

Oracle® Enterprise Manager Ops Center

Operate Logical Domains Workflow

12c Release 1 (12.1.2.0.0)

E37387-01

November 2012

This workflow provides an end-to-end example for how to use Oracle Enterprise Manager Ops Center.

Introduction

Workflows are divided into two categories: Deploy and Operate. Each workflow is a compilation of several examples.

This workflow is an example of how to use Oracle Enterprise Manager Ops Center to operate logical domains.

You can either use Oracle Enterprise Manager Ops Center UI or the native CLI to create logical domains. Oracle Enterprise Manager Ops Center provides more robust actions for operating logical domains created using the UI. This workflow assumes that the logical domains are created using Oracle Enterprise Manager Ops Center UI.

The UI provides various options to operate the logical domains from the UI such as modifying the logical domain configuration, reboot, start, shut down, migrate, and recover logical domains. You can also add storage and network resources to the logical domains.

Depending on the requirement, you can select the appropriate action to operate the logical domains from the UI.

Required Permissions and Roles

The following permissions and roles are required to operate the logical domains:

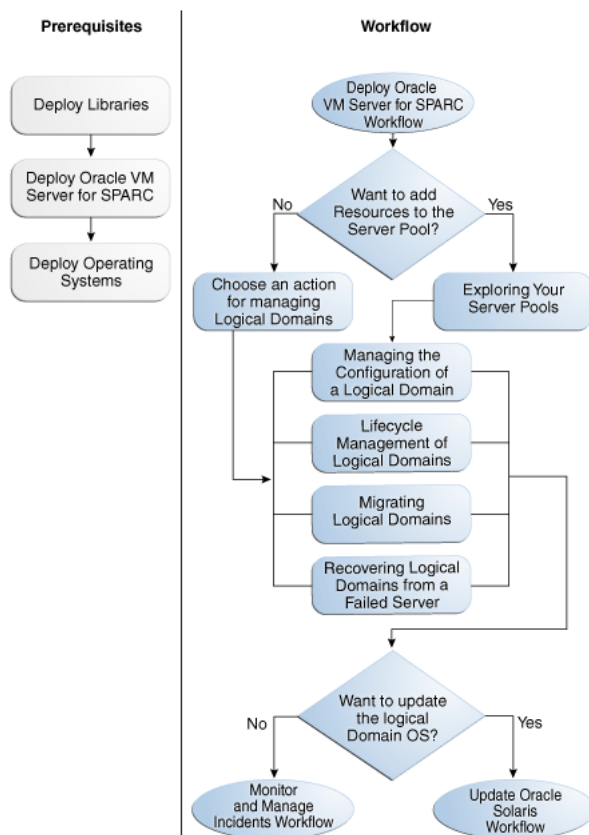

- Virtualization Admin
Operate the logical domains
- Asset Admin
Provision operating systems

Workflow

[Figure 1](#) shows the prerequisites and the tasks to operate logical domains in Oracle Enterprise Manager Ops Center.

Ensure that you have the network and storage resources available for usage when you want to add resources to the logical domains.

Figure 1 Operate Logical Domains Workflow

What's Next?

You can either follow to update the operating system of the logical domain or monitor the logical domain for resource usage. For more information about Oracle Enterprise Manager Ops Center, refer to *Oracle Enterprise Manager Ops Center Feature Reference Guide*.
