

Oracle® Enterprise Manager Ops Center

Tuning Monitoring Rules and Policies

12c Release 2 (12.2.2.0.0)

E40793-02

December 2014

This guide provides an end-to-end example for how to use Oracle Enterprise Manager Ops Center.

Introduction

Oracle Enterprise Manager Ops Center includes a set of monitoring policies that provide in-depth monitoring for your managed assets. This example shows you how to tune the alert triggers for your organization. For example, you might want to create a specific monitoring profile for assets that are on a critical path.

All of the monitoring rules for a specific type of asset, such as an operating system, are bundled into a monitoring policy. When you add an asset to Oracle Enterprise Manager Ops Center, the software automatically begins monitoring it with the appropriate default monitoring policy. You can use the default policies, or you can tune them for your needs. Tuning includes disabling, editing, and adding rules. You can tune rules for an individual asset, or you can create customized policies that monitor groups of like-assets. For example, you can create a group and add your mission-critical operating systems to the group. You can then create a monitoring policy with rules that are specific for the members of that group.

Monitoring rules define the values and boundaries for an asset's activity and the alerting conditions. Information on the available monitored attributes is available in the Javadoc that is in the Oracle Enterprise Manager Ops Center Software Developer's Kit (SDK). System-defined rules are for specific attributes and are hard-coded into the drivers. You can only disable and enable them. The more interesting rules are the user-defined rules. You can edit them, add new rules, or apply rules to a specific asset or group of assets.

User-defined rules are associated with, and determined by, the type of managed resource:

- **Threshold:** Sets an upper or lower monitoring threshold for the monitored attribute.
- **Boolean Control:** Sets a logical operator of true or false for the monitored attribute.
- **Enumerated Control:** A series of values that defines a subset of specific values among the possible values of the monitored attribute. An alert occurs when the attribute matches one of those specific values.
- **Expression:** Defines the variables, literals, and operators for an attribute. An expression is an instruction to execute something that returns a value.

Most types of user-defined rules include some parameters that you can tune, or edit. For example, threshold type rules have default values for Info, Warning, and Critical severity level alarms. You can change the values for each severity level.

You can view and edit the rules for a specific asset or policy:

- **Asset View:** Rules for a specific asset are located in asset's Monitoring tab. Select an asset in the Asset section of the Navigation pane, then click the Monitoring tab in the center pane. Editing a rule from the asset view creates a new policy for that asset.
- **Policy View:** Rules for a specific policy are located in Monitoring Policies in Plan Management. Expand Plan Management in the Navigation pane, scroll down to the Operational Plans section and click Monitoring Policies. Editing a rule from the policy view changes the monitoring policy.

Policies enable you to maintain consistency by applying the same rule parameters to individual assets or to a group of assets. When you edit a rule from the asset view, you create a separate policy. This might be appropriate for a single system, but the preferred method is to perform the tasks from the policy view. When you tune from the policy view, all assets associated with the policy use the same rules.

This document provides an example of how you can tune monitoring for your organization. This example shows you how to copy the generic OC - Operating System monitoring policy and create a new policy called Critical Operating Systems and create a new policy called Critical Servers. In this example, a policy is tuned by editing an existing rule, creating three new rules, and then assigning systems to the policy.

See [Related Articles and Resources](#) for links to related information and articles.

What You Will Need

You need the following to tune monitoring:

- Several agent-managed operating systems managed with Oracle Enterprise Manager Ops Center.
- The **Profile/Plan Admin** role to modify monitoring policies.
- The **Fault Admin** role to apply a monitoring policy to an asset. To apply the monitoring policy to a group, the **Asset Admin** role is also required.

Tuning Monitoring Rules and Policies

Tuning rules and policies involves creating monitoring policies and revising monitoring rules to meet your organization's objectives.

This example describes how to do the following:

- [Create a New Policy](#)
- [Edit a Rule](#)
- [Add New Rules](#)
 - [Add a New Threshold Rule](#)
 - [Add a New Boolean Rule](#)
 - [Add a New Enumerated Rule](#)
 - [Add a New Expression Rule](#)

- [Associate a Group of Assets With the Policy](#)

Create a New Policy

Oracle Enterprise Manager Ops Center has a default set of monitoring policies. The default set of policies all begin with the letters OC and are read-only. The policies are based on a target type. You cannot edit or add to the default policies, but you can copy an existing policy for the target type that you want to monitor, such as operating systems, and create an editable version. Alternatively, you can create a new policy and select the subtype for the policy.

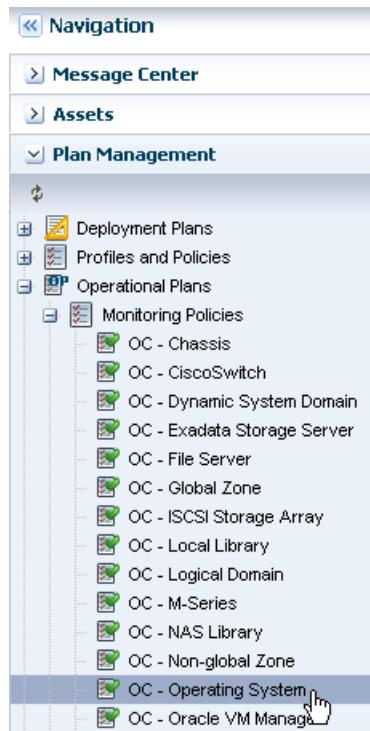

You will need to create two policies to use for later tasks. Either method is acceptable. This example uses both methods to create the new policies.

1. Create a policy for critical operating systems by using the **Copy Policy** action, see [To Create a Copy of a Policy](#).
2. Create a new policy for critical servers by using the **Create Policy** action, see [To Create a Policy](#).

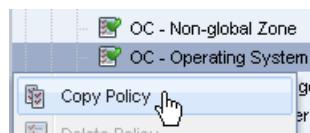

To Create a Copy of a Policy

This example creates a policy for critical operating systems.

1. Expand **Plan Management** in the Navigation pane, scroll down to Operational Plans, then click **Monitoring Policies**.

2. Right click and click **Copy Policy** or click **Copy Policy** in the Actions pane.

- Revise the policy name and description for the new policy, then click **Next**. In this example, the new policy is named Critical Operating Systems.

Identify Policy

*** Name:** Critical Operating Systems

Description: copy of the QC- Operating Systems policy for generic operating systems. Policy is tuned for OS monitoring on critical path systems.

Subtype: Subtype
Operating System

Target Type: Target Type
Operating Systems

- Click **Finish** to create the policy.

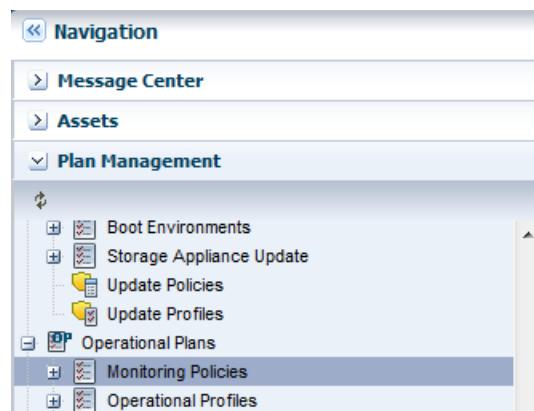

The policy appears in the list of Monitoring Policies. Click the policy to display details in the center pane. You can now tune the new policy by editing and adding rules.

To Create a Policy

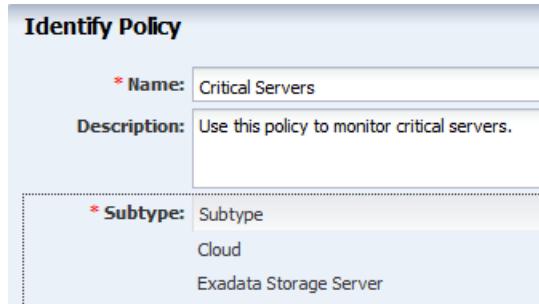

This example creates a new policy for critical servers.

- Expand **Plan Management** in the Navigation pane, scroll down to **Operational Plans**, then click **Monitoring Policies**.

- Right click and click **Create Policy** in the Navigation pane, or click **Create Policy** in the Actions pane.

3. Enter a policy name and description, then select **Server** as the subtype. In this example, the new policy is named Critical Servers. Click **Next**.

Identify Policy

* Name: Critical Servers

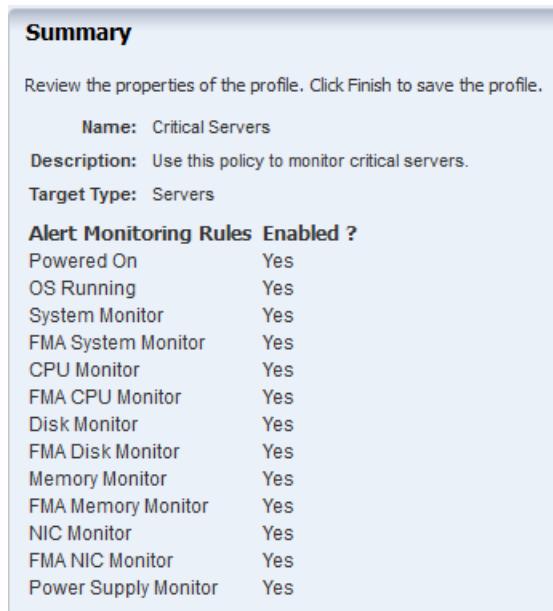

Description: Use this policy to monitor critical servers.

* Subtype: Subtype

Cloud

Exadata Storage Server

4. Click **Finish** to create the policy. The policy includes the default rules based on the Server subtype that you selected for the policy in the previous step.

Summary

Review the properties of the profile. Click **Finish** to save the profile.

Name: Critical Servers

Description: Use this policy to monitor critical servers.

Target Type: Servers

Alert Monitoring Rules Enabled ?

Powered On	Yes
OS Running	Yes
System Monitor	Yes
FMA System Monitor	Yes
CPU Monitor	Yes
FMA CPU Monitor	Yes
Disk Monitor	Yes
FMA Disk Monitor	Yes
Memory Monitor	Yes
FMA Memory Monitor	Yes
NIC Monitor	Yes
FMA NIC Monitor	Yes
Power Supply Monitor	Yes

You can edit the rules to customize them for your environment.

Edit a Rule

You can only edit rules that are in user-defined policies. You cannot change the monitored attribute, rule name, or description of a user-defined policy, but you can change the monitoring and alert conditions. You can change the monitoring time frame, the amount of time between when the event occurs and the alert to generate, the alert parameters, and the actions.

This example shows how to change the alert parameters for a threshold type rule to be more stringent for the critical operating systems.

1. Expand **Plan Management** in the Navigation pane, scroll down to **Operational Plans**, then click **Monitoring Policies**. Select the Critical Operating Systems policy that you created earlier.

- With the policy open in the center pane, select the rule you want to edit, then click the **Edit** icon. In this example, the File System Reachability rule in the Boolean Control rules section is selected.

Name: Critical Operating Systems **Subtype:**
Description: Use this policy to monitor critical Operating Systems **Nature:**
Target Type: Operating Systems **Last Modified:**
 Default monitoring policy for assets matching subtype and target type

Policy Details

Alert Monitoring Rules **Alert Limits**

BooleanControl Monitoring Rules (1)

File System Reachability **Critical: false**
 Immediate Action: N/A

- Edit the rule parameters. In this example, the default time to generate an alert is changed from 10 minutes to 5 minutes.

Configure Alert Rule Parameters

Rule Type: Boolean Control
Monitored Attribute: FileSystemUsages.name=*.reachable
Monitoring Rule Name: File System Reachability

Description: -

Monitor for alert limits continuously
 Monitor for alert limits at specific time, start at: **End:**

Generate alert after: 5 Minutes

Rule Parameters:	Severity	Monitored Attribute
	<input checked="" type="radio"/> Critical	FileSystemUsages.name=*.reachable

- Click **Apply** to submit the changes.

Add New Rules

In addition to using the default rules, you can create your own rules and add them to your user-defined monitoring policies. Before you add new rules, you must know the valid constructor details, attributes, and parameters. See the *Oracle Enterprise Manager Ops Center Feature Reference Guide* for details on monitoring attributes, classes, lexical

elements, grammar, and semantics. See [Get a List of the Monitoring Attributes](#) for the steps to download the API Javadocs that are part of the Software Development Kit (SDK) package.

The following examples are available for creating a new rule:

- [Add a New Threshold Rule](#)
- [Add a New Boolean Rule](#)
- [Add a New Enumerated Rule](#)
- [Add a New Expression Rule](#)

Note: It is a good practice to test your new rules. The software will show that you have successfully added your rule, but it does not test the validity of the new rule. In some, but not all cases, the word No appears in the Enabled column for a newly created, but invalid rule.

Get a List of the Monitoring Attributes

The Java documentation contains a list of the valid attributes that you can use when you create new monitoring rules. The Java documentation is in the Software Development Kit package (**SUNWxvmoc-sdk.pkg**) in the Oracle Enterprise Manager Ops Center downloaded installation bundle.

1. Go to the `/OC/xvmoc_full_bundle/SunOS_*/Product/components/packages` directory on the Enterprise Controller.
`/var/tmp/OC/xvmoc_full_bundle/SunOS_i386/Product/components/packages`
2. Unpack the Software Development Kit package (**SUNWxvmoc-sdk.pkg**). You can do this on the Enterprise Controller, or any other system.
`# pkgadd -d SUNWxvmoc-sdk.pkg`
3. Open the javadoc index, then the OperatingSystem javadoc page, or just go to the OperatingSystem javadoc page.
Index: `file:///<host_name>/xvm_oc/doc/javadoc/index.html`
or
OperatingSystem page: `file:///<host_name>/xvm_oc/doc/javadoc/com/sun/hss/type/os/OperatingSystem.html`
4. Locate the parameter you need. This image shows a `FileSystemUsage` constructor that creates a Boolean rule and Expression rule later in this document. The javadoc provides the constructor details, and the parameters that you can use in creating a rule. In this case, the parameters are: `name`, `type`, `totalSpace`, `freeSpace`, `usedSpace`, `freeSpacePercentage`, and `usedSpacePercentage`. A brief description appears next to each parameter.

Constructor Detail

FileSystemUsage

```
public FileSystemUsage(java.lang.String name,
                      java.lang.String type,
                      long totalSpace,
                      long freeSpace,
                      long usedSpace,
                      float freeSpacePercentage,
                      float usedSpacePercentage)
```

Constructs a `FileSystemUsage` given its `name`, `type`, `totalSpace`, `freeSpace`, `usedSpace`, `freeSpacePercentage` and `usedSpacePercentage`.

Parameters:

`name` - the name of the file system
`type` - the type of the file system
`totalSpace` - the total space of the file system
`freeSpace` - the free space of the file system
`usedSpace` - the used space of the file system
`freeSpacePercentage` - the free space percentage
`usedSpacePercentage` - the used space percentage

See Expression Query Language in the *Oracle Enterprise Manager Ops Center Feature Reference Appendix Guide* for details on monitoring attributes, classes, lexical elements, grammar, and semantics.

Add a New Threshold Rule

A Threshold rule sets an upper or lower monitoring threshold for the monitored attribute. You must define the monitored attribute for threshold rules.

The following are some examples of monitored attributes:

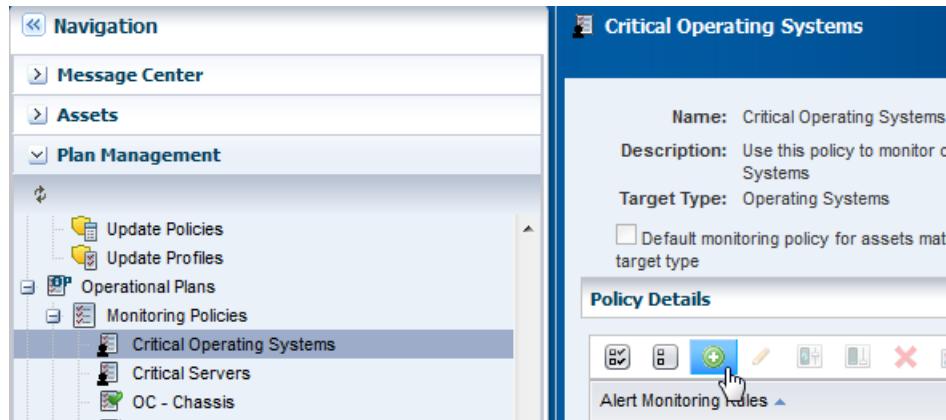

- `CpuUsage.usagePercentage`
- `ProcessUsage.topMemoryProcesses.pid=*.physicalMemoryUsage`
- `DiskUsageSet.name=*.busyPercentage`

See the *Oracle Enterprise Manager Ops Center Feature Reference Appendix Guide* for details on monitoring attributes, classes, lexical elements, grammar, semantics, and examples.

1. Expand **Plan Management** in the Navigation pane, scroll down to Operational Plans, then click **Monitoring Policies**. Select the type of monitoring policy to which you want to add a rule.

2. With the policy open in the center pane, click the **Add** icon.

3. Select **Threshold** from the menu.
4. Enter the monitored attribute and description.

Configure Alert Rule Parameters

* Rule Type:	Threshold
* Asset Type:	OperatingSystem
* Monitored Attribute:	DiskUsageSet.name=*.busyPercentage
* Monitoring Rule Name:	Percentage of Disk Used
Description:	disk usage, percent busy
<input checked="" type="radio"/> Monitor for alert limits continuously	
<input type="radio"/> Monitor for alert limits at specific time, start at: <input type="text"/> End: <input type="text"/>	
Generate alert after:	5 Minutes

5. Define the amount of time that can elapse before an alert is generated, then define the alert severity parameters and limits.

Generate alert after:	5 Minutes																
Rule Parameters:	<table border="1"> <thead> <tr> <th>Severity</th> <th>Monitored Attribute</th> <th>Operator</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td>Critical</td> <td>DiskUsageSet.name=*.busyPercentage</td> <td>></td> <td>80.00</td> </tr> <tr> <td>Warning</td> <td>DiskUsageSet.name=*.busyPercentage</td> <td>></td> <td>75.00</td> </tr> <tr> <td>Info</td> <td>DiskUsageSet.name=*.busyPercentage</td> <td>></td> <td>70.00</td> </tr> </tbody> </table>	Severity	Monitored Attribute	Operator	Value	Critical	DiskUsageSet.name=*.busyPercentage	>	80.00	Warning	DiskUsageSet.name=*.busyPercentage	>	75.00	Info	DiskUsageSet.name=*.busyPercentage	>	70.00
Severity	Monitored Attribute	Operator	Value														
Critical	DiskUsageSet.name=*.busyPercentage	>	80.00														
Warning	DiskUsageSet.name=*.busyPercentage	>	75.00														
Info	DiskUsageSet.name=*.busyPercentage	>	70.00														

6. Click **Apply**.

The new rule is now part of the policy.

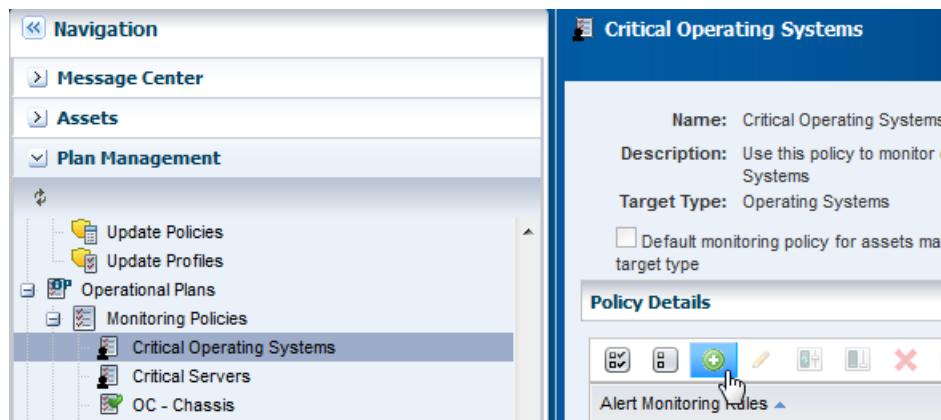

Threshold Monitoring Rules (9)		
CPU Usage Percentage	Warning: 90.0	
Immediate Action: N/A		
Disk IO Queue Length	Warning: 3.00	
Immediate Action: N/A		
Disk IO Utilization Percentage	Warning: 95	
Immediate Action: N/A		
File System Used Space Percentage	Critical: 95.0 Warning: 80.0	
Immediate Action: N/A		
Memory Usage Percentage	Warning: 100.0	
Immediate Action: N/A		
Percentage of Disk Used	Critical: 80 Warning: 75 Info: 70	
disk usage, percent busy		
Immediate Action: N/A		

Add a New Boolean Rule

A Boolean rule sets a logical operator of true or false for the monitored attribute.

A default Boolean rule uses the `FileSystemUsages.name=*.reachable` parameter and generates a critical problem when the file system is not reachable for five (5) minutes. This example uses the same parameter, but triggers a warning when the file system cannot be reached for two (2) minutes.

1. Expand **Plan Management** in the Navigation pane, scroll down to Operational Plans, then click **Monitoring Policies**. Select the policy for the rule.
2. With the policy open in the center pane, click the **Add** icon.

3. Select **Boolean Control** from the Rule Type menu.
4. Enter `FileSystemUsages.name=*.reachable` in the monitored attribute field, name the rule, and add a description

Configure Alert Rule Parameters

* Rule Type:	Boolean Control								
* Asset Type:	OperatingSystem								
* Monitored Attribute:	FileSystemUsages.name=*.reachable								
* Monitoring Rule Name:	Warning - File System Unavailable								
Description: Warning alert is generated when the file system is not available for 2 m									
<input checked="" type="radio"/> Monitor for alert limits continuously <input type="radio"/> Monitor for alert limits at specific time, start at: <input type="text"/> End: <input type="text"/>									
Generate alert after:	2 Minutes								
<table border="1"> <thead> <tr> <th>Severity</th> <th>Monitored Attribute</th> <th>Operator</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td></td> <td>FileSystemUsages.name=*.reachable</td> <td>=</td> <td>false</td> </tr> </tbody> </table>		Severity	Monitored Attribute	Operator	Value		FileSystemUsages.name=*.reachable	=	false
Severity	Monitored Attribute	Operator	Value						
	FileSystemUsages.name=*.reachable	=	false						

- Define the amount of time that can elapse before an alert is generated. This example uses 2 minutes. Select the Warning severity parameter. The monitored attribute is populated from the field at the top of the page. The operator is equals (=) and the Value is false.

Generate alert after:	2 Minutes								
<table border="1"> <thead> <tr> <th>Severity</th> <th>Monitored Attribute</th> <th>Operator</th> <th>Value</th> </tr> </thead> <tbody> <tr> <td></td> <td>FileSystemUsages.name=*.reachable</td> <td>=</td> <td>false</td> </tr> </tbody> </table>		Severity	Monitored Attribute	Operator	Value		FileSystemUsages.name=*.reachable	=	false
Severity	Monitored Attribute	Operator	Value						
	FileSystemUsages.name=*.reachable	=	false						

- Click Apply.

The new rule is now part of the policy. The first rule is the default system-defined Boolean control rule that generates a Critical problem when the file system is not reachable for 5 minutes. The second rule, which is highlighted, is the new rule that generates a Warning when the file system is not reachable for 2 minutes.

Policy Details

Alert Monitoring Rules ▾	Alert Limits	Enabled ?																
BooleanControl Monitoring Rules (2) <table border="1"> <tr> <td>File System Reachability</td> <td></td> <td>Critical: false</td> <td>Yes</td> </tr> <tr> <td>Immediate Action: N/A</td> <td colspan="3"></td> </tr> <tr> <td>Warning - File System Unavailable</td> <td></td> <td>Warning: false</td> <td>Yes</td> </tr> <tr> <td>Warning alert is generated when the file system is not available for 2 minutes.</td> <td colspan="3"></td> </tr> </table>			File System Reachability		Critical: false	Yes	Immediate Action: N/A				Warning - File System Unavailable		Warning: false	Yes	Warning alert is generated when the file system is not available for 2 minutes.			
File System Reachability		Critical: false	Yes															
Immediate Action: N/A																		
Warning - File System Unavailable		Warning: false	Yes															
Warning alert is generated when the file system is not available for 2 minutes.																		

Add a New Enumerated Rule

An Enumerated rule contains series of values that defines a subset of specific values among the possible values of the monitored attribute. An alert occurs when the attribute matches one of those specific values. The state of the SMF service for a non-global zone is an example of an enumerated rule. The attribute ServiceInfos.id=*.state is used in this example. The rule generates a critical alert when the SMF services are disabled.

- Expand **Plan Management** in the Navigation pane, scroll down to **Operational Plans**, then click **Monitoring Policies**. Select the policy for the rule.

- With the policy open in the center pane, click the **Add** icon.

- Select **Enumerated Control** from the Rule Type drop-down menu and **OperatingSystem** from the Asset Type drop-down menu.
- Enter **ServiceInfos.id=*.state** in the monitored attribute field, name the rule, and add a description.

- Define the amount of time that can elapse before an alert is generated. In this example, the policy is 0 minutes and there is no delay before generating an alert. Select the **Critical** severity parameter. The monitored attribute is populated from the field at the top of the page. The operator is equals (=) and the Value is **disabled**.

Rule Parameters:	Severity	Monitored Attribute	Operator	Value
<input checked="" type="checkbox"/>	CRITICAL	ServiceInfos.id=*.state	=	disabled
<input type="checkbox"/>	WARNING	ServiceInfos.id=*.state	=	
<input type="checkbox"/>	INFO	ServiceInfos.id=*.state	=	

- Click **Apply**.

The new rule is now part of the policy. When the SMF service is disabled, a critical alert is generated.

The screenshot shows the 'Policy Details' page with the following structure:

- Alert Monitoring Rules:** A table with two rows:

SMF Services disabled	Critical: disabled	Yes
SMF Service State	Critical: maintenance	Yes

 The first row has a red 'X' icon next to 'SMF Services disabled'. The second row has a red 'X' icon next to 'SMF Service State'.

Add a New Expression Rule

An expression is an instruction to execute something that returns a value. An Expression rule defines the variables, literals, and operators for an attribute. An expression rule specifies an expression that references one or more attributes to monitor

To create an expression monitoring rule, you must use the Oracle Enterprise Manager Ops Center query language to write a logical expression that defines the alerting condition for one or more resource attributes. The logical expression includes attribute names, operators, and literal values. You can use a dotted notation to reference attribute subfields.

The asset type is based on the policy. This example is based on a server policy and will raise an alert when the root disk is above 80% and the CPU usage is above 10. The expression for this example is: `FileSystemUsages.name="/"usedSpacePercentage >= 80) AND (CpuUsage.usagePercentage >= 10`.

1. Expand **Plan Management** in the Navigation pane, scroll down to Operational Plans, then click **Monitoring Policies**.
2. Select the **Critical Servers** policy that you created earlier. Click the **Add** icon in the center pane to add an alert monitoring rule.

The screenshot shows the Oracle Enterprise Manager interface with the following components:

- Navigation pane:** Shows the 'Plan Management' section with 'Monitoring Policies' expanded, showing 'Critical Operating Systems' and 'Critical Server'.
- Critical Server monitoring policy details:** A detailed view of the 'Critical Server' policy, including fields for Name, Description, Target Type, and a 'Policy Details' section with an 'Alert Monitoring Rules' table.

3. Configure the rule with following parameters:
 - a. Select **Expression** from the Rule Type menu.
 - b. The default Asset Type is **Server**. This is based on the monitoring policy and is the only option available.
 - c. Enter a monitoring rule name and description.
 - d. Select the monitoring frequency. This example uses Monitor for alert limits continuously.

- e. Define the amount of time that can elapse before an alert is generated. In this example, the policy is two (2) minutes and there is no delay before generating an alert.
- f. Select the **Warning** severity parameter.
- g. Enter the expression that you created. For this example, enter the following:
`FileSystemUsages.name="/".usedSpacePercentage >= 80) AND
(CpuUsage.usagePercentage >= 10`

Add Alert Monitoring Rule Parameters

Configure Alert Rule Parameters

* Rule Type: Expression

* Asset Type: Server

* Monitoring Rule Name: Root Disk and CPU Usage (80/10)

Description: alerts when the root disk is above 80% and the CPU usage is above 10

Monitor for alert limits continuously

Monitor for alert limits at specific time, start at: [] End: []

Generate alert after: 2 Minutes

Rule Parameters:

Severity	Expression
	<code>FileSystemUsages.name="/".usedSpacePercentage >= 80) AND (CpuUsage.usagePercentage >= 10</code>

4. Click **Apply**.

The new rule is now part of the policy. An alert will generate when the root disk is above 80% and the CPU usage is above 10.

Critical Servers

Name: Critical Servers Subtype: Server

Description: Use this policy to monitor critical servers. Nature: User defined

Target Type: Servers Last Modified: 09/12/2013 10:46:32 am MDT

Default monitoring policy for assets matching subtype and target type

Policy Details

Alert Monitoring Rules ▲ Alert Limits

Expression Monitoring Rules (1)

Root Disk and CPU Usage (80/10) **Warning:** `FileSystemUsages.name="/".usedSpace`
User defined expression rule that alerts when the root disk is above 80% and the CPU usage is above 10

Associate a Group of Assets With the Policy

The software automatically assigns a default monitoring policy when an asset is managed. You can change that default action for a defined set of systems by creating a group and associating the group with your customized monitoring policy.

With this example, you created a monitoring policy called Critical Operating Systems and tuned the rules to be more stringent. Now you can create an asset group and assign the monitoring policy to the group.

You can configure group rules to automatically add newly managed assets to the group. This example assumes that the host name for each of your critical operating systems includes the term *xvm* and uses that as a deciding factor in what is added to the group.

1. Click **Assets** in the Navigation pane, then click **Create Group**.
2. Enter a name and description for the group. Select a Top Level location. In Advanced Options, select **Configure Group Rules and Preview Group Before Creation**. Click **Next**.

Configure Group * Indicates Required

Enter the required information to configure a group.

* Group Name: <input type="text" value="Critical Operating Systems"/>	Location: <input checked="" type="radio"/> Top Level (root) <input type="radio"/> Inside a user-defined group or
Description: <input type="text" value="The members of this group are operating systems that are on a critical path."/>	Advanced Options: <input checked="" type="checkbox"/> Configure group rules <input type="checkbox"/> Configure subgroups <input checked="" type="checkbox"/> Preview group before creation

3. Configure the group rules. Select **All**, then select **Operating System** as the asset type in the first drop-down menu. Use the **Add** icon to add rules. This example uses one rule, which is to add all assets that have a user friendly name that contain the term *xvm*. Click **Next**.

Configure Group Rules

You can create rules that will automatically add assets to this group based on asset type and characteristics. Any asset that matches asset type and attribute parameters of at least one rule is included in the group.

Rule 1 To be added, assets must match All Any of the rule filters below

<input type="button" value=""/>	<input type="button" value=""/>	Operating System	<input type="button" value=""/>			
<input type="button" value=""/>	<input type="button" value=""/>	User Friendly Name	Contains	xvm	<input type="button" value=""/>	<input type="button" value=""/>

4. The Preview Group page shows all assets that meet the rules that you defined. These are the assets that will be added to the group. Click **Next**.

Preview Group

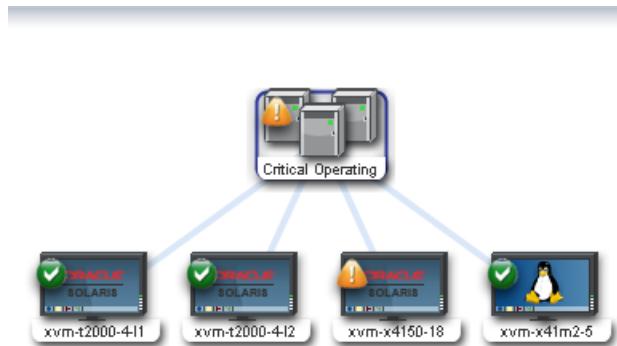

The following assets and subgroups will be included in your group

Assets	
Name	Type
xvm-x41m2-5	OperatingSystem
xvm-t2000-4-i2	OperatingSystem
xvm-x4150-18	OperatingSystem
xvm-t2000-4-i1	OperatingSystem

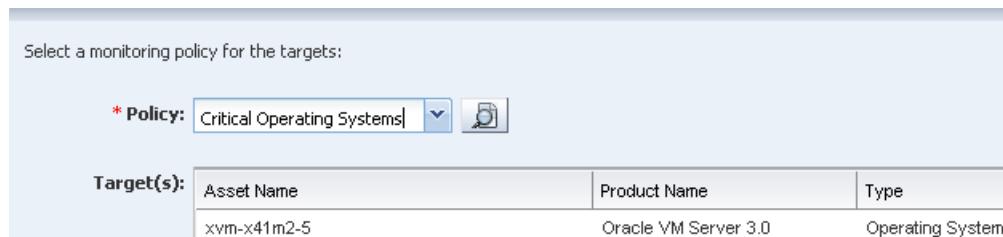

5. Click **Finish** to create the group.
6. Expand **Assets**, select **All User Defined Groups** filter from the menu.

7. Select the group. The Summary page and Membership Graph appear in the center pane. The Membership Graph shows the group with four members. One of the members has a Warning alert. The Warning shows on the affected asset and at the group level.

8. Click **Apply Monitoring Profile** in the Actions pane.
9. Select the policy from the Policy menu, then click **Apply**.

The policy is now associated with all assets in the group. To see all assets associated with the policy, open the policy in **Plan Management**, then view the Membership Graph, or click **View Associated Assets**.

What's Next?

Use the Analytics feature to analyze how a specific operating system is performing, and further tune the rules. You can create monitoring policies for other asset types and add those policies to your user-defined groups.

A best practice is to tune the rules in the monitoring policy, not the asset. When you tune a rule from the asset view, you create a new policy. The new policy is no longer associated with the group or with other assets of the same type and you can easily lose consistency in your monitoring strategy.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.
