Oracle Sales Cloud
Implementing Enterprise Contracts
This guide also applies to on-premise implementations

Release 8

April 2014
## Contents

### 1 Overview
- Enterprise Contracts Offering: Overview ................................................................. 1-1
- Getting Started with an Implementation: Overview .................................................. 1-3
- Manage Application Implementation ........................................................................... 1-4

### 2 Common Applications Configuration: Define Synchronization of Users and Roles from LDAP
- User and Role Synchronization: Explained ................................................................. 2-1

### 3 Common Applications Configuration: Define Implementation Users
- Initial Security Administration: Critical Choices ......................................................... 3-1
- Initial Security Administration: Worked Example ....................................................... 3-3

### 4 Common Applications Configuration: Maintain Common Reference Objects
- Maintain Common Reference Objects: Overview ......................................................... 4-1
- Define Application Taxonomy ...................................................................................... 4-1
- Define Reference Data Sharing .................................................................................... 4-4
- Define ISO Reference Data .......................................................................................... 4-8
- Manage Data Security Policies ..................................................................................... 4-12
- Set Activity Stream Options ....................................................................................... 4-22
- Manage Menu Customizations .................................................................................... 4-22
- Manage Audit Policies .................................................................................................. 4-28
- Manage Oracle Social Network Objects ..................................................................... 4-30
- Manage Applications Core Common Reference Objects ............................................ 4-36

### 5 Common Applications Configuration: Define Currencies and Currency Rates
- Manage Currencies ....................................................................................................... 5-1
- Manage Conversion Rate Types .................................................................................... 5-1
- Manage Daily Rates ..................................................................................................... 5-4

### 6 Common Applications Configuration: Define Enterprise Structures
- Enterprise Structures: Overview .................................................................................. 6-1
7 Common Applications Configuration: Define Security
8 Common Applications Configuration: Define Automated Governance, Risk, and Performance Controls

Segregation of Duties: Explained ................................................................. 8-1
Defining Segregation of Duties Policies: Points To Consider ..................................... 8-4
Managing Segregation of Duties Risks and Violations: Critical Choices ....................... 8-6
Role Provisioning and Segregation of Duties: How They Work Together ...................... 8-8

9 Common Applications Configuration: Define Approval Management

Approval Management: Highlights ........................................................................ 9-1

10 Common Applications Configuration: Define Help Configuration

Define Help Configuration: Overview ............................................................... 10-1
Set Help Options .............................................................................................. 10-1
FAQs for Assign Help Text Administration Duty .................................................... 10-4
Manage Help Security Groups ............................................................................ 10-4

11 Common Applications Configuration: Define Application Toolkit Configuration

Define Application Toolkit Configuration: Overview .............................................. 11-1
FAQs for Map Reports to Work Areas .................................................................. 11-1
Set Watchlist Options ......................................................................................... 11-2

12 Common Applications Configuration: Define WebLogic Communication Services Configuration

Oracle Sales Cloud Computer Telephony Integration: Explained ............................. 12-1
Oracle Sales Cloud CTI: Top Tasks ................................................................ 12-4
Configuring PSTN Gateway Address Using Topology Manager: Worked Example ...... 12-5

13 Common Applications Configuration: Other Common Setup and Maintenance Tasks

Define Transactional Business Intelligence Configuration ............................................ 13-1
Define Extensions: Define Custom Enterprise Scheduler Jobs .................................. 13-4
Contextual Addresses ......................................................................................... 13-6
FAQ for Privacy Statement .................................................................................. 13-7
14 Common Applications Configuration: Importing and Exporting Setup Data

Configuration Packages: Explained .......................................................... 14-1
Exporting and Importing Setup Data: Explained .................................................. 14-1
Moving Common Reference Objects .............................................................. 14-2

15 Define Contracts Common Configuration

Specifying Customer Contract Management Business Function Properties ............ 15-1
Specifying Supplier Contract Management Business Function Properties ................. 15-4
Defining Notes: Points to Consider ................................................................. 15-4
Managing Contract Party Roles and Sources ..................................................... 15-5
Managing Party Contact Roles ................................................................. 15-7
Managing Contract Types ............................................................................. 15-9
Contract Line Types: Explained ........................................................................ 15-15
Managing Contract Risks .............................................................................. 15-15
Enabling Different Levels of Contract Terms Editing During Contract Authoring:
Explain ........................................................................................................... 15-17
Setting Up Contract Text Search: Highlights ................................................... 15-18

16 Define Project Contracts Configurations: Define Customer Contracts Billing

Define AutoInvoice Line Ordering Rules .......................................................... 16-1
Define AutoInvoice Line Grouping Rules ......................................................... 16-2
Define AutoAccounting ................................................................................. 16-2
Define Transaction Types .............................................................................. 16-5
Define Transaction Sources .......................................................................... 16-8
Define Salesperson Reference Accounts .......................................................... 16-9
Define Remit-to Addresses .......................................................................... 16-10
Specify Customer Contract Management Business Function Properties ................. 16-10
Define Memo Lines ....................................................................................... 16-17

17 Define Project Contract Configurations: Define Transaction Taxes

Define Transaction Taxes: Overview .............................................................. 17-1
Defining Transaction Taxes: Critical Choices .................................................... 17-2
Scope Values for Define Transaction Taxes Task List: Explained ......................... 17-4
Foundation Tax Configuration: Points to Consider ........................................... 17-5
Advanced Tax Configuration: Points to Consider ............................................. 17-7
Define Tax Geographies ............................................................................... 17-9
Define Tax Regimes ..................................................................................... 17-15
Define Product Tax Classifications ................................................................ 17-46
Define Basic Catalogs .................................................................................... 17-47
Define Transaction Tax Classifications .......................................................... 17-66
Define Party Classifications ........................................................................ 17-76
Define Taxes ................................................................................................. 17-80
Manage Tax Determining Factor Sets and Tax Condition Sets .................... 17-109
Define Tax Recovery ....................................................................................... 17-120
Tax Recovery Distributions: Explained ......................................................... 17-128
Tax Recovery Distributions: Example ............................................................ 17-129
Define Tax Statuses ....................................................................................... 17-131
Define Tax Rates .......................................................................................... 17-132
Manage Tax Exceptions ................................................................................ 17-134
Define Tax Rules .......................................................................................... 17-134
Manage Tax Applicability and Place of Supply Rules .................................... 17-159
Manage Tax Formulas .................................................................................. 17-165
Manage Tax Calculation Rules ..................................................................... 17-170
Define First Party Tax Profiles ..................................................................... 17-170
Manage Intrastat Country Characteristics ..................................................... 17-172
Manage Configuration Owner Tax Options .................................................. 17-179
Configuration Owner Tax Options Controls and Defaults: Points to Consider .................................................. 17-182
Define Italian Exemptions .......................................................................... 17-188
Can I adjust the monthly limits once they are created? ............................... 17-188
What are the letter types for Italian exemptions? ....................................... 17-189
.................................................................................................................. 17-189
Define Third Party Tax Profiles .................................................................. 17-189
FAQs for Define Third Party Tax Profiles ..................................................... 17-190
.................................................................................................................. 17-191
Manage Tax Reporting Types ...................................................................... 17-191
Define Tax Override Controls ..................................................................... 17-193
Verify Tax Configuration ............................................................................. 17-194
Set Up Tax Calculation Service Provider Integration ................................... 17-195

18 Define Procurement Contracts Configurations

Specify Supplier Contract Management Business Function Properties .......... 18-1

19 Define Contract Terms and Clause Library Configuration

Contract Terms Library Setup Overview ......................................................... 19-1
Setting Up Business Units for the Contract Terms Library ............................. 19-6
FAQs for Setup Overview ............................................................................. 19-9
Managing Clauses in the Contract Terms Library ........................................ 19-9
FAQs About Managing Clauses ................................................................... 19-11
Managing Contract Terms Templates ........................................................... 19-20
.................................................................................................................. 19-23
Setting Up Contract Expert ......................................................................... 19-23
Setting Up Variables ..................................................................................... 19-41
Setting Up Adoption of Content Between Libraries ...................................... 19-49
Creating Folders to Organize Clauses ............................................................ 19-52
Setting Up Contract Preview and Printing ................................................... 19-52
Setting Up Contract Terms Deliverables ...................................................... 19-59
Indexing Clauses for Keyword Searches ................................................................. 19-65
Managing Clause and Section Numbering Schemes ............................................. 19-66
Importing Clauses into the Contract Terms Library: Explained ............................ 19-67

20 Define File-Based Data Import

File-Based Data Import: Highlights ........................................................................ 20-1
Frequently Asked Questions for File-Based Data Import ...................................... 20-2

21 Manage Bulk Data Export

Manage Export Objects ............................................................................................. 21-1
FAQs for Data Export ............................................................................................... 21-6
Preface

This Preface introduces the guides, online help, and other information sources available to help you more effectively use Oracle Fusion Applications.

Oracle Fusion Applications Help

You can access Oracle Fusion Applications Help for the current page, section, activity, or task by clicking the help icon. The following figure depicts the help icon.

Note

If you don’t see any help icons on your page, then click the Show Help icon button in the global area. However, not all pages have help icons.

You can add custom help files to replace or supplement the provided content. Each release update includes new help content to ensure you have access to the latest information. Patching does not affect your custom help content.

Oracle Fusion Applications Guides

Oracle Fusion Applications guides are a structured collection of the help topics, examples, and FAQs from the help system packaged for easy download and offline reference, and sequenced to facilitate learning. To access the guides, go to any page in Oracle Fusion Applications Help and select Documentation Library from the Navigator menu.

Guides are designed for specific audiences:

- **User Guides** address the tasks in one or more business processes. They are intended for users who perform these tasks, and managers looking for an overview of the business processes. They are organized by the business process activities and tasks.

- **Implementation Guides** address the tasks required to set up an offering, or selected features of an offering. They are intended for implementors. They are organized to follow the task list sequence of the offerings, as displayed within the Setup and Maintenance work area provided by Oracle Fusion Functional Setup Manager.

- **Concept Guides** explain the key concepts and decisions for a specific area of functionality. They are intended for decision makers, such as chief
financial officers, financial analysts, and implementation consultants. They are organized by the logical flow of features and functions.

- **Security Reference Manuals** describe the predefined data that is included in the security reference implementation for one offering. They are intended for implementors, security administrators, and auditors. They are organized by role.

These guides cover specific business processes and offerings. Common areas are addressed in the guides listed in the following table.

<table>
<thead>
<tr>
<th>Guide</th>
<th>Intended Audience</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common User Guide</td>
<td>All users</td>
<td>Explains tasks performed by most users.</td>
</tr>
<tr>
<td>Common Implementation Guide</td>
<td>Implementors</td>
<td>Explains tasks within the Define Common Applications Configuration task list, which is included in all offerings.</td>
</tr>
<tr>
<td>Functional Setup Manager User Guide</td>
<td>Implementors</td>
<td>Explains how to use Oracle Fusion Functional Setup Manager to plan, manage, and track your implementation projects, migrate setup data, and validate implementations.</td>
</tr>
<tr>
<td>Technical Guides</td>
<td>System administrators, application developers, and technical members of implementation teams</td>
<td>Explain how to install, patch, administer, and customize Oracle Fusion Applications. Note: Limited content applicable to Oracle Cloud implementations.</td>
</tr>
</tbody>
</table>

**Other Information Sources**

**My Oracle Support**

Use the My Oracle Support Knowledge Browser to find documents for a product area. You can search for release-specific information, such as patches, alerts, white papers, and troubleshooting tips. Other services include health checks, guided lifecycle advice, and direct contact with industry experts through the My Oracle Support Community.
Oracle Enterprise Repository for Oracle Fusion Applications

Oracle Enterprise Repository for Oracle Fusion Applications provides details on service-oriented architecture assets to help you manage the lifecycle of your software from planning through implementation, testing, production, and changes.

In Oracle Fusion Applications, you can use Oracle Enterprise Repository at http://fusionappsoer.oracle.com for:

- Technical information about integrating with other applications, including services, operations, composites, events, and integration tables. The classification scheme shows the scenarios in which you use the assets, and includes diagrams, schematics, and links to other technical documentation.

- Other technical information such as reusable components, policies, architecture diagrams, and topology diagrams.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/us/corporate/accessibility/index.html.

Comments and Suggestions

Your comments are important to us. We encourage you to send us feedback about Oracle Fusion Applications Help and guides. Please send your suggestions to oracle_fusionApplications_help_ww_grp@oracle.com. You can use Send Feedback to Oracle from the Settings and Actions menu in Oracle Fusion Applications Help.
Enterprise Contracts Offering: Overview

Using the Enterprise Contracts business process area, your enterprise can review and define the setup for managing project and procurement contracts, and define the setup configuration and tasks related to importing and exporting contract data.

Before you begin, use the Getting Started page in the Setup and Maintenance work area to access reports for each offering, including full lists of setup tasks, descriptions of the options and features you can select when you configure the offering, and lists of business objects and enterprise applications associated with the offering.

The first implementation step is to configure the offerings in the Setup and Maintenance work area by selecting the offerings and options that you want to make available to implement. For the Enterprise Contracts offering, you can select the following options:

- Project Contracts
- Procurement Contracts

Next, create one or more implementation projects for the offerings and options that you want to implement first, which generates task lists for each project. The application implementation manager can customize the task list and assign and track each task.

If you select all of the options, the generated task list for this offering contains the following groups of tasks:

- Define Common Applications Configuration for Enterprise Contracts
- Define Contracts Common Configuration
- Define Project Contracts Configuration
- Define Procurement Contracts Configuration
- Define Contract Terms and Clause Library Configuration
• Enterprise Contracts: Define File-Based Data Import
• Manage Bulk Data Export
• Define Transactional Business Intelligence Configuration

Define Common Applications Configuration for Enterprise Contracts

Use this task list to manage definitions used across offerings, typically applying to multiple products and product families. These definitions include enterprise structures, security, and approval rules, amongst others.

You can find other information that supports the common implementation tasks in the Oracle Fusion Applications Concepts Guide.

Define Contracts Common Configuration

Define and manage the setup for common functions within the contracts set of business processes.

Define Project Contracts Configuration

Define and manage the setup related to project contracts including contract types and content that can be used consistently across contracts.

Define Procurement Contracts Configuration

Define and manage the setup related to procurement contracts.

Define Contract Terms and Clause Library Configuration

Define and manage the setup to support creation and verification of contract terms.

Enterprise Contracts: Define File-Based Data Import

Define mappings between contract attributes and import files, and schedule import jobs.

Manage Bulk Data Export

Review and manage export objects and schedule export processes to export business objects to external data files.

Define Transactional Business Intelligence Configuration

Define the configuration for Oracle Transactional Business Intelligence to enable business intelligence reporting with the Oracle Fusion Applications.

Note

Although this task list appears in the Oracle Fusion Enterprise Contracts offering, Enterprise Contracts does not include business intelligence reporting. If you are implementing another offering where business intelligence reporting is available, then refer to that offering’s implementation guide for help with this set of tasks.
Getting Started with an Implementation: Overview

To start an Oracle Fusion Applications implementation, you must set up one or more initial users using the super user that was created during installation and provisioning of the Oracle Fusion Applications environment, or using the initial administrator user provided by Oracle for Oracle Cloud Application Services implementations. Because Oracle Fusion Applications is secure as delivered, the process of enabling the necessary setup access for initial users requires several specialized steps when getting started with an implementation.

The following high level steps are required for starting an implementation.

1. If you are not starting an Oracle Cloud Application Services implementation, sign into Oracle Identity Manager (OIM) as the OIM Administration users and provision the IT Security Manager job role with roles for user and role management. This enables the super user account, which is provisioned with the IT Security Manager job role, to create implementation users.

2. For starting all implementations, sign in as the user with initial access: either the Oracle Fusion Applications installation super user or the initial Oracle Cloud Application Services administrator user.

3. Select an offering to implement, and generate the setup tasks needed to implement the offering.

4. Perform the following security tasks:
   b. Create an IT security manager user by using the Create Implementation Users task.
   c. Provision the IT security manager with the IT Security Manager role by using the Provision Roles to Implementation Users task.

5. As the newly created IT security manager user, sign in to Oracle Fusion Applications and set up at least one implementation user for setting up enterprise structures.
   a. Create an implementation user by using the Create Implementation Users task.
   b. Provision the implementation user with the Application Implementation Manager job role or the Application Implementation Consultant job role by using the Provision Roles to Implementation Users task. The Application Implementation Consultant job role inherits from all product-specific application administrators and entitles the necessary View All access to all secured objects.
   c. Optionally, create a data role for an implementation user who needs only the limited access of a product-specific Application Administrator by using the Create Data Role for Implementation Users. Then assign
the resulting data role to the implementation user by using the Provision Roles to Implementation Users task.

The figure shows the task flow from provisioning the IT Security Manager job role with the user and role management entitlement to creating and provisioning implementation users for enterprise setup.

Manage Application Implementation

Manage Application Implementation: Overview

The Manage Applications Implementation business process enables rapid and efficient planning, configuration, implementation, deployment, and ongoing maintenance of Oracle Fusion applications through self-service administration.

The Setup and Maintenance work area offers you the following benefits:

- **Prepackaged Lists of Implementation Tasks**
  Task lists can be easily configured and extended to better fit with business requirements. Auto-generated, sequential task lists include prerequisites
and address dependencies to give full visibility to end-to-end setup requirements of Oracle Fusion applications.

• **Rapid Start**

Specific implementations can become templates to facilitate reuse and rapid-start for comparable Oracle Fusion applications across many instances.

• **Comprehensive Reporting**

A set of built-in reports helps to analyze, validate and audit configurations, implementations, and setup data of Oracle Fusion applications.

With Oracle Fusion Functional Setup Manager you can:

• Learn about and analyze implementation requirements.
• Configure Oracle Fusion applications to match your business needs.
• Achieve complete visibility to setup requirements through guided, sequential task lists downloadable into Excel for project planning.
• Enter setup data through easy-to-use user interfaces available directly from the task lists.
• Export and import data from one instance to another for rapid setup.
• Validate setup by reviewing setup data reports.
• Implement all Oracle Fusion applications through a standard and consistent process.

The following documentation resources are available for learning how to configure Oracle Fusion Applications.

• Functional Setup Manager Developer's Guide
• Common Implementation Guide
• Customer Data Management Implementation Guide
• Enterprise Contracts Implementation Guide
• Marketing Implementation Guide
• Sales Implementation Guide
• Fusion Accounting Hub Implementation Guide
• Financials Implementation Guide
• Compensation Management Implementation Guide
• Workforce Deployment Implementation Guide
• Workforce Development Implementation Guide
- Incentive Compensation Implementation Guide
- Procurement Implementation Guide
- P6 EPPM Administrator's Guide for an Oracle Database
- P6 EPPM Administrator's Guide for Microsoft SQL Server Database
Common Applications Configuration: Define Synchronization of Users and Roles from LDAP

User and Role Synchronization: Explained

Oracle Identity Management (OIM) maintains Lightweight Directory Access Protocol (LDAP) user accounts for users of Oracle Fusion applications. OIM also stores the definitions of abstract, job, and data roles and holds information about roles provisioned to users. During implementation, any existing information about users, roles, and roles provisioned to users must be copied from the LDAP directory to the Oracle Fusion Applications tables. Once the Oracle Fusion Applications tables are initialized with this information, it is maintained automatically. To perform the initialization, you run the process Retrieve Latest LDAP Changes.

Note

For security and audit best practice, implementation users have person records and appropriate role-based security access. So that appropriate roles can be assigned to implementation users, you must run the process Retrieve Latest LDAP Changes before you create implementation users.

During initial implementation, the installation super user performs the task Run User and Role Synchronization Process to run the Retrieve Latest LDAP Changes process.

Tip

The user name and password of the installation super user are created during installation provisioning of Oracle Fusion Applications. For details of the user name and password, contact your system administrator or the person who installed Oracle Fusion Applications.
Initial Security Administration: Critical Choices

After installation and provisioning, and before setting up enterprise structures and implementing projects, you must establish required entitlement for the super user account and at least one implementation user to proceed with the implementation. Once initial enterprise structure setup is complete, additional users may be created through processes available in Human Capital Management (HCM).

Initial security administration consists of the following.

- Preparing the IT Security Manager job role
- Synchronizing users and roles from Lightweight Directory Access Protocol (LDAP) with HCM
- Defining implementation users
- Optionally creating data roles for implementation users
- Provisioning implementation users with roles

Once the first implementation project begins and the enterprise work structure is set up, use standard user and security management processes such as the Manage Users task to create and manage additional users. Do not use the Create Implementation Users task after your enterprise has been set up.

Preparing the IT Security Manager Job Role

Initially the super user is not provisioned to manage users and roles.

You must add the following Oracle Identity Management (OIM) roles to the IT Security Manager job role's role hierarchy to enable the super user to create one or more initial implementation users.

- Identity User Administrators
- Role Administrators

Additionally, you must assign the Xellerate Users organization to the IT Security Manager role.
Synchronizing Users and Roles from LDAP

After configuring an offering and setting up the task lists for implementation, the Run User and Roles Synchronization Process task is available to the super user for synchronizing users and roles in the LDAP store with Oracle Fusion Human Capital Management (HCM).

Defining Initial Implementation Users

The super user is provisioned with roles that provide broad access to Oracle Fusion Middleware and Oracle Fusion Applications administration, and is not suitable as an implementation user in most enterprises. The super user should define at least one implementation user, which consists of creating the user account and provisioning it with at least the Application Implementation Consultant and Application Implementation Manager job roles.

As a security guideline, define an IT security manager user who in turn defines one or more implementation users to set up enterprise structures. The IT security manager users can provision the implementation user with the Application Implementation Consultant role, which entitles access to all enterprise structures. Or the IT security manager can create a data role that restricts access to enterprise structures of a specific product and provisioning that role.

Depending on the size of your implementation team, you may only need a single implementation user for security administration, implementation project management, enterprise structures setup, and application implementation. That single user must then be provisioned with all indicated roles, and therefore broad access.

Creating Implementation Users

The super user creates one or more implementation users by performing the Create Implementation Users task.

Note

This initial implementation user is a user account created in Oracle Identity Management only, specifically for setting up enterprise structures, and is not related to a real person or identity such as a user defined in HCM.

Creating Data Roles for Implementation Users

As an alternative to provisioning an implementation user with the Application Implementation Consultant role to access all enterprise structures, you may need implementation users with access restricted to enterprise structures for specific products. In this case, use the Create Data Roles for Implementation Users task to create a data role based on a job role with less broad access, such as the HCM Application Administrator job role.

Provisioning Roles to Implementation Users

After creating an implementation user, you must provision the user with one or more roles by performing the Provision Roles to Implementation Users task.
For example, assign a role to the implementation user that provides the access necessary for setting up the enterprise. Depending on need, provision to the implementation user the predefined Applications Implementation Consultant role or a product family-specific administrator data role, such as a data role based on the predefined Financials Applications Administrator.

Caution

The Application Implementation Consultant has broad access. It is a very useful role for experimentation or setting up a pilot environment, but may not be suitable for implementation users in a full implementation project.

Initial Security Administration: Worked Example

This example illustrates initial security administration after having installed and provisioned an Oracle Fusion Applications environment.

In Oracle Fusion Applications, you manage users and security through Oracle Fusion Human Capital Management (HCM) user management flows, which are included in each of the offering task lists. However, the HCM task flows require that enterprise structures have been set up, and yet to add users who can set up enterprise structures you need to have set up HCM. Therefore, you need to create one or more initial implementation users who are responsible for providing the following.

- Users and their applications security management
- Implementation project management
- Initial enterprise structures management

The following table summarizes key decisions for this scenario.

<table>
<thead>
<tr>
<th>Decision</th>
<th>In this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>How to sign in to Oracle Fusion Applications for the first time</td>
<td>Use the super user account that was created when installing and provisioning Oracle Fusion Applications (for example, FAADMIN).</td>
</tr>
<tr>
<td>How to ensure that the roles and users in the Lightweight Directory Access Protocol (LDAP) store match what is available for selection when defining implementation users</td>
<td>Perform the Run User and Roles Synchronization Process task.</td>
</tr>
<tr>
<td>How to create a first implementation user</td>
<td>Prepare the IT Security Manager job role for user and role management so the super user and any other user provisioned with the IT Security Manager job role can manage users and roles.</td>
</tr>
<tr>
<td>How to establish security administration users</td>
<td>Define an IT security manager user provisioned with the IT Security Manager job role.</td>
</tr>
<tr>
<td>How to establish an implementation user with access to set up enterprise structures</td>
<td>Define an implementation user provisioned with the Application Implementation Consultant job role.</td>
</tr>
</tbody>
</table>

You create an initial implementation user by performing the following tasks.
1. The Oracle Identity Management System Administrator user provisions the IT Security Manager job role with roles for user and role management.

2. The Oracle Fusion Applications super user synchronizes LDAP users with HCM user management so that users can be provisioned with roles through HCM.

3. The Oracle Fusion Applications super user performs the Create Implementation Users task to create one or more IT security manager and administrator users provisioned with security administrative entitlement.

4. The IT Security Manager user signs in to Oracle Fusion Applications and performs the Create Implementation Users task to create implementation managers and users.

5. The IT Security Manager user provisions implementation users for enterprise structure setup.

---

**Note**

The following tasks assume that the super user has configured an offering and set up task lists. When not following a task flow within an activity, you can find tasks in **Navigator > Tools > Setup and Maintenance > All Tasks**. Search for the task and click its **Go to Task** icon in the search results.

---

**Preparing the IT Security Manager Role**

The super user that was created when installing and provisioning Oracle Fusion Applications (for example, FAADMIN), or the initial administrator user provided by Oracle for Oracle Cloud Application Services, has all necessary access for implementing Oracle Fusion Applications and administering security. This access is provided by the following roles:

- Application Implementation Consultant
- IT Security Manager

Neither of these roles provides access needed for creating and managing Oracle Fusion Applications users. Therefore, you must add the following two OIM roles to the IT Security Manager role:

- Identity User Administrators
- Role Administrators

The following procedure is prerequisite to an IT security manager or administrator creating an initial one or more implementation users.

1. While signed into Oracle Identity Manager as the OIM System Administrator user, click the **Administration** link in the upper right of the Oracle Identity Manager.

   This accesses the Welcome to Identity Manager Delegated Administration menu.

2. In the Roles list of tasks, click **Advanced Search - Roles**. Search for the Identity Users Administrators role by entering the role name in **Display Name** and clicking **Search**.

   In the Search Results, click the role’s Display Name.
3. On the Hierarchy tab, select **Inherits From** and click **Add**.

4. In the Add Parent Role to: IDENTITY USER ADMINISTRATORS window, select the role category: Common - Job Roles and add the IT Security Manager.

   Click the arrow icon to show the list of available roles. Select IT Security Manager and move it to the **Roles to Add** list. Click **Save**.

5. Search for the Role Administrators role, and repeat steps 1 to 4 to add that role to the IT Security Manager role's role inheritance.

6. Assign the IT Security Manager role to the Xellerate Users organization.
   a. In the Welcome to Identity Manager Delegated Administration menu (see step 1, above), in the Organizations list of tasks, click **Advanced Search - Organizations**.
   b. Search for the Xellerate Users organization by entering Xellerate Users in **Display Name** and clicking **Search**.
   c. In the Search Results, click the organization's Display Name. The Xellerate Users page appears.
   d. Click the **Administrative Roles** link in the row of links above the Xellerate Users.
   e. In **Filter By Role Name** of the Details window, enter the following string:

      *IT_SECURITY_MANAGER*

      Click **Find**.
   f. Enable Read, Write, Delete, and Assign.
   g. Click **Assign**.
   h. Click **Confirm**.

**Synchronizing Users and Roles from LDAP**

Lightweight Directory Access Protocol (LDAP) must be synchronized with HCM user management so that users can be provisioned with roles through HCM.

1. Sign in to Oracle Fusion Applications using the super user's user name (for example FAADMIN) and password.

   If you do not know the super user name and password, check with your system administrator or the person who installed Oracle Fusion Applications. For more information about account creation in Oracle Fusion Applications provisioning, see the Oracle Fusion Applications Installation Guide.

2. Perform the Run User and Roles Synchronization Process task by clicking **Submit** in the Process Details page.

   The Retrieve Latest LDAP Changes process takes some time to complete the first time it is run.

3. Monitor completion of the Retrieve Latest LDAP Changes process from **Navigator > Tools > Scheduled Processes** before continuing with creating implementation users.
Defining an IT Security Manager User

The super user has broad access to Oracle Fusion Middleware and Oracle Fusion Applications administration. Due to this broad access, your enterprise needs users dedicated to managing users and applications security, such as an IT security manager user.

1. While signed in as the Oracle Fusion Applications super user, access the Create Implementation Users task and create an IT security manager. The Oracle Identity Manager appears.

2. Click Create User.

For details, see the Creating Users section in the Oracle Fusion Middleware User's Guide for Oracle Identity Manager.

3. Provide the following attributes:

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last name</td>
<td>&lt;any valid string&gt;</td>
<td>Smith</td>
</tr>
<tr>
<td>Organization</td>
<td>Xellerate Users</td>
<td>N/A</td>
</tr>
<tr>
<td>User type</td>
<td>Non Worker</td>
<td>N/A</td>
</tr>
<tr>
<td>User login</td>
<td>&lt;any valid string&gt;</td>
<td>IT_SECURITY_MANAGER</td>
</tr>
<tr>
<td>Login password</td>
<td>&lt;any valid string&gt;</td>
<td>SeKur1TyPa$$w0Rd</td>
</tr>
</tbody>
</table>

Note

In Oracle Fusion Applications, an implementation user is a user account created in OIM only, specifically for implementation tasks, and is not related to a real person or identity such as a user defined in HCM.

4. Click Save.

5. On the Roles tab in the IT_SECURITY_MANAGER user creation task flow, click Assign.

6. In the Add Role window, search for the IT Security Manager role and click Add.

Defining an Implementation User for Enterprise Structures Setup

1. Sign in to Oracle Fusion Applications using the IT security manager user’s name and password.

2. Create and provision an implementation user using the same task flow as for creating the IT security manager user in the previous section, except provision the following roles.

   • Application Implementation Manager
   • Application Implementation Consultant

Note
For an implementation to begin, at least one user must be provisioned with the Application Implementation Manager role, and another or the same user must be provisioned with the Application Implementation Consultant role. The Application Implementation Consultant has broad access to set up all enterprise structures.
Common Applications Configuration: Maintain Common Reference Objects

Maintain Common Reference Objects: Overview

The Maintain Common Reference Objects task list contains Oracle Middleware Extensions for Applications (Applications Core) tasks that support implementation of common behaviors, such as data security or reference data sets.

Use this task list to manage common reference objects that are defined centrally and shared across applications, in addition to those that are specific to Applications Core functionality. You can access this task list by starting in the Setup and Maintenance Overview page and searching for common reference object task lists.

For more information on configuring custom objects, see the Oracle Sales Extensibility Guide.

To make the Maintain Common Reference Objects task list available in your implementation project, go to Setup and Maintenance Overview - Configure Offerings, and for a specific offering, select the Maintain Common Reference Objects feature choice.

Define Application Taxonomy

Application Taxonomy: Highlights

Application taxonomy is the organization of Oracle application components and functions in a hierarchical structure, from product lines to logical business areas. This hierarchy represents a breakdown of products into units based on how applications are installed and supported. Maintain this hierarchy on the Manage Taxonomy Hierarchy page, which you can access by starting in the Setup and Maintenance Overview page and searching for the Manage Taxonomy Hierarchy task.

A detailed introduction to application taxonomy is provided in the Oracle Fusion Applications Developer’s Guide.
Hierachy

- The application taxonomy hierarchy contains various levels and types of nodes, or modules.

  See: Characteristics of the Level Categories
  See: Benefits of a Logical Hierarchy

Usage

- Use application taxonomy to understand relationships among applications and between an application and its files. This information is helpful in managing various phases of the product lifecycle.

  See: How to Manage the Lifecycle

Modules in Application Taxonomy: Explained

A module is any node in the application taxonomy hierarchy. The top level of the hierarchy is product line, followed by product family, application, and logical business area. There can be multiple levels of logical business areas, with one or more nested within a parent logical business area.

Product Line

A product line is a collection of products under a single brand name, for example, Oracle Fusion.

Product Family

A product family is a collection of products associated with a functional area that may or may not be licensed together as a single unit, for example Financials.

Application

An application is a single product within a product family, containing closely related features for a specific business solution, for example General Ledger.

Logical Business Area

A logical business area is a collection of business object definitions organized into a logical grouping. It contains the model objects, services, and UI components for those business objects. Logical business areas have their own hierarchy levels and in some cases can be two or three levels deep. Each leaf node has at least one business object and service, up to a maximum of four business objects and associated services. A logical business area with more than four business objects are further refined with child logical business area levels. Each of these parent-child levels is represented by a directory in the physical package hierarchy.
Managing Modules in Application Taxonomy: Points to Consider

Manage modules on the Create Child Module or Edit Module page, which you can access by starting in the Setup and Maintenance Overview page and searching for the Manage Taxonomy Hierarchy task. When you create a module, it is a child of the currently selected node in the application taxonomy hierarchy. This determines which values are available, for example for module type. Once created, you cannot delete the module or move it elsewhere in the hierarchy. As you create or edit modules, consider the following points regarding specific fields.

**Identifiers**

Module ID is the unique primary key for nodes in the taxonomy table. When you create a module, an ID is automatically generated. Once the module is created, you cannot update the ID.

Module key and alternative ID are additional identifiers of the module, presented in a way that is easier to read than the module ID. The module key is a string identifier, for example AP for the Oracle Fusion Payables application. The alternative ID is a numeric identifier, for example 1 for the Oracle Fusion product line. These IDs are provided for the product line, product family, and application modules, but you can optionally add them for logical business areas and new custom modules.

---

**Note**

Do not change the module key or alternative ID for predefined modules.

The product code is relevant only to application and logical business area modules. You can leave the field blank for other module types. The product code for applications is the short name that can be displayed in lists of application values, for example FND for Oracle Middleware Extensions for Applications.

**Names**

Module name is the logical name for the module and is always available. The name must be unique among nodes in the same hierarchy level with the same parent, but try to make it as unique in the whole hierarchy as possible.

The user name and description can appear to users in other parts of Oracle Fusion Applications, so make sure that the values are something that users know to represent the module.

**Usage Types**

Though you can update the usage type to reflect the current state of the module, just doing so does not affect the actual state. For example, setting a module as installed does not mean it is actually installed if the installation itself has not taken place. Installation refers to operations related to laying down all the components needed to create an Oracle Fusion Applications environment, while
deployment is the process that starts the managed servers and clusters and facilitates the actual use of product offerings. A licensed module is available for installation and deployment, and a deployed module is considered actively used when actually used by users.

**Seed Data**

If seed data is allowed, then seed data such as flexfields and lookups can be extracted for the module using seed data loaders. By default, extract is allowed for all predefined modules of type application and logical business area.

**Associations**

You can associate a logical domain to modules of type product family, as well as one or more enterprise applications to modules of type application. This association represents the relationship between the taxonomy modules and the corresponding domain and enterprise applications stored in the Oracle Fusion Applications Functional Core (ASK) tables.

**Define Reference Data Sharing**

**Reference Data Sharing: Explained**

Reference data sharing facilitates sharing of configuration data such as jobs and payment terms, across organizational divisions or business units. You define reference data sets and determine how the data is shared or partitioned. Use reference data sets to reduce duplication and maintenance by sharing common data across business entities where appropriate. Depending on the requirement (specific or common), each business unit can maintain its data at a central location, using a set of values either specific to it or shared by other business units.

You can share reference data after it is filtered on the basis of sets. A common reference data set is available as the default set, which can be assigned to several business units sharing the same reference data. For commonly used data such as currencies, you can use the common reference data set and assign it to multiple business units in various countries that use the same currency. In cases where the default set cannot be assigned to an entity, you can create specific sets. The data set visible on the transactional page depends on the sharing method used to share reference data.

For example, XYZ Corporation uses the same grades throughout the entire organization. Instead of managers in different business units setting up the same grades, XYZ Corporation decides to create a set called Grades and assign the grades reference data group for all business units in the organization to the Grades set, so that the grades can be shared.

**Note**

For specific information on configuring reference data sharing for a particular object or product, refer to its product documentation.
Reference Data Sets: Explained

Reference data sets are logical groups of reference data that can be accessed by various transactional entities depending on the business context. Oracle Fusion Applications contains a common reference data set as well as an enterprise set that may be used as a default set. Depending on your business requirement you can create and maintain additional reference data sets, while continuing to use the common reference data set.

Consider the following scenario.

Your enterprise can decide that some aspects of corporate policy should affect all business units and leave other aspects to the discretion of the business unit manager. This allows your enterprise to balance autonomy and control for each business unit. For example, if your enterprise holds business unit managers accountable for their profit and loss, but manages working capital requirements at a corporate level, you can let managers define their own sales methods, but define payment terms centrally. In this case, each business unit would have its own reference data set for sales methods, and there would be one central reference data set for payment terms assigned to all business units.

Partitioning

The partitioning of reference data and creation of data sets enable you to create reference entities across tables or lookup types, and share modular information and data processing options among business units. With the help of partitioning, you can choose to create separate sets and subsets for each business unit depending upon its business requirement, or create common sets or subsets to enable sharing reference data between several business units, without the need for duplicating the reference data. Partitioning provides you the flexibility to handle the reference data in a way appropriate to your business needs.

The following figure illustrates the reference data sharing method (assignment to one set only, with common values) where the user can access the data assigned to a specific set in a particular business unit, as well as access the data assigned to the common set.
Reference Data Sets and Sharing Methods: Explained

Oracle Fusion Applications reference data sharing feature is also known as SetID. The reference data sharing functionality supports operations in multiple ledgers, business units, and warehouses, thereby reducing the administrative burden and decreasing the time needed to implement new business units. For example, you can share sales methods, transaction types, or payment terms across business units or selected other data across asset books, cost organizations, or project units.

The reference data sharing features use reference data sets to which reference data is assigned. The reference data sets group assigned reference data. The sets can be understood as buckets of reference data assigned to multiple business units or other application components.

Reference Data Sets

You begin this part of your implementation by creating and assigning reference data to sets. Make changes carefully as changes to a particular set will affect all business units or application components using that set. You can assign a separate set to each business unit for the type of object that is being shared. For example, assign separate sets for payment terms, transaction types, and sales methods to your business units.

Your enterprise can decide that some aspects of corporate policy should affect all business units and leave other aspects to the discretion of the business unit manager. This allows your enterprise to balance autonomy and control for each business unit. For example, if your enterprise holds business unit managers accountable for their profit and loss, but manages working capital requirements at a corporate level, you can let managers define their own sales methods, but define payment terms centrally. In this case, each business unit would have its own reference data set for sales methods, and there would be one central reference data set for payment terms assigned to all business units.

The reference data sharing is especially valuable for lowering the cost of setting up new business units. For example, your enterprise operates in the hospitality industry. You are adding a new business unit to track your new spa services. The hospitality divisional reference data set can be assigned to the new business unit to quickly setup data for this entity component. You can establish other business unit reference data in a business unit specific reference data set as needed.

Reference Data Sharing Methods

There are variations in the methods used to share data in reference data sets across different types of objects. The following list identifies the methods:

- Assignment to one set only, no common values allowed. The simplest form of sharing reference data that allows assigning a reference data object instance to one and only one set. For example, Asset Prorate Conventions are defined and assigned to only one reference data set. This set can be shared across multiple asset books, but all the values are contained only in this one set.

- Assignment to one set only, with common values. The most commonly used method of sharing reference data that allows defining reference data
object instance across all sets. For example, Receivables Transaction Types are assigned to a common set that is available to all the business units without the need to be explicitly assigned the transaction types to each business unit. In addition, you can assign a business unit specific set of transaction types. At transaction entry, the list of values for transaction types includes transaction types from the set assigned to the business unit, as well as transaction types assigned to the common set that is shared across all business units.

- Assignment to multiple sets, no common values allowed. The method of sharing reference data that allows a reference data object instance to be assigned to multiple sets. For instance, Payables Payment Terms use this method. It means that each payment term can be assigned to one or more than one set. For example, you assign the payment term Net 30 to several sets, but the payment term Net 15 is assigned to only your corporate business unit specific set. At transaction entry, the list of values for payment terms consists of only one set of data; the set that is assigned to the transaction’s business unit.

Note: Oracle Fusion Applications contains a reference data set called Enterprise. Define any reference data that affects your entire enterprise in this set.

Assigning Reference Data Sets to Reference Objects: Points to Consider

You can assign the reference data sets to reference objects on the Manage Reference Data Set Assignments page. For multiple assignments, you can classify different types of reference data sets into groups and assign them to reference entity objects. The assignment takes into consideration the determinant type, determinant, and reference group, if any.

Determinant Types

The partitioned reference data is shared based on a business context setting called the determinant type. It is the point of reference used in the data assignment process. The following table lists the determinant types used in the reference data assignment.

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Asset Book</td>
<td>Information about the acquisition, depreciation, and retirement of an asset that belongs to a ledger or a business unit.</td>
</tr>
<tr>
<td>Business Unit</td>
<td>The departments or organizations within an enterprise.</td>
</tr>
<tr>
<td>Cost Organization</td>
<td>The organization used for cost accounting and reporting on various inventory and cost centers within an enterprise.</td>
</tr>
<tr>
<td>Project Unit</td>
<td>A logical organization within an enterprise that is responsible for enforcing consistent project management practices.</td>
</tr>
<tr>
<td>Reference Data Set</td>
<td>References to other shared reference data sets.</td>
</tr>
</tbody>
</table>
Determinant

The determinant or determinant value is the value that corresponds to the selected determinant type. The determinant is one of the criteria for selecting the appropriate reference data set. For example, when managing set assignments for the set determinant type, Reference Data Set is the determinant type, and you would enter the corresponding set code value as the corresponding determinant value.

Reference Groups

A transactional entity may have multiple reference entities (generally considered to be setup data) that are treated in the same manner because of commonness in implementing business policies and legal rules. Such reference entities in your application are grouped into logical units called reference groups, based on the functional area and the partitioning requirements that they have in common. For example, all tables and views that define Sales Order Type details might be part of the same reference group.

Note

The reference groups are predefined in the reference groups table and are available for selection and assignment.

Define ISO Reference Data

Defining Currencies: Points to Consider

When creating or editing currencies, consider these points relevant to entering the currency code, date range, or symbol for the currency.

Currency Codes

You cannot change a currency code after you enable the currency, even if you later disable that currency.

Date Ranges

Users can enter transactions denominated in the currency only for the dates within the specified range. If you do not enter a start date, then the currency is valid immediately. If you do not enter an end date, then the currency is valid indefinitely.

Symbols

Even if you enter a symbol for a currency, the symbol is not always displayed when an amount is displayed in this currency. Some applications use currency
symbols when displaying amounts. Others, like Oracle Fusion General Ledger, do not.

**Euro Currency Derivation: Explained**

Use the Derivation Type, Derivation Factor, and Derivation Effective Date fields to define the relationship between the official currency (Euro) of the European Monetary Union (EMU) and the national currencies of EMU member states. For each EMU currency, you define its Euro-to-EMU fixed conversion rate and the effective starting date.

**Note**

If you need to use a different currency code for Euro, you can disable the predefined Euro currency and create a new one.

**Derivation Type**

The *Euro currency* derivation type is used only for the Euro, and the *Euro derived* derivation type identifies national currencies of EMU member states. All other currencies do not have derivation types.

**Derivation Factor**

The derivation factor is the fixed conversion rate by which you multiply one Euro to derive the equivalent EMU currency amount. The Euro currency itself should not have a derivation factor.

**Derivation Effective Date**

The derivation effective date is the date on which the relationship between the EMU currency and the Euro begins.

**Natural Languages: Points to Consider**

Natural languages are all the languages that humans use, written and spoken. If a language is enabled, then users can associate it with entities, for example as languages spoken by sales representatives. When managing natural languages, consider tasks to perform and best practices for entering particular values.

**Tasks**

Once you add a language, it cannot be deleted, just disabled. You can optionally associate natural languages with International Organization for Standardization (ISO) languages and territories, just for reference.
Values

When you create a natural language, use the alpha-2 ISO code as the language code, or, if not available, then alpha-3. If the language is not an ISO language, then use x- as a prefix for the code, for example x-ja for a Japanese dialect. Use the sgn code of ISO-639-2 for sign languages, followed by territory code, for example sgn-US for American Sign Language. You can also use Internet Assigned Numbers Authority (IANA) language tags.

The natural language description should be the language name with territory name in parenthesis where needed, for example English (Australia) and English (Canada).

FAQs for Define ISO Reference Data

When do I create or edit territories?

Edit territory descriptions to determine how they are displayed in lists of country values throughout Oracle Fusion Applications. The predefined territories are all countries from the International Organization for Standardization (ISO) 3166 standard. You usually would not edit territory names or codes.

Do not edit National Language Support (NLS) territory codes, which are identifiers used in the system, unless you need to change the association between ISO and system territory. You usually would not edit the default currency, which is the value that defaults in the Currency field in Oracle Fusion Applications user preferences after the user first selects a territory.

Create territories if new countries emerge and the system has not yet been patched with the latest ISO country values.

When do I create or edit industries?

Edit industry descriptions to determine how they are displayed in Oracle Fusion Applications. You usually would not edit industry names, which are from the North American Industry Classification System (NAICS). Enabled industries are mainly used in the context of customization, though these values can also appear in any application.

Create industries if you have particular ones you need, for example for customization, that are not included in the NAICS standard.

When do I associate industries with territories?

Optionally associate industries with territories to provide an industry in territory value, used for customization. For example, administrators can customize a page in one way for users within an industry in one country, and another way for users within the same industry in another country. The administrator would select the appropriate industry in territory value to set the customization context.
When do I create or enable currencies?

Create currencies to use, for example for reporting purposes, if they are not already provided. All currencies from the International Organization for Standardization (ISO) 4217 standard are provided.

Enable any currency other than USD for use in Oracle Fusion Applications, for example for displaying monetary amounts, assigning to ledgers, entering transactions, and recording balances. Only USD is enabled by default.

What’s the difference between precision, extended precision, and minimum accountable unit for a currency?

Precision is the number of digits to the right of the decimal point used in regular currency transactions. Extended precision is the number of digits to the right of the decimal point used in calculations for this currency, and it must be greater than or equal to the standard precision. For example, USD would have 2 for precision because amounts are transacted as such, for example $1.00. For calculations, for example adding USD amounts, you might want the application to be more precise than two decimal digits, and would enter an extended precision accordingly.

Note

Some applications use extended precision. Others, such as Oracle Fusion General Ledger, do not.

Minimum accountable unit is the smallest denomination for the currency. For example, for USD that would be .01 for the cent. This unit does not necessarily correspond to the precision for all currencies.

What’s a statistical unit currency type?

The statistical unit currency type is used only for the Statistical (STAT) currency. The Statistical currency is used to record statistics such as the number of items bought and sold. Statistical balances can be used directly in financial reports, allocation formulas, and other calculations.

When do I create or edit ISO languages?

You can edit the names and descriptions of International Organization for Standardization (ISO) languages to determine how they are displayed in lists of ISO language values in Oracle Fusion Applications. The ISO languages are from the ISO 639 standard. If there were changes to the ISO standard and the system has not yet been patched with the latest ISO values, you can update the ISO alpha-2 code or add languages as needed.

When do I edit languages?

Installed languages automatically appear on the Manage Languages page, so you do not manually enter newly installed languages. This page contains
all languages available for installation and translation in Oracle Fusion Applications. Each dialect is treated as a separate language. The language codes and names are values used by the system.

You generally would not edit any of the detailed fields unless you really need to and know what they are.

**When do I create or edit time zones?**

Though all standard time zones are provided, optionally enable only a subset for use in lists of time zone values in Oracle Fusion Applications. You can add time zones if new zones became standard and the system has not yet been patched with the latest values.

## Manage Data Security Policies

### Data Security in the Security Reference Implementation: Explained

The reference implementation contains a set of data security policies that can be inspected and confirmed to be suitable or a basis for further implementation using the Authorization Policy Manager (APM).

The security implementation of an enterprise is likely a subset of the reference implementation, with the enterprise specifics of duty roles, data security policies, and HCM security profiles provided by the enterprise.

The business objects registered as secure in the reference implementation are database tables and views.

Granting or revoking object entitlement to a particular user or group of users on an object instance or set of instances extends the base Oracle Fusion Applications security reference implementation without requiring customization of the applications that access the data.

### Data Security Policies in the Security Reference Implementation

The data security policies in the reference implementation entitle the grantee (a role) to access instance sets of data based on SQL predicates in a WHERE clause.

**Tip**

When extending the reference implementation with additional data security policies, identify instance sets of data representing the business objects that need to be secured, rather than specific instances or all instances of the business objects.

Predefined data security policies are stored in the data security policy store, managed in the Authorization Policy Manager (APM), and described in the Oracle Fusion Applications Security Reference Manual for each offering. A data
security policy for a duty role describes an entitlement granted to any job role that includes that duty role.

Warning

Review but do not modify HCM data security policies in APM except as a custom implementation. Use the HCM Manage Data Role And Security Profiles task to generate the necessary data security policies and data roles.

The reference implementation only enforces a portion of the data security policies in business intelligence that is considered most critical to risk management without negatively affecting performance. For performance reasons it is not practical to secure every level in every dimension. Your enterprise may have a different risk tolerance than assumed by the security reference implementation.

HCM Security Profiles in the Security Reference Implementation

The security reference implementation includes some predefined HCM security profiles for initial usability. For example, a predefined HCM security profile allows line managers to see the people that report to them.

The IT security manager uses HCM security profiles to define the sets of HCM data that can be accessed by the roles that are provisioned to users.

Data Roles

The security reference implementation includes no predefined data roles to ensure a fully secured initial Oracle Fusion Applications environment.

The security reference implementation includes data role templates that you can use to generate a set of data roles with entitlement to perform predefined business functions within data dimensions such as business unit. Oracle Fusion Payables invoicing and expense management are examples of predefined business functions. Accounts Payable Manager - US is a data role you might generate from a predefined data role template for payables invoicing if you set up a business unit called US.

HCM provides a mechanism for generating HCM related data roles.

Data Security: Explained

By default, users are denied access to all data.

Data security makes data available to users by the following means.

- Policies that define grants available through provisioned roles
- Policies defined in application code

You secure data by provisioning roles that provide the necessary access. Enterprise roles provide access to data through data security policies defined for the inherited application roles.
When setting up the enterprise with structures such as business units, data roles are automatically generated that inherit job roles based on data role templates. Data roles also can be generated based on HCM security profiles. Data role templates and HCM security profiles enable defining the instance sets specified in data security policies.

When you provision a job role to a user, the job role implicitly limits data access based on the data security policies of the inherited duty roles. When you provision a data role to a user, the data role explicitly limits the data access of the inherited job role to a dimension of data.

Data security consists of privileges conditionally granted to a role and used to control access to the data. A privilege is a single, real world action on a single business object. A data security policy is a grant of a set of privileges to a principal on an object or attribute group for a given condition. A grant authorizes a role, the grantee, to actions on a set of database resources. A database resource is an object, object instance, or object instance set. An entitlement is one or more allowable actions applied to a set of database resources.

Data is secured by the following means.

<table>
<thead>
<tr>
<th>Data security feature</th>
<th>Does what?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data security policy</td>
<td>Grants access to roles by means of entitlement</td>
</tr>
<tr>
<td>Role</td>
<td>Applies data security policies with conditions to users through role provisioning.</td>
</tr>
<tr>
<td>Data role template</td>
<td>Defines the data roles generated based on enterprise setup of data dimensions such as business unit.</td>
</tr>
<tr>
<td>HCM security profile</td>
<td>Defines data security conditions on instances of object types such as person records, positions, and document types without requiring users to enter SQL code.</td>
</tr>
<tr>
<td>Masking</td>
<td>Hides private data on non-production database instances</td>
</tr>
<tr>
<td>Encryption</td>
<td>Scrambles data to prevent users without decryption authorization from reading secured data</td>
</tr>
</tbody>
</table>

The sets of data that a user can access via roles are defined in Oracle Fusion Data Security. Oracle Fusion Data Security integrates with Oracle Platform Security Services (OPSS) to entitle users or roles (which are stored externally) with access to data. Users are granted access through the entitlement assigned to the roles or role hierarchy with which the user is provisioned. Conditions are WHERE clauses that specify access within a particular dimension, such as by business unit to which the user is authorized.

**Data Security Policies**

Data security policies articulate the security requirement "Who can do What on Which set of data," where 'Which set of data' is an entire object or an object instance or object instance set and 'What' is the object entitlement.

For example, accounts payable managers can view AP disbursements for their business unit.
A data security policy is a statement in a natural language, such as English, that typically defines the grant by which a role secures business objects. The grant records the following:

- Table or view
- Entitlement (actions expressed by privileges)
- Instance set (data identified by the condition)

For example, disbursement is a business object that an accounts payable manager can manage by payment function for any employee expenses in the payment process.

**Note**

Some data security policies are not defined as grants but directly in applications code. The security reference manuals for Oracle Fusion Applications offerings differentiate between data security policies that define a grant and data security policies defined in Oracle Fusion applications code.

A business object participating in a data security policy is the database resource of the policy.

Data security policies that use job or duty roles refer to data security entitlement. For example, the data security policy for the Accounts Payable Manager job role refers to the view action on AP disbursements as the data security entitlement.

**Important**

The duty roles inherited by the job role can be moved and job roles reassembled without having to modify the data security.

As a security guideline, data security policies based on user session context should entitle a duty role. This keeps both function and data security policies at the duty role level, thus reducing errors.

For example, a Sales Party Management Duty can update Sales Party where the provisioned user is a member of the territory associated with the sales account. Or the Sales Party Management Duty can update Sales Party where the provisioned user is in the management chain of a resource who is on the sales account team with edit access. Or the Participant Interaction Management Duty can view an Interaction where the provisioned user is a participant of the Interaction.

For example, the Disbursement Process Management Duty role includes entitlement to build documents payable into payments. The Accounts Payable Manager job role inherits the Disbursement Process Management Duty role. Data security policies for the Disbursement Process Management Duty role authorize access to data associated with business objects such as AP disbursements within...
a business unit. As a result, the user provisioned with the Accounts Payable Manager job role is authorized to view AP disbursements within their business unit.

A data security policy identifies the entitlement (the actions that can be made on logical business objects or dashboards), the roles that can perform those actions, and the conditions that limit access. Conditions are readable WHERE clauses. The WHERE clause is defined in the data as an instance set and this is then referenced on a grant that also records the table name and required entitlement.

**Data Roles**

Data roles are implemented as job roles for a defined set of data.

A data role defines a dimension of data within which a job is performed. The data role inherits the job role that describes the job. For example, a data role entitles a user to perform a job in a business unit.

The data role inherits abstract or job roles and is granted data security privileges. Data roles carry the function security privileges inherited from job roles and also the data security privilege granted on database objects and table rows.

For example, an accounts payables specialist in the US Business Unit may be assigned the data role Accounts Payables Specialist - US Business Unit. This data role inherits the job role Accounts Payables Specialist and grants access to transactions in the US Business Unit.

A data role may be granted entitlement over a set people.

For example, a Benefits Administrator A-E is allowed to administer benefits for all people that have a surname that begins with A-E.

Data roles are created using data role templates. You create and maintain data roles in the Authorization Policy Manager (APM). Use the Manage Data Roles and Security Profiles task to create and maintain HCM data roles in Oracle Fusion HCM.

**HCM Security Profiles**

HCM security profiles are used to secure HCM data, such as people and departments. You use HCM security profiles to generate grants for an enterprise role. The resulting data role with its role hierarchy and grants operates in the same way as any other data role.

For example, an HCM security profile identifies all employees in the Finance division.

Applications outside of HCM can use the HCM Data Roles UI pages to give their roles access to HR people.

**Masking and Encryption**

Oracle Fusion Applications uses masking to protect sensitive data from view by unauthorized users. Encryption APIs mask sensitive fields in applications user interfaces. Additionally, Oracle Data Masking is available for masking data in non-production instances and Oracle Transparent Data Encryption is available.
for protecting data in transit or in backups independent of managing encryption keys.

Database Resources and Data Security Policies: How They Work Together

A data security policy applies a condition and allowable actions to a database resource for a role. When that role is provisioned to a user, the user has access to data defined by the policy. In the case of the predefined security reference implementation, this role is always a duty role. Data roles generated to inherit the job role based on data role templates limit access to database resources in a particular dimension, such as the US business unit.

The database resource defines and instance of a data object. The data object is a table, view, or flexfield.

The following figure shows the database resource definition as the means by which a data security policy secures a data object. The database resource names the data object. The data security policy grants to a role access to that database resource based on the policy’s action and condition.

Database Resources

A database resource specifies access to a table, view, or flexfield that is secured by a data security policy.

- Name providing a means of identifying the database resource
- Data object to which the database resource points
Data Security Policies

Data security policies consist of actions and conditions for accessing all, some, or a single row of a database resource.

- Condition identifying the instance set of values in the data object
- Action specifying the type of access allowed on the available values

Note

If the data security policy needs to be less restrictive than any available database resource for a data object, define a new data security policy.

Actions

Actions correspond to privileges that entitle kinds of access to objects, such as view, edit, or delete. The actions allowed by a data security policy include all or a subset of the actions that exist for the database resource.

Conditions

A condition is either a SQL predicate or an XML filter. A condition expresses the values in the data object by a search operator or a relationship in a tree hierarchy. A SQL predicate, unlike an XML filter, is entered in a text field in the data security user interface pages and supports more complex filtering than an XML filter, such as nesting of conditions or sub queries. An XML filter, unlike a SQL predicate, is assembled from choices in the UI pages as an AND statement.

Tip

An XML filter can be effective in downstream processes such as business intelligence metrics. A SQL predicate cannot be used in downstream metrics.

Securing Data Access: Points to Consider

Oracle Fusion Applications supports securing data through role-based access control (RBAC) by the following methods.

<table>
<thead>
<tr>
<th>Method of securing data</th>
<th>Reason</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data roles apply explicit data security policies on job and</td>
<td>Appropriate for job and abstract</td>
<td>Accounts Payable Manager - US data role to provide an accounts payable</td>
</tr>
<tr>
<td>abstract roles</td>
<td>roles that should only access a subset</td>
<td>manager in the US business unit with access to invoices in the US</td>
</tr>
<tr>
<td></td>
<td>of data, as defined by the data role</td>

</tr>
</tbody>
</table>
If a user has access to the same function through different roles that access different data sets, then the user has access to a union of those data sets.

When a runtime session is created, Oracle Platform Security Services (OPSS) propagates only the necessary user to role mapping based on Oracle Fusion Data Security grants. A grant can specify entitlement to the following.

- Specific rows of data (data object) identified by primary key
- Groups of data (instance set) based on a predicate that names a particular parameter
- Data objects or instance sets based on runtime user session variables

Data is either identified by the primary key value of the row in the table where the data is stored. Or data is identified by a rule (SQL predicate) applied to the WHERE clause of a query against the table where the data is stored.

Grants

Oracle Fusion Data Security can be used to restrict the following.

- Rows that are returned by a given query based on the intended business operation
- Actions that are available for a given row

Grants control which data a user can access.

Note

Attribute level security using grants requires a data security policy to secure the attribute and the entitlement check enforces that policy.

A grant logically joins a user or role and an entitlement with a static or parameterized object instance set. For example, REGION='WEST' is a static object instance set and REGION=Grant_ALIAS.PARAMETER1 is a parameterized object instance set. In the context of a specific object instance, grants specify the allowable actions on the set of accessible object instances. In the database, grants are stored in FND_GRANTS and object instance sets are stored in FND_OBJECT_INSTANCE_SETS. Object access can be tested using the privilege check application programming interface (API).

Securing a Business Object

A business object is a logical entity that is typically implemented as a table or view, and corresponds to a physical database resource. The data security policies of the security reference implementation secure predefined database resources. Use the Manage Data Security Policies task to define and register other database resources.

Data security policies identify sets of data on the registered business object and the actions that may be performed on the business object by a role. The grant can be made by data instance, instance set or at a global level.
Note

Use parameterized object instance sets whenever feasible to reduce the number of predicates the database parses and the number of administrative intervention required as static object instances sets become obsolete. In HCM, security profiles generate the instance sets.

Data Role Templates: Explained

You use data role templates to generate data roles. You generate such data roles, and create and maintain data role templates in the Authorization Policy Manager (APM).

Note

HCM data roles are generated using the Manage Data Roles and Security Profiles task, which uses HCM security profiles, not data role templates, to define the data security condition.

The following attributes define a data role template.

- Template name
- Template description
- Template group ID
- Base roles
- Data dimension
- Data role naming rule
- Data security policies

The data role template specifies which base roles to combine with which dimension values for a set of data security policies. The base roles are the parent job or abstract roles of the data roles.

Note

Abstract, job, and data roles are enterprise roles in Oracle Fusion Applications. Oracle Fusion Middleware products such as Oracle Identity Manager (OIM) and Authorization Policy Manager (APM) refer to enterprise roles as external roles. Duty roles are implemented as application roles in APM and scoped to individual Oracle Fusion Applications.

The dimension expresses stripes of data, such as territorial or geographic information you use to partition enterprise data. For example, business units are a type of dimension, and the values picked up for that dimension by the data role template as it creates data roles are the business units defined for your
enterprise. The data role template constrains the generated data roles with grants of entitlement to access specific data resources with particular actions. The data role provides provisioned users with access to a dimensional subset of the data granted by a data security policy.

An example of a dimension is a business unit. An example of a dimension value is a specific business unit defined in your enterprise, such as US. An example of a data security policy is a grant to access a business object such as an invoice with a view entitlement.

When you generate data roles, the template applies the values of the dimension and participant data security policies to the group of base roles.

The template generates the data roles using a naming convention specified by the template's naming rule. The generated data roles are stored in the Lightweight Directory Access Protocol (LDAP) store. Once a data role is generated, you provision it to users. A user provisioned with a data role is granted permission to access the data defined by the dimension and data security grant policies of the data role template.

For example, a data role template contains an Accounts Payable Specialist role and an Accounts Payable Manager role as its base roles, and region as its dimension, with the dimension values US and UK. The naming convention is [base-role-name]:[DIMENSION-CODE-NAME]. This data role template generates four data roles.

- Accounts Payable Specialist - US (business unit)
- Accounts Payable Specialist - UK (business unit)
- Accounts Payable Manager - US (business unit)
- Accounts Payable Manager - UK (business unit)

**Making Changes To Data Role Templates**

If you add a base role to an existing data role template, you can generate a new set of data roles. If the naming rule is unchanged, existing data roles are overwritten.

If you remove a base role from a data role template and regenerate data roles, a resulting invalid role list gives you the option to delete or disable the data roles that would be changed by that removal.

**Making Changes to Dimension Values**

If you add a dimension value to your enterprise that is used by a data role template, you must regenerate roles from that data role template to create a data role for the new dimension. For example if you add a business unit to your enterprise, you must regenerate data roles from the data role templates that include business unit as a dimension.

If you add or remove a dimension value from your enterprise that is used to generate data roles, regenerating the set of data roles adds or removes the data roles for those dimension values. If your enterprise has scheduled regeneration
as an Oracle Enterprise Scheduler Services process, the changes are made automatically.

For information on working with data role templates, see the Oracle Fusion Middleware Administrator’s Guide for Authorization Policy Manager.

Set Activity Stream Options

Activity Stream Options: Highlights

Activity Stream is a region on the Oracle Fusion Applications Welcome dashboard and other pages in various applications. Users track the activities and transactions of other users in this region. You can set options that affect the all Activity Stream regions for all users across your site. Individual users can still override your settings through Activity Stream preferences.

Activity stream settings are described in the Oracle Fusion Middleware User’s Guide for Oracle WebCenter Portal: Spaces. When you read content from that guide, note that:

• Your setup applies to all users, not just yourself or any individual user.
• You can disregard discussions about how to access the settings, because you access the Set Activity Stream Options page by starting in the Setup and Maintenance Overview page and searching for the Set Activity Stream Options task.

Setting Activity Stream Options

• Define the types of users to display activities about in the Activity Stream region, the types of activities to track, and other settings.

See: Setting Activity Stream Preferences

Manage Menu Customizations

Menu Customization: Explained

You use the Manage Menu Customizations task to customize the navigator and home page menus. This task is available from the Setup and Maintenance work area, which is accessible from the Administration menu in the Oracle Fusion Applications global area. Select either Customize - Navigator or Customize - Homepage to proceed with the customization activity.

Note
To perform menu customization at run time, it is important that you have the required privileges.

You customize the menus at the site level and your changes affect all users (or all users of a tenant if in a multi-tenant environment).

Tip

If you are making minor changes, such as adding or editing one or two nodes, then you can hide the changes until you have completed your customizations. However, if you are making more than minor changes, such as rearranging several nodes, you might want to instead create a sandbox before customizing menus.

Navigator Menu Configuration

The navigator menu is the global menu that is accessible from the Oracle Fusion Applications global area. It allows users to navigate directly to the pages inside Oracle Fusion Applications as well as to outside web pages. The menu is composed of links (items) that are organized in a hierarchy of groups.

You can customize the navigator menu to address needs that are specific to your organization. For example, you might want to add specialized groupings for cross-functional teams or add links to web pages or external applications. You can add groups and links to the navigator menu, as well as hide and show them.

The Manage Menu Customizations task displays the menu groups as expandable nodes, with which you can traverse the menu hierarchy.

Note

Not all Oracle Fusion Applications pages appear in the navigator menu, because some pages are accessible from a work area or from other links in the global area such as the Home link.

The following table lists the Navigator menu customization tasks that you can perform at run time as well as the tasks that you cannot perform.

<table>
<thead>
<tr>
<th>Permitted Tasks</th>
<th>Restricted Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Add and delete custom groups.</td>
<td>• You cannot add menu items (links) as top-level nodes. You can add nodes to only the groups in the top level and subgroups.</td>
</tr>
<tr>
<td>• Edit any group.</td>
<td>• You cannot delete nodes that are delivered with the product. Instead, you can hide them.</td>
</tr>
<tr>
<td>• Add and delete custom items.</td>
<td>• You cannot move nodes. Instead, you must duplicate the node and hide the original node.</td>
</tr>
<tr>
<td>• Edit any item.</td>
<td></td>
</tr>
<tr>
<td>• Specify navigation for an item:</td>
<td></td>
</tr>
<tr>
<td>• Specify navigation to a UI Shell page in an Oracle Fusion application.</td>
<td></td>
</tr>
<tr>
<td>• Specify navigation to an external web page.</td>
<td></td>
</tr>
<tr>
<td>• Hide or show groups and items.</td>
<td></td>
</tr>
</tbody>
</table>
Home Page Menu Configuration

The home page menu is the set of tabs that are displayed in the Oracle Fusion Applications global area. The home page menu displays tabs for all the items in the menu for which the end user has access privileges. You can add tabs to the home page menu, as well as hide and show them.

The following table lists the Home page menu customization tasks that you can perform at run time as well as the tasks that you cannot perform.

<table>
<thead>
<tr>
<th>Permitted Tasks</th>
<th>Restricted Tasks</th>
</tr>
</thead>
<tbody>
<tr>
<td>• Add and delete custom items.</td>
<td>• You cannot add menu items (links) as sub-nodes. All nodes are top-level nodes.</td>
</tr>
<tr>
<td>• Edit any item.</td>
<td>• You cannot delete nodes that are delivered with the product. Instead, you can hide them.</td>
</tr>
<tr>
<td>• Specify navigation to a UI Shell page in an Oracle Fusion application.</td>
<td>• You cannot move nodes. Instead, you must duplicate the node and hide the original node.</td>
</tr>
<tr>
<td>• Hide or show items.</td>
<td></td>
</tr>
</tbody>
</table>

Adding Navigator Menu Group: Points to Consider

You arrange the navigator menu by building a hierarchy of nested groups.

Use the View menu to expand or collapse a group of nodes. You can also right-click a node and access similar actions to facilitate tree navigation.

Adding Groups

To add a group, you can insert a group above or below a peer group or insert a child group. You edit a group by defining a label and specifying whether the group should be rendered. You typically hide the group until all changes have been completed.

Adding Menu Items: Points to Consider

The home page menu items are URL links to home pages in Oracle Fusion applications. The Navigator menu items can either be links to UI Shell pages or links to external applications and web sites.

In the menu hierarchy, the home page menu items are always top-level items. Whereas, you can add Navigator menu items to top-level groups and to their subgroups but you cannot add navigator menu items as top-level nodes.

Adding a Home Page Menu Item

To add a home page menu item, navigate to the place where you want the item to appear and insert it above or below the existing item. You can also duplicate
an existing menu item and position it at the required location. You must provide a label for the menu and link the menu item to a UI Shell page.

Adding a Navigator Menu Item

To add a Navigator menu item, you navigate to the item’s group and insert the item above or below another item.

You can also duplicate an existing item. You must provide a label for the menu and either link the menu item to a UI Shell page or link it to an external web site or application.

You can link a Navigator menu item to the following:

- A UI Shell page in an Oracle Fusion application.
- A dynamic URL of a page outside of Oracle Fusion Applications where the host, port, or context root might change.
- A Static URL of a page outside of Oracle Fusion Applications where the host, port, or context root does not change.

Linking to a UI Shell Page

If the new item points to a UI Shell page in an application, then you must provide the name of the web application and the view ID of the target page. The web application name and view ID can be obtained from an existing menu item that links to the same UI Shell page.

In a non-Cloud implementation, you also can obtain the web application name from the context root for the application, and you can obtain the view ID from the id attribute for the page's <view> tag in the product’s public_html/WEB-INF/adfc-config.xml file.

If you want secure access to the target UI Shell page from the menu item, then you must provide the name of the secured resource and the name of the policy store's application stripe. When an end user clicks the link, the Oracle Fusion Applications checks the secured resource and the Lightweight Directory Access Protocol (LDAP) policy store to determine whether the user has the privilege to view the page.

If there is another menu item that points to the same page, then you can get the secured resource name and application stripe from that item. In a non-Cloud implementation, you also can obtain the application stripe from the jps.policystore.applicationid parameter in the application's weblogic-application.xml file. Examples of application stripes are crm, fscm, and hcm.

For non-Cloud applications, you can determine the secured resource name by obtaining the name of the web page’s page definition file. By default, the page definition files are located in the view.PageDefs package in the Application Sources directory of the view project. If the corresponding JavaServer Faces (JSF) page is saved to a directory other than the default (public_html), or to a subdirectory of the default, then the page definition will also be saved to a package of the same name. An example of a secured resource name is oracle.apps.view.pageDefs.CaseList_Form_Attach_UIShellPagePageDef.
A UI Shell page might take parameters and display or act differently based on the parameters that are passed in. For example, if accessing a page from one group in the menu hierarchy, the parameter might be set to status=Open and if accessing the page from a different group, the parameter might be set to status=Closed. If the page takes parameters, you can use the Page Parameters List text box to provide a semicolon-delimited string of name-value pairs, such as org=m1;context=s1. You can use expression language (EL) to specify the parameters. If the EL evaluates to an Object, the toString value of that Object is passed as the value of the parameter.

**Linking to the Dynamic URL of an External Web Site or Application**

Linking a menu item to a dynamic URL is beneficial in cases where the host, port, or context root to which you point frequently changes. Instead of updating the link to each application, you can update the details of the web application in the topology registration, and that change affects all menu items that contain dynamic links pointing to that web application. For example, you would need a dynamic URL to link to a test version of an application and you will need to change the host and port when you move the application from a test environment to a production environment.

To link to a page outside of Oracle Fusion Applications where the host, port, or context root might change, you must first register the web application in the topology using the Register Enterprise Applications task.

While creating a new menu item on the Create Item Node dialog box, select the Dynamic URL option and provide the details of the web application as per the following example.

When the complete URL to be linked is: http://example:9011/myApp/faces/Page1,

- The name of the web application added to topology would be: myApp (the value that would eventually appear in the Web Application list) and the protocol host, port, and context root values of the URL would be: http://example:9011/myApp
- The value to be provided in the Destination for Web Application field would be: /faces/Page1

Once the menu item is linked to the dynamic URL, the target page appears in a new browser window or tab when you click the menu item.

**Linking to a Static URL of an External Web Site or Application**

This option is used when you link a menu item to a page outside Oracle Fusion Applications where the host, port, or context root remains constant. For example, you can use a static URL to link to http://www.oracle.com.

**Hiding or Displaying Menu Nodes: Points to Consider**

While you are creating or working with a menu group or a menu item, you might want to prevent end users from accessing the node. You can hide the
menu group or menu item while you are working with it, and then show the node when you have completed the task.

**Working with Nodes**

The Manage Menu Customizations page shows all nodes. The Rendered check box is selected by default for all nodes that are added and are visible.

To hide a node, clear the Rendered check box. You can edit the node anytime to either display or hide it.

If you want a menu group or a menu item to appear only if certain conditions are met, you can use an expression language (EL) command to make the node to appear. For example, `#{securityContext.userInRole('ADMIN')}`.

A node that appears in italics either contains an EL command or the Rendered check box beside it was cleared, and therefore is hidden from end users.

---

**Tip**

For major changes that need to be tested and approved, you might want to use the sandbox manager instead of hiding and showing nodes.

---

**Design Time Menu Customizations: Highlights**

The menu customization feature provides several options to add, modify, and organize the Navigator and home page menus during design time. You must have developer rights to perform these customizations.

---

**Note**

Design time menu customizations are not applicable to Oracle Cloud implementations.

---

An overview of customizing the Navigator menu and home page is provided in the Oracle Fusion Applications Extensibility Guide.

**Customizations**

- Use Oracle JDeveloper to customize the Navigator and home page menus at design time.
  
  See: Customizing Menus

- Define translations for your customizations in the locales you support.
  
  See: Translating Menu Customizations

- Customize the page template to display the Navigator menu groups as separate menus, each of them displaying their list of menu items. Refer to the Oracle Fusion Applications Developer's Guide.
  
  See: Rendering the Navigator Menu as Dropdown Buttons
Troubleshooting Navigator Menu: Highlights

If the Navigator menu does not display customizations as expected, use the following troubleshooting tips to verify the changes.

Issues and Resolutions

- If an expected menu item does not appear in the Navigator menu, verify whether the menu item has been hidden from view.

- If a custom menu item was added and the browser does not display the page indicated by the URL, open the Manage Menu Customizations task and verify whether the web application name is the same as the context root for the application, and that the view ID is the id attribute for the page's `<view>` tag in the product's `public_html/WEB-INF/adfc-config.xml` file. The URL should not contain the `.JSPX` suffix.

- If you see a "webApp value not define" error message when you choose an item in the Navigator menu, verify whether the application is in the topology tables. Refer to the Oracle Fusion Applications Administrator’s Guide.

See: Viewing the Routing Topology of an Oracle Fusion Applications Instance, Product Family, or Product

Manage Audit Policies

Managing Audit Policies: Explained

Auditing is used to monitor user activity and all configuration, security, and data changes that have been made to an application. Auditing involves recording and retrieving information pertaining to the creation, modification, and removal of business objects. All actions performed on the business objects and the modified values are also recorded. The audit information is stored without any intervention of the user or any explicit user action.

Use audit policies to select specific business objects and attributes to be audited. The decision to create policies usually depends on the type of information to be audited and to the level of detail that is required to be reported.

Enabling Audit Functionality

To enable audit, ensure that you have administrative privileges. For Oracle Fusion Applications, you must configure the business objects and select the attributes before enabling audit. If you enable audit without configuring the business objects, auditing remains inactive. By default, auditing is disabled for all applications.

To enable auditing for Oracle Fusion Middleware products, select one of the levels at which auditing is required for that product. The audit levels are
predefined and contain the metadata and events to be audited. For more information, refer to the Oracle Fusion Middleware documentation and also the Oracle Enterprise Repository for Oracle Fusion Applications at http://fusionappsoer.oracle.com.

If you do not want an application to be audited, you can stop the audit process by setting the Audit Level option to None. While viewing the audit report for that application, you can specify the period during which auditing remained enabled.

**Configuring Audit Business Object Attributes: Points to Consider**

Audit allows you to track the change history of particular attributes of a business object. However, those objects and their attributes must be selected for audit and auditing must be enabled for that application. Your configuration settings determine which attributes to audit for a given object, and when the audit starts and ends. Auditing takes into account all the create or insert, update, and delete operations performed on an object and its attributes.

To configure audit business object attributes, navigate to the Manage Audit Policies page in the Setup and Maintenance work area.

**Selecting an Application**

To set up auditing, you must select a web application that contains the required business objects that can be audited. From the list of business objects, select those business object that you want to audit. Selecting a business object also displays its attributes that are enabled for auditing.

**Selecting Attributes**

For each selected business object to be audited, select the corresponding attributes to include in the audit. All attributes that belong to that object are by default selected for audit and appear on the user interface. However, you can add or remove attributes from the list. When you remove an attribute from the list, you stop auditing it even when the parent object is selected for audit. So, if you want an attribute to be audited, you must add it to the list.

**Note**

If the object selected in an audit hierarchy is also a part of several other audit hierarchies, the attribute configuration for that object is applicable to all the hierarchies in that application.

**Starting and Stopping Audit**

The business object is ready for audit after you select its attributes and save the configuration changes. However, to start auditing, the audit level for Oracle Fusion Applications must be set to Auditing on the Manage Audit Policies page.

To stop auditing an object, you can deselect the entire object and save the configuration. As a result, all its selected attributes are automatically deselected.
and are not audited. To continue to audit the business object with select attributes, deselect those attributes that are not to be audited.

When end-users view the audit history for an application, they can specify the period for which they want the results. Therefore, it is important to note when you start and stop auditing an application. For example, today if end-users intend to view the audit history of an object for the previous week, but auditing for that object was stopped last month, they would not get any audit results for that week because during the entire month that object was not audited. Even if you enable audit for that object today, end-users cannot get the wanted results because audit data until today is not available.

Configuring Audit: Highlights

You can set up auditing for Oracle Fusion Applications using the Manage Audit Policies page in the Setup and Maintenance work area of Oracle Fusion Applications.

To set up auditing for Oracle Fusion Middleware products, you must select the level of auditing that maps to a predefined set of metadata and events that have to be audited. Information on configuring audit for Oracle Fusion Middleware products is provided in Oracle Fusion Middleware guides.

You can also create a configuration file and deploy it to audit a specific Oracle Fusion Middleware product. The configuration details for Oracle Fusion Middleware products are available in the form of audit-specific assets that can be used to create the configuration file (config.xml). For more information, see the Oracle Enterprise Repository for Oracle Fusion Applications at http://fusionappsoer.oracle.com, and search with Audit as the Asset Type to get the list of audit-specific assets.

Oracle Fusion Middleware Products

  
  See: Auditing Web Services

Oracle Fusion Security Products

- Configure business objects to enable auditing in Oracle Fusion security products. Refer to Oracle Fusion Middleware Application Security Guide.
  
  See: Oracle Fusion Middleware Audit Framework Reference

Manage Oracle Social Network Objects

Managing Oracle Social Network Objects: Explained

Use the Manage Oracle Social Network Objects task for managing the Oracle Social Network Objects. The integration of Oracle Social Network Cloud
Service with applications and business processes brings key attributes from the applications to share, socialize, and update information. This helps in making better business decisions based on additional information that you obtain and analyze within your social network environment.

Use the Manage Oracle Social Network Objects page to set up and define:

- The business objects and attributes to enable
- The enablement method for social network integration with Oracle Fusion Applications

You can access the Manage Oracle Social Network Objects page by starting in the Setup and Maintenance Overview page and searching for the task named Manage Oracle Social Network Objects.

Use social network to:

- Discuss projects and plans in public forums
- Maintain:
  - Membership groups
  - Activity feeds of the people you choose
- Facilitate:
  - One-on-one Conversations
  - Reviews
  - Document sharing

---

**Note**

Oracle Social Network Cloud Service is currently available in Cloud implementations only.

An important aspect of managing Oracle Social Network objects is enabling business objects for integration.

**Enabling Business Objects for Integration**

A business object can't be shared within social network until a functional administrator or implementor:

- Accesses the Manage Oracle Social Network Objects page in Oracle Fusion Applications
- Enables the business object for social network integration

**Options for Enabling Oracle Social Network Objects: Explained**

To enable business objects and apply attributes for Oracle Social Network Cloud Service integration with Oracle Fusion Applications, use the Manage Oracle Social Network Objects task.
In the **Manage Oracle Social Network Objects** page, you can:

- Enable an object
- Disable an object
- Enable all objects
- Enable business object attributes

To access the **Manage Oracle Social Network Objects** page:

1. Search for the **Manage Oracle Social Network Objects** task in the Setup and Maintenance work area.
2. In the Search Results section, click the **Go to Task** icon to open the **Manage Oracle Social Network Objects** page.

---

**Note**

Custom objects and attributes created in Application Composer in the mainline are also displayed on the **Manage Oracle Social Network Objects** page. You can enable these objects and attributes for social network integration.

---

### Enable Object

To enable a business object:

1. Access the **Manage Oracle Social Network Objects** page.
2. In the **Business Objects** section, select a business object, click **Enable Object**, and select one of the enablement options. The business objects are grouped by modules. The available enablement options are:
   - **Manual**: (Recommended) Empowers the user to decide whether to share each instance of the object with social network.
   - **Automatic**: Automatically sends the newly enabled object instances and updates to social network.
   - **No**: Does not send any information on object instance to social network. This is the default option.

---

**Note**

Once shared, all updates to the enabled attributes of the object instance, and deletes, are sent to social network. Updates to attributes that are not enabled are not sent.

---

- **Automatic**: Automatically sends the newly enabled object instances and updates to social network.

---

**Note**

All object instances are automatically shared with social network upon creation, and all subsequent updates to the enabled attributes of the object instances, and deletes, are automatically sent to social network.

---

3. Click **OK**.
This enables the selected business object, and empowers the user to decide whether to share each instance of the object with social network.

**Note**

After you enable an object, you must enable one or more attributes in the Attributes section of the Manage Oracle Social Network Objects page. Updates to enabled attributes are sent to social network.

**Disable Object**

To disable a business object:

1. Access the Manage Oracle Social Network Objects page.
2. In the Business Objects section, select a business object, and click Disable Object.
3. Save your changes.

This disables the selected business object by updating the enablement option as No.

**Enable All**

To enable all business objects:

1. Access the Manage Oracle Social Network Objects page.
2. In the Business Objects section, click Enable All.
3. Save your changes.

This enables all business objects in bulk, and updates the enablement option of all business objects as Manual.

**Note**

- After you enable business objects, you must enable one or more attributes in the Attributes section of the Manage Oracle Social Network Objects page. Updates to the enabled attributes are sent to social network.
- If you enable a business object, but don't configure any attributes for the enabled business object, no attributes are sent to social network during create and update. The only exception is that some internal bookkeeping information are sent. Deletes are sent as usual.

**Status Column**

The Status column in the Business Objects table visually indicates:

- Whether a business object is enabled
- Which enabled business objects don’t yet have an enabled attribute assigned

The status indicators include:

- A check mark, which indicates that you have configured attributes for an enabled business object
• A warning sign, which indicates that you have not configured any attributes for an enabled business object

Enable Business Object Attributes

To enable business object attributes:

1. In the Attributes section, click Add to display the Select Attributes dialog where you can select attributes to add to the table.
2. Select an attribute name in the table, and select the Enabled check box to enable the attribute.
3. Click OK.
4. Save your changes.

In the Attributes table, you can also:

• Click View to view a list of all attributes that are enabled.
• Click Remove to remove attributes from the table.
• Hover over the Attribute Information icon displayed next to descriptive flexfield attributes to view information about the attributes.

Update Translations: Explained

The Update Translations process sends attribute labels and business object names to Oracle Social Network Cloud Service for use in the user interface.

In social network, the attribute or business object labels appear in the language of your locale. If you change the locale in social network, then the attribute or business object labels appear in the updated language. However, the data appears in the language in which it was originally sent to social network. If you have previously sent an instance of the business object to social network, then the instance data isn’t updated. Clicking the Update Translations button on the Manage Oracle Social Network Objects page sends translations for business objects with the enablement option as Manual or Automatic.

Synchronize Business Objects: Explained

Use the Synchronize button on the Manage Oracle Social Network Objects page to synchronize business objects. This re-sends the definitions of business objects having the enablement option as Manual or Automatic to Oracle Social Network Cloud Service.

Use the Synchronize button at the:

• Business Objects table level: To re-send the definitions of a selected business object to social network. This button is enabled only when you select a row for a business object with the enablement option as Manual or Automatic.
• **Manage Oracle Social Network Objects page level:** To re-send the definitions of all business objects with the enablement option as **Manual** or **Automatic** to social network.

---

**Note**

If you had modified any business object enabled for social network and not saved your changes, then on clicking the **Synchronize** button, a warning message appears. This message informs you that you have not saved your changes, and you can select one of the following options:

- **Save and Synchronize:** To save the modified business objects, and synchronize the unmodified business objects.
- **Synchronize:** To ignore any unsaved business objects, and only synchronize the unmodified business objects.
- **Cancel:** To cancel the synchronization task.

---

**FAQs for Manage Oracle Social Network Objects**

**What happens if I update translations?**

When you update translations, you send translations for business objects with the enablement option as **Manual** or **Automatic** to Oracle Social Network Cloud Service.

On updating translations, you also:

- Synchronize the newly translated text from Oracle Fusion Applications so that it can be used within social network. This means you can:
  - Install and enable a new language.
  - Take a language patch at any time.
  - Send attribute labels and business object names to social network for use in its user interface.

**How can I update translations?**

Use the **Update Translations** button on the **Manage Oracle Social Network Objects** page for subsequent updates to labels and attributes.

Use the **Update Translations** button at the:

- **Business Objects table level:** To send translations for a selected business object to Oracle Social Network Cloud Service. This button is enabled only when you select a row for a business object with the enablement option as Manual or Automatic.

- **Manage Oracle Social Network Objects page level:** To send translations for all business objects with the enablement option as **Manual** or **Automatic** to social network.
Note

When you save the enablement of a business object to social network, it sends the translations as well. Hence, you need not click the **Update Translations** button after saving the enablement.

---

**When do I update translations?**

Run the **Update Translations** process only after you install a new language pack of Oracle Fusion Applications.

Updating translations synchronizes the newly translated text to Oracle Social Network Cloud Service for integration with Oracle Fusion Applications.

Note

When you save the enablement of a business object to social network, it sends the translations as well. Hence, you need not click the **Update Translations** button after saving the enablement.

---

**What happens if I synchronize business objects?**

When you synchronize business objects, you re-send the definitions of business objects having the enablement option as **Manual** or **Automatic** to Oracle Social Network Cloud Service.

---

**When do I synchronize business objects?**

Run the Synchronize process after you use customization sets to import the setup from the **Manage Oracle Social Network Objects** page in another environment.

You can also run the process any time you want to synchronize the settings of business objects with Oracle Social Network Cloud Service without making any changes in the **Manage Oracle Social Network objects** page.

---

**Manage Applications Core Common Reference Objects**

**Manage Applications Core Messages**

**Common Messages: Points to Consider**

Common messages, which have message names that begin with FND_CMN and message numbers between 0 and 999, are used throughout Oracle Fusion Applications. Each common message can appear in multiple places in any product family. For example, the FND_CMN_NEW_SRCH message can be used for any search to indicate that no results were found. Common messages that are of type error or warning are part of the message dictionary.
Editing Common Messages

Because a common message can be used in any application, consider the ramifications if you edit any aspect of the message, including incident and logging settings. Changes would be reflected in all instances where the message is used. For example, if you change the message text, make sure that the text would make sense to all users across Oracle Fusion Applications who might see it.

Creating Common Messages

You can create custom common messages for use in multiple places within a single product. Do not begin the message name with FND_CMN, but use another suitable convention. The message number should be within the range that is designated for the product.

Manage Applications Core Administrator Profile Values

Creating and Editing Messages: Highlights

Each message in the message dictionary has many attributes and components, including message properties, text, and tokens, that you define when creating or editing the message. To create or edit a message, navigate to the Manage Messages page in the Setup and Maintenance work area.

Details about these messages are described in the Oracle Fusion Applications Developer's Guide.

Message Properties

- The message type identifies the type of information that the message contains.
  
  See: Understanding Message Types

- The message name and number are identifiers for the message. There are specific message number ranges for predefined messages in each application, and you should not edit numbers assigned to predefined messages. When creating custom messages, use only message numbers within the 10,000,000 to 10,999,999 range.
  
  See: About Message Names

  See: About Message Numbers

- The translation notes for predefined messages might contain internal content that you can disregard.
  
  See: About Translation Notes

- The message category, severity, and logging enabled option are related to the incident and logging process.
Message Text and Tokens

- The message text comprises various components, some of which are displayed only to select users. To determine which component of the message text is displayed to a particular user, set the Message Mode profile option (FND_MESSAGE_MODE) at the user level for that user. The message component short text is visible to all users and therefore, the profile option does not apply to this component. Also, the profile option applies only to messages in the message dictionary.

See: About Message Components

- Tokens are variables that represent values to be displayed in the message text.

See: About Tokens

Profile Options and Related General Preferences: How They Work Together

Some Oracle Middleware Extensions for Applications profile options are related to general preferences in the global area.

Preferences

The related general preferences are Default Application Language, Territory, Date Format, Time Format, Currency, and Time Zone. When the user changes any of these preferences, the stored values in LDAP are updated accordingly.

Profile Options

The corresponding profile options are Default Language, Default Territory, Default Date Format, Default Time Format, Default Currency, and Default User Time Zone. No matter what you set for these profile options at any level, the preferences settings, or LDAP values, take precedence. The profile option value is used only if the LDAP value is not available. Updating the profile option value does not automatically update the value in LDAP or preferences.

FAQs for Manage Applications Core Administrator Profile Values

How can I enable the privacy statement?

Use the Privacy Statement URL profile option to enable the Privacy Statement menu item in the global area. This menu item in the Settings and Actions menu is disabled by default.

Open the Setup and Maintenance work area, and use the Manage Applications Core Administrator Profile Values task to find the Privacy Statement URL profile
option. In the Profile Value column, enter the full URL of the web page that contains the privacy content you want the menu item to link to.
Common Applications Configuration: Define Currencies and Currency Rates

Manage Currencies

Defining Currencies: Points to Consider

When creating or editing currencies, consider these points relevant to entering the currency code, date range, or symbol for the currency.

Currency Codes

You cannot change a currency code after you enable the currency, even if you later disable that currency.

Date Ranges

Users can enter transactions denominated in the currency only for the dates within the specified range. If you do not enter a start date, then the currency is valid immediately. If you do not enter an end date, then the currency is valid indefinitely.

Symbols

Even if you enter a symbol for a currency, the symbol is not always displayed when an amount is displayed in this currency. Some applications use currency symbols when displaying amounts. Others, like Oracle Fusion General Ledger, do not.

Manage Conversion Rate Types

Creating Conversion Rate Types: Critical Choices

Maintain different conversion rates between currencies for the same period with the Oracle Fusion General Ledger conversion rate types functionality. Four
predefined daily conversion rate types are seeded: Spot, Corporate, User, and Fixed, allowing you to use different rate types for different business needs. During journal entry, the conversion rate is provided automatically by the General Ledger based on the selected conversion rate type and currency, unless the rate type is user. For user rate types, you must enter the conversion rate. Define additional rate types as needed. Set your most frequently used rate type as the default. Conversion rate types cannot be deleted.

Assign conversion rate types to automatically populate the associated rate for your period average and period end rates for the ledger. For example, you can assign the predefined rate type Spot to populate your period average rates and the predefined rate type Corporate to populate your period end rates. Period average and period end rates are used in translation of account balances.

Conversion rate types are used to automatically assign a rate when you perform the following accounting functions:

- Convert foreign currency journal amounts to ledger currency equivalents
- Convert journal amounts from source ledgers to reporting currencies or secondary ledgers
- Run Revaluation or Translation processes

In creating new conversion rates, decide whether to do the following:

- Enforce inverse relationships
- Select pivot currencies
- Select contra currencies
- Enable cross rates and allow cross rate overrides
- Maintain cross rate rules

**Enforce Inverse Relationships**

Check the **Enforce Inverse Relationship** check box to specify whether or not to enforce the automatic calculation of inverse conversion rates when defining daily rates.

<table>
<thead>
<tr>
<th>Action</th>
<th>Results</th>
</tr>
</thead>
<tbody>
<tr>
<td>Checked</td>
<td>When you enter a daily rate to convert currency A to currency B, General Ledger automatically calculates the inverse rate, currency B to A, and enters it in the adjacent column. If either rate is changed, the application automatically recalculates the other rate. You can update the application calculated inverse rate, but once you do, the related rate is updated. The check box enforces that the inverse relationship is maintained but does not prevent you from updating the rates.</td>
</tr>
<tr>
<td>Unchecked</td>
<td>General Ledger calculates the inverse rate but you can change the rate and update the daily rates table without the corresponding rate being updated.</td>
</tr>
</tbody>
</table>
Select Pivot Currencies

Select a pivot currency that is commonly used in your currency conversions. A pivot currency is the central currency that interacts with contra currencies. For example, you set up a daily rate between the US dollar (USD) and the Euro currency (EUR) and another between the USD and the Canadian dollar (CAD). USD is the pivot currency in creating a rate between EUR and CAD. EUR and CAD are the contra currencies. Select the pivot currency from the list of values which contains those currencies that are enabled, effective, and not a statistical (STAT) currency. The description of the pivot currency is populated automatically based on the currency definition.

If you want the application to create cross rates against a base currency, define the base currency as the pivot currency. Selected pivot currencies can be changed in the Rate Types page.

Select Contra Currencies

Select currencies available on the list of values as contra currencies. The available currencies are those currencies which are enabled, effective, not STAT currency, and not the pivot currency selected earlier. The description of the contra currency is populated automatically based on the currency definition. Add or delete contra currencies in the Contra Currencies region of the Rate Types page.

Enable Cross Rates and Allow Cross Rate Overrides

Check the Enable Cross Rates check box to calculate conversion rates based on defined currency rate relationships. General Ledger calculates cross rates based on your defined cross rate rules. Associate your cross rate rules with a conversion rate type, pivot currency, and contra currencies. Cross rates facilitate the creation of daily rates by automatically creating the rates between contra currencies based on their relationship to a pivot currency. If the Enable Cross Rates check box is changed to unchecked after entering contra currencies, the application stops calculating cross rates going forward for that particular rate type. All the earlier calculated cross rates for that rate type remain in the database unless you manually delete them.

For example, if you have daily rates defined for the pivot currency, USD to the contra currency, EUR, and USD to another contra currency, CAD, the application will automatically create the rates between EUR to CAD and CAD to EUR. This prevents the need to manually define the EUR to CAD and CAD to EUR rates.

Check the Allow Cross Rates Override check box to permit your users to override application generated cross rates. If you accept the default of unchecked, the application generated cross rates cannot be overridden.

Maintain Cross Rate Rules

Define or update your cross rate rules at any time by adding or removing contra currency assignments. Add a contra currency to a cross rate rule and run
the Daily Rates Import and Calculation process to generate the new rates. If your remove a cross rate rule or a contra currency from a rule, any cross rates generated previously for that contra currency remain unless you manually delete them. Changes to the rule are not retroactive and will not affect previously stored cross rates. The Cross Rate process generates as many rates as possible and skips currencies where one component of the set is missing.

Note

With a defined web service that extracts daily currency conversion rates from external services, for example Reuters, currency conversion rates are automatically updated for the daily rates and all cross currency relationships.

Manage Daily Rates

Entering Daily Rates Manually: Worked Example

You are required to enter the daily rates for currency conversion from Great Britain pounds sterling (GBP) to United States dollars (USD) each day for your company InFusion America Inc.

Oracle Application Development Framework (ADF) Desktop Integration is an Excel add-in that must be loaded onto each client. Because ADF Desktop Integration is an add-in to Microsoft Office products, you can use this feature only if they have Microsoft Excel 2007 or above, Internet Explorer 7 or above, and Microsoft Windows 7, XP Professional SP2, or Vista. Users must download the installation files from Navigator - Tools - Download Desktop Integrator Installer.

Entering Daily Rates

1. Navigate to the Period Close work area.
   Use the Period Close work area to link to close processes and currency process.

2. Click the Manage Currency Rates link.
   Use the Currency Rates Manager page to create, edit, and review currency rate types, daily rates, and historical rates.

3. Click the Daily Rates tab.
   Use the Daily Rates tab to review and enter currency rates.

4. Click the Create in Spreadsheet button.
   Use the Create Daily Rates spreadsheet to enter daily rates in a template that you can save and reuse.
5. Click in the From Currency field. Select the GBP - Pound Sterling list item.
6. Click in the To Currency field. Select the USD - US Dollar list item.
7. Click in the Conversion Rate field. Select the Spot list item.
8. Click in the From Conversion field. Enter the desired information into the From Conversion field. Enter a valid value e.g. "8/1/2011".
9. Click in the To Conversion Date field. Enter the desired information into the To Conversion Date field. Enter a valid value e.g. "8/1/2011".
10. Click in the Conversion Rate field. Enter the desired information into the Conversion Rate field. Enter a valid value e.g. "1.33225".
11. Click the Submit button. Click the OK button twice.
12. Review the Record Status column to verify that all rows were loaded successfully.
13. Save the template to use to enter daily rates frequently. You can save the spreadsheet to either a local drive or a shared network drive.
Enterprise Structures: Overview

Oracle Fusion Applications have been designed to ensure your enterprise can be modeled to meet legal and management objectives. The decisions about your implementation of Oracle Fusion Applications are affected by your:

- Industry
- Business unit requirements for autonomy
- Business and accounting policies
- Business functions performed by business units and optionally, centralized in shared service centers
- Locations of facilities

Every enterprise has three fundamental structures, legal, managerial, and functional, that are used to describe its operations and provide a basis for reporting. In Oracle Fusion, these structures are implemented using the chart of accounts and organizations. Although many alternative hierarchies can be implemented and used for reporting, you are likely to have one primary structure that organizes your business into divisions, business units, and departments aligned by your strategic objectives.

Legal Structure

The figure above shows a typical group of legal entities, operating various business and functional organizations. Your ability to buy and sell, own, and
employ comes from your charter in the legal system. A corporation is a distinct legal entity from its owners and managers. The corporation is owned by its shareholders, who may be individuals or other corporations. There are many other kinds of legal entities, such as sole proprietorships, partnerships, and government agencies.

A legally recognized entity can own and trade assets and employ people in the jurisdiction in which it is registered. When granted these privileges, legal entities are also assigned responsibilities to:

- Account for themselves to the public through statutory and external reporting
- Comply with legislation and regulations
- Pay income and transaction taxes
- Process value added tax (VAT) collection on behalf of the taxing authority

Many large enterprises isolate risk and optimize taxes by incorporating subsidiaries. They create legal entities to facilitate legal compliance, segregate operations, optimize taxes, complete contractual relationships, and isolate risk. Enterprises use legal entities to establish their enterprise’s identity under the laws of each country in which their enterprise operates.

In the figure above, a separate card represents a series of registered companies. Each company, including the public holding company, InFusion America, must be registered in the countries where they do business. Each company consists of various divisions created for purposes of management reporting. These are shown as vertical columns on each card. For example, a group might have a separate company for each business in the United States (US), but have their United Kingdom (UK) legal entity represent all businesses in that country. The divisions are linked across the cards so that a business can appear on some or all of the cards. For example, the air quality monitoring systems business might be operated by the US, UK, and France companies. The list of business divisions is on the Business Axis. Each company’s card is also horizontally striped by functional groups, such as the sales team and the finance team. This functional list is called the Functional Axis. The overall image suggests that information might, at a minimum, be tracked by company, business, division, and function in a group environment. In Oracle Fusion Applications, the legal structure is implemented using legal entities.

Management Structure

Successfully managing multiple businesses requires that you segregate them by their strategic objectives, and measure their results. Although related to your legal structure, the business organizational hierarchies do not need to be reflected directly in the legal structure of the enterprise. The management structure can include divisions, subdivisions, lines of business, strategic business units, and cost centers. In the figure above, the management structure is shown on the Business Axis. In Oracle Fusion Applications, the management structure is implemented using divisions and business units.

Functional Structure

Straddling the legal and business organizations is a functional organization structured around people and their competencies. For example, sales, manufacturing, and service teams are functional organizations. This functional structure is represented by the Functional Axis in the figure above. You reflect
the efforts and expenses of your functional organizations directly on the income statement. Organizations must manage and report revenues, cost of sales, and functional expenses such as research and development (R&D) and selling, general, and administrative (SG&A) expenses. In Oracle Fusion Applications, the functional structure is implemented using departments and organizations, including sales, marketing, project, cost, and inventory organizations.

**Enterprise Structures Business Process Model: Explained**

In Oracle Fusion Applications, the Enterprise Performance and Planning Business Process Model illustrates the major implementation tasks that you perform to create your enterprise structures. This process model includes the Set Up Enterprise Structures business process, which consist of implementation activities that span many product families. Information Technology is a second Business Process Model which contains the Set Up Information Technology Management business process. Define Reference Data Sharing is one of the activities in this business process and is important in the implementation of the enterprise structures. This activity creates the mechanism to share reference data sets across multiple ledgers, business units, and warehouses, reducing the administrative burden and decreasing the time needed to implement.

The following figure and chart describes the Business Process Model structures and activities.

![Business Process Model (BPM)](image)
<table>
<thead>
<tr>
<th>BPM Activities</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Define Enterprise</td>
<td>Define the enterprise to capture the name of the deploying enterprise and the location of the headquarters. There is normally a single enterprise organization in a production environment. Multiple enterprises are defined when the system is used to administer multiple customer companies, or when you choose to set up additional enterprises for testing or development.</td>
</tr>
<tr>
<td>Define Enterprise Structures</td>
<td>Define enterprise structures to represent an organization with one or more legal entities under common control. Define internal and external organizations to represent each area of business within the enterprise.</td>
</tr>
<tr>
<td>Define Legal Jurisdictions and Authorities</td>
<td>Define information for governing bodies that operate within a jurisdiction.</td>
</tr>
<tr>
<td>Define Legal Entities</td>
<td>Define legal entities and legal reporting units for business activities handled by the Oracle Fusion Applications.</td>
</tr>
<tr>
<td>Define Business Units</td>
<td>Define business units of an enterprise to allow for flexible implementation, to provide a consistent entity for controlling and reporting on transactions, and to be an anchor for the sharing of sets of reference data across applications.</td>
</tr>
<tr>
<td>Define Financial Reporting Structures</td>
<td>Define financial reporting structures, including organization structures, charts of accounts, organizational hierarchies, calendars, currencies and rates, ledgers, and document sequences which are used in organizing the financial data of a company.</td>
</tr>
<tr>
<td>Define Chart of Accounts</td>
<td>Define chart of accounts including hierarchies and values to enable tracking of financial transactions and reporting at legal entity, cost center, account, and other segment levels.</td>
</tr>
<tr>
<td>Define Ledgers</td>
<td>Define the primary accounting ledger and any secondary ledgers that provide an alternative accounting representation of the financial data.</td>
</tr>
<tr>
<td>Define Accounting Configurations</td>
<td>Define the accounting configuration that serves as a framework for how financial records are maintained for an organization.</td>
</tr>
<tr>
<td>Define Facilities</td>
<td>Define inventory, item, and cost organizations. Inventory organizations represent facilities that manufacture or store items. The item master organization holds a single definition of items that can be shared across many inventory organizations. Cost organizations group inventory organizations within a legal entity to establish the cost accounting policies.</td>
</tr>
<tr>
<td>Define Reference Data Sharing</td>
<td>Define how reference data in the applications is partitioned and shared.</td>
</tr>
</tbody>
</table>

**Note**

There are product specific implementation activities that are not listed here and depend on the applications you are implementing. For example, you can...
Global Enterprise Configuration: Points to Consider

Start your global enterprise structure configuration by discussing what your organization’s reporting needs are and how to represent those needs in the Oracle Fusion Applications. Consider deployment on a single instance, or at least, on as few instances as possible, to simplify reporting and consolidations for your global enterprises. The following are some questions and points to consider as you design your global enterprise structure in Oracle Fusion.

- Enterprise Configuration
- Business Unit Management
- Security Structure
- Compliance Requirements

Enterprise Configuration

What is the level of configuration needed to achieve the reporting and accounting requirements? What components of your enterprise do you need to report on separately? Which components can be represented by building a hierarchy of values to provide reporting at both detail and summary levels? Where are you on the spectrum of centralization versus decentralization?

Business Unit Management

What reporting do I need by business unit? How can you set up your departments or business unit accounts to achieve departmental hierarchies that report accurately on your lines of business? What reporting do you need to support the managers of your business units, and the executives who measure them? How often are business unit results aggregated? What level of reporting detail is required across business units?

Security Structure

What level of security and access is allowed? Are business unit managers and the people that report to them secured to transactions within their own business unit? Are the transactions for their business unit largely performed by a corporate department or shared service center?

Compliance Requirements

How do you comply with your corporate external reporting requirements and local statutory reporting requirements? Do you tend to prefer a corporate first or
an autonomous local approach? Where are you on a spectrum of centralization, very centralized or decentralized?

Modeling Your Enterprise Management Structure in Oracle Fusion: Example

This example uses a fictitious global company to demonstrate the analysis that can occur during the enterprise structure configuration planning process.

Scenario

Your company, InFusion Corporation, is a multinational conglomerate that operates in the United States (US) and the United Kingdom (UK). InFusion has purchased an Oracle Fusion enterprise resource planning (ERP) solution including Oracle Fusion General Ledger and all of the Oracle Fusion subledgers. You are chairing a committee to discuss creation of a model for your global enterprise structure including both your US and UK operations.

InFusion Corporation

InFusion Corporation has 400 plus employees and revenue of $120 million. Your product line includes all the components to build and maintain air quality monitoring (AQM) systems for homes and businesses. You have two distribution centers and three warehouses that share a common item master in the US and UK. Your financial services organization provides funding to your customers for the startup costs of these systems.

Analysis

The following are elements you need to consider in creating your model for your global enterprise structure.

- Your company is required to report using US Generally Accepted Accounting Principles (GAAP) standards and UK Statements of Standard Accounting Practice and Financial Reporting Standards. How many ledgers do you need to achieve proper statutory reporting?

- Your managers need reports that show profit and loss (revenue and expenses) for their lines of business. Do you use business units and balancing segments to represent your divisions and businesses? Do you secure data by two segments in your chart of accounts which represents each department and legal entity or one segment that represents both to produce useful, but confidential management reports?

- Your corporate management requires reports showing total organizational performance with drill down capability to the supporting details. Do you need multiple balancing segment hierarchies to achieve proper rollup of balances for reporting requirements?

- Your company has all administrative, account payables, procurement, and human resources functions performed at their corporate headquarters. Do you need one or more business unit in which to perform all these functions? How will your shared service center be configured?
Global Enterprise Structure Model

The following figure and table summarize the model that your committee has designed and uses numerical values to provide a sample representation of your structure. The model includes the following recommendations:

- Creation of three separate ledgers representing your separate legal entities:
  - InFusion America Inc.
  - InFusion Financial Services Inc.
  - InFusion UK Services Ltd.
- Consolidation of results for system components, installations, and maintenance product lines across the enterprise
- All UK general and administrative costs processed at the UK headquarters
- US Systems’ general and administrative costs processed at US Corporate headquarters
- US Financial Services maintains its own payables and receivables departments
In this chart, the green globe stands for mandatory and gold globe stands for optional setup. The following statements expand on the data in the chart.

- The enterprise is mandatory because it serves as an umbrella for the entire implementation. All organizations are created within an enterprise.

- Legal entities are also mandatory. They can be optionally mapped to balancing segment values or represented by ledgers. Mapping balancing segment values to legal entities is mandatory if you plan to use the intercompany functionality.

- At least one ledger is mandatory in an implementation in which you record your accounting transactions.

- Business units are also mandatory because financial transactions are processed in business units.

- A shared service center is optional, but if used, must be a business unit.

- Divisions are optional and can be represented with a hierarchy of cost centers or by a second balancing segment value.

- Departments are mandatory because they track your employees.

- Optionally, add an item master organization and inventory organizations if you are tracking your inventory transactions in Oracle Fusion Applications.

**Note**

Some Oracle Fusion Human Capital Management and Oracle Sales Cloud implementations do not require recording of accounting transactions and therefore, do not require implementation of a ledger.

**Note**

The InFusion Corporation is a legal entity but is not discussed in this example.
Essbase Character and Word Limitations

The following is a comprehensive list of character and word limitations that apply to Essbase. All of the limitations apply to all of the Oracle Fusion General Ledger configurations summarized in the table.

<table>
<thead>
<tr>
<th>Oracle Fusion General Ledger Configuration</th>
<th>Maps to Essbase As:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Chart of Account Name</td>
<td>Cube Name</td>
</tr>
<tr>
<td>Chart of Account Segment Name</td>
<td>Dimension Name</td>
</tr>
<tr>
<td>Chart of Accounts Segment Value</td>
<td>Dimension Member Name</td>
</tr>
<tr>
<td>Chart of Accounts Segment Value Description</td>
<td>Alias for Member</td>
</tr>
<tr>
<td>Tree and Tree Version Name</td>
<td>Dimension Member Name</td>
</tr>
<tr>
<td>Primary Ledger Name</td>
<td>Dimension Member Name in Ledger Dimension</td>
</tr>
<tr>
<td>Secondary Ledger Name</td>
<td>Dimension Member Name in Ledger Dimension</td>
</tr>
<tr>
<td>Reporting Currency Name</td>
<td>Dimension Member Name in Ledger Dimension</td>
</tr>
<tr>
<td>Ledger Set Name</td>
<td>Dimension Member Name in Ledger Dimension</td>
</tr>
<tr>
<td>Accounting Calendar Period Names</td>
<td>Dimension Member Name in Accounting Period Name</td>
</tr>
<tr>
<td>Scenario Name Defined in Seeded Value Set Called Accounting Scenario</td>
<td>Dimension Member Name in Scenario Dimension</td>
</tr>
</tbody>
</table>

Even when case sensitivity is enabled in an aggregate storage outline for which duplicate member names is enabled, do not use matching names with only case differences for a dimension name. For example, do not:

- Name two dimensions Product and product.
- Use quotation marks or brackets.
- Use tabs in dimension, member, or alias names.
- Use accent characters.
- Use the characters for dimension or member names.

**Restricted Characters**

The following is a list of characters that are restricted and can not be used in dimension, member, or alias names.

<table>
<thead>
<tr>
<th>Character</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>@</td>
<td>at sign</td>
</tr>
<tr>
<td>\</td>
<td>backslash</td>
</tr>
<tr>
<td>,</td>
<td>comma</td>
</tr>
<tr>
<td>-</td>
<td>dash, hyphen, or minus sign</td>
</tr>
<tr>
<td>=</td>
<td>equal sign</td>
</tr>
<tr>
<td>&lt;</td>
<td>less than sign</td>
</tr>
<tr>
<td>()</td>
<td>parentheses</td>
</tr>
</tbody>
</table>
### Other Restrictions

- Do not place spaces at the beginning or end of names. Essbase ignores such spaces.
- Do not use these types of words as dimension or member names:
  - Calculation script commands, operators, and keywords.
  - Report writer commands.
  - Function names and function arguments.
  - Names of other dimensions and members (unless the member is shared).
  - Generation names, level names, and aliases in the database.
- Any of these words in the table below:

<table>
<thead>
<tr>
<th>List 1</th>
<th>List 2</th>
<th>List 3</th>
</tr>
</thead>
<tbody>
<tr>
<td>ALL</td>
<td>AND</td>
<td>ASSIGN</td>

Define Initial Configuration with the Enterprise Structures Configurator

Establishing Enterprise Structures Using the Enterprise Structures Configurator: Explained

The Enterprise Structures Configurator is an interview-based tool that guides you through the process of setting up a basic enterprise structure. By answering questions about your enterprise, the tool creates a structure of divisions, legal entities, business units, and reference data sets that reflects your enterprise structure. After you create your enterprise structure, you also follow a guided process to determine whether or not to use positions, and whether to set up additional attributes for jobs and positions. After you define your enterprise structure and your job and position structures, you can review them, make any necessary changes, and then load the final configuration.

This figure illustrates the process to configure your enterprise using the Enterprise Structures Configurator.

To be able to use the Enterprise Structures Configurator, you must select the Enterprise Structures Guided Flow feature for your offerings on the Configure
Offerings page in the Setup and Maintenance work area. If you do not select this feature, then you must set up your enterprise structure using individual tasks provided elsewhere in the offerings, and you cannot create multiple configurations to compare different scenarios.

**Establish Enterprise Structures**
To define your enterprise structures, you use the guided flow within the Establish Enterprise Structures task to enter basic information about your enterprise, such as the primary industry and the location of your headquarters. You then create divisions, legal entities, business units, and reference data sets. The Establish Enterprise Structures task enables you to create multiple enterprise configurations so that you can compare different scenarios. Until you load a configuration, you can continue to create and edit multiple configurations until you arrive at one that best suits your enterprise.

**Establish Job and Position Structures**
You also use a guided process to determine whether you want to use jobs only, or jobs and positions. The primary industry that you select in the Establish Enterprise Structures task provides the application with the information needed to make an initial recommendation. You can either accept the recommendation, or you can answer additional questions about how you manage people in your enterprise, and then make a selection. After you select whether to use jobs or positions, the guided process prompts you to set up a descriptive flexfield structure for jobs, and for positions if you have chosen to use them. Descriptive flexfields enable you to capture additional information when you create jobs and positions.

**Review Configuration**
You can view a result of the interview process prior to loading the configuration. In the review results, you can view the divisions, legal entities, business units, reference data sets, and the management reporting structure that the application will create when you load the configuration.

**Load Configuration**
You can load only one configuration. When you load a configuration, the application creates the divisions, legal entities, business units, and so on. After you load the configuration, you then use individual tasks to edit, add, and delete enterprise structures.

**Rolling Back an Enterprise Structure Configuration: Explained**

The Enterprise Structures Configurator (ESC) provides the ability to roll back an enterprise configuration in the following circumstances:

**Manual Rollback**
You can manually roll back an enterprise configuration after loading it, for example, because you decide you do not want to use it. Clicking the Roll Back Configuration button on the Manage Enterprise Configuration page rolls back any enterprise structures that were created as a part of loading the configuration.
Automatic Rollback

If an error occurs during the process of loading the configuration, then the application automatically rolls back any enterprise structures that were created before the error was encountered.

Designing an Enterprise Configuration: Example

This example illustrates how to set up an enterprise based on a global company operating mainly in the US and the UK with a single primary industry.

Scenario

InFusion Corporation is a multinational enterprise in the high technology industry with product lines that include all the components that are required to build and maintain air quality monitoring (AQM) systems for homes and businesses. Its primary locations are in the US and the UK, but it has smaller outlets in France, Saudi Arabia, and the United Arab Emirates (UAE).

Enterprise Details

In the US, InFusion employs 400 people and has a company revenue of $120 million. Outside the US, InFusion employs 200 people and has revenue of $60 million.

Analysis

InFusion requires three divisions. The US division will cover the US locations. The Europe division will cover the UK and France. Saudi Arabia and the UAE will be covered by the Middle East division.

InFusion requires legal entities with legal employers, payroll statutory units, tax reporting units, and legislative data groups for the US, UK, France, Saudi Arabia, and UAE, in order to employ and pay its workers in those countries.

InFusion requires a number of departments across the enterprise for each area of business, such as sales and marketing, and a number of cost centers to track and report on the costs of those departments.

InFusion requires business units for human capital management (HCM) purposes. Infusion has general managers responsible for business units within each country. Those business units may share reference data. Some reference data can be defined within a reference data set that multiple business units may subscribe to. Business units are also required for financial purposes. Financial transactions are always processed within a business unit.

Resulting Enterprise Configuration

Based on this analysis, InFusion requires an enterprise with multiple divisions, ledgers, legal employers, payroll statutory units, tax reporting units, legislative data groups, departments, cost centers, and business units.

This figure illustrates the enterprise configuration that results from the analysis of InFusion Corporation.
Managing multiple businesses requires that you segregate them by their strategic objectives and measure their results. Responsibility to reach objectives can be delegated along the management structure. Although related to your legal structure, the business organizational hierarchies do not need to reflect directly the legal structure of the enterprise. The management entities and structure can include divisions and subdivisions, lines of business, and other strategic business units, and include their own revenue and cost centers. These organizations can be included in many alternative hierarchies and used for reporting, as long as they have representation in the chart of accounts.

**Divisions**

A division refers to a business oriented subdivision within an enterprise, in which each division organizes itself differently to deliver products and services or address different markets. A division can operate in one or more countries, and can be comprised of many companies or parts of different companies that are represented by business units.

A division is a profit center or grouping of profit and cost centers, where the division manager is responsible for attaining business goals including profit.
goals. A division can be responsible for a share of the company’s existing product lines or for a separate business. Managers of divisions may also have return on investment goals requiring tracking of the assets and liabilities of the division. The division manager reports to a top corporate executive.

By definition a division can be represented in the chart of accounts. Companies may choose to represent product lines, brands, or geographies as their divisions: their choice represents the primary organizing principle of the enterprise. This may coincide with the management segment used in segment reporting.

Oracle Fusion Applications supports a qualified management segment and recommends that you use this segment to represent your hierarchy of business units and divisions. If managers of divisions have return on investment goals, make the management segment a balancing segment. Oracle Fusion applications allows up to three balancing segments. The values of the management segment can be comprised of business units that roll up in a hierarchy to report by division.

Historically, divisions were implemented as a node in a hierarchy of segment values. For example, Oracle E-Business Suite has only one balancing segment, and often the division and legal entity are combined into a single segment where each value stands for both division and legal entity.

**Use of Divisions in Oracle Fusion Human Capital Management (HCM)**

Divisions are used in HCM to define the management organization hierarchy, using the generic organization hierarchy. This hierarchy can be used to create organization based security profiles.

**Legal Entities: Explained**

A legal entity is a recognized party with rights and responsibilities given by legislation.

Legal entities have the right to own property, the right to trade, the responsibility to repay debt, and the responsibility to account for themselves to regulators, taxation authorities, and owners according to rules specified in the relevant legislation. Their rights and responsibilities may be enforced through the judicial system. Define a legal entity for each registered company or other entity recognized in law for which you want to record assets, liabilities, expenses and income, pay transaction taxes, or perform intercompany trading.

A legal entity has responsibility for elements of your enterprise for the following reasons:

- Facilitating local compliance
- Taking advantage of lower corporation taxation in some jurisdictions
- Preparing for acquisitions or disposals of parts of the enterprise
- Isolating one area of the business from risks in another area. For example, your enterprise develops property and also leases properties. You could operate the property development business as a separate legal entity to limit risk to your leasing business.

**The Role of Your Legal Entities**

In configuring your enterprise structure in Oracle Fusion Applications, you need to understand that the contracting party on any transaction is always the legal
entity. Individual legal entities own the assets of the enterprise, record sales and pay taxes on those sales, make purchases and incur expenses, and perform other transactions.

Legal entities must comply with the regulations of jurisdictions, in which they register. Europe now allows for companies to register in one member country and do business in all member countries, and the US allows for companies to register in one state and do business in all states. To support local reporting requirements, legal reporting units are created and registered.

You are required to publish specific and periodic disclosures of your legal entities' operations based on different jurisdictions' requirements. Certain annual or more frequent accounting reports are referred to as statutory or external reporting. These reports must be filed with specified national and regulatory authorities. For example, in the United States (US), your publicly owned entities (corporations) are required to file quarterly and annual reports, as well as other periodic reports, with the Securities and Exchange Commission (SEC), who enforces statutory reporting requirements for public corporations.

Individual entities privately held or held by public companies do not have to file separately. In other countries, your individual entities do have to file in their own name, as well as at the public group level. Disclosure requirements are diverse. For example, your local entities may have to file locally to comply with local regulations in a local currency, as well as being included in your enterprise’s reporting requirements in different currency.

A legal entity can represent all or part of your enterprise's management framework. For example, if you operate in a large country such as the United Kingdom or Germany, you might incorporate each division in the country as a separate legal entity. In a smaller country, for example Austria, you might use a single legal entity to host all of your business operations across divisions.

Creating Legal Entities in the Enterprise Structures Configurator: Points to Consider

Using the Enterprise Structures Configurator (ESC), you can create legal entities for your enterprise automatically, based on the countries in which divisions of your business operate, or you can upload a list of legal entities from a spreadsheet.

Automatically Creating Legal Entities

If you are not certain of the number of legal entities that you need, you can create them automatically. To use this option, you first identify all of the countries in which your enterprise operates. The application opens the Map Divisions by Country page, which contains a matrix of the countries that you identified, your enterprise, and the divisions that you created. You select the check boxes where your enterprise and divisions intersect with the countries to identify the legal entities that you want the application to create. The enterprise is included for situations where your enterprise operates in a country and acts on behalf of several divisions within the enterprise and is a legal employer in a country. If you select the enterprise for a country, the application creates a country holding company.
The application automatically creates the legal entities that you select, and identifies them as payroll statutory units and legal employers. For each country that you indicated that your enterprise operates in, and for each country that you created a location for, the application also automatically creates a legislative data group.

Any legal entities that you create automatically cannot be deleted from the Create Legal Entities page within the Enterprise Structures Configurator. You must return to the Map Divisions by Country page and deselect the legal entities that you no longer want.

**Example: Creating Legal Entities Automatically**

InFusion Corporation is using the ESC to set up their enterprise structure. They have identified two divisions, one for Lighting, and one for Security. The Lighting division operates in Japan and the US, and the Security division operates in the UK and India.

This figure illustrates InFusion Corporation’s enterprise structure.

[Diagram of InFusion Corporation’s enterprise structure]

This table represents the selections that InFusion Corporation makes when specifying which legal entities to create on the Map Divisions by Country page.

<table>
<thead>
<tr>
<th>Country</th>
<th>Enterprise</th>
<th>InFusion Lighting</th>
<th>InFusion Security</th>
</tr>
</thead>
<tbody>
<tr>
<td>Japan</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>US</td>
<td>No</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>UK</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
<tr>
<td>India</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

Based on the selections made in the preceding table, the ESC creates the following four legal entities:

- InFusion Lighting Japan LE
- InFusion Lighting US LE
- InFusion Security UK LE
- InFusion Security India LE

**Creating Legal Entities Using a Spreadsheet**

If you have a list of legal entities already defined for your enterprise, you can upload them from a spreadsheet. To use this option, you first download a
spreadsheet template, then add your legal entity information to the spreadsheet, and then upload directly to your enterprise configuration. You can export and import the spreadsheet multiple times to accommodate revisions.

Legal Entity in Oracle Fusion: Points to Consider

Oracle Fusion Applications support the modeling of your legal entities. If you make purchases from or sell to other legal entities, define these other legal entities in your customer and supplier registers, which are part of the Oracle Fusion Trading Community Architecture. When your legal entities are trading with each other, you represent both of them as legal entities and also as customers and suppliers in your customer and supplier registers. Use legal entity relationships to determine which transactions are intercompany and require intercompany accounting. Your legal entities can be identified as legal employers and therefore, are available for use in Human Capital Management (HCM) applications.

There are several decisions that need to be considered in creating your legal entities.

- The importance of legal entity in transactions
- Legal entity and its relationship to business units
- Legal entity and its relationship to divisions
- Legal entity and its relationship to ledgers
- Legal entity and its relationship to balancing segments
- Legal entity and its relationship to consolidation rules
- Legal entity and its relationship to intercompany transactions
- Legal entity and its relationship to worker assignments and legal employer
- Legal entity and payroll reporting
- Legal reporting units

The Importance of Legal Entity in Transactions

All of the assets of the enterprise are owned by individual legal entities. Oracle Fusion Financials allow your users to enter legal entities on transactions that represent a movement in value or obligation.

For example, the creation of a sales order creates an obligation for the legal entity that books the order to deliver the goods on the acknowledged date, and an obligation of the purchaser to receive and pay for those goods. Under contract law in most countries, damages can be sought for both actual losses, putting the injured party in the same state as if they had not entered into the contract, and what is called loss of bargain, or the profit that would have made on a transaction.

In another example, if you revalued your inventory in a warehouse to account for raw material price increases, the revaluation and revaluation reserves must be reflected in your legal entity’s accounts. In Oracle Fusion Applications, your
inventory within an inventory organization is managed by a single business unit and belongs to one legal entity.

**Legal Entity and Its Relationship to Business Units**

A business unit can process transactions on behalf of many legal entities. Frequently, a business unit is part of a single legal entity. In most cases the legal entity is explicit on your transactions. For example, a payables invoice has an explicit legal entity field. Your accounts payables department can process supplier invoices on behalf of one or many business units. In some cases, your legal entity is inferred from your business unit that is processing the transaction. For example, your business unit A agrees on terms for the transfer of inventory to your business unit B. This transaction is binding on your default legal entities assigned to each business unit. Oracle Fusion Procurement, Oracle Fusion Projects, and Oracle Fusion Supply Chain applications rely on deriving the legal entity information from the business unit.

**Legal Entity and Its Relationship to Divisions**

The division is an area of management responsibility that can correspond to a collection of legal entities. If desired, you can aggregate the results for your divisions by legal entity or by combining parts of other legal entities. Define date-effective hierarchies for your cost center or legal entity segment in your chart of accounts to facilitate the aggregation and reporting by division. Divisions and legal entities are independent concepts.

**Legal Entity and Its Relationship to Ledgers**

One of your major responsibilities is to file financial statements for your legal entities. Map legal entities to specific ledgers using the Oracle Fusion General Ledger Accounting Configuration Manager. Within a ledger, you can optionally map a legal entity to one or more balancing segment values.

**Legal Entity and Its Relationship to Balancing Segments**

Oracle Fusion General Ledger supports up to three balancing segments. Best practices recommend that one of these segments represents your legal entity to ease your requirement to account for your operations to regulatory agencies, tax authorities, and investors. Accounting for your operations means you must produce a balanced trial balance sheet by legal entity. If you account for many legal entities in a single ledger, you must:

1. Identify the legal entities within the ledger.
2. Balance transactions that cross legal entity boundaries through intercompany transactions.
3. Decide which balancing segments correspond to each legal entity and assign them in Oracle Fusion General Ledger Accounting Configuration Manager. Once you assign one balancing segment value in a ledger, then all your balancing segment values must be assigned. This recommended best practice facilitates reporting on assets, liabilities, and income by legal entity.
Represent your legal entities by at least one balancing segment value. You may represent it by two or three balancing segment values if more granular reporting is required. For example, if your legal entity operates in multiple jurisdictions in Europe, you might define balancing segment values and map them to legal reporting units. You can represent a legal entity by more than one balancing segment value, do not use a single balancing segment value to represent more than one legal entity.

In Oracle Fusion General Ledger, there are three balancing segments. You can use separate balancing segments to represent your divisions or strategic business units to enable management reporting at the balance sheet level for each division or business unit. For example, use this solution to empower your business unit and divisional managers to track and assume responsibility for their asset utilization or return on investment. Using multiple balancing segments is also useful when you know at the time of implementation that you are disposing of a part of a legal entity and need to isolate the assets and liabilities for that entity.

**Note**

Implementing multiple balancing segments requires every journal entry that is not balanced by division or business unit, to generate balancing lines. Also, you cannot change to multiple balancing segments easily after you have begun to use the ledger because your historical data is not balanced by the new multiple balancing segments. Restating historical data must be done at that point.

To use this feature for disposal of a part of a legal entity, implement multiple balancing segments at the beginning of the legal entity's corporate life or on conversion to Oracle Fusion.

If you decided to account for each legal entity in a separate ledger, there is no requirement to identify the legal entity with a balancing segment value within the ledger.

**Note**

While transactions that cross balancing segments don’t necessarily cross legal entity boundaries, all transactions that cross legal entity boundaries must cross balancing segments. If you make an acquisition or are preparing to dispose of a portion of your enterprise, you may want to account for that part of the enterprise in its own balancing segment even if it is not a separate legal entity. If you do not map legal entities sharing the same ledger to balancing segments, you will not be able to distinguish them using the intercompany functionality or track their individual equity.

**Legal Entity and Its Relationship to Consolidation Rules**

In Oracle Fusion Applications you can map legal entities to balancing segments and then define consolidation rules using your balancing segments. You are creating a relationship between the definition of your legal entities and their role in your consolidation.

**Legal Entity and its Relationship to Intercompany Transactions**

Use Oracle Fusion Intercompany functionality for automatic creation of intercompany entries across your balancing segments. Intercompany processing
updates legal ownership within the enterprise's groups of legal entities. Invoices or journals are created as needed. To limit the number of trading pairs for your enterprise, set up intercompany organizations and assign them to your authorized legal entities. Define processing options and intercompany accounts to use when creating intercompany transactions and to assist in consolidation elimination entries. These accounts are derived and automatically entered on your intercompany transactions based on legal entities assigned to your intercompany organizations.

Intracompany trading, in which legal ownership isn’t changed but other organizational responsibilities are, is also supported. For example, you can track assets and liabilities that move between your departments within your legal entities by creating departmental level intercompany organizations.

---

**Note**

In the Oracle Fusion Supply Chain applications, model intercompany relationships using business units, from which legal entities are inferred.

---

**Legal Entity and Its Relationship to Worker Assignments and Legal Employer**

Legal entities that employ people are called legal employers in the Oracle Fusion Legal Entity Configurator. You must enter legal employers on worker assignments in Oracle Fusion HCM.

**Legal Entity and Payroll Reporting**

Your legal entities are required to pay payroll tax and social insurance such as social security on your payroll. In Oracle Fusion Applications, you can register payroll statutory units to pay and report on payroll tax and social insurance on behalf of many of your legal entities. As the legal employer, you might be required to pay payroll tax, not only at the national level, but also at the local level. You meet this obligation by establishing your legal entity as a place of work within the jurisdiction of a local authority. Set up legal reporting units to represent the part of your enterprise with a specific legal reporting obligation. You can also mark these legal reporting units as tax reporting units, if the legal entity must pay taxes as a result of establishing a place of business within the jurisdiction.

**Business Units: Explained**

A business unit is a unit of an enterprise that performs one or many business functions that can be rolled up in a management hierarchy. A business unit can process transactions on behalf of many legal entities. Normally, it will have a manager, strategic objectives, a level of autonomy, and responsibility for its profit and loss. Roll business units up into divisions if you structure your chart of accounts with this type of hierarchy. In Oracle Fusion Applications, you assign your business units to one primary ledger. For example, if a business unit is processing payables invoices they will need to post to a particular ledger. This assignment is mandatory for your business units with business functions that produce financial transactions.

In Oracle Fusion Applications, use business unit as a securing mechanism for transactions. For example, if you run your export business separately from your
domestic sales business, secure the export business data to prevent access by the
domestic sales employees. To accomplish this security, set up the export business
and domestic sales business as two separate business units.

The Oracle Fusion Applications business unit model:

- Allows for flexible implementation
- Provides a consistent entity for controlling and reporting on transactions
- Anchors the sharing of sets of reference data across applications

Business units process transactions using reference data sets that reflect your
business rules and policies and can differ from country to country. With Oracle
Fusion Application functionality, you can choose to share reference data, such as
payment terms and transaction types, across business units, or you can choose to
have each business unit manage its own set depending on the level at which you
wish to enforce common policies.

In countries where gapless and chronological sequencing of documents is
required for subledger transactions, define your business units in alignment with
your ledger definition, because the uniqueness of sequencing is only ensured
within a ledger. In these cases, define a single ledger and assign one legal entity
and business unit.

In summary, use business units in the following ways:

- Management reporting
- Processing of transactions
- Security of transactional data
- Reference data definition and sharing

**Brief Overview of Business Unit Security**

Business units are used by a number of Oracle Fusion Applications to implement
data security. You assign data roles to your users to give them access to data in
business units and permit them to perform specific functions on this data. When
a business function is enabled for a business unit, the application can trigger
the creation of data roles for this business unit based on the business function's
related job roles.

For example, if a payables invoicing business function is enabled, then it is
clear that there are employees in this business unit that perform the function
of payables invoicing, and need access to the payables invoicing functionality.
Therefore, based on the correspondence between the business function and the
job roles, appropriate data roles are generated automatically. Use Human Capital
Management (HCM) security profiles to administer security for employees in
business units.

**Creating Business Units in the Enterprise Structures Configurator: Points to
Consider**

Business units are used within Oracle Fusion applications for management
reporting, processing of transactions, and security of transactional data. Using
the Enterprise Structures Configurator (ESC), you create business units for your enterprise either automatically or manually.

Automatically Creating Business Units

To create business units automatically, you must specify the level at which to create business units. Business units within your enterprise may be represented at the business function level, such as Sales, Consulting, Product Development, and so on, or they may be represented at a more detailed level, where a business unit exists for each combination of countries in which you operate and the functions in those countries.

You can automatically create business units at the following levels:

- Country
- Country and Division
- Country and business function
- Division
- Division and legal entity
- Division and business function
- Business function
- Legal entity
- Business function and legal entity

Select the option that best meets your business requirements, but consider the following:

- If you use Oracle Fusion Financials, the legal entity option is recommended because of the manner in which financial transactions are processed.
- The business unit level that you select determines how the application automatically creates reference data sets.

After you select a business unit level, the application generates a list of business units, and you select the ones you want the application to create. If you select a level that has two components, such as country and division, then the system displays a table listing both components, and you select the check boxes at the intersections of the components.

The business units listed by the application are suggestions only, and are meant to simplify the process to create business units. You are not required to select all of the business units suggested. When you navigate to the next page in the ESC guided flow, which is the Manage Business Units page, you cannot delete any of the business units that were created automatically. You must return to the Create Business Units page and deselect any business units that you no longer want.

Example: Selecting Business Unit Levels

InFusion Corporation is using the Enterprise Structures Configurator to set up their enterprise structure. They have identified two divisions, one for Lighting, and one for Security. They operate in four countries: US, UK, Japan, and India, and they have created a legal entity for each of the countries. The sales and
marketing functions are based in both India and Japan, while the US and the UK have only the sales function.
This figure illustrates InFusion Corporation’s enterprise structure.

The following table lists the options for business unit levels and the resulting business units that the application suggests for InFusion Corporation.

<table>
<thead>
<tr>
<th>Business Unit Level</th>
<th>Suggested Business Units</th>
</tr>
</thead>
<tbody>
<tr>

<td>• Infusion Security: India</td>
</tr>
</tbody>
</table>
Manually Creating Business Units

If none of the levels for creating business units meets your business needs, you can create business units manually, and you create them on the Manage Business Units page. If you create business units manually, then no reference data sets are created automatically. You must create them manually as well.

Reference Data Sets and Sharing Methods: Explained

Oracle Fusion Applications reference data sharing feature is also known as SetID. The reference data sharing functionality supports operations in multiple ledgers, business units, and warehouses, thereby reducing the administrative burden and decreasing the time needed to implement new business units. For example, you can share sales methods, transaction types, or payment terms across business units or selected other data across asset books, cost organizations, or project units.

The reference data sharing features use reference data sets to which reference data is assigned. The reference data sets group assigned reference data. The sets can be understood as buckets of reference data assigned to multiple business units or other application components.

Reference Data Sets
You begin this part of your implementation by creating and assigning reference data to sets. Make changes carefully as changes to a particular set will affect
all business units or application components using that set. You can assign a separate set to each business unit for the type of object that is being shared. For example, assign separate sets for payment terms, transaction types, and sales methods to your business units.

Your enterprise can decide that some aspects of corporate policy should affect all business units and leave other aspects to the discretion of the business unit manager. This allows your enterprise to balance autonomy and control for each business unit. For example, if your enterprise holds business unit managers accountable for their profit and loss, but manages working capital requirements at a corporate level, you can let managers define their own sales methods, but define payment terms centrally. In this case, each business unit would have its own reference data set for sales methods, and there would be one central reference data set for payment terms assigned to all business units.

The reference data sharing is especially valuable for lowering the cost of setting up new business units. For example, your enterprise operates in the hospitality industry. You are adding a new business unit to track your new spa services. The hospitality divisional reference data set can be assigned to the new business unit to quickly setup data for this entity component. You can establish other business unit reference data in a business unit specific reference data set as needed.

**Reference Data Sharing Methods**

There are variations in the methods used to share data in reference data sets across different types of objects. The following list identifies the methods:

- **Assignment to one set only, no common values allowed.** The simplest form of sharing reference data that allows assigning a reference data object instance to one and only one set. For example, Asset Prorate Conventions are defined and assigned to only one reference data set. This set can be shared across multiple asset books, but all the values are contained only in this one set.

- **Assignment to one set only, with common values.** The most commonly used method of sharing reference data that allows defining reference data object instance across all sets. For example, Receivables Transaction Types are assigned to a common set that is available to all the business units without the need to be explicitly assigned the transaction types to each business unit. In addition, you can assign a business unit specific set of transaction types. At transaction entry, the list of values for transaction types includes transaction types from the set assigned to the business unit, as well as transaction types assigned to the common set that is shared across all business units.

- **Assignment to multiple sets, no common values allowed.** The method of sharing reference data that allows a reference data object instance to be assigned to multiple sets. For example, Payables Payment Terms use this method. It means that each payment term can be assigned to one or more than one set. For example, you assign the payment term Net 30 to several sets, but the payment term Net 15 is assigned to only your corporate business unit specific set. At transaction entry, the list of values for payment terms consists of only one set of data; the set that is assigned to the transaction’s business unit.

Note: Oracle Fusion Applications contains a reference data set called Enterprise. Define any reference data that affects your entire enterprise in this set.
Business Units and Reference Data Sets: How They Work Together

Reference data sharing is a feature within Oracle Fusion that enables you to group set-enabled reference data such as jobs or grades so that the data can be shared across different parts of the organization. Sets also enable you to filter reference data at the transaction level so that only data that has been assigned to certain sets is available to select. To filter reference data, Oracle Fusion Human Capital Management (HCM), applications use the business unit on the transaction. To set up reference data sharing in Oracle Fusion HCM, you create business units and sets, and then assign the sets to the business units.

Common Set Versus Specific Sets

Some reference data in your organization may be considered global, and should therefore be made available for use within the entire enterprise. You can assign this type of data to the Common Set, which is a predefined set. Regardless of the business unit on a transaction, reference data that has been assigned to the Common Set will always be available, in addition to the reference data that has been assigned to the set that corresponds to the business unit on the transaction.

Other types of reference data may be specific to certain business units, so you want to restrict the use of the data to those business units. In this case, you can create sets specifically for this type of data, and assign the sets to the business units.

Business Unit Set Assignment

When you assign reference data sets to business units, you assign a default reference data set that will be used for all reference data types for that business unit. You can override the set assignment for one or more data types.

Example: Assigning Sets to Business Units

InFusion Corporation has two divisions: Lighting and Security, and the divisions each have two locations. Each location has one or more business functions. The following figure illustrates the structure of InFusion Corporation.
When deciding how to create business units, InFusion decides to create them using the country and business function level. Therefore, they created the following business units:

- Sales_Japan
- Marketing_Japan
- Sales_US
- Sales_UK
- Marketing_India
- Sales_India

Because locations, departments, and grades are specific to each business unit, InFusion does not want to share these types of reference data across business units. They will create a reference data set for each business unit so that data of those types can be set up separately. Because the jobs in the Sales business function are the same across many locations, InFusion decides to create one additional set called Jobs and they will override the set assignment for the Jobs reference data group and assign it to the Jobs set. Based on these requirements, they create the following sets:

- Sales_Japan_Set
- Mktg_Japan_Set
- Sales_US_Set
- Sales_UK_Set
- Mktg_India_Set
- Sales_India_Set
- Grades_Set

InFusion assigns business units to sets as follows:

<table>
<thead>
<tr>
<th>Business Unit</th>
<th>Default Set Assignment</th>
<th>Set Assignment Overrides</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sales_Japan</td>
<td>Sales_Japan_Set for grades, departments, and locations</td>
<td>Jobs set for jobs</td>
</tr>
<tr>
<td>Marketing_Japan</td>
<td>Mktg_Japan_Set for grades, departments, and locations</td>
<td>None</td>
</tr>
<tr>
<td>Sales_US</td>
<td>Sales_US_Set for grades, departments, and locations</td>
<td>Jobs set for jobs</td>
</tr>
<tr>
<td>Sales_UK</td>
<td>Sales_UK_Set for grades, departments, and locations</td>
<td>Jobs set for jobs</td>
</tr>
<tr>
<td>Marketing_India</td>
<td>Mktg_India_Set for grades, departments, and locations</td>
<td>None</td>
</tr>
<tr>
<td>Sales_India</td>
<td>Sales_India_Set for grades, departments, and locations</td>
<td>Jobs set for jobs</td>
</tr>
</tbody>
</table>

When setting up grades, departments, and locations for the business units, InFusion will assign the data to the default set for each business unit. When setting up jobs, they will assign the Jobs set and will assign the Common Set to any jobs that may be used throughout the entire organization.

When using grades, departments, and locations at the transaction level, users will be able to select data from the set that corresponds to the business unit that
they enter on the transaction, and any data that was assigned to the Common Set. For example, for transactions for the Marketing_Japan business unit, grades, locations, and departments from the Mktg_Japan_Set will be available to select, as well as from the Common Set.

When using jobs at the transaction level, users will be able to select jobs from the Jobs set and from the Common Set when they enter one of the Sales business units on the transaction. For example, when a manager hires an employee for the Sales_India business unit, the list of jobs will be filtered to show jobs from the Jobs set and from the Common Set.

The following figure illustrates what sets of jobs can be accessed when a manager creates an assignment for a worker.

Creating Reference Data Sets in the Enterprise Structures Configurator: Explained

If you created business units automatically, then the Enterprise Structures Configurator automatically creates reference data sets for you. The Enterprise Structures Configurator creates one reference data set for each business unit. You can add additional sets, but you cannot delete any of the sets that were created automatically.

A standard set called the Enterprise set is predefined.

Common Set

The common set is a predefined set that enables you to share reference data across business units. When you select set-enabled data at the transaction level, the list of values includes data in both the common set and the set associated with the data type for the business unit on the transaction. For example, when you create an assignment, the list of values for grades will include both grades in the common set and in the set that is assigned to grades for the business unit in which you creating the assignment.

Jobs and Positions: Critical Choices

Jobs and positions represent roles that enable you to distinguish between tasks and the individuals who perform those tasks. The key to whether to use jobs or
positions is how each is used. Positions offer a well-defined space independent of the person performing the job. Jobs are a space defined by the person. A job can be defined globally in the Common Set, whereas a position is defined within one business unit.

You can update the job and department of a position at any time. This is useful if you hire someone into a new role and want to transfer the position to another department.

During implementation, one of the earliest decisions you will make is whether to use jobs or a combination of jobs and positions. The determinants for this decision are:

- The primary industry of your enterprise
- How you manage your people

**Primary Industry of Your Enterprise**

Primary industries and how they usually set up their workforce are listed in the table below.

<table>
<thead>
<tr>
<th>Primary Industry</th>
<th>Workforce Setup</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mining</td>
<td>Positions</td>
</tr>

</tr>
</tbody>
</table>

## Positions: Examples

Positions are typically used by industries that use detailed approval rules, which perform detailed budgeting and maintain head counts, or have high turnover rates.

**Retail Industry**

ABC Corporation has high turnover. It loses approximately 5% of their cashiers monthly. The job of cashier includes three positions: front line cashier, service desk cashier, and layaway cashier. Each job is cross trained to take over another cashier position. When one cashier leaves from any of the positions, another existing cashier from the front line, service desk or layaway can assist where needed. But to ensure short lines and customer satisfaction, ABC must replace each cashier lost to turnover.

Since turnover is high in retail it is better for this industry to use positions. There is an automatic vacancy when an employee terminates employment. The position exists even when there are no holders. This is important if the person who leaves the company is a manager or supervisor with direct reports. All direct reports continue reporting to the position even if it is empty. You do not need to reassign these employees to another manager or supervisor; the replacement manager is assigned to the existing position.

Also, an advantage to using positions is that when you hire somebody new many of the attributes are defaulted in from the position. This speeds up the hiring process.

This figure illustrates the retail position setup.
Health Care Industry

The hospital has a structured head count and detailed budgeting. For example, a specific number of surgeons, nurses, and interns of various types are needed. These positions need to be filled in order for the hospital to run smoothly. Use jobs and positions if you need to apply detailed head count rules.

Health care is an industry that needs to regulate employment, roles, and compensation according to strict policies and procedures. Fixed roles tend to endure over time, surviving multiple incumbents. Industries that manage roles rather than individuals, where roles continue to exist after individuals leave, typically model the workforce using positions.

This figure illustrates the hospital position setup.

Jobs: Example

Jobs are typically used without positions by service industries where flexibility and organizational change are key features.
Software Industry

For example, XYZ Corporation has a director over the departments for developers, quality assurance, and technical writers. Recently, three developers have left the company. The director decides to redirect the head count to other areas. Instead of hiring all three back into development, one person is hired to each department, quality assurance, and technical writing.

In software industries, the organization is fluid. Using jobs gives an enterprise the flexibility to determine where to use head count, because the job only exists through the person performing it. In this example, when the three developers leave XYZ Corporation, their jobs no longer exist, therefore the corporation has the flexibility to move the headcount to other areas.

This figure illustrates the software industry job setup.

![Software Industry Job Setup Diagram](image)

Job and Position Structures: Explained

Job and position structures identify the descriptive flexfield structure that enables you to specify additional attributes that you want to capture when you define jobs and positions. Job and position attributes provide further detail to make jobs and positions more specific. You also use attributes to define the structure of your jobs and positions. You can specify attributes at the enterprise level for jobs and positions, at the business unit level for positions, and at the reference data set level for jobs. Job and position structures are optional.

Enterprise-Level Job Attributes

When you define a job, you enter a value for the name of the job. To make job names more specific, set up attributes that enable you to identify additional details about the job, such as the nature of the work that is performed or the relative skill level required for the job. If these attributes apply to all jobs within your enterprise, set up enterprise-level job attributes. Standard capabilities mean that you can use the different segments of the name to identify common jobs or job holders for analysis or compensation, or for grouping records in reports, for example, to find all jobs of a specific job type. You should not use attributes with values that change regularly, for example, salary ranges or expense approval levels that change every year.
This figure illustrates how job type and job level provide further details for the HR Application Specialist job.

Enterprise-Level Position Attributes

Position attributes at the enterprise level are similar to those for jobs. Each position that you define identifies a specific role in the enterprise, which you can manage independently of the person in the position, and it will belong to one specific department or organization. The name of each position must be unique. To simplify the process of managing unique names for positions, set up enterprise-level attributes to identify separate components of the position name. For example, you can set up an attribute for position title and one for position number. When defining the attributes that make up the structure of a position name you should also consider if any of your attributes are part of the definition of a common job type. Using job types for a position can help you manage common information that applies to many different positions. For example you can define a job type of Manager.Level 1 and use this for comparison of positions across departments or lines of business, or for setting common job requirements. You can then define multiple manager type positions in your HR department, each of which has responsibility for a different management function or group. This figure illustrates how title and position number provide further details for the manager position.

Business Unit-Level Attributes for Positions

If you have information that you want to capture for positions that is specific to each business unit, then you can define attributes at the business unit level.
for positions. When you create positions, these attributes appear in addition to any enterprise-level attributes. For example, you may want to identify the sales region for all positions in the sales business unit. You can set up a text attribute called Sales Region and use it to enter the necessary information when creating positions for the sales business unit.

**Reference Data Set-Level Attributes for Jobs**

If you have information for jobs that applies to specific reference data sets, set up attributes for jobs at the reference data set level. When you create jobs, these attributes appear in addition to any enterprise-level attributes. For example, you may want to identify all information technology (IT) jobs within a specific set. You can set up a text attribute called Function and use it to enter IT in jobs that you create that perform an IT function within a specific set.

**FAQs for Define Initial Configuration**

**What happens if I don't use the Enterprise Structures Configurator to set up my enterprise structures?**

The Enterprise Structures Configurator is an interview-based tool that guides you through setting up divisions, legal entities, business units, and reference data sets. The tool also enables you to assign reference data sets to business units and locations. You can set up multiple configurations to perform what-if scenarios, and then print each configuration to compare the resulting enterprise structure. If you do not use the Enterprise Structures Configurator, then you must set up your enterprise structure using the individual tasks that correspond to each enterprise component. In addition, you will not be able to set up multiple configurations and compare different scenarios. It is recommended that you use the Enterprise Structures Configurator.

**What's an ultimate holding company?**

The legal entity that represents the top level in your organization hierarchy, as defined by the legal name entered for the enterprise. This designation is used only to create an organization tree, with the ultimate holding company as the top level, divisions and country holding companies as the second level, and legal employers as the third level.

**What's the default reference data set?**

The reference data set that is assigned to a business unit for all reference data groups, such as grades, locations, departments, and jobs. You can override the default reference data set for any reference data group.

**What happens if I override the set assignment?**

For the selected business unit, you can override the default reference data set for one or more reference data groups. For example, assume you have three
reference data groups: Vision 1 SET, Vision 2 SET, and Vision 3 SET, where Vision SET 1 is the default set for business unit United Kingdom Vision 1 BU. You can override the default so that grades are assigned to Vision 2 SET, departments are assigned to Vision 3 SET, and jobs are assigned to the default set, Vision 3 SET.

Define Reference Data Sharing

Reference Data Sharing: Explained

Reference data sharing facilitates sharing of configuration data such as jobs and payment terms, across organizational divisions or business units. You define reference data sets and determine how the data is shared or partitioned. Use reference data sets to reduce duplication and maintenance by sharing common data across business entities where appropriate. Depending on the requirement (specific or common), each business unit can maintain its data at a central location, using a set of values either specific to it or shared by other business units.

You can share reference data after it is filtered on the basis of sets. A common reference data set is available as the default set, which can be assigned to several business units sharing the same reference data. For commonly used data such as currencies, you can use the common reference data set and assign it to multiple business units in various countries that use the same currency. In cases where the default set cannot be assigned to an entity, you can create specific sets. The data set visible on the transactional page depends on the sharing method used to share reference data.

For example, XYZ Corporation uses the same grades throughout the entire organization. Instead of managers in different business units setting up the same grades, XYZ Corporation decides to create a set called Grades and assign the grades reference data group for all business units in the organization to the Grades set, so that the grades can be shared.

Note

For specific information on configuring reference data sharing for a particular object or product, refer to its product documentation.

Define Enterprise: Manage Enterprise HCM Information

Enterprise: Explained

An enterprise consists of legal entities under common control and management.
Enterprise Defined

When implementing Oracle Fusion Applications you operate within the context of an enterprise that has already been created in the application for you. This is either a predefined enterprise or an enterprise that has been created in the application by a system administrator.

An enterprise organization captures the name of the deploying enterprise and the location of the headquarters. There is normally a single enterprise organization in a production environment. Multiple enterprises are defined when the system is used to administer multiple customer companies, for example, multiple tenants, or when a customer chooses to set up additional enterprises for testing or development.

Oracle Fusion Applications offers capabilities for multiple tenants to share the same applications instance for some human resources processes. If you offer business process outsourcing services to a set of clients, each of those clients may be represented as an enterprise within an Oracle Fusion Application instance. To support this functionality, system owned reference data such as sequences, sets, and flexfields are also defined within an enterprise.

In Oracle Fusion Applications, an organization classified as an enterprise is defined before defining any other organizations in the HCM Common Organization Model. All other organizations are defined as belonging to an enterprise.

Define Enterprise: Manage Locations

Locations: Explained

A location identifies physical addresses of a workforce structure, such as a department or a job. You can also create locations to enter the addresses of external organizations that you want to maintain, such as employment agencies, tax authorities, and insurance or benefits carriers.

The locations that you create exist as separate structures that you can use for reporting purposes, and also in rules that determine employee eligibility for various types of compensation and benefits. You enter information about a location only once. Subsequently, when you set up other workforce structures you select the location from a list.

Location Sets

When you create a location, you must associate it with a set. Only those users who have access to the set's business unit can access the location set and other associated workforce structure sets, such as those that contain departments and jobs.

You can also associate the location to the common set so that users across your enterprise can access the location irrespective of their business unit. When users search for locations, they can see the locations that they have access to along with the locations in the common set.
The following figure shows how locations sets restrict access to users.

**Uploading Locations Using a Spreadsheet**

If you have a list of locations already defined for your enterprise, you can upload them from a spreadsheet. To use this option, you first download a spreadsheet template, add your location information to the spreadsheet, and then upload directly to your enterprise configuration. You can upload the spreadsheet multiple times to accommodate revisions.

**Define Geographies**

**Defining Address Cleansing: Explained**

Address cleansing provides a way to validate, correct, and standardize addresses that are entered in a user interface. Geography validation only validates the geography attributes of an address, for example, State, City, and Postal codes; address cleansing validates both the geography attributes and the address line attributes.

To be able to use the address cleansing functionality, you need to have license for the customer data quality application, because the feature is delivered using data quality integration.

You can specify the real time address cleansing level for each country by choosing either **None**, meaning that there is no real time address cleansing, or by choosing **Optional**, meaning that you will have the choice to cleanse addresses. Once you have enabled address cleansing for a country a **Verify Address** icon appears at address entry points in the application. You can then click the icon to perform address cleansing and receive a corrected, standardized address. If the application does not find a matching address it will alert you.
Geography Structure, Hierarchy, and Validation: How They Fit Together

There are three components that are dependent on each other when defining a country: geography structure, geography hierarchy, and geography validation. Every country has to have the geography structure defined first before the hierarchy can be defined, and the geography hierarchy has to be defined before the validation can be defined.

Geography Structure

Firstly, you need to create a geography structure for each country to define which geography types are part of the country structure, and how the geography types are hierarchically related within the country structure. For example, you can create geography types called State, City, and Postal Code. Then you can rank the State geography type as the highest level within the country, the City as the second level, and the Postal Code as the lowest level within the country structure. Geography structure can be defined using the Manage Geographies task, or can be imported using tasks in the Define Geographies activity.

Geography Hierarchy

Once the geography structure is defined, the geographies for each geography type can be added to the hierarchy. For example, below the United States you can create a geography called California using a State geography type.

As part of managing the geography hierarchy you can view, create, edit, and delete the geographies for each geography type in the country structure. You can also add a primary and alternate name and code for each geography. A geography hierarchy can be created using the Manage Geographies task, or can be imported using tasks in the Define Geographies activity.

Geography Validation

After defining the geography hierarchy, you need to specify the geography validations for the country. You can choose which address style formats you would like to use for the country, and for each selected address style format you can map geography types to address attributes. You can also select which geography types should be included in geography or tax validation, and which geography types will display in a list of values during address entry in other user interfaces. The geography validation level for the country, such as error or warning, can also be selected.

Geography Structures: Explained

A geography structure is a hierarchical grouping of geography types for a country. For example, the geography structure for the United States is the geography type of State at the top, then followed by the County, then the City, and finally the Postal Code.

You can use the geography structure to establish:

- How geographies can be related
The types of geographies you can define for the country

**How Geographies Can Be Related**

You can determine how a country’s geographies are hierarchically related by creating the hierarchy of the geography types in the geography structure. When you define a country’s structure the country geography type is implicitly at the top of the geography structure, and the numbering of the subsequent levels start with 1 as the next geography level after country.

You must add a geography type as a level in the country structure before you can define a geography for that geography type in a country. For example, before defining the state of California, the State geography type must be added to the United States country structure. Only one geography type can be used for each level, you cannot define more than one geography type at the same level.

**Note**

After you first define a country structure you can only add geography types below the current lowest level, and delete geography types without defined geographies.

To simplify the creation of a country structure you can copy a structure from another country, and then amend the geography type hierarchy for the country.

**The Types of Geographies You Can Define for the Country**

The application provides you with a set of available master reference geography types. If required, you can create a geography type before adding it to the country structure. Each geography type is added below the current lowest level.

**Note**

If you want to delete a geography type that is not at the lowest level in the country structure, then you have to delete the geography type level and all the levels below it.

A geography type that you create within the country structure can be used for other country structures as well.

**Geography Hierarchy: Explained**

Geography hierarchy is a data model that lets you establish conceptual parent-child relationships between geographies. A geography, such as Tokyo or Peru, describes a boundary on the surface of the earth. The application can extrapolate information based on this network of hierarchical geographical relationships.

For example, in the geography hierarchy the state of California is defined as the parent of San Mateo county, which is the parent of Redwood City, which is the parent of the postal code 94065. If you enter just 94065, the application can determine that the postal code is in California, or that the corresponding city is Redwood City.

The application leverages geography hierarchy information to facilitate business processes that rely on geography information, for example, tax calculation, order sourcing rules, sales territory definition. The geography hierarchy information is centrally located and shared among other application offerings.
The top level of the geography hierarchy is Country, so the hierarchy essentially contains countries and their child geographies. Other aspects of the geography hierarchy include:

- Geography
- Geography type
- Geography usage
- Master reference geography hierarchy
- User defined zones

**Geography**

A geography is a boundary such as a country, state, province or city. It is a physical space with boundaries that is a defined instance of a geography type. For example, San Jose is a geography of the City geography type.

**Geography Type**

Geography types are a divisional grouping of geographies, which can be either geopolitical (for example, City, Province, and District) or user defined (for example, Continent, Country Regions, Tax Regions).

**Geography Usage**

Geography usage indicates how a geography type or geography is used in the application. A master reference geography always has the usage of Master Reference. User defined zones can have the usages of Tax, Shipping, or Territory, based on what is relevant for their purpose.

**Master Reference Geography Hierarchy**

The geography hierarchy data is considered to be the single source of truth for geographies. It comprises all geography related data, including geography types and geographies.

The geography usage for the entire hierarchy is the master reference, and defined geography types and geographies are considered as master reference geography types and geographies. For example, Country is a universally recognized geography type, and United States is considered a master geography.

**User Defined Zones**

User defined zones are a collection of geographical data, created from master reference data for a specific purpose. For example, territory zones are collections of master reference geographies ordered in a hierarchy. Tax and shipping zones are collections of master reference geographies without a hierarchical grouping.

**Geography Validation: Explained**

Geography validation determines the geography mapping and validation for a country’s address styles, as well as the overall geography validation control for a country.
The **No Styles Format** address style format is the default address style format for a country. By defining the mapping and validation for this format you will ensure that validations can be performed for any address in the country. After the **No Styles Format** is defined you can set up additional mapping for specific address styles.

For each address style format, you can define the following:

- Map to attribute
- Enable list of values
- Tax validation
- Geography validation
- Geography validation control

### Map to Attribute

For every address style format, you can map each geography type to an address attribute. For example, you can map the **State** geography type to the **State** address attribute for the United States, or map the **State** geography type to the **County** address attribute for the United Kingdom. The geography types that appear are based on how the country structure is defined. The list of address attributes that appear are based on address formats delivered with the application, or your customer defined address formats.

**Note**

You only need to map geography types that you want to use for geography or tax validation purposes.

### Enable List of Values

Once a geography type is mapped to an attribute, then you can specify whether the geography type will appear in a list of values during address entry in user interfaces. It is very important to review carefully if you want to enable a list of values. You should only enable a list of values if you have sufficient geography data imported or created for that geography. Once you have enabled a list of values for an address attribute, you can only select the geography data available for the geography type. This means that if a specific geography value is not available in the geography hierarchy, you cannot create an address with a different geography value.

### Tax Validation

You can also specify whether a geography type will be included in tax validation. For example, for the United States North America address style format you specify that County, State, and City are used for tax validation. This will mean that when a transaction involves an address with the North America address style, the address must have the correct county, state, and city combination based on the geography hierarchy data, to be considered valid for tax calculation.

### Geography Validation

You can specify whether a geography type will be included in geography validation. This will mean that, for example, when the user enters a United...
States address using the North America address style format, the address must have the correct country, state, and postal code combination based on geography hierarchy data to be considered geographically valid.

If an address element is mapped to a geography type, but not selected for geography validation usage, then during address entry suggested values will be provided for the address element, but the address element will not be validated.

**Note**
For either the tax or geography validation, do not skip more than one consecutive level unless you are certain that the selected geography types can uniquely identify geographies. For example, the United States country structure is: State, County, City, and Postal Code, and you want to select just State and Postal Code for geography or tax validation. However, for the combination of California and 94065, the city can be either Redwood Shores or Redwood City. In this case, you should also select at least the City geography type for geography or tax validation.

**Geography Validation Control**

You can select the geography validation level for a country. Validation will check if the entered address maps to the geography hierarchy data available for the country, and the geography validation control determines whether you can save an address that did not pass validation during address entry. For example, if the validation level is **Error**, then an address cannot be saved if the values do not match the geography hierarchy data.

These are the geography validation levels you can choose:

- **Error** - only completely valid addresses can be saved, with all mandatory address elements entered.
- **No Validation** - all addresses can be saved including incomplete and invalid addresses.

Regardless of the result of validation, the validation process will try to map any address attribute to a geography of the country, and store any mapping it could establish based on the available data. This is called **Geography Name Referencing** and it is executed as part of validation. The result of this referencing is used in several business processes in the application to map an address to a specific geography or zone.

**Note**
The Geography Dimension value in territories is derived from sell-to addresses of sales accounts. To use geography dimensions in territories, ensure that the geography elements in addresses, such as state, city, and postal code, are validated. You can do so by enabling geography validation for each country using the Manage Geographies task. While doing so, ensure that at least one level in the geography hierarchy is enabled for geography validation. It is recommended that you enable geography validation for all geography levels that you intend to use for territory definition for each country. You can enable a list of values containing specific geography elements. This will help users search and select appropriate geography values during addresses entry and eliminate all possibilities of wrong address entry. You can also set geography validation control to **Error** in the Manage Geography Validation page. This ensures that users can only use valid geography elements in addresses. If you have already
created addresses before setting up geography validation for a country, you must execute the Run Maintain Geography Name Referencing task for that country after enabling geography validation to ensure that all your geography elements are validated.

---

**Importing Geographies: Explained**

A geography, such as Tokyo or Peru, describes a boundary on the surface of the earth. You can create new geographies by importing data through interface tables. There are two options for populating the interface tables: using the tool of your preference to load the data or using file-based data import. If you plan to provide the data details in a source file, use the file-based import feature. If you will populate the interface table directly, run the geography loader process to import the data. Having a good understanding of the import entity, interface table, and destination table will help you prepare your import data.

Consider the following when importing geographies:

- File-based import option
- Geography loader process option
- Import object entity, interface table, and destination tables

**File-Based Import Option**

The file-based import process reads the data included in your XML or text file, populates the interface tables, and imports the data into the application destination tables. The **File-Based Data Import Setup and Maintenance** task list includes the tasks needed to configure the geography import object, create source file mappings, and schedule the import activities.

**Geography Loader Process Option**

Populate the interface table with your import data, then navigate to the **Run Geography Loader Setup and Maintenance** task to schedule the import of data from the interface table to the destination table.

**Import Object Entity, Interface Table, and Destination Tables**

The geography import object consists of one entity and interface table that forms the geography. If you are using file-based import, you can map your source file data to import entity attributes that correspond to the interface table columns. The import activity process populates the interface table based on the mapping and your source file. If using the geography loader scheduled process, populate the interface table directly using your preferred tool. If you need the unique IDs of existing application data for your import data, use the **Define Data Export Setup and Maintenance** task list to export the information.

**Note**

Spreadsheets containing detailed information about each interface table, including the import attributes, corresponding interface table columns, defaults,
and validations, are available from the Oracle Enterprise Repository by searching on a specific interface table name or initiating a search using the **FusionApps: Interface Table** asset type.

The following lists the object entity, tables, and resulting application object:

**Importing Country Structures Using File-Based Import: Explained**

This topic explains how to prepare and import country structure data from an external data source into Oracle Sales Cloud using the File-Based Data Import feature. A country structure is a hierarchical grouping of geography types for a country. For example, the geography structure for the United States has the geography type of State at the top, followed by the County, then the City, and finally the Postal Code.

You can use the country structure to set up the following:

- The relationships between geographies within a country
- The types of geographies that you can define for a country

Consider the following questions when importing your data:

- How does your legacy system or source system represent the country structure compared to how Oracle Sales Cloud represents the same data?
- Do you have to configure values in Oracle Sales Cloud to map to your data values?
- Do you have to customize Oracle Sales Cloud to capture additional attributes that are critical to the way you do business?
- What import features are available for importing your business object?
- How do you verify your imported data?

**Comparing Business Object Structures**

You must understand how your country structure data corresponds with the data in Oracle Sales Cloud in order to be able to map your legacy data to the data needed by Oracle Sales Cloud. First, you must understand how Oracle Sales Cloud represents the structure of the data for a country structure.

You must import a separate country structure import object for each country. Each of these import objects must contain the geography types that are used in the country’s structure, organized in a hierarchy using geography level numbers. For example, if you are importing the country structure of Australia, the country structure could be the following: 1: Country, 2: State, 3: County, 4: Town, 5: ZIP.
Import Objects for the Country Structure

To facilitate the import of country structures, Oracle Sales Cloud incorporates the structure of the country structure into import objects. The import object for country structures is GeoStructureLevel.

Comparing Business Object Data

Each import object is a collection of attributes that helps to map your data to the Oracle Sales Cloud data and to support one-to-many relationships between the structural components that make up the country structure.

A good understanding of the attribute details of the import objects is critical to preparing your import data. For information about the Oracle Sales Cloud attributes, see the Oracle Enterprise Repository. The reference files contain descriptions, logic used to choose default values, and validation information for each of the Oracle Sales Cloud attributes. The validation information includes the navigation to the task where you can define values in Oracle Sales Cloud. For example, if you have values in your data that correlate to a choice list in Oracle Sales Cloud, then the validation information for that attribute provides the task name in the Setup and Maintenance work area where you can define your values. For additional information, including a list of reference file names and locations that you need to complete this task, see the following table.

<table>

<td>Country Structure Import Objects: How They Work Together</td>
</tr>
</tbody>
</table>

Extensible Attributes

If you need to extend the Oracle Sales Cloud object to import your legacy or source data, you must use Application Composer to design your object model extensions and to generate the required artifacts to register your extensions and make them available for importing. The corresponding import object is updated with the extensible attributes, which can then be mapped to your source file data. You can use the same source file to import both extensible custom attributes and the standard import object attributes.

Importing Country Structures Using File-Based Data Import

For the country structure business object, you must use the File-Based Data Import feature. You prepare XML or text source data files in a form that is suitable for file-based import. The file-based import process reads the data included in your source file, populates the interface tables according to your mapping, and imports the data into the application destination tables.

The Define File-Based Data Import Setup and Maintenance task list includes the tasks needed to configure the import objects, to create source-file mappings, and to schedule the import activities. You submit file-based import activities for each import object. When creating a new country structure, you import the Country Structure object.

You must be assigned the Master Data Management Administrator job role to access and submit the import activities for country structures.
Verifying Your Imported Data

You can view the list of import activities from the Manage Import Activities page. You can verify your imported data by clicking the Status column for your import activity.

Country Structure Import Objects: How They Work Together

This topic describes the Country Structure import object. You use the Country Structure import object when you submit a file-based import activity to import your country structure information. This topic introduces the following:

• Target import object concepts
• Target objects for the Country Structure import object
• Target import object attributes
• Target object attribute reference guide files

Target Import Object Concepts

The Country Structure import object is used to import a country structure hierarchy, including details, such as geography type, geography type name, parent geography type, geography level numbers, and so on. To map the source data in your import file to the target attributes in Oracle Sales Cloud, you must understand how the target objects are related and what attributes are included in each target object.

Country Structure Target Import Objects

The Country Structure import object contains one target import object that organizes the individual attributes of the different aspects of the geography structure. When updating an existing country structure, you must provide the parent reference information of the existing country structure. This reference information connects the imported geography structure to the existing one. Use the ImpGeoStructureLevel target import object to create and update country structure information.

Target Import Objects Attributes

You must compare the attributes that you want to import with the target object attributes that are available and their valid values. To evaluate your source data and Oracle Sales Cloud attributes for mapping and validation, you use an Oracle Enterprise Repository reference guide, which is available for each target import object. The reference guide file includes attribute descriptions, default values, and validations performed by the import process. Review the validation for each attribute to determine whether there are functional prerequisites or setup tasks that are required.

To import your source file data, you define a mapping between your source file data and the combination of the target object and target object attribute. You can predefined and manage import mappings using the File-Based Import Mapping task, or you can define the mapping when you define the import activity using the File-Based Import Activity task. Both tasks are available in the Setup and Maintenance work area.
Note
If any of the attributes you want to import does not have an equivalent target object attribute, then review the Application Composer extensibility features for country structures.

Target Import Objects Attributes Resources
To access the reference guide files for the country code’s target import objects, see the File-Based Data Import assets in Oracle Enterprise Repository (http://fusionappsor.oracle.com).

For detailed information on importing geographies using file-based import, refer to Document No. 1481758.1, Importing Master Reference Geography Data, on the Oracle Support site.

The following table lists the reference guide files that are available from the Documentation tab for the Country Code File-Based Data Import asset.

<table>
<thead>

Importing Geographies Using File-Based Import: Explained

This topic describes the tasks you must perform to import geography information. A geography is any region with a boundary around it, regardless of its size. It might be a state, a country, a city, a county, or a ward. You must create or import geographies before you can associate them with custom zones and addresses.

Consider the following questions when importing your data:

- How does your legacy system or source system represent the geography compared to how Oracle Sales Cloud represents the same data?
- Do you have to configure values in Oracle Sales Cloud to map to your data values?
- What import features are available for importing your business object?
- How do you verify your imported data?

Comparing Business Object Structures

You must understand how your geography data corresponds with the data in Oracle Sales Cloud in order to be able to map your legacy data to the data needed by Oracle Sales Cloud. First, you must understand how Oracle Sales Cloud represents the structure of the data for a geography.
You must import a separate country structure import object for each country. Each of these import objects must contain the geography types that are used in the country's structure, organized in a hierarchy using geography level numbers. For example, if you are importing the country structure of Australia, the country structure could be the following: 1: Country, 2: State, 3: County, 4: Town, 5: ZIP.

**Import Objects for the Geography**

To facilitate the import of geographies, Oracle Sales Cloud incorporates the structure of the geography into import objects. The import object for the geography is ImpGeography.

**Comparing Business Object Data**

Each import object is a collection of attributes that helps to map your data to the Oracle Sales Cloud data and to support one-to-many relationships between the structural components that make up the geography.

A good understanding of the attribute details of the import objects is critical to preparing your import data. For information about the Oracle Sales Cloud attributes, see the Oracle Enterprise Repository. The reference guide files contain descriptions, logic used to choose default values, and validation information for each import object attribute. The validation information includes the navigation to the task where you can define values in Oracle Sales Cloud. For example, if you have values in your data that correlate to a choice list in Oracle Sales Cloud, then the validation information for that attribute provides the task name in the Setup and Maintenance work area where you can define your values. For additional information, including a list of reference file names and locations that you need to complete this task, see the following table.

<table>
<thead>
<tr>
<th>Import Object</th>
<th>Related Import Object Topic</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImpGeography</td>
<td>Geography Import Objects: How They Work Together</td>
</tr>
</tbody>
</table>

Hint: You can use the keyword importing geographies to search for related topics in Help.

**Extensible Attributes**

Oracle Sales Cloud does not support extensible attributes for geographies. You can only import data for attributes provided by Oracle Sales Cloud.

**Importing Geographies Using File-Based Data Import**

For the geography business object, you must use the File-Based Data Import feature. You prepare XML or text source data files in a form that is suitable for file-based import. The file-based import process reads the data included in your source file, populates the interface tables according to your mapping, and imports the data into the application destination tables.

The Define File-Based Data Import Setup and Maintenance task list includes the tasks needed to configure the import objects, to create source-file mappings, and to schedule the import activities. You submit file-based import activities for each import object. When creating a new geography, you import the Geography
object. You must be assigned the Master Data Management Administrator job role to access and submit the import activities for geographies. When importing geography information, you must provide the parent reference information for all parent levels for the entity.

Verifying Your Imported Data

Oracle Sales Cloud provides File-Based Import activity reports, which can be used to verify imported data. Users with the Master Data Management Administrator job role can also navigate to the Manage Geographies work area to view the imported geographies.

Geography Import Objects: How They Work Together

This topic describes the Geography import object. You use the Geography import object to import geography information. This topic introduces the following:

- Target import object concepts
- Target objects for the Geography import object
- Target import object attributes
- Target import object attribute reference guide files

Target Import Object Concepts

The Geography import object is used to import geography hierarchy information to create or update the geography data of a country. To map the source data in your import file to the target attributes in Oracle Sales Cloud, you must understand how the target objects are related and what attributes are included in each target object.

Geography Target Import Objects

The target import objects in the Geography import object contain information about the geography hierarchy. When updating an existing geography, you must provide the parent reference information of the existing geography, which connects the geography to the country of which it is a part. Use the ImpGeography target import object to create and update geography information.

Note

Before you import geography data for a country, you must define the country’s geography structure.

Target Import Objects Attributes

You must compare the attributes that you want to import with the target object attributes that are available and their valid values. To evaluate your source data and Oracle Sales Cloud attributes for mapping and validation, you use an Oracle Enterprise Repository reference guide, which is available for each target import object. The reference guide file includes attribute descriptions, default values, and validations performed by the import process. Review the validation for each attribute to determine whether there are functional prerequisites or setup tasks that are required.
To import your source file data, you define a mapping between your source file data and the combination of the target object and target object attribute. You can predefined and manage import mappings using the File-Based Import Mapping task, or you can define the mapping when you define the import activity using the File-Based Import Activity task. Both tasks are available in the Setup and Maintenance work area.

**Target Import Objects Attributes Resources**

To access the reference guide files for the geography's target import objects, see the File-Based Data Import assets in Oracle Enterprise Repository (http://fusionappsoer.oracle.com).

For detailed information on importing geographies using file-based import, refer to Document No. 1481758.1, Importing Master Reference Geography Data, on the Oracle Support site.

The following table lists the reference guide files that are available from the Documentation tab for the Geography File-Based Data Import asset.

<table>
<thead>
<tr>
<th>Target Import Object</th>
<th>Description</th>
<th>Attribute Reference Guide File Names</th>
</tr>
</thead>
<tbody>
<tr>
<td>ImpGeography</td>
<td>Contains information that captures a country's geography hierarchy details. Sample attributes: CountryCode, GeoDataProvider, GeographyType, PrimaryGeographyCode, PrimaryGeographyCodeType, and PrimaryGeographyName. Reference attribute: CountryCode</td>
<td>HZ_IMP_GEOGRAPHIES_T_Reference</td>
</tr>
</tbody>
</table>

**Importing Geographies Using File-based Data Import: Worked Example**

This example demonstrates how to import data using the File-Based Data Import tool. In this particular example, you have a source file containing geography data that you want to import into the application, so that the geography data can be used for real time address validation and tax purposes.

The following table summarizes the key decisions that you need to make in this scenario:

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>What type of object are you importing?</td>
<td>Geography</td>
</tr>
<tr>
<td>What file type are you using for your source data?</td>
<td>Text file</td>
</tr>
<tr>
<td>Where are you uploading your source data file from?</td>
<td>Your desktop</td>
</tr>
<tr>
<td>What data type is your source data file?</td>
<td>Comma separated</td>
</tr>
<tr>
<td>Which fields are you importing into Oracle Sales Cloud?</td>
<td>All, except for the RecordTypeCode field</td>
</tr>
<tr>
<td>When do you want to process the import?</td>
<td>Immediately</td>
</tr>
</tbody>
</table>
Summary of the Tasks

These are the steps that are required to create an import activity and activate the import:

1. Determine what information is in the source file.
2. Create and schedule the import activity.
3. Monitor the import results.

Prerequisites When Importing Additional Geography Data After Your Initial Import

1. You need to ensure that the combination of Source ID and Parent Source ID values are unique for each row of data within a single import. However, your source data files do not need to have the same Source ID and Parent Source ID values as your previously imported geography data. If the geography structure levels and the parents for each geography value are the same, the changed IDs will not affect the import.

2. Ensure that all of the parents of a child geography are included in your data file so that the child geography can be added. For example, if you originally imported US, CA, and San Francisco, and now you want to import the city of San Jose in CA, then your data file needs to include US, CA, and San Jose.

3. Check that your source data file has the correct values for the geography data that you have already loaded. For example, if your initial import included the value US for country and CA as state, and in a subsequent import you have California as a state, your geography import will result in two state records (CA and California) in the application data, with the US as the country parent.

Determine What Information Is in the Source File

1. Your source geography data files should include a unique Source ID value for each row of data, and a Parent Source ID value which identifies the parent of that row of geography data. Source IDs, or Parent Source IDs, should not be longer than 18 characters. You could structure your geography source data as follows:

<table>
<thead>
<tr>
<th>Geography Level</th>
<th>Name</th>
<th>Source ID</th>
<th>Parent Source ID</th>
</tr>
</thead>
<tbody>
<tr>
<td>1 (Country)</td>
<td>US</td>
<td>1</td>
<td></td>
</tr>
<tr>
<td>2 (State)</td>
<td>CA</td>
<td>11</td>
<td>1</td>
</tr>
<tr>
<td>3 (County)</td>
<td>Alameda</td>
<td>111</td>
<td>11</td>
</tr>
<tr>
<td>4 (City)</td>
<td>Pleasanton</td>
<td>1111</td>
<td>111</td>
</tr>
<tr>
<td>4 (City)</td>
<td>Dublin</td>
<td>1112</td>
<td>111</td>
</tr>
</tbody>
</table>

Create and Schedule the Import Activity

You create an import activity, enter the import details, and schedule the import. An import activity definition provides instructions for the import processing, including details related to selecting the source file, or file location; mapping
fields from the source file to the Oracle Sales Cloud database object and attribute, and scheduling the import.

1. Navigate to Setup and Maintenance and search for the Manage File Import Activities task. Click Go to Task.

2. In the Manage Import Activities page, click the Create icon.

3. In the Create Import Activity: Set Up page, create an import activity for the Geography object type by completing the fields, as shown in this table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Master Reference Geographies</td>
</tr>
<tr>
<td>Object</td>
<td>Geography</td>
</tr>
<tr>
<td>File Type</td>
<td>Text File</td>
</tr>
<tr>
<td>File Selection</td>
<td>Specific file</td>
</tr>
<tr>
<td>Upload From</td>
<td>Desktop</td>
</tr>
<tr>
<td>File Name</td>
<td>Choose relevant file from desktop</td>
</tr>
<tr>
<td>Data Type</td>
<td>Comma separated</td>
</tr>
</tbody>
</table>

**Note**

Ensure that the file type that you select in the Create Import Activity: Set Up page matches the file type of the source data file.

4. Click Next.

5. On the Create Import Activity: Map Fields page, map each field from your source file to the Oracle Sales Cloud database object and attribute, as shown in this example:

<table>
<thead>
<tr>
<th>Column Header</th>
<th>Example Value</th>
<th>Ignore</th>
<th>Object</th>
<th>Attribute</th>
</tr>
</thead>
<tbody>
<tr>
<td>Primary</td>
<td>Geography</td>
<td></td>
<td>Imp</td>
<td>Geography</td>
</tr>
<tr>
<td>Geography</td>
<td>Name</td>
<td>United</td>
<td>United</td>
<td>Geography</td>
</tr>
<tr>
<td>Name</td>
<td>Primary</td>
<td>States</td>
<td>Imp</td>
<td>Primary</td>
</tr>
<tr>
<td>Geography</td>
<td>Name</td>
<td>United</td>
<td>Geography</td>
<td>Geography</td>
</tr>
<tr>
<td>Country</td>
<td>Code</td>
<td>No</td>
<td>Imp</td>
<td>Country</td>
</tr>
<tr>
<td>Code</td>
<td></td>
<td></td>
<td>Geography</td>
<td>Country</td>
</tr>
<tr>
<td>Record Type</td>
<td>Code</td>
<td>Yes</td>
<td>Imp</td>
<td>Record Type</td>
</tr>
<tr>
<td>Code</td>
<td></td>
<td></td>
<td>Geography</td>
<td>Record Type</td>
</tr>
<tr>
<td>Source ID</td>
<td>10265</td>
<td>No</td>
<td>Imp</td>
<td>Source ID</td>
</tr>
<tr>
<td>Source ID</td>
<td></td>
<td></td>
<td>Geography</td>
<td>Source ID</td>
</tr>
<tr>
<td>Parent Source</td>
<td>ID</td>
<td>No</td>
<td>Imp</td>
<td>Parent</td>
</tr>
<tr>
<td>Source ID</td>
<td>1053</td>
<td></td>
<td>Geography</td>
<td>Source ID</td>
</tr>
</tbody>
</table>

If you do not want to import a column in the text file you can select Ignore.

**Note**
If you have any difficulties mapping the fields from your source file to the relevant Oracle Sales Cloud database object, you can use the import object spreadsheets for reference.

6. Click Next.

7. On the Create Import Activity: Create Schedule page, select **Immediate** in the Schedule field so that the import will start as soon as you activate it. Instead of immediately importing the data, you can choose a date and time to start the import. You can also specify if the import will be repeated, and the frequency of the repeated import.

8. Click Next.

**Monitor the Import Results**

You monitor the progress of the import activity processing, and view completion reports for both successful records and errors.

1. On the Create Import Activity: Review and Activate page, verify your import details in the Import Details, File Details, Import Options, and Schedule sections. Update the import details if required by navigating to the previous screens using the **Back** link.

2. Once you are sure your import details are correct, click **Activate** to submit the import.

Once the import activity has completed, the Status field value will change to Completed.

**Importing and Exporting Territory Geography Zones: Explained**

Territory geography zones are geographical boundaries that you can set up to replicate your organization’s regions, such as a Pacific Northwest sales region. You can set up territory geography zones in one Oracle Sales Cloud applications instance, and then after the territory geography zones are defined you can export the territory zones and import them into another Oracle Sales Cloud instance.

To define your territory geography zones and then import your territory zones into another Oracle Sales Cloud instance, you need to complete the following steps:

1. Import the master reference geography data into the Oracle Sales Cloud.

2. Define your territory geography zones using the Manage Territory Geographies task.

3. Export the territory geography zones.

4. Import the territory geography zones into another Oracle Sales Cloud instance.

**Import the master reference geography data**

Firstly, you need to import the master reference geography data. Master reference geography data consists of geography elements such as country, state,
and city, and is required for any geographical information you store in the application, such as address information used in customer and sales records. For more information, refer to the Geography Hierarchy: Explained topic listed in the related topics section. Master reference geography data can be imported into the application using the Manage File Import Activities task in Setup and Maintenance - refer to the Importing Master Reference Geography Data: Worked Example topic listed in the related topics section for more information.

**Define your territory geography zones**

Once the master reference geography data has been imported, you can then create your territory geography zones in the application using the Manage Territory Geographies task in Setup and Maintenance. For more information, refer to the Managing Territory Geographies: Worked Example topic listed in the related topics section.

**Export the territory geography zones**

Once you have completed importing the master reference geography data and defining your territory geography zone tasks, you can create a configuration package to export the territory zone data. For more information, refer to the Exporting Setup Data demo listed in the related topics section.

**Import the territory geography zones**

Once you have downloaded your configuration package for your territory geography zone setup, you can import the territory zones into another Oracle Sales Cloud instance. For more information, refer to the Importing Setup Data listed in the related topics section.

---

**Manage Geography Structures, Hierarchies, and Validation: Worked Example**

This example shows how to configure the geography structure, hierarchy, and validation for a country geography, using the United Kingdom country geography as an illustration.

The following table summarizes the key decisions for this scenario.

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Copy an existing country structure?</td>
<td>No, create a new country structure.</td>
</tr>
<tr>
<td>What is the structure of the geography types?</td>
<td>Create geography types with the following ranking structure:</td>
</tr>
<tr>
<td></td>
<td>1. County</td>
</tr>
<tr>
<td></td>
<td>2. Post Town</td>
</tr>
</tbody>
</table>

---

**Note**

Ensure that you import your master reference geography data into the new Oracle Sales Cloud instance before you import the configuration package.
What is the geography hierarchy?

Create the following hierarchy:

1. Country of United Kingdom
2. County of Berkshire
3. Post Town of Reading

Which address style format will you use when mapping geography validations?

The default address style format, called the No Styles Format.

Are you using Oracle Fusion Tax for tax purposes?

No, do not select Tax Validation for the geography types.

Add the County and Post Town geography types to the geography structure. Next, add the geographies for the County and Post Town geography types to define the geography hierarchy. Finally, specify the geography validations for the geography types you have added to the geography structure.

**Defining the geography structure**

Add the County and Post Town geography types to the United Kingdom geography structure.

1. On the Manage Geographies page, enter GB in the Code field. Click Search.
2. On the Manage Geographies page, click Structure Defined.
3. On the Manage Geography Structure page, click the Create button next to the Copy Country Structure From field.
4. In the Geography Structure section, select the County list item in the Add Geography Type field.
5. Click Add.
6. Select the Post Town list item in the Add Geography Type field.
7. Click Add.

**Defining the geography hierarchy**

To begin creating the geography hierarchy for the United Kingdom, you add the geographies for the County and Post Town geography types using the geography hierarchy user interfaces. You can also use the Manage File Import Activities task to import geography hierarchies using a csv or xml file.

1. On the Manage Geographies page, enter GB in the Code field. Click Search.
2. On the Manage Geographies page, click Hierarchy Defined.
3. On the Manage Geography Hierarchy page, Geography Hierarchy section, click the United Kingdom to highlight the table row.
4. Click the Create button.
5. In the Create County page, Primary and Alternate Names section, enter Berkshire in the Name field.
6. Click Save and Close.
7. On the Manage Geography Hierarchy page, Geography Hierarchy section, click Berkshire to highlight the table row.
8. Click the Create button.
9. In the **Create Post Town** page, Primary and Alternate Names section, enter Reading in the **Name** field.

10. Click Save and Close.

**Defining the geography validations**

Now you want to specify the geography validations for the geography types you have added to the United Kingdom. Define the geography mapping and validation for the United Kingdom default address style format. Then map the geography types to attributes, enable the geography types for Lists of Values and Geography validation, and set the geography validation level.

1. On the Manage Geographies page, click **Validation Defined**.

2. On the Manage Geography Validation page, Address Style section, click **No Styles Format** to highlight the table row.

3. For the County geography type, click the **County** list item in the **Map to Attribute** field.

4. Click the **Enable List of Values** option for the County geography type.

5. Click the **Geography Validation** option for the County geography type.

6. For the Post Town geography type, click the **City** list item in the **Map to Attribute** field.

7. Click the **Geography Validation** option for the Post Town geography type.

8. In the Geography Validation Control section, click the **Error** list item in the **Geography Validation Level for Country** field.

9. Click Save and Close.

**FAQs for Define Geographies**

**When do I define address cleansing?**

When address data entered into the application needs to conform to a particular format, in order to achieve consistency in the representation of addresses. For example, making sure that the incoming data is stored following the correct postal address format.

**Why can't I update a geography structure by copying an existing country structure?**

You can only update a geography structure by adding existing geography types, or by creating new geography types and then adding them to the geography structure. You can only copy an existing country structure when you are defining a new country structure.

**Why can't I delete a level of the country geography structure?**

If a geography exists for a country geography structure level then you cannot delete the level. For example, if a state geography has been created for the United
States country geography structure, then the State level cannot be deleted in the country geography structure.

**Can I add any geography to the geography hierarchy?**

Yes. However, the geography type for the geography that you want to add must be already added to the country geography structure.

**Can I edit a specific geography in the geography hierarchy?**

Yes. In the Manage Geography Hierarchy page you can edit details such as the geography’s date range, primary and alternate names and codes, and parent geographies.

**How can I add a geography that is the level below another geography in a geography hierarchy?**

Select the geography that you want your geography to be created below, and then click the Create icon. This will allow you to create a geography for a geography type that is the level below the geography type you selected. The structure of the country’s geography types are defined in the Manage Geography Structure page.

**Define Legal Jurisdictions and Authorities**

**Jurisdictions and Legal Authorities: Explained**

You are required to register your legal entities with legal authorities in the jurisdictions where you conduct business. Register your legal entities as required by local business requirements or other relevant laws. For example, register your legal entities for tax reporting to report sales taxes or value added taxes.

Define jurisdictions and related legal authorities to support multiple legal entity registrations, which are used by Oracle Fusion Tax and Oracle Fusion Payroll. When you first create a legal entity, the Oracle Fusion Legal Entity Configurator automatically creates one legal reporting unit for that legal entity with a registration.

**Define Legal Entities: Manage Legal Entity**

**Legal Entities: Explained**

A legal entity is a recognized party with rights and responsibilities given by legislation.

Legal entities have the right to own property, the right to trade, the responsibility to repay debt, and the responsibility to account for themselves to regulators, taxation authorities, and owners according to rules specified in the relevant legislation. Their rights and responsibilities may be enforced through the
judicial system. Define a legal entity for each registered company or other entity recognized in law for which you want to record assets, liabilities, expenses and income, pay transaction taxes, or perform intercompany trading.

A legal entity has responsibility for elements of your enterprise for the following reasons:

- Facilitating local compliance
- Taking advantage of lower corporation taxation in some jurisdictions
- Preparing for acquisitions or disposals of parts of the enterprise
- Isolating one area of the business from risks in another area. For example, your enterprise develops property and also leases properties. You could operate the property development business as a separate legal entity to limit risk to your leasing business.

**The Role of Your Legal Entities**

In configuring your enterprise structure in Oracle Fusion Applications, you need to understand that the contracting party on any transaction is always the legal entity. Individual legal entities own the assets of the enterprise, record sales and pay taxes on those sales, make purchases and incur expenses, and perform other transactions.

Legal entities must comply with the regulations of jurisdictions, in which they register. Europe now allows for companies to register in one member country and do business in all member countries, and the US allows for companies to register in one state and do business in all states. To support local reporting requirements, legal reporting units are created and registered.

You are required to publish specific and periodic disclosures of your legal entities' operations based on different jurisdictions' requirements. Certain annual or more frequent accounting reports are referred to as statutory or external reporting. These reports must be filed with specified national and regulatory authorities. For example, in the United States (US), your publicly owned entities (corporations) are required to file quarterly and annual reports, as well as other periodic reports, with the Securities and Exchange Commission (SEC), who enforces statutory reporting requirements for public corporations.

Individual entities privately held or held by public companies do not have to file separately. In other countries, your individual entities do have to file in their own name, as well as at the public group level. Disclosure requirements are diverse. For example, your local entities may have to file locally to comply with local regulations in a local currency, as well as being included in your enterprise’s reporting requirements in different currency.

A legal entity can represent all or part of your enterprise’s management framework. For example, if you operate in a large country such as the United Kingdom or Germany, you might incorporate each division in the country as a separate legal entity. In a smaller country, for example Austria, you might use a single legal entity to host all of your business operations across divisions.

**Define Legal Entities: Manage Legal Entity HCM Information**

**HCM Organization Models: Examples**

These examples illustrate different models for human capital management (HCM) organizations. Each example includes a legislative data group (LDG).
LDGs are not an organization classification, but they are included in the example to show how you associate them with a payroll statutory unit to partition payroll data.

**Simple Configuration**

This example illustrates a simple configuration that does not include any tax reporting units. The legal employer and payroll statutory units are the same, sharing the same boundaries. Reporting can only be done at a single level. Countries such as Saudi Arabia and the United Arab Emirates (UAE) might use this type of model, as reporting in these countries is done at the legal entity level.

This figure illustrates a simple configuration where the enterprise has only one legal entity that is both a payroll statutory unit and a legal employer.

---

**Multiple Legal Employers and Tax Reporting Units Under One Payroll Statutory Unit**

This example illustrates a more complex configuration. In this enterprise, one legal entity, InFusion US, is defined as a payroll statutory unit and has two separate legal entities, which are also legal employers. This model shows multiple legal employers that are associated with a single payroll statutory unit, and how tax reporting units are always associated with a specific legal employer (or employers) through the payroll statutory unit. The implication is that payroll statutory reporting boundaries vary from human resources (HR) management, and the balances can be categorized separately by either payroll statutory unit, legal employer, or tax reporting unit. This configuration is based on tax filing requirements, as some tax-related payments and reports are associated with a higher level than employers. An example of a country that might use this model is the US.

This figure illustrates an enterprise that has one payroll statutory unit and multiple legal employers and tax reporting units.
One Payroll Statutory Unit and Two Tax Reporting Units That Are Subsidiaries of the Legal Entity

This model makes no distinction between a legal employer and a payroll statutory unit. Tax reporting units are defined as subsidiaries to the legal entity. In this enterprise, legal entity is the highest level of aggregation for payroll calculations and reporting, and statutory reporting boundaries are assumed to be the same for both payroll and HR management. An example of a country that might use this model is France.

This figure illustrates an example of an organization with one legal entity that is both a legal employer and a payroll statutory unit and that has two tax reporting units.
One Payroll Statutory Unit with Several Tax Reporting Units That Are Independent from the Legal Employer

In this model, the enterprise has one legal entity, and legal employers and tax reporting units are independent from each other within a payroll statutory unit, because there is no relationship from a legal perspective. Therefore, you can run reporting on both entities independently. Using this model, you would not typically need to report on tax reporting unit balances within a legal employer, and balances can be categorized by either or both organizations, as required. An example of a country that might use this model is India.

This figure illustrates an enterprise with one legal entity that is a payroll statutory unit and a legal employer, and the tax reporting units are independent from the legal employer.
Multiple Payroll Statutory Units with Several Tax Reporting Units that are Independent from the Legal Employer

In this model, the enterprise has two legal entities, and legal employers and tax reporting units are independent from each other within a payroll statutory unit, because there is no relationship from a legal perspective. Therefore, you can run reporting on both entities independently. Using this model, you would not typically need to report on tax reporting unit balances within a legal employer, and balances can be categorized by either or both organizations, as required. An example of a country that might use this model is the United Kingdom (UK).

This figure illustrates an enterprise with two legal entities, and legal employers and tax reporting units are independent from each other.
Payroll Statutory Units, Legal Employers, and Tax Reporting Units: How They Work Together

When you set up legal entities, you can identify them as legal employers and payroll statutory units, which makes them available for use in Oracle Fusion Human Capital Management (HCM). A tax reporting unit is created automatically when you add a legal entity and identify it as a payroll statutory unit. Depending on how your organization is structured, you may have only one legal entity that is also a payroll statutory unit and a legal employer, or you may have multiple legal entities, payroll statutory units, and legal employers.

Legal Employers and Payroll Statutory Unit

Payroll statutory units enable you to group legal employers so that you can perform statutory calculations at a higher level, such as for court orders or for United Kingdom (UK) statutory sick pay. In some cases, a legal employer is also a payroll statutory unit. However, your organization may have several legal employers under one payroll statutory unit. A legal employer can belong to only one payroll statutory unit.
Payroll Statutory Units and Tax Reporting Units
Payroll statutory units and tax reporting units have a parent-child relationship, with the payroll statutory unit being the parent.

Tax Reporting Units and Legal Employers
Tax reporting units are indirectly associated with a legal employer through the payroll statutory unit. One or more tax reporting units can be used by a single legal employer, and a tax reporting unit can be used by one or more legal employers. For example, assume that a single tax reporting unit is linked to a payroll statutory unit. Assume also that two legal employers are associated with this payroll statutory unit. In this example, both legal employers are associated with the single tax reporting unit.

FAQs for Manage Legal Entity HCM Information

What's a legal employer?
A legal employer is a legal entity that employs workers. You define a legal entity as a legal employer in the Oracle Fusion Legal Entity Configurator. The legal employer is captured at the work relationship level, and all employment terms and assignments within that relationship are automatically with that legal employer. Legal employer information for worker assignments is also used for reporting purposes.

What's a payroll statutory unit?
Payroll statutory units are legal entities that are responsible for paying workers, including the payment of payroll tax and social insurance. A payroll statutory unit can pay and report on payroll tax and social insurance on behalf of one or many legal entities, depending on the structure of your enterprise. For example, if you are a multinational, multicompany enterprise, then you register a payroll statutory unit in each country where you employ and pay people. You can optionally register a consolidated payroll statutory unit to pay and report on workers across multiple legal employers within the same country. You associate a legislative data group with a payroll statutory unit to provide the correct payroll information for workers.

Define Legal Entities: Manage Legal Entity Tax Profile

Party Tax Profiles: Explained
A tax profile is the body of information that relates to a party’s transaction tax activities. A tax profile can include main and default information, tax registration, tax exemptions, party fiscal classifications, tax reporting codes, configuration options, and service subscriptions.
Set up tax profiles for the following parties involved in your transactions:

- **First parties**: All legal entities, legal reporting units, and business units in your organization that have a transaction tax requirement.
- **Third parties**: Your customers and suppliers and their locations and banks.
- **Tax authorities**: Parties that administer tax rules and regulations.

**First Parties**

Set up tax profiles for your first party legal entities, legal reporting units, and business units.

First party legal entities identify your organization to the relevant legal authorities, for example, a national or international headquarters. Legal entities let you more accurately model your external relationships to legal authorities. The relationships between first party legal entities and the relevant tax authorities normally control the setup of the transaction taxes required by your business. Under most circumstances the tax setup is used and maintained based on the configuration of the legal entity. Enter the default information, party fiscal classifications, tax reporting codes, and configuration options for your legal entities. You can also specify if you are using the tax services of an external service provider for tax calculation.

First party legal reporting units identify each office, service center, warehouse and any other location within the organization that has a tax requirement. A legal reporting unit tax profile is automatically created for the headquarter legal entity. Set up additional legal reporting unit tax profiles for those needed for tax purposes. For legal reporting units, enter the default information, tax registrations, party fiscal classifications, and tax reporting codes. Also, define tax reporting details for your VAT and global tax reporting needs for tax registrations of tax regimes that allow this setup.

Business units organize your company data according to your internal accounting, financial monitoring, and reporting requirements. To help you manage the tax needs of your business units, you can use the business unit tax profile in either of two ways:

- Indicate that business unit tax setup is used and maintained based on the configuration of the associated legal entity at transaction time. The tax setup of the associated legal entity setup is either specific to the legal entity or shared across legal entities using the Global Configuration Owner setup.
- Indicate that tax setup is used and maintained by a specific business unit. Create configuration options for the business unit to indicate that the subscribed tax content is used for the transactions created for the business unit.

For business units that maintain their own setup, enter the default information, tax reporting codes, configuration options, and service providers as required.

**Third Parties**

Set up third party tax profiles for parties with the usage of customer, supplier, and their sites. Enter the default information, tax registrations, party fiscal classifications, and reporting codes required for your third parties or third party sites. You can set up tax exemptions for your customers and customer sites.
Banks are also considered third parties. When a bank is created, the tax registration number specified on the bank record is added to the party tax profile record in Oracle Fusion Tax. You can not modify the party tax profile for a bank as it is view only. You can only modify the bank record itself.

**Note**

Setting up party tax profiles for third parties is not required. Taxes are still calculated on transactions for third parties that do not have tax profiles.

### Tax Authorities

Set up a tax authority party tax profile using the Legal Authorities set up task. The tax authority party tax profile identifies a tax authority party as a collecting authority or a reporting authority or both. A collecting tax authority manages the administration of tax remittances. A reporting tax authority receives and processes all company transaction tax reports.

The collecting and reporting tax authorities appear in the corresponding list of values on all applicable Oracle Fusion Tax pages. All tax authorities are available in the list of values as an issuing tax authority.

### Define Legal Entities: Define Legal Reporting Units

#### Planning Legal Reporting Units: Points to Consider

Each of your legal entities has at least one legal reporting unit. Legal reporting units can also be referred to as establishments. You can define either domestic or foreign establishments. Define legal reporting units by physical location, such as a sales office, or by logical unit, such as groups of employees subject to different reporting requirements. For example, define logical legal reporting units for both salaried and hourly paid employees.

Another example of logical reporting units is in the Human Capital Management (HCM) system where you use your legal reporting units to model your tax reporting units. A tax reporting unit is used to group workers for the purpose of tax reporting.

#### Planning Legal Reporting Units

Plan and define your legal reporting units at both the local and national levels if you operate within the administrative boundaries of a jurisdiction that is more granular than country. For example, your legal entity establishes operations in a country that requires reporting of employment and sales taxes locally as well as nationally. Therefore, you need more than one legally registered location to meet this legal entity’s reporting requirements in each local area. Additionally, legal entities in Europe operate across national boundaries, and require you to set up legal reporting units for the purposes of local registration in each country. There can be multiple registrations associated with a legal reporting unit. However, there can be only one identifying registration, defined by the legal authority used
for the legal entity or legal reporting unit, associated with the legal reporting unit.

**Define Chart of Accounts for Enterprise Structures: Manage Chart of Accounts**

**Chart of Accounts: Explained**

The chart of accounts is the underlying structure for organizing financial information and reporting. An entity records transactions with a set of codes representing balances by type, expenses by function, and other divisional or organizational codes that are important to its business.

A well-designed chart of accounts provides the following benefits:

- Effectively manages an organization’s financial business
- Supports the audit and control of financial transactions
- Provides flexibility for management reporting and analysis
- Anticipates growth and maintenance needs as organizational changes occur
- Facilitates an efficient data processing flow
- Allows for delegation of responsibility for cost control, profit attainment, and asset utilization
- Measures performance against corporate objectives by your managers

The chart of accounts facilitates aggregating data from different operations, from within an operation, and from different business flows, thus enabling the organization to report using consistent definitions to their stakeholders in compliance with legislative and corporate reporting standards and aiding in management decisions.

Best practices include starting the design from external and management reporting requirements and making decisions about data storage in the general ledger, including thick versus thin general ledger concepts.

**Define Chart of Accounts for Enterprise Structures: Manage Chart of Accounts Value Sets**

**Chart of Accounts Values Sets: Critical Choices**

A value set is the collection of account values that are associated with a segment of a chart of accounts structure instance. When creating values sets, consider the following critical choices:
• Module Designation
• Validation Type
• Format Assignments
• Security Rules
• Values Definition

Module Designation

The module designation is used to tag value sets in Oracle Fusion Applications and sets the value sets apart during upgrades and other processes. Chart of accounts value sets upgraded from Oracle E-Business Suite Release 12 generically bear the module value of Oracle Fusion Middleware. When creating new value sets for a chart of accounts, the module can be specified as Oracle Fusion General Ledger to distinctly identify its intended use in an accounting flexfield, basically a chart of accounts.

Validation Type

Assign one of the following validation types to chart of accounts value sets:

• Independent: The values are independently selected when filling out the segment in the account combination.
• Table Validated: The values are stored in an external table to facilitate maintenance and sharing of the reference data.

Format Assignments

Value sets for chart of accounts must use the Value Data Type of Character. The Value Subtype is set to Text. These two setting support values that are both numbers and characters, which are typical in natural account segment values. Set the maximum length of the value set to correspond to the length of the chart of accounts segment to which it is assigned. Best practices recommend restricting values to Upper Case Only or Numeric values that are zero filled by default.

Security Rules

If flexfield data security rules are to be applied to the chart of accounts segment associated with the value set, the Enable Security check box must be checked for the assigned value set. In addition, assign a data security resource name to enable creation of a data security object automatically for the value set. The data security object is used in the definition of flexfield data security rules.

Value Definition

Once these basic characteristic are defined for the value set, values can be added to the set in the Manage Values page.

• Set the values to conform to the value set length and type.
• Enter the value, its description, and its attributes including the Enable check box, Start Date, and End Date.
• Assign the following attributes: Parent or Summary check box, Posting is allowed, and Budgeting is allowed.

Note
If the value set is used with a natural account segment, the value also requires you set the Natural Account Type, with one of the following values: Asset, Liability, Equity, Revenue or Expense. Other attributes used are Third Party Control Account, Reconciliation indicator, and Financial Category used with Oracle Transaction Business Intelligence reporting.

Oracle Fusion General Ledger best practice is to define the values for the value set after the value set is assigned to a chart of accounts structure instance. Otherwise you are not able to define the mandatory value attributes, such as summary flag, posting allowed, and account type for natural account segment. The attributes must be added after the value set is assigned to a chart of accounts structure instance.

Define Chart of Accounts for Enterprise Structures: Manage Account Hierarchies

Trees: Overview

Use the tree management feature in Oracle Fusion applications to organize data into hierarchies. A hierarchy contains organized data and enables the creation of groups and rollups of information that exist within an organization. Trees are hierarchical structures that enable several data management functions such as better access control, application of business rules at various levels of hierarchies, improved query performance, and so on.

For example, XYZ Corporation has two departments: Marketing and Finance. The Finance department has two functional divisions: Receivables and Payables. Defining a tree for the XYZ Corporation establishes a hierarchy between the organization and its departments, and between the departments and their respective functional divisions. Such a hierarchical modeling of organizational data could be used for executing several data management functions within that organization.

You can create one or more versions of trees, and they can be labeled for better accessibility and information retrieval. You can create trees for multiple data sources, which allow the trees to be shared across Oracle Fusion applications.

Tree Structures
A tree structure is a representation of the data hierarchy, and guides the creation of a tree. A tree is an instance of the hierarchy as defined in the tree structure. Tree structures enable you to enforce business rules to which the data must adhere.

The root node is the topmost node of a tree. Child nodes report to the root node. Child nodes at the same level, which report to a common parent node, are called siblings. Leaves are details branching off from a node but not extending further down the tree hierarchy.
Tree Versions

A tree is created having only one version. However, users can create more than one tree version depending on the need, and they can make changes to those versions. Depending on varying requirements, users can create one or more tree versions and publish all of them or some of them by making the versions active at the same time. Similar to any other version control system, versions of trees are maintained to keep track of all the changes that a tree undergoes in its life cycle.

Tree Labels

Tree labels are short names associated with trees and tree structures and point directly to the data source. Tree labels are automatically assigned to the tree nodes. You can store labels in any table and register the label data source with the tree structure.

Manage Tree Structures

Tree Structures: Explained

A tree structure defines the hierarchy for creating trees and prescribes rules based on which trees are created, versioned, and accessed. You can associate multiple data sources with a tree structure. A tree is an instance of this hierarchy. Every tree structure can contain one or more trees.

You can create tree structures specific to an application but you can share tree structures across applications. If you apply version control to the tree structure, it is carried over to the trees that are based on the tree structure. Each tree version contains at least one root node. Occasionally, a tree version may have more than one root node.

An administrator controls the access to tree structures through a set of rules that are periodically audited for validity.

Tree Structure Definition: Points to Consider

Defining a tree structure involves specifying several important pieces of information on the Create Tree Structure: Specify Definition page.

Tree Node Selection

The Tree Node table displays data in nodes that exist in the data hierarchy. You must select the correct and most appropriate tree node table to be able to define the tree structure, based on the tree hierarchy you want to establish. This selection also affects the level of security that is set on a tree node and its child entities.

Tree Sharing Mode

The following options are used to determine the mode of sharing a tree structure across the applications.
• Open: Indicates that the tree is associated with all reference data sets.
• Set ID: Indicates that the tree will be associated with a specific reference data set.

Creation Mode

Indicates the source where the tree structure is being defined. For predefined tree structures select Oracle and for custom structures, select Customers.

Customization

You can customize the predefined tree structures as well as the ones that you created. However, customizing the predefined tree structures involves certain level of access restrictions, and will be limited to specific tree nodes and downwards in hierarchy.

Multiple Tree Versions

One or more trees and tree versions can be based on a tree structure. A tree structure can have one or more trees and tree versions based on it. Usually, only one active version is permitted at any given point of time. However, depending on the requirement, you can allow two or more tree versions to be in the active state for the same date range. This flexibility allows you to choose the tree version that you want to implement.

Managing Tree Structures: Points to Consider

You can create, edit, and delete tree structures depending upon the requirement. You can also audit and change the status a tree structure.

Creating and Editing Tree Structures

You can create trees on the basis of a tree structure. When you edit an active tree structure, the status of the tree structure and all associated trees and their versions change to draft. To reuse a tree structure, you can create a copy of it without copying the associated trees and tree versions. If you delete a tree structure, all the associated trees and tree versions are automatically deleted.

Note

For specific information on working with the predefined tree structures that exist in an Oracle Fusion application, refer to the specific product documentation.

Setting Status

If you change the status of a tree structure, the status of the trees and tree versions associated with that tree structure also changes.

The following table lists the different statuses of a tree structure.

<table>
<thead>
<tr>
<th>Status</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>Yet to be published or is in a modified state.</td>
</tr>
</tbody>
</table>
Active | In use and based on which one or more trees or tree versions are created.
Inactive | Not in use.

**Tree Structure Audit Results: Explained**

Use the tree structure audit results to verify the tree structure's correctness and data integrity. The audit results include the following details:

- The name of the validator, which is a specific validation check
- The result of the validation, including a detailed message
- Corrective actions to take if there are any validation errors

**Running an Audit**

Setting the status of a tree structure to active automatically triggers an audit of that tree structure. You can also manually trigger an audit on the manage Tree Structures page, using Actions - Audit. The Tree Structure Audit Result table shows a list of validations that ran against the selected tree structure.

**Validation Details**

The following table lists the validators used in the audit process and describes what each validator checks for. It also lists possible causes for validation errors and suggests corrective actions.

<table>
<thead>
<tr>
<th>Validator</th>
<th>Description (what is checked)</th>
<th>Possible Cause for Validation Failure</th>
<th>Suggested Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Restrict By Set ID</td>
<td>On the Manage Tree Structures: Specify Data Sources page, if the Set ID check box is selected to enable the Restrict Tree Node List of Values Based on option for a tree structure, each of its data source view objects must have a reference data set attribute. This validation does not take place when the check box is not selected.</td>
<td>Even when the check box is selected, one or more of its data source view objects does not contain a reference data set attribute.</td>
<td>If reference data set restriction is required for this tree structure, include a reference data set attribute on all data sources. Otherwise, deselect the check box.</td>
</tr>
<tr>
<td>Row Flattened Table Name</td>
<td>On the Manage Tree Structures: Specify Performance Options page, a valid row flattened table must be specified for the tree structure. It can either be the standard row flattened table FND_TREE_NODE_RF or a custom table.</td>
<td>The specified table does not exist in the database.</td>
<td>Correct the row flattened table definition.</td>
</tr>
</tbody>
</table>
| Available Label Data Sources | On the Manage Tree Structures: Specify Data Sources page, if a labeling scheme is specified for the tree structure by selecting a list item from the **Labeling Scheme** list box, the label data source view object specified for each data source must be accessible, and the primary keys must be valid. This restriction does not apply when you select **None** from the **Labeling Scheme** list box. | • Any of the specified label data source view objects do not exist.  
• Any of the specified label data source view objects do not have primary keys.  
• When a label data source view object is initially defined, the database registers the primary keys for the view object. If the view object is later modified such that its primary keys no longer match the primary keys that were registered earlier, this validation fails. | • Correct the specified label data source view object.  
• Correct the primary keys of the specified label data source view object.  
• Either correct the primary keys in the label data source view object to match the primary keys that were earlier registered in FND_TS_DATA_SOURCE, or correct the primary keys registered in that table to match the new view object definition. |
| Available Data Sources | Each data source view object specified for the tree structure must be accessible, and all its primary key attributes must be valid. | • Any of the specified data source view objects do not exist.  
• When a data source view object is initially defined, the database automatically registers the primary keys for the view object if the **Use non-defined primary key columns** check box on the Data Source dialog box is not selected. If the check box is selected, the database registers the primary keys specified explicitly by the user on the Add Data Source dialog box. If the registered primary keys contain any duplicates, this validation fails.  
• The **Use non-defined primary key columns** check box is selected in a data source, but the list of specified primary key columns does not match the primary keys defined in the corresponding data source view object.  
• Any common attribute that exists in both the data source view object and the tree node view object is not of the same data type in both view objects. | • Correct the specified data source view object.  
• Correct the duplicate column in the registered primary keys.  
• Correct the primary keys of the specified data source view object.  
• Correct any mismatch in data types. |
| Column Flattened Table Name | On the Manage Tree Structures: Specify Performance Options page, a valid column flattened table must be specified for the tree structure. It can either be the standard row flattened table FND_TREE_NODE_CF or a custom table. | • The specified table does not exist in the database.  
• The specified table does not contain the same columns as the FND_TREE_NODE_CF table. | Correct the column flattened table definition. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>Restrict by Date</td>
<td>On the Manage Tree Structures: Specify Data Sources page, if the Date Range check box is selected to enable the Restrict Tree Node List of Values Based on option for a tree structure, each of its data source view objects must have effective start date and effective end date attributes. This validation does not take place when the check box is not selected.</td>
<td>Even when the check box is selected, one or more of its data source view objects does not contain effective start date and effective end date attributes.</td>
<td>If the date restriction is required for this tree structure, include the effective start date and effective end date attributes on all data sources. Otherwise, deselect the check box.</td>
</tr>
</tbody>
</table>
| Tree Node Table Name        | On the Manage Tree Structures: Specify Definition page, a valid tree node table must be specified for the tree structure. It can either be the standard row flattened table FND_TREE_NODE or a custom table. | • No table is specified in the Tree Node Table field.  
• The specified table does not exist in the database.  
• The specified table does not contain the same columns as the FND_TREE_NODE table. | Correct the tree node table definition. |
| Allow Node Level Security   | If the Allow Node Level Security option is set to No for the tree structure, the same option cannot be set to Yes on any of its data sources. This is a database setting that is not visible on the Manage Tree Structures page. | The option is set to No for the tree structure but one or more associated data sources have that option set to Yes. | Correct the option setting in the tree structure and their data sources. |

### Specifying Data Sources for Tree Structures: Points to Consider

The data sources provide the items for establishing hierarchy in a tree structure. In the tree management infrastructure, these data sources are Oracle Application...
Development Framework (ADF) business components view objects, which are defined by application development.

**Labeling Schemes**

Selecting a labeling scheme determines how the tree nodes are labeled. You may select a labeling scheme to assign at the data source level, at the parent node level, or keep it open for customer assignment. You may also choose not to have any labeling scheme. However, if you decide to use any of the labeling schemes, you may need to select the following additional options, to restrict the list of values that appear under the selected tree node.

- **Allow Ragged Nodes**: To include nodes that have no child nodes, and are shorter than the remaining nodes in the entire hierarchy.
- **Allow Skip Level Nodes**: To include nodes that are at the same level but have parent nodes at different levels.

**Restriction of Tree Node Values**

You can decide the depth of the tree structure by selecting an appropriate value from the list. Keeping the depth limit open renders an infinite list of values. Using the following options, you can restrict the list of values that appear for selection under a specific tree node.

- **Date Range**: Specifies whether a selection of nodes should be restricted to the same date range as the tree version.
- **Allow Multiple Root Nodes**: Allows you to add multiple root nodes when creating a tree version.
- **Reference Data Set**: Specifies whether a selection of nodes should be restricted to the same set as the tree.

**Data Source Values and Parameters**

Tree data sources have optional data source parameters with defined view criteria and associated bind variables. You can specify view criteria as a data source parameter when creating a tree structure, and edit the parameters when creating a tree. Multiple data sources can be associated with a tree structure and can have well-defined relationships among them.

**Note**

Parameter values customized at the tree level override the default values specified at the tree-structure level.

The data source parameters are applied to any tree version belonging to that data source, when performing node operations on the tree nodes. Data source parameters also provide an additional level of filtering for different tree structures. The tree structure definition supports three data source parameter types.

- **Bound Value**: Captures any fixed value, which is used as part of the view criteria condition.
- **Variable**: Captures and binds a dynamic value that is being used by the data source view object. This value is used by the WHERE condition of the data flow.
- **View Criteria**: Captures the view criteria name, which is applied to the data source view object.
You can also specify which of the data source parameters are mandatory while creating or editing the tree structure.

View objects from the ADF business components are used as data sources. To associate the view object with the tree structure, you can pick the code from ADF business component view objects and provide the fully qualified name of the view object, for example, oracle.apps.fnd.appcore.trees.model.view.FndLabelVO.

**Specifying Performance Options for a Tree Structure: Points to Consider**

Tree structures are heavily loaded with data. As a tree management guideline, use the following settings to improve performance of data rendering and retrieval.

- Row Flattening
- Column Flattening
- Column Flattened Entity Objects
- ADF Business Component View Objects

**Row Flattening**

Row flattening optimizes parent-child information for run-time performance by storing additional rows in a table for instantly finding all descendants of a parent without initiating a CONNECT BY query. Row flattening eliminates recursive queries, which allows operations to perform across an entire subtree more efficiently.

To store row flattened data for the specific tree structure, users can either use the central FND_TREE_NODE_RF table or they can register their own row flattened table. For example, in a table, if Corporation is the parent of Sales Division (Corporation-Sales Division), and Sales Division is the parent of Region (Sales Division-Region), a row-flattened table contains an additional row with Corporation directly being the parent of Region (Corporation-Region).

**Column Flattening**

Column flattening optimizes parent-child information for run-time performance by storing an additional column in a table for all parents of a child.

To store column flattened data for the specific tree structure, users can either use the central FND_TREE_NODE_CF table or they can register their own column flattened table. For example, in a table, if Corporation is the parent of Sales Division (Corporation-Sales Division), and Sales Division is the parent of Region (Sales Division-Region), a flattened table in addition to these columns, contains three new columns: Region, Sales Division, and Corporation. Although positioned next to each other, the column Region functions at the lower level and Corporation at the higher level, retaining the data hierarchy.

**Column Flattened Entity Objects**

In the absence of a column-flattened table, if you need to generate the business component view objects for your tree structure for the flattened table, use the tree management infrastructure to correctly provide the fully qualified name of the entity object for the column flattened table.
ADF Business Component View Objects

View objects from the ADF business components can also be used as data sources, eliminating the need to create new types of data sources. This field is to store the fully qualified name for the business component view object generated by the tree management for business intelligence reporting and usage. The business component view object is a combination of the tree data source and column flattened entity. Using this option prevents data redundancy and promotes greater reuse of existing data, thereby improving the performance of the tree structure.

Manage Tree Labels

Tree Labels: Explained

Tree labels are tags that are stored on tree nodes. You can store labels in any table and register the label data source with the tree structure. When a labeling scheme is used for trees, the selected labels are stored in the tree label entity and each tree node contains a reference to a tree label in the labeling scheme.

The following table lists the three ways in which tree labels are assigned to the tree nodes.

<table>
<thead>
<tr>
<th>Labeling Scheme</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Level</td>
<td>Labels that are automatically assigned based on the data source to which the tree node belongs. A level label points to a specific data source. For example, in a tree that reflects the organizational hierarchy of an enterprise, all division nodes appear on one level and all department nodes on another.</td>
</tr>
<tr>
<td>Group</td>
<td>Labels that you can arbitrarily assign to tree nodes.</td>
</tr>
<tr>
<td>Depth</td>
<td>Labels that are automatically assigned based on the depth of the tree node within the tree. No manual assignment is performed.</td>
</tr>
</tbody>
</table>

Note

In an unbalanced hierarchy, a level may not be equal to depth.

Manage Trees and Tree Versions

Managing Trees and Tree Versions: Points to Consider

You can create and edit trees and tree versions depending upon the requirement. A tree can have one or more tree versions. Typically, when changes are made to an existing tree, a new version is created and published.
Creating and Editing Trees

Trees are created based on the structure defined in the tree structure. You can create trees, modify existing trees, and delete trees. If you want to copy an existing tree, you can duplicate it. However, only the tree is duplicated and not its versions.

Creating a tree involves specifying the tree definition and specifying the labels that are used on its nodes. If the selected tree structure has data sources and parameters defined for it, they appear on the page allowing you to edit the parameter values at the tree node level.

Note
Parameter values customized at the tree level will override the default values specified at the tree-structure level.

Creating and Editing Tree Versions

Tree versions are created at the time of creating trees. A tree must contain a version.

Editing an existing tree provides you the choice to update the existing version. You can also edit the existing version that lies nested under the tree in the search results.

When you edit a tree version bearing Active status, the status changes to Draft until the modifications are saved or cancelled.

Tree Version Audit Results: Explained

Use the tree version audit results to verify the tree version’s correctness and data integrity. The audit results include the following details:

- The name of the validator, which is a specific validation check
- The result of the validation, including a detailed message
- Corrective actions to take if there are any validation errors

Running an Audit

An audit automatically runs whenever a tree version is set to active. You can also manually trigger an audit on the Manage Trees and Tree Versions page, using Actions - Audit. The Tree Version Audit Result table shows a list of validations that ran against the selected tree version.

Validation Details

The following table lists the validators used in the audit process and describes what each validator checks for. It also lists possible causes for validation errors and suggests corrective actions.

<table>
<thead>
<tr>
<th>Validator</th>
<th>Description (what is checked)</th>
<th>Possible Cause for Validation Failure</th>
<th>Suggested Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Effective Date</td>
<td>The effective start and end dates of the tree version must be valid.</td>
<td>The effective end date is set to a value that is not greater than the effective start date.</td>
<td>Modify the effective start and end dates such that the effective start date is earlier than the effective end date.</td>
</tr>
<tr>
<td>Common Applications Configuration: Define Enterprise Structures</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>---------------------------------------------------------------</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td><strong>Root Node</strong></td>
<td>On the Manage Tree Structures: Specify Data Sources page, if the <strong>Allow Multiple Root Nodes</strong> check box for the <strong>Restrict Tree Node List of Values Based on</strong> option is not selected, and if the tree structure is not empty, the tree version must contain exactly one root node. This validation does not take place if the check box is selected.</td>
<td>Even if the check box is deselected, the tree version has multiple root nodes.</td>
<td>Modify the tree version such that there is exactly one root node.</td>
</tr>
<tr>
<td><strong>Data Source Max Depth</strong></td>
<td>For each data source in the tree structure, on the Data Source dialog box, if the data source is depth-limited, the data in the tree version must adhere to the specified depth limit. This validation does not apply to data sources for which the <strong>Maximum Depth</strong> field is set to <strong>Unlimited</strong>.</td>
<td>The tree version has data at a depth greater than the specified depth limit on one or more data sources.</td>
<td>Modify the tree version such that all nodes are at a depth that complies with the data source depth limit.</td>
</tr>
<tr>
<td><strong>Duplicate Node</strong></td>
<td>On the Data Source dialog box, if the <strong>Allow Duplicates</strong> check box is not selected, the tree version should not contain more than one node with the same primary key from the data source. If the check box is selected, duplicate nodes are permitted.</td>
<td>Even when the check box is deselected, the tree version contains duplicate nodes.</td>
<td>Remove any duplicate nodes from the tree version.</td>
</tr>
<tr>
<td>Available Node</td>
<td>All nodes in the tree version should be valid and available in the underlying data source.</td>
<td>• A node in the tree version does not exist in the data source. Deleting data items from the data source without removing the corresponding nodes from the tree version can result in orphaned nodes in the tree version. For example, if you added node A into your tree version, and subsequently deleted node A from the data source without removing it from the tree version, the validation fails. • The tree version contains a tree reference node, which references another tree version that does not exist.</td>
<td>Remove any orphaned nodes from the tree version. Update tree reference nodes so that they reference existing tree versions.</td>
</tr>
<tr>
<td>Node Relationship</td>
<td>All nodes must adhere to the relationships mandated by the data sources registered in the tree structure.</td>
<td>The tree structure has data sources arranged in a parent-child relationship, but the nodes in the tree do not adhere to the same parent-child relationship. For example, if the tree structure has a Project data source with a Task data source as its child, Task nodes should always be under Project nodes in the tree version. This validation fails if there are instances where a Project node is added as the child of a Task node.</td>
<td>Modify the tree version such that the nodes adhere to the same parent-child relationships as the data sources.</td>
</tr>
<tr>
<td>SetID Restricted Node</td>
<td>On the Manage Tree Structures: Specify Data sources page, if the <strong>Set ID</strong> check box is selected to enable the <strong>Restrict Tree Node List of Values Based on</strong> option for each tree node, the underlying node in the data source must belong to the same reference data set as the tree itself. This restriction does not apply when the check box is not selected.</td>
<td>Even when the check box is selected, the tree version has nodes whose data source values belong to a different reference data set than the tree.</td>
<td>Modify the tree version such that all nodes in the tree have data sources with reference data set matching that of the tree.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Label Enabled Node</td>
<td>On the Manage Tree Structures: Specify Data Sources page, if a labeling scheme is specified for the tree structure by selecting a list item from the <strong>Labeling Scheme</strong> list box, all nodes should have labels. This restriction does not apply when you select <strong>None</strong> from the <strong>Labeling Scheme</strong> list box.</td>
<td>The tree structure has a labeling scheme but the tree version has nodes without labels.</td>
<td>Assign a label to any node that does not have a label.</td>
</tr>
<tr>
<td>Date Restricted Node</td>
<td>On the Manage Tree Structures: Specify Data Sources page, if the <strong>Date Range</strong> check box is selected to enable the <strong>Restrict Tree Node List of Values Based on</strong> option for a tree structure, each node in the underlying data source must have an effective date range same as the effective date range of the tree version. This restriction does not apply if the check box is not selected.</td>
<td>Even when the check box is selected, there are data source nodes that have a date range beyond the tree version’s effective date range. For example, if the tree version is effective from Jan-01-2012 to Dec-31-2012, all nodes in the tree version must be effective from Jan-01-2012 to Dec-31-2012 at a minimum. It is acceptable for the nodes to be effective for a date range that extends partly beyond the tree version’s effective date range (for example, the node data source value is effective from Dec-01-2011 to Mar-31-2013). It is not acceptable if the nodes are effective for none or only a part of the tree version’s effective date range (for example, the node data source value are effective only from Jan-01-2012 to June-30-2012).</td>
<td>Ensure that all nodes in the tree version have effective date range for the effective date range for the tree version.</td>
</tr>
<tr>
<td>---</td>
<td>---</td>
<td>---</td>
<td>---</td>
</tr>
<tr>
<td>Multiple Active Tree Version</td>
<td>On the Manage Tree Structures: Specify Definition page, if the <strong>Allow Multiple Active Tree Versions</strong> check box is not selected for the tree structure, there should not be more than one active tree version under a tree at any time. This restriction does not apply if the check box is selected.</td>
<td>Even when the check box is not selected, there is more than one active tree version in the tree for the same date range.</td>
<td>Set no more than one tree version to Active within the same date range and set the others to inactive or draft status.</td>
</tr>
<tr>
<td>Range Based Node</td>
<td>On the Data Source dialog box, if the <strong>Allow Range Children</strong> check box is not selected, range-based nodes are not permitted from that data source. This restriction does not apply if the check box is selected.</td>
<td>Even when the check box is not selected, there are range-based nodes from a data source.</td>
<td>Ensure that any range nodes in your tree version are from a data source that allows range children.</td>
</tr>
</tbody>
</table>
### Terminal Node

<table>
<thead>
<tr>
<th>Description</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>On the Data Source dialog box, if the <strong>Allow Use as Leaves</strong> check box is not selected, values from that data source cannot be added as leaves (terminal nodes) to the tree version. This restriction does not apply if the check box is selected.</td>
<td>Even when the check box is not selected, values from a data source are added as leaf nodes (terminal nodes).</td>
</tr>
<tr>
<td>Modify the tree version such that all terminal nodes are from data sources for which this check box is selected.</td>
<td></td>
</tr>
</tbody>
</table>

### Usage Limit

<table>

## Trees and Data Sources: How They Work Together

Data sources form the foundation for tree management in Oracle Fusion Applications. Tree structures, trees, and tree versions establish direct and real-time connectivity with the data sources. Changes to the data sources immediately reflect on the **Manage Trees and Tree Versions** page and wherever the trees are being used.

### Metadata

Tree structures contain the metadata of the actual data that is used in Oracle Fusion Applications. Tree structures contain the core business logic that is manifested in trees and tree versions.

### Data Storage

Trees and tree versions are built upon the tree structures. They employ the business rules defined in the tree structures and allow an application to select and enable a subset of trees to fulfill a specific purpose in that application.

### Access Control

Source data is mapped to tree nodes at different levels in the database. Therefore, changes you make to the tree nodes affect the source data. Access control set on trees prevents unwanted data modifications in the database. Access control can be applied to the tree nodes or anywhere in the tree hierarchy.

### Adding Tree Nodes: Points to Consider

Tree nodes are points of data convergence that serve as the building blocks of a tree structure. Technically, the node may be stored either in a product-specific
table or in an entity that has been established by tree management as the default storage mechanism. However, since all data in Oracle Fusion Applications usually have a storage home, only user-created data needs to be stored in an entity.

Nodes are attached to tree versions. Whenever you create or edit a tree version, you need to specify its tree node.

**Managing Tree Nodes**

You can create, modify, or delete tree nodes on the **Tree Version: Specify Nodes** page. To add a tree node, ensure that the tree structure with which the tree version is associated is mapped to a valid data source. You can also duplicate a tree node if the multiple root node feature is enabled.

**Node Levels**

In most trees, all nodes at the same level represent the same kind of information. For example, in a tree that reflects the organizational hierarchy, all division nodes appear on one level and all department nodes on another. Similarly, in a tree that organizes a user’s product catalog, the nodes representing individual products might appear on one level and the nodes representing product lines on the next higher level.

When levels are not used, the nodes in the tree have no real hierarchy or reporting structure but do form a logical summarization structure. Strictly enforced levels mean that the named levels describe each node’s position in the tree. This is natural for most hierarchies. Loosely enforced levels mean that the nodes at the same visual level of indentation do not all represent the same kind of information, or nodes representing the same kind of information appear at multiple levels. With loosely enforced levels, users assign a level to each node individually. The level is not tied to a particular visual position.

**Node Types**

A tree node has the following node types.

- **Single**: Indicates that the node is a value by itself.
- **Range**: Indicates that the node represents a range of values and possibly could have many children. For example, a tree node representing account numbers 10000 to 99999.
- **Referenced Tree**: Indicates that the tree node is actually another version for the tree based on the same tree structure, which is not physically stored in the same tree. For example, a geographic hierarchy for the United States can be referenced in a World geographic hierarchy.

**Importing Segment Values and Hierarchies: Explained**

Use Import Segment Values and Hierarchies process to load segment values and hierarchies if you maintain your chart of accounts reference data outside
Oracle Fusion applications. You can load your segment values and hierarchies by populating two tables: GL_SEGMENT_VALUES_INTERFACE table and GL_SEGMENT_HIER_INTERFACE table, and running the Import Segment Values and Hierarchies process.

Note
You can load data to interface tables using predefined templates and the Load Interface File for Import scheduled process, which are both part of the External Data Integration Services for Oracle Cloud feature. For more information, see the Documentation tab for the Load Interface File for Import process in Oracle Enterprise Repository for Oracle Fusion Applications.

The GL_SEGMENT_VALUES_INTERFACE and GL_SEGMENT_HIER_INTERFACE tables
You can use GL_SEGMENT_VALUES_INTERFACE to load segment values and GL_SEGMENT_HIER_INTERFACE to load segment value hierarchies to Oracle Fusion applications. You can find details of the columns of the interface table in Oracle Enterprise Repository (OER) for Oracle Fusion Applications.

Assigning Values for Columns in the GL_SEGMENT_VALUES_INTERFACE table
You must enter values in all columns of the interface table that require values, which includes all of the not null columns, in order for the Import Segment Values and Hierarchies process to be successful. Enter values in the following required columns of the interface table:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_CODE</td>
<td>Enter the value NEW to indicate that you are bringing new segment value data.</td>
</tr>
<tr>
<td>VALUE_SET_CODE</td>
<td>Enter the value set code for the segment values.</td>
</tr>
<tr>
<td>VALUE</td>
<td>Enter the segment value.</td>
</tr>
<tr>
<td>SUMMARY_FLAG</td>
<td>Select N if the segment value is a child value or Y if the segment value is a parent value.</td>
</tr>
<tr>
<td>ENABLED_FLAG</td>
<td>Select Y to enable the segment value. Enter N to disable the segment value.</td>
</tr>
<tr>
<td>ACCOUNT_TYPE</td>
<td>Enter the natural account type if the segment value is for natural account segment. Valid values are: A for Assets, L for Liabilities, E for Expenses, O for Owner's Equities, and R for Revenues.</td>
</tr>
<tr>
<td>ALLOW_POSTING_FLAG</td>
<td>Select Y if posting is allowed for this segment value. Select N if posting is not allowed.</td>
</tr>
<tr>
<td>OBJECT_VERSION_NUMBER</td>
<td>Enter default value of 1.</td>
</tr>
</tbody>
</table>

You can enter values for the following optional columns:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>START_DATE_ACTIVE</td>
<td>Enter the start date of the segment value.</td>
</tr>
<tr>
<td>END_DATE_ACTIVE</td>
<td>Enter the end date of the segment value.</td>
</tr>
</tbody>
</table>
THIRD_PARTY_CTRL_ACCOUNT
Enter the third party control account value. Valid values are: CUSTOMER, SUPPLIER, R for Restrict Manual Journals, Y, and N.

FINANCIAL_CATEGORY
Enter a financial category value for Oracle Transactional Business Intelligence reporting. Valid values are values defined in the FINANCIAL_CATEGORY lookup type.

DESCRIPTION
There are different description columns for different languages. To see segment value description in a different language installation, you need to populate the segment description for that language too.

The following columns should be left as null as Import Segment Values and Hierarchies process uses them for internal processing or does not use them in the current release.

- CREATION_DATE
- CREATED_BY
- LAST_UPDATE_DATE
- LAST_UPDATE_LOGIN
- LAST_UPDATED_BY
- SEGMENT_VALUE_INTERFACE_ID
- REQUEST_ID
- LOAD_REQUEST_ID

Assigning Values for Columns in the GL_SEGMENT_HEIR_INTERFACE table

You must enter values in all columns of the interface table that require values, which includes all of the not null columns, in order for the Import Segment Values and Hierarchies process to be successful. Enter values in the following required columns of the interface table:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>STATUS_CODE</td>
<td>Enter the value NEW to indicate that you are bringing new hierarchy data.</td>
</tr>
<tr>
<td>VALUE_SET_CODE</td>
<td>Enter the value set code for the segment values.</td>
</tr>
<tr>
<td>TREE_CODE</td>
<td>Enter the hierarchy name (tree code).</td>
</tr>
<tr>
<td>TREE_VERSION_NAME</td>
<td>Enter the hierarchy version name (tree version name).</td>
</tr>
<tr>
<td>TREE_VERSION_START_DATE_ACTIVE</td>
<td>Enter the date that the tree version is activated.</td>
</tr>
<tr>
<td>TREE_VERSION_END_DATE_ACTIVE</td>
<td>Enter the date that the tree version is inactivated.</td>
</tr>
<tr>
<td>VALUE</td>
<td>Enter the segment value.</td>
</tr>
<tr>
<td>PARENT_VALUE</td>
<td>Select N if the segment value is a child value or Y if the segment value is a parent value.</td>
</tr>
<tr>
<td>DEPTH</td>
<td>Enter the depth of the hierarchy which shows the many ancestors the segment value has in the hierarchy.</td>
</tr>
<tr>
<td>OBJECT_VERSION_NUMBER</td>
<td>Enter default value of 1.</td>
</tr>
</tbody>
</table>
The following columns should be left as null as Import Segment Values and Hierarchies process uses them for internal processing or does not use them in the current release.

- CREATION_DATE
- CREATED_BY
- LAST_UPDATE_DATE
- LAST_UPDATE_LOGIN
- LAST_UPDATED_BY
- SEGMENT_VALUE_INTERFACE_ID
- REQUEST_ID
- LOAD_REQUEST_ID

Define Chart of Accounts for Enterprise Structures: Manage Accounting Calendars

Defining Accounting Calendars: Critical Choices

Define an accounting calendar to create your accounting year and the periods it contains. Specify common calendar options that the application uses to automatically generate a calendar with its periods. Specifying all the options makes defining a correct calendar easier and more intuitive with fewer errors. The choices you make when specifying the following options are critical, because it is difficult to change your accounting calendar after a period status is set to open or future enterable.

- Start Date
- Period Frequency
- Adjusting Period Frequency
- Period Name Format

Note

In Oracle Fusion, the common calendar types, monthly, weekly, 4-4-5, 4-5-4, 5-4-4, 4-week, quarterly, and yearly, are automatically generated. This functionality makes it easier to create and maintain accounting calendars. By using the period frequency option, you no longer have to go through the tedious task of defining each period manually.

Start Date

If you plan to run translation, specify a calendar start date that is a full year before the start date of the year of the first translation period for your ledger.
Translation cannot be run in the first period of a calendar. Consider how many years of history you are going to load from your previous system and back up the start date for those years plus one more. You cannot add previous years once the first calendar period has been opened.

**Period Frequency**

Use period frequency to set the interval for each subsequent period to occur, for example, monthly, quarterly, or yearly. If you select the period frequency of Other, by default, the application generates the period names, year, and quarter number. You specify the start and end dates. You must manually enter the period information. For example, select the period frequency of Other and enter 52 as the number of periods when you want to define a weekly calendar. For manually entered calendars, when you click the Add Year button, the application creates a blank year. Then, you must manually enter the periods for the new year. The online validation helps prevent erroneous entries.

If the year has been defined and validated, use the Add Year button to add the next year quickly. Accept or change the new rows as required. For example, with the Other frequency type calendar, dates may differ from what the application generates.

**Note**

In Oracle Fusion applications a calendar can only have one period frequency and period type. Therefore, if you have an existing calendar with more than one period type associated with it, during the upgrade from Oracle E-Business Suite, separate calendars are created based on each calendar name and period type combination.

**Adjusting Period Frequency**

Use the adjusting period frequency to control when the application creates adjusting periods. For example, some of the frequencies you select add one adjusting period at year end, two at year end, or one at the end of each quarter. The default is None which adds no adjusting periods. If you select the frequency of Other, the Number of Adjusting Periods field is displayed. Enter the number of desired adjusting periods and then, manually define them.

**Period Name Format Region**

The User-Defined Prefix field in the Period Name Format region is an optional feature that allows you to enter your own prefix. For example, define a weekly calendar and then enter a prefix of Week, - as the separator, and the period name format of Period numberYY fiscal year. The application creates the names of Week1-11, Week2-11, through Week52-11. The options for the Format field are predefined values. The list of values is filtered based on the selected separator and only displays the options that match the selected separator.

The year displayed in the period names is based on the selected period name format and the dates the period covers or if the period crosses years, on the year of the start date of the period. For example, April 10, 2010 to May 9, 2010 has the
period name of Apr-10 and December 10, 2010 to January 9, 2011 has the name of Dec-10. If period frequency is Other, then the period format region is hidden. The application generates a temporary period name for calendars with period frequency of Other, using a fixed format of Period numberYY. You can override this format with your own customized period names.

**Note**

For an accounting calendar that is associated with a ledger, changing period names or adding a year updates the accounting period dimension in the balances cubes.

---

**Calendar Validation: How It Works with the Accounting Calendar**

Calendar validation is automatic and prevents serious problems when you begin using the calendar. Once you set a calendar period status to open or future enterable, you cannot edit the period.

**Settings That Affect Calendar Validation**

The calendar validation runs automatically when you save the calendar.

**How the Calendar Is Validated**

The following table lists the validation checks performed when the accounting calendar is saved.

<table>
<thead>
<tr>
<th>Validation Performed</th>
<th>Example of Data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Unique period number</td>
<td>2 assigned for two periods</td>
</tr>
<tr>
<td>Unique period name</td>
<td>Jan-11 entered twice</td>
</tr>
<tr>
<td>Period number beyond the maximum number of periods per year</td>
<td>13 for a 12 period calendar with no adjusting periods</td>
</tr>
<tr>
<td>Entered period name contains spaces</td>
<td>Jan 11</td>
</tr>
<tr>
<td>Single or double quotes in the period name</td>
<td>Jan ’11</td>
</tr>
<tr>
<td>Nonadjusting periods with overlapping dates</td>
<td>01-Jan-2011 to 31-Jan-2011 and 30-Jan-2011 to 28-Feb-2011</td>
</tr>
<tr>
<td>Period date gaps</td>
<td>01-Jan-2011 to 28-Jan-2011 and 31-Jan-2011 to 28-Feb-2011</td>
</tr>
<tr>
<td>Missing period numbers</td>
<td>Periods 1 through 6 defined for a twelve month calendar</td>
</tr>
<tr>
<td>Period number gaps</td>
<td>1, 3, 5</td>
</tr>
<tr>
<td>Period numbers not in sequential order by date</td>
<td>Period 1 covers 01-Jan-2011 to 31-Jan-2011 and period 2 covers 01-Mar-2011 to 31-Mar-2011, and period 3 covers 01-Feb-2011 to 28-Feb-2011.</td>
</tr>
<tr>
<td>Quarter number gaps</td>
<td>1, 3, 4</td>
</tr>
<tr>
<td>Quarters not in sequential order by period</td>
<td>1, 3, 2, 4</td>
</tr>
<tr>
<td>Period start or end dates more than one year before or after the fiscal year</td>
<td>July 1, 2010 in a 2012 calendar</td>
</tr>
</tbody>
</table>
FAQs for Manage Accounting Calendars

How can I identify errors in my accounting calendar?

Oracle Fusion General Ledger identifies erroneous entries online as you enter a new calendar or change data on an existing calendar. The application also automatically validates the data when you save the calendar.

What's the difference between calendar and fiscal period naming?

The period naming format determines the year that is appended to the prefix for each period in the calendar. For the example, your accounting year has a set of twelve accounting period with a start date of September 1, 2011 and the end date is August 31, 2012, with each period’s date range following the natural calendar month date range.

Calendar period naming format: Select the calendar period format to append the period’s start date’s year to the prefix. For the period covering September 1, 2011 to December 31, 2011, then 2011 or just 11, depending on the period format selected, is appended to each period’s name. For the remaining periods covering January 1, 2012 to August 31, 2012, then 2012 or 12, is appended to each period’s name.

Fiscal period naming format: Select the fiscal period format to always append the period’s year assignment to the prefix. If the accounting periods in the set of twelve are all assigned the year of 2012, then 2012 or just 12, depending on the period format selected, is appended to the period name of all 12 periods.

When do I update an existing calendar?

Update an existing calendar before the new periods are needed as future periods, based on the future period setting in your accounting configuration. If a complete year has been defined and validated, use the Add Year button to add the next year quickly. Accept or change the new rows as required. For example, with the Other frequency type calendar, dates may differ from what the application generates.

What happens if I upgrade my calendar from Oracle E-Business Suite Release 12?

The migration script assigns a period frequency that most closely matches your Oracle E-Business Suite Release 12 calendar. When you use the Oracle Fusion applications Add Year functionality for the first time, you have an opportunity to review and change the period frequency. The Calendar Options page opens only for calendars upgraded from Release 12 to allow one time modification.

Make your changes to the period frequency, adjusting period frequency, and period name format, including the prefix and separator, as needed. Changes can
not conflict with the existing upgraded calendar definition. Update the calendar name and description in the calendar header, as needed, for all calendars. Period details for a new year will be generated automatically based on the latest calendar options. You can also manually update the calendar. The modified calendar options affect future years only.

Define Accounting Configurations of Enterprise Structures: Manage Primary or Secondary Ledgers

Accounting Configuration Offerings: Overview

The Setup and Maintenance work area in the Oracle Fusion Applications is used to manage the configuration of legal entities, ledgers, and reporting currencies that comprise your accounting configuration. To create a new legal entity or ledger, your implementation consultant or system administrator must create an implementation project. This implementation project can be populated by either adding a financials related offering or one or more task lists.

Note

Setup tasks that are not related to the ledger or legal entity specific setup tasks can be invoked from either an implementation project or launched directly from the Setup and Maintenance work area.

There are two offerings predefined for financial implementations.

- The Oracle Fusion Accounting Hub offering is used to add the Oracle Fusion General Ledger and Oracle Fusion Subledger Accounting application features to an existing enterprise resource planning (ERP) system to enhance the current reporting and analysis.

- The Oracle Fusion Financials offering, which includes the Oracle Fusion General Ledger and Oracle Fusion Subledger Accounting application features, as well as at least one of the subledger financial applications.

When adding an offering to an implementation project, implementation consultants can customize the tasks displayed by adding additional tasks to the implementation project.

Ledgers and Subledgers: Explained

Oracle Fusion Applications reflect the traditional segregation between the general ledger and associated subledgers. Detailed transactional information is captured in the subledgers and periodically imported and posted in summary or detail to the ledger.

A ledger determines the currency, chart of accounts, accounting calendar, ledger processing options, and accounting method for its associated subledgers. Each accounting setup requires a primary ledger and optionally, one or more
secondary ledgers and reporting currencies. Reporting currencies are associated with either a primary of secondary ledger.

The number of ledgers and subledgers is unlimited and determined by your business structure and reporting requirements.

**Single Ledger**

If your subsidiaries all share the same ledger with the parent company or they share the same chart of accounts and calendar, and all reside on the same applications instance, you can consolidate financial results in Oracle Fusion General Ledger in a single ledger. Use Oracle Fusion Financial Reporting functionality to produce individual entity reports by balancing segments. General Ledger has three balancing segments that can be combined to provide detailed reporting for each legal entity and then rolled up to provide consolidated financial statements.

**Multiple Ledgers**

Accounting operations using multiple ledgers can include single or multiple applications instances. You need multiple ledgers if one of the following is true:

- You have companies that require different account structures to record information about transactions and balances. For example, one company may require a six-segment account, while another needs only a three-segment account structure.

- You have companies that use different accounting calendars. For example, although companies may share fiscal year calendars, your retail operations require a weekly calendar, and a monthly calendar is required for your corporate headquarters.

- You have companies that require different functional currencies. Consider the business activities and reporting requirements of each company. If you must present financial statements in another country and currency, consider the accounting principles to which you must adhere.

**Subledgers**

Oracle Fusion Subledgers capture detailed transactional information, such as supplier invoices, customer payments, and asset acquisitions. Oracle Fusion Subledger Accounting is an open and flexible application that defines the accounting rules, generates detailed journal entries for these subledger transactions, and posts these entries to the general ledger with flexible summarization options to provide a clear audit trail.

**Ledgers: Points to Consider**

Companies account for themselves in primary ledgers, and, if necessary, secondary ledgers and reporting currencies. Your transactions from your subledgers are posted to your primary ledgers and possibly, secondary ledgers or reporting currencies. Local and corporate compliance can be achieved through
an optional secondary ledger, providing an alternate accounting method, or in some cases, a different chart of accounts. Your subsidiary’s primary and secondary ledgers can both be maintained in your local currency, and you can convert your local currency to your parent’s ledger currency to report your consolidated financial results using reporting currencies or translation.

**Primary Ledgers**

A primary ledger is the main record-keeping ledger. Like any other ledger, a primary ledger records transactional balances by using a chart of accounts with a consistent calendar and currency, and accounting rules implemented in an accounting method. The primary ledger is closely associated with the subledger transactions and provides context and accounting for them.

To determine the number of primary ledgers, your enterprise structure analysis must begin with your financial, legal, and management reporting requirements. For example, if your company has separate subsidiaries in several countries worldwide, enable reporting for each country’s legal authorities by creating multiple primary ledgers that represent each country with the local currency, chart of accounts, calendar, and accounting method. Use reporting currencies linked to your country specific primary ledgers to report to your parent company from your foreign subsidiaries. Other considerations, such as corporate year end, ownership percentages, and local government regulations and taxation, also affect the number of primary ledgers required.

**Secondary Ledgers**

A secondary ledger is an optional ledger linked to a primary ledger for the purpose of tracking alternative accounting. A secondary ledger can differ from its primary ledger by using a different accounting method, chart of accounts, accounting calendar, currency, or processing options. All or some of the journal entries processed in the primary ledger are transferred to the secondary ledger, based on your configuration options. The transfers are completed based on the conversion level selected. There are four conversion levels:

- **Balance:** Only Oracle Fusion General Ledger balances are transferred to the secondary ledger.
- **Journal:** General Ledger journal posting process transfers the journal entries to the secondary ledger.
- **Subledger:** Oracle Fusion Subledger Accounting creates subledger journals to subledger level secondary ledgers as well as reporting currencies.
- **Adjustments Only:** Incomplete accounting representation that only holds adjustments. The adjustments can be manual or detailed adjustments from Subledger Accounting. This type of ledger must share the same chart of accounts, accounting calendar, and period type combination, and currency as the associated primary ledger.

**Note**

A full accounting representation of your primary ledger is maintained in any subledger level secondary ledger.
Secondary ledgers provide functional benefits, but produce large volumes of additional journal entry and balance data, resulting in additional performance and memory costs. When adding a secondary ledger, consider your needs for secondary ledgers or reporting currencies, and select the least costly data conversion level that meets your requirements. For secondary ledgers, the least costly level is the adjustment data conversion level because it produces the smallest amount of additional data. The balance data conversion level is also relatively inexpensive, depending upon how often the balances are transferred from the primary to the secondary ledger. The journal and subledger data conversion levels are much more expensive, requiring duplication of most general ledger and subledger journal entries, as well as general ledger balances.

For example, you maintain a secondary ledger for your International Financial Reporting Standards (IFRS) accounting requirements, while your primary ledger uses US Generally Accepted Accounting Principles (GAAP). You decided to select the subledger level for your IFRS secondary ledger. However, since most of the accounting is identical between US GAAP and IFRS, a better solution is to use the adjustment only level for your secondary ledger. The subledger level secondary ledger requires duplication of most subledger journal entries, general ledger journal entries, and general ledger balances. With the adjustment only level, your secondary ledger contains only the adjustment journal entries and balances necessary to convert your US GAAP accounting to the IFRS accounting, which uses a fraction of the resources that are required by full subledger level secondary ledger.

Following are scenarios that may require different combinations of primary and secondary ledgers:

- The primary and secondary ledgers use different charts of accounts to meet varying accounting standards or methods. A chart of accounts mapping is required to instruct the application how to propagate balances from the source (primary) chart of accounts to the target (secondary) chart of accounts.

- The primary and secondary ledgers use different accounting calendars to comply with separate industry and corporate standards.

**Note**

Use the same currency for primary and secondary ledgers to avoid difficult reconciliations, if you have the resources to support the extra posting time and data storage. Use reporting currencies or translations to generate the different currency views needed to comply with internal reporting needs and consolidations.

**Reporting Currencies**

Reporting currencies maintain and report accounting transactions in additional currencies. Each primary and secondary ledger is defined with a ledger currency that is used to record your business transactions and accounting data for that ledger. It is advisable to maintain the ledger in the currency in which the majority of its transactions are denominated. For example, create, record, and close a transaction in the same currency to save processing and reconciliation time. Compliance, such as paying local transaction taxes, is also easier using a
local currency. Many countries require that your accounting records be kept in their national currency.

If you need to maintain and report accounting records in different currencies, you do this by defining one or more reporting currencies for the ledger. There are three conversion levels for reporting currencies:

- **Balance**: Only General Ledger balances are converted into the reporting currency using translation.
- **Journal**: General Ledger journal entries are converted to the reporting currency during posting.
- **Subledger**: Subledger Accounting creates subledger reporting currency journals along with primary ledger journals.

**Note**

A full accounting representation of your primary ledger is maintained in any subledger level reporting currency. Secondary ledgers cannot use subledger level reporting currencies.

Of the three data conversion levels available, the balance data conversion level is typically the least expensive, requiring duplication of only the balance level information. The journal and subledger data conversion levels are more expensive, requiring duplication of most general ledger and subledger journal entries, as well as general ledger balances.

**Note**

Do not use journal or subledger level reporting currencies if your organization has only an infrequent need to translate your financial statements to your parent company’s currency for consolidation purposes. Standard translation functionality meets this need. Consider using journal or subledger level reporting currencies when any of the following conditions exist.

- You operate in a country whose unstable currency makes it unsuitable for managing your business. As a consequence, you need to manage your business in a more stable currency while retaining the ability to report in the unstable local currency.
- You operate in a country that is part of the European Economic and Monetary Union (EMU), and you choose to account and report in both the European Union currency and your National Currency Unit (NCU).

**Note**

The second option is rare since most companies have moved beyond the initial conversion to the EMU currency. However, future decisions could add other countries to the EMU, and then, this option would again be used during the conversion stage.

**Financial Ledgers: How They Fit Together**

Oracle Fusion Applications is an integrated suite of business applications that connects and automates the entire flow of the business process across both
front and back office operations and addresses the needs of a global enterprise. The process of designing the enterprise structure, including the accounting configuration, is the starting point for an implementation. This process often includes determining financial, legal, and management reporting requirements, setting up primary and secondary ledgers, making currency choices, and examining consolidation considerations.

This figure shows the enterprise structure components and their relationships to each other. Primary ledgers are connected to reporting currencies and secondary ledgers to provide complete reporting options. Legal entities are assigned to ledgers, both primary and secondary, and balancing segments are assigned to legal entities. Business units must be connected to both a primary ledger and a default legal entity. Business units can record transactions across legal entities.

Primary Ledgers

A primary ledger is the main record-keeping ledger. Create a primary ledger by combining a chart of accounts, accounting calendar, ledger currency, and accounting method. To determine the number of primary ledgers, your enterprise structure analysis must begin with determining financial, legal, and management reporting requirements. For example, if your company has separate subsidiaries in several countries worldwide, create multiple primary ledgers representing each country with the local currency, chart of accounts, calendar, and accounting method to enable reporting to each country’s legal authorities.

If your company just has sales in different countries, with all results being managed by the corporate headquarters, create one primary ledger with multiple balancing segment values to represent each legal entity. Use secondary ledgers or reporting currencies to meet your local reporting requirements, as needed. Limiting the number of primary ledgers simplifies reporting because
consolidation is not required. Other consideration such as corporate year end, ownership considerations, and local government regulations, also affect the number of primary ledgers required.

Secondary Ledgers

A secondary ledger is an optional ledger linked to a primary ledger. A secondary ledger can differ from its related primary ledger in chart of accounts, accounting calendar, currency, accounting method, or ledger processing options. Reporting requirements, for example, that require a different accounting representation to comply with international or country-specific regulations, create the need for a secondary ledger.

Below are scenarios and required action for different components in primary and secondary ledgers:

- If the primary and secondary ledgers use different charts of accounts, the chart of accounts mapping is required to instruct the system how to propagate journals from the source chart of accounts to the target chart of accounts.

- If the primary and secondary ledgers use different accounting calendars, the accounting date and the general ledger date mapping table will be used to determine the corresponding non-adjusting period in the secondary ledger. The date mapping table also provides the correlation between dates and non-adjusting periods for each accounting calendar.

- If the primary ledger and secondary ledger use different ledger currencies, currency conversion rules are required to instruct the system on how to convert the transactions, journals, or balances from the source representation to the secondary ledger.

Note: Journal conversion rules, based on the journal source and category, are required to provide instructions on how to propagate journals and types of journals from the source ledger to the secondary ledger.

Reporting Currencies

Reporting currencies are the currency you use for financial, legal, and management reporting. If your reporting currency is not the same as your ledger currency, you can use the foreign currency translation process or reporting currencies functionality to convert your ledger account balances in your reporting currency. Currency conversion rules are required to instruct the system on how to convert the transactions, journals, or balances from the source representation to the reporting currency.

Legal Entities

Legal entities are discrete business units characterized by the legal environment in which they operate. The legal environment dictates how the legal entity should perform its financial, legal, and management reporting. Legal entities generally have the right to own property and the obligation to comply with labor laws for their country. They also have the responsibility to account for themselves and present financial statements and reports to company regulators, taxation authorities, and other stakeholders according to rules specified in the relevant legislation and applicable accounting standards. During setup, legal
entities are assigned to the accounting configuration, which includes all ledgers, primary and secondary.

**Balancing Segments**

You assign primary balancing segment values to all legal entities before assigning values to the ledger. Then, assign specific primary balancing segment values to the primary and secondary ledgers to represent nonlegal entity related transactions such as adjustments. You can assign any primary balancing segment value that has not already been assigned to a legal entity. You are allowed to assign the same primary balancing segment values to more than one ledger. The assignment of primary balancing segment values to legal entities and ledgers is performed within the context of a single accounting setup. The Balancing Segment Value Assignments report is available to show all primary balancing segment values assigned to legal entities and ledgers across accounting setups to ensure the completeness and accuracy of their assignments. This report allows you to quickly identify these errors and view any unassigned values.

**Business Units**

A business unit is a unit of an enterprise that performs one or many business functions that can be rolled up in a management hierarchy. When a business function produces financial transactions, a business unit must be assigned a primary ledger, and a default legal entity. Each business unit can post transactions to a single primary ledger, but it can process transactions for many legal entities. Normally, it will have a manager, strategic objectives, a level of autonomy, and responsibility for its profit and loss. You define business units as a separate task generally done after the accounting setups steps.

The business unit model:

- Allows for flexible implementation
- Provides a consistent entity for controlling and reporting on transactions
- Enables sharing of sets of reference data across applications

For example, if your company requires business unit managers to be responsible for managing all aspects of their part of the business, then consider using two balancing segments, company and business unit to enable the production of business unit level balance sheets and income statements.

Transactions are exclusive to business units. In other words, you can use business unit as a securing mechanism for transactions. For example, if you have an export business that you run differently from your domestic business, use business units to secure members of the export business from seeing the transactions of the domestic business.

**Creating Primary Ledgers: Example**

Create a primary ledger as your main record-keeping ledger. Like any other ledger, a primary ledger records transactional balances by using a chart of accounts with a calendar, currency, and accounting rules implemented in an
accounting method. The primary ledger is closely associated with the subledger transactions and provides context and accounting for them.

Scenario

Your company, InFusion Corporation is implementing Oracle Fusion Applications. You have been assigned the task of creating a primary ledger for your InFusion America entity.

1. Navigate to the Define Accounting Configurations task list and open Manage Primary Ledgers from within your implementation project. Click the Go to Task.
2. Click the Create icon.
3. Enter the following values:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>InFusion America</td>
</tr>
<tr>
<td>Description</td>
<td>InFusion America primary ledger for recording transactions.</td>
</tr>
<tr>
<td>Chart of Accounts</td>
<td>InFusion America Chart of Accounts</td>
</tr>
<tr>
<td>Accounting Calendar</td>
<td>Standard Monthly</td>
</tr>
<tr>
<td>Currency</td>
<td>USD</td>
</tr>
<tr>
<td>Accounting Method</td>
<td>Standard Accrual</td>
</tr>
</tbody>
</table>

4. Click Save and Edit Task List to navigate back to the accounting configuration task list.

Note

You cannot change the chart of accounts, accounting calendar, or currency for your ledger after you save your ledger.

Define Accounting Configurations of Enterprise Structures: Specify Ledger Options

Specifying Ledger Options: Worked Example

This example demonstrates specifying the ledger options for your primary ledger. Your company, InFusion Corporation, is a multinational conglomerate that operates in the United States (US) and the United Kingdom (UK). InFusion has purchased an Oracle Fusion enterprise resource planning (ERP) solution including Oracle Fusion General Ledger and all of the Oracle Fusion subledgers.

After completing your InFusion America Primary Ledger, select Specify Ledger Options under the Define Accounting Configuration task list on the Functional Setup Manager page.
Note

Both primary and secondary ledgers are created in the same way and use the same user interface to enable their specific ledger options.

Reviewing General Region Options

1. Accept the Name and Description defaults for the ledger selected.
2. Review the Currency and Chart of Accounts for the specified ledger, which are automatically populated.

Setting Accounting Calendar Region Options

1. Review the Accounting Calendar that defaults from your ledger.
2. Select Jan-2011 as the First Open Period for your ledger.
   Important: Select a period after the first defined period in the ledger calendar to enable running translation. You cannot run translation in the first defined period of a ledger calendar. In this example, your calendar began with Jan-2010.
3. Enter 3 for the Number of Future Enterable Periods.
   Any value between 0 and 999 periods can be specified to permit entering journals but not posting them in future periods. Minimize the number of open and future periods to prevent entry in the wrong period.

Selecting the Subledger Accounting Region Options

1. Accept the default Accounting Method from your ledger.

Completing the Period Close Region Options

1. Enter your Retained Earnings Account:
   101-00-31330000-0000-000-0000-0000.
   This account is required for the General Ledger to perform the movement of revenue and expense account balances to this account at the end of the accounting year.
2. Enter your Cumulative Translation Adjustment Account:
   101-00-31350000-0000-000-0000-0000.
   Note: The Cumulative Translation Adjustment (CTA) account is required for ledgers running translation.
3. Do not enter a Default Period End Rate Type or Default Period Average Rate Type.
   The values entered here are used as the default for balance level reporting currency processing. InFusion America Primary Ledger is using the subledger level reporting currency processing.

Specifying the Journal Processing Region Options

1. Specify the Balance options as outlined in the following table.
## Option Settings for Define Enterprise Structures

<table>
<thead>
<tr>
<th>Option</th>
<th>Setting</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Suspense</td>
<td>General Ledger</td>
</tr>
<tr>
<td>Default Expense Account</td>
<td>101-00-98199999-0000-000-0000-0000</td>
</tr>
<tr>
<td>Rounding Account</td>
<td>101-10-98189999-0000-000-0000-0000</td>
</tr>
<tr>
<td>Entered Currency Balancing Account</td>
<td>101-10-98179999-0000-0000-0000-0000</td>
</tr>
<tr>
<td>Balancing Threshold Percent</td>
<td>10</td>
</tr>
</tbody>
</table>

2. Click all the following Entry options listed in the table.

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable journal approval</td>
<td>Click to enable journal approval functionality. Approval rules must be</td>
</tr>
<tr>
<td></td>
<td>created in the Oracle Fusion Approvals Management (AMX).</td>
</tr>
<tr>
<td>Notify when prior period</td>
<td>Notify the user when a prior period date is selected on a journal entry.</td>
</tr>
<tr>
<td>journal entry</td>
<td></td>
</tr>
<tr>
<td>Allow mixed and statistical</td>
<td>Enter both monetary and statistical amounts on the same line in a journal</td>
</tr>
<tr>
<td>journals</td>
<td>entry.</td>
</tr>
<tr>
<td>Validate reference date</td>
<td>Requires a reference date in an open or future enterable period.</td>
</tr>
</tbody>
</table>

3. Click the **Separate journals by accounting date during journal import** for the Import option to create individual journal entries for each accounting date.

4. For the Reversal options, select InFusion America Accrual Set from the list of values in the **Journal Reversal Criteria Set** field and click the **Launch AutoReverse after open period** to reverse accrual journal entries automatically when a new period is opened.

5. Click the **Enable intercompany accounting** for the Intercompany option to enable automatic balancing by the application for primary, second, and third balancing segments (if implemented) on intercompany journal entries and transactions.

   Note: To complete the intercompany accounting functionality, you must define intercompany rules.

### FAQs for Specify Ledger Options

**What happens if I change the cumulative adjustment account?**

To avoid data corruption, your cumulative adjustment account (CTA) can only be changed if you first perform the following set of steps:

- Purge all translated balances
• Change the CTA account
• Rerun translation

**What happens if I change the retained earnings account?**

To avoid data corruption, your retained earnings account can only be changed if you first perform the following set of steps:

• Enter and post journals to bring the ending balances for your income statement accounts to zero at the end of each accounting year
• Purge actual translated balances
• Update the retained earnings account
• Reverse the journal entries use to bring the ending account balances to zero and rerun translation

**Assigning Legal Entities and Balancing Segments: Examples**

Optionally, assign legal entities and balancing segments to your accounting configuration.

**Assign Legal Entities**

Assign one or more legal entities to your configuration by following these steps:

1. Navigate to the Assign Legal Entities task. Click the Go to Task.
2. Click the Select and Add icon.
3. Click Search. Select your legal entities.
4. Click Apply. Click Done.
5. Click Save and Close.

**Assign Balancing Segments to Legal Entities**

Assign balancing segment values to your legal entities by following these steps:

1. Navigate to the Assign Balancing Segment Values to Legal Entities task. Click the Go to Task.
2. Click the Create icon.
3. Select the balancing segment value. Optionally, add a Start Date.
4. Click Save and Close to close the create page.
5. Click Save and Close.

**Assign Balancing Segments to Ledgers**

Assign balancing segment values directly to your ledger by following these steps:

1. Navigate to the Assign Balancing Segment Value to Ledger task. Click the Go to Task.
2. Select the balancing segment value.
3. Optionally enter a start date.
4. Click **Save and Close**.

**Note**
The balancing segment values that are assigned to the ledger represent nonlegal entity transactions, such as adjustments. If you use legal entities, you must assign balancing segment values to all legal entities before assigning values to the ledger. The only available balancing segment values that can be assigned to ledgers are those not assigned to legal entities.

**Define Accounting Configurations of Enterprise Structures: Manage Reporting Currencies**

**Reporting Currency Balances: How They Are Calculated**

Reporting currency balances, set at the journal or subledger level, are updated when journal entries that originate in Oracle Fusion General Ledger are posted and converted to your reporting currencies. This process includes General Ledger manual journals, periodic journals, and allocations, and at the subledger level, journals from Oracle Fusion Subledger Accounting and imported from sources other than your Oracle Fusion subledgers. When you post a journal in a ledger that has one or more reporting currencies defined, the posting process creates new journals converted to each of your reporting currencies and includes them in the same batch as the original journal with a status of Posted.

**Settings That Affect**

Reporting currencies share a majority of the ledger options with their source ledger. For example, the reporting currency uses the same suspense account and retained earnings accounts as its source ledger. However, there are certain options that need to be set specifically for the reporting currencies. For example, reporting currencies are maintained at one of these three currency conversion levels:

- **Balance Level**: Only balances are maintained in the reporting currency using the General Ledger Translation process.
- **Journal Level**: Journal entries and balances are converted to the reporting currency by the General Ledger Posting process.
- **Subledger Level**: Subledger Accounting creates reporting currency journals for subledger transactions. General Ledger converts journals that originated in General Ledger or that are imported from sources other than the Oracle Fusion subledgers. The full accounting representation of your primary ledger is maintained in the subledger level reporting currency.

**Note**
Secondary Ledgers cannot use subledger level reporting currencies.

There are multiple dependencies between a reporting currency and its source ledger. Therefore, it is important that you complete your period opening tasks,
daily journal or subledger level reporting currencies accounting tasks, and period closing tasks in the correct order. Some guidelines are presented in the table below.

<table>
<thead>
<tr>
<th>Type</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>Period Opening Tasks</td>
<td>Open the accounting period in both your ledger and reporting currencies before you create or import journals for the period. Converted journals are only generated in your reporting currency if the period is open or future enterable.</td>
</tr>
<tr>
<td>Daily Tasks</td>
<td>Enter the daily conversion rates to convert your journals to each of your reporting currencies.</td>
</tr>
<tr>
<td>Period Closing Tasks</td>
<td>• Finish entering all regular and adjusting journals for the period in your ledger.</td>
</tr>
<tr>
<td></td>
<td>• Post all unposted journals in your ledger if not already done in the previous step.</td>
</tr>
<tr>
<td></td>
<td>• Post all unposted journals in your reporting currencies if not already done in the previous step.</td>
</tr>
<tr>
<td></td>
<td>• Run Revaluation in both your ledger and reporting currencies. Post the resulting revaluation batches in each ledger.</td>
</tr>
<tr>
<td></td>
<td>• As needed, translate balances in your ledger.</td>
</tr>
<tr>
<td></td>
<td>• Generate needed reports from both your ledger and reporting currencies.</td>
</tr>
<tr>
<td></td>
<td>• Close your accounting period in both your ledger and reporting currencies.</td>
</tr>
</tbody>
</table>

**How Reporting Currencies Are Calculated**

If you use reporting currencies at the journal or subledger level, when you create accounting, post journal entries, or translate balances, journals are posted in your reporting currency. General Ledger and Subledger Accounting automatically generate journals in your reporting currencies where the entered currency amounts are converted to the reporting currency amounts. Other factors used in the calculation of reporting currency balances are listed:

- Manual Journals: Enter a manual journal batch in your reporting currency at the journal or subledger level by using the Create Journals page. Select the journal or subledger level reporting currency from the ledger’s list of values and continue in the same manner as entering any other manual journal.

- Conversion Rounding: Use the reporting currency functionality to round converted and accounted amounts using the same rounding rules used throughout your Oracle Fusion Applications. The reporting currency functionality considers several factors that are a part of the currencies predefined in your applications, including:
  - Currency Precision: Number of digits to the right of the decimal point used in currency transactions.
• Minimum Accountable Unit: Smallest denomination used in the currency. This might not correspond to the precision.

• Converted Journals: Generate and post automatically, using the General Ledger Posting process, journals in your reporting currencies when you post the original journals in the source ledger for the following types of journals:
  • Manual journals
  • Periodic and allocation journals
  • Unposted journals from non-Oracle subledger applications
  • Unposted journals from any Oracle Fusion subledger that does not support reporting currency transfer and import
  • Optionally, revaluation journals

• Unconverted Journals: Rely on the subledger accounting functionality to converted and transfer Oracle Fusion subledger journals for both the original journal and the reporting currency journal to the General Ledger for import and posting. The reporting currency conversion for these journals is not performed by the General Ledger.

• Approving Journals: Use the journal approval feature to process reporting currency journals through your organization's approval hierarchy. You can enable journal approval functionality separately in your source ledger and reporting currencies.

• Document Numbers: Accept the default document numbers assigned by the General Ledger application to your journal when you enter a journal in your ledger. The converted journal in the reporting currency is assigned the same document number. However, if you enter a journal in the reporting currency, the document number assigned to the journal is determined by the reporting currency.

• Sequential Numbering: Enable sequential numbering if you want to maintain the same numbering in your reporting currency and source ledger for journals, other than those journals for Oracle Fusion subledgers. Do not create separate sequences for your reporting currencies. If you do, the sequence defined for the reporting currencies is used and can cause document numbers not to be synchronized between the ledger and reporting currencies.

Note

If the Sequential Numbering profile option is set to Always Used or Partially Used and you define an automatic document numbering sequence, General Ledger enters a document number automatically when you save your journal. If you use manual numbering, you can enter a unique document number.

• Revaluation: Run periodically revaluation in your ledger and reporting currencies as necessary to satisfy the accounting regulations of the country in which your organization operates.
• Account Inquiries: Perform inquiries in the reporting currency. Drill down to the journal detail that comprises the reporting currency balance. If the journal detail is a converted journal that was converted automatically when the original journal was posted in the source ledger, you can drill down further to see the source ledger currency journal amounts.

Note

Be careful when changing amounts in a reporting currency, since the changes are not reflected in your source ledger. Making journal entry changes to a reporting currency makes it more difficult to reconcile your reporting currency to your source ledger. In general, enter or change your journals in your source ledger, and then allow posting to update the reporting currency.

Note

If you use reporting currencies at the journal or subledger level, statistical journals are generated for your reporting currencies, but the journals are not affected by the currency conversion process.

Define Business Units: Manage Service Provider Relationships

Shared Service Centers: Explained

Oracle Fusion Applications allows defining relationships between business units to outline which business unit provides services to the other business units.

Service Provider Model

In Oracle Fusion Applications V1.0, the service provider model centralizes only the procurement business function. Your business units that have the requisitioning business function enabled can define relationships with business units that have the procurement business function enabled. These service provider business units will process requisitions and negotiate supplier terms for their client business units.

This functionality is used to frame service level agreements and drive security. The definition of service provider relationships provides you with a clear record of how the operations of your business are centralized. For other centralized processing, business unit security is used (known in Oracle EBS as Multi-Org Access Control). This means that users who work in a shared service center have the ability to get access and process transactions on behalf of many business units.

Shared Service Center: Points to Consider

Oracle Fusion applications supports shared service centers in two ways. First, with business unit security, which allows your shared service centers personnel to process transactions for other business units called clients. This was the foundation of Multi Org Access Control in the Oracle E-Business Suite.
Second, the service provider model expands on this capability to allow a business unit and its personnel in a shared service center to work on transactions of the client business units. It is possible to view the clients of a service provider business unit, and to view service providers of a client business unit.

Your shared service centers provide services to your client business units that can be part of other legal entities. In such cases, your cross charges and recoveries are in the form of receivables invoices, and not merely allocations within your general ledger, thereby providing internal controls and preventing inappropriate processing.

For example, in traditional local operations, an invoice of one business unit cannot be paid by a payment from another business unit. In contrast, in your shared service center environment, processes allowing one business unit to perform services for others, such as paying an invoice, are allowed and completed with the appropriate intercompany accounting. Shared service centers provide your users with access to the data of different business units and can comply with different local requirements.

Security

The setup of business units provides you with a powerful security construct by creating relationships between the functions your users can perform and the data they can process. This security model is appropriate in a business environment where local business units are solely responsible for managing all aspects of the finance and administration functions.

In Oracle Fusion applications, the business functions your business unit performs are evident in the user interface for setting up business units. To accommodate shared services, use business unit security to expand the relationship between functions and data. A user can have access to many business units. This is the core of your shared service architecture.

For example, you take orders in many business units each representing different registered legal entities. Your orders are segregated by business unit. However, all of these orders are managed from a shared service order desk in an outsourcing environment by your users who have access to multiple business units.

Benefits

In summary, large, medium, and small enterprises benefit from implementing shared service centers. Examples of functional areas where shared service centers are generally implemented include procurement, disbursement, collections, order management, and human resources. The advantages of deploying these shared service centers are the following:

- Reduce and consolidate the number of control points and variations in processes, mitigating the risk of error.
- Increase corporate compliance to local and international requirements, providing more efficient reporting.
- Implement standard business practices, ensuring consistency across the entire enterprise and conformity to corporate objectives.
• Establish global processes and accessibility to data, improving managerial reporting and analysis.
• Provide quick and efficient incorporation of new business units, decreasing startup costs.
• Establish the right balance of centralized and decentralized functions, improving decision making.
• Automate self-service processes, reducing administrative costs.
• Permit business units to concentrate on their core competencies, improving overall corporate profits.

Service Provider Model: Explained

In Oracle Fusion applications, the service provider model defines relationships between business units for a specific business function, identifying one business in the relationship as a service provider of the business function, and the other business unit as its client.

Procurement Example

The Oracle Fusion Procurement product family has taken advantage of the service provider model by defining outsourcing of the procurement business function. Define your business units with requisitioning and payables invoicing business functions as clients of your business unit with the procurement business function. Your business unit responsible for the procurement business function will take care of supplier negotiations, supplier site maintenance, and purchase order processing on behalf of your client business units. Subscribe your client business units to the supplier sites maintained by the service providers, using a new procurement feature for supplier site assignment.

In the InFusion example below, business unit four (BU4) serves as a service provider to the other three business units (BU1, BU2, and BU3.) BU4 provides the corporate administration, procurement, and human resources (HR) business functions, thus providing cost savings and other benefits to the entire InFusion enterprise.
Define Business Units: Specify Customer Contract Management Business Function Properties

Customer Contracts Business Unit Setup: Explained

Using the Specify Customer Contract Management Business Function Properties task, available by navigating to Setup and Maintenance work area and searching on the task name, you can specify a wide variety of business function settings for customer contracts in a specific business unit. The selections you make for these business functions impact how Oracle Fusion Enterprise Contracts behaves during contract authoring.

Using the Specify Customer Contract Management Business Function Properties task, manage these business function properties:

- Enable related accounts
- Set currency conversion details
- Manage project billing options
- Set up clause numbering
- Set up the Contract Terms Library

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

Enabling Related Customer Accounts

Contract authors can specify bill-to, ship-to, and other accounts for the parties in a contract. Enable the related customer accounts option if you want accounts previously specified as related to the contract party to be available for selection.

Managing Currency Conversion Options

If your organization plans to transact project-related business in multiple currencies, then select the multicurrency option. This allows a contract author to override a contract’s currency, which defaults from the ledger currency of the business unit. It also enables the contract author to specify currency conversion attributes to use when converting from the bill transaction currency to the contract currency and from the invoice currency to the ledger currency.

In the Bill Transaction Currency to Contract Currency region, enter currency conversion details that will normally be used, by all contracts owned by this business unit, to convert transaction amounts in the bill transaction currency to the contract currency. Newly created contracts contain the default currency conversion values, but you can override the values on any contract, if needed.

In the Invoice Currency to Ledger Currency region:

- Enter invoice transaction conversion details if the invoice and ledger currencies can be different.
• Enter revenue transaction conversion details if the revenue and ledger currencies can be different for as-incurred and rate-based revenue.

Managing Project Billing Options

The options available for selection in the Project Billing region control the behavior of project invoicing and revenue recognition for contracts with project-based work.

Project billing can behave differently for external contracts (customer billing) or intercompany and interproject contracts (internal billing).

Set these options, which apply to all contracts:

• Select the Transfer Revenue to General Ledger option if you want to create revenue accounting events and entries, and transfer revenue journals to the general ledger. If this option is not selected, then revenue can still be generated, but will not be transferred to the general ledger.

• Indicate if a reason is required for credit memos that are applied to invoices.

There are two sets of the following options, one for customer billing and a second for internal billing:

• Select an invoice numbering method, either Manual or Automatic. The invoice numbering method is the method that Oracle Fusion Receivables uses to number its invoices, upon release of draft invoices from Project Billing.
  • If the invoice numbering method is Manual, then select an invoice number type, which sets the type of Receivables invoice numbers that are allowed. Valid values are Alphanumeric and Numeric.
  • If the invoice numbering method is Automatic, then enter the next invoice number to use when generating Receivables invoice numbers.

• Select the Receivables batch source to use when transferring invoices to Receivables.

Set this option only for customer billing:

• Indicate if you want contract authors to manually enter the Receivables transaction type on the customer contracts they create.

Managing Clause Numbering

You can choose to number clauses manually or automatically.

If you choose the automatic numbering method, you must select a determinant level for the numbering. You must then select the appropriate clause sequence category from document sequences that you set up for this numbering level.

Contract Terms Library Business Unit Setup: Explained

You can specify a wide variety of Contract Terms Library settings for either customer or supplier contracts within each business unit, by using either the Specify Customer Contract Management Business Function Properties or the Specify Supplier Contract Management Business Function Properties tasks.
These tasks are available by navigating to the **Setup and Maintenance** work area and searching on the task name.

For the Contract Terms Library in each business unit, you can:

- Enable clause and template adoption.
- Set the clause numbering method.
- Set the clause numbering level for automatic clause numbering of contracts.
- For a contract with no assigned ledger or legal entity, set the document sequence to Global or Business Unit level.
- Enable the Contract Expert feature.
- Specify the layout for printed clauses and contract deviation reports.

### Enabling Clause Adoption

If you plan to use clause adoption in your implementation, then set up the following:

- Specify a global business unit
  
  You must designate one of the business units in your organization as the global business unit by selecting the **Global Business Unit** option. This makes it possible for the other local business units to adopt and use approved content from that global business unit. If the **Global Business Unit** option is not available for the business unit you are setting up, this means that you already designated another business unit as global.

- Enable automatic adoption
  
  If you are implementing the adoption feature, then you can have all the global clauses in the global business unit automatically approved and available for use in the local business by selecting the **Autoadopt Global Clauses** option. If you do not select this option, the employee designated as the Contract Terms Library Administrator must approve all global clauses before they can be adopted and used in the local business unit. This option is available only for local business units.

- Specify the administrator who approves clauses available for adoption
  
  You must designate an employee as the Contract Terms Library administrator if you are using adoption. If you do not enable automatic adoption, then the administrator must adopt individual clauses or localize them for use in the local business unit. The administrator can also copy over any contract terms templates created in the global business unit. The clauses and contract terms templates available for adoption are listed in the administrator’s Terms Library work area.

### Setting Clause Numbering Options

You can set up automatic clause numbering for the clauses in the business unit by selecting Automatic in the **Clause Numbering** field and setting the clause numbering level. Then select the appropriate clause sequence category for the specified numbering level. You must have previously set up document sequences for the document sequence categories of global, ledger, and business unit. If clause numbering is manual, contract terms library administrators must enter unique clause numbers each time they create a clause.
You can choose to display the clause number in front of the clause title in contracts by selecting the **Display Clause Number in Clause Title** option.

**Enabling Contract Expert**

You must select the **Enable Contract Expert** option to be able to use the Contract Expert feature in a business unit. This setting takes precedence over enabling Contract Expert for individual contract terms templates.

**Specifying the Printed Clause and Deviations Report Layouts**

For each business unit, you can specify the Oracle BI Publisher RTF file that serves as the layout for:

- The printed contract terms
  
  Enter the RTF file you want used for formatting the printed clauses in the **Clause Layout Template** field.

- The contract deviations report
  
  The RTF file you select as the **Deviations Layout Template** determines the appearance of the contract deviations report PDF. This PDF is attached to the approval notification sent to contract approvers.

**Define Business Units: Specify Supplier Contract Management Business Function Properties**

**Supplier Contracts Business Unit Setup: Explained**

Using the **Specify Supplier Contract Management Business Function Properties** task, available by selecting Setup and Maintenance from the Tools menu and searching on the task name, you can specify a variety of business function settings for supplier contracts in a specific business unit.

The selections you make for these business functions impact how the Contract Terms Library behaves during supplier contract authoring.

**Managing Contract Terms Library Setup Options**

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

**Contract Terms Library Business Unit Setup: Explained**

You can specify a wide variety of Contract Terms Library settings for either customer or supplier contracts within each business unit, by using either the
Specify Customer Contract Management Business Function Properties or the Specify Supplier Contract Management Business Function Properties tasks. These tasks are available by navigating to the Setup and Maintenance work area and searching on the task name.

For the Contract Terms Library in each business unit, you can:

- Enable clause and template adoption.
- Set the clause numbering method.
- Set the clause numbering level for automatic clause numbering of contracts.
- For a contract with no assigned ledger or legal entity, set the document sequence to Global or Business Unit level.
- Enable the Contract Expert feature.
- Specify the layout for printed clauses and contract deviation reports.

**Enabling Clause Adoption**

If you plan to use clause adoption in your implementation, then set up the following:

- Specify a global business unit
  
  You must designate one of the business units in your organization as the global business unit by selecting the Global Business Unit option. This makes it possible for the other local business units to adopt and use approved content from that global business unit. If the Global Business Unit option is not available for the business unit you are setting up, this means that you already designated another business unit as global.

- Enable automatic adoption
  
  If you are implementing the adoption feature, then you can have all the global clauses in the global business unit automatically approved and available for use in the local business by selecting the Autoadopt Global Clauses option. If you do not select this option, the employee designated as the Contract Terms Library Administrator must approve all global clauses before they can be adopted and used in the local business unit. This option is available only for local business units.

- Specify the administrator who approves clauses available for adoption
  
  You must designate an employee as the Contract Terms Library administrator if you are using adoption. If you do not enable automatic adoption, then the administrator must adopt individual clauses or localize them for use in the local business unit. The administrator can also copy over any contract terms templates created in the global business unit. The clauses and contract terms templates available for adoption are listed in the administrator’s Terms Library work area.

**Setting Clause Numbering Options**

You can set up automatic clause numbering for the clauses in the business unit by selecting Automatic in the Clause Numbering field and setting the clause numbering level. Then select the appropriate clause sequence category.
for the specified numbering level. You must have previously set up document sequences for the document sequence categories of global, ledger, and business unit. If clause numbering is manual, contract terms library administrators must enter unique clause numbers each time they create a clause.

You can choose to display the clause number in front of the clause title in contracts by selecting the **Display Clause Number in Clause Title** option.

### Enabling Contract Expert

You must select the **Enable Contract Expert** option to be able to use the Contract Expert feature in a business unit. This setting takes precedence over enabling Contract Expert for individual contract terms templates.

### Specifying the Printed Clause and Deviations Report Layouts

For each business unit, you can specify the Oracle BI Publisher RTF file that serves as the layout for:

- The printed contract terms
  
  Enter the RTF file you want used for formatting the printed clauses in the **Clause Layout Template** field.

- The contract deviations report
  
  The RTF file you select as the **Deviations Layout Template** determines the appearance of the contract deviations report PDF. This PDF is attached to the approval notification sent to contract approvers.

### Define Business Units: Assign Business Unit Business Function

#### Business Functions: Explained

A business unit can perform many business functions in Oracle Fusion Applications. Prior to Oracle Fusion Applications, operating units in Oracle E-Business Suite were assumed to perform all business functions, while in Oracle PeopleSoft, each business unit had one specific business function. Oracle Fusion Applications blends these two models and allows defining business units with one or many business functions.

#### Business Functions

A business function represents a business process, or an activity that can be performed by people working within a business unit and describes how a business unit is used. The following business functions exist in Oracle Fusion applications:

- Billing and revenue management
- Collections management
- Customer contract management
- Customer payments
- Expense management
- Incentive compensation
- Marketing
- Materials management
- Inventory management
- Order fulfillment orchestration
- Payables invoicing
- Payables payments
- Procurement
- Procurement contract management
- Project accounting
- Receiving
- Requisitioning
- Sales

Although there is no relationship implemented in Oracle Fusion Applications, a business function logically indicates a presence of a department in the business unit with people performing tasks associated with these business functions. A business unit can have many departments performing various business functions. Optionally, you can define a hierarchy of divisions, business units, and departments as a tree over HCM organization units to represent your enterprise structure.

**Note**

This hierarchy definition is not required in the setup of your applications, but is a recommended best practice.

Your enterprise procedures can require a manager of a business unit to have responsibility for their profit and loss statement. However, there will be cases where a business unit is performing only general and administrative functions, in which case your manager’s financial goals are limited to cost containment or recovering of service costs. For example, if a shared service center at the corporate office provides services for more commercially-oriented business units, it does not show a profit and therefore, only tracks its costs.

In other cases, where your managers have a responsibility for the assets of the business unit, a balance sheet can be produced. The recommended best practice to produce a balance sheet, is to setup the business unit as a balancing segment in the chart of accounts. The business unit balancing segment can roll up to divisions or other entities to represent your enterprise structure.

When a business function produces financial transactions, a business unit must be assigned to a primary ledger, and a default legal entity. Each business unit can post transactions to a single primary ledger, but it can process transactions for many legal entities.

The following business functions generate financial transactions and will require a primary ledger and a default legal entity:
• Billing and revenue management
• Collections management
• Customer payments
• Expense management
• Materials management
• Payables invoicing
• Project accounting
• Receiving
• Requisitioning

**Business Unit Hierarchy: Example**

For example, your InFusion America Company provides:

• Air quality monitoring systems through your division InFusion Air Systems

• Customer financing through your division InFusion Financial Services

The InFusion Air Systems division further segments your business into the System Components and Installation Services subdivisions. Your subdivisions are divided by business units:

• System Components by products: Air Compressors and Air Transmission
• Installation Services by services: Electrical and Mechanical

Oracle Fusion applications facilitates independent balance sheet rollups for legal and management reporting by offering up to three balancing segments. Hierarchies created using the management segment can provide the divisional results. For example, it is possible to define management segment values to correspond to business units, and arrange them in a hierarchy where the higher nodes correspond to divisions and subdivisions, as in the Infusion US Division example above.
Define Business Units: Manage Business Units

Business Units: Explained

A business unit is a unit of an enterprise that performs one or many business functions that can be rolled up in a management hierarchy. A business unit can process transactions on behalf of many legal entities. Normally, it will have a manager, strategic objectives, a level of autonomy, and responsibility for its profit and loss. Roll business units up into divisions if you structure your chart of accounts with this type of hierarchy. In Oracle Fusion Applications, you assign your business units to one primary ledger. For example, if a business unit is processing payables invoices they will need to post to a particular ledger. This assignment is mandatory for your business units with business functions that produce financial transactions.

In Oracle Fusion Applications, use business unit as a securing mechanism for transactions. For example, if you run your export business separately from your domestic sales business, secure the export business data to prevent access by the domestic sales employees. To accomplish this security, set up the export business and domestic sales business as two separate business units.

The Oracle Fusion Applications business unit model:

- Allows for flexible implementation
- Provides a consistent entity for controlling and reporting on transactions
- Anchors the sharing of sets of reference data across applications

Business units process transactions using reference data sets that reflect your business rules and policies and can differ from country to country. With Oracle Fusion Application functionality, you can choose to share reference data, such as payment terms and transaction types, across business units, or you can choose to have each business unit manage its own set depending on the level at which you wish to enforce common policies.

In countries where gapless and chronological sequencing of documents is required for subledger transactions, define your business units in alignment with your ledger definition, because the uniqueness of sequencing is only ensured within a ledger. In these cases, define a single ledger and assign one legal entity and business unit.

In summary, use business units in the following ways:

- Management reporting
- Processing of transactions
- Security of transactional data
- Reference data definition and sharing

Brief Overview of Business Unit Security

Business units are used by a number of Oracle Fusion Applications to implement data security. You assign data roles to your users to give them access to data in business units and permit them to perform specific functions on this data. When
a business function is enabled for a business unit, the application can trigger the creation of data roles for this business unit based on the business function's related job roles.

For example, if a payables invoicing business function is enabled, then it is clear that there are employees in this business unit that perform the function of payables invoicing, and need access to the payables invoicing functionality. Therefore, based on the correspondence between the business function and the job roles, appropriate data roles are generated automatically. Use Human Capital Management (HCM) security profiles to administer security for employees in business units.

Define Workforce Structures: Manage Enterprise HCM Information

Managing Enterprise Information for Non-Oracle Fusion HCM Users: Explained

The Manage Enterprise HCM Information task includes default settings for your enterprise such as the employment model, worker number generation, and so on. If you are not implementing Oracle Fusion Human Capital Management (HCM), then the only action you may need to perform using this task is to change the enterprise name, if necessary. The other settings are HCM-specific and are not relevant outside of Oracle Fusion HCM.

Define Workforce Structures: Manage Locations

Locations: Explained

A location identifies physical addresses of a workforce structure, such as a department or a job. You can also create locations to enter the addresses of external organizations that you want to maintain, such as employment agencies, tax authorities, and insurance or benefits carriers.

The locations that you create exist as separate structures that you can use for reporting purposes, and also in rules that determine employee eligibility for various types of compensation and benefits. You enter information about a location only once. Subsequently, when you set up other workforce structures you select the location from a list.

Location Sets

When you create a location, you must associate it with a set. Only those users who have access to the set's business unit can access the location set and other associated workforce structure sets, such as those that contain departments and jobs.

You can also associate the location to the common set so that users across your enterprise can access the location irrespective of their business unit. When users search for locations, they can see the locations that they have access to along with the locations in the common set.
The following figure shows how locations sets restrict access to users.

**Uploading Locations Using a Spreadsheet**

If you have a list of locations already defined for your enterprise, you can upload them from a spreadsheet. To use this option, you first download a spreadsheet template, add your location information to the spreadsheet, and then upload directly to your enterprise configuration. You can upload the spreadsheet multiple times to accommodate revisions.

**Define Workforce Structures: FAQs for Manage Locations**

**Why can't I see my location in the search results?**

You can search for approved locations only. Also, if you created a location in Oracle Fusion Trading Community Model, then you can't access that location from Oracle Fusion Global Human Resources. For use in Oracle Fusion HCM, you must recreate the location from the Manage Locations page.

**How can I associate a location with an inventory organization?**

From the Manage Locations page in Oracle Fusion Global Human Resources.

To appear on the Create or Edit Location pages, your inventory organization must be effective on today's date and must exist in the location set that you selected.

**What happens if I select an inventory organization when I'm creating or editing a location?**

The location is available for selection in purchase documents of that inventory organization in Oracle Fusion Inventory Management. If you don't select an
inventory organization, then the location is available in purchase documents across all inventory organizations.

**What happens if I select a geographic hierarchy node when I'm creating or editing a location?**

The calendar events that were created for the geographical node start to apply for the location and may impact the availability of worker assignments at that location. The geographical hierarchy nodes available for selection on the Locations page display from a predefined geographic hierarchy.

**What happens if I inactivate a location?**

Starting from the effective date that you entered, you can no longer associate the location with other workforce structures, assignments, or applications. If the location is already in use, it will continue to be available to the components that currently use it.

---

**Define Workforce Structures: Manage Divisions**

**Division: Explained**

Managing multiple businesses requires that you segregate them by their strategic objectives and measure their results. Responsibility to reach objectives can be delegated along the management structure. Although related to your legal structure, the business organizational hierarchies do not need to reflect directly the legal structure of the enterprise. The management entities and structure can include divisions and subdivisions, lines of business, and other strategic business units, and include their own revenue and cost centers. These organizations can be included in many alternative hierarchies and used for reporting, as long as they have representation in the chart of accounts.

**Divisions**

A division refers to a business oriented subdivision within an enterprise, in which each division organizes itself differently to deliver products and services or address different markets. A division can operate in one or more countries, and can be comprised of many companies or parts of different companies that are represented by business units.

A division is a profit center or grouping of profit and cost centers, where the division manager is responsible for attaining business goals including profit goals. A division can be responsible for a share of the company’s existing product lines or for a separate business. Managers of divisions may also have return on investment goals requiring tracking of the assets and liabilities of the division. The division manager reports to a top corporate executive.

By definition a division can be represented in the chart of accounts. Companies may choose to represent product lines, brands, or geographies as their divisions:
their choice represents the primary organizing principle of the enterprise. This may coincide with the management segment used in segment reporting.

Oracle Fusion Applications supports a qualified management segment and recommends that you use this segment to represent your hierarchy of business units and divisions. If managers of divisions have return on investment goals, make the management segment a balancing segment. Oracle Fusion applications allows up to three balancing segments. The values of the management segment can be comprised of business units that roll up in a hierarchy to report by division.

Historically, divisions were implemented as a node in a hierarchy of segment values. For example, Oracle E-Business Suite has only one balancing segment, and often the division and legal entity are combined into a single segment where each value stands for both division and legal entity.

**Use of Divisions in Oracle Fusion Human Capital Management (HCM)**

Divisions are used in HCM to define the management organization hierarchy, using the generic organization hierarchy. This hierarchy can be used to create organization based security profiles.

**Adding a New Division After Acquiring a Company: Example**

This example shows how to restructure your enterprise after acquiring a new division.

**Scenario**

You are part of a senior management team at InFusion Corporation. InFusion is a global company with organizations in the United States (US), the United Kingdom (UK), France, China, Saudi Arabia, and the United Arab Emirates (UAE). Its main area of business is in the high tech industry, and it has just acquired a new company. You must analyze their current enterprise structure and determine what new organizations you need to create to accommodate the new company.

**Details of the Acquired Company**

The acquired company is a financial services business based in Germany. Because the financial services business differs significantly from the high tech business, you want to keep the financial services company as a separate business with all the costs and reporting rolling up to the financial services division.

**Analysis**

The following table summarizes the key decisions that you must consider when determining what new organizations to set up and how to structure the enterprise.

<table>
<thead>
<tr>
<th>Decision to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create location?</td>
<td>The financial services company is based in Frankfurt as are the departments, so you need to create only one location.</td>
</tr>
<tr>
<td>Question</td>
<td>Response</td>
</tr>
<tr>
<td>--------------------------------------</td>
<td>----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Create separate division?</td>
<td>Yes. Although the new division will exist within the current enterprise structure, you want to keep the financial services company as a separate line of business. Creating a separate division means you can manage the costs and reporting separately from the InFusion Corporation. It also means you do not have to modify any existing organizations in the enterprise setup.</td>
</tr>
<tr>
<td>Create business unit?</td>
<td>Yes. The financial services business requires you to create several jobs that do not exist in your high tech business. You can segregate the jobs that are specific to financial services in a new business unit.</td>
</tr>
<tr>
<td>How many departments?</td>
<td>The financial services company currently has three departments for sales, accounting, and marketing. As you have no plans to downsize or change the company, you can create three departments to reflect this structure.</td>
</tr>
<tr>
<td>How many cost centers?</td>
<td>Although you can have more than one cost center tracking the costs of a department, you decide to create one cost center for each department to track costs.</td>
</tr>
<tr>
<td>How many legal entities?</td>
<td>Define a legal entity for each registered company or other entity recognized in law for which you want to record assets, liabilities, and income, pay transaction taxes, or perform intercompany trading. In this case, you need only one legal entity.</td>
</tr>
<tr>
<td></td>
<td>You must define the legal entity as a legal employer and payroll statutory unit. As the new division operates in Germany only, you can configure the legal entity to suit Germany legal and statutory requirements.</td>
</tr>
<tr>
<td>Note</td>
<td>When you identify the legal entity as a payroll statutory unit, the application transfers the legal reporting unit that is associated with that legal entity to Oracle Fusion HCM as a tax reporting unit.</td>
</tr>
<tr>
<td>Create legislative data group?</td>
<td>Yes. Because you currently do not employ or pay people in Germany, you must create one legislative data group to run payroll for the workers in Germany.</td>
</tr>
</tbody>
</table>

**Resulting InFusion Enterprise Structure**

Based on the analysis, you must create the following:

- One new division
- One new location
- Three new departments
- Three new cost centers
- One new legal entity
- One new legislative data group
The following figure illustrates the structure of InFusion Corporation after adding the new division and the other organizations.

Define Workforce Structures: Manage Departments

Cost Centers and Departments: Explained

A cost center represents the smallest segment of an organization for which costs are collected and reported. A department is an organization with one or more operational objectives or responsibilities that exist independently of its manager and has one or more workers assigned to it.

The following two components need to be considered in designing your enterprise structure:

• Cost centers
• Departments

Cost Centers

A cost center also represents the destination or function of an expense as opposed to the nature of the expense which is represented by the natural account. For example, a sales cost center indicates that the expense goes to the sales department.
A cost center is generally attached to a single legal entity. To identify the cost centers within a chart of accounts structure use one of these two methods:

- Assign a cost center value in the value set for each cost center. For example, assign cost center values of PL04 and G3J1 to your manufacturing teams in the US and India. These unique cost center values allow easy aggregation of cost centers in hierarchies (trees) even if the cost centers are in different ledgers. However, this approach will require defining more cost center values.

- Assign a balancing segment value with a standardized cost center value to create a combination of segment values to represent the cost center. For example, assign the balancing segment values of 001 and 013 with cost center PL04 to represent your manufacturing teams in the US and India. This creates 001-PL04 and 013-PL04 as the cost center reporting values. The cost center value of PL04 has a consistent meaning. This method requires fewer cost center values to be defined. However, it prevents construction of cost center hierarchies using trees where only cost center values are used to report results for a single legal entity. You must specify a balancing segment value in combination with the cost center values to report on a single legal entity.

Departments

A department is an organization with one or more operational objectives or responsibilities that exist independently of its manager. For example, although the manager may change, the objectives do not change. Departments have one or more workers assigned to them.

A manager of a department is typically responsible for:

- Controlling costs within their budget
- Tracking assets used by their department
- Managing employees, their assignments, and compensation

Note

The manager of a sales department may also be responsible for meeting the revenue targets.

The financial performance of departments is generally tracked through one or more cost centers. In Oracle Fusion Applications, departments are defined and classified as Department organizations. Oracle Fusion Human Capital Management (HCM) assigns workers to departments, and tracks the headcount at the departmental level.

The granularity of cost centers and their relationship to departments varies across implementations. Cost center and department configuration may be unrelated, identical, or consist of many cost centers tracking the costs of one department.

Department Classifications: Points to Consider

A department can be classified as a project organization, sales and marketing organization, or cost organization.
Oracle Fusion Human Capital Management (HCM) uses trees to model organization hierarchies. It provides seeded tree structures for department and other organizational hierarchies that can include organizations with any classification.

**Project Organization**

Classify departments as a project owning organization to enable associating them with projects or tasks. The project association is one of the key drivers for project access security.

In addition, you must classify departments as project expenditure organizations to enable associating them to project expenditure items. Both project owning organizations and project expenditure organizations can be used by Oracle Fusion Subledger Accounting to derive accounts for posting Oracle Fusion Projects accounting entries to Oracle Fusion General Ledger.

**Sales and Marketing Organization**

In Oracle Sales Cloud, you can define sales and marketing organizations. Sales organization hierarchies are used to report and forecast sales results. Sales people are defined as resources assigned to these organizations.

In some enterprises, the HCM departments and hierarchies correspond to sales organizations and hierarchies. It is important to examine the decision on how to model sales hierarchies in relationship to department hierarchies when implementing customer relationship management to eliminate any possible redundancy in the definition of the organizations.

The following figure illustrates a management hierarchy, in which the System Components Division tracks its expenses in two cost centers, Air Compressors and Air Transmission. At the department level, two organizations with a classifications of Department are defined, the Marketing Department and Sales Department. These two departments can be also identified as a Resource Organizations, which will allow assigning resources, such as sales people, and other Oracle Sales Cloud specific information to them. Each department is represented in the chart of accounts by more than one cost center, allowing for granular as well as hierarchical reporting.
Cost Organization

Oracle Fusion Costing uses a cost organization to represent a single physical inventory facility or group of inventory storage centers, for example, inventory organizations. This cost organization can roll up to a manager with responsibility for the cost center in the financial reports.

A cost organization can represent a costing department. Consider this relationship when determining the setup of departments in HCM. There are no system dependencies requiring these two entities, cost organization and costing department, be set up in the same way.

Define Workforce Structures: FAQs for Manage Job Families

What’s the difference between a job set and a job family?

A job family is a group of jobs that have different but related functions, qualifications, and titles. They are beneficial for reporting. You can define competencies for job families by associating them with model profiles.

A job set is an organizational partition of jobs. For example, a job set can be global and include jobs for use in all business units, or it can be restricted to jobs for a specific country or line of business. When you select a job, for a position or an assignment, the available jobs are those in the set associated with the business unit in which you are working, and also those in the Common set.

Define Workforce Structures: Manage Job

Jobs: Explained

As part of your initial implementation, you specify whether to use jobs and positions, or only jobs. Jobs are typically used without positions by service industries where flexibility and organizational change are key features.

Basic Details

Basic details for a job include an effective start date, a job set, a name, and a code. A job code must be unique within a set. Therefore, you can create a job with the code DEV01 in the US set and another job with the same code in the UK set. However, if you create a job with the code DEV01 in the Common set, then you cannot create a job with the same code in any other set.

Benchmark Information

You can identify a job as being a benchmark job. A benchmark job represents other jobs in reports and salary surveys. You can also select the benchmark for jobs. Benchmark details are for informational purposes only. A progression job is the next job in a career ladder.
Progression Information

Progression jobs enable you to create a hierarchy of jobs and are used to provide the list of values for the Job field in the Promote Worker and Transfer Worker tasks. The list of values includes the next three jobs in the progression job hierarchy. For example, assume that you create a job called Junior Developer and select Developer as the progression job. In the Developer job, you select Senior Developer as the progression job. When you promote a junior developer, the list of values for the new job will include Developer and Senior Developer. You can select one of these values, or select another one.

Jobs and Grades

You can assign grades that are valid for each job. If you are using positions, then the grades that you specify for the job become the default grades for the position.

Evaluation Criteria

You can define evaluation criteria for a job, including the evaluation system, a date, and the unit of measure for the system. One predefined evaluation system is available, and that is the Hay system. An additional value of Custom is included in the list of values for the Evaluation System field, but you must add your own criteria and values for this system.

Uploading Jobs Using a Spreadsheet

If you have a list of jobs already defined for your enterprise, you can upload them from a spreadsheet. To use this option, you first download a spreadsheet template, then add your job information to the spreadsheet, and then upload directly to your enterprise configuration. You can upload the spreadsheet multiple times to accommodate revisions.

Define Workforce Structures: Manage Person Search Relevance

Profile Option Values

Search Relevance Profile Options: Explained

The strength of the relationship between the person performing a gallery search and each person whose assignment appears in the search results can determine the order of the results: the stronger the relationship, the closer to the top of the results an assignment appears. The search relevance profile options control how the strength of the relationship between the searcher and the search result is calculated.

Weighting Profile Options

Using the following profile options, you can change the weighting applied to the relevant factors.

<table>
<thead>
<tr>
<th>Profile Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HR: Organization Hierarchy Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the organization hierarchy proximity factor.</td>
</tr>
<tr>
<td>HR: Position Hierarchy Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the position hierarchy proximity factor.</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>HR: Manager Hierarchy Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the manager hierarchy proximity factor.</td>
</tr>
<tr>
<td>HR: Location Proximity Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the location proximity factor.</td>
</tr>
<tr>
<td>HR: Selection History Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the selection history factor.</td>
</tr>
<tr>
<td>HR: Social Network Weight</td>
<td>Specifies the weighting applied to the relationship strength value for the social network factor.</td>
</tr>
</tbody>
</table>

The default value of each weighting profile option is 0.5. To increase the relevance of a factor relative to other factors, you increase its weighting; to decrease its relevance, you reduce its weighting.

**HR: Selection History Timeout**

The number of times the searcher selects a person's assignment from the search results during a specified period, which is 7 days by default, is recorded automatically. You can specify this period for the enterprise on the HR: Selection History Timeout profile option.

**HR: Maximum Hierarchy Proximity**

When the searcher's primary assignment is in the same organization, position, or manager hierarchy as a person's assignment, the strength of the relationship depends on their proximity to each other in the hierarchy. The maximum number of hierarchy boundaries to include in the calculation is 4 by default. You can set this value for the enterprise on the HR: Maximum Hierarchy Proximity profile option.

**HR: Relationship Priority Factor**

The searcher can specify a rating for a search result, and each rating is associated with a multiplying factor. On this profile option, you can specify the highest possible multiplying factor that can be applied to a search result. By default, the multiplying factor is 2. If you increase its value, you increase the significance of the searcher's own ratings relative to other factors.

**Define Facilities: Manage Facility Shifts, Workday Patterns, and Schedules**

**Schedule Components: How They Fit Together**

Schedules are comprised of workday patterns and exceptions. Workday patterns are comprised of shifts. You can also create exceptions, nonworking days, to the schedules.

Begin by creating shifts and then assigning those shifts to workday patterns. Next, create a schedule that is a collection of workday patterns and any exception dates.
**Shift**

A shift is a period of time, typically expressed in hours, and it can be defined by a start time and an end time, or a duration. A shift can be for a work period or an off period. You can create time, duration, and elapsed shifts.

**Workday Pattern**

A workday pattern is a collection of shifts for a specific number of days. You can create time, duration, and elapsed workday patterns.

**Exception**

An exception is a record of a date that overrides the availability of a resource to which a schedule has been assigned. For example, a resource is assigned a schedule that includes December 25 as a working day. An exception can be created for December 25 and applied to that schedule to override resource availability for that date. Exceptions can also be for a date time period such as 9 a.m. to 11 a.m. on December 25th.

**Schedule**

A schedule is defined by a start date, an end date, and a sequence of workday patterns to be followed between those dates. A schedule can also contain
exception dates that override the availability of resources to which the schedule is assigned. Quarter types such as 4-4-5, 4-5-4 are supported.

Define Facilities: Manage Inventory Organizations

Inventory Organizations: Explained

An inventory organization is a logical or physical entity in the enterprise that is used to store definitions of items or store and transact items.

You select the following usages in the inventory organization’s properties:

- Item management
- Item and inventory management

Item Management

Inventory organizations used for item management, which are the same as item organizations, store only definitions of items. Use inventory organizations for item management when the storage or movement of inventory does not need to be physically or financially tracked. For example, in a retail implementation you can create an inventory organization for item management to store the names of items that are listed by and sold through each retail outlet, while a different system tracks physical inventory and transactions. If it is necessary in the future, you can change an inventory organization’s usage from item management to item and inventory management in the inventory organization’s properties.

Item and Inventory Management

Inventory organizations used for item and inventory management store and transact items, in addition to item definitions. An inventory organization used for item and inventory management is associated with one business unit, one legal entity, and one primary ledger. Use inventory organizations for item and inventory management when the storage or movement of inventory needs to be physically and financially tracked. Inventory organizations used for item and inventory management can represent facilities such as manufacturing centers, warehouses, or distribution centers. You cannot change an inventory organization’s use from item and inventory management to item management.

Define Facilities: Manage Item Organizations

Item Organization: Explained

An item organization defines an item when inventory balances are not stored and inventory storage or inventory movement is not reflected in the Oracle
Fusion Applications. For example, you would use an item organization in a retail scenario, if you need to know the items that are listed by and sold through each retail outlet even though inventory and transactions are recorded in another system. In Oracle Sales Cloud, item organizations are used to define sales catalogs.

Note

- Items belong to an item organization.
- Item attributes that are associated with financial and accounting information are hidden from the item if it exists within the item organization.
- Item organizations can be changed by administrators to an inventory organization by updating the necessary attributes. There is no difference in the way items are treated in these two types of organizations except that there cannot be any financial transactions in the downstream applications for items that are assigned to an item organization.
Common Applications Configuration: Define Security

Security Tasks: Highlights

Security tasks include the following.
- Security setup
- Security implementation and administration

**Note**
Security setup and administration tasks typically use integrated user interface pages that are provided by the following products.
- Oracle Identity Manager (OIM)
- Oracle Authorization Policy Manager (APM)
- Oracle Fusion Human Capital Management (HCM) products
- Oracle Application Access Control Governor (AACG) in Oracle Enterprise Governance, Risk and Compliance (GRC)

Security setup and administrative tasks performed by product administrators and implementation consultants, such as managing HCM security profiles, are presented in the documentation for those products.

**Set Up the IT Security Manager Job Role**
Provision the IT Security Manager job role with roles for user and role management.
- Using the OIM Administrator user name and password, sign in to Oracle Identity Manager (OIM). Refer to the Oracle Fusion Middleware Enterprise Deployment Guide for Oracle Identity Management. See: Creating Users and Groups
- Open the IT Security Manager job role’s attributes and use the Hierarchy tab to add the User Identity Administrators role and the Role Administrators role in the OIM Roles category using the Add action. Use the Delegated Administration menu to search for the Xellerate Users organization and assign it to the IT Security Manager role. Refer to the Oracle Fusion Middleware User’s Guide for Oracle Identity Manager. See: User Management Tasks

**Prerequisite Tasks for Security Administration**
Sign into Oracle Fusion Applications for the first time with the Installation Super User account to synchronize LDAP users with HCM user management and
create an IT security manager user account and provision it with the IT Security Manager role. For environments that are not in Oracle Cloud, use the super user account that was created during installation to sign in for the first time.

- Installation establishes the super user account. Refer to the Oracle Fusion Applications Installation Guide.

See: Identity Management Configuration

- Oracle provides an initial user for accessing your services in Oracle Cloud. For more information, refer to "Oracle Cloud Application Services Security: Explained" in Oracle Cloud documentation.

- Synchronize LDAP users with HCM user management by performing the Run User and Roles Synchronization Process task. Monitor completion of the predefined Enterprise Scheduler process called Retrieve Latest LDAP Changes.

- Refer to information about creating person records in Oracle Fusion Applications Workforce Development Implementation Guide, or refer to the Oracle Fusion Middleware User's Guide for Oracle Identity Manager.

See: Managing Users

- As a security guideline, provision a dedicated security professional with the IT Security Manager role as soon as possible after initial security setup and revoke that role from users provisioned with the Application Implementation Consultant role. If entitled to do so, see Security Tasks and Oracle Fusion Applications: How They Fit Together for details about provisioning the IT security manager.

**Required Security Administration Tasks**

Establish at least one implementation user and provision that user with sufficient access to set up the enterprise for all integrated Oracle Fusion Middleware and all application pillars or partitions.

- Perform the initial security tasks. If entitled to do so, see Initial Security Administration: Critical Choices.

- Sign in to Oracle Fusion Applications using the IT security manager’s or administrator’s user name and password, and create and provision users who manage your implementation projects and set up enterprise structures by performing the Create Implementation Users task. Refer to the Oracle Fusion Middleware User’s Guide for Oracle Identity Manager.

See: User Management Tasks

- Create a data role for implementation users who will set up HCM that grants access to data in secured objects required for performing HCM setup steps. Provision the implementation user with this View All data role. See "Creating an HCM Data Role: Worked Example."

- For an overview of security tasks from the perspective of an applications administrator, refer to the Oracle Fusion Applications Administrator’s Guide

See: Securing Oracle Fusion Applications
Optional Security Administration Tasks

Once initial security administration is complete and your enterprise is set up with structures such as business units, additional security administration tasks are optional and based on modifying and expanding the predefined security reference implementation to fit your enterprise. See points to consider for defining security, data security and trading partner security after enterprise setup.

• Create users. Refer to the Oracle Fusion Middleware User’s Guide for Oracle Identity Manager.

See: Creating Users

• Provision users with roles. Refer to the Oracle Fusion Middleware User’s Guide for Oracle Identity Manager.

See: Adding and Removing Roles

• You manage users and job roles, including data and abstract roles, in Oracle Identity Management user interface pages. Refer to the Oracle Fusion Middleware User’s Guide for Oracle Identity Manager.

See: User Interfaces

• You manage duties, security policies, and data role templates in the Authorization Policy Manager. Refer to the Oracle Fusion Middleware Authorization Policy Manager Administrator’s Guide.

See: Managing Oracle Fusion Applications Data Security Policies

• You manage role provisioning rules in Human Capital Management (HCM). Refer to the Role Mappings: Explained topic in the Oracle Fusion Applications Workforce Development Implementation Guide.

• For a complete description of the Oracle Fusion Applications security reference implementation, see the Oracle Fusion Applications Security Reference Manuals for each offering.

• For a detailed functional explanation of the Oracle Fusion Applications security approach, refer to the following guides.

See: Oracle Fusion Applications Security Guide

See: Oracle Fusion Applications Security Hardening Guide

• Since security in Oracle Fusion Applications is based on integrations with Oracle Identity Management in Fusion Middleware, security features in the database, and Oracle Enterprise Governance, Risk and Compliance (GRC), additional resources in support of performing security tasks include the following.

• Authorization Policy Manager (APM) is available in Oracle Fusion Applications through integration with Oracle Identity Management.
Authoritative policy management involves managing duty roles, data role templates, and data security policies. Refer to the Oracle Fusion Middleware Authorization Policy Manager Administrator’s Guide.

See: Getting Started With Oracle Authorization Policy Manager

- Oracle Identity Management (OIM) is available in Oracle Fusion Applications through integration with Oracle Fusion Middleware. Identity management in Oracle Fusion Application involves creating and managing user identities, creating and linking user accounts, managing user access control through user role assignment, managing enterprise roles, and managing workflow approvals and delegated administration.

See: Oracle Fusion Middleware User’s Guide for Oracle Identity Manager

- Oracle Fusion Applications is certified to integrate with Applications Access Controls Governor (AACG) in the Oracle Enterprise Governance, Risk and Compliance (GRC) suite to ensure effective segregation of duties (SOD).

See: Oracle Application Access Controls Governor Users Guide
See: Oracle Application Access Controls Governor Implementation Guide

- Configure and manage auditing. Refer to the Oracle Fusion Middleware Application Security Guide.

See: Configuring and Managing Auditing

**Defining Security After Enterprise Setup: Points to Consider**

After the implementation user has set up the enterprise, further security administration depends on the requirements of your enterprise.

The Define Security activity within the Information Technology (IT) Management business process includes the following tasks.

- Import Worker Users
- Import Partner Users
- Manage Job Roles
- Manage Duties
- Manage Application Access Controls

If no legacy users, user accounts, roles, and role memberships are available in the Lightweight Directory Access Protocol (LDAP) store, and no legacy workers are available in Human Resources (HR), the implementation user sets up new users and user accounts and provisions them with roles available in the Oracle Fusion Applications reference implementation.

If no legacy identities (workers, suppliers, customers) exist to represent people in your enterprise, implementation users can create new identities in Human Capital Management (HCM), Supplier Portal, and Oracle Sales Cloud Self Service, respectively, and associate them with users.
Before Importing Users

Oracle Identity Management (OIM) handles importing users. If legacy employees, contingent workers, and their assignments exist, the HCM Application Administrator imports these definitions by performing the Initiate HCM Spreadsheet Load task. If user and role provisioning rules have been defined, the Initiate HCM Spreadsheet Load process automatically creates user and role provisioning requests as the workers are created. Once the enterprise is set up, performing the Initiate HCM Spreadsheet Load task populates the enterprise with HR workers in records linked by global user ID (GUID) to corresponding user accounts in the LDAP store. If no user accounts exist in the LDAP store, the Initiate HCM Spreadsheet Load task results in new user accounts being created. Worker email addresses as an alternate input for the Initiate HCM Spreadsheet Load task triggers a search of the LDAP for user GUIDs, which may perform more slowly than entering user names.

In the security reference implementation, the HCM Application Administrator job role hierarchy includes the HCM Batch Data Loading Duty role, which is entitled to import worker identities. This entitlement provides the access necessary to perform the Initiate HCM Spreadsheet Load task in HCM.

Note
The Import Person and Organization task in the Define Trading Community Import activity imports the following resources, creates users, and links the resources to users for use in Oracle Sales Cloud.

- Internal employees
- Contingent workers
- External partner contacts
- Partner companies
- Legal entities
- Customers
- Consumers

If role provisioning rules have been defined, the Import Person and Organization task automatically provisions role requests as the users are created.

Import Users

If legacy users (identities) and user accounts exist outside the LDAP store that is being used by the Oracle Fusion Applications installation, the IT security manager has the option to import these definitions to the LDAP store by performing the Import Worker Users and Import Partner Users tasks. If no legacy users or user accounts can be imported or exist in an LDAP repository accessible to Oracle Identity Management (OIM), the IT security manager creates users manually in OIM or uses the Initiate HCM Spreadsheet Load task to create users from imported HR workers. Once users exist, their access to Oracle Fusion Applications is dependent on the roles provisioned to them in OIM or Human Capital Management. Use the Manage HCM Role Provisioning Rules task to define rules that determine what roles are provisioned to users.

Importing user identities from other applications, including other Oracle Applications product lines, is either a data migration or manual task. Migrating data from other Oracle Applications includes user data. For more information about importing users, see the Oracle Fusion Middleware Developer's Guide for Oracle Identity Manager.
In the security reference implementation, the IT Security Manager job role hierarchy includes the HCM Batch Data Loading Duty and the Partner Account Administration Duty. These duty roles provide entitlement to import or create users. The entitlement Load Batch Data provides the access necessary to perform the Import Worker Users task in OIM. The entitlement Import Partner entitlement provides the access necessary to perform the Import Partner Users task in OIM.

**Manage Job Roles**

Job and abstract roles are managed in OIM. This task includes creating and modifying job and abstract roles, but not managing role hierarchies of duties for the jobs.

**Note**

Manage Job Roles does not include provisioning job roles to users. Provisioning users is done in OIM, HCM, Oracle Sales Cloud, or Oracle Fusion Supplier Portal.

Roles control access to application functions and data. Various types of roles identify the functions performed by users.

The Oracle Fusion Applications security reference implementation provides predefined job and abstract roles. In some cases, the jobs defined in your enterprise may differ from the predefined job roles in the security reference implementation. The predefined roles and role hierarchies in Oracle Fusion may require changes or your enterprise may require you to create new roles. For example, you need a job role for a petty cash administrator, in addition to an accounts payable manager. The security reference implementation includes a predefined Accounts Payable Manager, and you can create a petty cash administrator role to extend the reference implementation.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Enterprise Role Management Duty role, which is entitled to manage job and abstract roles (the entitlement is Manage Enterprise Role). This entitlement provides the access necessary to perform the Manage Job Roles task in OIM.

**Manage Duties**

A person with a job role must be able to perform certain duties. In the Oracle Fusion Applications security reference implementation, enterprise roles inherit duties through a role hierarchy. Each duty corresponds to a duty role. Duty roles specify the duties performed within applications and define the function and data access granted to the enterprise roles that inherit the duty roles.

Managing duties includes assigning duties to job and abstract roles in a role hierarchy using Authorization Policy Manager (APM). If your enterprise needs users to perform some actions in applications coexistent with Oracle Fusion applications, you may wish to remove the duty roles that enable those actions. For details about which duty roles are specific to the products in an offering, see the Oracle Fusion Applications Security Reference Manual for each offering.

OIM stores the role hierarchy and the spanning of roles across multiple pillars or logical partitions of applications.

In cases where your enterprise needs to provide access to custom functions, it may be necessary to create or modify the duty roles of the reference implementation.
Tip
As a security guideline, use only the predefined duty roles, unless you have added new applications functions. The predefined duty roles fully represent the functions and data that must be accessed by application users and contain all appropriate entitlement. The predefined duty roles are inherently without segregation of duty violations of the constraints used by the Application Access Controls Governor.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Application Role Management Duty role, which is entitled to manage duty roles (the entitlement is Manage Application Role). This entitlement provides the access necessary to perform the Manage Duties task in APM.

Note
Product family administrators are not entitled to create role hierarchies or manage duty roles and must work with the IT security manager to make changes such as localizing a duty role to change a role hierarchy. Setup for localizations is documented in HCM documentation.

Manage Application Access Controls

Prevent or limit the business activities that a single person may initiate or validate by managing segregation of duties policies in the Application Access Controls Governor (AACG).

Note
In AACG, segregation of duties policies are called access controls or segregation of duties controls.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Segregation of Duties Policy Management Duty role, which is entitled to manage segregation of duties policies (the entitlement is Manage Segregation of Duties Policy). This entitlement provides the access necessary to perform the Manage Application Access Controls task in AACG.

Security Tasks and Oracle Fusion Applications: How They Fit Together

The major security tasks and their order within the context of an overall Oracle Fusion Applications implementation extend from security setup through production deployment audits.

The Oracle Fusion business process model (BPM) provides a sequence of security implementation tasks that includes the following.

- Security setup (Define Common Applications Configuration activity)
  - Define Implementation Users task group (optional)
    - Create Implementation Users task
    - Create Data Role for Implementation Users task
    - Provision Roles to Implementation Users task
• Define security - tasks vary depending on deployed Oracle Fusion product family
  • Revoke Data Role from Implementation Users task
  • Import Worker Users task
  • Import Partner Users task
  • Manage Duties task
  • Manage Job Roles task
  • Manage Application Access Controls task
• Define Automated Governance, Risk, and Performance Controls activity
  • Manage Application Access Controls task (AACG settings)
  • Manage Application Preventive Controls task
  • Manage Application Transaction Controls task
  • Manage Application Configuration Controls task
• User and role provisioning tasks
  • Implement Role Request and Provisioning Controls activity
    • Import Worker Users task
    • Import Partner Users task
    • Self Request User Roles task
    • Approve User and Role Provisioning Requests task
    • Assign User Roles task
    • Manage Supplier User Roles and User Role Usages task
    • Map and Synchronize User Account Details task
    • Tasks for viewing account details for self or others
    • Tasks for applying and managing various role provisioning rules
    • Tasks for running synchronization processes
• Security implementation and ongoing maintenance after setup (Manage IT Security activity)
  • Implement Function Security Controls
    • Create Job Role task
    • Import Worker Users task
• Import Partner Users task
• Manage Duties task
• Manage Job Roles task
• Manage Users task
• Implement Data Security Controls
• Manage Data Security Policies task
• Manage Role Templates task
• Manage Segment Security task
• Manage Data Access Sets task
• Define Security Profiles task group
• Auditing tasks
  • Manage Security Audit, Compliance and Reporting activity
  • Manage Application Access Controls task

Note
Go live deployment does not require lockdown or specific security tasks because security is enforced across the test to production information life cycle.

Required Roles
The following enterprise roles are provisioned to a single super user that is set up by the Oracle Fusion Applications installation process, and to the initial user set up by Oracle for Oracle Cloud Application Services:
  • Application Implementation Consultant
  • IT Security Manager
  • Application Administrators for the provisioned products
Initial security administration also includes provisioning the IT Security Manager role with Oracle Identity Management (OIM) roles for user and role management.
  • Identity User Administrator
  • Role Administrator
Additionally, the Xellerate Users organization must be assigned to the IT Security Manager role.

Important
As a security guideline, provision a dedicated security professional with the IT Security Manager role at the beginning of an implementation, and revoke that role from users provisioned with the Application Implementation Consultant role.

Tools Used to Perform Security Tasks
Security tasks are supported by tools within both Oracle Fusion Applications and Oracle Fusion Middleware.
The figure lists the tasks associated with each of the integrated products and pillars of an Oracle Fusion Applications deployment.
Security Tasks: Overview

Security tasks span multiple business processes and are performed by various roles using numerous integrated tools.

The following table shows the business process model (BPM) tasks and tools used to support securing Oracle Fusion Applications.

<table>
<thead>
<tr>
<th>Example Task</th>
<th>Oracle BPM Task</th>
<th>Supporting Tools</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>View duty roles inherited by a job role</td>
<td>Manage Duties</td>
<td>• Authorization Policy Manager (APM)</td>
<td>Each logical partition or pillar contains a collection of application roles, and function and data security policies.</td>
</tr>
<tr>

HCM creates a new user and identity when a new worker is created. The Hire Employee and Add Contingent Worker tasks also result in new user creation requests. Creating a new user automatically triggers role provisioning requests based on role provisioning rules.

Implementation users are provisioned through OIM since HCM is not setup at the start of the implementation. The Provision Roles to Implementation Users is not needed once implementation is complete.

Once HCM is setup, HCM is used to provision roles to non-implementation users by performing the Manage Users task. Human Resources (HR) transaction flows such as Hire and Promote also provision roles.

Once supplier users are setup, Supplier Model can be used by internal users to maintain supplier user accounts or supplier users can maintain their accounts in Supplier Portal.
View the job, abstract, and data roles provisioned to a user

1. Manage Users
2. Manage User Principal
3. Provision Roles to Implementation Users

• Human Capital Management (HCM)
• OIM

LDAP stores users, roles and provisioning information.
The Manage User Principal and Provision Roles to Implementation Users tasks are not needed once implementation is complete.

Revoke role from user.

Manage Users

• HCM

You can revoke roles from various Human Resources task flows, the HCM Manage Users task and OIM. User termination includes role revocation.

Approve role provisioning or user account request.

Approve User and Role Provisioning Requests

• OIM

View audit logs

Not applicable

• Oracle Enterprise Manager

Viewing audit logs is a Oracle Fusion Middleware function and not represented by an Oracle Fusion Applications BPM task.

For more information about provisioning identities and configuring audit policies, see the Oracle Fusion Applications Administrator’s Guide.

There may be more than one navigation path to the graphical user interface in which the task is performed. You can access most security tasks by starting in the Setup and Maintenance Overview page and searching for security tasks and task lists.

**Define Data Security**

**Data Security: Explained**

By default, users are denied access to all data.

Data security makes data available to users by the following means.

- Policies that define grants available through provisioned roles
- Policies defined in application code

You secure data by provisioning roles that provide the necessary access. Enterprise roles provide access to data through data security policies defined for the inherited application roles.
When setting up the enterprise with structures such as business units, data roles are automatically generated that inherit job roles based on data role templates. Data roles also can be generated based on HCM security profiles. Data role templates and HCM security profiles enable defining the instance sets specified in data security policies.

When you provision a job role to a user, the job role implicitly limits data access based on the data security policies of the inherited duty roles. When you provision a data role to a user, the data role explicitly limits the data access of the inherited job role to a dimension of data.

Data security consists of privileges conditionally granted to a role and used to control access to the data. A privilege is a single, real world action on a single business object. A data security policy is a grant of a set of privileges to a principal on an object or attribute group for a given condition. A grant authorizes a role, the grantee, to actions on a set of database resources. A database resource is an object, object instance, or object instance set. An entitlement is one or more allowable actions applied to a set of database resources.

Data is secured by the following means.

<table>
<thead>
<tr>
<th>Data security feature</th>
<th>Does what?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data security policy</td>
<td>Grants access to roles by means of entitlement</td>
</tr>
<tr>
<td>Role</td>
<td>Applies data security policies with conditions to users through role provisioning.</td>
</tr>
<tr>
<td>Data role template</td>
<td>Defines the data roles generated based on enterprise setup of data dimensions such as business unit.</td>
</tr>
<tr>
<td>HCM security profile</td>
<td>Defines data security conditions on instances of object types such as person records, positions, and document types without requiring users to enter SQL code</td>
</tr>
<tr>
<td>Masking</td>
<td>Hides private data on non-production database instances</td>
</tr>
<tr>
<td>Encryption</td>
<td>Scrambles data to prevent users without decryption authorization from reading secured data</td>
</tr>
</tbody>
</table>

The sets of data that a user can access via roles are defined in Oracle Fusion Data Security. Oracle Fusion Data Security integrates with Oracle Platform Security Services (OPSS) to entitle users or roles (which are stored externally) with access to data. Users are granted access through the entitlement assigned to the roles or role hierarchy with which the user is provisioned. Conditions are WHERE clauses that specify access within a particular dimension, such as by business unit to which the user is authorized.

**Data Security Policies**

Data security policies articulate the security requirement "Who can do What on Which set of data," where 'Which set of data' is an entire object or an object instance or object instance set and 'What' is the object entitlement.

For example, accounts payable managers can view AP disbursements for their business unit.
A data security policy is a statement in a natural language, such as English, that typically defines the grant by which a role secures business objects. The grant records the following.

- Table or view
- Entitlement (actions expressed by privileges)
- Instance set (data identified by the condition)

For example, disbursement is a business object that an accounts payable manager can manage by payment function for any employee expenses in the payment process.

**Note**

Some data security policies are not defined as grants but directly in applications code. The security reference manuals for Oracle Fusion Applications offerings differentiate between data security policies that define a grant and data security policies defined in Oracle Fusion applications code.

A business object participating in a data security policy is the database resource of the policy.

Data security policies that use job or duty roles refer to data security entitlement. For example, the data security policy for the Accounts Payable Manager job role refers to the view action on AP disbursements as the data security entitlement.

**Important**

The duty roles inherited by the job role can be moved and job roles reassembled without having to modify the data security.

As a security guideline, data security policies based on user session context should entitle a duty role. This keeps both function and data security policies at the duty role level, thus reducing errors.

For example, a Sales Party Management Duty can update Sales Party where the provisioned user is a member of the territory associated with the sales account. Or the Sales Party Management Duty can update Sales Party where the provisioned user is in the management chain of a resource who is on the sales account team with edit access. Or the Participant Interaction Management Duty can view an Interaction where the provisioned user is a participant of the Interaction.

For example, the Disbursement Process Management Duty role includes entitlement to build documents payable into payments. The Accounts Payable Manager job role inherits the Disbursement Process Management Duty role. Data security policies for the Disbursement Process Management Duty role authorize access to data associated with business objects such as AP disbursements within a business unit. As a result, the user provisioned with the Accounts Payable

<table>
<thead>
<tr>
<th>Who</th>
<th>can do</th>
<th>what</th>
<th>on which set of data</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accounts payable managers</td>
<td>view</td>
<td>AP disbursements</td>
<td>for their business unit</td>
</tr>
</tbody>
</table>
Manager job role is authorized to view AP disbursements within their business unit.

A data security policy identifies the entitlement (the actions that can be made on logical business objects or dashboards), the roles that can perform those actions, and the conditions that limit access. Conditions are readable WHERE clauses. The WHERE clause is defined in the data as an instance set and this is then referenced on a grant that also records the table name and required entitlement.

**Data Roles**

Data roles are implemented as job roles for a defined set of data.

A data role defines a dimension of data within which a job is performed. The data role inherits the job role that describes the job. For example, a data role entitles a user to perform a job in a business unit.

The data role inherits abstract or job roles and is granted data security privileges. Data roles carry the function security privileges inherited from job roles and also the data security privilege granted on database objects and table rows.

For example, an accounts payables specialist in the US Business Unit may be assigned the data role Accounts Payables Specialist - US Business Unit. This data role inherits the job role Accounts Payables Specialist and grants access to transactions in the US Business Unit.

A data role may be granted entitlement over a set people.

For example, a Benefits Administrator A-E is allowed to administer benefits for all people that have a surname that begins with A-E.

Data roles are created using data role templates. You create and maintain data roles in the Authorization Policy Manager (APM). Use the Manage Data Roles and Security Profiles task to create and maintain HCM data roles in Oracle Fusion HCM.

**HCM Security Profiles**

HCM security profiles are used to secure HCM data, such as people and departments. You use HCM security profiles to generate grants for an enterprise role. The resulting data role with its role hierarchy and grants operates in the same way as any other data role.

For example, an HCM security profile identifies all employees in the Finance division.

Applications outside of HCM can use the HCM Data Roles UI pages to give their roles access to HR people.

**Masking and Encryption**

Oracle Fusion Applications uses masking to protect sensitive data from view by unauthorized users. Encryption APIs mask sensitive fields in applications user interfaces. Additionally, Oracle Data Masking is available for masking data in non-production instances and Oracle Transparent Data Encryption is available for protecting data in transit or in backups independent of managing encryption keys.
Defining Data Security After Enterprise Setup: Points to Consider

After the implementation user has set up the enterprise, further security administration depends on the requirements of your enterprise.

The Define Data Security activity within the Information Technology (IT) Management business process includes the following tasks.

- Manage Data Access Sets
- Manage Segment Security
- Manage Role Templates
- Manage Data Security Policies

These tasks address data security administration. For information on using the user interface pages for setting up and managing data security, see the Oracle Fusion Middleware Administrator's Guide for Authorization Policy Manager.

---

Note

The Manage Data Role and Security Profiles task, and all other HCM security profile setup tasks are documented in Human Capital Management (HCM) documentation.

---

Manage Data Access Sets

Data access sets define a set of access privileges to one or more ledgers or ledger sets.

The information on ledgers that are attached to data access sets are secured by function security. Users must have access to the segment values associated with the data access sets to access the corresponding GL account.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Data Access Administration Duty role, which is entitled to manage data access sets (the entitlement is Define General Ledger Data Access Set). This entitlement provides the access necessary to perform the Manage Data Access Sets task in General Ledger.

Manage Segment Security

Balancing or management segment values can secure data within a ledger.

Segment values are stored in GL_ACCESS_SET_ASSIGNMENTS and secured by restrictions, such as Exclude, on parameters that control the set of values that a user can use during data entry.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Application Key Flexfield Administration Duty role, which is entitled to manage application key flexfields (the entitlement is Manage
Application Key Flexfield). This entitlement provides the access necessary to perform the Manage Segment Security task in General Ledger.

**Manage Role Templates**

Data role templates automatically create or update data roles based on dimensions such as business unit. As an enterprise expands, data role templates trigger replication of roles for added dimensions. For example, when creating a new business unit, a data role template generates a new Accounts Payables Manager data role based on the Financials Common Module Template for Business Unit Security data role template.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Application Role Management Duty role, which is entitled to manage data role templates (the entitlement is Manage Role Template). This entitlement provides the access necessary to perform the Manage Role Templates task in APM.

**Manage Data Security Policies**

Data security grants provisioned to roles are data security policies. The security reference implementation provides a comprehensive set of predefined data security policies and predetermined data security policies based on data role templates.

Data security policies are available for review in Authorization Policy Manager (APM). Data security policies are implemented by grants stored in Oracle Fusion Data Security (FND_GRANTS).

Data security policies secure the database resources of an enterprise. Database resources are predefined applications data objects and should not be changed. However, for cases where custom database resources must be secured objects, the IT security manager is entitled to manage database resources and create new data security policies.

**Warning**

Review but do not modify HCM data security policies in APM except as a custom implementation. Use the HCM Manage Data Role And Security Profiles task to generate the necessary data security policies and data roles.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Application Role Management Duty role, which is entitled to manage data security policies (the entitlement is Manage Data Security Policy). This entitlement provides the access necessary to perform the Manage Data Security Policies task in APM.

**Data Security in the Security Reference Implementation: Explained**

The reference implementation contains a set of data security policies that can be inspected and confirmed to be suitable or a basis for further implementation using the Authorization Policy Manager (APM).
The security implementation of an enterprise is likely a subset of the reference implementation, with the enterprise specifics of duty roles, data security policies, and HCM security profiles provided by the enterprise.

The business objects registered as secure in the reference implementation are database tables and views.

Granting or revoking object entitlement to a particular user or group of users on an object instance or set of instances extends the base Oracle Fusion Applications security reference implementation without requiring customization of the applications that access the data.

Data Security Policies in the Security Reference Implementation

The data security policies in the reference implementation entitle the grantee (a role) to access instance sets of data based on SQL predicates in a WHERE clause.

Tip

When extending the reference implementation with additional data security policies, identify instance sets of data representing the business objects that need to be secured, rather than specific instances or all instances of the business objects.

Predefined data security policies are stored in the data security policy store, managed in the Authorization Policy Manager (APM), and described in the Oracle Fusion Applications Security Reference Manual for each offering. A data security policy for a duty role describes an entitlement granted to any job role that includes that duty role.

Warning

Review but do not modify HCM data security policies in APM except as a custom implementation. Use the HCM Manage Data Role And Security Profiles task to generate the necessary data security policies and data roles.

The reference implementation only enforces a portion of the data security policies in business intelligence that is considered most critical to risk management without negatively affecting performance. For performance reasons it is not practical to secure every level in every dimension. Your enterprise may have a different risk tolerance than assumed by the security reference implementation.

HCM Security Profiles in the Security Reference Implementation

The security reference implementation includes some predefined HCM security profiles for initial usability. For example, a predefined HCM security profile allows line managers to see the people that report to them.

The IT security manager uses HCM security profiles to define the sets of HCM data that can be accessed by the roles that are provisioned to users.

Data Roles

The security reference implementation includes no predefined data roles to ensure a fully secured initial Oracle Fusion Applications environment.
The security reference implementation includes data role templates that you can use to generate a set of data roles with entitlement to perform predefined business functions within data dimensions such as business unit. Oracle Fusion Payables invoicing and expense management are examples of predefined business functions. Accounts Payable Manager - US is a data role you might generate from a predefined data role template for payables invoicing if you set up a business unit called US.

HCM provides a mechanism for generating HCM related data roles.

### Securing Data Access: Points to Consider

Oracle Fusion Applications supports securing data through role-based access control (RBAC) by the following methods.

<table>
<thead>
<tr>
<th>Method of securing data</th>
<th>Reason</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Data roles apply explicit data security policies on job and abstract roles</td>
<td>Appropriate for job and abstract roles that should only access a subset of data, as defined by the data role template that generates the data role or by HCM security profiles.</td>
<td>Accounts Payable Manager - US data role to provide an accounts payable manager in the US business unit with access to invoices in the US business unit.</td>
</tr>
<tr>
<td>Data security policies</td>
<td>Define data access for application roles and provide inheriting job and abstract roles with implicit data security</td>
<td>Projects</td>
</tr>
</tbody>
</table>

If a user has access to the same function through different roles that access different data sets, then the user has access to a union of those data sets.

When a runtime session is created, Oracle Platform Security Services (OPSS) propagates only the necessary user to role mapping based on Oracle Fusion Data Security grants. A grant can specify entitlement to the following.

- Specific rows of data (data object) identified by primary key
- Groups of data (instance set) based on a predicate that names a particular parameter
- Data objects or instance sets based on runtime user session variables

Data is either identified by the primary key value of the row in the table where the data is stored. Or data is identified by a rule (SQL predicate) applied to the WHERE clause of a query against the table where the data is stored.

### Grants

Oracle Fusion Data Security can be used to restrict the following.

- Rows that are returned by a given query based on the intended business operation
- Actions that are available for a given row

Grants control which data a user can access.
Note

Attribute level security using grants requires a data security policy to secure the attribute and the entitlement check enforces that policy.

A grant logically joins a user or role and an entitlement with a static or parameterized object instance set. For example, \texttt{REGION='WEST'} is a static object instance set and \texttt{REGION=\&GRANT\_ALIAS\_PARAMETER1} is a parameterized object instance set. In the context of a specific object instance, grants specify the allowable actions on the set of accessible object instances. In the database, grants are stored in \texttt{FND\_GRANTS} and object instance sets are stored in \texttt{FND\_OBJECT\_INSTANCE\_SETS}. Object access can be tested using the privilege check application programming interface (API).

Securing a Business Object

A business object is a logical entity that is typically implemented as a table or view, and corresponds to a physical database resource. The data security policies of the security reference implementation secure predefined database resources. Use the Manage Data Security Policies task to define and register other database resources.

Data security policies identify sets of data on the registered business object and the actions that may be performed on the business object by a role. The grant can be made by data instance, instance set or at a global level.

Note

Use parameterized object instance sets whenever feasible to reduce the number of predicates the database parses and the number of administrative intervention required as static object instances sets become obsolete. In HCM, security profiles generate the instance sets.

Manage Data Security Policies

Database Resources and Data Security Policies: How They Work Together

A data security policy applies a condition and allowable actions to a database resource for a role. When that role is provisioned to a user, the user has access to data defined by the policy. In the case of the predefined security reference implementation, this role is always a duty role. Data roles generated to inherit the job role based on data role templates limit access to database resources in a particular dimension, such as the US business unit.

The database resource defines and instance of a data object. The data object is a table, view, or flexfield.

The following figure shows the database resource definition as the means by which a data security policy secures a data object. The database resource names the data object. The data security policy grants to a role access to that database resource based on the policy’s action and condition.
Database Resources

A database resource specifies access to a table, view, or flexfield that is secured by a data security policy.

- Name providing a means of identifying the database resource
- Data object to which the database resource points

Data Security Policies

Data security policies consist of actions and conditions for accessing all, some, or a single row of a database resource.

- Condition identifying the instance set of values in the data object
- Action specifying the type of access allowed on the available values

Note

If the data security policy needs to be less restrictive than any available database resource for a data object, define a new data security policy.

Actions

Actions correspond to privileges that entitle kinds of access to objects, such as view, edit, or delete. The actions allowed by a data security policy include all or a subset of the actions that exist for the database resource.

Conditions

A condition is either a SQL predicate or an XML filter. A condition expresses the values in the data object by a search operator or a relationship in a tree hierarchy. A SQL predicate, unlike an XML filter, is entered in a text field in the
data security user interface pages and supports more complex filtering than an XML filter, such as nesting of conditions or sub queries. An XML filter, unlike a SQL predicate, is assembled from choices in the UI pages as an AND statement.

Tip
An XML filter can be effective in downstream processes such as business intelligence metrics. A SQL predicate cannot be used in downstream metrics.

Manage Role Templates

Data Role Templates: Explained

You use data role templates to generate data roles. You generate such data roles, and create and maintain data role templates in the Authorization Policy Manager (APM).

Note
HCM data roles are generated using the Manage Data Roles and Security Profiles task, which uses HCM security profiles, not data role templates, to define the data security condition.

The following attributes define a data role template.

• Template name
• Template description
• Template group ID
• Base roles
• Data dimension
• Data role naming rule
• Data security policies

The data role template specifies which base roles to combine with which dimension values for a set of data security policies. The base roles are the parent job or abstract roles of the data roles.

Note
Abstract, job, and data roles are enterprise roles in Oracle Fusion Applications. Oracle Fusion Middleware products such as Oracle Identity Manager (OIM) and Authorization Policy Manager (APM) refer to enterprise roles as external roles. Duty roles are implemented as application roles in APM and scoped to individual Oracle Fusion Applications.

The dimension expresses stripes of data, such as territorial or geographic information you use to partition enterprise data. For example, business units are a type of dimension, and the values picked up for that dimension by the data role template as it creates data roles are the business units defined for your enterprise. The data role template constrains the generated data roles with grants of entitlement to access specific data resources with particular actions. The data
role provides provisioned users with access to a dimensional subset of the data granted by a data security policy.

An example of a dimension is a business unit. An example of a dimension value is a specific business unit defined in your enterprise, such as US. An example of a data security policy is a grant to access a business object such as an invoice with a view entitlement.

When you generate data roles, the template applies the values of the dimension and participant data security policies to the group of base roles.

The template generates the data roles using a naming convention specified by the template's naming rule. The generated data roles are stored in the Lightweight Directory Access Protocol (LDAP) store. Once a data role is generated, you provision it to users. A user provisioned with a data role is granted permission to access the data defined by the dimension and data security grant policies of the data role template.

For example, a data role template contains an Accounts Payable Specialist role and an Accounts Payable Manager role as its base roles, and region as its dimension, with the dimension values US and UK. The naming convention is [base-role-name]:[DIMENSION-CODE-NAME]. This data role template generates four data roles.

- Accounts Payable Specialist - US (business unit)
- Accounts Payable Specialist - UK (business unit)
- Accounts Payable Manager - US (business unit)
- Accounts Payable Manager - UK (business unit)

Making Changes To Data Role Templates

If you add a base role to an existing data role template, you can generate a new set of data roles. If the naming rule is unchanged, existing data roles are overwritten.

If you remove a base role from a data role template and regenerate data roles, a resulting invalid role list gives you the option to delete or disable the data roles that would be changed by that removal.

Making Changes to Dimension Values

If you add a dimension value to your enterprise that is used by a data role template, you must regenerate roles from that data role template to create a data role for the new dimension. For example if you add a business unit to your enterprise, you must regenerate data roles from the data role templates that include business unit as a dimension.

If you add or remove a dimension value from your enterprise that is used to generate data roles, regenerating the set of data roles adds or removes the data roles for those dimension values. If your enterprise has scheduled regeneration as an Oracle Enterprise Scheduler Services process, the changes are made automatically.

For information on working with data role templates, see the Oracle Fusion Middleware Administrator's Guide for Authorization Policy Manager.
Manage Data Role and Security Profiles

HCM Data Roles: Explained

HCM data roles, like all Oracle Fusion Applications data roles, define data security policies: they enable users to perform a set of tasks, using identified menus, menu items, and pages in application user interfaces, on a specified set of data within those user interfaces. Because data roles are specific to the enterprise, no predefined HCM data roles exist.

How HCM Data Roles Differ from Other Data Roles

HCM data roles differ from other data roles in the following ways:

- You create and maintain HCM data roles outside Oracle Identity Management (OIM) and the Oracle Fusion Middleware Authorization Policy Manager (APM), and they are not based on data role templates.
  Although HCM data roles are visible in the Oracle Fusion Middleware APM, they must not be maintained there.
- A single HCM data role can enable access to data of multiple types.

You identify the data that users can access in HCM security profiles. You can create security profiles for the person, organization, position, country, legislative data group (LDG), document type, payroll, and payroll flow objects.

Selecting the Job Role

Each HCM data role is associated with a single job role, which you select from the list of enterprise roles. The HCM securing objects that the selected role needs to access are identified automatically, and the appropriate types of security profile are displayed. For example, if you select the job role human resource analyst, users with that job role need to access managed person, public person, organization, position, LDG, and document type data; therefore, security profiles for those object types must be included in the HCM data role. The security profile types that appear in the HCM data role vary according to the data requirements of the selected job role.

If you select a job role that requires no access to HCM data secured by security profiles, you cannot create an HCM data role.

Note

If you create custom job roles in OIM, you must add them to a locally defined role category that ends with "Job Roles"; otherwise, they do not appear in the list of job roles when you create an HCM data role. Do not add custom job roles to the predefined role category HCM - Job Roles.

Creating or Selecting the Security Profiles

You can either create new security profiles or use existing security profiles. For each object type, you can include only one security profile in an HCM data role.
Users with Multiple HCM Data Roles

When users have multiple HCM data roles, the data security policies arising from each role remain separate. For example, being able to promote or terminate workers in the purchasing department in one HCM data role and view contact details of all workers in the sales department in another HCM data role does not enable a user to promote or terminate workers in the sales department.

Components of the HCM Data Role

The following figure summarizes how the components of the HCM data role contribute to Oracle Fusion Data Security for the data role. Oracle Fusion Data Security comprises the data security policies for data roles that are generated automatically when data roles are created.

The job role that you select in the HCM data role inherits multiple duty roles. Each duty role has one or more function privileges and related data privileges, from which the relevant HCM objects are identified. The specific instances of the objects required by this HCM data role are identified in security profiles and stored in a data instance set. Data security policy data is created automatically in Oracle Fusion Data Security when you create the data role.

For example, the human resource specialist job role inherits the employee hire and worker promotion duty roles, among many others. The inherited duty roles provide both function privileges, such as Hire Employee, Rehire Employee, and Promote Workers, and data privileges to HCM objects, such as person and assignment. The specific instances of those objects required by this HCM data role, such as people with assignments in a specified legal employer and department, are identified in security profiles.
HCM Security Profiles: Explained

A security profile defines the criteria that identify instances of a human capital management (HCM) object. For example, a person security profile defines the criteria that identify one or more person records, and a position security profile defines the criteria that identify one or more positions. When you include a security profile in an HCM data role and provision the data role to a user, that user can access the data instances identified in the security profile. The type of access available to the user (for example whether the user can edit or simply view the data) depends on the job role identified in the HCM data role.

HCM Object Types

You can create security profiles for the following HCM object types:

- Person
- Managed person
- Public person
- Organization
- Position
- Legislative data group (LDG)
- Country
- Document type
- Payroll
- Payroll flow

All security profile definitions for these HCM objects are eventually visible in the Oracle Fusion Middleware Authorization Policy Manager (APM). The name of the security profile's data instance set in the Oracle Fusion Middleware APM is derived from the name of the security profile and the relevant object type. For example, if the security profile name is Manager Hierarchy, then the data instance set for the object PER_ALL_PEOPLE_F is HCM:PER:PER_ALL_PEOPLE_F:Manager Hierarchy.

You must use the Oracle Fusion Human Capital Management interfaces, which are designed for ease of use and access, to create and maintain security profiles; do not use the Oracle Fusion Middleware APM to maintain security profiles for these HCM objects.

Security Criteria in HCM Security Profiles

In any HCM security profile, you specify the criteria that identify data instances of the relevant type. For example, in an organization security profile, you can identify organizations by organization hierarchy, by organization classification, or by listing organizations to include in or exclude from the security profile. All of the criteria in an HCM security profile apply when the data instance set is defined; for example, if you identify organizations by both organization hierarchy and organization classification, then both sets of criteria apply, and only those organizations that satisfy all criteria belong to the data instance set.

Predefined HCM Security Profiles

The following HCM security profiles are predefined:
<table>
<thead>
<tr>
<th>Security Profile Name</th>
<th>HCM Security Profile Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>View All People</td>
<td>Person</td>
<td>Identifies all person records in the enterprise</td>
</tr>
<tr>
<td>View Own Record</td>
<td>Person</td>
<td>Identifies the signed-on user’s own person record and the person records of that user’s contacts</td>
</tr>
<tr>
<td>View Manager Hierarchy</td>
<td>Person</td>
<td>Identifies the signed-on user’s line manager hierarchy</td>
</tr>
<tr>
<td>View All Workers</td>
<td>Person</td>
<td>Identifies the person records of all people who have a work relationship in the enterprise</td>
</tr>
<tr>
<td>View All Organizations</td>
<td>Organization</td>
<td>Identifies all organizations in the enterprise</td>
</tr>
<tr>
<td>View All Positions</td>
<td>Position</td>
<td>Identifies all positions in the enterprise</td>
</tr>
<tr>
<td>View All Legislative Data Groups</td>
<td>LDG</td>
<td>Identifies all LDGs in the enterprise</td>
</tr>
<tr>
<td>View All Countries</td>
<td>Country</td>
<td>Identifies all countries in the enterprise</td>
</tr>
<tr>
<td>View All Document Types</td>
<td>Document Type</td>
<td>Identifies all document types in the enterprise</td>
</tr>
<tr>
<td>View All Payrolls</td>
<td>Payroll</td>
<td>Identifies all payrolls in the enterprise</td>
</tr>
<tr>
<td>View All Flows</td>
<td>Payroll Flow</td>
<td>Identifies all payroll flows in the enterprise</td>
</tr>
</tbody>
</table>

You can include the predefined security profiles in any HCM data role, but you cannot edit them. Note also that the View all option is disabled in any security profile that you create; this restriction exists because predefined security profiles exist for this requirement.

**Creating Security Profiles**

You can create security profiles either individually or as part of the process of creating an HCM data role. If you have standard requirements, it may be more efficient to create the security profiles individually and include them in appropriate HCM data roles.

**Reusability and Inheritance of Security Profiles**

Regardless of how you create them, all security profiles are reusable; they do not belong to particular HCM data roles, and you can include them in any HCM data role for which they define an appropriate data instance set.

You can include security profiles in other security profiles. For example, you can include an organization security profile:

- In a person security profile, to secure person records by department, business unit, or legal employer
- In a position security profile, to secure positions by department or business unit

Therefore, one security profile can inherit the data instance set defined by another.
Assigning Security Profiles to Abstract Roles: Explained

Abstract roles define a worker’s role in the enterprise independently of the job that the worker is hired to do.

These abstract roles are predefined in Oracle Fusion Human Capital Management:

- Line manager
- Employee
- Contingent worker

Enabling Data Access for Abstract Roles

Typically, you create role mappings during implementation to provision abstract roles automatically to eligible workers. Although users with these roles may be able to sign in to Oracle Fusion Applications and navigate to tasks of interest, they have no automatic access to data. For example, employees can navigate to the Person Gallery but cannot view portraits or see lists of person names in product interfaces, and line managers can navigate to the Manager Resources Dashboard but can see no data for their organizations. To enable users with abstract roles to access relevant HCM data, you must assign security profiles to those abstract roles.

Predefined Security Profiles to Assign to Abstract Roles

To enable users with abstract roles to access relevant data, you assign the following predefined security profiles directly to the employee, contingent worker, and line manager abstract roles.

<table>
<thead>
<tr>
<th>Security Profile Type</th>
<th>Employee</th>
<th>Contingent Worker</th>
<th>Line Manager</th>
</tr>
</thead>
<tbody>
<tr>
<td>Person</td>
<td>View Own Record</td>
<td>View Own Record</td>
<td>View Manager Hierarchy</td>
</tr>
<tr>
<td>Public person</td>
<td>View All Workers</td>
<td>View All Workers</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Organization</td>
<td>View All Organizations</td>
<td>View All Organizations</td>
<td>View All Organizations</td>
</tr>
<tr>
<td>Position</td>
<td>View All Positions</td>
<td>View All Positions</td>
<td>View All Positions</td>
</tr>
<tr>
<td>Legislative data group</td>
<td>View All Legislative Data Groups</td>
<td>View All Legislative Data Groups</td>
<td>View All Legislative Data Groups</td>
</tr>
<tr>
<td>Country</td>
<td>View All Countries</td>
<td>View All Countries</td>
<td>View All Countries</td>
</tr>
<tr>
<td>Document type</td>
<td>View All Document Types</td>
<td>View All Document Types</td>
<td>View All Document Types</td>
</tr>
<tr>
<td>Payroll Flow</td>
<td>Not applicable</td>
<td>Not applicable</td>
<td>View All Flows</td>
</tr>
</tbody>
</table>

After implementation, you may want to change aspects of this data access. For example, you may want to create your own security profiles and assign those directly to abstract roles; however, you must remember that such changes apply to all users who have the abstract role.

HCM Data Roles

Users who have abstract roles are likely to gain additional data access by means of HCM data roles that you define for their job roles. For example, you may create an HCM data role for human resource specialists to enable them to access...
the person records of all workers in a legal employer. Such data access is in addition to any data access provided by abstract roles.

**Assigning Security Profiles to Abstract Roles: Worked Example**

This example shows how to assign predefined security profiles to the employee, contingent worker, and line manager abstract roles.

**Searching for the Employee Abstract Role**

1. On the All Tasks tab of the Overview page of the Setup and Maintenance work area, search for the task Manage Data Role and Security Profiles.
2. In the Search Results region, click **Go to Task**.
3. On the Manage Data Roles and Security Profiles page, enter the abstract-role name Employee in the **Role** field. Click **Search**.
4. In the Search Results region, highlight the entry for the predefined Employee role and click **Assign**.

**Assigning Security Profiles to the Employee Abstract Role**

1. On the Assign Data Role: Security Criteria page, select the security-profile values shown in the following table. These are the security profiles that are typically assigned to the employee role. You may see a subset of these security profiles, depending on the combination of product offerings that you are implementing.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization Security Profile</td>
<td>View All Organizations</td>
</tr>
<tr>
<td>Position Security Profile</td>
<td>View All Positions</td>
</tr>
<tr>
<td>Country Security Profile</td>
<td>View All Countries</td>
</tr>
<tr>
<td>LDG Security Profile</td>
<td>View All Legislative Data Groups</td>
</tr>
<tr>
<td>Person Security Profile (Person section)</td>
<td>View Own Record</td>
</tr>
<tr>
<td>Person Security Profile (Public Person section)</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Document Type Security Profile</td>
<td>View All Document Types</td>
</tr>
</tbody>
</table>

2. Click **Review**.
3. On the Assign Data Role: Review page, click **Submit**.
4. On the Manage Data Roles and Security Profiles page, search again for the predefined Employee role.
5. In the Search Results region, confirm that a green check mark appears in the **Security Profiles** column for the Employee role. The check mark confirms that security profiles are assigned to the role.

Repeat the steps in Searching for the Employee Abstract Role and Assigning Security Profiles to the Employee Abstract Role for the predefined Contingent Worker role.
Searching for the Line Manager Abstract Role

1. On the Manage Data Roles and Security Profiles page, enter the abstract-role name Line Manager in the Role field. Click Search.

2. In the Search Results region, highlight the entry for the predefined Line Manager role and click Assign.

Assigning Security Profiles to the Line Manager Abstract Role

1. On the Assign Data Role: Security Criteria page, select the security-profile values shown in the following table. These are the security profiles that are typically assigned to the line manager role. You may see a subset of these security profiles, depending on the combination of product offerings that you are implementing.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Organization Security Profile</td>
<td>View All Organizations</td>
</tr>
<tr>
<td>Position Security Profile</td>
<td>View All Positions</td>
</tr>
<tr>
<td>LDG Security Profile</td>
<td>View All Legislative Data Groups</td>
</tr>
<tr>
<td>Person Security Profile (Person section)</td>
<td>View Manager Hierarchy</td>
</tr>
<tr>
<td>Person Security Profile (Public Person section)</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Document Type Security Profile</td>
<td>View All Document Types</td>
</tr>
<tr>
<td>Payroll Flow</td>
<td>View All Flows</td>
</tr>
</tbody>
</table>

2. Click Review.

3. On the Assign Data Role: Review page, click Submit

4. On the Manage Data Roles and Security Profiles page, search again for the predefined Line Manager role.

5. In the search results, confirm that a green check mark appears in the Security Profiles column for the Line Manager role. The check mark confirms that security profiles are assigned to the role.

Define Users

Securing Identities and Users: Points To Consider

Identity covers all aspects of an entity’s existence within the contexts in which it is used. The identity of an enterprise user consists of HR attributes, roles, resources, and relationships.

HR attributes include identifying information about a user that is relatively static and well understood, such as first and last name, title, and job function.
Roles are part of a user's identity and define the user's purpose and responsibilities.

Within identity management, resources define what a user can and does do. In an enterprise, this typically translates into what resources a user has access to, what privileges they have on that resource, and what they have been doing on that resource. Resources can be application accounts or physical devices such as laptops or access cards. The enterprise owns the resources, secures them, and manages access to the resources by managing the user's identity and access.

Relationships establish the portion of user identities that involve organizational transactions such as approvals.

An Oracle Fusion Applications user and corresponding identity are usually created in a single transaction, such as when a worker is created in Human Resources (HR). That transaction automatically triggers provisioning requests for the user based on role provisioning rules.

User accounts for some identities that are not employees, such as partner contacts, may be created in a later transaction using an identity that is already created in the identity store. Supplier contacts are created in the Supplier Model, not HR.

**Stores**

Various locations store identity and user data.

Identity data consists of the following.

- HR person records
- Oracle Fusion Trading Community Model party records

In Oracle Fusion Applications, identities and users correspond one to one, but not all identities correspond to a user, and not all users are provisioned with an identity. Some identities stored in HR and Trading Community Model may not be provisioned to user accounts and therefore are not synchronized with Oracle Identity Management (OIM). For example, a contact for a prospective customer is an identity in Trading Community Model but may not be provisioned with a user account in OIM. Some users stored in the Lightweight Directory Access Protocol (LDAP) store may not be provisioned with identities. For example, system user accounts used to run Web services to integrate third party services with Oracle Fusion Applications are not associated with a person record in HR or Trading Community Model. Some identifying credentials such as name, department, e-mail address, manager, and location are stored with user data in the LDAP store.

**Importing Users**

You can import users or user attributes in bulk from existing legacy identity and user stores.

Your tasks may include the following.

- Create users in bulk
- Update specific attributes for all users, such as postal code
- Link users to HR or Trading Community Model persons
• Monitor progress of the import process
• Correct errors & re-import
• Export users in bulk
• Import and export users using a standard plain text data interchange format like Lightweight Data Interchange Format (LDIF)

You can reserve a specific username not currently in use for use in the future, or release a reserved username from the reservation list and make it available for use. Between a user registration request and approved registration, Oracle Fusion Applications holds the requested username on the reservation list, and releases the name if an error occurs in the self-registration process or the request is rejected. Self-registration processes check the reservation list for username availability and suggest alternative names.

**Provisioning Events**

New identities, such as new hires, trigger user and role provisioning events. In addition to user creation tasks, other tasks, such as Promote Worker or Transfer Worker, result in role provisioning and recalculation based on role provisioning rules.

When an identity's attributes change, you may need to provision the user with different roles. Role assignments may be based on job codes, and a promotion triggers role provisioning changes. Even if the change in the identities attributes requires no role assignment change, such as with a name change, OIM synchronizes the corresponding user information in the LDAP store.

Deactivating or terminating an identity triggers revocation of some roles to end all assignments, but may provision new roles needed for activities, such as a pay stub review. If the corresponding user for the identity was provisioned with a buyer role, terminating the identity causes the user's buyer record in Procurement to be disabled, just as the record was created when the user was first provisioned with the buyer role.

**Notifications and Audits**

Oracle Fusion Applications provides mechanisms for notifying and auditing requests or changes affecting identities and users.

Oracle Fusion Applications notifies requestors, approvers, and beneficiaries when a user account or role is provisioned. For example, when an anonymous user registers as a business-to-customer (B2C) user, the B2C user must be notified of the registration activation steps, user account, password and so on once the approver (if applicable) has approved the request and the user is registered in the system.

User ID and GUID attributes are available in Oracle Fusion Applications session information for retrieving authenticated user and identity data.

End user auditing data is stored in database WHO columns and used for the following activities.
• Setting up sign-in audit
• Using the application monitor
• Notifying of unsuccessful sign ins
• Sign-in audit reports

You can conduct real time audits that instantiate a runtime session and impersonate the target user (with the proxy feature) to test what a user has access to under various conditions such as inside or outside firewall and authentication level.

For information on configuring audit policies and the audit store, see the Oracle Fusion Applications Administrator's Guide.

**Delegated Administration**

You can designate local administrators as delegated administrators to manage a subset of users and roles.

Delegated administrators can be internal or external persons who are provisioned with a role that authorizes them to handle provisioning events for a subset of users and roles.

For example, internal delegated administrators could be designated to manage users and roles at the division or department level. External delegated administrators could be designated to manage users and roles in an external organization such as a primary supplier contact managing secondary users within that supplier organization.

You can also define delegated administration policies based on roles. You authorize users provisioned with specific roles named in the policy to request a subset of roles for themselves if needed, such as authorizing a subset of roles for a subset of people. For example, the policy permits a manager of an Accounts Payables department to approve a check run administrator role for one of their subordinates, but prohibits the delegated administrator from provisioning a budget approver role to the subordinate.

**Credentials**

You activate or change credentials on users by managing them in Oracle Identity Management (OIM)

Applications themselves must be credentialed to access one another.

Oracle Fusion Applications distinguishes between user identities and application identities (APPID). Predefined application identities serve to authorize jobs and transactions that require higher privileges than users.

For example, a payroll manager may submit a payroll run. The payroll application may need access to the employee's taxpayer ID to print the payslip. However, the payroll manager is not authorized to view taxpayer IDs in the user interface as they are considered personally identifiable information (PII).

Calling applications use application identities (APPID) to enable the flow of transaction control as it moves across trust boundaries. For example, a user in the Distributed Order Orchestration product may release an order for shipping. The code that runs the Pick Notes is in a different policy store than the code
that releases the product for shipment. When the pick note printing program is invoked it is the Oracle Fusion Distributed Order Orchestration Application Development Framework (ADF) that is invoking the program and not the end user.

Manage HCM Role Provisioning Rules

Role Provisioning and Deprovisioning: Explained

A user’s access to data and functions depends on the user’s roles: users have one or more roles that enable them to perform the tasks required by their jobs or positions. Roles must be provisioned to users; otherwise, users have no access to data or functions.

Role Provisioning Methods

Roles can be provisioned to users:

- Automatically
- Manually, using delegated administration:
  - Users such as line managers and human resource specialists can provision roles manually to other users.
  - Users can request roles for themselves.

For both automatic and manual role provisioning, you create a role mapping to identify when a user becomes eligible for a role.

Oracle Identity Management (OIM) can be configured to notify users when their roles change; notifications are not issued by default.

Role Types

Data roles, abstract roles, and job roles can be provisioned to users. Roles available for provisioning include predefined roles, HCM data roles, and roles created using OIM.

Automatic Role Provisioning

A role is provisioned to a user automatically when at least one of the user’s assignments satisfies the conditions specified in the relevant role-mapping definition. The provisioning occurs when the assignment is either created or updated. For example, when a person is promoted to a management position, the line manager role is provisioned automatically to the person if an appropriate role mapping exists. Any change to a person’s assignment causes the person’s automatically provisioned roles to be reviewed and updated as necessary.

Role Deprovisioning

Automatically provisioned roles are deprovisioned automatically as soon as a user no longer satisfies the role-mapping conditions. For example, a line
manager role that is provisioned to a user automatically is deprovisioned automatically when the user ceases to be a line manager.

Automatically provisioned roles can be deprovisioned manually at any time.

Manually provisioned roles are deprovisioned automatically only when all of the user’s work relationships are terminated; in all other circumstances, users retain manually provisioned roles until they are deprovisioned manually.

**Changes to Assignment Managers**

When a person’s line manager is changed, the roles of both new and previous line managers are updated as necessary. For example, if the person’s new line manager now satisfies the conditions in the role mapping for the line manager role, and the role is one that is eligible for autoprovisioning, then that role is provisioned automatically to the new line manager. Similarly, if the previous line manager no longer satisfies the conditions for the line manager role, then that role is deprovisioned automatically.

**Roles at Termination**

When a work relationship is terminated, all automatically provisioned roles for which the user does not qualify in other work relationships are deprovisioned automatically. Manually provisioned roles are deprovisioned automatically only if the user has no other work relationships; otherwise, the user retains all manually provisioned roles until they are deprovisioned manually.

Automatic deprovisioning can occur either as soon as the termination is submitted or approved or on the day after the termination date. The user who is terminating the work relationship selects the appropriate deprovisioning date.

Role mappings can provision roles to users automatically at termination. For example, the locally defined roles Retiree and Beneficiary could be provisioned to users at termination based on assignment status and person type values.

If a termination is later reversed, roles that were deprovisioned automatically at termination are reinstated and post-termination roles are deprovisioned automatically.

**Date-Effective Changes to Assignments**

Automatic role provisioning and deprovisioning are based on current data. For a future-dated transaction, such as a future promotion, role changes are identified and role provisioning occurs on the day the changes take effect, not when the change is entered. The process Send Pending LDAP Requests identifies future-dated transactions and manages role provisioning and deprovisioning at the appropriate time. Note that such role-provisioning changes are effective as of the system date; therefore, a delay of up to 24 hours may occur before users in other time zones acquire the access for which they now qualify.

**Role Mappings: Explained**

User access to data and functions is determined by abstract, job, and data roles, which are provisioned to users either automatically or manually. To enable a role to be provisioned to users, you define a relationship, known as a mapping, between the role and a set of conditions, typically assignment attributes such as department, job, and system person type. In a role mapping, you can select
any role stored in the Lightweight Directory Access Protocol (LDAP) directory, including Oracle Fusion Applications predefined roles, roles created in Oracle Identity Management (OIM), and HCM data roles.

The role mapping can support:

- Automatic provisioning of roles to users
- Manual provisioning of roles to users
- Role requests from users
- Immediate provisioning of roles

**Automatic Provisioning of Roles to Users**

A role is provisioned to a user automatically if:

- At least one of the user's assignments satisfies all conditions associated with the role in the role mapping.
- You select the **Autoprovision** option for the role in the role mapping.

For example, for the HCM data role Sales Manager Finance Department, you could select the **Autoprovision** option and specify the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Finance Department</td>
</tr>
<tr>
<td>Job</td>
<td>Sales Manager</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

The HCM data role Sales Manager Finance Department is provisioned automatically to users with at least one assignment that satisfies all of these conditions.

Automatic role provisioning occurs as soon as the user is confirmed to satisfy the role-mapping conditions, which can be when the user's assignment is either created or updated. The provisioning process also removes automatically provisioned roles from users who no longer satisfy the role-mapping conditions.

**Note**

The automatic provisioning of roles to users is effectively a request to OIM to provision the role. OIM may reject the request if it violates segregation-of-duties rules or fails a custom OIM approval process.

**Manual Provisioning of Roles to Users**

Users such as human resource (HR) specialists and line managers can provision roles manually to other users; you create a role mapping to identify roles that can be provisioned in this way.

Users can provision a role to other users if:

- At least one of the assignments of the user who is provisioning the role (for example, the line manager) satisfies all conditions associated with the role mapping.
- You select the **Requestable** option for the role in the role mapping.
For example, for the HCM data role Quality Assurance Team Leader, you could select the **Requestable** option and specify the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manager with Reports</td>
<td>Yes</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

Any user with at least one assignment that satisfies both of these conditions can provision the role Quality Assurance Team Leader manually to other users, who are typically direct and indirect reports.

If the user’s assignment subsequently changes, there is no automatic effect on roles provisioned by this user to others; they retain manually provisioned roles until either all of their work relationships are terminated or the roles are manually deprovisioned.

**Role Requests from Users**

Users can request roles when reviewing their own account information; you create a role mapping to identify roles that users can request for themselves.

Users can request a role if:

- At least one of their own assignments satisfies all conditions associated with the role mapping.
- You select the **Self-requestable** option for the role in the role mapping.

For example, for the Expenses Reporting role you could select the **Self-requestable** option and specify the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>ABC Department</td>
</tr>
<tr>
<td>System Person Type</td>
<td>Employee</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

Any user with at least one assignment that satisfies all of these conditions can request the role. The user acquires the role either immediately or, if approval is required, once the request is approved. Self-requested roles are classified as manually provisioned.

If the user’s assignment subsequently changes, there is no automatic effect on self-requested roles. Users retain manually provisioned roles until either all of their work relationships are terminated or the roles are manually deprovisioned.

**Immediate Provisioning of Roles**

When you create a role mapping, you can apply autoprovisioning from the role mapping itself.

In this case, all assignments and role mappings in the enterprise are reviewed. Roles are:

- Provisioned immediately to all users who do not currently have roles for which they are eligible
- Deprovisioned immediately from users who are no longer eligible for roles that they currently have

Immediate autoprovisioning from the role mapping enables bulk automatic provisioning of roles to a group of users who are identified by the role-mapping conditions. For example, if you create a new department after a merger, you can provision relevant roles to all users in the new department by applying autoprovisioning immediately.

To provision roles immediately to a single user, the user's line manager or an HR specialist can autoprovion roles from that user's account.

Role-Mapping Names

The names of role mappings must be unique in the enterprise. You are recommended to devise a naming scheme that reveals the scope of each role mapping. For example:

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Autoprovisioned Roles Sales Department</td>
<td>Mapping includes all roles provisioned automatically to anyone in the sales department</td>
</tr>
<tr>
<td>Benefits Specialist Autoprovisioned</td>
<td>Mapping defines the conditions for autoprovisioning the Benefits Specialist role</td>
</tr>
<tr>
<td>Line Manager Requestable Roles</td>
<td>Mapping includes all roles that a line manager can provision manually to direct and indirect reports</td>
</tr>
</tbody>
</table>

Role Mappings: Examples

Roles must be provisioned to users explicitly, either automatically or manually; no role is provisioned to a user by default. This topic provides some examples of typical role mappings to support automatic and manual role provisioning.

Creating a Role Mapping for Employees

You want all employees in your enterprise to have the Employee role automatically when they are hired. In addition, employees must be able to request the Expenses Reporting role when they need to claim expenses. Few employees will need this role, so you decide not to provision it automatically to all employees.

You create a role mapping called All Employees and enter the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Person Type</td>
<td>Employee</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

In the role mapping you include the:
- Employee role, and select the **Autoprovion** option
- Expenses Reporting role, and select the **Self-requestable** option
You could create a similar role mapping for contingent workers called All Contingent Workers, where you would set the system person type to contingent worker.

**Note**

If the Employee and Contingent Worker roles are provisioned automatically, pending workers acquire them when their periods of employment or placements start. If they need roles before then, you create a separate role mapping for the pending worker system person type.

### Creating a Role Mapping for Line Managers

Any type of worker can be a line manager in the sales business unit. You create a role mapping called Line Manager Sales BU and enter the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Business Unit</td>
<td>Sales</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
<tr>
<td>Manager with Reports</td>
<td>Yes</td>
</tr>
</tbody>
</table>

You include the Line Manager role and select the **Autoprovision** option. This role mapping ensures that the Line Manager role is provisioned automatically to any worker with at least one assignment that matches the role-mapping conditions.

In the same role mapping, you could include roles that line managers in this business unit can provision manually to other users by selecting the roles and marking them as requestable. Similarly, if line managers can request roles for themselves, you could include those in the same role mapping and mark them as self-requestable.

### Creating a Role Mapping for Retirees

Retirees in your enterprise need a limited amount of system access to manage their retirement accounts. You create a role mapping called All Retirees and enter the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Person Type</td>
<td>Retiree</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Inactive</td>
</tr>
</tbody>
</table>

You include the locally defined role Retiree in the role mapping and select the **Autoprovision** option. When at least one of a worker’s assignments satisfies the role-mapping conditions, the Retiree role is provisioned to that worker automatically.

### Creating a Role Mapping for Sales Managers

Grade 6 sales managers in the sales department need the Sales Manager role. In addition, sales managers need to be able to provision the Sales Associate role to other workers. You create a role mapping called Sales Managers Sales Department and enter the following conditions.
<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Department</td>
<td>Sales</td>
</tr>
<tr>
<td>Job</td>
<td>Sales manager</td>
</tr>
<tr>
<td>Grade</td>
<td>6</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

In the role mapping, you include the:
- Sales Manager role, and select the **Autoprovision** option
- Sales Associate role, and select the **Requestable** option

**Import Worker Users**

**Defining Security After Enterprise Setup: Points to Consider**

After the implementation user has set up the enterprise, further security administration depends on the requirements of your enterprise.

The Define Security activity within the Information Technology (IT) Management business process includes the following tasks.

- Import Worker Users
- Import Partner Users
- Manage Job Roles
- Manage Duties
- Manage Application Access Controls

If no legacy users, user accounts, roles, and role memberships are available in the Lightweight Directory Access Protocol (LDAP) store, and no legacy workers are available in Human Resources (HR), the implementation user sets up new users and user accounts and provisions them with roles available in the Oracle Fusion Applications reference implementation.

If no legacy identities (workers, suppliers, customers) exist to represent people in your enterprise, implementation users can create new identities in Human Capital Management (HCM), Supplier Portal, and Oracle Sales Cloud Self Service, respectively, and associate them with users.

**Before Importing Users**

Oracle Identity Management (OIM) handles importing users.

If legacy employees, contingent workers, and their assignments exist, the HCM Application Administrator imports these definitions by performing the Initiate HCM Spreadsheet Load task. If user and role provisioning rules have been defined, the Initiate HCM Spreadsheet Load process automatically creates user and role provisioning requests as the workers are created.

Once the enterprise is set up, performing the Initiate HCM Spreadsheet Load task populates the enterprise with HR workers in records linked by global user
ID (GUID) to corresponding user accounts in the LDAP store. If no user accounts exist in the LDAP store, the Initiate HCM Spreadsheet Load task results in new user accounts being created. Worker email addresses as an alternate input for the Initiate HCM Spreadsheet Load task triggers a search of the LDAP for user GUIDs, which may perform more slowly than entering user names.

In the security reference implementation, the HCM Application Administrator job role hierarchy includes the HCM Batch Data Loading Duty role, which is entitled to import worker identities. This entitlement provides the access necessary to perform the Initiate HCM Spreadsheet Load task in HCM.

**Note**

The Import Person and Organization task in the Define Trading Community Import activity imports the following resources, creates users, and links the resources to users for use in Oracle Sales Cloud.

- Internal employees
- Contingent workers
- External partner contacts
- Partner companies
- Legal entities
- Customers
- Consumers

If role provisioning rules have been defined, the Import Person and Organization task automatically provisions role requests as the users are created.

**Import Users**

If legacy users (identities) and user accounts exist outside the LDAP store that is being used by the Oracle Fusion Applications installation, the IT security manager has the option to import these definitions to the LDAP store by performing the Import Worker Users and Import Partner Users tasks.

If no legacy users or user accounts can be imported or exist in an LDAP repository accessible to Oracle Identity Management (OIM), the IT security manager creates users manually in OIM or uses the Initiate HCM Spreadsheet Load task to create users from imported HR workers.

Once users exist, their access to Oracle Fusion Applications is dependent on the roles provisioned to them in OIM or Human Capital Management. Use the Manage HCM Role Provisioning Rules task to define rules that determine what roles are provisioned to users.

Importing user identities from other applications, including other Oracle Applications product lines, is either a data migration or manual task. Migrating data from other Oracle Applications includes user data. For more information about importing users, see the Oracle Fusion Middleware Developer’s Guide for Oracle Identity Manager.

In the security reference implementation, the IT Security Manager job role hierarchy includes the HCM Batch Data Loading Duty and the Partner Account
Administration Duty. These duty roles provide entitlement to import or create users. The entitlement Load Batch Data provides the access necessary to perform the Import Worker Users task in OIM. The entitlement Import Partner entitlement provides the access necessary to perform the Import Partner Users task in OIM.

**Manage Job Roles**

Job and abstract roles are managed in OIM. This task includes creating and modifying job and abstract roles, but not managing role hierarchies of duties for the jobs.

---

**Note**

Manage Job Roles does not include provisioning job roles to users. Provisioning users is done in OIM, HCM, Oracle Sales Cloud, or Oracle Fusion Supplier Portal.

---

Roles control access to application functions and data. Various types of roles identify the functions performed by users.

The Oracle Fusion Applications security reference implementation provides predefined job and abstract roles. In some cases, the jobs defined in your enterprise may differ from the predefined job roles in the security reference implementation. The predefined roles and role hierarchies in Oracle Fusion may require changes or your enterprise may require you to create new roles. For example, you need a job role for a petty cash administrator, in addition to an accounts payable manager. The security reference implementation includes a predefined Accounts Payable Manager, and you can create a petty cash administrator role to extend the reference implementation.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Enterprise Role Management Duty role, which is entitled to manage job and abstract roles (the entitlement is Manage Enterprise Role). This entitlement provides the access necessary to perform the Manage Job Roles task in OIM.

**Manage Duties**

A person with a job role must be able to perform certain duties. In the Oracle Fusion Applications security reference implementation, enterprise roles inherit duties through a role hierarchy. Each duty corresponds to a duty role. Duty roles specify the duties performed within applications and define the function and data access granted to the enterprise roles that inherit the duty roles.

Managing duties includes assigning duties to job and abstract roles in a role hierarchy using Authorization Policy Manager (APM). If your enterprise needs users to perform some actions in applications coexistent with Oracle Fusion applications, you may wish to remove the duty roles that enable those actions. For details about which duty roles are specific to the products in an offering, see the Oracle Fusion Applications Security Reference Manual for each offering.

OIM stores the role hierarchy and the spanning of roles across multiple pillars or logical partitions of applications.
In cases where your enterprise needs to provide access to custom functions, it may be necessary to create or modify the duty roles of the reference implementation.

**Tip**

As a security guideline, use only the predefined duty roles, unless you have added new applications functions. The predefined duty roles fully represent the functions and data that must be accessed by application users and contain all appropriate entitlement. The predefined duty roles are inherently without segregation of duty violations of the constraints used by the Application Access Controls Governor.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Application Role Management Duty role, which is entitled to manage duty roles (the entitlement is Manage Application Role). This entitlement provides the access necessary to perform the Manage Duties task in APM.

**Note**

Product family administrators are not entitled to create role hierarchies or manage duty roles and must work with the IT security manager to make changes such as localizing a duty role to change a role hierarchy. Setup for localizations is documented in HCM documentation.

**Manage Application Access Controls**

Prevent or limit the business activities that a single person may initiate or validate by managing segregation of duties policies in the Application Access Controls Governor (AACG).

**Note**

In AACG, segregation of duties policies are called access controls or segregation of duties controls.

In the security reference implementation, the IT Security Manager job role hierarchy includes the Segregation of Duties Policy Management Duty role, which is entitled to manage segregation of duties policies (the entitlement is Manage Segregation of Duties Policy). This entitlement provides the access necessary to perform the Manage Application Access Controls task in AACG.

**Importing Worker Users: Explained**

You can import workers from legacy applications to Oracle Fusion Applications using the Import Worker Users task. By enabling you to bulk-load existing data, this task is an efficient way of creating and enabling users of Oracle Fusion Applications.

**The Import Worker Users Process**

Importing worker users is a two-stage process:
1. When you perform the Import Worker Users task, the Initiate Spreadsheet Load page opens. On the Initiate Spreadsheet Load page, you generate and complete the Create Worker spreadsheet. You must map your data to the spreadsheet columns and provide all required attributes. Once the spreadsheet is complete, you click **Upload** in the spreadsheet to import the data to the Load Batch Data stage tables.

2. As valid data rows are imported to the Load Batch Data stage tables, the Load Batch Data process runs automatically. Load Batch Data is a generic utility for loading data to Oracle Fusion Human Capital Management from external sources. This process loads data from the Load Batch Data stage tables to the Oracle Fusion application tables.

### User-Account Creation

Oracle Fusion user accounts are created automatically for imported workers in Oracle Identity Management (OIM), unless automatic account creation is disabled.

By default, user account names and passwords are sent automatically to users when their accounts are created. This default action may have been changed at enterprise level, as follows:

- User account names and passwords may be sent to an enterprise-wide e-mail rather than to users themselves.
- Automatic sending of user account names and passwords may be disabled for the enterprise. In this case, you can notify users at an appropriate time.

### Role Provisioning

Once user accounts exist, roles are provisioned to users automatically in accordance with current role-provisioning rules. For example, current rules could provision the employee abstract role to every worker. Role provisioning occurs automatically unless it is disabled for the enterprise.

### Importing Worker Users: Worked Example

This example shows how to import worker users from legacy applications to Oracle Fusion Applications.

The following table summarizes key decisions for this task.

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is my spreadsheet name?</td>
<td>WorkersMMDDYBBatchnn.xlsx</td>
</tr>
<tr>
<td>You can define your own naming convention. In this example, the name is selected to make identifying the spreadsheet contents easy.</td>
<td>For example, Workers042713Batch01.xlsx.</td>
</tr>
<tr>
<td>What is my batch name?</td>
<td>Workers042713Batchnn</td>
</tr>
<tr>
<td>You can define your own batch name, which must be unique. In this example, the batch name is the same as the spreadsheet name.</td>
<td></td>
</tr>
</tbody>
</table>
Summary of the Tasks

Import worker users by:

1. Selecting the Import Worker Users task
2. Creating the spreadsheet
3. Entering worker data in the spreadsheet
4. Importing worker data and correcting import errors
5. Reviewing and correcting load errors

Prerequisites

Before you can complete this task, you must have:

1. Installed the desktop client Oracle ADF Desktop Integration Add-in for Excel
2. Enabled the Trust Center setting **Trust access to the VBA project object model** in Microsoft Excel

Selecting the Import Worker Users Task

1. On the Overview page of the Setup and Maintenance work area, click the All Tasks tab.
2. In the Search region, complete the fields as shown in this table.

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search</td>
<td>Task</td>
</tr>
<tr>
<td>Name</td>
<td>Import Worker Users</td>
</tr>
</tbody>
</table>

3. Click **Search**.
4. In the search results, click **Go to Task** for the task Import Worker Users.
   
   The Initiate Spreadsheet Load page opens.

   Alternatively, you can select the Import Worker Users task from an implementation project.

Creating the Spreadsheet

1. On the Initiate Spreadsheet Load page, find the entry for Create Worker in the list of business objects.

   Create Worker appears after other business objects such as departments, locations, and jobs. Those business objects must be created before worker users, regardless of how you create them.

2. Click **Create Spreadsheet** for the Create Worker entry.
3. When prompted, save the spreadsheet locally using the name Workers042713Batch01.xlsx.
4. When prompted, sign in to Oracle Fusion Applications using your Oracle Fusion user name and password.

**Entering Worker Data in the Spreadsheet**

1. In the **Batch Name** field of the spreadsheet Workers042713Batch01.xlsx, replace the default batch name with the batch name Workers042713Batch01.

2. If your data includes flexfields, click **Configure Flexfield** to configure flexfield data. Otherwise, go to step 5 of this task.

3. In the **Configure Flexfield** window, select an attributes value and click **OK**.

4. See the Flexfields Reference tab for information about the configured flexfield.

5. Enter worker data in the spreadsheet. Ensure that you provide any required values and follow instructions in the spreadsheet for creating rows.

**Importing Worker Data and Correcting Import Errors**

Use the default values except where indicated.

1. In the workers spreadsheet, click **Upload**.

2. In the **Upload Options** window, click **OK**.
   
   As each row of data is uploaded to the Load Batch Data stage tables, its status is updated.

3. When uploading completes, identify any spreadsheet rows with the status **Insert Failed**, which indicates that the row was not imported to the stage tables.

4. For any row that failed, double-click the status value to display a description of the error.

5. Correct any import errors and click **Upload** again to import the remaining rows to the same batch.
   
   As rows are imported successfully to the stage tables, the data is loaded automatically to the application tables.

**Reviewing and Correcting Load Errors**

1. In the spreadsheet, click **Refresh** to display latest load status.
   
   Any errors that occur during the load process are reported in the spreadsheet.

2. Correct any load errors in the spreadsheet.

3. Repeat this process from Importing Worker Data and Correcting Import Errors until all spreadsheet rows are both imported and loaded successfully.

4. Close the spreadsheet.

   To load a second batch of worker users on the same date, increment the batch number in the spreadsheet and batch names (for example, Workers042713Batch02).
Manage Users

Creating Users: Worked Example

You can create users by entering basic person and employment data. A user account is created automatically for a person when you create the user record. You can assign the users Oracle Fusion Human Capital Management (HCM) and non-HCM data roles, each providing access to specific functions and data. This example demonstrates how to create a user and assign roles to the user.

**Note**

This user management functionality is available for HCM Foundation and Oracle Fusion Workforce Directory Management (WDM) users only.

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In this Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>For whom are you creating the user record?</td>
<td>Gail Williams</td>
</tr>
<tr>
<td>What is the user account name?</td>
<td>Same as the e-mail ID, <a href="mailto:gail.williams@vision.com">gail.williams@vision.com</a></td>
</tr>
<tr>
<td>Where is Gail employed?</td>
<td>Gail is an employee of Vision Corporation, and works in the Human Resources (HR) department in the Canada office.</td>
</tr>
<tr>
<td>What roles must be provisioned to Gail?</td>
<td>Autoprovision the employee role. Gail is responsible for processing workers' expense claims so provision the role Expense Claims Administrator manually to Gail.</td>
</tr>
</tbody>
</table>

**Prerequisites**

1. Create a role mapping called All Employees and enter the following conditions.

<table>
<thead>
<tr>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Person Type</td>
<td>Employee</td>
</tr>
<tr>
<td>Assignment Status</td>
<td>Active</td>
</tr>
</tbody>
</table>

In the role mapping you include the:

- Employee role, and select the **Autoprovision** option
- Expense Claims Administrator role, and select the **Self-requestable** option

**Creating a User**

1. On the Search Person page, click the **Create** icon to open the Create User page.

2. Complete the fields, as shown in this table:
3. In the User Details region, leave the User Name field blank. The user name defaults to the user's e-mail ID.

4. In the Employment Information region, select the person type **Employee** and complete the fields as shown in the table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Last Name</td>
<td>Williams</td>
</tr>
<tr>
<td>First Name</td>
<td>Gail</td>
</tr>
<tr>
<td>E-Mail</td>
<td><a href="mailto:gail.williams@vision.com">gail.williams@vision.com</a></td>
</tr>
<tr>
<td>Hire Date</td>

</tr>
</tbody>
</table>

### Assigning Roles to the User

1. Click **Autoprovision Roles** to provision the employee role to the user.

2. Click **Add Role**.

3. Search for and select the **Expense Claims Administrator** role.

4. Click **Save and Close**. The user account is created and the roles are assigned to the user immediately.

### Changing User Names: Explained

You can change user names for both new and existing users.

#### Changing User Names When Creating Users

When you create a user using the Create User interface, the **User Name** field may be blank. If you leave it blank, then the user name is generated in the enterprise default format when you save the user.

Alternatively, you can enter a user name on the Create User page, regardless of whether the field is blank. Any name that you enter replaces the default user name.

The user is notified of the user name only if user notifications are enabled and the user has not yet been notified of any user name and password.

#### Changing Existing User Names

You can change an existing user name on the Manage User Account and Edit User pages. The new name is sent automatically to Oracle Identity Management. However, it becomes visible in Oracle Fusion Applications only after the user signs in for the first time using the new name.
When you change an existing user name:

- The password is unchanged.
- Roles provisioned to the user are unchanged.
- The user is not notified automatically of the new name.

You are recommended to send details of the new user name to the user.

**User Details System Extract Report**

The Oracle BI Publisher User Details System Extract Report includes details of some or all Oracle Fusion Applications user accounts.

To run this report, you must have an HCM data role that provides view-all access to person records for the Human Capital Management Application Administrator job role.

To run the report:

1. Navigate to Tools - Reports and Analytics.
3. Select the User Details System Extract report.
4. In the report window, click More.
5. On the Oracle Business Intelligence page for the report, select Open to run the report immediately or Schedule to schedule the report.

**Parameters**

**User Population**

Enter one of the following values to identify the group of user accounts to include in the report.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HCM</td>
<td>User accounts with an associated HCM person record.</td>
</tr>
<tr>
<td>TCA</td>
<td>User accounts with an associated TCA party account.</td>
</tr>
<tr>
<td>OIM</td>
<td>Accounts for users in the PER_USERS table who do not have an associated person number or party ID. OIM users are also referred to as implementation users.</td>
</tr>
<tr>
<td>ALL</td>
<td>HCM, TCA, and OIM users accounts.</td>
</tr>
</tbody>
</table>

**From Date**

Accounts for HCM and OIM users created on or after this date are included in the report. If you specify no From Date value, then accounts with any creation date are included, subject only to any To Date value that you specify.
From and to dates do not apply to the TCA user population; the report includes all TCA users if you include them in the report's user population.

**To Date**

Accounts for HCM and OIM users created on or before this date are included in the report. If you specify no *To Date* value, then accounts with any creation date are included, subject only to any *From Date* value that you specify.

From and to dates do not apply to the TCA user population; the report includes all TCA users if you include them in the report's user population.

**User Active Status**

Enter one of the following values to identify the user-account status.

<table>
<thead>
<tr>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Include active accounts, which belong to users with current roles.</td>
</tr>
<tr>
<td>I</td>
<td>Include inactive accounts, which belong to users with no current roles.</td>
</tr>
<tr>
<td>All</td>
<td>Include both active and inactive user accounts.</td>
</tr>
</tbody>
</table>

**Report Results**

The output is an XML-formatted file where user accounts are grouped by type, as follows:

- Group 1 (G_1) includes HCM user accounts.
- Group 2 (G_2) includes TCA party user accounts.
- Group 3 (G_3) includes OIM user accounts.

The information provided in the extract varies with the account type.

**HCM User Accounts**

**Business Unit Name**

The business unit from the primary work relationship.

**Composite Last Update Date**

The date when any one of a number of values, including assignment managers, location, job, and person type, was last updated.

**Department**

The department from the primary assignment.

**Worker Type**

The worker type from the user's primary work relationship.
**Generation Qualifier**

The user’s name suffix (for example, Jr., Sr., or III).

**Hire Date**

The enterprise hire date.

**Role Name**

A list of roles currently provisioned to workers whose work relationships are all terminated. This value appears for active user accounts only.

**Title**

The job title from the user’s primary assignment.

**TCA User Accounts**

**Organizations**

A resource group.

**Roles**

A list of job, abstract, and data roles provisioned to the user.

**Managers**

The manager of a resource group.

**OIM User Accounts**

**Start Date**

The date from when the account existed.

**CreatedBy**

The user name of the user who created the account.

**FAQs for Manage Users**

**What happens if I send the user name and password?**

An e-mail containing the user name and password is sent to the user’s primary work e-mail address. If the user has no primary work e-mail address, then the user name and password are sent to the primary work e-mail address of the user’s line manager, if available; otherwise, no notification is sent.

You can select **Send user name and password** only if these details have not already been sent for this user: the user name and password can be sent.
once only for any user. If this option is available for selection but you do not select it, then you can run the process Send User Name and Password E-Mail Notifications later to notify users of their user names and passwords.

**What happens when I autoprovise roles?**

When you autoprovise roles to a user, the user’s assignments are reviewed automatically against all current role mappings.

Roles for which the **Autoprovise** option is selected are:

- Provisioned to the user immediately, if the user is eligible for the role and does not currently have it
- Deprovised from the user immediately, if the user is no longer eligible for the role but currently has it

You are recommended to autoprovise roles to individual users if you know that new or changed role mappings exist for which those users are eligible. Otherwise, roles are not provisioned or deprovised automatically until the user’s assignments are next updated.

**Where do default user names come from?**

By default, user names are defined by Oracle Identity Management (OIM). The user name is typically the user’s first and last names, but this format can be changed in OIM.

The default format of user names can be specified for the enterprise in Oracle Fusion HCM. This setting overrides the OIM default format. Your enterprise may have selected one of the following values:

- Person number
- Party number
- Primary work e-mail

If the default user-name format for the enterprise is the person number, then primary e-mail is used instead for party users who have no person number.

Default user names may not appear for new users until the relevant value (for example, the person number) is available. The user-account request is not submitted to OIM until the value exists.

**What happens when I link a user account?**

The current person or party record is linked to the selected Oracle Identity Management (OIM) user account. When you click **Save**, the request is submitted to OIM and the account status is **Requested**. Once the account status is **Active**, the user can sign in using the account.

Any roles currently provisioned to the linked account do not appear in the Roles section of the page until the account status is **Active**. However, you can add roles before clicking **Save**.
The **Link User Account** action appears only for persons or party users whose records are not already linked to a user account. When you link a user account, the person or party is not notified automatically. You are recommended to notify the user when the account is linked.

**Can I extract details of all Oracle Fusion Applications users?**

Yes. The Oracle BI Publisher User Details System Extract report includes details of all user accounts or a specified subset. For example, you can produce a report showing inactive user accounts, accounts created between specified dates, or accounts associated with TCA parties only.

To run the report, you must have an HCM data role that provides view-all access to person records for the Human Capital Management Application Administrator job role.
Segregation of Duties: Explained

Segregation of duties (SOD) separates activities such as approving, recording, processing, and reconciling results so an enterprise can more easily prevent or detect unintentional errors and willful fraud. SOD policies, called access control policies in Application Access Controls Governor (AACG), exert both preventive and detective effects.

SOD policies constrain duties across roles so that unethical, illegal, or damaging activities are less likely. SOD policies express constraints among roles. Duty role definitions respect segregation of duties policies.

Application Access Controls Governor

You manage, remediate, and enforce access controls to ensure effective SOD using the Application Access Controls Governor (AACG) product in the Oracle Enterprise Governance, Risk and Compliance (GRC) suite.

AACG applies the SOD policies of the Oracle Fusion Applications security reference implementation using the AACG Oracle Fusion Adapter.

AACG is integrated with Oracle Identity Management (OIM) in Oracle Fusion Applications to prevent SOD control violations before they occur by ensuring SOD compliant user access provisioning. SOD constraints respect provisioning workflows. For example, when provisioning a Payables role to a user, the SOD policy that ensures no user is entitled to create both an invoice and a payment prevents the conflicting roles from being provisioned. AACG validates the request to provision a user with roles against SOD policies and provides a remediating response such as approval or rejections if a violation is raised.

Use AACG to for the following.

- Define SOD controls at any level of access such as in the definition of an entitlement or role.
• Simulate what-if SOD scenarios to understand the effect of proposed SOD control changes.
• Use the library of built-in SOD controls provided as a security guideline.

Managing Segregation of Duties

SOD policies express incompatible entitlement or incompatible access points into an application. In GRC, an access point is the lowest level access for a particular application. In GRC, entitlement is a grouping of access points. As a security guideline, group the lowest level access points or define the SOD policy at the access level causing the least amount of change. Business activities are enabled at access points. In Oracle Fusion Applications, the hierarchy of access points in descending levels is users, roles, and entitlement.

Note

AACG entitlements are logical groupings of security objects that represent Oracle Fusion Application access points such as roles or entitlement.

Note

In AACG, segregation of duties policies are called access controls.

Oracle Fusion Applications does not predefine business logic for dealing with SOD conflicts. Oracle Fusion Applications does define a set of states where role requests are suspended pending resolution of SOD violations the role request introduces. In most cases, Oracle Fusion Applications invokes OIM to handle role requests. Enterprises define SOD resolution rules when defining SOD policy.

Remediating Segregation of Duties Policy Violations

The risk tolerance of your enterprise determines what duties must be segregated and how to address violations.

AACG assists in remediation of violations with a guided simulation that identifies corrective action. You determine the exact effects of role and entitlement changes prior to putting them into production, and adjust controls as needed.

For information on managing segregation of duties, see the Oracle Application Access Controls Governor Implementation Guide and Oracle Application Access Controls Governor User's Guide.

Segregation of Duties in the Security Reference Implementation: Explained

Segregation of duties (SOD) is a special case of function security enforcement. A segregation of duties conflict occurs when a single user is provisioned with a
role or role hierarchy that authorizes transactions or operations resulting in the possibility of intentional or inadvertent fraud.

The predefined SOD policies result in duty separation with no inherent violations. For example, an SOD policy prevents a user from entitlement to create both payables invoices and payables payments.

However, the most common duties associated with some job and abstract roles could conflict with the predefined segregation of duties. A predefined role hierarchy or job or abstract role may include such common duties that are incompatible according to a segregation of duties policy. For example, the predefined Accounts Payable Supervisor job role includes the incompatible duties: Payables Invoice Creation Duty and Payables Payment Creation Duty.

Every single predefined duty role is free from an inherent segregation of duties violation. For example, no duty role violates the SOD policy that prevents a user from entitlement to both create payables invoices and payables payments.

Jobs in the reference implementation may contain violations against the implemented policies and require intervention depending on your risk tolerance, even if you define no additional jobs or SOD policies.

Provisioning enforces segregation of duties policies. For example, provisioning a role to a user that inherits a duty role with entitlement to create payables invoices enforces the segregation of duties policy applied to that duty role and ensures the user is not also entitled to create a payables payment. When a role inherits several duty rules that together introduce a conflict, the role is provisioned with a violation being raised in the Application Access Controls Governor (AACG). If two roles are provisioned to a user and introduce a segregation of duties violation, the violation is raised in AACG.

---

**Note**

SOD policies are not enforced at the time of role definition.

---

Aspects of segregation of duties policies in the security reference implementation involve the following.

- Application Access Controls Governor (AACG)
- Conflicts defined in segregation of duties policies
- Violations of the conflicts defined in segregation of duties policies

**Application Access Controls Governor (AACG)**

AACG is a component of the Oracle Enterprise Governance, Risk and Compliance (GRC) suite of products where segregation of duties policies are defined.

- Define SOD controls at any level of access such as in the definition of an entitlement or role.
- Simulate what-if SOD scenarios to understand the effect of proposed SOD control changes.
• Use the library of built-in SOD controls provided as a security guideline.

Your risk tolerance determines how many duties to segregate. The greater the segregation, the greater the cost to the enterprise in complexity at implementation and during maintenance. Balance the cost of segregation with the reduction of risk based on your business needs.

Conflicts

An intra-role conflict occurs when a segregation of duties policy expresses constraints within the construct of a single role (entitlement and duties) that creates violations.

Tip

As a security guideline, use only the predefined duty roles, unless you have added new applications functions. The predefined duty roles fully represent the functions and data that must be accessed by application users and contain all appropriate entitlement. The predefined duty roles are inherently without segregation of duty violations of the constraints used by the Application Access Controls Governor.

Violations

A segregation of duties violation occurs when a policy is defined that allows a segregation of duties conflict to occur.

Notifications report conflicts to the requester of the transaction that raised the violation. Oracle Identity Management (OIM) shows the status of role requests indicating if a segregation of duties violation has occurred.

For information on configuring audit policies, see the Oracle Fusion Applications Administrator’s Guide.

For more information on managing segregation of duties, see the Oracle Application Access Controls Governor Implementation Guide and Oracle Application Access Controls Governor User’s Guide.

Defining Segregation of Duties Policies: Points To Consider

Segregation of duties (SOD) policies express incompatibilities enforced to control access in defined contexts.

In Oracle Fusion Applications, SOD policies protect against the following incompatibilities.

• Privilege X is incompatible with privilege Y
• Role A is incompatible with role B

• Any privileges in role A are incompatible with any privileges in role B.

• Privilege X is incompatible with any privileges in role B.

The following examples of SOD policies illustrate incompatible entitlement.

• No user should have access to Bank Account Management and Supplier Payments duties.

• No user should have access to Update Supplier Bank Account and Approve Supplier Invoice entitlement.

Data Contexts

You can extend SOD policies to control access to specific data contexts.

For example, no single individual must be able to source a supplier in a business unit and approve a supplier invoice in the same business unit.

Exclusion and Inclusion Conditions

SOD policies may include exclusion conditions to narrow the SOD scope and reduce false positive violations, or inclusion conditions to broaden the scope.

Conditions apply to access points globally, to policies, or to access paths defined by policies. Access path conditions can exclude a user from a role, an Oracle Fusion Applications entitlement from a role, or a permission from an Oracle Fusion Applications entitlement.

The following global exclusion conditions are predefine in Oracle Fusion Applications and available when creating SOD policies.

• User Status

• User Name

• Enterprise Role

• Action

• Business Unit

• Within Same Business Unit

Enforcement

Oracle Fusion Applications enforces SOD policies under the following circumstances.

• When granting entitlement to a role

• When provisioning a role to a user
For information on managing segregation of duties, see Oracle Application Access Controls Governor Implementation Guide and Oracle Application Access Controls Governor User’s Guide.

**Note**

SOD policies are not enforced at the time of role definition.

Aspects of segregation of duties policies in the security reference implementation involve the following.

- Application Access Controls Governor (AACG)
- Conflicts defined in segregation of duties policies
- Violations of the conflicts defined in segregation of duties policies

A single SOD policy can include entitlement from multiple instances of a single enterprise resource planning environment. For example, one SOD policy is enforced in implementation, test, and production instances of Oracle Fusion Applications.

**Managing Segregation of Duties Risks and Violations: Critical Choices**

You assess and balance the cost of duty segregation against reduction of risk based on the requirements of your enterprise.

The types of people who resolve SOD conflicts include the following.

- Administrator of an external program such as the Procurement Administrator for the supplier portal or the Partner Manager for the PRM Program
- Senior executive spanning multiple organizations in an enterprise with opposing interests
- Risk management professional implementing an Oracle Enterprise Governance, Risk and Compliance (GRC) initiative
- Predefines a set of conditions and informs access provisioning staff to approve requests and prove the exception based on certain conditions
- Allows defining rules to route SOD violations for approval

You view and respond to risks and violations in the Application Access Controls Governor (AACG).

You may wish to override an SOD violation. For example, the Accounts Payable Supervisor includes incompatible duties to create both invoices and payments.
When you provision this job role to a user, you may waive the violation in the AACG. You may waive the violation for the currently provisioned user, for the SOD policy that raised the violation, or for the SOD policy within a particular data set, such as a business unit.

The risk tolerance of your enterprise guides how you respond to conflicts. For example, a user may be provisioned with both the role of Order Manager and Shipping Agent. The Order Manager role entitles the user to enter orders, which could result in exploitation when filling shipping quotas. You can remove the entitlement to enter orders that the Order Manager job role inherits from the Orchestration Order Scheduling Duty role. Or you could segregate the shipping and order entry duties by defining an SOD policy that allows a user to have either job role but not both.

**False Positives**

False positives can be SOD policy violations that are not actually violations, or are violations within your risk tolerance and therefore do not require corrective action.

You can reduce false positives by the following methods.

- Define exclusion conditions that can be applied to individual or groups of policies.
- Define logically complex SOD policies that enforce more exacting specifications.
- Determine whether conflicts should be prevented, monitored, or subjected to approval during provisioning.

**Path Level Detection**

Conflict analysis detects a user’s multiple paths to one or more conflicting access points.

For example, a user may be able to reach a single access point through one or more roles, or by one entitlement leading to another through submenus to a function that represents a risk. The resulting conflict path shows if the conflict is generated by inappropriate role provisioning or configuration of applications. The audit shows the paths from any number of users to any number of access points involved in conflicts, which lets you visualize the root cause and remediate effectively.

AACG assigns one or more users to review all paths involved in a given conflict so that the entire conflict can be addressed in a coherent way.

**Waiving or Accepting Violations**

AACG lets you accept or waive a violation. Your reasons may include that you accept the risk or will define compensating controls.

A waiver may apply to the current user, constraint, or constraint within a dimension such as the business unit.
**Resolving Conflicts**

The risk tolerance of the enterprise determines whether a segregation of duties conflict must be removed from the security reference implementation.

The following approaches resolve conflicts.

- Change the segregation of duties policy.
- Ensure a job role does not contain incompatible duties.
- Define data security policies that restrict authorized access by incompatible duties.

Changing a segregation of duties policy may not be possible in most cases. For example, a policy that segregates creation of payables invoice from making payables payments should be preserved, even if the Accounts Payables Manager job role includes a duty role for each activity. To prevent an accounts payables manager from being authorized to perform both duties, or from being authorized to make payables payments to self and direct reports, the Accounts Payables Manager job role must be changed. The security implementation can be changed to include two job roles that segregate the incompatible duties. Added data security policy grants can restrict the access to at risk data.

For information on managing segregation of duties, see the Oracle Application Access Controls Governor Implementation Guide and Oracle Application Access Controls Governor User’s Guide.

**Role Provisioning and Segregation of Duties: How They Work Together**

Segregation of duties (SOD) checks occur when roles are assigned to users. The checks are based on Oracle Application Access Controls Governor (AACG) policies in Oracle Enterprise Governance, Risk and Compliance (GRC). The Oracle Identity Management (OIM) integration includes predefined routing rules for remediation in the Manage IT Security business process.

External users such as suppliers or partners need to be provisioned with roles to facilitate access to parent company interfaces and data. The process by which such provisioning requests are approved in Oracle Fusion Applications helps explain the request flows and possible outcomes.

---

**Note**

In Oracle Identity Management (OIM), external users means users who are not specific to applications, such as enterprise roles or the absence of entitlement to access an application.
The figure shows the role provisioning request flow. OIM uses AACG to check segregation of duties violations.

Tables

A supplier or partner requests admission to a program using an implementation of the Supplier Portal Submission. The submission is captured in one or both of the following tables in advance of approving or rejecting the supplier or partner.

- Oracle Fusion Trading Community Model
- Interface Staging

Oracle Fusion Applications collects the employee names for the supplier or partner company at the time the company submits its request to join the program so that all employees accessing Oracle Fusion Applications on behalf of the supplier or partner are provisioned.

AACG in the Oracle Enterprise Governance, Risk and Compliance (GRC) suite is certified to synchronize with the policy and identity stores for all pillars or partitions of Oracle Fusion Applications and integrated with the Oracle Fusion Applications security approach to roll up entitlements (by means of duty roles) to the roles that are provisioned to internal users. SOD policies can be defined and enforced at any level of authorization. For external users, SOD policies use attribute information stored in the Trading Community Model tables.

OIM and the SPML Client

Enterprise business logic may qualify the requester and initiate a role provisioning request by invoking the Services Provisioning Markup Language.
(SPML) client module, as may occur during onboarding of internal users with Human Capital Management (HCM), in which case the SPML client submits an asynchronous SPML call to OIM. Or OIM handles the role request by presenting roles for selection based on associated policies.

OIM recognizes the role provisioning request and initiates a call to AACG.

OIM apprises the SPML client of the current state of the role provisioning request as SOD_CHECK_IN_PROGRESS.

OIM stores the SOD check result as part of OIM audit data.

OIM apprises SPML client of the current state of the SPML request. The provisioning is either still in progress with segregation of duties being checked, or conflicts were found. If conflicts exist, AACG rejects the request and notifies the application.

<table>
<thead>
<tr>
<th>Status</th>
<th>Conflicts</th>
<th>Current State</th>
</tr>
</thead>
<tbody>
<tr>
<td>SOD_CHECK_IN_PROGRESS</td>
<td>Unknown</td>

<td>Conflict found</td>
<td>AACG detected violations that are rejected by approver</td>
</tr>
</tbody>
</table>

In the absence of an SOD exception, OIM provisions all relevant users.

**Note**

When a partner user is provisioned, all employees of the partner enterprise are provisioned. SOD checks occur when an external user requests to join a program, because SOD policies operate across Oracle Fusion Applications, not at the individual level. Supplier or partner company user requests are not approved if there is an SOD conflict against the supplier company.

OIM provides AACG with the details of SOD exception approval workflow. AACG audits the outcome for use in future detective controls and audit processes.

**Oracle Application Access Controls Governor**

AACG may respond with the following.

- Roles may be provisioned to the external user or its employees because no SOD conflict is found

- SOD conflict is found and request is denied because the relevant SOD policy is to be strictly enforced and no exception approval should be allowed
• SOD conflict is found and the exception to the policy is allowed, so the request goes through additional processing, such as an approval process.

Supplier or Partner Relationship Management responds to an SOD exception by updating Trading Community Model tables with the current state. An enterprise may elect to implement a landing pad that offers external users a means of addressing the SOD problem by providing more information or withdrawing the request.

SOD violation checking occurs during role implementation and provisioning, and can be turned on or off if AACG is provisioned and enabled as part of the Oracle Fusion Applications deployment.

**Segregation of Duties Exception Resolution or Approval Workflow**

Depending upon status, OIM kicks off an auditable SOD exception resolution workflow. Resolution can be conditional based on approval or requirements such as contracts being met.

If one of the paths for exception resolution is to get an approval, then the SOD exception resolution drives the approval using AMX. Standard AMX rules, not business rules, resolve the approval for the SOD exception, including the following.

• Organizational hierarchies
• Multiple mandatory and optional approvers
• Rerouting and approval delegation

The approver resolution uses AMX Rules Designer to access various user attributes and organizational hierarchies managed in Oracle Fusion Applications repositories. This information is typically not available in OIM or the LDAP identity store repository. Enterprises can define additional approval rules using AMX Thin Client.

The SOD Exception Approver gets a notification through supported channels that a new request is awaiting approval. The approver signs in to the global SOA federated worklist application that aggregates all pending worklist items for the user from all Oracle Fusion applications and logical partitions or pillars of applications. The SOD exception approval tasks show up in the same list.

The SOD exception approval task shows the details of the SPML request and SOD Provisioning results in a page rendered by OIM. The approver may take one of the following actions.

• Approve the request as it is
• Reject the request

If the approver approves the request, OIM sends an SOD_REMEDIATION_APPROVED status to the SPML client.

If the approver rejects the request, OIM sends an SOD_REMEDIATION_REJECTED status to the SPML client. The provisioning request is considered completed with a failure outcome and the external users is notified. Oracle Fusion Applications updates the Trading Community Model tables with the rejected status.
Remediation Task Assignments

The SOD remediation tasks are assigned based on the role being requested.

1. If the role requested is Chief Financial Officer, the SOD remediation task is assigned to the IT Security Manager role.

2. If the SOD violation results from a policy where the SOD control tag is the Information Technology Management business process and the control priority is 1, the SOD remediation task is assigned to Application Administrator role.

3. In all other scenarios, the SOD remediation task is assigned to the Controller role.

For more information about configuring audit policies, see the Oracle Fusion Applications Administrator’s Guide.

For information on managing segregation of duties, see the Oracle Application Access Controls Governor Implementation Guide and Oracle Application Access Controls Governor User’s Guide.
Use approval management to determine the policies that apply to approval workflows for particular business objects such as expense reports. For example, you can specify levels of approval for expense reports over a particular amount, to reflect your own corporate policies. You also determine the groups of users who act on these workflow tasks, for example, the chain of approvers for expense reports.

Approval management is fully described in the Oracle Fusion Middleware Modeling and Implementation Guide for Oracle Business Process Management. Though the concepts described there apply also to Oracle Fusion Applications, the only setup relevant to Oracle Fusion Applications involves approval groups and task configuration. Customization of approval workflows themselves is described in the Oracle Fusion Applications Extensibility Guide for Developers.

**Overview**

  See: Introduction to Approval Management

  See: Understanding Approval Management Concepts

**Approval Groups and Task Configuration**

- An approval group consists of a name and a predefined set of users configured to act on a task in a certain pattern. Refer to the Oracle Fusion Middleware Modeling and Implementation Guide for Oracle Business Process Management.

  See: Administering Approval Groups

See: Using Task Configuration

- To configure a predefined approval policy, select the predefined rule set and click the Edit task icon button.

- To disable a predefined rule set, select the Ignore this participant check box for that rule set.

- To edit the rules within a predefined rule set, you can insert, update, or delete from the seeded rules as needed while in edit mode.

- You can configure a specific rule to automatically approve without being sent to any approver. Modify the routing for that rule so that it is sent to the initiator (which means the requestor is the approver), set the Auto Action Enabled option to True, and enter APPROVE in the Auto Action field.

**Customization**

- You can optionally customize predefined approval workflows, for example add post-approval activities or additional stages. Refer to the Oracle Fusion Applications Extensibility Guide for Developers.

See: Customizing and Extending SOA Components
Common Applications Configuration: Define Help Configuration

Define Help Configuration: Overview

The Define Help Configuration task list contains tasks that let you set up and maintain Oracle Fusion Applications Help for all users. Use the Set Help Options task to determine if certain aspects of Oracle Fusion Applications Help are available to users and to control how aspects of the help site work. Use the Assign Help Text Administration Duty and Manage Help Security Groups tasks to set up customization of help content.

After performing the help configuration tasks, you can review the predefined help and consider whether to add or customize any content. Help that is embedded in the application, for example hints, can also be customized.

Use the Setup and Maintenance work area to access the tasks in the Define Help Configuration task list.

Set Help Options

Help Feature Choices and Help Options: Points to Consider

Help feature choices on the Configure Offerings page in the Setup and Maintenance work area control the look and behavior of Oracle Fusion Applications Help, and also determine which help options are available. Help options are setup options on the Set Help Options page.

Local Installation of Help

Select the Local Installation of Help feature choice so that the Define Help Configuration task list appears in your implementation project, and you can select two additional features (Access to Internet-Based Help Features and Help Customization) to control the fields available on the Set Help Options page.
Access to Internet-Based Help Features

Select this feature choice to provide users access to features that involve navigation to sites on the Web. If you select this feature choice, then the Web Sites Available from Help Site section is available on the Set Help Options page. For Oracle Cloud, always leave this feature choice selected so that your users can access the Cloud Learning Center.

Important

For non-Cloud implementations only: Some help includes links to guides outside the help system. If you select this feature, then these links open guides on the Oracle Technology Network Web site. If you do not select this feature, then your system administrator must download the guides (http://download.oracle.com/docs/cds/E39540_01.zip) and put all the content from within the extracted E39540_01 folder directly into the appmgr/APPLTOP/fusionapps/applications/ahc/afh/reference/TechLib folder.

Help Customization

Select the Help Customization feature choice if you intend to customize predefined help or add your own files to help. For example, you can add internal policies or procedures as help, and Oracle User Productivity Kit content, if any. Only users with job roles containing the Application Help Text Administration duty role have access to customize help.

If you select this feature choice, then the Custom Help Security feature choice is available, as well as all these sections on the Set Help Options page:

- Custom Help
- User Productivity Kit
- Privacy Statement

Custom Help Security

Select this feature choice if you want certain help files to be available only to a restricted set of users. You can define the user groups allowed to view corresponding help files. Do not select this feature choice if you do not have this requirement, because the feature can have an impact on performance.

If you select the Custom Help Security feature choice, then the Manage Help Security Groups task is available in the Define Help Configuration task list in your implementation project. There are no help options associated with this feature choice.

Administering Collaboration Features and Announcements in Help: Points to Consider

Announcements and collaboration features (discussions, ratings and comments) allow users to share information regarding help and the subjects that particular
help files cover. The collaboration features are also used elsewhere in Oracle Fusion Applications. Discussions may not be available in Oracle Cloud implementations.

Use the Set Help Options page in the Setup and Maintenance work area to enable the announcements and discussions features and to set options about ratings. When administering these features, consider the purpose of each feature and points that are specific to Oracle Fusion Applications Help.

Announcements

Use announcements to broadcast information to all users of your help site. You can provide information about help, for example new custom help that was recently added, or about anything that users should take note of, for example a change in company policy. Announcements can appear on any of the tabs on the home page of Oracle Fusion Applications Help. You can target specific user groups by posting announcements to specific tabs, for example, posting information related to implementation to the Functional Setup tab.

Only users with the Application Help Text Administration duty role have access to the Manage Announcements icon button in the Announcements sections. They can create, edit, and delete announcements for the tab that they are on, and set the date range for when each announcement is to be displayed.

Note

Use the full URL, for example http://www.oracle.com, when creating links.

Discussions

Users can use discussions to post questions or comments about subjects covered in specific help files. For example, after reading help on expense reports, users might have questions or comments about company policies or processes for expenses. Other users who later access this help file would benefit from the information in the discussion.

You can set a help option to enable discussions. Each help file would contain a Discuss link that all users can use to read discussions about that file. They can also start a discussion topic or post to existing topics. These discussions are visible only to users in your enterprise.

Important

Do not enable discussions until servers for discussions are up and running.

Ratings and Comments

Users can rate any help file on a five star system and provide feedback about the content. This information is helpful to other users in deciding which help file to open. Help files with a higher average rating are listed first in help windows, and in the help listings you see as you browse using the help navigators.

The scope of ratings and reviews is limited to your enterprise.
FAQs for Set Help Options

When do I link to the Oracle User Productivity Kit library from the help site?

Provide a link to your Oracle User Productivity Kit (UPK) library if you have UPK licensed and custom UPK content to share with your users. You give them access to a library of custom UPK content in addition to any custom UPK demos that you added to the help site itself. UPK demos that you add as custom help are available only in the See It mode, so the library can include the same demo in other modes. If you have UPK versions earlier than 3.6.1, then you cannot add UPK demos as custom help, so the link is the only way for users to access custom UPK content from the help site.

How can I find the URL to the Oracle User Productivity Kit library?

The URL to enter on the Set Help Options page should be the full path from the Web server where you are hosting your Oracle User Productivity Kit (UPK) content to the index.html file that opens the table of contents for the library, for example, http://<your domain>.com/UPKcontent/PlayerPackage/index.html. In this example, you or your UPK administrator would publish one UPK player package that contains all the content to be linked to from Oracle Fusion Applications Help, as well as the index.html file, and place the PlayerPackage folder in a manually created folder called UPKcontent on the Web server.

FAQs for Assign Help Text Administration Duty

Who can add and manage custom help?

Users with the Application Help Text Administration duty role have access to customize help in Oracle Fusion Applications Help. This duty is assigned by default to various job roles, in particular the administrators for product families. You can assign the duty role to other users who need access to customize help. Use the Manage Duties task in the Setup and Maintenance work area to search for the Application Help Text Administration duty role on the Role Catalog page, and map additional job roles to this duty role.

Manage Help Security Groups

Creating Help Security Groups: Worked Example

This example demonstrates how to create a help security group to define a set of job roles that have access to help. The help security group can then be assigned
to particular help files so that only users with any of the defined roles have access to the help.

The following table summarizes key decisions for this scenario.

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>What type of users do you need to limit help access to?</td>
<td>Human resources (HR) specialists</td>
</tr>
<tr>
<td>Is there a specific time period for which this access is needed?</td>
<td>No, the help files should always be viewed only by the HR specialists</td>
</tr>
<tr>
<td>Where do you want this group to appear in the list of values for help security groups?</td>
<td>First</td>
</tr>
</tbody>
</table>

Define a help security group and assign a duty role to the group.

1. From the Setup and Maintenance work area, find the Manage Help Security Groups task and click **Go to Task**.
3. Complete the fields, as shown in this table. Leave the start and end dates blank.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Help Security Group</td>
<td>HR</td>
</tr>
<tr>
<td>Meaning</td>
<td>HR Only</td>
</tr>
<tr>
<td>Description</td>
<td>Viewing by HR specialists only</td>
</tr>
<tr>
<td>Display Sequence</td>
<td>1</td>
</tr>
</tbody>
</table>

4. Click **Save**.
5. With your new help security group selected, go to the Associated Roles section and add a new row.
6. Select **PER_HUMAN_RESOURCE_SPECIALIST** as the role name.
7. Click **Save and Close**.

You have created a new lookup code for the Help Security Groups lookup type, which is a standard lookup. The lookup code has the name, meaning, and description that you defined for the help security group.

You have also created a data security policy for the help database resource, specifying that the Human Resource Specialist role can view help that is defined with the HR security group. If you go to the Manage Database Resources and Policies page and find the database resource, or object, ATK_KR_TOPICS, then you can see the policy for the Human Resource Specialist role, with the condition that the column name, SECURITY_CODE, is equal to the value HR.
Common Applications Configuration: Define Application Toolkit Configuration

Define Application Toolkit Configuration: Overview

Oracle Fusion Application Toolkit (ATK) is an application that provides various core components of Oracle Fusion Applications, including the Welcome dashboard, Oracle Fusion Applications Help, the Reports and Analytics pane, and the Watchlist feature. Use the Define Application Toolkit Configuration task list to set up and maintain some of these components for all users, and the Define Help Configuration task list for Oracle Fusion Applications Help.

---

**Note**

The Define Application Toolkit Configuration task list is available in implementation projects only if the Application Toolkit Component Maintenance feature choice is selected.

---

Use the Setup and Maintenance work area to access the tasks in the Define Application Toolkit Configuration task list.

FAQs for Map Reports to Work Areas

**How can I set up the Reports and Analytics pane for all users?**

You can remove any currently mapped report from the Reports and Analytics pane, or add mappings to reports from the Oracle Business Intelligence (BI) Presentation catalog. To access the setup, click **Edit Settings** in the Reports and Analytics pane, or use the Map Reports to Work Areas task in the Setup and Maintenance work area. If you do the former, then you can set up only the Reports and Analytics pane on the work area that you are in.

If you do the latter, then you can select a work area to set up. If you do not see the desired work area, most likely you do not have access to it due to security.
You can request to be granted a role that has access to the work area, or another administrator or business user with access to the work area can be granted the Reports and Analytics Region Administration Duty to be able to map reports to the work area.

**Tip**

On the Map Reports to Work Areas page only, you can also use the Synchronize button to remove mappings to reports that are no longer in the catalog, for all work areas at once.

Any changes you make in either UI apply to all users with access to the mapped work area.

**Set Watchlist Options**

**Watchlist Setup: Points to Consider**

For all users across the site, you can disable or enable predefined Watchlist categories and items, edit their names, and determine how often item counts refresh. You cannot delete predefined Watchlist categories and items, nor create any for the site. Users can create their own Watchlist items through saved searches.

Access the Set Watchlist Options page by starting in the Setup and Maintenance Overview page and searching for the Set Watchlist Options task.

**Disabling Predefined Categories and Items**

Use the Set Watchlist Options page to enable or disable predefined Watchlist categories and items. Disabling any category or item also disables associated processes involved in calculating the Watchlist item counts for all users. These processes include creating data caches, performing security checks, invoking services across domains, running queries, and so on.

An item with the **Predefined** type represents the actual predefined Watchlist item that appears in the Watchlist. If you disable this type of Watchlist item, then:

- The item is not available for users to display in their watchlist
- The item is removed from any watchlist where it is currently displayed

A Watchlist item with the **User-created saved search** type does not appear in the Watchlist; it controls the display of the **Manage Watchlist** button or menu item in pages with saved searches. If you disable this type of Watchlist item, then:

- The **Manage Watchlist** option is not available to users in the corresponding work area, so users cannot use their own saved searches as Watchlist items. A message is displayed to users when they try to use this option.
• Any user-defined saved searches from that work area already used as Watchlist items are no longer available in the users’ watchlist. The user-defined saved searches are still available to be used for searching, but not for the Watchlist.

If you disable a Watchlist category, then the category is not available for users to include in their watchlist, and all Watchlist items within the category are also disabled.

Ultimately, the Watchlist for any user contains the subset of categories and items that are enabled in the Set Watchlist Options page:

• Plus any items based on user-defined saved searches
• Minus any categories or items that the user chooses to hide using Watchlist preferences
• Minus any items with no results found, if the user chooses to hide such items using Watchlist preferences

Specifying Refresh Intervals

All Watchlist items have a predefined refresh interval, which controls how often the query that calculates the count for a Watchlist item can be run. Use the Set Watchlist Options page to edit the interval values. What you specify as the refresh interval for a Watchlist item of type User-created Saved Search applies to all Watchlist items based on saved searches created by users on the corresponding search page.

When the user is in the Welcome dashboard with the Watchlist open for at least two and a half minutes, the query automatically runs for all Watchlist items if no refresh already ran in this user session. To subsequently run the query again, users can manually refresh the Watchlist region. The Refresh icon is enabled after five minutes since the last refresh.

Note

During a refresh, the query runs for an individual Watchlist item only if the time since the last query for this item is equal to or greater than the specified refresh interval. Since the manual refresh of the entire Watchlist is not available until five minutes after the last refresh, you should not set a Watchlist item refresh interval that is less than five minutes.

When users open Watchlist from the global area, a refresh automatically runs if five minutes have passed since the last refresh. During this refresh, the query runs for an individual Watchlist item only if the time since the last query for this item is equal to or greater than the specified refresh interval.

For example, you set the interval to eight minutes for a particular Watchlist item. When the user signs in and goes to the Welcome dashboard, with the Watchlist open, the query automatically runs for this Watchlist item after two and a half minutes. Every two and a half minutes after, a check is performed for stale counts and new cached counts are displayed.

Five minutes after the query ran, the Refresh icon is enabled and the user performs a manual refresh. However, the query does not run for this Watchlist
item, because the refresh interval is eight minutes. The user navigates away from the Welcome dashboard and opens the Watchlist from the global area six minutes later. A refresh automatically runs because more than five minutes have passed since the last refresh. This time, the query runs for this Watchlist item because it has been more than eight minutes since the query last ran for this item.

**Editing Predefined Category and Item Names**

Predefined Watchlist category and item names are stored as meanings of standard lookups. Lookup types for predefined categories end with WATCHLIST, for example EXM_EXPENSES_WATCHLIST. Edit the lookup type meaning to change the category name. To change item names, edit lookup code meanings for that lookup type.
Oracle Sales Cloud Computer Telephony Integration: Explained

You can use Oracle Sales Cloud’ Computer Telephony Integration (CTI) to place a call to a contact from a hyperlink on the phone number or phone icon.

Here are a few topics that are important to know when using CTI:

- Normal call flow
- Interaction Records and Notes
- Operational Notes

Note

CTI must be enabled to make calls using the various contact information pages and pop-up UIs. When enabled, phone numbers appear as hyperlinks. Interaction logging is available if that feature is enabled. If interaction logging is available, a note indicating that fact will be displayed.

Normal Call Flow

CTI uses a call-the-caller-then-call-the-callee procedure for completing a phone call. That format and the normal flow of this procedure are described below.

- You initiate a call

  If you see a small orange square next to a contact or customer name, click the square to display further details, including phone numbers. To place a call, place your mouse over the phone number hyperlink and click.

Note

CTI does not work on phone numbers that are marked with a Do Not Call icon.

- Select a Calling Phone
Choose the calling phone number. Usually the calling phone is a number from your profile information. Alternately, if you need to use a phone not in your profile, you can specify a different number to originate your call.

**Call Flow**

After you select the calling phone number, the system calls you back on that number, waits for you to answer, and then calls the person for whom the call is intended.

**Interaction Records and Notes**

CTI automatically creates an interaction record of the call, when that feature is enabled. The details window that provides the phone number may also show an Interaction icon that you can click to display a list of interaction records to edit, for example to provide a description of the call. The window may also provide a notes feature that you can use to record notes during the call.

**Interaction Logging**

The interaction record is logged as soon as the call is either successfully set up or known to have failed.

The interaction log records the customer, call participants, a timestamp noting the start time of the call, the direction of the communication, in or outbound, and
the resolution code. The description is automatically updated with these three items:

- Call ID from OWLCS
- Your chosen phone number
- Contact phone number

The call resolution code is determined from OWLCS and recorded in the interaction:

<table>
<thead>
<tr>
<th>OWLCS Call Status</th>
<th>Resolution Code in Interaction</th>
</tr>
</thead>
<tbody>
<tr>
<td>CallConnected</td>
<td>CALL ANSWERED</td>
</tr>
<tr>
<td>CallAborted</td>
<td>FAILED</td>
</tr>
<tr>
<td>CallHangUp</td>
<td>FAILED</td>
</tr>
<tr>
<td>CalledPartyBusy</td>
<td>NOT AVAILABLE</td>
</tr>
<tr>
<td>CalledPartyNoAnswer</td>
<td>NOT AVAILABLE</td>
</tr>
<tr>
<td>CalledPartyNotReachable</td>
<td>NOT AVAILABLE</td>
</tr>
<tr>
<td>CallingPartyBusy</td>
<td>FAILED</td>
</tr>
<tr>
<td>CallingPartyNoAnswer</td>
<td>FAILED</td>
</tr>
<tr>
<td>CallingPartyNotReachable</td>
<td>FAILED</td>
</tr>
</tbody>
</table>

**Editing interactions**

Once the call is established, if Interactions is available, you can use the Interactions icon on the UI to launch the interaction record list view. Select the current interaction record to edit it.

**Operational Notes**

Because of the call-the-caller-then-call-the-callee format, there are some conditions that may occur due to several calling situations. Some of these conditions are described below:

- Why don't I hear a ring-back tone? As soon as you answer the system call-back, the system immediately dials the contact. You won't hear a ring-back tone as in a normal outbound phone call. However, you can tell that the call attempt is progressing because:
  - The phone indicates that the connection is active. If the call to the contact reaches a busy tone or the call attempt times out, the connection is dropped.
  - The dialing window stays on the screen while the call attempt is progressing. It disappears when the connection is either successfully established or fails.

- What if your phone is busy and the call-back goes directly to voice mail? Normally this would not happen because you would not initiate a new call when you are already busy on another call. However, this situation could occur due to a race condition, that is where another incoming call reaches your phone before the CTI call-back. When this happens, two different scenarios could occur:
• If your phone is configured for busy-forward-all-to-voice-mail, the CTI call would be forwarded to your voice mail, and the system thinks that the caller has answered the call and will proceed to call the contact. On answering, the contact hears your voice-mail greeting.

• If your phone is capable of presenting a second call to the user, as is supported by many office phones and mobile phones, then you can still answer the CTI call and there is no issue.

• What if you wait too long to answer the call-back? In other words, you wait longer than the ring-no-answer-forward-to-voice-mail timer on the phone system and the call goes to voice mail. Normally, this would not happen because you are expecting the inbound call after you started the call, and would answer promptly. However, if for some reason you do not answer and allow the call to ring-no-answer-forward to voice mail, then the system would think that you have answered the call and will proceed to call the contact. On answering, the contact hears your voice-mail greeting.

• What if the contact does not answer in 30 seconds and the system abandons the call attempt? If the contact’s voice mail is configured to answer after 30 seconds, you will not be able to leave a message.

**Oracle Sales Cloud CTI: Top Tasks**

Oracle Sales Cloud CTI (Computer Telephony Integration) is a feature of the customer contact process. Phone communication to customers and employees is initiated with a click of the mouse, leveraging your customer contact information and the application context. The CTI feature uses Oracle WebLogic Communication Services, OWLCS, to enable communications. Applications that provide the CTI functionality do so primarily through contextual actions.

Additionally, CTI utilizes Oracle Sales Cloud interactions as an optional transaction logging feature that will track information about the call such as the customer, call participants, a timestamp noting the start time of the call, the direction of the communication, in or outbound, and the resolution code.

CTI integrates with your telephony environment and must be manually enabled in your deployment. This topic highlights what is required to set up the CTI feature and to implement logging of the calls made using the CTI feature.

Terms used in setting up these communications:

- **PSTN:** Public switched telephone network is the network of the world’s public circuit-switched telephone networks.

- **SIP:** Session initiation protocol, an open signaling protocol standard that is used to set up phone calls.

- **TPCC:** Third Party Call Control enables an application to control the telephony network to set up calls automatically.

- **OWLCS:** Oracle WebLogic Communication Services. Offers the TPCC service to Oracle applications and sets up the calls via SIP integration with the telephony network.
The set up task list Define WebLogic Communication Services Configuration delineates four tasks required for the correct configuration and implementation of CTI. There is an optional task, separate from the set up task list, required for implementing Interaction logging.

Information about implementing CTI can be found in the Oracle Sales Cloud Administrator's Guide. Detailed information about configuring and maintaining WebLogic Communication Services is found in the Oracle WebLogic Communication Services Administrator's Guide.

**Configure and Deploy WebLogic Server**

- Deploy WebLogic Communication Services: After the Oracle WebLogic communication server is deployed, this manual task activates the server.
  
  See: Oracle WebLogic Communication Services Administrator's Guide

**Integrate Communications Services**

- Integrate WebLogic Communication Services with Telephony Network: This manual task integrates communications within the telephony environment. OWLCS must be configured to interface with the specific characteristics of the telephony network.
  
  See: Managing Oracle WebLogic Communication Services for CTI Functionality

**Specify the Domain and Address**

- Register a URL for the telephony gateway or soft switch for SIP domain: This task defines the Server protocol, defaulted to http, the external server host address and external server port address. The Associated Modules section is not required for setup. You can also perform this as a manual task using Topology Manager to configure the address of the SIP Public Switched Telephone Network (PSTN) gateway or SIP soft switch serving the users within that domain. This address is needed by CTI to correctly form the SIP addresses required by WebLogic Communication Services.
  
  See the link to Configuring PSTN Gateway Address Using Topology Manager: Worked Example.

**Enable Click-to-Dial**

- After configuring the server and defining the SIP domain, perform the Enable Click-to-Dial task. This task sets the value of the profile option Enable Click-to-Dial to 'Yes.'

**Call Logging via Interactions**

- To initiate the Interaction based logging for CTI, set the profile option Call Interaction Logging Enabled to 'YES.'

**Configuring PSTN Gateway Address Using Topology Manager: Worked Example**

This example demonstrates how, during the implementation of the Register URL for the telephony gateway or soft switch for SIP domain task,
you must manually configure the PSTN gateway address by registering HzCTDPstnGatewayApp to a given environment using Oracle Fusion Topology Registration.

These steps configure the address of the SIP Public Switched Telephone Network (PSTN) gateway or SIP soft switch serving the users within that domain. This address is needed by Click-to-Dial to correctly form the SIP addresses required by WebLogic Communication Services.

For example: SIP:+1650-555-1212@pstn_gateway.oracle.com;user=phone  where pstn_gateway.oracle.com is the SIP domain. The SIP domain can also be expressed in the format 10.1.1.1 (IP address).

Configuring PSTN using the Topology Manager

1. Sign in to Oracle Fusion Applications as a user that has application implementation consultant and WebLogic Services administration roles.

2. In Fusion Applications Setup and Maintenance, click Register Enterprise Applications from the regional area under Topology Registration.

3. On the Register Enterprise Applications page, click the plus icon to add an enterprise application. An Add Enterprise Application popup appears.

4. Enter the new application information: Click Search in the Enterprise Application list field. Enter HzCTDPstnGatewayApp in the name field and click Search. Click OK.

5. Enter the other fields in the Add Enterprise Application popup.

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>HzCTDPstnGatewayApp</td>
</tr>
<tr>
<td>Server Protocol</td>
<td>SIP</td>
</tr>
<tr>
<td></td>
<td>This field is ignored by click-to-dial. Oracle WebLogic Communication</td>
</tr>
<tr>
<td></td>
<td>Service (OWLCS) always uses the SIP protocol.</td>
</tr>
<tr>
<td>External Server Host</td>
<td>10.143.167.91 (Used as an example)</td>
</tr>
<tr>
<td></td>
<td>A host name can be used instead of an IP address.</td>
</tr>
<tr>
<td>External Server Port</td>
<td>0 (Used as an example)</td>
</tr>
<tr>
<td></td>
<td>This field is ignored by Click-to-Dial.</td>
</tr>
</tbody>
</table>

6. Click Save and Close.
Common Applications Configuration: Other Common Setup and Maintenance Tasks

Define Transactional Business Intelligence Configuration

Define Transactional Business Intelligence Configuration: Highlights

Configure Oracle Transactional Business Intelligence for ad hoc reporting, review certain setup objects to be used in Transactional Business Intelligence, and manage the presentation catalog and currency type display.

Defining Transactional Business Intelligence Configuration

- Review details about the Transactional Business Intelligence tasks. Refer to the Oracle Fusion Transactional Business Intelligence Administrator’s Guide.

Access to Person Data

Assigning Security Profiles to Job Roles for Oracle Fusion Transactional Business Intelligence Users: Explained

Users of Oracle Fusion Transactional Business Intelligence (Transactional Business Intelligence) need access to some person data for reporting purposes. To provide this access, you assign a predefined security profile to relevant job or abstract roles using the Oracle Fusion Human Capital Management (HCM) setup task Manage Data Role and Security Profiles. On completion of this task, Oracle Fusion Data Security is updated automatically for roles being used to access Transactional Business Intelligence.

Job or Abstract Roles and Related Security Profiles

The following table identifies, by Oracle Fusion product, the job and abstract roles that need access to person data and the predefined security profile that you assign to each role.
<table>
<thead>
<tr>
<th>Product</th>
<th>Job or Abstract Role</th>
<th>Security Profile</th>
</tr>
</thead>
<tbody>
<tr>
<td>Oracle Fusion Assets</td>
<td>Asset Accountant</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Assets</td>
<td>Asset Accounting Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Enterprise Planning and Budgeting</td>
<td>Budget Analyst</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Enterprise Planning and Budgeting</td>
<td>Budget Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Financial Consolidation Hub</td>
<td>Consolidation Accountant</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Financial Consolidation Hub</td>
<td>Consolidation Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Financials Common Module</td>
<td>Intercompany Accountant</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion General Ledger</td>
<td>Financial Analyst</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion General Ledger</td>
<td>General Accountant</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion General Ledger</td>
<td>General Accounting Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Incentive Compensation</td>
<td>Incentive Compensation Participant Manager</td>
<td>View Manager Hierarchy</td>
</tr>
<tr>
<td>Oracle Fusion Inventory Management</td>
<td>Warehouse Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Project Foundation</td>
<td>Project Accountant</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Project Foundation</td>
<td>Project Administrator</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Project Foundation</td>
<td>Project Billing Specialist</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Purchasing</td>
<td>Buyer</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Sourcing</td>
<td>Category Manager</td>
<td>View All Workers</td>
</tr>
<tr>
<td>Oracle Fusion Sourcing</td>
<td>Sourcing Project Collaborator</td>
<td>View All Workers</td>
</tr>
</tbody>
</table>

For example, as part of their Transactional Business Intelligence setup:

- Oracle Fusion Assets implementors must assign the predefined security profile View All Workers to the Asset Accountant and Asset Accounting Manager job roles.

- Oracle Fusion Incentive Compensation implementors must assign the predefined security profile View Manager Hierarchy to the abstract role Incentive Compensation Participant Manager.

The security profiles that HCM roles need to access Transactional Business Intelligence are assigned during the setup of HCM data security: no additional setup is required for Transactional Business Intelligence purposes.

**Enabling an Oracle Fusion Transactional Business Intelligence User to Access Person Data: Worked Example**

This example shows how to assign a security profile to a job or abstract role to enable users with that role to access person data. This task is required for users of Oracle Fusion Transactional Business Intelligence (Transactional Business Intelligence) who do not also use Oracle Fusion Human Capital Management (HCM).
The following table summarizes key decisions for this scenario. When performing this task, use the job or abstract role for your product and the name of the relevant predefined person security profile in place of those shown here.

<table>
<thead>
<tr>
<th>Decisions to Consider</th>
<th>In This Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>What is the name of the Transactional Business Intelligence job or abstract role?</td>
<td>Warehouse Manager</td>
</tr>
<tr>
<td>What is the name of the person security profile?</td>
<td>View All Workers</td>
</tr>
</tbody>
</table>

Summary of the Tasks

To perform these tasks, you must have the role IT Security Manager.

1. Launch the task Manage Data Role and Security Profiles.
2. Search for the job or abstract role.
3. Assign the relevant predefined security profile to the job or abstract role.

Launching the Task Manage Data Role and Security Profiles

1. On the Overview page of the Setup and Maintenance work area, click the All Tasks tab.
2. In the Search region, complete the fields as shown in this table:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Search</td>
<td>Tasks</td>
</tr>
<tr>
<td>Name</td>
<td>Manage Data Role and Security Profiles</td>
</tr>
</tbody>
</table>
3. Click Search.
4. In the search results, click Go to Task for the Manage Data Role and Security Profiles task.

Searching for the Job or Abstract Role

1. On the Manage HCM Data Roles page, enter the job name Warehouse Manager in the Role field.
2. Click Search.
3. In the search results, highlight the entry for the Warehouse Manager job role.
4. Click Assign.

Assigning the Security Profile to the Job Role

1. In the Person Security Profile field on the Assign Data Role: Security Criteria page, select the security profile View All Workers.
2. Click Review.
3. On the Assign Data Role: Review page, click Submit.
Define Extensions: Define Custom Enterprise Scheduler Jobs

Managing Job Definitions: Highlights

Oracle Enterprise Scheduler jobs are run in Oracle Fusion Applications to process data and, in some cases, to provide report output. A job definition contains the metadata that determines what the job does and what options are available to users who run the job. You can create and maintain job definitions for use in Oracle Fusion Applications.

Managing job definitions is described in the Oracle Fusion Applications Administrator's Guide and Oracle Fusion Applications Extensibility Guide for Developers. As you read content from these guides, note that the guides mention managing Oracle Enterprise Scheduler, including job definitions, from Oracle Enterprise Manager Fusion Applications Control. You can also access job definitions by starting in the Setup and Maintenance Overview page and searching for the Enterprise Scheduler job tasks for your applications.

Note
Oracle Enterprise Manager Fusion Applications Control is not available for Oracle Cloud implementations.

Selecting the Appropriate Implementation Task

Each Enterprise Scheduler job definition task uses one Java EE application, which is referenced in the task name. You must use the right task because, to access the product job definition that you want to view or work on, the view objects must be contained in the application. If you do not select the right task, then the job definition will not be displayed properly or function correctly. The application name is usually the same as the product that the job definition belongs to, but not always.

- For example, the Oracle Fusion Payables Java EE application contains the Oracle Fusion Expenses product view objects. To create or maintain a job definition for use in Expenses, you select the Manage Custom Enterprise Scheduler Jobs for Payables and Related Applications task.

- In another example, the Oracle Fusion Payments product view objects are contained in both Oracle Fusion Payables and Oracle Fusion Receivables Java EE applications. You need to select the task appropriate to the job definition for Payments. Use the Manage Custom Enterprise Scheduler Jobs for Receivables and Related Applications task if the job is for receivables functionality, or the Manage Custom Enterprise Scheduler Jobs for Payables and Related Applications task if the job is for payables functionality.

- Use the task description to see the products that correspond to the Java EE application specified in the task name. For example, the description for the Payables task lists Oracle Fusion Payables, Assets, Expenses, and Payments.

- You can view task descriptions in the help window for the task, if any, or in the generated setup task lists and tasks report from the Getting Started page.
• If you have access to the Manage Task Lists and Tasks page, you can also open the details for specific tasks to see the description.

• For general information about product and Java EE application relationships, use Oracle Enterprise Manager Fusion Applications Control (Fusion Applications Control).

See: Topology Section

**Viewing, Creating, and Editing Job Definitions**

• You can access predefined and custom job definitions. In the table on the Manage Job Definitions tab, the Name column displays an asterisk for predefined job definitions. Refer to the Oracle Fusion Applications Administrator's Guide.

See: Viewing Job Definitions

• You or a technical administrator can create jobs based on Java, PL/SQL, Oracle Business Intelligence (BI) Publisher, or any other supported technology. Every predefined or custom job must have a job definition. For Oracle Cloud implementations, custom job definitions can be created only for custom jobs based on Oracle BI Publisher reports. Refer to the Oracle Fusion Applications Administrator's Guide.

See: Creating a Job Definition

• If you are using the Setup and Maintenance work area, then the Enable submission from Enterprise Manager check box is available for the job definition.

  • If you do not select this check box, then the job cannot be run from Enterprise Manager.

  • If you select this check box, then you can define parameters for this job definition only in Enterprise Manager. Save the rest of your work on the job definition, and then go to Enterprise Manager if you need to define parameters.

• You can edit all aspects of custom job definitions. For predefined job definitions, you can’t update parameters, but you can determine if user properties are read-only or not. You can also edit certain aspects of predefined definitions, which are described as job properties in the Oracle Fusion Applications Extensibility Guide for Developers.

See: Customizing Existing Oracle Enterprise Scheduler Job Properties

**Managing List of Values Sources: Highlights**

A list of values source for Oracle Enterprise Scheduler job definitions determines where a list of values comes from and what the specific values are. These lists of values are used in parameters and application defined properties of job definitions. For example, you can use a source of country values for a Country job parameter.

---

**Note**
Since parameters for predefined job definitions cannot be edited, list of values sources are only for parameters in custom job definitions.

Managing list of values sources is fully described in the Oracle Fusion Applications Administrator’s Guide. As you read content from that guide, note that the guide describes managing Oracle Enterprise Scheduler, including list of values sources, from Oracle Enterprise Manager Fusion Applications Control. You can also access list of values sources by starting in the Setup and Maintenance Overview page and searching for Enterprise Scheduler job tasks.

**Registering and Searching for List of Values Sources**

- Create list of values sources to register them for use in job definitions.
  
  See: Registering Sources for Lists of Values

- Search for list of values sources to edit or delete, or to make sure a particular source does not already exist before you create it.

  See: Searching for List of Value Sources

### Contextual Addresses

**Setting Up the Mapping Service for Contextual Addresses: Points to Consider**

A contextual address is marked with an orange square contextual action icon that can be clicked to display the address on a map. Use the Mapping Service for Contextual Addresses profile option to specify the web mapping service to be used to display the map. In the Setup and Maintenance work area, go to the Manage Administrator Profile Values task to set the profile option value.

**Profile Option Default**

By default, the Mapping Service for Contextual Addresses profile option has no value. Until you enter a valid value for this profile option, users get an error when they try to open a map for any contextual address.

**Profile Option Value**

After you find and select the Use the Mapping Service for Contextual Addresses profile option, enter a mapping service URL in the Profile Value column, for example:

- `http://maps.yahoo.com/maps_result.php?q1=`
- `http://bing.com/maps/?v=2&encType=1&where1=`
Optionally, add parameters to the URL. For example, to avoid a locator box in Google Maps, add \&iwloc=& to the URL, so that you enter http://maps.google.com/maps?iwloc=&\&output=embed&q= as the profile value.

FAQ for Privacy Statement

How can I enable the privacy statement?

Use the Privacy Statement URL profile option to enable the Privacy Statement menu item in the global area. This menu item in the Settings and Actions menu is disabled by default.

Open the Setup and Maintenance work area, and use the Manage Applications Core Administrator Profile Values task to find the Privacy Statement URL profile option. In the Profile Value column, enter the full URL of the web page that contains the privacy content you want the menu item to link to.
Common Applications Configuration: Importing and Exporting Setup Data

Configuration Packages: Explained

Almost all Oracle Fusion application implementations require moving functional setup data from one instance into another at various points in the lifecycle of the applications. For example, one of the typical cases in any enterprise application implementation is to first implement in a development or test application instance and then deploy to a production application instance after thorough testing. You can move functional setup configurations of applications from one application instance into another by exporting and importing Configuration packages from the Manage Configuration Packages page.

A Configuration Package contains the setup import and export definition. The setup import and export definition is the list of setup tasks and their associated business objects that identifies the setup data for export as well as the data itself. When you create a configuration package only the setup export and import definition exists. Once you export the configuration package appropriate setup data is added to the configuration package using the definition. Once a configuration package is exported, the setup export and import definition is locked and cannot be changed.

You generate the setup export and import definition by selecting an implementation project and creating a configuration package. The tasks and their associated business objects in the selected implementation project define the setup export and import definition for the configuration package. In addition, the sequence of the tasks in the implementation project determine the export and import sequence.

Exporting and Importing Setup Data: Explained

A configuration package is required to export setup data. You can export a configuration package once you create it, or at any time in the future. During export, appropriate setup data will be identified based on the setup export definition and added to the configuration package. The setup data in the configuration package is a snapshot of the data in the source application instance at the time of export. After the export completes, you can download the
configuration package as a zipped archive of multiple XML files, move it to the target application instance, and upload and import it.

Export

You can export a configuration package multiple times by creating multiple versions. While the export definition remains the same in each version, the setup data can be different if you modified the data in the time period between the different runs of the export process. Since each version of the configuration package has a snapshot of the data in the source instance, you can compare and analyze various versions of the configuration package to see how the setup data changed.

Import

In the target application instance, the setup import process will insert all new data from the source configuration package that does not already exist and update any existing data with changes from the source. Setup data that exists in the target instance but not in source will remain unchanged.

Export and Import Reports

You can review the results of the export and import processes using reports. The results appear ordered by business objects and include information on any errors encountered during the export or import process. If a setup export or import process paused due to errors encountered or for a manual task to be performed outside of the application, then you can resume the paused process.

These reports show what setup data was exported or imported and by which specific process. You can change the reports to validate the setup data as well as to compare or analyze it. A report is generated for each business object. These reports show the same information as the export and import results seen directly in the application.

Process status details are available as text files showing the status of an export or import process including the errors encountered during the process.

Moving Common Reference Objects

Moving Common Reference Objects: Overview

The common reference objects in Oracle Middleware Extensions for Applications are used by several setup tasks in the Setup and Maintenance work area. The common reference objects become a part of the configuration package that is created for an implementation project. While moving the application content, for example, from the test phase to the production phase of an implementation, you must pay special attention to the nuances of these common reference objects.

Parameters

The common reference objects are represented as business objects. A single object can be referenced in multiple setup tasks with different parameters. In the configuration package that is created for the implementation project, parameters
passed to a setup task are also passed to the business objects being moved. As a result, the scope of the setup tasks is maintained intact during the movement.

**Dependencies**

Common reference objects may have internal references or dependencies among other common reference objects. Therefore, it is necessary that all the dependencies are noted before the movement of objects so that there are no broken references among the objects.

**Business Objects for Moving Common Reference Objects: Points to Consider**

Common reference objects in Oracle Fusion Functional Setup Manager are represented by business objects. These business objects are the agents that contain the application content and carry them across whenever the application setup is moved from one environment to another, for example, test environment to production environment.

**Choice of Parameters**

The following table lists the business objects, the corresponding movement details, and the effect of the setup task parameter on the scope of the movement.

**Note**

- Only the translation in the current user language is moved.
- The Oracle Social Network business objects and the Navigator menu customizations are moved using the customization sets on the Customization Migration page instead of using the export and import function in the Setup and Maintenance work area.

|                             |                         | TreeStructureCode/TreeCode: only trees belonging to the specified tree structure and tree code are moved.  
| Application Tree Label      | Tree structures and any labels assigned to the tree structure | No parameters: all tree structures (and their labels) are moved.  
|                             |                         | moduleType/moduleKey: only tree structures (and their labels) belonging to the specified module and its descendant modules in the taxonomy hierarchy are moved.  
|                             |                         | treeStructureCode: only the specified tree structure (with its labels) is moved.  
| Application Data Security Policy | Database resources, actions, conditions, and data security policies | No parameters: all database resources/actions/conditions/policies are moved.  
|                             |                         | moduleType/moduleKey: only database resources/actions/conditions/policies belonging to the specified module and its descendant modules in the taxonomy hierarchy are moved.  
|                             |                         | objName: only the specified database resource along with its actions/conditions/policies is moved.  
| Note                       |                         | • If the policies being moved contain reference to newly created roles, move the roles before moving the policies.  
|                             |                         | • If the source and target systems use different LDAPs, manually perform the GUID reconciliation after moving the data security policies.  
| Application Activity Stream Configuration | Activity stream options | No parameters: all activity stream options are moved.  
|                             |                         |  

Moving Related Common Reference Objects: Points to Consider

Certain common reference objects may use other common reference objects creating dependencies among the objects. During the movement of common reference objects, these dependencies or references need to be taken care of.

Dependencies

The dependencies among the common reference objects may be caused by any of the following conditions.

- Flexfield segments use value sets
- Value sets may make use of standard, common, or set-enabled lookups
- Key flexfields may have an associated tree structure and key flexfield segments may have an associated tree code
- Tree codes and versions may be defined over values of a value set
- Data security policies may be defined over values of a value set that have been enabled for data security

You may choose to move one, some, or all of the business objects by including the ones you want to move in your configuration package. For example, you may choose to move only value sets and not lookups, or you may choose to move both value sets and their lookups as part of the same package. Whatever be the combination, it is recommended that during the movement of objects, you follow an order that maintains the dependencies among the objects.

While moving the business objects, adhere to the guidelines and exactly follow the order as listed below.

1. Move created taxonomy modules before moving any objects that reference them, such as flexfields, lookups, profiles, attachments, reference data sets, document sequences, messages, and data security.
2. Move created currencies before moving any objects that reference them, such as territories.
3. Move created territories before moving any objects that reference them, such as languages and natural languages.
4. Move created ISO languages before moving any objects that reference them, such as languages, natural languages, and industries.
5. Move created tree structures before moving any objects that reference them, such as trees or tree labels.
6. Move created profile options before moving any objects that reference them, such as profile categories or profile values.
7. Move created attachment entities before moving any objects that reference them, such as attachment categories that reference them.

Note
In scenarios where there may be dependencies on other objects, you must move the dependencies before moving the referencing object. For example, if data security policies being moved have dependencies on newly created security roles, you must move the security roles before moving the security policies.

Using Seed Data Framework to Move Common Reference Objects: Points to Consider

To move the common reference objects, you can use the Seed Data Framework (SDF). You can also use the command line interface of SDF to move the object setup data. For more information about seed data loaders including common reference object loaders, see Oracle Fusion Applications Developer’s Guide.

Movement Dependencies

The seed data interface moves only the setup metadata. For example, if you use SDF to import flexfield metadata, the flexfield setup metadata is imported into your database. However, you must invoke the flexfield deployment process separately after seed data import to regenerate the runtime flexfield artifacts in the target environment. Similarly, if you use SDF to import data security metadata, you must first move any new referenced roles and then manually run the GUID reconciliation where required.

To ensure that the reference data is not lost during the movement, certain guidelines are prescribed. It is recommended that you perform the movement of object data exactly in the order given below.

**Note**

Only the translation in the current user language is moved.

1. Move created taxonomy modules before moving any objects that reference them, such as flexfields, lookups, profiles, attachments, reference data sets, document sequences, messages, and data security.
2. Move created currencies before moving any objects that reference them, such as territories.
3. Move created territories before moving any objects that reference them, such as languages and natural languages.
4. Move created ISO languages before moving any objects that reference them, such as languages, natural languages, and industries.
5. Move created tree structures before moving any objects that reference them, such as trees or tree labels.
6. Move created profile options before moving any objects that reference them, such as profile categories or profile values.
7. Move created attachment entities before moving any objects that reference them, such as attachment categories that reference them.
8. Move created reference data sets before moving any objects that reference them, such as reference data set assignments and set-enabled lookups.
9. Move created document sequence categories before moving any objects that reference them, such as document sequences.

10. Move created tree labels before moving any objects that reference them, such as trees.

11. Move created data security objects and policies before moving any objects that reference them, such as value sets.

12. Move created value sets before moving any objects that reference them, such as flexfields.

13. Move created trees before moving any objects that reference them, such as key flexfields.
Define Contracts Common Configuration

Specifying Customer Contract Management Business Function Properties

Contract Security Setup: Explained

The contract security model provides different levels of access to admin and non-admin users.

Contract security works as follows:

- You must be designated as a resource to be able to create or edit a contract.
- Only a resource or resource organization can be team members of a contract.

The list of business units (BU) that a user can access is determined based on the resource organization to which the user is mapped as a resource.

Users can be of two types: admin and non-admin users, whose access is as follows:

- Admin users can create or edit contracts in all the business units they are authorized to.
- Non-admin user access to the contracts is controlled by team membership as follows:
  - They can create contracts in all the business units they are authorized to.
  - They can also view and edit contracts of other business units provided they are team members in those contracts.
  - All the managers of the organization in the upward resource hierarchy of a team member will also be able to access the contract.
  - All the users below the hierarchy are also authorized to the contract.

The following table clearly illustrates the access scenario:
<table>
<thead>
<tr>
<th>Contract Privilege &gt; Role</th>
<th>Admin User</th>
<th>Non-admin User</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating a contract</td>
<td>Can create contracts in all the BUs that he/she is authorized to, based on resource/resource organization mapping.</td>
<td>Can create contracts in all the BUs that he/she is authorized to, based on resource/resource organization mapping.</td>
</tr>
<tr>
<td>Editing a contract</td>
<td>Can edit all the contracts of the BUs that he/she is authorized to.</td>
<td>Can edit all the contracts in which he/she is a team member.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Though a user is authorized to a BU, he/she may not be authorized to all contracts in that BU.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Note</td>
</tr>
<tr>
<td></td>
<td></td>
<td>You can access a contract even if you are not authorized to its BU provided you are a team member in the contract.</td>
</tr>
</tbody>
</table>

### Customer Contracts Business Unit Setup: Explained

Using the **Specify Customer Contract Management Business Function Properties** task, available by navigating to Setup and Maintenance work area and searching on the task name, you can specify a wide variety of business function settings for customer contracts in a specific business unit. The selections you make for these business functions impact how Oracle Fusion Enterprise Contracts behaves during contract authoring.

Using the **Specify Customer Contract Management Business Function Properties** task, manage these business function properties:

- Enable related accounts
- Set currency conversion details
- Manage project billing options
- Set up clause numbering
- Set up the Contract Terms Library

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

#### Enabling Related Customer Accounts

Contract authors can specify bill-to, ship-to, and other accounts for the parties in a contract. Enable the related customer accounts option if you want accounts previously specified as related to the contract party to be available for selection.
Managing Currency Conversion Options

If your organization plans to transact project-related business in multiple currencies, then select the multicurrency option. This allows a contract author to override a contract's currency, which defaults from the ledger currency of the business unit. It also enables the contract author to specify currency conversion attributes to use when converting from the bill transaction currency to the contract currency and from the invoice currency to the ledger currency.

In the Bill Transaction Currency to Contract Currency region, enter currency conversion details that will normally be used, by all contracts owned by this business unit, to convert transaction amounts in the bill transaction currency to the contract currency. Newly created contracts contain the default currency conversion values, but you can override the values on any contract, if needed.

In the Invoice Currency to Ledger Currency region:

- Enter invoice transaction conversion details if the invoice and ledger currencies can be different.
- Enter revenue transaction conversion details if the revenue and ledger currencies can be different for as-incurred and rate-based revenue.

Managing Project Billing Options

The options available for selection in the Project Billing region control the behavior of project invoicing and revenue recognition for contracts with project-based work.

Project billing can behave differently for external contracts (customer billing) or intercompany and interproject contracts (internal billing).

Set these options, which apply to all contracts:

- Select the Transfer Revenue to General Ledger option if you want to create revenue accounting events and entries, and transfer revenue journals to the general ledger. If this option is not selected, then revenue can still be generated, but will not be transferred to the general ledger.
- Indicate if a reason is required for credit memos that are applied to invoices.

There are two sets of the following options, one for customer billing and a second for internal billing:

- Select an invoice numbering method, either Manual or Automatic. The invoice numbering method is the method that Oracle Fusion Receivables uses to number its invoices, upon release of draft invoices from Project Billing.
  - If the invoice numbering method is Manual, then select an invoice number type, which sets the type of Receivables invoice numbers that are allowed. Valid values are Alphanumeric and Numeric.
  - If the invoice numbering method is Automatic, then enter the next invoice number to use when generating Receivables invoice numbers.
- Select the Receivables batch source to use when transferring invoices to Receivables.

Set this option only for customer billing:
• Indicate if you want contract authors to manually enter the Receivables transaction type on the customer contracts they create.

**Managing Clause Numbering**

You can choose to number clauses manually or automatically.

If you choose the automatic numbering method, you must select a determinant level for the numbering. You must then select the appropriate clause sequence category from document sequences that you set up for this numbering level.

**Specifying Supplier Contract Management Business Function Properties**

**Supplier Contracts Business Unit Setup: Explained**

Using the Specify Supplier Contract Management Business Function Properties task, available by selecting Setup and Maintenance from the Tools menu and searching on the task name, you can specify a variety of business function settings for supplier contracts in a specific business unit.

The selections you make for these business functions impact how the Contract Terms Library behaves during supplier contract authoring.

**Managing Contract Terms Library Setup Options**

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

**Defining Notes: Points to Consider**

A note is a record attached to a business object that is used to capture nonstandard information received while conducting business. When setting up notes for your application, you should consider the following points:

- Note Types
- Note Type Mappings

**Note Types**

Note types are assigned to notes at creation to categorize them for future reference. During setup you can add new note types, and you can restrict them by business object type through the process of note type mapping.

**Note Type Mappings**

After note types are added, you must map them to the business objects applicable to your product area. Select a business object other than Default Note
Types. You will see the note types only applicable to that object. If the list is empty, note type mapping doesn’t exist for that object, and default note types will be used. Select Default Note Types to view the default note types in the system. Modifying default note types will affect all business objects without a note type mapping. For example, you have decided to add a new note type of Analysis for your product area of Sales-Opportunity Management. Use the note type mapping functionality to map Analysis to the Opportunity business object. This will result in the Analysis note type being an available option when you are creating or editing a note for an opportunity. When deciding which note types to map to the business objects in your area, consider the same issues you considered when deciding to add new note types. Decide how you would like users to be able to search for, filter, and report on those notes.

Note
Extensibility features are available on the Note object. For more information refer to the article Extending Oracle Sales Cloud Applications: how it works.

Managing Contract Party Roles and Sources

Party roles provide a way for you to specify the roles of different parties in the contract. For example, a sales contract may include the customer, a partner, and the internal business unit selling the product and service. Your application comes with predefined party roles, but you can create additional roles and you can specify how the roles are used in sales, purchasing, and project contracts.

This topic:

- Lists the predefined party roles and explains how you can add your own.
- Explains how you make those party roles available for use in buy-intent and sell-intent contracts.

Managing Party Roles

The application comes with the following predefined party role names in the lookup type OKC_PARTY_ROLE. You can add additional lookup codes in the Setup and Maintenance work area by selecting the Manage Contract Party Roles task.

<table>
<thead>
<tr>
<th>Lookup Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>CUSTOMER</td>
<td>Customer</td>
</tr>
<tr>
<td>INTERCOMPANY</td>
<td>Internal party</td>
</tr>
<tr>
<td>PARTNER</td>
<td>Partner</td>
</tr>
<tr>
<td>SUPPLIER</td>
<td>Supplier</td>
</tr>
<tr>
<td>THIRD_PARTY</td>
<td>Third party</td>
</tr>
</tbody>
</table>
Making Party Roles Available for Use in Contracts

To make party roles available for use in contracts, you must:

1. Associate each party role to the appropriate party source by selecting the Manage Contract Roles Sources task in the Contracts work area.

2. While managing contract types using the Manage Contract Types task in the Setup and Maintenance work area, add each party role to the contract types where you want the party role to be used. You can add a party role either as one of the two primary contract parties (the Buyer Role and the Seller Role) or as a secondary party. You can only have one Seller Role and one Buyer Role in a contract. You can have multiple secondary parties with the same role.

The application includes the following party sources which you cannot modify:

<table>
<thead>
<tr>
<th>Party Source Code</th>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OKX_PARTY</td>
<td>Customer</td>
<td>Parties in the Trading Community Architecture (TCA) where the party usage is External Legal Entity.</td>
</tr>
<tr>
<td>OKX_OPERUNIT</td>
<td>Business Unit</td>
<td>Internal business units.</td>
</tr>
<tr>
<td>OKX_VENDOR</td>
<td>Supplier</td>
<td>Parties in TCA where the party usage is Supplier.</td>
</tr>
<tr>
<td>OKX_INT_COMP_PARTY</td>
<td>Internal party</td>
<td>Internal parties available for Oracle Fusion Projects interproject billing.</td>
</tr>
<tr>
<td>OKX_PARTNER</td>
<td>Partner</td>
<td>Partners. This source is reserved for Oracle Fusion Partner Relationship Management.</td>
</tr>
</tbody>
</table>

You can use the same party role for both buy-intent and sell-intent contracts by associating the party role to different sources. This figure shows how you can reuse the role Customer in both buy and sell contracts. The customer for sales contracts is a TCA party (Customer). The customer for buy contracts is an internal business unit.

To reuse the same party in buy and sell contracts, you:

1. Select the Customer party role in the Manage Contract Role Sources page.

2. Set the Sell Intent Source to Customer and the Buy Intent Source to Business Unit.

3. To use the party role in a contract, you must also enter it in contract types where you want to use it as one of the primary contact parties or as a secondary party.

The setup in this figure will have the following effect:

- When you create a sales contract, the Customer list of values lists external parties.
- When you create a purchasing contract, the Customer list of values lists business units.
Managing Party Contact Roles

Setting Up Party Contact Roles and Making Them Available for Use: Explained

Contact roles specify the roles party contacts play in the contract. Your application comes with a set of predefined contact roles, but you can set up additional contact roles for use with different parties in the contract.

This topic:
- Lists the predefined contact roles and explains how you can add your own.
- Explains how you associate the contact roles with party roles and contact role sources.

Managing Contact Roles

The application comes with the following predefined contact roles in the extensible lookup type OKC_PARTY_CONTACT_ROLE:

<table>
<thead>
<tr>
<th>Lookup Code</th>
<th>Meaning</th>
</tr>
</thead>
<tbody>
<tr>
<td>BUYER</td>
<td>Buyer</td>
</tr>
<tr>
<td>CONTRACT_ADMIN</td>
<td>Contract administrator</td>
</tr>
<tr>
<td>EMPLOYEE</td>
<td>Employee</td>
</tr>
</tbody>
</table>
You can add additional contact roles by selecting the Manage Contract Contact Roles task in the Setup and Maintenance work area.

**Making Contact Roles Available for Use in Contracts**

For a contact role to be available for use in contracts, you must navigate to the Manage Contract Role Sources page by selecting the Party Role and Contact Sources task in the Contracts work area and make the following entries for each of the party roles where you want the contact role to be available:

1. Select the party role.
2. Add the contact role.
3. Enter the sell-intent contact source or the buy-intent contact source or both. Which contact sources you can enter depends on the party source settings for the party role.

The following contact sources come predefined with the application in the system lookup type OKC_PARTY_CONTACT_SOURCE. You cannot edit the contract role sources or add additional ones.

<table>
<thead>
<tr>
<th>Lookup Code</th>
<th>Meaning</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OKX_PARTNER_CONTACT</td>
<td>Partner contact</td>
<td>Used exclusively for Oracle Fusion Partner Management contracts.</td>
</tr>
<tr>
<td>OKX_PCONTACT</td>
<td>Customer contact</td>
<td>Contacts of parties in the Trading Community Architecture (TCA) where the party usage is External Legal Entity.</td>
</tr>
<tr>
<td>OKX_RESOURCE</td>
<td>Resource</td>
<td>The internal resource</td>
</tr>
<tr>
<td>OKXRESOURCE_ORG</td>
<td>Resource organization</td>
<td>The internal resource organization</td>
</tr>
<tr>
<td>OKX_VCONTACT</td>
<td>Supplier contact</td>
<td>Contacts of parties in TCA where the party usage is Supplier.</td>
</tr>
</tbody>
</table>

The following figure illustrates the setup required to make a contact role available in both customer and supplier contracts:

1. The party role Customer is associated with both a sell intent and buy intent source. In a sales contract, a Customer party is a TCA party (party source Customer). In a buy-intent contract, the Customer is an internal business unit.
2. You make the contact role available in both customer and supplier contracts by specifying the **Sell Intent Source** as **Customer contact** and to the **Buy Intent Source** as **Resource or Resource organization**.
3. In sales contracts, customer contacts will now be TCA party contacts. In procurement contracts, customer contacts will be resources.
Managing Contract Types

Contract Types: Explained

A contract type is a contract category that contract authors must select when creating a contract. It is a mandatory setup that determines the nature of the contract. For example, this step determines if the contract is a project contract, a purchasing contract, or simple nondisclosure or employment agreement. A contract type also specifies what kind of information you can enter and what contract lines, parties, and party contacts are permitted.

The contract type also specifies if electronic signature is required for contract acceptance and activation and if yes, then the standard email format to be used for notifying signers. In turn, the requirement for electronic signature makes it necessary to designate contacts as signers on the contract and makes additional statuses and contract header actions available.

This topic provides an overview of the super set of contract type setups for a broad range of contracts. When setting up individual contract types, only a subset of the fields listed here are visible. For example, the project billing option entries are visible only in contract types with a sellintent, and the notifications fields appear only for contract types with a buy-intent.
Create contract types by selecting the **Manage Contract Types** action from the Setup and Maintenance work area. You can also create contract types in the Contracts work area by selecting **Contract Types** under the Setup task heading. In each contract type you can:

- Specify document numbering sequences for the category of global, ledger, legal entity or business unit level to enable automatic contract numbering on contracts.
- Specify if the contract includes lines and what can be entered into them.
- Specify if external item masters can be referenced.
- Require contract authors to manually capture customer acceptance after internal contract approval.
- If electronic acceptance is required, enable the contract for electronic signature integration.
- Specify what primary and secondary parties can be entered during contract creation.
- Specify if one or more contacts on the contract must be designated as signers for electronic signature acceptance.
- Specify the layout templates that will be used for printing the contract and the contract terms.
- Specify if and when the contract owner is notified before the contract expires.
- Specify the billing options for project contracts.
- Enable the capture of contract risks.
- Enable the ability to relate a contract to other contracts.
- Permit the authoring of contract terms using the Contract Terms Library.

### Common Contract Type Entries

The following table describes the common contract type entries:

<table>
<thead>
<tr>
<th>Field or Option</th>
<th>Description</th>
</tr>
</thead>
</table>
| Class           | Indicates the category of the contract you are authoring:  
  - Enterprise Contract: Used for authoring both buy and sell contracts where you are buying or selling items and services now. Examples of contracts of this class include contract purchase agreements, project contracts, and repository contracts.  
  - Partner Agreement: Used exclusively for Oracle Fusion Partner Management.  
  - Purchase Agreement: Used for negotiating a future purchase of goods and services.  
You cannot change the class after the contract type is created. |
| Set             | Determines the data security for contracts of this type. |
| Name            | The name contract authors select when authoring contracts. |
| Description     | Description that is visible only for administrators managing contract types. |
| Allow lines | Selecting this option makes it possible for you to specify what line types can be added to the contract. You cannot change the setting after the contract type is created. |
| Use external item master | Selecting this option lets you reference items from an external item source master.  
**Note**  
This option is available only for sell intent contracts if Allow lines option is available and selected. |
| Enable Automatic Numbering | Enables automatic numbering of contract lines during contract authoring. |
| Requires Signature | Determines if customer signature is required for contract acceptance before this type of contract can become active. After approval, the contract is set to the Pending Signature status and requires the signer or the contract author to enter the date of customer approval to make the contract active. |
| Enable Electronic Signature | Determines if designated signers must sign the contract before the contract becomes active. In this case, after approval the contract moves to the Pending Signature status and when the contract is sent for signature, the contract moves to the Sent for Signature status. |
| Contract Numbering Method, Contract Numbering Level, and Contract Sequence Category | Specifies if the contract number is entered manually by the contract author or generated automatically based on the numbering level and the document sequence category that you specify. |
| Intent | Contracts can have either a sell intent (project contracts and partner agreements) or buy intent (purchase contracts).  
You cannot change the intent after the contract type is created. |
| Buyer Role | The party role of the recipient of the goods and services in the contract. For a sales or a project contract, this is the role you set up for the customer. For a purchasing contract, it is the role you set up for the business units in your organization. You cannot edit the entry in this field after contract type creation. For sell-side contracts, the source of party role can be Customer, Internal Party or All Eligible Customers. |
| Seller Role | The party role of the party delivering the goods and services covered by the contract. For a sales or a project contract, this is the role you set up for one of the internal business units. For a purchasing contract, it is the role you set up for the supplier. You cannot edit this field after contract type creation. |
| Contract Owner Role | The contact role assigned to the owner of the contract. Contract ownership is automatically assigned to the employee who creates the contract. The owner is automatically assigned the role you specify here. |
Buyer Contact Role

The role you specify in this field specifies the role of the buyer that will be copied from the contract header to the contract fulfillment lines created for contract lines.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>This option is available for purchase contracts only:</td>
</tr>
</tbody>
</table>

Requester Contact Role

In purchase contracts only: The role of employee who will be used as the creator of a requisition in Oracle Fusion Purchasing.

<table>
<thead>
<tr>
<th>Contract Layout Template</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Oracle BI Publisher template that is used to print the entire contract.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>This option is not available if Use external item master is enabled.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Terms Layout Template</th>
</tr>
</thead>
<tbody>
<tr>
<td>The Oracle BI Publisher template used to print the contract terms.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>This option is not available if Use external item master is enabled.</td>
</tr>
</tbody>
</table>

Notify Before Expiration, Days to Expiration, and Contact Role to be Notified

Selecting this option sends a notification before contract expiration to the individual with the role specified in the Contact Role to Be Notified the number of days specified the Days to Expiration field.

<table>
<thead>
<tr>
<th>Note</th>
</tr>
</thead>
<tbody>
<tr>
<td>These options are not available if Use external item master is enabled.</td>
</tr>
</tbody>
</table>

### Line Types

You can enter the line types permitted by the class you selected for the contract type and only if you selected the Allow Lines option during the contract type creation. The following table describes the possible line types.

<table>
<thead>
<tr>
<th>Line Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buy agreement, free-form</td>
<td>Enables entry of items not tracked in inventory for purchasing. You can create master agreements in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>Buy agreement, item</td>
<td>Enables entry of inventory items for purchasing. You can create master agreements in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>Buy intent, free-form</td>
<td>Enables entry of items not tracked in inventory for purchasing. You can create purchase orders in the purchasing application from lines of this type.</td>
</tr>
</tbody>
</table>
Buy intent, item

Enables entry of inventory items for purchasing. You can create purchase orders in the purchasing application from lines of this type.

Sell intent, free-form, project-based

Enables entry of items not tracked in inventory and displays project-related tabs and fields in a contract. You can associate and bill the line to a project in Oracle Fusion Projects.

Sell intent, item, project-based

Enables entry of inventory items and displays project-related tabs and fields in a contract. You can associate and bill the line to a project in Oracle Fusion Projects.

If you enable Use external item master when creating a contract type, you can create only the following line types:

<table>
<thead>
<tr>
<th>Line Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sell Intent, Subscription</td>
<td>This line type applies to sell contracts and describes the sale of subscription items that are tracked in inventory.</td>
</tr>
<tr>
<td>Sell Intent, Bundle</td>
<td>This line type applies to sell contracts and describes the sale of bundled items tracked in inventory. Bundles can include other bundles or items.</td>
</tr>
</tbody>
</table>

Additional Party Roles

You can add party roles that contract authors can add to a contract in addition to the primary parties specified in the Buyer Role and Seller Role fields. A contract author can add multiple additional parties with the same role to the contract.

Project Billing Options

For contract types created for projects (sales-intent contract types of class Enterprise Contract and at least one project line type), you can set the following project billing options:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Intercompany</td>
<td>Enables project billing between internal organizations.</td>
</tr>
<tr>
<td>Interproject</td>
<td>Enables billing to other projects.</td>
</tr>
<tr>
<td>Enable Billing Controls and Billing Limit Type</td>
<td>Enables billing controls for each contract line, making it possible for you to specify a hard limit or a soft limit as the Billing Limit Type. A soft limit warns you if the billing limit is reached. A hard limit prevents you from billing above the limit.</td>
</tr>
</tbody>
</table>

Enabling Contract Fulfillment Notifications for Purchase Contracts

For purchase contracts, you can use the Notifications tab to specify what contract fulfillment notifications will be sent to what contact role. Available notifications are slightly different for each type of contract:
For contracts with purchase order fulfillment lines, you can notify contacts with a specific role:

- A specified number of days before or after the fulfillment due date
- When a purchase order is created from a fulfillment line
- When a purchase order cannot be created from a fulfillment line
- When a fulfillment line is placed on hold
- When purchasing activity is complete on a fulfillment

For contracts with blanket purchase agreement fulfillment lines or contract purchase agreement fulfillment lines, you can notify:

- When an agreement is created from a fulfillment line
- When an agreement cannot be created from a fulfillment line
- When purchasing activity is complete on a fulfillment
- When an agreement is placed on hold
- A specified number of days before or after the agreement end date

**Enabling Contract Terms Authoring and Other Advanced Options**

If you do not enable Use external item master, you can enable contract terms authoring and other advanced contract terms authoring options on the Advanced Authoring Options tab.

**Note**

If you enable Use external item master, the Advanced Authoring Options tab is not available but Related Contracts option is automatically enabled.

The advanced authoring options are described in the following table:

<table>
<thead>
<tr>
<th>Option</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable Terms Authoring</td>
<td>Displays the Contract Terms tab in contracts and enables contract terms authoring using contract terms templates from the Contract Terms Library. You must set up the content of the library from the Terms Library work area before you can take advantage of this feature.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong></td>
</tr>
<tr>
<td></td>
<td>When this option is disabled, contract authors can attach contract terms along with other supporting documents.</td>
</tr>
<tr>
<td>Enable Risk Management</td>
<td>Enables the entry of contract risks.</td>
</tr>
<tr>
<td></td>
<td>You must set up contract risks selecting the <strong>Manage Contracts Risks</strong> task in Oracle Fusion Functional Setup Manager.</td>
</tr>
</tbody>
</table>
**Enable Related Contracts**

| Makes it possible for contract authors to relate contracts to each other. |

**Enabling Customer E-Signature**

For a contract created from a contract type enabled for electronic signature, the contract must be signed by all designated signers on the contract before the contract can become active.

Before enabling a contract type for electronic signature, you must have used the Manage Electronic Signature setup task to set up contract user accounts with the electronic signature solution provider.

You can then select the predefined terms layout template appended with signature tags as the default template for the contract type and enable the contract for signature. In the e-Signature tab, you can further enable the contract type for electronic signature and optionally create the standard email to be used when sending the contract document to signers and recipients during the integrated electronic signature process.

On the contract that you create from a contract type enabled for electronic signature, you must designate one or more contacts on the contract as signers. Only the user with edit privileges on the contract can manage the signature process. This includes sending the contract for signature, editing the contract and sending it out again, withdrawing the contract from the signature process, and cancelling the contract sent for signature.

**Contract Line Types: Explained**

Using the Manage Contract Line Types task, you can rename the types of lines available for selection when you create contract types. This optional implementation task is available by selecting Setup and Maintenance from the Tools menu and searching on the task name.

**Line Types**

Line types are names you give to the contract lines.

You must associate each line type name with one of the fixed set of predefined line sources. A line source defines what item you can enter in a contract line and enables functionality of one of the integrated applications to that line. For example, project line sources expose Oracle Fusion Projects fields in contracts and make it possible for contract authors to relate lines to projects. Buy sources make it possible to create contract deliverables for the line and use those contract deliverables to create and manage purchase orders and purchase agreements in Oracle Fusion Purchasing or other integrated purchasing systems.

The application already includes a full set of predefined line type names for all of the available line sources. You can create additional names for use in different contract types, if desired.
The predefined line types names are the same as the names of the lines sources they are associated with.

**Line Sources**

The application includes the following predefined line sources. These line sources cannot be modified or extended.

If you do not enable the Use external item master option, you can create the following line sources only:

<table>
<thead>
<tr>
<th>Line Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buy agreement, free-form</td>
<td>Enables entry of items not tracked in inventory. You can create master agreements in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>By agreement, item</td>
<td>Enables entry of inventory items. You can create master agreements in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>Buy intent, free-form</td>
<td>Enables entry of items not tracked in inventory. You can create purchase orders in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>Buy intent, item</td>
<td>Enables entry of inventory items. You can create purchase orders in the purchasing application from lines of this type.</td>
</tr>
<tr>
<td>Sell intent, free-form, project-based</td>
<td>Enables entry of items not tracked in inventory. You can associate and bill the line to a project in Oracle Fusion Projects.</td>
</tr>
<tr>
<td>Sell intent, item, project-based</td>
<td>Enables entry of inventory items. You can associate and bill the line to a project in Oracle Fusion Projects.</td>
</tr>
</tbody>
</table>

If you enable Use external item master, you can create the following line sources only:

<table>
<thead>
<tr>
<th>Line Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Sell Intent, Subscription</td>
<td>This line type applies to sell contracts and describes the sale of subscription items that are tracked in inventory.</td>
</tr>
<tr>
<td>Sell Intent, Bundle</td>
<td>This line type applies to sell contracts and describes the sale of bundled items tracked in inventory. Bundles can include other bundles or items.</td>
</tr>
</tbody>
</table>
Recording contract risks helps your organization prepare for potential problems. It does not affect contract processing.

Note

Risk names must be unique.

Enabling Different Levels of Contract Terms Editing During Contract Authoring: Explained

The level of editing a contract author can perform on contract terms depends on the privileges granted to them during security setup. This topic describes the different levels of editing privileges that system administrators can assign a contract author from the basic to the most advanced.

Privilege Levels and What They Permit

The following table lists the privileges which grant different levels of editing abilities from the basic to the most advanced. Each privilege adds additional authoring capabilities to the privileges before it, but the privileges are not cumulative. The contract author must also be granted all of the privileges below the level they need. For example, a contract author with a level 3 privilege must be granted the level 1 and level 2 privileges as well.

<table>
<thead>
<tr>
<th>Level</th>
<th>Privilege</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Author Standard Contract Terms and Conditions</td>
<td>Restricts contract authoring to applying contract terms templates, validating the contract, and running Contract Expert when required. It includes the ability to change the template or attach the contact terms as a file.</td>
</tr>
<tr>
<td>2</td>
<td>Author Additional Standard Contract Terms and Conditions</td>
<td>Adds the ability to add, delete, and move the standard clauses and sections after the contract terms template is applied. This includes the ability to select alternate clauses.</td>
</tr>
<tr>
<td>3</td>
<td>Author Nonstandard Contract Terms and Conditions</td>
<td>Allows authoring of nonstandard terms and conditions in the contract. This includes editing standard clauses, creating nonstandard clauses, removing contract terms, and importing edits made offline in Microsoft Word.</td>
</tr>
<tr>
<td>4</td>
<td>Override Contract Terms and Conditions Controls</td>
<td>Adds the ability to edit protected clauses and delete mandatory clauses and sections in contract terms.</td>
</tr>
</tbody>
</table>
Setting Up Contract Text Search: Highlights

If you have implemented the Oracle Enterprise Crawl and Search Framework, you can enable text searches of contracts and their attachments from within the contracts application by running the following indexing schedules:

<table>
<thead>
<tr>
<th>Indexing Schedule Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Contracts</td>
<td>Indexes and enables text search on contracts created in Oracle Fusion Contracts.</td>
</tr>
<tr>
<td>Purchasing Contracts</td>
<td>Indexes and enables text search in the POs and agreements within Oracle Fusion Purchasing.</td>
</tr>
<tr>
<td>Sourcing Contracts</td>
<td>Indexes and enables text search in the RFI and other negotiation documents in Oracle Fusion Sourcing.</td>
</tr>
<tr>
<td>Contract Documents</td>
<td>Indexes and enables text search in documents attached to Oracle Fusion Contracts.</td>
</tr>
<tr>
<td>Purchasing Contract Documents</td>
<td>Indexes and enables text search in documents attached to Oracle Fusion Purchasing POs and agreements.</td>
</tr>
<tr>
<td>Sourcing Contract Documents</td>
<td>Indexes and enables text search in the documents attached to Oracle Fusion Sourcing RFI and other negotiation documents.</td>
</tr>
</tbody>
</table>

Running Indexing Schedules

The management of indexing schedules is fully described in the Managing Search with Oracle Enterprise Crawl and Search Framework chapter in the Oracle Fusion Applications Administrator’s Guide.

- Deploying and starting indexing schedules.

See: Managing Index Schedules
Define AutoInvoice Line Ordering Rules

Line Ordering Rule Transaction Attributes: Explained

AutoInvoice uses line ordering rules to determine how to order and number each line after your transactions have been grouped into invoices, debit memos and credit memos. You can specify a line ordering rule for each grouping rule.

Transaction Attributes

Oracle Fusion Receivables provides the following transaction attributes from the RA_INTERFACE_LINES_ALL table that you can use for AutoInvoice line ordering rules:

- ACCOUNTING_RULE_DURATION
- ACCOUNTING_RULE_ID
- ACCOUNTING_RULE_NAME
- AMOUNT
- ATTRIBUTE_CATEGORY
- ATTRIBUTE1-15
- FOB_POINT
- INTERFACE_LINE_ATTRIBUTE1-15
- INTERFACE_LINE_CONTEXT
- ORIG_SYSTEM_SHIP_ADDRESS_ID
- QUANTITY
• QUANTITY_ORDERED
• REASON_CODE
• REASON_CODE_MEANING
• REFERENCE_LINE_ATTRIBUTE1-15
• REFERENCE_LINE_CONTEXT
• REFERENCE_LINE_ID
• SALES_ORDER
• SALES_ORDER_DATE
• SALES_ORDER_LINE
• SALES_ORDER_SOURCE
• SHIP_DATE_ACTUAL
• SHIP_VIA
• TAX_CODE
• UNIT_SELLING_PRICE
• UNIT_STANDARD_PRICE
• UOM_CODE
• UOM_NAME
• WAYBILL_NUMBER

Define AutoInvoice Line Grouping Rules

Mandatory and Optional Grouping Rule Attributes: Explained

AutoInvoice grouping rules contain transaction attributes that must be identical for all items on the same transaction. For example, transaction number (TRX_NUMBER) is a mandatory attribute of all grouping rules. If you have two records in the interface tables with different transaction numbers, AutoInvoice creates separate transactions for each record.

Oracle Fusion Receivables provides both mandatory and optional transaction attributes for imported transactions. You cannot delete a mandatory attribute from any grouping rule, but you can add optional attributes to the mandatory attributes to create a new grouping rule.
Mandatory Transaction Attributes

Receivables provides the following mandatory transaction attributes from the RA_INTERFACE_LINES_ALL table that must apply to all transactions created using AutoInvoice grouping rules:

- COMMENTS
- CONS_BILLING_NUMBER
- CONVERSION_DATE
- CONVERSION_RATE
- CONVERSION_TYPE
- CREDIT_METHOD_FOR_ACCT_RULE
- CREDIT_METHOD_FOR_INSTALLMENTS
- CURRENCY_CODE
- CUSTOMER_BANK_ACCOUNT_ID
- CUST_TRX_TYPE_ID
- DOCUMENT_NUMBER
- DOCUMENT_NUMBER_SEQUENCE_ID
- GL_DATE
- HEADER_ATTRIBUTE1-15
- HEADER_ATTRIBUTE_CATEGORY
- HEADER_GDF_ATTRIBUTE1-30
- INITIAL_CUSTOMER_TRX_ID
- INTERNAL_NOTES
- INVOICING_RULE_ID
- ORIG_SYSTEM_BILL_ADDRESS_ID
- ORIG_SYSTEM_BILL_CONTACT_ID
- ORIG_SYSTEM_BILL_CUSTOMER_ID
- ORIG_SYSTEM_SHIP_CONTACT_ID
- ORIG_SYSTEM_SHIP_CUSTOMER_ID
- ORIG_SYSTEM_SOLD_CUSTOMER_ID
- ORIG_SYSTEM_BATCH_NAME
- PAYMENT_SERVER_ORDER_ID
- PAYMENT_SET_ID
- PREVIOUS_CUSTOMER_TRX_ID
• PRIMARY_SALESREP_ID
• PRINTING_OPTION
• PURCHASE_ORDER
• PURCHASE_ORDER_DATE
• PURCHASE_ORDER_REVISION
• REASON_CODE
• RECEIPT_METHOD_ID
• RELATED_CUSTOMER_TRX_ID
• SET_OF_BOOKS_ID
• TERM_ID
• TERRITORY_ID
• TRX_DATE
• TRX_NUMBER

Optional Transaction Attributes

Receivables provides the following optional transaction attributes from the RA_INTERFACE_LINES_ALL table that you assign to transaction classes within an AutoInvoice grouping rule:

• ACCOUNTING_RULE_DURATION
• ACCOUNTING_RULE_ID
• ATTRIBUTE1-15
• ATTRIBUTE_CATEGORY
• INTERFACE_LINE_ATTRIBUTE1-15
• INTERFACE_LINE_CONTEXT
• INVENTORY_ITEM_ID
• REFERENCE_LINE_ID
• RULE_START_DATE
• SALES_ORDER
• SALES_ORDER_DATE
• SALES_ORDER_LINE
• SALES_ORDER_REVISION
• SALES_ORDER_SOURCE
• TAX_CODE
• TAX_RATE
Define AutoAccounting

AutoAccounting Account Types and Segment Values

Define AutoAccounting to specify how to determine the default general ledger accounts for transactions that you enter manually or import using AutoInvoice. You must define AutoAccounting before you can enter transactions in Oracle Fusion Receivables. When you enter transactions, you can override the default general ledger accounts that AutoAccounting creates.

Account Types

Define an AutoAccounting record for each type of account. You can then assign either a table name or constant value to each segment of the account.

AutoInvoice Clearing

The clearing account for imported transactions. Receivables uses the clearing account to hold any difference between the specified revenue amount and the selling price times the quantity for imported invoice lines. Receivables only uses the clearing account if you have enabled this option on the transaction source used for imported transactions.

Freight

The freight account for transactions.

Receivable

The receivable account for transactions.

Revenue

The revenue and late charges account for transactions.

Tax

The tax account for transactions.

Unbilled Receivable

The unbilled receivable account for transaction. Receivables uses this account when the transaction uses the In Arrears invoicing rule. If the revenue scheduling rule on the transaction recognizes revenue before the invoicing rule bills it, Receivables uses this account.

Unearned Revenue

The unearned revenue account for transactions. Receivables uses this account when a transaction uses the In Advance invoicing rule. If the revenue scheduling rule on the transaction recognizes revenue after the invoicing rule bills it, Receivables uses this account.
Table Names

Enter either the table name or constant value that you want Receivables to use to retrieve information for each accounting flexfield segment of a given account.

Enter a constant value instead of a table name if you want AutoAccounting to always use the same value for a given segment. You must ensure that you enter information that is valid for this segment. For example, if you defined your Company segment as a two-character segment with valid values ranging from 00 to 10, you must enter a two-character value within this range.

Bill-to Site

Use the bill-to site of the transaction to determine this segment of revenue, freight, receivable, AutoInvoice clearing, tax, unbilled receivable, and unearned revenue accounts.

Salesperson

Use the salesperson table to determine this segment of revenue, freight, receivable, AutoInvoice clearing, tax, unbilled receivable, and unearned revenue accounts.

If you select this option for AutoInvoice clearing, tax, or unearned revenue accounts, Receivables uses the revenue account associated with the salesperson on the transaction. If you select this option for the unbilled receivable account, Receivables uses the receivable account associated with the salesperson on the transaction.

If the transaction has a line type of Line with an inventory item of Freight, AutoAccounting uses the revenue scheduling rules for the freight account rather than the revenue account.

Standard Lines

Use the memo line or inventory item on the transaction to determine this segment of revenue, AutoInvoice clearing, freight, tax, unbilled receivable, and unearned revenue accounts.

If you select this option for AutoInvoice clearing, freight, tax, unbilled receivable or unearned revenue accounts, Receivables uses the revenue account associated to the memo line item or inventory item.

If the transaction has a line type of Line with an inventory item of Freight, AutoAccounting uses the revenue scheduling rules for the freight account rather than the revenue account.

Tax

Use the tax account assigned to the tax rate codes on the transaction.

Transaction Types

Use the transaction types table to determine this segment of revenue, freight, receivable, AutoInvoice clearing, tax, unbilled receivable, and unearned revenue accounts.

If the transaction has a line type of Line with an inventory item of Freight, AutoAccounting uses the revenue scheduling rules for the freight account rather than the revenue account.
Define Transaction Types

Recording Posted and Non-Posted Activities using Transaction Types: Critical Choices

Use the Open Receivable and Post to GL options on the transaction type to manage posted and non-posted activities on transactions.

If the Open Receivable option is enabled, Oracle Fusion Receivables updates your customer balances each time you create a complete debit memo, credit memo, chargeback, or on-account credit with this transaction type. Receivables also includes these transactions in the standard aging and collection processes.

If the Post to GL option is enabled, Receivables posts transactions with this transaction type to general ledger. If this option is not enabled, then no accounting is generated for transactions with this transaction type.

Considerations for defining transaction types include:

- Creating a Void Transaction Type
- Updating Customer Accounts and Aging
- Updating Accounting Only

Creating a Void Transaction Type

You can void a debit memo, credit memo, on-account credit or invoice by defining a Void transaction type. When you define a Void transaction type, set the Open Receivable and Post to GL options to No. Then, as long as there is no activity against the transaction, and it has not been posted to general ledger, you can make the transaction invalid by changing the transaction type to Void.

This activity is not included on the Review Customer Account Details page since the activity does not modify the customer balance.

Updating Customer Accounts and Aging

If you set the Open Receivable option to Yes and Post to GL option to No, Receivables updates customer accounts with the transaction activity of transactions assigned this transaction type. Receivables also includes these transaction in aging reports. There is no effect on accounting.

Use transaction types with these settings during your initial implementation, where the transaction amount is included in the general ledger beginning balance for the receivable account, but activity still needs to be aged and payment collected against it. All related activities against the transaction, such as credit memos, payments, and adjustments, are accounted as affecting the customer balance. You can review these activities on the Review Customer Account Details page.
**Updating Accounting Only**

If you set the **Open Receivable** option to No and **Post to GL** option to Yes, Receivables updates accounting without any impact on the customer balance.

Use transaction types with these settings when you want to adjust accounting activity, such as when you rebill a customer in order to reclassify the general ledger account. A credit memo and invoice with the **Open Receivable** option set to No are created where the credit memo reverses the general ledger account of the original invoice, and the invoice creates accounting with the new general ledger account. This activity is transparent to the customer because the original invoice is used for the cash application when payment is received.

This activity is not included on the Review Customer Account Details page since the activity does not modify the customer balance.

**Define Transaction Sources**

**Managing Transaction Numbering: Points to Consider**

Use the various options on the transaction source assigned to a transaction to manage your transaction numbering requirements.

There are these points to consider when defining transaction numbering for transactions assigned to specific transaction sources:

- Defining Document Sequences
- Using Automatic Transaction Numbering
- Copying Document Numbers to Transaction Numbers
- Allowing Duplicate Transaction Numbers
- Using the Credit Memo Transaction Source

**Defining Document Sequences**

If necessary, define document sequences to assign unique numbers to each transaction, in addition to the transaction number automatically assigned by Oracle Fusion Receivables.

**Using Automatic Transaction Numbering**

To automatically number new transactions you create using a transaction source, enable the **Automatic transaction numbering** option and enter a number in the **Last Number** field.
For example, to start numbering transactions with 1000, enter a last number of 999. Receivables automatically updates the Last Number fields on transaction sources, so you can review the transaction source later to see the last transaction number that was generated.

**Note**

The last transaction number on the transaction source is an approximation only, due to caching.

You can use automatic transaction numbering with both Imported and Manual transaction sources.

**Copying Document Number to Transaction Number**

If you are using document sequences and you want to use the same value for both the document number and the transaction number for transactions assigned to a transaction source, enable the Copy document number to transaction number option.

If you are using Gapless document sequences, you should enable this option if you require gapless transaction numbering. This ensures that transaction numbers are generated sequentially and that there are no missing numbers.

**Allowing Duplicate Transaction Numbers**

Enable the Allow duplicate transaction numbers option to allow duplicate transaction numbers within a transaction source.

You cannot use this option with automatic transaction numbering.

**Using the Credit Memo Transaction Source**

Assign a credit memo transaction source to an invoice transaction source, if you want to number credit memos differently from the invoices that they credit.

---

**Define Salesperson Reference Accounts**

**What are salesperson reference accounts?**

Assign general ledger accounts to your salespersons. When AutoAccounting depends on salesperson, Oracle Fusion Receivables uses the account references that you define here to derive the accounts to use on transactions that are assigned a particular salesperson.
Define Remit-to Addresses

How can I use remit-to addresses?

The remit-to address lets your customers know where to send payment for their open debit items. After you create a remit-to address, you can assign it to the bill-to addresses of the customers and customer sites that you designate by country and, if applicable, by region and postal code range.

If the Print remit-to address system option is enabled, Oracle Fusion Receivables prints the remit-to address on the related dunning letters and statements.

Specify Customer Contract Management Business Function Properties

Bill Plan and Revenue Plan Components: How They Work Together

Bill plans and revenue plans provide you with the ability to create a consolidated set of billing attributes that can be shared across contract lines within a contract. Create bill plans and revenue plans within a contract, and associate them to one or more contract lines.

Configure the regions of a bill plan and revenue plan according to your invoicing and revenue recognition requirements. The regions are:

- Hold option
- Invoice or Revenue Method Name
- General Information
- Billing Extensions
- Schedules and Overrides

Hold Option

Enable the hold option to prevent transactions associated with contract lines using the bill plan or revenue plan from being included in invoice or revenue generation.

Invoice or Revenue Method

Determine how you want to invoice or recognize revenue for the contract lines that use the bill plan or revenue plan. Select the invoice method or revenue method that has a method classification with the invoicing or revenue recognition instructions that meet your requirements.
**General Information**

Define customer information, invoicing instructions and invoice summarization options for the bill plan. Select the associated contract lines for the bill plan or revenue plan.

The following table explains the options.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Customer Information</td>
<td>The invoice customer, site, and contact person that receives the invoice for project-related work on contract lines that use the bill plan.</td>
</tr>
<tr>
<td>Invoice Information</td>
<td>Instructions for the billing currency, billing cycle, payment terms, billing offset days, and the bill set number for the invoices. Enter any specific comments that you want to appear on the customer invoice. Also enter any instructions for the billing administrator to follow during invoice preparation.</td>
</tr>
<tr>
<td>Invoice Summarization Options</td>
<td>Select the labor, nonlabor, and event formats that group transactions on invoice lines.</td>
</tr>
<tr>
<td>Associated Contract Lines</td>
<td>Select the contract lines that you want to use the bill plan or revenue plan. Each bill plan or revenue plan can be associated with multiple contract lines within a contract. However, a contract line can only be linked to one bill plan or revenue plan.</td>
</tr>
</tbody>
</table>

**Note**

Associate contract lines to the bill plan or revenue plan when the contract is in Draft status. After the contract is approved, you must place the contract under amendment to change or add contract lines.

**Billing Extensions**

Optionally, add a billing extension to calculate the invoice or revenue event amounts for contract lines using the bill plan or revenue plan. If the invoice or revenue method uses a billing extension, it is automatically copied onto the bill plan or revenue plan.

The billing extension status must be Active for the invoice or revenue generation process to call the billing extension.

**Important**

Select whether you want the billing extension to calculate an event for either the Associated Project or the Contract Line. If you select Contract Line, the event amount will be for all projects associated with a contract line.

**Schedules and Overrides**

Select the labor and nonlabor schedules that determine the origin of the standard bill rates, burdening, or transfer prices for contract lines associated with the bill plan. Enter any applicable discount information for standard bill rate schedules.
Optionally, enter any overrides or multipliers that will take precedence over the standard bill rate schedules, if applicable.

**Note**

Schedules and overrides are only available for bill plans and revenue plans that use a rate-based invoice or revenue method classification.

### Contract Components for Internal Billing: How They Work Together

To use intercompany billing or interproject billing, your implementation team must configure a number of distinct features within Oracle Fusion Enterprise Contracts. These features work in cohesion with financial and project features to create internal invoices and transfer revenue between organizations.

#### Contract Type for Intercompany Billing

Select the intercompany billing option on a contract type to identify a contract as enabled for intercompany billing. This option permits editing of the internal billing options of contracts of that contract type. These internal billing options include the attributes required to create the intercompany payables invoice such as expenditure type, expenditure organization, receiver project, receiver task, and the provider business unit.

#### Contract Type for Interproject Billing

Select the interproject billing option on a contract type to identify a contract as enabled for interproject billing. This option permits editing of the internal billing options of contracts of that contract type. These internal billing options include the attributes required to create the interproject payables invoice such as expenditure type, expenditure organization, receiver project, and the receiver task.

#### Contract Business Unit Internal Billing Options

Review and update the customer contract management business function options to control the processing of interproject billing. This table lists the internal billing options that must be defined for the contract business unit.

<table>
<thead>
<tr>
<th>Feature Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Invoice Numbering Method</td>
<td>• If you want to enter invoice numbers manually, select the manual option and either the alphanumeric or numeric invoice number type.</td>
</tr>
<tr>
<td></td>
<td>• If you want the application to create invoice numbers automatically, select the automatic option, and enter a starting invoice number.</td>
</tr>
<tr>
<td>Invoice Batch Source</td>
<td>Specify the invoice batch source for the interproject contract invoices that are transferred to Oracle Fusion Receivables.</td>
</tr>
</tbody>
</table>
Contract Line and Receiver Project

After you create an internal contract, link a contract line to the receiver project and task. This allows for the cross-charge transactions that are charged to the project and task to be billed from the provider business unit to the receiver business unit.

By default, the receiver project is also the associated project for the contract line, and you cannot add another associated project or change the associated project for that contract line. However, the associated task and receiver task can be different, so you can select another associated task for the project if necessary.

The receiver project must have the same legal entity as the internal customer.

Note

Only one receiver project can be linked to a contract line. The intercompany invoice generation process automatically groups invoice lines by the contract lines. Interproject invoices have a fixed format.

Customer Contracts Business Unit Setup: Explained

Using the Specify Customer Contract Management Business Function Properties task, available by navigating to Setup and Maintenance work area and searching on the task name, you can specify a wide variety of business function settings for customer contracts in a specific business unit. The selections you make for these business functions impact how Oracle Fusion Enterprise Contracts behaves during contract authoring.

Using the Specify Customer Contract Management Business Function Properties task, manage these business function properties:

- Enable related accounts
- Set currency conversion details
- Manage project billing options
- Set up clause numbering
- Set up the Contract Terms Library

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

Enabling Related Customer Accounts

Contract authors can specify bill-to, ship-to, and other accounts for the parties in a contract. Enable the related customer accounts option if you want accounts previously specified as related to the contract party to be available for selection.

Managing Currency Conversion Options

If your organization plans to transact project-related business in multiple currencies, then select the multicurrency option. This allows a contract author
to override a contract's currency, which defaults from the ledger currency of the business unit. It also enables the contract author to specify currency conversion attributes to use when converting from the bill transaction currency to the contract currency and from the invoice currency to the ledger currency.

In the Bill Transaction Currency to Contract Currency region, enter currency conversion details that will normally be used, by all contracts owned by this business unit, to convert transaction amounts in the bill transaction currency to the contract currency. Newly created contracts contain the default currency conversion values, but you can override the values on any contract, if needed.

In the Invoice Currency to Ledger Currency region:

- Enter invoice transaction conversion details if the invoice and ledger currencies can be different.
- Enter revenue transaction conversion details if the revenue and ledger currencies can be different for as-incurred and rate-based revenue.

**Managing Project Billing Options**

The options available for selection in the Project Billing region control the behavior of project invoicing and revenue recognition for contracts with project-based work.

Project billing can behave differently for external contracts (customer billing) or intercompany and interproject contracts (internal billing).

Set these options, which apply to all contracts:

- Select the **Transfer Revenue to General Ledger** option if you want to create revenue accounting events and entries, and transfer revenue journals to the general ledger. If this option is not selected, then revenue can still be generated, but will not be transferred to the general ledger.
- Indicate if a reason is required for credit memos that are applied to invoices.

There are two sets of the following options, one for customer billing and a second for internal billing:

- Select an invoice numbering method, either **Manual** or **Automatic**. The invoice numbering method is the method that Oracle Fusion Receivables uses to number its invoices, upon release of draft invoices from Project Billing.
  - If the invoice numbering method is **Manual**, then select an invoice number type, which sets the type of Receivables invoice numbers that are allowed. Valid values are **Alphanumeric** and **Numeric**.
  - If the invoice numbering method is **Automatic**, then enter the next invoice number to use when generating Receivables invoice numbers.
- Select the Receivables batch source to use when transferring invoices to Receivables.

Set this option only for customer billing:

- Indicate if you want contract authors to manually enter the Receivables transaction type on the customer contracts they create.
Managing Clause Numbering

You can choose to number clauses manually or automatically.

If you choose the automatic numbering method, you must select a determinant level for the numbering. You must then select the appropriate clause sequence category from document sequences that you set up for this numbering level.

Contract Terms Library Business Unit Setup: Explained

You can specify a wide variety of Contract Terms Library settings for either customer or supplier contracts within each business unit, by using either the Specify Customer Contract Management Business Function Properties or the Specify Supplier Contract Management Business Function Properties tasks. These tasks are available by navigating to the Setup and Maintenance work area and searching on the task name.

For the Contract Terms Library in each business unit, you can:

- Enable clause and template adoption.
- Set the clause numbering method.
- Set the clause numbering level for automatic clause numbering of contracts.
- For a contract with no assigned ledger or legal entity, set the document sequence to Global or Business Unit level.
- Enable the Contract Expert feature.
- Specify the layout for printed clauses and contract deviation reports.

Enabling Clause Adoption

If you plan to use clause adoption in your implementation, then set up the following:

- Specify a global business unit
  
  You must designate one of the business units in your organization as the global business unit by selecting the Global Business Unit option. This makes it possible for the other local business units to adopt and use approved content from that global business unit. If the Global Business Unit option is not available for the business unit you are setting up, this means that you already designated another business unit as global.

- Enable automatic adoption
  
  If you are implementing the adoption feature, then you can have all the global clauses in the global business unit automatically approved and available for use in the local business by selecting the Autoadopt Global Clauses option. If you do not select this option, the employee designated as the Contract Terms Library Administrator must approve all global clauses before they can be adopted and used in the local business unit. This option is available only for local business units.
• Specify the administrator who approves clauses available for adoption

You must designate an employee as the Contract Terms Library administrator if you are using adoption. If you do not enable automatic adoption, then the administrator must adopt individual clauses or localize them for use in the local business unit. The administrator can also copy over any contract terms templates created in the global business unit. The clauses and contract terms templates available for adoption are listed in the administrator's Terms Library work area.

Setting Clause Numbering Options

You can set up automatic clause numbering for the clauses in the business unit by selecting Automatic in the Clause Numbering field and setting the clause numbering level. Then select the appropriate clause sequence category for the specified numbering level. You must have previously set up document sequences for the document sequence categories of global, ledger, and business unit. If clause numbering is manual, contract terms library administrators must enter unique clause numbers each time they create a clause.

You can choose to display the clause number in front of the clause title in contracts by selecting the Display Clause Number in Clause Title option.

Enabling Contract Expert

You must select the Enable Contract Expert option to be able to use the Contract Expert feature in a business unit. This setting takes precedence over enabling Contract Expert for individual contract terms templates.

Specifying the Printed Clause and Deviations Report Layouts

For each business unit, you can specify the Oracle BI Publisher RTF file that serves as the layout for:

• The printed contract terms

  Enter the RTF file you want used for formatting the printed clauses in the Clause Layout Template field.

• The contract deviations report

  The RTF file you select as the Deviations Layout Template determines the appearance of the contract deviations report PDF. This PDF is attached to the approval notification sent to contract approvers.

FAQs About Project Contracts

Why can't I see the internal billing details on a contract?

If you do not see the internal billing features on a contract, check the attributes on the contract type. The internal billing options of a contract are only visible if the contract type is designated as either intercompany or interproject.
define memo lines

revenue accounts and memo lines: explained

you can optionally associate a revenue account with a memo line.

if autoaccounting depends on memo line, oracle fusion receivables uses the revenue account segment values defined for the memo line, in combination with the rest of your autoaccounting structure, to determine the default revenue, freight, autoinvoice clearing, tax, unbilled receivable, unearned revenue, and receivable accounts for invoices that include the memo line.

when you create a debit memo or on-account credit memo with memo lines, receivables uses the revenue account from the original receivable item as the credit account. however, when you create debit memo reversals or chargebacks, receivables uses instead the revenue flexfield from the original receivable item as the credit account.

faqs for memo lines

when do i use memo lines?

use memo lines on your transactions when the item is not an inventory item. for example, you can define a memo line called consulting services to identify charges for consulting activities. you can assign memo lines to debit memos, on-account credits, debit memo reversals, chargebacks, and invoices.

how can i use tax memo lines?

you can use tax memo lines on transactions if your tax definition lets you enter manual tax lines on transactions. after you enter a tax memo line on a transaction, you can specify the amount of tax to assign to the transaction line.
Define Transaction Taxes: Overview

Oracle Fusion Tax provides a single-point solution for managing your transaction-based tax requirements. In the Define Transaction Taxes activity, set up your entire tax configuration.

Oracle Fusion Tax:
- Uniformly delivers tax services to all Oracle Fusion application business flows through one application interface
- Provides a single integration point for third-party tax products and services
- Is configurable and scalable for adding and maintaining country-specific tax content

With Oracle Fusion Tax, you can model your taxes according to the needs of the following local and international tax requirements:
- Both simple and complex country-specific tax legislation
- Cross-border transactions, including exports and Intra-European Community transactions
- Intercompany transactions
- Local compliance requirements for recording and reporting
- Continual changes to tax legislation, such as new taxes, local law changes, special tax rates, and special exceptions for products and customers

You can manage the entire configuration and maintenance of tax content from the one Oracle Fusion Tax application. Using one application ensures a uniform tax setup across applications, with a centrally managed system of automated tax services and control over manual intervention and update.

Task Lists
The Define Transaction Taxes activity is logically defined with prerequisite tasks, core tax configuration tasks, optional setup tasks, and validate configuration tasks. The activity categories include:
- Define Tax Geographies: Configure tax geographies to define geographical regions that share the same tax requirement. These prerequisite tasks are required for core tax configuration but they might not have been defined in the previous steps of the Financials offering.
- Define Tax Regimes: Configure tax regimes for the taxes in each country and geographic region where a separate tax applies. These tasks are
most commonly used by all the implementations. You should be able to
calculate taxes on the transactions based on this configuration.

- Define First Party Tax Profiles: Configure tax profile details that control
the transaction tax activities for your first party legal entities, legal
reporting units, and business units.
- Define Third Party Tax Profiles: Configure tax profile details that control
the transaction tax activities for your third party customer, customer sites,
supplier, and supplier sites.
- Define Occasional Implementation Setups: Configure initial tax setup
that impacts tax calculation and reporting. These tasks either are
predefined and you do not have to configure them unless the predefined
data needs to be extended or these are tasks required only for certain
implementations.
- Verify Tax Configuration: Verify the transaction tax configuration by
simulating transaction data and reviewing tax calculation results.

Defining Transaction Taxes: Critical Choices

With Oracle Fusion Tax, you can model your tax requirements according to the
needs of local and international tax requirements. These requirements include:

- Both simple and complex country-specific tax legislation
- Cross-border transactions
- Local compliance requirements for recording and reporting
- Continual changes to tax legislation, such as new taxes, local law changes,
special tax rates, and special exceptions for products and customers

In order to determine how to set up your tax configuration, you must first
analyze your tax requirements.

Analyzing Your Tax Requirements

The following table represents key decisions that you must make when you
analyze your tax requirements and use Oracle Fusion Tax and other Oracle
Fusion applications to implement a solution

<table>
<thead>
<tr>
<th>Question</th>
<th>Consideration</th>
<th>Impact to Tax Configuration</th>
</tr>
</thead>
<tbody>
<tr>
<td>Who am I?</td>
<td>You must first answer questions about yourself and your relationship to the legal and regulatory agencies that enable you to operate in one or more counties.</td>
<td></td>
</tr>
<tr>
<td>Where do I have operations and businesses?</td>
<td>Identify the countries in which you operate. You will need to identify the country where you are legally registered and the countries where you have subsidiary companies that are legally registered or have a legal presence.</td>
<td>Use Oracle Fusion Legal Entity Configurator to capture information about your legal entities and legal registration.</td>
</tr>
<tr>
<td>What taxes am I subject to?</td>
<td>Analyze your tax environment for each of the countries in which you operate.</td>
<td>Set up your tax regimes, taxes, and tax jurisdictions according to the tax requirements for each country.</td>
</tr>
</tbody>
</table>
| What are the operations and businesses that I have? | Consider the types of operations and businesses in which you are engaged and the countries where you have legal entities or reporting units. The type of industries that you work under (for example, mining, telecommunications, and pharmaceuticals), the kind of operations in which you engage (for example, trading, manufacturing, and services), and the scale of your operations (for example, your turnover, company size, and growth) may all impact your taxability. | Use the classifications feature to categorize or classify your first parties under various classification schemes. In analyzing your operations, you can associate the three main classifications of a transaction to:  
• What you do: Use transaction fiscal classifications.  
• What products you buy or sell: Use product fiscal classifications.  
• Who your customers and suppliers are: Use party fiscal classifications. |
<table>
<thead>
<tr>
<th></th>
<th></th>
<th></th>
</tr>
</thead>
<tbody>
<tr>
<td>What do I do?</td>
<td>Identify and classify the transactions that you enter into. For example, do you primarily sell physical goods? If you do, do you manufacture them, or do you buy and sell them without additional manufacturing? Do you sell these goods in another state or province? Do you export these goods? Do you provide or use services?</td>
<td>Use Oracle Fusion Tax to create fiscal classifications to classify and categorize your transactions in a common manner across your organization. Use these fiscal classifications in tax rules to obtain the appropriate tax result.</td>
</tr>
<tr>
<td>What products do I buy or sell?</td>
<td>Determine the products that you buy and sell as they impact the taxes to which you are subject. For example, you must register for, and therefore collect and remit, service taxes only if you provide taxable services. If you manufacture goods for export, you may not be subject to taxes on the purchases that go into the manufacture of such goods.</td>
<td>Where Oracle Fusion Inventory is installed use the Inventory Catalog feature with Oracle Fusion Tax product fiscal classifications and intended use functionality to classify the taxable nature and intended use of the items. You can then define tax rules using these classifications to obtain the appropriate tax result. Define product category and noninventory-based intended use fiscal classifications to address classification needs for transactions that do not use inventory items.</td>
</tr>
<tr>
<td>Who are my customers and suppliers?</td>
<td>Determine the types of customers and suppliers with whom you do business, as they can impact the taxes to which you are subject or the tax status or tax rate that applies. For example, let’s say that you are a company in the UK that supplies physical goods to another country that is also a member of the European Union. The transaction rate for UK VAT is dependant on whether the customer is registered for VAT in the country to which the supply is made.</td>
<td>Use the party classifications feature to categorize or classify your customers and suppliers. You can use these classifications in your tax rules to derive the appropriate tax result. You create a party fiscal classification by assigning an Oracle Fusion Trading Community Model class category to a party fiscal classification type code that you define. The Trading Community Model class codes defined under the class category become fiscal classification codes belonging to the party fiscal classification type. You can create a hierarchy of party fiscal classification types to reflect the levels of codes and subcodes within the Trading Community Model classification.</td>
</tr>
</tbody>
</table>

**Scope Values for Define Transaction Taxes Task List: Explained**

The purpose of scope is to define the parameters of your implementation project by setting the context of a task list during initial configuration.

The foundation tax setup is an incremental setup where each step of the foundation configuration builds on the previous step. The task list is organized sequentially to ensure that you perform setup tasks in the order required. You can define scope values at incremental steps in the implementation project to pass to subsequent tasks to ensure:

- Continuity
- Ease of setup

When exporting setup data based on setup migration services, the scope values serve as parameters to control the data selected for export to the respective configuration package. Scope is a valuable tool when implementing, but tax scope values are not a required element of the implementation and you do not need to define them.

**Defining Scope**

When implementing transaction tax, you can define scope values for taxes, tax jurisdictions, tax statuses, tax rates, and tax recovery rates in the foundation setup. To set scope, you can:

- Select and add multiple values
- Create a new value

When you select the scope value, that value defines the context of that setup. For example, if you select a tax regime to use as a scope value for a tax, that value is automatically populated in the search attributes on the Manage Tax page. That tax regime’s attributes are also populated in the Create Tax page. The same logic applies to the next step in the foundation setup.
Scope Values
The following table identifies where you define the scope value in the Define Transaction Taxes task list:

<table>
<thead>
<tr>
<th>Where Scope is Defined</th>
<th>Scope Values</th>
</tr>
</thead>
<tbody>
<tr>
<td>Manage Taxes</td>
<td>Tax regime</td>
</tr>
<tr>
<td>Manage Tax Jurisdictions</td>
<td>• Tax regime</td>

Foundation Tax Configuration: Points to Consider

Use Oracle Fusion Tax to set up and maintain your transaction tax requirements in all geographic locations where you do business. Foundation tax configuration refers to a set of tax setup components that you will use to satisfy your tax requirements. At transaction time, Oracle Fusion Tax uses your tax configuration to determine the taxes that apply to each transaction and to calculate the tax amounts.

Foundation tax configuration components consist of:
• Tax regimes
• Taxes
• Tax jurisdictions
• Tax statuses
• Tax rates

**Foundation Tax Configuration**

Complete the setup tasks to create a basic tax configuration for each of your tax regimes. A foundation tax configuration contains the data applicable to the taxes belonging to a tax regime. The following table describes the appropriate levels of specifying setup options for foundation tax components and provides a Canada Goods and Services Tax (GST) and Harmonized Sales Tax (HST) example for each component.

<table>
<thead>
<tr>
<th>Component</th>
<th>Appropriate Level to:</th>
<th>Typically, Not Appropriate Level to:</th>
<th>Canada GST and HST Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime</td>
<td>• Share tax content among legal entities and business units.</td>
<td>• Define configuration owner tax options.</td>
<td>CA GST &amp; HST</td>
</tr>
<tr>
<td></td>
<td>• Enable partner integration.</td>
<td>• Define application tax options.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Associate fiscal classifications.</td>
<td>• Define party tax profiles.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Define tax reporting types and codes.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Define features to influence setup task list.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tax</td>
<td>• Enable controls to influence tax behavior.</td>
<td>• Share tax content.</td>
<td>CA GST</td>
</tr>
<tr>
<td></td>
<td>• Specify defaults that are commonly applicable.</td>
<td>• Define integration with partners.</td>
<td>CA HST</td>
</tr>
<tr>
<td></td>
<td>• Define applicability tax rules.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Define customer exemptions.</td>
<td></td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Specify party registrations.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Tax Jurisdictions</td>
<td>• Define location-based tax rates.</td>
<td>Specify tax rule defaults.</td>
<td>CA Alberta GST</td>
</tr>
<tr>
<td></td>
<td>• Define customer exemptions and rate exceptions.</td>
<td></td>
<td>CA BC HST</td>
</tr>
</tbody>
</table>
Define Project Contract Configurations: Define Transaction Taxes

| Tax Status       | • Define common rules for tax rates. | • Specify tax rule defaults. | • GST Standard     |

**Advanced Tax Configuration: Points to Consider**

Create a simple tax model using tax rule defaults that you define in setting up your foundation tax configuration. You can also create tax rules for your complex tax requirements that consider each tax requirement related to a transaction before making the final tax calculation. When running the tax determination process, Oracle Fusion Tax evaluates, in order of priority, the tax rules that you have defined against the foundation tax configuration setup and the details on the transactions. If the first rule is successfully evaluated, the result associated with the rule is used. If that tax rule is not successful, the next rule is evaluated until either a successful evaluation or a default value is found.

Advanced tax configuration consists of tax rules to define exceptions to the default results.

**Advanced Tax Configuration**

The complexity of tax rule setup falls into three general categories: no tax rules required, simple tax rule regimes, and complex tax regimes. This table presents the scenarios and actions associated with each of these categories.

<table>
<thead>
<tr>
<th>Category</th>
<th>Scenario</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>No tax rules required</td>
<td>The tax authority levies tax on all sales and purchase transactions at the same rate. Neither tax applicability nor the tax rates and recovery rates vary by the parties to the transaction, the products or services in the transaction, or the business processes involved in the transaction.</td>
<td>For the tax, define tax rule defaults for the tax status, tax rate, and tax recovery rate. The tax determination process uses the tax rule defaults to determine the tax.</td>
</tr>
</tbody>
</table>
Simple tax rule regimes

The tax authority levies tax on your transactions at the same rate, with a simple set of identifiable exceptions. The exceptions either apply to one part of the transaction only, such as to certain parties, or to a combination of parties, products, and transaction processes that you can summarize in a simple way.

Create a simple set of rules, for example, to identify place of supply and tax registration, and use the tax rule default values for the other processes. The tax determination process uses the tax rules and the tax rule defaults to determine the tax.

Complex tax regimes

Tax regimes in certain countries require a complex logic to determine the applicable taxes and rates on a transaction. Both tax applicability and tax rates can vary, for example, by place of origin and place of destination, party registration, tax status, service, or a combination of factors. In some cases, the taxable amount of one tax may depend upon the amount of another tax on the same transaction. And in rare cases, the tax amount itself may depend on the tax amount of another tax.

Set up tax rule to define the logic necessary to identify each step of the tax determination process. The tax determination process uses the tax rules to determine the tax.

Define Exception to Default Results

Set a tax rule default value to the most commonly used value for tax determination. In the case of tax registration the default or most commonly used value for registration party is ship-from party. However, you can set up a rule to provide additional logic to use the registration of the bill-to party if the registration status is Not Registered for the ship-from party for purchase transactions. Create a determining factor set with the registration status and transaction business category determining factors along with condition sets to provide values for the respective determining factors.

For this example, the following setup exists for the Determine Tax Registration tax rule:

- Tax rule default: The default for tax registration is ship-from party.
- Tax rule: If the supplier is not registered, then you should consider the tax registration of the bill-to party.

When the following conditions are true, then the tax registration is the same as that defined for the bill-to party:

<table>
<thead>
<tr>
<th>Tax Determining Factor Class</th>
<th>Tax Class Qualifier</th>
<th>Tax Determining Factor</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Registration</td>
<td>Ship-from party</td>
<td>Registration status</td>
<td>Equal to</td>
<td>Not registered</td>
</tr>
<tr>
<td>Transaction Generic Classification</td>
<td>Level 1</td>
<td>Transaction business category</td>
<td>Equal to</td>
<td>Purchase transaction</td>
</tr>
</tbody>
</table>

The tax determination process determines the tax registration by first considering the Determine Tax Registration tax rule and then the default...
party registration. As a result of this rule, the tax determination process determines that for a purchase transaction, if the supplier is not registered, the tax registration of the bill-to party is considered.

**Define Tax Geographies**

**Place Information: Explained**

All tax regimes need information about place or geography. Information is required to determine:

- Where the tax is applicable
- The tax rules that can identify when a transaction is an export, or delivered to another country, or deliveries inside or outside an economic region such as, the European Community (EC).
- Specific regions such as, city, country, and states for US Sales and Use Tax or provinces in Canada.

To support these requirements, Oracle Fusion Tax allows you to define and use geography regions and tax zones. Geography regions and tax zones provide a conceptual model to use place information on transactions and information related to the transaction.

The following types of places are supported for tax purposes in Oracle Fusion Tax:

- Country information: Use country as a specific geography element in tax rules to define tax regimes, taxes, and tax jurisdictions.
- Geography elements: Use geography elements or levels defined in the Oracle Fusion Trading Community Model geography functionality in tax rules to define tax regimes, taxes, and tax jurisdictions.
- Tax zones: Use geography elements or levels defined in Trading Community Model geography in tax rules to define tax regimes, taxes, and tax jurisdictions.

Use place information for determining factors within tax rules in the tax determination process. Also, use place information while defining tax regimes, tax geography, and tax jurisdictions.

**Country Information**

Country is a required field in all of the tax-related address locations. The country fields are supported by a predefined ISO 3166 country name and two-character country code. For more information on country names and codes, see http://www.iso.org/iso/english_country_names_and_code_elements.

You do not set up a country as a specific geography level in Trading Community Model geography because country is an inherent part of all tax-related address locations.

**Tip**

Use the highest level of geography, typically country, wherever possible.
**Geography Elements**

Define geography elements as part of Trading Community Model geography. They control the use of geography and addresses throughout Oracle Fusion. Oracle Fusion Tax commonly uses the following features: geography or tax zones, geography levels, address controls, and geography name referencing.

Use geography levels to define the levels of geography that are used within a country. For example, addresses in the US comprise of state, county, city, street, and postal code. Addresses in the UK comprise of county, city or town, street, and postal code. There may be other geography elements as well, such as building. From a tax perspective it is only those elements of the address that are referenced for tax purposes. For example, state, county, and city are important for US Sales and Use Tax while county in UK is not relevant from a tax perspective and therefore, you do not need to set it up.

<table>
<thead>
<tr>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>When address elements are needed for tax purposes, such as country and city for US Sales and Use Tax, set these address levels as mandatory within Trading Community Model geography. This ensures that these elements are always present on all applicable addresses.</td>
</tr>
<tr>
<td>Setting address levels as mandatory ensures that amended or newly applicable addresses are validated and that the level is either derived or entered. When you are setting up migrated addresses ensure that they are also compliant with the mandatory levels being present. This should be validated and any address levels added as part of the migration process.</td>
</tr>
</tbody>
</table>

The geography name referencing process within Trading Community Model geography links specific addresses to the levels defined in the geography setup. This process is typically automatic. However, when you encounter issues, you may need to trigger this process to ensure that all addresses are correctly linked to their applicable levels.

**Tax Zones**

Use the tax zone functionality when you need to identify a group of geography elements while calculating tax. Tax zones are defined as part of Trading Community Model geography.

For example, in the EC it is important to know whether goods and services are being delivered within the EC. Use the tax zone functionality to create a tax zone, which defines the membership to the EC as well as, the dates on which a country became the member.

<table>
<thead>
<tr>
<th>Tip</th>
</tr>
</thead>
<tbody>
<tr>
<td>Create a generic tax zone so that you create a tax zone type that can be used in multiple situations. For example, for a tax zone type needed to identify EC, create a generic tax zone type for all economic communities, which can later be used in other situations where economic communities or trade agreements affect tax determination.</td>
</tr>
<tr>
<td>You can also use the tax zone functionality to group postal codes to provide useful groupings that can identify some higher-level tax regions such as, cities or counties.</td>
</tr>
</tbody>
</table>
Country Information: How It Works in Tax Rules and on Transactions

Geography determination factors allow you to use country information in the tax rules. A combination of determination factor class, class qualifier, and determining factor represent these determination factors. Specify the taxation country at transaction time which is used, along with the tax rules, during the tax determination process.

Country Information in Tax Rules

Use geography as the determining factor class, location type on the transaction as the class qualifier, and country as the determining factor. You can also use country as a tax rule qualifier.

The tax determining factors for locations are given generic names such as ship-to and bill-from, depending on the transaction types. The transaction types are Order-to-cash, for example, Oracle Fusion Order Management and Oracle Fusion Receivables, and Procure-to-pay, for example Oracle Fusion Purchasing and Oracle Fusion Payables.

Oracle Fusion Tax translates these generic locations into specific locations based on the transaction as shown in the following table:

<table>
<thead>
<tr>
<th>Generic Party</th>
<th>Order-to-Cash Party</th>
<th>Procure-to-Pay Party</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill-from party</td>
<td>Location assigned to the business unit for the transactions</td>
<td>Supplier</td>
</tr>
<tr>
<td>Bill-to party</td>
<td>Customer</td>
<td>Location assigned to the business unit for the transactions</td>
</tr>
<tr>
<td>Ship-to party</td>
<td>Customer (ship-to) party site</td>
<td>Ship-to location on the line</td>
</tr>
<tr>
<td>Ship-from party</td>
<td>Warehouse on the line. If there is no warehouse on the line, such as with services, the default location assigned in the Receivables system parameters is used.</td>
<td>Supplier (ship-from) party site</td>
</tr>
<tr>
<td>Point of acceptance party</td>
<td>Customer point of acceptance party</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Point of origin party</td>
<td>Customer point of origin party</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

Country Information at Transaction Time

Specify the taxation country on the transaction to identify the country in which the transaction is deemed to have taken place for taxation purposes. The default value is the country of the legal entity. Use the country name to search for country defaults, which control the fiscal classification defaults, party tax profile defaults, and tax regime and tax defaults. Use the country name to select the following fiscal classifications associated with that specific country:

- User-defined fiscal classifications
- Product categories
- Intended use fiscal classifications
Using Country Information in Tax Rules: Example

For many regimes, it is important to know if the supply of goods is exported. The easiest way of doing this is to ensure that the ship-from location is from the country in question and the ship-to location is a different country. The following scenario illustrates setting up tax rule components to identify if the goods are exported from the United States.

Scenario

Use geography as the determining factor class, country as the class qualifier for ship-from and ship-to locations, and country as the determining factor as shown in the following table:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-from</td>
<td>Country</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>Country</td>
</tr>
</tbody>
</table>

Create a condition set that refers to this geography determining factor as follows:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-from</td>
<td>Country</td>
<td>Equal to</td>
<td>United States</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>Country</td>
<td>Not equal to</td>
<td>United States</td>
</tr>
</tbody>
</table>

Use this combination of determining factors in any situation where you need to identify exports from the United States.

Geography Elements: How They Work in Tax Rules

Geography determination factors allow you to use geography elements in tax rules. A combination of determination factor class, class qualifier, and determining factor represent these determination factors.

Geography Elements in Tax Rules

Use geography as the determining factor class, location type on the transaction as the class qualifier, and geography level such as county, province, or city, as the tax determining factor.

The tax determining factors for locations are given generic names such as ship-to and bill-from, depending on the transaction types. The transaction types are Order-to-cash, for example, Oracle Fusion Order Management and Oracle Fusion Receivables, and Procure-to-pay, for example Oracle Fusion Purchasing and Oracle Fusion Payables.

These generic locations are mapped to the specific location, based on the transaction as shown in the following table:
Define Project Contract Configurations: Define Transaction Taxes

<table>
<thead>
<tr>
<th>Generic Party</th>
<th>Order-to-Cash Party</th>
<th>Procure-to-Pay Party</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill-from party</td>
<td>First party legal entity</td>
<td>Supplier</td>
</tr>
<tr>
<td>Bill-to party</td>
<td>Customer</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-to party</td>
<td>Customer (ship-to) party site</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-from party</td>
<td>First party legal reporting unit</td>
<td>Supplier (ship-from) party site</td>
</tr>
<tr>
<td>Point of acceptance party</td>
<td>Customer point of acceptance party</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Point of origin party</td>
<td>Customer point of origin party</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

You can also use the geography level as a tax rule qualifier.

**Using Geography Levels in Tax Rules: Example**

Use the geography element in tax rules to identify a specific geography region when taxes in a specific country need to identify specific geography elements below the country level. For example, in US Sales and Use Tax for county taxes, there may be specific rules for a specific state.

The following scenario describes how you can set up tax rule components to identify when goods are being delivered to a specific state, such as Ohio.

**Scenario**

Use geography as the determining factor class, ship-to as the class qualifier, and state as the determining factor as shown in the following table:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>State</td>
</tr>
</tbody>
</table>

Create a condition set that refers to a specific state value as follows:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>State</td>
<td>Equal to</td>
<td>Ohio</td>
</tr>
</tbody>
</table>

You can use this combination of determining factors in any situation where you need to identify specific deliveries to a specific state.

**Tax Zones: How They Work in Tax Rules**

Geography determination factors allow you to use geography elements in the tax rules. A combination of determination factor class, class qualifier, and determining factor represent these determination factors.

**Tax Zones in Tax Rules**

Use geography as the determining factor class, location type on the transaction as the class qualifier, and tax zone type such as county, as the determining factor.
The tax determining factors for locations are given generic names such as ship-to and bill-from, depending on the transaction types. The transaction types are Order-to-cash, for example, Oracle Fusion Order Management and Oracle Fusion Receivables, and Procure-to-pay, for example Oracle Fusion Purchasing and Oracle Fusion Payables.

These generic locations are mapped to the specific location based on the transaction as shown in the following table:

<table>
<thead>
<tr>
<th>Generic Party</th>
<th>Order-to-Cash Party</th>
<th>Procure-to-Pay Party</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill-from party</td>
<td>First party legal entity</td>
<td>Supplier</td>
</tr>
<tr>
<td>Bill-to party</td>
<td>Customer</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-to party</td>
<td>Customer (ship-to) party site</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-from party</td>
<td>First party legal reporting unit</td>
<td>Supplier (ship-from) party site</td>
</tr>
<tr>
<td>Point of acceptance party</td>
<td>Customer point of acceptance party</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Point of origin party</td>
<td>Customer point of origin party</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

You can also use tax zones as tax rule qualifiers.

**Using Tax Zones in Tax Rules: Example**

For the European Community (EC) or the Economic Union (EU) it is important to know whether goods and services are being delivered within the EC. Use the tax zone functionality to create a tax zone that defines the membership of the EC as well as the dates on which a country became a member.

The following scenario describes the use of a partial condition set that you can use within tax rules to define when a delivery is being made to an EC from the United Kingdom.

**Scenario**

Use geography as the determining factor class, ship-to as the class qualifier, and all economic communities and country as the determining factors of the tax zone type as shown in the following table:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>All Economic Communities</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>Country</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-from</td>
<td>Country</td>
</tr>
</tbody>
</table>

Create the condition set as follows:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor Name</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>All Economic Communities</td>
<td>Equal to</td>
<td>European Community</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-to</td>
<td>Country</td>
<td>Not equal to</td>
<td>United Kingdom</td>
</tr>
<tr>
<td>Geography</td>
<td>Ship-from</td>
<td>Country</td>
<td>Equal to</td>
<td>United Kingdom</td>
</tr>
</tbody>
</table>
Define Project Contract Configurations: Define Transaction Taxes

You can use this combination of determining factors in any situation where you need to identify the deliveries that are made from the UK to other EU countries.

Define Tax Regimes

Features at the Tax Regime Level: Critical Choices

Streamline your implementation by selecting the features that are applicable to the tax regime in scope. Features are used in rendering the task lists and tasks in the context of the features applicable to the tax regime in scope.

Features

The following table displays each feature and the impact of not selecting that feature.

Warning
Once you select a feature for a tax regime, you cannot disable it. You can enable the feature later if you do not enable it initially for a tax regime.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
<th>Impact of Not Selecting Feature</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiple Tax Jurisdictions</td>
<td>Create tax jurisdictions for a particular tax in more than one geographic region.</td>
<td>The Allow multiple jurisdictions option is not available to taxes within this tax regime.</td>
</tr>
<tr>
<td>Offset Taxes</td>
<td>Create offset taxes for tax calculation and recording of third party payables tax liabilities for reverse charges, self-assessments, and in the United States, Consumer’s Use tax.</td>
<td>The Set as offset tax option is not available to taxes within this tax regime.</td>
</tr>
<tr>
<td>Tax Exemptions</td>

<td>The Intended Use Fiscal Classification pages are not available. You cannot use intended use fiscal classifications in tax rules.</td>
</tr>
<tr>
<td>User-Defined Fiscal Classifications</td>
<td>Manage tax classifications for any tax requirement that you cannot define using the existing fiscal classification types.</td>
<td>The User-Defined Fiscal Classification pages are not available. You cannot use user-defined fiscal classifications in tax rules.</td>
</tr>
</tbody>
</table>

**Regimes to Rates: Explained**

Regime to rate setup contains the details of a tax regime, including all taxes, tax jurisdictions, tax statuses, and tax rates. You can update existing records or create new records at any point in the tax regime hierarchy.

Regime to rate setup tasks include:
- Tax regimes
Define Project Contract Configurations: Define Transaction Taxes

- Taxes
- Tax jurisdictions
- Tax statuses
- Tax rates

**Tax Regimes**

Set up tax regimes in each country and geographical region where you do business and where a separate tax applies. A tax regime associates a common set of default information, regulations, fiscal classifications, and optionally, registrations, to one or more taxes. For example, in the United States create a Sales and Use Tax tax regime to group taxes levied at the state, county, and district levels.

The tax regime provides these functions:

- Groups similar taxes together
- Designates the geography within which taxes apply
- Applies as defaults the settings and values that you define for each tax in the tax regime
- Defines for which taxes the configuration options apply and a specific subscription option applies
- Provides a single registration for all taxes associated with the tax regime
- Defines the use of fiscal classifications as follows:
  - Transaction fiscal classifications
  - Product fiscal classifications
  - Party fiscal classifications

The common tax regime setup is one tax regime per country per tax type, with the tax requirements administered by a government tax authority for the entire country. There are also cases where tax regimes are defined for standard geographical types or subdivisions within a country, such as a state, province, country, or city. In these cases, you base the tax regime on the Oracle Fusion Trading Community Model standard geography.

There are more rare cases where a tax regime is based on disparate parts of a country or more than one country. In these cases, you can create one or more tax zones and set up tax regimes for these tax zones. You can also set up a tax regime as a parent tax regime to group related tax regimes together for reporting purposes.

You must set up a tax regime before you set up the taxes in the tax regime. Some tax regime values appear as defaults on the taxes that belong to the tax regime in order to help minimize tax setup.

You must associate a tax regime with all of the first party legal entities and business units that are subject to the tax regulations of the tax regime. You can set up tax configuration options when you create or edit a tax regime or when you create or edit a first party legal entity tax profile. Both setup flows appear and maintain the same party and tax regime configuration options.
**Taxes**

Set up details for the taxes of a tax regime. Each separate tax in a tax regime includes records for the tax statuses, tax rates, and tax rules that are used to calculate and report on the tax. Oracle Fusion Tax applies as defaults tax information from the tax regime to each tax that you create under a tax regime. You can modify this information at the tax level according to your needs, as well as add additional defaults and overrides. For tax rule defaults, specify values that apply to the majority of your transactions. Use tax rules to configure exceptions to the tax rule defaults.

Identify what taxes you must define. Each tax appears as a single tax line on a transaction. If you need to show or report more than one tax line per transaction, then you should set up more than one tax. For example, for US Sales and Use Tax you would define a tax for each state, county, and city.

You can create a new tax, or create a tax that is based on an existing tax within the tax regime. You do this to minimize setup by sharing tax jurisdictions and tax registrations. When you create a new tax based on an existing tax, the attributes that remain constant for all taxes derived from the source tax are not available for update. Attributes that are copied and are display only include:

- Tax regime
- Tax
- Geography information
- Tax jurisdiction settings

**Note**

The enable tax settings are not selected, in the same way that they are not selected when you access the Create Tax page.

You can enable a tax for simulation or for transactions only after you have completed all of the required setup.

**Tax Jurisdictions**

Set up tax jurisdictions for geographic regions or tax zones where a specific tax authority levies a tax. A tax jurisdiction specifies the association between a tax and a geographic location. At transaction time, Oracle Fusion Tax derives the jurisdiction or jurisdictions that apply to a transaction line based on the place of supply. You must set up at least one tax jurisdiction for a tax before you can make the tax available on transactions.

You also use tax jurisdictions to define jurisdiction-based tax rates. A tax jurisdiction tax rate is a rate that is distinct to a specific geographic region or tax zone for a specific tax. You can also create multiple jurisdictions at once using the mass create functionality for taxes that relate to specific Trading Community Model geographic hierarchies. For example, create a county jurisdiction for every county in the parent geography type of State and in the parent geography name of California.

The tax within a tax jurisdiction can have different rates for the parent and child geographies. For example, a city sales tax rate can override a county rate for the same tax. In this case, you can set up an override geography type for the city...
and apply a precedence level to the city and county tax jurisdictions to indicate which tax jurisdiction takes precedence.

In addition, in some cities a different city rate applies to the incorporated area of the city, called the inner city. In these cases, you can set up an inner city tax jurisdiction with its own tax rate for the applicable customers and receivables tax. Inner city tax jurisdictions are often based on postal code groupings.

**Tax Statuses**

Set up the tax statuses that you need for each tax that you create for a combination of tax regime, tax, and configuration owner. A tax status is the taxable nature of a product in the context of a transaction and specific tax on the transaction. You define a tax status to group one or more tax rates that are the same or similar in nature.

For example, one tax can have separate tax statuses for standard, zero, exemptions, and reduced rates. A zero rate tax status may have multiple zero rates associated with it, such as Intra-EU, zero-rated products, or zero-rated exports.

You define a tax status under a tax and a configuration owner, and define all applicable tax rates and their effective periods under the tax status. The tax status controls the defaulting of values to its tax rates.

**Tax Rates**

Set up tax rates for your tax statuses and tax jurisdictions. For tax statuses, set up a tax rate record for each applicable tax rate that a tax status identifies. For tax jurisdictions, set up tax rate records to identify the tax rate variations for a specific tax within different tax jurisdictions. For example, a city sales tax for a state or province may contain separate city tax jurisdictions, each with a specific tax rate for the same tax.

You can also define tax recovery rates to claim full or partial recovery of taxes paid.

You can define tax jurisdiction and tax status rates as a percentage or as a value per unit of measure. For example, a city may charge sales tax at a rate of 8 percent on most goods, but may levy a duty tax with a special rate of 0.55 USD per US gallon on fuel. Values per unit of measure are in the tax currency defined for the tax.

You define tax rate codes and rate detail information per rate period. Rate periods account for changes in tax rates over time. A tax rate code can also identify a corresponding General Ledger taxable journal entry.

**Tax Recovery Rates**

Set up tax recovery rate codes for the recovery types identified on the taxes within a tax regime. A tax recovery rate code identifies the percentage of recovery designated by the tax authority for a specific transaction. In Canada, where more than one type of recovery is possible for a given tax, you must set up the applicable tax recovery rate codes for both the primary and secondary recovery types that can apply to a transaction.

If you set the Allow tax recovery option for a tax within a tax regime, then you must set up at least one recovery rate for the tax in order to make the tax available on transactions. If the recovery rate can vary based on one or more
factors, including the parties, locations, product or product purpose, then set up tax rules to determine the appropriate recovery rate to use on specific transactions. At transaction time, Oracle Fusion Tax uses the recovery rate derived from the recovery tax rules, or uses instead the default recovery rate that you define, if no recovery rate rules are defined or if no existing recovery rate rule applies to the transaction.

**Minimum Tax Configuration: Explained**

Oracle Fusion Tax provides you with a single interface for defining and maintaining the taxes that are applicable in each country where you do business.

The minimum tax configuration path to meet the basic tax requirements of transactions in a given regime is a 2-step configuration process:

1. Define tax regime: This step includes the tax regime definition as well as the subscription by the appropriate legal entity or business unit.
2. Define transaction taxes: This step includes the basic tax definition, controls and defaults, direct and indirect tax rule defaults, and tax accounts.

The following prerequisite setups must be completed for minimum tax configuration:

- First parties, such as legal entities and business units
- Tax geographies and zones
- Ledger and accounts
- Currency codes and exchange rates

A legal entity tax profile is automatically created when a legal entity is defined in the implementation. Similarly, a business unit tax profile is automatically created when a business unit is defined. For the business unit, you need to indicate whether it will use the subscription of the legal entity instead of creating its own.

In addition, there are predefined event class mappings that describe the mapping between an application event class and the corresponding tax event class. For example, the tax determination process for a sales debit memo and sales invoice are essentially the same. These two application event classes correspond to the same tax event class namely, a sales transaction. Although you cannot update the event class mappings, you can set up configuration specific event class mappings.

**Define Tax Regime**

The first step includes the tax regime definition and subscription by an appropriate legal entity or business unit. While creating your tax regime, you can minimize configuration and maintenance costs by creating content that can be shared by more than one entity. For example, legal entities can subscribe to the shared reference data instead of creating separate and repetitive data. If the subscribing legal entities have some variations in their setup, you can create override data to meet the specific exceptions that are applicable to these organizations.
Define Project Contract Configurations: Define Transaction Taxes

Use Oracle Fusion Tax features to enable only those features that are relevant to taxes in the tax regime. Based on the features you select, the subsequent setup pages and task lists for the tax regime are rendered or hidden.

**Define Transaction Taxes**

The second step includes basic tax definition, such as geographic information, controls and defaults, direct and indirect tax rule defaults, and tax accounts.

The basic tax definition includes controls that you can set to provide the override capability at transaction time. For example, if you want to allow users to make manual updates on transaction tax lines, select the **Allow override for calculated tax lines** and the **Allow entry of manual tax lines** options. However, if you want to enforce automatic tax calculation on transaction tax lines, do not enable these options.

Use the direct and indirect tax rule defaults to specify the values that apply to the majority of your transactions. Create tax rules to address the exceptions or variations to the defaults. For example, for the Goods and Services Tax (GST) that applies to the supply of most goods and services in Canada, set the Tax Applicability direct tax rule default to **Applicable**. A luxury tax, on the other hand, is a tax on luxury goods or products not considered essential. As it would not apply to most goods and services, set the Tax Applicability direct tax rule default to **Not Applicable**, and create a tax rule to make the tax applicable when the product in the transaction satisfies the luxury requirement.

Assign your default tax accounts for the taxes in a tax regime to post the tax amounts derived from your transactions. The tax accounts you associate serve as default accounting information for taxes, tax rates, tax jurisdictions, and tax recovery rates. The tax accounts you define at the tax level, default to either the tax rate accounts or tax jurisdiction accounts for the same tax and operating unit, depending upon the tax accounts precedence level of the tax regime. You can update these default tax accounts in the tax rate or tax jurisdiction setup.

**Minimum Tax Configuration: Points to Consider**

The minimum tax configuration setup must be designed to handle the majority of tax requirements. As part of defining transaction taxes, decide the direct and indirect tax rule defaults for the tax and set up the associated tax accounts.

For complex tax requirements, create tax rules that consider each tax requirement related to a transaction before making the final tax calculation. During the execution of the tax determination process, Oracle Fusion Tax evaluates, in order of priority, the tax rules that are defined against the foundation tax configuration setup and the details on the transactions. If the first rule is successfully evaluated, the result associated with the rule is used. If not, the next rule is evaluated until either a successful evaluation or default value is found.

**Setting Up Direct Tax Rule Defaults**

The direct tax rule defaults are the default values for the direct tax rule types, which include:
• Place of supply
• Tax applicability
• Tax registration
• Tax calculation formula
• Taxable basis formula

**Place of Supply**

Use the Place of Supply direct tax rule default to indicate the specific tax jurisdiction where the supply of goods or services is deemed to have taken place. For example, in Canada, the place of supply for GST is typically the ship-to location. To handle the majority of Goods and Services Tax (GST) transactions, select **Ship to** as your default place of supply.

**Note**

The corresponding place of supply differs based on the type of transaction. For example, a place of supply of **Ship to** corresponds to the location of your first party legal entity for Payables transactions. For Receivables transactions, **Ship to** corresponds to the location of your customer site. For exceptions to this default, create Determine Place of Supply rules.

**Tax Applicability**

Use the Tax Applicability direct tax rule default to indicate whether the tax is typically applicable or not applicable on transactions. For example, the GST in Canada is a tax that applies to the supply of most property and services in Canada. When you create the GST tax, select **Applicable** as your default tax applicability. For exceptions to this default, create Determine Tax Applicability rules.

**Tax Registration**

Use the Tax Registration direct tax rule default to determine the party whose tax registration status is considered for an applicable tax on the transaction. For example, with a direct default of bill-to party, Oracle Fusion Tax considers the tax registration of the bill-to party and stamps their tax registration number onto the transaction, along with the tax registration number of the first party legal reporting unit. For exceptions to this default, create Determine Tax Registration rules.

**Tax Calculation Formula**

Use the Tax Calculation Formula direct tax rule default to select the formula that represents the typical calculation of tax for a transaction line. A common formula, **STANDARD_TC**, is predefined, where the tax amount is equal to the tax rate multiplied by the taxable basis. For exceptions to this default, create Calculate Tax Amounts rules.

**Taxable Basis Formula**

Use the Taxable Basis Formula direct tax rule default to select the formula that represents the amount on which the tax rate is applied. The following common formulas are predefined:
• **STANDARD_TB**: The taxable basis is equal to the line amount of the transaction line.

• **STANDARD_QUANTITY**: The taxable basis is equal to the quantity of the transaction line.

• **STANDARD_TB_DISCOUNT**: The taxable basis is the line amount of the transaction line less the cash discount.

For exceptions to this default, create Determine Taxable Basis rules.

**Setting Up Indirect Tax Rule Defaults**

The indirect tax rule defaults for a tax include:

- Tax jurisdiction
- Tax status
- Tax recovery rate
- Tax rate

**Tax Jurisdiction**

Use the Tax Jurisdiction indirect tax rule default to indicate the most common geographic area where a tax is levied by a specific tax authority. For example, value-added tax (VAT) is applicable to the supply of most goods and services in Portugal. For the tax PT VAT, create the default tax jurisdiction as the country of Portugal. To address specific tax regions such as Azores and Madeira, which have lower VAT rates than Portugal, define jurisdiction rates with different VAT rates.

**Tax Status**

Use the Tax Status indirect tax rule default to indicate the taxable nature of the majority of your transactions. For example, if your operations primarily include zero-rated transactions, select the default tax status as *Zero* instead of *Standard*. This setting facilitates tax determination when multiple zero rates are defined to handle different reporting requirements for zero rate usage, such as intra-EU, zero-rated products, or zero-rated exports. For exceptions to this default, create Determine Tax Status rules.

**Tax Recovery**

Use the Tax Recovery rate indirect tax rule default to indicate the recovery rate to apply to each recovery type for each applicable tax on a purchase transaction. For example, in Canada, both federal and provincial components of Harmonized Sales Tax (HST) are 100% recoverable on goods bought for resale. In this case, with two recovery types, you can set up two recovery rate defaults for the HST tax. For exceptions to this default, such as when the recovery rate determination is based on one or more transaction factors, create Determine Recovery Rate rules.

**Tax Rate**

Use the Tax Rate indirect tax rule default to specify the default tax rate that is applicable to the majority of your transactions associated with this tax. You can
create additional tax setup, such as jurisdiction rates, or create tax rules to set alternate values as required. For example, HST in Canada is applied at a 13% rate in most provinces that have adopted HST, except for British Columbia where the rate is 12% and Nova Scotia where the rate is 15%. To satisfy this requirement a single rate of 13% can be defined with no jurisdiction and then a 12% rate can be defined and associated with the British Columbia jurisdiction (15% rate assigned to Nova Scotia). This minimizes the setup required by creating an exception based setup. For exceptions to this default, create Determine Tax Rate rules.

Setting Up Tax Accounts

Set up tax accounts at the tax level. The application automatically copies the tax account combination to the tax rates that you subsequently create for the tax for the same ledger and optionally, the same business unit.

Define tax accounts at any of the following levels. The defaulting option is only available at the tax level.

- Tax
- Tax jurisdiction
- Tax rate
- Tax recovery rate

Note

This is a one-time defaulting opportunity. Any subsequent changes at the account level are not copied to the tax rate level nor are they used during the AutoAccounting process. Changes at the tax level do impact tax account defaulting when you create new tax rates.

Setting up tax accounts comprise of specifying the following:

- **Ledger and Business Unit**: The ledger and business unit for which you are creating the tax accounts.

- **Interim Tax**: An account that records tax recovery or liability until the event prescribed by the statute is complete. Generally, the payment of the invoice is the event that triggers the generation of the tax recovery or liability. You must set up an interim tax account for taxes and tax rates that have a deferred recovery settlement. Once you set up an interim tax account for this tax rate, you cannot change the recovery settlement to Immediate.

- **Tax Recoverable or Liability Account**: An account that records tax recovery amounts or relieves tax liability amounts. If you set up recovery rates for a tax that you also intend to self-assess, then define a tax recovery account for the associated recovery rates and a tax liability account for the associated tax rates.

- **Finance Charge Tax Liability**: An account that records the tax liability associated with finance charges that is used as a deduction against overall tax liability.
Define Project Contract Configurations: Define Transaction Taxes

- **Nonrecoverable Tax Accounts**: Accounts that record tax amounts on earned and unearned discounts and adjustments that you cannot claim as a deduction against tax liability.

- **Expense and Revenue Accounts**: Accounts that record net changes generated by adjustments, earned and unearned discounts, and finance charges. Receivables activities such as discounts and adjustments reduce the receivable amount, and are therefore considered an expense.

### Minimum Tax Configuration: Worked Example

The following example illustrates the minimum tax configuration setup to meet the basic requirements in Canada for the Goods and Services Tax (GST). You set up a tax regime for both GST and Harmonized Sales Tax (HST). One recovery type is created for the fully recoverable status of the transaction.

In Canada, GST is a tax that applies to the supply of most property and services in Canada. The provinces of British Columbia, Ontario, New Brunswick, Nova Scotia, and Newfoundland and Labrador, referred to as the participating provinces, combine their provincial sales tax with GST to create HST. Generally, HST applies to the same base of property and services as the GST. Every province in Canada except Alberta has implemented either provincial sales tax or the HST. In countries like Canada, some or all taxes on business transactions for registered companies are recoverable taxes.

ABC Corporation is a business with a chain of bookstores across Canada. It intends to implement the Oracle Fusion Tax solution at its store in the province of Alberta. The GST rate of 5% is applicable for sales in Alberta. Input Tax Credit is available for GST included in purchases. ABC Corporation’s primary ledger is CA Ledger, and the business unit is CA Operations. The tax account 0001-1500-1100-1000 is reserved for the **Tax Recoverable or Liability** account.

The tax implications in this scenario are:

- Five percent (5%) GST is applicable on the sale of goods in Alberta
- Neither the HST nor provincial sales tax applies in Alberta
- Place of supply for GST tax is generally based on the place of delivery or ship-to location.

To determine the GST tax in Alberta, perform the following steps:

1. Define tax regime
2. Define transaction taxes
3. Create the direct tax rule defaults
4. Create the indirect tax rule defaults
5. Enable tax

### Define Tax Regime

1. On the Create Tax Regime page, enter the tax regime code for GST and HST in Canada.

---

**Note**
Use a coding convention to indicate both the country and the type of tax that belongs to this regime. For example, CA GST and HST.

2. Select the regime level to define the geographic area of the tax treatment. The option selected must depict the need for the tax regime. It should be set to Country for all federal taxes.

3. Specify Canada as the country for which this tax regime is being defined.

4. Enter a start date that will appear as a default to all related tax setup within the tax regime.

**Note**

Consider your tax planning carefully before entering the start date. This date must accommodate the oldest transaction that you want to process within this tax regime. After you create the tax regime, you can only update this date with an earlier date. If you enter an end date, you cannot update this date after you save the record.

5. Enter tax currency. Enter CAD, which is the three-letter ISO code for the Canadian dollar.

Tax currency is the currency required by the tax authority. Use the tax currency to pay the tax authority and to report on all tax transactions.

6. Select the Allow cross regime compounding option to set taxes within the tax regime to be based on the calculation of, or compounded on, taxes in another tax regime.

For example, in Quebec, the provincial sales tax is applied to both the selling price and GST. Enter a value as the compounding precedence to indicate the order of cross regime compounding. A lower number indicates that the tax regime will be processed first. Allowing gaps between numbers provide flexibility in the event that another higher priority tax regime is introduced in the future.

7. On the Configuration Options tab, select the party name that identifies either the legal entity or the business unit or both for which you will define the configuration options.

8. For the Configuration of Taxes and Rules, select the subscription that defines the configuration owner setup that will be used for transactions of the specific legal entity and business unit for this tax regime.

This selection also defines whether any shared content can be overridden by the subscribing party to allow unique, separate setup for certain tax content.

9. Enter the effective start date for this configuration option. Enter a date range that is within the date range of both the party tax profile and the tax regime.

**Define Transaction Taxes**

1. On the Create Tax page, enter the name of the tax regime that you created in the Define Tax Regime step, such as CA GST and HST.
2. Select the configuration owner for this tax. To minimize configuration and maintenance costs, select **Global Configuration Owner** as the configuration owner.

3. Enter the name of the tax you are defining, such as CA GST.

4. Select **Province** as the geography type.

5. To minimize setup and maintenance costs, specify the highest-level parent geography type (Country), unless the tax is only applicable to a specific geography. Select **Country** from the list of values. For the parent geography name, enter **Canada**.

6. Enter a value as the compounding precedence to reflect the order of tax compounding. A lower number indicates that a tax is processed first. Allowing gaps between numbers provide flexibility in the event that another higher priority tax is introduced in the future.

7. Enable the **Allow override of calculated tax lines** option to allow users to override the automatic tax calculation on invoice tax lines.

8. Enable the **Allow multiple jurisdictions** option to define tax jurisdictions for this tax in more than one geographic region.

9. Enable the **Allow mass create of jurisdictions** option to enable mass creation of tax jurisdictions for this tax, which allows you to create multiple jurisdictions at the same time.

10. Enable the **Allow tax recovery** option.

11. Enable the **Allow tax recovery rate override** option if you want to allow user override of the calculated tax recovery rate on transaction lines.

12. Select **Standard** as the primary recovery type.

**Assign Tax Accounts**

1. Navigate to the Tax Accounts tab.

2. Select **CA Ledger** as the primary ledger to use for tax accounts and **CA Operations** as the business unit.

3. Enter 0001-1500-1100-1000 as the Tax Recoverable or Liability account.

**Create Direct Tax Rule Defaults**

1. Navigate to the Tax Rule Defaults tab.

2. Select **Ship to** from the Place of Supply list of values, to specify the default.

3. Select **Applicable** from the Tax Applicability list of values to specify the Tax Applicability default.

4. Select **Ship-from party** to specify the Tax Registration default.

5. Select **STANDARD_TC** as the Tax Calculation Formula default.

6. Select **STANDARD_TB** as the Taxable Basis Formula default.

**Create Indirect Tax Rule Defaults**

1. Select **Tax Jurisdiction** as your rule type and create the rule type default. In the Tax Jurisdiction Code field, enter a tax jurisdiction code for the province of Alberta, such as CA Alberta. Select **Province** as the
geography type. For the geography name, enter AB for Alberta. Set this tax jurisdiction as your default, and specify your default start and end dates.

2. Select Tax Status as your rule type and create the rule type default. Enter a tax status code for GST, such as CA GST STD. Set this tax status as your default, and specify your default start and end dates.

3. Select Tax Recovery Rate as your rule type and create the rule type default. Enter a tax recovery rate code for GST, such as CA GST STD REC RATE. For the recovery type, select Standard. Enter a rate percentage of 100 for a fully recoverable tax. Set this tax recovery rate as your default, and specify your default start and end dates.

4. Select Tax Rate as your rule type and create the rule type default. In the Tax Status Code field, enter the name of the tax status that you just created, CA GST STD. Enter a tax rate code for GST, such as CA GST STD RATE. Enter a rate percentage of 5 for the current GST rate as of January 1, 2008, and specify your default start and end dates.

Enable Tax

1. Click the Enable tax for simulation option. This allows you to verify the tax configuration using the Tax Simulator.

2. Once you have verified your tax configuration with simulated transactions, click the Enable tax for transactions option. This allows you to use this tax in transaction processing.

3. Click Save and Close.

For ABC’s transactions in the province of Alberta, the following is determined by default:

- GST tax is applicable and will be calculated at a percentage rate of 5%.
- 100% of the GST can be recovered.

Associated Taxes Setup for a Tax Regime: Explained

When you create a tax regime, you specify the options and defaults available to the taxes associated with the tax regime. You also enable the features that are applicable to the tax regime and its taxes.

The options appearing in the Associated Taxes Setup Information region on the Edit Tax Regime page are a result of the features enabled and the options you selected at the tax level. These options include:

- Allow multiple jurisdictions
- Allow tax recovery
- Allow tax exceptions
- Allow tax exemptions

The preceding options always appear as read-only check boxes in the Associated Taxes Setup Information region. The option appears as selected if you selected
the option in one of the taxes within this tax regime. If you did not select the option in one of the taxes, then the option appears as not selected.

For example, suppose you have a California county sales tax that applies to all counties, so you need a tax with multiple jurisdictions. In this case, you must enable the **Multiple Jurisdictions** feature at the tax regime level and then select the **Allow multiple jurisdictions** option at the tax level. When you access the Edit Tax Regime page, Associated Taxes Setup Information region for this tax regime, the **Allow multiple jurisdictions** option appears as selected.

**Manage Controls and Defaults**

**Tax Regime Controls and Defaults: Points to Consider**

A tax regime associates a common set of default information, regulations, fiscal classifications, and optionally, registrations, to one or more taxes. Set up tax regimes in each country and geographical region where you do business and where a separate tax applies.

The tax regime setup details include:

- Designating the geography to which taxes within a tax regime apply
- Defining the controls and defaults that apply to taxes and associated lower level information
- Specifying configuration options and service subscriptions

**Designating the Geography**

The common tax regime setup is one tax regime per country per tax type, but you can also have tax regimes based on parts of a country or more than one country. Select the regime level as:

- **Country**: The tax regime is applicable to a specific country.
- **Tax zone**: The tax regime is applicable to parts of a country or more than one country. Enter the tax geography type and tax geography name associate with the group of countries or the tax zone that you want. The tax geography type and tax geography name correspond to the tax zone type and tax zone respectively.

If applicable, designate the tax regime as a parent regime or indicate the parent regime name if the tax regime belongs to a parent regime. Use a tax regime defined as a parent tax regime to group other nonparent tax regimes for reporting purposes.

**Defining Controls and Defaults**

Set tax-level controls to enable the options that you want to make available to the taxes in this tax regime. If necessary, you can disable the options that you enable here for individual taxes within the tax regime. Enter default values for the taxes in this tax regime. You can update the default values at the tax level.
If you disable a controlled option at the tax regime level it is not available as an option at the tax level.

The following table describes the defaults and controls available at the tax regime level.

Defaults Region

<table>
<thead>
<tr>

Important

Oracle Fusion Tax provides features at the tax regime level to streamline your implementation by selecting the features that are applicable to the tax regime in scope. You must enable the features to use that functionality for the tax regime and related taxes.

Specifying Configuration Options and Service Subscriptions

Set up configuration options to associate tax regimes with the parties in your company that have a tax requirement under these tax regimes. You can set up tax configuration options when you create a tax regime or when you create a party tax profile for a first party legal entity or business unit. Both tax regime and party tax profile setup flows appear and maintain the same party and tax regime association. Configuration options only apply to tax regimes directly linked to taxes and not to tax regimes that are used to group other tax regimes.

Oracle Fusion Tax lets you use the tax services of external service providers for tax calculation of US Sales and Use Tax on receivables transactions. The setup for provider services is called a service subscription. A service subscription applies to the transactions of one configuration option setup for a combination of tax regime and legal entity or business unit.

Note

The level of detail of tax rounding definitions for the taxes in the tax regime must equal or exceed the level of detail of the service provider tax rounding definitions.

Inclusive Taxes: Explained

Calculating tax on a transaction as inclusive of the line amount is generally a business decision. This decision is based on the relationship between the transacting parties and the items or taxes involved.
Taxes applicable on a transaction are made inclusive of the item line amount either:

- Manually
- Automatically

**Manual Approach**

In the manual approach, you access the calculated tax lines on a transaction and select the *Inclusive* option. This action includes the calculated tax amount with the item value.

However, this option is controlled through two factors:

- Privileges are assigned to the users for accessing and editing the calculated tax lines.
- Setup restrictions are applied to edit the *Inclusive* option on the calculated tax lines.

**Automatic Approach**

In the automatic approach, you can configure the tax setup and calculate the tax on a transaction as inclusive of the item line amount. Since this requirement is primarily driven by the tax legislation and the business relationship between the transacting parties, the option for configuring the inclusiveness is made available on the tax and tax rate definition and the third party and legal reporting unit tax profiles on the tax registration and general data tabs. The tax determination process uses a hierarchy approach to evaluate the defined setup and applies the inclusiveness option on the transaction.

In tax setup there are options to choose for applying the inclusiveness on a transaction. They are:

- **Standard noninclusive handling**: This option calculates the taxes as exclusive of the given transaction line amount.
- **Standard inclusive handling**: This option calculates the taxes as inclusive of the given transaction line amount.
- **Special inclusive handling**: This option calculates the taxes as inclusive of the given transaction line amount, but the calculation methodology differs from the standard inclusive process.

The following table illustrates the calculation methodology used with each of these options when a transaction line amount is 1000 USD and the applicable tax rate is 10% of the taxable basis amount, for example, line amount:

<table>
<thead>
<tr>
<th>Method</th>
<th>Calculation</th>
<th>Taxable Basis Amount</th>
<th>Tax Amount</th>
<th>Transaction Line Amount</th>
</tr>
</thead>
<tbody>
<tr>
<td>Standard Noninclusive</td>
<td>1000 USD * 10/100</td>
<td>1000 USD</td>
<td>100 USD</td>
<td>1100 USD</td>

<tr>
<td>Standard Inclusive</td>
<td>1000 USD * 10/110</td>
<td>909.09 USD</td>
<td>90.91 USD</td>
<td>1000 USD</td>
</tr>
<tr>
<td>Special Inclusive</td>
<td>1000 USD * 10/100</td>
<td>900 USD</td>
<td>100 USD</td>
<td>1000 USD</td>
</tr>
</tbody>
</table>
Tax Amount Rounding: Explained

Taxes applicable on a transaction are generally calculated as the taxable basis multiplied by the tax rate equals the tax amount. This calculated amount can result in an odd value or with a large number of decimal place. You can configure the tax setup to adjust or round the tax calculation according to the specific requirements of the transacting parties and tax authority or to the accepted currency denominations.

Key parameters that influence the rounding of calculated tax amount are:

- **Tax precision**: The number of decimal places to which to calculate the tax amount.
- **Minimum accountable unit**: The smallest currency unit that a tax amount can have.
- **Rounding level**: The transaction level at which the rounding is to be performed. The available options are **Header** and **Line**.
- **Rounding rule**: The method that is used to round off the calculated taxes to the minimum accountable unit. The available options are **Up**, **Down**, and **Nearest**.

Define the key parameters at various places within Oracle Fusion Tax. The rounding process derives the tax precision and minimum accountable unit details from the tax setup. The rounding process derives the rounding rule and rounding level details through the predefined processing hierarchy involving:

- Configuration owner tax options defined for the configuration owner and event class
- Event class options for the event class
- Party tax profiles of the parties or party sites as given in the rounding precedence of the configuration owner tax options or in the derived registration party
- Tax

---

**Note**

If you plan to use a third party service provider then you must define tax rounding information that is at least as detailed as the rounding information of the service provider.

---

Manage Configuration Options and Service Subscriptions

**Configuration Options: Explained**

Set up configuration options to associate tax regimes with the parties in your company that have a tax requirement under these tax regimes.

There are two fundamentally different approaches to tax configuration options namely:
• Using tax configuration setup defined within Oracle Fusion Tax.
• Using an external tax service provider.

Using Tax Configuration Setup Defined Within Oracle Fusion Tax

Use the tax configuration setup in Oracle Fusion Tax to calculate, record, and account for transaction taxes on transaction taxable transactions.

The following concepts control how this setup is managed, used, and shared:

• Tax configuration owner
• Tax content subscription
• Existing tax option

Tax Configuration Owner

The tax configuration owner is a business unit, legal entity, or the global configuration owner that owns the data. The global configuration owner is an abstract owner which is used to define the owner of content that can be shared by any business units and first party legal entities.

Identify a specific first party legal entity as a parent first party organization to allow the configuration to be owned by a specific first party and shared by other parties. You can then share this setup with another first party legal entity or business unit for their transactions. Use a parent first party organization tax configuration to share among a group of first party organizations but you still have the tax setup managed by a single first party organization.

In the case of global configuration owner, if you are assigned the Create Tax Regime privilege, you have update rights to all tax configuration data maintained by the global configuration owner.

Tax Content Subscription

Use tax content subscriptions to define which configuration owner's setup is used for transactions for a specific first party legal entity or business unit for a specific tax regime. Also, use tax content subscriptions to specify whether any shared content can be overridden by the subscribing party to allow unique, separate setup for certain tax content.

Party override is permitted for the following setup:

• Tax
• Tax status
• Tax rate
• Tax recovery rate
• Tax rules
  Do this indirectly by adding higher priority rules specific to the subscribing first party legal entity or business unit.

The content subscription options are:
### Tax Content Subscription

<table>
<thead>
<tr>
<th>Tax Content Subscription</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common configuration</td>
<td>For tax processing, the tax determination process uses the shared tax content defined and maintained by the global configuration owner.</td>
</tr>
<tr>
<td>Party-specific configuration</td>
<td>The specified first party organization defines and maintains its own tax content. For tax processing, the tax determination process uses only the tax content owned by the specific first party legal entity or business unit.</td>
</tr>
<tr>
<td>Common configuration with party overrides</td>
<td>This option is similar to the common configuration in that it allows you to use tax content owned by the global configuration owner. However, you can also maintain party-specific content which is used in preference to the common configuration content. In the absence of tax content owned by the specific first party organization, the tax determination process uses the tax content owned by the global configuration owner.</td>
</tr>
<tr>
<td>Parent first party organization with party overrides</td>
<td>This option is similar to the common configuration with party override subscription except instead of the tax content being owned by the global configuration owner it is owned by a specific first party legal entity. You can override the specific first party setup.</td>
</tr>
</tbody>
</table>

A similar concept is used to define where you use tax exceptions for a specific tax configuration. The tax subscription option available for product exceptions is dictated to some extent by the main tax content subscription as follows:

<table>
<thead>
<tr>
<th>Options Defined for Tax Content Subscription</th>
<th>Content Subscription Options Available for Product Exceptions</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common configuration</td>
<td>Common configuration</td>
<td>For tax processing, the tax determination process uses tax exceptions defined and maintained by the global configuration owner.</td>
</tr>
<tr>
<td>Party-specific configuration</td>
<td>Party-specific configuration</td>
<td>The specified first party organization defines and maintains its own tax exceptions. For tax processing, the tax determination process uses only the tax exceptions owned by the specific first party organization.</td>
</tr>
<tr>
<td>Common configuration with party overrides</td>
<td>Common configuration</td>
<td>For tax processing, the tax determination process uses tax exceptions defined and maintained by the global configuration owner.</td>
</tr>
<tr>
<td>Common configuration with party overrides</td>
<td>Party-specific configuration</td>
<td>The specified first party organization defines and maintains its own tax exceptions. For tax processing, the tax determination process uses only the tax exceptions owned by the specific first party organization.</td>
</tr>
<tr>
<td>Parent first party organization with party overrides</td>
<td>Party-specific configuration</td>
<td>The specified first party organization defines and maintains its own tax exceptions. For tax processing, the tax determination process uses only the tax exceptions owned by the specific first party organization.</td>
</tr>
</tbody>
</table>

Set up tax configuration options when you create a tax regime or when you create a party tax profile for a first party legal entity or business unit. Both setup flows display and maintain the same party or regime definitions. Specify effective start and end dates to identify which configuration should be used based on the transaction date. You can enable the business unit so that Oracle Fusion Tax automatically uses the configuration of the legal entity. Once you set this option the application records the date it occurred as the start date. This date is used and compared to the transaction dates to identify if the application uses the legal entity subscription in preference to the subscription of the business unit. The specific first party legal entity that is used is defined by the legal entity associated with the transaction.

**Existing Tax Option**

Copy a tax from an existing tax in the Manage Taxes page to share tax registrations and tax jurisdictions while maintaining two versions of the same tax, owned by two different tax configuration owners each with their own tax statuses, tax rates, and tax rules. For example, this is useful when you set up US sales and use tax that requires a significant number of tax registrations and tax jurisdictions.

**Using External Tax Service Provider**

Oracle Fusion Tax lets you use the tax services of external service providers for tax calculation of US Sales and Use Tax on Receivables transactions. Oracle Fusion Tax provides transparent integration between the external provide tax service and Oracle Fusion Receivables.

You can use the tax services of these external service providers:
- **Taxware, LP: a First Data Company**
- **Vertex, Inc.**

The setup for provider services is called a service subscription. A service subscription applies to the transactions of one configuration option setup for a combination of tax regime and legal entity or business unit. Set up service subscriptions when you create a tax regime or when you create a party tax profile for a first party legal entity or business unit. Specify effective start and end dates to identify which configuration should be used based on the transaction date.

**Content Subscriptions: Critical Choices**

Choose which of the following tax content subscription options to use to optimize your tax setup:
- Whether to use service subscriptions versus Oracle Fusion tax content.
- What type of tax configuration options to use.
- When to change from business unit to using tax configuration at the first party legal entity.
• When to use create from an existing tax option.

**Using a Service Subscription Versus Oracle Fusion Tax Content**

Use the tax services of external service providers where tax content is required for Receivables transactions for a significant number of tax jurisdictions. You should not use a service provider if their use is not needed to support US Sales and Use Tax regimes or you need to create and maintain tax regimes outside of the United States.

You can use the tax services of these external service providers:
• Taxware, LP: a First Data Company
• Vertex, Inc.

**Using Tax Configuration Options**

If you decide not to use an external service provider or you need to create tax content for tax regimes outside the US then create and maintain your tax content in Oracle Fusion Tax.

Once the decision is made to use Oracle Fusion Tax you need to choose the level of tax configuration options. Sharing tax content prevents the need for duplicate maintenance with its inefficiencies and potential inconsistencies. Consider these scenarios and options:

<table>
<thead>
<tr>
<th>Scenario</th>
<th>Option</th>
</tr>
</thead>
<tbody>
<tr>
<td>You have a single central corporate tax center responsible for maintenance of tax setup for all legal entities and business units.</td>
<td>Use the common configuration with party override option. This allows a single tax setup to be created and maintained by the corporate tax center.</td>
</tr>
<tr>
<td>You need to have strict control of who can maintain the tax content.</td>
<td>Use the common configuration option. By not allowing party override you restrict the access to the global configuration owner to an authorized user who can maintain all of the tax content.</td>
</tr>
<tr>
<td>You have regional centers responsible for tax content.</td>
<td>Use the parent first party configuration with party override option. This permits a regional setup with an actual or logical parent legal entity to be created and maintained by each regional center.</td>
</tr>
</tbody>
</table>

Even if there is no obvious need to share tax configuration, for example, there is only a single first party legal entity operating in each tax regime, significant business events such as takeovers or mergers may mean that there could be a future need to share content. In this case the original first party legal entity can act as the configuration owner and then any subsequent first party can subscribe to the first party’s content using the parent first party configuration with party override. Alternatively, set up the original tax content using global configuration owner in preparation for any future business event that requires tax content to be shared.

**Changing from Business Unit to Using Tax Configuration at the First Party Legal Entity**

If you can standardize your tax setup across all business units for a given legal entity then consider moving to configuring and using tax setup at the legal entity.
level. Set the **Use subscription of the legal entity** option on the business unit tax profile. Oracle Fusion Tax records the date this occurs and compares it to the transaction date to identify if the legal entity subscription should be used in preference to the subscription to the business unit.

**Using Create from an Existing Tax Option**

Create a tax from an existing tax when you have a need to share tax jurisdictions and tax registrations. You maintain the tax jurisdictions and tax registrations once for taxes with the same name within the same tax regime owned by different configuration owners.

**Tax Configuration Options in the Tax Determination Process: How They Are Used**

At transaction time the owner of the transaction derives the configuration options that are used. When you enter a transaction for a given first party organization, the tax data applied to that transaction is determined by the configurations defined for the combination of that first party organization (business unit or first party legal entity) and the tax regime derived from the addresses or from the tax classification codes used on the transaction.

**Settings That Affect the Application of Tax Data on Transactions**

Use tax content subscriptions to define which configuration owner’s setup is used for transactions for a specific first party legal entity or business unit for a specific tax regime. Also, use tax content subscriptions to specify whether any shared content can be overridden by the subscribing party to allow unique, separate setup for certain tax content.

Tax content subscription options are:

- Common configuration
- Party-specific configuration
- Common configuration with party overrides
- Parent first party organization with party overrides

**How Tax Data Is Determined**

Based on the defaults and tax rules you have defined, tax data is applied to transactions as follows:

<table>
<thead>
<tr>
<th>Configuration for Taxes and Rules Option</th>
<th>Tax Content Available</th>
</tr>
</thead>
</table>
| Common configuration                    | • The tax determination process uses only the tax content owned by the global configuration owner.  
• If you manually override tax information on the transaction only tax content owned by the global configuration owner is displayed in the list of valid values available. |
• The tax determination process uses only the tax content owned by the first party organization, business unit or first party legal entity, for whom the transaction is being entered.

• If you manually override tax information on the transaction only tax content owned by the first party organization is displayed in the list of valid values available.

Note
For the first party organization it can be the business unit owning the tax content or the first party legal entity-owned setup depending on the specific subscription being used.

• The tax determination process uses any tax content owned by the first party for whom the transaction is being entered. In the absence of tax content owned by that first party organization, the tax determination process uses tax content owned by the global configuration owner.

• If you manually override tax information on the transaction both the override tax content owned by the specific first party and the tax content owned by the global configuration owner that you have not overridden are displayed in the list of valid values available.

• The tax determination process uses any tax content owned by the first party for whom the transaction is being entered. In the absence of tax content owned by the first party organization, the tax determination process uses tax content owned by the parent first party organization.

• If you manually override tax information on the transaction both the override tax content owned by the specific first party and the tax content owned by the designated parent first party organization that you have not overridden are displayed in the list of valid values available.

If you are using product exceptions, those exceptions are applied to the transactions as shown in the following table:

<table>
<thead>
<tr>
<th>Configuration for Product Exceptions</th>
<th>Tax Exceptions Available</th>
</tr>
</thead>
<tbody>
<tr>
<td>Common configuration</td>
<td>The tax determination process uses only the tax exceptions defined and maintained by the global configuration owner.</td>
</tr>
<tr>
<td>Party-specific configuration</td>
<td>The tax determination process uses only the tax exceptions owned by the specific first party organization.</td>
</tr>
</tbody>
</table>
Setting Up Tax Configuration Options: Worked Example

This example demonstrates how you set up the appropriate tax configuration options for your company that has three regional centers. These centers are responsible for tax setup and maintenance among other corporate activities. Each of these regional corporate centers is associated with a first party legal entity and business unit.

Your company has their regional centers in:

- North America (NAM), based in Redwood City, California, US
- Asian and Pacific (APAC), based in Melbourne, Australia
- Europe, Middle East, and Africa (EMEA), based in London, UK

Each country has a single first party legal entity with a single business unit, except for:

- Countries which have the regional corporate centers have a first party legal entity and business unit for each corporate center.
- Sales, marketing, and manufacturing organization has a first party legal entity and business unit.

Create tax regimes for each country and the appropriate tax configuration options.

Prerequisites

To create the appropriate tax configurations, you must set up the following:

1. The legal entities for:

<table>
<thead>
<tr>
<th>First Party Legal Entity</th>
<th>Country</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMEA LE</td>
<td>UK</td>
</tr>
<tr>
<td>GB LE</td>
<td>UK</td>
</tr>
<tr>
<td>FR LE</td>
<td>FR</td>
</tr>
<tr>
<td>DE LE</td>
<td>DE</td>
</tr>
<tr>
<td>APAC LE</td>
<td>AU</td>
</tr>
<tr>
<td>AU LE</td>
<td>AU</td>
</tr>
<tr>
<td>SI LE</td>
<td>SI</td>
</tr>
<tr>
<td>NZ LE</td>
<td>NZ</td>
</tr>
<tr>
<td>NAM LE</td>
<td>US</td>
</tr>
<tr>
<td>US LE</td>
<td>US</td>
</tr>
<tr>
<td>CA LE</td>
<td>CA</td>
</tr>
</tbody>
</table>

2. The sales, marketing, and manufacturing organization’s business unit uses the tax configuration of the legal entity.
3. The relevant tax regimes for each country’s tax include:

<table>
<thead>
<tr>
<th>Region</th>
<th>Country</th>
<th>Tax Regime</th>
<th>Tax</th>
</tr>
</thead>
<tbody>
<tr>
<td>EMEA</td>
<td>United Kingdom</td>
<td>GB VAT</td>
<td>GB VAT</td>
</tr>
<tr>
<td>EMEA</td>
<td>France</td>
<td>FR VAT</td>
<td>FR VAT</td>
</tr>
<tr>
<td>EMEA</td>
<td>Germany</td>
<td>DE VAT</td>
<td>DE VAT</td>
</tr>
<tr>
<td>APAC</td>
<td>Australia</td>
<td>AU GST</td>
<td>AU GST</td>
</tr>
<tr>
<td>APAC</td>
<td>Singapore</td>
<td>SI VAT</td>
<td>SI VAT</td>
</tr>
<tr>
<td>APAC</td>
<td>New Zealand</td>
<td>NZ VAT</td>
<td>NZ VAT</td>
</tr>
<tr>
<td>NAM</td>
<td>United States</td>
<td>US SALES TAX</td>
<td>• US STATE SALES TAX</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• US COUNTY SALES TAX</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• US CITY SALES TAX</td>
</tr>
<tr>
<td>NAM</td>
<td>Canada</td>
<td>CA HST &amp; GST</td>
<td>• CA HST</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• CA GST</td>
</tr>
</tbody>
</table>

**Setting Up Tax Configuration Options**

1. On the Create Legal Entity Tax Profile page select EMEA LE in the Legal Entity field. In the Configuration Options tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>GB VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>Blank</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click Save and Create Another.

2. Select GB LE in the Legal Entity field. In the Configuration Options tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>GB VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>EMEA LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>
Click **Save and Create Another**.

3. Select FR LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>FR VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>EMEA LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

4. Select DE LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>DE VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>EMEA LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

5. Select APAC LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>AU GST</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>Blank</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

6. Select AU LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>AU GST</td>
</tr>
<tr>
<td>Field</td>
<td>Value</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>--------------------------------------------</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>APAC LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

7. Select SI LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>SI VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>APAC LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

8. Select NZ LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>NZ VAT</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>APAC LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

9. Select NAM LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>US SALES TAX</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Party-specific configuration</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>Blank</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.
10. Select US LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>US SALES TAX</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>NAM LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Create Another**.

11. Select CA LE in the **Legal Entity** field. In the **Configuration Options** tab enter:

<table>
<thead>
<tr>
<th>Field</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax Regime Code</td>
<td>CA GST &amp; PST</td>
</tr>
<tr>
<td>Configuration for Taxes and Rules</td>
<td>Parent first party with party overrides</td>
</tr>
<tr>
<td>Configuration for Product Exceptions</td>
<td>Parent first party organization</td>
</tr>
<tr>
<td>Parent First Party Organization</td>
<td>NAM LE</td>
</tr>
<tr>
<td>Effective Start Date</td>
<td>01-Jan-01</td>
</tr>
</tbody>
</table>

Click **Save and Close**.

**FAQs for Define Tax Regimes**

**What's a service subscription?**

A service subscription is the setup for provider services. It applies to the transactions of one configuration option setup for a combination of tax regime and legal entity or business unit. Oracle Fusion Tax lets you use the tax services of external service providers for tax calculation of US Sales and Use Tax on Oracle Fusion Receivables transactions.

You can use the tax services of these external service providers:

- Taxware, LP: a First Data Company
- Vertex, Inc.

If you integrate with a tax service provider, these actions are not required for Receivables transactions:

- Entering tax classification codes on transaction lines.
- Entering transaction line attributes in the Additional Tax Determining Factors region.

Tax service provider integration returns the calculated tax lines to Oracle Fusion Tax. The tax lines for Receivables transactions returned by tax service providers are stored in Oracle Fusion Tax similar to the way tax lines calculated by the application itself are stored.
Why are controls and defaults important?

Throughout Oracle Fusion Tax care is taken to minimize your effort in creating setup. One way of doing this is the extensive use of defaulting so that you can enter your data once and use the defaults that appear on the subordinate or child records where applicable. For example, many values you enter on the tax regime appear as defaults on each tax that is associated to that tax regime. Generally, you can override the data where necessary if the defaulted value is not correct. Also, to ensure maximum flexibility, as well as to ensure that the accuracy and integrity of the data and transactions are maintained, Oracle Fusion Use Tax makes extensive use of data-driven controls that enable and control how tax functionality works. For example, you have the requirement to set up tax recovery for value-added tax (VAT) processing. Enable the Allow tax recovery option on the tax record so you can set up tax recovery rates for this type of tax.

Define Product Tax Classifications

Define Product Tax Classifications: Overview

Many tax regimes define rules for specific products or types of products. This is often done to stimulate or enhance trade in these specific products or to ensure that certain products or product types are excluded from taxes where they are considered staples of life. To support these requirements Oracle Fusion Tax has extensive and powerful features to allow items to be classified. They make extensive use of the Oracle Fusion Inventory catalog functionality. If you do not implement Inventory you can use product category fiscal classifications as an alternative classification in Oracle Fusion Tax. Set up your product classifications in the Define Product Tax Classifications activity.

For example, value-added tax (VAT) in the UK exempts children clothing and normal foods from Great Britain’s (GB) VAT. It is also common that tax authorities vary the tax status of product types depending on how they are planned to be used. For example, a company purchases products that are subject to VAT. The use of these items is not related to the company’s sale of taxable supplies. Therefore, the company cannot recover any VAT or can only partially recover VAT on those purchases.

There has also been a recent trend to introduce antifraud tax legislation for specific products so that they can be treated in a different way to prevent fraud. For example, the GB Missing Trader Intra Community antifraud legislation specifies that certain types of business-to-business domestic supplies of certain, typically high value, electronic products, such as mobile phones, computer equipment and accessories are reversed charged even when there is a domestic supply. For more information on GB Missing Trader Intra Community legislation, see Her Majesty’s Revenue and Customs (HMRC) - Business Brief 10/06.

The following product classifications for tax purposes can be used within Oracle Fusion Tax and are summarized in the following table:
### Define Project Contract Configurations: Define Transaction Taxes

<table>
<thead>
<tr>
<th>Product Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Product fiscal classification types and codes</td>
<td>Use this classification to group items for tax determination and reporting purposes. This functionality uses the Oracle Fusion Inventory catalog and item functionality and therefore, you can only use it when this functionality is installed.</td>
</tr>
<tr>
<td>Product category fiscal classification codes</td>
<td>Use this classification where Inventory is not installed. It is used to classify transaction lines for tax determination and reporting purposes.</td>
</tr>
<tr>
<td>Intended use fiscal classifications</td>
<td>Use this functionality for tax determination and reporting purposes. Use this classification where transaction lines need to be classified based on the intended use of the product defined on that item.</td>
</tr>
</tbody>
</table>

---

**Tip**

When available use the product fiscal classifications in preference to product categories, because the application automatically derives product fiscal classifications at transaction time based on the items defined on the transaction line and their relationship to the applicable catalog classification.

You can use product category fiscal classifications in conjunction with product fiscal classifications. This combination allows you to define two different determining factors at transaction time.

---

### Define Basic Catalogs

#### Catalogs: How They Work Together

A catalog is a collection of categories that you use to classify items. You can organize the categories into a hierarchy the represents a taxonomy. You create new categories only in the context of a catalog. You can add existing categories to one or more catalogs, either from another catalog or as shared categories from a source catalog.

You can set the **Catalog Content** value to **Items at all levels** which allows items to be assigned to any level within the category hierarchy, not only to the leaf levels.

The following diagram shows the relationships of the catalog components.
**Catalog**
A catalog is a collection of categories that are organized to define a classification of items. The top most level of a catalog is the catalog root. All categories for the first level in the category hierarchy are associated with the catalog root through the catalog category association component.

**Category**
A category is a component of a catalog that represents a portion of the classification defined by the categories and category hierarchy in the catalog. You can associate a category to a catalog through the catalog category association. Both the shared category and the native category are associated thorough the catalog category association.

**Catalog Category Association**
Catalog category association represents the relationship between a catalog and a category, or a parent category and a child category. Each catalog category association represents one relationship between the catalog and a category or one relationship between a parent category and a child category.

**Item Category Assignment**
Item category assignment represents the assignment of the item to a category in a catalog. Each item category assignment represents the relationship between a category and an item.
**Item**

An item represents objects such as a product, service or template. An item is assigned through the item category assignment component.

**Attachment or Image**

Information is associated to the catalog and/or category, or both, through the attachment framework. Multiple attachments are supported but you can associate only a single attachment or attachment type image with a catalog or category.

**Catalog Formatting: Explained**

The format of a catalog is defined at the time the catalog is created and controls the behavior of the catalog at runtime.

When you format a catalog the layout controls three main areas and includes the following tasks, some fields are required, and others are optional.

- Catalog configuration
- Date enablement
- Category sharing

**Catalog Configuration**

You can configure the catalog, and this affects how the content behaves. The catalog configuration contains a set of attributes that define the catalog configuration. These attributes interact to define the runtime behavior of the catalog.

The configuration functions are:

- Catalog code: A unique identifier that is used.
- Catalog structure: The key flexfield structure used to define the catalog.
- Controlled at: Controls how items are assigned to categories and has two values. The first value is master level, which enables the automatic assignment of items to all child organizations associated with the master organization, if the current context is a master organization. The second value is organization level, which assigns the item only to the organization in the current context.
- Default category: Applies any time a new item is created. The newly created item is assigned to this category within the catalog automatically. The automatic assigned is controlled by the functional area.
- Catalog content: Controls what content can be added to the catalog and where the content can be added. This attribute has three values:
  - The Item at leaf levels allows items to be added only to the bottom level categories in the hierarchy.
  - The Items at all levels allows items to be assigned to any category in the hierarchy regardless of level.
Categories only allows categories to be added only to the catalog.

Allow multiple item category assignment: When this option is selected, you can assign an item to one or more categories in the catalog. The default is deselected, which means that each item can be assigned to only one category in the catalog.

Enable hierarchies for categories: When this option is selected, you can create a hierarchy for the catalog. The default is deselected, which means that the catalog cannot have a hierarchy and categories are associated with the catalog root.

Enable automatic assignment of categories: When this option is selected, the catalog is built by automatically associating all categories, based on matching the catalog structure value to the category structure value.

Catalog Date Enablement

The date enablement function controls when the catalog is in an active state or inactive state by using the start date and end date attributes.

Category Sharing

The category sharing function enables sharing by reference to categories from a designated source catalog.

The sharing function has these attributes:

- Source catalog: A catalog that does not have sharing enabled from which categories, category hierarchies, and assigned items can be added to the catalog.
- Sharing content: Controls what content can be added from the source catalog. This attribute has three values:
  - Categories only: Only categories without assigned items can be shared.
  - Items only: Only categories with assigned items can be shared.
  - Items and categories: All categories can be shared.

Catalog Details: Explained

You can change a default category so that you can use it for item creation, or modify the inactive date so that the category is no longer used as you update a catalog. You can correct mistakes or reclassify the category due to shifting relationships within the category hierarchy.

You can view and edit a catalog on the Edit Catalog page when you have editing rights. For users that do not have rights to edit, the page is in read only mode.

The following aspects are important regarding managing and editing catalog details:

- Catalog header region
- Catalog detail tab
• Category hierarchy tab

**Catalog Header Region**

This region contains the catalog name and description, the selection of the default category and the start and end date for the catalog.

**Catalog Detail Tab**

The Detail tab contains:

• The configuration attributes for the catalog that controls the runtime behavior for the catalog.
• The sharing attributes for the catalog which controls the source catalog that will be used for sharing from and what content can be shared.
• The additional information which contains the descriptive flexfields defined for the catalog.

**Category Hierarchy Tab**

This contains the category hierarchy region in which the category hierarchy can be created and maintained. In addition, items can be assigned, and the usage of the category in other catalog can be viewed, and the attributes for the category and catalog category association can be edited.

**Automatic Assignment Catalogs: Explained**

The automatic assignment catalog feature enables you to reduce the cost of creating and maintaining a catalog. It is a simple way to create a nonhierarchical catalog because you do not have to add categories manually to the catalog.

All categories that have the same category structure value as the catalog are automatically assigned and associated to the catalog when you create a catalog category association for each category. Note that if you create a category in another catalog with the same structure value as the automatic assignment catalog, the category is added to your catalog. The categories displayed for auto assignment catalogs are refreshed only at startup and after you save.

**Automatic Assignments**

The automatic assignment feature is enabled during catalog creation when you select the Enable automatic assignment of category check box. When you open a new catalog, any categories that have the same category structure value as the catalog structure value for the catalog are automatically assigned to the catalog.

For example, Purchasing may maintain a master catalog containing all categories that represent commodities. Each commodity team can create categories for their commodity in their own catalog.

• The master catalog for Purchasing is named Purchasing and is configured during creation to support the automatic assignment of categories.
• The Electronic commodity team creates a catalog named Electronics and proceeds to create categories that represent the classification of their commodity. The Electronic commodity team creates the categories televisions, computers, and home theaters.
• The other commodity teams create and maintain separate catalogs.
• Because you enabled automatic assignments for the Purchasing catalog, any categories created by the commodity teams are added to the catalog automatically. The Purchasing managers can view the collection of all commodities represented as categories in the Purchasing catalog.

Manage Catalogs

Catalog Edits: Explained

The Edit Catalog dialog is a shared page that has two modes, view and update. The view mode displays the selected catalog in a read-only file. The update mode displays the selected catalog in an editable file. You must have edit catalog privileges to access the catalog in update mode. You can edit only an active or future-dated catalog.

The following fields are editable in the catalog:

• Catalog Name
• Description
• Start Date
• End Date
• Default Category
• Allow multiple item category assignment
• Addition Information
• Category Hierarchy
• Category Details
• Items assigned to category

Default Category

You can edit this field to select another category as the default category for item creation. You cannot remove the default category if the catalog is assigned to a functional area that requires a default category to be specified.

Allow Multiple Item Category Assignment

This check box is editable only until you assign an item to a category in the catalog.

Addition Information

You can edit the values of the descriptive flexfields attributes.

After you make changes, clicking the Save button saves the changes to the database but will does not close the Edit Catalog page. Clicking the Save and Close button saves the changes to the database and closes the Edit Catalog page.
**Categories and Catalog Relationships: Explained**

Catalogs are used to organize and classify collections of items by associating categories to the catalog. The categories are organized to form a taxonomy and items are assigned to the categories. When a category is associated with the catalog a catalog category association is created which specifies the relationship of the association. The catalog category association may also represent the relationship between two categories, for example a relationship between a parent category and a child category.

The following aspect is important regarding catalog category association:

- Date enablement attribute value

**Catalog Category Association**

The catalog category association is date enabled providing the control of when the catalog category association is active in the catalog and when the catalog category association is inactive. The catalog category association has two attributes to support date enablement; the start date and the end date. The start date is value is the first day that the catalog category association is available or active for use and the end date is the last day the catalog category association can be used, after this date the catalog category association is inactive. The date enablement attribute values are also used to control the visibility of content and the behavior of the category in the catalog. If a category association is inactive or end dated, having the value of the end date attribute past the current date, then the items cannot be assigned to the category.

A catalog category association will be set to inactive state when the category referenced by the catalog category association is set to an inactive state automatically, but the display will not be refreshed automatically.

**Date Enablement for Catalogs and Categories: Explained**

The catalog, categories, and catalog category association use date enablement to determine if the object specified is active or inactive based on the start date and end date. The following are date enablement definitions:

- **Active** An object is active when the current date is later than or equal to the value of the start date, but earlier than or equal to value of the end date.

- **Inactive** An object is inactive when the current date is later than the value of the end date.

- **Future dated** An object is future dated when the current date is earlier than the value of the start date.

You set the date enablement attributes are used to determine when a catalog, category, or catalog category association is used or visible.

- On the Manage Catalog page, a table filter determines which catalogs appear. The default value for the choice list is Active, indicating that only active catalogs will be displayed. You can select the value All to view both active and inactive catalogs.
• On the Edit Catalog page, on the category hierarchy tab, two table filters determine what categories and catalog category associations appear. The default values for the two choice lists are **Active**, indicating that only active categories and active catalog category associations will be displayed. You can select the value **All** to view both active and inactive categories and catalog categories associations.

• Other applications also use the date enablement attributes to filter information retrieved through application programming interfaces or services for catalogs.

The following illustration provides the date enablement attributes for these objects. The catalog, category, or the catalog category association has an internal state that is active or inactive.

The following aspects are important regarding date enablement for catalogs and categories:

- Start date
- End date
- Catalog and category objects
- Catalog category association
- Catalog and category rules
Start Date

The start date is defined as the first date that the object can be active. The start date can be future dated by setting the value to a date later than the current date. The start date value defaults to the system date if no date is entered during catalog or category creation.

End Date

The end date is defined as the last date that the object can be active. The object is end dated one second after the date specified by the value of End Date, that is the next day at 12:00:01 a.m. You cannot set the end date in the past. Also, you can change the end date from a condition when the object is ended to a new end date greater than or equal to the system date, causing the object to go from inactive to active. The end date value is optional during catalog or category creation.

Catalog and Category Objects

The start and end dates have been added for the catalog and catalog category association. The inactive date for categories has been renamed as the end date and the start date has been added.

Catalog Category Association

The catalog category association is used to specify the parent and child relationships between catalogs and categories and for category to category relationships. The catalog category association date enablement is independent of the category data enablement, except for the case where the category is end dated; the association is ended automatically as well. The catalog category association dates represents the state of the category for the catalog in which the category is associated.

Catalog and Category Rules

When a catalog is inactive the following rules apply:

- All operations for the catalog are disabled; the catalog is not editable.
- The catalog cannot be used in other processes.
- The catalog can be viewed only if you set filters on the Manage Catalog page to a value of All, enabling you to view active and inactive catalogs.

When a category is inactive the following rules apply:

- All operations for the category are disabled; the category is not editable.
- The category cannot be added to other catalogs.
- The category can be viewed only if you set the filters on the Edit Catalog page to a value of All, enabling you to view active and inactive catalogs.
- The system sets the catalog category association for the inactive category to inactive.

When a catalog category association is inactive the following rules apply:
• The category may be inactive or active; if the category is active it can be edited.

• The catalog category associations and related category can be viewed only if you set the association filter on the Edit Catalog page to a value of All, enabling you to view active and inactive catalogs.

When a catalog is future dated the following rules apply:

• All the operations of the catalog are enabled and the catalog is editable.

• The catalog can be used in other processes, if allowed.

• The catalog can be viewed only if you set the filters on the Manage Catalog page to value of All.

Catalog Hierarchies: How They Fit Together

You use catalogs to organize and classify collections of items by associating categories with the catalog. You organize the categories to form a taxonomy and assign items to the categories. When you associate a category with the catalog, a catalog category association is created which specifies the relationship of the association. The catalog category association may also represent the relationship between two categories, for example, a relationship between a parent category and a child category.

The following diagram shows the relationships of the category hierarchy components:
Components

The components of a category hierarchy are:

- Catalog root: The topmost node in category hierarchy that represents the object called catalog.
- Category: The catalog component that is used to represent the classification structure.
- Catalog category association: The line in the diagram represents the relationship between a catalog and category or between a parent category and child category.
- Item category assignment: The dotted line in the dialog represents the relationship between a category and an item.
- Reference category: The category C5 in this diagram is shared as a reference category from a source catalog.
- Leaf level category: The lowest or bottom-level category in a category hierarchy. You can assign items to all levels in a category hierarchy if you configure the catalog to support this.
- Browsing category: The category C2 in this diagram is a browsing category. Browsing categories are categories that you add to the category hierarchy for the purpose of classification and do not have items assigned to them.

The category hierarchy does not have a limit on how many levels can be represented. The category hierarchy can have multiple hierarchies within a single category hierarchy.

Category Edits: Explained

Categories can be edited only from within an Edit Catalog page, the category hierarchy tab. The category can be edited by selecting row for the category in the category hierarchy table and editing the category information in the category detail panel. The category can only be edited if the category is active and the catalog is active or future dated.

The category information can be edited in both the details and items tabs.

Details and Items Tabs

The following fields are editable in the category:

- Category name
- Description
- Attachments
- Category start date
- Category end date
- Items assigned to category
After changes are made the **Save** button will save the changes to the database but will not close the Edit Catalog page. The **Save and Close** button will save the changes to the database and close the Edit Catalog page.

**Catalog Category Association: Explained**

The catalog category association can be edited only within the Edit Catalog page, in the category hierarchy tab. The catalog category association start date and end date attributes can be edited in the details region.

**Category Catalog Associations**

You select the category in the category hierarchy table for the catalog category association that is being edited, the category details are displayed in the right hand panel. The association start date and association end date are the only editable fields.

After completing the edits, click on the **Save** button to save your changes to the database, the Edit Catalog page will not close. The **Save and Close** button will save the changes to the database and close the Edit Catalog page.

**Category Details: Explained**

You can update category details when you select the row with the category in the category hierarchy table, the category details are displayed in the right hand panel in the user interface in an edit mode for all native categories. The category detail region contains information about the category that is associated to the catalog. It also contains the association start and end dates.

You can view and edit a catalog on the category details tab when you have editing rights. For users that do not have rights to edit, the page is in read only mode.

The following aspects are important regarding managing and editing category details:

- Category details tab
- Items tab
- Where used tab

**Category Details Tab**

The details tab contains information about the category that has been associated to the catalog. This information appears in all catalogs, since a category can be associated to one or more catalogs. The details tab contains the category configuration, category date enablement, association date enablement, and the additional attributes for the category.

The details tab contains attributes that define a category. Unstructured information is added through attachments. Images are added to a category and are displayed in the category details tab.
Items Tab

The item assignments are specific to the catalog where the category is associated.

Where Used Tab

The Where used tab contains a list of catalogs that the category is associated with.

Categories: Explained

You can create categories only in the context of a catalog, on the Edit Catalog page, Category hierarchy tab. When you select the Create icon in the category hierarchy table, it launches the Create Category dialog.

Consider the following important aspects when creating categories for catalogs:

- Create category region
- Configuration region
- Date enablement region
- Additional information region

Create Category Region

Enter a name and a meaningful description of the category in the create category region. Optionally, you can add an image and an attachment to this category.

Configuration Region

The key flexfield is determined during creation based on the catalog structure of the catalog. Enter the key flexfield segment values for the category. The number of key flexfield segment values depends on how you define the key flexfield at setup time. The category structure is the key flexfield structure instance that you create as part of the setup. When you define the key flexfield structure instance, you define the segments for the structure instance. For example, the family group and class group are segments. The segments appear in the Create Category dialog based on the key flexfield structure instance that you select.

The default value of the category content selection value is Items and Categories, but you can change the value. The values in the category content choice list vary based on the catalog content value.

The category content attribute value controls the content that you can add to this category.

- Items Only: Select to add only items to the category
- Categories Only: Select to add only categories to the category
- Items and Categories: Select to add both items and categories to the category
**Date Enablement Region**

Date enablement determines if an object is active or inactive based on the start date and end date. When categories are created, the default start date value is the current date. You can move the category start date beyond the current date to a future date within the category. The end date value is optional.

**Additional Information Region**

The additional information region contains all descriptive flexfield attributes that you set up for categories. You can edit the values of the descriptive flexfield attributes at the time of category creation.

After you complete the required fields for the catalog, clicking OK creates the category in the database, adds the category to the point of selection in the category hierarchy, and closes the dialog.

**Category Moves: Explained**

You use the move category function in the category tree table region of the Edit Catalog page. This is a table row action. The dialog is launched when you select an active or future dated category within the catalog and select this action. The move category function is disabled when the Enable hierarchies for categories check box is not checked or left unchecked.

Consider the following important aspects when moving categories within catalogs:

- Indentifying the new parent

**Indentifying the New Parent**

The dialog provides the current category parent and allows you to pick a new category parent. Only the legal category parents are displayed in the choice list. The category list within the New Parent choice list is filtered by based on a set of rules:

- The new parent category must be an active or future dated category; the end date value of the category must be later than the current system date.
- The value of the category content for the new parent category must allow the selected category to be added; the legal values are items and categories and categories only.
- A selected category associated with the catalog at a level below the categories at the root categories can be moved to the root of the catalog.
- The new parent category catalog category association must be active; the end date value of the catalog category association must be later than the current system date.

**Import Category Hierarchies: Explained**

Category hierarchy can be created and maintained through a spreadsheet interface reducing the amount of time to create and maintain catalogs. Existing
catalog content can be exported and the content used in other catalogs for catalog category hierarchies.

The following aspects are important regarding category hierarchy import used in catalogs:

- Spreadsheet interface
- Export category hierarchy

Spreadsheet Interface

You can manage the catalog category hierarchy to use the spreadsheet interface that is available in the Edit Catalog page by using the Export Hierarchy button to download existing catalog content, modify this content in a spreadsheet, and upload the content back into the Product Information Management application.

Export Category Hierarchy

You use export category hierarchy for example, when you need to provide the category hierarchy to a partner. Your partner has the capability to import the catalog file using an Excel spreadsheet.

You can export the category hierarchy from our catalog and it can be used by partners. If your partner has the Oracle Product Information Management solution, they can directly import the category hierarchy into their catalog.

Catalog or Category Attachments: Explained

Catalogs and categories support attachments and use a common component for managing attachment content. You can add attachments on both the Create Catalog and Edit Catalog pages.

The attachment component displays a green plus sign icon indicating that no attachments are available for the object. The Attachment dialog appears when you click the green plus sign icon. You define the attachment by selecting the attachment type, file name or Uniform Resource Locator (URL), title, description, and by indicating whether the attachment can be shared with other objects.

Once you define the attachments and click the OK button, that attachment title appears in the attachment component region of the page along with a red X icon that you can click to delete the attachment.

The attachment file types are:

- File
- Repository File/Folder
- Text
- URL

File

You must provide a title for the file and create a description for the attachment. You select a file to upload from your desktop.
Repository File/Folder

You click the **Browse** button to attach a repository file/folder from the document repository to a catalog. The attachment repository contains existing attachments and is organized as a set of folders. The **Browse** button launches the Attachment Repository dialog to enable you to select an attachment. You must provide a title for the repository file/folder and create a description for the attachment.

Text

Enter the text string in the field that you want to appear as an attachment. You must provide a title for the text and create a description for the text attachment.

URL

Enter the URL address to a web page that you want to attach to the catalog. You must provide a title for the URL attachment and create a description for it.

The **Share** check box alerts users that you added an attachment and the date that you performed the task.

Items to Categories Assignment: Explained

You can assign items to categories on the Edit Catalog page, category hierarchy tab, on the category detail item tab. You can assign items only to active categories and categories where the **Category Content** field value is **Items and Categories** or **Items Only**. In addition, you can configure catalogs to control item assignment to categories within the catalog by selecting the **Allow multiple item category assignment** check box, which allows items to be added to all levels of the category hierarchy.

You select items from a choice list and add them to the category. The choice list is filtered based on a set of rules:

- Item data level security: Displays only the items that the user has permission to view and assign.

- Organization context: Based on the organization context that is controlled by a choice list in the item table header, only the items assigned to organizations are displayed.

Controlling Item Assignment

You also control item assignment by selecting the value of the **Controlled at** check box. If you select the **Master Level** value and the organization context is a master organization, the items are automatically assigned to all child organizations that are associated with the master organization.

Catalog Publishing: Explained

Other applications can use catalog data if you export the catalog content. For example, you may want to export catalog content to use as a monthly report of all items assigned to a specific catalog. You can use the default publish template
provided in hyper text markup language (HTML). You can specify the content and layout of the catalog information. When the catalog is published, you select the format and initiate the creation of the content in the file.

The following aspects are important regarding catalog data to be published:

- Publish a catalog
- Type of catalog content that can be published

**Publish a Catalog**

You initiate a search for a catalog from the Manage Catalogs page, select the row corresponding to the catalog that you want to publish and select the **Publish** action. The application generates the report based on the default template in HTML format, and the locale prior to creation of the file. You can select a new template or format from the report window. The content displayed for items, categories, catalog categories, and catalog is based on the publish template.

**Type of Catalog Content That Can Be Published**

The default catalog publish template allows the publication of the catalog header details, category hierarchy, category details, and category item assignments. The order of a published report begins with the catalog header and the catalog category details. If the category has a child relationship then the catalog category association details for the child category follows. If the child category has a hierarchy, then the complete hierarchy under the category is published with the catalog category association details and categories details.

**FAQs for Define Basic Catalogs**

**How can I share catalog content?**

Categories can be shared across multiple catalogs allowing catalog content to be reused and saving the work needed to maintain multiple copies of the categories. In the case of category sharing, the category structure in the source catalog can be different than the native catalog.

Categories can be shared using two methods; the first method is directly associating the category to the catalog. The category is added to the catalog and can be edited in the catalog or any catalog the category is associated to. The items assigned to the category are not shared, but are assigned to the category in context with the catalog the category is associated with. For example, if the category name or description is changed in one catalog, the change will be reflected in all catalogs where the category is associated, but if items are assigned to a category, the assignment will be for that single catalog.

The second method of sharing categories is adding a category by reference into the catalog. During the creation of the catalog, sharing can be enabled by specifying a single source catalog that will be used for sharing by reference and setting the value of the sharing content to control what content will be shared from the source catalog. The advantage of using sharing by reference is source
catalog content can be shared to multiple catalogs and maintained in a single place, the source catalog. In addition, the referenced content can be more than one category, for example a complete category hierarchy and any assigned items to categories in shared content can also be reference within the catalog.

**How can I define category hierarchies?**

Categories can be organized to represent classification taxonomies. The hierarchy organizations for categories have parent and child relationships that form a tree structure. The category hierarchy is created and maintained within the Edit Catalog page, category hierarchy tab. The category hierarchy is shown in true relationship to the way it is defined.

The category hierarchy can be created using two methods: the first is manually creating the hierarchy by adding referenced categories, duplicating categories or creating category for the catalog.

The second method for creating the hierarchy is by importing the category hierarchy through the spreadsheet interface. The category hierarchy can be exported from other catalog or other sources, edited and imported into a new catalog, additionally it can be added manually to the spreadsheet.

The category hierarchy can be edited using **Move Category**. The catalog category association cannot be deleted, but can be end dated to make the catalog category association inactive. The category hierarchy table provides a choice list filter that controls what catalog category associations and categories area displayed based on the date enablement. The category hierarchy can also be edited by exporting the complete hierarchy, editing it and importing the category hierarchy back into the catalog.

**How can I duplicate categories?**

You can select and duplicate a category as a quick way to create a similar category configuration. Selecting the **Duplicate** icon action launches a Create Category dialog that has attribute fields populated based on the selected category attribute values. The category name is prefixed with **Copy**_ followed by the name of the selected category. You fill in the required field information in the key flexfield segment values which are blank. Once the category attributes are updated and the key flexfield segments values are entered, the **OK** button adds the newly created category into the category hierarchy of the selected category you have configured.

**How can I add categories?**

Categories are catalog components that are associated to a catalog for purpose of classification of items. You can add existing categories to the point of selection which can be a category in the hierarchy or the root of the catalog. If no category is selected, the default is the root of the catalog.

You can add categories by selecting the **Add Category** field and selecting the value **Add Category**. You can then search for existing categories based on the value of the catalog structure for the catalog. You can narrow the search for existing categories by using the **Advance Search** region in the dialog.
add each selected category by selecting the **Apply** button and the add category region remains open. The **OK** button adds a category if a category is selected and then closes the dialog.

**How can I add shared categories?**

Adding a shared category is similar to adding an existing category except the category is selected from the catalog that has been designated as a source catalog. The sharing content attribute value determines what content is shared from the source catalog. A category within a source catalog that has been added to a native catalog is also known as a referenced category. You use the drop list menu from the Add Categories menu, and the Shared Category option will be disabled if the catalog has not been configured for category sharing.

**How can I add images to a catalog or category?**

You can attach an image from your desktop or from a configured repository to a catalog or a category, or both. The image is displayed in the catalog detail and the category detail section of the catalog page. Only one image can be associated with a catalog or category. To attach an image, select the green plus icon to launch the Manage Attachment dialog. The image attachment type can have values of **File** or **Repository File/Folder** and is selected in this dialog. The title you provide for the image attachment will appear under the image that is displayed in the catalog. The description you provide is not displayed. **Browse** will allow you to select the file to be used as the image for the catalog or category. After the information is entered in to the dialog, you click the **OK** button to load the image and the image attachment title will be displayed under the image. The image will not initially be displayed until the catalog is saved. The image can be replaced with another image by selecting the red X to delete the existing image and entering a new image.

**What is catalog mapping?**

You use **Catalog Category** mapping to map categories of different catalogs to the reporting categories in other catalogs. This feature allows one or more categories within a catalog to be mapped to category in a second catalog. For example, suppose that you want to roll up the costs associated with allow items assigned to a set of categories in catalog. Catalog mapping allows you to select a category in a catalog, and map all the categories in the set to that category. When you use this feature you are required to write code to do the roll up as identified in the example.

**FAQs for Manage Default Catalogs**

**How can I map default catalogs?**

You can map a catalog to be assigned to a functional area such as Purchasing. When a catalog is assigned to a functional area, the catalog will behave based on the rules you defined for that functional area. Only one catalog can be assigned to a functional area.
Define Transaction Tax Classifications

Define Transaction Tax Classifications: Overview

Many tax regimes define rules for specific transactions or information related to the transaction. To support these requirements Oracle Fusion Tax has extensive and powerful features to allow the transaction process to be classified. These classifications provide a conceptual model to classify the type of transactions and documents related to the transaction. Set up your transaction process classifications in the Define Transaction Tax Classifications activity.

The following process classifications for tax purposes can be used within Oracle Fusion Tax and are summarized in the following table:

<table>
<thead>
<tr>
<th>Process Classification</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction business category</td>
<td>Use this classification to classify a transaction line to define the type of transaction.</td>
</tr>
<tr>
<td>Transaction fiscal classification</td>
<td>Use this classification to group transaction business categories so that tax rules setup and maintenance can be minimized.</td>
</tr>
<tr>
<td>Document fiscal classification</td>
<td>Use this classification where there is a need to relate documents to a transaction that affect the tax applicability or determination of transaction taxes on the transaction.</td>
</tr>
<tr>
<td>User-defined fiscal classification</td>
<td>Use this classification for classifying transaction lines where none of other classification are appropriate.</td>
</tr>
</tbody>
</table>

Tip

If possible, use other fiscal classifications that are automatically derived at transaction time in preference to the process classification which requires manual intervention at transaction time.

Use these classifications as determining factors within tax rules in the tax determination process, although you can also use them for tax reporting.

Transaction Business Categories: Explained

Use transaction business categories to classify transaction lines to drive tax determination and reporting.

Transaction business categories provide a hierarchy of up to five levels. The first level is predefined with standard events that are supported by Oracle Fusion Tax. The predefined levels are:

- EXPENSE_REPORT
• INTERCOMPANY_TRANSACTION
• PAYMENT_REQUEST
• PURCHASE_PREPAYMENT_TRANSACTION
• PURCHASE_TRANSACTION
• SALES_TRANSACTION
• SALES_TXN_ADJUSTMENT

Use the transaction business category functionality to add additional levels and transaction business categories to these levels. However, you cannot add additional level one transaction business categories, you can only add additional transaction business categories that are children, or lower levels, of the predefined level one records.

When defining additional transaction business categories, use the **Country** field to specify the taxation countries where the transaction business category is used. During transaction time, the taxation country is used to restrict the list of transaction business categories that are available on the transaction line to those that have been set up with the same country or where the country is blank.

When setting up transaction business categories, leave the **Country** field blank or use the country name as defined on any parent level of the record that is being added.

Use the Associated Transaction Fiscal Classifications region to link a specific transaction business category to the transaction fiscal classification. You can use this association to allow different transaction business categories to be linked to the same transaction fiscal classification. This facilitates in setting up tax rules using a specific transaction fiscal classification instead of creating multiple tax rules for different transaction business categories.

**Tip**

While setting up the transaction business categories, use different levels so that you can define all of the necessary tax rules at the highest level possible. This facilitates in minimizing the needed number of tax rules.

**Transaction Business Categories in Tax Rules**

The transaction business category tax determination factors allow you to use the transaction business category in tax rules. A combination of determination factor class, class qualifier, and determining factor represent these determination factors.

Use the transaction generic classification as the determining factor class, the level of the transaction business category being used, level 1, level 2, level 3, level 4, or level 5 as the class qualifier, and transaction business category as the determining factor.

When a country name is specified on the condition set, the application selects only those transaction business categories that match the country name or where the country name is blank on the transaction business category.
**Transaction Business Categories at Transaction Time**

During transaction time, enter the transaction business category on the transaction line to classify the transaction line for tax determining and reporting purposes.

The transaction business category is stored in the tax reporting ledger and is available for reporting.

**Transaction Business Categories: Example**

Transaction business categories classify transaction lines for tax determination and reporting.

The following scenario illustrates how transaction business categories can be used for tax determination and reporting in Brazil.

**Scenario**

In Brazil, you need to identify a transaction correctly to be able to report and determine the correct applicable taxes. Create specific transaction business categories as children of the sales transaction. The transaction business categories include:

<table>
<thead>
<tr>
<th>Level</th>
<th>Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Country</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SALES_TRANSACTION</td>
<td>Sales Transaction</td>
<td></td>
<td>1-Jan-1951</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE_MNFTRD_FOR_SALE</td>
<td>Interstate Manufactured for Sale</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE_MNFTRD_FOR_MANUFACTURE</td>
<td>Interstate Manufactured for Manufacture</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
</tbody>
</table>

To create these transaction business categories:

1. On the Manage Transaction Business Codes page select the SALES_TRANSACTION record.
2. Click Create Child Node. The Create Fiscal Classification Code page appears.
3. Enter the values as shown in the above table. By default, the start date is the start date of the sales transaction parent record, that is, 1-Jan-1951.
4. Specify the latest of:
   a. Earliest applicable transaction to be used in the implementation.
   b. Start date of the applicable Brazilian tax.

**Tip**
Specify the country name while creating transaction business categories. This ensures that a limited applicable list is presented while entering the transaction business category during transaction or tax rule creation.

---

**Tip**

While using the transaction business categories classification, classify the nonstandard items of your business as standard items. This can be modeled as a default tax rule and therefore, does not require an explicit classification or an explicit tax rule. Classify only exception items and define specific tax rules for them. For a standard item, none of the explicit tax rules are applicable and the default rate applies.

---

**Transaction Fiscal Classifications: Explained**

Use transaction fiscal classifications to categorize transaction business categories so that multiple transaction business categories can be classified and a single transaction fiscal classification can be used within the tax rules. This facilitates all of the applicable transaction business categories to trigger the relevant tax rule.

Transaction fiscal classifications provide a hierarchy of up to five levels. Each grouping of 1 to 5 levels is given a fiscal classification type group, which is used to retrieve all of the associated levels of one transaction fiscal classification type.

You assign each level a fiscal classification type code and name with associated start and end dates. Use the fiscal classification type code as the determining factor when you create tax rules. The start date must be equal to or before the earliest transaction date that triggers a tax rule that uses the applicable transaction fiscal classification.

Associate each fiscal classification type record with a tax regime that is used when the tax rules are created. This ensures that the list of values of the transaction fiscal classification is restricted by the tax regime for which the tax rule is being created.

---

**Tip**

Set the transaction fiscal classification start date to the earliest tax regime start date of any tax that uses the given transaction fiscal classification.

---

To create these transaction fiscal classifications:

1. On the Create Transaction Fiscal Classification Types page save the current transaction fiscal classification type values before proceeding to the next step of creating transaction fiscal classification codes, associating business categories, and specifying tax reporting codes.

2. Use the Edit Transaction Fiscal Classification Codes page to create the level 1 fiscal classification code nodes.

   a. Select the level 1 node.
b. Click the **Create Child Node** to create the subordinate levels. Create the subordinate levels up to the maximum levels defined for the transaction fiscal classification type group.

3. Associate the fiscal classification type record with one or more transaction fiscal classification codes. These codes are used to group the transaction business category, which is used in the tax rule as the condition set value.

---

**Tip**

While setting up the transaction fiscal classification, use different levels so that all of the necessary tax rules are defined at the highest level possible. This facilitates in minimizing the needed number of tax rules.

---

Associate and form a relationship between the transaction fiscal classification codes and the transaction fiscal classification. This relationship is used during transaction time to derive the transaction fiscal classification that validates the tax rules that use the transaction fiscal classification.

Use the Associated Codes Details region to define the relationship between transaction fiscal classification codes, the transaction business category codes, and the tax reporting codes. Use the Transaction Business Category Codes and the Tax Reporting Codes tab to define the relationship.

**Transaction Fiscal Classifications in Tax Rules**

The transaction fiscal classification tax determination factors allow you to use the transaction fiscal classifications in tax rules. A combination of determination factor class and determining factor represent these determination factors.

Use the transaction fiscal classification as the determining factor class and the specific transaction fiscal classification type as the determining factor.

**Transaction Fiscal Classifications at Transaction Time**

During transaction time, use the transaction business category entered on the transaction line to classify the transaction line. The application derives the transaction fiscal classification using the defined relationship between the transaction business category and the transaction fiscal classification.

The tax determination process uses the derived transaction fiscal classification and any associated parent records for the higher levels to compare against the relevant tax rules.

**Transaction Fiscal Classifications: Example**

A transaction fiscal classification is the grouping multiple transaction business categories into a single transaction fiscal classification that is used with tax rules. This facilitates in triggering all of the applicable transaction business categories with relevant tax rules.
The following scenario illustrates how transaction fiscal classifications can be used for tax determination and reporting in Brazil.

**Scenario**

In Brazil, you need to identify a transaction correctly to be able to report and determine the correct applicable taxes. Create specific transaction business categories as children of the sales transaction. The transaction business categories include:

<table>
<thead>
<tr>
<th>Level</th>
<th>Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Country</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>SALES_TRANSACT</td>
<td>Sales Transaction</td>
<td></td>
<td>1-Jan-1951</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE MNTFRD FOR SALE</td>
<td>Interstate Manufactured for Sale</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE MNTFRD FOR MANUFACTURE</td>
<td>Interstate Manufactured for Manufacture</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
</tbody>
</table>

**Tip**

Specify the country name while creating transaction business categories. This ensures that a limited applicable list is presented while entering the transaction fiscal classification during transaction or tax rule creation.

**Tip**

In this classification and many other tax classifications, classify the nonstandard items of your business as standard items. This can be modeled as a default tax rule and therefore, does not require an explicit classification or an explicit rule. Classify only exception items and define specific tax rules for them. For a standard item none of the explicit tax rules are applicable, only the default rate applies.

The tax rules that apply to sales transactions are also applicable to purchase transactions. In this case, equivalent set rules are needed to represent the purchase side of the same transaction type. Therefore, create the following additional transaction business categories:

<table>
<thead>
<tr>
<th>Level</th>
<th>Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Country</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>PURCHASE_TRANSACT</td>
<td>Purchase Transaction</td>
<td></td>
<td>1-Jan-1951</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE MNTFRD FOR SALE</td>
<td>Interstate Manufactured for Sale</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
<tr>
<td>2</td>
<td>INTERSTATE MNTFRD FOR MANUFACTURE</td>
<td>Interstate Manufactured for Manufacture</td>
<td>Brazil</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
</tbody>
</table>
In the above scenario, instead of creating tax rules based on the type of transaction business category, that is, separate tax rules for sales and purchase transactions, create a single transaction fiscal classification and both the applicable sales and purchase transactions can be linked to it.

Create the following specific transaction fiscal classification with the relevant tax regime and transaction business category associations. In addition, create appropriate tax rules against this transaction fiscal classification.

<table>
<thead>
<tr>
<th>Level</th>
<th>Transaction Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>BRAZIL MNFTRD (O2C and P2P) FOR SALE</td>
<td>Brazil Manufacture</td>
<td>1-Jan-1951</td>
</tr>
</tbody>
</table>

At transaction time, the tax determination process derives this transaction fiscal classification whenever the related transaction business categories are used on the transaction.

**Document Fiscal Classifications: Explained**

Use the document fiscal classification in situations where the documentation associated with the transaction is needed for tax determination and reporting. Unlike other process classifications, document classifications are associated with the header of the transaction and therefore, apply to all the transaction lines on a transaction.

Document fiscal classifications provide a hierarchy of up to five levels. When defining the document fiscal classification codes, use the **Country** field to specify the taxation countries where the document fiscal classification is used.

During transaction time, the taxation country is used to restrict the list of document fiscal classification on the transaction line to those that have been set up with the same country or where the country is blank. When setting up the document fiscal classification, leave the **Country** field blank or use the same country that is defined on any parent level of the record that is being added.

**Tip**

While setting up the document fiscal classification, use different levels so that all the necessary rules are defined at the highest level possible. This facilitates in minimizing the needed number of tax rules.

**Document Fiscal Classifications in Tax Rules**

The document fiscal classification tax determination factors allow you to use the document fiscal classification in tax rules. A combination of the determination factor class, class qualifier, and determining factor represents these determination factors.

Use document as the determining factor class, the level of the transaction business category being used, level 1, level 2, level 3, level 4, or level 5 as the class qualifier, and the document fiscal classification as the determining factor.
The value you enter against the condition set is the document fiscal classification code or name set up for the specific level defined in the class qualifier, as well as for the same country or where the country is blank on the document fiscal classification.

**Document Fiscal Classifications at Transaction Time**

During transaction time, enter the document fiscal classification on the transaction to classify the transaction for tax determining and reporting purposes.

The document fiscal classification is stored in the tax reporting ledger and is available for reporting.

**Document Fiscal Classifications: Example**

The document fiscal classifications classify transactions for tax determination and reporting. Use this classification when the documentation associated with the transaction is needed to support the tax determination and reporting processes.

The following scenario illustrates how Intra-EU supplies are controlled through zero-rating of transactions. A zero-rating is given to a transaction only when the export documentation related to the transaction is received.

**Scenario**

When the export documentation is not received in time, the customer is invoiced with the VAT that is applicable in the country of the supplier. The transaction is not zero-rated, which is the normal case for Intra-EU business-to-business supplies.

To model this scenario, create a document fiscal classification and attach it to a transaction only when the documentation is received. If the document fiscal classification is not attached to a transaction, the Intra-EU goods business-to-business supply rules are not triggered and the applicable VAT is charged.

When the documentation is received after the invoice is generated, the invoice that is sent is credited and a new invoice is produced.

Create the following document fiscal classification:

<table>
<thead>
<tr>
<th>Level</th>
<th>Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Country</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>INTRA-EU DOCUMENTS</td>
<td>Sales Transaction</td>
<td></td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
<tr>
<td>2</td>
<td>INTRA-EU EXPORT DOCUMENTATION</td>
<td>Intra-EU Export Documentation Received</td>
<td></td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
</tbody>
</table>
The tax rule that defines the conditions under which the Intra-EU supply of business-to-business goods are zero-rated includes a determining factor as shown in the following table:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Document</td>
<td>Level 2</td>
<td>Document Fiscal Classification</td>
<td>Equal to</td>
<td>INTRA-EU EXPORT DOCUMENTATION</td>
</tr>
</tbody>
</table>

**Tip**

Specify the country name while creating transaction business categories. This ensures that a limited applicable list is presented while entering the document fiscal classification during transaction or tax rule creation.

**Tip**

In this classification and many other tax classifications, classify the nonstandard items of your business as standard items. This can be modeled as a default tax rule and therefore, does not require an explicit classification or an explicit rule. Classify only exception items and define specific tax rules for them. For a standard item none of the explicit tax rules are applicable, only the default rate applies.

**User-Defined Fiscal Classifications: Explained**

Use user-defined fiscal classification to classify transactions to drive tax determination and reporting. Use user-defined fiscal classifications when other classifications are not appropriate or an additional classification is required. Enter user-defined classifications on a transaction line at the time of transaction.

User-defined fiscal classifications provide only one level. When defining the user-defined fiscal classification codes, use the **Country** field to specify the taxation countries where that user-defined fiscal classification is used. Leave the country blank if the user-defined fiscal classification code is used for multiple countries. When setting up user-defined fiscal classification, leave the country field blank or use the same country as defined on any parent level of the record that is being added. During transaction time, the taxation country is used to restrict the list of user-defined fiscal classifications on the transaction line to those that are set up with the same country or where the country is blank on the user-defined fiscal classification.

**User-Defined Fiscal Classifications in Tax Rules**

The user-defined fiscal classification tax determination factors allow you to use user-defined fiscal classification in tax rules. A combination of determination factor class and determining factor represent these determination factors.

Use the transaction input factor as the determining factor class and user-defined fiscal classification as the determining factor.
The value entered against the condition set is the specific user-defined fiscal classification code or name and the same country or where the country on the user-defined fiscal classification is blank.

**User-Defined Fiscal Classifications at Transaction Time**

During transaction time, enter the user-defined fiscal classification on the transaction line to classify the transaction for tax determination and reporting purposes.

The user-defined fiscal classification is stored in the tax reporting ledger and is available for reporting.

**User-Defined Fiscal Classifications: Example**

Use the user-defined fiscal classification to classify transactions for tax determination and reporting. This classification is used when other classifications are not appropriate or an additional classification is required in tax determination and reporting.

This scenario illustrates how a user-defined fiscal classification is used to identify if a customer is a foreign diplomat and therefore, exempt from value-added tax (VAT).

**Scenario**

To model this scenario, create a user-defined fiscal classification that is added to a transaction line only when the customer is a foreign diplomat and VAT is exempted.

In practice, it is likely that most businesses monitor such transactions and therefore, specifically create a zero (0%) rate within the exempt tax status to allow monitoring of such situations. By reporting this specific 0% rate, all applicable transaction can be identified.

Create the following user-defined fiscal classification:

<table>
<thead>
<tr>
<th>Fiscal Classification Code</th>
<th>Fiscal Classification Name</th>
<th>Country</th>
<th>Start Date</th>
</tr>
</thead>
<tbody>
<tr>
<td>FOREIGN DIPLOMAT EXEMPTION</td>
<td>Foreign Diplomat Exemption</td>
<td>United Kingdom</td>
<td>The earliest transaction date or start date of tax.</td>
</tr>
</tbody>
</table>

Set up the following determining factor for the tax rule that defines the condition where the sales transaction is zero percent (0%) rated using the special exempt rate, tax status and tax rate rule:

<table>
<thead>
<tr>
<th>Determining Factor Class</th>
<th>Class Qualifier</th>
<th>Determining Factor</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Transaction Input Factor</td>
<td></td>
<td>User-Defined Fiscal Classification</td>
<td>Equal to</td>
<td>FOREIGN DIPLOMAT EXEMPTION</td>
</tr>
</tbody>
</table>
This tax rule, to apply a zero tax rate to a transaction, is applicable only when the user-defined fiscal classification is associated with the transaction line.

**Tip**

Specify the country name while creating the user-defined fiscal classification. This ensures that a limited applicable list is presented while entering the user-defined fiscal classification during transaction or tax rule creation.

---

**Define Party Classifications**

**Party Information: Explained**

Party classification defines the different types of party. Use party classifications to define party types for tax determination and tax reporting purposes.

Oracle Fusion Tax uses two types of tax party classifications:

- Party fiscal classifications
- Legal party classifications

Both are used to classify parties to provide determining factors or building blocks on which tax rules are defined. They are also used to classify parties so that they can be reported.

**Party Fiscal Classifications**

Use party classifications to classify your customers, suppliers, first party legal entities, and first party legal reporting units for tax determination and tax reporting.

Define the party classification categories and associated classification codes within the Oracle Fusion Trading Community Model party classification setup. Create the party fiscal classifications and associate the specific Trading Community Model party classification category to these party fiscal classifications, one for each level of the specific Trading Community Model party classification category. Associate tax regimes to these party classifications to ensure that these relationships are only visible and usable where needed. Oracle Fusion Tax uses this relationship to indicate which Trading Community Model party classification categories are used for tax purposes. By reusing the Trading Community Model party classification category functionality Oracle Fusion Tax can leverage the common classification setup and where applicable, use that for tax purposes.

Within the party fiscal classifications functionality, define the Trading Community Model classification level to use within Oracle Fusion Tax. For example, if you have a three level Trading Community Model party fiscal classification category, define three levels, giving each a specific party fiscal classification code and name. By naming each level, you can use the specific
level as a determining factor when defining tax rules. Use the same party fiscal classification flow to define the tax regimes with which the party fiscal classifications are associated.

Note

You can only amend the number of levels by increasing the number of levels. It is not possible to decrease the number of levels once the record has been stored.

Once you have defined your Trading Community Model party classification and associated it with a party fiscal classification and tax regime, you can use it to classify your parties and party sites. These parties and party sites are:

- Customers
- Customer sites
- Suppliers
- Supplier sites
- Legal entities
- Legal reporting units

In the case of supplier and customer parties and party sites, you can associate the specific party classification codes used for tax purposes using either:

- Party tax profile flows within Customer Maintenance and Supplier Maintenance.
- Dedicated flows in Oracle Fusion Tax.

Legal Party Classifications

Legal party classifications are similar to party fiscal classifications. Both use the Trading Community Model party classification setup and allows you to classify the party for tax determination and tax reporting purposes. However, the legal party classifications are predefined and are available when you implement the application.

The following legal classification codes are predefined:

<table>
<thead>
<tr>
<th>Legal Party Type Code</th>
<th>Legal Party Type Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>LEGAL_ACTIVITY_CODE_CL</td>
<td>Legal activity code for Chile</td>
</tr>
<tr>
<td>LEGAL_ACTIVITY_CODE_PE</td>
<td>Legal activity code for Peru</td>
</tr>
<tr>
<td>LEGAL_ACTIVITY_CODE_VE</td>
<td>Legal activity code for Venezuela</td>
</tr>
<tr>
<td>LEGAL_ACTIVITY_CODE_CO</td>
<td>Legal activity code for Columbia</td>
</tr>
<tr>
<td>2003 SIC</td>
<td>Legal activity code for United Kingdom</td>
</tr>
</tbody>
</table>

Use legal party classifications to classify first party legal entities within the Legal Entity setup functionality. Use these classifications as determining factors within tax rules. Association between the legal party classification and specific legal parties is done within the Legal Entity Maintenance flow.
No specific setup is required as the legal party classifications are predefined and can be directly used in tax rule setup.

**Party Fiscal Classifications: How They Work in Tax Rules and Tax Reporting**

Party fiscal classification tax determination factors allow you to use party fiscal classifications in tax rules. A combination of determination factor class, class qualifier, and determining factor represent these determination factors. In the tax rules setup, define the actual party to be used to determine the relevant party fiscal classification by using a generic definition for class qualifier. You can also use party fiscal classifications for tax reporting.

**Party Fiscal Classifications in Tax Rules**

Depending on the type of transaction, the following generic class qualifiers are defined as class qualifiers when using the party fiscal classification as a tax determining factor:

- Supplier bill-from party
- Bill-to party
- Ship-to party
- Ship-from party
- Point-of-acceptance party
- Point-of-origin party

Oracle Fusion Tax translates the generic parties into specific transaction parties as defined in the following table:

<table>
<thead>
<tr>
<th>Generic Party</th>
<th>Order-to-Cash Party</th>
<th>Procure-to-Pay Party</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill-from party</td>
<td>First party legal entity</td>
<td>Supplier</td>
</tr>
<tr>
<td>Bill-to party</td>
<td>Customer</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-to party</td>
<td>Customer (ship-to) party site</td>
<td>First party legal entity</td>
</tr>
<tr>
<td>Ship-from party</td>
<td>First party reporting unit</td>
<td>Supplier (ship-from) party site</td>
</tr>
<tr>
<td>Point-of-acceptance party</td>
<td>Customer point of acceptance party</td>
<td>Not applicable</td>
</tr>
<tr>
<td>Point-of-origin party</td>
<td>Customer point of origin party</td>
<td>Not applicable</td>
</tr>
</tbody>
</table>

**Tip**

Always use the highest applicable level to define the party classification. For example, if appropriate, define the party fiscal classification at the customer or supplier level instead of defining the same classification on all the party sites for the customer and suppliers.
Because party fiscal classifications are automatically derived during transaction time, use them as determining factors instead of process-based determining factors, which require manual entry for every transaction.

**Party Fiscal Classifications in Tax Reporting**

Use party classifications to classify parties for tax reporting purposes if specific party classifications need to be reported. However, you should use tax reporting codes for tax reporting instead of party fiscal classifications as it offers a more flexible and less intrusive mechanism to support reporting without creating unnecessary complexity in setup and maintenance.

**Classifying Parties: Example**

The following example illustrates using party fiscal classifications in tax rules. It is based on the following scenario:

- A company Widget Inc., UK Ltd. produces widgets that are used by military forces who are part of the North Atlantic Treaty Organization (NATO).
- The widgets are sold to the Belgium Troops stationed in UK under a joint NATO exercise.
- The supply of widgets by Widget Inc., UK Ltd. is within the terms and conditions of supplies to NATO forces which allows a supplier to zero rate supplies to visiting NATO forces. See Visiting Forces - HMRC Reference: Notice 431 (November 2003).

This dispensation is given when deliveries are made to:

- NATO visiting forces in the UK, specifically those from: Belgium, Canada, Czech Republic, Denmark, France, Germany, Greece, Hungary, Iceland, Italy, Luxembourg, Netherlands, Norway, Poland, Portugal, Spain, Turkey, and United States of America.
- The NATO International Military Headquarters at Northwood and High Wycombe.
- The American Battle Monuments Commission in respect of supplies of goods and services for the maintenance of the US military cemeteries at Brookwood and Madingley.

**Creating Party Classifications and Tax Rules**

To model this requirement, the company site that represents the Belgium troops working at the joint NATO exercise is associated with GB Special Tax Parties, a special party classification type and NATO Troops, a party fiscal classification code.

To do this:

2. Create a level 2 code for this level 1 code of NATO.

3. Create party fiscal classifications of GB Special Tax Parties Level 1 and GB Special Tax Parties Level 2, which are linked to the Trading Community Model party classification.

4. Associate the party fiscal classifications with the GB VAT tax regime using a start date of the earliest transaction date of supplies to this or similar customer sites.

5. Associate the company site that represents the Belgium troops working at the joint NATO exercise to the GB Special Tax Parties Level 2 party fiscal classification using code of NATO.

6. Create the determining factor set and condition set that uses this classification code Zero Rated Parties of the level 1 party fiscal classification type. No specific Determine Tax Rate tax rule is needed as you can set up the zero tax rate as the default tax rate for this tax status.

7. Create a Determine Tax Status tax rule linked to a zero tax status by using the determining factor and condition set created above.

At transaction time the tax determination process considers this tax status rule and derives a zero tax status when the customer ship-to party is associated with the level 1 party fiscal classification of GB Special Tax Parties Level 1 and code of Zero Rated Parties.

---

**Tip**

Use the levels in the Trading Community Model party classification categories model and the party fiscal classification setup to group party classification categories together.

---

**Tip**

Define tax rules at the highest level possible thus minimizing the number of tax rules needed. In this example, the tax rule uses the level 1 party fiscal classification to determine the zero tax status.

---

**Define Taxes**

**Regimes to Rates: Explained**

Regime to rate setup contains the details of a tax regime, including all taxes, tax jurisdictions, tax statuses, and tax rates. You can update existing records or create new records at any point in the tax regime hierarchy.

Regime to rate setup tasks include:

- Tax regimes
- Taxes
• Tax jurisdictions
• Tax statuses
• Tax rates

**Tax Regimes**

Set up tax regimes in each country and geographical region where you do business and where a separate tax applies. A tax regime associates a common set of default information, regulations, fiscal classifications, and optionally, registrations, to one or more taxes. For example, in the United States create a Sales and Use Tax tax regime to group taxes levied at the state, county, and district levels.

The tax regime provides these functions:

• Groups similar taxes together
• Designates the geography within which taxes apply
• Applies as defaults the settings and values that you define for each tax in the tax regime
• Defines for which taxes the configuration options apply and a specific subscription option applies
• Provides a single registration for all taxes associated with the tax regime
• Defines the use of fiscal classifications as follows:
  • Transaction fiscal classifications
  • Product fiscal classifications
  • Party fiscal classifications

The common tax regime setup is one tax regime per country per tax type, with the tax requirements administered by a government tax authority for the entire country. There are also cases where tax regimes are defined for standard geographical types or subdivisions within a country, such as a state, province, country, or city. In these cases, you base the tax regime on the Oracle Fusion Trading Community Model standard geography.

There are more rare cases where a tax regime is based on disparate parts of a country or more than one country. In these cases, you can create one or more tax zones and set up tax regimes for these tax zones. You can also set up a tax regime as a parent tax regime to group related tax regimes together for reporting purposes.

You must set up a tax regime before you set up the taxes in the tax regime. Some tax regime values appear as defaults on the taxes that belong to the tax regime in order to help minimize tax setup.

You must associate a tax regime with all of the first party legal entities and business units that are subject to the tax regulations of the tax regime. You can set up tax configuration options when you create or edit a tax regime or when you create or edit a first party legal entity tax profile. Both setup flows appear and maintain the same party and tax regime configuration options.
Taxes

Set up details for the taxes of a tax regime. Each separate tax in a tax regimes includes records for the tax statuses, tax rates, and tax rules that are used to calculate and report on the tax. Oracle Fusion Tax applies as defaults tax information from the tax regime to each tax that you create under a tax regime. You can modify this information at the tax level according to your needs, as well as add additional defaults and overrides. For tax rule defaults, specify values that apply to the majority of your transactions. Use tax rules to configure exceptions to the tax rule defaults.

Identify what taxes you must define. Each tax appears as a single tax line on a transaction. If you need to show or report more than one tax line per transaction line on a transaction, then you should set up more than one tax. For example, for US Sales and Use Tax you would define a tax for each state, county, and city.

You can create a new tax, or create a tax that is based on an existing tax within the tax regime. You do this to minimize setup by sharing tax jurisdictions and tax registrations. When you create a new tax based on an existing tax, the attributes that remain constant for all taxes derived from the source tax are not available for update. Attributes that are copied and are display only include:

- Tax regime
- Tax
- Geography information
- Tax jurisdiction settings

Note

The enable tax settings are not selected, in the same way that they are not selected when you access the Create Tax page.

You can enable a tax for simulation or for transactions only after you have completed all of the required setup.

Tax Jurisdictions

Set up tax jurisdictions for geographic regions or tax zones where a specific tax authority levies a tax. A tax jurisdiction specifies the association between a tax and a geographic location. At transaction time, Oracle Fusion Tax derives the jurisdiction or jurisdictions that apply to a transaction line based on the place of supply. You must set up at least one tax jurisdiction for a tax before you can make the tax available on transactions.

You also use tax jurisdictions to define jurisdiction-based tax rates. A tax jurisdiction tax rate is a rate that is distinct to a specific geographic region or tax zone for a specific tax. You can also create multiple jurisdictions at once using the mass create functionality for taxes that relate to specific Trading Community Model geographic hierarchies. For example, create a county jurisdiction for every county in the parent geography type of State and in the parent geography name of California.

The tax within a tax jurisdiction can have different rates for the parent and child geographies. For example, a city sales tax rate can override a county rate for the
same tax. In this case, you can set up an override geography type for the city and apply a precedence level to the city and county tax jurisdictions to indicate which tax jurisdiction takes precedence.

In addition, in some cities a different city rate applies to the incorporated area of the city, called the inner city. In these cases, you can set up an inner city tax jurisdiction with its own tax rate for the applicable customers and receivables tax. Inner city tax jurisdictions are often based on postal code groupings.

**Tax Statuses**

Set up the tax statuses that you need for each tax that you create for a combination of tax regime, tax, and configuration owner. A tax status is the taxable nature of a product in the context of a transaction and specific tax on the transaction. You define a tax status to group one or more tax rates that are the same or similar in nature.

For example, one tax can have separate tax statuses for standard, zero, exemptions, and reduced rates. A zero rate tax status may have multiple zero rates associated with it, such as Intra-EU, zero-rated products, or zero-rated exports.

You define a tax status under a tax and a configuration owner, and define all applicable tax rates and their effective periods under the tax status. The tax status controls the defaulting of values to its tax rates.

**Tax Rates**

Set up tax rates for your tax statuses and tax jurisdictions. For tax statuses, set up a tax rate record for each applicable tax rate that a tax status identifies. For tax jurisdictions, set up tax rate records to identify the tax rate variations for a specific tax within different tax jurisdictions. For example, a city sales tax for a state or province may contain separate city tax jurisdictions, each with a specific tax rate for the same tax.

You can also define tax recovery rates to claim full or partial recovery of taxes paid.

You can define tax jurisdiction and tax status rates as a percentage or as a value per unit of measure. For example, a city may charge sales tax at a rate of 8 percent on most goods, but may levy a duty tax with a special rate of 0.55 USD per US gallon on fuel. Values per unit of measure are in the tax currency defined for the tax.

You define tax rate codes and rate detail information per rate period. Rate periods account for changes in tax rates over time. A tax rate code can also identify a corresponding General Ledger taxable journal entry.

**Tax Recovery Rates**

Set up tax recovery rate codes for the recovery types identified on the taxes within a tax regime. A tax recovery rate code identifies the percentage of recovery designated by the tax authority for a specific transaction. In Canada, where more than one type of recovery is possible for a given tax, you must set up the applicable tax recovery rate codes for both the primary and secondary recovery types that can apply to a transaction.
If you set the **Allow tax recovery** option for a tax within a tax regime, then you must set up at least one recovery rate for the tax in order to make the tax available on transactions. If the recovery rate can vary based on one or more factors, including the parties, locations, product or product purpose, then set up tax rules to determine the appropriate recovery rate to use on specific transactions. At transaction time, Oracle Fusion Tax uses the recovery rate derived from the recovery tax rules, or uses instead the default recovery rate that you define, if no recovery rate rules are defined or if no existing recovery rate rule applies to the transaction.

**Minimum Tax Configuration: Explained**

Oracle Fusion Tax provides you with a single interface for defining and maintaining the taxes that are applicable in each country where you do business.

The minimum tax configuration path to meet the basic tax requirements of transactions in a given regime is a 2-step configuration process:

1. Define tax regime: This step includes the tax regime definition as well as the subscription by the appropriate legal entity or business unit.
2. Define transaction taxes: This step includes the basic tax definition, controls and defaults, direct and indirect tax rule defaults, and tax accounts.

The following prerequisite setups must be completed for minimum tax configuration:

- First parties, such as legal entities and business units
- Tax geographies and zones
- Ledger and accounts
- Currency codes and exchange rates

A legal entity tax profile is automatically created when a legal entity is defined in the implementation. Similarly, a business unit tax profile is automatically created when a business unit is defined. For the business unit, you need to indicate whether it will use the subscription of the legal entity instead of creating its own.

In addition, there are predefined event class mappings that describe the mapping between an application event class and the corresponding tax event class. For example, the tax determination process for a sales debit memo and sales invoice are essentially the same. These two application event classes correspond to the same tax event class namely, a sales transaction. Although you cannot update the event class mappings, you can set up configuration specific event class mappings.

**Define Tax Regime**

The first step includes the tax regime definition and subscription by an appropriate legal entity or business unit. While creating your tax regime, you can minimize configuration and maintenance costs by creating content that can
be shared by more than one entity. For example, legal entities can subscribe to the shared reference data instead of creating separate and repetitive data. If the subscribing legal entities have some variations in their setup, you can create override data to meet the specific exceptions that are applicable to these organizations.

Use Oracle Fusion Tax features to enable only those features that are relevant to taxes in the tax regime. Based on the features you select, the subsequent setup pages and task lists for the tax regime are rendered or hidden.

**Define Transaction Taxes**

The second step includes basic tax definition, such as geographic information, controls and defaults, direct and indirect tax rule defaults, and tax accounts.

The basic tax definition includes controls that you can set to provide the override capability at transaction time. For example, if you want to allow users to make manual updates on transaction tax lines, select the **Allow override for calculated tax lines** and the **Allow entry of manual tax lines** options. However, if you want to enforce automatic tax calculation on transaction tax lines, do not enable these options.

Use the direct and indirect tax rule defaults to specify the values that apply to the majority of your transactions. Create tax rules to address the exceptions or variations to the defaults. For example, for the Goods and Services Tax (GST) that applies to the supply of most goods and services in Canada, set the Tax Applicability direct tax rule default to **Applicable**. A luxury tax, on the other hand, is a tax on luxury goods or products not considered essential. As it would not apply to most goods and services, set the Tax Applicability direct tax rule default to **Not Applicable**, and create a tax rule to make the tax applicable when the product in the transaction satisfies the luxury requirement.

Assign your default tax accounts for the taxes in a tax regime to post the tax amounts derived from your transactions. The tax accounts you associate serve as default accounting information for taxes, tax rates, tax jurisdictions, and tax recovery rates. The tax accounts you define at the tax level, default to either the tax rate accounts or tax jurisdiction accounts for the same tax and operating unit, depending upon the tax accounts precedence level of the tax regime. You can update these default tax accounts in the tax rate or tax jurisdiction setup.

**Minimum Tax Configuration: Points to Consider**

The minimum tax configuration setup must be designed to handle the majority of tax requirements. As part of defining transaction taxes, decide the direct and indirect tax rule defaults for the tax and set up the associated tax accounts.

For complex tax requirements, create tax rules that consider each tax requirement related to a transaction before making the final tax calculation. During the execution of the tax determination process, Oracle Fusion Tax evaluates, in order of priority, the tax rules that are defined against the foundation tax configuration setup and the details on the transactions. If the first rule is successfully evaluated, the result associated with the rule is used. If not, the next rule is evaluated until either a successful evaluation or default value is found.
Setting Up Direct Tax Rule Defaults

The direct tax rule defaults are the default values for the direct tax rule types, which include:

- Place of supply
- Tax applicability
- Tax registration
- Tax calculation formula
- Taxable basis formula

**Place of Supply**

Use the Place of Supply direct tax rule default to indicate the specific tax jurisdiction where the supply of goods or services is deemed to have taken place. For example, in Canada, the place of supply for GST is typically the ship-to location. To handle the majority of Goods and Services Tax (GST) transactions, select **Ship to** as your default place of supply.

**Note**

The corresponding place of supply differs based on the type of transaction. For example, a place of supply of **Ship to** corresponds to the location of your first party legal entity for Payables transactions. For Receivables transactions, **Ship to** corresponds to the location of your customer site. For exceptions to this default, create Determine Place of Supply rules.

**Tax Applicability**

Use the Tax Applicability direct tax rule default to indicate whether the tax is typically applicable or not applicable on transactions. For example, the GST in Canada is a tax that applies to the supply of most property and services in Canada. When you create the GST tax, select **Applicable** as your default tax applicability. For exceptions to this default, create Determine Tax Applicability rules.

**Tax Registration**

Use the Tax Registration direct tax rule default to determine the party whose tax registration status is considered for an applicable tax on the transaction. For example, with a direct default of bill-to party, Oracle Fusion Tax considers the tax registration of the bill-to party and stamps their tax registration number onto the transaction, along with the tax registration number of the first party legal reporting unit. For exceptions to this default, create Determine Tax Registration rules.

**Tax Calculation Formula**

Use the Tax Calculation Formula direct tax rule default to select the formula that represents the typical calculation of tax for a transaction line. A common
formula, **STANDARD_TC**, is predefined, where the tax amount is equal to the tax rate multiplied by the taxable basis. For exceptions to this default, create Calculate Tax Amounts rules.

**Taxable Basis Formula**

Use the Taxable Basis Formula direct tax rule default to select the formula that represents the amount on which the tax rate is applied. The following common formulas are predefined:

- **STANDARD_TB**: The taxable basis is equal to the line amount of the transaction line.
- **STANDARD_QUANTITY**: The taxable basis is equal to the quantity of the transaction line.
- **STANDARD_TB_DISCOUNT**: The taxable basis is the line amount of the transaction line less the cash discount.

For exceptions to this default, create Determine Taxable Basis rules.

**Setting Up Indirect Tax Rule Defaults**

The indirect tax rule defaults for a tax include:

- Tax jurisdiction
- Tax status
- Tax recovery rate
- Tax rate

**Tax Jurisdiction**

Use the Tax Jurisdiction indirect tax rule default to indicate the most common geographic area where a tax is levied by a specific tax authority. For example, value-added tax (VAT) is applicable to the supply of most goods and services in Portugal. For the tax PT VAT, create the default tax jurisdiction as the country of Portugal. To address specific tax regions such as Azores and Madeira, which have lower VAT rates than Portugal, define jurisdiction rates with different VAT rates.

**Tax Status**

Use the Tax Status indirect tax rule default to indicate the taxable nature of the majority of your transactions. For example, if your operations primarily include zero-rated transactions, select the default tax status as **Zero** instead of **Standard**. This setting facilitates tax determination when multiple zero rates are defined to handle different reporting requirements for zero rate usage, such as intra-EU, zero-rated products, or zero-rated exports. For exceptions to this default, create Determine Tax Status rules.

**Tax Recovery**

Use the Tax Recovery rate indirect tax rule default to indicate the recovery rate to apply to each recovery type for each applicable tax on a purchase transaction.
For example, in Canada, both federal and provincial components of Harmonized Sales Tax (HST) are 100% recoverable on goods bought for resale. In this case, with two recovery types, you can set up two recovery rate defaults for the HST tax. For exceptions to this default, such as when the recovery rate determination is based on one or more transaction factors, create Determine Recovery Rate rules.

**Tax Rate**

Use the Tax Rate indirect tax rule default to specify the default tax rate that is applicable to the majority of your transactions associated with this tax. You can create additional tax setup, such as jurisdiction rates, or create tax rules to set alternate values as required. For example, HST in Canada is applied at a 13% rate in most provinces that have adopted HST, except for British Columbia where the rate is 12% and Nova Scotia where the rate is 15%. To satisfy this requirement a single rate of 13% can be defined with no jurisdiction and then a 12% rate can be defined and associated with the British Columbia jurisdiction (15% rate assigned to Nova Scotia). This minimizes the setup required by creating an exception based setup. For exceptions to this default, create Determine Tax Rate rules.

**Setting Up Tax Accounts**

Set up tax accounts at the tax level. The application automatically copies the tax account combination to the tax rates that you subsequently create for the tax for the same ledger and optionally, the same business unit.

Define tax accounts at any of the following levels. The defaulting option is only available at the tax level.

- Tax
- Tax jurisdiction
- Tax rate
- Tax recovery rate

**Note**

This is a one-time defaulting opportunity. Any subsequent changes at the account level are not copied to the tax rate level nor are they used during the AutoAccounting process. Changes at the tax level do impact tax account defaulting when you create new tax rates.

Setting up tax accounts comprise of specifying the following:

- **Ledger** and **Business Unit**: The ledger and business unit for which you are creating the tax accounts.

- **Interim Tax**: An account that records tax recovery or liability until the event prescribed by the statute is complete. Generally, the payment of the invoice is the event that triggers the generation of the tax recovery or liability. You must set up an interim tax account for taxes and tax rates that have a deferred recovery settlement. Once you set up an interim tax account for this tax rate, you cannot change the recovery settlement to **Immediate**.
• **Tax Recoverable or Liability Account**: An account that records tax recovery amounts or relieves tax liability amounts. If you set up recovery rates for a tax that you also intend to self-assess, then define a tax recovery account for the associated recovery rates and a tax liability account for the associated tax rates.

• **Finance Charge Tax Liability**: An account that records the tax liability associated with finance charges that is used as a deduction against overall tax liability.

• **Nonrecoverable Tax Accounts**: Accounts that record tax amounts on earned and unearned discounts and adjustments that you cannot claim as a deduction against tax liability.

• **Expense and Revenue Accounts**: Accounts that record net changes generated by adjustments, earned and unearned discounts, and finance charges. Receivables activities such as discounts and adjustments reduce the receivable amount, and are therefore considered an expense.

**Minimum Tax Configuration: Worked Example**

The following example illustrates the minimum tax configuration setup to meet the basic requirements in Canada for the Goods and Services Tax (GST). You set up a tax regime for both GST and Harmonized Sales Tax (HST). One recovery type is created for the fully recoverable status of the transaction.

In Canada, GST is a tax that applies to the supply of most property and services in Canada. The provinces of British Columbia, Ontario, New Brunswick, Nova Scotia, and Newfoundland and Labrador, referred to as the participating provinces, combine their provincial sales tax with GST to create HST. Generally, HST applies to the same base of property and services as the GST. Every province in Canada except Alberta has implemented either provincial sales tax or the HST. In countries like Canada, some or all taxes on business transactions for registered companies are recoverable taxes.

ABC Corporation is a business with a chain of bookstores across Canada. It intends to implement the Oracle Fusion Tax solution at its store in the province of Alberta. The GST rate of 5% is applicable for sales in Alberta. Input Tax Credit is available for GST included in purchases. ABC Corporation's primary ledger is CA Ledger, and the business unit is CA Operations. The tax account 0001-1500-1100-1000 is reserved for the **Tax Recoverable or Liability** account.

The tax implications in this scenario are:

- Five percent (5%) GST is applicable on the sale of goods in Alberta
- Neither the HST nor provincial sales tax applies in Alberta
- Place of supply for GST tax is generally based on the place of delivery or ship-to location.

To determine the GST tax in Alberta, perform the following steps:

1. Define tax regime
2. Define transaction taxes
3. Create the direct tax rule defaults
4. Create the indirect tax rule defaults
5. Enable tax

Define Tax Regime

1. On the Create Tax Regime page, enter the tax regime code for GST and HST in Canada.

   **Note**
   Use a coding convention to indicate both the country and the type of tax that belongs to this regime. For example, CA GST and HST.

2. Select the regime level to define the geographic area of the tax treatment. The option selected must depict the need for the tax regime. It should be set to **Country** for all federal taxes.

3. Specify **Canada** as the country for which this tax regime is being defined.

4. Enter a start date that will appear as a default to all related tax setup within the tax regime.

   **Note**
   Consider your tax planning carefully before entering the start date. This date must accommodate the oldest transaction that you want to process within this tax regime. After you create the tax regime, you can only update this date with an earlier date. If you enter an end date, you cannot update this date after you save the record.

5. Enter tax currency. Enter **CAD**, which is the three-letter ISO code for the Canadian dollar.

   Tax currency is the currency required by the tax authority. Use the tax currency to pay the tax authority and to report on all tax transactions.

6. Select the **Allow cross regime compounding** option to set taxes within the tax regime to be based on the calculation of, or compounded on, taxes in another tax regime.

   For example, in Quebec, the provincial sales tax is applied to both the selling price and GST. Enter a value as the compounding precedence to indicate the order of cross regime compounding. A lower number indicates that the tax regime will be processed first. Allowing gaps between numbers provide flexibility in the event that another higher priority tax regime is introduced in the future.

7. On the Configuration Options tab, select the party name that identifies either the legal entity or the business unit or both for which you will define the configuration options.

8. For the Configuration of Taxes and Rules, select the subscription that defines the configuration owner setup that will be used for transactions of the specific legal entity and business unit for this tax regime.
This selection also defines whether any shared content can be overridden by the subscribing party to allow unique, separate setup for certain tax content.

9. Enter the effective start date for this configuration option. Enter a date range that is within the date range of both the party tax profile and the tax regime.

**Define Transaction Taxes**

1. On the Create Tax page, enter the name of the tax regime that you created in the Define Tax Regime step, such as CA GST and HST.

2. Select the configuration owner for this tax. To minimize configuration and maintenance costs, select **Global Configuration Owner** as the configuration owner.

3. Enter the name of the tax you are defining, such as CA GST.

4. Select **Province** as the geography type.

5. To minimize setup and maintenance costs, specify the highest-level parent geography type (Country), unless the tax is only applicable to a specific geography. Select **Country** from the list of values. For the parent geography name, enter **Canada**.

6. Enter a value as the compounding precedence to reflect the order of tax compounding. A lower number indicates that a tax is processed first. Allowing gaps between numbers provide flexibility in the event that another higher priority tax is introduced in the future.

7. Enable the **Allow override of calculated tax lines** option to allow users to override the automatic tax calculation on invoice tax lines.

8. Enable the **Allow multiple jurisdictions** option to define tax jurisdictions for this tax in more than one geographic region.

9. Enable the **Allow mass create of jurisdictions** option to enable mass creation of tax jurisdictions for this tax, which allows you to create multiple jurisdictions at the same time.

10. Enable the **Allow tax recovery** option.

11. Enable the **Allow tax recovery rate override** option if you want to allow user override of the calculated tax recovery rate on transaction lines.

12. Select **Standard** as the primary recovery type.

**Assign Tax Accounts**

1. Navigate to the Tax Accounts tab.

2. Select CA Ledger as the primary ledger to use for tax accounts and CA Operations as the business unit.

3. Enter 0001-1500-1100-1000 as the Tax Recoverable or Liability account.

**Create Direct Tax Rule Defaults**

1. Navigate to the Tax Rule Defaults tab.

2. Select **Ship to** from the Place of Supply list of values, to specify the default.
3. Select **Applicable** from the **Tax Applicability** list of values to specify the Tax Applicability default.

4. Select **Ship-from party** to specify the Tax Registration default.

5. Select **STANDARD_TC** as the Tax Calculation Formula default.

6. Select **STANDARD_TB** as the Taxable Basis Formula default.

**Create Indirect Tax Rule Defaults**

1. Select **Tax Jurisdiction** as your rule type and create the rule type default. In the **Tax Jurisdiction Code** field, enter a tax jurisdiction code for the province of Alberta, such as **CA Alberta**. Select **Province** as the geography type. For the geography name, enter **AB** for Alberta. Set this tax jurisdiction as your default, and specify your default start and end dates.

2. Select **Tax Status** as your rule type and create the rule type default. Enter a tax status code for **GST**, such as **CA GST STD**. Set this tax status as your default, and specify your default start and end dates.

3. Select **Tax Recovery Rate** as your rule type and create the rule type default. Enter a tax recovery rate code for **GST**, such as **CA GST STD REC RATE**. For the recovery type, select **Standard**. Enter a rate percentage of 100 for a fully recoverable tax. Set this tax recovery rate as your default, and specify your default start and end dates.

4. Select **Tax Rate** as your rule type and create the rule type default. In the **Tax Status Code** field, enter the name of the tax status that you just created, **CA GST STD**. Enter a tax rate code for **GST**, such as **CA GST STD RATE**. Enter a rate percentage of 5 for the current GST rate as of January 1, 2008, and specify your default start and end dates.

**Enable Tax**

1. Click the **Enable tax for simulation** option. This allows you to verify the tax configuration using the Tax Simulator.

2. Once you have verified your tax configuration with simulated transactions, click the **Enable tax for transactions** option. This allows you to use this tax in transaction processing.

3. Click **Save and Close**.

For ABC’s transactions in the province of Alberta, the following is determined by default:

- GST tax is applicable and will be calculated at a percentage rate of 5%.
- 100% of the GST can be recovered.

**Tax Account Configuration: Explained**

Set up default tax accounts for the taxes in a tax regime to post the tax amounts derived from your transactions. The tax accounts you define for tax serve as default accounting information for tax rates and tax jurisdictions. You can override the defaulted accounts. Configure the tax recoverable or liability
account for the tax recovery rate. Accounts assigned to the tax rate and recovery rate are used when the taxes are applicable to the transaction.

Set up tax accounts for a primary ledger or in combination with a business unit. The calculated tax amounts are posted to the accounts specified for a business unit. If those accounts are not available, tax accounts defined for the primary ledger are used. These are default accounts and the actual accounts that are used for accounting depend on the subledger accounting configuration.

For a tax, either assign new tax accounts or use accounts from an existing tax. This depends on the option selected in the Tax Accounts Creation Method attribute for the tax. If you choose to use accounts from an existing tax, specify another tax as the source tax. All the tax account details that you set up at the source tax level are copied into the Tax Accounts region as read only values. You cannot edit the details or create new records.

Tax Accounts
Define tax accounts for a tax, tax rate, and tax jurisdiction. Tax accounts are:

- **Tax Expense**: A Payables tax account that records tax amounts from invoice distributions; or a Receivables tax account that records net changes generated by adjustments, earned and unearned discounts, and finance charges. Receivables activities such as discounts and adjustments reduce the receivable amount, and are therefore considered an expense. This occurs only if the adjustment type has tax handling.

- **Tax Recoverable or Liability**: An account that records tax recovery amounts or relieves tax liability amounts. If you set up recovery rates for a tax that you also intend to self-assess, then define a tax recovery account for the associated recovery rates and a tax liability account for the associated tax rates.

**Note**
If you intend to use different accounts for tax recovery and liability then set up the recovery account for the tax recovery rate. This account is used to debit the recoverable tax amount while the account on the tax rate is used to account for tax liability.

- **Interim Tax**: An account that records interim tax recovery or liability before the actual recovery or liability arises on a payment of an invoice. You must set up an interim tax account for taxes and tax rates that have a deferred recovery settlement.

- Accounts for Receivables activities:
  - **Finance Charge Tax Liability**: An account that records tax amounts on finance charges that are used as a deduction against overall tax liability.
  - **Nonrecoverable Tax Accounts**: Accounts that record tax amounts on earned and unearned discounts and adjustments that you cannot claim as a deduction against tax liability.
  - **Expense and Revenue Accounts**: Accounts that record net changes generated by adjustments, earned and unearned discounts, and finance charges. Receivables activities such as discounts and adjustments reduce the receivable amount, and are therefore considered an expense.
Manage Controls and Defaults

Tax Controls and Defaults: Points to Consider

Set up details for the taxes of a tax regime. Each separate tax in a tax regime includes records for the statuses, rate, and rules that are used to calculate and report on the tax. Oracle Fusion Tax derives defaults tax information from the tax regime to each tax that you create under a regime. You can modify this information at the tax level according to your needs, as well as add additional defaults and overrides.

Defining Controls and Defaults

The following table describes the defaults and controls available at the tax level.

Header Region

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Default Derived from</th>
<th>Default Appears on</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enable tax for simulation</td>
<td>Controls whether this tax is available for computation within the Tax Simulator functionality</td>
<td>None</td>
<td>None</td>
<td>If selected then this tax is available for calculation in the Tax Simulator if the evaluate taxes is enabled for simulation.</td>
</tr>
<tr>
<td>Enable tax for transactions</td>
<td>Controls whether this tax is available for transactions and selecting this option triggers integrity checks to validate that the setup for this tax is accurate and complete</td>
<td>None</td>
<td>None</td>
<td>If selected then this tax is used by transactions if applicable. If not selected then this tax is not processed as an applicable tax at transaction time.</td>
</tr>
</tbody>
</table>

Tax Information Region

<table>

</tbody>
</table>
Enter and update detail and summary tax lines according to the requirements of your transactions. Depending on your security settings and options specified during tax setup, you can:

- Enter manual tax lines
- Enter tax only tax lines
- Change existing tax line information
- Cancel tax lines

**Note**
The Summary Tax Lines component is applicable only to Oracle Fusion Payables.

### Entering Manual Tax Lines

These requirements apply to entering a manual detail or summary tax line:

1. Enable the **Allow entry of manual tax lines** option for the:
   - Configuration owner and application event class
   - Tax

2. Ensure that the **Manual Tax Line Entry** profile option is enabled. It is enabled by default.

3. Enter a unique combination for a tax regime and tax. You cannot enter a manual tax line for a tax that already exists for the transaction line.
4. Enter a tax status to enter a tax rate.

5. Enter a tax regime, tax, tax status, and tax rate to enter a tax amount.

The tax calculation on a manual tax line is a standard formula of Tax Amount = Taxable Basis * Tax Rate. The tax determination process does not evaluate tax rules defined for the tax of any tax rule type.

**Entering Tax Only Tax Lines**

You can enter a tax-only invoice in Payables to record tax lines that are not linked to a transaction. A tax-only invoice is used, for example, to record tax lines on purchases that are assessed and invoiced separately or to enter tax-only invoices from tax authorities or import agents that record import taxes.

These requirements apply to entering a tax only tax line:

1. Enable the **Allow manual tax only lines** option for the configuration owner and application event class.

2. Select a tax regime from the tax regimes belonging to the configuration option of the applicable legal entity or business unit.

3. Select a tax, tax status, and tax rate and enter a tax amount.

**Note**

When you select or deselect the Tax Only Line option on a tax line for the first time, the update does not take effect. You must select the specific tax line, click the row header or a noneditable area, and then select the Tax Only Line option.

**Editing Tax Line Information**

These requirements apply to changing an existing detail or summary tax line:

1. Enable the **Allow override for calculated tax lines** option for the:
   - Configuration owner and application event class
   - Tax

2. Ensure that the **Manual Tax Line Entry** profile option is enabled. It is enabled by default.

3. Optionally, enable the following options for the configuration owner and application event class:
   - **Allow recalculation for manual tax lines** option. The tax determination process recalculates the manual tax lines when there is an update to automatically calculated tax lines.
   - **Tax line override impacts other tax lines** option. The tax determination process recalculates the taxes on all other tax lines on the same transaction when there is an override of automatically calculated tax lines on transactions.

4. Save any changes to summary tax lines before you enter or change Payables summary tax lines.

5. Change the tax status if necessary. These requirements apply to changing tax statuses:
   - You cannot update the tax status if the tax on the detail tax line is enforced from the natural account.
• If you edit a tax only tax line and change the tax status, you must re-enter the tax rate code.

6. Change the tax rate if necessary. These requirements apply to changing tax rates:
   • The **Allow tax rate override** option is enabled for the applicable tax status.
   • The **Allow ad hoc rate** option is enabled for the applicable tax rate.
   • You may need to change the tax status to change to the appropriate tax rate.
   • You can change the calculated tax rate derived from the tax status by selecting another tax rate defined for the same tax regime, tax, and tax status.

7. Change the tax rate percentage or quantity rate if necessary. These requirements apply to changing tax rate percentages or quantity rates:
   • You cannot update the tax rate code and rate fields if the tax on the detail tax line is enforced from the natural account.
   • You can only update the tax rate percentage if the tax rate code has the **Allow ad hoc rate** option enabled.

8. Change the tax amount if necessary. These requirements apply to changing tax amounts:
   • When you change the tax amount the setting for the **Adjustment for ad hoc amounts** option of the tax rate determines which value is adjusted, the taxable amount or the tax rate.
   • You can only edit the tax amount if a detail tax line belongs to an historic transaction.
   • You can change the tax amount independent of the tax inclusive and compound tax settings.
   • If you defined tax tolerances for Payables transactions, then if you edit the tax amount and it exceeds the specified tolerance, Oracle Fusion Tax places the invoice on hold.
   • You can only enter 0 as the tax amount if the tax rate is 0.

9. Update the **Inclusive** option setting if necessary. The tax determination process recalculates the taxable amount and transaction amount.

For tax calculation, a limited evaluation of tax rules on certain updates to a tax line is performed.

**Canceling Tax Lines**
These requirements apply to canceling an existing detail or summary tax line:
1. Cancel tax lines on Payables transactions only.
2. Enter a new manual tax line to reverse a canceled tax line if necessary.

**Note**
On canceling the invoice or invoice lines, tax lines are automatically canceled. When you cancel a tax line both the associated tax line and any distributions that were previously accounted are reversed. If the distributions were not accounted, then the amounts are set to zero.

**Note**
When you select or deselect the Cancel option on a tax line for the first time, the update does not take effect. You must select the specific tax line, click the row header or a noneditable area, and then select the Cancel option.

**Tax Amount Rounding: Explained**

Taxes applicable on a transaction are generally calculated as the taxable basis multiplied by the tax rate equals the tax amount. This calculated amount can result in an odd value or with a large number of decimal place. You can configure the tax setup to adjust or round the tax calculation according to the specific requirements of the transacting parties and tax authority or to the accepted currency denominations.

Key parameters that influence the rounding of calculated tax amount are:

- **Tax precision**: The number of decimal places to which to calculate the tax amount.
- **Minimum accountable unit**: The smallest currency unit that a tax amount can have.
- **Rounding level**: The transaction level at which the rounding is to be performed. The available options are **Header** and **Line**.
- **Rounding rule**: The method that is used to round off the calculated taxes to the minimum accountable unit. The available options are **Up**, **Down**, and **Nearest**.

Define the key parameters at various places within Oracle Fusion Tax. The rounding process derives the tax precision and minimum accountable unit details from the tax setup. The rounding process derives the rounding rule and rounding level details through the predefined processing hierarchy involving:

- Configuration owner tax options defined for the configuration owner and event class
- Event class options for the event class
- Party tax profiles of the parties or party sites as given in the rounding precedence of the configuration owner tax options or in the derived registration party
- Tax

**Note**
If you plan to use a third party service provider then you must define tax rounding information that is at least as detailed as the rounding information of the service provider.

**Setting Up Rounding Rules: Choices to Consider**

Criteria for rounding the calculated tax amounts comes from various parties involved in a transaction. For example, for a purchase transaction, the rounding methodology is generally specified by the supplier. Specify rounding details in your tax setup to ensure that your entered invoice amount, including the calculated tax, is the same as the actual invoice amount. For a Receivables invoice, you can specify rounding details based on your organization's policy, but for most countries the rounding criterion is directed by tax legislation. Rounding requirements can originate from:
• Third parties
• First parties
• Tax legislation

Rounding Requirements from Third Parties

If rounding is based on third party requirements, particularly for purchase transactions, you:
• Define the configuration owner tax options for the combination of business unit or legal entity for which the transaction is registered and the event class. In the Rounding Precedence field enter the reference of the third party or third party. For purchase transactions it is either the ship-from party or the bill-from party.
• Define the party tax profile for the third party and specify the rounding level and rounding rule on the General tab as preferred by the third party.
• If the rounding level is at the line level in the party tax profile, create registration details for each tax and specify the rounding rule. Also, define tax registration rules for each tax so that the tax determination process uses the third party registration.
• If a registration record is not defined for the tax registration party, select the Allow tax rounding override option on the Create or Edit Tax page. The application then looks at the party account site details and party tax profile details for deriving the rounding rule.

Rounding Requirements from First Parties

If rounding is based on business unit or legal entity requirements, particularly for sale transactions, and configuration owner tax options are defined, you:
• Define the configuration owner tax options for the combination of business unit or legal entity for which the transaction is registered and the event class. In the Rounding Precedence field enter the reference of the first party. For sale transactions it is either the ship-from party or the bill-from party.
• Ensure that the party tax profile details are available for the corresponding legal reporting unit. Specify the rounding level and rounding rule on the General tab per the first party requirement or your business policy.
• If the rounding level is at the line level in the party tax profile, create registration details for each tax and specify the rounding rule. Also, define tax registration rules for each tax so that the tax determination process uses the first party registration.
• If a registration record is not defined for the tax registration party, select the Allow tax rounding override option on the Create or Edit Tax page. The application then looks at the party tax profile details for deriving the rounding rule.

The rounding criteria applied if configuration owner tax options are not defined and the criteria in the predefined event class options are considered include:
• For a purchase transaction, the predefined event class options use the ship-from party site and ship-from party within the rounding precedence with the default rounding level as the header level. The supplier’s rounding preferences are considered first on the transaction. If there are no specific supplier preferences, for example, the party tax profile record does not exist, then the default rounding level of Header is considered and the corresponding rounding rule from each tax setup detail is used.
- For a sale transaction, the predefined event class options do not include any rounding precedence details. However, the default rounding level is set to **Line** so the rounding level is always taken as **Line** and the corresponding registration record for the tax registration party is considered for the rounding rule. The tax registration party is identified through the Determine Tax Registration tax rule or tax rule defaults. If a registration record does not exist for the tax registration party, the rounding rule defined within each tax is considered.

**Rounding Requirements from Tax Legislation**

If rounding is based on tax legislation, the following occurs:

- If the configuration owner tax options are defined for the combination of business unit and legal entity for which the transaction is registered and for the event class, the default rounding level is used from the configuration owner tax options. Select **Blank** as the rounding precedence for the event class.
- If the rounding level is at the line level for the configuration tax options, ensure that the registration record defined for the tax registration party has the rounding rule based on the tax requirements. The tax registration party is identified through the Determine Tax Registration tax rule or tax rule defaults.

**Rounding Precedence Hierarchy: How It Is Determined**

During the rounding process, the tax precision and minimum accountable unit details are derived from the tax setup. The rounding process derives the rounding rule and rounding level details through the predefined processing hierarchy involving:

- Configuration owner tax options defined for the configuration owner and event class
- Event class options for the event class
- Party tax profiles of the parties or party sites as given in the rounding precedence of the configuration owner tax options or in the derived registration party
- Tax

**Settings That Affect Tax Rounding**

Key parameters that influence the rounding of calculated tax amount are:

- **Tax precision**: The number of decimal places to which to calculate the tax amount.
- **Minimum accountable unit**: The smallest currency unit that a tax amount can have.
- **Rounding level**: The transaction level at which the rounding is to be performed.
- **Rounding rule**: The method that is used to round off the calculated taxes to the minimum accountable unit.

Options available for the rounding level are:

- **Header**: Applies rounding to calculated tax amounts once for each tax rate per invoice.
- **Line**: Applies rounding to the calculated tax amount on each invoice line.

Options available for the rounding rule are:

- **Up**: the amount is rounded to the next highest minimum accountable unit.
• **Down**: The amount is rounded to the next lowest minimum accountable unit.

• **Nearest**: The amount is rounded to the nearest minimum accountable unit.

**How Tax Rounding Is Determined**

If you did not define configuration owner tax option settings for the combination of configuration owner and event class, the rounding process uses the default rounding level of the event class and the default rounding rule of the tax.

If you defined a rounding precedence hierarchy in the configuration owner tax option settings for the combination of configuration owner and event class, the rounding process looks for a rounding level and rounding rule in this way:

1. Looks for rounding details in the party tax profiles of the parties and party sites involved in the transaction, according to the rounding precedence hierarchy.

2. If an applicable tax profile is found then uses the rounding level and rounding rule of the tax profile.

3. If the rounding level is at the header level then uses these values to perform the rounding. The process ends.
   - If the rounding level is at the line level then goes to step 6.

4. If an applicable tax profile is not found then uses the rounding level setting of the configuration owner tax option.

5. If the configuration owner tax option rounding level is at the header level then uses the rounding rule that is set at the tax level for each tax of the transaction to perform the rounding. The process ends.
   - If the rounding level is at the line level then goes to step 6.

6. If the rounding level is at the line level then:
   a. For each tax line, uses the rounding rule belonging to the tax registration of the party type derived from the Determine Tax Registration rule.

   b. If a registration record does not exist for the registration party type and if you did not define configuration owner tax option settings for the combination of configuration owner and event class, then the rounding process uses the rounding rule that is set at the tax level to perform the rounding. The process ends.

   c. If a registration record does not exist for the registration party type and if you defined a rounding precedence hierarchy in the configuration owner tax option settings for the combination of configuration owner and event class, then the rounding process looks for a rounding rule in this way:
      1. Refers to the party or party site of the first party type defined in the rounding precedence hierarchy.
      2. Uses the rounding rule of the party or party site tax registration, if defined.
      3. If a tax registration is not defined, uses the rounding rule of the party or party site account site details, if defined.
4. If a rounding rule is not defined, uses the rounding rule of the party or party site tax profile, if defined.

5. If a tax profile is not defined, repeats the previous substeps for each rounding party in the rounding precedence hierarchy.

6. If a rounding rule is found, uses this rounding rule to perform the rounding. The process ends.

7. If a rounding rule is not found, then uses the rounding rule that is set at the tax level to perform the rounding. The process ends.

**Tax Rounding: Examples**

During the rounding process, the tax precision and minimum accountable unit details are derived from the tax setup. The rounding process derives the rounding rule and rounding level details through the predefined processing hierarchy involving configuration owner tax options, event classes, party tax profiles, and taxes. These examples illustrate how the rounding process works.

**Scenario**

The following examples represent how the rounding process determines the tax rounded amount based on transaction, tax setup, and rounding details.

The transaction and tax setup details for the two examples are:

- Invoice header amount: 5579 USD
- Invoice line 1 amount: 1333 USD
- Invoice line 2 amount: 1679 USD
- Invoice line 3 amount: 2567 USD
- Applicable taxes:
  - State tax, rate percentages of 12.5%, 6.75%, and 3.33%
  - City tax, rate percentages of 7.5%

The rounding details for the two examples are:

- Rounding level: Header
- Rounding Rule:
  - State tax: Up
  - City tax: Nearest
- Tax precision: 2
- Minimum accountable unit: 0.01

Example 1 represents the rounding details applied at the header level. Applying these factors, the rounding process calculates the invoice amounts, all in USD currency, as follows:

<table>
<thead>
<tr>
<th>Document Level</th>
<th>Amount</th>
<th>Tax and Tax Rate</th>
<th>Tax Amount Not Rounded</th>
<th>Step 1: Line amounts truncated per tax precision and rounding</th>
<th>Step 2: Difference between the header amount and the sum of</th>
<th>Step 3: Apply the difference amount to the maximum tax line amount</th>
<th>Tax Amount Rounded</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
Example 2 represents the rounding details applied at the line level. Applying these factors, the rounding process calculates the invoice amounts, all in USD currency, as follows:

<table>
<thead>
<tr>
<th>Document Level</th>
<th>Amount</th>
<th>Tax and Tax Rate</th>
<th>Tax Amount Not Rounded</th>
<th>Step 1: Rounding criteria is applied at the line level</th>
<th>Step 2: Line amounts are added to obtain revised header amounts</th>
<th>Tax Amount Rounded</th>
</tr>

**FAQs for Define Taxes**

**What's the minimum setup to enable a tax for transactions or simulation?**

You can enable a tax for simulation or for transactions only after you have completed all of the minimum setup.

Minimum setup for a country-level standard tax with no recovery and always applicable includes:

- Entering the required fields in the Create Tax or Edit Tax pages.
- Entering direct tax rule defaults for Place of Supply, Tax Registration, Tax Calculation Formula, and Taxable Basis Formula. Also, setting Tax Applicability to **Applicable**.
- Entering indirect tax rule defaults for Tax Jurisdiction, Tax Status, and Tax Rate.
- Entering tax accounts for **Tax Expense** and **Tax Recoverable or Liability Account**. Accounts you specify at the tax level appear as defaults at the tax rate and tax recovery rate level.

If you have tax recovery, minimum setup also includes:

- Defining a tax recovery rate.
- Entering an indirect tax rule default for Tax Recovery Rate.

If the direct tax rule default for Tax Applicability is set to **Not Applicable**, you must define a determining factor set, condition set, and tax applicability rule.

**Manage Tax Determining Factor Sets and Tax Condition Sets**

**Tax Determining Factor Sets and Condition Sets: Explained**

A tax determining factor is an attribute that contributes to the outcome of a tax determination process, such as a geographical location, tax registration status, or a fiscal classification. Determining factors are represented in tax rules as the following concepts:

- **Determining factor class**: Tax determining factors are categorized into logical groupings called determining factor classes, such as Accounting or Geography.
- **Tax class qualifier**: Use a class qualifier with a determining factor class when it is possible to associate a determining factor class with more than one value on the transaction. For example, you need to specify which location type, such as ship-to party, a specific geography level, such as country, is associated with.
• Determining factor name: Each determining factor class contains one or more determining factor names that constitute the contents of the class.

The result of a determining factor class, and its class qualifiers and determining factor names, is a list of available factors for use with tax conditions. Each tax condition within a tax condition set must result in a valid value or range of values for tax determination.

Conceptually, determining factors fall into four groups: party, product, process, and place. The following figure expands upon the determining factors within each grouping.

The relationship between the determining factor and condition sets and the party, product, process, and place is shown in the following table. The relationship value is a concept to group tax drivers and not an element in the tax rule definition. The determining factor, determining factor class, tax class qualifier, determining factor name, condition set operator, and condition set value are all components of tax rule setup.

Tip

Do not mix the interpretation of the party, product, process, and place and the associated determining factors if possible. For example, if the information you need to model concerns the geography associated with the locations on the transaction do not use party classifications to model this type of requirement.

Tip

Whenever possible, use automatically determined or derived determining factors, such as party classifications, product fiscal classifications, or geography instead of using those that are reliant on information entered at transaction time, such as product category, intended use, or user-defined fiscal classifications. Those entering information at transaction time may not be familiar with the impact this information has on tax determination.

You can use multiple party and product fiscal classifications at the same time. However, only the primary product fiscal classification, as defined in the country defaults is displayed on the transaction line. When you override the product fiscal classification at transaction time that value is used in preference to the default product fiscal classification.

Party, Product, Place, and Process as Determining Factors: Explained

Determining factors are the key building blocks of the tax rules. They are the variables that are passed at transaction time derived from information on the transaction or associated with the transaction. They are used within tax rules logic to determine the conditions under which specific tax rules are applicable to a specific transaction.

Conceptually they fall into four groups as shown in the following figure:
The four groups are described as:

- **Party**: Information about the parties on or associated with a transaction such as party fiscal classification, tax registration, and tax exemptions.

- **Product**: Information of the types and classifications of the goods and services on or associated to items on a transaction.

- **Place**: Information on the addresses of the locations associated to the party and party locations on the transaction.

- **Process**: Information on the type of tax services that are being requested such as purchase invoice and debit memo.

**How Tax Is Determined Using Party, Product, Place, and Process Transaction Attributes**

The following table describes how the party, product, place, and process transaction attributes contribute to the outcome of the tax determination process:
<table>
<thead>
<tr>
<th>Group</th>
<th>Transaction Attributes</th>
<th>Process</th>
</tr>
</thead>
<tbody>
<tr>
<td>Place</td>
<td>• Ship from&lt;br&gt;• Ship to&lt;br&gt;• Bill from&lt;br&gt;• Bill to&lt;br&gt;• Point of acceptance&lt;br&gt;• Point of origin</td>
<td>Restrict your tax rules based on the location where the transaction took place. For example, you may only want to apply this tax rule to goods that are delivered from an EC country into the UK. The tax determination process uses the countries associated with the transaction to select the tax regimes associated with the first parties defined for those countries. The tax determination process also uses the location on the transaction that corresponds to the location type derived from the tax rule for the candidate tax or the rule default location type. It then identifies the tax jurisdiction of the candidate tax to which the location identified belongs. If the location does not belong to any tax jurisdiction of this tax, then the tax does not apply to the transaction.</td>
</tr>
<tr>
<td>Party</td>
<td>• First party legal entities&lt;br&gt;• Ship from or ship to parties and bill from or bill to parties&lt;br&gt;• Tax registration and registration statuses of each party&lt;br&gt;• Type or classification of a party</td>
<td>Restrict your tax rules based on the party of the transactions. For example, the supplier must be registered in another EC country for this tax rule to be applied. The tax determination process determines the first party of the transaction which is either the legal entity or business unit. It uses the first party legal entity or business unit to identify the tax regimes to consider for the transaction. It also identifies other configuration options, if defined, to use in processing taxes for the transaction. The tax determination process also determines the party whose tax registration is used for each tax on the transaction, and, if available, derives the tax registration number. If the tax registration or registrations are identified, the process stamps the transaction with the tax registration numbers.</td>
</tr>
</tbody>
</table>
**Define Tax Recovery**

**Tax Recovery: Explained**

Tax recovery is the full or partial recovery of tax paid on purchases by a registered establishment to offset the tax collected from sales transactions. There are usually many regulations surrounding the details of tax recovery. For example, in most European countries, tax is fully recoverable on all purchases except for businesses that only sell nontaxable supplies, such as financial institutions. In cases in which businesses only sell nontaxable supplies, value-added tax (VAT) on their purchases is not recoverable. In certain countries like Canada, more than one type of recovery is possible. Tax authorities designate the tax recovery rates that indicate the extent of recovery for a specific tax.

Tax recovery information on a transaction may be viewed on the invoice distributions level, including any pertinent information for nonrecoverable and recoverable taxes where applicable.

If the recovery rate on a tax varies based on one or more transaction factors, set up recovery rate rules to determine the appropriate recovery rate on the transaction. For example, most VAT-type taxes allow full recovery of taxes paid...
on goods and services that relate to taxable business supplies. In cases where an organization makes purchases relating to both taxable and exempt supplies, the tax authority can designate a partial recovery rate to reflect the proportion that relates to the taxable supplies. For instance, in the UK, Her Majesty's Revenue and Customs (HMRC) have two methods to work out the tax recovery rate percentage:

- Standard method: Taxable supplies divided by the value of all supplies added together (both taxable and exempt). This formula is based on a previous period with an adjustment when the actual proportions are known.
- Special method: A custom formula approved by HMRC that reflects a business's unique circumstances that must produce a fair and reasonable result. Approval to use this special method is based on the business type, the types of supplies, and the business's cost structure.

The Determine Recovery Rate process evaluates tax recovery for applicable taxes. The Determine Recovery Rate process determines the recovery rate to apply to each recovery type for each applicable tax on the transaction.

**Determine Recovery Rate**

Tax rules use the tax configuration setup defined within Oracle Fusion Tax and the details on the transaction to determine which taxes apply to the transaction and how to calculate the tax amount for each tax that applies to the transaction.

Tax rules let you create a tax determination model to reflect the tax regulations of different tax regimes and the tax requirements of your business. You can create a simple tax model or a complex tax model. A simple tax model makes use of the default values without extensive processing while a complex tax model considers each tax requirement related to a transaction before making the final calculation.

The tax determination process evaluates, in order of priority, the tax rules that are defined and the details on the transaction. If the first rule is successfully evaluated, the result associated with the rule is used. If not, the next rule is evaluated until either a successful evaluation or default value is found.

The tax determination process is organized into rule types. Each rule type identifies a particular step in the determination and calculation of taxes on transactions. The rule type and related process used for tax recovery determination is Determine Recovery Rate. This is an optional setup that is applicable to taxes that have tax recovery enabled.

This process determines the recovery rate to apply to each recovery type for each applicable tax on the transaction that allows for full, partial, or no recovery of the tax amount. In many cases, the tax determination process uses either the recovery rate associated with the tax rate or the default recovery rate defined for the tax. However, if the tax recovery rate varies according to determining factors, such as intended use, then create a Determine Recovery Rate tax rule to derive the recovery rate.

You can only set up a Determine Recovery Rate tax rule for taxes that have the tax recovery option enabled. For countries with more than one type of recovery, use primary and secondary recovery types to address this requirement. After the recovery rate is determined for each recovery type, the tax determination process determines the recoverable amounts against each recovery type for each tax line.
The remaining tax amount becomes the nonrecoverable tax amount for the tax line.

The following outlines the process that results in a recoverable tax amount for each recoverable tax distribution:

1. Allocate tax amount per item distributions. While taxes are determined at the transaction line level, tax recovery is determined at the transaction line distribution, or item distribution, level.

2. Determine recovery types. The tax determination process determines for each tax and item distribution, whether the primary and, if defined, secondary recovery types apply. The result of this process is a tax distribution for each recovery type for each tax and item distribution. If recovery types are not defined, go to step 5.

3. Determine recovery rates. For each tax distribution, the tax determination process determines the recovery rate based on the following:
   a. Consider the Determine Recovery Rate tax rule for the first recoverable tax distribution.
   b. Use the tax recovery rate derived from the tax rule.
   c. If the tax determination process cannot derive a tax rule based on the transaction values, use the tax recovery rate associated with the tax rate for the tax line.
   d. If there is no tax recovery rate associated with the tax rate, use the default tax recovery rate for the recovery type and tax. If there is no default tax recovery rate for the recovery type and tax, use the default tax recovery rate defined for the tax.
   e. Repeat the above steps for each recoverable tax distribution, if applicable.

4. Determine the recoverable amounts. The tax determination process applies the recovery rates to the apportioned tax amounts to determine the recoverable tax amounts. The result of this process is a recoverable tax amount for each recoverable tax distribution.

5. Determine the nonrecoverable amount. Oracle Fusion Tax calculates the difference between the apportioned tax amount of every tax line per item distribution and the sum of the recoverable tax distribution to arrive at the nonrecoverable tax amount, and then creates a nonrecoverable tax distribution for this amount. If a primary recovery type was not defined for a tax, the entire apportioned amount for the item distribution is designated as the nonrecoverable tax amount.

**Tax Recovery: Points to Consider**

The tax determination process uses your tax configuration setup and the details on the transaction to determine which taxes are recoverable.

You need to decide when to:

- Create Determine Recovery Rate rules
- Specify separate ledger accounts
Define Project Contract Configurations: Define Transaction Taxes

- Manage tax distributions
- Specify settlement options

**When to Create Determine Recovery Rate Rules**

Use recovery rate rules to determine the applicable recovery rates when this determination is based on one or more transaction factors, including the parties, locations, product or product purpose.

At transaction time, the tax determination process uses the recovery rate derived from the recovery tax rules. If no recovery rate rules are defined or if no existing recovery rate rule applies to the transaction, the tax determination process uses the default recovery rate that you define.

Commonly used factors that are used in tax recovery rules include:

- Intended use, such as resale or manufacturing
- Party fiscal classification, such as reseller or charitable organization
- Location, such as British Columbia or New Brunswick

**When to Specify Separate Ledger Accounts**

Recovery details are primarily captured and tracked through invoice distributions. If there is a requirement to capture the recovery details into separate general ledger accounts for each tax, define the recovery account at the recovery rate level. If the recovery and liability can be combined at the account level, the common account for liability or recovery defined at the tax rate level can be used.

While generating the invoice distributions, the application first considers the recovery account defined at the recovery rate level. If it is null, the liability or recovery account defined at the tax rate level is used.

The nonrecoverable component of a tax gets registered into the expense account defined at the tax rate level. If no specific expense account is given, the item charge account available on the transaction is used. There may be a need to apportion the nonrecoverable component of the tax amount on the item cost. As such, you should consider all of the costing requirements while setting up an expense account.

**When to Manage Tax Distributions**

Use the Tax Distributions window to review and update the tax recovery rate on tax distributions. Oracle Fusion Tax creates recoverable distributions and calculates tax recovery rates when you save the line distribution, according to the Determine Recovery Rate tax rule process or the default recovery rate.

You can update the recovery rate code if the **Allow tax recovery rate override** option is enabled for the tax.

You can update the recovery rate if the **Allow ad hoc tax rate** option is enabled for the recovery rate. The update method differs according to the transaction application:

- Oracle Fusion Purchasing: You can either enter a new recovery rate or select another recovery rate that you previously defined from the list of values.
• Oracle Fusion Payables: You can only select another rate that you previously defined. If you update the recovery rate on a tax distribution, Oracle Fusion Tax also updates the related nonrecoverable rate and amount, and the distribution for the tax line.

If there are tax rules defined based on the Accounting determining factor class, then changing or creating a distribution may affect tax calculation.

**When to Specify Settlement Options**

Tax authorities allow tax recovery at different stages of a transaction life cycle. You can specify the settlement options to indicate when tax recovery is possible:

<table>
<thead>
<tr>
<th>Settlement Option</th>
<th>Purpose</th>
</tr>
</thead>
<tbody>
<tr>
<td>Immediate</td>
<td>Tax recovery is settled after invoice validation.</td>
</tr>
<tr>
<td>Deferred</td>
<td>Tax recovery is settled only after the invoice is paid.</td>
</tr>
</tbody>
</table>

If the recovery settlement is **Deferred**, you must set up an interim tax account for this tax to record the tax recoveries or liabilities that accrue prior to the payment. Though this is an interim account the balance in this account represents a contingent asset. As such, management and other reporting requirements need to be duly considered while setting up or changing this account.

**Tax Recovery Rates Controls and Defaults: Points to Consider**

Define tax recovery rates to claim full or partial recovery of taxes paid. Set up tax recovery rate codes for the recovery types identified on the taxes within a tax regime. A tax recovery rate code identifies the percentage of recovery designated by the tax authority for a specific transaction.

**Defining Controls and Defaults for Tax Recovery Rates**

The following table describes the defaults and controls available at the tax recovery rate level.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Default Derived from</th>
<th>Default Appears on</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set as Default Rate</td>
<td>Controls whether this tax recovery rate is the default recovery rate for this tax at transaction time</td>
<td>None</td>
<td>None</td>
<td>If selected then this recovery tax rate is the default rate for the period specified. Where there are no tax recovery rate rules applicable at transaction time then the tax determination process selects this tax recovery rate.</td>
</tr>
</tbody>
</table>
Recoverable Taxes: Worked Example

The following example illustrates the tax setup and associated tax conditions that drive tax recovery. Set up tax rules to assign specific recovery rates instead of using the default recovery rates defined for the tax. Two recovery types are used to show the primary and secondary recovery type options for a tax.

In Canada, the Goods and Services Tax (GST) is a tax that applies to the supply of most property and services in Canada. The provinces of British Columbia, Ontario, New Brunswick, Nova Scotia, and Newfoundland and Labrador, referred to as the participating provinces, combined their provincial sales tax with the GST to create the Harmonized Sales Tax (HST). Generally, HST applies to the same base of property and services as GST. In countries like Canada, some or all of the taxes on business transactions for registered companies are recoverable taxes.

ABC Corporation is a business located in the province of British Columbia. The sales invoice indicates that ABC purchases books for the purposes of resale. ABC has already created the following setup:

- CA GST and HST, a GST and HST based tax regime
- CA HST, an HST based tax
- CA HST STANDARD, the default HST based tax status for the CA HST tax
- CA HST ZERO FED REC RATE and CA HST ZERO PROV REC RATE, 0% recovery rates for HST, which are set as the default recovery rates for the CA HST tax
- CA HST STANDARD RATE, the default HST based tax rate for the CA HST tax

The percentage rate is 13% for most provinces, and 12% for British Columbia.

The following tax implications are applicable in this scenario:

- Both federal and provincial components of HST are 100% recoverable on books bought for resale.
- Zero recovery rates for federal and provincial components of HST are required, and are set as the default recovery rates for the HST tax.
- Recovery rates for most of the participating provinces are required to address the full recovery of the 13% HST rate.
- Recovery rates for British Columbia are required to address the 12% HST rate.
- Recovery rate rules are required to assign nondefault recovery rates for resale purchases.
- HST is not recoverable on consumable items, such as computers for use in ABC’s store. Default zero recovery rates apply in this case.

Perform the following steps:

Define Project Contract Configurations: Define Transaction Taxes 17-125
- Create tax recovery rates
- Create an intended use fiscal classification
- Create recovery rate rules

**Create Tax Recovery Rates**

For most participating provinces in Canada, the HST is 13%, out of which 5% is the federal component and 8% is the provincial component.

Create the tax recovery rates of 38.46% for the federal component of HST, and 61.54% for the provincial component of HST for these provinces.

1. On the Create Tax Recovery Rate page, enter the name of the tax regime, CA GST and HST.
2. Select the configuration owner for this tax recovery rate. To minimize configuration and maintenance costs, select Global Configuration Owner as the configuration owner.
3. Select the HST tax, CA HST.
4. Enter the name of the tax recovery rate you are defining, such as CA HST STD FED REC RATE.
5. Select PREC as the recovery type.
6. In the recovery rate periods table, enter 38.46 as the percentage recovery rate, and an effective start date.
7. Click **Save and Close**.
8. Repeat steps 1 to 7 to create the tax recovery rate CA HST STD PROV REC RATE, with a recovery type of SREC, and a percentage recovery rate of 61.54%.

For British Columbia, where the HST rate is 12%, you need one federal recovery rate to address the 5% federal component and one provincial recovery rate to address the 7% provincial component. Create a tax recovery rate of 41.67% for the federal component of HST, and a tax recovery rate of 58.33% for the provincial component of HST for British Columbia.

1. On the Create Tax Recovery Rate page, enter the name of the tax regime, CA GST and HST.
2. Select the configuration owner for this tax recovery rate. To minimize configuration and maintenance costs, select Global Configuration Owner as the configuration owner.
3. Select the HST tax, CA HST.
4. Enter the name of the tax recovery rate you are creating, such as CA HST BC FED REC RATE.
5. Select PREC as the recovery type.
6. In the recovery rate periods table, enter 41.67 as the percentage recovery rate, and an effective start date.
7. Click **Save and Close**.
8. Repeat steps 1 to 7 to create the tax recovery rate CA HST BC PROV REC RATE, with a recovery type of SREC, and a percentage recovery rate of 58.33%.
Create Intended Use Fiscal Classification

Create an intended use fiscal classification for Resale. An intended use fiscal classification is a tax classification based on the purpose for which the product is used.

1. In the Create Fiscal Classification Code window of the Manage Intended Use Classification page, enter a code for the classification, such as CA INTENDED USE RESALE.
2. Enter a name for this classification, such as CA Intended Use Resale.
3. Optionally, select Canada as the country and enter a start date, such as 1/01/2001.
4. Click **Save and Close**.

Create Recovery Rate Rules

Create the recovery rate rules that apply for most participating provinces when the conditions for HST recovery are met. Recall that by default, tax recovery on HST is 0% at the federal and provincial levels.

1. In the Create Determine Recovery Rate Rule page, select Global Configuration Owner as the configuration owner, CA GST and HST as the tax regime, and CA HST as the tax.
2. Enter the code and name of the tax recovery rate rule you are creating, such CA HST FED RECOVERY RULE, the start date, and a recovery type code of PREC.
3. Create or select a tax determining factor set and an associated tax condition set whereby the intended use of the acquired product is the intended use fiscal classification you defined earlier, namely CA INTENDED USE RESALE.
   - When this condition is met, 100% recovery rate for the federal component is applicable.
4. For the tax condition set, assign the result of CA HST STD FED REC RATE.
5. Assign a rule order, such as 100.
6. Click **Save and Close**.
7. Repeat steps 1 to 6 to create CA HST PROV RECOVERY RULE for the standard provincial recovery rule, with a recovery type code of SREC, a result of CA HST STD PROV REC RATE, and a rule order of 110.

Create the recovery rate rules that apply for British Columbia when the conditions for HST recovery are met.

1. In the Create Determine Recovery Rate Rule page, select Global Configuration Owner as the configuration owner, CA GST and HST as the tax regime, and CA HST as the tax.
2. Enter the code and name of the tax recovery rate rule you are creating, such CA HST BC FED RECOVERY RULE, the start date, and a recovery type code of PREC.
3. Create or select a tax determining factor set and an associated tax condition set whereby the ship-to location is British Columbia and
the intended use of the acquired product is the intended use fiscal
classification you defined earlier, CA INTENDED USE RESALE.

When this condition is met, 100% recovery rate for the federal component
is applicable.

4. For the tax condition set, assign the result of CA HST BC FED REC RATE.

5. Assign a rule order, such as 50, that gives a higher priority to this rule
than the 2 rules you created previously.

6. Click **Save and Close**.

7. Repeat steps 1 to 6 to create CA HST BC PROV RECOVERY RULE for
British Columbia’s provincial recovery rule, with a recovery type code of
SREC, a result of CA HST BC PROV REC RATE, and a rule order of 55.

For ABC’s transactions in Canada, the following is determined by the
previous setup:

- HST tax is applicable and is calculated at a percentage rate of 13% for
  most participating provinces, and a percentage rate of 12% in British
  Columbia.

- The intended resale of these books makes these transactions eligible for
  100% tax recovery.

- For most participating provinces, tax recovery is calculated at a federal
  percentage rate of 38.46% and a provincial rate of 61.54%.

- For British Columbia, tax recovery is calculated at a federal percentage
  rate of 41.67% and a provincial rate of 58.33%.

**Tax Recovery Distributions: Explained**

A recoverable tax is a tax that allows full or partial recovery of taxes paid on
purchases, either as a recoverable payment or as a balance against taxes owed.
A tax recovery rate identifies the percentage of recovery for a tax designated by
the tax authority for a specific transaction line. You can review Oracle Fusion
Payables tax distributions and, if applicable, update the tax recovery rate on a tax
distribution depending on your tax setup and security access. The component in
Oracle Fusion Purchasing is view-only.

**Managing Tax Recovery Distributions**

Oracle Fusion Tax creates recoverable distributions and calculates tax recovery
rates when you save the line distribution, according to the Determine Recovery
Rate tax rule process or the default recovery rate. If self-assessment is enabled
for the applicable party, two distributions for each tax are created, one with a
positive amount and the other with a negative amount.

One recoverable distribution for the primary recovery type and, if applicable,
the secondary recovery type is created, for each tax line for each of the item
distributions into which the item line or expense line is distributed. The tax
distributions are displayed in this way:
• If the tax is nonrecoverable, one nonrecoverable tax distribution line for the tax is created, with the nonrecoverable amount equal to the tax amount. You cannot update a nonrecoverable tax distribution nor create a manual recoverable distribution.

• If the tax is recoverable, two or three distribution lines are displayed, one for the primary recoverable amount, one for the secondary recoverable amount, if applicable, and another for the nonrecoverable amount. If the tax is fully recoverable, then the recoverable distribution amount is equal to the tax amount and the nonrecoverable distribution amount is equal to zero.

If the tax is recoverable and the recovery rate is zero, then the nonrecoverable distribution amount is equal to the tax amount and the recoverable distribution amount is equal to zero.

• If self-assessment is enabled for the applicable party, the application creates two distributions for each tax, one with a positive amount and the other with a negative amount.

If the tax applied on the transaction is self-assessed, then the corresponding recoverable and nonrecoverable tax distributions are not visible in the distributions window, but the application does generate them at the time of accounting for the invoice.

• If the tax applied on the transaction is of the offset type, then the application creates two distributions for the recovery and nonrecovery portions of the tax. Since they are intended to offset each other, they are created for the same amount, but one with a positive value and the other with a negative value.

In a Payables transaction you can update the recovery rate code if the Allow tax recovery rate override option is enabled for the tax. You can update the recovery rate if the Allow ad hoc tax rate option is enabled for the recovery rate.

If you update the recovery rate on a tax distribution, Oracle Fusion Tax also updates the related nonrecoverable rate and amount, and the distribution for the tax line. If the distribution status is frozen, you cannot update the tax distribution. In order to change the distribution, you must reverse the tax distribution and enter a new distribution.

If applicable, accounting-related setups may affect tax calculation:

• If there are tax rules defined based on the Accounting determining factor class, then changing or creating a distribution may affect tax calculation.

• If the Enforce tax from account option is enabled for the configuration owner and event class, this may affect the tax calculation based on the distribution.

**Tax Recovery Distributions: Example**

Recoverable distributions are created and tax recovery rates are calculated when you save the line distribution, according to the Determine Recovery Rate tax rule process or the default recovery rate. You can review tax distributions and, if applicable, update the tax recovery rate on a tax distribution.

**Note**
The authorized user can update the tax recovery rate on the distribution in Oracle Fusion Payables. The component in Oracle Fusion Purchasing is view-only.

**Scenario**

Your company is located in a Canadian province that has combined the provincial sales tax with the federal goods and services tax (GST) into a harmonized sales tax (HST). They recently purchased books to sell in their stores. They also purchased some computers to use in kiosks within the stores for customers to use to locate books.

**Transaction Details**

The transaction details are as follows:

- Total cost of books is 10,000 CAD
  
  The invoice indicates the intended use as Resale.

- Total cost of computers is 5,000 CAD
  
  The computers will be expensed as they do not meet the capitalization threshold.

- Tax rate applicable to each item is 13%

**Analysis**

In most tax regimes, a tax that is paid by a registered establishment can claim back 100% of taxes due from the tax authority, except for specific designated purchases. Depending upon the details of a company's business purchases and tax authority regulations, a number of exception regulations may accompany the details of tax recovery. Tax implications are:

- The HST associated with the cost of books to be sold in stores is 100% recoverable. Therefore, 1,300 CAD is recoverable (10,000 CAD * 13%).

- The HST associated with the cost of the computers to be used in kiosks within the stores is not recoverable. Therefore, 650 CAD is nonrecoverable (5,000 CAD * 13%).

The HST tax configuration specifies that the recovery tax rate for zero 0% recoverable is used as a default. A tax rule is defined to apply a 100% recoverable rate for products with an intended use of Resale.

**Tax Recovery Distributions**

Based on the analysis, the following distributions are created for the transaction:

<table>
<thead>
<tr>
<th>Accounting Class</th>
<th>Debit</th>
<th>Credit</th>
</tr>
</thead>
<tbody>
<tr>
<td>Item Expense</td>
<td>10,000</td>
<td></td>

<td>1,300</td>
<td></td>
</tr>
<tr>
<td>Liability</td>
<td>650</td>
<td></td>
</tr>
</tbody>
</table>
Define Tax Statuses

Tax Status Controls and Defaults: Points to Consider

Set up tax statuses that you need for each tax that you create for a combination of tax regime, tax, and configuration owner. You define a tax status under a tax and a configuration owner, and define all applicable tax rates and their effective periods under the tax status. The tax status controls the defaulting of values to its tax rates.

Defining Controls and Defaults

The following table describes the defaults and controls available at the tax status level.

Header Region

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Default Derived from</th>
<th>Default Appears on</th>
<th>Controls</th>
</tr>
</thead>
<tbody>
<tr>
<td>Set as default tax status</td>

**Define Tax Rates**

**Define Tax Rates: Overview**

The tax determination process identifies the applicable tax rate when taxes are considered applicable to a transaction. Tax rates can apply to a specific location or jurisdiction, for example, you define state, county, and city jurisdiction-based rates for a US Sales and Use Tax regime. Tax rates can change over time, for example when a tax rate increase occurs, you end date one rate period definition and create a new rate period with an effective start date. There can be tax exceptions or exemptions to tax rates based on specific items, third parties, general ledger accounts, or other factors. You must set up tax rates for tax statuses and optionally for tax jurisdictions. For tax statuses, set up tax rate records for each applicable tax rate that a tax status identifies. For tax jurisdictions, set up tax rate records to identify the tax rate variations for a specified tax and tax status within different tax jurisdictions. Set up your tax rates in the Define Tax Rates activity.

The tax rate determination process can be viewed as a two step process:

- **Tax rate determination**, which includes:
  - A default tax rate associated to the tax
  - An effective rate period
  - Jurisdiction-based rates
  - Tax rules; direct rate rules, tax rate rules, and account-based direct rate rules
  - Migrated tax classification codes and tax classification-based direct rate rules
- **Tax rate modification**, which includes:
  - Item or product fiscal classification exceptions using special rates, discounts, or surcharges
  - Third party and third party site tax exemptions using special rates and full or partial exemptions
Manage Tax Exceptions

Tax Exception on a Transaction Line: How Tax Is Calculated

Set up tax exceptions to apply special tax rates to products. At transaction time, Oracle Fusion Tax determines whether the tax exception applies to the transaction line for the product, and if so, uses the applicable exception rate.

Settings That Affect Tax Exceptions

A tax exception must belong to a combination of tax regime, configuration owner, and tax. You can also assign tax exceptions to a tax status or tax rate belonging to the tax or to a tax jurisdiction.

You can define Oracle Fusion Inventory organization tax exceptions for items, or you can define tax exceptions for Inventory-based product fiscal classifications or noninventory-based product categories. If you are using Inventory-based product fiscal classifications then generally, the application classifies the transaction line based on the item. If you are using noninventory-based product category fiscal classifications you enter the appropriate product category on all applicable lines to influence the tax result.

Product categories and product fiscal classifications are defined in a hierarchical structure. It is important that you select the appropriate level where the tax exception is applicable. For product fiscal classifications to be used in item exceptions, you must indicate that it is used in item exceptions at the tax regime association to the product fiscal classification. You can set up only one product fiscal classification for any specific tax regime with the Used in Item Exceptions option selected.

When you set up configuration options for first party legal entities and business units, you can set a separate configuration option for the owning and sharing of product tax exceptions for a combination of party and tax regime.

The Allow tax exceptions option is set at the tax regime level and you can override it at the tax and tax status levels. However, the setup you define for the tax rate is what is evaluated during tax rate determination.

At transaction time, the tax exception is used if the details of the transaction and the tax match all of the entities assigned to the tax exception. Only one tax exception can apply to a transaction line for a specific tax.

Note

Tax exemptions are specific to the order-to-cash event class while tax exceptions are applicable across event classes.

How Tax Exceptions Are Calculated

The tax determination process determines tax applicability, tax status, and the tax rate for the transaction line. If tax exceptions are allowed, the application looks at the item entered on the transaction line to determine if an exception is defined at the tax, tax status, tax rate, tax jurisdiction, Inventory organization, or Inventory level and uses the exception at the most specific level.
If the application does not find any tax exception for the item, it looks for a product fiscal classification associated with the transaction line. If one exists, the application determines if an exception is defined at the tax, tax status, tax rate, tax jurisdiction, and product fiscal classification level and uses the exception at the most specific level with the highest precedence.

The tax rate is then based on the exception type and calculated as follows:

- **Discount**: A reduction of the base tax rate. For example, if the discount is 15% off the standard rate and the standard rate is 10%, then the discount rate is 85% of the original 10%, or 8.5%.

- **Surcharge**: An increase to the base tax rate. For example, if the surcharge is 10% and the standard rate is 10%, then the surcharge rate is 110% of the original 10%, or 11%.

- **Special Rate**: A rate that replaces the base tax rate. For example, if the special rate is 5% and the standard rate is 10%, the tax rate is the special rate of 5%.

Finally, the new tax rate is applied to the taxable basis and the tax amount is calculated.

For manual tax lines, no additional processing is performed and exceptions are not considered. A manual tax line suggests that you have specific business requirements for a particular transaction to apply a manual tax. No additional processing is performed for manual tax lines to avoid any applying conflicting or inconsistent values to the user-entered tax line. The tax calculation on a manual tax line is the standard formula of: tax amount is equal to the taxable basis multiplied by the tax rate.

### Define Tax Rules

#### Tax Determination: Explained

Taxes are levied on transactions as per the legislations in a country or region. They are seldom uniformly applied on all transactions and tax legislation may seek differential levy, treatment, and administration of taxes based on various transaction attributes. Configure Oracle Fusion Tax to evaluate transactions based on transaction attributes to determine which taxes apply to a transaction and how to calculate tax amount for each tax that applies to the transaction.

The tax determination process evaluates transaction header and line information to derive tax lines for taxes applicable to the transactions. The evaluation process is subdivided into the following processes:

- Determine Applicable Tax Regimes and Candidate Taxes
- Determine Place of Supply and Tax Jurisdiction
- Determine Tax Applicability
- Determine Tax Registration
- Determine Tax Status
- Determine Tax Rate
- Determine Taxable Basis
• Define Tax Calculation
• Define Tax Recovery

The tax determination process utilizes the tax foundation configuration in conjunction with configuration options and tax rules to process transactions for tax applicability and calculation. Tax configuration ranges from simple models that make use of default values without extensive processing to complex models that consider each tax requirement related to a transaction before making the final calculation.

When setting up a tax examine the regulations that govern the determination of the tax amount, from identifying applicability drivers to how the tax is calculated. Organize the regulations into one or more rule types for each tax. When the regulations indicate that more than one result is possible for a given rule type, then you need to define rules within that rule type. Otherwise you can defer to a default value for that rule type associated to the tax.

The complexity of setup can be classified as follows:

• No tax rules required: Oracle Fusion Tax uses the default tax status, tax rate, and tax recovery rate defined for the tax. Tax rules are not required but tax rates can vary by class of products set up using tax exceptions, location set up using tax jurisdictions, and party set up using exemption definitions. In addition, applicability can still be controlled without the use of tax rules such as through the party tax profile that you define for a supplier.

• Simple tax rule regimes: The tax authority levies tax on your transactions at the same rate, with a simple set of identifiable exceptions. The exceptions either apply to one part of the transaction only, such as to certain parties, or to a combination of parties, products, and transaction processes that you can summarize in a simple way. In such cases, use a simple set of tax rules, for example, to identify place of supply and tax registration, and use default values for other processes.

• Complex tax regimes: Tax regimes in certain countries require a complex logic to determine the applicable taxes and rates on a transaction. Both tax applicability and tax rates can vary, for example, by place of origin and place of destination, party registration, status, service, or a combination of factors. In some cases, the taxable amount of one tax may depend upon the amount of another tax on the same transaction. And in rare cases, the tax amount itself may depend on the tax amount of another tax. For all of these and similar situations, you set up tax rules to define the logic necessary to identify each step of the tax determination process.

Tax Determination Steps

The first step of the determination process is to identify the first party of the transaction. The tax determination process looks to the business unit on the transaction and identifies whether it is pointing to the configuration owner of the business unit or legal entity depending on the Use subscription of the legal entity option on the party tax profile definition of the business unit. The tax determination process checks to determine if there are configuration owner tax options associated to this party or if the predefined event class option should be used.

The Determine Applicable Tax Regimes process can be the predefined TAXREGIME, STCC (standard tax classification code), or another regime
determination set that is user-defined. TAXREGIME or user-defined regime
determination sets derive the applicable tax regimes or tax regime through
country or zone of the location identified in the processing of the regime
determination determining factor set location values. STCC determination is
typically used for purposes of migrated data and has a different processing logic
driven by tax classification code. A third option of determination is third party
integration.

Determine Applicable Tax Regimes and Candidate Taxes

Tax regimes are considered based on geography and subscription. Either a
country or zone associated to the tax regime definition must be the same as the
country or zone identified via the location that evaluates to true on the regime
determination set of the first party of the transaction. In addition, the tax regime
must have a subscription to the applicable configuration owner. Once the tax
determination process identifies the tax regimes the list of candidate taxes can be
evaluated based on the configuration option setting of the first party in the tax
regime subscription definition:

- Common Configuration: Consider all taxes with the configuration owner
  of global configuration owner.
- Party Specific Configuration: Consider all taxes with the first party as
  configuration owner.
- Common Configuration with Party Overrides: Consider all taxes with the
  first party and the global configuration owner as configuration owner. If a
tax is defined by both the first party and the global configuration owner,
then the application only uses the tax defined by the first party.
- Parent First Party Configuration with Party Overrides: Consider all taxes
  with the first party and the parent first party as configuration owner.
  If a tax is defined by the first party and the parent first party then the
application only uses the tax defined by the first party.

Determine Tax Applicability and Place of Supply and Tax Jurisdiction

This process determines the tax applicability of each candidate tax based on
direct rate determination, place of supply, tax applicability, and tax jurisdiction.
The first step in tax applicability is to process any direct rate rules defined for
a tax regime, configuration owner, and candidate taxes. If a direct rate rule
evaluates to true then place of supply is processed for this transaction tax.
If successful the tax is applicable and the tax status and tax rate defined for
the direct rate rule are used in the tax calculation. If a direct rate rule does
not evaluate to true for this tax regime, configuration owner, and tax the tax
applicability rules are processed next. After a tax is found applicable based on an
applicability rule or a default value the process verifies the place of supply and
associated tax jurisdiction. This is required except in the cases of migrated taxes.
The place of supply process identifies the applicable location type and associated
tax jurisdiction where the supply of goods or services is deemed to have taken
place for a specific tax. If the tax determination process cannot find a tax
jurisdiction for the location that corresponds to the place of supply location
type, then the tax does not apply and it is removed as a candidate tax for the
transaction.

For example, the place of supply for UK value-added tax (VAT) on goods is
generally the ship-from country. Thus, the place of supply of a sale or purchase
within the UK is the UK itself. However, if a UK legal entity supplies goods from
Define Project Contract Configurations: Define Transaction Taxes

its French warehouse to a German customer, then the place of supply will not find a jurisdiction for UK VAT in France, and therefore UK VAT does not apply.

Determine Tax Registration
This process determines the party whose tax registration is used for each tax on the transaction, and, if available, derives the tax registration number.

Determine Tax Status
This process determines the tax status of each applicable tax on the transaction. If the process cannot find a tax status for an applicable tax, then Tax raises an error.

Determine Tax Rate
This process determines the tax rate code for each tax and tax status derived from the previous process. First the application looks for a rate based on rate code and tax jurisdiction. If this is not found then the application looks for a rate with no tax jurisdiction. If applicable, the tax rate is then modified by any exception rate or tax exemption that applies. The result of this process is a tax rate code and tax rate for each applicable tax.

Determine Taxable Basis
This process determines the taxable base for each tax rate code. Depending on the tax rate type the taxable basis is amount based or quantity based. The tax determination process typically determines the tax by applying the tax rate to the taxable base amount. In some cases, the taxable basis either can include another tax or is based on the tax amount of another tax. Define taxable basis formulas to manage these requirements.

Determine Tax Calculation
This process calculates the tax amount on the transaction. In most cases, the tax amount is computed by applying the derived tax rate to the derived taxable basis. In some exceptional cases, the tax amount is altered by adding or subtracting another tax. Define tax calculation formulas to manage these requirements.

Determine Tax Recovery
This process determines the recovery rate to use on procure-to-pay transactions when the tax allows for full or partial recovery of the tax amount. For example, for UK manufacturing companies VAT on normal purchases used for company business is 100% recoverable. However, if you are a financial institution which only makes VAT exempt on sales then you are not allowed to recover any taxes and your recovery rate is zero percent on all purchases. The recovery process impacts the distribution level, tax amounts, and inclusiveness of taxes. The resulting distribution amounts are adjusted as a result of the recovery process. The recovery type is defined on the tax and identifies whether there are one or two recovery types; primary and secondary. For each tax and recovery type the application determines the recovery rate based on a tax rule or default value defined on the tax.

**Tax Rules: Explained**

Tax determination can be configured as a simple process with all default values for the determination points and it can be enhanced with the definition of tax rules to identify and process any exceptions to the common treatment scenario.
The tax rules that are part of the tax determination process are organized into rule types. Each rule type identifies a particular step in the determination and calculation of taxes on transactions. The tax determination process evaluates, in order of priority, the tax rules that are defined against the tax configuration setup and the details on the transaction. The application processes tax rules in order of evaluation until one evaluates successfully, then the process stops. If none of the rules defined evaluate successfully the associated default value is used.

The tax line determination process uses the information of the transaction header and the transaction line and any information derived by the transaction attributes such as party fiscal classification to determine the tax lines. The rule types and related processes are used for tax line determination and tax calculation.

Tax rules have the following elements as part of the definition:

- Rule type and rule attributes:
  - Tax regime, configuration owner, tax and optionally, tax status and tax recovery type
  - Event class association
  - Geography association
  - Effective dates
  - Determining factors and condition sets
  - Rule order and status

A rule type associates a tax rule to a particular point in the determination process. The following are the possible tax rules you can define:

- Place of Supply Rules
- Tax Applicability Rules
- Tax Registration Determination Rules
- Tax Status Determination Rules
- Tax Rate Determination Rules
- Taxable Basis Rules
- Tax Calculation Rules
- Tax Recovery Rate Determination Rules
- Manage Direct Tax Rate Determination Rules
- Account Based Direct Tax Rate Determination Rules
- Tax Classification Based Direct Tax Rate Determination Rules

Define a tax rule in the context of a tax regime, configuration owner, tax. Define Tax Rate Determination Rules within the context of a tax regime, configuration owner, tax, and tax status. Define Tax Recovery Rate Determination Rules within the context of a tax regime, configuration owner, tax, and recovery type. When processing a transaction the transaction date must be within the effective date of the rule.

Associate a tax rule with an event class or tax event class on the tax rule header to identify the tax rule as only being applicable to a specific event class. The tax determination process evaluates event-specific rules and tax event-specific rules before non-event-specific rules for the same rule type, tax regime, configuration...
Define Project Contract Configurations: Define Transaction Taxes

owner, and tax. Set up more specific event classes to less specific tax event classes to generic tax rules applicable to all event classes. Include geography information on the tax rule header as well as within the determining factor or condition set detail. Including geography detail does not change evaluation order but improves the performance of tax rule processing. Include reference information, such as tax law or other text, in the definition of the tax rule.

**Tip**
Always try to minimize tax rules and setup for tax regimes and taxes. Tax rules are specific to a tax regime and tax, thus by minimizing the number of tax regimes and taxes, the number and complexity of the tax rules can be minimized.

**Tip**
Move any complexity from the beginning to the end of the rule types and supporting setup. For example, it is better to use tax recovery rate rules in preference to setting up specific tax rates with individual defaults associated with tax recovery rates.

Tax reporting requirements adds some level of complexity to the pure tax setup needed to support the tax determination and calculation processes, make every effort to minimize this additional level of complexity. Write tax reports wherever possible to use tax reporting codes or use the determination factors that identify your reporting requirements. These reporting determination factors should replace the need to create specific taxes, tax statuses, and tax rates purely defined to allow tax reporting.

For extreme cases you may need to create a more complex tax setup to meet your tax reporting needs. For example, currently there are no determining factors that can easily identify asset purchases. In many countries it is a requirement to report the tax associated with asset purchases separately. In this case, create tax status and tax rate rules based on asset account segments to uniquely allocate a specific tax status and tax rate to these asset purchases. These asset purchases can then be reported by searching for the specific tax status and tax rate or specific tax reporting codes associated with the specific tax status or tax rate.

**Direct Tax Rate Rules: Explained**

Define tax rules on an exception basis to handle requirements that cannot be addressed by foundation tax setup. You can define tax status rules, tax rate rules, direct tax rate rules, account-based direct tax rate rules, or tax classification-based direct tax rate rules to derive the applicable tax rate.

The tax determination process uses direct tax rate rules to determine tax applicability, tax status, and tax rate. The tax determination process uses a tax rate rule to determine the tax rate once the tax status is determined. A direct tax rate determination rule is a good choice if there are specific requirements to drive a specific tax, tax status, and tax rate and no variation in tax status or tax rate is required.

**Tip**
If tax applicability is not impacted by a tax law but the tax rate is you can set up a tax status rule to point to a different tax status and utilize a default tax rate.
associated to that tax status. If the tax status does not need to be unique a tax rate rule can drive a specific tax rate but keep the tax applicability and tax status based on existing rules.

Direct Tax Rate Determination

Use the Direct Tax Rate Determination rule type for situations where you do not need to create separate tax rules for tax applicability, tax status, and tax rate. The following must occur for a Direct Tax Rate Determination rule to be applicable:

- The Direct Tax Rate Determination rule must evaluate to true
- The tax rate code must be defined for the product family
- The place of supply must evaluate successfully except in the case of migrated taxes when Allow multiple jurisdictions is selected

If a Direct Tax Rate Determination rule is not evaluated successfully, then Determine Tax Applicability rules are processed to determine if tax is applicable. If the tax is not applicable then the determination process ends for tax.

Account-Based Direct Tax Rate Determination

Account-based rules are direct rate rules that are driven by the line account of the transaction. A matching account drives the applicability, tax status, and tax rate defined on the tax rule. These tax rules are only applicable when the regime determination method is Determine applicable regimes and the configuration owner tax option for the event class has the Enforce from account option selected. These tax rules are evaluated after standard applicability rules. If a standard applicability rule evaluated the tax to Not applicable then it cannot be applicable through an Account-Based Direct Tax Rate Determination rule.

Tax Classification-Based Direct Tax Rate Determination

Use the Tax Classification-Based Direct Tax Rate Determination rule when the regime determination for the configuration owner tax option is defined as STCC (standard tax classification code). This setup is primarily intended for migrated tax classification codes, specifically tax classification groups. The tax classification code populated on the transaction line drives the tax determination and tax rate directly. A default tax rate associated to a tax rate code is not applicable in this case. Tax classification codes are created automatically as user-extensible lookup codes when you save a tax rate definition. The Tax Classification-Based Direct Tax Rate Determination rule is an extension to an existing migrated configuration where the tax calculation was based on tax classification codes.

Tax Setup Components in the Tax Determination Process: How They Are Used

The tax determination process uses your tax configuration setup and the details on the transactions to determine which taxes apply to the transaction and how to calculate the tax amount.

How Tax Is Calculated Using Tax Setup Components

Each step of the tax determination and tax calculation processes requires the completion of a certain number of setup tasks. The number and complexity of
your setups depends upon the requirements of the tax authorities where you do business.
This table describes the order of tax determination processes that Oracle Fusion Tax uses to calculate taxes on transactions. Use this table to review the details of each process and to identify the setups that you need to complete for each step in the tax determination and tax calculation process.

<table>

---

**Tax Rule Qualifiers: Explained**

Tax rules that have a rule qualifier are used only when the qualifier matches with the transaction line. Use the tax rule qualifiers to restrict or apply specific tax rules to an event or geography.

**Event Qualifiers**

The event qualifier is of two types: normal event and tax event.

Normal events comprise of the following events:

<table>
<thead>
<tr>
<th>Event Name</th>
<th>Oracle Fusion Application Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>Credit Card Expenses</td>
<td>Expenses</td>
</tr>
<tr>
<td>Employee Expense Report</td>
<td>Expenses</td>
</tr>
<tr>
<td>Expense Report</td>
<td>Payables</td>
</tr>
<tr>
<td>Standard Invoices</td>
<td>Payables</td>
</tr>
<tr>
<td>Prepayment Invoices</td>
<td>Payables</td>
</tr>
<tr>
<td>Purchase Order and Agreement</td>
<td>Purchasing</td>
</tr>
<tr>
<td>Change Orders</td>
<td>Purchasing</td>
</tr>
<tr>
<td>Debit Memo</td>
<td>Receivables</td>
</tr>
<tr>
<td>Invoice</td>
<td>Receivables</td>
</tr>
<tr>
<td>Credit Memo</td>
<td>Receivables</td>
</tr>
</tbody>
</table>

The event class qualifiers have a direct affect on the evaluation order of tax rules. The following list summarizes the affect:

1. When a normal event-based qualifier is used then it is used in preference to tax rules qualified by tax event qualifiers or other nonevent-based qualified tax rules regardless of the rule priority.

2. When multiple normal event-based qualified tax rules are applicable, the application uses rule priority to define the rule processing order.
3. When a tax event based qualifier is used then it is used in preference to other nonevent-based qualified rules regardless of rule priority.

4. When multiple tax events-based qualified tax rules are applicable, the application uses rule priority to define the rule processing order.

5. When no event-based qualifier, normal event or tax event-based, is used, tax rule evaluation is used for rule priority order.

6. When a geography qualifier is used, it does not affect the tax rule evaluation order. That is, tax rules are evaluated based on the above points regardless of whether a geography qualifier is used or not.

The following table considers five tax rules, namely, A, B, C, D, and E with or without event qualifiers and rule order and the resulting evaluation sequence:

<table>
<thead>
<tr>
<th>Tax Rule</th>
<th>Normal Event Qualified</th>
<th>Tax Event Qualified</th>
<th>Rule Order</th>
<th>Evaluation Sequence</th>
</tr>
</thead>
<tbody>
<tr>
<td>A</td>
<td>Yes</td>
<td>No</td>
<td>100</td>
<td>2</td>
</tr>
<tr>
<td>B</td>
<td>Yes</td>
<td>No</td>
<td>50</td>
<td>1</td>
</tr>
<tr>
<td>C</td>
<td>No</td>
<td>No</td>
<td>10</td>
<td>5</td>
</tr>
<tr>
<td>D</td>
<td>No</td>
<td>Yes</td>
<td>20</td>
<td>3</td>
</tr>
<tr>
<td>E</td>
<td>No</td>
<td>Yes</td>
<td>30</td>
<td>4</td>
</tr>
</tbody>
</table>

Rule B is evaluated first because it is the highest priority rule with a normal event rule qualifier. Rule A is identified as second in evaluation sequence it is the only other tax rule with a normal event rule qualifier. Rule D is third in evaluation sequence as it is the highest priority rule with a tax event rule qualifier followed by rule E as the only other tax rule with a tax event rule qualifier. Finally, the application evaluates rule C as it does not have any event rule qualifiers.

The use of normal event or tax event rule qualifiers alters the way in which the tax determination process processes the tax rules. For an event class qualified tax rule, normal event or tax event-based, the tax rule is evaluated first in preference to tax rules qualified by tax event qualifiers or a nonevent class qualified tax rule of higher priority.

Consider that you have two rules: rule A and rule C with rule priority 100 and 10 respectively. The rules are associated with condition sets that match against the transaction line details. Rule A has a normal event class qualifier which is satisfied while rule C does not have an event class qualifier, rule A is processed and used first regardless of the rule priority order, even though rule A has a lower priority than rule C.

Tax rules qualified by tax event qualifiers are processed after normal event qualified tax rules but before tax rules with no event or tax event qualifiers. When there are two or more rules with normal event class qualifiers that match the transaction line details, the application uses rule priority to determine the order in which the tax rules are processed.

**Note**

Geography qualifiers do not function in this way. When a tax rule has a geography qualifier and no event class qualifier, the tax determination process
processes the tax rules based on the rule priority against other tax rules that do not have any tax event rule qualifiers.

**Geography Qualifiers**

Enable the **Set as geography specific rule** option to use the geography qualifier. Once you enable this option you can enter either a normal geography or a tax zone geography.

When you use a normal geography, select the parent geography type and parent geography to help restrict the list of geography type and subsequently, the geography name fields. For example, when you want to select counties for a specific state such as California, define the:

- Parent geography type as State
- Parent geography name as CA (California)
- Geography type as County

This limits the list of values for the geography name field to the counties that are in the state of California instead of listing all of the counties.

**Tip**

When selecting the normal geography qualifiers, use the parent geography to ensure that the correct geography element is selected, as there are many multiple geography elements with the same name across the world. For example, Richmond is a city in Canada’s provinces of British Columbia, Ontario, and Quebec. Richmond is also a city in the state of Virginia in the United States.

---

**Order of Processing Within a Rule Type: How Tax Rules Are Evaluated**

During tax determination processing, Oracle Fusion Tax considers the tax rules belonging to each rule type in the order that you defined them.

**How Tax Rules Are Evaluated**

The sequence of tax rules evaluation is:

- Generally, you define tax rules for a configuration owner, tax regime, tax, and rule type. If a tax regime is subscribed to an entity as **Common configuration**, all the tax rules you defined for the **Global configuration owner** are considered for rule evaluation. If it is subscribed as **Party-specific configuration** or **Parent first party organization**, then only the tax rules you defined for that entity or the reference entity are considered. If it is **Common configuration with party overrides** then all the tax rules you defined for the entity as well as for the **Global configuration owner** are combined and evaluated in the order specified. If the effective dates of a tax rule does not cover the transaction date or if it is disabled, then the tax rule is ignored during rule evaluation.

- From the previous listed rules, if one or more tax rules belonging to a tax regime, tax, and rule type are defined for a normal event class or tax event class, then such rules are evaluated first by normal event class and then by tax event class regardless of the overall rule order. If more than one
event class rule is listed for a rule type, then such set of rules are further sequenced according to their corresponding rule orders.

- Further to the previous sequencing, if one or more tax rules belonging to a tax regime, tax, and rule type are defined for a tax event class, then such rules are next sequenced for evaluation, regardless of the overall rule order. If more than one tax event class rule is listed for a rule type, then the set of rules are further sequenced according to their given rule order.

- Finally, the tax rules belonging to a tax regime, tax, and rule type are listed according to their defined rule order for evaluation.

While processing each tax rule in the evaluation sequence, the tax determination process evaluates the condition sets defined within a tax rule according to the defined condition set order sequence. If a condition set criteria does not match with the transaction details, the tax determination process evaluates the next condition set. If none of them match with the transaction details, the next rule within the ordered rule set is considered. If a condition set criteria matches with the transaction details, then the tax determination process considers the rule result defined against that condition set and the tax rule is marked as successfully evaluated. If none of the defined rule conditions match the transaction details, then the tax determination process considers the default result defined for that tax.

**Example**

The following is an example of a tax regime that is subscribed to by a business unit with common configuration treatment. To meet the tax law requirements to determine the tax rates, the following tax rate rules are defined against the global configuration owner. The details shown below are a summary of the rate rules including rule order, geography specific details, associated conditions sets, and the rate results associated to these condition sets:

<table>
<thead>
<tr>
<th>Rule Order</th>
<th>Normal Event Class</th>
<th>Geography-Specific Rule</th>
<th>Condition Set</th>
<th>Condition Set Order</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>10</td>
<td>Blank</td>
<td>Blank</td>
<td>• CS-1</td>
<td>10</td>
<td>VAT10%</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• CS-2</td>
<td>20</td>
<td>VAT12%</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td>• CS-3</td>
<td>30</td>
<td>VAT15%</td>
</tr>
<tr>
<td>20</td>
<td>Purchase invoice</td>
<td>• Location type: Bill from</td>
<td>CS-4</td>
<td>10</td>
<td>VAT12.5%</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Geography name: California</td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>30</td>
<td>Purchase invoice</td>
<td>Blank</td>
<td>CS-5</td>
<td>10</td>
<td>VAT13%</td>
</tr>
</tbody>
</table>

**Scenario 1**

If a Payables invoice is involved and Texas is the bill-from party state, the tax rule processing sequence is as follows:

1. The tax rules are listed according to the sequencing logic. For example, the tax determination process evaluates tax rules involving normal event class qualifiers first regardless of having a lower rule order.
2. The tax determination process further evaluates condition sets listed within each tax rule.

The tax determination process is represented as follows:

<table>
<thead>
<tr>
<th>Rule Order</th>
<th>Normal Event Class</th>
<th>Geography-Specific Rule</th>
<th>Condition Set</th>
<th>Condition Set Order</th>
<th>Result</th>
<th>Evaluation Status</th>
<th>Result</th>
</tr>
</thead>
<tbody>
<tr>
<td>20</td>
<td>Purchase invoice</td>
<td></td>
<td>CS-4</td>
<td>10</td>
<td>VAT12.5%</td>
<td>Condition set: Not evaluated</td>
<td>Move to next tax rule</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Location type: Bill from</td>
<td></td>
<td></td>

Scenario 2

If a Receivables invoice is involved, the tax rule processing sequence is as follows:

1. The tax rules are listed according to the sequencing logic. For example, the tax determination process evaluates tax rules involving normal event class qualifiers first regardless of having a lower rule order.

2. The tax determination process further evaluates condition sets listed within each tax rule.
<table>

</tbody>
</table>
### Setting Up Tax Rules: Points to Consider

The performance of the tax determination process is in inverse proportion to the number of tax rules and conditions that the process needs to evaluate in order to arrive at a specific result.

### Creating Tax Rules

Use these guidelines and examples to help plan your tax rules implementation:

- If the tax condition results and rule results always equal the default values, then you do not need a tax rule. You only need to define a tax rule for a result that is different from the default value. For example, if more than one tax rate is possible for a given tax and tax status, then you need to create at least one tax rule.
These qualifications apply to tax rules and default values:

• If you require many different results other than the default value for a given tax and rule type, it probably means that the default value itself sometimes applies. In these cases, you should also define a tax rule for the default value. Otherwise the tax determination process must always process and eliminate the tax rules defined for all other values before arriving at the default.

• As an alternative to defining a tax rule for the default value, you can assign the least frequent result as the default value. The tax determination process processes the maximum number of tax rules on the minimum number of occasions. In this kind of an implementation, you must ensure that your tax rules and conditions cover all of the more common results in order to prevent the tax determination process from using an incorrect result as a default.

• If more than one tax rate is possible for a given tax this may be a consideration for a tax rule.

• If you define multiple tax rules to derive distinct results for a process, assign the least frequent result as the default value for the process. The most frequent value should be the first tax rule. There are occasions for the default to be the most frequent value so you may want to define tax rules for exceptions, such as by item. In general, define tax rules for exceptions, but if there are a lot of tax rules that you need to define, then you may want to define a tax rule for the most common scenario to avoid processing all of the exceptions.

• When you define tax rules consider the need to repeat tax conditions in multiple rule types if the condition is part of the applicability evaluation. For example, if you define a Determine Tax Applicability rule for UK VAT that only applies when ship to is equal to United Kingdom, then you do not need to repeat this condition in a tax rule for a subsequent tax determination process, such as a Determine Tax Status rule.

• Where possible, use the tax rule header information instead of creating tax conditions that arrive at the same result. For example, if tax rules apply to the Purchase business process, set the tax event class to **Purchase transaction** rather than defining a tax condition within the tax rule, such as tax event class is equal to Purchase transaction.

• When you order the tax condition sets within a tax rule, assign the higher priority to the set of conditions that occurs more frequently. Similarly, when you order the tax rules within a rule type and tax, assign the higher priority to the tax rule that gives the most frequently arrived at process result.

• Use product tax exceptions for special rates based on product fiscal classifications rather than defining a Determine Tax Rate rule based on product fiscal classifications. For example, if three out of five product fiscal classifications use a special rate, define three product tax exceptions based on the three product fiscal classifications that need a special rate, and set the standard rate as the default rate.

• Define the minimum number of tax conditions necessary for a tax rule. For example, if a special rate applies to goods shipped outside a state as opposed to within a state, define one tax condition as ship from state is not equal to ship to state, rather than defining two separate tax conditions
Define Project Contract Configurations: Define Transaction Taxes

for each ship from and ship to location, such as ship from state is equal to Nevada and ship to state is not equal to Nevada.

- Consider the reusability of determining factor sets during the creation process. Any determining factor not set as required in the determining factor set definition can be set to ignore in the condition set so you do not have to define the condition and it is not evaluated. This allows flexibility in the condition set definition not requiring a unique determining factor set for every variation in condition set logic.

- For tax rules that involve the shipping to and from a tax zone, for example the European Union, define a tax condition for all ship to countries within the tax zone rather than separate tax conditions for each country, such as ship to is equal to Great Britain, ship to is equal to France, and so on.

- For tax rules that apply to a specific geographic area, define tax rules with the additional context of the geographic area rather than adding location-based equal to tax conditions. For example, if you have a tax rule that only applies if the ship to state is California, then define the tax rule such that it is only evaluated when the ship to state is California. You can do this by associating geography during the first step of the tax rule definition at the tax rule header level.

- Define tax rules that are common across all legal entities or business units under the global configuration owner, instead of creating the same tax rules for each legal entity or business unit. If all tax rules are not commonly applicable to all legal entities or business units, then:

  - Set the configuration option of the legal entities or business units that require additional rules to Common configuration with party overrides

  - Define supplementary party-specific rules under the applicable legal entities or business units. You can set priority values for party-specific rules that complement the tax rules of the global configuration owner, in accordance with the tax requirements.

Turning Tax Regulations into Tax Rules: Example

This example illustrates how to set up tax rules based on tax regulation in the Her Majesty’s Revenue and Customs (HMRC) VAT guide. It provides the detailed business conditions under which goods can be reverse charge (self-assessment) as part of the Intra-EU Supply legislation.

Scenario

You are a UK business registered for VAT in the UK. You purchase goods from other European Union (EU) countries and therefore fall under the HMRC Tax Regulation Intra-EU Purchase of Goods legislation.

HMRC Tax Regulation

According to the HMRC VAT guide, if you purchase goods from a VAT-registered business in another EU country, and the goods are moved to the UK, then you may be required to account for VAT in the UK on the acquisition of goods. This VAT can be recovered as input tax on the same VAT return, subject to the normal rules for reclaiming input tax.
Analysis

Analyze the text of the legislation and identify the key phrases in the legislation.

The following figure shows an extract of the UK HMRC VAT guide regarding the Intra-EU Supply legislation.

Extract of the UK Her Majesty Revenue and Customer VAT Guide website information.

You purchase goods from a VAT registered business in another EU Country and the goods are removed to the UK, then you may be required to account for VAT in the UK on the acquisition of the goods. This VAT can be recovered as input tax on the same VAT return, subject to the normal rules for reclaiming input tax.

Break these phrases down into product, party, process, and place determining factors that describe under what conditions the legislation is applicable. Look at the legislation and identify what is the outcome when the legislation is applicable and determine which rule types are appropriate.

The following figure shows these determining factors and rule types in detail and how you can turn them into expressions that can be modeled in Oracle Fusion Tax.
This table describes the phrases identified in this tax legislation as represented in the previous figure:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Text</th>
<th>Requirement</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>If you <em>purchase</em> goods...</td>
<td>The tax rule is limited to purchase transactions.</td>
</tr>
<tr>
<td>2</td>
<td>...from a VAT-registered business in another European Community country...</td>
<td>The tax rule requires that the supplier be registered in another EU country.</td>
</tr>
<tr>
<td>3</td>
<td>...and the <em>goods</em> are removed...</td>
<td>The tax rule is limited to the Goods product type.</td>
</tr>
<tr>
<td>4</td>
<td>...are removed to the United Kingdom...</td>
<td>The tax rule refers to goods delivered to the United Kingdom from another country in the EU country.</td>
</tr>
<tr>
<td>5</td>
<td>...you may be <em>required to account for</em>...</td>
<td>The party must reverse charge (self-assess) the tax.</td>
</tr>
<tr>
<td>6</td>
<td>...for VAT in the United Kingdom...</td>
<td>The tax is UK VAT.</td>
</tr>
</tbody>
</table>

**Resulting Tax Rules**

Legislation Phrase 1
Tax legislation phrase 1 indicates that the determining factor that defines this specific tax rule is only applicable to purchase transactions. This equates to a tax event class equal to purchase transactions. Use a tax event class rather than an event class as the tax event class covers other products in the procure-to-pay flow. This covers Oracle Fusion Payables and Oracle Fusion Purchasing processing with a single approach.

The following figure shows that the determining factor that defines this specific tax rule is only applicable to purchase transactions.

This table describes the contents of the tax condition set as represented in the previous figure:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Determining Factor Name</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Tax Event Class</td>
<td>Equal to</td>
<td>Purchase transaction</td>
</tr>
</tbody>
</table>

Tip

Always look for the most generic approaches that cover more of the business requirements in a single tax rule. For example, here the tax event class is used instead of a specific event class for Payables transactions and another similar rule for Purchasing transactions.

It is determining factors like this that allows you to define tax rules that are only applicable to specific types of transactions. The previous approach allows you a convenient way of splitting order-to-cash and procure-to-pay transactions. By using event class you can make a more detailed refinement so that tax rules are only applicable to specific product transactions. This flexibility drives the simplification of combining procure-to-pay tax setup with order-to-cash tax setup into a single model. In the majority of cases you do not need to distinguish between procure-to-pay or order-to-cash transactions within the tax rules, however, where there is a need create specific procure-to-pay or order-to-cash tax rules using this key design concept.

Legislation Phrase 2

Tax legislation phrase 2 indicates that the determining factor that defines the supplier is registered in another EU. There are several ways of modeling this
but the approach that is recommended for you to take is to use a registration status on the tax registration record set up for the GB tax regime. It is also recommended that a business process is in place and documentary evidence retained to show that the supplier is validated as a true supplier registered in another EU country. Until you complete this manual business process the supplier should not be marked with the registration status of registered in another EU country.

The following figure shows the determining factor that defines that the supplier is registered in another EU country.

![Diagram showing the determining factor](image)

This table describes the contents of the tax condition set as represented in the previous figure:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Determining Factor Name</th>
<th>Class Qualifier</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Registration Status</td>
<td>of supplier</td>
<td>Equal to</td>
<td>Registered in another EU country</td>
</tr>
</tbody>
</table>

**Tip**

Always look for approaches which coupled with business procedures provide the necessary controls. In this case it is recommended that you devise and implement a business procedure to ensure that sufficient level of checking is done before the supplier or supplier site tax registration record is created and that the correct registration status entered. This business procedure ensures that the supplier is a valid supplier and that their tax registration number is a valid tax registration number.

**Legislation Phrase 3**

Tax legislation phrase 3 indicates that the determining factor that defines the product type is goods. Another way of modeling this is to use a product fiscal classification which can automatically be derived from the item defined on the
transaction. However, in this case if an item is not specified on the transaction, for example in an unmatched purchase invoice being processed, then there is no product fiscal classification derived. You need to create additional tax rules and setup to address this situation.

The following figure shows the determining factor that defines that the product type is goods.

This table describes the contents of the tax condition set as represented in the previous figure:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Determining Factor Name</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>3</td>
<td>Product Type</td>
<td>Equal to</td>
<td>Goods</td>
</tr>
</tbody>
</table>

**Tip**

Always look for an approach which provides an automated process that covers as many transactions as possible. For example, by using product type of **Goods** rather than a product fiscal classification then unmatched Purchase invoice tax processing can also be covered by this one tax rule.

Legislation Phrase 4

Tax legislation phrase 4 indicates that the determining factors that define the supply is from another EU country. This is modeled by:

1. Goods are being shipped to UK
2. Goods are being shipped from an EU country
3. The shipped from country is not UK

You can take items 2 and 3 to ensure that the goods are being sent from another EU country outside the UK.

The following figure shows the determining factor that defines the supply is from another EU country.
Define Project Contract Configurations: Define Transaction Taxes

This table describes the contents of the tax condition set as represented in the previous figure:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Determining Factor Name</th>
<th>Class Qualifier</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>4</td>
<td>Country</td>
<td>of ship to</td>
<td>Equal to</td>
<td>United Kingdom</td>
</tr>
<tr>
<td>4</td>
<td>Economic Region</td>
<td>of ship from</td>
<td>Equal to</td>
<td>European Economic Community</td>
</tr>
<tr>
<td>4</td>
<td>Country</td>
<td>of ship from</td>
<td>Not equal to</td>
<td>United Kingdom</td>
</tr>
</tbody>
</table>

**Tip**

Geography and tax zones are powerful features of Oracle Fusion Tax and you should use them wherever possible to identify tax jurisdictions and geography requirements in general. Use the geography or tax zone information for tax reporting instead of trying to build geography information into concepts such as tax rates. For example, use tax jurisdictions, such as over sea tax territories based on tax zone, to identify specific territories needed for tax reporting rather than creating specific tax regimes, taxes, tax statuses, and tax rates.

**Legislation Phrases 5 and 6**

Tax legislation phrase 5 indicates how the determining factors discussed previously are brought together as the basis for the Tax Registration tax rule which identified that the bill-to party registration be used in preference to the normal default bill-from party registration. It is this bill-from party registration that triggers the reverse charge (self-assessment) for the type of transaction.

Tax legislation phrase 6 indicates how the determining factors discussed previously are brought together as the basis for the Place of Supply tax rule. This tax rule changes the normal place of supply to be the ship-to location,
which in the context of this setup means that at least for the reverse charge (self-assessment) side of this transaction it is deemed to have occurred in the UK.

The following figure shows how you can bring together the determining factors discussed previously as the basis for the Tax Registration and Place of Supply tax rules.

This translated in Oracle Fusion Tax to the following:

<table>
<thead>
<tr>
<th>Legislation Phrase</th>
<th>Determining Factor Name</th>
<th>Class Qualifier</th>
<th>Operator</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>5 and 6</td>
<td>Tax Event Class</td>
<td></td>
<td>Equal to</td>
<td>Purchase Transaction</td>
</tr>
<tr>
<td>5 and 6</td>
<td>Registration Status</td>
<td>of supplier</td>
<td>Equal to</td>
<td>Registered in another EU country</td>
</tr>
<tr>
<td>5 and 6</td>
<td>Product Type</td>
<td></td>
<td>Equal to</td>
<td>Goods</td>
</tr>
<tr>
<td>5 and 6</td>
<td>Country</td>
<td>of ship to</td>
<td>Equal to</td>
<td>United Kingdom</td>
</tr>
<tr>
<td>5 and 6</td>

<td>Not equal to</td>
<td>European Economic Community</td>
</tr>
<tr>
<td>5 and 6</td>
<td>Country</td>
<td>of ship from</td>
<td>Not equal to</td>
<td>United Kingdom</td>
</tr>
</tbody>
</table>

This table describes the contents of the tax condition set for the Tax Registration and Place of Supply tax rules as represented in the previous figure:

Tip

From this example you can see that a simple Tax Registration tax rule and Place of Supply tax rule is all that is needed to define what is a complex scenario for
the purchasing of goods from another EU country, not the UK, from an EU registered supplier by a UK registered business. The other tax rules that are used if these goods are purchased in the UK, are the normal tax rules such as Tax Status, Tax Rate, and Tax Recovery tax rules.

**Manage Tax Applicability and Place of Supply Rules**

**Tax Applicability: Explained**

The tax determination process uses your tax configuration setup and the details on the transaction to determine which taxes apply to the transaction and how to calculate the tax amount for each tax that applies to the transaction. Tax is applicable to a transaction when nexus, or presence in the geographical scope of the tax, exists. The criterion for nexus or presence differs by governing tax authorities.

Examples for establishing nexus include:
- A physical establishment in the location
- Resident employees working in the location
- Property, including intangible property, in the location

In addition to location, there are other factors that can contribute to the applicability of a tax. Some examples are:
- Telecommunications specific taxes
- Sales tax holidays
- Tax on sale of luxury items

The tax determination process is organized into rule types. Each rule type identifies a particular step in the determination and calculation of taxes on transactions. The rule types and related processes used for tax applicability determination are:
- Determine Place of Supply: Determines the location where a transaction is considered to have taken place for a specific tax.
- Determine Tax Applicability: Determines the taxes that apply to a given transaction.

A third rule type, Direct Tax Rate Determination, is a special tax rule type that lets you specify the results of tax applicability, tax status, and tax rate for a given tax. You use this rule type for specific tax determination requirements. If available, the Direct Tax Rate Determination rules are processed first. If it is found to be applicable, then the Determine Tax Applicability rules are processed, followed by the Determine Place of Supply rules. If it is not found to be applicable, the Determine Place of Supply rules are processed, followed by the Determine Tax Applicability rules.
**Determine Place of Supply**

The Determine Place of Supply step identifies the applicable place of supply, which is the location type where the supply of goods or services is deemed to have taken place for a specific tax. If Oracle Fusion Tax cannot find a tax jurisdiction for the location that corresponds to the place of supply location type, then the tax does not apply and it is removed as a candidate tax for the transaction. No jurisdiction is required if it is a migrated tax which has the other jurisdictions indicator equal to No.

For example, the place of supply for UK VAT on goods is generally the ship-from country. Thus, the place of supply of a sale or purchase within the UK is the UK itself. However, if a UK legal entity supplies goods from its French warehouse to a German customer, then the place of supply will not find a jurisdiction for UK VAT in France, and therefore UK VAT does not apply.

The following outlines the process that results in a list of applicable taxes per transaction line:

1. Consider the Determine Place of Supply tax rule of the first candidate tax in order of rule priority.
2. Use the location type derived from the tax rule for the tax. The possible location types are:
   - Bill from
   - Bill to
   - Point of acceptance (Receivables transactions only)
   - Point of origin (Receivables transactions only)
   - Ship from
   - Ship to
   - Ship to, use bill to if ship to is not found
3. Identify the location on the transaction that corresponds to the location type derived from step 2. If no location applies, then the default location type for the rule is used.
4. Identify the tax jurisdiction of the candidate tax to which the location identified in step 3 belongs. If the location does not belong to any tax jurisdiction of this tax, then the tax does not apply to the transaction.
5. Repeat steps 1 to 4 for each candidate tax.
6. Create refined list of candidate taxes.

**Determine Tax Applicability**

The Determine Tax Applicability step determines the tax applicability of each candidate tax derived from the Determine Place of Supply step, and eliminates taxes that are found to be not applicable.

The tax determination process first attempts to derive the applicability of each candidate tax based on the rule conditions of the Determine Tax Applicability.
rules for the tax. If no rule applies, the process uses the default value of **Applicable** or **Not Applicable** that was assigned to the rule type for the tax. If the tax does not apply, it is removed from the list of candidate taxes.

The following outlines the process that results in a final tax of list of taxes that apply to the transaction:

1. Consider the Determine Tax Applicability tax rules of the first candidate tax in order of rule priority.
2. Use the **Applicable** or **Not Applicable** value derived from the tax rule for the tax.
3. Use the default value for the rule if no applicability rule evaluates successfully.
4. Repeat steps 1 to 3 for each candidate tax.
5. Identify the final tax or list of taxes by eliminating the taxes that have an applicability value of **Not Applicable**.

**Tax Applicability Options: Points to Consider**

The tax determination process uses your tax configuration setup and the details on the transaction to determine which taxes are applicable to the transaction.

You need to decide when to:

- Create tax rules
- Set up tax zones
- Use **Allow tax applicability** option
- Use **Perform additional applicability for imported documents** option

**Create Tax Rules**

If the tax authority levies tax on all sales and purchase transactions at the same rate, and neither tax applicability nor the tax rates and recovery rates vary by any factors, you do not have to set up tax rules. Oracle Fusion Tax can simply use the default tax status, tax rate, and tax recovery rate defined for the tax. If, however, the applicability of tax is dependent upon certain criteria, you may need to use default values in combination with one or many tax rules to define the logic necessary to derive the values in the tax determination process.

The tax rules used for tax applicability determination are:

- Place of supply rules
- Tax applicability rules

**Place of Supply Rules**

Use place of supply rules to determine the place where the transaction is deemed to have taken place when this determination is based on certain criteria.

For example, consider a German company supplying physical services, such as work on goods, at a customer's site in the UK, where the customer is registered...
for UK VAT. With a default value of **Ship to** for place of supply, the customer’s tax registration number is used on the transaction.

Next, consider the same German company supplying physical services at a customer’s site in the UK, where the customer is not registered for UK VAT. The default value of **Ship to** for place of supply yields no tax registration number since the customer is not registered for UK VAT. In this case, you create a place of supply rule to deem the **Ship from** as the place of supply when the customer is not registered.

At transaction time the application derives the place of supply from the transaction as shown in the table below. It is important to consider how place of supply translates for the event classes being considered for tax calculation in a regime since this can include and exclude candidate taxes.

<table>
<thead>
<tr>
<th>Place of Supply</th>
<th>Order-to-Cash Transactions</th>
<th>Procure-to-Pay Transactions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Bill from</td>
<td>Legal entity address</td>
<td>Supplier site header level address</td>
</tr>
<tr>
<td>Ship from</td>
<td>Warehouse address</td>
<td>Supplier site header level address</td>
</tr>
<tr>
<td>Bill to</td>
<td>Customer site bill-to address</td>
<td>Business unit address on the associated party tax profile</td>
</tr>
<tr>
<td>Ship to</td>
<td>Customer site ship-to address</td>
<td>Ship-to location at line level</td>
</tr>
<tr>
<td>Ship to, use bill to if ship to not found</td>
<td>Customer site bill-to or ship-to address</td>
<td>Ship-to location at line level</td>
</tr>
</tbody>
</table>

**Tax Applicability Rules**

Use tax applicability rules to apply a specific tax to certain transaction lines, or conversely, exempt certain transaction lines from a specific tax. For example, a given tax may not apply to a domestic supply of goods to an exempt customer.

An important consideration in creating your tax applicability rules is that when a tax is deemed not applicable, a tax line is not created. However when a tax is deemed exempt based on an exemption or special rate, the tax line is still created for reporting purposes.

**Note**

For migrated data using the Standard Tax Classification Code approach, which uses a tax code to derive tax, tax status, and tax rate, you can set the tax to be applicable or not applicable by default or by using a tax applicability rule.

**Direct Tax Rate Determination Rules**

If you need to create tax rules but do not require separate rules for tax applicability, tax status, and tax rate, you can create a Direct Tax Rate Determination rule type. Direct rate rules and account based direct rate rules determine tax applicability, tax status, and tax rate without evaluating applicability rules and defaults.

If a direct tax rate determination rule is evaluated successfully, then the tax is applicable and the tax status and tax rate defined for the rule are used in tax determination. If a direct tax rate determination rule is not evaluated successfully, then the tax determination process resumes with the tax applicability rules.
Create Tax Zones

Use tax zones to group existing geographical regions that share the same tax requirement. You can use tax zones with tax regimes, to identify tax requirements for a special geographic area, and to create parent tax regimes that represent a related grouping of geographic regions for tax reporting purposes. You can also use tax zones with tax rules, to create tax rules that refer to a specific geographic location. The use of tax zones is optional and depends on your overall tax setup planning.

For example, if a separate economic community exists in part of a country only, you can either set up a tax zone and corresponding tax regime for the applicable geographic area, or set up a country tax regime and use applicability rules to exclude the parts of the country where the tax requirement does not apply.

Use Allow Tax Applicability Option

Use the Allow tax applicability option to determine if Oracle Fusion Tax calculates tax on transactions for a specific event class. This option is available on the Configuration Owner Tax Options page, which enables you to review the default tax settings for each application event class. Oracle Fusion Tax uses these settings as the basis for determining and calculating taxes on transactions belonging to each event class.

If the Allow tax applicability option is set for the Payables event class, you must also set this option on the party tax profile of third parties and third party sites acting as suppliers or supplier sites that are involved in transactions belonging to this event class. You can set this option, for example, for customers that also act as suppliers on transactions.

Use Perform Additional Applicability for Imported Documents Options

Use the Perform additional applicability for imported documents option to indicate whether Oracle Fusion Tax runs the tax applicability process to identify missing taxes on an imported document. This option is also available on the Configuration Owner Tax Options page, and applicable to Payables event classes only. Taxes not included in the imported document are marked as Self-Assessed, if self-assessment applies to the transaction.

Setting Up Tax Applicability Influencers: Example

This example illustrates the tax setup for two taxes: one that is generally applicable, the other that is only applicable by exception. The taxes are set to apply their general applicability by default, however tax rules are used to switch applicability for both taxes when certain criteria is met.

Scenario

In Canada, the First Nations Goods and Services Tax (FNGST) is a tax that is applied by participating Aboriginal governments on the consumption of
goods and services within their reserves or settlement lands. The 5% FNGST is administered in exactly the same way as the federal Goods and Services Tax (GST), however, where it applies, GST does not apply.

The tax implications are:

- FNGST is generally not applicable and would only apply on an exception basis
- Place of supply for FNGST tax is based on the place of delivery or ship-to location
- If FNGST applies then GST would not be applicable

**Transaction Details**

A customer who resides on lands where FNGST applies buys supplies from ABC Corporation located in the province of Ontario. This store is not located on lands where FNGST applies. The sales invoice indicates that ABC Corporation delivers the furniture to the customer’s residence. The FNGST applies to the sale, and GST does not apply.

As part of the setup, create a tax that is applicable to any party that qualifies as First Nation. Due to the specificity of the tax, set the default applicability to **Not Applicable**. In this example, you do not need to configure a place of supply rule as a standard default of ship to would suffice.

There is more than one way to configure this rule and applicability. They include:

- Define an applicability rule and use a default status and rate associated with the tax.
- Define a direct rate rule to apply the tax, tax status, and tax rate directly.

**Analysis**

For this scenario, the following setup is needed:

1. Create a tax regime for the tax that is applicable to any First Nation party. The regime level is **Country** and the country of applicability is **Canada**.
2. Create a tax with a default applicability of **Not Applicable** since this tax is only applicable in exception cases. Set the default Place of Supply as Ship To. To make this tax applicable, you will need to create a tax rule.
3. Create a standard tax status and a standard tax rate. Create the default tax rate with a rate percentage of 5%. You do not need to define a jurisdiction rate since the rate is standard across Canada.
4. For FNGST, identify a driver to determine applicability, such as a party fiscal classification. Create a party fiscal classification for First Nation, and associate the tax regimes affected by this tax. Note that CA FNGST is associated to trigger applicability, but CA GST AND HST is also associated to avoid applicability when CA FNGST applies.
5. Once you create a party fiscal classification and associated the tax regimes, associate the classification to the specific party. To do so, create or edit an existing third party tax profile and associate it to the First Nation party fiscal classification.
6. For FNGST, create a tax applicability rule that is **Applicable** when the conditions for FNGST are met. Recall that by default, FNGST is **Not Applicable** since in most cases it only applies as an exception. For this tax rule, you need a tax determining factor set and associated tax condition set whereby the party fiscal classification of the ship-to party corresponds to the First Nation party fiscal classification you created.

7. For GST, create a tax applicability rule that is **Not Applicable** when the conditions for FNGST are met. By default, GST is **Applicable** since in most cases it applies and FNGST is the exception.

**Resulting Tax Applicability**

FNGST, a tax that is not applicable by default, becomes applicable on transactions to First Nation parties. The first Determine Tax Applicability rule makes FNGST applicable when the ship-to party on the transaction corresponds to the party fiscal classification that identifies a First Nation party. Since GST does not apply when FNGST is applicable, the second Determine Tax Applicability rule has the opposite result, whereby GST becomes not applicable when the ship-to party on the transaction is a First Nation party.

**Manage Tax Formulas**

**Tax Formulas: Explained**

Tax formulas are used in the tax calculation process to determine the taxable basis of a transaction line and the calculation methodology that must be applied to obtain the tax amount.

When the parameters available on a transaction do not satisfy the rule conditions, the default tax formulas defined for the tax are applicable.

There are two types of tax formulas:

- Taxable basis tax formula
- Tax calculation tax formula

**Taxable Basis Tax Formula**

The taxable basis tax formula is used in the tax calculation process to determine the amount or quantity that should be considered as the taxable basis of a transaction line. The tax rate is applied on the taxable basis amount to derive the basic tax amount on a transaction line.

The key factor that decides the characteristics of the taxable basis amount is the taxable basis type that is defined in the taxable basis formula. The various taxable basis types are:

- **Assessable value**
- **Line amount**
• Prior tax
• Quantity

The following standard predefined taxable basis tax formulas are available:

• STANDARD_QUANTITY
• STANDARD_TB
• STANDARD_TB_DISCOUNT

Assessable Value

Use **Assessable value** when the transaction line amount does not reflect the correct taxable basis, from the tax calculation perspective. The assessable value given on the transaction line is considered as the taxable basis amount for the purpose of tax calculation.

**Line Amount**

Use **Line amount** when the transaction line amount is to be treated as the taxable basis for tax calculation purposes.

The transaction line amount is considered as the taxable basis. This is done after deducting the associated discounts, or after proportionately enhancing or reducing it by a certain percentage, or after adding other applicable taxes available on the transaction line. These adjustments on the line amount are controlled through the following parameters that are defined on the tax formula:

• Subtract cash discount: The cash discount applicable on the transaction, derived through the attached payment terms, is deducted from the transaction line amount. This option is considered only for Receivable transactions.

• Base rate modifier: The transaction line amount is increased or decreased based on the percentage value given.

• Tax formula compounding: The tax details specified in the tax formula compounding region are added to the transaction line amount to determine the taxable basis amount. These tax details are also enforced by selecting the **Enforce Compounding** option. If a compounded tax is enforced and if it is not calculated on the transaction, the tax to which this tax formula is associated with also does not become applicable.

**Prior Tax**

Use **Prior tax** if the taxable basis is one or more than the other taxes calculated on the transaction line. The option to compound the prior taxes that are calculated on the transaction line are also available.

**Quantity**

Use **Quantity** if a tax on the transaction is to be calculated based on the number of units or items that are involved in the transaction.
Tax Calculation Tax Formula

The tax calculation tax formula is used to determine the calculation methodology that is applied to derive the basic tax amount on a transaction line. The tax amount on a transaction is generally calculated by multiplying the derived tax rate by the taxable basis. However, in some cases the tax amount is required to be altered by adding other taxes that are applicable on the same transaction line. Use a tax calculation formula defined with compounding criteria to address this requirement.

The tax details specified in the tax formula compounding region are added to the calculated tax that is associated with the tax formula. These compounded tax details can also be enforced when you select the **Enforce Compounding** option. When the compounded tax is enforced and when it is not calculated on the transaction, the tax to which this tax formula is associated with also does not become applicable.

Taxable Basis Tax Formula: Examples

The tax calculation process uses the taxable basis tax formula to determine the amount or quantity that should be considered as the taxable basis of a transaction line. The tax rate is applied on the taxable basis amount to derive the basic tax amount on a transaction line.

Taxable basis type that is defined in the taxable basis formula is a key factor that decides the characteristics of the taxable basis amount. The taxable basis types are:

- **Assessable value**
- **Line amount**
- **Prior tax**
- **Quantity**

Taxable Basis Formula Based on Assessable Value

The tax formula that is based on assessable value is used as the taxable basis for calculating tax when the tax authority does not consider the transaction amount to reflect the true sale consideration, from the tax perspective.

Consider a sales transaction between two companies, A and B. The item value on the invoice is 1000 USD. However, if they are related companies, that is, within the same group, the tax authority has the discretion to mark the item value as 5000 USD for the purpose of tax based on the average market price. The tax authority can choose to collect the tax based on that value instead of the actual sales value of 1000 USD.

The tax amount is calculated from the transaction details and tax setup as follows:

- Invoice line amount: 1000 USD
- Assessable value: 5000 USD
• State tax rate: 10%
• Taxable basis type: Assessable value
• Taxable Basis: 5000 USD

The state tax is equal to the taxable basis multiplied by the state tax rate (5000 USD * 10% = 500 USD).

**Taxable Basis Formula Based on Line Amount**

In this case, the amount given on the transaction line is considered for deriving the taxable basis.

Consider a situation when two taxes, state tax and county tax, are applicable on a transaction. In such a situation, the transaction details and tax setup is as follows:

• Invoice line amount: 1000 USD
• Payment terms: 2/10, Net 30
• State tax rate: 20%
• County tax rate 10%
• Taxable basis type: Line amount
• Subtract cash discount: Yes
• Base rate modifier: 50%
• Compounding tax regime: Sale and use tax
• Compounding tax: State tax

The tax calculation is as follows:

• The state tax is equal to the invoice line amount multiplied by the state tax rate (1000 USD * 20% = 200 USD).

• The taxable basis for the county tax is equal to the line amount plus the base rate modifier less the cash discount at 2% plus the state tax (1000 USD + 500 USD - 20 USD + 200 USD = 1680 USD).

  The country tax is equal to the taxable basis multiplied by the county tax rate (1680 USD * 10% = 168 USD).

**Taxable Basis Formula Based on Prior Tax**

In this case, the previous tax that is calculated on a transaction is considered as the taxable basis.

Consider a situation when two taxes, state tax and county tax, are applicable on a transaction. In such a situation, the transaction details and tax setup is as follows:

• Invoice line amount: 1000 USD
• State tax rate: 20%
• Country tax rate: 10%
• Taxable basis type: Prior tax
• Compounding regime: Sale and use tax
• Compounding tax: State tax
The tax calculation is as follows:

1. The state tax is equal to the invoice line amount multiplied by the state tax rate (1000 USD * 20% = 200 USD).

2. The taxable basis for the county tax is the tax calculated for the state tax (200 USD).
   The country tax is equal to the taxable basis multiplied by the county tax rate (200 USD * 10% = 20 USD).

**Taxable Basis Formula Based on Quantity**

In this case, the quantity of the goods or serviceable units is considered as the taxable basis.

Consider a scenario in which liquor is transacted between two organizations in Canada. In such situation, when excise tax is levied on it, the transaction details and tax setup is as follows:

- Line amount: 1000 CAD
- Quantity: 50 liters
- Price per liter: 20 CAD
- Excise tax: 11.69 CAD per liter
- Taxable basis type: Quantity

The tax calculation is as follows:

1. The taxable basis for the excise tax is the quantity given on the invoice (50).
2. The excise tax is equal to the taxable basis multiplied by the excise tax (50 * 11.69 CAD = 584.5 CAD).

**Tax Calculation Tax Formula: Example**

The tax calculation tax formula is used to determine the calculation methodology that is applied to derive the basic tax amount on a transaction line.

**Scenario**

Consider a situation when two taxes, state tax and county tax, are applicable on a transaction. In such a situation, the transaction details and tax setup is as follows:

- Line amount: 1000 USD
- State tax rate: 20%
- County tax rate: 10%
- Compounding regime: Sale and use tax
- Compounding tax: State tax

The tax calculation is as follows:

1. The state tax is equal to the invoice line amount multiplied by the state tax rate (1000 USD * 20% = 200 USD).
The county tax is equal to the invoice line amount multiplied by the county tax rate plus the state tax \(((1000 \text{ USD} \times 10\%) + 200 \text{ USD} = 300 \text{ USD})\).

**Manage Tax Calculation Rules**

**Tax Calculation Influencers: Explained**

Transactions using Oracle Fusion Tax services pass key tax determinants relating to parties, products, places, and processes captured on a transaction to the tax determination process. Using these details, along with the other derived determinants, the tax determination process performs a series of process steps and determines various components of the applicable taxes. The basic tax amount applicable on a transaction is calculated using the derived tax components and applying the generic calculation logic of Taxable Basis * Tax Rate = Tax Amount.

The key processes within the tax determination process and the resulting tax components that influence tax calculation logic, other than the determination of the tax rate, are:

- Taxable basis formula: Influences taxable basis.
- Tax inclusiveness requirements: Influences the taxable basis and the tax amount. It is part of the Determine Taxable Basis process.
- Tax calculation formula: Influences the tax amount.
- Tax rounding requirements: Influences the tax amount. It is part of the Calculate Tax Amounts process.

The taxable basis formula determines the taxable basis amount or quantity for each tax that is processed on the invoice line.

The tax calculation formula determines the calculation process to be applied on the transaction line for arriving at the tax amount.

The inclusiveness and rounding aspects determine the need to calculate the tax amount as inclusive of the transaction line amount and the rounding criteria to be used on the calculated tax amount.

**Define First Party Tax Profiles**

**Party Tax Profiles: Explained**

A tax profile is the body of information that relates to a party’s transaction tax activities. A tax profile can include main and default information, tax registration, tax exemptions, party fiscal classifications, tax reporting codes, configuration options, and service subscriptions.

Set up tax profiles for the following parties involved in your transactions:
• First parties: All legal entities, legal reporting units, and business units in your organization that have a transaction tax requirement.

• Third parties: Your customers and suppliers and their locations and banks.

• Tax authorities: Parties that administer tax rules and regulations.

**First Parties**

Set up tax profiles for your first party legal entities, legal reporting units, and business units.

First party legal entities identify your organization to the relevant legal authorities, for example, a national or international headquarters. Legal entities let you more accurately model your external relationships to legal authorities. The relationships between first party legal entities and the relevant tax authorities normally control the setup of the transaction taxes required by your business. Under most circumstances the tax setup is used and maintained based on the configuration of the legal entity. Enter the default information, party fiscal classifications, tax reporting codes, and configuration options for your legal entities. You can also specify if you are using the tax services of an external service provider for tax calculation.

First party legal reporting units identify each office, service center, warehouse and any other location within the organization that has a tax requirement. A legal reporting unit tax profile is automatically created for the headquarter legal entity. Set up additional legal reporting unit tax profiles for those needed for tax purposes. For legal reporting units, enter the default information, tax registrations, party fiscal classifications, and tax reporting codes. Also, define tax reporting details for your VAT and global tax reporting needs for tax registrations of tax regimes that allow this setup.

Business units organize your company data according to your internal accounting, financial monitoring, and reporting requirements. To help you manage the tax needs of your business units, you can use the business unit tax profile in either of two ways:

• Indicate that business unit tax setup is used and maintained based on the configuration of the associated legal entity at transaction time. The tax setup of the associated legal entity setup is either specific to the legal entity or shared across legal entities using the Global Configuration Owner setup.

• Indicate that tax setup is used and maintained by a specific business unit. Create configuration options for the business unit to indicate that the subscribed tax content is used for the transactions created for the business unit.

For business units that maintain their own setup, enter the default information, tax reporting codes, configuration options, and service providers as required.

**Third Parties**

Set up third party tax profiles for parties with the usage of customer, supplier, and their sites. Enter the default information, tax registrations, party fiscal classifications, and reporting codes required for your third parties or third party sites. You can set up tax exemptions for your customers and customer sites.
Banks are also considered third parties. When a bank is created, the tax registration number specified on the bank record is added to the party tax profile record in Oracle Fusion Tax. You cannot modify the party tax profile for a bank as it is view only. You can only modify the bank record itself.

**Note**

Setting up party tax profiles for third parties is not required. Taxes are still calculated on transactions for third parties that do not have tax profiles.

**Tax Authorities**

Set up a tax authority party tax profile using the Legal Authorities set up task. The tax authority party tax profile identifies a tax authority party as a collecting authority or a reporting authority or both. A collecting tax authority manages the administration of tax remittances. A reporting tax authority receives and processes all company transaction tax reports.

The collecting and reporting tax authorities appear in the corresponding list of values on all applicable Oracle Fusion Tax pages. All tax authorities are available in the list of values as an issuing tax authority.

**Manage Intrastat Country Characteristics**

**Using Triangulation Method: Examples**

You can specify how triangular trade transactions will be analyzed for the generation of Intrastat report of an individual country.

You can report triangular trade transactions by:

- **Invoice**: A triangular trade transaction is reported in the Intrastat report based on the issue of an invoice. A record is created based on the invoice and not the physical movement of goods.

- **Shipment**: A triangular trade transaction is reported in the Intrastat report based on the physical movement of goods. A record is created based on the physical movement of goods and not the invoice.

You can also specify who declares the transaction when the seller is the same country as the shipper and the customer to avoid duplication of records in the Intrastat report.

Examples of how triangular trade transactions are reported are discussed for the following scenarios:

**Shipment based triangular trade transactions**

Your company based in Italy receives an order from a German company. To fulfill the order, you order goods from your supplier in the France. The goods are delivered from the French company to the German company.

The following transactions are created as a result of this triangular trade:

- You send a sales order to your customer in Germany
• You invoice your customer in Germany
• You create a purchase order to your supplier in France
• Your supplier in France sends you an invoice
• France creates a shipment to Germany, fulfilling the sales order

If you have selected Shipment as your triangulation method, then no record is generated for inclusion in the Intrastat report since no physical movement of goods occurred in Italy. However, Germany is required to declare the arrival of goods from France.

**Invoice based triangular trade transactions**

Considering the example of the triangular trade transaction scenario given above, if you have selected Invoice as your triangulation method, then:

• A sales order or dispatch record is generated from Italy to Germany with the following information:
  • Movement Amount: zero (no movement of goods took place between these countries)
  • Movement Quantity: zero (no movement of goods took place between these countries)
  • Extended Value: calculated as the invoice quantity multiplied by invoice price
  • Dispatch Country: Italy
  • Destination Country: Germany
  • Triangulation Country: France

  **Note**
  Germany is required to declare the arrival of goods from France.

• A purchase order or arrival record is generated in Italy for France with the following information:
  • Movement Amount: calculated as the receipt quantity multiplied by unit price
  • Movement Quantity: zero (no movement of goods took place between these countries)
  • Extended Value: is calculated as the receipt quantity multiplied by unit price
  • Dispatch Country: France
  • Destination Country: Germany

  **Note**
  Germany is required to declare the arrival of goods from France.
Required Attributes: Points to Consider

You can define the required set of attributes that need to be reported in the Intrastat report for an individual country. These attributes can be defined for both the Arrival and Dispatch flow types.

Before selecting the required attributes, consider:

- What is the required set of attributes for the individual country for the Arrival flow?
- What is the required set of attributes for the individual country for the Dispatch flow?

Arrival

The Intrastat authority of an individual country requires that a specific set of attributes should be included in the Intrastat report for an Arrival flow. Before selecting the required attributes for the Arrival flow type, you must consider:

- Commodity description
  Consider if a description of the commodities arriving in the country should be provided in the Intrastat report.
- Freight terms
  Consider if the freight terms or Incoterms applicable for the arrival transaction should be provided in the Intrastat report.
- Mode of transport
  Consider if the mode of transport for every arrival transaction is provided in the Intrastat report.
- Region of destination
  Consider if the details of the region within the destination or receiving country where the good will be finally consumed should be provided in the Intrastat report.
- Country of origin
  Consider if the details of the dispatch country from where the goods originated should be provided in the Intrastat report.
- Nature of transaction code
  Consider if the Nature of transaction code details of the arrival transaction should be provided in the Intrastat report. Nature of transaction codes is published by an individual country’s Intrastat authority and hence may vary based on country.
- Fiscal regime
  Consider if the Fiscal regime details for the arrival transaction should be provided in addition to the Nature of transaction code details in the Intrastat report.
• Statistical procedure

Consider if the Statistical procedure code details for the arrival transaction should be provided in addition to the Nature of transaction code details in the Intrastat report.

Note
You can provide either the Fiscal regime attribute or the Statistical procedure attribute.

• Net Mass

Consider if the net mass of the transaction, which is the quantity of items multiplied by the unit weight of the item, should be provided in the Intrastat report.

• Invoice amount

Consider if the actual invoice amount that is already created for the transaction should be provided in the Intrastat report.

Dispatch

The Intrastat authority of an individual country requires that a specific set of attributes should be included in the Intrastat report for a Dispatch flow. Before selecting the required attributes for the Dispatch flow type, you must consider:

• Freight terms

Consider if the freight terms or Incoterms applicable for the dispatch transaction should be provided in the Intrastat report.

• Mode of transport

Consider if the mode of transport for every dispatch transaction is provided in the Intrastat report.

• Region of origin

Consider if the details of the region within the dispatching country from where the goods are dispatched should be provided in the Intrastat report.

• Country of origin

Consider if the details of the dispatch country from where the goods originated should be provided in the Intrastat report.

• Nature of transaction code

Consider if the Nature of transaction code details of the dispatch transaction should be provided in the Intrastat report. Nature of transaction codes is published by an individual country’s Intrastat authority and hence may vary based on country.

• Fiscal regime
Consider if the Fiscal regime details for the dispatch transaction should be provided in addition to the Nature of transaction code details in the Intrastat report.

- **Statistical procedure**

  Consider if the Statistical procedure code details for the dispatch transaction should be provided in addition to the Nature of transaction code details in the Intrastat report.

---

**Note**

You can provide either the Fiscal regime attribute or the Statistical procedure attribute.

---

- **Net Mass**

  Consider if the net mass of the transaction, which is the quantity of items multiplied by the unit weight of the item, should be provided in the Intrastat report.

- **Invoice amount**

  Consider if the actual invoice amount that is already created for the transaction should be provided in the Intrastat report.

---

**Intrastat Rule Types: Explained**

Intrastat rules are used to configure Intrastat reporting as per the requirement of an individual country. Intrastat rules enable you to define the guidelines and validations that are applicable for creating the Intrastat Declaration. These rules can be shared across Legal Reporting Units or can be specific to one Legal Reporting Unit.

The 7 Intrastat rule types that can be used to define the reporting criteria for Intrastat transactions are:

- Validation
- Supplementary UOM
- Nature of Transaction Code
- Fiscal Regime
- Statistical Procedure Code
- Statistical Value Calculation
- Exclusion

**Validation Rules**

Validation rules enable you to define the criteria for validating the collected and manually entered Intrastat transactions. Only those transactions that are
validated successfully as per the specified criteria can be reported in the Intrastat declaration. Validation rules are defined for a combination of source transaction and Intrastat reporting attribute.

Validation rules enable you to specify the following:

- the required attribute to be reported for a particular source transaction
- the value set that should be used for validating the values of the specific attributes

**Note**

If an attribute is defined as required for a source transaction, then an exception is logged if the collected transaction does not have that attribute.

**Supplementary UOM**

Supplementary UOM rules enable you to define the requirement for reporting Intrastat transactions in a supplementary UOM other than the weight UOM. The movement of goods or specific items is reported in an UOM other than the weight UOM. For example, it specifies that movement of commodity, Oil, should be reported in Barrels.

Supplementary UOM rules are defined for a category code under the Intrastat catalog. And that category code in turn defines the UOM in which the Intrastat transaction is reported. Whenever there is an item in an Intrastat transaction that belongs to the specific category code, then the supplementary UOM rule is applied. The quantity of the item is thereby derived in supplementary UOM based on the UOM conversion factor.

**Nature of Transaction Code**

Nature of Transaction Code is used to define the category of the Intrastat transaction. The Nature of Transaction Codes are published by the Intrastat authority of an individual country and hence differ based on country. The codes can be either in single digit or double digits.

The Nature of Transaction Code rules enable you to define the Nature of Transaction Code applicable based on source transaction, inventory organization, item, and trading partner attributes of the base transaction. The rules defined at a specific or granular level are given priority over rules defined at a higher level. For example, there are two rules; one for a Source Transaction and other for a Source Transaction and Item. In this case, the rule for Source Transaction and Item is given higher priority wherever applicable.

**Fiscal Regime Code**

Fiscal Regime Code is used in some countries in addition to Nature of Transaction Code in to categorize transactions. Fiscal Regime rules define the Fiscal Regime Code applicable based on source transaction, inventory organization, item, and trading partner attributes of the base transaction. Similar to the Nature of Transaction Code rules, the Fiscal Regime Code rules defined at a specific or granular level are given priority over rules defined at a higher level.
Note
You can only define either a Fiscal Regime Code or a Statistical Procedure Code for a particular transaction.

**Statistical Procedure Code**

Statistical Procedure Code is used in some countries of the European Union in addition to Nature of Transaction Code in to categorize transactions. Statistical Procedure Code enables you to define the Statistical Code applicable for deriving the statistical procedure of the collected transaction. This is based on source transaction, inventory organization, item, and trading partner attributes of the base transaction.

Note
You can only define either a Statistical Procedure Code or a Fiscal Regime Code for a particular transaction.

**Statistical Value Calculation**

Statistical value calculation rules enable you to specify the freight factor that is included in the statistical value. Freight factor is defined in percentage and indicates the component of freight charge that should be included in the statistical value.

You can define this rule based on country, organization, item, freight terms, and mode of transport of the base transaction. You can then specify the freight factor, which is a percentage of the freight charge. This freight factor is included while calculating the statistical value. For example, you need to only include the freight charge up to the country’s border for a dispatch transaction. You can specify this by defining a freight factor that accounts for the freight charge up to the country’s border only.

Note
In cases where freight charges are applicable for shipments across two countries within the European Union, you are required to only include the freight charge for moving the goods from the establishment to the border of the country.

**Exclusion**

Exclusion rules enable you to define the criteria to exclude specific goods movement transactions from collections. You can exclude a specific item that you do not want to be reported in the Intrastat collections by defining the exclusion criteria in the rule. For example, you don’t require service items to be included in the collection. You can define this rule based on source transaction, organization, category code, item, and trading partner of the base transaction. You can specify the exclusion criterion that includes the source transaction, category code, and item details of the transaction containing the service items. This ensures that the specified items are not included in the collections.
FAQs for Manage Intrastat Country Characteristics

Can I define Intrastat parameters for any legal reporting unit?

No, Intrastat parameters cannot be defined for every legal reporting unit. They can be defined only for the legal reporting units where the country characteristics are defined for the country of the legal reporting unit. If the Intrastat parameters are to be defined for a secondary legal reporting unit, then the secondary legal reporting unit must be associated with an inventory organization.

Can I configure Intrastat according to individual country guidelines?

Yes. Intrastat rules can be used to configure Intrastat reporting as per the guidelines of an individual country of the European Union. You can specify the validations that are applicable for creating the Intrastat Declaration.

Can I identify exceptions in the collected transactions?

Yes. Use an Exception Validation rule to identify exceptions in the collected transactions. The exception validation process uses validation rules to identify if there are any exceptions in the transactions that might cause noncompliance issues during submission of declarations.

Can I use the supplementary UOM reporting requirement for specific item categories?

Yes. Supplementary UOM rules are used to define reporting requirements for certain commodity codes or item categories in alternate UOMs other than the weight UOM. For example, it may be required to report liquids in Liters.

Can I use the statistical value calculation for including freight values in the statistical value?

Yes. Statistical value calculation can be used to represent an approximate freight factor for a set of qualifiers like mode of transport, item category, etc. For example, some countries require including the freight cost incurred within the country of reporting in the statistical value. In this case, you can use the statistical value calculation to specify the freight values.

Manage Configuration Owner Tax Options

Tax Settings and Rules: How They Apply to Tax Line Operations

Enter and update detail and summary tax lines according to the requirements of your transactions. Depending on your security settings and options specified during tax setup, you can:
• Enter manual tax lines
• Enter tax only tax lines
• Change existing tax line information
• Cancel tax lines

Note

The Summary Tax Lines component is applicable only to Oracle Fusion Payables.

Entering Manual Tax Lines

These requirements apply to entering a manual detail or summary tax line:

1. Enable the Allow entry of manual tax lines option for the:
   • Configuration owner and application event class
   • Tax

2. Ensure that the Manual Tax Line Entry profile option is enabled. It is enabled by default.

3. Enter a unique combination for a tax regime and tax. You cannot enter a manual tax line for a tax that already exists for the transaction line.

4. Enter a tax status to enter a tax rate.

5. Enter a tax regime, tax, tax status, and tax rate to enter a tax amount.

The tax calculation on a manual tax line is a standard formula of Tax Amount = Taxable Basis * Tax Rate. The tax determination process does not evaluate tax rules defined for the tax of any tax rule type.

Entering Tax Only Tax Lines

You can enter a tax-only invoice in Payables to record tax lines that are not linked to a transaction. A tax-only invoice is used, for example, to record tax lines on purchases that are assessed and invoiced separately or to enter tax-only invoices from tax authorities or import agents that record import taxes.

These requirements apply to entering a tax only tax line:

1. Enable the Allow manual tax only lines option for the configuration owner and application event class.

2. Select a tax regime from the tax regimes belonging to the configuration option of the applicable legal entity or business unit.

3. Select a tax, tax status, and tax rate and enter a tax amount.

Note

When you select or deselect the Tax Only Line option on a tax line for the first time, the update does not take effect. You must select the specific tax line, click the row header or a noneditable area, and then select the Tax Only Line option.
**Editing Tax Line Information**

These requirements apply to changing an existing detail or summary tax line:

1. Enable the **Allow override for calculated tax lines** option for the:
   - Configuration owner and application event class
   - Tax

2. Ensure that the **Manual Tax Line Entry** profile option is enabled. It is enabled by default.

3. Optionally, enable the following options for the configuration owner and application event class:
   - **Allow recalculation for manual tax lines** option. The tax determination process recalculates the manual tax lines when there is an update to automatically calculated tax lines.
   - **Tax line override impacts other tax lines** option. The tax determination process recalculates the taxes on all other tax lines on the same transaction when there is an override of automatically calculated tax lines on transactions.

4. Save any changes to summary tax lines before you enter or change Payables summary tax lines.

5. Change the tax status if necessary. These requirements apply to changing tax statuses:
   - You cannot update the tax status if the tax on the detail tax line is enforced from the natural account.
   - If you edit a tax only tax line and change the tax status, you must re-enter the tax rate code.

6. Change the tax rate if necessary. These requirements apply to changing tax rates:
   - The **Allow tax rate override** option is enabled for the applicable tax status.
   - The **Allow ad hoc rate** option is enabled for the applicable tax rate.
   - You may need to change the tax status to change to the appropriate tax rate.
   - You can change the calculated tax rate derived from the tax status by selecting another tax rate defined for the same tax regime, tax, and tax status.

7. Change the tax rate percentage or quantity rate if necessary. These requirements apply to changing tax rate percentages or quantity rates:
   - You cannot update the tax rate code and rate fields if the tax on the detail tax line is enforced from the natural account.
   - You can only update the tax rate percentage if the tax rate code has the **Allow ad hoc rate** option enabled.
8. Change the tax amount if necessary. These requirements apply to changing tax amounts:
   - When you change the tax amount the setting for the Adjustment for ad hoc amounts option of the tax rate determines which value is adjusted, the taxable amount or the tax rate.
   - You can only edit the tax amount if a detail tax line belongs to an historic transaction.
   - You can change the tax amount independent of the tax inclusive and compound tax settings.
   - If you defined tax tolerances for Payables transactions, then if you edit the tax amount and it exceeds the specified tolerance, Oracle Fusion Tax places the invoice on hold.
   - You can only enter 0 as the tax amount if the tax rate is 0.

9. Update the Inclusive option setting if necessary. The tax determination process recalculates the taxable amount and transaction amount. For tax calculation, a limited evaluation of tax rules on certain updates to a tax line is performed.

Canceling Tax Lines
These requirements apply to canceling an existing detail or summary tax line:
1. Cancel tax lines on Payables transactions only.
2. Enter a new manual tax line to reverse a canceled tax line if necessary.

**Note**
On canceling the invoice or invoice lines, tax lines are automatically canceled.

When you cancel a tax line both the associated tax line and any distributions that were previously accounted are reversed. If the distributions were not accounted, then the amounts are set to zero.

**Note**
When you select or deselect the Cancel option on a tax line for the first time, the update does not take effect. You must select the specific tax line, click the row header or a noneditable area, and then select the Cancel option.

**Configuration Owner Tax Options Controls and Defaults: Points to Consider**

Set up configuration owner tax options for a combination of configuration owner and application event class. Configuration owner tax options let a configuration owner update default tax options on transactions that belong to a specific application event class. At transaction time, Oracle Fusion Tax uses the tax option settings of the configuration owner and application event class instead of the default settings.
## Defining Controls and Defaults

The following table describes the defaults and controls available at the configuration owner tax options level for the following applications and event classes:

- Payables: Expense Reports
- Payables: Prepayment Invoices
- Payables: Standard Invoices
- Purchasing: Purchase Order and Agreement
- Purchasing: Purchase Requisition
- Purchasing: Change Orders

### Default Tax Options Region

Define Italian Exemptions

Italian Exemptions: Explained

In Italy, export transactions are exempted from value-added tax (VAT), but companies that are classified as regular exporters have more input VAT than output VAT. Italian law lets you claim an exemption if you meet certain legal requirements.

These legal requirements are:

- You have a regular exporter ratio that is higher than 10 percent.
- The value of goods and services that you purchased without VAT charges last year is lower than your exemption limit.
- You declare all export activities to your tax authorities.

The exemption limit is the total VAT exemption amount that a regular exporter can claim to its suppliers. For each year, the initial exemption limit is the sum of all reported export invoices of the previous year. You can allocate your yearly exemption limit among different suppliers. To each supplier, you send exemption letters that indicate the exemption amounts and request that they do not charge you tax when they send you the according invoices.

At the end of the year, if your total exempt purchases of goods and services is higher than your exemption limit, you incur administrative sanctions and penalties. Use the Italian Supplier Exemption Limit Consumption report to help you keep track of your exemption limit consumption. Use the Italian Exemption Limit Declaration report to report exemption details to the tax authority.

To set up for the exemption process:

- Manually calculate the initial exemption limit for the current year by summing all reported invoices of the previous year. The tax authority must agree upon the exemption limit.
- Use the Create Exemption Limit page from the Manage Italian Exemption Limits page to set up a new exemption limit year for your legal entities. Optionally, use the Adjust Exemption Limit page from the Manage Italian Exemption Limits page to adjust the yearly exemption limit.
- Use the Create Exemption Letters page from the Manage Italian Exemption Letters page to allocate exemption limits to your suppliers and set up the exemption letters to send to your suppliers.
- Use Oracle Fusion Tax to create tax reporting types for each of your exemption limit groups. You can also define tax reporting codes within these tax reporting types for further tax reporting granularity.

Can I adjust the monthly limits once they are created?

Use the Exemption Limit window to modify (add or subtract) either the current month amount or adjust the current month and future periods. For example, you want to reduce the current month and future periods limit by 25,000 EUR. Enter -25,000 in the Monthly Adjustment field and select the Adjust selected and subsequent months radio button. The application subtracts 25,000 from the current month amount and from each of the remaining month amounts in the calendar year.
What are the letter types for Italian exemptions?

If you want to assign exemption limits to the supplier, enter a letter type in the Letter Type field.
Options include:

- **Exempted Amount**: Exemption letter with exemption limit printed.
- **Exempted Period**: Exemption letter with a date range.
- **Specific Operation**: Customs letter for a single transaction.

**Note**
The default is **Exempted Amount**, which is the only type that prints an exemption limit amount on the letter.

Define Third Party Tax Profiles

**Party Tax Profiles: Explained**

A tax profile is the body of information that relates to a party’s transaction tax activities. A tax profile can include main and default information, tax registration, tax exemptions, party fiscal classifications, tax reporting codes, configuration options, and service subscriptions.

Set up tax profiles for the following parties involved in your transactions:

- **First parties**: All legal entities, legal reporting units, and business units in your organization that have a transaction tax requirement.
- **Third parties**: Your customers and suppliers and their locations and banks.
- **Tax authorities**: Parties that administer tax rules and regulations.

**First Parties**
Set up tax profiles for your first party legal entities, legal reporting units, and business units.

First party legal entities identify your organization to the relevant legal authorities, for example, a national or international headquarters. Legal entities let you more accurately model your external relationships to legal authorities. The relationships between first party legal entities and the relevant tax authorities normally control the setup of the transaction taxes required by your business. Under most circumstances the tax setup is used and maintained based on the configuration of the legal entity. Enter the default information, party fiscal classifications, tax reporting codes, and configuration options for your legal entities. You can also specify if you are using the tax services of an external service provider for tax calculation.

First party legal reporting units identify each office, service center, warehouse and any other location within the organization that has a tax requirement. A legal reporting unit tax profile is automatically created for the headquarters legal entity. Set up additional legal reporting unit tax profiles for those needed for tax purposes. For legal reporting units, enter the default information, tax
registrations, party fiscal classifications, and tax reporting codes. Also, define tax reporting details for your VAT and global tax reporting needs for tax registrations of tax regimes that allow this setup.

Business units organize your company data according to your internal accounting, financial monitoring, and reporting requirements. To help you manage the tax needs of your business units, you can use the business unit tax profile in either of two ways:

- Indicate that business unit tax setup is used and maintained based on the configuration of the associated legal entity at transaction time. The tax setup of the associated legal entity setup is either specific to the legal entity or shared across legal entities using the Global Configuration Owner setup.

- Indicate that tax setup is used and maintained by a specific business unit. Create configuration options for the business unit to indicate that the subscribed tax content is used for the transactions created for the business unit.

For business units that maintain their own setup, enter the default information, tax reporting codes, configuration options, and service providers as required.

**Third Parties**

Set up third party tax profiles for parties with the usage of customer, supplier, and their sites. Enter the default information, tax registrations, party fiscal classifications, and reporting codes required for your third parties or third party sites. You can set up tax exemptions for your customers and customer sites. Banks are also considered third parties. When a bank is created, the tax registration number specified on the bank record is added to the party tax profile record in Oracle Fusion Tax. You can not modify the party tax profile for a bank as it is view only. You can only modify the bank record itself.

**Note**

Setting up party tax profiles for third parties is not required. Taxes are still calculated on transactions for third parties that do not have tax profiles.

**Tax Authorities**

Set up a tax authority party tax profile using the Legal Authorities set up task. The tax authority party tax profile identifies a tax authority party as a collecting authority or a reporting authority or both. A collecting tax authority manages the administration of tax remittances. A reporting tax authority receives and processes all company transaction tax reports.

The collecting and reporting tax authorities appear in the corresponding list of values on all applicable Oracle Fusion Tax pages. All tax authorities are available in the list of values as an issuing tax authority.

**FAQs for Define Third Party Tax Profiles**

**When does a party tax profile get created for a third party?**

The third party tax profile is automatically created when a third party (customer or supplier) with tax configuration is created. Edit the tax profile that was
automatically generated with the relevant tax information, but it is not required for tax calculation. Otherwise, create a party tax profile using the Create Third Party Tax Profile or Create Third Party Site Tax Profile pages.

Manage Tax Reporting Types

Tax Reporting Types and Codes: Explained

Use tax reporting types to capture additional tax information on transactions for your tax reports. You can use tax reporting types for your internal reporting needs and to fulfill country-specific reporting requirements. Create tax reporting codes for a tax reporting type to provide additional granularity for tax reporting.

A tax reporting type identifies a specific unit of information, such as a date or a text comment, to associate with a specific tax usage, such as a fiscal classification or tax jurisdiction. You can:

- Define tax reporting types at a generic level, tax regime level, or tax level.
- Define the validation for the tax reporting type for tax reporting codes to be added in terms of data type and a minimum and maximum length. Data types include **Date**, **Numeric value**, **Text**, and **Yes or no indicator**.
- Use tax reporting codes you create under one tax reporting type across various entities, such as tax, tax status, tax rate, party tax profiles, and fiscal classifications. To use a tax reporting type for a particular entity, associate that entity to the tax reporting type in the Reporting Type Uses region on the Create Tax Reporting Type page.

There is no impact of the tax reporting type on tax calculation. The tax reporting codes are used in the tax reports.

Tax configuration facilitates the association between various entities and tax reporting codes. The entity details are stored as part of the tax repository. During tax report generation necessary tax reporting codes are derived based on the entities associated with the tax line. The functionality to include the reporting type code is handled by the Tax Reporting Ledger.

Tax Reporting Type Uses

Some reporting type uses have a one to one relationship of tax reporting type use to an entity, such as tax, tax jurisdiction, tax rate, and tax status. For example, the tax reporting type use of Tax defines tax reporting type codes for association to taxes you define and the Tax Jurisdiction tax reporting type use defines tax reporting type codes for association to the tax jurisdictions you define.

The Fiscal Classification tax reporting type use defines tax reporting type codes for association to the following classifications:

- User-defined fiscal classifications
- Product category fiscal classifications
- Document fiscal classifications
- Transaction fiscal classifications
The Party Tax Profile tax reporting type use defines reporting type codes for association to the following party tax profiles:

- Legal entity tax profiles
- Legal reporting unit tax profiles
- Business unit party tax profiles
- Third party tax profiles
- Third party site tax profiles

The Process Result tax reporting type use defines reporting type codes for association to the following rule types:

- Direct tax rate determination rules
- Place of supply rules
- Tax applicability rules
- Tax registration rules
- Tax status rules
- Tax rate rules
- Taxable basis rules
- Tax calculation rules

**Tax Reporting Types and Codes and Their Use in Tax Reporting**

The following table describes key predefined tax reporting types and codes and their association and use in tax reporting:

<table>
<thead>

Verify Tax Configuration

Tax Simulator: Explained

The Tax Simulator is a tool for simulating the tax determination process in your tax setup. The Tax Simulator lets you preview the workings of your tax configuration before you perform tax calculations on live transactions in a subledger application. The Tax Simulator also allows you to test new tax configuration in conjunction with existing tax configuration to preview the resulting tax calculation. The Tax Simulator is a useful tool to identify the root cause when tax calculation is not what is expected on live data.

Run taxes from all applicable tax regimes against a sample transaction to verify that your tax configuration and tax rules were created and applied according to your requirements. You can either create a sample transaction within Tax Simulator or copy an existing transaction. The simulated tax calculations do not affect live data.

Principle aspects of the Tax Simulator include:

- Functions and verifications
- Analysis tools
- Restrictions

Tax Simulator Functions and Verifications

The Tax Simulator lets you simulate the tax determination process on transactions without creating live data.

The Tax Simulator enables you to complete these functions:

- Enter transactions to simulate tax calculation based on various scenarios.
- Simulate the characteristics of the Payables, Purchasing, and Receivables transactions and create the tax line for each type of operation.
- View the detail tax lines generated for each transaction line.
- View the tax rules that were applied to a tax calculation and the processed result for each rule type.

The Tax Simulator provides these verifications:

- How the tax rules that you have defined for one or more taxes work in conjunction with the defaults that you have set for them.
- Whether a tax rule that you expected to have a successful evaluation for a given set of transaction conditions achieved the desired result.
- How the options that you have set at various levels are reflected in the results of tax determination processing. If a certain transaction does not process taxes as you predicted, then you can use the simulated result to troubleshoot the cause. For example:
  - You thought that there were product tax exceptions, but they were not used on a transaction as expected. You then discover that the Allow tax exceptions option was not enabled on the applicable tax rate record.
• Your supplier record has the option enabled to use offset taxes, but the offset taxes do not appear. You then discover that the tax rate record does not have an offset tax rate associated with it.

**Tax Simulator Analysis Tools**

The Tax Simulator provides these pages to analyze the tax calculations on simulated transactions:

- Simulator Transaction page: View the details of the simulated transaction.
- Tax Line Details page: View the calculated tax lines for the simulated transaction. The page displays, for each transaction line, the applicable tax and tax configuration details, as well as if the result was determined by a tax rule or the default value. If a tax rule was applied, the page also displays the associated tax condition set.
- Rule Type page: View details of all enabled rules for a rule type. The page displays the processed result for each rule. The page also displays the associated tax condition sets and their processing details and results.

**Tax Simulator Restrictions**

The following restrictions apply when using the Tax Simulator:

- Payables tax recovery processing cannot be simulated.
- Application-specific actions on transactions or transaction lines, such as canceling, deleting, and reversing, are not tested.
- User control settings are not tested or verified.

**Set Up Tax Calculation Service Provider Integration**

**Tax Calculation Services Provider Integration: Overview**

Oracle Fusion Tax enables the integration with third party order-to-cash transaction tax calculation applications.

---

**Note**

Tax calculation integration with third party service providers is currently not available in Oracle Cloud implementations. However, Oracle Cloud implementations can still use Oracle Fusion Tax functionality to meet transaction tax calculation needs.

Oracle Fusion Tax provides a set of tax interfaces to enable tax service provider agnostic integration. Tax service providers’ application programming interfaces (APIs) must conform to Oracle Fusion Tax interfaces.

Oracle Fusion Tax captures all transaction events into three API calls to the tax service providers:

- Tax calculation: This API is used to calculate and recalculate transaction taxes for manually entered and imported transactions.
- Tax synchronization: This API is used to update information in the tax service provider repository for the transaction line attributes that do not
influence tax calculation, but are used in tax reports. Another use of this API is to synchronize the tax service provider repository with the tax amount overrides made in Oracle Fusion applications.

- Global document update: This API is used to handle certain transaction level actions such as Delete, physically delete transaction lines and tax lines, and Freeze for Tax, mark the transaction as ready to report.

The following graphic describes a typical tax calculation and recalculation and the tax amount update flow for an Oracle Fusion Receivables transaction. This graphic explains the interaction between Oracle Fusion Receivables, Oracle Fusion Tax, and a tax service provider.

Oracle Fusion Tax Configuration for Tax Service Provider Integration: Points to Consider

Integration with tax service providers requires a minimal configuration of Oracle Fusion Tax to maintain referential integrity of required attributes of a tax line.

Tax Configuration for Tax Service Provider Integration

Complete the following configuration in Oracle Fusion Tax if you are using a tax service provider to calculate taxes on order-to-cash transactions:
<table>
<thead>
<tr>
<th>Component</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tax regime</td>
<td>Create a tax regime for tax service provider services to use for tax calculation.</td>
</tr>
<tr>
<td></td>
<td>Specify the regime level as <strong>Country</strong> or <strong>Tax Zone</strong>.</td>
</tr>
<tr>
<td></td>
<td>When you use the tax regime at the tax zone level, use only a tax zone with the boundary of world.</td>
</tr>
<tr>
<td></td>
<td>The tax service provider application programming interface (API) is called once for a tax regime.</td>
</tr>
<tr>
<td></td>
<td>For example, if a single tax service provider API can calculate taxes of the United States, Canada, and Mexico, define a tax regime</td>
</tr>
<tr>
<td></td>
<td>for a tax zone comprising of the three countries. If a transaction involves any one or more of these countries, the tax service</td>
</tr>
<tr>
<td></td>
<td>provider API is invoked once to calculate applicable taxes for all of the countries in the tax zone.</td>
</tr>
<tr>
<td></td>
<td></td>
</tr>
<tr>
<td>Tax</td>
<td>Create the taxes of the tax regime. You can create more than one tax for a tax regime.</td>
</tr>
<tr>
<td></td>
<td>Define tax accounts for each tax for general ledger accounting. Oracle Fusion Tax copies these tax accounts from the tax to the tax</td>
</tr>
<tr>
<td></td>
<td>jurisdictions and tax rates.</td>
</tr>
<tr>
<td>Tax status</td>
<td>Create at least one tax status for each tax. Each tax must have one default tax status.</td>
</tr>
<tr>
<td>Tax service provider party</td>
<td>Create a tax service provider as a party using the Partner Tax Profile web service. This should be done as an automatic installation</td>
</tr>
<tr>
<td></td>
<td>step in the tax service provider installation process.</td>
</tr>
<tr>
<td>Tax jurisdiction</td>
<td>Create at least one tax jurisdiction for each tax. Alternatively, for US sales and use taxes, tax service providers can provide a tax</td>
</tr>
<tr>
<td></td>
<td>jurisdiction and tax rate content file for loading into Oracle Fusion Tax.</td>
</tr>
<tr>
<td></td>
<td>The application copies tax accounts from the tax that you are allowed to change, if necessary.</td>
</tr>
<tr>
<td>Tax rates</td>
<td>Define at least one tax rate code for the default tax status. Each tax status is required to have a default tax rate code. For the</td>
</tr>
<tr>
<td></td>
<td>default tax rate code, leave the tax jurisdiction blank and select the <strong>Allow ad hoc tax rate</strong> option.</td>
</tr>
<tr>
<td>Tax regime configuration options and service</td>
<td>Create configuration options and service subscriptions for the business units and legal entities that are using tax service</td>
</tr>
<tr>
<td>subscriptions</td>
<td>provider services for tax calculation for a specific tax regime.</td>
</tr>
</tbody>
</table>

Define Project Contract Configurations: Define Transaction Taxes  17-197
Tax content

For US sales and use tax, you can upload geography, tax zones, tax jurisdictions, and tax rates from your tax service provider content file. The enables tax service provider calculated tax lines to have the same tax jurisdiction codes and tax rate codes as returned by the tax service provider application. This step can only be done after the tax service provider has been created as a party.

If you do not create state, county, or city taxes for the tax regime, the content upload program creates these taxes. The content upload program creates default tax status codes of **Standard** for each of these three taxes. It also creates tax rate codes for each default tax status for storing sales, use, lease, and rental tax rates.

Oracle Fusion Setup Manager

To minimize the setup tasks associated with setting up a tax regime clear the features that do not need to be configured for that tax regime:

- Party fiscal classifications
- Legal fiscal classifications
- Product fiscal classifications
- Product category classifications
- Transaction business categories
- Transaction fiscal classifications
- Document fiscal classifications
- Intended use fiscal classifications
- User-defined fiscal classifications
- Multiple tax jurisdictions
- Tax exemptions
- Tax rate exceptions
- Tax recovery
- Tax registration statuses
- Offset taxes

**Important**

Do not configure offset taxes, tax rate exceptions, and tax recovery when using a tax service provider. You can optionally configure tax exemptions if using Vertex Inc. Q-Series or ADP-Taxware SUT applications.

If your tax service provider leverages any other feature refer to your tax service provider's documentation for explanation on its usage.
Order-to-Cash Transaction and Service Provider Processes: How They Work Together

There are impacts to your business processes if you integrate with a tax service provider. These impacts include:

- Transaction options in Oracle Fusion Receivables
- Tax jurisdiction codes
- Monthly procedures
- US Sales and Use Tax import
- Tax exemption handling
- Reconciliation and audit procedures
- Support procedures

Transaction Options in Oracle Fusion Receivables

If you integrate with a tax service provider, these actions are not required for Receivables transactions:

- Entering tax classification codes on transaction lines
- Entering transaction line attributes in the Additional Tax Determining Factors region

Tax Jurisdiction Codes

Tax service providers may use their own tax jurisdiction code to identify a taxing jurisdiction. A tax service provider jurisdiction code is typically needed when the postal code of an address does not uniquely identify the exact taxing jurisdiction. For example, the same city and postal code may have two or more different taxing jurisdictions in different geographical areas within the same postal code. For such postal codes, you should enter the tax service provider tax jurisdiction codes when you enter your customer address.

Monthly Procedures

Each month tax service providers send an updated version of their data file. You need to upload the data file into both the tax service provider system and Oracle Fusion Tax. This ensures that Oracle Fusion Tax has the latest information for address validation and tax jurisdiction code retrieval during tax calculation.

US Sales and Use Tax Import

Use the Upload Tax Configuration Content processes to upload US sales and use tax updates from your tax service provider. The Upload Tax Configuration Content processes import tax content for US sales tax rates at various jurisdiction levels. For example, at the state, county, city, and postal code or postal code range levels. The processes also support the import of incremental tax content.
The application loads the data into Oracle Fusion Trading Community Model geography and into all related Oracle Fusion Tax entities, including taxes, tax statuses, tax rates, tax jurisdictions, and tax accounts. The data the application loads into the Trading Community Model geography includes master geography data, such as state, county, city, postal code, and their relationships and hierarchy. The application also creates the geography identifiers for alternate city names apart from the geography types and geography nodes.

**Exemption Handling**

You can define your customer and product exemptions using a tax service provider, Oracle Fusion Tax, or both. For exemptions set up in Oracle Fusion Tax you can only use the exemption rate type of **Discount or surcharge**. The exemption rate type of **Special rate** is not considered. At transaction time, if an applicable Oracle Fusion Tax exemption or nonjurisdiction-based tax exception is found, it is passed to the tax service provider application programming interface and applied to the tax calculation. The tax service provider tax repository includes the exempt tax line for complete audit and reconciliation. You can also build your own logic to pass exemptions to the tax service provider.

If the **Tax Handling** field is enabled on an Oracle Fusion Receivables transaction line, you can override the tax service provider setup and identify a transaction as exempt, according to your tax exemption setup in Oracle Fusion Tax. Select the **Tax Exemption Override Control** profile option to control the display of the **Tax Handling** field.

**Reconciliation and Audit Procedures**

Tax service providers return the calculated tax lines to Oracle Fusion Tax. The tax lines for Receivables transactions returned by tax service providers are stored in Oracle Fusion Tax similar to the way tax lines calculated by Oracle Fusion Tax itself are stored.

Before completing your tax returns using the tax service provider reports, you should reconcile the total tax amounts held in Oracle Fusion Tax, Oracle Fusion General Ledger, and a tax service provider repository. All Receivables transactions are stored in the tax service provider repository at the time of tax calculation. Thus, the tax details in Oracle Fusion Tax and in a tax service provider repository are always the same. The Receivables transactions are posted to General Ledger only when they are completed and posted to General Ledger from Oracle Fusion Subledger Accounting. Therefore, before reconciliation with General Ledger, all transactions must be completed and posted to the General Ledger.

You can reconcile the total tax amounts of Receivables transactions by state to General Ledger. The total tax amounts by state reported by the **Tax Reconciliation Report** should reconcile to each state tax liability account held in General Ledger.

**Support Procedures**

Begin with Oracle Fusion Tax error messages to review issues that arise with tax calculation by tax service providers. The debug file contains details of the transaction in error together with the error message.

---

**Note**
Refer to the tax service provider's manuals and documents and contact tax service provider support for details on the process of the installation required by tax service providers, reports provided by tax service providers, or upgrades to newer releases.

FAQs for Set Up Tax Calculation Service Provider Integration

What happens if a value of a required attribute of a tax line is invalid for tax service provider calculated tax lines?

Tax service provider calculated tax lines are validated before storing them in the Oracle Fusion Tax repository. If the value of a required attribute of a tax line is invalid but can be replaced by a default value, Oracle Fusion Tax inserts a message in the debug log file. If a default value cannot be determined, Oracle Fusion Tax raises an error along with inserting the cause of the error in the debug log file.

Following attribute values are used as defaults by Oracle Fusion Tax:

- **TAX_STATUS_CODE**: The application populates the record with the tax status code specified as the default tax status code.

- **JURISDICTION_CODE**: The application populates the record with the tax jurisdiction derived based on the tax regime, tax, and situs. If the application does not find a jurisdiction code, the value is blank.

- **TAX_RATE_CODE**: The application populates the record with the tax rate code for the tax status code with no associated tax jurisdiction code.

Oracle Fusion Tax takes the default accounting code combinations for the tax liability account in the following order:

1. From the tax configuration
2. From the tax jurisdiction configuration
3. From the tax rate configuration

You can ignore default accounting code combination values by defining the subledger accounting rules to derive the accounting code combinations.
Define Procurement Contracts Configurations

Specify Supplier Contract Management Business Function Properties

Supplier Contracts Business Unit Setup: Explained

Using the Specify Supplier Contract Management Business Function Properties task, available by selecting Setup and Maintenance from the Tools menu and searching on the task name, you can specify a variety of business function settings for supplier contracts in a specific business unit.

The selections you make for these business functions impact how the Contract Terms Library behaves during supplier contract authoring.

Managing Contract Terms Library Setup Options

The setup options available for the Contract Terms Library are applicable to both customer and supplier contracts, and are described in the business unit setup topic for the Contract Terms Library. That topic is available as a related link to this topic.

Contract Terms Library Business Unit Setup: Explained

You can specify a wide variety of Contract Terms Library settings for either customer or supplier contracts within each business unit, by using either the Specify Customer Contract Management Business Function Properties or the Specify Supplier Contract Management Business Function Properties tasks. These tasks are available by navigating to the Setup and Maintenance work area and searching on the task name.

For the Contract Terms Library in each business unit, you can:

- Enable clause and template adoption.
- Set the clause numbering method.
- Set the clause numbering level for automatic clause numbering of contracts.
• For a contract with no assigned ledger or legal entity, set the document sequence to Global or Business Unit level.
• Enable the Contract Expert feature.
• Specify the layout for printed clauses and contract deviation reports.

Enabling Clause Adoption
If you plan to use clause adoption in your implementation, then set up the following:

• Specify a global business unit

You must designate one of the business units in your organization as the global business unit by selecting the Global Business Unit option. This makes it possible for the other local business units to adopt and use approved content from that global business unit. If the Global Business Unit option is not available for the business unit you are setting up, this means that you already designated another business unit as global.

• Enable automatic adoption

If you are implementing the adoption feature, then you can have all the global clauses in the global business unit automatically approved and available for use in the local business by selecting the Autoadopt Global Clauses option. If you do not select this option, the employee designated as the Contract Terms Library Administrator must approve all global clauses before they can be adopted and used in the local business unit. This option is available only for local business units.

• Specify the administrator who approves clauses available for adoption

You must designate an employee as the Contract Terms Library administrator if you are using adoption. If you do not enable automatic adoption, then the administrator must adopt individual clauses or localize them for use in the local business unit. The administrator can also copy over any contract terms templates created in the global business unit. The clauses and contract terms templates available for adoption are listed in the administrator’s Terms Library work area.

Setting Clause Numbering Options
You can set up automatic clause numbering for the clauses in the business unit by selecting Automatic in the Clause Numbering field and setting the clause numbering level. Then select the appropriate clause sequence category for the specified numbering level. You must have previously set up document sequences for the document sequence categories of global, ledger, and business unit. If clause numbering is manual, contract terms library administrators must enter unique clause numbers each time they create a clause.

You can choose to display the clause number in front of the clause title in contracts by selecting the Display Clause Number in Clause Title option.

Enabling Contract Expert
You must select the Enable Contract Expert option to be able to use the Contract Expert feature in a business unit. This setting takes precedence over enabling Contract Expert for individual contract terms templates.
Specifying the Printed Clause and Deviations Report Layouts

For each business unit, you can specify the Oracle BI Publisher RTF file that serves as the layout for:

- The printed contract terms
  Enter the RTF file you want used for formatting the printed clauses in the Clause Layout Template field.

- The contract deviations report
  The RTF file you select as the Deviations Layout Template determines the appearance of the contract deviations report PDF. This PDF is attached to the approval notification sent to contract approvers.

Contract Fulfillment: How It Works

Contract fulfillment makes it possible for you to track goods, services, reports and other fulfillment items you are purchasing in buy-intent contracts. Depending on the type of contract you are creating, you can use contract fulfillment to initiate the creation purchase orders or purchase agreements within Oracle Fusion Purchasing or in other integrated purchasing applications and monitor their fulfillment from within the contract. This topic explains how you create and work with contract fulfillment.

The figure below illustrates how you can create and work with both contractual and noncontractual fulfillment lines and how you can initiate purchasing activity from those fulfillment lines:

1. You can create a fulfillment either on the contract header or on individual contract lines by selecting either the Autocreate Fulfillment Lines or the Create fulfillment actions. The Autocreate Fulfillment Lines action creates the fulfillment line and copies the contract basic header or contract line information to the fulfillment line so you do not have to enter it manually.

   Selecting the Autocreate Fulfillment Lines action from the header automatically creates one fulfillment line per contract line. If there are no contract lines, then the application creates one fulfillment based on the header details provided the contract type is of class Purchase Agreement. You cannot autocreate fulfillment lines for contracts without contract lines if the contract type class is Enterprise Contract.

2. Review the notifications that are sent automatically to interested parties regarding fulfillment progress and deadlines. The contract type can be set up to automatically specify who gets notified and when. You can change and add additional notifications for the contract.

3. If you are using the fulfillment to initiate the purchase of goods and services using the integrated purchasing applications, then you must enter the required purchasing details. For autocreated fulfillment, these details are copied automatically from the corresponding contract lines.

4. When the contract is approved and becomes active, you can initiate the creation of the purchasing documents in one of the purchasing
applications. When you do, the application validates the information you entered to make sure it meets all the requirements of the purchasing application and creates the purchasing document. If it does not you must edit the fulfillment to enter additional information.

**Note**
If the contract goes into amendment after being approved, you cannot create any further fulfillment lines or edit existing ones. If you initiated the creation of purchasing documents when the contract became active, you can still continue to execute the fulfillments on the purchasing document. In the event that you did not initiate a purchasing document for the approved contract before it went into amendment, you can create one based on the latest active version of the contract and treat this as an active contract on which you can execute existing fulfillment lines.

5. After the purchasing document is created in the purchasing application, you can monitor the progress of its execution.

6. You can mark a fulfillment as complete after execution of the purchasing document is completed.

---

**Creating a Contract Fulfillment**
If the fulfillment you are creating is related to the information entered in the contract, then you can select the Autocreate Fulfillment Lines action to create a fulfillment line in either the contract Header tab or the Lines tab. Using
Autocreate Fulfillment Lines on the contract header creates a single fulfillment line for each contract line. On the Lines tab, you can select individual contract lines where you want to create a fulfillment.

Select the **Create fulfillment** action in the Fulfillment tab to create a completely new fulfillment.

**Note**

The Create Fulfillment and Autocreate Fulfillment Lines actions are not available for a contract that is under amendment.

**Tip**

You can create multiple fulfillment lines for a single contract line if you need the fulfillment line items to be shipped to different destinations, for example. This is accomplished by autocreating a fulfillment line, duplicating it, and then editing the fulfillment line information.

**Setting Up Fulfillment Notifications**

You can specify which internal contacts are automatically notified about contract fulfillment milestones and when.

You can notify internal contacts:

- A specified number of days before or after the fulfillment due date
- When the fulfillment line is placed on hold
- When a purchasing document is created from one or more fulfillment lines
- When purchasing document creation fails for the fulfillment
- When purchasing activity is complete for a fulfillment line

Different notification types are available for different fulfillment types. Some notifications may already be specified for you by the contract type you selected to create your contract.

**Creating the Purchasing Document**

Before you initiate the purchasing document by selecting either the **Create Purchase Order** or **Create Purchase Agreement** actions, you must enter all purchasing information required by the purchasing document you are creating and wait until the contract is approved.

You can create one purchase document from multiple contract fulfillment lines. For example, selecting all the fulfillment lines created from contract lines when creating a purchase order, creates one PO with lines corresponding to each of the fulfillment lines.

The application validates your entries to make sure you have entered all the required information. You must correct any errors you receive and resubmit you
request. You know that the purchase document is successfully created when the fulfillment status changes to the **PO Created** or **Agreement Created** status.

---

**Note**

Purchase orders are created automatically in Oracle Fusion Purchasing, but agreements are created only when you run the Import Blanket Agreements and Import Contract Agreements processes from the Purchasing work area as described in a related topic.

---

**Monitoring Purchasing Activity**

You can monitor the status of the purchasing activity for the fulfillment on the Purchasing Activity tab.

---

**Note**

For all agreements and purchase orders created in Oracle Fusion Purchasing, the tab information is updated each time you run the Track Purchasing Activity process as described in a related topic.

---

**Specifying Purchasing Activity for a Fulfillment is Complete**

You can specify the purchasing activity on a fulfillment is complete by selecting the **Complete** action on the Fulfillment tab. You also use this action to indicate fulfillment lines with no purchasing documents are complete.
Define Contract Terms and Clause Library Configuration

Contract Terms Library Setup Overview

Contract Terms Library Setups: How They Work Together

This topic provides a brief overview of setups for the Contract Terms Library. The following figure outlines the main setups for the Contract Terms Library which are described in the sections of this topic. The setups on the left are accomplished using tasks from the Setup and Maintenance work area. To set up most of the Contract Terms Library features, including clauses and contract terms templates, you must navigate to the Terms Library work area. Dashed boxes highlight features that are available only in procurement contracts.
Setups in Oracle Fusion Functional Setup Manager

Different Oracle Fusion Functional Setup Manager tasks enable or affect Contract Terms Library features. These setups include:

- **Setting Up Contract Types to Work with the Contract Terms Library**
  
  Contract types specify properties of different contracts including the type of permitted contract lines, party roles, contract validation checks, and the contract acceptance and signature requirements. For the Contract Terms Library, you can use the **Manage Contract Types** task to:
  
  - Enable contract terms authoring
    
    You must enable contract terms authoring for a contract type to use any of the library features for contracts of that type.
  
  - Specify the Oracle BI Publisher layout template that will be used to format the printed contract terms for contracts of this type.

- **Defining Clause Types**
  
  If you want to categorize the clauses in the library, select the **Manage Contract Clause Types** task to set up clause types.

- **Configuring Business Units for Contracts**
  
  The use of most of the Contract Terms Library content is restricted to the business unit where you create it. This includes clauses, contract terms templates, and Contract Expert business rules. Using either the **Specify Customer Contract Business Function Properties** or the **Specify Supplier Contract Business Function Properties** tasks, you can:
  
  - Enable content adoption between business units and automatic approvals for content
  
  - Specify the Contract Terms Library administrator, the employee who will receive approvals and other notifications regarding library content.
  
  - Enable the Contract Expert feature for the business unit.

- **Creating Contract Layout Templates**
  
  Using Oracle BI Publisher, you can set up layout templates that determine the formatting of clauses, contract terms template previews, the contract deviations report, and the contract itself.
  
  Download the sample layout templates provided with your application from the Oracle BI Publisher library. You can copy and edit the sample layout templates and upload them.

- **Creating Contract Terms Value Sets**
  
  Select the **Manage Contract Terms Value Sets** task to set up value sets for use in contract terms variables and Contract Expert questions.

- **Specifying the Location of the File Used for Clause Import**
  
  You can import legacy clauses into the Contract Terms Library, either from a file or from an interface table using Oracle Fusion Enterprise Scheduler processes.
If you are importing clauses from a file, then you must specify the location of the file by setting the system profile option **Specify Contract Clause Import XML File Location** by selecting the **Manage Clause and Template Management Profiles** task.

**Contract Terms Library Work Area Setups**

The Contract Terms Library is built using the tasks within the Terms Library work area:

- **Creating Clauses**
  Create standard clauses for use during contract terms authoring, including alternate clauses, clauses included by reference, and provision clauses. By specifying different clause properties, you can modify clause behavior. For example, you can make clauses mandatory in contracts or protect them from editing by contract authors.

- **Creating Variables**
  You can use variables in the Contract Terms Library to represent information within individual clauses and for use within Contract Expert rule conditions. Your application comes with predefined variables, called system variables. You can create additional variables, called user variables, with or without programming.

- **Creating Numbering Schemes**
  You can set up additional clause and section numbering for contract terms. You can select which numbering scheme you want to use with each contract terms template.

- **Creating Contract Terms Templates**
  Create contract terms templates to insert boilerplate terms and conditions into contracts during contract authoring. Contract authors can apply the templates manually, or the application can apply the templates automatically using defaulting rules you set up.

- **Creating Contract Expert Business Rules**
  Set up business rules that ensure compliance of contracts with corporate standards.

  Contract Expert makes it possible for you to set up business rules that can:

  - Apply the appropriate contract terms template to a contract
    For example, apply the contract terms template Software License and Service Agreement if the contract is authored in the North America Operations business unit and the contract amount exceeds one million dollars.

  - Insert additional clauses into specific predetermined locations in the contract
    For example, add an audit clause if an audit is required.

  - Report contract deviations from corporate policies
For example, report a contract worth one million dollars or more that includes payment terms greater than 90 days. You can base Contract Expert rule conditions on the values of variables in the contract, the presence of other clauses, or you can set up questions that contract authors must answer during authoring. For example, you can ask authors a series of questions about the nature of the materials being shipped to customers and insert additional liability clauses based on their answers. If you are setting up business rules with numeric conditions (for instance, insert a special payment terms clause if the contract amount exceeds $1 million) then you must set up constants to hold the numeric values. You cannot enter the numeric values directly.

- Contract Deliverables
  Contract deliverables track both contractual and non-contractual commitments that must be completed as part of negotiations, purchasing, and enterprise contracts between businesses and suppliers or customers based on contract intent. These deliverables can be used in purchasing and sourcing documents that include contract terms and in enterprise contracts.

- Importing Clauses
  You can import clauses from legacy applications by running Oracle Fusion Enterprise Scheduler (ESS) processes from the Terms Library work area by selecting the Import Clauses task or from the Setup Manager by selecting the Manage Processes task.

- Setting Up and Maintaining the Index for Clause Text Searches Using the Keyword Field
  By selecting the Manage Processes task in the Terms Library work area, you can also run the ESS processes required to set up and maintain the text index required for searches of clauses and contract terms templates using the Keyword field.

**How the Contract Terms Library Supports Translation: Explained**

You can set up your contract terms library to handle the translation of clauses, templates, and other content in multiple languages. This topic discusses the features included in Oracle Fusion Enterprise Contracts that support translation, making it possible for you to

- Indicate a localized clause is a translation of another
- Manage contract terms template translations

These two features are only a small part of a translation solution, however. The rest of the setup is very much open-ended. For instance, when you have different business units that operate in different languages, you can use the adoption and localization feature of contracts to keep separate libraries in different languages. Alternately if you are using only one business unit, you can create separate numbering or naming schemes to keep the content in multiple languages separate.
Indicating a Localized Clause is a Translation of Another

If you have set up the multiple business unit structure that supports clause adoption and localization, you can use the localization feature to translate clauses. The global clause you create in the global business unit becomes the clause you are translating from. To translate the global clause, you localize it using the localize action and enter the translation on the Localize Clause page. The Localize Clause page displays both the original and translated text. You can indicate the localized clause is a translation-only clause by selecting a check box. This check box is for informational purposes only and can be used to generate reports.

Note
Unlike contract terms templates, clauses have no language field that tracks the language of the clause.

Tracking Contract Terms Template Translations

For each contract terms template you can specify the template language and the template it was translated from, if it is a translation. The Translations tab in the contract terms template edit page shows all of the templates related by translation. For instance, if you translate an English template into French, Japanese, and Chinese, then each of the templates lists the translations as shown in the following diagram.

All of the templates listed display the source template in the Translated From column. For the source template, this column is blank. In this example, you can tell the English template is the source template for the French, Chinese, and Japanese translations because there is no entry in the Translated From column.
To manage the translated templates, you can search for all of the templates in a particular language and for all templates translated from a specific template.

### Setting Up Business Units for the Contract Terms Library

#### Contract Terms Library Business Unit Setup: Explained

You can specify a wide variety of Contract Terms Library settings for either customer or supplier contracts within each business unit, by using either the Specify Customer Contract Management Business Function Properties or the Specify Supplier Contract Management Business Function Properties tasks. These tasks are available by navigating to the Setup and Maintenance work area and searching on the task name.

For the Contract Terms Library in each business unit, you can:

- Enable clause and template adoption.
- Set the clause numbering method.
- Set the clause numbering level for automatic clause numbering of contracts.
- For a contract with no assigned ledger or legal entity, set the document sequence to Global or Business Unit level.
- Enable the Contract Expert feature.
- Specify the layout for printed clauses and contract deviation reports.

#### Enabling Clause Adoption

If you plan to use clause adoption in your implementation, then set up the following:

- Specify a global business unit

You must designate one of the business units in your organization as the global business unit by selecting the Global Business Unit option. This makes it possible for the other local business units to adopt and use approved content from that global business unit. If the Global Business Unit option is not available for the business unit you are setting up, this means that you already designated another business unit as global.

- Enable automatic adoption

If you are implementing the adoption feature, then you can have all the global clauses in the global business unit automatically approved and available for use in the local business by selecting the Autoadopt Global Clauses option. If you do not select this option, the employee designated as the Contract Terms Library Administrator must approve all global clauses before they can be adopted and used in the local business unit. This option is available only for local business units.
- Specify the administrator who approves clauses available for adoption

You must designate an employee as the Contract Terms Library administrator if you are using adoption. If you do not enable automatic adoption, then the administrator must adopt individual clauses or localize them for use in the local business unit. The administrator can also copy over any contract terms templates created in the global business unit. The clauses and contract terms templates available for adoption are listed in the administrator's Terms Library work area.

**Setting Clause Numbering Options**

You can set up automatic clause numbering for the clauses in the business unit by selecting Automatic in the **Clause Numbering** field and setting the clause numbering level. Then select the appropriate clause sequence category for the specified numbering level. You must have previously set up document sequences for the document sequence categories of global, ledger, and business unit. If clause numbering is manual, contract terms library administrators must enter unique clause numbers each time they create a clause.

You can choose to display the clause number in front of the clause title in contracts by selecting the **Display Clause Number in Clause Title** option.

**Enabling Contract Expert**

You must select the **Enable Contract Expert** option to be able to use the Contract Expert feature in a business unit. This setting takes precedence over enabling Contract Expert for individual contract terms templates.

**Specifying the Printed Clause and Deviations Report Layouts**

For each business unit, you can specify the Oracle BI Publisher RTF file that serves as the layout for:

- The printed contract terms
  Enter the RTF file you want used for formatting the printed clauses in the **Clause Layout Template** field.

- The contract deviations report
  The RTF file you select as the **Deviations Layout Template** determines the appearance of the contract deviations report PDF. This PDF is attached to the approval notification sent to contract approvers.

**How the Selection of a Business Unit Affects Clauses and Other Objects in the Library**

The choice of a business unit while creating many Contract Terms Library objects restricts where you can use these objects. Objects affected include clauses, contract terms templates, and Contact Expert rules. Objects created in a local business unit can only be used in that local business unit. Objects created in a global business unit can be adopted or copied over to other business units.
provided they are specified as global. This topic details the impacts of the business unit choice on the different library objects.

The following figure shows a hypothetical implementation with four business units: one global business unit and three local business units. You can designate one business unit as global during Business Unit setup. The other business units are local business units.

![Diagram of business units]

**How Business Units Affect Terms Library Objects**

This table details how the selection of a business unit affects different objects in the Contract Terms Library.

<table>

**FAQs for Setup Overview**

**How can I set up the content of the Contact Terms Library?**

You must navigate to the Terms Library work area to set up the content of the Contract Terms Library.

**What drafts display in the Terms Library Overview page?**

The Drafts region of the Contract Terms Overview page displays drafts or revisions that you either created or last updated.

**Managing Clauses in the Contract Terms Library**

**Contract Terms Library Clauses: Explained**

You can create different types of clauses for different uses and use clause properties to specify if a clause is protected from edits by contract authors, if it is mandatory, and if it is related to or incompatible with other clauses. A clause you create in the Contract Terms Library is available for use within the business unit where you create it after it is approved.

The types of clauses you can create include:
- Standard clauses
- Clauses included by reference
- Provision clauses for contracts with a buy intent

Using different clause properties you can:
• Make a clause mandatory in a contract.
• Protect it from edits by contract authors.
• Specify that a clause can be selected by contract authors as an alternate of another clause.
• Specify that the clause cannot be in the same document as another clause.
• Make a clause created in a global business unit available for use in other business units.

Creating Standard Clauses

Any clause you create in the library becomes a standard clause that can be used in the business unit where you create it after it is approved. Unless you specify that the clause is protected, contract authors can edit the clause in a specific contract. Any edits they make are highlighted in a clause deviations report when the contract is approved. Similarly, contract authors can delete the clause from a contract, unless you specify the clause is mandatory.

Including Clauses by Reference

For clauses, such as Federal Acquisition Regulation (FAR), you can print the clause reference in the contract instead of the clause text itself. During contract creation, you enter the reference on the Instructions tab of the clause edit page and select the Include by Reference option.

Creating Provision Clauses for Contracts with a Buy Intent

For contracts with a buy intent, you can create provision clauses, clauses that are included in contract negotiations but are removed after the contract is signed. Provision clauses are used primarily in Federal Government contracting.

Altering Clause Behavior with Clause Properties

Using different clause properties, you can alter the behavior of a clause. You can:

• Make a clause mandatory.
  A mandatory clause is highlighted by a special icon during contract terms authoring and cannot be deleted by contract authors without a special privilege. You can make a clause mandatory for a particular contract terms template by selecting the Make Mandatory action after you have added the clause to the template. A clause is also become mandatory if it is added by a Contract Expert rule and you have selected the Expert Clauses Mandatory option in the template.

• Protect it from edits by contract authors.
  A protected clause is highlighted by a special icon during contract terms authoring and cannot be edited by contract authors without a special privilege. You can protect any clause by selecting the protected option during clause creation or editing.

• Specify that a clause can be selected by contract authors as an alternate of another clause.
  You can specify clauses to be alternates of each other on the Relationships tab of the create and edit clause pages. When editing contract terms,
contract authors are alerted by an icon that a particular clause includes alternates and can select an alternate to replace the original clause.

- Specify that the clause cannot be in the same document as another clause
  You can use the Relationship tab to specify a clause you are creating is incompatible with another clause in the library. The application highlights incompatible clauses added by contract authors in the contract deviations report and during contract validation.

- Make a clause available for use in other business units.
  Clauses you create in the library are normally available only within the same business unit where you create them. If you create the clause in the business unit that is specified as global during business unit setup, then you can make the clause available for adoption in other business units by selecting the Global option during clause creation or edit. This option appears only in the one business unit specified as global.

**FAQs About Managing Clauses**

**What are the clause statuses and what do they mean?**

Clause statuses in the Contract Terms Library reflect the state of the current version you are editing and restrict what actions you can take.

The following table describes the clause statuses and explains their implications:

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Effect</th>
</tr>
</thead>
</table>
| Draft  | A clause is automatically set to the Draft status after you create a clause initially or when you create a new version. | • Available for authoring and adoption?  
Not available.  
• Effect contract approval?  
No effect. Contracts do not include draft clauses.  
• Editing?  
No restriction.  
• Inclusion in contract terms templates and Contract Expert rules?  
You can include a draft clause version, but the templates or rules cannot be activated until the clause version is approved.  
• Deletion?  
Yes. You can delete versions in the Draft and Rejected statuses |

Define Contract Terms and Clause Library Configuration 19-11
<table>
<thead>
<tr>
<th>Pending Approval</th>
<th>The status of a clause after it is submitted for approval.</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>• Available for authoring and adoption?</td>
</tr>
<tr>
<td></td>
<td>Not available.</td>
</tr>
<tr>
<td></td>
<td>• Effect on contract approval?</td>
</tr>
<tr>
<td></td>
<td>None. Contracts do not include clause versions in this status.</td>
</tr>
<tr>
<td></td>
<td>• Editing?</td>
</tr>
<tr>
<td></td>
<td>Limited to description and the end date.</td>
</tr>
<tr>
<td></td>
<td>• Inclusion in contract terms templates and Contract Expert rules?</td>
</tr>
<tr>
<td></td>
<td>You can include clauses with their latest versions pending approval, but the templates and rules cannot be activated until the clause version is approved.</td>
</tr>
<tr>
<td></td>
<td>• Deletion?</td>
</tr>
<tr>
<td></td>
<td>Not directly but indirectly by first withdrawing it from approval and thus reverting the clause to its original Draft status.</td>
</tr>
<tr>
<td></td>
<td>• Stop Approval?</td>
</tr>
<tr>
<td></td>
<td>Yes. You can withdraw the clause from approval using the Stop Approval action. Withdrawing the clause from approval reverts the clause to Draft status.</td>
</tr>
<tr>
<td>------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Rejected</td>
<td>The approvers rejected the clause version. You can edit clauses in this status and resubmit them for approval.</td>
</tr>
<tr>
<td>Approved</td>
<td>The clause was approved.</td>
</tr>
</tbody>
</table>
| Expired  | The clause is past its end-date. The application automatically enters a clause end date in the old version when a new version is approved. You can also manually enter an end date in an approved clause. | • Available for authoring and adoption?  
No.  
• Effect contract approval?  
Creates an error during contract approval validation. The clause must be removed before submitting the contract for approval.  
• Editing?  
No edits permitted.  
• Inclusion in contract terms templates and Contract Expert rules?  
You cannot add an expired clause.  
If the latest version of a clause becomes expired when it is already in a template or rule, then the application displays an error during template or rule activation.  
• Deletion?  
No. |
<table>
<thead>
<tr>

**How can I find clauses that I drafted or that require my action?**

You can view clauses that you drafted and clauses that require your action on the Terms Library Overview page.

**How do I use the Clause Title and Display Title fields?**

The title you enter in the Clause Title field must be unique for each clause within a business unit and cannot be changed after the clause is approved. You can use the Display Title field, which has no uniqueness requirement, to modify the title that appears in contracts or to specify the same title for multiple alternate clauses.

**How can I create clauses with the same title?**

You cannot have two clauses with the same title entered in the **Clause Title** field in the Contract Terms Library, but by entering the same title in the **Display Title** field for each clause, you can create multiple clauses with the same printed title. The **Display Title** overrides the **Clause Title** in printed contracts.
How can I search for a clause in the library by its text?

You can search for clause text using the **Keyword** field. This field also searches clause title, display title, and description.

How can I set up the clause title to include the clause number?

You can have the clause number automatically added to the front of the clause title as a prefix in printed contracts by selecting the **Include Clause Number in Display** option during business unit setup. You will want to do this only if the clause number is meaningful in some way, for example when it refers to a number of a government regulation. The clause number is a number of the clause in the Contract Terms Library and it is usually generated by the application automatically. It is not the number of the clause in the contract generated by the numbering scheme.

How does Contract Expert identify where to insert clauses into contracts?

If you are using a Contract Expert rule to insert clauses into a contract, then Contract Expert inserts the clause in the location that is predefined for the clause in the terms template. If the clause location is not defined in the terms template, then Contract Expert inserts the clause into the section that is specified in the Default Section field in the General Information region on the create and edit clause pages. If you do not specify a default section for the clause, then Contract Expert uses the default section specified in the Contract Expert region on the General tab in the create and edit contract terms template pages. If the section doesn’t already exist in the contract where the clause is being inserted, Contract Expert adds the section along with the clause.

How does creating a new version of a Contract Expert rule affect contracts?

Activating a new version of a rule makes that new version effective whenever the contract author runs Contract Expert. Authors who validate or submit for approval contracts that used a previous version of the rule receive an error asking them to run Contract Expert again. Approved contracts are not effected.

What can I use clause analysis for?

Use clause analysis to find out how the Contract Terms Library clauses, contract terms templates, and Contract Expert rules are used in contracts:

Use clause analysis to:

- Identify which contracts make use of a legal concept.
• Identify contracts that use a given set of clauses.
• Research the effectiveness of standard policies and standards defined in the Contract Terms Library.

For example, you can find out if you need to revise a standard clause by searching for the nonstandard versions of the standard clause.

**What do I enter as the clause text if I plan to include the clause reference instead?**

Even if you are printing the clause reference instead of the clause text in a contract, you must still enter text in the clause text field. The text you enter in this field is not printed in the contract, but it is used for searching clauses by text. For this reason, it is preferable if you enter the text of your referenced clause.

**How can I embed a question response in a clause?**

You can embed a question response in a clause by inserting the associated variable of the question in the clause text. To associate a question response to a variable, the value sets of the question response and the variable must be identical.

**What information is copied over when I duplicate a clause?**

Duplicating a clause copies all information about the clause except for its historical information (the templates where it is used and adoption history). You can edit all of the information about the new clause except for its business unit.

**Note**

To copy a clause to another business unit, you must recreate the clause in that business unit.

**Why can't I find a clause when I search by clause text?**

You may not be able to find a clause by searching for its text if the clause text has not been indexed. The application administrator must periodically index clause text by running two processes: Build Keyword Search Index for Contract Clauses and Optimize Keyword Search Index for Contract Clauses.

**How can I find clauses that are adopted by other business units?**

If you are in the global business unit, you can search clauses that have been localized or adopted by other business units using the Search Clauses page (you
What's the difference between the clause Instructions and the clause Description fields?

Use the clause Instructions field to enter instructions for contract authors on clause use.

Use the clause Description field to enter any information about a clause.

Both text fields are visible to contract authors during contract terms authoring and the text of both can be searched using the Keyword field. Neither field is printed in contracts.

What's a clause intent?

The clause intent specifies if the clause is going to be used for sales or procurement contracts. You can only create a clause for one intent.

What's the difference between saving a clause and submitting a clause?

Saving a clause saves it as a draft.

Submitting a clause triggers validation checks and submits the clause for approval. While a clause is in the approval process, you cannot make any edits. The clause must be either approved or rejected for you to edit it again.

What's the difference between setting up multiple alternate clauses and one with a variable?

There are two ways of setting up alternate clauses:

- You create multiple separate alternate clauses
- You create just one alternate clause and include variables to supply the different variants

This table highlights the differences between the two setup methods:
<table>
<thead>
<tr>
<th>Setup Method</th>
<th>Advantages</th>
<th>Disadvantages</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiple Alternate Clauses</td>
<td>• You can use clause analysis to track usage of the clause and its alternates</td>
<td>• Must create and maintain a large number of clauses.</td>
</tr>
<tr>
<td></td>
<td>• One-step selection: Contract authors select the clause from a list.</td>
<td>• Authors are restricted to the alternates you create.</td>
</tr>
<tr>
<td></td>
<td>• Language of the alternate clauses you create can vary.</td>
<td>• Authors may have to search for the clause they want if there are many.</td>
</tr>
<tr>
<td>Single Alternate Clause with Variables</td>
<td>• Permits you to create and maintain just one alternate clause.</td>
<td>• Two-step selection: Authors select the alternate and then run Contract Expert to fill in the variable values.</td>
</tr>
<tr>
<td></td>
<td>• Supports unlimited number of alternates.</td>
<td>• Language of the alternate clause cannot change. The only difference is the information supplied by the variables.</td>
</tr>
</tbody>
</table>

**Who can edit protected and mandatory clauses?**

Only users with the Override Contract Terms and Conditions Controls privilege can edit mandatory and protected clauses. Contact your application administrator with questions about the privileges granted to you.

**Why can't I edit the clause information?**

You cannot edit clause information if you lack the proper privileges or if the clause is not in the draft status. When the clause is pending approval, the approvers must approve or reject the clause before you can edit it. If the clause is rejected or approved, you must create a new version before editing.

**Why can't I edit the clause text?**

You cannot edit the clause text if it was imported from a Word document or if you do not have adequate privileges assigned to you. To edit imported clause text, download the clause text, use Word 2007 or later version to make your edits, and then import your changes. To edit protected or mandatory clauses, you must obtain the Override Contract Terms and Conditions Controls privilege from the application administrator.
Why can't I edit the clause title?

You cannot edit the clause title after you first save the clause. However, you can change the clause title in printed contracts by entering a new title in the Display Title field. The display title replaces the clause title in printed contracts.

Managing Contract Terms Templates

Contract Terms Templates: How They Work

You can create contract terms templates in the Contract Terms Library to insert appropriate terms and conditions into contracts during contract authoring. Contract authors can apply the templates manually or the application can apply the templates automatically using defaulting rules you set up.

Contract terms templates:

- Contain sections and clauses from the Contract Terms Library.
- Are created in the Contract Terms Library separately. You cannot create them directly from an existing contract.
- Are specific to one business unit.
- Apply to enterprise contracts of the contract types you specify in the template.
- Are specific to either sell-intent or buy-intent contracts.
- Can default contract terms directly on purchase orders and sourcing documents, and on enterprise contracts. For these documents, contract terms templates can also include contract deliverables which can be used to track the completion of contractual tasks in the contract.

In addition, for a contract terms template you can:

- Set up Contract Expert rules to recommend additional clauses for contracts that use the template and insert these clauses in specified locations in the contract if marked as conditional.
- Associate a layout template for previewing the template.
- Specify a contract terms numbering scheme for the template.
- Set up template selection rules to default the template into a contract automatically.
Adding Sections
You can add sections that you have created in the library or create sections that are specific to the template itself.

Adding Clauses
You can add clauses in one of two ways:

- Add a clause from the Contract Terms Library directly into a section in the template.
  You can create the clause in the library from the template if the library does not have what you need.

- Create Contract Expert rules to add clauses to the contract terms in a contract depending on the specifics of the contract.

For example, you may want to add a boilerplate jurisdiction clause directly into the template, but use a Contract Expert rule to insert the appropriate liability clause. This way a contract that calls for the shipment of hazardous materials will get a liability clause that's different from a contract that does not include any, for example.

The properties that you set up in the clause apply automatically. If you set up a clause as mandatory, contract authors will not be able to delete the clause after it is inserted by the template unless they have the special Override Contract Terms and Conditions Controls privilege. If you set up a clause with alternates, then authors can substitute any of the alternate clauses in the contract.
Note
You are not required to add any sections or clauses to a template directly. You can use Contract Expert rules exclusively, if appropriate.

Enabling Contract Expert on the Template
If you want to use Contract Expert in a contract where the template is applied, you must enable the template for Contract Expert by selecting the Enable option in the Contract Expert region in the Create Terms Template or Edit Terms Template pages.

When Contract Expert rules enabled for the template suggest additional clauses, these additional clauses are presented for review by contract authors before they are inserted in the default section specified in each clause. Depending on their level of privileges, some contract authors can choose which clauses to insert and which to omit. If you make Contract Expert suggestions mandatory for the template, then only users with the special Override Contract Terms and Conditions Controls privilege can reject the recommendations.

The clauses recommended for insertion may also be placed in their predetermined locations, if the clauses are marked as conditional clauses and their locations defined in the terms template associated with the contract.

Adding Contract Deliverables to Purchase Orders, Sourcing Documents, and Enterprise Contracts
For Oracle Fusion Purchasing purchase orders, Oracle Fusion Sourcing documents, and enterprise contracts, you can track compliance of tasks that the contract parties have agreed to execute as part of the agreement by adding contract deliverables.

You can use the deliverables to record the status of the tasks, keep everyone notified of past and future deadlines, and as a repository of the deliverable documents themselves. For example, vendors agreeing to supply a monthly report can log in to their sourcing portal and attach the report or ask for an extension. If they fail to respond by the specified deadline, the deliverable can trigger an automatic notification that the deliverable is overdue.

Assigning a Layout Template for Previewing the Contract Terms Template
You must assign a layout template with the contract terms template to make it possible for contract authors to get a preview of the template content, when they need to make a template selection, for example. The layout template, which you select on the General tab while editing the contract terms template, specifies what gets displayed in the preview, including the fields displayed, graphics such as a company logo, page numbering, headers and footers, and boilerplate text. This layout template is not used for printing the contract.

If you marked Contract Expert recommended clauses as conditional on the terms template, then these are displayed in gray font in the print preview to distinguish them from regular clauses.

The layout template is an RTF file stored in the Enterprise Contracts folder in the Business Intelligence Presentation Catalog. A sample layout template is provided with your application. You can copy the sample template and edit it to create your own as described in a related topic.

Specifying a Numbering Scheme
You can associate a numbering scheme to the template that will automatically number sections and clauses in the contract. Several predefined numbering
schemes are available with your application, and you can create additional numbering schemes of your own.

**Defaulting the Template on Contracts**

You can have a contract terms template apply automatically in all contracts based on:

- Contract type
- Contract Expert rules that select the template based on the specific information in the contract itself

If you enabled the feature Enable Contract Terms in Fusion Procurement for the option Procurement Contracts during implementation, then you can also apply templates to procurement documents based on document type.

The following document types become available:

- Auction
- Bid
- Blanket Purchase Agreement
- Contract Purchase Agreement
- Standard Purchase Order
- RFI
- RFI Response
- RFQ
- Sourcing Quote

While editing the contract terms template, you specify a template to be the default for a contract type or document type in the Document Types region. You can set up only one template as the default for each contract type or document type. You set up the Contract Expert template selection rules separately as described in a related topic. You can have multiple rules recommend the same template.

Here is how the defaults you enter in the Document Types region and the Contract Expert template selection rules interact to select and apply a template during contract authoring:

- Contract Expert template selection rules always take priority. If the rules specify a single template for a contract, then it gets applied regardless of the default you entered in the Document Type region.
- If the Contract Expert rules recommend different templates, then the application uses the default from the Document Type region as a tiebreaker.
- If no Contract Expert selection rule applies and you specified a default, then the application uses the default.
- If no rule or default was set up for a contact type or document type, then contract authors must select the template they want from a list.

**Setting Up Contract Expert**

**Contract Expert: How It Works**

Use Contract Expert to enforce corporate policies and standards for all types of contracts, including enterprise contracts, purchase orders, and sourcing contracts.
Contract Expert makes it possible for you to set up business rules that can:

- Apply the appropriate contract terms template to a contract
  
  For example, apply the contract terms template Software License and Service Agreement if the contract is authored in the North America Operations business unit and the contract amount exceeds one million dollars.

- Insert additional clauses into specific predetermined locations in the contract
  
  For example, add an audit clause if an audit is required.

- Report contract deviations from corporate policies
  
  For example, report a contract worth one million dollars or more that includes payment terms greater than 90 days.

Contract Expert consists of two components.

- Rule Setup
  
  Administrators create the rules that are stored in the Contract Terms Library. A rule can be based on the following types of conditions:

  - The values of variables in the contract
    
    For example, recommend an additional clause if the shipment date on an order is greater than 90 days.

  - Answers that contract authors provide to questions
    
    For example, recommend an additional liability clause depending on a response to a question about hazardous materials.

  - The presence of clauses in the contract.
    
    For example, if the contract includes a hazardous materials clause, then insert additional insurance clauses.

  The first two condition types require contract author input during authoring.

- Rule Execution
  
  During contract authoring, Contract Expert evaluates the rules. For rules with conditions that require author input, Contract Expert asks authors to provide missing variable values and to answer questions when the authors select the Run Contract Expert action. Authors can then evaluate any recommended clauses for insertion in the contract. The clauses recommended for insertion may also be placed in their predetermined locations, if the clauses are marked as conditional clauses and their locations defined in the terms template associated with the contract.

  Authors can review any policy and clause deviations by selecting the **Review Contract Deviations** action. Clause deviations are shown in a dashed box because they do not require Contract Expert rules.
The following figure illustrates the two components:

**Contract Expert Rule Setup**

Depending on the type of rule that you are creating, you can base rule conditions on:

- **Variables**
  
  This condition is based on the value of a variable in the contract. The application either derives the value automatically from the contract, or contract authors enter the value when they run Contract Expert.

- **Questions**
  
  This condition is based on answers to questions contract authors supply when they run Contract Expert.

- **Clauses**
  
  This condition is based on the presence of a specific clause in the contract.

Contract Expert rules apply only to contract terms templates where Contract Expert is enabled. You can specify if you want a rule to apply to all or selected templates.

**Contract Expert Rule Execution During Contract Authoring**

Depending on their type, all active rules for the contract terms template used in a contract are evaluated automatically during contract terms authoring or when a contract author runs Contract Expert in the Contract Terms tab.
The following figure illustrates what happens when Contract Expert is run during contract authoring:

1. If rule conditions require user input, Contract Expert prompts the contract author to enter variable values and answer questions. Answers to questions can trigger follow-up questions. In this figure, the answer to Question 1 triggered the follow-up Question 2.

2. Contract Expert displays any recommended clauses for review by the author. Authors can choose which of the recommended clauses to insert into the contract provided that they have sufficient privileges.

3. Contract Expert inserts the clauses in the contract terms section specified during clause setup in the Contract Terms Library. If no section is specified in the clause, the application uses the default section specified in the contract terms template. Contract Expert automatically inserts the default section if it does not already exist in the contract. The clauses recommended for insertion may also be placed in their predetermined locations, if the clauses are marked as conditional clauses and their locations defined in the terms template associated with the contract.

4. On subsequent runs, Contract Expert first removes any clauses that it inserted into the contract in earlier runs, including clauses that have been moved or have been made nonstandard.

Authors who do not make all the required entries or forget to run Contract Expert altogether receive warnings when they validate the contract terms or when they review the contract deviations report.
You can set up Contract Expert rules to apply contract terms templates automatically to contracts, to suggest additional clauses for insertion during contract terms authoring, and to flag any contract deviations from company policy.

Each rule comprises conditions that must be met and the rule results. You can base rule conditions on:

- The presence of another clause already in the contract
- The value of a system variable or a user variable
- Questions that the contract author must answer

Different Contract Expert rule types support different condition types, as illustrated in the following figure.

- Clause selection rules, which can default individual clauses and sections into a contract, can be based on clauses, questions, and variables.
- Template selection rules, which identify the default contract terms template for the contract, can be based on variables only.
- Policy deviation rules, which flag contract deviations from company policies, use questions and variables only.

Key rule properties include:

- All rules can use multiple conditions linked together with either the AND or OR logical operators.
- The values of non-numeric conditions are supplied by value sets.
- The values for numeric conditions are supplied by constants.
- Rule types that permit the inclusion of questions can trigger follow-up questions, permitting you to chain rules together.
• Rules are restricted to the specific business unit and the contract intent where you create them.

• Rules do not get copied when you copy a global contract terms template to another business unit.

• Conditions support both logical and numeric operators:
  • IS
  • IS NOT
  • IN (allows the selection of multiple values)
  • NOT IN (allows the selection of multiple values)
  • >=: (greater than or equal to)
  • <=: (less than or equal to)
  • =: (equal to)
  • >: (greater than)
  • <: (less than)

**Clause Selection Rules**

Clause selection rules permit you to insert one or more clauses and sections into a contract.

The following table describes the rule properties.
<table>
<thead>
<tr>
<th>Rule Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule outcomes</td>
<td>The rule can:</td>
</tr>
<tr>
<td></td>
<td>• Recommend one or more clauses for insertion into the contract</td>
</tr>
<tr>
<td></td>
<td>Contract authors can review the Contract Expert recommendations before the clauses get inserted into the contract. By setting the <strong>Expert Clauses Mandatory</strong> option when creating a contract terms template, you can specify if you want the clause insertion to be mandatory or if the authors can ignore the recommendations.</td>
</tr>
<tr>
<td></td>
<td>If you make the insertion mandatory, then only contract authors with the <strong>Override Contract Terms and Conditions Controls</strong> privilege, a special privilege that allows deleting mandatory clauses from the contract, can reject the recommendations. Similarly, if the recommended clauses are standard clauses, then the authors must have the <strong>Author Additional Standard Contract Terms and Conditions</strong> privilege to reject the recommendations. This privilege allows the deletion of standard clauses from the contract.</td>
</tr>
<tr>
<td></td>
<td>If you marked recommended clauses as conditional and specified the location of these clauses in the terms template, then Contract Expert inserts the clause in the contract in the location that you specified. If the location of an Expert suggested clause is not specified in the terms template, Contract Expert inserts each clause in the section specified as the default for the clause in the Contract Terms Library.</td>
</tr>
<tr>
<td></td>
<td>If no default section is specified in the clause, then Contract Expert inserts the clause into the default section specified in the contract terms template. Contract Expert automatically inserts the default section if it does not already exist in the contract.</td>
</tr>
<tr>
<td></td>
<td>• Ask follow-up questions</td>
</tr>
<tr>
<td></td>
<td>You can ask follow-up questions by adding them in the Additional Questions region of the Results tab. Any additional question that you add must be part of another rule. Adding the follow-up question chains the rules together.</td>
</tr>
<tr>
<td>When the rule is evaluated</td>
<td>The rule is evaluated every time that a user runs Contract Expert.</td>
</tr>
<tr>
<td></td>
<td>Users receive an warning message during contract validation if they fail to run Contract Expert.</td>
</tr>
</tbody>
</table>
Conditions

Conditions can be based on:
- clauses
- questions
- variables

You can use both predefined system variables and user variables. Both types of user variables are supported: those that require entry by contract authors and those where the values are supplied by a Java procedure.

Where it applies

The rule applies only within the business unit and for the intent that you specify. You can have the rule apply to one of the following:
- Specific contract terms templates
- All contract terms templates for the business unit

### Contract Terms Template Selection Rules

Contract terms template selection rules permit you to automatically apply a contract terms template to a contract.

The following table describes the rule properties.

<table>
<thead>
<tr>
<th>Rule Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule outcomes</td>
<td>The application automatically applies a contract terms template to a contract. Or, if the author removed the contract terms using the Actions menu, the template displays the template name as the default when applying a new template.</td>
</tr>
<tr>
<td>When the rule is evaluated</td>
<td>The application evaluates the rule whenever the author navigates to the Contract Terms tab as long as no contract terms template is applied. If a contract terms template is applied to the contract, the template selection rules are not executed again, even if changes to the contract would result in a different rule outcome. The rule is also evaluated to determine if the contract contains the recommended template whenever the contract author:</td>
</tr>
<tr>
<td></td>
<td>- runs the clause deviations report</td>
</tr>
<tr>
<td></td>
<td>- validates the contract terms or the contract</td>
</tr>
<tr>
<td></td>
<td>In both cases, the rule generates a warning if the author applied a different template from that recommended by the rule.</td>
</tr>
<tr>
<td>Conditions</td>
<td>Variables only</td>
</tr>
<tr>
<td></td>
<td>You can use predefined system variables and those user-defined variables where the values are supplied by a Java procedure.</td>
</tr>
</tbody>
</table>
Where it applies | The rule applies only within the business unit and for the intent specified in the rule.
---|---

Contract Expert does not apply a contract terms template if the contract terms template defaulting rules you set up recommend multiple terms templates for a single contract. Instead, Contract Expert applies the contract terms template specified as the default for the business document type during contract terms template setup. If no document type default is specified, then the application displays the **Add Contract Terms** button and permits authors to select a template of their own choice. The choices are restricted to the templates specified for the contract type.

Policy Deviation Rules

Policy deviation rules flag deviations from company policies on the contract deviations report. This report is run by the contract author before submitting a contract for approval.

The following table lists the rule properties.

<table>
<thead>
<tr>
<th>Rule Property</th>
<th>Details</th>
</tr>
</thead>
<tbody>
<tr>
<td>Rule results</td>
<td>The rule displays a deviation in the contract deviations report.</td>
</tr>
<tr>
<td></td>
<td>The rule name becomes the deviation.</td>
</tr>
</tbody>
</table>
When the rule is evaluated | The rule is evaluated whenever the user:
| • Runs the contract deviations report
| • Validates the contract terms or the contract

Conditions | Conditions can based on:
| • Questions
| • Variables

Both predefined system variables and those user-defined variables where the values are supplied by a Java procedure.

Where it applies | The rule applies only for the contract terms templates within the business unit and for the intent that you specify.

The following figure illustrates the policy deviation rule setup. You can build rule conditions out of both questions and variables. In the contract deviation report, your entry in the **Rule Name** field becomes the deviation name and your entry in the rule **Description** field becomes the deviation description.

Policy deviation rules list policy deviations in the contract deviations report, along with any clause deviations that are flagged automatically by the application. Contract authors can run the report before submitting the contract for approval and enter comments to explain the deviation to the approver. The report is rerun automatically when the author submits the contract for approval and a copy of the report is attached to the approval notification.

**Activating and Validating Rules**

After you set up a rule, you must activate it using the Activate Rule action. Rules do not require approval before activation, but the contract terms templates that they apply to do.
In order to activate a rule, you must assign it to at least one contract terms template. The template does not have to be approved at the time that you make the assignment, but it does have to be approved before the rule can be used.

Activating a rule triggers an automatic validation process. You must correct all errors before the rule gets activated.

**Contract Expert Rule Statuses and Available Actions: Explained**

Statuses track the life-cycle of a Contract Expert rule from creation through activation and versioning and restrict available actions.

**Contract Expert Statuses and Available Actions**

This table describes available rule statuses and lists the permitted actions for each.

<table>
<thead>
<tr>
<th>Status</th>
<th>Description</th>
<th>Available Actions</th>
</tr>
</thead>
<tbody>
<tr>
<td>Draft</td>
<td>When you first create a rule, it remains in the Draft status until you activate it and it passes all the validation checks without error.</td>
<td>• Activate</td>

</tr>
<tr>
<td></td>
<td></td>
<td>• Disable</td>
</tr>
<tr>
<td>Disabled</td>
<td>The rule was disabled using the Disable action.</td>
<td>Duplicate</td>
</tr>
</tbody>
</table>

The following diagram illustrates the rule statuses and main actions.
Contract Expert Question Setup: Explained

You can set up Contract Expert questions in the Contract Terms Library to solicit contract author input during contract authoring. Contract Expert presents the questions to authors when they are part of a Contract Expert rule. The questions you create are restricted to one intent and their names must be unique within that intent. Questions can be reused across all business units.

Question Response Types
Question responses can be one of the following:

- **Yes or no**
  These questions appear to contract authors with a choice list with two values: Yes and No. This question type supplies the choice list automatically without additional setup.

- **Numeric**
  Contract authors enter responses to numeric questions directly using the keyboard.

- **Selection from a list of values**
  For questions that require users to make a selection from a list of values, you must set up a value set with the Char format type and one of the following validation types: Independent, Translatable Independent, or Table.

Note
Contract Expert does not permit you to provide default responses to user questions. However, the application sets numeric questions without a user response to 0.

Inserting Additional Clauses Based on Follow-up Questions: How It Works

You can ask follow-up questions and insert additional clauses into the contract terms based on the answers the contract author gives.
The following diagram illustrates how you can ask a follow-up question using the follow-up question to link two rules.

**Asking a Follow-up Question to Insert an Additional Clause**

1. Include the follow-up question as an additional question on the Results tab of a rule. In this example, contract authors get the follow-up question if they provide an answer that satisfies the condition with Question 1 (the only condition in Rule 1).

2. Create a second rule with the follow-up question in a condition. In this example, the application inserts the additional clause if the contract author satisfies the condition based on the Follow-up Question (the only condition in Rule 2).

**Contract Expert Constants: Examples**

Contract Expert constants supply numerical values to numeric conditions in Contract Expert rules. The same constant can supply the value in multiple rules. Constants are specific to one intent, but can be used in all business units.

**Scenario**

For example, to default a payment terms clause when the contract amount is greater than $1 million, you create a Contract Expert rule with the condition: Contract Amount > 1,000,000.
Instead of entering the number directly into the condition, you create the constant Contract Amount Threshold and set its value to 1,000,000. The condition in your rule becomes: Contract Amount > Contract Amount Threshold.
You can use this same constant in multiple conditions. This way, if the threshold is later increased later to $2 million, you need only to update the constant instead of every rule that uses the condition.

Contract Expert Clause Selection Rules and Asking Follow-up Questions: Examples

Two examples illustrate how you can set up a Contract Expert clause selection rule to insert additional clauses and sections into a contract and how you can set up rules to ask follow-up questions.

Scenario
Suppose, that you want to add two additional insurance clauses under the section Additional Insurance when a shipment of hazardous materials is to be delivered within 30 days. You can handle this scenario by setting up one clause selection rule with two conditions:
• Condition 1: Delivery < 30
  This condition will be evaluated when contract authors enter the delivery period by updating a user variable when they run Contract Expert.
• Condition 2: Hazardous Materials = Yes
  This condition will be evaluated when contract authors answer the question "Is hazardous material involved?" by selecting Yes or No.

Here is how you set up the rule:
1. Ensure that both of the clauses that you want to add are created in the Contract Terms Library with the default section Additional Insurance. This guarantees that both appear in the contract under that section. If the section is not already in the contract, Contract Expert inserts it automatically.

   Note
   If you do not set up the clauses with a default section, Contract Expert inserts the clauses in the default section specified in the contract terms template.

2. For condition 1, you must create a constant called Shipping and set its value to 30. This is because numerical values for conditions must be entered using constants rather than directly.
3. Set up a question that requires a yes or no answer for the prompt "Is hazardous material involved?" for Condition 2.
4. Create the clauses that you want to add to the contract in the Contract Terms Library.

   Note
The clauses must be approved before the rule can be used.

5. Create the Contract Expert rule with the two conditions.

Selecting the Match All option means both conditions must be evaluated before the rule is true.

6. Associate the rule with the contract terms templates where you want the rule to apply.

You can assign the rule to individual templates or all templates with the same intent and within the same business unit.

7. Activate the rule by clicking the **Activate** button while editing the rule.

The rule is evaluated for only those contracts that use templates that have been assigned to the rule. When both conditions in the rule are true, Contract Expert defaults the two insurance clauses.

This diagram illustrates the clause selection rule example.

![Rule Diagram](image)

**Scenario**

Now suppose you want to add an additional clause to the previous example if the hazardous material in the shipment is flammable. To do this, you create:

- The follow-up question:

- A rule where the follow-up question is a condition.

- You link the rules together by entering the follow-up question the Additional Questions region on the Results tab of the first rule.

The following diagram illustrates the setup:
Here are the steps in detail:

1. Set up the follow-up question "Is the material flammable?" with yes and no answers.

2. Create the additional insurance clause that you want to add to the contract in the Contract Terms Library.

3. Create a new Contract Expert rule, Rule 2, with the follow-up question as the condition. The rule will be true if the author answers yes.

4. Associate Rule 2 with the same contract terms templates where Rule 1 applies.

5. Edit Rule 1 to add the newly created question in the Additional Questions region on the Results tab.

6. Activate both rules using the Actions menu.

Contract authors see the question from Rule 2 in Contract Expert only if Rule 1 is true. Rule 2 inserts the additional clause in the contract if authors answer yes.

**FAQs About Contract Expert Setup**

**What are Contract Expert questions?**

Questions contract authors answer when running Contract Expert while authoring the contract. The answers can trigger Contract Expert to suggest
additional clauses or ask follow-up questions, depending on how you set up the Contract Expert rules.

What does it mean to make clauses suggested by Contract Expert mandatory in a contract terms template?

When contract authors run Contract Expert on a contract, Contract Expert displays a list of any clauses that it recommends for insertion.

Contract authors can review the Contract Expert recommendations before the clauses get inserted into the contract. By setting the Expert Clauses Mandatory option when creating a contract terms template, you can specify if you want the clause insertion to be mandatory or if the authors can ignore the recommendations.

If you make the insertion mandatory, then only contract authors with the Override Contract Terms and Conditions Controls privilege, a special privilege that allows deleting mandatory clauses from the contract, can reject the recommendations. Similarly, if the recommended clauses are standard clauses, then the authors must have the Author Additional Standard Contract Terms and Conditions privilege to reject the recommendations. This privilege allows the deletion of standard clauses from the contract.

What happens if the clause to be inserted by the Contract Expert rule is versioned or removed from use?

If the current clause version is not approved or removed from use, Contract Expert automatically uses the previous approved version. If none exists, the contract author receives an error when validating the contract.

What happens to existing contracts if I disable a Contract Expert rule?

The change applies to all new contracts and to existing contracts whenever the contract authors run Contract Expert. Approved contracts are not affected. If you disable a clause selection rule, for instance, Contract Expert removes the suggested clause the next time Contract Expert is run. If you disable a contract terms template selection rule, the application does not make changes to the templates that are already applied to contracts, but does flag the change during contract validation and on the contract deviations report.

What validations get performed when I activate a Contract Expert rule?

The application automatically validates a Contract Expert rule when you attempt to activate it. You must correct any errors before the rule can become active.

The application performs the following checks:

- Circular references between questions used in the rule
- The presence of clauses that are in the Draft, Expired, or On Hold status
- Invalid or absent Java procedures associated with a variable used in the rule
- Disabled questions
- Invalid SQL in the value set associated to a question or variable used in the rule
• Invalid value in a value set associated to a question or variable used in the rule
• Other invalid rules associated to the contract terms template
• Question or variable using a deleted value set
• Expired or on-hold templates that are a part of template selection rules

What's a system variable?

A predefined variable that gets its value from an attribute of the contract or other document.

For buy-intent contracts, system variables include payment terms, the purchase order number, and the purchase order amount. For sales-intent contracts, they include the customer name, the ship-to address, and the payment terms. System variables are supplied with your application and cannot be modified or deleted.

When does a Contract Expert rule become effective?

A Contract Expert rule becomes effective after you activate it and associate it to a contract terms template.

Why are some conditions unavailable for creating my Contract Expert rule?

Rule conditions are restricted by rule type. For example, rules for selecting default contract terms templates must be based on variables. However, clause selection rules can be based on variables, questions, or clauses.

Why can't I assign a Contract Expert rule to a contract terms template?

For you to assign a Contract Expert rule to a contract terms template, the template must be in a Draft or Approved status; it must be enabled for Contract Expert; and it must belong to the same intent as the rule.

Why doesn't a Contract Expert question display during authoring?

A question does not display during contract terms authoring if the rule is not activated or if the rule is not assigned to an active contract terms template. If you chain contract terms rules to ask follow-up questions, then the display also depends on the answer the contract author gives to the previous question.

Are Contract Expert rules affected by the relationships between clauses?

The alternate and incompatible relationships you specify for clauses do not affect the execution or setup of Contract Expert rules. However, the presence of more than one incompatible and alternate clause show up as warnings when the contract author validates the contract.

How are Contract Expert questions presented during contract authoring?

Contract authors see all of the activated Contract Expert questions that apply to a specific contract terms template on a single page when they run Contract Expert
during authoring. Use the Reorder button on the View Question Sequence page to specify the order in which the questions are displayed. If you chained rules to ask additional follow-up questions, then each follow-up question appears underneath the previous question after the contract author answers it.

How can I find all the Contract Expert rules that use a question?

Use the Search Rule page to find all the Contract Expert rules that contain a particular question.

How can I find out which questions contract authors see when they run Contract Expert?

The Rules tab on the contract terms template edit page displays all of the possible questions contract authors may be required to answer when they run Contract Expert and in the order they are asked. A contract author may see only a subset of the questions, depending on what variable values they enter and how they answer the Contract Expert questions. You can view and change the order of questions from the Terms Template search page by selecting the Manage Question Sequence action.

How does creating a new version of a Contract Expert rule affect contracts?

Activating a new version of a rule makes that new version effective whenever the contract author runs Contract Expert. Authors who validate or submit for approval contracts that used a previous version of the rule receive an error asking them to run Contract Expert again. Approved contracts are not effected.

Setting Up Variables

Variables: Explained

You can use variables in the Contract Terms Library to represent information within individual clauses and for use within Contract Expert rule conditions.

Your application comes with predefined variables, called system variables. You can create additional variables, called user variables, with or without programming.

Predefined System Variables

Your application comes with predefined system variables that you cannot modify. These include:

- System variables

  These variables make it possible for you to use information that is entered in integrated procurement, sales, and projects applications. For example, you can use the purchase order amount from procurement contracts or the
payment terms from sales in Contract Expert rules that insert additional clauses to a contract as necessary.

- **Deliverable variables**

  These variables, which are available in buy-intent contacts only, permit you to list the titles of contract terms deliverables within a clause in the contract terms. For instance, if a vendor must deliver a monthly quality report as part of the contract terms, you can create a deliverable to ensure compliance. But creating the deliverable does not automatically print that deliverable in the contract terms. To ensure that the deliverable name is printed, you must include a clause with the appropriate deliverable variable inserted.

- **Table variables**

  Table variables make it possible for you to print in a contract all of the values in a list such as a price list. Table variables are available only in sales-intent contracts.

To obtain a list of the predefined variables and the information that they represent, navigate to the Search Variables page and filter your search on the Variable type. Select the Document Association tab to view the application and document where the variable information originates. Alternately, you can search for variables by document type.

**User Variables**

There are two types of user variables that you can create:

- **Java Method**
- **Manual**

Java Method user variables require you to create Java methods to capture attribute values. Sample code is provided in a related topic.

While Java Method user variables require programming knowledge, you can create manual user variables without programming. To do so, you:

1. Create a value set using Oracle Fusion Application Setup Manager to validate the value entry for the variable.

   A value set can either specify the list of values that users must choose from or merely specify the variable format and length. Value sets are common application components described in the Oracle Fusion Applications Flexfields Guide.

2. Navigate to the Create Variable page.

3. Select the variable intent.

   Variables can be created for either buy (procurement) or sell contracts.

4. Select the value set, and enter the name and the description that will help users identify the variable when they are inserting into a clause or entering its value in Contract Expert.

5. If you are creating a variable for buy intent, then you can make the variable updatable by vendors in the Oracle Fusion Sourcing application by selecting the Updatable by External Parties option.
How User Variables Are Used

The user variables that you create can be:

- Inserted in the Contract Terms Library clauses
- Inserted into individual nonstandard clauses created by contract authors during contract authoring.
- Used in Contract Expert rule conditions

When contract authors run Contract Expert during authoring, they are prompted to enter the variable value. The value is automatically substituted in the contract terms and any rules where the variable is used are evaluated.

You can use value sets to determine what entries contract authors can make in user variables and in Contract Expert feature questions. You can use them either to specify the format an entry must take, or to create a list of values contract authors must choose from.

Value sets are a common application component which you can set up by navigating to the **Setup and Maintenance** work area and searching for the **Manage Contract Terms Value Sets** task. This topic highlights value sets nonprogrammers can set up for Oracle Fusion Enterprise Contracts.

This topic covers:

- Using value sets for creating user variables
- Restrictions for values sets used in Contract Expert feature rules

Using Value Sets for User Variables

You use value sets in the setup of user variables for one of the two following purposes:

- To set up the list of values the contract author must choose from to enter the value
- To specify only the length and format of the information the author must enter manually

Suppose, for example, that you need to create a user variable contract authors can use to enter the name of one of your warehouses into a clause during contract authoring. Without any knowledge of programming, you can:

- Create the list of values the contract author will use to select one of the warehouses.
  
  You create the values first and then enter them into an independent value set.
- Create a format only value set that restricts the entry to a specified number of characters.

Other value set features are also available for use by nonprogrammers. If you want to restrict the entry of the available warehouses by country, then you can make the above value set dependent on a second value set of countries, for instance.
Restrictions for Using Value Sets in Contract Expert Rules

If you are using the value set for a variable that will be used in Contract Expert rules or to specify the values used in responses to a question used in such a rule, then you only use a subset of the value set features as described in the following table.

<table>
<thead>
<tr>
<th>Value Set Format Type</th>
<th>Value Set Validation Type</th>
<th>Supported?</th>
</tr>
</thead>
<tbody>
<tr>
<td>Char</td>
<td>Independent</td>
<td>Yes</td>
</tr>
<tr>
<td></td>
<td></td>
<td>Valid operators are: Is, Is Not, In, and Not In</td>
</tr>
<tr>

<td>Numeric operators.</td>
</tr>
<tr>
<td>Standard Date / Standard Date Time</td>
<td>Not Applicable</td>
<td>No</td>
</tr>
<tr>
<td>Date / Date Time</td>
<td>Not Applicable</td>
<td>No</td>
</tr>
</tbody>
</table>

Creating Java Methods for User Variables: Examples

If you want to use attribute values captured in application documents and these attributes are not defined as existing system variables, then you can create user variables that obtain these values from Java methods you write based on the sample code in this topic.

This topic provides two sample methods with comments to help you write such Java methods. The sourcing of the Java variable value in these methods are different based on the database table and view object (VO).

If the Java user variable is an attribute of the Document Header VO (for example, Contract Header VO or PO Header VO) then use the first method. Use the second method if the Java user variable is an attribute on any child table of the document header VO.

Sample Java Method 1

This sample assumes that CurrencyCode is an attribute on the PO Header VO. This Contract Expert Java variable works even if the header information is not saved during document authoring. In this scenario, getCurrencyCode() is the
method name associated with the user-defined Java variable in the variable definition page.

Note

Because Java is case sensitive, be careful when entering VO attribute names. Do not change the signature of any method or the parameter names.

1. Using JDeveloper 11g, create an application and a project within that application.
2. Within the project, create a Java file with the method for the Java user variable.
3. Create a temporary folder and copy the ContractsTermsLibraryPublicModel JAR file from the fusionapps/jlib directory to this folder.
4. Right click the project in jDeveloper and in the Project Properties:
   a. Select Libraries and Classpath.
   b. Add the ContractsTermsLibraryPublicModel JAR from the temporary folder.
5. Create a JAR for the current project, by right-clicking on the project and selecting Project Properties and Deployment profile.
6. Copy this new JAR to the following directory: mw_home_standalone/user_projects/domains/fusion_domain/servers/AdminServer/upload/ContractManagementApp/V2.0/app/ContractManagementApp/APP-INF/lib

The following is a sample Java class to implement Java user variables. To customize, change the class name (MyPurchaseUDV). Do not change or remove any of the import statements.

```java
/**
 * MyPurchaseUDV.java
 * package oracle.apps.contracts.termsLibrary.publicModel.Attributes.model.java;
 * import java.math.BigDecimal;
 * import java.sql.*;
 * import java.util.Collection;
 * import java.util.HashMap;
 * import java.util.Iterator;
 * import oracle.apps.contracts.termsLibrary.publicModel.variables.model.java.ProgrammaticUDV;
 */

public class MyPurchaseUDV extends ProgrammaticUDV {

/**
 CASE 1: For achieving CASE 1 use the methods registerAttributes() and getCurrencyCode().
 */
```
```java
/**
The following method registers the Java variable present in the Header VO. The name of the variable should be the same as the name of the attribute in the Header VO.
TO CUSTOMIZE: Change only the VO attribute name of the variable (in this case CurrencyCode) to match the attribute name in the Header VO. Do not change the method name or scope of the method. The only thing can be changed is the VO attribute name of the user variable.
*/

protected void registerAttributes() {
    registerAttribute("CurrencyCode");
}

/**
The following method obtains the value of java variable used in the Header VO. The attribute name of the java variable used in this method is CurrencyCode. This method returns the value of the CurrencyCode.
The value of the variable which we are trying to get using this method (getCurrencyCode) should be registered in the previous method registerAttributes().
TO CUSTOMIZE: Change the name of the method (getCurrencyCode()). Do not change the scope of the method.
The return type can be changed. To get the value of the variable we have to use the getAttributeValue() method only.
*/

public String getCurrencyCode() throws Exception {
    String retVal = null;
    retVal = getAttributeValue("CurrencyCode");
    return retVal;
}

Sample Java Method 2

The following method is used to get the value of Java variable through SQL queries. In this scenario, we want to add clauses to the contract terms if the contract has any sales credit. Sales credit information is stored in a different table from the contract header. To work this scenario, the document must be saved before invoking Contract Expert. Java variable used is in this case is Sales Credit. Use method getSalesCredit() if the Java user variable is an attribute on any child table of the document header VO.

To customize, change the name of the method getSalesCredit() and the return type of the method. The other attribute values, such as document ID and document type, which might be needed while executing the query, can be obtained from the getter methods getDocumentId(), getDocumentType(), and getDocumentVersion().

The executeQuery method:

- Will always return a scalar value which is present in the first row and first column in the result set.
- Will always return a string value:
  - If you are expecting an integer value, then you must do a conversion before returning value.
```
• No conversion is required if you are expecting a string.
In the following example, an ID value of a Yes or No value set value is returned based on whether the contract has sales credits entries or not.
*/

```java
class ProgrammaticUDV {
    private HashMap attributesData;
    private DBTransaction dTransactions; // private statement statement;
    protected BigDecimal documentId;
    protected String documentType;
    protected BigDecimal documentVersion;
    private ArrayList<String> attributeNamesUsed = new ArrayList<String>();

    public ProgrammaticUDV() {
        registerAttributes();
    }

    protected void registerAttributes() {
        // attributeNamesUsed.add(attributeName);
    }
}
```

The following file content is provided here only for reference.
DO NOT INCLUDE THE FOLLOWING CODE IN ANY USER METHOD.

```
public int getSalesCredit() throws SQLException, Exception {
    int retVal = 0;
    int value = 0;
    String s1 = null;
    BigDecimal id = getDocumentId();
    s1 = executeQuery("SELECT to_char(count(*)) FROM OKC_K_SALES_CREDITS
    where dnz_chr_id = "+ id);
    value = Integer.parseInt(s1);
    if(value > 0) {
        retVal = 271230; // Value Set id for "YES"
    } else {
        retVal = 271229; // Value Set id for "NO"
    }
    return retVal;
}
```

The following file content is provided here only for reference.
DO NOT INCLUDE THE FOLLOWING CODE IN ANY USER METHOD.
protected String getAttributeValue(String attributeName) throws Exception {
    if (attributesData.get(attributeName) == null) {
        throw new Exception("Attribute name '" + attributeName + '" is either invalid or not registered.");
    }
    return (String)attributesData.get(attributeName);
}

public HashMap getAttributesData() {
    return attributesData;
}

public void setAttributesData(HashMap variableData) {
    attributesData = variableData;
}

public ArrayList getAttributesUsed() {
    return attributeNamesUsed;
}

public void setDBTransaction(DBTransaction dBTransaction) {
    this.dBTransaction = dBTransaction;
}

protected String executeQuery(String query) throws SQLException {
    ResultSet rs = null;
    String s = null;
    if (statement != null) {
        statement.close();
    }
    statement = dBTransaction.createStatement(0);
    rs = statement.executeQuery(query);
    if (rs.next()) {
        s = rs.getString(1);
    }
    statement.close();
    return s;
}

protected void closeQuery() throws SQLException {
    if (statement != null) {
        statement.close();
        statement = null;
    }
}

public void setDocumentId(BigDecimal documentId) {
    this.documentId = documentId;
}

public void setDocumentType(String documentType) {
    this.documentType = documentType;
}

public void setDocumentVersion(BigDecimal documentVersion) {
    this.documentVersion = documentVersion;
}

public BigDecimal getDocumentId() {
    return documentId;
}

public String getDocumentType() {
    return documentType;
}
FAQs About Variables

How can I obtain a list of system variables for use in Contract Expert rules?

Use the Search Variables page to create a list of system variables you can use in Contract Expert rules. You can use the Document Type field to narrow down your search by contract document type, such as a purchase order or Request for Quote.

How do I enable, disable, and delete variables?

When you create a variable, it is immediately available for use in clauses and Contract Expert rules. While there is no activation process or validation for a variable, variable setup is validated when you use variables in rules.

You can delete any variable as long as it is not being used in a clause or a Contract Expert rule. If it is in use, you can only disable it. Disabling a variable by selecting the Disabled option in the Edit Variable page prevents a variable from being used. The application displays an error for all clauses and rules that already use the variable.

Setting Up Adoption of Content Between Libraries

Adoption of Content from Global to Local Terms Libraries: How It Works

Much of the content in the Contract Terms Library is available only in the business unit where you create it. When you designate one of the business units as global during business unit setup, however, the content you create within that business unit can be copied over by other business units, a process known as adoption.

Different kinds of content in the global library can be adopted for use in a local library in different ways, as outlined in the following figure.

- Clauses designated as global can be adopted by selecting either the Adopt or the Localize action in local business units.

  Adopt adopts the clause as is. Localize permits the local business unit to edit the clause text.

- Local clauses are visible only in the business unit where they are created.

- Contract terms templates designated as global are visible to the local business units and can be copied over using the duplicate command.
• Contract Expert rules are visible only in the business unit where they are created.

**Note**

Sections, folders, and numbering schemes do not need to be adopted or copied. They are automatically available across all business units.

---

**Clause Localization and Adoption**

Here is how you adopt and localize clauses:

1. In the global business unit, you create a clause with the **Global** option selected.

2. After the global clause is approved, it is automatically listed as available for adoption on the Terms Library Overview pages in the local business units.

3. Contract Terms Library administrators in local business units select **Adopt** or **Localize** from the Actions menu to adopt the clauses.

4. Both adopted and localized clauses now exist as independent clauses in the local library and must be approved before they can be used in contracts.

**Note**

During the local business unit setup, you can make clause approvals automatic.

5. When a new version of one of the adopted or localized global clauses is approved in the global business unit, the terms library administrators in the local business units are notified automatically

**Note**
You specify the administrator to receive the notification during the local business unit setup.

6. Administrators in the global business unit can create a clause analysis report that details the adoption and localization of the global clauses in the local business units.

**Contract Terms Template Adoption**

You adopt contract terms templates by copying them:

1. In the global business unit, you create a contract terms template with the **Global** option selected.
2. After the global template is approved, it is automatically available for copying in the local business units.
3. Contract Terms Library administrators can search for the global templates available for adoption by selecting the **Global** option in the Search Templates page.
4. Global templates are copied over by selecting the **Duplicate** action.

**Note**

Clauses in the copied templates must be first adopted or localized in the local business unit.

5. The copied contract terms template must be approved in the local business unit before it can be used.

**FAQs About Adoption**

**How can I find clauses that are available for adoption?**

Clauses that are available for adoption are listed in the Clauses for Adoption region on the Terms Library Overview page. You can also search for them using the Search Clauses page by selecting the Available for Adoption from the Adoption Type drop-down list.

**What happens if the global library publishes a new version of the clause I localized?**

The new version of the clause appears as available for adoption in the Terms Library Overview page and in clause searches. The Contract Terms Library administrator receives an automatic notification.

**What’s the difference between an adopted clause and a localized clause?**

Adopt a global clause to reuse it without change in a local business unit.
Localize a global clause to use it with edits in a local business unit.

All clauses you adopt and localize must be approved within your local business unit before they can be used for contract authoring. You can set up approvals to be automatic for adopted clauses, but not for localized clauses.

**Creating Folders to Organize Clauses**

**Folders: Explained**

You can use folders to organize clauses in the Contract Terms Library.

**Folder Properties**

Folders have the following properties:

- A single folder can contain clauses with both buy and sell intent.
- Folders can be used only in the business unit where you create them.
- Folders cannot be copied to other business units.
- Folder names must be unique within the business unit where you create them.

**Setting Up Contract Preview and Printing**

**Contract Printing and Layout Templates: Explained**

Previewing and printing clauses, reports, contracts, and contract terms uses a number of Oracle Business Intelligence (BI) Publisher layout templates which specify what information is displayed in the contract and supply the headers, footers, text style, and pagination. The layout templates are RTF files stored in the BI Presentation Catalog. Samples of all the required layout templates are included with the application. You can copy the sample layout templates described here, and edit the copies to add your own boilerplate text, font styles, and logos.

You can copy and edit layout templates used for:

- Printing enterprise contracts, including partner agreements
- Printing purchasing and sourcing documents
- Printing the report of contract deviations that can be attached to contract approval notifications
- Previewing contract terms templates
• Previewing and importing clauses into the Contract Terms Library

The sample layout templates are available in different subfolders within the Enterprise Contracts folder in the catalog. You can navigate to the folders in the catalog either from the Reports and Analytics pane or by selecting the Reports and Analytics link in the Navigator. Contact your system administrator to grant you the appropriate BI duty roles if these are not available.

You can download the sample templates, copy them, and edit the copies. When you upload your edited copy to the same directory, it becomes immediately available for use within the application.

Restriction

The catalog includes additional layout templates which are used internally by the application. You can edit only the layout templates listed below.

Printing Enterprise Contracts

The application uses two layout templates for printing enterprise contracts, including partner agreements:

• The contract layout template

This layout template provides the layout for printing the contract except for the contract terms.

There are two sample layout templates available for you to copy and edit. Both sample layout templates are stored in the same directory.

<table>
<thead>
<tr>
<th>Sample Layout Template Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
</table>

• The contract terms layout template

This template provides the layout of the structured terms for printing and for downloading the contract terms for editing offline in Microsoft Word.

If printing an amended contract, the layout template selected determines whether only a summary of amendments is printed, or both the amendment summary and the amended contract terms and conditions are printed.

Note

You cannot download the amendment summary to Word.
<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContractTermsECM</td>
<td>Layout for printing the contract terms in enterprise contracts when the contract terms are authored in the application.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Download and Preview</td>
</tr>
<tr>
<td>ContractTermsAmendments</td>
<td>Layout for only printing a summary of the amendments made to contract terms in enterprise contracts.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Preview</td>
</tr>
<tr>
<td>ContractTermsPlusAmendments</td>
<td>Layout for printing the contract terms in enterprise contracts when the contract terms are authored in the application. In addition, for a contract that is under amendment, a summary of the amendments made to contract terms is included.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Preview</td>
</tr>
</tbody>
</table>

You specify which templates you want to use during contract type setup. This means that you can create different layout templates for each contract type. To set up contract types, select Manage Contract Types action from the Setup and Maintenance work area or Contract Types under the Setup task heading in the Contracts work area.

The following figure outlines how the application uses the layout templates when you print an enterprise contract:

1. The application uses the contract layout template, specified in the **Contract Layout** field of the contract type, to create a PDF of the contract. If the contract does not include any contract terms, this is the only layout template used.

2. If the contract includes structured terms, then the application uses the contract terms layout template specified in the **Terms Layout Template** field to create the contract terms PDF. To create the contract terms PDF, you must set the terms layout template in contract type.

3. If amendments were made to contract terms and the terms layout template specified includes an amendment summary, then the application creates a PDF document of the amendment summary. If amendments were made and the specified terms layout template includes both the amendment summary and the amended terms of the contract, then the application creates a PDF document of both.

4. If the contract terms are attached as a file and the file retains the structured terms format, the application creates the contract terms PDF from the file. Contract terms attached as a file can retain the structured XML format if the file was downloaded from the application using the **Download Contract** action.
5. The application then merges the two generated PDFs (one for the basic contract and the other for contract terms) into a single PDF.

6. If the contract terms are attached in a file that is not structured, then the application prints only the contents of the file. It does not print the contract information in the application or use either layout template. If you need help in editing the layout templates, download the sample XML file provided in Enterprise Contracts > Contract Printing > ContractPrintDm.

Printing of Contract Terms on Purchase Orders and Sourcing Documents

For printing purchasing documents with structured terms, Oracle Fusion Procurement uses two layout templates.

- The document layout template supplied by Oracle Fusion Procurement which is located in the Procurement folder.
- The contract terms layout template.

The sample file provided is:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContractTermsProcurement</td>
<td>Layout for printing the contract terms in enterprise contracts when the contract terms are authored in the application.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Download and Preview</td>
</tr>
<tr>
<td>File Name</td>
<td>Description</td>
<td>Location in BI Publisher Catalog Directory</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>ContractTermsAmendment</td>
<td>Layout for only printing a summary of the amendments made to contract terms in enterprise contracts.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Download and Preview</td>
</tr>
<tr>
<td>ContractTermsPlusAmend</td>
<td>Layout for printing the contract terms in enterprise contracts when the contract terms are authored in the application. In addition, for a contract that is under amendment, a summary of the amendments made to contract terms is included.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Download and Preview</td>
</tr>
</tbody>
</table>

You select both of these templates while setting up business unit properties using the **Configure Procurement Business Function** task available by navigating to the Setup and Maintenance work area.

If the contract terms are attached rather than authored in the application and the attached file is not structured, then Procurement uses a third layout template which includes a brief sentence explaining that the contract terms are contained in a separate document.

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContractTermsNoMerge</td>
<td>This layout template includes the following text: The contract terms for this {doc type} are listed in a separate document which is either attached to the e-mail you received or sent separately. These contract terms should be read in conjunction with this {doc type}. The document type name is substituted in the printed contract.</td>
<td>Enterprise Contracts/Contract Terms Printing/Attached Contract Preview</td>
</tr>
</tbody>
</table>

**Important**

If you edit the ContractTermsNoMerge layout template, then you must save it under the same name in the same directory.

The following figure outlines how the procurement application uses these layout templates for printing:

1. The application uses the document layout template specified in the Document Layout field in the PO or purchase agreement to create the PDF.

2. If the contract includes structured terms, then the application uses the contract terms layout template to generate the contract terms PDF.

3. If the contract terms are attached as a file and the file retains the structured terms format, then the application creates the contract
terms PDF from the file. Contract terms attached as a file can retain the structured XML format if the file was downloaded from the application using the **Download Contract** action.

4. If the contract terms are attached as a file that is not structured, then the application creates a small PDF of the message contained in the layout template `ContractTermsNoMerge`.

5. The application merges the two PDFs into a single document PDF.

**Printing the Contract Deviations Report**

The application uses the contract deviations layout template to generate a PDF report of deviations of a contract from company standards. This report can be automatically attached to the notification sent to the contract approvers during contract authoring. You can create different layout templates for each business unit. You specify which layout template you want to use in a specific business unit using either the **Specify Customer Contract Business Function Properties** or the **Specify Supplier Contract Business Function Properties** tasks. These tasks are available in the Setup and Maintenance work area.

Separate sample layout files are available for buy-intent and sell-intent contracts. Both are located in the same directory:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
</table>
### Previewing Contract Terms Templates

Contract Terms Library administrators as well as contract authors can preview the content of a template by selecting the preview icon. For example, a contract author may want to preview a template to verify they are selecting the correct one. The preview lists all the clauses and sections the template contains and any boilerplate included in the layout template. It does not list any additional clauses inserted by Contract Expert rules.

You can create different layout templates for each contract terms template. You specify the layout template to be used for the preview on the General tab while editing the contract terms template. The sample layout template is:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContractTermsTemplate</td>
<td>This layout template specifies the layout of the contract terms template preview.</td>
<td>Enterprise Contracts/Contract Terms Printing/Contract Terms Download and Preview</td>
</tr>
</tbody>
</table>

### Previewing and Importing Clauses

The application uses the clause layout template for:

- Formatting individual clauses for preview
  
  Library administrators can use the preview icon to view preview of individual clauses on the clause search page.

- Formatting clauses imported from outside the application

  You can either load clause data directly into interface tables using SQL*Loader, PL/SQL scripts, or JDBC or you can import the data from an XML file.

You can specify which template you want to use in a specific business unit using either the Specify Customer Contract Business Function Properties or the Specify Supplier Contract Business Function Properties tasks. These tasks are available in the Setup and Maintenance work area.

The sample layout template provided is:

<table>
<thead>
<tr>
<th>File Name</th>
<th>Description</th>
<th>Location in BI Publisher Catalog Directory</th>
</tr>
</thead>
<tbody>
<tr>
<td>ContractTermsLibraryClause</td>
<td>Specifies the layout of clause text in the Contract Terms Library.</td>
<td>Enterprise Contracts/Contract Terms Printing/Clause Export and Preview</td>
</tr>
</tbody>
</table>
FAQs About Contract Preview and Printing

Can you still print the contract if there are no layout templates specified for a contract type?

No, you cannot print or create a PDF of a contract if no contract layout template is specified in the contract type that was used to create the contract. If you do not specify the terms layout template, then you cannot preview the contract terms as a PDF.

Setting Up Contract Terms Deliverables

Contract Deliverables: Explained

Contract deliverables establish and track both contractual and noncontractual commitments that must be honored as part of negotiations and contractual agreements between businesses and suppliers or customers based on contract intent. These deliverables can be used in enterprise contracts, purchasing documents, and in negotiations.

This topic provides an overview of:

• How you can use contract deliverables
• Creating and managing contract deliverables
• One-time and repeating deliverables
• Where you can create and use contract deliverables
• The different deliverable types
• Fixed and relative due dates
• Deliverable notifications

Using Contract Deliverables

You can use contract deliverables:

• To communicate with the external party on the contract about commitments and fulfillments.

To do this, the responsible party on the contract deliverable must update the contract deliverable such that this change is reflected in the Oracle Fusion Enterprise Contracts Application.

• To submit any required documents
For an enterprise contract, the external contact that is the responsible party on the deliverable can log in to the Oracle Fusion Contracts Application to submit a report and change the deliverable status to Complete.

- As a repository of documents submitted in the negotiations
  All documents submitted as attachments are stored in the deliverable history and can be accessed from the deliverable itself.

- To track a contract deliverable from the initial stages of a negotiation to the signed contract
  The application can automatically copy the appropriate deliverables from the negotiation document to the final contract.

- To automatically calculate deliverable due dates
  You can set deliverable due dates relative to contract events, for example, a week before the contract is signed or comes into effect. The application automatically calculates the actual date the deliverable is due. You can also create multiple instances of a deliverable to track repeating deliverables, such as monthly reports.

- To automatically notify interested parties when the deliverable is due or overdue
  You can set up the deliverable to automatically notify parties of an upcoming deadline or when the deliverable is overdue.

Creating and Managing Contract Deliverables

You create and manage contract deliverables in two separate interfaces. You create the contract deliverables while the contract is in negotiations. You manage the deliverables while the contract is active and in the process of being executed except for internal deliverables with fixed due date that you can manually activate before the contract is active.

Here is how the two interfaces work:

1. You create the deliverable either in a contract terms template that can then be applied to the contract or directly in the contract. For the deliverable, you must enter the responsible party contact, the deliverable deadlines, and the notifications required.

2. If deliverables are present in a contract terms template you apply to a contract, then the deliverables get copied to the contract automatically. The type of deliverables that are applied automatically can vary based on the document type.

3. The application creates deliverable instances with the calculated deadlines based on your setups at the time the contract becomes active. For instance, if you created a deliverable that calls for the submission of a report every week after the contract is signed, then the application creates a separate instance of the deliverable for each week based on the date the contract was signed.
4. You and the responsible party contact use the Manage Deliverables page to access and update each deliverable instance. In the above example, each week the deliverable instance that is due that week is updated and any collateral attached.

5. Based on your setups, the parties are automatically notified when the deliverable is due or overdue, or when one of the parties changes its status (dashed lines).

6. The contractual deliverables you set up are listed in the printed contract terms when you add the deliverable variable to a clause.

One-Time and Repeating Deliverables

You can create both one-time and repeating deliverables.

A one-time deliverable tracks the performance and deadlines for an individual required action that must be performed by one of the parties in the contract.

A repeating deliverable tracks a deliverable that must be performed periodically, for instance a progress report that must be submitted every week after the agreement is signed.

The following diagram uses an example to illustrate the two variable types:

- A one-time deliverable (Report 1) that the responsible party contact must provide that is due one week after the agreement is signed.
- A repeating deliverable (Report 2) that the responsible party contact must provide weekly after the contract is signed.

After the contract is signed and active, the application automatically creates instances of the two deliverables which can be viewed and updated by
the responsible party contact using the Manage Deliverables page and the Deliverables bin. The due dates for each deliverable in this example are based on the date the contract was signed.

**Note**

Note that the name of each deliverable instance for a repeating deliverable is the same. The only difference is the due date.

The internal contact, requestor, or responsible external party contact attaches the report file to the appropriate instance of the deliverable and changes its status to Complete.

**Where You Can Create and Use Contract Deliverables**

You can create contract terms deliverables both in buy-intent and sell-intent contract terms templates, in the Deliverables tab of an enterprise contract, and in Oracle Fusion Purchasing and Oracle Fusion Sourcing documents.

For purchasing, you can create and use deliverables on documents which include:

- Blanket Purchase Agreement
- Contract Purchase Agreement
- Standard Purchase Order

For sourcing, deliverables are copied over from the negotiation document. Sourcing documents include:

- Auction
- Bid
- RFI
- RFI Response
- RFQ
- Sourcing Quote

**Contract Deliverable Types**

Deliverable types restrict where a deliverable is available and where it can be printed. There are three deliverable types:

<table>
<thead>
<tr>
<th>Deliverable Type</th>
<th>Where Available</th>
<th>Description</th>
<th>Where It Prints</th>
</tr>
</thead>
</table>
| Contractual Deliverables | Purchasing and sourcing (except RFI documents) documents and enterprise contracts | Deliverables that must be completed as part of the contract. | Prints in all documents:  
- As part of the Contract Terms Template preview  
- Enterprise contracts  
- Purchasing documents  
- Sourcing documents |
| Negotiation Deliverables     | Sourcing only                                           | Deliverables that are a part of a negotiation document but are not part of the final contract. | Prints as part of:  
- As part of the Contract Terms Template preview  
- Sourcing documents |
| Internal Deliverables            | Purchasing documents and enterprise contracts            | Deliverables that are used to track internal schedules and commitments. | Not printed as part of the contract terms. |

**Note**

If you create a deliverable as part of a contract terms template and that deliverable is of a type that is not compatible with the contract where the template is applied, then the deliverable does not get created in that contract. For instance, a negotiation deliverable in a template is dropped when that template is applied to a purchase order but added when that same template is used for an RFQ.
Fixed and Relative Due Dates

You can specify a deliverable to be due on a fixed date, such as the first of the month, or relative to a contract event, such as one week after the contract is signed.

The available events include:

- The contract start and end dates
- The dates the negotiations are opened and closed
- The date the contract is signed
- On negotiation documents, the date you receive a response from the responsible external party contact

The available contract events differ depending on where you create the deliverable and the deliverable type. For instance, for contractual deliverables you create in a contract terms templates, you can base the due dates on: Contract Canceled, Contract Closed, Contract Signed, Contract Start Date, and Contract End Date. Negotiation deliverables can be based on: Negotiation Closed, Negotiation Opened, and Response Received.

Deliverables Notifications

You can notify interested parties using Oracle BPEL Process Manager via e-mail, voice message, instant messaging (IM), or short message service (SMS).

You can send automatic notifications:

- Prior to the due date
- When one of the parties changes the status of the deliverable
- When a deliverable is overdue
- When a deliverable needs to be escalated after the due date

Who receives the notification depends on a combination of the notification type and the party who is responsible for the deliverable as listed in the following table. The requester is an internal party. The external contact is a supplier or customer contact.

<table>
<thead>
<tr>
<th>Notification Type</th>
<th>Responsible Party</th>
<th>Recipients</th>
</tr>
</thead>
<tbody>
<tr>
<td>Prior to due date</td>
<td>Internal</td>
<td>Internal Contact</td>
</tr>
<tr>

FAQs About Contract Deliverables

How do I create contract deliverables for an enterprise contract?

You can create deliverables for a terms template and apply this terms template to a contract. The deliverables from the applied terms template are then visible in the Deliverables tab of the contract.

Alternatively, you can navigate to the Deliverables tab using the contract header Deliverables menu item and create deliverables directly in the contract.

What does it mean to change the printing sequence for contract deliverables?

Contract deliverables can be listed by title in a clause in your terms and conditions. You can change the sequence in which the titles appear on this list by modifying the print sequence.

What's the difference between contract deliverables and contract fulfillment?

Contract deliverables establish and track both contractual and noncontractual commitments that must be honored as part of negotiations and contractual agreements between businesses and suppliers or customers based on contract intent. These deliverables can be used in enterprise contracts, purchasing documents, and in negotiations.

Contract fulfillment lines in procurement contracts denote commitments in terms of goods or services that must be delivered. You can use contract fulfillment lines to initiate and monitor purchasing activity in integrated procurement applications. For example, you can use contract fulfillment to create a purchase order in Oracle Fusion Purchasing for items in a contract line and then monitor the purchasing activity on that purchase order as it is being executed.

Indexing Clauses for Keyword Searches

Building and Maintaining the Text Index for Keyword Searches: Explained

In the Contract Terms Library, you can use the Keyword field to search the text of clauses and contract terms templates. You can automatically build and maintain the text index by running the processes listed in this topic.

Setting Up and Maintaining the Text Index

You can set up the processes listed in this table to automatically build and optimize the text index at desired intervals. How frequently depends on how
often your clauses and contract terms templates are updated. New clause and template versions become available for searching after they are indexed.

<table>
<thead>
<tr>
<th>Process</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Build Keyword Search Index for Contract Clauses</td>
<td>Builds the index for clauses. The process indexes the text in the following fields: Clause Text, Clause Title, Display Title, Description, and Instructions.</td>
</tr>
<tr>
<td>Optimize Keyword Search Index for Contract Clauses</td>
<td>Optimizes the clause search.</td>
</tr>
<tr>
<td>Build Keyword Search Index for Contract Terms Templates</td>
<td>Builds the index for clauses in contract terms templates. The process indexes the text in the following fields: Template Name, Description, and Instructions.</td>
</tr>
<tr>
<td>Optimize Keyword Search Index for Contract Terms Templates</td>
<td>Optimizes the clause search in contract terms templates.</td>
</tr>
</tbody>
</table>

To run the processes:
1. Select the **Manage Processes** task link in the Terms Library work area.
2. In the Managed Scheduled Processes page, click **Schedule New Process**.

**Managing Clause and Section Numbering Schemes**

**Numbering Schemes: Explained**

Use a numbering scheme to number sections and clauses in a contract terms template or in an individual contract. In addition to the preset numbering schemes that come with your application, you can create additional numbering schemes in the Terms Library work area.

**Numbering Scheme Properties**

Numbering schemes include the following properties:

- Numbering schemes are available in all business units.
- You can create numbering schemes with up to five levels.
- Numbering clauses is optional.
- You can add the numbering of the previous level to the front of the current level by selecting the Concatenate with Child option.
- You can skip the numbering of specific sections and clauses for printing and display of contract terms by selecting the Skip Numbering printing option. This automatically moves up the numbering of subsections and clauses in the section and following sections and clauses in the contract.
- Edits you make to an existing numbering scheme in the Contract Terms Library are not automatically applied to contracts using that numbering scheme. You must reapply the scheme on each contract.
• You cannot delete any of the numbering schemes that come with your application.
• You cannot delete a numbering scheme if it is used in an existing contract.

FAQs About Numbering Schemes

How can I change the numbering scheme for sections and clauses?

You can apply a numbering scheme for sections and clauses by selecting the Change Numbering Scheme action on the Contract Terms tab while creating a contract terms template or authoring a contract. You can also change the numbering sequence for the printing and display of subsequent subsections and clauses in a section or sections and clauses in a contract by selecting the Suppress Title or Skip Numbering printing options for a section or clause. If you need to create additional numbering schemes, you can do so using the Create Numbering Scheme action on the Terms Library Overview page.

Importing Clauses into the Contract Terms Library: Explained

You can import clauses, values sets, and manual user variables from external sources into the Contract Terms Library by using interface tables. You can either load your data directly into the interface tables using SQL*Loader, PL/SQL scripts, or JDBC or you can import the data from an XML file by running the processes described in this topic.

This topic describes:
• What data you can import
• The interface tables
• Importing clauses by loading them into the interface tables
• Importing clauses from an XML file
• Purging the interface tables

What You Can Import

You can import:
• Clauses
• Clause relationships
• Manual user variables
• Value sets that are used for the variables
• Value set values

Details about the fields and valid values for import are available in the import schema file OKXMLIMPDXF.xsd which you can download from the following file location: fusionapps/crm/components/contractManagement/okc/termsLibrary/publicModel/src/oracle/apps/contracts/termsLibrary/publicModel/libraryImport/model/resource.
Note

Clause status determines when the clause becomes available for use in contract terms authoring:

- Draft: The clause can be edited and submitted for approval.
- Pending Approval: The clause is automatically routed to approvers.
- Approved: The clause is available for use immediately after import.

Interface Tables

The same interface tables are used whether you are importing clauses using an XML file or loading data directly into the interface tables. The following are the database tables used for clause import:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OKC_ART_INTERFACE_ALL</td>
<td>The main interface table for loading clause data from external systems.</td>
</tr>
<tr>
<td>OKC_ART_RELS_INTERFACE</td>
<td>Table that stores information about clause relationships.</td>
</tr>
<tr>
<td>OKC_VARIABLES_INTERFACE</td>
<td>Table used to import variables used in clauses.</td>
</tr>
<tr>
<td>OKC_VALUESETS_INTERFACE</td>
<td>Table used to import value sets that are used by variables.</td>
</tr>
<tr>
<td>OKC_VS_VALUES_INTERFACE</td>
<td>Table that stores value set values.</td>
</tr>
<tr>
<td>OKC_ART_INT_ERRORS</td>
<td>Table that stores errors that are reported during import validation or import</td>
</tr>
<tr>
<td>OKC_ART_INT_BATPROCS_ALL</td>
<td>The internal system table that stores the batch run details. This includes the processing status as well as all the parameters that are used for each import.</td>
</tr>
</tbody>
</table>

Importing Clauses by Loading Them Into the Interface Tables

To import clauses by loading them directly into the interface tables:

1. Format the data in a form that is suitable for loading into the interface tables. For example, if you are using SQL*Loader to load data into the interface tables, then you can use a comma separated data file (.csv) and a control file that describes the data format.

2. Select the Manage Processes task link from the Terms Library work area.

3. In the Managed Scheduled Processes page, click Schedule New Process and run the Import Clauses from Interface Tables process. It is recommended that you run the process first in the validation mode to review any errors. The following table describes the process parameters:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Possible Values</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Batch Name</td>
<td>A name for identification purposes.</td>
<td>Yes</td>
<td>Provides a way for you to identify the records you are importing.</td>
</tr>
</tbody>
</table>
### Define Contract Terms and Clause Library Configuration

<table>
<thead>
<tr>
<th>Run in Validation Mode</th>
<th>Yes or No</th>
<th>No</th>
<th>Set to Yes if you want to identify potential errors before you import.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Commit Size</td>
<td>1 to 300</td>
<td></td>
<td>Indicates the maximum number of records that the process commits to the database at one time. For example, if you are importing 1,000 records and set the commit size to 100, then the process will commit records each time it processes 100 records without error. If an error occurs on the 150th record, then the process will not reprocess the first 100 the next time that you run the program. Consult your database administrator for the appropriate value.</td>
</tr>
</tbody>
</table>

4. Use the **Manage Process** task available in the Terms Library work area to monitor the progress of your import and review the log for any error messages. Records with errors remain in the interface tables until you purged them or correct them.

5. To improve performance, periodically purge the interface tables used in the import by running the Purge Contract Clause Import Tables process.

### Importing Clauses From an XML File

To import clauses from a file:

1. Prepare the XML file as specified in the schema file OKCXMLIMPDFN.xsd and the sample file OKCXMLIMPDFN.xml. You can download both files from the following location: fusionapps/crm/components/contractManagement/okc/termsLibrary/publicModel/src/oracle/apps/contracts/termsLibrary/publicModel/libraryImport/model/resource.

2. Specify the location of the import file in the system profile Location of XML File for Importing Clauses. You can set this profile in the...
Oracle Fusion Setup Manager using the Manage Clause and Template Management Profiles task.

3. Select the **Import Clauses** task link in the Terms Library work area and enter the following parameters for running the Import Clauses from XML File process:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>XML File Name</td>
<td>The name of the file you are importing. The file must be uploaded to the location specified in the system profile Clause Import XML File Location.</td>
</tr>
<tr>
<td>Default Business Unit</td>
<td>The business unit where clauses are assigned when no specific business unit is included in a clause record you are importing. If the import file includes business units for all clause records, then you can leave this field blank.</td>
</tr>
<tr>
<td>Create as Global Clause</td>
<td>You can specify clauses imported into the global business unit as global clauses. This means they will be available for adoption by other business units.</td>
</tr>
<tr>
<td>Default Clause Status</td>
<td>The status you enter here is used to specify the status of clause records where no status is specified.</td>
</tr>
<tr>
<td>Mode</td>
<td>Use the Validate option to test the quality of your data. Use the Import option to import the clauses.</td>
</tr>
</tbody>
</table>

4. Use the **Manage Process** task available in the Terms Library work area to monitor the progress of your import and review the log for any error messages. Records with errors remain in the interface tables until you purge them or correct them.

5. To improve performance, periodically purge the interface tables used in the import by running the Purge Contract Clause Import Tables process.

**Purging the Interface Tables**

To optimize import performance, periodically run the Purge Contract Clause Import Tables process. This process purges records in all of the interface tables. The following table describes the parameters you can use to restrict the extend of the purge. If you do not enter any parameters, the process purges all records.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Mandatory</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start Date and End Date</td>
<td>No</td>
<td>Use the start and end dates to identify the date range for the interface records you want to purge.</td>
</tr>
<tr>
<td>Process Status</td>
<td>No</td>
<td>Enter a status if you want to purge interface records with that status. The possible values are Error, Success, and Warning.</td>
</tr>
<tr>
<td>---------------</td>
<td>----</td>
<td>-------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Batch Name</td>
<td>No</td>
<td>You can restrict the purge to a specific batch by entering its name.</td>
</tr>
</tbody>
</table>
Define File-Based Data Import

File-Based Data Import: Highlights

You can import application data from external sources into the Oracle Sales Cloud database by using the Define File-Based Data Import group of tasks available from the Setup and Maintenance work area. The two primary sources of documentation on file-based data import are:

- My Oracle Support Article 1564536.1 (Oracle Sales Cloud File-Based Data Import Guide) at https://support.oracle.com
- Oracle Enterprise Repository assets of type File Based Data Import at http://fusionappsoer.oracle.com

Oracle Sales Cloud File-Based Data Import Guide

The Oracle Sales Cloud File-Based Data Import Guide is a collection of topics that aids you in using file-based data import by providing:

- High-level information about the file-based data import process, architecture, and tools
- Detailed information for importing specific objects and their related objects
- Guidance on importing a minimal set of fields for specific objects
- References to Oracle Enterprise Repository assets that support import of specific objects

Oracle Enterprise Repository Assets

Oracle Enterprise Repository assets of type File Based Data Import provide:

- Reference files that contain detailed object-specific import information, such as target import objects and attributes, required import fields, validation requirements, lookup sources, and default values
- References to other documentation sources, such as My Oracle Support and Fusion Applications Help topics
Frequently Asked Questions for File-Based Data Import

What determines the list of objects displayed?

A single import object can have multiple associated components that are considered objects by themselves. Whether or not an associated object can be grouped as a component of another object for the purpose of file import is determined by the complexity of the object structure and how it is stored in the data model. Oracle Sales Cloud provides import objects predefined to meet the file processing import requirements. Consequently, in some cases, more than one source file may be required to capture all associated components of an object.

What happens if I inactivate an Import Activity?

The Import Activity will not stop the currently running process. However, it will stop the next process that has not started plus any future repeating file import activities. You can always activate the process at a later stage.

What happens if I add a marketing list in the Import Activity definition?

File-based data import enables you to record consumers and organization contacts in a marketing list when importing consumer, lead, and response import objects. Select an existing list or create a new one. A marketing list is assigned the list type value of Imported if created while defining an import activity. After the objects are imported successfully, the consumers and contacts are added as members of the marketing list.
Manage Export Objects

Bulk Export: Overview

The Bulk Export application provides a mechanism to extract large volumes of data from Oracle Sales Cloud objects. These extracts can be the full set of records for an object or incremental extracts. For example, data extracted for a specific period of time, from the hosted cloud services to an on-premise database that resides behind a user’s fire-wall. The system will create comma separated variable or tab delimited files with the extracted data, which will be available to users as attachments to the batch records that have been executed.

The following figure depicts the process of selecting data for export, scheduling and finally delivering the exported data file.
Bulk Export Process Definition: Explained

This solution provides a mechanism to extract large volumes of data from Oracle Sales Cloud objects, both as extracts of a full set of records for an object as well as incremental extracts. The system will create comma or tab delimited files with the extracted data which will be available to users as attachments to the batch records that have been executed.

In order to create the extracts, two steps must be completed. First, mapping files for the full and incremental extract processes must be defined in the Oracle Sales Cloud. These maps will specify which columns and filters will be applied to each export process for each export object. For the incremental extracts, filters can be created that leverage time stamps to determine which rows will be queried out of the system. All mapping files will be saved in the system and reused for each extract.

Next, the hourly and weekly data export processes are scheduled in the export tool. For any required incremental and scheduled export, the export task should either exist or created through the UI. Oracle Web Services would only be used to schedule the export and start it. After each export process executes and completes, a comma or tab delimited data file is created and stored as an attachment. The formatted file can be downloaded by using the `getAttachment()` web service or by using the interactive UI in the export tool.
There are no transactional steps for this process in the Oracle Sales Cloud, there are only prerequisite setup steps. Once these steps are complete the process should run automatically. The prerequisite steps in Fusion are to create an export map and export job schedule for each object to be extracted (this only needs to be done once).

The Bulk Export Process Definition is made up of the Export Map and the processing schedule. See the steps below.

Select the Export Object

The export object is the data base object where the data resides, and is made up of attributes. If you need to export data from a custom table, you must register the object as an export object. This is accomplished from the Manage Export Process UI, Manage Export Objects action. All the delivered tables and their attributes are available for export.

Select Attributes

The export object is made up of attributes. These attribute may be selected for export or not included. You can edit the header text of the attribute to make its meaning more clear to other users of this process.
Filter Criteria

Each attribute may have limits or conditions enforced. Various operators are available for selecting the data to precisely select the data required for the export. You can save the filter criteria and then modify the criteria and save it under a new name. You can then change the filter by coming here to select an alternate filter name. Because the filters are related to the export object, if you reuse a map and change the filter, you are changing it for any Export Process Definition that uses that map. The attributes you use for the map have no bearing on what is available in the filter. All fields from the VO are available for use in the filter. For example, you can filter by TYPE but not show TYPE in the output.

Schedule the Export Process

Once defined, the export process is scheduled. You can run the process immediately or at the time and date of your choosing. If you decide to schedule the job at a later date you can also choose to set up a recurring schedule of extracts.

Activate the Job

By clicking on the Activate button, you make the job available to be run. It does not start an export process.

Bulk Export Process Components: How They Work Together

In the two step process used by Bulk Export, the first is the mapping of files for the full and incremental extract processes. The second step is the scheduling of the export. You create a process definition that includes both of these steps.

The process definition has three components that together make exporting data easier by leveraging the export maps that you have already built. The process name, the export process ID and the export map ID all serve to identify the specific process definition as well as leverage your work with reusable export maps.
Process Name

A user-supplied, natural language way to refer to the Export Process Definition. This enables you to refer to the export process definition easily rather than using the machine generated ID. For example, use Customer or some other meaningful name as the export process name instead of the export process ID 100000019897192.

Export Process ID

A unique, system generated identifier for the export process definition that ties together the export map, with its export objects and filters, and the defined export schedule.

Export Map ID

A unique identifier for the export map itself. You can name the export map or leave the field blank for a system generated map name to be entered. You can reuse the export map in different process definitions. For example, you could create a process definition to export all the data from the Customer export object. You could then reuse that export map and apply a new filter on the data to create an incremental export, such as data accrued since the last export date.
FAQs for Data Export

How can I tell which objects to select?

Review the requirements for the data to be exported and determine the source view object that holds the attributes you want.

How can I create a subset of data for export?

Full sets of data are not always required for export. To create a subset of data, use filter criteria to determine the time frame or scope of data, based on values of the attributes. For example, to find activities for a certain period, use a project start date from 1/1/11 through 3/31/11, navigate to the Export Objects Detail Sub Page and click the filter icon. Fill in the filter criteria dialog for the project start dates to select the data to be exported. You run the export by navigating to the Setup and Maintenance menu, selecting Manage Task Lists and Tasks. Then, search for Schedule Export Processes and click the Go to Task icon on the line for this task.

How can I see my exported data?

You can look on the Schedule Export Processes, Overview page to see the History subpage. The column Exported Data File shows a hyperlink to your output file. This file will be a comma separated variable or a tab delimited file. Click that link to open the file and see the exported data.

How can I use my own View Object for export?

You can use your own defined view objects as a source for Bulk Export. To register your view objects for export, select Setup and Maintenance from the Tools menu and search for the Manage Export Objects task. Click the Go to Task icon and on the Manage Export Objects page click the Create icon to add your View Object, making it available for use.

What happens if I change the sequence number or header text?

Changing the sequence number changes the order of the attributes in the exported data file. Changing the header text enables you to give a more intuitive meaning to the attribute and the associated data.
What happens if I need data from more than one view object?

Select as many view objects as required to be export objects for the export process. Choose the individual attributes required from each export object.
abstract role
A description of a person’s function in the enterprise that is unrelated to the person’s job (position), such as employee, contingent worker, or line manager. A type of enterprise role.

accounting method
A set of journal entry rules which determine how a subledger journal entry is to be created for each event class or event type.

action
The kind of access named in a security policy, such as view or edit.

alternate clause
A clause with an alternate relationship to another clause. Contract authors can substitute an alternate clause for the standard clause in their contracts.

application feature
A standardized functionality that is available to implemented.

application identity
Predefined application level user with elevated privileges. An application identity authorizes jobs and transactions for which other users are not authorized, such as a payroll run authorized to access a taxpayer ID while the user who initiated the job is not authorized to access such personally identifiable information.

application role
A role specific to applications and stored in the policy store.

Applications Core
Abbreviation for Oracle Middleware Extensions for Applications. The technical product code is FND.

assignment
A set of information, including job, position, pay, compensation, managers, working hours, and work location, that defines a worker’s or nonworker’s role in a legal employer.

automatic assignment catalog
A non-hierarchical catalog to which categories that match the catalog’s Catalog Structure value are automatically added. Add categories and share categories actions are disabled for this catalog configuration.
balancing segment
A chart of accounts segment used to automatically balance all journal entries for each value of this segment.

beneficiary
A person or organization designated to receive benefits from a compensation plan on the death of the plan participant.

browsing category
Parent or intermediate category that is associated with other categories in the catalog hierarchy, but has no assigned items.

business function
A business process, or an activity that can be performed by people working within a business unit and describes how a business unit is used.

business object
A resource in an enterprise database, such as an invoice or purchase order.

business unit
A unit of an enterprise that performs one or many business functions that can be rolled up in a management hierarchy.

calendar event
A period that signifies an event, such as a public holiday or a training course, that impacts worker availability.

catalog
A collection of categories used to classify items which can be organized into a hierarchy that represents a taxonomy.

category
Catalog component that is associated to a catalog to classify items.

chart of accounts
The account structure your organization uses to record transactions and maintain account balances.

clause adoption
Reusing a clause from the global business unit in local business units either by adopting the clause without change or by localizing it.
**clause localization**

A type of clause adoption where the adopted clause is edited to suit the local business unit needs.

**clause relationships**

Clauses in the Contract Terms Library can be incompatible with or alternates for other clauses.

**condition**

An XML filter or SQL predicate WHERE clause in a data security policy that specifies what portions of a database resource are secured.

**constant**

Holds the numeric value used to evaluate numeric conditions in Contract Expert rules. A constant permits you to reset the conditions of many rules with just one edit.

**contact role source**

Source of the contact role list of values, such as employees, salespeople, and customer contacts..

**contingent worker**

A self-employed or agency-supplied worker. Contingent worker work relationships with legal employers are typically of a specified duration. Any person who has a contingent worker work relationship with a legal employer is a contingent worker.

**contract deliverable**

A task that needs to be performed as part of the execution of a contract or business document, and that is tracked as part of the contract terms and conditions.

**contract deviations**

Differences between the contract terms in a contract and those in the contract terms template applied to that contract and any deviations from company policies as determined by Contract Expert feature rules.

**Contract Expert**

A feature of the application that permits you to create business rules in the Contract Terms Library to enforce corporate policies and standards for contracts.

**contract fulfillment**

Tracks the progress of contractual and noncontractual commitments by interested parties in a procurement enterprise contract and can initiate purchasing activity in integrated purchasing applications.

**Contract Terms Library**
A repository of standard clauses, contract terms templates, and business rules maintained by your organization.

**Contract Terms Library**
A repository of standard clauses, contract terms templates, and business rules built using Contract Expert.

**Contract Terms Library administrator**
The employee, designated as administrator during business unit setup, who is responsible for approving Contract Terms Library content.

**contract terms template**
A template of standard clauses set up in the Contract Terms Library applied during contract authoring either automatically by the application or manually by contract authors.

**contract type**
A setup that specifies enterprise contract content, including the presence of contract terms and contract lines.

**contractual fulfillment**
Contract fulfillment lines that covered by the terms of the contract.

**corporate rate type**
Rate you define to standardize rates used in conversion of one currency to another over a period of time. This rate is generally a standard market rate determined by senior financial management for use throughout the organization.

**cost center**
A unit of activity or group of employees used to assign costs for accounting purposes.

**cost organization**
A grouping of inventory organizations that indicates legal and financial ownership of inventory, and which establishes common costing and accounting policies.

**country holding company**
A legal entity that acts on behalf of several divisions within an enterprise, and is the legal employer in a country.

**data dimension**
A stripe of data accessed by a data role, such as the data controlled by a business unit.
data instance set
The set of human capital management (HCM) data, such as one or more persons, organizations, or payrolls, identified by an HCM security profile.

data role
A role for a defined set of data describing the job a user does within that defined set of data. A data role inherits job or abstract roles and grants entitlement to access data within a specific dimension of data based on data security policies. A type of enterprise role.

data role template
A template used to generate data roles by specifying which base roles to combine with which dimension values for a set of data security policies.

data security
The control of access to data. Data security controls what action a user can taken against which data.

data security policy
A grant of entitlement to a role on an object or attribute group for a given condition.

database resource
An applications data object at the instance, instance set, or global level, which is secured by data security policies.

department
A division of a business enterprise dealing with a particular area of activity.

determinant
A value that determines which reference data set will be used in a specific business context.

determinant type
Designates the field within transactional columns that controls how data is shared across organizations such as business unit, asset book, cost organization or project unit. The type determines the reference data sets that would be used in a transaction.

division
A business-oriented subdivision within an enterprise. Each division is organized to deliver products and services or address different markets.
**document fiscal classification**
A classification used by a tax authority to categorize a document associated with a transaction for a tax.

**document sequence**
A unique number that is automatically or manually assigned to a created and saved document.

**document sequence category**
A classification that groups the documents of a particular type and stores them in a database table. When a sequence is assigned to the document sequence category, all documents that it contains are assigned that sequence.

**document type**
A categorization of person documents that provides a set of options to control what document information to retain, who can access the documents, whether the documents require approval, and whether the documents are subject to expiry. A document type exists for a combination of document category and subcategory.

**document type**
A categorization of contracts, including auction, blanket purchase agreement, contract purchase agreement, RFI, RFQ, standard purchase order, and enterprise contract.

**duty role**
A group of function and data privileges representing one duty of a job. Duty roles are specific to applications, stored in the policy store, and shared within an Oracle Fusion Applications instance.

**employment terms**
A set of information about a nonworker's or employee's job, position, pay, compensation, working hours, and work location that all assignments associated with the employment terms inherit.

**enterprise**
An organization with one or more legal entities under common control.

**enterprise contract**
A contract created in the Oracle Fusion Enterprise Contracts application.

**enterprise role**
Abstract, job, and data roles are shared across the enterprise. An enterprise role is an LDAP group. An enterprise role is propagated and synchronized across
Oracle Fusion Middleware, where it is considered to be an external role or role not specifically defined within applications.

**entitlement**
Grants of access to functions and data. Oracle Fusion Middleware term for privilege.

**Europe, Middle East, and Africa (EMEA)**
A regional designation used for government, marketing and business purposes for countries in Europe, the Middle East, and Africa.

**feature choice**
A selection you make when configuring offerings that modifies a setup task list, or a setup page, or both.

**fixed rate type**
Rate you set between two currencies that remains constant. For example, a rate set between the euro currency and each Economic and Monetary Union (EMU) currency during the conversion to the euro currency.

**flexfield**
Grouping of extensible data fields called segments, where each segment is an attribute added to an entity for capturing additional information.

**function security**
The control of access to a page or a specific widget or functionality within a page. Function security controls what a user can do.

**gallery**
A searchable collection of portraits that combines the functions of the person directory with corporate social networking and self-service applications for both workers and managers.

**global area**
The region across the top of the user interface. It provides access to features and tools that are relevant to any page you are on.

**global business unit**
A business unit, designated as global during business unit setup, that can make its clauses and contract terms templates available for adoption by local business units.

**grade**
A component of the employment model that defines the level of compensation for a worker.
HCM
Abbreviation for Human Capital Management.

HCM data role
A job role, such as benefits administrator, associated with specified instances of Oracle Fusion Human Capital Management (HCM) data, such as one or more positions or all persons in a department.

HCM securing object
An HCM object that secures access to both its own data and data in other, related objects. For example, access to a specified set of person records can allow access to data secured by person records, such as goal plans and evaluations.

identity
A person representing a worker, supplier, or customer.

Incoterms
Incoterms are a series of international sales terms that represent international commercial transportation practices and are used in contracts for the sale of goods. These terms help clarify and divide transaction costs, risks, and responsibilities between buyer and seller.

intended use fiscal classification
A tax classification based on the purpose for which a product is used.

intent
Specifies if an object in the Contract Terms Library is used for procurement contracts or for sales contracts.

intercompany billing
Feature that enables you to bill an internal customer for work done on a receiver project and transfer internal revenue or costs between provider and receiver organizations.

interface table
A database table used for transferring data between applications or from an external application or data file.

interproject billing
Feature that enables you to bill an internal customer for work done on a provider project. The cost of work performed is not reflected on the receiver project until the project receives an invoice for the work.
inventory organization
An organization that tracks inventory transactions and balances, and can manufacture or distribute products.

item master
A collection of data that describes items and their attributes recorded in a database file.

item organization
Item definition where inventory balances are not stored and movement of inventory is not tracked in the applications. Item attributes that carry financial and accounting information are hidden.

job
A generic role that is independent of any single department or location. For example, the jobs Manager and Consultant can occur in many departments.

job role
A role for a specific job consisting of duties, such as an accounts payable manager or application implementation consultant. A type of enterprise role.

layout template
RTF document that contains the contract layout for printing and preview.

legal authority
A government or legal body that is charged with powers such as make laws, levy and collect fees and taxes, and remit financial appropriations for a given jurisdiction.

legal classification
A classification associated with a legal entity that represents its legal status within a country and which also guides the tax determination process.

legal employer
A legal entity that employs people.

legal entity
An entity is identified and given rights and responsibilities under commercial law, through the registration with the country’s appropriate authority.

legal reporting unit
The lowest level component of a legal structure that requires registrations. Used to group workers for the purpose of tax and social insurance reporting.
or represent a part of your enterprise with a specific statutory or tax reporting obligation.

**legislative data group**
A means of partitioning payroll and related data. At least one legislative data group is required for each country where the enterprise operates. Each legislative data group is associated with one or more payroll statutory units.

**line of business**
Set of one or more highly related products which service a particular customer transaction or business need. Refers to an internal corporate business unit.

**local business unit**
A business unit, not designated as global during business unit setup, which can adopt global clauses created in the global business unit.

**lookup code**
A value available for lookup within a lookup type such as the code BLUE within the lookup type COLORS.

**lookup type**
A set of lookup codes to be used together as a list of values on a field in the user interface.

**managed person**
In Oracle Fusion Human Capital Management security, a person for whom the user can maintain some information. For example, line managers can maintain information about their direct and indirect reports, and workers can maintain information about themselves, their dependents, and their beneficiaries.

**mandatory clause**
Clause from the Contract Terms Library that you cannot edit or delete without special permission.

**marketing list**
A static selection of contacts for the purpose of communicating a marketing message by e-mail, direct mail or phone.

**model profile**
A collection of the work requirements and required skills and qualifications of a workforce structure, such as a job or position.

**native catalog**
A catalog that a user is managing.
natural account
Categorizes account segment values by account type, asset, liability, expense, revenue, or equity, and sets posting, budgeting, and other options.

natural account segment
A chart of accounts segment used to categorize your accounting transactions by account type: asset, liability, owner's equity, revenue, or expense.

noncontractual fulfillment
Contract fulfillment lines that are not negotiated as part of the contract, but are used to monitor the progress or quality of contractual fulfillment.

nonstandard clause
A clause created during contract terms authoring by editing a standard clause or by creating a new clause that is not in the Contract Terms Library.

numbering scheme
The style of numbering used for the sections and clauses in contract terms.

offering
A comprehensive grouping of business functions, such as Sales or Product Management, that is delivered as a unit to support one or more business processes.

OWLCS
Abbreviation for Oracle WebLogic Communication Services. Offers the TPCC service to Oracle Sales Cloud and sets up the calls via SIP integration with the telephony network.

party
A physical entity, such as a person, organization or group, that the deploying company has an interest in tracking.

party fiscal classification
A classification used by a tax authority to categorize a party for a tax.

party source
Source of the list of values for entering contract parties, such as business units, customers, suppliers, and partners.

payroll statutory unit
A legal entity registered to report payroll tax and social insurance. A legal employer can also be a payroll statutory unit, but a payroll statutory unit can represent multiple legal employers.
pending worker
A person who will be hired or start a contingent worker placement and for whom you create a person record that is effective before the hire or start date.

person number
A person ID that is unique in the enterprise, allocated automatically or manually, and valid throughout the enterprise for all of a person's work and person-to-person relationships.

person type
A subcategory of a system person type, which the enterprise can define. Person type is specified for a person at the employment-terms or assignment level.

personally identifiable information
Any piece of information that can potentially be used to uniquely identify, contact, or locate a single person. Within the context of an enterprise, some PII data can be considered public, such as a person's name and work phone number, while other PII data is confidential, such as national identifier or passport number.

portrait
A selection of information about a worker or nonworker, including contact details, social connections, and activities and interests, that can be viewed and edited. Both the amount and type of information and the available actions depend on the role of the portrait user.

position
A specific occurrence of one job, fixed within one department, also often one location. For example, the position Finance Manager is an instance of the job Manager in the Finance Department.

primary ledger
Main record-keeping ledger.

privilege
A grant or entitlement of access to functions and data. A privilege is a single, real world action on a single business object.

product category fiscal classification
A classification defined for a noninventory-based product category, that is used for tax determination or tax reporting purpose.

product fiscal classification
A classification used by a tax authority to categorize a product for a tax. There could be more than one by tax. For example, for Brazil two classifications are required.
**project expenditure organization**

An organization that can incur expenditures and hold financial plans for projects.

**protected clause**

Standard clause that you cannot edit unless you are granted special permission by the Contract Terms library administrator.

**provider business unit**

Business unit with resources that provide services to another project (provider project) or business unit. For cross-charge transactions, the provider business unit is the expenditure business unit; the project business unit owns the intercompany billing project.

**provision clause**

A clause that is used only in negotiations and is dropped when the negotiation is converted to a contract.

**PSTN**

Abbreviation for public switched telephone network which is the network of the world’s public circuit-switched telephone networks.

**public person**

In Oracle Fusion Human Capital Management security, a person for whom some basic information is publicly available. For example, users typically access the contact details of public persons, such as phone numbers and locations, using the person gallery.

**purchasing document**

A document such as a purchase order, a purchase agreement, or a blanket purchase agreement created in an integrated purchasing application from a contract deliverable.

**receiver project**

Project for which work is performed by another (provider) project. In interproject billing, the receiver project incurs costs from an Oracle Fusion Payables invoice generated by the Update Invoice from Oracle Fusion Receivables process performed for the provider project.

**reference data**

Data in application tables that is not transactional and not high-volume such as sales methods, transaction types, or payment terms, and can be shared and used across organizational boundaries.
**reference data set**

Contains reference data that can be shared across a number of business units or other determinant types. A set supports common administration of that reference data.

**referenced category**

A category within the native catalog that is shared from a designated source catalog. A reference category is not editable.

**registration**

The record of a party’s identity related details with the appropriate government or legal authorities for the purpose of claiming and ensuring legal and or commercial rights and responsibilities.

**repository contract**

An enterprise contract with no contract or fulfillment lines, such as a nondisclosure agreement or an employment agreement.

**resource**

People designated as able to be assigned to work objects, for example, service agents, sales managers, or partner contacts. A sales manager and partner contact can be assigned to work on a lead or opportunity. A service agent can be assigned to a service request.

**role**

Controls access to application functions and data.

**role hierarchy**

Structure of roles to reflect an organization’s lines of authority and responsibility. In a role hierarchy, a parent role inherits all the entitlement of one or more child roles.

**role mapping**

A relationship between one or more job roles, abstract roles, and data roles and one or more conditions. Depending on role-mapping options, the role can be provisioned to or by users with at least one assignment that matches the conditions in the role mapping.

**role provisioning**

The automatic or manual allocation of an abstract role, a job role, or a data role to a user.

**security profile**

A set of criteria that identifies one or more human capital management (HCM) objects of a single type for the purposes of securing access to those objects.
Security profiles can be defined for persons, organizations, positions, countries, LDGs, document types, payrolls, and payroll flows.

**security reference implementation**
Predefined function and data security in Oracle Fusion Applications, including role based access control, and policies that protect functions, data, and segregation of duties. The reference implementation supports identity management, access provisioning, and security enforcement across the tools, data transformations, access methods, and the information life cycle of an enterprise.

**segregation of duties**
An internal control to prevent a single individual from performing two or more phases of a business transaction or operation that could result in fraud.

**service provider model**
A business unit that provides specific business functions for another business unit.

**set**
Reference data that is organized into groups appropriate to organizational entities, to enable reference data sharing.

**shared category**
A category within a source catalog that has been added to a native catalog as a referenced category. The category can be shared with one or more catalogs.

**spot rate type**
Rate you enter to perform conversion based on this rate as of a specific date. This rate applies to the immediate delivery of a currency.

**SQL predicate**
A type of condition using SQL to constrain the data secured by a data security policy.

**standard clause**
Legally approved language that is part of the terms and conditions in the Contract Terms Library.

**structured terms**
Contract terms that are authored within the Oracle Fusion Enterprise Contracts application.

**system person type**
A fixed name that the application uses to identify a group of people.
**system variable**
A predefined variable that gets its value from an attribute of the contract or other document.

**tax**
The classification of a charge imposed by a government through a fiscal or tax authority.

**tax determining factor**
An input that affects the outcome of a tax calculation process. Tax determining factors are grouped into tax determining factor sets and used to define tax condition sets and tax rules.

**tax exception**
A condition or combination of conditions that result in a change from the standard values for a particular product.

**tax exemption**
A full or partial exclusion from taxes within a given time period.

**tax formula**
A tax formula is used to define the taxable basis and tax calculation for a given tax.

**tax jurisdiction**
A geographic area where a tax is levied by a specific tax authority.

**tax rate**
The rate specified for a tax status for an effective time period. A tax rate can be expressed as a percentage or a value per unit quantity.

**tax recovery**
The full or partial reclaim of taxes paid on the purchase or movement of a product.

**tax regime**
The set of tax rules that determines the treatment of one or more taxes administered by a tax authority.

**tax registration**
The registration of a party with a tax authority that confers tax rights and imposes certain tax obligations.
**tax rule**
A user-defined rule that looks for a result for a specific tax determination process, such as determining place of supply or tax registration, in relation to a tax on a transaction.

**tax status**
The taxable nature of a product in the context of a transaction for a tax.

**territory**
A legally distinct region that is used in the country field of an address.

**transaction business category**
A business classification used to identify and categorize an external transaction into a tax transaction.

**transaction fiscal classification**
A classification used by a tax authority to categorize a transaction for a tax. There could be more than one by tax. For example, for Brazil, three classifications are required: a) transaction nature, such as free sample, demonstration, consignment, donation; b) transaction classification, such as the sale of products previously acquired, the sale of products that were manufactured by the company; and c) operation classification, such as ship from - ship to relationship.

**translation-only clause**
A clause with text that was translated but not edited.

**tree**
Information or data organized into a hierarchy with one or more root nodes connected to branches of nodes. A tree must have a structure where each node corresponds to data from one or more data sources.

**tree structure**
Characteristics applied to trees, such as what data to include or how the tree is versioned and accessed.

**tree version**
An instance of a tree. If a tree is associated with a reference data set, all versions belong to one set. Includes life cycle elements such as start and end date and a status indicator whether the tree is active or not.

**user rate type**
Rate you enter at journal entry time to convert foreign currency transactions to your functional currency.
**user variable**

A variable that can be created by the Contract Terms Library administrator for use within clause text or in Contract Expert rules.

**value-added tax (VAT)**

An indirect tax on consumer expenditure that is collected on business transactions and imported goods. Value-added tax (VAT) is charged at each production, distribution, and retail stage in the supply of products. If customers are registered for VAT and use the supplies for taxable business purposes, then they will typically receive credit for the VAT that is paid.

**work relationship**

An association between a person and a legal employer, where the worker type determines whether the relationship is a nonworker, contingent worker, or employee work relationship.

**worker type**

A classification selected on a person’s work relationship, which can be employee, contingent worker, pending worker, or nonworker.

**workflow**

An automated process in which tasks are passed from a user, a group of users, or the application to another for consideration or action. The tasks are routed in a logical sequence to achieve an end result.

**XML**

Abbreviation for eXtensible markup language.

**XML filter**

A type of condition using XML to constrain the data secured by a data security policy.
