This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

About this Guide

Introduction

The *Oracle Communications Session Border Controller HDR Resource Guide* provides information about the following:

- Management Information Base (MIBs)
- Acme Packet's enterprise MIBs
- General trap information, including specific details about standard traps and enterprise traps
- Simple Network Management Protocol (SNMP) GET query information, including standard and enterprise SNMP GET query names, object identifier names and numbers, and descriptions
- Example of scalar and table objects
- This guide also describes the correlation between system alarms and the MIBs that support traps, and it provides reference information about log levels, syslog level severities (the protocol used for the network logging of system and network events), and trap receiver filter levels. Appendix A contains several trap examples. Appendix B contains the location of documents where you can obtain more information.

Supported Platforms

Release S-CZ7.1.2 is supported on the Acme Packet 4500 and Acme Packet 6300 series platforms.

Related Documentation

The following table lists the members that comprise the documentation set for this release:

| Document Name | Document Description |
|---|---|
| Acme Packet 4500 System Hardware Installation Guide | Contains information about the components and installation of the Acme Packet 4500 system. |
| Acme Packet 6300 Hardware Installation Guide | Contains information about the components and installation of the Acme Packet 6300 system. |
| Release Notes | Contains information about the current documentation set release, including new features and management changes. |
| ACLI Configuration Guide | Contains information about the administration and software configuration SBC. |
| ACLI Reference Guide | Contains explanations of how to use the ACLI, as an alphabetical listings and descriptions of all ACLI commands and configuration parameters. |

| Document Name | Document Description |
|---------------------------------------|--|
| Maintenance and Troubleshooting Guide | Contains information about Net-Net SBC logs, performance announcements, system management, inventory management, upgrades, working with configurations, and managing backups and archives. |
| MIB Reference Guide | Contains information about Management Information Base (MIBs), Enterprise MIBs, general trap information, including specific details about standard traps and enterprise traps, Simple Network Management Protocol (SNMP) GET query information (including standard and enterprise SNMP GET query names, object identifier names and numbers, and descriptions), examples of scalar and table objects. |
| Accounting Guide | Contains information about the SBC's accounting support, including details about RADIUS accounting. |
| HDR Resource Guide | Contains information about the SBC's Historical Data Recording (HDR) feature. This guide includes HDR configuration and system-wide statistical information. |
| Administrative Security Essentials | Contains information about the SBC's support for its Administrative Security license. |

About the Net-Net MIB Reference Guide

Documented Objects and Traps

This *Net-Net SBC MIB Reference Guide* only documents the traps and objects supported in the release version S-CZ7.1.2 for the AP3820, AP4500, AP6100, and AP6300 platforms. Acme Packet enterprise MIBs, however, can contain additional traps and objects not documented here.

Enterprise MIB files are global across all Net-Net session border controllers. Each MIB contains a superset of objects and traps for all Net-Net SBC:

- platforms
- current releases
- prior releases

In addition, a MIB might contain objects and traps intended for future releases. For example, the ap-smgmt.mib might contain traps intended for support in release Release S-CZ7.1.2.

Objects and traps are not supported in this release version and not documented in this guide if they are intended for a:

- platform other than the 4000
- future release

You can verify what is supported in this release version by:

1. Reviewing the list of supported capabilities in MIB README.txt.
2. Reading the capability descriptions in the ap-agentcapability.mib to identify which object and/or notification groups they contain and in which MIB those groups are located.

3. Locating the object and/or notification group in its specific MIB to review what individual objects or traps it contains.

Acme Packet Platform sysObjectIDs

Each hardware platform in the Net-Net family has a designated system object ID (sysObjectID). In addition to the system object ID, each platform includes a descriptive string (sysDescr) comprised of the product name followed by a string identifying the full software version operating on the system.

The table below provides sysObjectID values for all Net-Net platforms and their corresponding sysDescr values. X stands for a string value of the software version, such as SCX6.1.0.

| Platform | sysObjectID Object Identifier Name: Number | sysDescr |
|----------------------------|--|---------------------------------------|
| Net-Net 4250 | apNetNet4250: 1.3.6.1.4.1.9148.1.1.1 | Acme Packet Net-Net 4000 Series SBC X |
| Net-Net 4500 | apNetNet4500: 1.3.6.1.4.1.9148.1.1.2 | Acme Packet Net-Net 4500 X |
| Net-Net 3800 (Sku 3810) | apNetNet3800: 1.3.6.1.4.1.9148.1.3.1 | Acme Packet Net-Net 3800 X |
| Net-Net 3820 | apNetNet3820: 1.3.6.1.4.1.9148.1.3.2 | Acme Packet Net-Net 3820 X |
| Net-Net 6000 series | apNetNet6000Series: 1.3.6.1.4.1.9148.1.5 | Net-Net 6000 Series |
| Net-Net 6300: | apNetNet6300 1.3.6.1.4.1.9148.1.5.1 | The Net-Net 6300 product |

Revision History

This section contains a revision history for this document.

| Date | Description |
|----------------|--|
| July 17, 2013 | <ul style="list-style-type: none"> • Initial Release |

DIAMETER Rf Charging Failure and Recover Detection

The Net-Net SBC can detect and send a trap when Diameter Rf transport interface has failed and when it has recovered. If multiple transport failures have been

detected, SNMP traps are sent for each failure. Local alarms are also generated for these events.

- apDiameterAcctSrvrUpTrap
- apDiamAcctSrvrDownTrap

DIAMETER Internal Errors

The Net-Net SBC creates internal errors and sends traps upon a CCF returning an error-containing ACA.

- apDiameterSrvrErrorResultTrap
- apDiameterSrvrSuccessResultTrap

Diameter Rf Charging Buffering and Storage

Diameter Rf Charging, Buffering, and Storage enables the Net-Net SBC to buffer all accounting requests (ACR) in memory for a configurable number of ACRs. The Net-Net SBC sends an SNMP trap when accounting records begin to drop from the buffer due to an overflow condition. Subsequently, a clearing SNMP trap is sent once the fault condition is removed.

- apAcctMsgQueueFullTrap
- apAcctMsgQueueFullClearTrap

Registrations on Secondary Interfaces

New objects and traps are added to monitor the total number of registrations on secondary interfaces.

- apSipSecInterfaceRegThresholdExceededTrap
- apSipSecInterfaceRegThresholdClearTrap
- apSipSecInterfaceTotalRegistrations
- apSipSecInterfaceRegThreshold
- apSipSecInterfaceClearThreshold

Overview

This chapter describes Acme Packet® Management Information Bases (MIBs) and the correlation between Net-Net® system alarms and the MIBs that support traps. It also provides reference information about Acme Packet log levels, syslog level severities (the protocol used for the network logging of system and network events), and trap receiver filter levels.

About MIBs

Each network device managed by SNMP must have a MIB that describes its manageable objects. MIBs are collections of objects or definitions that define the properties of the managed objects. Each managed object has specific characteristics.

The manager relies upon the database of definitions and information about the properties of managed resources and the services the agents support. When new agents are added to extend the management domain of a manager, the manager must be provided with a new MIB component that defines the manageable features of the resources managed through that agent.

The data types and the representations of resources within a MIB, as well as the structure of a particular MIB, are defined in a standard called the Structure of Management Information (SMI).

Object Identifiers and Instance IDs

Each managed object/characteristic has a unique object identifier (OID) consisting of numbers separated by decimal points (for example, 1.3.6.1.4.1.9148.1); numeric OIDs can also be translated into human-readable form. The MIB associates each OID with a readable label and various other parameters related to the object. The OID identifies the location of a given managed object within the MIB tree hierarchy by listing the numbers in sequence from the top of the tree down to the node, separated by dots.

By specifying a path to the object through the MIB tree, the OID allows the object to be uniquely identified. The digits below the enterprise OID in the tree can be any sequence of user-defined numbers chosen by an organization to represent its private MIB groups and managed objects.

An instance ID identifies developments that have occurred for the managed object. The instance ID values are represented as a combination of the OID and the table index. For example, you can find the following instance ID in the TCP connection table:

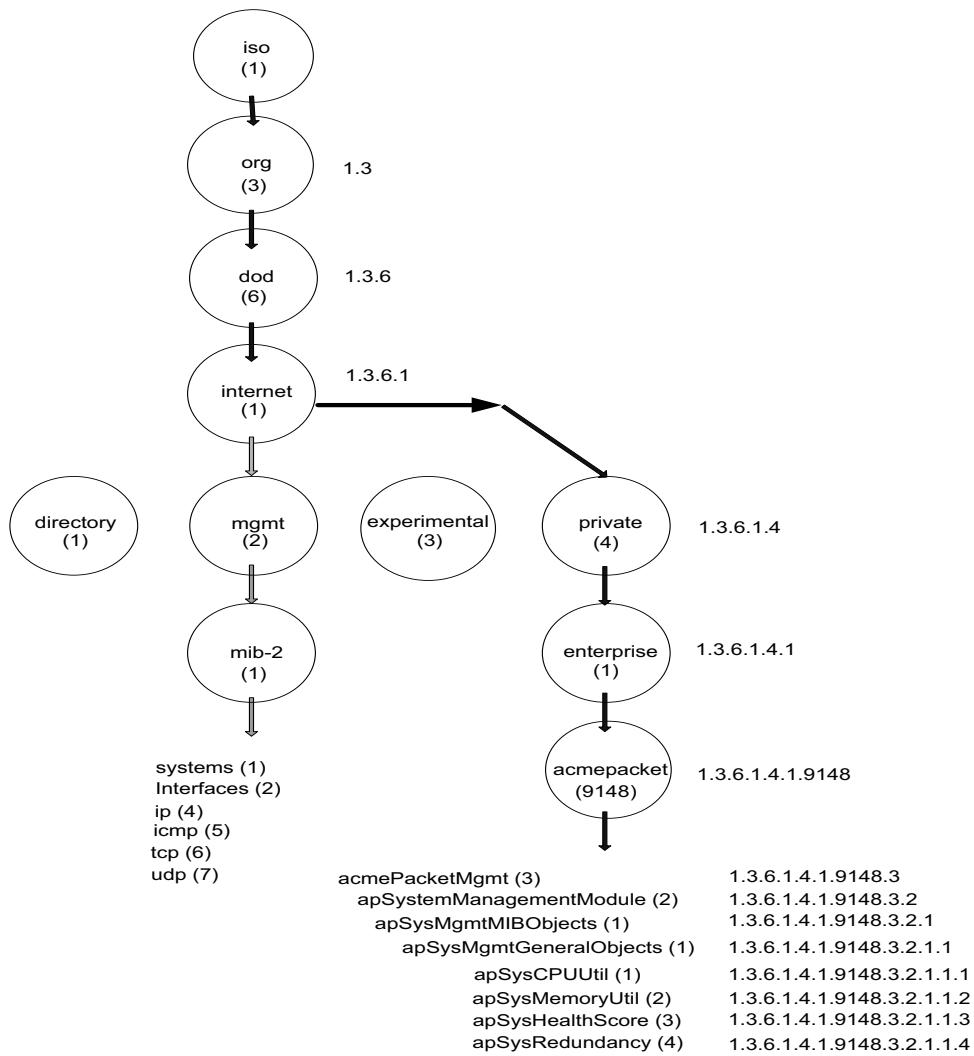

`tcpConnState.127.0.0.1.1024.127.0.0.1.3000`

- `tcpConnState` is the OID
- `127.0.0.1` is an IPv4 address
- `1024` is the port number
- `127.0.0.1` is another IPv4 address
- `3000` is another port number

MIB Tree Structure

MIBs are arranged in a tree-structured fashion, similar in many ways to a operating system directory structure of files. The following diagram illustrates a MIB tree with a sample of the standard MIBs shown under the mib-2 node and a sample of a Acme Packet system management enterprise MIB under the enterprise node. (The listing is only a partial sample of the MIB contents.)

The diagram shows how the OID is a concatenation of the prior addresses up to that point. For example, the OID for apSysCPUUtil is 1.3.6.1.4.1.9148.3.2.1.1.1.

The diagram shows the Acme Packet node has the value 9148; this is Acme Packet's vendor-specific number that uniquely identifies and Acme Packet product MIB. This node is the highest level of the private (proprietary) branch containing Acme Packet managed objects. The number 9148 was assigned to signify Acme Packet's private branch by the Internet Assigned Numbers Authority (IANA).

About Managed Objects

Managed objects are made up of one or more object instances, which are essentially variables. Managed objects can be scalar (defining a single object instance) or tabular (defining multiple, related instances).

Scalar MIB Objects

Scalar MIB objects contain one precise piece of data (also referred to as discrete). These objects are often distinguished from the table objects by adding a .0 (dot-zero) extension to their names. Many SNMP objects are scalar. That is, the operator merely has to know the name of the object and no other information. Discrete objects often represent summary values for a device, particularly useful for scanning information from the network for the purposes of comparing network device performance. If the extension (instance number) of the object is not specified, it can be assumed as .0 (dot-zero). See the Enterprise SNMP Get Requests chapter for examples of scalar MIB objects.

Table MIB Objects

Table MIB objects contain multiple pieces of management data. These objects are distinguished from the scalar objects by requiring a . (dot) extension to their names that uniquely distinguishes the particular value being referenced. The . (dot) extension is also referred as the *instance* number of an SNMP object. In the case of table objects, this instance number is the index into the SNMP table. (In the case of scalar objects, this instance number is zero.)

SNMP tables allow parallel information to be supported. Tables are distinguished from scalar objects, in that tables can grow without bounds. For example, SNMP defines the ifDescr object as a standard SNMP object, which indicates the text description of each interface supported by a particular device. Since network devices can be configured with more than one interface, this object could only be represented as an array. By convention, SNMP objects are always grouped in an Entry directory, within an object with a Table suffix. (The ifDescr object described above resides in the ifEntry directory contained in the ifTable directory.) See the Enterprise SNMP Get Requests chapter for examples of table MIB objects.

About SNMP Traps

The MIB also contains information about SNMP traps, which enable an agent to notify the management station of significant events by way of an unsolicited SNMP message. When an element sends a TRAP packet, it can include OID and value information (bindings) to clarify the event.

SNMPv3 Secure Traps

The Net-Net SBC supports SNMPv3, which provides the SNMP agent and SNMP Network Management System (NMS) with authentication, privacy, and access control during the delivery of secured traps. Currently, SNMPv3 traps are supported on the Net-Net SBC; SNMPv3 Get/Get-Bulk/Set actions are not supported at this time.

By default, the Net-Net SBC supports SNMPv1v2. If you want to retain existing SNMPv1v2 behavior, you do not need to update configuration. You can enable SNMPv3 at any time, at which point SNMPv1v2 configurations are ignored, and only SNMPv3 encrypted traps are sent to associated external SNMP managers. **Snmp-agent-mode**, an attribute under **system-config**, allows you to select the desired mode.

Authentication and Privacy

SNMPv3 employs a User-Based Security Model (USM). The two protocols used for authentication and privacy are:

- Authentication—HMAC-SHA-96
- Privacy—CBC-DES

Four parameters generate keys under the designated algorithm:

- SNMPEngineID—The unique identifier for the SNMP Engine. This value is a specially formatted string for use in the SNMP.
- User name—The user's name as defined under **snmp-user-entry**.
- Authorization password—The authorization password configured under the **snmp-user-entry** configuration. This parameter is used to derive the authentication key.
- Privacy password—You set the privacy password in the **snmp-user-entry** configuration. It is used to derive the password key.

Password-to-Key Conversion

There are two distinct passwords in SNMPv3. The authentication password is manipulated using the HMAC-SHA-96 algorithm to produce a key used to authenticate the trap. Authentication ensures the identity of the user and that the trap has not been tampered with in transit. Likewise, the privacy password is manipulated using the CBC-DES algorithm to ensure message privacy.

One user is associated by a name, an authentication password and a privacy password. These three parameters are always consistent for the user and can be used across multiple SBCs. The key generation differs from one SBC to another due to the varying SNMPEngineIDs. This ensures that a compromised key for one SBC does not compromise the keys for other SBCs associated with the same user.

Enabling SNMPv3

The table below gives a brief overview of the SNMPv3 configuration on your Net-Net SBC. The Caveats column describes the SNMPv1V2 configuration attributes that are ignored if **SECURE-TRAP** mode is enabled.

| Configuration | Description | Caveat |
|------------------------------|--|--|
| snmp-agent-mode | Set this attribute to SECURE-TRAP to enable SNMPv3. | Once SNMPv3 is enabled, the snmp-community and community-name attributes are ignored. |
| snmp-engine-id-suffix | Set this attribute as a string to customize and uniquely identify the SNMP Engine. | The show snmp-info command has been expanded to include the SNMP Engine Base, the SNMP Engine Suffix, and the SNMP Engine ID. |
| snmp-user-entry | Enter the user name, authorization password and privacy password. | The user, as defined in this object, must be added to the attribute user-list under trap-receiver in order to receive secured traps. |

| Configuration | Description | Caveat |
|---------------|--|--|
| trap-receiver | Configure a trap-receiver with the IP address of the NMS that receives secured traps. | |
| user-list | Add users who are authorized to receive secured traps. | If instances of snmp-user-entry are configured, but no users are listed under user-list , a warning message is sent during a verify-config execution. |

Retaining Existing SNMPv1v2 Behavior

If you are upgrading to software version S-CX6.3.0 or above and want to retain your existing SNMP configurations, you do not need to take any action. The Net-Net SBC sets **snmp-agent-mode** to V1V2 by default, disabling all SNMPv3 configurations.

Downgrading Software After Enabling SNMPv3

If you enable SNMPv3 on an SBC running S-CX6.3.0 or above, and you downgrade to a previous software version, the software does not recognize the SNMPv3 configuration objects or attributes.

Consideration for HA Nodes

Key pairs are generated based on the user and SNMPEngineID. In the event of a switchover, the SNMPEngineID will vary. The user's NMS should be updated with the SNMPEngineID of the standby SBC.

ACLI Instructions and Examples

Enabling SNMPv3

To enable SNMPv3 on the Net-Net SBC for sending secured traps:

1. In Superuser mode, type **configure terminal** and press <Enter>.
ACMEPACKET# **configure terminal**
2. Type **system** and press <Enter>.
ACMEPACKET(configure)# **system**
3. Type **system-config** and press <Enter>.
ACMEPACKET(system)# **system-config**
ACMEPACKET(system-config)#
 4. **snmp-agent-mode**—To enable support, change this parameter from its default (V1V2) to SECURE-TRAP.
ACMEPACKET(system-config)# **snmp-agent-mode secure-trap**
 5. **snmp-engine-id-suffix**—To set a unique suffix for the SNMPEngineID, enter a string. This attribute is optional.
ACMEPACKET(system-config)# **snmp-engine-id-suffix Group1Unit3**

Users and Password Configuration

To configure users for SNMPv3:

1. In Superuser mode, type **configure terminal** and press <Enter>.
ACMEPACKET# **configure terminal**
2. Type **system** and press <Enter>.

- ACMEPACKET(configure)# **system**
3. Type **snmp-user-entry** and press <Enter>.

ACMEPACKET(system)# **snmp-user-entry**
ACMEPACKET(snmp-user-entry)#{}

 4. **user-name**—Enter the name for this user. This value is required and must be unique.

ACMEPACKET(snmp-user-entry)# **user-name monitor**

 5. **auth-password**—Enter the authorization password for this user. Passwords must be 6-24 characters long. The password will be shown as “****” regardless of the length. This value is required.

ACMEPACKET(snmp-user-entry)# **auth-password ******
The system will prompt you to enter the password again.

 6. **priv-password**—Enter the privacy password for this user. Passwords must be 6-24 characters long. The password will be shown as “****” regardless of the length. This value is required.

ACMEPACKET(snmp-user-entry)# **priv-password ******
The system will prompt you to enter the password again.

Adding Authorized Trap Receivers

To add users as authorized trap-receivers:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# **configure terminal**

2. Type **system** and press <Enter>.

ACMEPACKET(configure)# **system**

3. Type **trap-receiver** and press <Enter>.

ACMEPACKET(system)# **trap-receiver**
ACMEPACKET(trap-receiver)#{}

4. **ip-address**—Enter the IP address and port for the NMS that supports SNMPv3.

ACMEPACKET(trap-receiver)# **ip-address 172.30.0.82:1620**

5. **user-list**—Add or subtract users to the list using (+) and (-) symbols.

ACMEPACKET(trap-receiver)# **user-list +monitor**

MIBs Supported by Acme Packet

The Net-Net system supports both standard MIBs and Acme Packet-specific MIBs (enterprise MIBs). The configurable Net-Net system elements are identified in the MIBs provided by Acme Packet. Every Net-Net system maintains a database of values for each of the definitions written in these MIBs.

Standard MIBS

The values in the standard MIBs are defined in RFC-1213, (one of the governing specifications for SNMP). A standard MIB includes objects to measure and monitor IP activity, TCP activity, UDP activity, IP routes, TCP connections, interfaces, and general system description. Each of these values is associated both an official name (such as sysUpTime, which is the elapsed time since the managed device was booted) and a numeric value expressed in dot-notation (such as 1.3.6.1.2.1.1.3.0, which is the OID for sysUpTime).

Acme Packet provides the following standard MIBs:

- rfc3411-framework.mib
- rfc1907-snmpv2.mib
- rfc2011-ip.mib
- rfc2737-entity.mib
- rfc2863-if.mib (Acme Packet supports the ifName entry of the ifXTable, which is an extension to the interface table and which replaces ifExtnsTable. See RFC 2863 for details.)
- ianaiftype.mib
- rfc4001-inetAddr.mib
- rfc4022-tcp.mib
- rfc4113-udp.mib

Acme Packet Enterprise MIBs

Acme Packet provides the following enterprise MIBs:

| MIB Name | Description |
|------------------------|---|
| ap-agentcapability.mib | <p>Details the SNMP agent's capabilities that includes support for different modules:</p> <ul style="list-style-type: none"> • SNMPv2 capabilities support the SNMPv2 MIB and include the systemGroup, snmpGroup, snmpCommunityGroup, and snmpBasicNotificationsGroup variables. • MIB-II capabilities support MIB-II and include the User Datagram Protocol (UDP)-MIB (udpGroup) variables and some, but not all of the IF-MIB (ifGeneralGroup and ifPacketGroup), IP-MIB (ipGroup and icmpGroup), and TCP-MIB (tcpGroup) variables. For more information about which variables are currently supported, refer to the ap-agentcapability.mib file. • MIB capabilities include support for the contents of the Acme Packet MIBs listed in this table. Refer to the individual MIBs for details. |
| ap-ami.mib | Acme Packet management interface on the Net-Net SBC. |
| ap-codec.mib | Codec and transcoding information generated by Acme Packet systems. |

| MIB Name | Description |
|--------------------------|--|
| ap-ems.mib | Net-Net EMS traps. |
| ap-entity-vendortype.mib | Acme Packet OID assignments for Acme Packet hardware components. |
| ap-env-monitor.mib | Fan speed, voltage, temperature, and power supply for the Net-Net system. It also sends out traps when status changes occur. |
| ap-license.mib | Status of your Net-Net licenses. |
| ap-products.mib | Descriptions of the different Net-Net SBC versions. |
| ap-security.mib | Information about the Acme Management Interface running on the Net-Net SBC. |
| ap-slog.mib | <p>syslog messages generated by the Net-Net system via SNMP. Used for the network logging of system and network events, the syslog protocol facilitates the transmission of event notification messages across networks. The Acme Packet syslog MIB can also be used to allow remote log access. The SNMP system manager references syslog to find out about any and all syslog messages.</p> <p>If the following conditions are present, the SNMP agent sends an SNMP trap when a message is sent to the syslog system:</p> <ul style="list-style-type: none"> • The system configurations's snmp-enabled parameter is set to enabled. • The system configuration's enable-snmp-syslog-notify parameter is set to enabled. • The actual syslog severity level is of equal or greater severity than the severity level configured in the system config's snmp-syslog-level field. <p>No trap is sent under the following conditions:</p> <ul style="list-style-type: none"> • A syslog event is generated and the system config's enable-snmp-syslog-notify parameter is set to disabled. • The actual syslog severity level is of lesser severity (for example, higher numerical code value) than the severity level configured in the system config's snmp-syslog-level parameter. |
| ap-smgmt.mib | Status of the Net-Net system (for example, system memory or system health). |
| ap-smi.mib | General information about the Net-Net system's top-level architectural design. |
| ap-swinventory.mib | Status of the boot images, configuration information, and bootloader images for the Net-Net system. |
| ap-tc.mib | Textual conventions used in Acme Packet enterprise MIBs. |

About Traps

This section defines the standard and proprietary traps supported by the Net-Net system. A trap is initiated by tasks to report that an event has happened on the Net-Net system. SNMP traps enable an SNMP agent to notify the NMS of significant events using an unsolicited SNMP message.

Acme Packet uses SNMPv2c. These notification definitions are used to send standard traps and Acme Packet's own enterprise traps.

Traps are sent according to the criteria established in the following:

- IETF RFC 1907 *Management Information Base for Version 2 of the Simple Network Management Protocol*
- IETF RFC 2233 *The Interfaces Group MIB using SMIv2*
- Appropriate enterprise MIB (for example the Acme Packet syslog MIB or the Acme Packet System Management MIB).

Standard Traps

The following table identifies the standard traps that the Net-Net system supports.

| Trap Name | Description |
|-----------------------|---|
| linkUp | The SNMPv2 agent detects that the ifOperStatus object of an interface has transferred from the down state to the up state. The ifOperStatus value indicates the other state. |
| linkDown | The SNMPv2 agent detects that the ifOperStatus object of an interface has transferred from the up state to the down state. The ifOperStatus value indicates the other state. |
| coldStart | The SNMPv2 agent is reinitializing itself and its configuration may have been altered. This trap is not associated with a Net-Net system alarm. |
| authenticationFailure | The SNMPv2 agent received a protocol message that was not properly authenticated. If the snmp-enabled and enable-snmp-auth-traps fields in the ACLI's system-config element are set to enabled a snmpEnableAuthenTraps object is generated. This trap is not associated with a Net-Net system alarm. |

Enterprise Traps

The following table identifies the proprietary traps that Net-Net system supports.

| Trap Name | Description |
|---|---|
| apEnvMonI2CFailNotification: 1.3.6.1.4.1.9148.3.3.4.0.1 | Sent when the Inter-IC bus (I2C) state changes from normal (1) to not functioning (7). |
| apEnvMonPortChangeNotification: 1.3.6.1.4.1.9148.3.3.4.0.5 | For Net-Net SBC 4500 only. Generated if a physical port is inserted/present or removed/not present. |
| apEnvMonStatusChangeNotification: 1.3.6.1.4.1.9148.3.3.4.0.2 | Sent when any entry of any environment monitor table changes in the state of a device being monitored. To receive this trap, you need to set the system config's enable-env-monitor-table value to enabled. |
| apH323StackMaxCallThresholdTrap: 1.3.6.1.4.1.9148.3.10.3.0.1 | Generated when the number of H.323 calls increases the percentage of the max calls threshold. |
| apH323StackMaxCallThresholdClearTrap: 1.3.6.1.4.1.9148.3.10.3.0.2 | Generated when the number of H.323 calls decreases to below the lowest max calls threshold. |
| apLicenseApproachingCapacityNotification: 1.3.6.1.4.1.9148.3.5.3.0.1 | Generated when the total number of active sessions on the system (across all protocols) is within 98 - 100% of the licensed capacity. |
| apLicenseNotApproachingCapacityNotification: 1.3.6.1.4.1.9148.3.5.3.0.2 | Generated when the total number of active sessions on the system (across all protocols) has gone to or below 90% of its licensed capacity (but no sooner than 15 seconds after the original alarm was triggered). |
| apSecurityTunnelFailureNotification: 1.3.6.1.4.1.9148.3.9.3.1.0.1 | Generated when an IPSec IKEV2 tunnel cannot be established. |
| apSecurityTunnelDPDNotification: 1.3.6.1.4.1.9148.3.9.3.2.0.1 | Generated when an IPSec IKEV2 tunnel fails because of Dead Peer Detection (DPD). |
| apSyslogMessageGenerated: 1.3.6.1.4.1.9148.3.1.2.0.1 | Generated by a syslog event. For example, this trap is generated if a switchover alarm occurs (for High Availability (HA) Net-Net system peers only), or if an HA Net-Net system peer times out or goes out-of-service. |
| apSysMgmtAlgCPUloadTrap: 1.3.6.1.4.1.9148.3.2.6.0.24 | Generated if the CPU utilization percentage of application tasks has exceeded the threshold algd-load-limit. |
| apSysMgmtAlgCPUloadClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.25 | Generated when the CPU utilization percentage of application tasks has fallen below the threshold algd-load-limit. |
| apSysMgmtRejectedMessagesThresholdExceededTrap 1.3.6.1.4.1.9148.3.2.6.0.57 | Generates when the number of rejected messages exceeds the configured threshold within the configured window. This trap is used for both whitelists and HMR rejected messages. The trap does not indicate which feature enabled this trap. To indicate which messages and rules generated the trap, you can consult the matched.log file. |
| apSysMgmtAdminAuditLogFullTrap: 1.3.6.1.4.1.9148.3.2.6.0.58 | Generated when one of the audit logs full threshold is met: <ul style="list-style-type: none"> • time interval • file size • percentage full |
| apSysMgmtAdminAuditLogFullClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.59 | Generated when free audit log storage space becomes available. |
| apSysMgmtAdminAuditPushFailTrap: 1.3.6.1.4.1.9148.3.2.6.0.60 | Generated when the audit file transfer fails. |
| apSysMgmtAdminAuditPushFailClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.61 | Generated when the audit file is successfully transferred. |
| apSysMgmtAdminAuthLockoutTrap: 1.3.6.1.4.1.9148.3.2.6.0.64 | Generated upon system lockout after multiple authentication failures. |

| Trap Name | Description |
|---|---|
| apSysMgmtAuthenticationFailedTrap: 1.3.6.1.4.1.9148.3.2.6.0.16 | <p>Generated when an attempt to login to the Net-Net SBC through Telnet, SSH, or by using the console fails for any reason; also sent when if a user fails authentication on the console or over FTP, SSH, or SFTP. The trap sent to all configured trap receivers includes the following information:</p> <ul style="list-style-type: none"> • administration and access level (SSH, user, enable) • connection type (Telnet or console) <p>FTP support is new to Release C5.0.</p> |
| apSysMgmtCallRecordingStateChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.50 | Generated when a call recording server changes state. |
| apSysMgmtCdrFileDeleteTrap | Generated when a CDR file is deleted because of lack of space on the partition or the drive exceeds the number of files specified. |
| apSysMgmtCDRPushReceiverFailureTrap: 1.3.6.1.4.1.9148.3.2.6.0.53 | Generated when an enabled CDR push receiver fails. Returns the address, the address type, and the failure reason code. |
| apSysMgmtCDRPushReceiverFailureClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.54 | Generated when an enabled CDR push receiver resumes normal operation after a failure. |
| apSysMgmtCDRPushAllReceiversFailureTrap: 1.3.6.1.4.1.9148.3.2.6.0.55 | Generated when all enabled CDR push receivers fail. |
| apSysMgmtCDRPushAllReceiversFailureClearTrap 1.3.6.1.4.1.9148.3.2.6.0.56 | Generated when one or more enabled CDR push receivers return to normal operation after failures were encountered on all push receivers. |
| apSysMgmtCfgSaveFailTrap: 1.3.6.1.4.1.9148.3.2.6.0.13 | Generated if an error occurs while the system is trying to save the configuration to memory. |
| apSysMgmtCollectorPushSuccessTrap: 1.3.6.1.4.1.9148.3.2.6.0.44 | Generated when the collector successfully completes a push operation. |
| apSysMgmtENUMStatusChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.27 | <p>Generated if the reachability status of an ENUM server changes; contains:</p> <ul style="list-style-type: none"> • apENUMConfigName • apENUMServerIpAddress • apENUMServerStatus |
| apSysMgmtExpDOSTrap: 1.3.6.1.4.1.9148.3.2.8.0.2 | Generated when a device exceeds configured thresholds and is denied access by the Net-Net SBC. |
| apSysMgmtFanTrap: 1.3.6.1.4.1.9148.3.2.6.0.3 | Generated if a fan unit speed falls below the monitoring level. |
| apSysMgmtGatewaySynchronizedTrap: 1.3.6.1.4.1.9148.3.2.6.0.49 | Generated when the default gateway is synchronized in the ARP table. |
| apSysMgmtGatewayUnreachableTrap: 1.3.6.1.4.1.9148.3.2.6.0.10 | Generated if the gateway specified becomes unreachable by the system. |
| apSysMgmtGatewayUnreachableClear: 1.3.6.1.4.1.9148.3.2.6.0.21 | Generated when the Net-Net determines that the gateway in question is once again reachable. |
| apSysMgmtGroupTrap: 1.3.6.1.4.1.9148.3.2.3.0.1 | <p>Generated when a significant threshold for a Net-Net system resource use or health score is exceeded. For example, if Network Address Translation (NAT) table usage, Address Resolution Protocol (ARP) table usage, memory usage, or Central Processing Unit (CPU) usage reaches 90% or greater of its capacity, the apSysMgmtGroupTrap is generated. If the health score (for HA Net-Net peers only) falls below 60, the apSysMgmtGroupTrap is generated. This trap is sent for sessions only if tiered thresholds for sessions have been configured in system-config>alarm-threshold. If no tiered thresholds have been configured for sessions, then the apSysMgmtLicenseCapacity is sent.</p> |

| Trap Name | Description |
|--|---|
| apSysMgmtGroupClearTrap: 1.3.6.1.4.1.9148.3.2.3.0.2 | Generated when the Net-Net SBC's system resource use or its health score returns to levels that are within thresholds. For example, NAT table usage or memory usage could return to acceptable levels, and the systems health score could return to a level above 60. |
| apSysMgmtH323InitFailTrap: 1.3.6.1.4.1.9148.3.2.6.0.12 | Generated if an H.323 stack has failed to initialize properly and has been terminated. |
| apSysMgmtHardwareErrorTrap: 1.3.6.1.4.1.9148.3.2.6.0.14 | Provides a text string indicating the type of hardware error that has occurred. If the message text exceeds 255 bytes, the message is truncated to 255 bytes. |
| apSysMgmtInetAddrWithReasonDOSTrap: 1.3.6.1.4.1.9148.3.2.8.0.4 | Generated when an IP address is placed on a deny list because of denial-of-service attempts. It provides the IP address that has been demoted, the realm ID of that IP address (if available), the URI portion of the SIP From header for the message that caused the demotion, and the reason for the demotion. |
| apSysMgmtInterfaceStatusChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.26 | Generated when there is a change in the status of the SIP interface; either the SIP interface is in service or constraints have been exceeded. |
| | <ul style="list-style-type: none"> • apSysMgmtSipInterfaceRealmName—Realm identifier for the SIP interface (OID 1.3.6.1.4.1.9148.3.2.5.24) • apSysMgmtSipInterfaceIP—IP address of the first SIP port in the SIP interface (OID 1.3.6.1.4.1.9148.3.2.5.25) • apSysMgmtSipInterfaceStatus—Code is 0 (OID 1.3.6.1.4.1.9148.3.2.5.26) • apSysMgmtSipInterfaceStatusReason—Status reasons and in-service (3) and constraintExceeded (4) (OID 1.3.6.1.4.1.9148.3.2.5.27) |
| apSysMgmtLDAPStatusChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.42 | Generated if the status of whether a LDAP server is reachable changes. |
| apSysMgmtMediaBandwidthTrap: 1.3.6.1.4.1.9148.3.2.6.0.7 | Generated if bandwidth allocation fails at a percentage higher or equal to the system's default threshold rate. |
| | Bandwidth allocation failure rates are checked every 30 seconds. The trap is sent when the failure rate is at 50% or higher. After that time, the trap is sent every 30 seconds until the failure rate drops below 35%. The clear trap is sent once the failure rate drops below 5%. |
| apSysMgmtMediaBandwidthClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.19 | Generated when the percentage rate of failure for media bandwidth allocation decreases to the default allowable threshold. |
| apSysMgmtMediaOutOfMemory: 1.3.6.1.4.1.9148.3.2.6.0.8 | Generated if the media process cannot allocate memory. |
| apSysMgmtMediaOutOfMemoryClear: 1.3.6.1.4.1.9148.3.2.6.0.20 | Generated when the alarm for insufficient memory for media processes is cleared manually. |
| apSysMgmtMediaPortsTrap: 1.3.6.1.4.1.9148.3.2.6.0.6 | Generated if port allocation fails at a percentage higher or equal to the system's default threshold rate. |
| | Port allocation failure rates are checked every 30 seconds. The trap is sent when the failure rate is at 50% or higher. After that time, the trap is sent every 30 seconds until the failure rate drops below 35%. The clear trap is sent once the failure rate drops below 5%. |
| apSysMgmtMediaPortsClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.18 | Generated if the port allocation failure rate drops below the system's default acceptable threshold. |
| apSysMgmtMediaUnknownRealm: 1.3.6.1.4.1.9148.3.2.6.0.9 | Generated if the media process cannot find an associated realm for the media flow. |
| apSysMgmtNTPClockSkewTrap: 1.3.6.1.4.1.9148.3.2.6.0.43 | Generated if the NTP has to adjust the clock by more than 1000 seconds. |

| Trap Name | Description |
|---|---|
| <code>apSysMgmtNTPServerUnreachableTrap: 1.3.6.1.4.1.9148.3.2.6.0.30</code> | Generated if the specified NTP server becomes unreachable. <ul style="list-style-type: none">• <code>apSysMgmtNTPServer</code>—Server that is or was formerly unreachable (OID 1.3.6.1.4.1.9148.3.2.5.31) |
| <code>apSysMgmtNTPServerUnreachableClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.31</code> | Generated when an NTP server deemed unreachable subsequently becomes reachable. |
| <code>apSysMgmtNTPServiceDownTrap: 1.3.6.1.4.1.9148.3.2.6.0.32</code> | Generated if all configured NTP servers are unreachable. |
| <code>apSysMgmtNTPServiceDownClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.33</code> | Generated if NTP service again becomes available. |
| <code>apSysMgmtPhyUtilThresholdTrap</code> | Generated when the media port's utilization crosses a configured threshold. Indicates whether the OverloadProtection feature is active. |
| <code>apSysMgmtPhyUtilThresholdClearTrap</code> | Generated when a media port's utilization falls below the lowest configured threshold. |
| <code>apSysMgmtPowerTrap: 1.3.6.1.4.1.9148.3.2.6.0.1</code> | Generated if a power supply is powered down, powered up, inserted/present or removed/not present. |
| <code>apSysMgmtPushServerUnreachableTrap: 1.3.6.1.4.1.9148.3.2.6.0.28</code> | Generated if the system collector cannot reach a specified server; used with the historical data recording (HDR) feature. |
| <code>apSysMgmtPushServerUnreachableClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.29</code> | Generated if the system collector can again reach a specified server that was unreachable; used with the historical data recording (HDR) feature. |
| <code>apSysMgmtRadiusDownTrap: 1.3.6.1.4.1.9148.3.2.6.0.11</code> | Generated if all or some configured RADIUS accounting servers have timed out from a RADIUS server. |
| <code>apSysMgmtRadiusDownClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.22</code> | Generated when some or all of the previously unreachable RADIUS servers can be again be reached. |
| <code>apSysMgmtRealmICMPFailureTrap: 1.3.6.1.4.1.9148.3.2.6.0.51</code> | Generated when ICMP heartbeat failure occurs. |
| <code>apSysMgmtRealmICMPFailureClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.52</code> | Generated when ICMP heartbeat failure clears. |
| <code>apSysMgmtRegCacheThresholdTrap: 1.3.6.1.4.1.9148.3.2.6.0.46</code> | Generated when the number of contacts stored in the registration cache exceeds the configured threshold. |
| <code>apSysMgmtRegCacheThresholdClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.47</code> | Generated when the number of contacts stored in the registration cache falls below the configured threshold. |
| <code>apSysMgmtRealmMinutesExceedTrap: 1.3.6.1.4.1.9148.3.2.6.0.40</code> | Generated if the monthly minutes for a realm are exceeded. |
| <code>apSysMgmtRealmMinutesExceedClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.41</code> | Generated if monthly minutes for a realm are reset. |
| <code>apSysMgmtRealmStatusChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.45</code> | Generated when there is a change in the status of the realm constraints. |
| <code>apSysMgmtRedundancyTrap: 1.3.6.1.4.1.9148.3.2.6.0.5</code> | Generated if a state change occurs on either the primary or secondary system in a redundant (HA) pair. |
| <code>apSysMgmtSASStatusChangeTrap: 1.3.6.1.4.1.9148.3.2.6.0.15</code> | <p>Generated when a session agent is declared unreachable or unresponsive for the following reasons:</p> <ul style="list-style-type: none"> • signaling timeout (H.323 and SIP) • session agent does not respond to SIP pings (SIP only) <p>When session agents are declared unreachable or unresponsive, they are placed out-of-service for a configurable period of time.</p> |

| Trap Name | Description |
|--|--|
| apSysMgmtSipRejectionTrap: 1.3.6.1.4.1.9148.3.2.10.0.1 | Generated when a SIP INVITE or REGISTRATION request fail. |
| apSysMgmtSpaceAvailThresholdTrap: 1.3.6.1.4.1.9148.3.2.6.0.68 | Generated when the space available on a partition crosses a configured space threshold. |
| apSysMgmtSpaceAvailThresholdClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.69 | Generated when the space available on a partition falls below the lowest configured threshold. |
| apSysMgmtSurrogateRegFailed: 1.3.6.1.4.1.9148.3.2.6.0.39 | Generated if a SIP user attempts to register more than the configured, allowable number of times; supports SIP surrogate registration for IMS. |
| <ul style="list-style-type: none">• apSysMgmtSurrogateRegHost (OID 1.3.6.1.4.1.9148.3.2.5.5.35)• apSysMgmtSurrogateRegAor (OID 1.3.6.1.4.1.9148.3.2.5.5.36) | |
| apSysMgmtSystemStateTrap: 1.3.6.1.4.1.9148.3.2.6.0.17 | Generated when the Net-Net SBC is instructed to change the system-state or the transition from becoming offline to online occurs. This trap contains one field called apSysMgmtSystemState, and that field has three values: |
| <ul style="list-style-type: none">• online(0)• becoming-offline(1)• offline(2) | |
| apSysMgmtTaskDelete: 1.3.6.1.4.1.9148.3.2.5.24 | Generated to described what task was deleted. |
| | From Release C4.1.4 and C5.1.0 forward, this trap contains text noting that the time has been reset when the system clock time and remote clock time are too far skewed. |
| apSysMgmtTaskDeleteTrap: 1.3.6.1.4.1.9148.3.2.6.0.23 | [Reserved for future use.] |
| | Generated when a task is deleted; it reads apSysMgmtTaskDelete and includes the test in the trap. |
| apSysMgmtTaskSuspendTrap: 1.3.6.1.4.1.9148.3.2.6.0.4 | Generated if a critical task running on the system enters a suspended state. |
| apSysMgmtTempTrap: 1.3.6.1.4.1.9148.3.2.6.0.2 | Generated if the temperature falls below the monitoring level. |
| apSysMgmtAdminWriteFailTrap: 1.3.6.1.4.1.9148.3.2.6.0.62 | Generated when a write to file fails. |
| apSysMgmtAdminWriteFailClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.63 | Generated when a write to file succeeds. |
| apSwCfgActivateNotification: 1.3.6.1.4.1.9148.3.4.3.0.1 | Generated when an activate-config command is issued and the configuration has been changed at running time. |
| apSecurityOCSRDownNotification: 1.3.6.1.4.1.9148.3.9.3.3.0.1 | Generated when an OSCR server becomes unreachable. |
| apSecurityOCSRUpNotification: 1.3.6.1.4.1.9148.3.9.3.3.0.2 | Generated when an OSCR server becomes available. |
| apSysMgmtOCSRDownTrap: 1.3.6.1.4.1.9148.3.2.6.0.80 | Generated if all or some of the configured OSCR accounting servers are down. |
| apSysMgmtOCSRDownClearTrap: 1.3.6.1.4.1.9148.3.2.6.0.81 | Generated if all OSCR accounting servers have resumed communications. |
| apSecurityCRLInvalidNotification: 1.3.6.1.4.1.9148.3.9.3.4.0.1 | Generated when an invalid CRL is detected. |

| Trap Name | Description |
|--|--|
| apDiameterAcctSrvrUpTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.1 | Generated when a Diameter Accounting Server goes up. |
| apDiameterAcctSrvrDownTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.2 | Generated when a Diameter Accounting Server goes down. |
| apAcctMsgQueueFullTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.3 | Generated when the accounting message queue is full and all accounting servers are down. |
| apAcctMsgQueueFullClearTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.4 | Generated when the apAcctMsgQueueFullTrap condition clears. |
| apDiameterSrvrErrorResultTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.5 | Generated when the Diameter Server returns 3xxx (Protocol Errors), 4xxx (Transient Failures), or 5xxx (Permanent Failure) Result-Code AVP (268). |
| apDiameterSrvrSuccessResultTrap: 1.3.6.1.4.1.9148.3.13.1.2.2.0.6 | After an error result, generated when the Diameter Server returns a 2xxx (Success) Result-Code AVP (268). |
| apSipSeInterfaceRegThresholdExceededTrap: 1.3.6.1.4.1.9148.3.15.2.1.2.0.1 | Generated if the total number of registrations on all secondary SIP interfaces exceeds the configured threshold. |
| apSipSeInterfaceRegThresholdClearTrap: 1.3.6.1.4.1.9148.3.15.2.1.2.0.2 | Generated if the total number of registrations on all secondary SIP interfaces falls below the configured threshold. |

Refer to Appendix A for examples of enterprise traps.

Net-Net EMS Traps

This section describes the Net-Net EMS traps contained in the Acme Packet EMS MIB. Net-Net EMS generates traps when it detects the following:

- failure to discover or rediscover a Net-Net SBC configuration
- failure to save a Net-Net SBC configuration
- failure to activate a Net-Net SBC configuration
- missing components when validating a Net-Net SBC configuration
- node status change from reachable to unreachable

You need to configure an external server as the receiver for these traps.

Net-Net EMS generates the following traps:

| Trap Name | Description |
|-----------------------|--|
| apEMSDiscoveryFailure | Generated when Net-Net EMS fails to discover or rediscover a Net-Net SBC configuration. The trap is generated from any discovery or rediscovery failure initiated by the SOAP XML API, Net-Net EMS, or system processing. The trap contains the Net-Net SBC's node ID, the start and end time of the discovery or rediscovery operation, and the user who initiated the operation. |
| apEMSSaveFailure | Generated when Net-Net EMS fails to save a configuration. The trap is generated by a save failure whether initiated by the SOAP XML API or Net-Net EMS GUI for save/activate, save or offline save operations. The trap contains the Net-Net SBC node ID, the start and stop time of the save configuration attempt, and the user initiating the save operation. |

| Trap Name | Description |
|---|--|
| apEMSActivateFailure | Generated when Net-Net EMS fails to activate a configuration, whether initiated from the SOAP XML API or Net-Net EMS GUI for the save/activate or activate operations. |
| apEMSIInvalidConfigDiscoveredNotification | Generated when Net-Net EMS validates a discovered Net-Net SBC's configuration (for example confirms each referenced realm is configured) and detects missing components. The trap contains the time and the Net-Net SBC node ID. |
| apEMSNodeUnreachableNotification | Generated when a node's status changes from reachable to unreachable. The trap contains the Net-Net SBC's node ID and the time of the event. |
| apEMSNodeUnreachableClearNotification | Generated when a node's status changes from unreachable to reachable. The trap contains the Net-Net SBC's node ID and the time of the event. |

Net-Net System Alarms

A Net-Net system alarm is triggered when a condition or event happens within either the Net-Net system hardware or software. Given a specific alarm, the Net-Net system generates the appropriate SNMP trap. These traps include a description of the event or condition that caused the trap to be generated; or provides information associated with the alarm, such as the interface ID (`ifIndex`)/status or object identifier/object type integer values.

The following table maps Net-Net system alarms to SNMP traps. This table includes the following information:

- alarm names
- alarm IDs
- alarm severities (including threshold values)
- alarm causes
- example log messages

In addition, this table specifies the type of traps that are generated for SNMP and the trap reference locations (the supported MIB or RFC).

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|------------------------------|----------|---|--|---|--|
| Hardware Alarms | | | | | |
| FAN STOPPED | 65537 | CRITICAL: any fan speed is <50%. Or speed of two or more fans is >50% and ≤75%. MAJOR: speed of two or more fans is > 75% and ≤ 90%. Or speed of one fan is >50% and ≤75% and the other two fans are at normal speed. MINOR: speed of one fan > 75% and ≤90%, the other two fans are at normal speed. | Fan speed failure. NOTE: If this alarm occurs, the Net-Net system turns up the fan speed to the fastest possible speed. | fan speed: XXXX, XXXX, XXXX (where xxxx xxxx xxxx is the revolutions per minute (RPM) of each fan on the fan module) | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtFanTrap (ap-smgmt.mib) |
| TEMPERATURE HIGH | 65538 | SD1: CRITICAL: ≥70 °C MAJOR: ≥60 °C MINOR: ≥50 °C SD2: CRITICAL: ≥75 °C MAJOR: ≥65 °C MINOR: ≥55 °C SD3: CRITICAL: ≥105 °C MAJOR: ≥95 °C MINOR: ≥85 °C | Fans are obstructed or stopped. The room is abnormally hot. | Temperature: XX.XX C (where XX.XX is the temperature in degrees) | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtTempTrap (ap-smgmt.mib) |
| ENVIRONMENTAL SENSOR FAILURE | 65539 | CRITICAL | The environmental sensor component cannot detect fan speed and temperature. | Hardware monitor failure! Unable to monitor fan speed and temperature! | apSyslogMessageGenerated (ap-slog.mib) apEnvMonI2CFailNotification (ap-env-monitor.mib) |
| PLD POWER A FAILURE | 65540 | MINOR | Power supply A has failed. | Back Power Supply A has failed! | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtPowerTrap (ap-smgmt.mib) |

PLD stands for Programmable Logical Device

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|--|----------|---|--|---------------------------------|--|
| PLD POWER A UP | 65541 | MINOR | Power supply A is now present and functioning. | Back Power Supply A is present! | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtPowerTrap (ap-smgmt.mib) |
| NOTE: If the Net-Net system boots up with one power supply, the health score is 100, and an alarm is not generated. If another power supply is then added to that same Net-Net system, this alarm is generated, but the health score is not decremented. | | | | | |
| PLD POWER B FAILURE | 65542 | MINOR | Power supply B has failed. | Back Power Supply B has failed! | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtPowerTrap (ap-smgmt.mib) |
| PLD POWER B UP | 65543 | MINOR | Power supply B is now present and functioning. | Back Power Supply B is present! | apSyslogMessageGenerated (ap-slog.mib) apEnvMonStatusChangeNotification (ap-env-monitor.mib) apSysMgmtPowerTrap (ap-smgmt.mib) |
| NOTE: If the Net-Net system boots up with one power supply, the health score is 100, and an alarm is not generated. If another power supply is then added to that same Net-Net system, this alarm is generated, but the health score is not decremented. | | | | | |

| ARP TABLE UTILIZATION | 131103 | MINOR | ARP table usage reached 90% or greater of its capacity. | ARP table X% over threshold X% | apSysMgmtGroupTrap (ap-smgmt.mib) |
| REDUNDANT SWITCH-TO-ACTIVE | 131104 | CRITICAL | A state transition occurred from Standby/BecomingStandby to BecomingActive. | Switchover, <state to state>, active peer <name of HA peer> has timed out or Switchover, <state to state>, active peer <name of HA peer> has unacceptable health (x) (where x is the health score) or Switchover, <state to state>, forced by command | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtRedundancyTrap (ap-smgmt.mib) |
| REDUNDANT SWITCH-TO-STANDBY | 131105 | CRITICAL | A state transition occurred from Active/BecomingActive to BecomingStandby/RelinquishingActive . | Switchover, <state to state>, peer <name of HA peer> is healthier (x) than us (x) (where x is the health score) or Switchover, <state to state>, forced by command | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtRedundancyTrap (ap-smgmt.mib) |
| REDUNDANT TIMEOUT | 131106 | MAJOR | An HA Net-Net system peer was not heard from within the configured silence window. | Peer <name of HA peer> timed out in state x, my state is x (where x is the state (e.g., BecomingStandby)) | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtRedundancyTrap (ap-smgmt.mib) |

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|--|----------|--|--|--|--|
| REDUNDANT OUT OF SERVICE | 131107 | CRITICAL | Unable to synchronize with Active HA Net-Net system peer within BecomingStandby timeout. | Unable to synchronize with Active redundant peer within BecomingStandby timeout, going OutOfService or activate-config failed, process busy or activate-config failed, must do save-config before activating. or activate-config failed, could not get current config version from file or activate-config failed, could not set running config version to file. | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtRedundancyTrap (ap-smgmt.mib) |
| <p>The activate-config failed log message appears for those cases in which the execution of the activate config command failed on the standby Net-Net SBC.</p> | | | | | |
| SYSTEM TASK SUSPENDED | 131108 | CRITICAL | A Net-Net system task (process) suspends or fails. | Task X suspended, which decremented health by 75! (where X is the task/process name) | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtTaskSuspendTrap (ap-smgmt.mib) |
| Media Alarms | | | | | |
| MBCD ALARM OUT OF MEMORY | 262145 | CRITICAL: for flow MAJOR: for media (if server cannot allocate a new context) | No further memory can be allocated for MBCD. | Flow: Cannot create free port list for realm. Media Server: Failed to allocate new context. | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtMediaOutofMemory (ap-smgmt.mib) |
| MBCD ALARM UNKNOWN REALM | 262147 | MAJOR: if media server is adding a new flow | Media server is unable to find realm interface. | Realm type (ingress, egress, hairpin) X, not found | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtUnknownRealm (ap-smgmt.mib) |
| MBCD ALARM OUT OF BANDWIDTH | 262149 | CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50% | The realm is out of bandwidth. | Out of bandwidth | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtMediaBandwidthTrap (ap-smgmt.mib) |
| MBCD ALARM OUT OF PORTS | 262150 | CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50% | The realm is out of steering ports. | Out of steering ports | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtMediaPortsTrap (ap-smgmt.mib) |
| Network Alarms | | | | | |

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|---------------------|------------|----------------|---|--|---|
| GATEWAY UNREACHABLE | dynamic ID | MAJOR | The Net-Net SBC lost ARP connectivity to a front interface gateway. | gateway X.X.X.X unreachable on slot Y port Z subport ZZ (where X.X.X.X is the IPv4 address of the front interface gateway, Y is the front interface slot number, Z is the front interface port number, and ZZ is the subport ID) | apSysMgmtGatewayUnreachableTrap (ap_smgmt.mib) |

NOTE: The value of this alarm ID is dynamic. That is, it changes based on a numbers of factors, but the total alarm ID range falls between 196608 and 262143. The alarm ID is calculated based on the compilation of the following information: a hexadecimal number that represents the VLAN ID and the front interface port/slot numbers.

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|---|----------|--|---|---|--|
| Application Alarms | | | | | |
| RADIUS ACCOUNTING CONNECTION DOWN | 327681 | CRITICAL: if all enabled and configured Remote Authentication Dial-in User Service (RADIUS) accounting server connections have timed-out without response from the RADIUS server. MAJOR: if some, but not all configured RADIUS accounting server connections have timed-out without response from the RADIUS server. | The enabled connections to RADIUS servers have timed-out without a response from the RADIUS server. | CRITICAL: All enabled accounting connections have been lost! Check accounting status for more details. MAJOR: One or more enabled accounting connections have been lost! Check accounting status for more details. | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtRadiusDownTrap (ap-smgmt.mib) |
| ENUM SERVER STATUS New to Release C5.0 | XX | CRITICAL: All ENUM servers are unreachable MAJOR: Some ENUM servers are unreachable | The enabled connections to ENUM servers have been lost. | CRITICAL: All ENUM Servers are currently unreachable! MAJOR: One or more ENUM Servers are currently unreachable! | apSysMgmtENUMStatusChangeTr ap (ap-smgmt.mib) |
| H.323 ALARM STACK INITIALIZATION FAILURE | 327682 | CRITICAL | The H.323 stack has failed to initialize properly and is terminated. | [H.323 IWF] stack <stack-name> has failed to initialize and is terminated | apSyslogMessageGenerated (ap-slog.mib) (ap-smgmt.mib) |

| Alarm Name | Alarm ID | Alarm Severity | Cause(s) | Example Log Message | Trap Generated (Trap Reference) |
|-----------------------------|----------|----------------|--|--|---|
| Configuration Alarms | | | | | |
| CFG ALARM SAVE FAILED | 393217 | MAJOR | The save-config command execution failed on a standby Net-Net SBC peer operating as part of an HA pair. | save-config failed on targetName! /code full, config sync stopped! or save-config failed on targetName! /code full, config sync stopped! (where the targetName is the target name (tn) configured in the boot parameters) | apSyslogMessageGenerated (ap-slog.mib) apSysMgmtCfgSaveFailTrap (ap-smgmt.mib) |
| License Alarm | | | | | |
| LICENSE APPROACH CAPACITY | 50004 | MAJOR | Total session count is approaching the license capacity allowed (98% or higher) This alarm is cleared when total sessions is less than 90% of license capacity. | | apSyslogMessageGenerated (ap-slog.mib) apLicenseApproachingCapacityNotification (ap-smgmt.mib) |

For additional information about system alarms for the components of the Net-Net system, refer to the *Alarms* section of the *Monitoring via the ACLI* chapter of the *Net-Net Administration and Configuration Guide for the ACLI*.

Alarm Severities

The Net-Net system architecture includes five levels of alarm severity. These levels have been designated so that the Net-Net system can take action that is appropriate to the situation triggering the alarm.

| Alarm Severity | Description |
|----------------|--|
| Emergency | Requires immediate attention. If you do not attend to this condition immediately, there will be physical, permanent, and irreparable damage to your Net-Net system. |
| Critical | System is inoperable, causing a complete loss of service in a production environment. Requires attention as soon as it is noted. |
| Major | Functionality has been seriously compromised. This situation might cause loss of functionality, hanging applications, and dropped packets. If you do not attend to this situation, your Net-Net system will suffer no physical harm, but it will cease to function. |
| Minor | Functionality has been impaired to a certain degree. As a result, you might experience compromised functionality. You should attend to this type of alarm as soon as possible in order to keep your Net-Net system operating properly. |
| Warning | Some irregularities in performance. This condition describes situations that are noteworthy, however, you should attend to this condition in order to keep your Net-Net system operating properly. For example, this type of alarm might indicate the Net-Net system is running low on bandwidth and you may need to contact your Acme Packet customer support representative to arrange for an upgrade. |

Alarm Clearing

When alarms conditions occur on the Net-Net SBC, corresponding SNMP traps are sent to alert SNMP monitoring utilities. Traps are sent to the SNMP monitoring device when the conditions causing the alarms have been cleared or have subsided. You can now use a monitoring tool to track the current alarm state on the Net-Net SBC using SNMP traps sent when conditions change.

The following traps are triggered when alarms conditions on the Net-Net SBC are cleared:

- apSysMgmtGroupClearTrap—Generated when the Net-Net SBC's system resource use or its health score returns to levels that are within thresholds. For example, NAT table usage or memory usage could return to acceptable levels, and the systems health score could return to a level above 60.
- apSysMgmtPortsClearTrap—Generated when the rate of allocating media ports decreases to a level within thresholds.
- apSysMgmtMediaBandwidthClearTrap—Generated when the percentage rate of failure for media bandwidth allocation decreases to the default allowable threshold.
- apSysMgmtMediaOutOfMemoryClear—Generated when the alarm for insufficient memory for media processes is cleared manually.
- apSysMgmtGatewayUnreachableClear—Generated when the Net-Net determines that the gateway in question is once again reachable.
- apSysMgmtRadiusDownClearTrap—Generated when some or all of the previously unreachable RADIUS servers can be again be reached.

Acme Packet Log Levels and syslog Level Severities

There is a direct correlation between Acme Packet log levels and syslog level severities. This correlation can be used for syslog MIB reference purposes.

Acme Packet Log Levels

The following table defines the Acme Packet log levels by name and number, and provides a description of each level.

| Numerical Code | Acme Packet Log Level | Description |
|----------------|-----------------------|--|
| 1 | EMERGENCY | The most severe condition within the Net-Net system which requires immediate attention. If you do not attend to it immediately, there could be physical, irreparable damage to your Net-Net system. |
| 2 | CRITICAL | A serious condition within the Net-Net system which requires attention as soon as it is noted. If you do not attend to these conditions immediately, there may be physical damage to your Net-Net system. |
| 3 | MAJOR | Functionality has been seriously compromised. As a result, there may be loss of functionality, hanging applications, and dropped packets. If you do not attend to this situation, your Net-Net system will suffer no physical harm, but it will cease to function. |
| 4 | MINOR | Functionality has been impaired to a certain degree and, as a result, you may experience compromised functionality. There will be no physical harm to your Net-Net system. However, you should attend to it as soon as possible in order to keep your Net-Net system operating properly. |
| 5 | WARNING | The Net-Net system has noted some irregularities in its performance. This condition is used to describe situations that are noteworthy. Nonetheless, you should attend to it in order to keep your Net-Net system operating properly. |
| 6 | NOTICE | All used for Acme Packet customer support purposes. |
| 7 | INFO | |
| 8 | TRACE | |
| 9 | DEBUG | |

syslog Level Severities

The following table defines the Acme Packet syslog levels by severity and number against the University of California Berkeley Software Distribution (BSD) syslog severities (by level and number).

Refer to the Example Log Message column to view example syslog-related content/messages.

| Acme Packet syslog Level (Numerical Code) | BSD syslog Severity Level (Number) |
|---|--|
| EMERGENCY (1) | Emergency - system is unusable (0) |
| CRITICAL (2) | Alert - action must be taken immediately (1) |
| MAJOR (3) | Critical - critical conditions (2) |
| MINOR (4) | Error - error conditions (3) |
| WARNING (5) | Warning - warning conditions (4) |
| NOTICE (6) | Notice - normal, but significant condition (5) |
| INFO (7) | Informational - informational messages (6) |
| TRACE (8) | Debug - debug level messages (7) |
| DEBUG (9) | |

Mapping Trap Filter Levels to syslog and Alarm Severities

Although there is no direct correlation between Net-Net system alarms and the generation of SNMP traps, traps can be mapped to syslog and alarm severities through trap filters that are configured in the `filter-level` field of the `trap-receiver` configuration element of the ACLI. The following table shows this mapping.

| filter-level Field Value | Filter Level Description | Acme Packet syslog Level (Numerical Code) | Alarm Severity Levels |
|--------------------------|---|--|--|
| CRITICAL | The SNMP agent sends a trap for all alarms and syslogs with a severity level that is greater than or equal to CRITICAL (with a lesser Acme Packet log level numerical code). The corresponding NMS receives only error events. | <ul style="list-style-type: none"> • EMERGENCY (1) • CRITICAL (2) | <ul style="list-style-type: none"> • EMERGENCY • CRITICAL |
| MAJOR | The SNMP agent sends a trap for all alarms and syslogs with a severity level that is greater than or equal to MAJOR (with a lesser Acme Packet log level numerical code). The corresponding NMS receives warning and error events. | <ul style="list-style-type: none"> • EMERGENCY (1) • CRITICAL (2) • MAJOR (3) | <ul style="list-style-type: none"> • EMERGENCY • CRITICAL • MAJOR |
| MINOR | The SNMP agent sends a trap for all alarms and syslogs with a severity level that is greater than or equal to MINOR (i.e., with a lesser Acme Packet log level numerical code) to generate a trap. The corresponding NMS receives informational, warning, and error events. | <ul style="list-style-type: none"> • EMERGENCY (1) • CRITICAL (2) • MAJOR (3) • MINOR (4) | <ul style="list-style-type: none"> • EMERGENCY • CRITICAL • MAJOR • MINOR |
| ALL | The SNMP agent sends a trap for all alarms, syslogs, and other traps. The corresponding NMS receives informational, warning, and error events. | <ul style="list-style-type: none"> • EMERGENCY (1) • CRITICAL (2) • MAJOR (3) • MINOR (4) • WARNING (5) • NOTICE (6) • INFO (7) • TRACE (8) • DEBUG (9) | <ul style="list-style-type: none"> • EMERGENCY • CRITICAL • MAJOR • MINOR • WARNING |

The following table describes the types of events that an NMS can receive.

| Event Category | Description |
|-----------------------|--|
| Error | Indicates a catastrophic condition has occurred (e.g., an internal temperature reading exceeds the recommendation). |
| Warning | Indicates pending failures or unexpected events (e.g., at the console, you typed the wrong password three consecutive times) |
| Informational | Represents non-critical conditions (e.g., an event can indicate to an administrator that a configuration element has changed). |

For more information about the `filter-level` field specifically or the `trap-receiver` element in general, refer to the *Configuration via the ACLI* chapter of the *Net-Net Administration and Configuration Guide for the ACLI*.

Introduction

This section explains the standard SNMP GET requests supported by the Net-Net system. SNMP uses five basic messages, one of which is the GET request that is used to query for information on or about a network entity.

Interfaces Group

The following table describes the standard SNMP Get support for the interfaces table, which contains information on the entity's interfaces. Each interface is thought of as being attached to a *subnetwork*. (Note that this term should not be confused with *subnet*, which refers to an addressing partitioning scheme used in the Internet suite of protocols.)

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--------------------------------------|--|
| interfaces (1.3.6.1.2.1.2) | | |
| ifNumber | interfaces: 1.3.6.1.2.1.2.1 | Number of network interfaces (regardless of their current state) present on this system. |
| The Interfaces Table | | |
| ifTable.ifEntry (1.3.6.1.2.1.2.2.1) | | |
| ifIndex | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.1 | Unique value for each interface. Value has a range between 1 and the value of ifNumber and must remain constant at least from one re-initialization of the entity's NMS to the next re-initialization. See for examples of ifIndex values. |
| ifDescr | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.2 | Textual string containing information about the interface. This string includes the name of the manufacturer, the product name, and the version of the hardware interface. |
| ifType | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.3 | Information about the type of interface, distinguished according to the physical/link protocol(s) immediately below the network layer in the protocol stack. |
| ifMtu | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.4 | Size of the largest datagram which can be sent/received on the interface, specified in octets. For interfaces that transmit network datagrams, this is the size of the largest network datagram that can be sent on the interface. |
| ifSpeed | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.5 | Estimate of the interface's current bandwidth in bits per second. For interfaces which do not vary in bandwidth or for those where an accurate estimation cannot be made, it contains the nominal bandwidth. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|--|---|
| ifPhysAddress | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.6 | Address of the interface, at the protocol layer immediately below the network layer in the protocol stack. For interfaces which do not have such an address for example., a serial line), it contains an octet string of zero length. |
| ifAdminStatus | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.7 | Current administrative state of the interface. The testing(3) state indicates that operational packets cannot be passed. |
| ifOperStatus | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.8 | Current operational state of the interface. The testing(3) state indicates that operational packets cannot be passed. |
| ifLastChange | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.9 | Value of sysUpTime at the time the interface entered its current operational state. If the current state was entered prior to the last re-initialization of the local network management subsystem, then it contains a zero value. |
| ifInOctets | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.10 | Total number of octets received on the interface, including framing characters. |
| ifInUcastPkts | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.11 | Number of subnetwork-unicast packets delivered to a higher-layer protocol. |
| ifInNUcastPkts | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.12 | Number of non-unicast (i.e., subnetwork-broadcast or subnetwork-multicast) packets delivered to a higher-layer protocol. |
| ifInDiscards | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.13 | Number of inbound packets which were chosen to be discarded even though no errors had been detected to prevent their being deliverable to a higher-layer protocol. One possible reason for discarding such a packet could be to free up buffer space. |
| ifInErrors | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.14 | Number of inbound packets that contained errors preventing them from being deliverable to a higher-layer protocol. |
| ifInUnknownProtos | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.15 | Number of packets received via the interface which were discarded because of an unknown or unsupported protocol. |
| ifOutOctets | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.16 | Total number of octets transmitted out of the interface, including framing characters. |
| ifOutUcastPkts | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.17 | Total number of packets that higher-level protocols requested be transmitted to a subnetwork-unicast address, including those that were discarded or not sent. |
| ifOutNUcastPkts | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.18 | Total number of packets that higher-level protocols requested be transmitted to a non-unicast (i.e., a subnetwork-broadcast or subnetwork-multicast) address, including those that were discarded or not sent. |
| ifOutDiscards | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.19 | Number of outbound packets which were chosen to be discarded even though no errors had been detected to prevent their being transmitted. One possible reason for discarding such a packet could be to free up buffer space. |
| ifOutErrors | ifTable.ifEntry: 1.3.6.1.2.1.2.2.1.20 | Number of outbound packets that could not be transmitted because of errors. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|--|--|
| ifOutQLen | ifTable.ifEntry: 1.3.6.1.2.1.2.1.21 | Length of the output packet queue (in packets). |
| ifSpecific | ifTable.ifEntry: 1.3.6.1.2.1.2.1.22 | Returns a reference to MIB definitions specific to the particular media being used to realize the interface. For example, if the interface is realized by an ethernet, then the value of this object refers to a document defining objects specific to Ethernet. If this information is not present, its value should be set to the OBJECT IDENTIFIER {0 0}, which is a syntactically valid object identifier, and any conformant implementation of ASN.1 and BER must be able to generate and recognize this value. |

Interface Scalar Example

The following example shows the scalar variable associated with the interface MIB. The value given in the example will differ from your value.

| Instance ID | Value |
|-------------|-------|
| IfNumber.0 | 4 |

Interface Table Examples

The following table contains examples of Interface table values. The values are for the purpose of the example and differ from yours.

| OID | Table Index | | | |
|----------------|-------------------------------------|------------------|-------------------------------------|-------------------------------------|
| | 1 | 2 | 3 | 4 |
| ifIndex | 1 | 2 | 3 | 4 |
| ifDescr | wancom0 | lo0 | wancom1 | FOO |
| ifType | ethernet-csmacd | softwareLoopback | ethernet-csmacd | gigabitEthernet |
| ifMtu | 1500 | 32768 | 1500 | 1500 |
| ifSpeed | 100000000 | 100000000 | 100000000 | 1000000000 |
| ifPhysAddress | 0x00 0x08 0x25 0x01 0x48 0x40 | | 0x00 0x08 0x25 0x01 0x48 0x41 | 0x00 0x08 0x25 0x01 0x48 0x44 |
| ifAdminStatus | up | up | down | up |
| ifOperStatus | up | up | down | up |
| ifLastChange | 4318 | 4318 | 4318 | 4099 |
| ifInOctets | 0 | 0 | 0 | 0 |
| ifInUcastPkts | 461 | 431 | 0 | 0 |
| ifInNUcastPkts | 37975 | 0 | 0 | 43 |
| ifInDiscards | 0 | 0 | 0 | 0 |
| ifInErrors | 0 | 0 | 0 | 0 |

| OID | Table Index | | | |
|-----------------|-------------|------|------|------|
| ifOutOctets | 0 | 0 | 0 | 2752 |
| ifOutUcastPkts | 810 | 431 | 0 | 0 |
| ifOutNUcastPkts | 0 | 0 | 0 | 43 |
| ifOutDiscards | 0 | 0 | 0 | 0 |
| ifOutErrors | 0 | 0 | 0 | 0 |
| ifSpecific | .0.0 | .0.0 | .0.0 | .0.0 |

ifName Support (RFC 2863)

Acme Packet supports the ifName entry of the ifXTable, which is an extension to the interface table and which replaces ifExtnsTable. See RFC 2863 for details.

ifName is the textual name of the interface. The value of this object should be the name of the interface as assigned by the local device and should be suitable for use in commands entered at the device's *console*. This might be a text name, such as `1e0` or a simple port number, such as `1`, depending on the interface naming syntax of the device. If several entries in the ifTable together represent a single interface as named by the device, then each will have the same value of ifName. For an agent that responds to SNMP queries concerning an interface on some other (proxied) device, the value of ifName is the proxied device's local name for it.

If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string.

Examples of ifIndex Values

The following table lists examples of ifIndex values.

| IfIndex Value | Interface | Slot and Port |
|--|--------------------------|----------------|
| <i>Rear interfaces</i> | | |
| 1 | VXINTF 0 | wancom 0 |
| 2 | loopback interface (lo0) | |
| 3 | VXINTF 1 | wancom 1 |
| 4 | VXINTF 2 | wancom 2 |
| <i>Single-port GigE physical layer cards</i> | | |
| 5 | GIGPORT 0 | slot 1, port 0 |
| 6 | GIGPORT 1 | slot 1, port 1 |
| <i>Dual-port GigE physical layer cards</i> | | |
| 5 | GIGPORT 0 | slot 1, port 0 |
| 6 | GIGPORT 1 | slot 2, port 0 |
| 7 | GIGPORT 2 | slot 1, port 1 |
| 8 | GIGPORT 3 | slot 2, port 1 |
| <i>Fast Ethernet 10/100 physical layer cards</i> | | |
| 5 | FEPOR T 0 | slot 1, port 0 |

| ifIndex Value | Interface | Slot and Port |
|---------------------------|-------------------------|--|
| 6 | FEPOR T 1 | slot 2, port 0 |
| 7 | FEPOR T 2 | slot 1, port 1 |
| 8 | FEPOR T 3 | slot 2, port 1 |
| 9 | FEPOR T 4 | slot 1, port 2 |
| 10 | FEPOR T 5 | slot 2, port 2 |
| 11 | FEPOR T 6 | slot 1, port 3 |
| 12 | FEPOR T 7 | slot 2, port 3 |
| <i>Virtual Interfaces</i> | | |
| 13 (and continuing) | sp0 (and continuing) | slow path Values will increment starting at ifIndex 13 for each virtual interface that you have configured on your Net-Net SBC. |

High Capacity MIB Counters (ifXtable Support)

New to Release C5.0.

To support 64-bit counters for interface statistics, the Net-Net SBC now supports the ifXTable MIB (OID 1.3.6.1.2.1.31.1.1) from the IFMIB (1.2.3.1.2.1.31). Only Gets are supported for this MIB object, and only media interfaces will be returned in an SNMP query. All other interfaces do not support 64-bit counters.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|---|
| interfaces (1.3.6.1.2.1.2) | | |
| ifNumber | interfaces: 1.3.6.1.2.1.2.1 | Number of network interfaces (regardless of their current state) present on this system. |
| ifMIB (1.3.6.1.2.1.31) | | |
| ifXTable.ifXEntry (1.3.6.1.2.1.31.1.1.1) | | |
| ifName | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.1 | The textual name of the interface. The value of this object should be the name of the interface as assigned by the local device and should be suitable for use in commands entered at the device's 'console.' This might be a text name, such as 'le0' or a simple port number, such as '1,' depending on the interface naming syntax of the device. If several entries in the ifTable together represent a single interface as named by the device, then each will have the same value of ifName. Note that for an agent which responds to SNMP queries concerning an interface on some other (proxied) device, then the value of ifName for such an interface is the proxied device's local name for it. If there is no local name, or this object is otherwise not applicable, then this object contains a zero-length string. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|--|--|
| ifInMulticastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.2 | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifInBroadcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.3 | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifOutMulticastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.4 | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifOutBroadcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.5 | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCInOctets | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.6 | The total number of octets received on the interface, including framing characters. This object is a 64-bit version of ifInOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCInUcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.7 | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were not addressed to a multicast or broadcast address at this sub-layer. This object is a 64-bit version of ifInUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCMulticastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.8 | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a multicast address at this sub-layer. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifInMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|------------------------|---|---|
| ifHCInBroadcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.9 | The number of packets, delivered by this sub-layer to a higher (sub-)layer, which were addressed to a broadcast address at this sub-layer. This object is a 64-bit version of ifInBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCOutOctets | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.10 | The total number of octets transmitted out of the interface, including framing characters. This object is a 64-bit version of ifOutOctets. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCOutUcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.11 | The total number of packets that higher-level protocols requested be transmitted, and which were not addressed to a multicast or broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutUcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifHCOutMulticastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.12 | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a multicast address at this sub-layer, including those that were discarded or not sent. For a MAC layer protocol, this includes both Group and Functional addresses. This object is a 64-bit version of ifOutMulticastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifOutBroadcastPkts | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.13 | The total number of packets that higher-level protocols requested be transmitted, and which were addressed to a broadcast address at this sub-layer, including those that were discarded or not sent. This object is a 64-bit version of ifOutBroadcastPkts. Discontinuities in the value of this counter can occur at re-initialization of the management system, and at other times as indicated by the value of ifCounterDiscontinuityTime. |
| ifLinkUpDownTrapEnable | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.14 | Indicates whether linkUp/linkDown traps should be generated for this interface. By default, this object should have the value enabled(1) for interfaces which do not operate on 'top' of any other interface (as defined in the ifStackTable), and disabled(2) otherwise. |
| ifHighSpeed | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.15 | An estimate of the interface's current bandwidth in units of 1,000,000 bits per second. If this object reports a value of `n` then the speed of the interface is somewhere in the range of `n-500,000` to `n+499,999`. For interfaces which do not vary in bandwidth or for those where no accurate estimation can be made, this object should contain the nominal bandwidth. For a sub-layer which has no concept of bandwidth, this object should be zero. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|---|---|
| ifPromiscuousMode | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.16 | <p>This object has a value of false(2) if this interface only accepts packets/frames that are addressed to this station. This object has a value of true(1) when the station accepts all packets/frames transmitted on the media. The value true(1) is only legal on certain types of media. If legal, setting this object to a value of true(1) may require the interface to be reset before becoming effective.</p> <p>The value of ifPromiscuousMode does not affect the reception of broadcast and multicast packets/frames by the interface.</p> |
| ifConnectorPresent | ifXTable.ifXEntry: 1.3.6.1.2.1.31.1.1.1.17 | <p>This object has the value 'true(1)' if the interface sublayer has a physical connector and the value 'false(2)' otherwise.</p> |

IP Group

The following table describes the standard SNMP Get support for the IP group. Implementation of the IP group is mandatory for all systems. The IP address table contains this entity's IP addressing information.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------------|-----------------------------------|---|
| The IP Group | | |
| ip (1.3.6.1.2.1.4) | | |
| ipForwarding | ip: 1.3.6.1.2.1.4.1 | <p>Indicates whether this entity is acting as an IP gateway in respect to the forwarding of datagrams received by, but not addressed to, this entity. IP gateways forward datagrams. IP hosts do not (except those source-routed via the host). Note that for some managed nodes, this object may take on only a subset of the values possible. Accordingly, it is appropriate for an agent to return a badvalue response if a management station attempts to change this object to an inappropriate value.</p> |
| ipDefaultTTL | ip: 1.3.6.1.2.1.4.2 | <p>Default value inserted into the Time-To-Live (TTL) field of the IP header of datagrams originated at this entity, whenever a TTL value is not supplied by the transport layer protocol.</p> |
| ipInReceives | ip: 1.3.6.1.2.1.4.3 | <p>Total number of input datagrams received from interfaces, including those received in error.</p> |
| ipInHdrErrors | ip: 1.3.6.1.2.1.4.4 | <p>Number of input datagrams discarded due to errors in their IP headers, including bad checksums, version number mismatch, other format errors, time-to-live exceeded, errors discovered in processing their IP options, and so on.</p> |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|-----------------------------------|--|
| ipInAddrErrors | ip: 1.3.6.1.2.1.4.5 | Number of input datagrams discarded because the IP address in their IP header's destination field was not a valid address to be received at this entity. This count includes invalid addresses (for example, 0.0.0.0) and addresses of unsupported Classes (for example, Class E). For entities which are not IP Gateways and therefore do not forward datagrams, this counter includes datagrams discarded because the destination address was not a local address. |
| ipForwDatagrams | ip: 1.3.6.1.2.1.4.6 | Number of input datagrams for which this entity was not their final IP destination, as a result of which an attempt was made to find a route to forward them to that final destination. In entities which do not act as IP gateways, this counter includes only those packets which were Source-Routed via this entity, and the Source-Route option processing was successful. |
| ipInUnknownProtos | ip: 1.3.6.1.2.1.4.7 | Number of locally-addressed datagrams received successfully but discarded because of an unknown or unsupported protocol. |
| ipInDiscards | ip: 1.3.6.1.2.1.4.8 | Number of input IP datagrams for which no problems were encountered to prevent their continued processing, but which were discarded (e.g., for lack of buffer space). (Note that this counter does not include any datagrams discarded while awaiting re-assembly.) |
| ipInDelivers | ip: 1.3.6.1.2.1.4.9 | Total number of input datagrams successfully delivered to IP user-protocols including ICMP. |
| ipOutRequests | ip: 1.3.6.1.2.1.4.10 | Total number of IP datagrams which local IP user-protocols (including ICMP) supplied to IP in requests for transmission. (Note that this counter does not include any datagrams counted in ipForwDatagrams.) |
| ipOutDiscards | ip: 1.3.6.1.2.1.4.11 | Number of output IP datagrams for which no problem was encountered to prevent their transmission to their destination, but which were discarded (e.g., for lack of buffer space). (Note that this counter would include datagrams counted in ipForwDatagrams if any such packets met this (discretionary) discard criterion.) |
| ipOutNoRoutes | ip: 1.3.6.1.2.1.4.12 | Number of IP datagrams discarded because a route could not be found to transmit them to their destination. Note that this counter includes any packets counted in ipForwDatagrams which meet this "no-route" criterion. (This includes any datagrams which a host cannot route because all of its default gateways are down.) |
| ipReasmTimeout | ip: 1.3.6.1.2.1.4.13 | Maximum number of seconds which received fragments are held while they are awaiting reassembly at this entity. |
| ipReasmReqds | ip: 1.3.6.1.2.1.4.14 | Number of IP fragments received which needed to be reassembled at this entity. |
| ipReasmOKs | ip: 1.3.6.1.2.1.4.15 | Number of IP datagrams successfully re-assembled. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|-----------------------------------|--|
| ipReasmFails | ip: 1.3.6.1.2.1.4.16 | Number of failures detected by the IP re-assembly algorithm (for whatever reason: timed out, errors, etc.). (Note that this is not necessarily a count of discarded IP fragments since some algorithms (notably the algorithm in RFC 815) can lose track of the number of fragments by combining them as they are received.) |
| ipFragOKs | ip: 1.3.6.1.2.1.4.17 | Number of IP datagrams that have been successfully fragmented at this entity. |
| ipFragFails | ip: 1.3.6.1.2.1.4.18 | Number of IP datagrams that have been discarded because they needed to be fragmented at this entity but could not be (for example, because their Don't Fragment flag was set). |
| ipFragCreates | ip: 1.3.6.1.2.1.4.19 | Number of IP datagram fragments that have been generated as a result of fragmentation at this entity. |

The IP Address Table

ipAddrTable.ipAddrEntry (1.3.6.1.2.1.4.20.1)

| | | |
|---------------------|--|---|
| ipAdEntAddr | ipAddrTable.ipAddrEntry: 1.3.6.1.2.1.4.20.1.1 | IP address to which this entry's addressing information pertains. |
| ipAdEntIfIndex | ipAddrTable.ipAddrEntry: 1.3.6.1.2.1.4.20.1.2 | Index value which uniquely identifies the interface to which this entry is applicable. The interface identified by a particular value of this index is the same interface as identified by the same value of ifIndex. |
| ipAdEntNetMask | ipAddrTable.ipAddrEntry: 1.3.6.1.2.1.4.20.1.3 | Subnet mask associated with the IP address of this entry. The value of the mask is an IP address with all the network bits set to 1 and all the host bits set to 0. |
| ipAdEntBcastAddr | ipAddrTable.ipAddrEntry: 1.3.6.1.2.1.4.20.1.4 | Value of the least-significant bit in the IP broadcast address used for sending datagrams on the (logical) interface associated with the IP address of this entry. For example, when the Internet standard all-ones broadcast address is used, the value is 1. This value applies to both the subnet and network broadcasts addresses used by the entity on this (logical) interface. |
| ipAdEntReasmMaxSize | ipAddrTable.ipAddrEntry: 1.3.6.1.2.1.4.20.1.5 | Size of the largest IP datagram which this entity can re-assemble from incoming IP fragmented datagrams received on this interface. |

IP Scalar Example

The following example shows the scalar variables associated with the IP MIB. The values given in the example will differ from your values.

| Instance ID | Value |
|------------------|------------|
| IpForwarding.0 | Forwarding |
| IpDefaultTTL.0 | 64 |
| IpInReceives.0 | 15716 |
| IpInHdrErrors.0 | 0 |
| IpInAddrErrors.0 | 1024 |

| Instance ID | Value |
|---------------------|-------|
| IpForwDatagrams.0 | 0 |
| IPInUnknownProtos.0 | 177 |
| IpInDiscards.0 | 0 |
| IpInDelivers.0 | 14521 |
| IpOutRequests.0 | 30319 |
| IpOutDiscards.0 | 0 |
| IpOutNoRoutes.0 | 0 |
| IpReasmTimeout.0 | 60 |
| IpReasmReqds.0 | 0 |
| IpReasmOKs.0 | 0 |
| IpReasmFails.0 | 0 |
| IpFragOKs.0 | 0 |
| IpFragFails.0 | 0 |
| IpFragCreates.0 | 0 |

IP Address Table Example

The following table contains examples of IP address table values. The values are for the purpose of the example and differ from yours.

| OID | Table Index | | | |
|---------------------|-------------|-----------|--------------|---------------|
| | 11.0.0.1 | 127.0.0.1 | 172.30.29.31 | 192.168.0.71 |
| ipAdEntAddr | 11.0.0.1 | 127.0.0.1 | 172.30.29.31 | 192.168.0.71 |
| ipAdEntIfIndex | 3 | 2 | 1 | 5 |
| ipAdEntNetMask | 255.0.0.0 | 255.0.0.0 | 255.255.0.0 | 255.255.255.0 |
| ipAdEntBcastAddr | 1 | 1 | 1 | 1 |
| ipAdEntReasmMaxSize | 65535 | 65535 | 65535 | 65535 |

ICMP Group

The following table describes the standard SNMP Get support for the Internet Control Message Protocol (ICMP) group. Implementation of the ICMP group is mandatory for all systems.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|-----------------------------|-----------------------------------|---|
| The ICMP Group | | |
| icmp (1.3.6.1.2.1.5) | | |
| icmpInMsgs | icmp: 1.3.6.1.2.1.5.1 | Total number of ICMP messages which the entity received. (Note that this counter includes all those counted by icmpInErrors.) |
| icmpInErrors | icmp: 1.3.6.1.2.1.5.2 | Number of ICMP messages which the entity received but determined as having ICMP-specific errors (bad ICMP checksums, bad length, and so on). |
| icmpInDestUnreachs | icmp: 1.3.6.1.2.1.5.3 | Number of ICMP Destination Unreachable messages received. |
| icmpInTimeExcds | icmp: 1.3.6.1.2.1.5.4 | Number of ICMP Time Exceeded messages received. |
| icmpInParmProbs | icmp: 1.3.6.1.2.1.5.5 | Number of ICMP Parameter Problem messages received. |
| icmpInSrcQuenches | icmp: 1.3.6.1.2.1.5.6 | Number of ICMP Source Quench messages received. |
| icmpInRedirects | icmp: 1.3.6.1.2.1.5.7 | Number of ICMP Redirect messages received. |
| icmpInEchos | icmp: 1.3.6.1.2.1.5.8 | Number of ICMP Echo (request) messages received. |
| icmpInEchoReps | icmp: 1.3.6.1.2.1.5.9 | Number of ICMP Echo Reply messages received. |
| icmpInTimestamps | icmp: 1.3.6.1.2.1.5.10 | Number of ICMP Timestamp (request) messages received. |
| icmpInTimestampReps | icmp: 1.3.6.1.2.1.5.11 | Number of ICMP Timestamp Reply messages received. |
| icmpInAddrMasks | icmp: 1.3.6.1.2.1.5.12 | Number of ICMP Address Mask Request messages received. |
| icmpInAddrMaskReps | icmp: 1.3.6.1.2.1.5.13 | Number of ICMP Address Mask Reply messages received. |
| icmpOutMsgs | icmp: 1.3.6.1.2.1.5.14 | Total number of ICMP messages which this entity attempted to send. (This counter includes all those counted by icmpOutErrors.) |
| icmpOutErrors | icmp: 1.3.6.1.2.1.5.15 | Number of ICMP messages which this entity did not send due to problems discovered within ICMP such as a lack of buffers. This value does not include errors discovered outside the ICMP layer such as the inability of IP to route the resultant datagram. In some implementations there may be no types of error which contribute to this counter's value. |
| icmpOutDestUnreachs | icmp: 1.3.6.1.2.1.5.16 | Number of ICMP Destination Unreachable messages sent. |
| icmpOutTimeExcds | icmp: 1.3.6.1.2.1.5.17 | Number of ICMP Time Exceeded messages sent. |
| icmpOutParmProbs | icmp: 1.3.6.1.2.1.5.18 | Number of ICMP Parameter Problem messages sent. |
| icmpOutSrcQuenches | icmp: 1.3.6.1.2.1.5.19 | Number of ICMP Source Quench messages sent. |
| icmpOutRedirects | icmp: 1.3.6.1.2.1.5.20 | Number of ICMP Redirect messages sent. For a host, this object will always be zero, since hosts do not send redirects. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|----------------------|-----------------------------------|--|
| icmpOutEchos | icmp: 1.3.6.1.2.1.5.21 | Number of ICMP Echo (request) messages sent. |
| icmpOutEchoReps | icmp: 1.3.6.1.2.1.5.22 | Number of ICMP Echo Reply messages sent. |
| icmpOutTimestamps | icmp: 1.3.6.1.2.1.5.23 | Number of ICMP Timestamp (request) messages sent. |
| icmpOutTimestampReps | icmp: 1.3.6.1.2.1.5.24 | Number of ICMP Timestamp Reply messages sent. |
| icmpOutAddrMasks | icmp: 1.3.6.1.2.1.5.25 | Number of ICMP Address Mask Request messages sent. |
| icmpOutAddrMaskReps | icmp: 1.3.6.1.2.1.5.26 | Number of ICMP Address Mask Reply messages sent. |

ICMP Scalar Example

The following example shows the scalar variables associated with the ICMP MIB. The values given in the example will differ from your values.

| Instance ID | Value |
|-----------------------|-------|
| IcmpInMsgs.0 | 246 |
| IcmpInErrors.0 | 0 |
| IcmpInDestUnreachs.0 | 246 |
| IcmpInTimeExcds.0 | 0 |
| IcmpInParmProbs.0 | 0 |
| IcmpInSrcQuenches.0 | 0 |
| IcmpInRedirects.0 | 0 |
| IcmpInEchos.0 | 0 |
| IcmpInEchoReps.0 | 0 |
| IcmpInTimestamps.0 | 0 |
| IcmpInTimestampReps.0 | 0 |
| IcmpInAddrMasks.0 | 60 |
| IcmpInAddrMaskReps.0 | 0 |
| IcmpOutMsgs.0 | 132 |
| IcmpOutErrors.0 | 132 |
| IcmpOutDestUnreachs.0 | 132 |
| IcmpOutTimeExcds.0 | 0 |
| IcmpOutParmProbs.0 | 0 |
| IcmpOutSrcQuenches.0 | 0 |
| IcmpOutRedirects.0 | 0 |
| IcmpOutEchos.0 | 0 |
| IcmpOutEchoReps.0 | 0 |
| IcmpOutTimestamps.0 | 0 |

| Instance ID | Value |
|------------------------|-------|
| IcmpOutTimestampReps.0 | 0 |
| IcmpOutAddrMasks.0 | 0 |
| IcmpOutAddrMaskReps.0 | 0 |

TCP Group

The following table describes the standard SNMP Get support for the TCP connection table, which contains information about this entity's existing TCP connections.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|----------------------------|-----------------------------------|---|
| The TCP Group | | |
| tcp (1.3.6.1.2.1.6) | | |
| tcpRtoAlgorithm | tcp: 1.3.6.1.2.1.6.1 | Algorithm used to determine the timeout value used for retransmitting unacknowledged octets. |
| tcpRtoMin | tcp: 1.3.6.1.2.1.6.2 | Minimum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is <code>rsre(3)</code> , an object of this type has the semantics of the LBOUND quantity described in RFC 793. |
| tcpRtoMax | tcp: 1.3.6.1.2.1.6.3 | Maximum value permitted by a TCP implementation for the retransmission timeout, measured in milliseconds. More refined semantics for objects of this type depend upon the algorithm used to determine the retransmission timeout. In particular, when the timeout algorithm is <code>rsre(3)</code> , an object of this type has the semantics of the UBOUND quantity described in RFC 793. |
| tcpMaxConn | tcp: 1.3.6.1.2.1.6.4 | Total number of TCP connections the entity supports. In entities where the maximum number of connections is dynamic, this object contains the value -1. |
| tcpActiveOpens | tcp: 1.3.6.1.2.1.6.5 | Number of times TCP connections made a direct transition to the SYN-SENT state from the CLOSED state. |
| tcpPassiveOpens | tcp: 1.3.6.1.2.1.6.6 | Number of times TCP connections made a direct transition to the SYN-RCVD state from the LISTEN state. |
| tcpAttemptFails | tcp: 1.3.6.1.2.1.6.7 | Number of times TCP connections made a direct transition to the CLOSED state from either the SYN-SENT state or the SYN-RCVD state, plus the number of times TCP connections made a direct transition to the LISTEN state from the SYN-RCVD state. |
| tcpEstabResets | tcp: 1.3.6.1.2.1.6.8 | Number of times TCP connections made a direct transition to the CLOSED state from either the ESTABLISHED state or the CLOSE-WAIT state. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|---|
| tcpCurrEstab | tcp: 1.3.6.1.2.1.6.9 | Number of TCP connections for which the current state is either ESTABLISHED or CLOSE-WAIT. |
| tcpInSegs | tcp: 1.3.6.1.2.1.6.10 | Total number of segments received, including those received in error. This count includes segments received on currently established connections. |
| tcpOutSegs | tcp: 1.3.6.1.2.1.6.11 | Total number of segments sent, including those on current connections but excluding those containing only retransmitted octets. |
| tcpRetransSegs | tcp: 1.3.6.1.2.1.6.12 | Total number of segments retransmitted - that is, the number of TCP segments transmitted containing one or more previously transmitted octets. |
| tcpInErrs | tcp: 1.3.6.1.2.1.6.14 | Total number of segments received in error (for example, bad TCP checksums). |
| tcpOutRsts | tcp: 1.3.6.1.2.1.6.15 | Number of TCP segments sent containing the RST flag. |
| The TCP Connection Table | | |
| tcpConnTable.tcpConnEntry (1.3.6.1.2.1.6.13.1) | | |
| tcpConnState | tcpConnTable.tcpConnEntry: 1.3.6.1.2.1.6.13.1.1 | <p>State of this TCP connection. The only value which may be set by a management station is deleteTCB(12). Accordingly, it is appropriate for an agent to return a badValue response if a management station attempts to set this object to any other value.</p> <p>If a management station sets this object to the value deleteTCB(12), then this has the effect of deleting the TCB (as defined in RFC 793) of the corresponding connection on the managed node, resulting in immediate termination of the connection. As an implementation-specific option, an RST segment may be sent from the managed node to the other TCP endpoint (note however that RST segments are not sent reliably).</p> |
| tcpConnLocalAddress | tcpConnTable.tcpConnEntry: 1.3.6.1.2.1.6.13.1.2 | Local IP address for this TCP connection. In the case of a connection in the listen state which is willing to accept connections for any IP interface associated with the node, the value is 0.0.0.0. |
| tcpConnLocalPort | tcpConnTable.tcpConnEntry: 1.3.6.1.2.1.6.13.1.3 | Local port number for this TCP connection. |
| tcpConnRemAddress | tcpConnTable.tcpConnEntry: 1.3.6.1.2.1.6.13.1.4 | Remote IP address for this TCP connection. |
| tcpConnRemPort | tcpConnTable.tcpConnEntry: 1.3.6.1.2.1.6.13.1.5 | Remote port number for this TCP connection. |

TCP Scalar Example

The following example shows the scalar variables associated with the TCP MIB. The values given in the example will differ from your values.

| Instance ID | Value |
|-------------------|-------|
| TcpRtoAlgorithm.0 | vanj |
| TcpRtoMin.0 | 1000 |
| TcpRtoMax.0 | 64000 |
| TcpMaxConn.0 | -1 |
| TcpActiveOpens.0 | 9 |
| TcpPassiveOpens.0 | 9 |
| TcpAttemptFails.0 | 0 |
| TcpEstabResets.0 | 0 |
| TcpCurrEstab.0 | 18 |
| TcpInSegs.0 | 70 |
| TcpOutSegs.0 | 70 |
| TcpRetranSegs.0 | 0 |
| TcpInErrs.0 | 0 |
| TcpOutRsts.0 | 0 |

TCP Connection Table Example

The following table contains examples of the TCP connection table indexed by tcpConnLocalAddress, tcpConnLocalPort, tcpConnRemAddress, and tcpConnRemPort. The values used in the example will differ from what you see.

| OID | Table Index Values | Table Index | | | | | |
|---------------------|---------------------|-------------|---------|-------------|-------------|--------------|--------------|
| | tcpConnLocalAddress | 0.0.0.0 | 0.0.0.0 | 127.0.0.1 | 127.0.0.1 | 172.30.29.31 | 172.30.29.31 |
| | tcpConnLocalPort | 0 | 21 | 1024 | 3000 | 3000 | 3001 |
| | tcpConnRemAddress | 0.0.0.0 | 0.0.0.0 | 127.0.0.1 | 127.0.0.1 | 0.0.0.0 | 0.0.0.0 |
| | tcpConnRemPort | 0 | 0 | 3000 | 1040 | 0 | 0 |
| tcpConnState | | closed | listen | established | established | listen | listen |
| tcpConnLocalAddress | | 0.0.0.0 | 0.0.0.0 | 127.0.0.1 | 127.0.0.1 | 172.30.29.31 | 172.30.29.31 |
| tcpConnLocalPort | | 0 | 21 | 1024 | 3000 | 3000 | 3001 |
| tcpConnRemAddress | | 0.0.0.0 | 0.0.0.0 | 127.0.0.1 | 127.0.0.1 | 0.0.0.0 | 0.0.0.0 |
| tcpConnRemPort | | 0 | 0 | 3000 | 1040 | 0 | 0 |

UDP Group

The following table describes the standard SNMP Get support for the UDP group. Implementation of the UDP group is mandatory for all systems which implement the UDP. The UDP listener table contains information about this entity's UDP endpoints on which a local application is currently accepting datagrams.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--|---|
| The UDP Group | | |
| udp (1.3.6.1.2.1.7) | | |
| udpInDatagrams | udp: 1.3.6.1.2.1.7.1 | Total number of UDP datagrams delivered to UDP users. |
| udpNoPorts | udp: 1.3.6.1.2.1.7.2 | Total number of received UDP datagrams for which there was no application at the destination port. |
| udpInErrors | udp: 1.3.6.1.2.1.7.3 | Number of received UDP datagrams that could not be delivered for reasons other than the lack of an application at the destination port. |
| udpOutDatagrams | udp: 1.3.6.1.2.1.7.4 | Total number of UDP datagrams sent from this entity. |
| The UDP Listener Table | | |
| udpTable.udpEntry (1.3.6.1.2.1.7.5.1) | | |
| udpLocalAddress | udpTable.udpEntry: 1.3.6.1.2.1.7.5.1.1 | Local IP address for this UDP listener. In the case of a UDP listener which is willing to accept datagrams for any IP interface associated with the node, the value is 0.0.0.0. |
| udpLocalPort | udpTable.udpEntry: 1.3.6.1.2.1.7.5.1.2 | Local port number for this UDP listener. |

UDP Scalar Example

The following example shows the scalar variables associated with the UDP MIB. The values given in the example will differ from your values.

| Instance ID | Value |
|-------------------|-------|
| UdpInDatagrams.0 | 5007 |
| UdpNoPorts.0 | 21434 |
| UdpInErrors.0 | 0 |
| UdpOutDatagrams.0 | 51525 |

UDP Table Example

The following table contains examples of the UDP table values. The values used in the example will differ from what you see.

| OID | Table Index Values | Table Index | | | | | |
|-----------------|--------------------|-------------|----------|-----------|-----------|--------------|--------------|
| UdpLocalAddress | UdpLocalAddress | 0.0.0.0 | 11.0.0.1 | 127.0.0.1 | 127.0.0.1 | 172.30.29.31 | 172.30.29.31 |
| | UdpLocalPort | 0 | 1985 | 123 | 5060 | 123 | 1030 |
| | | 0.0.0.0 | 11.0.0.1 | 127.0.0.1 | 127.0.0.1 | 172.30.29.31 | 172.30.29.31 |
| UdpLocalPort | | 0 | 1985 | 123 | 5060 | 123 | 1030 |

System Group

The following table describes the standard SNMP Get support for the system group which is a collection of objects common to all managed systems.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|-------------------------------|--------------------------------|---|
| The System Group | | |
| system (1.3.6.1.2.1.1) | | |
| sysDescr | system: 1.3.6.1.2.1.1.1 | Textual description of the entity. This value includes the full name and version identification of the system's hardware type, software operating-system, and networking software. |
| sysObjectID | system: 1.3.6.1.2.1.1.2 | Vendor's authoritative identification of the network management subsystem contained in the entity. This value is allocated within the SMI enterprises subtree (1.3.6.1.4.1) and provides an easy and unambiguous means for determining what kind of box is being managed. For example, if vendor Flintstones, Inc. was assigned the subtree 1.3.6.1.4.1.4242, it could assign the identifier 1.3.6.1.4.1.4242.1.1 to its Fred Router. |
| sysUpTime | system: 1.3.6.1.2.1.1.3 | Time (in hundredths of a second) since the network management portion of the system was last re-initialized. |
| sysContact | system: 1.3.6.1.2.1.1.4 | Textual identification of the contact person for this managed node, together with information on how to contact this person. If no contact information is known, the value is the zero-length string. |
| sysName | system: 1.3.6.1.2.1.1.5 | Administratively-assigned name for this managed node. By convention, this is the node's fully-qualified domain name. If the name is unknown, the value is the zero-length string. |
| sysLocation | system: 1.3.6.1.2.1.1.6 | Physical location of this node (for example, telephone closet, 3rd floor). If the location is unknown, the value is the zero-length string. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|-----------------------------------|--|
| sysServices | system: 1.3.6.1.2.1.1.7 | <p>Value which indicates the set of services that this entity may potentially offer. The value is a sum which initially takes the value zero, Then, for each layer, L, in the range 1 through 7, that this node performs transactions for, 2 raised to (L - 1) is added to the sum. For example, a node which performs only routing functions would have a value of 4 ($2^{(3-1)}$). In contrast, a node which is a host offering application services would have a value of 72 ($2^{(4-1)} + 2^{(7-1)}$). In the context of the Internet suite of protocols, values should be calculated accordingly:</p> |
| layer: functionality | | |
| 1: physical (for example, repeaters) | | |
| 2: datalink/subnetwork (for example, bridges) | | |
| 3: internet (for example, supports IP) | | |
| 4: end-to-end (for example, supports TCP) | | |
| 7: applications (for example., supports SMTP) | | |
| For systems including OSI protocols, layers 5 and 6 may also be counted. | | |
| sysORLastChange | system: 1.3.6.1.2.1.1.8 | Value of sysUpTime at the time of the most recent change in state or value of any instance of sysORID. |

System Scalar Example

The following example shows the scalar variables associated with the system MIB. The values given in the example will differ from your values.

| Instance ID | Value |
|-------------------|-------------------------------|
| SysDescr.0 | Acme Packet Agent |
| SysObjectID.0 | enterprises.9148 |
| SysUpTime.0 | (1518227) 4:13:02.27 |
| SysContact.0 | Xyz (configurable) |
| SysName.0 | performance1 (configurable) |
| SysLocation.0 | Burlington, MA (configurable) |
| SysServices.0 | 79 |
| SysORLastChange.0 | (1518227) 4:13:02.27 |

Object Resource Information

The following table describes the standard SNMP Get support for the object resource information which is a collection of objects which describe the SNMPv2 entity's (statistically and dynamically configurable) support of various MIB modules.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|--|
| Object Resource Information | | |
| sysORTable.sysOREEntry (1.3.6.1.2.1.1.9.1) | | |
| sysORID | sysORTable.sysOREEntry: 1.3.6.1.2.1.1.9.1.2 | Authoritative identification of a capabilities statement with respect to various MIB modules supported by the local SNMPv2 entity acting in an agent role. |
| sysORDescr | sysORTable.sysOREEntry: 1.3.6.1.2.1.1.9.1.3 | Textual description of the capabilities identified by the corresponding instance of sysORID. |
| sysORUpTime | sysORTable.sysOREEntry: 1.3.6.1.2.1.1.9.1.4 | Value of sysUpTime at the time this conceptual row was last instantiated. |

SysORTableTable Examples

The following table contains examples of the SysORTable values. Using this table, you can see that the instance index sysORID.1 corresponds to enterprises.0148.2.1.1.

| OID | Table Index | | | |
|-------------|---|---|--|--|
| | 1 | 2 | 3 | 4 |
| sysORID | enterprises.9148. 2.1.1 | enterprises.9148. 2.1.2 | enterprises.9148. 2.1.3 | enterprises.9148. 2.1.4 |
| sysORDescr | Acme Packet Inc. Agent supports SNMPv2. | Acme Packet Inc. Agent supports MIB-II. No set requests for ifAdminStatus and tcpConnStat. | Acme Packet Inc. Agent supports Acme Syslog MIBs. | Acme Packet Inc. Agent supports Acme system management MIBs. |
| sysORUpTime | (1518227) 4:13:02.27 | (1518227) 4:13:02.27 | (1518228) 4:13:02.28 | (1518228) 4:13:02.28 |

SNMP Group

The following table describes the standard SNMP Get support for the SNMP group which is a collection of objects providing basic instrumentation and control of an SNMP entity.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|------------------------------|-----------------------------------|--|
| The SNMP Group | | |
| snmp (1.3.6.1.2.1.11) | | |
| snmpInPkts | snmp: 1.3.6.1.2.1.11.1 | Total number of messages delivered to the SNMP entity from the transport service. |
| snmpInBadVersions | snmp: 1.3.6.1.2.1.11.3 | Total number of SNMP messages delivered to the SNMP entity for an unsupported SNMP version. |
| snmpInBadCommunityNames | snmp: 1.3.6.1.2.1.11.4 | Total number of SNMP messages delivered to the SNMP entity which used a SNMP community name not known to said entity. |
| snmpInBadCommunityUses | snmp: 1.3.6.1.2.1.11.5 | Total number of SNMP messages delivered to the SNMP entity which represented an SNMP operation which was not allowed by the SNMP community named in the message. |
| snmpInASNParseErrs | snmp: 1.3.6.1.2.1.11.6 | Total number of ASN.1 or BER errors encountered by the SNMP entity when decoding received SNMP messages. |
| snmpEnableAuthenTraps | snmp: 1.3.6.1.2.1.11.30 | Indicates whether the SNMP entity is permitted to generate authenticationFailure traps. The value of this object overrides any configuration information; as such, it provides a means whereby all authenticationFailure traps may be disabled. (It is strongly recommended that this object be stored in non-volatile memory so that it remains constant across re-initializations of the network management system.) |
| snmpSilentDrops | snmp: 1.3.6.1.2.1.11.31 | Total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the size of a reply containing an alternate Response-PDU with an empty variable-bindings field was greater than either a local constraint or the maximum message size associated with the originator of the request. |
| snmpProxyDrops | snmp: 1.3.6.1.2.1.11.32 | Total number of GetRequest-PDUs, GetNextRequest-PDUs, GetBulkRequest-PDUs, SetRequest-PDUs, and InformRequest-PDUs delivered to the SNMP entity which were silently dropped because the transmission of the (possibly translated) message to a proxy target failed in a manner (other than a timeout) such that no Response-PDU could be returned. |

SNMP Scalar Example

The following example shows the scalar variables associated with the SNMP MIB. The values given in the example will differ from the values you will see.

| Instance ID | Value |
|--|----------|
| <code>SnmpOutPkts.0</code> | 5134 |
| <code>SnmpInBadVersions.0</code> | 3 |
| <code>SnmpInBadCommunityNames.0</code> | 0 |
| <code>SnmpInBadCommunityUses.0</code> | 0 |
| <code>SnmpInASNParseErrs.0</code> | 0 |
| <code>SnmpInTooBigs.0</code> | 0 |
| <code>SnmpInNoSuchNames.0</code> | 0 |
| <code>SnmpInBadValues.0</code> | 0 |
| <code>SnmpInReadOnlys.0</code> | 0 |
| <code>SnmpInGenErrs.0</code> | 0 |
| <code>SnmpInTotalReqVars.0</code> | 4853 |
| <code>SnmpInTotalSetVars.0</code> | 0 |
| <code>SnmpInGetRequests.0</code> | 1 |
| <code>SnmpInGetNexsts.0</code> | 4860 |
| <code>SnmpInSetRequests.0</code> | 0 |
| <code>SnmpInGetResponses.0</code> | 0 |
| <code>SnmpInTraps.0</code> | 0 |
| <code>SnmpOutTooBigs.0</code> | 0 |
| <code>SnmpOutNoSuchNames.0</code> | 0 |
| <code>SnmpOutBadValues.0</code> | 0 |
| <code>SnmpOutGenErrs.0</code> | 0 |
| <code>SnmpOutGetRequests.0</code> | 0 |
| <code>SnmpOutGetNexsts.0</code> | 0 |
| <code>SnmpOutSetRequests.0</code> | 0 |
| <code>SnmpOutGetResponses.0</code> | 4871 |
| <code>SnmpOutTraps.0</code> | 287 |
| <code>SnmpEnableAuthenTraps.0</code> | disabled |
| <code>SnmpSilentDrops.0</code> | 0 |
| <code>SnmpProxyDrops.0</code> | 0 |

Physical Entity Table (rfc2737.mib)

Acme Packet implements the Physical Entity table from the Entity MIB (RFC 2737). The following table describes the standard SNMP Get support for the Entity group, which is a collection of multiple logical entities supported by a single SNMP agent.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|--|
| Physical Entity Table | | |
| entityMIB (1.3.6.1.2.1.47) | | |
| entityMIBObjects (1.3.6.1.2.1.47.1) | | |
| entityPhysical (1.3.6.1.2.1.47.1.1) | | |
| entityPhysicalTable (1.3.6.1.2.1.47.1.1.1) | | |
| entityPhysicalEntry (1.3.6.1.2.1.47.1.1.1.1) | | |
| entPhysicalIndex | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.1 | The index for this entry. |
| entPhysicalDescr | entityPhysicalEntry1.3.6.1.2.1.47. 1.1.1.1.2 | Textual description of the physical entity. A string that identifies the manufacturer's name; which should be set to a distinct value for each version or model of the physical entity. |
| entPhysicalVendorType | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.3 | Indication of the vendor-specific hardware type of the physical entity. (This is different from the definition of MIB-II's sysObjectID). An agent should set this object to a enterprise-specific registration identifier value indicating the specific equipment type in detail. The associated instance of entPhysicalClass is used to indicate the general type of hardware device. If no vendor-specific registration identifier exists for this physical entity, or the value is unknown by this agent, then the value { 0 0 } is returned. |
| entPhysicalContainedIn | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.4 | Value of entPhysicalIndex for the physical entity which contains this physical entity. A value of zero indicates this physical entity is not contained in any other physical entity. The set of <i>containment</i> relationships define a strict hierarchy; that is, recursion is not allowed. In the event a physical entity is contained by more than one physical entity (for example, double-wide modules), this object should identify the containing entity with the lowest value of entPhysicalIndex. |
| entPhysicalClass | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.5 | Indication of the general hardware type of the physical entity. An agent should set this object to the standard enumeration value that most accurately indicates the general class of the physical entity, or the primary class if there is more than one. If no appropriate standard registration identifier exists for this physical entity, then the value other(1) is returned. If the value is unknown by this agent, then the value unknown(2) is returned |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|-------------------------|--|--|
| entPhysicalParentRelPos | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.6 | <p>An indication of the relative position of this <i>child</i> component among all its <i>sibling</i> components. Sibling components are defined as entPhysicalEntries that share the same instance values of each of the entPhysicalContainedIn and entPhysicalClass objects. An NMS can use this object to identify the relative ordering for all sibling components of a particular parent (identified by the entPhysicalContainedIn instance in each sibling entry).</p> <p>This value should match any external labeling of the physical component if possible. For example, for a container (such as card slot) labeled as <i>slot #3</i>, entPhysicalParentRelPos should have the value 3. The entPhysicalEntry for the module plugged in slot 3 should have an entPhysicalParentRelPos value of 1.</p> <p>If the physical position of this component does not match any external numbering or clearly visible ordering, use external reference material to determine the parent-relative position. If this is not possible, the agent should assign a consistent (but possibly arbitrary) ordering to a given set of sibling components, perhaps based on internal representation of the components.</p> <p>If the agent cannot determine the parent-relative position for some reason, or if the associated value of entPhysicalContainedIn is 0, then the value -1 is returned. Otherwise a non-negative integer is returned, indicating the parent-relative position of this physical entity. Parent-relative ordering normally starts from 1 and continues to N, where N represents the highest positioned child entity. However, if the physical entities (for example, slots) are labeled from a starting position of zero, the first sibling should be associated with a entPhysicalParentRelPos value of 0.</p> <p>This ordering might be sparse or dense, depending on agent implementation. The actual values returned are not globally meaningful, as each parent component may use different numbering algorithms. The ordering is only meaningful among siblings of the same parent component. The agent should retain parent-relative position values across reboots, either through algorithmic assignment or use of non-volatile storage</p> |
| entPhysicalName | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.7 | <p>Textual name of the physical entity. The value of this object should be the name of the component as assigned by the local device and should be suitable for use in commands entered at the device's console. This might be a text name, such as <i>console</i> or a simple component number (for example, port or module number), such as 1, depending on the physical component naming syntax of the device. If there is no local name, or this object is otherwise not applicable, this object contains a zero-length string. The value of entPhysicalName for two physical entities will be the same in the event that the console interface does not distinguish between them, for example, <i>slot-1</i> and the card in <i>slot-1</i>.</p> |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|------------------------|---|--|
| entPhysicalHardwareRev | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.8 | Vendor-specific hardware revision string for the physical entity. The preferred value is the hardware revision identifier actually printed on the component itself (if present). If revision information is stored internally in a non-printable (for example, binary) format, the agent must convert such information to a printable format, in an implementation-specific manner. If no specific hardware revision string is associated with the physical component, or this information is unknown to the agent, this object contains a zero-length string. |
| entPhysicalFirmwareRev | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.9 | Vendor-specific firmware revision string for the physical entity. If revision information is stored internally in a non-printable (for example, binary) format, the agent must convert such information to a printable format, in an implementation-specific manner. If no specific firmware programs are associated with the physical component, or this information is unknown to the agent, this object contains a zero-length string. |
| entPhysicalSoftwareRev | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.10 | Vendor-specific software revision string for the physical entity. If revision information is stored internally in a non-printable (for example, binary) format, the agent must convert such information to a printable format, in an implementation-specific manner. If no specific software programs are associated with the physical component, or this information is unknown to the agent, this object contains a zero-length string. |
| entPhysicalSerialNum | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.11 | <p>Vendor-specific serial number string for the physical entity. The preferred value is the serial number string actually printed on the component itself (if present). On the first instantiation of an physical entity, the value of entPhysicalSerialNum associated with that entity is set to the correct vendor-assigned serial number, if this information is available to the agent. If a serial number is unknown or non-existent, the entPhysicalSerialNum will be set to a zero-length string instead.</p> <p>Implementations which can correctly identify the serial numbers of all installed physical entities do not need to provide write access to the entPhysicalSerialNum object.) Agents which cannot provide non-volatile storage for the entPhysicalSerialNum strings are not required to implement write access for this object.</p> <p>Not every physical component will have, or need, a serial number. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to false(2) do not need their own unique serial number. An agent does not have to provide write access for such entities, and might return a zero-length string.</p> <p>If write access is implemented for an instance of entPhysicalSerialNum, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalSerialNum instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the network management system, including those which result in a change of the physical entity's entPhysicalIndex value.</p> |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---------------------|---|---|
| entPhysicalMfgName | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.12 | <p>Name of the manufacturer of this physical component. The preferred value is the manufacturer name string actually printed on the component itself (if present). (Note that comparisons between instances of the entPhysicalModelName, entPhysicalFirmwareRev, entPhysicalSoftwareRev, and the entPhysicalSerialNum objects, are only meaningful amongst entPhysicalEntries with the same value of entPhysicalMfgName.)</p> <p>If the manufacturer name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string.</p> |
| entPhysicalModeName | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.13 | <p>Vendor-specific model name identifier string associated with this physical component. The preferred value is the customer-visible part number, which may be printed on the component itself. If the model name string associated with the physical component is unknown to the agent, then this object will contain a zero-length string.</p> |
| entPhysicalAlias | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.14 | <p>Alias name for the physical entity as specified by a network manager, it provides a non-volatile <i>handle</i> for the physical entity.</p> <p>On the first instantiation of an physical entity, the value of entPhysicalAlias associated with that entity is set to the zero-length string. However, an agent might set the value to a locally unique default value, instead of a zero-length string.</p> <p>If write access is implemented for an instance of entPhysicalAlias, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalAlias instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the network management system, including those which result in a change of the physical entity's entPhysicalIndex value.</p> |
| entPhysicalAssetID | entityPhysicalEntry:1.3.6.1.2.1.47. 1.1.1.1.15 | <p>User-assigned asset tracking identifier for the physical entity as specified by a network manager, which provides non-volatile storage of this information. On the first instantiation of an physical entity, the value of entPhysicalAssetID associated with that entity is set to the zero-length string.</p> <p>Not every physical component will have a asset tracking identifier, or even need one. Physical entities for which the associated value of the entPhysicalIsFRU object is equal to false(2), do not need their own unique asset tracking identifier.</p> <p>An agent does not have to provide write access for such entities, and might instead return a zero-length string. If write access is implemented for an instance of entPhysicalAssetID, and a value is written into the instance, the agent must retain the supplied value in the entPhysicalAssetID instance associated with the same physical entity for as long as that entity remains instantiated. This includes instantiations across all re-initializations/reboots of the network management system, including those which result in a change of the physical entity's entPhysicalIndex value. If no asset tracking information is associated with the physical component, then this object will contain a zero-length string</p> |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|--|
| entPhysicalIsFRU | entityPhysicalEntry:1.3.6.1.2.1.47.1.16 | Whether this physical entity is considered a field replaceable unit by the vendor. true(1) means this is a field replaceable unit. false(2) means this is not a replaceable unit |
| entityGeneral (1.3.6.1.2.1.47.1.4) | | |
| entLastChangeTime | entityPhysicalEntry:1.3.6.1.2.1.47.1.4.1 | Currently the only object in the entGeneral group, this scalar object represents the value of sysUptime when any part of the Entity MIB configuration last changed. |

entPhysicalTable Example

The following table contains examples of the entityPhysicalTable values. The values are for the purpose of the example and are not intended to be a complete list. The table skips from column 3 in the table to column 30.

| OID | Table Index | | | | | |
|-------------------------|------------------------------------|---------------------|----------------------------------|-------|--|--|
| | 1 | 2 | 3 | | 30 | |
| entPhysicalDescr | Assy, Session Director II with QOS | Power Supply tray A | Assy, 150 Watt 110V Power Supply | | Single voltage sensor with multiple inputs | |
| entPhysicalVendorType | .9148.6.1.1.3.2.4 | .9148.6.1.1.4.4 | .9148.6.1.1.5.2 | | .9148.6.1.1.7.3 | |
| entPhysicalContainedIn | 0 | 1 | 2 | | 1 | |
| entPhysicalClass | chassis | container | powerSupply | | Sensor | |
| entPhysicalParentRelPos | 0 | 1 | 1 | | 12 | |
| entPhysicalName | Session Director | Power Tray A | | | Voltage Sensor | |
| entPhysicalHardwareRev | 5 | | | | | |
| entPhysicalFirmwareRev | 1.35 | | | | | |
| entPhysicalSoftwareRev | 0504480025 13 | | | | | |
| entPhysicalSerialNum | Unknown manufacturer | | | | | |
| entPhysicalMfgName | 102-1002-00 | | | | | |
| entPhysicalModelName | | | | | | |
| entPhysicalAlias | | | | | | |
| entPhysicalAssetID | | | | | | |
| entPhysicalIsFRU | 2 | 2 | 1 | | 2 | |

Example**

The following example shows the scalar variable associated with the entityPhysicalTable. The value given in the example will differ from your value.

| Instance ID | Value |
|---------------------|-------|
| EntLastChangeTime.0 | 0 |

Introduction

This section explains the proprietary Acme Packet enterprise SNMP GET requests supported by the Net-Net system. The SNMP GET is used to query for information on or about a network entity.

Acme Packet syslog MIB (ap-slog.mib)

The following table describes the SNMP GET query names for the Acme Packet syslog MIB (ap-slog.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|---|--|
| Object Identifier Name: apSyslogBasic (1.3.6.1.4.1.9148.3.1.1.1) | | |
| apSyslogNotificationsSent | apSyslogBasic: 1.3.6.1.4.1.9148.3.1.1.1.1 | Number of apSyslogMessageGenerated notifications sent. This number may include notifications that were prevented from being transmitted due to reasons such as resource limitations and/or non-connectivity. If one is receiving notifications, one can periodically poll this object to determine if any notifications were missed. If so, a poll of the apSyslogHistoryTable might be appropriate. |
| apSyslogNotificationsEnabled | apSyslogBasic: 1.3.6.1.4.1.9148.3.1.1.1.2 | Information about whether or not apSyslogMessageGenerated notifications will be sent when a syslog message is generated by the device. Disabling notifications does not prevent syslog messages from being added to the apSyslogHistoryTable. |
| apSyslogMaxLevel | apSyslogBasic: 1.3.6.1.4.1.9148.3.1.1.1.3 | Information about which syslog severity levels will be processed. Any syslog message with a log-level value greater than this value will be ignored by the syslog agent. Note that severity numeric values increase as their severity decreases (for example, major (3) is more severe than debug (9)). |
| apSyslogMsgIgnores | apSyslogBasic: 1.3.6.1.4.1.9148.3.1.1.1.4 | Number of syslog messages which were ignored, meaning that there is no need to send an apSyslogMessageGenerated notification. A message will be ignored if it has a log level value greater than the apSyslogMaxLevel value. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--|---|
| apSyslogMsgDrops | apSyslogBasic: 1.3.6.1.4.1.9148.3.1.1.1.5 | Number of syslog messages which could not be processed due to lack of system resources. Most likely, this will occur at the same time that syslog messages are generated to indicate this lack of resources. Increases in this object's value may serve as an indication that Net-Net system resource levels should be examined via other MIB objects. A message that is dropped will not appear in the history table, and no notification will be sent for this message. |
| Object identifier Name: apSyslogHistory (1.3.6.1.4.1.9148.3.1.1.2) | | |
| apSyslogHistTableMaxLength | apSyslogHistory: 1.3.6.1.4.1.9148.3.1.1.2.1 | Upper limit for the number of entries that the apSyslogHistoryTable may contain. A value of 0 will prevent any history from being retained. When the apSyslogHistoryTable is full, the oldest entry will be deleted and a new one will be created. |
| apSyslogHistMsgsFlushed | apSyslogHistory: 1.3.6.1.4.1.9148.3.1.1.2.2 | Number of entries that have been removed from the apSyslogHistoryTable in order to make room for new entries. Use this to determine whether the polling frequency on the history table is fast enough and/or if the size of the history table is large enough such that messages are not missed. |
| Object Identifier Name: apSyslogHistoryEntry (1.3.6.1.4.1.9148.3.1.1.2.3) | | |
| apSyslogHistIndex | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.1 | Monotonically increasing integer for the sole purpose of indexing messages. When it reaches the maximum value, the agent wraps the value back to 1. |
| apSyslogHistFrom | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.2 | Process name and host of the sending client (for example, anyclient@sr.acme.com) |
| apSyslogHistLevel | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.3 | Log level of the message. |
| apSyslogHistType | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.4 | Textual identification for the log type, which categorizes the log message. |
| apSyslogHistContent | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.5 | Text of the syslog message. If the text of the message exceeds 255 bytes, it is truncated to 255 bytes. |
| apSyslogHistTimestamp | apSyslogHistoryEntry: 1.3.6.1.4.1.9148.3.1.1.2.3.6 | Value of sysUpTime when this message was generated. |

Syslog Scalar Example

The following example shows the scalar variables associated with the syslog MIB. The values given in the example are samples that will differ from your values.

| Instance ID | Value |
|--------------------------------|---------|
| ApSyslogNotificationsSent.0 | 955 |
| ApSyslogNotificationsEnabled.0 | TRUE |
| ApSyslogMaxLevel.0 | warning |
| ApSyslogMsgIgnores.0 | 0 |
| ApSyslogMsgDrops.0 | 0 |
| ApSyslogHistTableMaxLength.0 | 1 |
| ApSyslogHistMsgsFlushed.0 | 954 |

Syslog History Table Examples

The following example shows the scalar variables associated with the syslog MIB. The values given in the example are samples that will differ from your values.

| OID | Table Index |
|-----------------------|--|
| ApSyslogHistIndex | 955 |
| ApSyslogHistFrom | performance1 |
| ApSyslogHistLevel | critical |
| ApSyslogHistType | application |
| ApSyslogHistContent | All enabled accounting connections have been lost! Check accounting status for more details. |
| ApSyslogHistTimestamp | 1132330978 |

Acme Packet System Management MIB (ap-smgmt.mib)

The following table describes the SNMP GET query names for the Acme Packet System Management MIB (ap-smgmt.mib).

Note that the apSigRealmStats MIB is populated for realms on which H.323 and SIP are configured; this supports aggregate statistics for H.323 and SIP. A note like this one appears with the OID information shown in the table below.

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|---|--|
| Object Identifier Name: apSysMgmtMIBObjects (1.3.6.1.4.1.9148.3.2.1) | | |
| Object Identifier Name: apSysMgmtGeneralObjects (1.3.6.1.4.1.9148.3.2.1.1) | | |
| apSysCPUUtil | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.1 | Percentage of CPU utilization. |
| apSysMemoryUtil | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.2 | Percentage of memory utilization. |
| apSysHealthScore | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.3 | System health percentage, with a system health percentage value of 100 (100%) being the healthiest. |
| apSysRedundancy | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.4 | For Net-Net HA pairs, information about whether this Net-Net SBC is active or standby. Possible values are: <ul style="list-style-type: none"> initial(1): system is at initial stage active(2): system is active standby(3): system is standby outOfService(4): system is out of service For a Standalone system, a value of (2) is returned. |
| apSysGlobalConSess | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.5 | Total instant number of global concurrent sessions at the moment. |
| apSysGlobalCPS | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.6 | Number of global calls per second. This is an instant value, which is the sum of SIP, H.323, and MGCP calls. |
| apSysNATCapacity | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.7 | Percentage of NAT table in Content Addressable Memory (CAM) utilization. |
| apSysARPCapacity | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.8 | Percentage of ARP table (in CAM) utilization. |
| apSysState | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.9 | Current system state. Online denotes regular call processing and offline implies no call processing occurring but other administrative functions are available. |
| apSysLicenseCapacity | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.10 | Percentage of licensed sessions currently in progress. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|---|--|
| apSysSipStatsActiveLocalContacts | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.11 | Number of currently cached registered contacts in the Net-Net SBC. |
| apSysMgcpGWEndpoints | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.12 | Number of currently registered GW endpoints in the Net-Net SBC. |
| apSysH323Registration | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.13 | Number of H.323 registrations in the Net-Net SBC. |
| apSysRegCacheLimit | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.14 | Maximum number of contacts to be accepted into the registration cache. A value of 0 indicates no limit. |
| apSysApplicationCPULoadRate | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.16 | Average load rate of the service applications taken over a period up to 10 seconds. |
| apSysRejectedMessages | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.18 | Number of messages rejected by the SBC due to matching criteria. |
| apSysSipEndptDemTrustToUntrust | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.19 | Global counter for SIP endpoint demotion from trusted to untrusted. |
| apSysSipEndptDemUntrustToDeny | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.20 | Global counter for SIP endpoint demotion from untrusted to deny. |
| apSysMgcpEndptDemTrustToUntrust | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.21 | Global counter for MGCP endpoint demotion from trusted to untrusted. |
| apSysMgcpEndptDemUntrustToDeny | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.22 | Global counter for MGCP endpoint demotion from untrusted to deny. |
| apSysSipTotalCallsRejected | 1.3.6.1.4.1.9148.3.2.1.1.25 | Global counter for SIP calls that are rejected by the SBC |
| apSysSipStatsActiveSubscriptions | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.27 | An unsigned 32-bit integer that specifies the current global count of active SIP subscriptions. |
| apSysSipStatsPerMaxSubscriptions | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.28 | An unsigned 32-bit integer that specifies the maximum global count of SIP subscriptions initiated during any 100 second period since the last SBC re-boot. |
| apSysSipStatsPerMaximumActiveSubscriptions | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.29 | An unsigned 32-bit integer that specifies the maximum global count of active SIP subscriptions since the last SBC re-boot. |
| apSysSipStatsTotalSubscriptions | apSysMgmtGeneralObjects: 1.3.6.1.4.1.9148.3.2.1.1.30 | An unsigned 32-bit integer that specifies the global count of active SIP subscriptions since the last SBC re-boot. |

Object Identifier Name: apSysStorageSpaceTable (1.3.6.1.4.1.9148.3.2.1.1.23)

Object Identifier Name: apSysStorageSpaceEntry (1.3.6.1.4.1.9148.3.2.1.1.23.1)

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--|--|
| apSysVolumeIndex | apSysStorageSpaceEntry: 1.3.6.1.4.1.9148.3.2.1.1.23.1.1 | Monotonically increasing integer for the purpose of indexing volumes. |
| apSysVolumeName | apSysStorageSpaceEntry: 1.3.6.1.4.1.9148.3.2.1.1.23.1.2 | Name of the volume. |
| apSysVolumeTotalSpace | apSysStorageSpaceEntry: 1.3.6.1.4.1.9148.3.2.1.1.23.1.3 | Total size of the volume in MB. |
| apSysVolumeAvailSpace | apSysStorageSpaceEntry: 1.3.6.1.4.1.9148.3.2.1.1.23.1.4 | Total space available on the volume in KB. |
| Object Identifier Name: apCombinedSessionAgentStatsEntry (1.3.6.1.4.1.9148.3.2.1.2.1,1) | | |
| apCombinedStatsSessionAgentIndex | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.1 | A monotonically increasing integer for the sole purpose of indexing session agents. When it reaches the maximum value the agent wraps the value back to 1. |
| apCombinedStatsSessionAgentHostname | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.2 | The hostname of the session agent for which the following statistics are being calculated. |
| apCombinedStatsSessionAgentType | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.3 | The type of the specified session agent, either SIP or H323. |
| apCombinedStatsCurrentActiveSessionsInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.4 | Number of current active inbound sessions. |
| apCombinedStatsCurrentSessionRateInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.5 | Current inbound session rate in CPS. |
| apCombinedStatsCurrentActiveSessionsOutbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.6 | Number of current active outbound sessions. |
| apCombinedStatsCurrentSessionRateOutbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.7 | Current outbound session rate in CPS. |
| apCombinedStatsTotalSessionsInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.8 | Total number of inbound sessions during the 100 second sliding window period. |
| apCombinedStatsTotalSessionsNotAdmittedInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.9 | Total number of non-bandwidth constraints that exceeded rejections on inbound sessions (for example, max-sessions, burst rate, etc.). |
| apCombinedStatsPeriodHighInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.10 | Highest number of concurrent inbound sessions during the period. |
| apCombinedStatsAverageRateInbound | apCombinedSessionAgentStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.1.1.11 | Average rate of inbound sessions during the 100 second sliding window period in CPS. |

System Management Scalar Examples

The following example shows the scalar variables associated with the system management MIB. The values given in the example are samples that will differ from your values.

| Instance ID | Value |
|-------------------|-------|
| ApSysCPUUtil.0 | 0 |
| ApSysMemoryUtil.0 | 32 |

| Instance ID | Value |
|----------------------|--------|
| ApSysHealthScore.0 | 0 |
| ApSysRedundancy.0 | active |
| ApSysGlobalConSess.0 | 0 |
| ApSysGlobalCPS.0 | 0 |
| ApSysNATCapacity.0 | 0 |
| ApSysARPCapacity.0 | 1 |
| ApSysState.0 | online |

Session Statistical Group Table Examples

The following example system management MIB session statistical values. The values given in the example are samples that will differ from your values.

| OID | Table Index |
|---|---------------|
| | 1 |
| apCombinedStatsSessionAgentIndex | 1 |
| apCombinedStatsSessionAgentHostname | 192.168.69.64 |
| apCombinedStatsSessionAgentType | sip |
| apCombinedCurrentActiveSessionsInbound | 0 |
| apCombinedStatsSessionRateInbound | 0 |
| apCombinedStatsCurrentActiveSessionsOutbound | 0 |
| apCombinedStatsTotalSessionsInbound | 0 |
| apCombinedStatsTotalSessionsInbound | 0 |
| apCombinedStatsTotalSessionsNotAdmittedInbound | 0 |
| apCombinedStatsPeriodHighInbound | 0 |
| apCombinedStatsAverageRateInbound | 0 |
| apCombinedStatsTotalSessionsOutbound | 0 |
| apCombinedStatsTotalSessionsNotAdmittedOutbound | 0 |
| apCombinedStatsPeriodHighOutbound | 0 |
| apCombinedStatsAverageRateOutbound | 0 |
| apCombinedStatsMaxBurstRate | 1 |
| apCombinedStatsPeriodSeizures | 0 |
| apCombinedStatsPeriodAnswers | 0 |
| apCombinedStatsPeriodASR | 0 |
| apCombinedStatsAverageLatency | 0 |
| apCombinedStatsMaxLatency | 0 |
| apCombinedStatsSessionAgent | inService |

SIP Session Agent Statistics Table Example

The following example shows system management SIP session agent statistical values. The values given in the example are samples that will differ from your values.

| OID | Table Index |
|--|---------------|
| | 1 |
| apSipSAStatsSessionAgentIndex | 1 |
| apSipSAStatsSessionAgentHostname | 192.168.69.64 |
| apSipSAStatsSessionAgentType | sip |
| apSipSAStatsCurrentActiveSessionsInbound | 0 |
| apSipSAStatsCurrentSessionRateInbound | 0 |
| apSipSAStatsCurrentActiveSessionsOutbound | 0 |
| apSipSAStatsCurrentSessionRateOutbound | 0 |
| apSipSAStatsTotalSessionsInbound | 0 |
| apSipSAStatsTotalSessionsNotAdmittedInbound | 0 |
| apSipSAStatsPeriodHighInbound | 0 |
| apSipSAStatsAverageRateInbound | 0 |
| apSipSAStatsTotalSessionsOutbound | 0 |
| apSipSAStatsTotalSessionsNotAdmittedOutbound | 0 |
| apSipSAStatsPeriodHighOutbound | 0 |
| apSipSAStatsAverageRateOutbound | 0 |
| apSipSAStatsMaxBurstRate | 1 |
| apSipSAStatsPeriodSeizures | 0 |
| apSipSAStatsPeriodAnswers | 0 |
| apSipSAStatsPeriodASR | 0 |
| apSipSAStatsAverageLatency | 0 |
| apSipSAStatsMaxLatency | 0 |
| apSipSAStatsSessionAgentStatus | inService |

H.323 Session Agent Statistics Table Example

The following example shows system management H.323 session agent statistical values. The values given in the example are samples that will differ from your values.

| OID | Table Index |
|---|---|
| | 1 |
| aph323SAStatsSessionAgentIndex | 1 |
| aph323SAStatsSessionAgentHostname | There are no session agents of this type defined. |
| aph323SAStatsSessionAgentType | sip |
| aph323SAStatsCurrentActiveSessionsInbound | 0 |

| OID | Table Index |
|---|--------------|
| apH323SAStatsCurrentSessionRateInbound | 0 |
| apH323SAStatsCurrentActiveSessionsOutbound | 0 |
| apH323SAStatsCurrentSessionRateOutbound | 0 |
| apH323SAStatsTotalSessionsInbound | 0 |
| apH323SAStatsTotalSessionsNotAdmittedInbound | 0 |
| apH323SAStatsPeriodHighInbound | 0 |
| apH323SAStatsAverageRateInbound | 0 |
| apH323SAStatsTotalSessionsOutbound | 0 |
| apH323SAStatsTotalSessionsNotAdmittedOutbound | 0 |
| apH323SAStatsPeriodHighOutbound | 0 |
| apH323SAStatsAverageRateOutbound | 0 |
| apH323SAStatsMaxBurstRate | 1 |
| apH323SAStatsPeriodSeizures | 0 |
| apH323SAStatsPeriodAnswers | 0 |
| apH323SAStatsPeriodASR | 0 |
| apH323SAStatsAverageLatency | 0 |
| apH323SAStatsMaxLatency | 0 |
| apH323SAStatsSessionAgentStatus | outOfService |

Signaling Realm Statistics Table Example

The following example shows system management signaling realm statistical values. The values given in the example are samples that will differ from your values.

| OID | Table Index | Table Index |
|--|-------------|-------------|
| | 1 | 2 |
| apSigRealmStatsRealmIndex | 1 | 2 |
| apSigRealmStatsRealmName | sip192 | sip192a |
| apSigRealmStatsCurrentActiveSessionsInbound | 0 | 0 |
| apSigRealmStatsCurrentSessionRateInbound | 0 | 0 |
| apSigRealmStatsCurrentActiveSessionsOutbound | 0 | 0 |
| apSigRealmStatsCurrentSessionRateOutbound | 0 | 0 |
| apSigRealmStatsTotalSessionsInbound | 0 | 0 |
| apSigRealmStatsTotalSessionsNotAdmittedInbound | 0 | 0 |
| apSigRealmStatsPeriodHighInbound | 0 | 0 |
| apSigRealmStatsAverageRateInbound | 0 | 0 |
| apSigRealmStatsTotalSessionsOutbound | 0 | 0 |

| OID | Table Index | |
|--|-------------|---|
| apSigRealmStatsTotalSessionsNotAdmittedOutbound | 0 | 0 |
| apSigRealmStatsPeriodHighOutbound | 0 | 0 |
| apSigRealmStatsAverageRateOutbound | 0 | 0 |
| apSigRealmStatsMaxBurstRate | 0 | 0 |
| apSigRealmStatsPeriodSeizures | 1 | 0 |
| apSigRealmStatsPeriodAnswers | 0 | 0 |
| apSigRealmStatsPeriodASR | 0 | 0 |
| apSigRealmStatsAverageLatency (not supported) | 0 | 0 |
| apSigRealmStatsMaxLatency (not supported) | 0 | 0 |

Notes on ENUM Server Names

Note that the characters of the name are given in the ASCII values because of SNMP's restrictions. This representation affects the order in which entries in the table appear. Entries are listed:

- By the length of their names
- Then by a comparison of the characters they contain; this comparison is not limited to alphabetical order in that uppercase letter precede lowercase characters
- Last, by the IP address of the server for that entry

Take, for example, the case where there are three ENUM configurations:

- aaa, with servers 1.1.1.1 and 1.1.1.2
- BBB, with servers 3.3.3.3 and 3.3.3.2
- cc, with server 2.2.2.2

The entries would appear in the following order, with the following instance IDs:

1. cc 2.2.2.2 would appear first because "cc" is the shortest name), and would be represented by the instance ID:2.99.99.2.2.2.2
2. BBB entries would be next, sorted by IP address, because "BBB" is considered less than "aaa," and would be represented by the instance IDs:3.66.66.66.3.3.3.2 and3.66.66.66.3.3.3.3
3. aaa entries would appear last, represented by the instance IDs:3.97.97.97.1.1.1.1 and3.97.97.97.1.1.1.2

Acme Packet License MIB (ap-license.mib)

The following table describes the SNMP GET query names for the Acme Packet License MIB (ap-license.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--|---|
| Object Identifier Name: apLicenseEntry (1.3.6.1.4.1.9148.3.5.1.1.1) | | |
| apLicenseKey | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.2 | Key, not applicable to the first index, which represents the consolidated license. Displays N/A. |
| apLicenseCapacity | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.3 | Maximum number of simultaneous sessions allowed by a Net-Net system for all combined protocols. |
| apInstallDate | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.4 | Installation time and date in the following format: hh:mm:ss Month Day Year. Displays N/A if a license is not enabled. |
| apLicenseBeginDate | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.5 | Installation time and date in the following format: hh:mm:ss month day year. Displays N/A if a license is not enabled. |
| apLicenseExpireDate | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.6 | Expiration time and date in the following format: hh:mm:ss Month Day Year. Displays N/A if a license is not enabled. |
| apLicenseSIPFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.7 | Value that indicates whether a Session Initiation Protocol (SIP) license is present. A value of 1 indicates that SIP licensing is enabled. A value of 2 indicates that SIP licensing is not enabled. |
| apLicenseMGCPFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.8 | Value that indicates whether a Media Gateway Control Protocol (MGCP) license is present. A value of 1 indicates that MGCP licensing is enabled. A value of 2 indicates that MGCP licensing is not enabled. |
| apLicenseH323Feature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.9 | Value that indicates whether a H.323 Protocol license is present. A value of 1 indicates that H.323 licensing is enabled. A value of 2 indicates that H.323 licensing is not enabled. |
| apLicenseIWFFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.10 | Value that indicates whether a Interworking Feature (IWF) license is present. A value of 1 indicates that IWF licensing is enabled. A value of 2 indicates that IWF licensing is not enabled. |
| apLicenseQOSFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.11 | Value that indicates whether a Quality of Service (QoS) license is present. A value of 1 indicates that QoS licensing is enabled. A value of 2 indicates that QoS licensing is not enabled. |
| apLicenseACPFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.12 | Value that indicates whether a Acme Control Protocol (ACP) license is present. A value of 1 indicates that ACP licensing is enabled. A value of 2 indicates that ACP licensing is not enabled. |
| apLicenseLPFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.13 | Value that indicates whether a Local Policy (LP) license is present. A value of 1 indicates that LP licensing is enabled. A value of 2 indicates that LP licensing is not enabled. |
| apLicenseSAGFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.1.14 | Value that indicates whether a Session Agent Group (SAG) license is present. A value of 1 indicates that SAG licensing is enabled. A value of 2 indicates that SAG licensing is not enabled. (load balancing feature) |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|----------------------|--|--|
| apLicenseACCTFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.15 | Value that indicates whether a ACCT license is present. An ACCT license allows the Net-Net system to create connections and send CDRs to one or more RADIUS servers. A value of 1 indicates that ACCT licensing is enabled. A value of 2 indicates that ACCT licensing is not enabled. |
| apLicenseHAFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.16 | Value that indicates whether a High Availability (HA) license is present. A value of 1 indicates that HA licensing is enabled. A value of 2 indicates that HA licensing is not enabled. |
| apLicensePACFeature | apLicenseEntry: 1.3.6.1.4.1.9148.3.5.1.1.17 | Value that indicates whether a PAC license is present. A value of 1 indicates that PAC licensing is enabled. A value of 2 indicates that PAC licensing is not enabled. |

License Table Examples

The following example shows license table values. The values given in the example are samples that will differ from your values.

| OID | Table Index | |
|----------------------|-------------|---|
| | 1 | 2 |
| apLicenseKey | N/A | gjjt4vv602vhg387mrfuatjist093gg u42hbto3 |
| apLicenseCapacity | 32000 | 32000 |
| apLicenseInstallDate | N/A | 10:57:12 FEB 16 2005 |
| apLicenseBeginDate | N/A | N/A |
| apLicenseExpireDate | N/A | N/A |
| apLicenseSIPFeature | TRUE | TRUE |
| apLicenseMGCPFeature | TRUE | TRUE |
| apLicenseH323Feature | TRUE | TRUE |
| apLicenseIWFFeature | TRUE | TRUE |
| apLicenseQOSFeature | TRUE | TRUE |
| apLicenseACPFeature | TRUE | TRUE |
| apLicenseLPFeature | TRUE | TRUE |
| apLicenseSAGFeature | TRUE | TRUE |
| apLicenseACCTFeature | TRUE | TRUE |
| apLicenseHAFeature | TRUE | TRUE |
| apLicensePACFeature | TRUE | TRUE |

Acme Packet Software Inventory MIB (ap-swinventory.mib)

The following table describes the SNMP GET query names for the Acme Packet Software Inventory MIB (ap-swinventory.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|---|
| Object Identifier Name: apSwBootEntry (1.3.6.1.4.1.9148.3.4.1.1.1.1) | | |
| apSwBootDescr | apSwBootEntry: 1.3.6.1.4.1.9148.3.4.1.1.1.2 | Description of the software image which may consist of a filename, data and time this image was built or the unique identifier of the software. For example: boot image: 10.0.1.12/sd201p3.gz for host address is 10.0.1.12, and image name is sd201p3.gz boot image: /tffs0/sd201p3.gz for boot from flash 0 and image name is sd201p3.gz boot loader: bank0:03/18/2005 10:58:25 for boot from bank 0, and version is March 18 2005, 10:58:25'. |
| apSwBootType | apSwBootEntry: 1.3.6.1.4.1.918.3.4.1.1.1.3 | Type of software image. A value of 1 indicates a boot Image. A value of 2 indicates a bootloader image. |
| apSwBootStatus | apSwBootEntry: 1.3.6.1.4.1.918.3.4.1.1.1.4 | Status of the software image. A value of 1 indicates an image that is currently being used. A value of 2 indicates a previously used image. |
| Object Identifier Name: apSwInventoryCfgObjects (1.3.6.1.4.1.9148.3.4.1.2) | | |
| apSwCfgCurrentVersion | apSwInventoryCfgObjects: 1.3.6.1.4.1.9148.3.4.1.2.1 | Current version of the saved configuration. |
| apSwCfgRunningVersion | apSwInventoryCfgObjects: 1.3.6.1.4.1.9148.3.4.1.2.2 | Current version of the running configuration. |
| Object Identifier Name: apSwCfgBackupEntry (1.3.6.1.4.1.9148.3.4.1.2.3.1) | | |
| apSwCfgBackupName | apSwCfgbackupEntry: 1.3.6.1.4.1.9148.3.4.1.2.3.1.2 | Description of the configuration filename, for example: p1604, 063004-cfg. |

Configuration Scalar Example

The following example shows the configuration scalar variables associated with the software inventory MIB. The values given in the table are samples that will differ from your values.

| Instance ID | Value |
|-------------------------|-------|
| ApSwCfgCurrentVersion.0 | 80 |
| ApSwCfgRunningVersion.0 | 80 |

Software Image Table Examples

The following example shows software image table values. The values given in the table are samples that will differ from your values.

| OID | Table Index | | |
|----------------|----------------------|-------------------------|------------------------------|
| | 1 | 2 | 3 |
| apSwBootDescr | 111.22.3.44/prod1.gz | 111.22.3.44/distrib2.gz | bank0:01/21/2005 08:17:26 |
| apSwBootType | bootImage | bootImage | bootLoader |
| apSwBootStatus | previousUsed | currentUsing | currentUsing |

Backup Configuration Table Example

The following example shows backup configuration table values. The values given in the table are samples that will differ from your values.

| OID | Table Index | | |
|-------------------|---------------------------|------------------|---------------------------|
| | 1 | 2 | 3 |
| apSwCfgBackupName | Perf1-SingleSipNat.tar.gz | perf1_200.tar.gz | my3-single-sip-nat.tar.gz |

Acme Packet Environment Monitor MIB (ap-env-monitor.mib)

The following table describes the SNMP GET query names for the Acme Packet Environment Monitor MIB (ap-env-monitor.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|---|---|
| Object Identifier Name: apEnvMonObjects(1.3.6.1.4.1.9148.3.3.1) | | |
| apEnvMonI2CState | apEnvMonObjects: 1.3.6.1.4.1.9148.3.3.1.1 | <p>State of the environmental monitor located in the chassis. Values are:</p> <ul style="list-style-type: none"> initial (1): environment is at the initial state normal (2): environment is good; for example at low temperature minor (3): environment is not good; for example fans speed is more than minor alarm threshold but less than major alarm threshold major (4): environment is bad; for example an speed is more than major alarm threshold, but less than critical alarm threshold critical (5): environment is very bad; for example fan speed is more than critical alarm threshold shutdown (6): environment is at its worst, the system should be shutdown immediately notPresent (7): environmental monitor is not present notFunctioning (8): environmental monitor does not function properly; for example, IC2 failure or temperature sensor generates abnormal data unknown (9): no information available because of internal error |
| Object Identifier Name: apEnvMonVoltageStatusEntry (1.3.6.1.4.1.9148.3.3.1.2.1.1) | | |
| apEnvMonVoltageStatusType | apEnvMonVoltageStatusEntry: 1.3.6.1.4.1.9148.3.3.1.2.1.1.2 | <p>Entity part type from which the voltage value is from:</p> <ul style="list-style-type: none"> v2p5- 2.5v sensor: L3 cache core voltage; micro-processor and co-processor I/O voltage; Field-Programmable Gate Array (FPGA) memories I/O voltage. v3p3 - 3.3V sensor: general TTL supply rail; control logic; micro-processor; micro-processor and co-processor; SDRAM v5- 5V sensor: fans; micro-processor core voltage regulator CPU sensor: CPU voltage; micro-processor core voltage |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--|---|
| apEnvMonVoltageStatusDescr | apEnvMonVoltageStatusEntry: 1.3.6.1.4.1.9148.3.3.1.2.1.1.3 | Textual description of the entity being monitored for voltage. |
| apEnvMonVoltageStatusValue | apEnvMonVoltageStatusEntry: 1.3.6.1.4.1.9148.3.3.1.2.1.1.4 | Current voltage measurement, in millivolts, if available. A value of -1 indicates that the monitor cannot obtain a value. |
| apEnvMonVoltageState | apEnvMonVoltageStatusEntry: 1.3.6.1.4.1.9148.3.3.1.2.1.1.5 | Current state of the voltage for the device being monitored. Possible values are: Host Processor 7455 <ul style="list-style-type: none">• normal range: 1.55v to 1.65v• minor range: 1.4v to 1.55v or 1.65v to 1.8v• shutdown range: <1.4v or >1.8v Host Processor 7457 <ul style="list-style-type: none">• normal range: 1.35v to 1.45v• minor range: 1.00v to 1.35v or 1.45v to 1.6v• shutdown range: <1.0v or >1.6v Version 1.0 <ul style="list-style-type: none">• normal range: 1.25v to 1.35v• minor range: 1.00v to 1.25v or 1.35v to 1.6v• shutdown range: <1.0v or >1.6v Version 1.1 and later <ul style="list-style-type: none">• normal range: 1.25v to 1.35v• minor range: 1.00v to 1.25v or 1.35v to 1.6v• shutdown range: <1.0v or >1.6v |
| apEnvMonVoltageSlotID | apEnvMonVoltageStatusEntry: 1.3.6.1.4.1.9148.3.3.1.2.1.1.6 | Slot for this voltage. |

I2C State Scalar Examples

The following example shows the I2C scalar variables associated with the environment monitoring MIB. The values given in the example are samples that will differ from your values.

| Instance ID | Value |
|---------------------------------|--------|
| ApEnvMonI2Cstate.0 | normal |
| ApEnvMonEnableStatChangeNotif.0 | 32 |

Voltage Status Table Examples

The following example shows voltage status table values. The values given in the example are samples that will differ from your values.

| OID | Table Index | | | |
|----------------------------|------------------------------|------------------------------|----------------------------|-----------------------------|
| | 1 | 2 | 3 | 4 |
| apEnvMonVoltageStatusType | v2p5 | v3p3 | v5 | cpu |
| apEnvMonVoltageStatusDesc | 2.5V voltage (millivolts) | 3.3V voltage (millivolts) | 5V voltage (millivolts) | CPU voltage (millivolts) |
| apEnvMonVoltageStatusValue | 2526 | 3265 | 5052 | 1253 |
| apEnvMonVoltageState | normal | normal | normal | normal |

Temperature Status Table Examples

The following example shows temperature status values. The values given in the example are samples that will differ from your values.

| OID | Table Index |
|--------------------------------|--|
| | 1 |
| apEnvMonTemperatureStatusType | ds1624sCPU |
| apEnvMonTemperatureStatusDescr | Host processor PROM Temperature (degrees Celsius) |
| apEnvMonTemperatureStatusValue | 38 |
| apEnvMonTemperatureState | Normal |

Fan Status Table Examples

The following table shows fan status values. The values given in the example are samples that will differ from your values.

| OID | Table Index | | | |
|------------------------|-------------|-------------|-------------|------|
| | 1 | 2 | 3 | |
| apEnvMonFanStatusType | Fan1 | Fan2 | Fan3 | Fan4 |
| apEnvMonFanStatusDesc | Fan 1 speed | Fan 2 speed | Fan 3 speed | |
| apEnvMonFanStatusValue | 99 | 100 | 98 | |
| apEnvMonFanState | normal | normal | normal | |

Power Supply Status Table Examples

The following table shows power supply status values. The values given in the example are samples that will differ from your values.

| OID | Table Index | |
|-------------------------------|----------------|----------------|
| | 1 | 2 |
| apEnvMonPowerSupplyStatusType | right | left |
| apEnvMonPowerSupplyStatusDesc | Power supply A | Power supply B |
| apEnvMonPowerSupplyState | normal | notPresent |

Acme Packet H.323 MIB (ap-h323.mib)

The following table describes the SNMP GET query names for the Acme Packet H.323 MIB (ap-h323.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|---|------------------------------|
| Object Identifier Name: apH323MIBObjects (1.3.6.1.4.1.9148.3.10.1) | | |
| Object Identifier Name: apH323StackTable (1.3.6.1.4.1.9148.3.10.1.1) | | |
| Object Identifier Name: apH323StackEntry (1.3.6.1.4.1.9148.3.10.1.1.1) | | |
| aph323StackName | aph323StackEntry: 1.3.6.1.4.1.9148.3.10.1.1.1 | Configured H.323 stack name. |
| aph323StackCurrentCalls | aph323StackEntry: 1.3.6.1.4.1.9148.3.10.1.1.2 | Number of current calls. |

Acme Packet Security MIB (ap-security.mib)

The following table describes the SNMP Get query names for the Acme Packet Security MIB (ap-security.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|--------------------------------|------------------------|
| Object Identifier Name: apSecurityMIBObjects (1.3.6.1.4.1.9148.3.9.1) | | |
| apSecurityOCSRIpAddress | 1.3.6.1.4.1.9148.3.9.1.5 | OCSR server IP Address |
| apSecurityOCSRHostname | 1.3.6.1.4.1.9148.3.9.1.6 | OCSR server hostname |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|--|
| Object Identifier Name: apSecurityTacacsTable (1.3.6.1.4.1.9148.3.9.1.4) | | |
| Object Identifier Name: apSecurityTacacsEntry (1.3.6.1.4.1.9148.3.9.1.4.1) | | |
| apSecurityTacacsCliCommands | apSecurityTacacsEntry: 1.3.6.1.4.1.9148.3.9.1.4.1.3 | Number of CLI commands sent for TACACS+ accounting |
| apSecurityTacacsSuccessAuthentication | apSecurityTacacsEntry: 1.3.6.1.4.1.9148.3.9.1.4.1.4 | Number of successful TACACS+ authentication requests |
| apSecurityTacacsFailureAuthentication | apSecurityTacacsEntry: 1.3.6.1.4.1.9148.3.9.1.4.1.5 | Number of failed TACACS+ authentication requests |
| apSecurityTacacsSuccessAuthorization | apSecurityTacacsEntry: 1.3.6.1.4.1.9148.3.9.1.4.1.6 | Number of successful TACACS+ authorization requests |
| apSecurityTacacsFailureAuthorization | apSecurityTacacsEntry: 1.3.6.1.4.1.9148.3.9.1.4.1.7 | Number of failed TACACS+ authorization requests |

Acme Packet Diameter MIB (ap-diameter.mib)

The following table describes the SNMP Get query names for the Acme Packet Diameter MIB (ap-diameter.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|-----------------------------------|---|
| Object Identifier Name: apDiamMIBObjects (.1.3.6.1.4.1.9148.3.13.1.1) | | |
| Object Identifier Name: apDiamMIBTabularObjects (.1.3.6.1.4.1.9148.3.13.1.1.2) | | |
| Object Identifier Name: apDiamClfErrorStatsTable (.1.3.6.1.4.1.9148.3.13.1.1.2.1) | | |
| Object Identifier Name: apDiamClfErrorStatsEntry (.1.3.6.1.4.1.9148.3.13.1.1.2.1.1) | | |
| apDiamClfExtPolSvrName | 1.3.6.1.4.1.9148.3.13.1.1.2.1.1.2 | External policy server name |
| apDiamClfErrorsRecent | 1.3.6.1.4.1.9148.3.13.1.1.2.1.1.3 | Number of diameter errors in recent period received on e2 interface with the CLF. |
| apDiamClfErrorsTotal | 1.3.6.1.4.1.9148.3.13.1.1.2.1.1.4 | Total number of diameter errors in life time received on e2 interface with the CLF. |
| apDiamClfErrorsPerMax | 1.3.6.1.4.1.9148.3.13.1.1.2.1.1.5 | PerMax count of diameter errors in life time received on e2 interface with the CLF. |

| | | |
|---------------------------------|---|--|
| Object group in ap-diameter.mib | apDiamACCTObjectsGroup Objects: <ul style="list-style-type: none">• apDiamAcctSrvrHostName• apDiamAcctSrvrIPPort• apDiamAcctSrvrOriginRealm• apDiamAcctSrvrOriginHost• apDiamAcctSrvrOriginTransportType (apDiamNotificationGroups 1) | Object group accessible only to traps for Diameter Server information. |
| Object group in ap-diameter.mib | apDiamACCTNotificationsGroup Objects: <ul style="list-style-type: none">• apDiameterAcctSrvrUpTrap• apDiamAcctSrvrDownTrap• apAcctMsgQueueFullTrap• apAcctMsgQueueFullClearTrap (apDiamNotificationGroups 2) | Notification group for Diameter server events. |
| Object group in ap-diameter.mib | apDiamClfErrorStatsGroup Includes: <ul style="list-style-type: none">• apDiamClfExtPolSrvName• apDiamClfErrorsRecent• apDiamClfErrorsTotal• apDiamClfErrorsPerMax (apDiamObjectGroups 1) | Object group for CLF statistics of external policy server errors. |
| Object group in ap-diameter.mib | apDiamACCTRResultObjectsGroup Includes: <ul style="list-style-type: none">• apDiameterResultCode (apDiamNotificationGroups 3) | Object group accessible only to traps for Result-Code (268) AVP value. |

Acme Packet SIP MIB (ap-sip.mib)

The following table describes the SNMP Get query names for the Acme Packet SIP MIB (ap-sip.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|---------------------------------|---|
| Object Identifier Name: apSipMIBGeneralObjects (| | |
| apSipSecInterfaceTotalRegistrations | 1.3.6.1.4.1.9148.3.15.1.1.1.1.0 | Total number of registrations on all secondary SIP interfaces. |
| apSipSecInterfaceRegThreshold | 1.3.6.1.4.1.9148.3.15.1.1.1.2.0 | The maximum threshold for registrations on all secondary SIP interfaces. If this threshold is exceeded, an alarm is raised. |
| apSipSecInterfaceClearThreshold | 1.3.6.1.4.1.9148.3.15.1.1.1.3.0 | The threshold for registrations on all secondary SIP interfaces to clear an alarm. |

| | | |
|----------------------------|---|--|
| Object group in ap-sip.mib | apSipSecInterfaceRegObjectsGroup Includes: apSipSecInterfaceTotalRegistrations apSipSecInterfaceRegThreshold apSipSecInterfaceClearThreshold (apSipObjectGroups 1) | Object group to monitor registrations for secondary SIP interfaces. |
| Object in ap-sip.mib | apSipSecInterfaceTotalRegistrations (apSipSecInterfaceObjects 1) | Total number of registration on all secondary SIP interfaces. |
| Object in ap-sip.mib | apSipSecInterfaceRegThreshold (apSipSecInterfaceObjects 2) | The max threshold for registrations on all secondary interfaces beyond which a trap is generated. |
| Object in ap-sip.mib | apSipSecInterfaceClearThreshold (apSipSecInterfaceObjects 3) | The threshold for registrations on all secondary SIP interfaces below which a clear trap is generated. |

Acme Packet Codec and Transcoding MIB (ap-codec.mib)

The following table describes the SNMP GET query names for the Acme Packet Codec and Transcoding MIB (ap-codec.mib).

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|--|---|---|
| Object Identifier Name: apCodecMIBObjects (1.3.6.1.4.1.9148.3.7.1) | | |
| Object Identifier Name: apCodecRealmStatsTable (1.3.6.1.4.1.9148.3.7.1.1) | | |
| Object Identifier Name: apCodecRealmStatsEntry (1.3.6.1.4.1.9148.3.7.1.1.1) | | |
| apCodecRealmCountOther | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.1 | Count of the SDP media streams received in the realm which negotiated to a codec not defined in this table. |
| apCodecRealmCountPCMU | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.2 | Count of SDP media streams received in the realm which negotiated to the PCMU codec. |
| apCodecRealmCountPCMA | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.3 | Count of SDP media streams reveived in the realm which negotiated to the PCMA codec. |
| apCodecRealmCountG722 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.4 | Count of SDP media streams reveived in the realm which negotiated to the G722 codec. |
| apCodecRealmCountG723 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.5 | Count of SDP media streams reveived in the realm which negotiated to the G723 codec. |
| apCodecRealmCountG726-16 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.6 | Count of SDP media streams reveived in the realm which negotiated to the G726-16 codec. |
| apCodecRealmCountG726-24 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.7 | Count of SDP media streams reveived in the realm which negotiated to the G726-24 codec. |
| apCodecRealmCountG726-32 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.8 | Count of SDP media streams reveived in the realm which negotiated to the G726-32 codec. |
| apCodecRealmCountG726-40 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.1.9 | Count of SDP media streams reveived in the realm which negotiated to the G726-40 codec. |

| SNMP GET Query Name | Object Identifier Name: Number | Description |
|---|--|--|
| apCodecRealmCountG728 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.10 | Count of SDP media streams received in the realm which negotiated to the G728 codec. |
| apCodecRealmCountG729 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.11 | Count of SDP media streams received in the realm which negotiated to the G729 codec. |
| apCodecRealmCountGSM | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.12 | Count of SDP media streams received in the realm which negotiated to the GSM codec. |
| apCodecRealmCountiLBC | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.13 | Count of SDP media streams received in the realm which negotiated to the iLBC codec. |
| apCodecRealmCountAMR | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.14 | Count of SDP media streams received in the realm which negotiated to the AMR codec. |
| apCodecRealmCountEVRC | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.15 | Count of SDP media streams received in the realm which negotiated to the EVRC codec. |
| apCodecRealmCountH261 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.16 | Count of SDP media streams received in the realm which negotiated to the H261 codec. |
| apCodecRealmCountH263 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.17 | Count of SDP media streams received in the realm which negotiated to the H.263 codec. |
| apCodecRealmCountT38 | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.18 | Count of SDP media streams received in the realm which negotiated to the T.38 codec. |
| apCodecRealmCountAMRWB | apCopdecRealmStatsEntry 1.3.6.1.4.1.9148.3.7.1.1.19 | Count of SDP media streams received in the realm which negotiated to the AMR-WB codec. |
| Object Identifier Name: apTranscodingMIBObjects (1.3.6.1.4.1.9148.3.7.2) | | |
| Object Identifier Name: apCodecTranscodingRealmStatsTable (1.3.6.1.4.1.9148.3.7.2.1) | | |
| Object Identifier Name: apTranscodingRealmStatsEntry (1.3.6.1.4.1.9148.3.7.2.1.1) | | |
| apCodecRealmSessionsTranspare nt | apCodecTranscodingRealmStatsE ntry: 1.3.6.1.4.1.9148.3.7.2.1.1.1 | Number of sessions in the realm that did not use any DSP resources for transcoding or transrating. |
| apCodecRealmSessionsTransrate d | apCodecTranscodingRealmStatsE ntry: 1.3.6.1.4.1.9148.3.7.2.1.1.2 | Number of sessions in the realm that had a common codec but used DSP resources to modify packetization rate. |
| apCodecRealmSessionsTranscode d | apCodecTranscodingRealmStatsE ntry: 1.3.6.1.4.1.9148.3.7.2.1.1.3 | Number of sessions in the realm that had used DSP resources to transcode between codecs. |
| Object Identifier Name: apSysMgmtMIBSessionObjects (1.3.6.1.4.1.9148.3.2.1.2) | | |
| Object Identifier Name: apSigRealmStatsTable (1.3.6.1.4.1.9148.3.2.1.2.4) | | |

| apSigRealmStatsTotalSessionsInbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.7 | Total number of inbound sessions. |
| apSigRealmStatsTotalSessionsNoAdmittedInbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.8 | Total number of inbound sessions rejected due to insufficient bandwidth. |
| apSigRealmStatsPeriodHighInbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.9 | Highest number of concurrent inbound sessions during the period. |
| apSigRealmStatsAverageRateInbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.10 | Average rate of inbound sessions during the period in CPS. |
| apSigRealmStatsTotalSessionsOutbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.11 | Total number of outbound sessions. |
| apSigRealmStatsTotalSessionsNoAdmittedOutbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.12 | Total number of outbound sessions rejected due to insufficient bandwidth. |
| apSigRealmStatsPeriodHighOutbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.13 | Highest number of concurrent outbound sessions during the period. |
| apSigRealmStatsAverageRateOutbound | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.14 | Average rate of outbound sessions during the period in CPS. |
| apSigRealmStatsMaxBurstRate | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.15 | Maximum burst rate of traffic measured during the period (combined inbound and outbound). |
| apSigRealmStatsPeriodSeizures | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.16 | Total number of seizures during the period. |
| apSigRealmStatsPeriodAnswers | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.17 | Total number of answered sessions during the period. |
| apSigRealmStatsPeriodASR | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.18 | Answer-to-seizure ratio, expressed as a percentage. For example, a value of 90 represents 90% or .90. |
| apSigRealmStatsAverageLatency(not supported) | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.19 | Average observed one-way signaling latency during the period in milliseconds. |
| apSigRealmStatsMaxLatency(not supported) | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.20 | Maximum observed one-way signaling latency during the period in milliseconds. |
| apSigRealmStatsMinutesLeft | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.21 | Number of monthly-minutes left in the pool per calendar month for a given realm. |
| apSigRealmStatsMinutesReject | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.22 | Peg counts of number of rejected calls due to monthly-minutes constraints exceeded. |
| apSigRealmStatsShortSessions | apSigRealmStatsEntry: 1.3.6.1.4.1.9148.3.2.1.2.4.1.23 | Lifetime number of sessions whose duration was less than the configured short session duration. |

Transcoding Capacity in Acme Packet System Management MIB (ap-smgmt.mib)

The following VARBINDs are used in Transcoding related traps. They may not be polled and retrieved using an SNMP GET.

| SNMP Object Name | Object Identifier Name: Number | Description |
|---|--|---|
| Object Identifier Name: apSysMgmtMIBObjects (1.3.6.1.4.1.9148.3.2.1) | | |
| Object Identifier Name: apSysMgmtGeneralObjects (1.3.6.1.4.1.9148.3.2.1.1) | | |
| apSysXCodeCapacity | apSysMgmtGeneralObjects 1.3.6.1.4.1.9148.3.2.1.1.34 | Percentage of transcoding utilization. |
| apSysXCodeAMRCapacity | apSysMgmtGeneralObjects 1.3.6.1.4.1.9148.3.2.1.1.35 | Percentage of licensed AMR transcoding sessions. |
| apSysXCodeAMRWBCapacity | apSysMgmtGeneralObjects 1.3.6.1.4.1.9148.3.2.1.1.36 | Percentage of licensed AMR-WB transcoding sessions. |
| apSysXCodeEVRCCapacity | apSysMgmtGeneralObjects 1.3.6.1.4.1.9148.3.2.1.1.39 | Percentage of licensed EVRC transcoding sessions. |
| apSysXCodeEVRCBCapacity | apSysMgmtGeneralObjects 1.3.6.1.4.1.9148.3.2.1.1.40 | Percentage of licensed EVRCB transcoding sessions. |

Acme Packet (ap-usbcsys.mib) Multicore Monitoring MIB

A variety of statistics that report information on the CPUs/Cores within the Net-Net SBC are available via the ap-usbcsys.mib MIB. These statistics are:

| OID | Object Name | Description |
|------------------------------|------------------------|---|
| 1.3.6.1.4.1.9148.3.17 | apUsbcSysModule | |
| 1.3.6.1.4.1.9148.3.17.1 | apUsbcSysMIBObjects | |
| 1.3.6.1.4.1.9148.3.17.1.1 | apUsbcSysObjects | |
| 1.3.6.1.4.1.9148.3.17.1.1.1 | apUsbcSysCpuUtilAll | The percentage of total Cpu utilization. |
| 1.3.6.1.4.1.9148.3.17.1.1.2 | apUsbcSysCpuCount | The number of cpus for this system. |
| 1.3.6.1.4.1.9148.3.17.1.1.3 | apUsbcSysCpuSpeedMHz | The speed in MHz of the cpus for this system. |
| 1.3.6.1.4.1.9148.3.17.1.1.4 | apUsbcSysMemSzMB | The number of megabytes of all cpus for this system. |
| 1.3.6.1.4.1.9148.3.17.1.1.5 | apUsbcSysMemSzGB | The number of gigabytes of all cpus for this system. This value is derived from the apUsbcSysMemSzMB object. |
| 1.3.6.1.4.1.9148.3.17.1.1.6 | apUsbcSysAppMemUtil | The number of megabytes of memory used by the applications. |
| 1.3.6.1.4.1.9148.3.17.1.1.7 | apUsbcSysKernelMemUtil | The number of megabytes of memory used by the kernel. |
| 1.3.6.1.4.1.9148.3.17.1.1.8 | apUsbcSysMyBogoMips | The processor speed measured in millions of instructions per second per processor, calculated by the kernel at boot time. |
| 1.3.6.1.4.1.9148.3.17.1.1.9 | apUsbcSysAllBogoMips | The sum of all bogo mips(millions of instructions per second) of all cpus for this system. |
| 1.3.6.1.4.1.9148.3.17.1.1.10 | apUsbcSysCpuTblObjects | |

| OID | Object Name | Description |
|------------------------------------|-------------------|--|
| 1.3.6.1.4.1.9148.3.17.1.1.10.1 | apUsbcSysCpuTable | A read-only table to hold information for a cpu indexed by the cpu number i + 1. |
| 1.3.6.1.4.1.9148.3.17.1.1.10.1.1 | apUsbcSysCpuEntry | A entry designed to hold the status of a single Cpu. |
| 1.3.6.1.4.1.9148.3.17.1.1.10.1.1.1 | apUsbcSysCpuNum | The cpu number + 1 of this entry. |
| 1.3.6.1.4.1.9148.3.17.1.1.10.1.1.2 | apUsbcSysCpuUtil | The percent of cpu utilization of this cpu. |

This MIB reflects statistics displayed by the **show platform cpu**, **show platform cpu-load**, and **show platform memory** commands. The following screen capture is annotated with the correspondence.

```

ACMEPACKET# show platform cpu
CPU count : 8 //apUsbcSysCpuCount
CPU speed : 2301 MHZ //apUsbcSysCpuSpeedMHz
CPU model : Intel(R) Core(TM) i7-3615QE CPU @ 2.30GHz
CPU flags : [...]

CPU workload:
Capacity : 80000 bogoMIPS //apUsbcSysAllBogoMips
App load : 4599 bogoMIPS //apUsbcSysMyBogoMips

ACMEPACKET> show platform cpu-load
Total load: 9% //apUsbcSysCpuUtilAll
CPU#00 4% //apUsbcSysCpuNum + apUsbcSysCpuUtil
CPU#01 13% //apUsbcSysCpuNum + apUsbcSysCpuUtil

ACMEPACKET> show platform memory
Mem Total : 1892 MB //apUsbcSysMemSzMB
Mem App : 213 MB //apUsbcSysAppMemUtil
Mem OS : 849 MB //apUsbcSysKernelMemUtil

```

Overview

This following table lists the topic and the Internet Engineering Task Force Request for Comments (IETF RFC) document where you can obtain more information.

| Topic | More Information |
|---|---|
| SNMPv2c | IETF RFC 1907, “Management Information Base for Version 2 of the Simple Network Management Protocol (SNMPv2).” |
| Trap criteria | (http://www.ietf.org/rfc/rfc1907.txt) |
| coldStart Trap | |
| authenticationFailure Trap | |
| MIBs | IETF RFC 1213, “Management Information Base for Network Management of TCP/IP-based Internets: MIB-II.” |
| | (http://www.ietf.org/rfc/rfc1213.txt) |
| MIB-II | IETF RFC 2233, “Interfaces Group MIB using SMIv2.” |
| Trap criteria | (http://www.ietf.org/rfc/rfc2233.txt) |
| linkUp Trap | |
| linkDown Trap | |
| University of California Berkeley Software Distribution (BSD) syslog severities | IETF RFC 3164 “The BSD syslog Protocol.” |
| | (http://www.ietf.org/rfc/rfc3164.txt) , |
| IP datagram reassembly algorithms | RFC 815 “IP Datagram Reassembly Algorithms” |
| | (http://www.ietf.org/rfc/rfc0815.txt) , |

| UBOUND quantity | |
| Deleting the TCB | |

Overview

This appendix provides examples of traps sent according to the criteria established in the Acme Packet syslog MIB (`ap-slog.mib`) and an example of a trap sent according to the criteria established in the Acme Packet System Management MIB (`ap-smgmt.mib`).

Enterprise Trap Examples

Two Net-Net Session Directors (SDs), both capable of sending out traps, generated these examples. One Net-Net SBC's IP address is 10.0.1.144 and the other Net-Net SBC's IP address is 10.0.2.233.

Note: The display format of SNMP traps depends on the type of packet capture or SNMP test tools that you use.

snmp-community and trap-receiver Elements

The following ACLI examples show the Net-Net SBC's configured `snmp-community` and `trap-receiver` configuration elements used in the syslog MIB and System management MIB trap examples. Although two different Net-Net SBCs were used to generate these examples, the configured `snmp-community` and `trap-receiver` elements and field values are the same.

Note: To access the `snmp-community` and `trap-receiver` configuration elements, you must first access the ACLI in Superuser mode. From the system prompt, enter `configure terminal` and follow the system ACLI path to access these configuration elements.

The trap receiver (configured in the `trap-receiver` element) corresponds to an SNMP test tool with an IP address of 10.0.1.27. Acme Packet's enterprise MIBs have been compiled in this tool.

Note: The **bold** text indicates what you should enter at the prompt to display the configured `snmp-community` and `trap-receiver` elements.

The following example shows the configured `snmp-community` configuration element.

```
ACMEPACKET# configure terminal
ACMEPACKET(configure)# system
ACMEPACKET(system)# snmp-community
ACMEPACKET(snmp-community)# select
<community-name>:
1: public
selection:1
```

```

ACMEPACKET(snmp-community)# show
snmp-community
  community-name          public
  access-mode              READ-WRITE
  ip-addresses
    10.0.1.27
    10.0.0.43
    10.0.1.13
  last-modified-date      2003-11-01 00:04:50

```

The following example shows the trap-receiver element:

```

ACMEPACKET# configure terminal
ACMEPACKET(configure)# system
ACMEPACKET(system)# trap-receiver
ACMEPACKET(trap-receiver)# select
<ip-address>:
1: 10.0.1.27
selection:1
ACMEPACKET(trap-receiver)# show
trap-receiver
  ip-address          10.0.1.27
  filter-level        All
  community-name      public
  last-modified-date 2003-11-01 00:05:12

```

For more information about the snmp-community or trap-receiver elements, refer to the *ACLI Reference Guide*.

syslog MIB Trap Examples

The Acme Packet System Management MIB trap (apSysMgmtGroupTrap) displays syslog severity information in the trap itself. The following section shows Acme Packet syslog MIB trap examples.

You can display the severity of the Net-Net system alarm(s) that maps to Acme Packet syslog traps by executing the `display-alarms` command in the Superuser Mode of the ACLI.

Note: Only Net-Net system Superusers (Level 1) have access to all system commands and information pertaining to the configuration and management of the device. This mode can be password-protected in order to allow only system administrators to utilize the entire range of ACLI system commands.

Hardware Monitor Failure Trap Example

The following is an example of an apSyslogMessageGenerated trap caused by the failure of the Net-Net system's environmental sensor. This generated a Critical-level alarm.

```
=====PACKET CAPTURED=====

        apSyslogHistIndex

```

Critical Fan Speed Failure Trap Example

The following is an example of an apSyslogMessageGenerated trap caused by one fan's speed being less than (i.e., slower than) 50% of the full fan speed. This trap generated a Critical-level alarm.

```

System Management MIB Trap Example

Execute the `display-alarms` command in the Superuser Mode of the ACLI to display the severity of the Net-Net system alarm(s) that maps to Acme Packet System Management traps. The following section shows Acme Packet System Management MIB trap example.

CPU Usage Over-Threshold Trap Example

The following is an example of an `apSysMgmtGroupTrap` trap caused by CPU usage exceeding the threshold value (i.e., the Net-Net system's CPU usage reached 90% or greater of its capacity). This trap output is similar to that of other System Management MIB traps (e.g., memory utilization, health score, NAT table utilization, and ARP table utilization).

```

Environmental Monitor MIB Trap Example

Execute the `display-alarms` command in the Superuser Mode of the ACLI to display the severity of the Net-Net system alarm(s) that maps to Acme Packet Environmental Monitor traps. The following section shows an Acme Packet Environmental Monitor MIB trap example.

Voltage Trap Example

The following example shows the `apEnvMonStatusChangeNotification` trap for voltage state change from init to unknown.
