or transportation time, and receiving and inspection time.

leadtime offset. A technique used in MRP where a planned order receipt in one time period requires the release of that order in an earlier time period based on the leadtime for the item.

ledger type. A ledger used by the system for a particular purpose. For example, all transactions are recorded in the AA (actual amounts) ledger type in their domestic currency. The same transactions may also be stored in the CA (foreign currency) ledger type.

level. Every item or assembly in a product structure is assigned a code signifying the relative level in which that item or assembly is used within the product structure. Normally the end items are assigned to level 0 with the components and subassemblies of the item assigned to level 1 and so forth. The MRP explosion process starts from level 0 and proceeds downward one level at a time.

LIFO. See last in, first out.

linked service type. A service type that is associated with a primary service type. Linked service types are cancelled and the maintenance tasks are performed when the primary service type to which they are linked comes due. You can specify whether the system generates work orders for linked service types, as well as the status the system assigns to work orders that have already been generated. Syn: associated service type. See also primary service type, service type.

load. The amount of planned work scheduled and actual work released for a work center, or operation for a specific span of time. It is usually expressed in terms of standard hours of work or, when items consume similar resources at the same rate, units of production.

load center. See work center.

lot. A control quantity produced together that shares the same production components. Lots are uniquely identified to allow for traceability.

lot number control. Assignment of unique numbers to each instance of receipt. This number carries forth into subsequent manufacturing processes. Thus, in review of an end item lot, each lot consumed can be identified as having been used for the manufacture of this specific end item lot.

low-level code. A number that identifies the lowest level in any bill of material at which a particular component appears. Net
requirements for a given component are not calculated until all the gross requirements have been calculated down to that level. Low-level codes are calculated and maintained automatically. Syn: explosion level.

**machine hours.** The amount of time, in hours, that a machine is required to produce a product. Machine hours, rather than labor hours, may be used for planning capacity and scheduling, and for allocating costs.

**maintenance loop.** See **maintenance route.**

**maintenance route.** A method of performing PMs for multiple pieces of equipment from a single preventive maintenance work order. A maintenance route includes pieces of equipment that share one or more identical maintenance tasks that can be performed at the same time for each piece of equipment. Maintenance routes eliminate the need to create separate maintenance work orders for each piece of equipment, yet still accommodate all of the features of the preventive maintenance cycle. Syn: maintenance loop.

**maintenance work order.** A term used to distinguish work orders created for the performance of equipment and plant maintenance from other work orders within J.D. Edwards systems, such as manufacturing work orders, utility work orders, engineering change orders, and so on.

**make-to-order.** A product that is produced after receipt of a customer's order. The final product is usually a combination of standard purchased items and items custom-designed to meet the special needs of the customer. Frequently, long leadtime components are planned prior to the order arriving to reduce the delivery time to the customer. Contrast with assemble-to-order.

**make-to-stock product.** A product that is shipped from finished goods “off-the-shelf,” and is finished prior to a customer order arriving. Master scheduling and final assembly scheduling are conducted at the finished goods level.

**manufacturing calendar.** See **work day calendar.**

**manufacturing and distribution planning.** Consists of Resource and Capacity Planning and Material Planning Operations. Resource and Capacity Planning allow you to prepare a feasible production schedule that reflects your demand forecasts and production capability. Material Planning Operations provides a short-range plan to cover material requirements that are needed to make a product.

**manufacturing leadtime.** The total time required to manufacture an item, exclusive of lower level purchasing leadtime. It includes the time for queue, setup, run, and move.

**master planning.** A classification scheme that includes the following activities: forecasting and order servicing (which together constitute demand management); production and resource planning; and master scheduling (which includes the final assembly schedule, the master schedule, and the rough cut capacity plan).

**master planning family.** A group of products used in material planning that have similar characteristics.

**master production schedule (MPS).** A detailed statement of how many items are planned to be produced and when. The MPS focuses on products to be made and, through the detailed planning system, identifies the resources (materials, work force, plant equipment, and capital) needed and the timing of the need. See also **material requirements planning.**

**material requirements planning (MRP).** A set of techniques that uses bill of material, inventory data, and the master production
schedule to calculate the time-phased net material requirements for every component item and subassembly. MRP suggests a replenishment plan to support the production of the quantities that are specified in the Master Production Schedule. See also master production schedule.

**Model work order.** In Equipment and Plant Maintenance, a work order that functions as a template for the creation of other work orders. You can assign model work orders to service types. When the service type comes due, the system automatically generates a work order based on information from the model work order.

**MPS.** See master production schedule.

**MRP.** See material requirements planning.

**Net added cost.** The net added cost represents the cost to manufacture an item at the current level in the bill of material. Thus for manufactured parts, the net added cost includes labor, outside operations, and cost extras applicable to this level in the bill of material, but not materials (lower-level items). For purchased parts, the net added cost also includes the cost of materials.

**Next number facility.** A facility used to control the automatic numbering of such items as new purchase orders, sales orders, and work orders. The next number facility provides a method to increment numbers to reduce transposition and typing errors.

**Nonconforming product.** Items which do not meet the requirements of a relevant specification, contract, regulation, or quality test.

**Nonsignificant item numbers.** Item numbers that are assigned to each item but do not convey any information about the item. They are identifiers, not descriptors. Contrast with significant item numbers.

**Numeric character.** Represents data using the numbers 0 through 9. Contrast with alphabet character and alphanumeric character.

**Operand.** See Boolean logic operand.

**Operation sequence.** The sequential steps for an item to follow in its flow through the plant. For instance, operation 10: cut bar stock; operation 20: grind bar stock; operation 30: shape; operation 40: polish; operation 50: inspect and send to stock. This information is maintained in the routing table.

**Overhead.** Costs incurred in the operation of a business that cannot be directly related to the individual products or services produced. These costs, such as light, heat, supervision, and maintenance, are grouped into department overhead, factory overhead, and general overhead. They are distributed to units of product or service by some standard allocation method.

**Overlap.** The percentage by which an operation overlaps the previous operation in the sequence. For example, a 20% overlap means that a step can begin when the previous step is 80% complete.

**Parent/child relationship.** See parent/component relationship.

**Parent/component relationship.** 1) In Equipment/Plant Management, a hierarchical relationship of the components of a piece of equipment to the parent equipment. For example, a manufacturing line could be a parent and the machinery on the line could be components of the line. In addition, each piece of machinery could be a parent of still more components. 2) In Product Data Management, a hierarchical relationship of the components and subassemblies of a parent item to that parent item. For example, an automobile is a parent item and its components and subassemblies include: engine, frame, seats, and windows. Syn: parent/child relationship.

**Parent item.** See end item.

**Pay on consumption.** The concept of not incurring a liability for items received from a supplier until the material is used in the production process.
**pegging.** In MRP, the ability to identify for a given item the sources of its gross requirements, allocations, or both. Pegging can be thought of as “live where-used” information.

**phantom bill of material.** A bill of material used primarily for nonstocked items. A phantom bill of material represents an item that is physically built, but rarely stocked. It is instead used in the next step or level of manufacturing. MRP uses the bill to drive the requirements through the phantom item to its components.

**picking.** The process of withdrawing from stock the components to make the products or the finished goods to be shipped to a customer.

**pick list.** A document that lists the material to be picked for manufacturing or shipping orders.

**planning calendar.** See work day calendar.

**planned order.** A suggested order quantity, release date, and due date created by MRP processing when it encounters net requirements. Planned orders at one level are exploded into gross requirements for components at the next lower level. Planned orders, along with released orders, serve as input to capacity requirements planning to show the total capacity requirements by work center in future time periods. See also firm planned order.

**planning bill of material.** An artificial grouping of items or events in bill of material format, used to facilitate master scheduling or material planning, and forecasting. Syn: pseudo bill of material.

**planning family.** A means of grouping end items whose similarity of design and manufacture facilitates being planned in aggregate.

**planning horizon.** The amount of time the master schedule extends into the future. This is normally set to cover a minimum of cumulative leadtime, plus time for lot sizing low-level components, and for capacity changes of primary work centers.

**PM.** Refers to one or more service types that are due to be performed for a piece of equipment, based on the service intervals for each service type. When you complete a PM, a new PM cycle begins for the service types included in the PM.

**potency.** Identifies the percent of a process item in solution. For example, 80% solution could be used in a process which called for 100%, but would require 25% more in terms of quantity to meet the requirement (100 / 80 = 1.25).

**predictive maintenance.** A maintenance strategy that uses computerized data collection and analysis of equipment operating parameters to predict the point at which equipment is expected to fail and then schedules the appropriate procedures just before the expected equipment failure. Predictive maintenance can significantly reduce costs and equipment downtime by eliminating unnecessary preventive maintenance procedures. In addition, by predicting and averting catastrophic equipment failure, predictive maintenance reduces overall maintenance costs and allows for equipment to be operated for its full service life. Contrast with corrective maintenance and preventive maintenance.

**preference profile.** The ability to define default values for specified fields for a user defined hierarchy of items, item groups, customers, and customer groups.

**preflush.** An automatic deduction by the system of materials from inventory when the parts list and routing are attached.

**preventive maintenance.** Maintenance tasks and procedures that are routine and repetitive, such as periodic lubrications and filter replacements. Preventive maintenance procedures are designed to eliminate breakdowns and the need for corrective maintenance. Contrast with corrective maintenance and predictive maintenance.
preventive maintenance cycle. Refers to the sequence of events that make up a preventive maintenance task, from its definition to its completion. Because most preventive maintenance tasks are commonly performed at scheduled intervals, parts of the preventive maintenance cycle repeat, based on those intervals.

preventive maintenance schedule. Defines the service types that apply to a specific piece of equipment, as well as the intervals at which each service type is scheduled to be performed.

primary location. The designation of a certain storage location as the standard, preferred location for an item.

primary service type. A service type to which you can link related service types. For example, for a particular piece of equipment, you might set up a primary service type for a 1000-hour inspection and a linked service type for a 500-hour inspection. The 1000-hour inspection includes all tasks performed at 500 hours. When a primary service type is scheduled to be performed, the system schedules the linked service type. See also linked service type.

priority. 1) The relative importance of jobs in a queue. 2) The sequence in which jobs should be completed.

process manufacturing. Production that adds value by mixing, separating, forming, or performing chemical reactions. It may be done in either batch or continuous mode.

product data management (PDM). The Product Data Management (PDM) system enables a business to organize and maintain information about each item it manufactures. Features of this system, such as bills of material, work centers, and routings, define the relationships between components and how they can be combined to manufacture an item. PDM also provides data for other manufacturing systems including Manufacturing Accounting, Shop Floor Control, and Manufacturing and Distribution Planning.

product family. See master planning family.

production line. A series of work centers or machines allocated to the production of a limited number of items with similar routings.

pseudo bill of material. See planning bill of material.

purchased part. An item bought from a supplier.

quality control. The process of measuring quality conformance by comparing the actual with a standard for the characteristic and acting on the difference.

quality management. A system that allows testing of products based on user defined tests and acceptable result values. Test results can be entered in a consistent fashion at any time in the sales, purchasing, production, or shipping process.

quantity per. The quantity of a component to be used in the production of its parent. This value is stored in the bill of material and is used to calculate the gross requirements for components during the explosion process of MRP, and to calculate the quantity on the parts list for a work order.

queue. The jobs waiting to be processed at a given work center. As queues increase, so do average queue time and work-in-process inventory.

rated capacity. The demonstrated capability of a system. Capacity is calculated from such data as planned hours, efficiency, and utilization. The rated capacity = available hours x efficiency x utilization.

raw material. Purchased items or extracted materials that are converted through the manufacturing process into components or products.
**receipt.** 1) The physical acceptance of an item into a stocking location. 2) The transaction reporting of this activity.

**record.** A collection of related, consecutive fields of data the system treats as a single unit of information. For example, a supplier record consists of information such as the supplier’s name, address, and telephone number.

**release.** Authorization to produce or ship material that has already been ordered.

**repetitive manufacturing.** Producing items in high-volume concentration, often with entire production lines dedicated to a family of products.

**replacement parts.** Parts that can be used as substitutes. They differ from completely interchangeable service parts in that they require some physical modification, such as cutting, drilling, and so forth, before they can replace the original part.

**replenishment point.** The location on or near a production line where requests for additional components or subassemblies are to be delivered.

**reporting code.** See category code.

**requirements explosion.** See explosion.

**reserved material.** See committed material.

**resource requirements planning (RRP).** The process of converting the production plan into capacity needs for key resources: workforce, machinery, warehouse space, suppliers’ capabilities, and in some cases, money. Comparison of capacity required of items in the MPS to available capacity is usually done for each key resource.

**revision level.** A number or letter representing the number of times a document or item has been changed.

**rework order.** A manufacturing order to rework and salvage defective parts or products.

**rollup.** See cost rollup.

**rough cut capacity planning (RCCP).** The process of converting the master production schedule into capacity needs for key resources: workforce, machinery, warehouse space, suppliers’ capabilities, and in some cases, money. Comparison of capacity required of items in the MPS to available capacity is usually done for each key resource.

**routing.** Information detailing the method of manufacture or maintenance of a particular item. It includes the operations to be performed, their sequence, the various work centers involved, and the standards for setup and run. In some companies, the routing also includes information on tooling, operator skill levels, inspection operations, testing requirements, and so on.

**run size.** See standard batch quantity.

**safety stock.** 1) In general, a quantity of stock planned to be in inventory to protect against fluctuations in demand or supply. 2) In the context of master production scheduling, the additional inventory or capacity planned as protection against forecast errors or short-term changes in the backlog. Overplanning can be used to create safety stock.

**scheduling workbench.** A multiple-function program which allows the sequencing of work orders and/or rates on a production line. Sequencing can be automatic based on user defined category code definition or manual. Sequencing includes forward, finite scheduling, including the option to cross shifts or days.

**scrap.** Unusable material that results from the production process. It is material outside of specifications and of such characteristics that rework is impractical.

**scrap factor.** A percentage factor in the product structure used to increase gross requirements to account for anticipated loss within the manufacture of a particular product. Syn: scrap rate.

**scrap rate.** See scrap factor.
selection. Found on J.D. Edwards menus, selections represent functions that you can access from a given menu. To make a selection, you type its associated number in the Selection field and press Enter.

sequencing. Determining the order in which a facility processes different jobs.

serial number. A unique number assigned to identify a specific item with a lot size of one.

service interval. Refers to the frequency at which a service type is to be performed. Service intervals can be based on dates, periods, or statistical units that are user defined. Examples of statistical units are hours, miles, and fuel consumption.

service type. An individual preventive maintenance task or procedure, such as an inspection, lubrication, or overhaul. Service types can apply to a specific piece of equipment or to a class of equipment. You can specify that service types come due based on a predetermined service interval, or whenever the task represented by the service type becomes necessary.

setup. 1) The work required to change a specific machine, resource, work center, or line from the last good piece of unit A to the first good piece of unit B. 2) Teardown of the just completed production and preparation of the equipment for production of the next scheduled item.

setup cost. The labor costs associated with setting up an operation for the next product.

shelf life. The amount of time an item may be held in inventory before it becomes unusable.

shop calendar. See work day calendar.

shop floor calendar. See work day calendar.

shop floor control. A system that uses data from Product Data Management, Master Production Schedule, and Material Requirements Planning to create, maintain, and communicate status on shop orders (work orders.). The major subfunctions of shop floor control are: 1) assigning priority of each shop order, 2) maintaining work-in-process quantity information, 3) conveying shop order status information to the office, 4) providing actual output data for capacity control purposes, 5) providing quantity by location by shop order for work-in-process inventory and accounting purposes, and 6) providing measurement of efficiency, utilization, and productivity of machines and labor resources.

shrinkage. Reductions of actual quantities of items in stock, in process, or in transit. The loss might be caused by scrap, theft, deterioration, evaporation, and so forth.

shrink factor. A percentage factor in the item master record that compensates for expected loss during the manufacturing cycle either by increasing the gross requirements or by reducing the expected completion quantity of planned and open orders. The shrink factor differs from the scrap factor in that the former affects all uses of the part and its components and the scrap factor relates to a single component. Syn: shrinkage rate.

shrinkage rate. See shrink factor.

significant item numbers. Item numbers that are intended to convey certain information, such as the source of the part, the material in the part, the shape of the part, and so forth. Contrast with nonsignificant item numbers.

simulated cost. After a cost rollup, the cost of an item, operation, or process according to the current cost scenario. This cost can be finalized, by performing a frozen update. You can create simulated costs for a number of cost methods, for example. standard, future, and simulated current costs. See also cost rollup.

simulation. 1) The technique of using representative or artificial data to reproduce a model of various conditions that are likely to occur in the actual performance of a
system. It is frequently used to test the behavior of a system under different operating policies. 2) Within MRP, using the operational data to perform “what if” evaluations of alternative plans to determine the feasibility of the model.

**single level bill of material.** A display of those components that are directly used in a parent item. It shows only the relationships one level down.

**single level where-used.** A type of bill of material listing each parent in which a specific component is directly used and in what quantity.

**specification.** A statement of the technical requirements of an application or item and the process involved to ensure the requirements are met.

**standard batch quantity.** The quantity of a parent that is used as the basis for specifying the material requirements for production. The “quantity per” is expressed as the quantity needed to make the standard batch quantity, not to make only one of the parent. It is often used by manufacturers that use some components in very small quantities or by process-related manufacturers. Syn: run size.

**standard cost.** The expected, or target cost of an item, operation, or process. Standard costs represent only one cost method in the Product Costing system. You can also calculate, for example, future costs or current costs. However, the Manufacturing Accounting system uses only standard frozen costs.

**standard costing.** A cost system that uses cost units determined before production. For management control purposes, the system compares standards to actual costs and computes variances.

**standard hours.** The length of time that should be required to 1) set up a given machine or operation and 2) run one part, assembly, batch, or end product through that operation. This time is used in determining machine and labor requirements. It is also frequently used as a basis for incentive pay systems and as a basis for allocating overhead in cost accounting systems.

**subassembly.** An assembly that is used at a higher level to make up another assembly.

**substitution.** Using alternate components in production when the primary item is not available.

**super backflush.** Creates backflush transactions against a work order at pay points defined in the routing. This allows you to relieve inventory at strategic points throughout the manufacturing process. See also backflush.

**supplier scheduling.** Provides suppliers with consistent shipping information and advanced demand profiles to support just-in-time production and delivery. The supplier scheduling system includes a business agreement and delivery schedule for each supplier. Supplier scheduling includes a formal priority planning system and EDI functionality to provide the supplier with valid due dates.

**supply chain.** The link from the initial raw materials to the consumption of the finished product.

**supplying location.** The location from which inventory is transferred once quantities of the item on the production line have been depleted. Used in kanban processing.

**threshold percentage.** In Equipment/Plant Management, the percentage of a service interval that you define as the trigger for maintenance to be scheduled. For example, you might set up a service type to be scheduled every 100 hours with a threshold percentage of 90 percent. When the equipment accumulates 90 hours, the system schedules the maintenance.

**throughput.** The total volume of production through a facility (machine, work center, department, plant, or network of plants).
time series. A set of data that is distributed over time, such as demand data, in monthly time periods.

traceability. The ability to trace the production history of a product for quality or warranty purposes. This is usually done through the use of lot or serial numbers to link raw materials from the supplier to the end product. Lot/SN traceability can be a government requirement in certain regulated industries, such as the pharmaceutical or automotive industries. See also lot.

unit cost. Total labor, material, and overhead cost for one unit of production.

unit of measure. The unit by which the quantity of an item is managed, such as by weight, each, box, package, case, and so forth.

variable overhead. All manufacturing costs that vary directly with production volume, other than direct labor and direct materials. Variable overhead is necessary to produce the product, but cannot be directly assigned to a specific product.

variable quantity. In manufacturing, a variable quantity of a component or ingredient indicates that the amount required varies based on the quantity of the end product produced. Contrast with fixed quantity.

variance. 1) In Product Costing and Manufacturing Accounting, the difference between two methods of costing the same item. For example, the difference between the frozen standard cost and the current cost is an engineering variance. Frozen standard costs come from the Cost Components table, and the current costs are calculated using the current bill of material, routing, and overhead rates. 2) In Equipment/Plant Management, the difference between revenue generated by a piece of equipment and costs incurred by the equipment.

where-used. A listing of every parent item that calls for a given component, and the respective quantity required, from a bill of material file. Syn: implosion.

work center. A specific production facility with identical capabilities, consisting of one or more people, machines, or both. A work center can be considered as one unit for purposes of capacity requirements planning and detailed scheduling. Syn: load center.

work day calendar. A calendar used in planning functions that consecutively lists only the working days so that component and work order scheduling can be done based on the actual number of work days available. Syn: planning calendar, manufacturing calendar, and shop floor calendar.

work-in-process (WIP). A product or products in various stages of completion throughout the plant, including all material from raw material that has been released for initial processing up to completely processed material awaiting final inspection and acceptance as finished product. Syn: in-process inventory.

work order life cycle. In Equipment/Plant Management, refers to the sequence of events through which a work order must pass to accurately communicate the progress of the maintenance tasks it represents.
