About this Guide

Overview

The Net-Net 4000 Accounting Guide describes:

- The Net-Net[™] SBC's accounting-based on Remote Authentication Dial-in User Service (RADIUS)
- How to configure RADIUS accounting support, and the features related to it
- Local CDR storage and FTP file push
- Use and maintenance of the Storage Expansion Module
- Diameter-based Rf Accounting

It includes the Acme Packet accounting Vendor-Specific Attributes (VSAs), and the Cisco Systems, Inc.™ VSAs supported by the Net-Net SBC. This reference guide indicates the Cisco Systems′ VSAs supported by Acme Packet's Net-Net products.

This guide also includes RADIUS-related statistics and alarm information and associated Acme Packet Command Line Interface (ACLI) configuration element examples. Appendix A of this guide contains a selection of examples of RADIUS logs for purposes of reference.

Supported Platforms

Release Version S-C6.2.0 is supported on the Acme Packet 4500 and Acme Packet 3800 series platforms.

Related Documentation

The following table lists the members that comprise the documentation set for this release:

Document Name	Document Description
Acme Packet 4500 System Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 4500 system.
Acme Packet 3800 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 3800 system.
Release Notes	Contains information about the current documentation set release, including new features and management changes.
ACLI Configuration Guide	Contains information about the administration and software configuration SBC.

Document Name	Document Description
ACLI Reference Guide	Contains explanations of how to use the ACLI, as an alphabetical listings and descriptions of all ACLI commands and configuration parameters.
Maintenance and Troubleshooting Guide	Contains information about Net-Net SBC logs, performance announcements, system management, inventory management, upgrades, working with configurations, and managing backups and archives.
MIB Reference Guide	Contains information about Management Information Base (MIBs), Enterprise MIBs, general trap information, including specific details about standard traps and enterprise traps, Simple Network Management Protocol (SNMP) GET query information (including standard and enterprise SNMP GET query names, object identifier names and numbers, and descriptions), examples of scalar and table objects.
Accounting Guide	Contains information about the SBC's accounting support, including details about RADIUS accounting.

Revision History

This section contains a revision history for this document.

Date	Revision Number	Description
November 30, 2009	Revision 0.00	Initial Release
August 23, 2010	Revision 1.00	 Adds failed Interim local CSV CDR format to Appendix C Fixed other local CSV CDR errors Adds section on IPv6 CDR data in local CSV files to Appendix C
May 31, 2012	Revision 1.10	 Updates VSAs 69 and 70 in description table to correct data type Adds to Chapter 1, Using RADIUS with the Net-Net SBC: SIP: Call Tear Down Due to Media Guard Timer Expiration, which documents CDR output of specific application scenarios
June 29, 2012	Revision 1.20	 Adds the codec, G722 to the list for Acme- FlowType_FS1_F, in the Using RADIUS with the Net-Net SBC chapter, Notes on Media Flow Attributes

Date	Revision Number	Description
December 17, 2012	Revision 1.30	Notes the circumstance for including VSA 59 in Local CDR files Corrects recommendation for local CDR capacity configuration Notes vsa-id-range entry specification caveat Restates local CDR deletion criteria Adds useful accounting termination causes Adds missing values to Acme-Disconnect-Cause 62 Instructs user on including recursive local policy lookup events in RADIUS interim records Updates list of RADIUS-generated VSAs
February 19, 2013	Revision 1.40	 Updates SFTP push receiver configuration procedure with corrections and clarifications
May 1, 2013	Revision 1.50	Sets max-files range

1 Using RADIUS with the Net-Net SBC

Introduction

RADIUS is an accounting, authentication, and authorization (AAA) system. In general, RADIUS servers are responsible for receiving user connection requests, authenticating users, and returning all configuration information necessary for the client to deliver service to the user.

You can configure your Net-Net SBC to send call accounting information to one or more RADIUS servers. This information can help you to see usage and QoS metrics, monitor traffic, and even troubleshoot your system. For more information about QoS, refer to the *Admission Control and QoS* chapter of the *Net-Net 4000 ACLI Configuration Guide*.

For information about how to configure the Net-Net SBC for RADIUS accounting use, refer to this guide's <u>Configuring Accounting</u> (39) chapter.

Licensing

In order to use RADIUS with your Net-Net SBC, you must have the accounting license installed and activated on your system. For more information about licensing, see the "Software Licensing" section of the *Net-Net 4000 ACLI Configuration Guide*'s *Getting Started* chapter. This chapter provides details about Acme Packet software licensing, including instructions for how to obtain and install licenses.

Overview

For H.323, SIP, and calls being interworked between H.323 and SIP (IWF), you can obtain sets of records that contain information to help you with accounting and that provide a quantitative and qualitative measurement of the call. For H.323 and SIP calls, the Net-Net SBC generates one set of records; for calls requiring IWF, the Net-Net SBC generates two sets of records.

You can use the RADIUS records generated by your Net-Net SBC to assist you with:

- Usage accounting—See the calling and called parties for a call, the protocol
 used, the realm the call traversed (as well as local and remote IP address and
 port information), and the codec used
- Traffic monitoring—You can see information about the setup, connect, and disconnect times, as well as the SIP or H.323 disconnect cause
- SLA monitoring—The Net-Net SBC supports RADIUS attributes that provide information about jitter, latency, and loss for H.323, SIP, and calls that require interworking between H.323 and SIP
- Troubleshooting—Obtain information about calls that can help you to identify and address issues with quality and how calls are setup and torn down.

Standard RADIUS Attributes

This section describes the standard RADIUS attributes that the Net-Net SBC supports. These attributes appear along with VSAs (Vendor-Specific Attributes) in the CDRs that the Net-Net SBC generates.

The <u>Standard RADIUS Attributes Dictionary (12)</u> is a dictionary of the standard RADIUS attributes included in Accounting Request messages sent by the Net-Net SBC to the RADIUS server. The CDR event information determines which messages are generated and which RADIUS attributes are included in the messages. Standard RADIUS messages and attributes are used whenever possible; however, RADIUS does not have attributes to record all important session information.

Possible messages are:

- Start—Marks the start of service delivery and describes the type of service being delivered and the user to whom it is being delivered
- Interim-Update—Indicates to the accounting server that the session parameters have changed
- Stop—
 - Marks the end of service delivery
 - Describes the type of service that was delivered
 - Sometimes describes statistics such as elapsed time, input and output octets, or input and output packets
- On—Marks the start of accounting
- Off—Marks the end of accounting

VSAs are used to record the necessary session information missing from this list of standard RADIUS attributes.

For more information about RADIUS, see to the following Internet Engineering Task Force Request for Comments (IETF RFCs):

- RFC 2865, "Remote Authentication Dial In User Service (RADIUS)," Rigney, et al., June 2000 (http://www.ietf.org/rfc/rfc2865.txt)
- RFC 2866, "RADIUS Accounting," C. Rigney, June 2000 (http://www.ietf.org/rfc/rfc2866.txt)

Standard RADIUS Attributes Dictionary

The table below lists and describes standard RADIUS attributes.

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
NAS-IP-Address	IP address of the SIP proxy or the H.323 stack's call signaling address.	4	IP address	Start Interim-Update Stop On Off
NAS-Port	SIP proxy port or the H.323 stack's call signaling RAS port.	5	integer	StartInterim-UpdateStopOnOff

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Called-Station-Id	"To" field value of the SIP INVITE message (a type of message used to initiate a session) or the call edPartyNumber of the H.323 message.	30	string	StartInterim-UpdateStop
Calling-Station-Id	"From" field value of the SIP INVITE message or the callingPartyNumber of the H.323 message.	31	string	StartInterim-UpdateStop
NAS-Identifier	Value, if any, set in the optional NAS – I D field for the accounting server that you configure as part of the accounting configuration. This identifier sets the value that the remote server (the accounting server) uses to identify the Net-Net SBC so that RADIUS messages can be transmitted. The remote server to which the accounting configuration will send messages uses at least one of two pieces of information for identification: NAS IP address: always included in the accounting message NAS identifier: configured in the NAS-ID parameter of the accounting server; if configured, the NAS identifier is sent to the remote server	32	string	 Start Interim-Update Stop On Off
	This attribute only appears if a value is configured in the NAS-ID field.			
Acct-Status-Type	Whether this Accounting Request marks the beginning of the RADIUS message (Start), the middle (Interim-Update), or the end (Stop), and whether the accounting function is on or off (Accounting-On or Accounting-Off).	40	integer	Start (1)Interim-UpdateStop (2)OnOff
Acct-Session-Id	Either the "Call-ID" field value of the SIP INVITE message, the call I dentifier of the H.323 message, or RADIUS client information.	44	string	StartInterim-UpdateStopOnOff
Acct-Session- Time	How much time in seconds the user has received service.	46	integer	Interim-UpdateStopOff
Acct-Terminate- Cause	How or why the session ended.	49	integer	• Stop • Off

RADIUS Accounting Termination Causes

The table below describes the possible session termination causes for the Acct-Terminate-Cause RADIUS attribute.

RADIUS Termination Cause	Related Integer Value (per RFC 2059)	Termination Event	Message
User Request	1	A SIP BYE message.	• Stop
User Error	17	Input from user is erroneous; for example, SIP signaling failed to establish the session. Used in combination with the Cisco Systems Disconnect Cause. (This termination cause is not used for H.323.)	• Stop
Lost Service	3	Service cannot be sustained for reasons such as a lost connection.	• Stop
idle-timeout	4	Idle timer expired.	• Stop
session- timeout	5	Maximum session length timer expired.	• Stop
Admin Reset	6	Net-Net SBC hard reset occurred: A hard reset occurs when you use the front panel's orange Reset button; it reboots the Net-Net SBC.	• Off
Admin Reboot	7	Net-Net SBC gracefully rebooted.	• Off
NAS Request	10	RADIUS server is disabled; session terminated for non-error reason.	• Off

VSAs

This section describes the VSAs that the Net-Net SBC supports. These attributes appear along with standard RADIUS attributes in the CDRs that the Net-Net SBC generates.

VSAs are defined by vendors of remote access servers in order to customize how RADIUS works on their servers. This section describes the accounting VSAs for Acme Packet and for Cisco Systems.

Acme Packet RADIUS VSAs

Acme Packet's vendor identification number is 9148. This number refers to the 4-octet VSA Vendor-ID field. The high-order octet is 0 and the low-order 3 octets are the SMI Network Management Private Enterprise Code of the Vendor in network byte order, defined in the Assigned Numbers RFC

(http://www.faqs.org/rfcs/rfc1700.html; Reynolds, J. and J. Postel, "Assigned Numbers", STD 2, RFC 1700, October 1994).

The table in this section is a dictionary of Acme Packet's accounting VSAs. You can use this information to translate the Acme Packet VSAs in Net-Net SBC RADIUS messages into human-readable form. Acme Packet maintains VSA dictionary definition files for the most popular RADIUS distributions; ask your Acme Packet account representative for details.

Grouped according to attribute function, this table contains the following sections:

- General Flow Attributes—Overall traits of the media flow, these attributes
 appear in all CDRs regardless of the session's protocol; these attribute fields are
 only populated if there are media flows
- Inbound Flow Attributes—Detailed traits of the inbound media flow (including realm, remote IP address and port, and local IP address and port); these attribute fields are only populated if there are media flows
- Outbound Flow Attributes—Detailed traits of the outbound media flow (including realm, remote IP address and port, and local IP address and port); these attribute field are only populated if there are media flows
- Session Attributes—Information about the protocol type, ingress and egress realms used, and an identifier that links the H.323 and SIP legs of a call requiring IWF
- QoS Attributes—RADIUS call records are instantiated by individual signaling applications on the Net-Net SBC. The Net-Net SBC writes the following additional parameters to the call record for QoS (Quality of Service):
 - RTP Lost packets
 - RTP Jitter
 - RTP Maximum Jitter
 - RTCP Lost packets
 - RTCP Jitter
 - RTCP Latency
 - RTCP Maximum Latency
 - RTP Total Packets
 - RTP Total Octets

Only RADIUS Stop records contain QoS information. For non-QoS calls, the attributes appear in the record, but their values are always be zero (0). When you review the list of QoS VSAs, please note that "calling" in the attribute name means the information is sent by the calling party and "called" in the attribute name means the information is sent by the called party.

Examples of how this information appears in CDRs appears in Appendix A (97) of this guide. Please note that the contents of Interim-Update messages do not depend on what events cause a Start message to be generated.

New in Release S-C6.0.0

The Net-Net SBC reports R-Factor and MOS data for the calling and called segments at the end of a session. This information appears in RADIUS CDRs, and in the Acme Packet VSA dictionary:

- Acme-Calling-R-Factor (151)
- Acme-Calling-MOS (152)
- Acme-Called-R-Factor (153)
- Acme-Called-MOS (154)

Note: These values are reported as * 100 in order to appear as integers.

Notes on Media Flow Attributes

The Net-Net SBC records media flow attributes in RADIUS CDRs, and there can be multiple flows per session. In order to distinguish between the two flows that appear

for a basic session (forward and reverse), the Net-Net SBC supports unique media flow attribute names.

The term "flow-set" represents a pair of media flows, where one is the forward flow and one is the reverse. The flow attributes described in the table below have the designation FS1 or FS2, which identifies it as either the first or the second flow-set. In addition, all non-QoS attributes have a direction indicator: F for forward, and R for reverse.

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
General Attributes				
Acme-CDR-Sequence- Number	Sequence number (that increases by 1) the Net-Net SBC generates; recorded in each CDR.	59	integer	Start Interim-Updat Stop
Acme-Intermediate- Time	Time interval at which periodic interim records are generated during a call.	63	string	Interim-Upda
Acme-Local-Time-Zone	Local GMT/UTC time zone that is provisioned on the Net-Net SBC.	57	string	StartInterim-UpdaStop
Acme-Firmware- Version	Current software version running on the Net-Net SBC.	56	string	StartInterim-UpdaStop
General Flow Attributes				
Acme-FlowID_FS1_F	Unique identifier for every media flow processed by the Net-Net SBC, flow-set 1 forward direction. This VSA always prefaces other flow information.	1	string	StartInterim-UpdaStopOnOff
Acme-FlowID_FS1_R	Unique identifier for every media flow processed by the Net-Net SBC, flow-set 1 reverse direction. This VSA always prefaces other flow information.	78	string	StartInterim-UpdaStopOnOff
Acme-FlowID_FS2_F	Unique identifier for every media flow processed by the Net-Net SBC, flow-set 2 forward direction. This VSA always prefaces other flow information.	90	string	StartInterim-UpdaStopOnOff
Acme-FlowID_FS2_R	Unique identifier for every media flow processed by the Net-Net SBC, flow-set 2 reverse direction.	112	string	StartInterim-UpdaStopOn
	This VSA always prefaces other flow information.			• Off

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-FlowType_FS1_F	Codec that describes the flow, flow-set 1 forward direction: PCMU, PCMA, G722, G726, G723, G728, G729, H261, H263, T38.	2	string	Start Interim-Update Stop On Off
Acme-FlowType_FS1_R	Codec that describes the flow, flow-set 1 reverse direction: PCMU, PCMA, G726, G723, G728, G729, H261, H263, T38.	79	string	StartInterim-UpdatStopOnOff
Acme-FlowType_FS2_F	Codec that describes the flow, flow-set 2 forward direction: PCMU, PCMA, G726, G723, G728, G729, H261, H263, T38.	91	string	StartInterim-UpdateStopOnOff
Acme-FlowType_FS2_R	Codec that describes the flow, flow-set 2 reverse direction: PCMU, PCMA, G726, G723, G728, G729, H261, H263, T38.	113	string	StartInterim-UpdateStopOnOff
Inbound Flow Attributes				
Acme-Flow-In- Realm_FS1_F	Inbound realm identifier for flow-set 1, forward direction.	10	string	StartInterim-UpdatStop
Acme-Flow-In- Realm_FS1_R	Inbound realm identifier for flow-set 1, reverse direction.	80	string	StartInterim-UpdateStop
Acme-Flow-In- Realm_FS2_F	Inbound realm identifier for flow-set 2, forward direction.	92	string	StartInterim-UpdatStop
Acme-Flow-In- Realm_FS2_R	Inbound realm identifier for flow-set 2, reverse direction.	114	string	StartInterim-UpdatStop
Acme-Flow-In-Src- Addr_FS1_F	Inbound source address (remote) information for flow-set 1, forward direction.	11	IP address	StartInterim-UpdatStop
Acme-Flow-In-Src- Addr_FS1_R	Inbound source address (remote) information for flow-set 1, reverse direction.	81	IP address	StartInterim-UpdatStop
Acme-Flow-In-Src- Addr_FS2_F	Inbound source address (remote) information for flow-set 2, forward direction.	93	IP address	StartInterim-UpdatStop
Acme-Flow-In-Src- Addr_FS2_R	Inbound source address (remote) information for flow-set 2, reverse direction.	115	IP address	StartInterim-UpdatStop
Acme-Flow-In-Src- Port_FS1_F	Inbound source (remote) port information for flow-set 1, forward direction.	12	integer	StartInterim-UpdatStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Flow-In-Src- Port_FS1_R	Inbound source (remote) port information for flow-set 1, reverse direction.	82	integer	StartInterim-UpdateStop
Acme-Flow-In-Src- Port_FS2_F	Inbound source (remote) port information for flow-set 2, forward direction.	94	integer	StartInterim-UpdateStop
Acme-Flow-In-Src- Port_FS2_R	Inbound source (remote) port information for flow-set 2, reverse direction.	116	integer	StartInterim-UpdateStop
Acme-Flow-In-Dst- Addr_FS1_F	Inbound destination (local) address information (the IPv4 address field value of the steering pool configuration) for flow-set 1, forward direction.	13	IP address	 Start Interim-Update Stop
Acme-Flow-In-Dst- Addr_FS1_R	Inbound destination (local) address information (the IPv4 address field value of the steering pool configuration) for flow-set 1, reverse direction.	83	IP address	StartInterim-UpdateStop
Acme-Flow-In-Dst- Addr_FS2_F	Inbound destination (local) address information (the IPv4 address field value of the steering pool configuration) for flow-set 2, forward direction.	95	IP address	StartInterim-UpdateStop
Acme-Flow-In-Dst- Addr_FS2_R	Inbound destination (local) address information (the IPv4 address field value of the steering pool configuration) for flow-set 2, reverse direction.	117	IP address	StartInterim-UpdateStop
Acme-Flow-In-Dst- Port_FS1_F	Inbound destination (local) port information (a port in the range between the start port and end port field values of the steering pool configuration) for flow-set 1, forward direction.	14	integer	StartInterim-UpdateStop
Acme-Flow-In-Dst- Port_FS1_R	Inbound destination (local) port information (a port in the range between the start port and end port field values of the steering pool configuration) for flow-set 1, reverse direction.	84	integer	StartInterim-UpdateStop
Acme-Flow-In-Dst- Port_FS2_F	Inbound destination (local) port information (a port in the range between the start port and end port field values of the steering pool configuration) for flow-set 2, forward direction.	96	integer	StartInterim-UpdateStop
Acme-Flow-In-Dst- Port_FS2_R	Inbound destination (local) port information (a port in the range between the start port and end port field values of the steering pool configuration) for flow-set 2, reverse direction.	118	integer	StartInterim-UpdateStop
Outbound Flow Attributes				
Acme-Flow-Out- Realm_FS1_F	Outbound realm identifier for flow-set 1, forward direction.	20	string	StartInterim-UpdateStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Flow-Out- Realm_FS1_R	Outbound realm identifier for flow-set 1, reverse direction.	85	string	StartInterim-UpdateStop
Acme-Flow-Out- Realm_FS2_F	Outbound realm identifier for flow-set 2, forward direction.	97	string	StartInterim-UpdateStop
Acme-Flow-Out- Realm_FS2_R	Outbound realm identifier for flow-set 2, reverse direction.	119	string	StartInterim-UpdateStop
Acme-Flow-Out-Src- Addr_FS1_F	Outbound source (local) address information (the IPv4 address field value of the steering port configuration) for flow-set 1, forward direction.	21	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Src- Addr_FS1_R	Outbound source (local) address information (the IPv4 address field value of the steering port configuration) for flow-set 1, reverse direction.	86	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Src- Addr_FS2_F	Outbound source (local) address information (the IPv4 address field value of the steering port configuration) for flow-set 2, forward direction.	98	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Src- Addr_FS2_R	Outbound source (local) address information (the IPv4 address field value of the steering port configuration) for flow-set 2, reverse direction.	120	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Src- Port_FS1_F	Outbound source (local) port information for flow-set 1, forward direction (a port in the range between the start port and end port field values of the steering port configuration).	22	integer	StartInterim-UpdateStop
Acme-Flow-Out-Src- Port_FS1_R	Outbound source (local) port information for flow-set 1, reverse direction (a port in the range between the start port and end port field values of the steering port configuration).	87	integer	StartInterim-UpdateStop
Acme-Flow-Out-Src- Port_FS2_F	Outbound source (local) port information for flow-set 2, forward direction (a port in the range between the start port and end port field values of the steering port configuration).	99	integer	StartInterim-UpdateStop
Acme-Flow-Out-Src- Port_FS2_R	Outbound source (local) port information for flow-set 2, reverse direction (a port in the range between the start port and end port field values of the steering port configuration).	121	integer	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Addr_FS1_F	Outbound destination (remote) address information for flow-set 1, forward direction.	23	IP address	 Start Interim-Update Stop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Flow-Out-Dst- Addr_FS1_R	Outbound destination (remote) address information for flow-set 1, reverse direction.	88	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Addr_FS2_F	Outbound destination (remote) address information for flow-set 2, forward direction.	100	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Addr_FS2_R	Outbound destination (remote) address information for flow-set 2, reverse direction.	122	IP address	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Port_FS1_F	Outbound destination (remote) port information for flow-set 1, forward direction.	24	integer	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Port_FS1_R	Outbound destination (remote) port information for flow-set 1, reverse direction.	89	integer	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Port_FS2_F	Outbound destination (remote) port information for flow-set 2, forward direction.	101	integer	StartInterim-UpdateStop
Acme-Flow-Out-Dst- Port_FS2_R	Outbound destination (remote) port information for flow-set 2, reverse direction.	123	integer	StartInterim-UpdateStop
Session Attributes				
Acme-Session-Generic-Id	Common ID shared by H.323 and SIP call legs of a session. This attribute is a combination of a time stamp (measured in seconds) and a monotonically increasing 16-bit integer, followed by an at-sign (@) and the MAC address of the rear interface (wancom). This attribute is only used to correlate the H.323 and SIP legs of an interworking call/session.	40	string	Start Interim-Update Stop
	This VSA is not configurable; all CDRs contain this attribute.			
Acme-Session-Ingress- CallId	Call ID generated by the originating device.	3	string	StartInterim-UpdateStop
Acme-Session-Egress- Callid	Call ID generated by the Net-Net SBC to represent a two-way transaction.	4	string	StartInterim-UpdatStop
Acme-Session-Ingress- Realm	Explicitly identifies the ingress realm, and contains the name of the ingress realm for the session. All CDRs contain this attribute.	41	string	StartInterim-UpdatStop
	This VSA is not configurable; all CDRs contain this attribute.			

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Session-Egress- Realm	Explicitly identifies the egress realm, and contains the name of the egress realm for the session. All CDRs contain this attribute.	42	string	Start Interim-Update Stop
	This VSA is not configurable. All CDRs contain this attribute, but it is only populated if an egress realm is found; a call without a route does not have an egress realm.			
Acme-Session-Protocol- Type	Signaling protocol used for a particular leg of a session (in the case of IWF, there may be two legs). This attribute contains the signaling protocol type; for example, SIP or H323.	43	string	StartInterim-UpdateStop
	This VSA is not configurable; all CDRs contain this attribute.			
Acme-Session- Charging-Vector	Appears when the Net-Net SBC inserts, passes, or deletes the P-Charging-Vector header (SIP).	54	string	StartInterim-UpdateStop
	This attribute is only populated for SIP CDRs, and is not populated if the Net-Net SBC does not have P-Charging-Vector information.			
Acme-Session- Charging- Function_Address	Appears when the Net-Net SBC inserts, passes, or deletes the P-Charging-Function-Address.	55	string	StartInterim-UpdateStop
	This attribute is only populated for SIP CDRs, and is not populated if the Net-Net SBC does not have P-Charging-Function-Address information.			
Acme-Session- Disposition	Status of the call attempt as it progresses from being initiated (using a SIP INVITE or H.323 Setup message) to being either answered or failing to be answered.	60	integer	StartInterim-UpdateStop
Acme-Post-Dial-Delay	Amount of time between session initiation and an alerting event.	58	integer	StartInterim-UpdateStop
Acme-P-Asserted-ID	P-Asserted ID as described in RFC 3325.	69	string	StartInterim-UpdateStop
Acme-SIP-Diversion	SIP Diversion header; communicates to the called party from whom and why a call diverted.	70	string	StartInterim-UpdateStop
Acme-Primary-Routing- Number	Primary routing number and phone context (or ingress SIP Request-URI).	64	string	StartInterim-UpdateStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Egress-Final- Routing-Number	Final routing number and phone context (or egress SIP Request-URI).	134	integer	• Stop
Acme-Disconnect- Initiator	Initiator of a call disconnect.	61	integer	• Stop
Acme-Disconnect- Cause	Q.850 cause code value.	62	integer	• Stop
Acme-SIP-Status	SIP status code for RFC 3326 support.	71	integer	• Stop
Acme-Originating- Trunk-Group	Originating trunk group.	65	string	StartInterim-UpdateStop
Acme-Originating- Trunk-Context	Originating trunk group context.	67	string	StartInterim-UpdateStop
Acme-Terminating- Trunk-Group	Terminating trunk group.	66	string	StartInterim-UpdateStop
Acme-Terminating- Trunk-Context	Terminating trunk group context.	68	string	StartInterim-UpdateStop
Acme-Ingress-Local- Addr	Signaling IP address and port of the ingress Net-Net SBC signaling interface.	74	string	StartInterim-UpdateStop
Acme-Ingress-Remote- Addr	Signaling IP address and port of the ingress remote signaling element.	75	string	StartInterim-UpdateStop
Acme-Egress-Local- Addr	Signaling IP address and port of the egress Net-Net SBC signaling interface.	76	string	StartInterim-UpdateStop
Acme-Egress-Remote- Addr	Signaling IP address and port of the destination signaling element.	77	string	StartInterim-UpdateStop
Acme-Session-Ingress- RPH	RPH value received in the incoming call (e.g., ets.1).	135	string	 Start Interim-Update Stop
	Only populated for NSEP calls.			5.5.6
Acme-Session-Egress- RPH	RPH value sent in the outgoing call (e.g., ets.3).	136	string	StartInterim-UpdateStop
	Only populated for NSEP calls.			
Acme-Ingress-Network- Interface-Id	To differentiate overlapping IP address spaces (with the Acme-Ingress-Vlan-Tag-Value), gives the ID of the ingress network interface.	137	string	StartInterim-UpdateStop
Acme-Ingress-Vlan-Tag- Value	To differentiate overlapping IP address spaces (with the Acme-Ingress-Network-Interface-Id), gives the VLAN tag.	138	integer	StartInterim-UpdateStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Egress-Network- Interface-Id	To differentiate overlapping IP address spaces (with the Acme-Egress-Vlan-Tag-Value), gives the ID of the ingress network interface.	139	string	StartInterim-UpdateStop
Acme-Egress-Vlan-Tag- Value	To differentiate overlapping IP address spaces (with the Acme-Egress-Network-Interface-Id), gives the VLAN tag.	140	integer	StartInterim-UpdateStop
Acme-Refer-Call- Transfer-Id	For SIP REFER call method transfer, communicates a call has been transferred from the referer to the referree	141	string	• Stop
QoS Attributes				
Acme-Calling-RTCP- Packets-Lost_FS1	Total lost packets reported via Real-time Transport Protocol Control Protocol (RTCP), flow-set 1.	32	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- Packets-Lost_FS2	Total lost packets measured on RTP packets in milliseconds, flow-set 2.	104	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- Avg-Jitter_FS1	Average jitter reported via RTCP measured in milliseconds, flow-set 1.	33	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- Avg-Jitter_FS2	Average jitter reported via RTCP measured in milliseconds, flow-set 2.	105	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP-Avg Latency_FS1	Average latency reported by comparing the timestamps in RTCP packets for each direction of a call, flow-set 1.	34	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP-Avg Latency_FS2	Average latency reported by comparing the timestamps in RTCP packets for each direction of a call, flow-set 2.	106	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- MaxJitter_FS1	Maximum amount of jitter value reported via RTCP measured in milliseconds, flow-set 1.	35	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- MaxJitter_FS2	Maximum amount of jitter value reported via RTCP measured in milliseconds, flow-set 3.	107	integer	• Stop
	Populated only if QoS is enabled.			

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Calling-RTCP- MaxLatency_FS1	Maximum latency value measured in milliseconds as observed through RTCP, flow-set 1.	36	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTCP- MaxLatency_FS2	Maximum latency value measured in milliseconds as observed through RTCP, flow-set 2.	108	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling- Octets_FS1	Bytes of RTP traffic for this call, flow-set 1.	28	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling- Octets_FS2	Bytes of RTP traffic for this call, flow-set 2.	102	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-	RTP packets for this call, flow-set 1.	29	integer	• Stop
Packets_FS1	Populated only if QoS is enabled.			
Acme-Calling-	RTP packets for this call, flow-set 2.	103	integer	• Stop
Packets_FS2	Populated only if QoS is enabled.			
Acme-Calling-RTP- Packets-Lost_FS1	Total lost packets measured on RTP packets in milliseconds, flow-set 1.	37	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTP- Packets-Lost_FS2	Total lost packets measured on RTP packets in milliseconds, flow-set 2.	109	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTP-Avg- Jitter_FS1	Total jitter measured on RTP packets in milliseconds, flow-set 1.	38	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTP-Avg- Jitter_FS2	Total jitter measured on RTP packets in milliseconds, flow-set 2.	110	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTP- MaxJitter_FS1	Maximum jitter measured on RTP packets in milliseconds, flow-set 1.	39	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-RTP-Avg- MaxJitter_FS2	Maximum jitter measured on RTP packets in milliseconds, flow-set 2.	111	integer	• Stop
	Populated only if QoS is enabled.			

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Called- Octets_FS1	Bytes of RTP traffic for the ingress side of the call, flow-set 1.	44	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called- Octets_FS2	Bytes of RTP traffic for the ingress side of the call, flow-set 2.	124	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called- Packets_FS1	RTP packets for the ingress side of the call, flow-set 1.	45	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called- Packets_FS2	RTP packets for the ingress side of the call, flow-set 2.	125	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP- Packets-Lost_FS1	Total lost packets measured on RTCP packets in milliseconds for the ingress side of the call, flow-set 1.	46	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP- Packets-Lost_FS2	Total lost packets measured on RTCP packets in milliseconds for the ingress side of the call, flow-set 2.	126	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP-Avg- Jitter_FS1	Average jitter reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 1.	47	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP-Avg- Jitter_FS2	Average jitter reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 2.	127	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-Avg- Latency_FS1	Average latency reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 1.	48	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-Avg- Latency_FS2	Average latency reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 2.	128	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP- MaxJitter_FS1	Maximum amount of jitter reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 1.	49	integer	• Stop
	Populated only if QoS is enabled.			

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Called-RTCP- MaxJitter_FS2	Maximum amount of jitter reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 2.	129	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP- MaxLatency_FS1	Maximum amount of latency reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 1.	50	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTCP- MaxLatency_FS2	Maximum amount of latency reported via RTCP measured in milliseconds for the ingress side of the call, flow-set 2.	130	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP- Packets-Lost_FS1	Total lost packets measured on RTP packets in milliseconds for the ingress side of the call, flow-set 1.	51	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP- Packets-Lost_FS2	Total lost packets measured on RTP packets in milliseconds for the ingress side of the call, flow-set 2.	131	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP-Avg- Jitter_FS1	Average jitter reported via RTP measured in milliseconds for the ingress side of the realm, flow-set 1.	52	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP-Avg- Jitter_FS2	Average jitter reported via RTP measured in milliseconds for the ingress side of the realm, flow-set 2.	132	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP- MaxJitter_FS1	Maximum amount of jitter reported via RTP measured in milliseconds for the ingress side of the call, flow-set1.	53	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Called-RTP- MaxJitter_FS2	Maximum amount of jitter reported via RTP measured in milliseconds for the ingress side of the call, flow-set 2.	133	integer	• Stop
	Populated only if QoS is enabled.			
Acme-Calling-R-Factor New in Release S-	QoS R-Factor calculation for the calling side of a session.	151	integer	Stop
C6.1.0	Populated only if QoS is enabled.			
	This value is reported as * 100 in order to appear as an integer.			

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Calling-MOS	QoS MOS calculation for the calling side of a session.	152	integer	Stop
New in Release S-				
C6.1.0	Populated only if QoS is enabled.			
	This value is reported as * 100 in order to appear as an integer.			
Acme-Called-R-Factor	QoS R-Factor calculation for the called side of a session.	153	integer	Stop
New in Release S- C6.1.0	Populated only if QoS is enabled.			
	This value is reported as * 100 in order to appear as an integer.			
Acme-Called-MOS	QoS MOS calculation for the called side of a session.	154	integer	Stop
New in Release S- C6.1.0	Populated only if QoS is enabled.			
	This value is reported as * 100 in order to appear as an integer.			
Acme-Session-Forked- Call-Id	The VSA is a string value, and appears as the header-value without the header parameters from the P-Multiring-	171	string	Stop
New in release S-C6.2.0	Correlator header for a session identified as part of a forked call.			

IPv6 Support

The following table lists the media flow attributes for IPv6 flows.

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Flow-In-Src- IPv6_Addr_FS1_F	Inbound source IPv6 address (remote) information for flow-set 1, forward direction.	155	ipv6addr	 Start Interim-Update Stop
Acme-Flow-In-Dst- IPv6_Addr_FS1_F	Inbound destination (local) address information (the IPv6 address field value of the steering pool configuration) for flow-set 1, forward direction.	156	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Src- IPv6_Addr_FS1_F	Outbound source (local) address information (the IPv6 address field value of the steering port configuration) for flow-set 1, forward direction.	157	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Dst- IPv6_Addr_FS1_F	Outbound destination (remote) IPv6 address information for flow-set 1, forward direction.	158	ipv6addr	 Start Interim-Update Stop
Acme-Flow-In-Src- IPv6_Addr_FS1_R	Inbound source IPv6 address (remote) information for flow-set 1, reverse direction.	159	ipv6addr	StartInterim-UpdateStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Acme-Flow-In-Dst- IPv6_Addr_FS1_R	Inbound destination (local) address information (the IPv6 address field value of the steering pool configuration) for flow-set 1, reverse direction.	160	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Src- IPv6_Addr_FS1_R	Outbound source (local) address information (the IPv6 address field value of the steering port configuration) for flow-set 1, reverse direction.	161	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Dst- IPv6_Addr_FS1_R	Outbound destination (remote) IPv6 address information for flow-set 1, reverse direction.	162	ipv6addr	Start Interim-Update Stop
Acme-Flow-In-Src- IPv6_Addr_FS2_F	Inbound source address (remote) IPv6 information for flow-set 2, forward direction.	163	ipv6addr	Start Interim-Update Stop
Acme-Flow-In-Dst- IPv6_Addr_FS2_F	Inbound destination (local) address information (the IPv6 address field value of the steering pool configuration) for flow-set 2, forward direction.	164	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Src- IPv6_Addr_FS2_F	Outbound source (local) address information (the IPv6 address field value of the steering port configuration) for flow-set 2, forward direction.	165	ipv6addr	StartInterim-UpdateStop
Acme-Flow-Out-Dst- IPv6_Addr_FS2_F	Outbound destination (remote) IPv6 address information for flow-set 2, forward direction.	166	ipv6addr	Start Interim-Update Stop
Acme-Flow-In-Src- IPv6_Addr_FS2_R	Inbound source address (remote) IPv6 address information for flow-set 2, reverse direction.	167	ipv6addr	Start Interim-Update Stop
Acme-Flow-In-Dst- IPv6_Addr_FS2_R	Inbound destination (local) address information (the IPv6 address field value of the steering pool configuration) for flow-set 2, reverse direction.	168	ipv6addr	StartInterim-UpdateStop
Acme-Flow-Out-Src- IPv6_Addr_FS2_R	Outbound source (local) address information (the IPv6 address field value of the steering port configuration) for flow-set 2, reverse direction.	169	ipv6addr	Start Interim-Update Stop
Acme-Flow-Out-Dst- IPv6_Addr_FS2_R	Outbound destination (remote) IPv6 address information for flow-set 2, reverse direction.	170	ipv6addr	StartInterim-UpdateStop

Acme Packet VSA Values

The table below defines the possible values for several Acme Packet VSAs.

Acme Packet VSA Name	Attribute Value	Possible Values
Acme-PostDial- Delay	58	Unit value in milliseconds
Acme-Session- Disposition	60	 0=unknown 1=call_attempt 2=ringing 3=answered
Acme-Disconnect- Initiator	61	 0=UNKNOWN_DISCONNECT_INITIATOR 1=CALLING_PARTY_DISCONNECT 2=CALLED_PARTY_DISCONNECT 3=INTERNAL_DISCONNECT
Acme-Disconnect- Cause	62	34=No circuit/channel available 47=Resource unavailable 3=No route destination 31=Normal, unspecified 88=Incompatible destination 111=Interworking, unspecified 38=Network out of order 42=Switching equip congestion 28=Invalid number format 41=Temporary failure 17=User busy 16=Normal call clearing 20=Subscriber absent 31=Normal call clearing 18=Request error timeout response 55=Forbidden error response

Acme Packet VSA Name	Attribute Value	Possible Values
Acme-SIP-	70	SIP Diversion header based on this RFC draft: draft-
Diversion		levy-sip-diversion-05.txt
Acme-SIP-Status	71	This is a complete list of support status codes; only a
		subset would be reported in a Stop record:
		 RESP_STATUS_TRYING 100
		 RESP_STATUS_RINGING 180
		RESP_STATUS_FORWARD 181 RESP_STATUS_CUELED_100
		 RESP_STATUS_QUEUED 182 RESP_STATUS_PROGRESS 183
		RESP_STATUS_PROGRESS 183RESP_STATUS_OK 200
		RESP_STATUS_OR
		RESP_STATUS_ACCEPTED 202
		• RESP_STATUS_PART 206
		RESP_STATUS_MAX_OK 299
		RESP_STATUS_MULTIPLE 300
		 RESP_STATUS_MOVED 301
		 RESP_STATUS_MOVED_TMP 302
		 RESP_STATUS_USE_PROXY 305
		 RESP_STATUS_ALTERNATE 380
		RESP_STATUS_BAD 400
		RESP_STATUS_UNAUTH 401
		RESP_STATUS_PAY_REQ 402 RESP_STATUS_FOREIGNESS
		RESP_STATUS_FORBIDDEN 403 DESP_STATUS_NOT_FOUND 404
		RESP_STATUS_NOT_FOUND
		RESP_STATUS_NOT_ALLOW 405RESP_STATUS_NOT_ACCEPT 406
		• RESP_STATUS_AUTH_REQ 407
		RESP_STATUS_REQ_TMO
		RESP_STATUS_CONFLICT 409
		RESP_STATUS_GONE 410

		RESP_STATUS_BUSY 600 RESP_STATUS_DECLINE 603
		RESP_STATUS_DECLINE 603 RESP_STATUS_DONT_EXIST 604

Authentication VSAs

The table below defines Acme Packet VSAs used for RADIUS authentication.

Acme Packet VSA Name	Attribute Value	Attribute Values
Acme-User- Privilege	Describes at RADIUS login the privileges granted to the administrator (VSA only available with admin security license installed). Values can be: • sftpForAudit (SFTP is allowed for audit logs) • sftpForAll (SFTP is allowed for logging, and audit logs)	253
Acme-User-Class	Identifies the type user on the Net-Net SBC; used for RADIUS authentication only and does not apply to accounting. Values can be user, admin, and SystemAdmin (only with admin security license installed).	254

Cisco Systems RADIUS Decodes

The following table is a dictionary of the Cisco Systems (vendor identification number is 9) accounting VSAs. These attribute names are vendor-specific and subject to change without notice.

You can use the information in this table to translate the Cisco Systems VSAs that sometimes appear in Net-Net SBC RADIUS messages into a more human-readable form.

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Setup Time	Time that a SIP INVITE or H.323 SETUP message was received. The SETUP message is used to request a connection (and therefore corresponds with the SIP INVITE).	25	string	• Start • Stop
Connect Time	Time that a SIP or H.323 session was accepted. This is the time a 200 OK SIP response to the SIP INVITE message was received or the time that a call ANSWERED/CONNECTED response to the H.323 SETUP message was received.	28	string	StartInterim- UpdateStop

Attribute Name	Attribute Description	Attribute Value	Attribute Value Type	Messages
Disconnect Time	Time that a SIP BYE or H.323 Release Complete message was received or the session terminated. This is the time a SIP INVITE or H.323 SETUP transaction terminates for any reason.	29	string	• Stop
Disconnect Cause	SIP Reasons for Disconnection (normal, redirection, client error, network error, global error, time-out, or user abandon) or the H.323 Release Complete Reason code (bad format address, unavailable, destination rejection, adaptive busy, etc.).	30	string	• Stop
	For more information, refer to this guide's Mappings and Disconnect Cause Values (32) section.			

Mappings and Disconnect Cause Values

This section provides information about H.323 and SIP disconnect cause values for RADIUS CDRs generated by the Net-Net SBC.

SIP, H.323, and Q.850 Mappings

This section provides tables that show the mappings between SIP Status and: H.323 Disconnect Reason, H.323 Release Complete Reason, and RAS error. It also shows the mapping for Q.850 cause to H.323 Release Complete Reason.

SIP Status to H.323 Disconnect Reason Mapping

SIP Status	H.323 Disconnect Reason
480 Temporarily Unavailable	No Bandwidth
404 Not Found	Gatekeeper Resource
404 Not Found	Unreachable Destination
603 Decline	Destination Rejection
505 Version Not Supported	Invalid Revision
401 Unauthorized	No Permission
503 Service Unavailable	Unreachable Gatekeeper
480 Temporarily Unavailable	Gateway Resource
400 Bad Request	Bad Format Request
486 Busy Here	Adaptive Busy
486 Busy Here	In Conference
500 Internal Server Error	Undefined Reason

SIP Status	H.323 Disconnect Reason
486 Busy Here	Facility Call Deflection
401 Unauthorized	Security Denied

SIP Status to H.323 RAS Error Mapping

SIP Status	H.323 RAS Error
404 Not Found	Gatekeeper Resource
401 Unauthorized	Invalid Permission
503 Service Unavailable	Request Denied
500 Internal Server Error	Undefined
401 Unauthorized	Caller Not Registered
305 User Proxy	Route Call to Gatekeeper
500 Internal Server Error	Invalid Endpoint ID
503 Service Unavailable	Resource Unavailable
401 Unauthorized	Security Denial
501 Not Implemented	QoS Control Not Supported
484 Address Incomplete	Incomplete Address
302 Moved Temporarily	Route Call to SCN
485 Ambiguous	Aliases Inconsistent
401 Unauthorized	Not Currently Registered

SIP Status to H.323 Release Complete Reason Error Mapping

SIP Status	H.323 RAS Error
300 Multiple Choices	Undefined Reason
401 Unauthorized	Security Denied
402 Payment Required	Undefined Reason
403 Forbidden	No Permission
404 Not Found	Unreachable Destination
405 Method Not Allowed	Undefined Reason
606 Not Acceptable	Undefined Reason
407 Proxy Authentication Required	Security Denied
408 Request Timeout	Adaptive Busy

SIP Status	H.323 RAS Error
409 Conflict	Undefined Reason
410 Gone	Unreachable Destination
411 Length Required	Undefined Reason
414 Request-URI Too Large	Bad Format Address
415 Unsupported Media Type	Undefined Reason
420 Bad Extension	Bad Format Address
480 Temporarily Unavailable	Adaptive Busy
481 Call/Transaction Does Not Exist	Undefined Reason
482 Loop Detected	Undefined Reason
483 Too Many Hops	Undefined Reason
484 Address Incomplete	Bad Format Address

Q.850 Cause to H.323 Release Complete Reason Mapping

The table below describes how the Q.850 Causes and the H.323 release complete reasons are mapped internally on the Net-Net SBC.

Q.850 Cause	Numeric Code	H.323 Release Complete Reason
Not Route To Destination	3	Unreachable Destination
Normal Call Clearing	16	Destination Rejection
User Busy	17	In Conference
Subscriber Absent	20	Called Party Not Registered
Invalid Number Format	28	Bad Format Address
Normal Unspecified	16	Undefined Reason
No Circuit/Channel Available	34	No Bandwidth
Network Out of Order	38	Unreachable Gatekeeper
Temporary Failure	41	Adaptive Busy
Switching Equipment Congestion	42	Gateway Resource
Resource Unavailable	47	Gatekeeper Resource
Incompatible Destination	88	Invalid Revision
Interworking Unspecified	111	No Permission

SIP-SIP Calls

The Net-Net SBC maps SIP status codes and events to disconnect cause attribute values used by Cisco Systems Proxy Server (CSPS) accounting services.

SIP Status Category/Event	CDR Disconnect Cause	Description
Undetermined reason	0	Undetermined reason
BYE	1	Normal clearing
3xx: Redirection	2	Redirection
4xx: Client Error	3	Client error
5xx: Server Error	4	Server error
6xx: Global Failure	5	Global error

SIP-H.323 Calls with Interworking

For calls that require SIP-H.323 interworking, the Net-Net SBC generates two sets of RADIUS CDRs: one for the SIP call-leg and one for the H.323 call leg. The values recorded in RADIUS Stop records for the disconnect cause depend on the nature and source of the call disconnect or rejection.

SIP Events and Errors

For calls rejected or disconnected because of SIP events and errors, the Net-Net SBC records Q.850 cause values mapped from the SIP event/status code in the SIP CDR. For the H.323 CDR, the SIP status categories and events are mapped to Q.850 cause codes.

The entries in this table are determined by the <u>SIP Status to H.323 Release Complete Reason Error Mapping (33)</u>.

SIP Status Category/Event	SIP CDR Disconnect Cause	H.323 Disconnect Cause Value (Q.850) 16—Normal call clearing	
BYE	16—Normal call clearing		
Зхх	23—Redirection to new destination	16—Normal call clearing	
404 Not Found	21—Call rejected	3—No route to destination	
410 Gone	21—Call rejected	3—No route to destination	
403 Forbidden	21—Call rejected	111—Interworking unspecified	
408 Request Timeout	21—Call rejected	41—Temporary failure	
413 Request Entity Too Big	21—Call rejected	28—Invalid number format	
414 Request URI Too Large	21—Call rejected	28—Invalid number format	
420 Bad Extension	21—Call rejected	28—Invalid number format	
484 Address Incomplete	21—Call rejected	28—Invalid number format	
408 Request Timeout	21—Call rejected	41—Temporary failure	
480 Temporarily unavailable	21—Call rejected	41—Temporary failure	

SIP Status Category/Event	SIP CDR Disconnect Cause	H.323 Disconnect Cause Value (Q.850)	
486 Busy Here	21—Call rejected		
401 Unauthorized	21—Call rejected	32—Normal unspecified	
407 Proxy Authentication Required	21—Call rejected	32—Normal unspecified	
All other 4xx	21—Call rejected	16—Normal unspecified	
502 Bad Gateway	38—Network out of order	28—Invalid number format	
505 Bad Version	38—Network out of order	88—Incompatible destination	
All other 5xx	38—Network out of order	16—Normal unspecified	
600 Busy Everywhere	31—Normal unspecified	41—Temporary failure	
603 Decline	31—Normal unspecified	31—Normal unspecified	
604 Does Not Exist Anywhere	31—Normal unspecified	3—No route to destination	
All other 6xx	31—Normal unspecified	31—Normal unspecified	

H.323 Events and Errors

The Q.850 cause code value is recorded for the disconnect cause in the CDR for the H.323 call leg if the Q.850 cause is received. H.323 recommendations state that either Q.850 Cause of RelCompReason is mandatory for the RELEASE COMPLETE; the Cause information element (IE) is optional everywhere. The Cause IE and the ReleaseCompleteReason (part of the release complete message) are mutually exclusive.

If a Q.850 cause code is not received, the Net-Net SBC records a Q.850 cause value mapped from the received ReleaseCompleteReason as defined in the table below.

The entries in this table are determined by the <u>SIP Status to H.323 Disconnect Reason Mapping (32)</u>.

H.323 ReleaseCompleteReason	H.323 CDR Disconnect Cause	SIP Status	SIP CDR Disconnect
No Bandwidth	34—No channel/circuit available	480 Temporarily Unavailable	21—Call rejected
Gatekeeper Resource	47—Resource unavailable	404 Not Found	21—Call rejected
Unreachable Destination	3—No route to destination	404 Not Found	21—Call rejected
Destination Rejected	31—Normal unspecified	603 Decline	31—Normal unspecified

H.323 ReleaseCompleteReason	H.323 CDR Disconnect Cause	SIP Status	SIP CDR Disconnect Cause
Invalid Revision	88-Incompatible destination	505 Version Not Supported	38—Network out of order
No Permission	111—Interworking unspecified	401 Unauthorized	21—Call rejected
Unreachable Gatekeeper	38—Network out of order	503 Service Unavailable	38—Network out of order
Gateway Resource	42—Switching equipment congestion	480 Temporarily unavailable	21—Call rejected
Bad Format Request	28—Invalid number format	400 Bad request	21—Call rejected
Adaptive Busy	41—Temporary failure	486 Busy Here	21—Call rejected
In Conference	17—User busy	486 Busy Here	21—Call rejected
Undefined Reason	16—Normal unspecified	500 Internal Server Error	38—Network out of order
Called Party Not Registered	20—Subscriber absent	404 Not Found	21—Call rejected
Caller Not Registered	31—Normal call clearing		
New Connection Needed	47—Resource Unavailable	401 Unauthorized	21—Call rejected

H.225 RAS Errors

For calls that are rejected because of H.225 RAS, there is no CDR generated for the H.323 call leg as no Setup message is generated. The Net-Net SBC maps RAS errors to SIP Status as specified in the table below. The SIP CDR disconnect cause values are the same as the CSPS disconnect cause values already mentioned and defined.

The entries in this table are determined by the <u>SIP Status to H.323 RAS Error Mapping (33)</u>.

H.225 RAS Error	SIP Status	SIP CDR Disconnect Cause
Called Party Not Registered	404 Not Found	21—Call Rejected
Invalid Permission	401 Unauthorized	21—Call Rejected
Request Denied	503 Service Unavailable	38—Network out of order
Undefined	500 Internal Server Error	38—Network out of order
Caller Not Registered	401 Unauthorized	21—Call Rejected
Route Call to Gatekeeper	305 Use Proxy	23—Redirection to new destination
Invalid Endpoint ID	500 Internal Server Error	38—Network out of order
Resource Unavailable	503 Service Unavailable	38—Network out of order
Security Denial	401 Unauthorized	21—Call Rejected

H.225 RAS Error	SIP Status	SIP CDR Disconnect Cause
QoS Control Not Supported	501 Not Implemented	38—Network out of order
Incomplete Address	484 Address Incomplete	21—Call Rejected
Route Call to SCN	302 Moved Temporarily	2—Redirection
Aliases Inconsistent	485 Ambiguous	21—Call Rejected
Not Currently Registered	401 Unauthorized	21—Call Rejected

SIP: Call Tear Down Due to Media Guard Timer Expiration

When a SIP call is torn down by the Net-Net SBC due to media timers expiring, the following standard and VS attributes and their corresponding values will appear in the CDR stop message:

CDR Output

The following five CDR AVPs must be observed in the same CDR.

Acct-Terminate-Cause = Idle-Timeout

h323-di sconnect-cause = "6"

Acme-Disconnect-Initiator = 3

Acme-Disconnect-Cause = 0

Acme-SIP-Status = 0

Explanation

- Acct-Termi nate-Cause = Idle-Timeout: This standard RADIUS AVP indicates the call was ended due to a timer expiring.
- h323-di sconnect-cause = "6": This VSA AVP indicates the call was ended due to a timeout.
- Acme-Di sconnect-I ni ti ator = 3: This VSA AVP indicates the call disconnect
 was initiated internally from the Net-Net SBC, and not from an endpoint or due
 to an unknown reason.
- Acme-Di sconnect-Cause = 0: This VSA AVP indicates that a media timer expired.
- Acme-SIP-Status = 0: This VSA AVP indicates the call disconnect was initiated internally from the Net-Net SBC, and not from an endpoint or due to an unknown reason for a SIP call.

Configuring Accounting

Overview

This chapter provides you with information about configuring RADIUS accounting on your Net-Net SBC.

The Net-Net products support Net-Net SBC RADIUS accounting, including these essential configurations and specialized features:

- Accounting for SIP and H.323
- Local CDR storage on the Net-Net SBC, including CSV file format settings-
- The ability to send CDRs via FTP to a RADIUS sever
- Per-realm accounting control
- Configurable intermediate period
- RADIUS CDR redundancy
- RADIUS CDR content control

Accounting for SIP and H.323

This section explains SIP and H.323 accounting using the RADIUS Accounting System (RAS).

For accounting purposes, the Net-Net SBC uses RADIUS to send accounting messages. These messages are transmitted to one of a predefined list of accounting servers using a predefined forwarding strategy. RAS provides a mechanism for temporarily storing session initiation and completion statistics and for delivering these statistics to accounting servers located elsewhere in the network.

Call Detail Records

The Net-Net SBC supports CDRs through RADIUS reporting with additional VSAs to include information that is not available with the standard RADIUS session information. CDRs provide billing information on sessions traversed through a system, as well as troubleshooting information, fraud detection, fault diagnostics, and service monitoring.

CDRs can contain information about recent system usage such as the identities of sources (points of origin), the identities of destinations (endpoints), the duration of each call, the amount billed for each call, the total usage time in the billing period, the total free time remaining in the billing period, and the running total charged during the billing period.VSAs are defined by vendors of remote access servers in order to customize how RADIUS works on their servers.

RAS Overview

The RAS acts as a RADIUS client. It provides a mechanism for generating accounting information in CDRs. The CDRs are transmitted to a RADIUS server in UDP datagrams, using RADIUS Accounting Request messages.

The RAS receives RADIUS accounting messages when different events occur. The event and CDR event trigger list information determines which RADIUS messages,

if any, are included, as well as which RADIUS attributes are included. The library adds RADIUS messages to the waiting queue only when the message is ready to be sent. The SIP proxy needs to populate the CDR as session information becomes available so, by the time the session ends, it contains the information necessary to generate all of the messages.

The RADIUS accounting client process manages its queue and a list of servers. The servers each have a UDP connection and manage their own pending message queues. Changes in the state of the server connection might cause interaction with the client process waiting queue.

When RADIUS messages are added to the RAS waiting queue, the RAS sends them to a server based on strategy. If the RAS is configured to transmit all the messages when the session ends, all the messages are sent to the same server. Each session continues logging messages according to the event logging scheme in effect when the session began (for example, when the CDR was created).

The RAS notifies the RADIUS server with Accounting-On/Off messages when the RAS's entry for that server is enabled/disabled. The response to the Accounting-On message is the RAS's first determination of RTT, and serves as notification that the server is reachable. Until the Accounting-On response is received, the server cannot send other messages.

RADIUS Accounting Client

The RADIUS accounting client process has a local socket at which it accepts RADIUS messages. RADIUS messages received on the local socket are added to the waiting queue for transmission to a RADIUS server. The waiting queue is a first-in, first-out (FIFO) queue.

The RADIUS accounting client process sends messages to a server queue based on the configuration (servers configured/enable/connected, as well as the strategy). Messages that return from a server (due to server failure/disabling) are first in the FIFO queue.

The RADIUS accounting client process interfaces with the RADIUS accounting servers using the RADIUS protocol with the VSAs outlined above.

The RADIUS server collects a variety of information that can be used for accounting and for reporting on network activity. The RADIUS client sends information to designated RADIUS servers when the user logs on and logs off. The RADIUS client might send additional usage information on a periodic basis while the session is in progress. The requests sent by the client to the server to record logon/logoff and usage information are generally called accounting requests.

RADIUS accounting permits a RADIUS server to track when users commence and terminate their connections. Typical accounting information includes the following:

- Full user name
- RAS identification name or IP address
- RAS port number
- Time connection started

When a client is configured to use RADIUS accounting, it generates an Accounting Start packet describing the type of service being delivered and the user it is being delivered to at the start of service delivery. It sends that packet to the RADIUS Accounting server, which sends back an acknowledgement that the packet has been received. At the end of service delivery, the client generates an Accounting Stop

packet describing the type of service that was delivered and, optionally, statistics such as elapsed time, input and output octets, or input and output packets. It sends that packet to the RADIUS Accounting server, which sends back an acknowledgement that the packet has been received. The Accounting-Request (whether for Start or Stop) is submitted to the RADIUS accounting server through the network.

Transactions between the client and RADIUS accounting server are authenticated through the use of a shared secret, which is never sent over the network.

Session Accounting

The RAS client can record SIP, H.323, and IWF session activity based on configuration and a CDR. The CDR determines which messages are generated and determines the RADIUS attributes included in the messages. The RAS client must be capable of sending CDRs to any number of RADIUS accounting servers, using the defined hunt, failover, round robin, fewest pending, or fastest server strategies.

The establishment, failed establishment, change, or removal of a session can trigger RADIUS Accounting Request messages. The RAS might also send notification of its status (enabled/disabled). RADIUS Accounting Request messages include the following:

- Start—Session has started.
- Interim-Update—Session parameters have changed.
- Stop—Session has ended.
- Accounting-On—Creation of a new RADIUS client.
- Accounting-Off—RADIUS client has shut down.

Each session might generate Start, Interim-Update, and Stop messages based on the local configuration when the session is initiated. Each Start message tells the RADIUS server that a session has started. Each Interim-Update message changes the session parameters, and may report the session characteristics for the session to that point. Each Stop message informs the RADIUS server that a session has ended and reports session characteristics.

The RAS has the ability to transmit all RADIUS messages related to a session at the end of the session, regardless of which messages are generated and when they are generated. Some customers might choose this option to reduce the likelihood of the RADIUS messages being logged to different servers, or in different log files on the same server.

The RAS always generates a RADIUS Stop message when the session ends, regardless of the session termination cause. The termination cause and the session characteristics are reported.

Interim RADIUS Records for Recursive Attempts

When the Net-Net SBC routes calls, it performs local policy look-ups that can return several next hops, ordered by preference. This can also happen as a results of an LRT lookup, an ENUM query response, or SIP redirect. To set up sessions, the Net-Net SBC uses—in ordered preference—and recurses through the list if it encounters failures.

You can configure SIP accounting to send RADIUS Interim records when the Net-Net SBC encounters these failures. The interim message contains: the destination IP address, the disconnect reason, a timestamp for the failure, and the number that was called. This feature is enabled by setting the *generate-interim* parameter to

unsuccessful-attempt. Please refer to Appendix C to view the format of an unsuccessful-attempt interim record.

RADIUS Messages

The following table identifies the relationship between the signaling elements and the RADIUS attributes included in Accounting Request messages to the RADIUS server.

RADIUS Attribute	Data Element	Message
NAS IP-Address	IP address of the SIP proxy or the H.323 stack's call signal address.	Start, Interim- Update, Stop, On, Off
NAS Port	SIP proxy port or the H.323 stack's call signaling RAS port.	Start, Interim- Update, Stop, On, Off
NAS Identifier	Value, if any, set in the optional NAS-I D field for the accounting server that you configure as part of the accounting configuration. This identifier sets the value that the remote server (the accounting server) uses to identify the Net-Net SBC so that RADIUS messages can be transmitted.	Start, Interim- Update, Stop, On, Off
	The remote server to which the accounting configuration will send messages uses at least one of two pieces of information for identification: NAS IP address: always included in the accounting message NAS identifier: configured in the NAS-ID parameter of the accounting server; if configured, the NAS identifier is sent to the remote server	
	This attribute only appears if a value is configured in the NAS-ID field.	
Acct-Session-ID	Either the "Call-ID" field value of the SIP INVITE message, the call I dentifier of the H.323 message, or RADIUS client information.	Start, Interim- Update, Stop, On, Off
Called Station ID	"To" field value of the SIP INVITE message (a type of message used to initiate a session) or the called PartyNumber of the H.323 message.	Start, Interim- Update, Stop
Calling Station ID	"From" field value of the SIP INVITE message or the call ingPartyNumber of the H.323 message.	Start, Interim- Update, Stop
Acct-Terminate-Cause	Reason for session ending (refer to Session Termination session).	Stop, Off
Acct-Session-Time	Length of session (time in seconds).	Interim-Update, Stop, Off

Session Termination

Sessions are terminated for reasons that include normal termination, signaling failure, timeout, or network problems. The following table maps RADIUS accounting termination cause codes to network events.

RADIUS Termination Cause	Event	Message
User request	SIP BYE message or H.323	Stop
User error	SIP signaling failed to establish session (accompanied by disconnect cause)	Stop
NAS request	RADIUS server disabled	Off

ACLI Instructions and Examples

This section tells you how to access and set parameters for RADIUS accounting support. To use the Net-Net SBC with external RADIUS (accounting) servers to generate CDRs and provide billing services requires, you need to configure account configuration and account server list.

Accessing the Accounting and Accounting Servers Configuration

To configure the account configuration and account servers:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

2. Type **session-router** and press <Enter> to access the system-level configuration elements.

ACMEPACKET(confi gure)# session-router

3. Type **account-config** and press <Enter>. The system prompt changes to let you know that you can begin configuring individual parameters.

```
ACMEPACKET(sessi on-router)# account-config
ACMEPACKET(account-config)#
```

4. To configure account server parameters (a subset of the account configuration parameters, type **account-servers** and press <Enter>. The system prompt changes to let you know that you can begin configuring individual parameters.

```
ACMEPACKET(account-config)# account-servers
ACMEPACKET(account-server)#
```

Setting Up the Account Configuration

You set the account configuration parameters to indicate where you want accounting messages sent, when accounting messages you want them sent, and the strategy you want used to select account servers.

To configure the account configuration:

- 1. hostname—Defaults to and must remain I ocal host.
- 2. **port**—Retain the default value of 1813 or enter the number of the UDP port associated with the Net-Net SBC from which RADIUS messages are sent.

minimum: 1025maximum: 65535

3. **strategy**—Indicate the strategy you want used to select the accounting servers to which the Net-Net SBC will send its accounting messages. The following table lists the available strategies:

Strategy	Description
hunt	Selects accounting servers in the order in which they are listed.
	If the first accounting server is online, working, and has not exceeded any of the defined constraints, all traffic is sent to it. Otherwise the second accounting server is
	selected. If the first and second accounting servers are offline or exceed any defined constraints, the third
	accounting server is selected. And so on through the entire list of configured servers
failover	Uses the first server in the list of predefined accounting servers until a failure is received from that server. Once a
	failure is received, it moves to the second accounting server in the list until a failure is received. And so on through the entire list of configured servers.
round robin	Selects each accounting server in order, distributing the selection of each accounting server evenly over time.
fastest round trip time	Selects the accounting server that has the fastest round trip time (RTT) observed during transactions with the servers (sending a record and receiving an ACK).
fewest pending	Selects the accounting server that has the fewest number of unacknowledged accounting messages (that are in transit to the Net-Net SBC).

- 4. **state**—Retain the default value **enabl ed** if you want the account configuration active on the system. Enter **di sabl ed** if you do not want the account configuration active on the system.
- 5. **max-msg-delay**—Retain the default value of **60** seconds or indicate the length of time in seconds that you want the Net-Net SBC to continue trying to send each accounting message. During this delay, the Net-Net SBC can hold a generic queue of 4096 messages.

Minimum: zero (0)
Maximum: 2³²-1

max-wait-failover—Retain the default value of 100 messages or indicate the
maximum number of accounting messages the Net-Net SBC can store its
message waiting queue for a specific accounting server, before it is considered a
failover situation.

Once this value is exceeded, the Net-Net SBC attempts to send it accounting messages, including its pending messages, to the next accounting server in its configured list.

• Minimum: one (1) message

• Maximum: 4096 messages

- 7. **trans-at-close**—Retain the default value of **di sabl ed** if you do not want to defer the transmission of message information to the close of a session. Enter **enabl ed** if you want to defer message transmission.
 - **di sabl ed**—The Net-Net SBC transmits accounting information at the start of a session (Start), during the session (Interim), and at the close of a session

- (Stop). The transmitted accounting information for a single session might span a period of hours and be spread out among different storage files.
- **enabl ed**—Limits the number of files on the Net-Net SBC used to store the accounting message information for one session. It is easiest to store the accounting information from a single session in a single storage file.
- 8. **generate-start**—Retain the default value **ok** if you want the RADIUS Start message to be generated once the Net-Net SBC receives an OK message in response to an INVITE. (A RADIUS Start message informs the accounting server that a SIP session has started.)

Other options include:

- Start—RADIUS Start message should not be generated.
- Invite—RADIUS Start message should be generated once the Net-Net SBC receives a SIP session INVITE.
- 9. **generate-interim**—Retain the default value **rei nvi te response** to cause the Net-Net SBC to transmit a RADIUS Interim message. (A RADIUS Interim message indicates to the accounting server that the SIP session parameters have changed.)

You can select none, one, or more than one of the following values:

Option	Description
ok	RADIUS Start message is generated when the Net-Net SBC receives an OK message in response to an INVITE.
reinvite	RADIUS Interim message is generated when the Net-Ne SBC receives a SIP session reINVITE message.
reinvite response (default)	RADIUS Interim message is generated when the Net-Ne SBC receives a SIP session reINVITE and responds to it (for example, session connection or failure).
reinvite cancel	RADIUS Interim message is generated when the Net-Ne SBC receives a SIP session reINVITE, and the Reinvite is cancelled before the Net-Net SBC responds to it.
unsuccessful-attempt	RADIUS Interim message is generated when a SIP session set-up attempt from a preference-ordered list or next-hop destinations is unsuccessful. This can happen when a local policy lookup, LRT lookup, ENUM query response, or SIP redirect returns a preference-ordered list of next-hop destinations. The interim message contains: the destination IP address, the disconnect reason, a timestamp for the failure, and the number that was called.

10. **account-server**—Create the account server list to store accounting server information for the account configuration. Each account server can hold 100 accounting messages. See the next section for step-by-step instructions.

Account server entries are specific to the account configuration. They cannot be viewed or accessed for editing outside of the account configuration.

Note: RADIUS will not work if you do not enter one or more servers in a list.

Setting Up Accounting Servers

You must establish the list of servers to which the Net-Net SBC can send accounting messages.

- hostname—Name of the host associated with the account server in hostname format (FQDN) or as an IP address.
- 2. **port**—Retain the default 1813 or enter the number of the UDP port associated with the account server to which RADIUS messages are sent.

minimum: 1025maximum: 65535

- 3. **state**—Retain the default enabled to enable the account servers on the system or enter disabled to disable them.
- 4. **min-round-trip**—Retain the default 250 milliseconds or indicate the minimum round trip time of an accounting message.

• minimum: 1025 milliseconds

maximum: 65535 milliseconds

A round trip consists of the following:

- The Net-Net SBC sends an accounting message to the account server.
- The account server processes this message and responds back to the Net-Net SBC.

If the fastest RTT is the strategy for the account configuration, the value you enter here can be used to determine an order of preference (if all the configured account servers are responding in less than their minimum RTT).

5. **max-inactivity**—Retain the default 60 seconds or indicate the length of time in seconds that you want the Net-Net SBC with pending accounting messages to wait when it has not received a valid response from the target account server.

• minimum: 1 second

• maximum: 300 seconds

Once this timer value is exceeded, the Net-Net SBC marks the unresponsive account server as disabled in its failover scheme. When a server connection is marked as inactive, the Net-Net SBC attempts to restart the connection and transfers pending messages to another queue for transmission. RADIUS messages might be moved between different account servers as servers become inactive or disabled.

6. **restart-delay**—Retain the default 30 seconds or indicate the length of time in seconds you want the Net-Net SBC to wait before resending messages to a disabled account server.

minimum: 1 second

maximum: 300 seconds

7. **bundle-vsa**—Retain the default enabled if you want the account server to bundle the VSAs within RADIUS accounting messages. Enter disabled if you do not want the VSAs to be bundled. (Bundling means including multiple VSAs within the vendor value portion of the message.)

In a bundled accounting message, the RADIUS message type is vendor-specific, the length is determined for each individual message, and the vendor portion begins with a 4-byte identifier, and includes multiple vendor type, vendor length, and vendor value attributes.

8. **secret**—Enter the secret passed from the account server to the client in text format. Transactions between the client and the RADIUS server are authenticated by the shared secret; which is determined by the source IPv4 address of the received packet.

9. NAS-ID—Optional. Enter the NAS ID in text format (FQDN allowed). The account server uses this value to identify the Net-Net SBC for the transmittal of accounting messages.

The remote server to which the account configuration sends messages uses at least one of two potential pieces of information for purposes of identification. The Net-Net SBC accounting messages always includes in the first of these:

- Network Access Server (NAS) IP address (the IP address of the Net-Net SBC's SIP proxy)
- NAS ID (the second piece of information) provided by this value. If you enter a value here, the NAS ID is sent to the remote server.

If you have more than one Net-Net SBC pointing to the same account server, the NAS ID can be used to identify which Net-Net SBC generated the record.

Per Realm Accounting Control

You can enable or disable accounting control for specific realms by setting one parameter. This feature is enabled by default.

The Net-Net SBC's SIP and H.323 tasks check whether this parameter is set to enabled or disabled, and sends record on that basis.

ACLI Instructions and Examples

To configure per realm accounting:

- 1. In Superuser mode, type **configure terminal** and press <Enter>.
 - ACMEPACKET# configure terminal
- 2. Type **session-router** and press <Enter>.
 - ACMEPACKET(configure)# media-router
- 3. Type **realm-config** and press <Enter>.
 - ACMEPACKET(media-router)# realm-config
- 4. **accounting-enable**—Either leave this parameter set to **enabl ed** (default) to generate CDRs for this realm, or change it to **di sabl ed**.
- 5. Save and activate your configuration.

Configurable Intermediate Period

You can set how often the Net-Net SBC generates periodic interim records for H.323 and for SIP.

- H.323—The periodic timer (set to the value you specify in the accounting configuration) is dynamically created when the Net-Net SBC receives a Connect message and an H.323 call answer method is invoked. The Net-Net SBC deletes the timer when the H.323 session is terminated.
- SIP—The periodic timer (set to the value you specify in the accounting configuration) is dynamically created when the Net-Net SBC receives a a 200 OK response to an INVITE message. The Net-Net SBC deletes the timer when the session is terminated.

To set the timer for periodic interim records:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

- 2. Type **session-router** and press <Enter>.
 - ACMEPACKET(confi gure)# session-router
- 3. Type **account-config** and press <Enter>.
 - ACMEPACKET(session-router)# account-config
- 4. **intermediate-period**—Enter amount of time in seconds between generating periodic interim records during a SIP or H.323 call. This parameter defaults to zero, which is not a valid value.
- 5. Save and activate your configuration.

RADIUS CDR Content Control

The Net-Net SBC's RADIUS support has been enhanced so that you can limit the size of RADIUS CDRs. The Net-Net SBC's RADIUS accounting provides a detailed set of records that can contain, for example, multiple media flow descriptions for forked calls that can contain multiple sets of media and QoS attributes. While the level of detail might be required for some networks, in others the large CDRs generated to reflect that level of granularity can cause issues for the application receiving the records.

You can use the following enhancements to control the size of the RADIUS CDRs your Net-Net SBC produces:

- Duplicate RADIUS attribute prevention—Using this feature, you can configure
 the Net-Net SBC to send only one set of RADIUS attributes in CDR for a forked
 call. (When a forked SIP INVITE contains media information, media and QoS
 attributes can potentially be duplicated.)
- RADIUS attribute selection—You can set a list of the Acme Packet VSAs you want included in a RADIUS CDR, and the Net-Net SBC will exclude the others from the record; standard attributes are always included. You specify attributes using their unique identifier in a comma-delimited list, and you can list them in any order. However, entering an invalid range disables this feature.

The Net-Net SBC excludes attributes from the records in which they are already defined. If an attributes only appears in a Stop record, then it will be deleted from Stop records.

The configuration provides a mechanism to make entries flexible and easy.

ACLI Instructions and Examples

You enable these enhancements using two parameters in the accounting configuration.

Accessing the Accounting Configuration

To access the accounting configuration:

- 1. In Superuser mode, type **configure terminal** and press <Enter>.
 - ACMEPACKET# configure terminal
- 2. Type **session-router** and press <Enter>.
 - ACMEPACKET(confi gure)# sessi on-router
- 3. Type **account-config** and press <Enter>.
 - ACMEPACKET(session-router)# account-config

From this point, you can reach the individual parameters for duplicate RADIUS attribute prevention and for RADIUS attribute selection.

Preventing Duplicate RADIUS Attributes

To enable duplicate RADIUS attribute prevention:

 prevent-duplicate-attrs—Change this parameter from di sabl ed (default) to enabl ed.

ACMEPACKET(account-config)# prevent-duplicate-attrs enabled

2. Save and activate your configuration.

RADIUS Attribute Selection

You enter the list of VSAs that you want included as a comma-delimited list. There are special entry types you can use in the comma-delimited list to set ranges and make entries easier:

- X- Where X is a VSA identifier, the Net-Net SBC will include all attributes with an identifier equal to or greater than X.
- -X Where X is a VSA identifier, the Net-Net SBC will include all attributes with an identifier equal to or less than X.
- — Use the minus sign (-) alone when you want to turn off attribute selection, including all VSAs in the CDR.

To enter a list of RADIUS attributes to include in a CDR:

1. **vsa-id-range**—Enter a comma-delimited list that represents the VSA you want to appear in the RADIUS CDR. There is no default for this parameter.

Do not use <Spaces> when typing in your comma-delimited list.

ACMEPACKET(account-config)# vsa-id-range -5,7,10-

This entry specifies that CDRs contain VSA with identifiers equal to and less than 5, VSA 7, and VSAs with identifiers equal to and greater than 10.

Limit this list to accounting VSAs. For example, VSA 254 is an authentication VSA, so it should not be included in the range. The system generates validate-config errors if your range includes VSAs that are not accounting VSAs.

2. Save and activate your configuration.

Custom RADIUS CDR VSAs for SIP

This section describes these additions to the Net-Net SBC's RADIUS accounting capabilities for customizing your call detail records (CDRs):

- Generating CDRs with call detail information from a SIP message—The Net-Net SBC reserves a set of vender-specific attributes (VSAs) and then populates them according to your header manipulation (HMR) configuration
- Generating CDRs with trunk group information—You can enable your Net-Net SBC to provide terminating trunk-group and trunk-context data even when the Net-Net SBC is not performing trunk-group routing.

Both support using the CSV file for RADIUS records, which you can either save locally or push to a defined FTP server.

About User-Defined VSAs for SIP Calls

The Net-Net SBC reserves VSAs 200-229 for you to define for use with SIP calls. These VSAs should never be used for other purposes, and their use should never conflict with the need to add new VSAs in the future. Because this leaves a significant number of VSAs unused, there is still ample space for any new VSAs that might be required.

Since RADIUS START records are created on session initiation, their content cannot be updated. However, the content for INTERIM and STOP records can be.

To configure user-defined VSAs for a SIP call, you use HMR. For example, when you set up HMR correctly, the Net-Net SBC reports originating or terminating country codes in CDRs in whatever format they appear in the SIP username field. The HMR rules you configure uses the SIP header name P-Acme-VSA, adding it to the SIP header from any part of the SIP message. Then the Net-Net SBC searches for the P-Acme-VSA header, generates a VSA for it, and then includes that VSA in the CDR for the call.

You can include multiple custom VSAs per CDR by adding the corresponding number of rules; in essence, you add in the header as many times as required.

HMR Adaptations

The following HMR element rule types support user-defined VSA for SIP calls:

- uri-user-only—The uri-user-only element rule type represents the URI username without the URI user parameters. You can perform these actions for the uri-user-only type: store, replaces, delete, and add. This means, for example, that you can add a username string to SIP or TEL URI without having any impact on other parameters.
- uri-phone-number-only—The uri-phone-number-only applies when all rules are met. It refers to the user part of the SIP/TEL URI without the user parameters when the user qualifies for the BNF shown here:

Once the URI user part qualifies as a uri-phone-number-only based on this BNF, the Net-Net SBC ignores the visual separators when comparing it against a match value. Furthermore, the Net-Net SBC performs on or using the uri-phone-number-only after the excluding the visual separators.

But anew value being added as a uri-phone-number-only or replacing a uri-phone-number-only does not have to match the BNF noted above. That is, you can use the **uri-phone-number-only** type knowing that:

- The action only occurs if the URI username matches the BNF defined here.
- Even so, you can also replace the uri-phone-number-only with one that does not match—using the same rule.

HMR String Variable

HMR supports the use of a string variable that you can use to populate headers and elements. You set this value in the **hmr-string** parameter for a realm, SIP session agent, or SIP interface. Then, you reference it as the \$HMR_STRING variable.

When a message arrives, the Net-Net SBC matches the string you provision to the closest session agent, realm, or SIP interface. The precedence for matching is in this order: session agent, realm, and then SIP interface. For example, the Net-Net SBC populates messages matching a session agent using the \$HMR_STRING variable, but it leaves the value empty for session agents that do not match.

You can use the string variable, for instance, for values specific to realms and session agents such as country code values when the regular expression pattern used to match a country code fails to do so.

ACLI Instructions and Examples: User-Defined VSAs

This section shows you how to configure user-defined VSAs for SIP calls. It also contains subsections with configuration examples so you can see how this feature is put to use.

This section also shows you two configuration examples for this feature.

To create a header manipulation rule that generates user-defined VSAs for SIP calls:

1. In Superuser mode, type **configure terminal** and press <Enter>.

```
ACMEPACKET# configure terminal ACMEPACKET(configure)#
```

2. Type **session-router** and press <Enter>.

```
ACMEPACKET(configure)# session-router
ACMEPACKET(session-router)#
```

3. Type **sip-manipulation** and press <Enter>.

```
ACMEPACKET(session-router)# sip-mani pul ati on ACMEPACKET(sip-mani pul ati on)#
```

4. Type **header-rules** and press <Enter>.

```
ACMEPACKET(sessi on-router)# header-rul es
ACMEPACKET(si p-header-rul es)#
```

- 5. **name**—Enter a meaningful name for the header rule you are creating. For example, if you want to add VSA 200 to your CDRs for SIP calls, you might name your rule **generateVSA200**. There is no default for this parameter, and it is required.
- 6. **header-name**—Set this parameter to P-Acme-VSA so the Net-Net SBC will add this accounting information to CDRs for the call.
- 7. **action**—Set this parameter to **add**.
- 8. **new-value**—Enter the regular expression value for the new value you want to add. For example, to add VSA 200 that contains the value from the SIP From header, you would enter **200:+\$storeFrom.\$0**.
- 9. Save and activate your configuration.

The first example shows you how to generate custom VSA for the To and From headers in SIP messages.

- VSA 200 contains the header value from the SIP From header.
- VSA 220 contains the header value from the SIP To header.

```
si p-mani pul ati on
        namecustom
                                                    VSA1
        description
        header-rul e
                 name
                                                    storeFrom
                 header-name
                                                    from
                 acti on
                                                    store
                 comparison-type
                                                    pattern-rul e
                 match-value
                                                    request
                 msg-type
                 new-value
                 methods
                                                    I NVI TE
        header-rul e
                 name
                                                    storeTo
```

header-name to acti on store comparison-type pattern-rul e match-value msg-type request new-val ue methods INVITE header-rul e generateVSA200 name P-Acme-VSA header-name acti on add comparison-type case-sensi ti ve match-value msg-type any 200: +\$storeFrom. \$0 new-value methods INVITE header-rul e generateVSA220 name header-name P-Acme-VSA acti on add comparison-type case-sensi ti ve match-value msg-type any new-value 220: +\$storeTo. \$0 methods INVITE

The second example shows you how to configure HMR to generate VSA 225, which contains the customer P_From header when it is present. When that header is not present, the rule instructs the Net-Net SBC to include the header value from the SIP From header for VSA 225.

```
si p-mani pul ati on

ACLI Instructions and Examples: String Variable

To use the HMR string variable, you set the **hmr-string** value in the SIP session agent, realm, or SIP interface where you want the feature applied. The following sample shows you how to configure the **hmr-string** parameter for SIP session agent.

match-value

1. In Superuser mode, type **configure terminal** and press <Enter>.

new-val ue

ACMEPACKET# configure terminal ACMEPACKET(configure)#

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure)# sessi on-router
ACMEPACKET(sessi on-router)#

3. Type **session-agent** and press <Enter>.

ACMEPACKET(session-router)# session-agent ACMEPACKET(session-agent)#

If you are adding this feature to an existing configuration, you need to select the configuration (using the ACLI **select** command) before making your changes.

4. **manipulation-string**—Enter a value that references the \$HMR_STRING variable that will be used to populate SIP headers and elements using HMR. There is no default value for this parameter.

5. Save and activate your configuration.

Trunk-Group VSA Generation

You can force the Net-Net SBC to generate VSAs related to trunk groups even when you are not using the trunk group feature. With the **force-report-trunk-info** parameter turned on in the session router configuration:

- The Net-Net SBC reports terminating trunk group and trunk-context information even though it has not perform trunk-group routing.
 - The appropriate VSAs report the terminating trunk-group (VSA 65) and trunk context (VSA 67) with the information of the matching ingress session agent and realm of the originator.
- The Net-Net SBC reports the terminating trunk-group (VSA 66) and trunk context (VSA 68) as the received trunk group and context from the call's SIP REQUEST message. If the SIP message has none, then the Net-Net SBC uses the information from the matching egress session agent (or egress realm, when available) and next-hop realm.

Note that information is reported after HMR processing—meaning that header manipulation has been performed on the message information reported.

ACLI Instructions and Examples

You enable trunk-group VSA generation on a system-wide basis in the session-router configuration.

To enable forced trunk-group VSA generation:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal ACMEPACKET(configure)#

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure)# session-router
ACMEPACKET(session-router)#

3. Type **session-agent** and press <Enter>.

ACMEPACKET(sessi on-router)# sessi on-router
ACMEPACKET(sessi on-router)#

- 4. forced-report-trunk-info—Change this parameter to enabled if you want to turn on the Net-Net SBC's ability to generate VSAs for trunk group information even when you are not using trunk-group routing. The Net-Net SBC uses VSAs 65-68 to report originating and terminating trunk group information as described in the Trunk-Group VSA Generation (54) section above. By default, this parameter is disabled.
- 5. Save and activate your configuration.

RADIUS Account Server Prioritization

Especially useful for customers with multiple Net-Net SBCs, the RADIUS account server prioritization feature allows you to assign a priority to each of the account servers you configure. Setting the priority for RADIUS accounting servers allows you to load balance traffic across the servers.

Without this feature, the Net-Net SBC sorts RADIUS accounting servers by their IP addresses and ports. For example, if you have a pre-existing accounting server with the IP address and port combination of 10.1.31.2:1813 and then configure a new server at 10.0.3.12:2145, the new server will take priority over the pre-existing one.

Of course, you always have the option of allowing the system to set the priority or your accounting servers in this way.

The prioritization feature works with all of the strategy types you set in the accounting configuration. However, it is most applicable to the **hunt** or **failover** strategies. You can assign a number to each server to mark its priority, or you can leave the priority parameter set to 0 (default) so the Net-Net SBC prioritizes them by IP address and port.

How You Might User Server Prioritization

This example shows you how you can might benefit from using the prioritization feature if you have multiple Net-Net SBCs sending RADIUS CDRs to multiple RADIUS servers. Consider the following Net-Net SBCs and accounting servers.

Net-Net SBC	Account Server1 Priority	Account Server2 Priority	Account Server3 Priority
Net-Net SBC1	10	7	4
Net-Net SBC2	7	4	10
Net-Net SBC3	4	10	7
Net-Net SBC4	10	7	4
Net-Net SBC5	7	4	10
Net-Net SBC6	4	10	7

If the strategy for this example is set to **hunt** or **failover** and assuming no timeouts are pending, you can see that Net-Net SBC1 sends its accounting traffic to Account Server3 over the other two. Net-Net SBC2 sends its traffic to Account Server2 over the others, and likewise for the remainder of Net-Net SBCs and servers. The traffic, then, is load balanced across the servers, less likely to overburden any of them.

ACLI Instructions and Examples

This section shows you how set the priority for an account server.

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal ACMEPACKET(configure)#

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure)# sessi on-router
ACMEPACKET(sessi on-router)#

3. Type **account-config** and press <Enter>.

ACMEPACKET(sessi on-router)# account-config
ACMEPACKET(account-config)#

4. Type **account-server** and press <Enter>.

ACMEPACKET(session-router)# account-server ACMEPACKET(account-server)#

5. **priority**—Enter the number corresponding to the priority you want this account server to have in relation to the other account servers to which you send traffic. The default for this parameter is 0, meaning the prioritization feature is turned off—and that the Net-Net SBC will therefore prioritize accounting servers by IP

address and port. Otherwise, you can use any numbering scheme that suits your needs and ease of use.

6. Save and activate your configuration.

Accounting Configuration Example

Using the Net-Net SBC with external RADIUS accounting servers to generate CDRs and provide billing services requires you to configure accounting configuration and any associated accounting servers you might need.

The following example shows how you can set accounting configuration and accounting server parameters to support multiple RADIUS accounting servers.

ACMEPACKET(account-	config)# show

Local CDR Storage and FTP Push

The local CDR storage feature allows you to save RADIUS CDR data to a local CSV text file on the Net-Net SBC. Local CDR file creation and storage can be used in addition to or independently of sending CDRs to RADIUS servers for every call. Once the Net-Net SBC creates and saves local CDR files, you can:

- Send the files to an FTP server by configuring a push receiver
- Develop and implement your own script for retrieving them as necessary from the Net-Net SBC

You configure the Net-Net SBC to:

- Set directory path where you want to save local CDR files
- Set a maximum file size for the CSV file
- Set a maximum number of local CDR files
- Set an interval in which to close the existing local CDR file and begin writing a new file.

Once local CDR file creation is enabled, you can configure push receivers to "push" any non-active and closed CDR files to an FTP server using FTP or SFTP protocols. You configure the Net-Net SBC with the push receiver's:

- server IP address and port information
- login credentials
- path to save the local CDR Files
- The interval at which the Net-Net SBC should send files to a push receiver

For flexibility and security, the Net-Net SBC can log into a push receiver with either FTP or SFTP. If you are creating a secure connection with SFTP, your Net-Net SBC can authenticate to the server with either a public shared key or SSH-encrypted username and password.

Bear in mind that the Net-Net SBC deletes a local CDR file after the local CDR file has been successfully transferred to a push receiver.

Local CDR File Format

The CDRs are written as comma-delimited ASCII records to files on the Net-Net SBC. The types of records are controlled by the same accounting configuration parameters used for RADIUS. The fields of the comma-delimited entries correspond to RADIUS START, INTERIM, and STOP records. Using the accounting configuration, you can configure the Net-Net SBC to record STOP records only.

Because the record types do not have consistent field positioning, any server parsing them would need to read the first field to determine the type and learn how to parse the remaining fields.

Local CDR File Format Consistency

Unpopulated or unused fields in the RADIUS CDR are omitted from the locally-stored CSV file. This means that there is no fixed position for a RADIUS attribute across all CSV files. Instead, the missing values are skipped in the CSV file so that the order and appearance for attribute values can differ from record to record.

You can optionally guarantee the placement of attributes in locally-stored CSV files with the CDR output inclusive parameter. With this enhancement enabled, RADIUS records sent to a RADIUS client contain even empty attributes with an integer, date and time, or IP address format; the default value is zero. In other words, when there is no value to report:

- An IP address attribute will report as 0. 0. 0. 0
- A date and time attribute will report as 00: 00: 00. 000 UTC JAN 01 1970
- An integer attribute value will report as 0

To maintain RFC 2865 and 2866 compliance, the Net-Net SBC will not send empty attributes that are string values to a RADIUS client. And when you enable this feature, the Net-Net SBC adds all attributes to the locally-stored CSV file.

Refer to Appendix C (119) of this document for details about where in locally-generated CSV file VSAs appear for Start, Interim, and Stop records.

Requirements

If you want to guarantee the CSV placement for RADIUS attribute values, you must use the entire RADIUS dictionary. You cannot use the RADIUS CDR abbreviation feature. Using an abbreviated form of the RADIUS dictionary results in adverse effects for the CSV file.

In your configuration, then, you must set the **vsa-id-range** parameter to use the entire range of attributes. Leaving this parameter blank disables abbreviation and all attributes are included. Alternatively, you can specify all of the parameters (by attribute number) that are used in the Net-Net OS release loaded on your system.

See the <u>RADIUS CDR Content Control (48)</u> section for more information.

Local CDR File Naming Convention

Filenames are derived from the date and time that the CDR file is opened for writing. The format is cdrYYYYMMDDHHMM[a-j], where:

- YYYY=the year
- MM=the month
- DD=the day
- HH=the hour
- MM=the minute
- [a-j]=a suffix that provides additional discrimination in case of changing system time, setting the rotation time for this feature to one minute, or in case of another occurrence that might compromise the date and time

Your file name will resemble the following sample: cdr200511151200.

Local CDR File Storage Directories

The Net-Net SBC only allows local storage of ASCII CDRs to the /ramdrv and /ramdrv/I ogs directories. If you try to save to another directory (such as /code or /boot), you will receive an error message.

If you are using the ACLI and enter an inappropriate directory, the ACLI will issue an error message.

Local CDR File Size and Rotation

You can configure maximum file size, maximum number of local CSV files to store, and the interval at which the files rotate.

The Net-Net SBC saves up to the file size limit (**max file size**) and maintains only number of files that you configure (**max files**). When the maximum file size is reached, the Net-Net SBC closes that file and begins writing VSA attributes and values to a new local CDR file. When it is time for the Net-Net SBC to write the *max files* + 1 file, the oldest file is deleted so that the newest one can be stored.

More About File Rotation Time

You can use the CDR local storage feature on its own, without enabling the ftp push feature. The Net-Net SBC uses a period of time that you set to periodically rotate the files. The **file rotate time** parameter rotates the local CSV files regardless of whether you use the FTP push feature.

RADIUS CDR Redundancy

When you are using the RADIUS CDR storage and FTP push feature, the Net-Net SBC can create a redundant copy of the comma-delimited CDR files that it stores on the standby system in the HA node.

This enhancement to the CDR storage feature ensures against data loss if, for example, an active Net-Net SBC fails immediately before an FTP push. The standby has a duplicate set of records that it sends. This feature is enabled with the CDR output redundancy parameter found in the account config configuration element.

Caveats for H.323

H.323 calls proceed without interruption over an HA node in the event of a failover from one Net-Net SBC to another, and RADIUS records are generated and duplicated across the active and standby systems in an HA node. However if a switchover occurs during an H.323 call (that has been initiated, but not completed), the newly active (formerly standby) system will not generate RADIUS Stop records when the call completes.

FTP Push

The FTP push feature is used to copy local CDR files to a remote FTP server on a periodic basis. This feature is configured by defining push receivers which contain standard login and FTP server credentials of the remote machine. At the configured time interval (file rotate time), the Net-Net SBC closes the current file, and pushes the files that are complete and have not yet been pushed; including the just-closed-file.

Deprecated ACLI Configuration

The following parameters in the account-config configuration element are deprecated:

- ftp-address
- ftp-port
- ftp-user
- ftp-password
- ftp-remote-path

These parameters will only be used if no account-config > push-receiver configuration elements have been defined. All new push receivers must be defined in the account-config > push-receiver configuration element.

Multiple Push Receivers

Net-Net SBC now supports up to five CDR push receivers for use with the local file storage and FTP push feature. For each receiver you configure, you can set the file transfer protocol you want to use—either FTP or SFTP. The system uses the push receivers according to the priorities you set by giving a 0 through 4 priority number to the server when you configure it; 0 is the highest priority, and 4 is the lowest. By default, push receivers always have their priority at the lowest setting (4).

Based on the priority level you set, the Net-Net SBC uses a strategy (which you also set) to select a CDR push receiver. If the highest priority push receiver selected using the strategy becomes unavailable (i.e., times out), the Net-Net SBC uses the strategy (hunt, round robin, etc.) to select another.

This feature is dynamically configurable. When you change the configuration, the Net-Net SBC updates the list of push receivers if it has changed.

Push Receivers

A push receiver configuration includes all the credentials that the Net-Net SBC needs to log into an FTP server and upload any recent local CDR files. Push receiver configurations must include:

- the server's IP address and port
- remote path of where to upload the local CDR files
- protocol used to connect to the server
- · account login credentials

Secure FTP Push

The Net-Net SD can securely log into a push receiver using one of two methods that create a secure connection.

You can use password-based SSH authentication for logging into an SFTP server by setting the push receiver's **protocol** parameter to sftp, configuring a username and password and leaving the **public-key** parameter blank. Note that you must also import the SFTP server's SSH host key onto the Net-Net SD for this authentication.

You can use public key authentication for loggin into an SFTP server by setting the push receiver's **protocol** parameter to sftp setting the **public-key** parameter to a configured public key record name (security > public key > name), including an account **username** and configuring your SFTP server with the Net-Net SD's public key pair.

It is often difficult to determine whether the SFTP server is using its RSA or DSA key for its server application. For this reason, it is common for administors to try importing both RSA and DSA keys onto the Net-Net SD before getting the Net-Net SD configuration to operate FTP Push properly.

Note that it is also common for the SFTP server to be a Linux machine. In this case, the command ssh-keygen-e creates the public key you need to import to the Net-Net SD. This command sequence requires you to specify file export type, as shown below

[linux-vpn-1 ~]# ssh-keygen -e
Enter file in which the key is (/root/.ssh/id_rsa/):
/etc/ssh/ssh_host_rsa_key.pub

If you do not have access to the SFTP server but can access it from another Linux host, use the command ssh-keyscan to get the key. An example command line is shown below.

root@server: ~\$ssh-keyscan -t dsa sftp. server.com

ACLI Instructions and Examples

This section shows you how to configure Local CDR storage and FTP push on your Net-Net SBC.

Accessing the Accounting Configuration

To configure parameter for these features, you must access the accounting configuration.

To access the accounting configuration:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

2. Type **session-router** and press <Enter>.

ACMEPACKET(configure)# session-router

3. Type account-config and press <Enter>.

ACMEPACKET(sessi on-router)# account-config

ACMEPACKET(account-confi g)#

From here, you can enable local CDR storage and FTP push.

Enabling Local CDR Storage

To enable local CDR storage:

- 4. **file-output**—Enable this parameter for the Net-Net SBC to create commadelimited CDRs (generated from RADIUS records). By default, this parameter is disabled.
- 5. **file-path**—You must configure this path or the CDR push feature will not work. Set the path to use on the Net-Net SBC for file storage from these two options:
 - /ramdrv
 - /ramdrv/logs

To use FTP push, you must configure a usable path.

- 6. **max-file-size**—Set the maximum CDR file size in bytes. The default and minimum value is 1000000. Acme Packet recommends you limit local CDR storage on your system to 30M. For example, if you retain the **max-file-size** default, set **max-files** to 30. However, if you are using a Storage Expansion Module the maximum value is 10⁸.
- 7. **max-files**—Set the maximum number of files to be stored on the Net-Net SBC at one time. You can configure the Net-Net SBC to store as few as one file or as many as 4096. The default is 5.
- 8. **file-rotate-time**—Set how often in minutes you want to rotate the stored files; the Net-Net SBC will overwrite the oldest file first. The minimum rotation time is 2 minutes; the default is 60 minutes. This parameter defaults to 0, and leaving it set to the default means that the Net-Net SBC will not rotate the files.
- 9. **cdr-output-redundancy**—Set this parameter to enabled for the Net-Net SBC to store a redundant copy of the local CSV file to the standby HA node.

Configuring a Push Receiver Fallback Method

You set the push receiver strategy and define the maximum timeout in seconds in the main accounting configuration.

Note: You may ignore the following two parameters if only one push receiver is configured.

10. **ftp-strategy**—Set the strategy you want the Net-Net SBC to use when selecting from multiple push receivers. The default is **hunt**.

Strategy	Description
Hunt	The Net-Net SBC selects the push receiver from the available list according the priority level. The system uses this strategy as its default.
Failover	The Net-Net SBC selects the push receiver based on priority level and will continue to use that same push receiver until it fails over.
RoundRobin	The Net-Net SBC selects push receivers systematically one after another, balancing the load among all responsive push receivers.
FastestRTT	The Net-Net SBC selects the push receiver based on best average throughput. For this situation, throughput is the number of bytes transferred divided by the response time. The system uses a running average of the five most recent throughput values to accommodate for network load fluctuations.

11. **ftp-max-wait-failover**—Enter the amount of time in seconds to wait before the Net-Net SBC declares a push receiver to have failed over. This default value for this parameter is **60**.

Setting the CSV File Format

This section shows you how to guarantee the CSV placement for RADIUS attribute values by using the entire RADIUS dictionary.

To enable fixed value placement in CSV files for RADIUS CDRs:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal ACMEPACKET(configure)#

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure) # sessi on-router

3. Type **account-config** and press <Enter>.

ACMEPACKET(sessi on-router)# account-config
ACMEPACKET(account-config)#

If you are adding support for this feature to a pre-existing accounting configuration, then you must use the ACLI **select** command so that you can edit it.

4. **vsa-id-range**—Either leave this parameter blank (default), or enter the complete range of VSAs for the Net-Net OS release loaded on your system. The following example shows what you would enter to use all of the VSAs for Net-Net OS Release 4.1.4p4 for a system that is not running QoS.

ACMEPACKET(account-confi g)# **vsa-i d-range 1-4, 10-14, 20-24, 28, 29, 32-71, 74-136**

5. **cdr-output-inclusive**—Set this parameter to enabled to fill in 0s in otherwise empty fields in local CDR files. It is disabled by default.

Enabling FTP Push

To enable FTP push:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal ACMEPACKET(configure)#

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure)# session-router

3. Type account-config and press <Enter>.

ACMEPACKET(session-router)# account-config

If you are adding support for this feature to a pre-existing accounting configuration, then you must use the ACLI **select** command so that you can edit it.

- 4. **ftp-push**—Set the state of FTP push feature to **enabled**. It is disabled by default.
- 5. Type push-receiver and press <Enter>.

ACMEPACKET(account-confi g)# push-recei ver

- 6. **server**—Enter the IP address of this push receiver FTP server.
- 7. **port**—Enter the port number of this push receiver FTP server.
- 8. **remote-path**—Enter the remote pathname to which you want CDR files to be sent on the push receiver. There is no default for this parameter.
- 9. **filename-prefix**—Enter the filename prefix (as a string) to prepend to the to the CDR files the Net-Net SBC sends to the push receiver. The Net-Net SBC does not rename local files. There is no default for this parameter.
- 10. **protocol**—Enter **SFTP** if you want to change the transport protocol for this push receiver from its default, **FTP**.
- 11. **username**—Enter the username the Net-Net SBC uses when connecting to this push receiver. There is no default for this parameter. This parameter is always required.
- 12. **password**—Enter the password corresponding to the username the Net-Net SBC uses when connecting to this push receiver. There is no default for this parameter. You can leave this field blank if you are using public key authentication.
- 13. **public-key**—Enter the public key profile to use for authentication to this push receiver and decryption of this servers packets. Note the procedure below, which tells you how to create a public key profile. Profile configuration is required for both password and public key authentication.
- 14. Save and activate your configuration.

Creating a Public Key Profile

The Secure Shell (SSH) and related Secure Shell File Transfer (SFTP) protocols provide for the secure transfer of audit files and for the secure transfer of management traffic across the *wancom0* interface. When using password or public key authentication with push receiver configurations, use the procedures described below to create your profiles.

Create your profile by configuring:

- SSH Properties
- Import an SSH Host Key
- Create the public key profile

The following two tasks are required for public key authentication mode only.

- Generate an SSH Key Pair
- Copy the Net-Net SD public Key to the SFTP server

After the above, you can use this profile within the context of your FTP push configuration.

SSH Operations

SSH Version 2.0, the only version supported on the Acme Packet Net-Net SBC, is defined by a series of five RFCs.

- RFC 4250, The Secure Shell (SSH) Protocol Assigned Numbers
- RFC 4251, The Secure Shell (SSH) Protocol Architecture
- RFC 4252, The Secure Shell (SSH) Authentication Protocol
- RFC 4253, The Secure Shell (SSH) Transport Layer Protocol
- RFC 4254, The Secure Shell (SSH) Connection Protocol

RFCs 4252 and 4253 are most relevant to SBC operations.

The transport layer protocol (RFC 4253) provides algorithm negotiation and key exchange. The key exchange includes server authentication and results in a cryptographically secured connection that provides integrity, confidentiality and optional compression. Forward security is provided through a Diffie-Hellman key agreement. This key agreement results in a shared session key. The rest of the session is encrypted using a symmetric cipher, currently 128-bitAES, Blowfish, 3DES, CAST128, Arcfour, 192-bit AES, or 256-bit AES. The client selects the encryption algorithm to use from those offered by the server. Additionally, session integrity is provided through a crypto-graphic message authentication code (hmacmd5, hmac-sha1, umac-64 or hmac-ripemd160).

The authentication protocol (RFC 4252) uses this secure connection provided and supported by the transport layer. It provides several mechanisms for user authentication. Two modes are supported by the Net-Net SD: traditional password authentication and public-key authentication.

ACLI Instructions and Examples

This section provides ACLI procedures for SFTP push configurations, including SSH property configuration, certificate import, and public key profile configuration on your Net-Net SD.

Configure SSH Properties

The single instance **ssh-config** configuration element specifies SSH re-keying thresholds.

1. From admin mode, use the following command path to access the ssh configuration element:

```
ragnarok# configure terminal > security > admin-security >
ssh-config
ragnarok(ssh-config)#
```

ssh configuration element properties are shown below with their default values

rekey-interval 60 rekey-byte-count 31

2. **rekey-interval**—specifies the maximum allowed interval, in minutes, between SSH key negotiations

Allowable values are integers within the range 60 through 600, with a default of 60 (minutes). Shorter lifetimes provide more secure connections.

Works in conjunction with **rekey-byte-count**, which sets a packet-based threshold, to trigger an SSH renegotiation. If either trigger is activated, an SSH renegotiation is begun.

Retain the default value, or specify a new value.

```
ragnarok(ssh-config)# rekey-interval 20
ragnarok(ssh-config)
```

3. **rekey-byte-count**—specifies the maximum allowed send and receive packet count, in powers of 2, between SSH key negotiations

Allowable values are integers within the range 20 (1,048,576 packets) through 31 (2,147,483,648 packets), with a default of 31 (2³¹). Smaller packet counts provide more secure connections.

Works in conjunction with **rekey-interval**, which sets a time-based threshold, to trigger an SSH renegotiation. If either trigger is activated, an SSH renegotiation is begun.

Retain the default value, or specify a new value.

```
ragnarok(ssh-confi g)# rekey-packet-count 24
ragnarok(ssh-confi g)
```

A sample SSH configuration appears below:

```
ragnarok(ssh-config)# rekey-interval 20
ragnarok(ssh-config)# done
ragnarok(ssh-config)# exit
ragnarok(admin-security)#
```

Specifies a key renegotiation every 20 minutes, or at the reception/transmission of 2,147,483,648 packets, whichever comes first.

Import an SSH host Key

Importing a host key requires access to the SFTP server or servers which receive audit log transfers. Access is generally most easily accomplished with a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

- 1. Use a terminal emulation program to access the SSH file system on a configured SFTP server.
- 2. Copy the server's base64 encoded public file making sure in include the Begin and End markers as specified by RFC 4716, *The Secure Shell (SSH) Public Key File Format*.

For OpenSSH implementations host files are generally found at <code>/etc/ssh/ssh_host_dsa_key.pub</code>, or <code>etc/ssh/sss_host_rsa.pub</code>. Other SSH implementations can differ.

3. From admin mode use the **ssh-pub-key** command to import the host key to the SBC

For importing a host key, this command takes the format:

```
ssh-pub-key i mport known-host <name>
```

where *name* is an alias or handle assigned to the imported host key, generally the server name or a description of the server function.

ragnarok# ssh-pub-key import known-host fedallah

I MPORTANT:

Please paste ssh public key in the format defined in rfc4716. Terminate the key with ";" to exit......

- 4. Paste the public key with the bracketing Begin and End markers at the cursor point.
- 5. Enter a semi-colon (;) to signal the end of the imported host key.
- 6. Follow directions to save and activate the configuration.

The entire import sequence is shown below.

ragnarok# ssh-pub-key import known-host fedallah IMPORTANT:

Please paste ssh public key in the format defined in rfc4716. Terminate the key with ";" to exit......

```
---- BEGIN SSH2 PUBLIC KEY ----
```

Comment: "2048-bit RSA, converted from OpenSSH by klee@acme54" AAAAB3NzaC1yc2EAAAABI wAAAQEA70Bf08j Je7MSMgerj DTgZpbPbI rX4n17LQJgPC7cI L cDGEtKSi Vt5Mj cSav3v6AEN2pYZi h0xd2Zzi smpoo019kkJ56s/I j GstEzqXMKHKUr9mBV qvqI EOTqbowEi 5sz2AP31GUj QTCKZRF1XOQx8A44vHZCum93/j fNRsnWQ1mhHmaZMmT2LS h0r4J/NI p+vpsvpdroI V6Ftz5ei VfgocxrDrj NcVtsAMyLBpDdL6e9XebQzGSS92TPuKP/ yqzLJ2G5NVFhxdw5i +FvdHz1vBdvB505y2QPj /i z1u3TA/307tyntB0b7beDyI rg64Azc8 G7E3AGi H49LnBtI Qf/aw==

```
---- END SSH2 PUBLIC KEY ----;

SSH public key imported successfully...

Activate Complete ragnarok#

It is important to note that it is often difficult to determine whether the server is using RSA or DSA keys for your application. Unless you can definitively determine this, bear in mind that you need to try importing both.

Create the Public Key Record

The initial step in generating an SSH key pair is to configure a public key record which will serve as a container for the generated key pair.

1. Navigate to the **public-key** configuration element.

```
ragnarok# confi gure termi nal
ragnarok(confi gure)# securi ty
ragnarok(securi ty)# public-key
ragnarok(public-key)#
```

2. Use the **name** command to provide the object name, and the **show** command to verify object creation.

This command creates a public key record named *tashtego*.

3. Use the **done** command to complete object creation.

- 4. Make a note of the last-modified-date time value.
- 5. Move back to admin mode, and save and activate the configuration.

```
ragnarok(public-key)# exit
ragnarok(security)# exit
ragnarok(configure)# exit
ragnarok#
ragnarok# save-config
...
...
ragnarok# activate-config
...
ragnarok#
```

Generate an SSH key pair

1. Now use the **ssh-pub-key generate** command, in conjunction with the name of the public key record created in Step 3, to generate an SSH key pair.

For importing an SSH key pair, this command takes the format:

ssh-pub-key generate < name >

where *name* is an alias or handle assigned to the generated key pair, generally the client name or a description of the client function.

```
ragnarok# ssh-pub-key generate tashtego
Please wait...
public-key 'tashtego' (RFC 4716/SECSH format):
---- BEGIN SSH2 PUBLIC KEY ----

ragnarok(public-key)#

5. Verify that the record has been updated to reflect key generation by examining the value of the I ast-modi fi ed-date field.

Copy a client public key to an SFTP server.

Copying the client public key to an SFTP server requires server access generally using a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

- 1. Use a terminal emulation program to access the SSH file system on a configured SFTP server.
- 2. Copy the client key to the SFTP server.

On OpenSSH implementations, public keys are usually stored in the ~/.ssh/authorized_keys file. Each line this file (1) is empty, (2) starts with a pound (#) character (indicating a comment), or (3) contains a single public key.

Refer to the sshd man pages for additional information regarding file format.

Use a text editor such as *vi* or *emacs* to open the file and paste the public key to the tail of the *authorized_keys* file.

For SSH implementations other than OpenSSH, consult the system administrator for file structure details.

View a Public key on the Net-Net SD

You can use the show security ssh-pub-key command to display information about SSH keys imported to the SBC with the ssh-pub-key command; you cannot display information about keys generated by the ssh-pub-key command.

```

3 RADIUS Accounting Management

Overview

This chapter provides information about management and monitoring of RADIUS accounting functions on your Net-Net SBC.

- Net-Net SBC alarm generation and monitoring
- Status and statistics monitoring

Alarm Generation and Monitoring

The Net-Net products generate alarms when certain hardware and software events occur. For more information about Net-Net SBC alarms for RADIUS, refer to the *Net-Net Maintenance and Troubleshooting Guide*.

The RADIUS ACCOUNTING CONNECTION DOWN alarm, detailed in the table below, is directly associated with the Net-Net SBC's RADIUS functionality. When enabled connections to RADIUS servers have timed-out without a response from the RADIUS server, the alarm is activated. The RADIUS ACCOUNTING CONNECTION DOWN alarm triggers a Simple Network Management Protocol (SNMP) trap that is sent via the syslog Management Information Base (MIB) (apsyslog.mib). For a list of all SNMP-related alarms and their associated traps, refer to the table of SNMP trap correlation to Net-Net SBC's alarms in Acme Packet's MIB Reference Guide.

This alarm has no impact on a the health score of a Net-Net SBC that is part of an HA Node.

RADIUS Alarms

The table below describes the Net-Net SBC's alarms for RADIUS.

Alarm	Alarm ID	Alarm Severity	Cause	Log Message	Actions
RADIUS ACCOUNTING CONNECTION DOWN	327681	CRITICAL if all enabled and configured RADIUS accounting server connections have timed-out without a response from the RADIUS server.	The enabled connections to RADIUS servers have timed-out without a response from the RADIUS	CRITICAL: All enabled accounting connections have been lost. Check accounting status for more details.	 apSyslogMess ageGenerate d trap generated critical, major dry contact syslog
		MAJOR if some, but not all configured RADIUS accounting server connections have timed-out without a response from the RADIUS server.	server.	MAJOR: One or more enabled accounting connections have been lost. Check accounting status for more details.	

Status and Statistics Monitoring

The ACLI **show radius** command, used with the three arguments described below, displays the status of any established RADIUS accounting connections and authentications. A working RADIUS connection displays READY, and a disabled connection displays DI SABLED.

When an accounting server is disabled, the triggering and clearing of RADIUS ACCOUNTING CONNECTION DOWN alarms is not affected.

For more information about Net-Net SBC about monitoring your Net-Net SBC, refer to the *Net-Net Maintenance and Troubleshooting Guide*.

ACLI Show RADIUS Display

The **show radius** command can take one of the three available arguments:

- authentication—Shows authentication statistics for primary and secondary RADIUS servers, including: server IP address and port; round trip time; information about failed and successful requests/authentications; number of rejections; number of challenges; number of time-outs, number of retransmissions
- accounting—Shows the information described in this table:

Section	Description
Client Display	General accounting setup (as established in the accounting configuration element), including:
	 Information about the state of the RADIUS client
	 Accounting strategy used (Hunt, Failover, RoundRobin, FastestRTT, or FewestPending)
	IP address and port on which the Net-Net server is listening
	Maximum message delay in seconds
	Number of configured accounting servers
Waiting Queue	Amount of accounting (RADIUS) messages waiting to be sent.
_	Waiting queue capacity is 4,096 messages.
<ip address:port=""></ip>	Information about each configured accounting server (established in the accounting servers configuration). The heading above each accounting server section is the IPv4 address and port combination of the accounting server described. This section also includes information about the accounting server's state (e.g., Connect Attempt, INIT).

 all—Shows all of the information for both the authentication and accounting displays

The following is an example of the ACLI **show radius authentication** command output.

ACMEPACKET# show radius authentication

```

Monitoring CDR Push Receivers

You can use the ACLI **show radius cdr** command to view information about CDR push receivers. The existing display for this command has been extended to include information that looks like the following:

FTP timeouts = 0, FTP Delays = 0, FTP Put failures = 0 FTP conn failures = 0, FTP terminates = 0, FTP triggered terminates = 0

SNMP Support

The Net-Net SBC sends traps when a single push receiver or all push receivers become unavailable.

- When one CDR push receiver becomes unavailable, the CDR_PUSH_RECEIVER_FAIL_TRAP trap is sent and a minor alarm is generated.
- When all of the configured CDR push receivers become unavailable, the CDR_ALL_PUSH_RECEIVERS_FAIL_TRAP is sent and a major alarm is generated.

When one or more of the push receivers comes back, the CDR_ALL_PUSH_RECEIVERS_FAIL_CLEAR_TRAP is sent and the alarm is cleared.

CDR File Transfer Failure Alarm

The Net-Net SBC sends out traps and triggers corresponding alarms when it encounters failure when attempting to transfer locally stored CDR files via FTP or SFTP. One set of traps is used for instances when one CDR push receiver fails; another is used when all enabled CDR receivers fail. They are part of the apSysMgmtCDRPushRecei verNoti fi cati onsGroup.

All of the traps contain information about the type of push receiver, the address of the push receiver, and the failure reason code.

All of the traps contain information about the type of push receiver, the address of the push receiver, and the failure reason code.

The trap and corresponding clearing trap for single push receiver failure are:

- apSysMgmtCDRPushRecei verFailureTrap
- apSysMgmtCDRPushRecei verFailureClearTrap

The trap and corresponding clearing trap for global push receiver failure are:

- apSysMgmtCDRAI I PushRecei versFai I ureTrap
- apSysMgmtCDRAI I PushRecei verFai I uresCI earTrap

Storage Expansion Module

Storage Expansion Module Use With Local CDRs / FTP Push

The Net-Net 3800 and 4500 can be configured with an optional Storage Expansion Module that extends the system's internal storage beyond the fixed amount of flash RAM. When configuring local CDR creation, you can configure the Net-Net SBC to use the Storage Expansion Module for local CDR files instead of the limited internal flash RAM.

Disk space on the Storage Expansion Module appears as a local volume on the Net-Net SBC. Wherever you specify a volume name for a configuration parameter value, you can enter a volume located on the Storage Expansion Module, (unless the parameter is otherwise specified).

Local CDR Storage Directory

To save local CDR files to the Storage Expansion Module, configure the **file path** parameter in the account config with a volume and directory located on the Storage Expansion Module.

FTP Push Backup

When FTP push is enabled, if all FTP push servers are unreachable, then local CDR files are written to local file system until the FTP push servers return to service. Once an FTP Push server becomes reachable, the Net-Net SBC transfers all local CDR files to the remote server automatically. After all local CDR files have been successfully transferred to the FTP server from the Net-Net SBC, they are deleted from the local volume.

Local CDR File Compression

You can configure the Net-Net SBC to compress local CDRs in zip format to save disk space. The local CDRs will be compressed and appear with a .zip file extension. This feature is enabled with the **cdr compression** parameter.

ACLI Configuration and Examples

The following ACLI configuration procedure describes:

- identifying volumes on the Storage Expansion Module
- configuring Storage Expansion Module volumes as the destination for local CDR files

These procedures are only a portion of local CDR file generation and FTP Push configuration. Please refer to the Net-Net 4000 S-C6.1.0 ACLI Accounting Guide's Local CDR Storage and FTP Push section for a full explanation and all prerequisites before referencing the following procedure.

To identify the volumes on the Storage Expansion Module to use with local CDR storage:

1. Note the volume name on the Storage Expansion Module you wish to use for local CDR output using the **show space hard-drive** command. The following example indicates that there are 4 partitions, which are set in bold:

SYSTEM# show space hard-disk

/sys: 19695716352/19695749120 bytes (99%) remaining

/local: 19693335040/19693367808 bytes (99%) remaining

/logs: 19693335040/19693367808 bytes (99%) remaining

/misc: 19693335040/19693367808 bytes (99%) remaining

SYSTEM#

Note: The **check-space-remaining hard-disk** command is identical to the **show space hard-disk** command.

To configure a Net-Net 3800 or Net-Net 4500 to write local CDRs to the Storage Expansion Module:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

2. Type **session-router** and press <Enter>.

ACMEPACKET(configure)# session-router

3. Type **account-config** and press <Enter>.

ACMEPACKET(session-router)# account-config ACMEPACKET(account-config)#

- 4. **file-path**—Set this parameter to the volume you identified to use for local CDR file storage in the previous section. Ensure the path begins with a forward slash, "|"
- 5. Save and activate your configuration.

Storage Expansion Module Management

The Net-Net SBC provides you with a set of tools to manage the Storage Expansion Module.

Identifying Storage Expansion Module Volumes

You can identify volumes that exist on the Storage Expansion Module using the **show space hard-drive** command. In addition, free and used space are reported too. For Example:

SYSTEM# show space hard-disk

/sys: 19695716352/19695749120 bytes (99%) remaining

/local: 19693335040/19693367808 bytes (99%) remaining

/logs: 19693335040/19693367808 bytes (99%) remaining

/misc: 19693335040/19693367808 bytes (99%) remaining

SYSTEM#

Viewing Directories and Files

You can view files and directories on the Storage Expansion Module using the **show directory <path>** command. Remember to use absolute paths beginning with the forward slash. For example:

SYSTEM# show directory /misc

Listing Directory /misc:
-rwxrwxrwx 1 0 0 0 Aug 24 14:26 tmp.dat
-rwxrwxrwx 1 0 0 1048580 Aug 25 11:50 file_0.txt
SYSTEM#

To view all volumes on the Net-Net SBC, type **show directory** without any arguments. For Example:

SYSTEM# show directory
Top-level directories:
/ramdrv
/code
/boot
/local
/logs

Typing **show directory** * displays all top-level directories and their contents.

Formatting the Storage Expansion Module

You can use the Storage Expansion Module's default partition configuration, or you can create your own scheme creating a maximum of 4 volumes.

Default Format Plan

When formatting the Storage Expansion Module, the ACLI's default partitioning scheme is as follows:

Storage Expansion Module Default Format Plan:

Volume Number	Volume Name	Volume Size
1	/sys	10%
2	/app	90%

Custom Format Plan

Before formatting the Storage Expansion Module, plan the number of volumes, volume names, and relative percentage of Storage Expansion Module disk space. For example:

Storage Expansion Module Format Plan:

Volume Number	Volume Name	Volume Size
1	/archive	20%
2	/misc	35%
3	/localcdrs	45%

The following are invalid Storage Expansion Module volume names:

- ramdrv
- code
- boot

Custom Partition Scheme

To format the Storage Expansion Module using a custom partition scheme:

1. Type **format hard-disk** <Enter>. You will be prompted to confirm this action.

SYSTEM# format hard-disk

WARNING: Please ensure device is not currently in use by any applications before proceeding

Continue [y/n]?:

Type **y** <Enter> to continue

2. Type \mathbf{n} <Enter> when prompted to use the factory default partitions.

Use factory default partitions [y/n]?:

3. Enter the number of volumes you wish to create and press <Enter>.

Enter the number of partitions to create: 3

4. Enter the name of volume 1 and press <Enter>

Total unallocated space = 100 %
Enter the name of volume 1 (or 'q' to quit): archive

5. Enter the size in percent of volume 1 and press <Enter>

Enter the size of the volume (in %): 20

- 6. Repeat steps 4 and 5 for all additional volumes.
- 7. A summary of how the Storage Expansion Module will be formatted is displayed on the screen. Type y <Enter> at the prompt that confirms you wish to commit this.

The following partitions will be created:

/archi ve 16005272371 bytes

/misc 28009226649 bytes

/local cdrs 36011862835 bytes

Format disk and create the partitions as configured above [y/n]?: ${\bf y}$

8. You will be prompted again to confirm formatting the Storage Expansion Module. All existing data on the Storage Expansion Module will be lost. Type y <Enter> to continue.

WARNING: All data on the drive will be permanently erased and unrecoverable.

Are you sure [y/n]?: y

9. You will be prompted one last time to confirm formatting the Storage Expansion Module. Type y <Enter> to continue.

The format process will take a few minutes. Once the format process begins, it cannot be stopped. Please do not power down or reboot the SD until the format process is complete.

Continue [y/n]?: y

The formatting process displays progress on the screen and concludes after several minutes.

[progress text removed for brevity]

Format finished successfully New partitions have been created SYSTEM#

Default Partition Scheme

To format the Storage Expansion Module using the factory default partitions:

1. Type **format hard-disk** <Enter>. You will be prompted to confirm this action.

SYSTEM# format hard-disk

WARNING: Please ensure device is not currently in use by any applications before proceeding

Continue [y/n]?: y

Type y <Enter> to continue

2. Type y <Enter> when prompted to use the factory default partitions. The factory partition scheme will be displayed on the screen. Type Y <Enter> at the prompt that confirms you wish to commit this.

Use factory default partitions [y/n]?: y

The following partitions will be created:

/sys 8002636185 bytes

/app 72023725670 bytes

Format disk and create the partitions as configured above [y/n]?: y

3. You will be prompted again to confirm you wish to format the Storage Expansion Module. All existing data will be lost. Type y <Enter> to continue.

WARNING: All data on the drive will be permanently erased and unrecoverable.

Are you sure [y/n]?: y

You will be prompted one last time to confirm formatting the Storage Expansion Module. Type y <Enter> to continue.

The format process will take a few minutes. Once the format process begins, it cannot be stopped. Please do not power down or reboot the SD until the format process is complete.

Continue [y/n]?: y

The formatting process will display progress on the screen and concludes after several minutes.

*** Beginning format process ***

[progress text removed for brevity]

Format finished successfully New partitions have been created

Storage Expansion Module Monitoring

Low Disk Space Warning

The Net-Net SBC can initiate an alarm and an SNMP trap when a volume reaches a configured threshold of remaining free disk space, configured as a percentage of volume. You can configure multiple alarms, each with increasing severity that indicate less free disk space.

Low Disk Space Threshold Alarm

The low disk space threshold alarm is configured in alarm threshold configuration element. It is non-health affecting. The threshold alarm appears as follows:

SYSTEM# display-alarms

1 alarms to show

Task Severi ty First Occurred Last Occurred 131142 547896076 4 2009-08-25 13: 36: 26 2009-08-25 13: 36: 26 Count Description

Volume /misc space used 81% is over major threshold of 80%.

Low Disk Space Threshold SNMP Trap

For any threshold reached, an SNMP trap will be sent to all configured trapreceivers. The apSysMgmtStorageSpaceAvailThresholdTrap trap contains the following information:

- VolumeName—name of the volume where a threshold was exceeded
- CurrentValue—current percentage of disk space value that is exceeding one of the thresholds.
- MinorThreshold—configured minor threshold for this volume, if none then this
- MajorThreshold—configured major threshold for this volume, if none then this
- CriticalThreshold—configured critical threshold for this volume, if none then this is 0.

Configuration and Examples

To configure alarm thresholds for monitoring free disk space:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

2. Type **system** and press <Enter>.

ACMEPACKET(configure)# system ACMEPACKET(system)#

3. Type **system-config** and press <Enter>.

ACMEPACKET(system)# system-config ACMEPACKET(system-config)#

4. Type select and press <Enter>.

```
ACMEPACKET(system-config)# select
ACMEPACKET(system-config)#
```

5. Type **alarm-threshold** and press <Enter>.

```
ACMEPACKET(system-config)# alarm-threshold
ACMEPACKET(alarm-threshold)#
```

The system prompt changes to let you know that you can begin configuring individual parameters.

- type—Set this parameter to space to create an alarm based on reduced free disk space.
- 7. **volume**—Set this parameter to the volume name you wish to monitor. Generally this string should be the same as the **file-path** parameter located in the account-config.
- 8. **severity**—Enter the severity level of this alarm. Valid severity values are MINOR, MAJOR, and CRITICAL.
- 9. **value**—Enter the percent of resource (*type*) in use that triggers the configured alarm (*severity*).
- 10. Save your work.
- 11. Repeat this procedure to configure multiple alarm thresholds.

The following example reflects what a major and critical alarm would look like:

alarm-threshold	
type	space
vol ume	/mi sc
severi ty	maj or
val ue	80
alarm-threshold	
type	space
vol ume	/mi sc
severi ty	cri ti cal
val ue	90

Local CDR File Delete Warning

You can configure the Net-Net SBC to initiate an alarm and send an SNMP trap when the oldest local CDR file was deleted under fault conditions. This feature is enabled with the **file delete alarm** parameter.

The Net-Net SBC deletes a local CDR file in the following three cases:

- 1. After the local CDR file has been successfully transferred to a push receiver
- 2. The number of local CDR files exceed the limit configured in the account-config > max-files parameter
- 3. No free disk space remains on the partition where the local CDR files are written: account-config > file-path

If a local CDR file is deleted after it was successfully uploaded to a push receiver, no fault is triggered because this is standard, expected operation. But if a local CDR file is deleted for case 2 or 3 above, it is considered a fault condition initiating an alarm and SNMP trap.

Local CDR File Delete Alarm

The CDR file delete alarm is configured in **account config** configuration element by enabling the **file-delete-alarm** parameter. This is a minor severity alarm and is non-health affecting. This alarm has no clearing condition and must be manually cleared.

Local CDR File Delete SNMP Trap

Under the same circumstances that cause a CDR file delete alarm, an SNMP trap will be sent to all configured trap-receivers. The apSysMgmtCdrFileDeleteTrap trap contains the following information:

• File Name—name of the file that was deleted

Querying Storage Space

You can monitor currently used and remaining storage space on the Storage Expansion Module by ACLI, SNMP MIB, and HDR collection group.

ACLI

To view the total disk space used percentage remaining with the ACLI, use the **show space hard-drive** command. For example:

SYSTEM# show space hard-disk

/sys: 19695716352/19695749120 bytes (99%) remaining

/local: 19693335040/19693367808 bytes (99%) remaining

/logs: 19693335040/19693367808 bytes (99%) remaining

/misc: 19693335040/19693367808 bytes (99%) remaining

SYSTEM#

Note: The **check-space-remaining hard-disk** command is identical to the **show space hard-disk** command.

Unmounting The Storage Expansion Module

This section explains the ACLI unmount hard-disk command, which—as its name indicates—unmounts the storage expansion module. This command should only be run when you plan to shut down the system. You issue this command to ensure the integrity of the disk when you power off the Net-Net 4500 System or Net-Net 3800 using the power switch. If you do not run the command and use the power switch to power down the system, the Net-Net 4500 System runs a checkdisk on the module the next time the system boots. The checkdisk lasts one to two minutes.

Note that once you run the **unmount hard-disk** command, any application configuration set to use a module partition will no longer work. The only way to regain access is to reboot or power cycle the system.

ACLI Instructions and Examples

To ensure the storage expansion module's integrity when powering down the system (using the power switch), use the **unmount hard-disk** command:

ACMEPACKET# unmount hard-disk

SNMP MIB

The following MIB Objects are available to query the amount of remaining drive space.

Name	OID	MIB	Description
apSysStorageSpaceTable	1.3.6.1.4.1.9148.3.2.1.1.23	APSYSMGMT-MIB	The total percentage space available on the drive/partitions.

HDR

Historical Data Record statistics are available that track the amount of storage space available on each Storage Expansion Module partition. At each collect interval, space consumption statistics are gathered for every partition. The Storage Space collect group, configured as **space**, contains these statistics. The contents of this Storage Space group are:

- TimeStamp
- Partition
- Space used
- Space available

Diameter Rf Accounting

Diameter Accounting

The Net-Net SBC supports the Diameter charging interface, Rf. This interface provides similar functionality to the RADIUS interface, but utilizes Diameter as the underlying application layer protocol. As a result, the Net-Net SBC can integrate more thoroughly with IMS standards as well as provide a more dynamic, secure, and robust accounting interface.

Diameter Accounting Messages

The Rf interface can send two types of messages based on the signaling application's actions. These messages are Accounting Charging Request (ACR) Start and ACR Stop messages.

- ACR start messages are sent at the start of service delivery and describes the type
 of service being delivered and the user to whom it is being delivered.
- Additional ACR Start messages are sent when service changes; this roughly
 maps to a RADIUS Interim-Update message. See <u>Accounting-Record-Type AVP</u>
 (480) (90).
- ACR Stop messages are sent at the end of service delivery.

The Net-Net SBC sends a set of a AVPs in each ACR start and stop message that make up the charging data. The following table lists which AVPs are included in ACR Start and ACR Stop messages. Individual AVP descriptions are located in the following section.

AVP	ACR Start	ACR Stop
Session-Id AVP (263)	Х	х
Origin-Host AVP (264)	х	х
Origin-Realm AVP (296)	х	х
Destination-Realm AVP (283)	х	х
Destination-Host AVP (293)	Х	х
Accounting-Record-Type AVP (480)	Х	х

Cause AVP (860) Cause-Code AVP (861) Node-Functionality AVP (862)		х

ACR AVP Descriptions

Session-Id AVP (263)

Uniquely identify this session. It is a string value and is delimited by semi-colons. hostname of the accounting server the communication is to out on.

The second two parts are values that get generated by the signaling application related to the signaling session that is occurring. It is a number that gets increased every time a new signaling session is created. An example of a Session-Id from the SD is as follows, acmesystem;0;1.

Origin-Host AVP (264)

Contains the account-server configuration element's **hostname** parameter followed by the "@" character, followed by the account-server configuration element's **origin-realm** parameter. For example: acmesystem@wancom.com.

Origin-Realm AVP (296)

Contains the **account server** configuration element's **origin-realm** and **domain-name-suffix** parameters where the server request is sent.

Destination-Realm AVP (283)

Contains the value of the Origin-Realm AVP in the CEA received from the accounting server for this connection.

Destination-Host AVP (293)

Contains the value of the Origin-Host AVP in the CEA received from the accounting server for this connection.

Accounting-Record-Type AVP (480)

Contains the value indicating the type of accounting message being sent.

- start record = 2
- interim record = 3
- stop record = 4

If this is an interim-type message, it's still included in an ACR Start message but with the value of this AVP set to "3".

Accounting-Record-Number AVP (485)

A value that uniquely identifies this message in the session, i.e., a sequence number for this connection. This value is arbitrarily created by the Net-Net SBC with the caveat that it is unique for a session.

Acct-Application-Id AVP (259)

Set to value "3"; This value indicates Diameter-based accounting messages.

User-Name AVP (1)

Contains the account-server configuration element's hostname parameter followed by the "@" character, followed by the account-server configuration element's origin-realm parameter. For example: acmesystem@wancom.com.

Event-Timestamp AVP (55)

Contains the number of seconds since January 1, 1900 when this accounting event took place.

Event-Type AVP (823)

A grouped AVP containing information about the signaling event. It contains the following AVPs:

- SIP-Method AVP (824)—Contains the exact string payload from the SIP request line; i.e., the Method that triggered the accounting event.
- Content-Type AVP (826)—Contains the exact string payload from the "Content-Type" SIP header of the message that triggered the accounting event.
- Content-Length AVP (827)—Contains the exact string payload from the Content-Length" SIP header of the message that triggered the accounting event.

Role-of-Node AVP (829)

Set to the value "2" which indicates that the Net-Net SBC is operating in a PROXY role.

User-Session-Id AVP (830)

Contains VSA 44 as used in the RADIUS interface.

Calling-Party-Address AVP (831)

Contains the calling party address in the SIP message. The Net-Net SBC first checks for a P-Asserted-Id header. If present, its value is used for this AVP. If not present, the Net-Net SBC inserts the "To:" field from the SIP message into this AVP. ONLY IN ACR Start.

Called-Party-Address AVP (832)

Contains the "From:" field of the SIP message. ONLY IN ACR Start.

Time-Stamps AVP (833)

A grouped AVP that contains timestamps for the related SIP signaling. It contains the following AVPs.

- SIP-Request-Timestamp AVP (834)—A UTC formatted timestamp that corresponds to when the SIP INVITE that started the session was received.
- SIP-Response-Timestamp AVP (835)—A UTC formatted timestamp that corresponds to when the SIP 200 OK response to the INVITE that started the session was received.

Inter-Operator-Identifier AVP (838)

A grouped AVP that indicates the ingress and egress networks from the Net-Net SBC's perspective. It contains the following AVPs.

- Originating-IOI AVP (839)—The realm where the Net-Net SBC received the SIP signaling messages.
- Terminated-IOI AVP (840)—The realm where the SIP signaling message exit the Net-Net SBC.

SDP-Session-Description AVP (842)

This AVP may occur multiple times in an ACR message. It is populated with SDP attribute-lines from the SIP messages to which this ACR Stop message refers. Thus, all "i=", "c=", "b=", "k=", "a=", etc.., lines comprise multiple instances of this AVP.

If the Net-Net SBC is configured to generate Start events on the INVITE, the calling SDP will be used; if the Net-Net SBC is configured to generate Start events on the OK, the called SDP will be used. ONLY IN ACR Start.

Session-Media-Component AVP (845)

A grouped AVP that contains information about the media session. It contains the following AVPs. ONLY IN ACR Start.

- SDP-Media-Name AVP (844)—populated with the "m=" line from the SDP being used.
- SDP-Media-Description AVP (845)—this AVP may occur multiple times in this grouped AVP. It is populated with SDP attribute-lines from the media component as specified by the media described in the SDP-Media-Name AVP. Thus, all "i=", "c=", "b=", "k=", "a=", etc..., lines related to the above specified "m=" line comprise multiple instances of this AVP.

Cause AVP (860)

A grouped AVP that contains the reason for the termination event and the role/function of the node where the call was terminated. It contains the following AVPs. ONLY IN ACR Stop.

- Cause-Code AVP (861)—Set to value "0".
- Node-Functionality AVP (862)—Set to value "0".

Configuring Diameter-based Accounting

Diameter-based Rf accounting relies on many of the same configuration elements used for RADIUS based accounting. The following two sections explain how to configure both the **account-config** and **account-servers** configuration elements. In addition, you must ensure that accounting is enabled for each realm where you want it to occur. The **accounting-enable** parameter in the realm-config is enabled by default.

ACLI Instructions and Examples

To configure the global Diameter-based accounting (Rf) features in the account-config:

1. In Superuser mode, type **configure terminal** and press <Enter>.

ACMEPACKET# configure terminal

2. Type **session-router** and press <Enter>.

ACMEPACKET(confi gure)# session-router

3. Type **account-config** and press <Enter>.

ACMEPACKET(sessi on-router)# account-config
ACMEPACKET(account-config)#

- 4. **hostname**—Enter a hostname for this system.
- 5. **port**—Enter 3868 for the RFC-recommended Diameter port number. You may enter a different port number.

minimum: 1025maximum: 65535

 strategy—Set the strategy used to select the accounting server which the Net-Net SBC sends accounting messages. The following table lists the available strategies:

Value	Description		
hunt	Selects accounting servers in the order in which they are listed. If the first accounting server is online, working, and has not exceeded any of the defined constraints, all traffic is sent to it. Otherwise the second accounting server is selected. If the first and second accounting servers are offline or exceed any defined constraints, the third accounting server is selected. And so on through the entire list of configured servers		
failover	Uses the first server in the list of predefined accounting servers until a failure is received from that server. Once a failure is received, it moves to the second accounting server in the list until a failure is received. And so on through the entire list of configured servers.		
round robin	Selects each accounting server in order, distributing the selection of each accounting server evenly over time.		
fastest round trip time	Selects the accounting server that has the fastest round trip time (RTT) observed during transactions with the servers (sending a record and receiving an ACK).		
fewest pending	Selects the accounting server that has the fewest number of unacknowledged accounting messages (that are in transit to the Net-Net SBC).		

- 7. **protocol**—Set this parameter to **diameter** to use the Rf accounting interface with a Diameter-based accounting server.
- 8. **state** Enter **enabl ed** to use accounting on this system.
- 9. max-msg-delay—Retain the default value of **60** seconds or indicate the length of time in seconds that you want the Net-Net SBC to continue trying to send each accounting message. During this delay, the Net-Net SBC can hold a generic queue of 4096 messages.

• Minimum: zero (0)

Maximum: 2³²-1

10. max-wait-failover—Retain the default value of **100** messages or indicate the maximum number of accounting messages the Net-Net SBC can store its message waiting queue for a specific accounting server, before it is considered a failover situation.

Once this value is exceeded, the Net-Net SBC attempts to send it accounting messages, including its pending messages, to the next accounting server in its configured list.

• Minimum: one (1) message

• Maximum: 4096 messages

- 11. **trans-at-close**—Retain the default value of **di sabi ed** if you do not want to defer the transmission of message information to the close of a session. Enter **enabl ed** if you want to defer message transmission.
 - **di sabl ed**—The Net-Net SBC transmits accounting information at the start of a session (Start), during the session (Interim), and at the close of a session (Stop). The transmitted accounting information for a single session might span a period of hours and be spread out among different storage files.
 - **enabl ed**—Limits the number of files on the Net-Net SBC used to store the accounting message information for one session. It is easiest to store the accounting information from a single session in a single storage file.
- 12. **generate-start**—Retain the default value **ok** if you want the ACR Start message to be generated once the Net-Net SBC receives an OK message in response to an INVITE.

Other options include:

- none—Accounting Start message should not be generated.
- invite—Accounting Start message should be generated once the Net-Net SBC receives a SIP INVITE.
- 13. **generate-interim**—Retain the default value **rei nvi te-response** to cause the Net-Net SBC to send an Interim charging message to the accounting server.

You can select none, one, or more than one of the following values:

Value	Description
ok	Start message is generated when the Net-Net SBC receives an OK message in response to an INVITE.
reinvite	Interim message is generated when the Net-Net SBC receives a SIP session reINVITE message.
reinvite-response (default)	Interim message is generated when the Net-Net SBC receives a SIP session relNVITE and responds to it (for example, session connection or failure).

Value	Description
reinvite-cancel	Interim message is generated when the Net-Net SBC receives a SIP session reINVITE, and the Reinvite is cancelled before the Net-Net SBC responds to it.
unsuccessful-attempt	Interim message is generated when a SIP session set-up attempt from a preference-ordered list of next-hop destinations is unsuccessful. This can happen when a local policy lookup, LRT lookup, ENUM query response, or SIP redirect returns a preference-ordered list of next-hop destinations. The interim message contains: the destination IP address, the disconnect reason, a timestamp for the failure, and the number that was called.

- 14. **intermediate-period**—Enter amount of time in seconds between generating periodic interim ACR messages during a SIP call. This parameter defaults to zero, which disables continuous Interim charging messages.
- 15. **vsa-id-range**—Ensure that this parameter is left blank when communicating with a Diameter-based Rf accounting server.
- 16. Save your work.

To configure individual Diameter-based accounting servers:

Configuring Accounting Servers

You must create one or more servers to which the Net-Net SBC can send accounting messages.

1. Continuing from the previous account-config configuration, enter the account server sub-element by typing **account-servers** <Enter>.

AZALEA(account-config)# account-servers
AZALEA(account-server)#

- 2. **hostname**—Set this to the IP address or hostname (FQDN) of the Diameter-based Rf accounting server.
- 3. **port**—Enter 3868 for the RFC-recommended Diameter port number. You may enter a different port number if desired.

minimum: 1025maximum: 65535

- 4. **state**—Retain the default enabled to enable this account server or enter disabled to disable it.
- 5. **min-round-trip**—Retain the default 250 milliseconds or indicate the minimum round trip time of an accounting message.

minimum: 1025 milliseconds

maximum: 65535 milliseconds

A round trip consists of the following:

- The Net-Net SBC sends an accounting message to the account server.
- The account server processes this message and responds back to the Net-Net SBC.

If the fastest RTT is the strategy for the account configuration, the value you enter here can be used to determine an order of preference (if all the configured account servers are responding in less than their minimum RTT).

6. **max-inactivity**—Retain the default 60 seconds or indicate the length of time in seconds that you want the Net-Net SBC with pending accounting messages to wait when it has not received a valid response from the target account server.

minimum: 1 secondmaximum: 300 seconds

Once this timer value is exceeded, the Net-Net SBC marks the unresponsive account server as disabled in its failover scheme. When a server connection is marked as inactive, the Net-Net SBC attempts to restart the connection and transfers pending messages to another queue for transmission. Accounting messages might be moved between different account servers as servers become inactive or disabled.

7. **restart-delay**—Retain the default 30 seconds or indicate the length of time in seconds you want the Net-Net SBC to wait before resending messages to a disabled account server.

minimum: 1 secondmaximum: 300 seconds

- 8. **priority**—Enter the number corresponding to the priority of this account server, for use with server prioritization. The default for this parameter is 0, meaning the prioritization feature is turned off—and that the Net-Net SBC will therefore prioritize accounting servers by IP address and port.
- 9. **origin-realm**—Enter the realm in which the Net-Net SBC communicates with the Diameter Rf accounting server.
- 10. **domain-name-suffix**—Enter the suffix to be appended to any Diameter FQDN or Diameter Identity used when the Net-Net SBC communicates with the Diameter Rf accounting server. Your value can be any string, to which the Net-Net SBC will prepend with a dot.
- 11. Save your work.

Overview

Several examples of RADIUS logs appear in this appendix. These logs were processed and the output generated by a FreeRADIUS server; the labels for each field come from the installed VSA dictionaries, including the Acme Packet RADIUS dictionary.

As you review these examples, please note:

- The Client-IP-Address =, Acct-Unique-Session-Id = and Timestamp = fields shown in the following examples are generated by the RADIUS server and not by the Net-Net SBC.
- The Client-IP-Address = may not appear in your output as later versions of freeRADIUS no longer include this field.
- For non-QoS calls, the attributes appear in the record, but their values are always zero (0).

RADIUS CDR Samples for SIP

This section provides an example CDRs for SIP calls.

Basic Successful SIP Call

The following sample CDRs are for a successful SIP call.

Successfull SIP Call - Peer

Acct-Status-Type = Start

NAS-IP-Address = 192.168.12.100

Appendix C Comma-Delimited Entries for Local Files

Local File Format

Appendix C contains three tables that show where, in locally-generated CSV files, specific VSAs appear. There is one table for each of the following type of record: Start, Stop, Interim.

For more information about this feature and how to enable it, refer to the <u>Local CDR Storage and FTP Push (57)</u> section in this guide's <u>Configuring Accounting (39)</u> chapter.

Note that the Acme-CDR-Sequence-Number, VSA ID 59, appears in local CDR files when both file-output is enabled and an account server is configured.

Start Record CSV Placement

IPv6 Values in CDRs

Net-Net OS Release S-C6.2.0 introduces IPv6 to its body of supported features and provides new RADIUS VSAs for IPv6 media flows. This body of VSAs includes numbers 155-170 in the Acme Packet RADIUS dictionary, and they are IPv6 equivalents to their IPv4 counterparts. In this way, the introduction of IPv6 does not change the local CDR CSV format because—for an IPv6 call or where an IPv6 address applies—the IPv6 VSA replaces its IPv4 equivalent.

For example, the new attribute 155 (ACME_ATTR_FLOW_FS1_F_INPUT_SRC_IPV6_ADDR) is the IPv6 version of attribute 11 (ACME_ATTR_FLOW_FS1_F_INPUT_SRC_ADDR), which expresses IPv4 information. In an IPv6 call, the IPv6 address value for VSA 155 will appear in the position occupied by VSA 11 for an IPv4 call—and VSA 11 would not appear at all.

The following table maps the IPv4 and IPv6 equivalent VSAs.

IPv4 VSA Description	IPv4 VSA Number	Equivalent IPv6 VSA Description	IPv6 VSA Number
Acme-Flow-In-Src-Addr_FS1_F	11	Acme-Flow-In-Src-IPv6_Addr_FS1_F	155
Acme-Flow-In-Dst-Addr_FS1_F	13	Acme-Flow-In-Dst-IPv6_Addr_FS1_F	156
Acme-Flow-Out-Src-Addr_FS1_F	21	Acme-Flow-Out-Src-IPv6_Addr_FS1_F	157
Acme-Flow-Out-Dst-Addr_FS1_F	23	Acme-Flow-Out-Dst-IPv6_Addr_FS1_F	158
Acme-Flow-In-Src-Addr_FS1_R	81	Acme-Flow-In-Src-IPv6_Addr_FS1_R	159
Acme-Flow-In-Dst-Addr_FS1_R	83	Acme-Flow-In-Dst-IPv6_Addr_FS1_R	160
Acme-Flow-Out-Src-Addr_FS1_R	86	Acme-Flow-Out-Src-IPv6_Addr_FS1_R	161
Acme-Flow-Out-Dst-Addr_FS1_R	88	Acme-Flow-Out-Dst-IPv6_Addr_FS1_R	162
Acme-Flow-In-Src-Addr_FS2_F	93	Acme-Flow-In-Src-IPv6_Addr_FS2_F	163
Acme-Flow-In-Dst-Addr_FS2_F	95	Acme-Flow-In-Dst-IPv6_Addr_FS2_F	164
Acme-Flow-Out-Src-Addr_FS2_F	98	Acme-Flow-Out-Src-IPv6_Addr_FS2_F	165
Acme-Flow-Out-Dst-Addr_FS2_F	100	Acme-Flow-Out-Dst-IPv6_Addr_FS2_F	166
Acme-Flow-In-Src-Addr_FS2_R	115	Acme-Flow-In-Src-IPv6_Addr_FS2_R	167
Acme-Flow-In-Dst-Addr_FS2_R	117	Acme-Flow-In-Dst-IPv6_Addr_FS2_R	168
Acme-Flow-Out-Src-Addr_FS2_R	120	Acme-Flow-Out-Src-IPv6_Addr_FS2_R	169
Acme-Flow-Out-Dst-Addr_FS2_R	122	Acme-Flow-Out-Dst-IPv6_Addr_FS2_R	170
