Chapter 1

Introduction

Topics:

- Overview.....5
- Scope and Audience.....5
- Manual Organization.....5
- Documentation Admonishments.....5
- Related Publications.....6
- Customer Care Center.....7
- Emergency Response.....9
- Locate Product Documentation on the Customer Support Site.....10

This chapter contains an overview of procedures to use to configure the RBAR application. The contents include sections on the scope, audience, and organization of the documentation, and how to contact Tekelec for assistance.
Overview

The Range Based Address Resolution (RBAR) document provides information about how to use the DSR GUI to configure the RBAR application.

The document provides procedures to configure:

- Applications
- Exceptions
- Destinations
- Address Tables
- Addresses
- Address Resolutions
- System Options

Scope and Audience

This RBAR Help is intended for anyone responsible for configuring and using the Range Based Address Resolution application. Users of this manual must have a working knowledge of telecommunications, network installations, and the Diameter Signaling Router (DSR).

Manual Organization

This document is organized into the following chapters:

- **Introduction** contains general information about the RBAR help documentation, the organization of this manual, and how to get technical assistance.
- **Range Based Address Resolution** describes the function of the RBAR application.
- **Configuration** describes how to configure the RBAR application, including Applications, Exceptions, Destinations, Address Tables, Addresses, Address Resolutions, and System Options.

Documentation Admonishments

Admonishments are icons and text throughout this manual that alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.
Table 1: Admonishments

Related Publications

The Diameter Signaling Router (DSR) documentation set includes the following publications, which provide information for the configuration and use of DSR and related applications.

*Getting Started* includes a product overview, system architecture, and functions. It also explains the DSR GUI features including user interface elements, main menu options, supported browsers, and common user interface widgets.

*Feature Notice* describes new features in the current release, provides the hardware baseline for this release, and explains how to find customer documentation on the Customer Support Site.

*Roadmap to Hardware Documentation* provides links to access manufacturer online documentation for hardware related to the DSR.

*Operation, Administration, and Maintenance (OAM) Guide* provides information on system-level configuration and administration tasks for the advanced functions of the DSR, both for initial setup and maintenance.

*Communication Agent User Guide* explains how to use the Communication Agent GUI pages to configure Remote Servers, Connection Groups, and Routed Servers, and to maintain configured connections.

*Diameter and Mediation User Guide* explains how to use the Diameter GUI pages to manage the configuration and maintenance of Local and Peer Nodes, connections, Configuration Sets, Peer Routing Rules, Application Routing Rules, and System and DNS options; explains how to configure and use Diameter Mediation; and describes DSR capacity and congestion controls.

*IP Front End (IPFE) User Guide* explains how to use the IPFE GUI pages to configure IPFE to distribute IPv4 and IPv6 connections from multiple clients to multiple nodes.
Range-Based Address Resolution (RBAR) User Guide explains how to use the RBAR GUI pages to configure RBAR to route Diameter end-to-end transactions based on Diameter Application ID, Command Code, Routing Entity Type, and Routing Entity address ranges and individual addresses.

Full-Address Based Resolution (FABR) User Guide explains how to use the FABR GUI pages to configure FABR to resolve designated Diameter server addresses based on Diameter Application ID, Command Code, Routing Entity Type, and Routing Entity addresses.

Charging Proxy Application (CPA) and Offline Charging Solution User Guide describes the Offline Charging Solution and explains how to use the CPA GUI pages to set System Options for CPA, configure the CPA’s Message Copy capability, and configure the Session Binding Repository for CPA.

Policy DRA User Guide describes the topology and functions of the Policy Diameter Routing Agent (Policy DRA) DSR application and the Policy Session Binding Repository, and explains how to use the GUI pages to configure Policy DRA.

DSR Alarms, KPIs, and Measurements Reference Guide provides detailed descriptions of alarms, events, Key Performance Indicators (KPIs), and measurements; indicates actions to take to resolve an alarm, event, or unusual Diameter measurement value; and explains how to generate reports containing current alarm, event, KPI, and measurement information.

DSR Administration Guide describes DSR architecture, functions, configuration, and tools and utilities (IPsec, Import/Export, DIH, and database backups); and provides references to other publications for more detailed information.

Customer Care Center

The Tekelec Customer Care Center is your initial point of contact for all product support needs. A representative takes your call or email, creates a Customer Service Request (CSR) and directs your requests to the Tekelec Technical Assistance Center (TAC). Each CSR includes an individual tracking number. Together with TAC Engineers, the representative will help you resolve your request.

The Customer Care Center is available 24 hours a day, 7 days a week, 365 days a year, and is linked to TAC Engineers around the globe.

Tekelec TAC Engineers are available to provide solutions to your technical questions and issues 7 days a week, 24 hours a day. After a CSR is issued, the TAC Engineer determines the classification of the trouble. If a critical problem exists, emergency procedures are initiated. If the problem is not critical, normal support procedures apply. A primary Technical Engineer is assigned to work on the CSR and provide a solution to the problem. The CSR is closed when the problem is resolved.

Tekelec Technical Assistance Centers are located around the globe in the following locations:

Tekelec - Global
Email (All Regions): support@tekelec.com

- USA and Canada
  
  Phone:
  1-888-FOR-TKLC or 1-888-367-8552 (toll-free, within continental USA and Canada)
  1-919-460-2150 (outside continental USA and Canada)
TAC Regional Support Office Hours:
8:00 a.m. through 5:00 p.m. (GMT minus 5 hours), Monday through Friday, excluding holidays

- **Caribbean and Latin America (CALA)**

Emergency Response

In the event of a critical service situation, emergency response is offered by the Tekelec Customer Care Center 24 hours a day, 7 days a week. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem with the installed equipment that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical situations affect service and/or system operation resulting in one or several of these situations:

- A total system failure that results in loss of all transaction processing capability
- Significant reduction in system capacity or traffic handling capability
Introduction

- Loss of the system’s ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions
- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity/traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with the Tekelec Customer Care Center.

Locate Product Documentation on the Customer Support Site

Access to Tekelec’s Customer Support site is restricted to current Tekelec customers only. This section describes how to log into the Tekelec Customer Support site and locate a document. Viewing the document requires Adobe Acrobat Reader, which can be downloaded at www.adobe.com.

1. Log into the Tekelec Customer Support site.
   Note: If you have not registered for this new site, click the Register Here link. Have your customer number available. The response time for registration requests is 24 to 48 hours.

2. Click the Product Support tab.
3. Use the Search field to locate a document by its part number, release number, document name, or document type. The Search field accepts both full and partial entries.
4. Click a subject folder to browse through a list of related files.
5. To download a file to your location, right-click the file name and select Save Target As.
This section provides an overview of the function of the Range Based Address Resolution (RBAR) application.
Range Based Address Resolution overview

Range Based Address Resolution (RBAR) is a DSR-enhanced routing application that allows the routing of Diameter end-to-end transactions based on Diameter Application ID, Command Code, Routing Entity Type, and Routing Entity addresses (range and individual) as a Diameter Proxy Agent. A Routing Entity can be:

- a User Identity:
  - International Mobile Subscriber Identity (IMSI)
  - Mobile Subscriber Integrated Services Digital Network (Number) (MSISDN)
  - IP Multimedia Private Identity (IMPI)
  - IP Multimedia Public Identity (IMPU)
- an IP Address associated with the User Equipment
  - IPv4
  - IPv6-prefix
- a general purpose data type: UNSIGNED16

Routing resolves to a destination that can be configured with any combination of a Realm and Fully Qualified Domain Name (FQDN) such as Realm-only, FQDN-only, or Realm and FQDN.

When a message successfully resolves to a destination, RBAR replaces the destination information (Destination-Host and / or Destination-Realm) in the ingress (incoming) message, with the corresponding values assigned to the resolved destination, and forwards the message to the (integrated) DSR Relay Agent for egress (forward) routing into the network.

Reserved MCC Ranges

Mobile Country Code (MCC) ranges that are reserved for future use are defined in a system-wide MCC Ranges table. If the MCC digits portion of decoded IMSI digits fall within one of the ranges designated in the MCC Ranges table, the IMSI digits will NOT be used for further Address Resolution. RBAR will continue decoding the digits using other AVP instances, or next PriorityAVP (if provisioned), or next Routing Entity (if provisioned).

Routing Exception Handling

When an ingress RBAR Request message cannot be resolved to a Destination (no address matched, no valid digits decoded, or any other error is returned), RBAR will invoke a routing exception handling procedure based on user-defined configuration. The following routing exception handling procedures are supported:

- Forward the message unchanged
- Forward the message using a user-defined default Destination
- Send an Answer response with a user-defined Result-Code AVP value
- Send an Answer response with user-defined Experimental-Code AVP values
- Abandon Transaction

The following types of routing exceptions will be supported:

- Unknown Application ID
- Unknown Command Code
• No valid Routing Entity addresses were found
• A valid Routing Entity address did not resolve to a configured address
Chapter 3

Configuration

Topics:

- Pre-Configuration Activities.....15
- RBAR Configuration.....16
- Post-Configuration Activities.....40

This section describes the procedures used to configure the RBAR application.
Pre-Configuration Activities

Before RBAR configuration can be performed, the following activities need to be performed in the system:

- Verify Server status
- Gather information that is required for Diameter and RBAR configuration
- Configure Diameter components that are required for RBAR configuration

Verifying Server status

Use this task to verify Server status prior to RBAR configuration.

1. From the active SOAM, select **Status & Manage > Server**.
2. Verify that for each Server, the **Appl State** field is **Disabled**, and the **DB, Reporting Status**, and **Proc** fields are **Norm**.

Diameter Configuration for RBAR

The following Diameter configuration must be done before RBAR configuration can be performed. All Diameter Configuration is done using the SOAM GUI.

Use the explanations and procedures in the Diameter Configuration help and the *Diameter and Mediation User Guide* to complete the Diameter configuration, including the Diameter components needed for use with RBAR.

1. **MP Profiles**

   Use the **Diameter > Configuration > DA-MPs > Profile Assignments** page to assign an **MP Profile** for each configured RBAR DA-MP shown in the **DA-MP** list.

   From the pulldown list, select the MP Profile that is for the correct blade and for a Database application, for example **G6:Database** or **G8:Database**.

   If you are running RBAR and P-DRA on the same DA-MP, select a **Session_Database** MP Profile.

2. **Application Ids**

   Diameter Application Ids must be configured prior to making them available for use in an RBAR Address Resolution. Use the **Diameter > Configuration > Application Ids [Insert]** page to configure Diameter Application Ids.

   The Application Ids that need to be configured depend on the types of Diameter Servers being supported, including HSS, PCRF, OFCS, and OCS.

3. **Command Codes**

   Diameter Command Codes must be configured prior to using them in an RBAR Address Resolution. Use the **Diameter > Configuration > Command Codes [Insert]** page to configure Diameter Command Codes.
Configure any Command Codes that need to be handled by RBAR. The Command Codes are associated with the Diameter Applications supported by the Diameter Servers (for example, HSS, PCRF, OCFS, or OCS) which are the destination of Diameter Requests being routed by RBAR. For example, the combination of Application Id = S6a and Command Code = ULR/ULA might be relevant for HSS.

4. Application Route Tables

Either use the default Application Route Table (always available), or use the Diameter > Configuration > Application Route Tables [Insert] page to configure one or more Application Route Tables in addition to the default. Application Route Tables contain Application Routing Rules that direct messages to RBAR and other DSR Applications.

5. Application Routing Rules

On the Diameter > Configuration > Application Route Tables page, select an Application Route Table Name and click View/Edit Rules.

Use the Viewing Rules for Application Route Table page to insert or edit an Application Routing Rule so that messages with Diameter Application ID = 3 are directed to RBAR.

When defining the Application Routing Rule:

- In the Conditions field, set the Application-Id Operator to Equals and the Value to 3. For all other Parameters, set the Operator to Always True.
- Set the Application Name to RBAR.

6. Reserved MCC Ranges

Use the Diameter > Configuration > MCC Ranges [Insert] page to specify up to 10 distinct, non-overlapping MCC Ranges.

The following two MCC Ranges are reserved by telephony standards and are recommended to be created in addition to other specified ranges:

1. 000-199
2. 800-899

**RBAR Configuration**

The RBAR > Configuration pages allow you to manage the RBAR configuration.

RBAR configuration typically occurs in the following order:

1. Add Diameter Applications to a list of RBAR supported Diameter Applications.
2. Configure Destinations.
3. If necessary, edit the Routing Exception Action associated with routing Exceptions.
4. Configure Address Tables.
5. Configure Addresses, specifying either address ranges or individual addresses.
6. Configure Address Resolutions.
7. If necessary, change the System Options.
Applications configuration

The RBAR > Configuration > Applications page allows you to access a list of Diameter applications supported by RBAR.

From the RBAR > Configuration > Applications page, you can:

- Filter the list of supported Diameter applications to display only the desired application(s).
- View a list of supported Diameter applications.
- Insert a supported Diameter application.
  
  **Note:** When an application entry is added, Routing Exceptions (Unknown Command Code, No valid Routing Entity Address, No Address Match) are automatically inserted with the Routing Exception Action value as Forward Unchanged.

- Delete a Diameter application from the list of supported Diameter applications.
  
  **Note:** When an application entry is deleted, the associated Routing Exceptions are automatically deleted.

Applications configuration elements

This table describes the fields on the Applications View, Insert, and Edit pages. Data Input Notes only apply to the Insert and Edit pages; the View page is read-only.

Table 2: Applications Configuration Elements

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application ID</td>
<td>Diameter Application ID which can be used by RBAR, along with Command Code and Routing Entity Type, to determine Address Resolution for routing Request messages.</td>
<td>Format: Pulldown list Range: Configured Diameter Application IDs</td>
</tr>
<tr>
<td>Routing Mode (Read only)</td>
<td>Method of routing for Request messages received containing the Diameter Application ID</td>
<td>Format: Disabled pulldown list with a value of Proxy.</td>
</tr>
</tbody>
</table>

Viewing supported Diameter applications

Use this task to view currently configured supported Diameter applications.

Select RBAR > Configuration > Applications.

The RBAR > Configuration > Applications page appears.

The Applications page appears with a list of supported Diameter applications. This list of applications can be filtered to display only desired applications. The fields are described in Applications configuration elements.

Inserting a supported Diameter application

Use this task to add a new Diameter application.
Inserting a supported Application automatically adds three (3) Routing Exceptions (Unknown Command Code, No valid Routing Entity Address, and Missing Configured Address Entry) with the Routing Exception Action set to Forward Unchanged.

1. Select RBAR > Configuration > Applications.
The RBAR > Configuration > Applications page appears.

2. Click Insert.
The RBAR > Configuration > Applications [Insert] page appears.

3. From the Application ID drop down list, select the Application ID in the Diameter message.
   
   Note: The Application IDs presented in this list are those created using Main Menu > Diameter > Application Ids.

4. Note that the Routing Mode field is disabled.

5. Perform one of the following actions:
   
   • Click OK to save the application and return to the RBAR > Configuration > Applications page.
   • Click Apply to save the application and stay on this page.
     
     Note: If field validations succeed after clicking either OK or Apply, the new Application is saved and an informational message about the automatic addition of the Routing Exceptions appears.
   • Click Cancel to return to the RBAR > Configuration > Applications page without saving the changes.

If OK or Apply is clicked and any of the following conditions exist, an error message appears:

   • The Application ID is empty; no value was entered or selected
   • The Application Name or Application ID is not unique; it already exists in the system
   • The entry in any field is not valid (wrong data type or out of the valid range)
   • The maximum number of supported Diameter applications (16) is already defined in the system

Editing a supported Diameter application

A supported Diameter Application entry cannot be edited. Selecting a supported Diameter Application, clicking Edit, and changing the Application ID value results in an error message.

To change a supported Diameter Application entry:

   • Use the procedure in Inserting a supported Diameter application to insert the Diameter Application you want.
   • Use the procedure in Deleting a Diameter application from the list of supported Diameter applications to delete the Diameter Application you do not want.

Deleting a Diameter application from the list of supported Diameter applications

Use this task to delete a Diameter application from the list of supported Diameter applications.

An application cannot be deleted if it is being used by an Address Resolution. Before you perform this task, delete any Address Resolution that uses the Application.

1. Select RBAR > Configuration > Applications.
The RBAR > Configuration > Applications page appears.
2. Select the Application you want to delete, then click **Delete**. A popup window appears.

3. Perform one of the following actions:
   - Click **OK** to delete the application.
   - Click **Cancel** to cancel the delete function and return to the **RBAR > Configuration > Applications** page.

   If **OK** is clicked and the following condition exists, an error message appears:
   - The Application is in use by an Address Resolution

Exceptions configuration

The **RBAR > Configuration > Exceptions** page allows you to specify the routing exception action to take when RBAR is unable to resolve an address to a Destination for each supported Diameter Application and Routing Exception Type.

There are three (3) Routing Exception entries (**No Address Match**, **No valid Routing Entity Address**, and **Unknown Command Code**) automatically inserted with the **Routing Exception Action** set to Forward Unchanged as the default action for a supported Diameter application entry when that application entry is added. Similarly, these Routing Exceptions that are associated with an application entry are automatically deleted when that application entry is deleted.

From the **RBAR > Configuration > Exceptions** page, you can:
   - Filter the list of exceptions to display only the desired exceptions.
   - View a list of supported Diameter applications and their associated Routing Exception Types and Routing Exception Actions.
   - Edit the Routing Exception Action and its associated attributes for a supported Diameter application.

Exceptions configuration elements

This table describes the fields on the Exceptions View and Edit pages only.

**Table 3: Exceptions Configuration Elements**

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Application ID (Read only)</td>
<td>Application ID in a Diameter message</td>
<td>N/A</td>
</tr>
<tr>
<td>Application Name (Read only)</td>
<td>Name of the application</td>
<td>N/A</td>
</tr>
<tr>
<td>Routing Exception Type (Read only)</td>
<td>The routing exception that prevented address resolution. This field displays one of the following values:</td>
<td>N/A</td>
</tr>
<tr>
<td></td>
<td>• Unknown Application ID</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• Unknown Command Code</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No valid Routing Entity Address</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• No Address Match</td>
<td></td>
</tr>
</tbody>
</table>
### Viewing Exceptions

Use this task to view currently configured Exceptions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Routing Exception Action</td>
<td>Action that RBAR takes associated with the Routing Exception Type</td>
<td>Format: Radio buttons Range: • Forward Unchanged • Forward to Destination • Send Answer with Result-Code AVP • Send Answer with Experimental-Result AVP • Abandon Request</td>
</tr>
<tr>
<td>Destination</td>
<td>Destination to where the message is forwarded associated with the Routing Exception Type. This field is enabled when the Routing Exception Action is set to Forward to Destination.</td>
<td>Format: Pulldown list Range: Available user-configured destinations</td>
</tr>
<tr>
<td>Result-Code Value</td>
<td>Result code associated with this Routing Exception Type. This field is enabled when the Routing Exception Action is set to either Send Answer with Result-Code AVP or Send Answer with Experimental-Result AVP.</td>
<td>Format: • Selection text box; numeric • Selection pulldown list Range: • Selection box: 1000–5999 • Selection pulldown list: available Diameter answer codes</td>
</tr>
<tr>
<td>Vendor-ID</td>
<td>Value returned in the Vendor-ID AVP of the answer message associated with this Routing Exception Type. This field is enabled when the Routing Exception Action is set to Send Answer with Experimental-Result AVP.</td>
<td>Format: Text box; numeric Range: 1–4294967295</td>
</tr>
<tr>
<td>Error Message</td>
<td>Value returned in the Error-Message AVP of the answer message. This field is enabled when the Routing Exception Action is set to either Send Answer with Result-Code AVP or Send Answer with Experimental-Result AVP.</td>
<td>Format: Alphanumeric, underscore (_), period () Range: 0–64 characters Default: Null string</td>
</tr>
</tbody>
</table>
Select RBAR > Configuration > Exceptions.
The RBAR > Configuration > Exceptions page appears. This list of applications and associated Routing Exception information can be filtered to display only desired items.

Editing a Routing Exception

Use this task to edit a Routing Exception.

1. Select RBAR > Configuration > Exceptions.
The RBAR > Configuration > Exceptions page appears.
2. Select the Application ID/Name you want to edit, then click Edit.
The RBAR > Configuration > Exceptions [Edit] page appears.
3. Update the relevant fields.
For more information about each field, see Exceptions configuration elements.
4. Perform one of the following actions:
   • Click OK to save the application and return to the RBAR > Configuration > Exceptions page.
   • Click Apply to save the application and stay on this page.
   • Click Cancel to return to the RBAR > Configuration > Exceptions page without saving the changes.

If OK or Apply is clicked and any of the following conditions exist, an error message appears:

   • A valid Vendor-ID is missing when the Routing Exception Action is Send Answer with Experimental Result-Code AVP.
   • A valid Destination is missing when the Routing Exception Action is Forward to Destination.
   • A valid Result-Code Value is missing when the Routing Exception Action is Send Answer or Send Answer with Experimental-Result AVP.

Destinations configuration

The RBAR > Configuration > Destinations page contains the attributes associated with a destination to which RBAR routes a message. RBAR uses these attributes to modify the contents of a received message before forwarding the message.

Each destination can be configured with any combination of a Realm and FQDN such as Realm-only, FQDN-only, or Realm and FQDN.

From the RBAR > Configuration > Destinations page, you can:

   • Filter the list of destinations to display only the desired destinations.
   • View a list of destinations.
   • Insert a destination.
   • Edit a destination.
   • Delete a destination.

Destinations configuration elements

This table describes the fields on the Destinations View, Insert, and Edit pages.
### Table 4: Destinations Configuration Elements

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the Destination</td>
<td>Format: Alphanumeric and underscore (_). Range: 1–32 characters; cannot start with a digit and must contain at least one alpha.</td>
</tr>
<tr>
<td></td>
<td>If a duplicate Name is entered or the Name is not specified, an error message appears.</td>
<td></td>
</tr>
<tr>
<td>Realm</td>
<td>Realm of the Destination</td>
<td>Format: Text box; string consisting of a list of labels separated by dots, where a label must contain letters, digits, hyphen (-) and underscore (_). A label must start with a letter or underscore and must end with a letter or digit. Underscores may be used only as the first character. Range: A label consists up to 63 characters and a Realm or FQDN up to 255 characters.</td>
</tr>
<tr>
<td></td>
<td>The <strong>Realm</strong> and <strong>Fully Qualified Domain Name</strong> cannot both be empty; otherwise, an error message appears.</td>
<td></td>
</tr>

<td></td>
<td><strong>Note:</strong> If the <strong>System Options</strong> Allow Subsequent RBAR Invocation option is checked, then this attribute will be ignored.</td>
<td></td>
</tr>
</tbody>
</table>

### Viewing Destinations

Use this task to view currently configured Destinations.

Select **RBAR > Configuration > Destinations.**

The **RBAR > Configuration > Destinations** page appears. This list of destinations can be filtered to display only desired items.

### Inserting a Destination

Use this task to add a new Destination.

1. Select **RBAR > Configuration > Destinations.**
   The **RBAR > Configuration > Destinations** page appears.
2. Click **Insert**.
The RBAR > Configuration > Destinations [Insert] page appears.

3. Enter a unique name for the destination in the **Name** field.

4. Enter the realm in the **Realm** field.

5. Enter a unique FQDN in the **Fully Qualified Domain Name** field.

6. If you want to allow subsequent invocation of RBAR on a different DSR node in the network, leave the **Allow Subsequent RBAR invocation** check box selected (by default, this option is checked).

   **Note:** If you do not want to allow subsequent invocation of RBAR on a different DSR node in the network when RBAR resolves to this destination, uncheck this check box. In addition, the **Allow Subsequent RBAR invocation** check box on the **System Options** page must be unchecked. For more information about the **System Options** attributes, see **System Options elements**.

7. Perform one of the following actions:
   - Click **OK** to save the destination and return to the RBAR > Configuration > Destinations page.
   - Click **Apply** to save the destination and stay on this page.
   - Click **Cancel** to return to the RBAR > Configuration > Destinations page without saving the data.

   If **OK** or **Apply** is clicked and any of the following conditions exist, an error message appears:
   - Both the **Realm** and **Fully Qualified Domain Name** are empty; no value was entered
   - The **Fully Qualified Domain Name** is not unique; it already exists in the system
   - The entry in any field is not valid (wrong data type or out of the valid range)
   - The required **Name** is empty
   - The maximum number of destinations (1024) is already defined in the system

---

**Editing a Destination**

Use this task to edit a Destination.

1. Select RBAR > Configuration > Destinations.
The RBAR > Configuration > Destinations page appears.

2. Select the Destination you want to edit, then click **Edit**.
The RBAR > Configuration > Destinations [Edit] page appears.

3. Update the relevant fields.
   For more information about each field, see **Destinations configuration elements**.

   The **Name** field is read-only and cannot be edited.

4. Perform one of the following actions:
   - Click **OK** to save the changes and return to the RBAR > Configuration > Destinations page.
   - Click **Apply** to save the changes and stay on this page.
   - Click **Cancel** to return to the RBAR > Configuration > Destinations page without saving the changes.

   If **OK** or **Apply** is clicked and any of the following conditions exist, an error message appears:
   - Both the **Realm** and **Fully Qualified Domain Name** are empty; no value was entered
   - The **Fully Qualified Domain Name** is not unique; it already exists in the system
The entry in any field is not valid (wrong data type or out of the valid range)

Deleting a Destination

Use this task to delete a destination. A destination cannot be deleted if it is being used by any Address Range, Individual Address, or Routing Exception. Before this task is performed, delete the association with any Individual Address, Address Range, or Routing Exception.

1. Select RBAR > Configuration > Destinations.
   The RBAR > Configuration > Destinations page appears.
2. Select the destination you want to delete, then click Delete.
   A popup window appears.
3. Perform one of the following actions:
   • Click OK to delete the destination.
   • Click Cancel to cancel the delete function and return to the RBAR > Configuration > Destinations page.

   If OK is clicked and the following condition exists, an error message appears:
   • The destination is in use by an Address Range, Individual Address, or Routing Exception.

Address Tables configuration

The RBAR > Configuration > Address Tables page allows you to access an Address Table and its associated attributes.

From the RBAR > Configuration > Address Tables page, you can:
• Filter the list of address tables to display only the desired application(s).
• View a list of address tables.
• Insert an address table.
• Delete an address table.

Address Tables configuration elements

This table describes the fields on the Address Tables View and Insert pages only.

Table 5: Address Tables Configuration Elements

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>Unique name of the Address Table</td>
<td>Format: Alphanumeric and underscore (_)</td>
</tr>
<tr>
<td></td>
<td>If a duplicate Name is entered or the Name is not specified, an error message appears.</td>
<td>Range: 1–32 characters; cannot start with a digit and must contain at least one alpha</td>
</tr>
</tbody>
</table>
### Viewing Address Tables

Use this task to view currently configured Address Tables.

Select `RBAR > Configuration > Address Tables`. The `RBAR > Configuration > Address Tables` page appears. This list of address tables can be filtered to display only desired tables.

### Inserting an Address Table

Use this task to add a new Address Table.

1. Select `RBAR > Configuration > Address Table`. The `RBAR > Configuration > Address Table` page appears.
2. Click Insert. The `RBAR > Configuration > Address Table [Insert]` page appears.
3. Enter a unique name for the Address Table in the **Name** field.
4. If needed, enter a comment or additional information about the Address Table in the **Comment** field.
5. Select the type of routing entity from the **Routing Entity Type** pulldown list.
6. Perform one of the following actions:
   - Click **OK** to save the Address Table and return to the `RBAR > Configuration > Address Table` page.
   - Click **Apply** to save the Address Table and stay on this page.
   - Click **Cancel** to return to the `RBAR > Configuration > Address Table` page without saving the data.

   If **OK** or **Apply** is clicked and any of the following conditions exist, an error message appears:
   - Any required field is empty; no value was entered or selected
   - The **Name** is not unique; it already exists in the system
• The entry in any field is not valid (wrong data type or out of the valid range)
• The maximum number of Address Tables (40) is already defined in the system

Deleting an Address Table

Use this task to delete an Address Table. An Address Table cannot be deleted if it is being used by
any Individual Address, Address Range, or Address Resolution. Before you perform this task, delete
the association with any Individual Address, Address Range, or Address Resolution.

1. Select RBAR > Configuration > Address Table.
The RBAR > Configuration > Address Table page appears.
2. Select the Address Table you want to delete, then click Delete.
   A popup window appears.
3. Perform one of the following actions:
   • Click OK to delete the Address Table.
   • Click Cancel to cancel the delete function and return to the RBAR > Configuration > Address
     Table page.
If OK is clicked and the following condition exists, an error message appears:
• The Address Table is in use by an Address Range, Individual Address, or Address Resolution.

Addresses configuration

The RBAR > Configuration > Addresses page allows you to access the Routing Entity Address Range
and Individual Address configurable options.
• The Address Range provides the mapping between a single address range and a Destination for
  routing.
• The Individual Address provides the mapping between an individual address and a Destination
  for routing.

Note: If an incoming message maps both an Address Range and an Individual Address, then the
Individual Address entry takes priority.

The Address Range and Individual Address entries have their own associated attributes, which are
accessed from this RBAR > Configuration > Addresses page.

From the RBAR > Configuration > Addresses page, you can:
• Filter the list of addresses to display only the desired records. You can filter the list by the following
criteria:
  • Address table
  • Address table and Individual address
  • Address table and Range (start address, end address)
  • Address table, Individual address, and Range (start address, end address)
  • Destination
  • Destination and Address table
  • Destination, Address table, and Individual address
  • Destination, Address table, and Range (start address, end address)
• Destination, Address table, Individual address, and Range (start address, end address)
• View a list of addresses.
• Insert an address.
• Edit an address.
• Delete an address.

Addresses configuration elements
This table describes the fields on the Addresses View, Insert, and Edit pages. Data Input Notes only apply to the Insert and Edit pages; the View page is read-only.

**Viewing Addresses**

Use this task to view currently configured addresses.

1. Select **RBAR > Configuration > Addresses**.
   The **RBAR > Configuration > Addresses** page appears.

2. Click the desired tab (**Address Ranges**, **Individual Addresses**, or **All Addresses**) to display the associated records.
   The list of associated records appears. The total number of records is also provided.

3. If you want to filter this list of records, select the desired criteria and click **Go**.

   **Note:** To clear any of the fields, click **Reset**.
   The list can be filtered in the following combinations:
   - Address table
   - Address table and Individual address
   - Address table and Range (start address, end address)
   - Address table, Individual address, and Range (start address, end address)
   - Destination
   - Destination and Address table
   - Destination, Address table, and Individual address
   - Destination, Address table, and Range (start address, end address)
   - Destination, Address table, Individual address, and Range (start address, end address)

   The addresses that match the search criteria appear.

   **Note:** The IPv4 address appears in a collapsed form (for example: 1:2:3:4). The IPv6 Prefix address appears in the format **ipv6-address/prefix-length** where **ipv6-address** is in a collapsed form and **prefix-length** is a decimal value specifying how many of the leftmost contiguous bits of the address comprise the prefix.

   The list of addresses is restricted to display a maximum of 100,000 records. If this condition occurs, an informational message will display stating that the number of records was restricted to 100,000.
In addition, an informational message appears stating the number of records that correspond to the applied filter.

When Go is clicked and any of the following conditions exist, an error message appears:

- Address entry is not within the Start Address and End Address entries
- Start Address is greater than the End Address
- The entry in any field is not valid (wrong data type or out of the valid range)

Inserting an Address

Use this task to add a new address or range of addresses to a Routing Entity type.

Before this task is performed, make sure there is at least one Address Table and one Destination configured in the system.

1. Select RBAR > Configuration > Addresses.
   The RBAR > Configuration > Addresses page appears.
2. Click Insert.
   The RBAR > Configuration > Addresses [Insert] page appears.
3. Select the type of Routing Entity from the Routing Entity Type pulldown list.
4. Select the name of the Address Table from the Address Table pulldown list.
5. Select the desired Address Type radio button (Range or Individual Address).
6. Enter the appropriate address data depending on the selection of the Address Type:
   - For Range:
     1. Enter the starting address for the range in the Start Address field.
     2. Enter the ending address for the range in the End Address field.
   - For Individual Address, enter the specific address in the Address field.
7. If the address entered is an IPv6-prefix, enter the prefix length in the IPv6 Prefix length field.
8. Select the Destination from the Destination pulldown list.
9. Perform one of the following actions:
   - Click OK to save the address entry and return to the RBAR > Configuration > Addresses page.
   - Click Apply to save the address entry and stay on this page.
   - Click Cancel to return to the RBAR > Configuration > Addresses page without saving the data.

If OK or Apply is clicked and any of the following conditions exist, an error message appears:

- Start Address is greater than the End Address
- Start Address and End Address for an Address Range are overlapping or already exists
- At least one Address Table and one Destination have not been configured; they do not exist in the system
- Address already exists for a Table Name
- The entry in any field is not valid (wrong data type or out of the valid range)
- Any required field is empty
- The maximum number of records for the Address Type (1,000,000 for each type) is already defined in the system
Editing an Address

Use this task to edit an address associated with a Routing Entity type.

1. Select RBAR > Configuration > Addresses.
   The RBAR > Configuration > Addresses page appears.
2. Select the Address you want to edit, then click Edit.
   Note: For details about locating an address, see Viewing Addresses.
   The RBAR > Configuration > Addresses [Edit] page appears.
3. Update the relevant fields.
   For more information about each field, see Addresses configuration elements.
   The following fields are read-only and cannot be edited:
   • Routing Entity Type
   • Address Type
4. Perform one of the following actions:
   • Click OK to save the changes and return to the RBAR > Configuration > Addresses page.
   • Click Apply to save the changes and stay on this page.
   • Click Cancel to return to the RBAR > Configuration > Addresses page without saving the changes.
   If OK or Apply is clicked and any of the following conditions exist, an error message appears:
   • Start Address is greater than the End Address
   • Start Address and End Address for an Address Range are overlapping or already exists
   • Address already exists for a Table Name
   • The entry in any field is not valid (wrong data type or out of the valid range)
   • Any required field is empty

Deleting an Address

Use this task to delete an Address.

1. Select RBAR > Configuration > Addresses.
   The RBAR > Configuration > Addresses page appears.
2. Select the Address you want to delete, then click Delete.
   Note: For details about locating an address, see Viewing Addresses.
   A popup window appears.
3. Perform one of the following actions:
   • Click OK to delete the Address.
   • Click Cancel to cancel the delete function and return to the RBAR > Configuration > Addresses page.
Address Resolutions configuration

The RBAR > Configuration > Address Resolutions page allows you to define the routing relationship between message content and an address by mapping a Diameter Application ID, Command Code, and Routing Entity Type to a user-configured address (a range or individual address). An Address Resolution supports up to two prioritized Routing Entity Types for each Application ID and Command Code (highest priority – Primary Routing Entity Type – and lowest priority – Secondary Routing Entity Type).

From the RBAR > Configuration > Address Resolutions page, you can:

- Filter the list of address resolutions to display only the desired records.
- View a list of address resolutions.
- Insert an address resolution.
- Edit an address resolution.
- Delete an address resolution.

Address Resolutions configuration elements

This table describes the fields on the Address Resolutions View, Insert, and Edit pages. Data Input Notes only apply to the Insert and Edit pages; the View page is read-only.

</table>

### Viewing Address Resolutions

Use this task to view currently configured Address Resolutions.

Select **RBAR > Configuration > Address Resolutions**. The **RBAR > Configuration > Address Resolutions** page appears. This list of Address Resolutions can be filtered to display only desired records.
Inserting an Address Resolution

Use this task to add a new Address Resolution.

Before this task is performed, make sure there is at least one supported Diameter Application and one Address Table configured in the system.

1. Select RBAR > Configuration > Address Resolutions.
   The RBAR > Configuration > Address Resolutions page appears.

2. Click Insert.
   The RBAR > Configuration > Address Resolutions [Insert] page appears.

3. Select an application ID from the Application ID pulldown list.
   Note: The Application IDs presented in this list are those created using Main Menu > RBAR > Configuration > Applications.

4. Select the appropriate command code from the Command Code pulldown list.
   Note: The Command Codes presented in this list are those created using Main Menu > Diameter > Command Codes.

5. For the Primary Routing Entity section, perform the following:
   a) Select the appropriate Routing Entity type from the Routing Entity Type pulldown list.
   b) Select the Primary AVP from the Primary AVP pulldown list.
   c) If needed, select the Secondary AVP from the Secondary AVP pulldown list.
      Note: The Secondary AVP field is disabled if either IPv4, IPv6 Prefix, or UNSIGNED16 is selected in the Routing Entity Type field.
   d) Select the Address Table name from the Address Table Name pulldown list.

6. If needed, for the Secondary Routing Entity section, perform the following:
   a) Select the appropriate Routing Entity type from the Routing Entity Type pulldown list.
   b) Select the Primary AVP from the Primary AVP pulldown list.
   c) If needed, select the Secondary AVP from the Secondary AVP pulldown list.
      Note: The Secondary AVP field is disabled if either IPv4, IPv6 Prefix, or UNSIGNED16 is selected in the Routing Entity Type field.
   d) Select the Address Table name from the Address Table Name pulldown list.

7. Perform one of the following actions:
   - Click OK to save the address resolution and return to the RBAR > Configuration > Address Resolutions page.
   - Apply to save the address resolution and stay on this page.
   - Click Cancel to return to the RBAR > Configuration > Address Resolutions page without saving the data.

If OK or Apply is clicked and any of the following conditions exist, an error message appears:

- The combination of Application ID and Command Code Value is not unique; it already exists in the system
- At least one supported Diameter Application and one Address Table have not been configured; they do not exist in the system
• The entry in any field is not valid (wrong data type or out of the valid range)
• Any required field is empty
• Duplicate Routing Entity Types were selected in the Primary and Secondary Routing Entity sections
• Duplicate AVPs were selected in the Primary AVP and Secondary AVP fields
• The maximum number of Address Resolutions (64) is already defined in the system

Editing an Address Resolution
Use this task to edit an Address Resolution.
1. Select RBAR > Configuration > Address Resolution.
The RBAR > Configuration > Address Resolutions page appears.
2. Select the Address Resolution you want to edit, then click Edit.
The RBAR > Configuration > Address Resolutions [Edit] page appears.
3. Update the relevant fields.
   For more information about each field, see Address Resolutions configuration elements.
The following fields are read-only and cannot be edited:
   • Application ID
   • Command Code
4. Perform one of the following actions:
   • Click OK to save the changes and return to the RBAR > Configuration > Address Resolutions page.
   • Click Apply to save the changes and stay on this page.
   • Click Cancel to return to the RBAR > Configuration > Address Resolutions page without saving the changes.
If OK or Apply is clicked and any of the following conditions exist, an error message appears:
• The entry in any field is not valid (wrong data type or out of the valid range)
• Any required field is empty
• Duplicate Routing Entity Types were selected in the Primary and Secondary Routing Entity sections
• Duplicate AVPs were selected in the Primary AVP and Secondary AVP fields

Deleting an Address Resolution
Use this task to delete an Address Resolution.
1. Select RBAR > Configuration > Address Resolutions.
The RBAR > Configuration > Address Resolutions page appears.
2. Select the Address Resolution you want to delete, then click Delete.
A popup window appears.
3. Perform one of the following actions:
   • Click OK to delete the Address Resolution.
• Click Cancel to cancel the delete function and return to the RBAR > Configuration > Address Resolutions page.

System Options configuration

The RBAR > Configuration > System Options page allows you to modify the default system values for RBAR global parameters (for example, FQDN/Realm, or Allow Subsequent RBAR Invocation, or Application Unavailable action).

System Options elements

This table describes the fields on the System Options page.

Table 8: System Options Elements

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
<th>Data Input Notes</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMPU URI Local Number Enabled</td>
<td>This only applies to the Routing Entity Type IMPU; defines whether Local Numbers are considered valid addresses within a SIP or TEL URI. An address of this form is considered a &quot;Local Number&quot; if it does not start with the Global Number prefix character &quot;+&quot;. If checked, both Local and Global Numbers are valid addresses for IMPU decoded from Diameter Requests. If unchecked, only Global Numbers are valid addresses.</td>
<td>Format: Check box&lt;br&gt;Range: Checked, unchecked&lt;br&gt;Default: Unchecked</td>
</tr>
<tr>
<td>ASCII Excluded Digits</td>
<td>List of ASCII characters to ignore while parsing digits from a raw AVP data field of AVP Type UTF8String. If an invalid character is entered, an error message appears.</td>
<td>Format: Text boxes&lt;br&gt;Range: ASCII-printable characters except &quot;%&quot;</td>
</tr>
<tr>
<td>Exclude Space</td>
<td>Defines whether ASCII character space is ignored while parsing digits from a raw AVP data field of AVP Type UTF8String If checked, ASCII character space is ignored. If not checked, ASCII character space is not ignored.</td>
<td>Format: Check box&lt;br&gt;Range: Checked, unchecked&lt;br&gt;Default: Unchecked</td>
</tr>
<tr>
<td>TBCD Excluded Digits</td>
<td>Defines whether the associated character is ignored while parsing digits from a raw AVP data field of AVP Type OctetString encoded as a TBCD-string If checked, character is ignored.</td>
<td>Format: Check boxes&lt;br&gt;Range: Checked, unchecked for each option: *(0010), #(1011), a(1100), b(1101), c(1110)</td>
</tr>

</tbody>
</table>
| Resource Exhaustion Error Message | Error-Message AVP value to be returned in an Answer message when a message is not successfully routed because of internal resource being exhausted                                                                 | Format: Alphanumeric, underscore (_), and period (.)  
Range: 0–64 characters  
Default: 3004                                                                                                                                                      |
| Resource Exhaustion Vendor-Id | Vendor-Id AVP value to be returned in an Answer message when a message is not successfully routed because of internal resource being exhausted                                                                 | Format: Text box; numeric  
Range: 1–4294967295                                                                                                                                                          |
| Application Unavailable Action | Defines action to be taken when RBAR is not available to process messages  
If the Default Route option is selected, an entry must be provided for the Application Unavailable Route List.                                                                 | Format: Radio buttons  
Range:  
• Continue Routing  
• Default Route  
• Send Answer with Result-Code AVP  
• Send Answer with Experimental-Result-Code AVP  
Default: Continue Routing                                                                                                                                                                           |
| Application Unavailable Route List | Defines where the requests will be routed when RBAR is not available. Peer Routing Rules will be bypassed.  
A route list must be entered if Default Route is selected as the Application Unavailable Action.                                                                 | Format: Pulldown list  
Range: Available Route List entries                                                                                                                                                           |
| Application Unavailable Result-Code | Result-Code or Experimental-Result-Code value to be returned in an Answer message when a message is not successfully routed because RBAR is not available.  
If Vendor-Id is configured, this result-code value is encoded as Experimental-Result-Code AVP; otherwise the result-code is encoded as Result-Code AVP.  
A code must be entered if either the Send Answer with Result-Code AVP or the Send Answer with Result-Code AVP.                                                                 | Format:  
• Selection Text box; numeric  
• Selection pulldown list  
Range:  
• Selection box: 1000–5999                                                                                                                                                                   |
Experimental Result-Code AVP option is selected as the **Application Unavailable Action**.

- **Pulldown list:** available Code values
  - Default: 3002

**Application Unavailable Error Message**

Error-Message AVP value to be returned in an Answer message when a message is not successfully routed because RBAR is not available.

A message can be entered, if needed, when either the Send Answer with Result-Code AVP or the Send Answer with Experimental Result-Code AVP option is selected as the **Application Unavailable Action**.

- **Format:** Alphanumeric, underscore (_), and period (.)
- **Range:** 0–64 characters
  - Default: RBAR
  - Unavailable

**Application Unavailable Vendor-Id**

Vendor-Id AVP value to be returned in an Answer message when a message is not successfully routed because RBAR is not available.

A vendor-Id must be entered if the Send Answer with Experimental Result-Code AVP option is selected as the **Application Unavailable Action**.

- **Format:** Text box; numeric
  - **Range:** 1–4294967295

### Editing System Options

Use this task to edit System Options.

1. Select **RBAR > Configuration > System Options**.
   - The **RBAR > Configuration > System Options** page appears.

2. Update the relevant fields.
   - For more information about each field, see **System Options elements**.

3. Perform one of the following actions:
   - Click **OK** to save the changes and return to the **RBAR > Configuration > System Options** page.
   - Click **Apply** to save the changes and stay on this page.
   - Click **Cancel** to return to the **RBAR > Configuration > System Options** page without saving the changes.

If **OK** or **Apply** is clicked and any of the following conditions exist, an error message appears:

- Either the **Realm** or **Fully Qualified Domain Name** is empty; no value was entered; these fields must be configured as a pair
- Any required field is empty; no value was entered
- The entry in any field is not valid (wrong data type or out of the valid range)
Post-Configuration Activities

After RBAR configuration is complete, the following activities need to be performed to make RBAR fully operational in the system:

- Enabling the RBAR application
- Status Verification

Enabling the RBAR Application

Use this task to enable the RBAR application.

1. From the each active SOAM, select Diameter > Maintenance > Applications. The Diameter > Maintenance > Applications page appears.
2. Under DSR Application Name, select each RBAR row.
   To select more than one row, press and hold Ctrl while you click each row.
3. Click Enable.
4. Verify the application status on the page.
   The Admin State, Operational Status, Operational Reason, and Congestion Level in each of the selected rows should have changed respectively to Enabled, Available, Normal, and Normal.

Status Verification

Use this task to verify RBAR status after configuration is complete.

1. Verify Communication Agent (ComAgent) Connection status.
   a) From the active SOAM, select Communication Agent > Maintenance > Connection Status
   b) Verify that the Automatic Connections Count field displays X of X in service where X is the number of peer server connections.
2. Verify Server status.
   a) From the active SOAM, select Status & Manage > Server
   b) Verify that for each Server, the Appl State field is Enabled, and the DB, Reporting Status, and Proc fields are Norm.

DSR Bulk Import and Export

The following documents describe the use and operation of DSR Bulk Import and Export functions:

- Diameter Configuration and Mediation User Guide, "Diameter Configuration", "DSR Bulk Import", "DSR Bulk Export"
- Help > Diameter > Configuration > DSR Bulk Import
- Help > Diameter > Configuration > DSR Bulk Export
The DSR Bulk Import and Export functions can be used to export Diameter, IPFE, and DSR Application configuration data in CSV files to a location outside the system, and to import the files (usually edited) into the system where the Import function is executed.

Configuration data refers to any data that is configured for one of the Export Application types (FABR, RBAR, Policy DRA, or CPA and SBR DSR Applications; IPFE; and the Diameter Configuration components).

**DSR Bulk Export**

The DSR Bulk Export operation creates ASCII Comma-Separated Values (CSV) files (.csv) containing Diameter, IPFE, and DSR Application configuration data. Exported configuration data can be edited and used with the DSR Bulk Import operations to change the configuration data in the local system without the use of GUI pages. The exported files can be transferred to and used to configure another DSR system.

Each exported CSV file contains one or more records for the configuration data that was selected for the Export operation. The selected configuration data can be exported once immediately, or exports can be scheduled to periodically occur automatically at configured times.

The following configuration data can be exported in one Export operation:

- All exportable configuration data in the system
- All exportable configuration data from the selected DSR Application, IPFE, or Diameter (each component's data is in a separate file)
- Exportable configuration data from a selected configuration component for the selected DSR Application, IPFE, or Diameter

Exported files can be written to the File Management Directory in the local File Management area (Status & Manage > File page), or to the Export Server Directory for transfer to a configured remote Export Server.

CSV files that are in the local File Management area can be used for Bulk Import operations on the local system.

The result of each Bulk Export operation is logged into a file with the same name as the exported file, but with extension .log. The log file appears in the File Management area. The log file contains the names of the selected configuration data components, the number of records exported for each configuration component, and either the first error or all errors that occurred during the Export operation.

If the export has any failures or is unsuccessful, the results of the export operation are logged to a log file with the same name as the exported file but with a "_.log" extension. Successful export operations will not be logged.

**DSR Bulk Import**

The DSR Bulk Import operations use configuration data in ASCII Comma-Separated Values (CSV) files (.csv), to insert new data into, update existing data in, or delete existing data from the Diameter Configuration, IPFE Configuration, or DSR Applications (FABR, RBAR, Policy DRA, and CPA/SBR) Configuration data in the system.

Import CSV files can be created by using a DSR Bulk Export operation, or can be manually created using a text editor.

**Note:** The format of each Import CSV file record must be compatible with the configuration data in the DSR release that is used to import the file.
Files that are created using the DSR Bulk Export operation can be exported either to the local Status & Manage File Management Directory (Status & Manage > Files page), or to the local Export Server Directory.

CSV files that are in the local File Management area can be used for Bulk Import operations on the local system.

Files can be created manually using a text editor on a computer; the files must be uploaded to the File Management area of the local system before they can be used for Import operations on the local system.

The following Import operations can be performed:

- Insert new configuration data records that do not currently exist in the system
- Update existing configuration data in the system
- Delete existing configuration data from the system

Each Import operation creates a log file. If errors occur, a Failures CSV file is created that appears in the File Management area. Failures files can be downloaded, edited to correct the errors, and imported to successfully process the records that failed. Failures files that are unchanged for more than 14 days and log files that are older than 14 days are automatically deleted from the File Management area.
A

AVP

Attribute-Value Pair

The Diameter protocol consists of a header followed by one or more attribute-value pairs (AVPs). An AVP includes a header and is used to encapsulate protocol-specific data (e.g., routing information) as well as authentication, authorization or accounting information.

D

DSR

Diameter Signaling Router

A set of co-located Message Processors which share common Diameter routing tables and are supported by a pair of OAM servers. A DSR Network Element may consist of one or more Diameter nodes.

Delete Subscriber Data Request

F

FQDN

Fully qualified domain name

The complete domain name for a specific computer on the Internet (for example, www.tekelec.com). A domain name that specifies its exact location in the tree hierarchy of the DNS.

G

GUI

Graphical User Interface

The term given to that set of items and facilities which provide the user with a graphic means for manipulating screen data rather
<table>
<thead>
<tr>
<th><strong>G</strong></th>
<th>than being limited to character based commands.</th>
</tr>
</thead>
<tbody>

M
unique, network-specific subscriber number of a mobile communications subscriber. MSISDN follows the E.164 numbering plan; that is, normally the MSISDN is the phone number that is used to reach the subscriber.

O
OCS Online Charging Server
OFCS Offline Charging Server

P
PCRF Policy and Charging Rules Function
The ability to dynamically control access, services, network capacity, and charges in a network.
Maintains rules regarding a subscriber’s use of network resources. Responds to CCR and AAR messages. Periodically sends RAR messages. All policy sessions for a given subscriber, originating anywhere in the network, must be processed by the same PCRF.

P-DRA Policy DRA

Proxy Agent Performs the basic forwarding functions of a Relay Agent, but unlike a Relay Agent, a Proxy Agent can modify the message content and provide value-added services, enforce rules on different messages, or perform administrative tasks for a specific realm.
