
## ent-subnetid

### Enter Subnet ID

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (**subnetidlen** parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

**Keyword:** ent-subnetid  
**Related Commands:** dlt-subnetid, rtrv-subnetid  
**Command Class:** Database Administration

## Parameters

**:subnetid=** (optional)

Vendor Subnet ID

**Range:** 1-15 digits

This number must contain the number of digits defined by the **subnetidlen** parameter value.

Valid digits are **0-9, a-f, A-F**.

**:subnetidlen=** (optional)

Subnet ID Length.

**Range:** 1-15

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

**:subnetnum=** (optional)

Subnet Number. The Subnet Number is used as a reference to the prefix number for the ISUP NP with EPAP feature.

**Range:** 1-5

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

4—Corresponds to the prefix defined with prefix number 4 (see the **chg-prefix** command).

5—Corresponds to the prefix defined with prefix number 5 (see the **chg-prefix** command).

## Example

**ent-subnetid:subnetidlen=6**

**ent-subnetid:subnetid=886933:subnetnum=1**

## Dependencies

The value **none** cannot be specified for the **subnetid** parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

All SUBNETID table entries must have the number of digits defined by the **subnetidlen** parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The **subnetidlen** parameter cannot be specified in the same command with the **subnetid** and **subnetnum** parameters.

Either the **subnetidlen** parameter, or the **subnetid** and **subnetnum** parameters can be specified in one command.

**Notes**

None.

**Output**

The Subnet ID length must be entered first.

**ent-subnetid:subnetidlen=6**

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-SUBNETID: MASP A - COMPLTD
;
```

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

**ent-subnetid:subnetid=886933:subnetnum=1**

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 50) 11% full
ENT-SUBNETID: MASP A - COMPLTD
;
```

**ent-t1****Enter T1 Interface**

Use this command to enter an interface for an E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card used as a T1 card. The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

Framing, line length, encoding, master/slave clocking options, and the signaling bit setting can be specified.

On an HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through. Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified.

**Keyword:** ent-t1

**Related Commands:** chg-t1, dlt-t1, rtrv-t1, tst-t1

**Command Class:** Database Administration

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:t1port=** (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:chanbrdg=** (optional)

Indicates whether an odd numbered port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even numbered port for non-signaling data pass through.

**Range:** on, off

**Default:** off

**:encode=** (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

**Range:**      **b8zs, ami**

**Default:**

**:framing=** (optional)

Indicator for framing format.

**Range:**      **sf, esf**

**Default:**

**:ll=** (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

**Range:**      **0-655**

**Default:**    **133**

**:t1tsel=** (optional)

Timing source. Indicates master (external) or slave (line) timing source, or timing source recovered from the paired master port for the channel bridged slave port.

**Range:**      **line, external, recovered**

**Default:**    **line**

### Example

**ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100**

**ent-t1:loc=1205:t1port=2:encode=b8zs:t1tsel=external:framing=esf**

**ent-t1:loc=1203:t1port=1:chanbrdg=on:t1tsel=recovered**

**ent-t1:loc=1203:t1port=3:chanbrdg=on:t1tsel=external**

### Dependencies

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter must not be already equipped with a T1 interface.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered T1 ports (**t1port** parameter).

The timing source parameter **t1tsel** must be specified if the **chanbrdg=on** parameter is specified.

The **t1tsel=line** parameter cannot be specified for a T1 port (**t1port** parameter) when the **chanbrdg=on** parameter is specified.

The **t1tsel=recovered** parameter cannot be specified for a T1 port (**t1port** parameter) unless the **chanbrdg=on** parameter is specified.

When provisioning an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card to channel bridging mode using the **chanbrdg=on** parameter, the **force=yes** parameter must be specified if the adjacent even-numbered port is already provisioned with a T1 interface.

All signaling links assigned to adjacent even-numbered T1 ports must be deleted before an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card can be provisioned into channel bridging mode using the **chanbrdg=on** parameter. See the **dlt-slk** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified and an HC-MIM card is present in the specified odd card location (**loc** parameter).

HIPR cards must be equipped in card locations *xy09* and *xy10* (*x* is the frame, *y* is the shelf) on each EAGLE 5 SAS shelf that contains one or more HC-MIM or E5-E1T1 cards. The system checks for HIPR cards when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified for HC-MIM and E5-E1T1 cards.

T1 ports **3 - 8** (**t1port** parameter) can be specified only for HC-MIM and E5-E1T1 cards.

### Notes

One or two T1 interfaces must be defined on an E1/T1 MIM card used as a T1 card after the T1 and any associated Channel card types (**limt1** and **limch**) are defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card and any associated Channel cards (with the **ent-slk** command).

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a T1 card after the T1 card type (**limt1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card.

On a HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg** parameter must be specified for the odd-numbered T1 port.

### Output

```
ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
ENT-T1: MASP A - COMPLTD
;
```

## ent-tt

### Enter Translation Type

Use this command to add a translation type to the system database.

**NOTE: If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).**

**Keyword:** ent-tt

**Related Commands:** dlt-tt, rtrv-tt

**Command Class:** Database Administration

### Parameters

**:type/typea/typei/typen/typen24=** (mandatory)

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

**Range:** 000-255

**Default:** No translation type is specified

**:alias=** (optional)

The alias of the global title translation type

**Range:** 000-255

**Default:** No alias assignment is made.

**:ndgt=** (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

**Range:** 1-21

**Default:** 6

(not applicable if the VGTT feature is on)

**:ttn=** (optional)

Translation type name.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** No translation name is given

### Example

**ent-tt:type=230:ttn=lidb:ndgt=5**

**ent-tt:type=230:ttn=lidb:alias=007**

**ent-tt:type=2:ndgt=5**

**ent-tt:type=3**

### Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (\*) parameter values are not allowed for this command.

The translation type specified by **type** or **typea** cannot already exist in the database containing the ANSI types. A translation type specified by **typei**, **typen**, or **typen24** cannot already exist in the database containing the ITU types.

The translation name cannot already exist in either the ANSI or ITU database.

If an alias is specified, the translation type must be specified and must already exist in the database for the network type. If the translation name is specified when defining an alias, the name must already be associated with the translation type.

The translated signaling point code must be a full point code (*ni-nc-ncm*).

The translated signaling point code must have been specified previously as a full point code destination, or it must be a member of a previously specified cluster.

The **alias** parameter and the **ndgt** parameter cannot be specified together in the command.

If an alias is specified, the **alias** value cannot already be defined as either a translation type or an alias for the respective (ANSI or ITU) type.

The translation type name must be unique.

The **ndgt** parameter is not valid if the VGTT (variable length GTT) feature is turned on.

### Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The **ttn** parameter always refers to a translation type. Aliases do not have translation type names.

### Output

**ent-t1:loc=1205:t1port=1:encode=ami:t1tsel=internalexternal:framing=sf:ll=100**

rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0

ENT-TT: MASP A - COMPLTD

;

**ent-ttmap****Enter Translation Type Mapping**

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

**Keyword:** ent-ttmap

**Related Commands:** chg-ttmap, dlt-ttmap, rtrv-ttmap

**Command Class:** Database Administration

**Parameters**

**:ett=** (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** 000-255

**:io=** (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

**Range:** i, o  
i—incoming  
o—outgoing

**:lsn=** (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

**Range:** ayyyyyyyyy  
1 alphabetic character followed by 9 alphanumeric characters

**:mtt=** (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message *after* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** 000-255

**Example**

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

**Dependencies**

The linkset must be defined.

The Translation Type Mapping table must not be full for the linkset specified in the **lsn** parameter.

**Notes**

None

**Output**

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
rlghncxa03w 04-02-21 13:09:27 EST EAGLE 31.3.0
ENT-TTMAP: MASP A - COMPLTD

TTMAP table for nc001 is (2 of 64) 3% full
;
```

**ent-user****Enter User**

Use this command to add a user to the database. When you first enter the command, the system prompts you for the user's password, which must follow the administered password guidelines. For security reasons, the password is not displayed. After successfully entering a user password, you are prompted to verify it by entering it again.

**Keyword:** ent-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

**Command Class:** Security Administration

**Parameters**

**:uid=** (mandatory)

User ID

**Range:** *aaaaaaaaaaaaaaaa*

1 alphabetic character followed by up to 15 alphanumeric characters (including asterisks, single quotes, and commas)

**:all=** (optional)

Specifies whether or not the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP, LNPDB, LNPSUB).

**Range:** **yes, no**

**Default:** **no**

**:cc1=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy -no* or *ayy -yes*.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc2=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy -no* or *ayy -yes*.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc3=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *configmdclassname, bool*

*configmdclass*—; value

*bool*—; value **yes, no**

**:cc4=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc5=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc6=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc7=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc8=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

- :db=** (optional)  
Access to all commands in command class Database Administration.  
**Range:**     **yes, no**  
**Default:**   **no**
- :dbg=** (optional)  
Access to all commands in command class Debug.  
**Range:**     **yes, no**  
**Default:**   **no**
- :link=** (optional)  
Access to all commands in command class Link Maintenance.  
**Range:**     **yes, no**  
**Default:**   **no**
- :lnpbas=** (optional)  
Access to all commands in the command class LNP Basic  
**Range:**     **yes, no**  
**Default:**   **no**
- :lnpdb=** (optional)  
Access to all commands in the command class LNP Database  
**Range:**     **yes, no**  
**Default:**   **no**
- :lnpsub=** (optional)  
Access to all commands in the command class LNP Subscription  
**Range:**     **yes, no**  
**Default:**   **no**
- :page=** (optional)  
The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.  
**Range:**     **0-999** days  
**Default:**   The value specified for the **page** parameter on the **chg-secu-dflt** command
- :pu=** (optional)  
Access to all commands in command class Program Update.  
**Range:**     **yes, no**  
**Default:**   **no**
- :revoke=** (optional)  
Revoke the user ID. The system rejects login attempts for a revoked user ID.  
**Range:**     **yes, no**  
**Default:**   **no**
- :sa=** (optional)  
Access to all commands in command class Security Administration.  
**Range:**     **yes, no**  
**Default:**   **no**
- :sys=** (optional)  
Access to all commands in command class System Maintenance.  
**Range:**     **yes, no**  
**Default:**   **no**

**:uout=** (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

**Range:**     **0-999**

**Default:**     The value specified for the **uout** parameter on the **chg-secu-dflt** command

### Example

**ent-user:uid=john:db=yes**

**ent-user:uid=john\*mayer:db=yes**

**ent-user:uid=user123:cc5=u21=yes:cc8=u32=yes**

### Dependencies

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

All new users are given access to the command class Basic as a default.

The specified user ID cannot already exist.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **lnpbas**, **lnpdb**, and **lnpsub** parameters can be specified.

If the **all=yes** parameter is specified, and the LNP feature has not been turned on, the **lnpbas**, **lnpdb**, and **lnpsub** parameter values default to **no**.

The user IDs **seas** or **none** cannot be entered because they are reserved for system use. Up to 100 users can be entered.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1-cc8** parameters.

The **cc1-cc8** parameter values must have valid default or provisioned configurable command class names. Default names are **u01-u32**.

### Notes

To disable user ID aging, specify the **uout=0** parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.

- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

## Output

```
ent-user:uid=john*mayer:db=yes
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-USER: MASP A - COMPLTD
;
```

## ent-vendid

### Enter Vendor ID

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (**vendidlen** parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

**Keyword:** ent-vendid

**Related Commands:** dlt-vendid, rtrv-vendid

**Command Class:** Database Administration

## Parameters

**:vendid=** (optional)

Vendor ID

**Range:** 1-15 digits

**:vendidlen=** (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

**Range:** 0-15

**:vendnum=** (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

**Range:** 1-3

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

**:vendtype=** (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

**Range:** 1-2

**Example**

```
ent-vendidvend:len=6
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

**Dependencies**

The value **none** cannot be specified for the **vendid** parameter.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 200 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the **vendidlen** parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The **vendidlen** parameter cannot be specified in the same command with the **vendid**, **vendidlen**, and **vendtype** parameters. Either the **vendidlen** parameter, or the **vendid**, **vendidlen**, and **vendtype** parameters can be specified in one command.

**Notes**

None.

**Output**

The Vendor ID length must be entered first, before any Vendor IDs can be entered.

**ent-x25-dstn****Enter X.25 Destination**

Use this command to associate an X.25 network address with an existing SS7 point code in the routing table, and optionally, a subsystem within that point code. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

**Keyword:** ent-x25-dstn

**Related Commands:** chg-x25-dstn, dlt-x25-dstn, rtrv-x25-dstn

**Command Class:** Database Administration

**Parameters**

**:dpc=** (mandatory)

This parameter is the real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity. The value for this parameter is a point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

**Synonym:** **dpca****Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:xaddr=** (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

**Range:** 1-15 digits**:ssn=** (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

**Range:** **1-255****Default:** **5****Example**

**ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123**

**ent-x25-dstn:xaddr=255864567:dpc=033-001-013**

**Dependencies**

Each X.25 address must have at least four digits.

The DPC must exist in the destination table.

The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-nem*).

The X.25 address cannot exist in X.25 destination table.

The maximum number of X.25 destinations is 1024.

**Notes**

None

**Output**

**ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123**

rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0

X.25 DSTN TABLE 45 % FULL

ENT-X25-DSTN: MASP A - COMPLTD

;

**ent-x25-rte****Enter X.25 Route**

Use this command to define the routing parameters needed by the gateway portion of the LIMs with the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system STP.

**Keyword:** **ent-x25-rte****Related Commands:** **chg-x25-rte, dlt-x25-rte, rtrv-x25-rte****Command Class:** Database Administration

## Parameters

**:saddr=** (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

**Range:** 1-15 digits

**:type=** (mandatory)

The type of X.25 connection that the link is expected to maintain.

**Range:** **pvc**, **svca**, **svcr**

**pvc**—Permanent virtual circuit

**svca**—automatic virtual circuit

**svcr**—remote virtual circuit

**:xaddr=** (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

**Range:** 1-15 digits

**:lc=** (optional)

The number of the logical channel on the X.25 signaling link to which the PVC connection is assigned.

This parameter is mandatory if the **type=pvc** parameter is specified. If the **type=svca** or

**type=svcr** parameters are specified, the logical channel number is arbitrary and cannot be specified.

**Range:** 1-255

**Default:** The logical channel is not given.

**:lc2nm=** (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

**Range:** **yes**, **no**

**Default:** **yes**—if **rt=xpc** is specified

**no**—if **rt=pc** is specified

**no**—if **rt** is not specified

**:loc=** (optional)

The card location containing the X.25 signaling link that will maintain the connection. For an automatic virtual circuit, this link is the link on which the system STP initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** The card location is not given

**:port=** (optional)

The port on the card containing the X.25 signaling link.

**Range:** **a**

**Default:** The port is not given

**:rt=** (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) Route on X.25 destination point code (XPC) and (2) Route using X.25 origination and destination point code combinations (PC).

**Range:** **xpc**, **pc**

**Default:** **pc**

**Example**

**ent-x25-rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svca:loc=1201:port=a**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svcr**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svcr:rt=xpc:lc2nm=yes**

**Dependencies**

Each X.25 address must have at least four digits.

The **limds0**, **limdscs**, **limocu** and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL type.

The shelf and card must be equipped.

The logical channel number cannot be specified if the connection type is an automatic virtual circuit or a remote virtual circuit (**type=svca** or **type=svcr**).

The logical channel number must be specified if the connection type is PVC (**type=pvc**).

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

The **loc** and **port** parameters cannot be specified if the connection type is a remote switched virtual circuit (**type=svcr**). The far end initiates a remote switched virtual circuit and sends the system the location and port information.

The card location (**loc**) must be specified if the connection type is a permanent virtual circuit or an automatic virtual circuit (**type=pvc** or **type=svca**).

Each X.25 address must exist in X.25 destination table.

The X.25 address must be assigned to a destination in the X.25 domain.

The SS7 address must be assigned to a destination in the SS7 domain.

The combination of the two X.25 addresses must be unique in the X.25 route table.

The combination of point code/SSNs assigned to the two X.25 addresses must be unique in the X.25 route table.

The maximum number of X.25 routes in a system is 1024.

The point codes assigned to each of the X.25 destinations must also be assigned to routes.

The signaling link must be assigned to a LIM with the **ss7gx25** application.

The signaling link assigned to the X.25 route must be in the database and must be assigned to a linkset. The linkset must be assigned to a route associated with an X.25 destination and must contain an APC in the X.25 domain. This can be verified by entering the following commands:

- **rtrv-slk**—Displays the signaling links
- **rtrv-ls**—Displays the linksets
- **rtrv-rte**—Displays the routes
- **rtrv-x25-dstn**—Displays the X.25 destinations
- **rtrv-dstn**—Displays the destination point codes.

The logical channel number cannot be greater than the maximum number of permanent virtual circuits allowed for the signaling link. For example, if the total number of permanent virtual circuits allowed for the signaling link is 15, the logical channel number for this signaling link cannot be greater than 15.

The logical channel of the signaling link cannot already be assigned to an X.25 route.

The number of permanent virtual circuits cannot exceed the maximum number of permanent virtual circuits defined for the signaling link.

The number of automatic virtual circuits cannot exceed the maximum number of switched virtual circuits defined for the signaling link.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

### Notes

The connection can be one of three types, a permanent virtual circuit, an automatic virtual circuit, or a remote virtual circuit.

Permanent virtual circuits are permanent X.25 virtual connections between two signaling points established on one of the logical channels of an X.25 signaling link. This connection is setup by the network, therefore no setup is required by the system to establish a permanent virtual circuit connection.

Automatic virtual circuits are essentially the same as permanent virtual circuits, except that the connection must be established by either the system or the X.25 destination entity.

Remote virtual circuits are also essentially the same as automatic virtual circuits, except that the connection can be established only by the X.25 destination entity.

All LIMs with the **ss7gx25** application share this information. Even though these connections apply to only one card, they are used by all cards.

### Output

## flash-card

## Flash-Card

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the **init-flash** and the **act-flash** commands.

**Keyword:** flash-card

**Related Commands:** act-flash, init-flash

**Command Class:** System Maintenance

### Parameters

**:code=** (mandatory)

The GPL type to be loaded.

**Range:** **appr**, **trial**

**appr**—Approved GPL

**trial**—Trial GPL

**:loc=** (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

**Range:** **1101-1112, (1113 and 1115 OAM), 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:force=** (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

**Range:**        **yes, no**

**Default:**     **no**

### Example

**flash-card:loc=1105:code=trial**

**flash-card:loc=1105:code=appr:force=yes**

### Dependencies

Cards do not have to be provisioned to use the **flash-card** command. However, if the specified card is provisioned and not inhibited, use of the **force** parameter is required.

The specified card locations must be running a flashable software image.

HMUX or HIPR cards are not supported.

If the even-numbered TDM (1114,1116) is specified, the flash occurs on the odd-numbered GPSM-II running OAM (1113,1115).

The specified card location cannot be the active MASP (either the active GPSM-II or the active TDM).

### Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the **force** parameter. The **act-flash** and **init-flash** commands must then be used to reload the same code level.

### Output

**flash-card:loc=1105:code=appr:force=yes**

## format-disk

## Format Disk

Use this command to format and initialize a system removable cartridge or standby Terminal Disk Module (TDM).

**NOTE: The format-disk command leaves the disk unusable until the chg-db and copy-gpl commands are entered.**

**Keyword:** format-disk

**Related Commands:** chg-db, copy-disk, copy-gpl, copy-meas, disp-disk-dir, rept-stat-db, rtrv-gpl

**Command Class:** System Maintenance

### Parameters

**:type=** (mandatory)

The type of removable cartridge to format.

**Range:** **fixed**, **meas**, **system**

**fixed**—The standby fixed disk on the standby TDM

**meas**—The measurement cartridge

**system**—The system cartridge

**:force=** (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

**Range:** **yes**, **no**

**Default:** **no**

**:low=** (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying **low=no** can be used to decrease formatting time.

**Range:** **yes**, **no**

**Default:** **yes**

**:prtnggrp=** (optional)

Partition group. This parameter indicates which disk partition group is to be formatted. Specifying the inactive group is relevant only when **type=fixed** is specified.

**CAUTION:** Do not enter the **format-disk:prtngrp=inactive** command unless directed to by Tekelec Technical Services to avoid possible loss of a previously archived software release.

**Range:** active, inactive  
**Default:** active

### Example

**format-disk:type=system**

**format-disk:type=meas:force=yes**

### Dependencies

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

To format a cartridge that already contains system data, the **force=yes** parameter must be specified.

The **force=yes** parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have a **dms.cfg** file are recognized as system removable cartridges. A removable cartridge must be inserted and made ready before the **type=meas** or **type=system** parameter can be specified in the command.

Measurements collection must be inhibited during execution of the **format-disk** command. If measurements are not inhibited, **format-disk** cannot be executed.

- Do not enter the **chg-measopts:collect=on** command while the **format-disk** command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter **format-disk** until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The **low=no** parameter must be specified when the **prtngrp** parameter is specified.

### Notes

The **low=no** parameter should be specified when upgrading a spare TDM. The **low=yes** parameter should be specified when there is a suspected hardware problem.

When the **type=meas** parameter is specified, a measurements removable cartridge is built.

When the **type=system** parameter is specified, a system removable cartridge is built.

A system removable cartridge can contain only GPLs and the database. Measurement data cannot be placed on a system removable cartridge. After a system removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-gpl** and **chg-db:action=backup:dest=remove** commands. The **copy-gpl** command copies all approved GPLs from the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the approved GPLs. The **chg-db:action=backup:dest=remove** command copies the

database from the current partition of the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the database.

A measurements removable cartridge can contain only measurement data. Database information and GPLs cannot be placed on a measurements removable cartridge. After a measurements removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-meas** command. The **copy-meas** command copies all measurement data from the fixed disk on the active TDM to a measurements removable cartridge for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the **format-disk** command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

Standby MASP has not finished initializing - please wait...

Standby MASP initialization timed out - continuing...

The **dms.cfg** file on either the active TDM or a system formatted removable cartridge is used by the **format-disk** command when formatting the target disk. The location of the **dms.cfg** file cannot be specified by the **format-disk** command. The value of the **type** parameter is used to determine the target disk to format and the location of the **dms.cfg** file on which to base the format. Table 5-48 shows the location of the **dms.cfg** file based on the value of the **type** parameter for the **format-disk** command.

**Table 5-48. DMS.CFG File Location for format-disk Command**

| Value of the type Parameter | Target Disk (Card Location) | Location of the DMS.CFG File |
|-----------------------------|-----------------------------|------------------------------|
| <b>fixed</b>                | Standby TDM (1114 or 1116)  | Removable Cartridge (1117)   |
| <b>system</b>               | Removable Cartridge (1117)  | Active TDM (1114 or 1116)    |

The **format-disk** command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

Table 5-49 shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

**Table 5-49.** Disk Format Capacity

| Target Disk Type                                                                                                                                                                                                                                                                                                                                                                                                                              | Disk Location | Target Capacity | Number of Partitions | Formatted Size of the Partition |

## inh-alm

## Inhibit Alarm Reporting

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All **rept-stat-xxx** commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

**Keyword:** inh-alm

**Related Commands:** `rept-stat-alm`, `rept-stat-card`, `rept-stat-cdt`, `rept-stat-dlk`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-lsms`, `rept-stat-rte`, `rept-stat-rtx`, `rept-stat-seas`, `rept-stat-slk`, `rept-stat-sys`, `rept-stat-trbl`, `rept-stat-trm`, `rtrv-log`, `unhb-alm`

**Command Class:** System Maintenance

## Parameters

**NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.**

**:dev=** (mandatory)

**Device.** This parameter specifies the device where the reporting of alarms is to be inhibited.

**Range:** **applsock**, **as**, **card**, **cdt**, **clock**, **dlk**, **e1port**, **ls**, **lsmconn**, **route**, **seasx25**, **slk**, **t1port**, **trm**, **rtx**

**applsock**—IP gateway application socket

**as**—IP gateway application Application Server

**card**—Cards in the database

**cdt**—Customer defined troubles

**clock**—System clock

**dlk**—TCP/IP data links

**e1port**—E1 port on E1/T1 MIM or HC MIM cards

**ls**—Linksets

**lsmconn**—Communication link between the LSMS and the EMS

**route**—Route

**seasx25**—The SEAS X.25 links

**slk**—Signaling links

**t1port**—T1 port on E1/T1 MIM or HC MIM cards

**trm**—Terminals

**rtx**—Exception Route

**:asname=** (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to inhibit alarms for the named Application Server.

**Range:** *aaaaaaaaaaaaaa*  
Up to 15 alphanumeric characters; the first character must be a letter.

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used with the **ecic** parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

**Range:**       **0-16383**

**:dpc=** (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:**       **p-, 000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination Point Code

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**       **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:dur=** (optional)

Duration. The period for which the alarms are inhibited. If the **dur=temp** parameter is specified, the clearing of the event that caused an alarm also clears the alarm inhibit, and the alarms become uninhibited on the device.

**Range:** **perm, temp, timed**

**perm**—A permanent inhibition of an alarm.

**temp**—A temporary inhibition of an alarm.

**timed**—An inhibition of an alarm for a specified duration.

**Default:** **perm**

**:e1port=** (optional)

Port ID. The E1 port on the specified E1 card.

The **e1port** parameter is mandatory if the **dev=e1port** parameter is specified.

**Range:** **1-8**

Ports **3 - 8** can be specified only for HC-MIM cards and E5-E1T1 cards.

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** **0-16383**

**:edate=** (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the **etime** parameter value.

The **edate** parameter is valid and required when the **dur=timed** parameter is specified.

**Range:** **101-991231**

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yymmdd*).

**:etime=** (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the **edate** parameter value.

The **etime** parameter is valid and required when the **dur=timed** parameter is specified.

**Range:** **0-2359**

Specify the time in the format of *hour* followed by *minute* (*hhmm*).

**:force=** (optional)

Allows critical alarms to be inhibited on a device.

The **force** parameter is mandatory if the **lvl=crit** parameter is specified.

The **criticalminh** STP option must be turned on before the **force** parameter can be specified.

**Range:** **yes, no**

**Default:** **no**

**:id=** (optional)

Identification number of the customer-defined trouble (**5 - 16**). Customer-defined troubles **1 - 4** are generated critical alarms and cannot be specified as values for the **id** parameter.

**Range:**       **5-16**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**       ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**:link=** (optional)

Signaling link on the card specified in the **loc** parameter.

**Synonym:** port

**Range:**       a, b, a1-a31, b1-b31

a, b—For **dev=dlk**, **dev=slk** for a two-port LIM

a1, a2, b1, b2—For **dev=ndclk/seasx25/lsmconn**

a, b, a1, b1, a2, b2, a3, b3—For **dev=slk** for a multi-port LIM

a, b, a1-a31, b1-b31—For **dev=slk** for an HC MIM

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:**       1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318,  
3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118,  
5201-5218, 5301-5318, 6101-6118

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:**       ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters.

**:lvl=** (optional)

The alarm severity level (critical, major, or minor).

**Range:**       crit, majr, minr

**Default:**   majr

**:opc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** opca

**Range:**       000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Origination point code.

**:opci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

**Range:** **0-15**

**:sname=** (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to inhibit alarms for the named application socket.

**Range:** *aaaaaaaaaaaaaaaa*

1 to 15 alphanumeric characters.

**:t1port=** (optional)

Port ID. This parameter is mandatory if the **dev=t1port** parameter is specified.

**Range:** 1-8

Ports 3 - 8 can be specified only for HC MIM cards.

**:trm=** (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

**Range:** 1-40

### Example

**inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes**

**inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4**

**inh-alm:dev=route:dpc=1-1-1:dur=timed:lvl=crit:edate=050515:etime=2300:force=yes**

### Dependencies

This command is not allowed in upgrade mode.

Table 5-50 shows the valid parameter combinations for the **inh-alm** command. The **dur** and **lvl** parameters are valid with all **dev** parameter values.

**Table 5-50.** Parameter Combinations for the **inh-alm** command

| Value (:dev)                       | a | a | c | c | c | d | e | l | l | n | n | r | s | s | t | t |
|------------------------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Device Parameter                   | p | s | a | d | l | l | l | s | s | d | d | o | e | l | l | r |
|                                    | p | r | t | o | k | p | m | c | c | u | a | k | p | m |   |   |
|                                    | l | d | c | o | s | l | q | t | s | o | r | t |   |   |   |   |
|                                    | s |   | k | r | c | k | 3 | e | x | 2 | t |   |   |   |   |   |
|                                    | o |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|                                    | c |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
|                                    | k |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| No Parameters                      |   |   |   |   | x |   |   |   |   | x |   |   |   |   |   |   |
| :asname                            |   | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :dpc/dpca/dpci/dpcn/dpcn24         |   |   |   |   |   |   |   |   |   |   | x |   |   |   |   |   |
| :id                                |   |   |   | x |   |   |   |   |   |   |   |   |   |   |   |   |
| :loc                               |   |   | x |   | x | x |   |   |   |   |   |   |   | x | x |   |
| :lsn                               |   |   |   |   |   |   |   | x |   |   |   |   |   |   |   |   |
| :e1port=1-8                        |   |   |   |   |   | x |   |   |   |   |   |   |   |   |   |   |
| :link=a, b                         |   |   |   |   | x |   |   |   |   |   |   |   |   | x |   |   |
| :link=a, b, a1, a2, b1, b2, a3, a3 |   |   |   |   |   |   |   |   |   |   |   |   |   | x |   |   |
| :link=a1, a2, b1, b2               |   |   |   |   |   |   |   | x | x |   |   | x |   |   |   |   |
| :sname                             | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :t1port=1-8                        |   |   |   |   |   |   |   |   |   |   |   |   |   |   | x |   |

Table 5-50. Parameter Combinations for the **inh-alm** command

| Value (:dev)     | a | a | c | c | d | e | l | l | n | n | r | s | s | t | t |
|------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
|                  | p | s | a | d | l | l | s | s | d | d | o | e | l | l | r |
| Device Parameter | p | r | t | o | k | p | m | c | c | u | a | k | p | m |   |
|                  | l | d | c | o | s | l | q | t | s | o |   |   |   |   |   |
|                  | s |   | k | r | c | k | 3 | e | x | r |   |   |   |   |   |
|                  | o |   |   | t | o |   |   | 2 | t |   |   |   |   |   |   |
|                  | c |   |   |   |   | n |   | 5 |   |   |   |   |   |   |   |
|                  | k |   |   |   |   | n |   |   |   |   |   |   |   |   |   |
| :trm             |   |   |   |   |   |   |   |   |   |   |   |   |   |   | x |

No other action command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option **criticalminh** must be enabled. The **chg-stpopts:criticalminh=yes** command enables this option.

Alarms cannot already be inhibited for the specified device.

When the **lvl=crit** parameter is specified, the **force=yes** parameter must be specified.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=seasx25** parameter is specified, the **link** parameter must be specified.

When the **dev=lsmconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the **dev=rtx** parameter can be specified.

Permanant alarm inhibit is not allowed on the cluster PC because either the cluster or a member PC of the cluster is already alarm inhibited. Issue an **unhb-alm** command on the cluster PC or the member PC before issuing an **inh-alm** command on the cluster PC.

When the **dur=timed** parameter is specified, the **edate** and **etime** parameters must be specified.

When a **dur** parameter value other than **timed** is specified, the **edate** and **etime** parameters cannot be specified.

The **edate** parameter value must be a date equal to or later than the current system date. If the current system date is specified, the **etime** parameter value must a time later than the current system time. If a date later than the current system date is specified, the **etime** parameter value can be any valid time in the format *hhmm*.

The **inh-alm** command cannot be used to change the level of inhibition on a device.

## Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The **dur** parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

**inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit**

rlghncxa03w 04-02-23 13:20:59 EST EAGLE 31.3.0

**inh-card****Inhibit Card**

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the DCM/LIM/ACM/TSM/DSM/GPSM-II/MIM card or physically remove it from the shelf.

**Keyword:** inh-card

**Related Commands:** alw-card, dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

Card address. The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:force=** (optional)

Force indicator. This parameter is required for the following conditions:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-DSM connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified HC MIM card or E5-E1T1 card is in channel bridging mode

**Range:** yes, no

**Default:** no

**Example**

**inh-card:loc=1101**

**inh-card:loc=1201:force=yes**

**Dependencies**

No other action commands can be in progress when this command is entered.

The card must be a TSM, ACM, DCM, DSM, LIM, GPSM-II, E1/T1 MIM, HC MIM, or E5-E1T1.

The card location cannot be 1114, 1116, or 1117.

If the card is the only linkset, SCCP, or GLS card remaining, the **force=yes** parameter must be specified in the command to inhibit the card.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type **lime1**, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

If the card is type **limt1**, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

The shelf and card must be equipped.

If the specified card is the only in-service EMDCA-DCM or MPS-DSM, the **force=yes** parameter is required.

If the specified card is the only in-service TSM, LIM, or MCPM, the **force=yes** parameter is required.

If the specified HC-MIM or E5-E1T1 card is in channel bridging mode, the **force=yes** parameter is required.

If inhibiting the VSCCP card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the **force=yes** parameter must be specified.

The card that is specified cannot be running the active OAM.

### Notes

The function of this command is the same as the **rmv-card** command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

**CAUTION:** This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the **chg-measopts:platformenable=on** command. To disable collection, ALL MPCM cards in the system must be inhibited. THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS. Use the **alw-card** command to enable measurements collection after the MCPM cards have been inhibited.

### Output

```
inh-card:loc=1101
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been inhibited.
;
```

## inh-imt

### Inhibit IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

**CAUTION:** Use this command only when directed by Tekelec Technical Service at (888) FOR-TKLC.

**Keyword:** inh-imt

**Related Commands:** alw-imt, clr-imt-stats, conn-imt, disc-imt, rept-imt-lvl1, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)  
IMT bus to be inhibited  
**Range:** a, b

### Example

```
inh-imt:bus=a
```

### Dependencies

The function of this command is the same as the **rmv-imt** command.

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited. This command cannot be entered during an IMT Fault Isolation Test.

### Notes

Cards not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the alternate IMT bus.

### Output

#### inh-imt:bus=a

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit IMT Bus A command issued

rlghncxa03w 04-01-07 13:12:41 EST EAGLE 31.3.0
3116.0098      IMT BUS A          IMT inhibited
;
```

## inh-map-ss

### Inhibit Mated Application Subsystem

Use this command to shut down (inhibit) a mated application subsystem. The command requires a parameter specifying the SSN to be inhibited. Currently, the LNPQS, INPQS, and Equipment Identity Register (EIR) subsystems are the subsystems that may be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the **force** parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

**CAUTION:** After the LNP subsystem is inhibited before performing an LNP ELAP bulk download, **chg-ss-appl:appl=lnp:nstat=offline** must be entered to ensure that the subsystem remains down through DSM card replacements and reloads.

**Keyword:** inh-map-ss

**Related Commands:** alw-map-ss, rept-stat-lnp, rept-stat-sccp

**Command Class:** System Maintenance

### Parameters

**:ssn=** (mandatory)

The LNP, INP, or EIR subsystem number.

**Range:** 2-255

**:force=** (optional)

Force the shutdown of the LNP, INP, or EIR subsystem.

**Range:** yes, no

**Default:** no

### Example

**inh-map-ss:ssn=10**

**inh-map-ss:ssn=10:force=yes**

### Dependencies

The LNP feature (see the **enable-ctrl-feat** command) or the INP feature must be turned on, or the EIR feature must be enabled and turned on, before this command can be entered.

No other action command can be in progress when this command is entered.

The specified **ssn** parameter value must represent the LNPQS, INPQS, or EIR subsystem.

The EAGLE 5 ISS must be configured with at least one card running the **sccp** application.

**Notes**

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE 5 ISS to generate a TFP for the EAGLE 5 ISS CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

**Table 5-51.** Route Set Test When LNP is Offline

| <b>Network Management</b> | <b>Concerned PC</b> | <b>Network Management</b> |
|---------------------------|---------------------|---------------------------|
| RSP                       | CPC                 | TFA concerning CPC        |
| RSP                       | LNP CPC             | None                      |
| RSP                       | TPC                 | TFA concerning TPC        |
| RSR                       | CPC                 | TFA concerning CPC        |
| RSR                       | LNP CPC             | TFP concerning LNP CPC    |
| RSR                       | TPC                 | TFA concerning TPC        |

Table 5-52 shows what actions EAGLE 5 ISS takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

**Table 5-52.** Receiving Messages when LNP is Offline

| <b>Routing Indicator in Incoming Message</b> | <b>DPC</b>    | <b>Result of GTT</b>     | <b>Message Handling</b> | <b>Network Management</b> |
|----------------------------------------------|---------------|--------------------------|-------------------------|---------------------------|
| rt-on-gt                                     | Capability PC | rt-on-ssn, LNP subsystem | Reroute to mate         | TFP concerning CPC        |
| rt-on-gt                                     | True PC       | rt-on-ssn, LNP subsystem | Reroute to mate         | None                      |
| rt-on-gt                                     | Capability PC | Message Relay required   | Generate UDTs           | TFP concerning CPC        |
| rt-on-gt                                     | True PC       | Message Relay required   | Generate UDTs           | None                      |
| rt-on-ssn                                    | Capability PC | Not applicable           | Generate UDTs           | None                      |
| rt-on-ssn                                    | True PC       | Not applicable           | Generate UDTs           | SSP concerning True PC    |

## Output

## inh-slk

## Inhibit Signaling Link

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

**NOTE:** The signaling link's inhibited status is not preserved across a LIM reboot.

**Keyword:** inh-slk

**Related Commands:** act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

**Command Class:** Link Maintenance

## Parameters

**:link=** (mandatory)

The signaling link on the card that is specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

**inh-slk:loc=1307:link=b**

**Dependencies**

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- A dual-slot DCM or EDCM card running the **iplim** or **iplimi** application with links having **ipliml2=saaltali**
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM, an HC-MIM or an E5-E1T1 card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim** or **iplimi** application

This command cannot be entered for an IPLIMx signaling link that has an **ipliml2** parameter value of **m3ua**.

This command is not valid on TCP/IP point to multipoint links (DCM cards equipped as SS7IPGW links).

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a7**, and **b7** can be specified only for the following cards:

- A multi-port LIM card
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card.
- An E5-ENET card running the **iplim** or **iplimi** application that supports 16 links (**a**, **b**, **a1-a7**, **b1-b7**)

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card.

This command is not valid on TCP/IP point-to-multipoint links (DCM cards equipped as IPGWI links).

**Notes**

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, the inhibit request is denied. If a command request is denied, it is because the SS7 changeover procedure cannot take place.

If the **inh-slk** command is followed by the **init-card** command, the inhibition of the signaling link is not preserved after the **init-card** command completes.

Card locations are illustrated in the *Installation Manual – EAGLE 5 ISS*.

The **inh-slk** command might time out if a far-end remote does not respond to the inhibit message.

## Output

```
inh-slk:loc=1301:link=a
rlghncxa03w 05-01-07 11:11:28 EST EAGLE5 33.0.0
Inhibit Link message sent to card
;
```

## inh-trm

## Inhibit Terminal

Use this command to set the primary state of a serial port to OOS-MT-DSBLD. It sets the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

**Keyword:** inh-trm

**Related Commands:** act-echo, alw-trm, canc-echo, chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

**Command Class:** System Maintenance

## Parameters

**:trm=** (mandatory)

The ID of serial port to be inhibited

**Range:** 1-40

**:force=** (optional)

Forces the removal of the specified terminal, even if it is the last in-service OAP port available.

**Range:** yes, no

**Default:** no

## Example

```
inh-trm:trm=5
```

```
inh-trm:trm=1:force=yes
```

## Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

The **force=yes** parameter must be specified to inhibit the last in-service OAP port.

This command cannot be used to inhibit the terminal from which the command is entered.

## Notes

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

**Output**

```
inh-trm:trm=5
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit message sent to terminal
;
```

**init-card****Initialize Card**

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued to the OAM software, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

**CAUTION: When a LIME1 or LIMT1 card has associated channel cards (LIMCH) with provisioned links, the init-card command entered for the LIME1 or LIMT1 card causes all links on the associated channel cards to go out of service.**

**Keyword:** init-card

**Related Commands:** dlt-card, ent-card, init-sys, rept-stat-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

**Parameters**

**:appl=** (optional)

Application. The type of application residing on the card.

**CAUTION: Because the appl parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.**

**Range:** xxxxxxxx

- atmansi**—This application is used by the LIM cards to support the high-speed ATM signaling link feature.
- atmitu**—This application is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.
- ccs7itu**—This application is used by the LIM cards for ITU-TSS MTP functionality.
- ebdablm**—This application is used by the TSM card for enhanced bulk download.
- ebdadcm**—This application is used by the DCM card to transmit the LSMS LNP database to the system at high speed over an ethernet connection for enhanced bulk download.
- eroute**—This application is used by the STC cards for the EAGLE 5 Integrated Monitoring Support feature.
- gls**—This application is used by the TSM cards for downloading gateway screening to LIM cards.
- ipgwi**—This application is used by the system to support ITU TCP/IP point-to-multipoint connectivity.
- iplim**—This application is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.
- iplimi**—This application is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.
- ips**—This application is used by the IPSM card for the IP User Interface feature.
- oam**—This application is a software load that runs in a GPSM-II card in card slots 1113 and 1115.

**mcp**—This application is used by the MCPM card for the Measurements Platform feature.

**sccp**—This application is used by the TSM cards for the global title translation application.

**ss7ansi**—This application is used by the LIM cards for the MTP functionality.

**ss7gx25**—This application is used by the LIM cards to support X.25 functionality.

**ss7ipgw**—This application is used by the system to support TCP/IP point-to-multipoint connectivity.

**stplan**—This application is used by the ACM card to support the STP LAN application.

**vsccp**—This application is used by the DSM card to support the G-Flex, G-Port, INP, and LNP ELAP Configuration features. This application is used by the DSM card to support the G-Flex, G-Port, LNP ELAP Configuration, and INP features. If the G-Flex, G-Port, LNP ELAP Configuration, or INP feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

**vxwslan**—This application is used by the DCM card to support the STP LAN application.

**all**—All cards are to be initialized.

**Default:** The application assigned to the card

**:data=** (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP, G-Flex, G-Port, or INP feature is on. This parameter is applicable only to network cards containing the LNP database (SCCP, EBDABLM), or the MPS database (VSCCP).

**Range:** **refresh, persist**

**refresh**—Causes data to be reloaded to the specified card.

**persist**—Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place (for example, that the TSM/BLM card is present and ready and that the downloaded LNP database is coherent. The LNP database audit cannot be performed prior to the card reset.) The force parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

**Default:** **refresh**

**:force=** (optional)

Force indicator. Enables the command to be processed under the following conditions:

- If **serial=yes** and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If **data=persist** and all cards of the GPL type cannot maintain a persistent LNP database over the reset.
- If **initclk=yes** and the TDM card specified in the **loc** parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If **initclk=yes** and **appl=eoam** is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

**Range:** **yes, no**

**Default:** **no**

**:initclk=** (optional)

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION:** The resulting clock outage will probably cause loss of traffic on all links.

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

**Range:**     **yes, no**

If **initclk=yes** is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If **initclk=yes** is specified with **appl=eoam** and **force=yes**, the bitfile reloads on both TDMs.

**:loc=** (optional)

Card address. The card location as stenciled on the shelf of the system.

**Range:**     **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2301-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

When the **initclk** parameter is not specified, the listed card locations are valid.

When the **initclk** parameter is specified with the **loc** parameter, only card locations **1113** and **1115** are valid.

**Default:**   All valid card locations are initialized.

**:serial=** (optional)

Controls the manner in which cards are initialized. If **serial=yes** is specified, cards of the specified GPL type are initialized one at a time. If **serial=no** is specified, cards of the specified GPL type are initialized simultaneously.

**Range:**     **yes, no**

**Default:**   **no**

### Example

**init-card:loc=1201**

**init-card:loc=1101:data=persist**

**init-card:loc=1113:initclk=yes**

**init-card:appl=eoam:initclk=yes:force=yes**

### Dependencies

The shelf and card must be equipped.

Either the **loc** or **appl** parameter, but not both parameters, must be specified in the command.

The following card locations (**loc** parameter) are not allowed for this command: 1114, 1116, 1117, 1118, and all *xy09* and *xy10* card locations (where *x* is the frame and *y* is the shelf).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

If TDM reload would cause system clocks to fail that are required to keep links active or TSCSYNC available, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION: The resulting clock outage will probably cause loss of traffic on all links.**

Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.
- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A&B) are required.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

The **force** parameter must be specified for cards that are not the In-service Normal state.

The **serial** parameter is valid only when used with the **appl** parameter.

The **appl=all** parameter can be specified only when the **serial=yes** parameter is also specified.

If the **serial** parameter is specified, the value of the **appl** parameter must be one of the following: **atmansi**, **ccs7itu**, **gls**, **sccp**, **ss7ansi**, **ss7gx25**, **stplan**, or **all**.

If the **data=persist** parameter is specified and any SCCP or EBDABLM cards present in the system cannot maintain a persistent LNP database over the reset, the **force** parameter must be specified.

The **force** parameter can be specified only when the **initclk**, **appl**, and **data** parameters are specified.

The **data** parameter is valid only for SCCP and EBDABLM card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

## Notes

The TDM card has a processor but no application.

The LNP (see the **enable-ctrl-feat** command), G-Flex, G-Port, or INP feature must be turned on before the **data** parameter can be specified.

Various conditions in the system can prevent the persistence of the LNP data on the SCCP/EBDABLM cards. When this occurs and the **force** parameter is not specified, the following error is generated:

```
E3849 Cmd Rej: Card(s) cannot warm restart - FORCE parameter required
Verifying card(s) persistent LNP database - please wait
The following cards require a full data download:
Card      Reason
-----
zzzz      xxxxxxxx
```

where **zzzz** is the card requiring the full data download, and **xxxxxxx** is one of the values listed in Table 5-53

**Table 5-53.** Reason That Card Requires a Full Data Download

| xxxxxxx value  | Description                      |
|----------------|----------------------------------|
| POWER ON       | Power on reset                   |
| XILINX VERSION | M256 Xilinx version has changed  |
| DB VERSION     | LNP Database version has changed |

**Table 5-53.** Reason That Card Requires a Full Data Download

| xxxxxxx value | Description                                                                               |
|---------------|-------------------------------------------------------------------------------------------|
| DB LEVEL      | Database level is not supported or difference exceeds incremental loading capability      |

**init-flash****Initialize Flash**

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

**Keyword:** **init-flash**

**Related Commands:** **act-flash, clr-imt-stats, flash-card, init-imt-gpl, rept-imt-info, rept-imt-lvl1, rept-imt-lvl2, tst-imt**

**Command Class:** System Maintenance

**Parameters**

**:code=** (mandatory)

The version of the GPL being loaded onto the card.

**Range:** **appr, trial**

**appr**—The approved GPL version

**trial**—The trial GPL version

**:boot=** (optional)

This parameter indicates whether the HC-MIM or EPM based card should boot or not boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the HC-MIM or EPM based card, this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card.

**Range:**     **yes, no**

**yes**—Reboot the card after the command completes successfully

**no**—Do not reboot the card after the command completes successfully.

**Default:**   **yes**

**:eloc=** (optional)

End location. Location of the last card of a range of cards to be initialized.

**Range:**     **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:force=** (optional)

This parameter is required to force the TDM-GTI bitfile reload if a clock outage will occur when **initclk=yes** is specified.

**Range:**     **yes, no**

**Default:**   **no**

**:gpl=** (optional)

The flash GPL type that is running on the cards in the specified range of cards.

**Range:**     xyyyyyyy

1 alphabetic character followed by 6 alphanumeric characters. Valid GPLs are:

**blbios, blbepm, blcpld, bldiag, bldiag6, blvxw6, bpdcm, bphcap, bphcapt, bphmux, bpmpl, bpmplt, hipr, imtpci, plde1t1, and pldpmc1.**

**:initclk=** (optional)

If this parameter is specified for an EOAM card location (1113 or 1115), it determines whether or not the TDM-GTI bitfile should be reloaded, causing a clock initialization.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

**Range:**     **yes, no**

**Default:**   **no**

**:loc=** (optional)

The location of a single card to be initialized.

**Range:**     **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:sloc=** (optional)

Start location. Location of the first card of a range of cards to be initialized.

**Range:** 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

**:appl=** (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

### Example

```
init-flash:loc=1105:code=trial
init-flash:sloc=1101:eloc=1112:gpl=bpdcm:code=appr
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
```

### Dependencies

The specified card for this command must be an HCAP, HCAP-T, DCM, DSM, E1/T1 MIM, HC-MIM, GPSM-II, MPL, MPL-T or EPM based. An HMUX card or a HIPR card can be specified, but only for locations *xy09* and *xy10* (*x* is the frame and *y* is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, the card must be inhibited before this command is entered (unless the card is an HMUX card or a HIPR card).

If the target card is HMUX or HIPR, both of the card locations specified in the **sloc** and **eloc** parameters must contain HMUX cards or HIPR cards on the same IMT bus. For HMUX or HIPR the bus is implicit based on the specified location. Location *xy09* specifies HMUX or HIPR A Bus, and location *xy10* specifies HMUX or HIPR B Bus (where *x* is the frame and *y* is the shelf). For example, **sloc=1109:eloc=6109** specifies all HMUX cards or HIPR cards on the A Bus only; **sloc=1110:eloc=6110** specifies all HMUX cards or HIPR cards on the B Bus only. HMUX cards or HIPR cards from both the A bus and B bus cannot be flash downloaded simultaneously.

If the target card is an HC-MIM or EPM based card, the **gpl** parameter must be specified when the **loc** parameter is specified.

The **boot** parameter can be specified only if the target is an HC-MIM or EPM based card.

The **boot** parameter cannot be specified for the **blepld** HC-MIM GPL.

The **init-flash** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

A card location that contains the active MASP cannot be specified for the **loc**, **sloc**, or **eloc** parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

If the **eloc** and **sloc** parameters are specified, the **gpl** parameter must be specified. The cards in the locations specified in the **sloc** and **eloc** parameters must be running the specified general program load (**gpl**). Other cards in the range of card locations can be running other GPLs, but will not be initialized. Only the cards within the range that are running the specified GPL will be initialized.

The **sloc** parameter value must be less than the **eloc** parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed.

If **initclk** is specified, the card location parameter value must be **1113** or **1115**.

If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION: The resulting clock outage will probably cause loss of traffic on all links.**

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

EPM-based cards cannot support a valid trial version of the **blbepm** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded. The HC-MIM card cannot support a valid trial version of the **blbios** GPL and **blepld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

## Notes

Card locations **1114**, **1116**, and **1117** are not valid and cannot be specified.

For the HC-MIM or EPM based cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the **boot=no** parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the **init-flash** command with the **boot=yes** parameter or by entering the **init-card** command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

## Output

### **init-flash:loc=1105:code=trial**

```
rlghncxa03w 04-01-05 13:05:05 EST EAGLE 31.3.0

## init-imt-gpl

## Initialize IMT GPL

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

**Keyword:** **init-imt-gpl**

**Related Commands:** **alw-card**, **inh-card**, **init-card**, **rept-stat-card**

**Command Class:** System Maintenance

### Parameters

**:code=** (mandatory)

Specifies which IMT GPL to load to the card.

**Range:** **appr**, **refresh**, **trial**

**appr**—The approved GPL version

**refresh**—Reload approved GPL version without card reset

**trial**—The trial GPL version

**:loc=** (optional)

Specifies the address of the card to be initialized.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All locations

### Example

**init-imt-gpl:loc=1201:code=trial**

**init-imt-gpl:code=refresh**

**init-imt-gpl:code=appr**

### Dependencies

The card location shelf must be within the allowed ranges as specified on the **loc** parameter. The shelf is the first two digits of the **loc** parameter.

The card location slot must be within the allowed ranges as specified on the **loc** parameter. The slot is the second two digits of the **loc** parameter.

The card location cannot contain a card with flash memory (HCAP, HCAP-T, DCM, MPL, MPL-T, HC MIM, HIPR, or HMUX).

When this command is entered, no other action command can be in progress.

If the **code=appr** parameter is specified, the **loc** parameter must be specified.

If the **code=trial** parameter is specified, the **loc** parameter must be specified, and the specified card location must be equipped and in service.

If the **code=appr** or the **code=refresh** parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

The **init-imt-gpl** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**.

This command must not be entered during IMT statistics collection following an hourly boundary.

## Notes

None

## Output

### init-imt-gpl:loc=1201:code=trial

```

0194.0096   CARD 1201 SS7ANSI      Card has been reloaded
;
```

## init-mux

## Initialize High-Speed Multiplexer

Use this command to reset a single HMUX or HIPR card or all HMUX or HIPR cards on the specified HMUX or HIPR bus.

If the command is entered between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the HMUX or HIPR card or cards come back into service.

If the command entry is not between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor without bringing down the respective IMT bus.

**Keyword:** init-mux

**Related Commands:** act-flash, init-flash

**Command Class:** System Maintenance

## Parameters

**:bus=** (optional)

The HMUX or HIPR bus to be reset. All HMUX or HIPR cards on the specified bus will be reset.

**Range:** a, b

**Default:** a

**:force=** (optional)

Use this parameter to override normal safeguards. The **force=yes** parameter can be used to:

- Reset an entire HMUX or HIPR bus when the alternate bus is non-functional
- Reset one HMUX or HIPR card during a fault isolation test (**tst-imt**) command

**Range:** yes, no

**Default:**     **no**

**:loc=** (optional)

The card location of a single HMUX or HIPR card to be reset.

**Range:**       **1109-1110, 1209-1210, 1309-1310, 2109-2110, 2209-2210, 2309-2310, 3109-3110, 3209-3210, 3309-3310, 4109-4110, 4209-4210, 4309-4310, 5109-5110, 5209-5210, 5309-5310, 6109-6110**

**Default:**     If not specified, all HMUX or HIPR cards on bus A or bus B are reset

### Example

**init-mux:bus=a**

**init-mux:loc=1109**

### Dependencies

An **act-flash** or **init-flash** command cannot be in progress when this command is entered.

Either the **bus** parameter or the **loc** parameter, but not both, must be specified.

This command is not allowed during an IMT Fault Isolation test (**tst-imt**), unless the **force=yes** parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

### Notes

None

### Output

**init-mux:loc=1109**

rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0

Command Completed.

;

## init-network

### Initialize the Network

Use this command to reset all the network cards. The network cards are ACMs, TSMs, and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

**CAUTION:** Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

**Keyword:** **init-network**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:force=** (optional)

Force the resetting of all the network cards.

**Range:**       **yes, no**

**Default:**     **no**

**Example****init-network****Dependencies**

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with either the **ss7ansi** or the **ccs7itu** application installed must exist with an in-service active signaling link.

The **force=yes** parameter must be specified to override the required four-card **ss7ansi** or **ccs7itu** configuration. The system then selects the best available of the remaining **ss7ansi** or **ccs7itu** cards.

**Notes*****Upgrade Phase 3***

*Upgrade Phase 3* mode means that the MASPs are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

***Full Function***

*Full Function* mode means that all MASPs are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

**Output**

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

**init-network**

```

## init-oap

## Initialize OAP Processor

Use this command to send a hardware signal to the indicated OSS/Application Processor (OAP), causing it to reset and reinitialize its operational software.

**NOTE: This command cannot be used for EOAPs (Enhanced Operation System Support Application Processes).**

**Keyword:** **init-oap**

**Related Commands:** **chg-trm, rept-stat-seas**

**Command Class:** System Maintenance

### Parameters

**:oap=** (mandatory)

The OAP that is to be initialized. Any value (**a**, **b**, or **both**) can be specified, regardless of the actual or intended OAP configuration.

**Range:** **a, b, both**

**:force=** (optional)

If the specified OAP is operational (that is, if its state is IS-NR or IS-ANR), and it is the only operational OAP, then the **force=yes** parameter must be specified to reset it. If the specified OAP is not operational, then **force=yes** is not required.

**Range:** **yes, no**

**Default:** **no**

### Example

**init-oap:oap=a**

**init-oap:oap=b**

**init-oap:oap=both:force=yes**

### Dependencies

The SEAS feature must be turned on before this command can be entered.

No other action command can be in progress when this command is entered.

The **force=yes** parameter must be specified to reset the last OAP.

### Notes

The EAGLE 5 ISS determines the OAP configuration (single vs. dual) by querying the OAP. If one or both of the OAPs are not operational, then the EAGLE 5 ISS might receive incorrect information about the OAP configuration. Furthermore, if no OAP terminals are defined, no OAP queries are sent, the OAM defaults to a single configuration, and this information may be incorrect.

To allow an OAP to be reset by an OAM not configured for it or when no OAP terminals are yet defined, the **init-oap** command can be used to specify either OAP or both OAPs, even if doing so conflicts with the actual OAP configuration.

## Output

### init-oap:oap=a

```
rlghncxa03w 05-07-01 16:40:40 EST EAGLE 31.3.0
Initialization signal sent to OAP A
Command Completed.
```

### init-oap:oap=both:force=yes

```
rlghncxa03w 05-07-01 16:40:40 EST EAGLE 31.3.0
Initialization signal sent to OAP A
Initialization signal sent to OAP B
Command Completed.
```

In the following example, assume that the MDAL is malfunctioning when the command is entered.

### init-oap:oap=b

```
rlghncxa03w 05-07-01 16:40:40 EST EAGLE 31.3.0
Info: MDAL is not operational. OAP initialization may not occur.
Initialization signal sent to OAP B
Command Completed.
```

;

## init-sys

## Initialize System

Use this command to reset all cards in the system (except HMUX and HIPR cards). Use this command also to log out the current users. When you first enter this command, a caution message is displayed in the scroll area requesting that you re-enter the command to confirm the operation. You have 30 seconds to re-enter the command. The only valid commands that you can enter after entering the **init-sys** command the *second* time are the commands **login** and **act-user**.

**CAUTION:** This command causes a complete system reload, and you should use it only during periods of low traffic. Use this command only when directed by Tekelec Technical Service at (888) FOR-TKLC.

**CAUTION:** When the **init-sys** command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. You will need to manually put each device back into its previous state after the system is back on line. It is, therefore, advisable to print or electronically capture the output of the **rept-stat-slk**, **rept-stat-card**, and **rept-stat-trm** commands for reference prior to issuing the **init-sys** command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above **rept-stat** commands.

**Keyword:** **init-sys**

**Related Commands:** **act-gpl**, **chg-db**, **chg-gpl**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**

**Command Class:** System Maintenance

## Parameters

**:data=** (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP, G-Flex, G-Port, or INP feature is on. This parameter is applicable only to network cards containing the LNP database (SCCP, EBDABLM) or the MPS database (VSCCP).

**Range:** **refresh**, **persist**

**refresh**—Causes data to be reloaded to the specified card.

**persist**—Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place (for example, that the TSM/BLM card is present and ready and that the downloaded LNP database is coherent. The LNP database audit cannot be performed prior to the card reset.) The force parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

**Default:**     **refresh**

**:force=** (optional)

Allows the command to be processed if the **data=persist** parameter is specified and all the network cards containing the LNP database (SCCP, EBDABLM) cannot maintain a persistent LNP database over the reset.

**Range:**       **yes, no**

**Default:**     **no**

### Example

**init-sys**

**init-sys:data=persist**

### Dependencies

When this command is entered, another **init-sys** command cannot be in progress on another port.

If the **data=persist** parameter is specified and any SCCP or EBDABLM cards present in the system cannot maintain a persistent LNP database over the reset, the **force** parameter must be specified.

The **force** parameter is valid only with the **data** parameter.

The LNP, G-Flex, G-Port, or INP feature must be turned on before the **data** parameter can be specified,

When the **init-sys** command is entered with parameters, the parameters that are entered the first time must be the same parameters that are entered the second time for the confirmation command.

### Notes

When the **init-sys** command is entered the first time, you have 30 seconds to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the **init-sys** command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicates that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the **init-sys** command, the MASP that was active before the **init-sys** command was entered will be the active MASP when the system has finished reinitializing. TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require the TSM cards to be reloaded.

Various conditions in the system may prevent the persistence of the LNP data on the SCCP/EBDABLM cards. When this occurs and the **force** parameter is not specified, the following error is generated:

```

E3849 Cmd Rej: Card(s) cannot warm restart - FORCE parameter required
Verifying card(s) persistent LNP database - please wait
The following cards require a full data download:
Card      Reason
----      -
zzzz      xxxxxxxx

```

where *zzzz* is the card requiring the full data download, and *xxxxxx* is one of the values listed in Table 5-54

**Table 5-54.** Reason That Card Requires a Full Data Download

| xxxxxxx value  | Description                                                                               |
|----------------|-------------------------------------------------------------------------------------------|
| POWER ON       | Power on reset                                                                            |
| XILINX VERSION | M256 Xilinx version has changed                                                           |

| UNKNOWN        | Unknown                                                                                   |
| OTHER          | Other                                                                                     |

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```

rlghncxa03 03-07-11 07:05:00 EST  EAGLE 30.2.0
0021.1493   CARD 1111      INFO   SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11  Time:22:27:36

```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST  EAGLE 30.2.0
0021.1493      CARD 1111      INFO      SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11  Time:22:27:36
```

## Output

The following example shows what happens when you enter the **init-sys** command once and enter the **init-sys** command a second time within 30 seconds, causing the system to start resetting all of its cards.

### init-sys

```
rlghncxa03w 04-01-07 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

### init-sys

```
rlghncxa03w 04-01-07 07:05:16 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:17 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

The following example shows what happens when you enter the **init-sys** command once and allow more than 30 seconds to pass with no other keyboard entry.

### init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3.

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when you enter the **init-sys** command once and enter a different command (**rls-alm:lvl=minr**), letting the 30-second timer expire for the second entry of the **init-sys** command.

### init-sys

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

### rls-alm:lvl=minr

```
rlghncxa03w 04-01-05 07:05:10 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:11 EST  EAGLE 31.3.0
All the minor alarms are released

rlghncxa03w 04-01-05 07:05:12 EST  EAGLE 31.3.0
Command Completed
```

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when the **init-sys** command is entered twice within 30 seconds, and specifies the **data=persist** parameter to perform a warm restart of the requested cards without reloading the database to the cards.

#### **init-sys:data=persist**

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and will result in
traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
init-sys:data=persist
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Init System command issued at terminal #3
```

## lock

## Lock Keyboard

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the **unlock** command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

**Keyword:** lock

**Related Commands:** unlock

**Command Class:** Basic

### Parameters

This command has no parameters.

### Example

**lock**

### Dependencies

The terminal cannot be an OAP terminal.

The terminal cannot be an **mgmt** terminal used for Network Surveillance.

The terminal cannot be a **telnet** terminal (terminal IDs 17-40).

### Notes

As an alternative, you can unlock a locked terminal by entering the **inh-trm** command, followed by the **alw-trm** command.

### Output

**lock**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

## login

## Login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

**Keyword:** login

**Related Commands:** act-user, chg-pid, chg-secu-dflt, chg-user, dact-user, dlt-user, ent-user, logout, rept-stat-user, rtrv-secu-dflt, rtrv-secu-user, rtrv-user

**Command Class:** Basic

### Parameters

**:uid=** (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

**Range:** azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

### Example

**login:uid=john**

### Dependencies

All the following dependencies assume the appropriate features are turned **on**.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the **uout** parameter of the **ent-user** command.

If the OA&M IP Security Enhancements feature is not turned on, you cannot change the password at the prompt from an IP User Interface telnet terminal (IDs 17-40) when:

- It is the first time the user is logging in with the assigned Userid and password
- The password has expired because of aging out.  
You must log in with a new Userid and password for the first time or change an expired password from a serial terminal (terminal IDs 1-16).

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that you specify on the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that you specify on the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

### Notes

The **act-user** command can be used in place of **login**. The **act-user** command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

### Output

Not applicable.

## logout

## Logout

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** and **canc-user** commands.

**Keyword:** logout

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, rept-stat-user, rtrv-secu-user, rtrv-user

**Command Class:** Basic

### Parameters

This command has no parameters.

### Example

**logout**

### Dependencies

This command cannot be entered from a terminal that is configured as an OAP terminal.

### Notes

The **dact-user** or **canc-user** commands can be used in place of **logout**.

### Output

**logout**

```
rlghncxa03w 06-06-05 07:05:31 EST EAGLE 35.0.0
Command Completed.
```

;

## pass

## Pass

Use this command to pass a command string to an individual card for processing. This command reduces the reliance on the OAM build for card and on application-specific information.

**Keyword:** pass

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:cmd=** (mandatory)

Command string including quotes (" "). The command represented in the quoted string is sent to the specified card. Maximum command string length including quotes is 132 characters.

**Range:** `////////////////////////////////////`

Any string of characters that represent a pass-through command. The string must be enclosed in double quotation marks.

The valid pass-through commands are **arp**, **aslog**, **asplog**, **assocrtt**, **connmgr**, **drklog**, **ftpctest**, **help**, **linkinfo**, **msucount**, **msuroute**, **msutrace**, **netstat**, **nslookup**, **ping**, **sctp**, **sockrtt**, **sockstate**, **traceroute**, **ualog**.

See Chapter 7, "Pass-Through Commands" for information on pass-through commands.

**NOTE:** Pass-through commands shown in online help that are not documented in Chapter 7 are not supported at this time.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,

4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,  
5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

```
pass:loc=1201:cmd="ping 198.89.1.2"
```

```
pass:loc=1201:cmd="help"
```

### Dependencies

The **loc** parameter value must correspond to an SSEDCM card location, or for INP, a VSCCP card location. SS7IPGW, IPGWI, IPLIM, and IPLIMI card locations are valid.

### Notes

See Chapter 7, "Pass-Through Commands" for information on pass-through commands.

### Output

The following example is not definitive of the output of the **ping** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1201:cmd="ping 198.89.1.2"
  rlghncxa03w 04-02-17 15:35:05 EST  EAGLE 31.3.0
  ping - Command Accepted by 1201.
  PASS: MASP A - COMPLTD
;
  OUTPUT FROM 1201:
  Pinging 192.168.100.4 with 32 bytes of data:
  Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
  Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
  Reply from 192.168.100.3: bytes=32 time=140ms TTL=255
  Reply from 192.168.100.3: bytes=32 time=10ms TTL=255
  ping - Command Completed.
  END OUTPUT FROM 1201.
;
```

## rept-ftp-meas

## Report Measurements to FTP

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM to the customer's FTP server.

**Keyword:** rept-ftp-meas

**Related Commands:** rept-meas

**Command Class:** Link Maintenance

### Parameters

**:enttype=** (mandatory)

Entity type to report on in the measurements report.

**Range:**    **eir**, **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**,  
              **origininc**, **stp**, **stplan**, **tt**  
              **eir**—Measurements for Equipment Identity Register  
              **link**—Measurements for signaling links  
              **lnkset**—Measurements for linksets  
              **lnp**—Measurements for local number portability  
              **lsdestni**—Measurements for linkset destination network identifiers  
              **lsonismt**—Measurements for ISUP message type screening  
              **lsorigni**—Measurements for linkset originating network identifiers  
              **mapscrn**—Measurements for GSM MAP message screening  
              **np**—Measurements for INP and G-Port

**origni**—Measurements for originating network identifiers greater than 5  
**originine**—Measurements for originating network identifiers (less than 5, small networks) for network clusters  
**stp**—Measurements for all nodes  
**stplan**—Measurements for TCP/IP links.  
**tt**—Measurements for translation types

**:type=** (mandatory)

The measurement report type.

**Range:** **avl, avld, avldth, comp, gtwy, mtcd, mtcddth, mtch, mtcs, nm, rbase, systot**

**avl**—Availability measurements

**avld**—Daily availability measurements

**avldth**—Day to hour availability measurements.

**comp**—Component measurements

**gtwy**—Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

**mtcd**—Daily maintenance measurements

**mtcdth**—Day-to-hour maintenance measurements

**mtch**—Hourly maintenance measurements

**mtcs**—Link/linkset maintenance status

**nm**—Network management, on-demand

**rbase**—Schedule-report type record base measurements

**systot**—STP system totals

**:day=** (optional)

Day of the week for the specified daily measurement report.

**Range:** **mon, tue, wed, thu, fri, sat, sun**

**Default:** If not specified, the previous single day is reported.

**:hh=** (optional)

The specific half-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **hh=0300** generates a report for the interval 2:30-3:00.

**Range:** **0000-2400**

*hhmm* where *hh* = **00-24** (hour) and *mm* = **00 or 30** (minute)

**:period=** (optional)

The relative period for the report.

**Range:** **active, last, specific**

**:qh=** (optional)

The specific quarter-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **qh=0315** generates a report for the interval **3:00-3:15**.

**Range:** **0000-2400**

*hhmm* where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

## Example

**rept-ftp-meas:type=systot:enttype=stp**

**rept-ftp-meas:type=mtch:enttype=lnp**

## Dependencies

Only one **rept-ftp-meas** command can be in progress at any one time.

The Measurements Platform feature must be turned on (**chg-feat** command) and the Measurements Platform collection function (**chg-measopts:platformenable=on** command) must be enabled before this command can be entered.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (**chg-measopts:collect15min=on** command) must be on before the **qh** parameter can be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before:

- The **mtchlnp=on** parameter or the **mtcdlnp=on** parameter can be specified
- Entity type **lnp** can be specified

The GSM Map Screening feature (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) must be turned on before

- The **mtcdmap=on** parameter can be specified.
- Entity type **mapscrn** can be specified

Either the G-Port feature or the INP feature must be turned on before

- The **mtchnp=on** parameter or the **mtcdnp=on** parameter can be specified
- Entity type **np** can be specified

The Equipment Identity Register (EIR) feature must be enabled and turned on before the **enttype=eir** parameter can be specified,.

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**mtcd** and **nm** are excluded with message “**E2307: QH or HH is not valid for this TYPE**”).

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld**, **mtcd**, **nm**, **rbase**, and **mtcs** are excluded with message “**E2307: QH or HH is not valid for this TYPE**”).

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type **mtcd** is specified
- When report type **mtcdth** is specified

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

The **day** parameter can be specified only for report type **mtcd** and entity types **eir**, **lnp**, **np**, and **mapscrn**.

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=active** parameter is specified, the **qh** parameter cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch**.

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch**.

Table 5-55 indicates with an X valid parameter combinations for measurements reports; invalid combinations will generate an error message.

**Table 5-55. rept-ftp-meas Valid and Invalid Parameter Combinations**

| Parameter Value | :type Parameter Values |      |        |      |      |      |        |      |      |    |        |       |
|-----------------|------------------------|------|--------|------|------|------|--------|------|------|----|--------|-------|
|                 | avl                    | avld | avldth | comp | gtwy | mtcd | mtchth | mtch | mtcs | nm | systot | rbase |
| <b>:entity</b>  |                        |      |        |      |      |      |        |      |      |    |        |       |
| <b>link</b>     | X                      | X    | X      | X    |      | X    | X      |      | X    |    | X      | X     |

```

**rept-imt-info****Display IMT Error and Use Statistics**

Use this command to display the following statistics:

- The IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- The current IMT bus use statistics (Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.)
- The HMUX and HIPR card error statistics

**Keyword:** **rept-imt-info**

**Related Commands:** **clr-imt-stats**, **init-imt-gpl**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**

**Command Class:** System Maintenance

**Parameters**

**:report=** (mandatory)

Type of report to generate.

**Range:** **err**, **util**, **hmutexerr**, **hiprerr**

**err**—Produces a report of the IMT bus error statistics

**util**—Produces a report of the IMT bus use (utilization) statistics

**hmutexerr**—Produces a report of the HMUX card error statistics

**hiprerr**—Produces a report of the HIPR card error statistics

**:ebucket=** (optional)

End bucket. Specifies the last one-hour time period (*bucket*) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

**Range:** **0-15**

**Default:** If **sbucket** is specified—current **sbucket** value; information for only that time period is displayed.

If **sbucket** is not specified—**15**, the report includes statistics for all 16 time periods

**:eloc=** (optional)

End location. Specifies the card location of the last card in the range for the report.

**Range:** **1101-1113**, **1115**, **1201-1218**, **1301-1318**, **2101-2118**, **2201-2218**, **2301-2318**,  
**3101-3118**, **3201-3218**, **3301-3318**, **4101-4118**, **4201-4218**, **4301-4318**, **5101-5118**,  
**5201-5218**, **5301-5318**, **6101-6118**

**Default:** If **sloc** is specified—current **sloc** value; displays information for one card

If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

**:erronly=** (optional)

Use this parameter to filter output to display only non-zero counts in the error report.

This parameter can be specified only if **report=err** is specified.

**Range:** **yes**, **no**

**Default:**    yes

**:eshelf=** (optional)

End shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the last shelf in the range.

This parameter can be specified only if **report=hmuxerr** or **report=hiprerr** is specified.

**Range:**       **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**Default:**     If **sshelf** is specified—current **sshelf** value.  
If **sshelf** is not specified—**6100**, displays information for entire range of shelves.

**:eslot=** (optional)

Ending slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

**Range:**       **1-8, 11-18**

**Default:**     If **sslot** is specified—current **sslot** value.  
If **sslot** is not specified—not used.

**:mode=** (optional)

Display mode to use for error report.

This parameter can be specified only if **report=err** is specified.

**Range:**       **full, stats, summary**

**full**—Displays information for each card along with a summary report

**stats**—Displays only individual card statistics

**summary**—Displays the summary portion of the report

**Default:**     **summary**

**:sbucket=** (optional)

Start bucket. Specifies the first one-hour time period (bucket) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

**Range:**       **0-15**

**Default:**     **0**

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range for the report.

**Range:**       **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Default:**     If **eloc** is specified—current **eloc** value.  
If **eloc** is not specified—**1201**, which corresponds to IMT address 0; displays information for entire range of card locations.

**:sshelf=** (optional)

Start shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the first shelf in the range.

This parameter can be specified only if **report=hmuxerr** or **report=hiprerr** is specified.

**Range:**       **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**Default:**     If **eshelf** is specified—current **eshelf** value.  
If **eshelf** is not specified—**1100**, displays information for entire range of shelves.

**:sslot=** (optional)

Starting slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

**Range:** 1-8, 11-18

**Default:** If **eslot** is specified—current **eslot** value.  
If **eslot** is not specified—not used.

**:trm=** (optional)

The serial port (printer location) to which the report is to be sent.

**Range:** 1-16

**Default:** Report displays on the terminal where the command is issued

### Example

**rept-imt-info:report=err**

**rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats**

**rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no**

**rept-imt-info:report=util**

**rept-imt-info:report=hmuxerr**

**rept-imt-info:report=hiprerr:sbucket=0**

**rept-imt-info: report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0**

### Dependencies

No related IMT command can be in progress when the **rept-imt-info** command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

The **rept-imt-info** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The following **report** parameter combinations are not valid in the command:

- When the **report=util** parameter is specified, the **ebucket**, **erronly**, **mode**, and **sbucket** parameters cannot be specified.
- When the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified, the **erronly** and **mode** parameters cannot be specified.
- When the **report** parameter values **err**, **util**, and **hmuxerr** are specified, the **sslot** and **eslot** parameters cannot be specified.

The ending hourly time period cannot be less than the starting hourly time period. For example, **rept-imt-info:report=err:sbucket=5:ebucket=3** cannot be specified.

When the **sslot** and **eslot** parameters are specified, the **sshelf** parameter must be specified and the **eshelf** parameter cannot be specified (slot information is reported for a single shelf).

The **sshelf** and **eshelf** parameters can be specified only when the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified.

The HIPR card slots (**09** and **10**) cannot be specified for the **sslot** and **eslot** parameter values.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**IMT Bus Error Statistics:** Each hourly time period (*bucket*) contains the IMT bus error statistics for a single hour. A total of 16 hourly time periods, numbered **0** to **15**, exist. Hourly time period **0** is the most-recent (current), and hourly time period **15** is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period **0** are now reported in the hourly time period **1**, and so on. The statistics reported in the hourly time period **15** are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period **0** and changes to hourly time period **1** at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

**IMT Bus Use Statistics:** The statistics are calculated for all cards in the specified range and summarized. Only the summarized statistics are displayed. *IMT bus use* is the percentage of the capacity of the IMT bus that is used for data during a particular time.

**HMUX or HIPR Statistics (Bucket Summary):** Each hourly time period (*bucket*) contains the HMUX or HIPR statistics for a single hour. A total of 16 hourly buckets, numbered **0** to **15**, exist. Bucket **0** is the most-recent (current) bucket; bucket **15** is the least-recent (oldest).

Each hour on the hour, the least-recent bucket expires and the hourly time periods advance. That is, after the advance, the statistics previously reported in bucket **0** are now reported in bucket **1**, and so on. The statistics that were reported in bucket **15** are no longer available after the change.

If a card booted within the past 16 hours, a message is displayed indicating that no data is available for that card. When a card boots, it starts to collect statistics in bucket **0**. It changes to bucket **1** at the start of the next hour. Thus, the first bucket of statistics that a card collects after booting might be for part of an hour.

A HIPR card stores the statistics separately for each card on its shelf. When the **sloc** and **eloc** parameters are specified, the HIPR card sends the statistics for each card to the OAM application for display. When the **sloc** and **eloc** parameters are not specified, the HIPR card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

**HMUX or HIPR Statistics (Cumulative):** HMUX or HIPR cumulative statistics maintain running totals of the error count for each parameter from card initialization. The error counts can be cleared by entering a **clr-imt-stats:all=yes** command to clear all HMUX and HIPR cards, or a **clr-imt-stats** command to clear a specific card.

Table 5-56 explains the **rept-imt-info:report=hmuxerr** statistics.

"Excessive" is primarily determined by the operator, based upon:

- Overall system behavior
- Duration of time since the last statistics were taken
- Statistics of an individual card in relation to other cards

**Table 5-56.** Explanation of **rept-imt-info:report=hmuxerr** Statistics

| IMT Statistic           | Explanation Of Statistic                                                                     | Probable Causes                                                             | Recommended Action                                                                                   |

Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.                                                                          |
| IMT Rx Violation Error       | Received an illegal character from the IMT. Detected by hardware.                                                                                                       | Card insertion/removal or boot.                                                                                                       | None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.                                                                          |
| CPU Rx FIFO Full             | HMUX's IMT interface is congested. Detected by hardware.                                                                                                                | Indicates that data was received at a higher rate than could be processed                                                             | Call Tekelec Technical Services if count is excessive in relation to other HMUX cards.                                                                                                                             |
| CPU Rx FIFO Half Full        | HMUX's IMT interface is becoming congested. Detected by hardware.                                                                                                       | Indicates that data was received at a higher rate than could be switched for a short period.                                          | None. FIFO half full is just an indication; no action is required.                                                                                                                                                 |
| CPU Rx FIFO Empty Before SOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the beginning (SOM) of the packet before all the data was read. | The SOM was corrupted while being written into the CPU Rx FIFO from the low speed link.                                               | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA problem that requires further investigation. |
| CPU Rx FIFO Empty Before EOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.    | The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the low speed link. | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, some type of FPGA or high-speed link problem                                           |

|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
|                              |                                                                                                                                                                                                   |                                                                                                                       | might require further investigation.                                                                                                                             |
| CPU Rx Packet SOM Before EOM | A Start of Message was received when an End of Message was expected from the IMT bus.                                                                                                             | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                                  | None.                                                                                                                                                            |
| CPU Rx Packet CRC Error      | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA and transferred to the processor memory, and the FPGA calculated CRC does NOT match the CRC word at the end of the packet. | The data was corrupted while being written into the CPU Rx FIFO, or data coming from the low speed link is corrupted. | None. If the problem persists, some type of FPGA or high-speed link problem might require further investigation.                                                 |
| DMA Terminal Count Interrupt | Received IMT packet length is longer than the max allowed. Detected by hardware.                                                                                                                  | Card insertion/removal or boot.                                                                                       | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards.                       |
| CPU Tx Buffer EOB            | A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted.                                                | The data was corrupted while being written into or being read from the FIFO.                                          | None. If the problem persists, some type of FPGA problem might require further investigation.                                                                    |
| CPU Tx Buffer Full           | The Tx Buffer has had 512 bytes written to it and can accept no more.                                                                                                                             | A packet is being sent that is too large.                                                                             | Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor. |

|                              | receiving sync characters                                                                                                                                                | High-speed cable was disconnected.<br>One of the HMUXs in the ring was removed.                                                         | persists, more detailed high-speed bus analysis is required.                                                                                                                                                       |
| IMT Rx Code Word Error       | Fibre Channel transceiver has received an invalid code word.                                                                                                             | Noisy high-speed ring. Wrong command transmitted.                                                                                       | This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.                                                                                                          |
| CPU Receive FIFO Full        | Communication CPU on the card is congested. Detected by hardware                                                                                                         | Indicates that data was received at a higher rate than could be processed by the Communications processor.                              | Call Tekelec Technical Services if count is excessive in relation to other cards.                                                                                                                                  |
| CPU Receive FIFO Half Full   | Communication CPU on the card is becoming congested. Detected by hardware.                                                                                               | Indicates that data was received at a higher rate than could be processed for a short period.                                           | None. FIFO half full is just an indication; no action is required.                                                                                                                                                 |
| CPU Rx FIFO Empty Before SOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the beginning (SOM) of the packet before all the data was read. | The SOM was corrupted while being written into the CPU Rx FIFO from the high speed link.                                                | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA problem that requires further investigation. |
| CPU Rx FIFO Empty Before EOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.    | The SOM was corrupted while being written into the CPU Rx FIFO, or a partial packet was written into the FIFO from the high speed link. | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, some type of FPGA or low-speed link problem might require further investigation.       |

**Table 5-56.** Explanation of **rept-imt-info:report=hmuxerr** Statistics

| <b>IMT Statistic</b>              | <b>Explanation Of Statistic</b>                                                                                                                    | <b>Probable Causes</b>                                                                                                                                 | <b>Recommended Action</b>                                                                                                                                        |
|-----------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU Rx Packet SOM Before EOM      | A Start of Message was received when an End of Message was expected from the Fibre Channel bus.                                                    | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                                                                   | None.                                                                                                                                                            |
| CPU Rx Packet CRC Error           | A packet received for this shelf contains a CRC error.                                                                                             | Packet was transmitted incorrectly or was corrupted by another device in the system.                                                                   | Discard packet. If this problem persists, a more detailed analysis of the system is needed.                                                                      |
| DMA Terminal Count Interrupt      | Received IMT packet length (on Fibre Channel) is longer than the maximum allowed. Detected by hardware.                                            | Card insertion/removal or boot.                                                                                                                        | None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.                        |
| CPU Tx Buffer EOB                 | A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted. | The data was corrupted while being written into or being read from the FIFO.                                                                           | None. If the problem persists, some type of FPGA problem might require further investigation.                                                                    |
| CPU Tx Buffer Full                | The Tx Buffer has had 512 bytes written to it and can accept no more.                                                                              | A packet is being sent that is too large.                                                                                                              | Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor. |
| CPU Tx FIFO Half Full             | The Tx Buffer has had 256 bytes written to it.                                                                                                     | 256 bytes have been written to the Tx Buffer.                                                                                                          | None.                                                                                                                                                            |
| IMT (High-speed) Bypass FIFO Full | The High-speed Bypass FIFO has 2K bytes of data in it.                                                                                             | The high-speed link is experiencing very heavy traffic conditions, or the HMUX High-speed Transmitter has been disabled or is not operating correctly. | Determine why high-speed traffic is so heavy. Make sure the HMUX High-speed Transmitter is enabled.                                                              |

**Table 5-56.** Explanation of **rept-imt-info:report=hmuxerr** Statistics

| <b>IMT Statistic</b>                   | <b>Explanation Of Statistic</b>                                                     | <b>Probable Causes</b>                                                                                                                                             | <b>Recommended Action</b>                                                                                                                                     |
|----------------------------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMT (High-speed) Bypass FIFO Half Full | The High-speed Bypass FIFO has 1K bytes of data in it.                              | The high-speed link is experiencing very heavy traffic conditions or the HMUX High-speed Transmitter has been disabled or is not operating correctly.              | Determine why high-speed traffic is so heavy. Make sure HMUX High-speed Transmitter is enabled. Under normal operation this condition should clear itself.    |
| IMT (High-speed) Rx FIFO Full          | The High-speed Rx FIFO has 128K bytes of data in it.                                | The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly. | Determine why high-speed traffic is so heavy. Determine why low speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled.               |
| IMT (High-speed) Rx FIFO Half Full     | The High-speed Rx FIFO has 1K bytes of data in it.                                  | The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly. | Determine why high-speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled. Under normal operation this condition should clear itself. |
| <b>MISC STATS</b>                      |                                                                                     |                                                                                                                                                                    |                                                                                                                                                               |
| Shelf ID UART Framing Error            | UART Framing error received by HMUX in Shelf address data stream received from OAM. | Noisy or bad clock cable from Control Shelf to shelf in which error is reported.                                                                                   | Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.                     |
| Shelf ID UART Overrun Error            | UART Overrun error received by HMUX in Shelf address data stream received from OAM. | Noisy or bad clock cable from Control Shelf to shelf in which error is reported.                                                                                   | Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.                     |

Table 5-57 explains the **rept-imt-info:report=hiprerr** statistics.

"Excessive" is primarily determined by the operator, based upon:

- Overall system behavior
- Duration of time since the last statistics were taken
- Statistics of an individual card in relation to other cards

**Table 5-57.** Explanation of **rept-imt-info:report=hiprerr** Statistics

| IMT Statistic              | Explanation Of Statistic                                                                                      | Probable Causes                                                                              | Recommended Action                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LOW SPEED STATS</b>     |                                                                                                               |                                                                                              |                                                                                                                                            |
| IMT Rx Packet CRC Error    | Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware.                  | Card insertion, removal or boot. May occur infrequently in a normal system.                  | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards. |
| IMT Rx Packet Format Error | Occurs when the Start of Message byte of the IMT packet is followed by unexpected data. Detected by hardware. | Card insertion/ removal or boot.                                                             | None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.  |
| IMT Rx Violation Error     | Received an illegal character from the IMT. Detected by hardware.                                             | Card insertion/ removal or boot.                                                             | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards. |
| IMT Rx Command Error       | An invalid TAXI command detected in a received packet.                                                        | Packet was corrupted in the system.                                                          | None.                                                                                                                                      |
| IMT Rx FIFO Full           | HIPR's IMT interface is congested. Detected by hardware.                                                      | Indicates that data was received at a higher rate than could be processed                    | Call Tekelec Technical Services if count is excessive in relation to other HIPR cards.                                                     |
| IMT Rx FIFO Half Full      | HIPR's IMT interface is becoming congested. Detected by hardware.                                             | Indicates that data was received at a higher rate than could be switched for a short period. | None. FIFO half full is just an indication; no action is required.                                                                         |

**Table 5-57.** Explanation of **rept-imt-info:report=hiprerr** Statistics

| <b>IMT Statistic</b>         | <b>Explanation Of Statistic</b>                                                                 | <b>Probable Causes</b>                                                                                    | <b>Recommended Action</b>                                                                                           |
|------------------------------|-------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------|
| IMT Tx FIFO Full             | HIPR's IMT Transmit FIFO Full                                                                   | TAXI transmitter logic for this channel is not operating properly.                                        | Reset Tx FIFO. If all channels exhibit this problem, there might be an internal FPGA problem with the 125MHz clock. |
| IMT Tx FIFO Half Full        | HIPR's IMT Transmit Half FIFO Full                                                              | High burst rate or multiple large packet transmissions from IXP1250.                                      | None                                                                                                                |
| <b>HIGH SPEED STATS</b>      |                                                                                                 |                                                                                                           |                                                                                                                     |
| IMT Rx Packet Format Error   | Packet was received with a format error (for example, no EOM)                                   | Packet was transmitted incorrectly or was corrupted by another device in the system.                      | None                                                                                                                |
| IMT Rx Disparity Error       | Fibre Channel transceiver received a disparity error on a character.                            | Noisy high-speed ring.                                                                                    | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required.             |
| IMT Rx Sync Lost Error       | Fibre Channel transceiver is not receiving sync characters                                      | Noisy high-speed ring.<br>High-speed cable was disconnected.<br>One of the HIPRs in the ring was removed. | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required.             |
| IMT Rx Code Word Error       | Fibre Channel transceiver has received an invalid code word.                                    | Noisy high-speed ring. Wrong command transmitted.                                                         | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required.             |
| IMT Rx Packet SOM Before EOM | A Start of Message was received when an End of Message was expected from the Fibre Channel bus. | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                      | None.                                                                                                               |

**Table 5-57.** Explanation of **rept-imt-info:report=hiprerr** Statistics

| <b>IMT Statistic</b>      | <b>Explanation Of Statistic</b>                                 | <b>Probable Causes</b>                                                                                                                                                           | <b>Recommended Action</b>                                                                   |
|---------------------------|-----------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------|
| IMT Rx Packet CRC Error   | A packet received for this shelf contains a CRC error.          | Packet was transmitted incorrectly or was corrupted by another device in the system                                                                                              | Discard packet. If this problem persists, a more detailed analysis of the system is needed. |
| IMT Bypass FIFO Full      | The high-speed shelf bypass FIFO has been overflowed with data. | Fibre Channel transmit logic not operating correctly. Very high simultaneous data traffic rates on the high-speed ring and on the low-speed to high-speed path within the shelf. | System is operating above limits. Reduce data traffic. Reset FIFO.                          |
| IMT Bypass FIFO Half Full | The high-speed shelf bypass FIFO is half full.                  | Data traffic burst on the high-speed bus.                                                                                                                                        | None                                                                                        |
| IMT Rx FIFO Full          | The 128k FIFO has been overflowed with data.                    | IXP1250 not removing data from FPGA.                                                                                                                                             | Reset FIFO. Determine why IXP1250 not removing data.                                        |
| IMT Rx FIFO Half Full     | The 128k FIFO has gone half full with data.                     | Large burst of traffic on high-speed ring.                                                                                                                                       | None                                                                                        |
| IMT Tx FIFO Full          | The high-speed transmit FIFO has been overflowed with data.     | The Fibre Channel transmit logic is not operating.<br>The 106.25MHz is not operating.<br>The data in the FIFO is incorrectly formatted (no EOM).                                 | Reset Tx FIFO.                                                                              |
| IMT Tx FIFO Half Full     | The high-speed transmit FIFO is half full with data.            | High burst rate or multiple large packet transmissions from IXP1250.                                                                                                             | None                                                                                        |
| IXP Rx FIFO Full          | IXP1250 FIFO has been overflowed with data.                     | IXP1250 not removing data from the FPGA.                                                                                                                                         | Reset the IXP1250 FIFO.                                                                     |

**Legend**

IMT Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.**STATISTIC**—The error statistic type for the IMT buses A and B.**BUS A VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.**BUS B VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**MISC SPEED STATISTICS**—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**BUCKET SUMMARY**—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the **rept-imt-info** command.)**CUMULATIVE**—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HMUX Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).**MISC SPEED STATISTIC**—The miscellaneous error statistic type.

**Bus A**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

**Bus B**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

HIPR Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.

**LOC**—The card location (shelf and slot) for which information is displayed.

**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**MISC SPEED STATISTIC**—The miscellaneous error statistic type.

**Bus A**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

**Bus B**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

## rept-imt-lvl1

## Report IMT Level 1

Use this command to display the IMT level 1 statistics for a card or a range of cards. If more than one card is specified, a summary report of totals for all cards can be generated.

**Keyword:** `rept-imt-lvl1`

**Related Commands:** `clr-imt-stats`, `conn-imt`, `disc-imt`, `rept-imt-info`, `rept-imt-lvl2`, `rept-stat-imt`, `rmv-imt`, `rst-imt`, `tst-imt`

**Command Class:** System Maintenance

### Parameters

**:e=** (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 7-4 on page 7-25 to map the values by card location).

**Range:** **0-251**

The value can be specified in decimal (**0–251**) or hexadecimal (**h'00–h'fb**).

**Default:** If the start address (**s**) value is specified, the **e** parameter default value is the specified **s** parameter value.

If the **s** parameter is not specified, the **e** parameter is not specified and the **sloc** parameter must be specified.

**:sloc=** (optional)

End location. Specifies the card location of the last card in the range.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** If **sloc** is specified—current **sloc** value; displays information for one card  
If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

**:r=** (optional)

Report type value

**Range:** **full, stats, summary**

**full**—Displays information for each card along with a summary report.

**stats**—Displays only individual card statistics.

**summary**—Displays the summary portion of the report.

**Default:** **full**

**:s=** (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 7-4 on page 7-25 to map the values by card location).

**Range:** **0-251**

The value can be specified in decimal (**0-251**) or hexadecimal (**h'00-h'fb**).

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** If **eloc** is specified—current **eloc** value

If **eloc** is not specified—**1201**, which corresponds to IMT address 0 (**s=0**).

**:trm=** (optional)

The serial port (printer location) where the report is to be sent.

**Range:** **1-16**

**Default:** Report displays on the terminal where the command was issued

### Example

```
rept-imt-lvl1:s=00:e=01
```

### Dependencies

Only one report status command can be in progress at a time.

Either the start address (**s** parameter) or the start location (**sloc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The **rept-imt-lvl1** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl2**, **tst-imt**.

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

### Notes

Table 5-58 maps each card location to the decimal and hexadecimal values that can be specified for the **s** and **e** parameters.

**Table 5-58.** Hexadecimal/Decimal Values for s and e parameters

| Card Location      | Hexadecimal Value | Decimal Value | Card Location | Hexadecimal Value | Decimal Value |
|--------------------|-------------------|---------------|---------------|-------------------|---------------|
| Control Shelf 11   |                   |               |               |                   |               |
| 1101               | h'f0              | 240           | 1102          | h'f1              | 241           |

### Legend

**CARD**—The IMT address of the card in hexadecimal

**ELAPSED TIME ( day - h:m:s )**—The amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the **clr-imt-stats** command. This is shown in the format **day - h:m:s**, where **day** is the number of days that have elapsed, and **h:m:s** is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).

**COUNT**—The IMT level 1 statistics displayed in this report.

**BUS A VALUE** and **BUS B VALUE**—The values of the IMT level 1 statistics on IMT bus A and IMT bus B.

Table 7-5 describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Safety Packets are included in the counts:

**Table 5-59. rept-imt-lvl1 Statistics Explanation**

| <b>IMT Statistic</b>               | <b>Explanation Of Statistic</b>                                                                                                                | <b>Probable Causes</b>                                                         | <b>Recommended Action</b>                                                                                                                                                                         |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Transmit Packet                    | Number of transmitted IMT packets                                                                                                              | N/A                                                                            | N/A                                                                                                                                                                                               |
| Transmit Byte                      | Number of transmitted IMT Bytes                                                                                                                | N/A                                                                            | N/A                                                                                                                                                                                               |
| Receive Packet                     | Number of received IMT Packets                                                                                                                 | N/A                                                                            | N/A                                                                                                                                                                                               |
| Receive Byte                       | Number of received IMT Bytes                                                                                                                   | N/A                                                                            | N/A                                                                                                                                                                                               |
| Receive Packet with CRC Error      | Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware                                                    | Card insertion, removal, or boot. Might occur infrequently in a normal system. | <ul style="list-style-type: none"> <li>• None if card has booted or was just inserted.</li> <li>• Contact Tekelec Technical Services if count is excessive in relation to other cards.</li> </ul> |
| Receive Packet with Format Error   | Occurs when the Start of Message byte of the IMT packet is followed by unexpected data. Detected by hardware.                                  | Card insertion, removal, or boot                                               | <ul style="list-style-type: none"> <li>• None if card has booted or was just inserted.</li> <li>• Contact Tekelec Technical Services if count is excessive in relation to other cards.</li> </ul> |
| Receive Packet with Invalid Length | Card received an IMT packet where the actual length of the packet did not match the length indicated in the length field. Detected by software | Card insertion, removal, or boot                                               | <ul style="list-style-type: none"> <li>• None if card has booted or was just inserted.</li> <li>• Contact Tekelec Technical Services if count is excessive in relation to other cards.</li> </ul> |

Table 5-59. rept-imt-lvl1 Statistics Explanation

| IMT Statistic                  | Explanation Of Statistic                                                     | Probable Causes                                      | Recommended Action                                                                                                                                                                                |
|--------------------------------|------------------------------------------------------------------------------|------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary Control Receive Error  | Corrupted packet.<br>Detected by hardware                                    | Card insertion, removal, or boot                     | <ul style="list-style-type: none"> <li>• None if card has booted or was just inserted.</li> <li>• Contact Tekelec Technical Services if count is excessive in relation to other cards.</li> </ul> |

**rept-imt-lvl2****Report IMT Level 2**

Use this command to display the IMT level 2 statistics for a card. This report displays IMT traffic statistics for either one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the **loc** or **l** parameters), whose statistics pool is queried for report information, and another card (specified with the **sloc** or **s** parameter).
- Report statistics between the source card and a range of cards (specified with both the **sloc** and **eloc** or the **s** and **e** parameter combinations).

**Keyword:** rept-imt-lvl2

**Related Commands:** clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl1, rept-stat-imt, rmv-imt, rst-imt, tst-imt

**Command Class:** System Maintenance

**Parameters**

**:b=** (optional)

IMT bus identification.

**Range:** **a, b, both**

**a**—Displays statistics for IMT bus A.

**b**—Displays statistics for IMT bus B.

**both**—Displays statistics for both IMT busses, A and B.

**Default:** **both**

**:e=** (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 7-4 on page 7-25 to map the values by card location).

**Range:** **0-251**

The value can be specified in decimal (**0–251**) or hexadecimal (**h'00–h'fb**).

**Default:** If the **s** parameter is specified, the default is the **s** parameter value.

If the **s** parameter is not specified, the default is **251**.

**:eloc=** (optional)

End location. Specifies the card location of the last card in the range.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** If **sloc** is specified—current **sloc** value; displays information for one card

If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

**:l=** (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for report information.

**Range:**       **0-251**

(See the *Installation Manual – EAGLE 5 ISS* for an illustration of the card locations.)

**:loc=** (optional)

Source card location. The location of the card whose "statistics pool" is to be queried for report information.

**Range:**       **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:s=** (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 7-4 on page 7-25 to map the values by card location).

**Range:**       **0-251**

The value can be specified in decimal (**0-251**) or hexadecimal (**h'00-h'fb**).

**Default:**     If **e** is specified—current **l** parameter value.

If **e** is not specified—**0**.

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range.

**Range:**       **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:**     If **eloc** is specified—current **sloc** value.

If **eloc** is not specified—IMT address 0 (**s=0**).

**:trm=** (optional)

The serial port (printer location) where the report is to be sent.

**Range:**       **1-40**

**Default:**     The report displays on the terminal where the command was issued.

## Example

```
rept-imt-lvl2:l=00:s=00:e=02:b=a
```

## Dependencies

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

The **rept-imt-lvl2** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **tst-imt**.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified; but not both at the same time.

This command cannot be entered during IMT statistics collection following an hourly boundary.

## Notes

None

## Output

If the source card location falls within the range of cards specified with the **sloc** and **eloc** parameters or the **s** and **e** parameters, the output report for the source card will show zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports only the values or pegs received or transmitted across the IMT bus.

In the following example, the output for the source card location (**loc=1213**) is shown in column 0a (the equivalent card location expressed as a hexadecimal digit). The 0a column displays zeros because **loc=1213**, falls within the range specified for the start and end card location (**sloc=1211** and **eloc=1215**). (Note that the Receive FSN row displays a value of **1**, which is not a count, but rather the initial sequence number of the FSN that the source card location expects to receive).

Columns 09 and 0b display zeros because these slots are not provisioned with any card (the adjacent card slots (08 and 0c) contain DCM cards).

*Legend*

**CARD**—The IMT address of the card location specified by the **I** parameter in this command in hexadecimal.

**BUS**—The IMT bus for which the IMT level 2 statistics are being reported.

**FIELD**—The IMT level 2 statistics displayed in this report.

**00 - EF**—The IMT address of the cards on the IMT bus in hexadecimal.

**LINK STATUS**—The status of the link, either ALGN (aligned) or OS (out of service).

**OS COUNT**—The number of times the link has cycled between being aligned and being out of service.

**TRANSMIT BSN**—The number of BSNs transmitted.

**TRANSMIT FSN**—The number of FSNs transmitted.

**RECEIVE BSN**—The number of BSNs received.

**RECEIVE FSN**—The sequence number for the next FSN that the source card location expects to receive.

**UNACK MESSAGES**—The number of unacknowledged messages received.

**INVALID LENGTH**—The number of messages received with invalid length indicators.

**INVALID RX BSN**—The number of invalid BSNs received.

**INVALID RX FSN**—The number of invalid FSNs received.

**INVALID LSSU**—The number of invalid LSSUs received.

**INVALID ASU**—The number of invalid ASUs received.

**RTB ADDRESS**—The address of the retransmission buffer, in hexadecimal.

**AVERAGE ACK TIME**—The average amount of time for an acknowledgment, in milliseconds.

**MINIMUM ACK TIME**—The minimum amount of time for an acknowledgment, in milliseconds.

**MAXIMUM ACK TIME**—The maximum amount of time for an acknowledgment, in milliseconds.

**rept-meas****Report Measurements**

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

ITU gateway measurements are done for **stp** and, on a per-linkset basis, for **lnkset**, **lsonismt**, **lsdestni**, and **lsorigni** entity types.

**Keyword:** **rept-meas**

**Related Commands:** **chg-meas**, **copy-meas**, **rept-ftp-meas**, **rtrv-meas-sched**

**Command Class:** Link Maintenance

**Parameters**

**:enttype=** (mandatory)

The entity type to report on.

**Range:** **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **originnc**, **stp**, **stplan**, **tt**

**link**—Measurements for signaling links

**lnkset**—Measurements for linksets

**lnp**—Measurements for local number portability

**lsdestni**—Measurements for linkset destination network identifiers

**lsonismt**—Measurements for ISUP message type screening  
**lsorigni**—Measurements for linkset originating network identifiers  
**mapscrn**—Measurements for GSM MAP message screening  
**np**—Measurements for INP and G-Port  
**origni**—Measurements for originating network identifiers greater than 5  
**originine**—Measurements for originating network identifiers (less than 5, small networks) for network clusters  
**stp**—Measurements for all nodes  
**stplan**—Measurements for TCP/IP links.  
**tt**—Measurements for translation types

**:type=** (mandatory)

The type of measurement report.

**Range:** **avl, avld, avldth, comp, gtwy, mtc, mtc, mtc, nm, rbase, systot**

**avl**—Availability measurements

**avld**—Daily availability measurements

**avldth**—Day to hour availability measurements.

**comp**—Component measurements

**gtwy**—Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

**mtcd**—Daily maintenance measurements

**mtcdth**—Day-to-hour maintenance measurements

**mtch**—Hourly maintenance measurements

**mtcs**—Link/linkset maintenance status

**nm**—Network management, on-demand

**rbase**—Schedule-report type record base measurements

**systot**—STP system totals

**:appl=** (optional)

The GPL to report measurements on. This parameter can be used only with the **stplan-avl** (**enttype=stplan:type=avl**) measurement report. The **rtrv-gpl:gpl=all** command can be entered to list all valid applications.

**Range:** *xxxxxxxx*

**Default:** No value given.

**:day=** (optional)

The specific day of the week for daily LNP measurement reports.

**Range:** **mon, tue, wed, thu, fri, sat, sun**

**Default:** The previous single day report is generated.

**:hh=** (optional)

The specific half-hour interval. The **hh** parameter implies the ending time for the collection interval; for example, **hh=0300** generates a report for **2:30-3:00**.

**Range:** *hhmm* where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

**Default:** The **hh** parameter value is not given.

**:link=** (optional)

The link on the card specified in the **loc** parameter

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** The **link** parameter value is not given.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** The **loc** parameter value is not given.

**:lsn=** (optional)

The name of the linkset for which link or linkset measurements are reported.

**Range:** ayyyyyyyyy  
1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** The **lsn** value is not given.

**:nc=** (optional)

The network cluster for the specified GTWY measurement report.

**Range:** 0-255

**Default:** The **nc** parameter value is not given.

**:ni=** (optional)

The network indicator for the specified GTWY measurement report.

**Range:** 1-255

**Default:** The **ni** parameter value is not given.

**:nzo=** (optional)

Print non-zero measurements only.

**Range:** yes, no

**Default:** yes for types **avl**, **avld**, and **avldth**.  
This parameter is not used with the other report types.

**:period=** (optional)

The relative time period to report.

**Range:** last, specific, active, all  
**last**—The previous collection interval  
**specific**—A specific half-hourly interval (specified with the **hh** parameter)  
**active**—The current collection interval  
**all**—All collection intervals.

**Default:** The **period** parameter value is not given.

**:qh=** (optional)

The specific quarter-hour interval. The **qh** parameter implies the ending time for the collection interval; for example, **qh=0315** generates a report for **3:00-3:15**.

**Range:** hhmm where **hh** = 00-24 (hour) and **mm** = 00, 15, 30, or 45 (minute)

**Default:** The **qh** value is not given.

**:trm=** (optional)

The serial port (printer location) where the report is to be sent.

**Range:** 1-16

**Default:** The **trm** value is not given.

**:tt=** (optional)

A specific translation type to be reported.

**Range:** 0-255

**Default:** The **tt** parameter value is not given.

**Example**

```

rept-meas:type=systot:enttype=stp
rept-meas:type=comp:enttype=lnkset:lsn=sp1
rept-meas:enttype=link:type=avl:loc=1201:link=a
rept-meas:enttype=lnp:type=mtcd
rept-meas:enttype=lnp:type=mtch:period=last
rept-meas:enttype=lnp:type=mtch:period=specific:hh=1300
rept-meas:enttype=lnp:type=mtcd:period=specific:day=tue
rept-meas:enttype=stplan:type=avl:appl=atmansi
rept-meas:type=systot:enttype=tt:tt=26
rept-meas:type=mtcd:enttype=mapscrn
rept-meas:type=mtch:enttype=mapscrn

```

**Dependencies**

Only one **rept-meas** command can be in progress at any one time.

The valid parameter combinations depend on the report type specified. These combinations are shown in Table 5-60. An X in a cell indicates that the parameter is valid for the report type shown.

When the Enhanced GSM MAP Screening (EGMS) feature is turned on, this command cannot be used to generate EGMS measurements reports.

The entity specified by the **loc**, **port**, or **lsn** parameter must be in the database.

The link specified by the **loc** and **link** parameters must already be defined in the database.

When **enttype=link** is specified, the card in the location specified by the **loc** parameter must be a LIM.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress

- When report type **mtcd** is specified
- When report type **mtcdth** is specified

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

When **enttype=lnp**, only **mtcd** and **mtch** can be specified for the **type** parameter.

If **nc** is specified for **enttype=origninc** reports, **ni** must also be specified.

If **ni** is specified for **enttype=origni** reports, measurements data must be available at the time the command is entered.

The **day** parameter can be specified only for report type **mtcd** and entity types **lnp** and **mapscrn**.

The **period=all** parameter can be specified only for **type=avl** and **enttype=lnp:type=mtcd** reports.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **enttype=lnp** parameter can be specified.

The GSM Map Screening feature (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) must be turned on before the **enttype=mapscrn** parameter can be specified.

Either the G-Port feature or the INP feature must be turned on before the **entity=np** parameter can be specified.

A primary MCPM card must be available when the Measurements Platform collection option is enabled and this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the **qh** parameter can be specified.

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld**, **mtcd**, **nm**, **rbase**, and **mtcs** are excluded with message "E2307: QH or HH is not valid for this TYPE").

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**mtcd** and **nm** are excluded with message "E2307: QH or HH is not valid for this TYPE").

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, or the day parameter cannot be specified.

When the **period=active** parameter or the **period=all** parameter is specified, the **hh** and **qh** parameters cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified. The **hh**, **qh**, and **day** parameters can be specified only if the **period=specific** parameter is specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only half hours ending in **00**, such as **0100**, **0200** or **0300**).

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only quarter hours ending in **00**, such as **0100**, **0200** or **0300**).

The **hh** parameter and the **qh** parameter cannot be specified when report type **avld**, **mtcd**, **nm**, **rbase**, or **mtcs** is specified.

If the **link** parameter is specified, the **loc** parameter must be specified.

The **lsn** parameter cannot be specified in the same command with the **loc** parameter or the **port** parameter.

When entity type **link** is specified, either the **loc** and **port** parameters or the **lsn** parameter must be specified.

The **appl** parameter can be specified only when the **enttype=stplan** and the **type=avl** parameters are specified.

When the **appl** parameter is specified, the **period=active** parameter and the **period=all** parameter cannot be specified.

The **period=active** parameter cannot be specified when the **enttype=stp** parameter or the **enttype=tt** parameter is specified.

The **ni** parameter cannot be specified for ITU linksets (for **enttype=lsdestni** and **enttype=lsorigni** reports)

The **lsn** parameter cannot be specified with the following parameters: **enttype=stp/tt/stplan/origni/origninc/lnp/np/mapscrn** or **type=systot**.

For entity type **lnkset**, the **lsn** parameter must be specified, regardless of whether the value of the **lsn** parameter is an ANSI or an ITU linkset.

For entity type **avl**, if **period=all** is specified, the **loc** and **port** parameters must be specified.

The **nzo** parameter is used only for entity types **avl**, **avld**, and **avldth**.

The **loc** and **lnkset** parameters cannot be specified in the same command. Either the **loc** parameter or the **lnkset** parameters can be specified, but not both. For example, the following command is not a valid parameter combination: **rept-meas:type=mtcd:enttype=link:loc=1211:link=a:lnkset=nc2785**

The **appl** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp**, the **trm** parameter cannot be specified because LNP measurements can be written only to the FTA. To retrieve this data, use the procedure described with the **act-file-trns** command information.

For the **stplan-avl** reports (**enttype=stplan** and **type=avl** parameters), if the **appl** parameter is specified, the **period=active** and **period=all** parameters cannot be specified.

The **type=systot** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp** and **type=mtch**, only **last** and **specific** can be specified for the **period** parameter.

When **enttype=lnp**, **nzo=yes** cannot be specified.

When **enttype=lnp**, the **appl**, **loc**, **port**, **lsn**, **ni**, and **nc** parameters cannot be specified.

The **tt** parameter must be specified when **enttype=tt**. The only time the **tt** parameter is valid is when it is specified with **enttype=tt**.

If the **type=gtwy:enttype=lsorigni/lsdestni/sonismt** parameter combination is specified, the **ni** parameter cannot be specified for ITU linksets. The **ni** parameter is allowed only for ANSI linksets.

If the **type=gtwy:enttype=stp** parameter combination is specified, no additional parameters may be specified.

If the **type=gtwy:enttype=lsdestni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=lsorigni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=sonismt** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

**Table 5-60.** Valid Parameter Combinations for the **type** Parameter

| Parameter Value | Report Types (type parameter) |      |      |        |      |      |    |     |      |        |      |       |  |
|-----------------|-------------------------------|------|------|--------|------|------|----|-----|------|--------|------|-------|--|
|                 | systot                        | comp | mtcd | mtcdth | mtch | mtcs | nm | avl | avld | avldth | gtwy | rbase |  |
| <b>enttype=</b> |                               |      |      |        |      |      |    |     |      |        |      |       |  |
| stp             | X                             |      | X    | X      |      | X    |    |     |      |        | X    | X     |  |

| period=         |                               |      |      |        |      |      |    |     |      |        |      |       |
| last            | X                             | X    | X    | X      | X    |      | X  | X   | X    | X      | X    |       |
| specific        | X                             | X    |      |        | X    |      |    | X   |      |        | X    |       |
| active          |                               | X    |      |        |      | X    | X  | X   |      |        |      | X     |
| all             |                               |      | X    |        |      |      |    | X   |      |        |      |       |
| nzo             |                               |      |      |        |      |      |    | X   | X    | X      |      |       |

## Notes

The *Maintenance Manual* provides a description of all report parameters.

INP, GSM MAP screening, and LNP measurements are sent to the FTA (file transfer area) rather than to the EAGLE 5 ISS terminal. Refer to Chapter 2 of the *Maintenance Manual* for procedural information on accessing the FTA.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The **rept-meas** command must be entered again.

For the entity types **avld** and **avldth**, if no link or linkset is specified, all links are reported.

## Output

**rept-meas:type=systot:enttype=stp**

```
rlghncxa03w 06-05-27 16:53:22 EST EAGLE 35.0.0
Measurements Report will be generated.
rlghncxa03w 06-05-27 16:53:22 EST EAGLE 35.0.0
TYPE OF REPORT: STP SYSTEM TOTAL MEASUREMENTS ON STP
REPORT PERIOD: LAST
REPORT INTERVAL: 06-05-27 12:00:00 THRU 12:29:59
```

```

### Legend

**TYPE OF REPORT**—The type of report, defined by the **type** and **enttype** parameters.

**REPORT PERIOD**—The date and the time period for which the report was generated.

**REPORT INTERVAL**—The time period for which the report was generated.

**LINK-AVL MEASUREMENTS: LOC**—For the link reports (in this example the availability report), the card location, port, and linkset name of the link for which the report is being generated.

**LINK-COMP MEASUREMENTS: LOC**—For the link reports (in this example the components report), the card location, port, and linkset name of the link for which the report is being generated.

**LINKSET-COMP MEASUREMENTS**—For the linkset components report, the name of the linkset for which the report was generated.

**STPLAN-AVL MEASUREMENTS: LOC**—For the STPLAN availability reports, the card location for which the report is being generated.

**<ENTITY>-GTWY MEASUREMENTS**—For Gateway Measurements reports, where the **entity** value will be one of the following: STP, LNKSET, ORIGNI, ORIGINC, LSDESTNI, LSONISMT, LSORIGNI, depending on what is being reported.

The remainder of the items displayed are the measurements that were made. For more information about these measurements, refer to the *Maintenance Manual*.

## rept-stat-alm

## Report Status Alarm

Use this command to provide status of all alarms.

**Keyword:** `rept-stat-alm`

**Related Commands:** `dact-alm-trns`, `rept-stat-clk`, `rept-stat-trbl`, `rtrv-obit`, `rtrv-trbl`

**Command Class:** System Maintenance

## Parameters

**:cli=** (optional)

CLLI string. This parameter allows the user to see only alarms that pertain to a particular CLLI.

**Range:** `ayyyyyyyyy`

**:dev=** (optional)

Device. This parameter provides the type of device for which alarms are displayed. The

**display=inhb** parameter must be specified when this parameter is specified.

**Range:** `applsock`, `as`, `card`, `cdt`, `clock`, `dlk`, `ls`, `lmsconn`, `route`, `seasx25`, `slk`, `trm`, `rtx`

**:display=** (optional)

Type of alarms to be displayed. When the **disply=inhb** parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The **dev** parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

**Range:** `inhb`

**:dur=** (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the **display=inhb** parameter is specified.

**Range:** `perm`, `temp`, `timed`

**:edate=** (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

**Range:** `101-991231`

Specify the date in the format *year*, followed by *month*, followed by *day*.

## Example

`rept-stat-alm`

`rept-stat-alm:display=inhb:dev=card`

`rept-stat-alm:display=inhb:dur=timed`

`rept-stat-alm:display=inhb:dur=timed:edate=040520`

`rept-stat-alm:display=inhb:cli=slkset1:dev=ls`

`rept-stat-alm:display=inhb`

`rept-stat-alm:display=inhb:dur=timed`

`rept-stat-alm:display=inhb:dur=timed:edate=040520`

`rept-stat-alm:display=inhb:cli=slkset1:dev=ls`

## Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **edate** parameter can be specified only if the **dur=timed** parameter is specified.

The **dev** parameter can have only the values **slk**, **ls**, or **route** if the **cli** parameter is specified.

The **dur** parameter must be compatible with the specified device.

The **dev** parameter can be specified only if the **display=inhb** parameter is specified.

The specified **elli** parameter value must exist in the DSTN table.

The **dur** parameter value must be **timed** if the **edate** parameter is specified.

## Notes

None

## Output

The following example shows output when the system is clean and before a maintenance baseline has been established:

### rept-stat-alm

```
rlghncxa03w 06-05-27 15:00:53 EST EAGLE 35.0.0

Command Completed.

;

The following example includes the Alarm Inhibit report for multiple device types. It includes point codes with point code subtype prefixes, and exception routes that require a second line of display to uniquely identify the exception class/criteria of the routes. A plus sign (+) following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

Command Completed.

**Legend**

**ALARM TRANSFER**—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.

**ALARM MODE**—Displays whether the critical, major, and minor alarms are silent or audible

**ALARM FRAME 1**—The number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1).

**ALARM FRAME 2**—The number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2).

**ALARM FRAME 3**—The number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3).

**ALARM FRAME 4**—The number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4).

**ALARM FRAME 5**—The number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5).

**ALARM FRAME 6**—The number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6).

**ALARM FRAME OAP**—The number of critical, major, and minor alarms detected in the OAP Frame.

**ALARM FRAME GPF**—The number of critical, major, and minor alarms detected at the MPS (multi-purpose server). If the LNP ELAP Configuration feature is turned on, the number includes alarms for any applications running on the MPS. If the G-Flex, G-Port, or INP feature is turned on, the number includes alarms for any applications running on the GSM subsystem and the DSM/EPAP links.

**PERM. INH. ALARMS**—The number of alarms that are permanently inhibited per alarm level.

**TEMP. INH. ALARMS**—The number of alarms that are temporarily inhibited per alarm level.

**TIMED. INH. ALARMS**—The number of alarms that are timed inhibited per alarm level.

**ACTIVE ALARMS**—The number of alarms still active per alarm level.

**TOTAL ALARMS**—The total number of alarms per alarm level. The inhibited alarm count plus the active alarm count equals the total alarm count.

**CRIT**—Critical alarms with silent/audible indicator.

**MAJOR**—Major alarms with silent/audible indicator.

**MINOR**—Minor alarms with silent/audible indicator.

Alarm Inhibit Report:

**DEVICE**—The device for which alarms are currently inhibited. Only devices that are alarm inhibited are shown.

**ELEMENT**—The element of the device for which alarms are inhibited (such as card location, port, routing key, socket or association name)

**DURATION**—Indicates whether the device is alarm inhibited permanently or temporarily or for a specific length of time

**INH LVL**—Level in which devices are alarm inhibited (Critical, Major, Minor). The **inh-alm** command defaults the level to Major. Devices cannot be alarm inhibited at a critical level unless the **chg-stpopt** command **critalminh** parameter is turned on.

**CUR LVL**—Level of the current alarm on the device (Critical, Major, Minor). "None" indicates that there is currently no alarm on the device (DUR should show "PERM." A plus sign (+) seen following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

**DATE**—The date on which a timed inhibited alarm will automatically clear at the specified time

**TIME**—The time at which a timed inhibited alarm will automatically clear on the specified date

## rept-stat-applsock

## Report Status Application Socket

Use this command to display the status of the IP application sockets.

**Keyword:** **rept-stat-applsock**

**Related Commands:** **chg-appl-sock, ent-appl-sock, rtrv-appl-sock**

**Command Class:** System Maintenance

### Parameters

**:lhost=** (optional)

Local host name. The logical name assigned to the local host device.

**Range:** aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z, A-Z, 0-9, -** (dash), **.** (period)

**Default:** Current value

**:port=** (optional)

The signaling link port associated with this socket.

**Range:** **a, b, a1, b1, a2, b2, a3, b3**

Not all card types support all **port** parameter values.

See Table A-1 for valid **port** parameter range values for each type of card that can have signaling links.

**Default:** Current value

**:rhost=** (optional)

Remote host name. The logical name assigned to the remote host device.

**Range:** aaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaaa

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z, A-Z, 0-9, -** (dash), **.** (period)

**Default:** Current value

**:sname=** (optional)

Socket name. The name of the IP application socket that is to be reported.

**Range:** aaaaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter

**Default:** All IP application sockets are reported

### Example

**rept-stat-applsock**

**rept-stat-applsock:port=b**

### Dependencies

The **sname** parameter value, if specified, must exist in the Socket table.

### Notes

This command displays the primary states (PST) and the secondary state (SST). Primary states are:

IS-NR—In-service normal

IS-ANR—In-service abnormal (congested)

OOS-MT—Out of service

OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Secondary states are:

ALMINH—Alarm inhibited

OOS—Out-of-service

NEA—Near-end allowed

FEA—Far-end allowed

NEP—Near-end prohibited

FEP—Far-end prohibited

### Output

**rept-stat-as****Report Status AS Association**

Use this command to generate a report of the Application Server (AS) association status.

**Keyword:** **rept-stat-as**

**Related Commands:** **chg-as**, **ent-as**, **rtrv-as**

**Command Class:** System Maintenance

**Parameters**

**:aname=** (optional)

Association name to report on. When the **aname** parameter is specified, the **rept-stat-as** command will report the ASP states for a given association in all of the AS's that it is assigned to.

**Range:** *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

**:asname=** (optional)

Application Server name; the AS name to report on. When the **asname** parameter is specified, the **rept-stat-as** command will report the PST, SST, ASP state, and ASP-ID for each association in the AS.

**Range:** *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**Example**

**rept-stat-as**

**Dependencies**

If an association is specified in the command, the specified association must exist in the AS table.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

**Output****rept-stat-as**

```
rlghncxa03w 04-02-04 12:57:21 EST EAGLE 34.0.0
ASNAME      PST      SST
m3ua0001    OOS-MT    AS-INACTIVE
m3ua0002    IS-NR     AS-ACTIVE
m3ua0003    OOS-MT-DSBLD AS-DOWN
m3ua0004    IS-ANR    AS-PENDING
```

Command Completed.

;

**rept-stat-as:asname=m3ua0001**

```
rlghncxa03w 05-02-04 12:57:21 EST EAGLE 34.0.0

## rept-stat-asp

## Report Status ASP

Use this command to generate a report of the Application Server Process (ASP) status.

**NOTE: This command is obsolete.**

**Keyword:** **rept-stat-asp**

**Related Commands:** **ent-asp, rtrv-asp**

**Command Class:** System Maintenance

### Parameters

**:aspname=** (optional)

Application Server Process (ASP) name to report on.

**Range:** *aaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

### Example

**rept-stat-asp**

### Dependencies

If an ASP name is specified in the command, the specified name must exist in the ASP table.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the command is specified without a parameter, status for all ASPs is displayed.

This command displays the following states: ACTIVE, DOWN, UP.

### Output

```

rept-stat-asp
rlghncxa03w 05-07-04 12:57:21 EST EAGLE 30.0.0
ASP      ASP ID      PST      SST
asp1     0x00000001     IS-NR     ASP-ACTIVE
asp2     undefined        OOS-MT     CONNECTING
asp3     0x00000003     OOS-MT     ASP-INACTIVE
asp4     undefined        OOS-MT     ASP-INACTIVE
asp5     undefined        OOS-MT     ASP-DOWN
Command Completed.
;

```

## rept-stat-assoc

## Report Status SCTP Association

Use this command to generate a report of the SCTP association's status.

**Keyword:** **rept-stat-assoc**

**Related Commands:** **chg-assoc**, **ent-assoc**, **rtrv-assoc**

**Command Class:** System Maintenance

### Parameters

**:aname=** (optional)

Name of association to report on.

**Range:** *aaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**:lhost=** (optional)

The Local Host name as defined in the IP Host table.

**Range:** *////////////////////*

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

**:link=** (optional)

The signaling link associated with this socket.

**Synonym:** **port**

**Range:** **a, b, a1-a7, b1-b7**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

**:rhost=** (optional)

Name of Remote Host as defined in the IP Host table.

**Range:** *////////////////////*

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

### Example

**rept-stat-assoc**

**rept-stat-assoc:aname= a23456789012345**

### Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command displays the primary states (PST) and the secondary state (SST).

Primary states are:

IS-NR—In-service normal

IS-ANR—In-service abnormal (congested)

OOS-MT—Out of service

OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Secondary states are:

ASP ACTIVE—(Not valid for M2PA associations)

ASP DOWN—(Not valid for M2PA associations)

ASP UP—(Not valid for M2PA associations)

Connecting

Established—Valid only for M2PA associations

## Output

### rept-stat-assoc

| 0                                                                    | 1    | 2    | 3    | 4      | 5           | 6          | 7 |

## rept-stat-card

## Report Status Card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

**Keyword:** rept-stat-card

**Related Commands:** dlt-card, ent-card, init-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

### Parameters

**:appl=** (optional)

Application. Report status on cards running the specified application.

**Range:** xxxxxxxx

**atmansi**—The application is used by the LIM cards to support the ATM high-speed signaling link feature.

**atmitu**—The application is used by the E1 ATM cards to support the E1 ATM high-speed signaling link feature.

**ccs7itu**—This application is used by the LIM cards, the E1/T1 MIM card, and the HC-MIM card for ITU-TSS MTP functionality.

**ebdablm**—This application is used by the TSM card for enhanced bulk download.

**ebdadcm**—This application is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 ISS at high speed over an ethernet connection for enhanced bulk download.

**eroute**—This EAGLE Router application is used by the STC card for the EAGLE Support for application Sentinel feature.

**gls**—This application is used by the TSM cards for downloading gateway screening to LIM cards.

**ipgwi**—This application is used by the DCM card for CMIP/OSI measurement collection interface.

**eroute** —This EAGLE Router application is used by the STC card for the EAGLE 5 Integrated Monitoring Support TCP/IP point-to-point connectivity for ITU point codes. The system allows a maximum of 2 cards to be assigned the **ipgwi** application.

**iplim** —This application is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes. The system allows a maximum of 41 cards to be assigned the **iplim** or **iplimi** application if a maximum of 700 links are assigned in the

system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 1500 links are assigned in the system.

**iplimi**—This application is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes. The system allows a maximum of 41 cards to be assigned the **iplimi** or **iplim** application if a maximum of 700 links are assigned in the system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 1500 links are assigned in the system.

**ips**—This application is used by the IPSM card for the IP User Interface feature.

**mcp**—This application is used by the MCPM card for the Measurements Platform application.

**sccp**—This application is used by the TSM cards for the global title translation application.

**ss7ansi**—This application is used by the LIM cards, the E1/T1 MIM card, and the HC-MIM card for the MTP functionality.

**ss7gx25**—This application is used by the LIM cards to support X.25 functionality.

**ss7ipgw**—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 2 cards to be assigned the **ss7ipgw** application.

**stplan**—This application is used by the ACM card to support the STPLAN application.

**vsccp**—This application is used by the DSM card to support the G-Flex, G-Port, INP, and LNP ELAP Configuration features. If the G-Flex, G-Port, INP, or LNP ELAP Configuration feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

**vxwslan**—This application is used by the DCM card to support the STPLAN application.

**:links=** (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (**loc**).

**Range:** **all, equip, unequip**

**all**—Reports the maximum number of links available on the card in the specified loc

**equip**—Reports only links that are equipped

**unequip**—Reports only links that are unequipped

**Default:** **equip**

**:loc=** (optional)

Card address. The card location as stenciled on the shelf of the system.

**Range:** **1101-1117, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Default:** A status of all cards is displayed.

**:mode=** (optional)

Mode. The type of report to display (full or summary).

**Range:** **full**

**Default:** A summary report is displayed.

**:stat=** (optional)

Primary state filter. This parameter cannot be used with the **loc** or **mode** parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In service abnormal (IS-ANR)  
**dsbld**—Out of service maintenance disabled (OOS-MT-DSBLD)  
**mt**—Out of service maintenance (OOS-MT)  
**nr**—In service normal (IS-NR)

**Default:**     **all**

### Example

```
rept-stat-card
rept-stat-card:loc=1201
rept-stat-card:loc=1106:mode=full
rept-stat-card:loc=1201:mode=full
rept-stat-card:stat=alminh
rept-stat-card:loc=1109:mode=full
rept-stat-card:appl=ss7ansi
rept-stat-card:loc=1205:links=equip:mode=full
```

### Dependencies

No other command can be in progress when this command is entered.

The **mode** parameter can be specified only when the **loc** parameter is specified.

Only one of the **loc** parameter, the **stat** parameter, and the **appl** parameter can be specified in the command.

The shelf and card must be equipped.

### Notes

ATM, SS7 LIM, and X.25 cards show TVG results for SNM (signaling network management), SCCP, and SLAN traffic. SCCP cards show only SNM traffic statistics for TVG.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The **mode=full** parameter gives more information than the summary report.

In the output, the SCCP service card field shows which TSM is providing the specified card with GTT service.

The group ticket voucher (TVG) status for low-speed signaling links, ATM high-speed signaling links, and TSMs is displayed when the **mode=full** and **loc** parameters are specified. The status displayed is for the previous 5 minutes and the previous 24 hours.

A plus (+) symbol in the output indicates that the flash GPL (**bphcap**, **bphcapt**, **bpmpl**, **bpmplt**, or the **bpdcm**) currently being run has not yet been activated on the card.

E1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist, the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the **links** parameter is set to **all**, 64 links are displayed.

If the **links=unequip** parameter is specified, but the card has not been intalled or loaded, 64 unequipped links are displayed.

If the **links=unequip** parameter is specified, and the card is or has been installed or loaded, the number of links displayed is equal to 64 minus the provisioned links.

If the **links=equip** parameter is specified, only provisioned links are displayed.

## Output

The clock status fields are reported when the **mode=full** report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are ----, **Idle**, **Active**, and **Fault**. The meanings of these values are:

---- (dashes)—Undefined, card must be OOS

**Idle**—Clock is available but is not being used by the card

**Active**—Clock is available and is being used by the card

**Fault**—Clock is unavailable

**Idle** and **Active** are shown when the CLK or HS CLK distribution to the card is good. The **Active** value does not denote that the card is actually using the clock source for link alignment. Use the **rtrv-slk**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

The following example shows the output for a multi-port LIM (location 1203) card. The GPL column, which displays the GPL running on the card, enables you to differentiate between the two-port LIMDS0 and the multi-port LIM. A multi-port LIM always displays SS7ML in the GPL column. When the parameter **mode=full**, the mother board ID is displayed. The MIM type is displayed for multi-port LIM cards, while the PROM type is displayed for dual-port cards.

#### Legend

- CARD—The location of the card.
- VERSION—The version number of the application loaded on the card. Dashes ( - - - - ) in the version column indicate one of the following conditions about the card:
  - The card is configured but is not physically present in the system.
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is IS-ANR or is in the process of being loaded.
- TYPE—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- APPL—The application loaded on this card.

- PST—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- SST—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- AST—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

The group ticket voucher status is displayed in these fields: SCCP TVG RESULT (for SCCP messages), SLAN TVG RESULT (for STPLAN messages), and SNM TVG RESULT (for SNM messages). Group ticket voucher status output is displayed as a series of these letters:

**G**—Service Granted. Indicates normal system behavior.

**D**—Service Denied. Indicates an overload, but the group ticket voucher hardware and software are working correctly.

**N**—No granter in the system. For GTT or STPLAN traffic, there can be no SCCP cards or STPLAN in the system. If there are SCCP cards or STPLAN in the system, then a serious failure is indicated (hardware or software bug or hardware failure).

**H**—Hardware time-out. Indicates the hardware timed out waiting for a group ticket voucher packet to return. Group ticket voucher packets can be lost when a card is plugged in or booted. This is a serious condition if cards have not been connecting or disconnecting from the IMT. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced..

**S**—Software time-out. No result was ever returned from hardware, indicating a probable hardware failure.

**I**—Invalid result from hardware. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced.

The HW VERIFICATION CODE field is shown only in the mode=full report. ----- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

\* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

**Table 5-61.** Auto-Inhibit Hardware Verification Codes

| HW Verification Code | Card or Application Code | Description                                                 | Associated UAM Code |

**rept-stat-cdl****Report Command Driven Loopback Status**

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receive.

**Keyword:** rept-stat-cdl

**Related Commands:** act-cdl, dact-cdl

**Command Class:** Link Maintenance

## Parameters

**:link=** (optional)

SS7 signaling links. The signaling links that is being tested.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** All signaling links that are in CDL testing are displayed.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All cards containing signaling links that are in CDL testing are displayed.

**:loopback=** (optional)

Loopback test type.

**Range:** line, payload

The **payload** value is valid only on LIM-ATM and E1-ATM cards.

**Default:** All loopback tests are displayed.

## Example

```
rept-stat-cdl
```

```
rept-stat-cdl:loc=1201
```

```
rept-stat-cdl:loc=1203:link=a
```

```
rept-stat-cdl:loopback=payload
```

## Dependencies

If the **link** parameter is specified, the **loc** parameter must be specified.

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

This command is not available during upgrade.

The card location specified in the **loc** parameter cannot be reserved by the system.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information

**Output****rept-stat-cdl**

```

tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK        CDL        CDL-TIME
1102,A1    LINE       00:04:01
1201,A     PAYLOAD    01:04:11
1203,A     LINE       00:22:21
1203,B     LINE       20:04:01

1211,A     PAYLOAD    00:14:01
;

```

**Legend**

**SLK**—The card and assigned signaling link that is in CDL testing.

**CDL**—Command Driven Loopback test type (LINE or PAYLOAD).

**CDL-TIME**—The time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

**rept-stat-cdt****Report Status Customer Defined Troubles**

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

**Keyword:** **rept-stat-cdt**

**Related Commands:** **act-alm-trns, canc-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit, rtrv-trbl**

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

```
rept-stat-cdt
```

**Dependencies**

No other status command can be in progress when this command is entered.

**Notes**

These troubles are customer-defined and configured by the factory.

**Output****rept-stat-cdt**

```

rlghncxa03w 04-01-07 20:20:43 EST EAGLE 31.3.0

;

```

**Legend**

**ID**—The customer defined trouble ID number followed by the status of the customer-defined trouble.

**ALARM STATUS**—The status of the alarm for the specified device.

**rept-stat-clk****Report Status Clock**

Use this command to display the clock status summary for cards in the system.

**Keyword:** **rept-stat-clk**

**Related Commands:** **rept-stat-card**, **rept-stat-dstn**, **rept-stat-imt**, **rept-stat-ls**, **rept-stat-sccp**, **rept-stat-slk**, **rept-stat-trbl**

**Command Class:** System Maintenance

**Parameters**

**:mode=** (optional)

Display mode. When **mode=full** is specified, the "Cards with bad clock source" section of the report is displayed

**Range:** **full**

**Example**

**rept-stat-clk**

**Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Notes**

The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1-ATM, and E1/T1 MIM cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I.

The Time Slot Counter Synchronization (TSC) clock is displayed only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the **chg-feat** command.

HS clock sections are displayed only when at least 1 HS clock capable card is provisioned, or when the TDM type is TDM-GTI and the TSC Synchronization feature has been turned on. The HS clock sections of the report are the HS PRIMARY CLK, HS SECONDARY CLK, HS CLK TYPE, and HS CLK LINELEN fields at the top of the report; the HS SYSTEM CLOCK section; and the HS clock columns in the **mode=full** "Cards with bad clock source" section.

HS clock capable cards are those that can support a link provisioned to use HS Master Timing (including ATMANSI, ATMITU, and E1/T1 MIM cards). The clock status values are the same as those listed in the **rept-stat-card:mode=full:loc=xxx** report.

The "Cards with bad clock source" section is displayed when the **mode=full** report is specified. When HS clock A and B status is included in this section, cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status. The valid values for each clock status are:

-----Undefined, card must be OOS

**Idle**—Clock is available but is not being used by the card

**Active**—Clock is available and is being used by the card, but does not mean that the card is using the clock for link alignment. Use the **rtrv-sl**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

**Fault**—Clock is unavailable

## Output

The following example shows output when **mode=full** is not specified, with no HS clock sections, and when the TSCSYNC feature is not on:

### rept-stat-clk

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )
PRIMARY BITS = Active          PRIMARY BITS = -----
SECONDARY BITS = Fault         SECONDARY BITS = -----

SYSTEM CLOCK                    PST          SST          AST
OOS-MT                         Fault        -----
ALARM STATUS = No Alarms.
# Cards using CLK A = 4        # Cards with bad CLK A = 0
# Cards using CLK B = 0        # Cards with bad CLK B = 4
# Cards using CLK I = 0

Command Completed.
```

;

The following example shows output when **mode=full** is specified, with no HS clock sections, and the TSCSYNC feature is not on:

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )
PRIMARY BITS = Active          PRIMARY BITS = -----
SECONDARY BITS = Fault         SECONDARY BITS = -----

SYSTEM CLOCK                    PST          SST          AST
OOS-MT                         Fault        -----
ALARM STATUS = No Alarms.
# Cards using CLK A = 4        # Cards with bad CLK A = 0
# Cards using CLK B = 0        # Cards with bad CLK B = 4
# Cards using CLK I = 0

Cards with bad clock source:
CARD          CLK A          CLK B
1103          Active         Fault
1104          Active         Fault
1106          Active         Fault
1113          Active         Fault

Command Completed.
```

;

If the Time Slot Counter Synchronization feature (TSCSYNC) is turned on, the output includes the TSC clock status.

### rept-stat-clk

```
rlghncxa03w 04-04-07 08:51:31 EST EAGLE 31.6.0
CARD LOC = 1114 (Active )      CARD LOC = 1116 (Isolated )

#### Legend

**CARD LOC**—The card location of the TDM and the status of the MASP

**PRIMARY BITS**—The status of the primary BITS clock

**SECONDARY BITS**—The status of the secondary BITS clock

**HS PRIMARY CLK**—The status of the high-speed primary clock

**HS SECONDARY CLK**—The status of the high-speed secondary clock

Possible values for HS PRIMARY CLK and HS SECONDARY CLK status are:

---- (dashes)—Undefined or not applicable

**ACTIVE**—High-speed primary clock is valid and is the current reference being distributed by TDMx to all system shelves.

**FAULT**—High-speed primary clock source from TDMx is currently invalid.

**IDLE**—High-speed primary clock is valid, the high-speed secondary clock is the current reference being distributed by TDMx to all system shelves.

**HS CLK TYPE**—HS clock source (see the **chg-stpopts** command)

**HS CLK LINELEN**—HS clock line length (see the **chg-stpopts** command)

**TSC CLOCK**—The status of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.

**SYSTEM CLOCK**—System clock status

**PST**—The primary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—System clock alarms; "No alarms" is shown when there are no alarms.

**# CARDS USING CLK A, B, I**—The number of cards using clock A, clock B, and clock I.

**# CARDS WITH BAD CLK A, B**—The number of cards using clock A or clock B, when clock A or B is bad.

**HS SYSTEM CLOCK**—HS system clock status

**PST**—The primary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the clock. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—HS System clock alarms; "No alarms" is shown when there are no alarms.

**# CARDS USING HSCLK A, B, I**—The number of cards using high-speed clock A, B, and I.

**NOTE:** The value for the internal high-speed clock (# Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by TDMx when both BITS clock sources are invalid and then distributed to all system shelves.

The use of HSCLK I is not automatic when both the high-speed primary and secondary clocks are invalid. A LIM-ATM card must be provisioned (with the **ent-slk:atmtsel=internal** parameter) to use the high-speed internal clock.

**# CARDS WITH BAD HSCLK A, B**—The number of cards using high-speed clock A or B, when high-speed clock A or B is bad.

## rept-stat-cluster

## Report Status Cluster-Related DPC

Use this command to report summary status and statistical information for all provisioned clusters. Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

**NOTE:** This command does not support 24-bit ITU national point codes.

**Keyword:** rept-stat-cluster

**Related Commands:** chg-feat, chg-stpopts, rept-stat-cluster, rtrv-stpopts

**Command Class:** System Maintenance

## Parameters

**:dpc=** (optional)

ANSI destination point code of the cluster whose status is to be reported, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

**Synonym:** dpca

**Range:** p-, 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**Default:** Display summary for all provisioned clusters

**:mode=** (optional)

The type of display. Specify **mode=full** to display additional information for the specified DPC.

**Range:** full

**Default:** Display summary report

**:stat=** (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

**Range:** all, alminh, anr, dsbld, mt, nr

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In service abnormal (IS-ANR)

**dsbld**—Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**—Out of service maintenance (OOS-MT)

**nr**—In service normal (IS-NR)

**Default:** all

## Example

```
rept-stat-cluster
```

```
rept-stat-cluster:stat=alminh
```

```
rept-stat-cluster:stat=MT
```

```
rept-stat-cluster:dpc=20-2-*
```

```
rept-stat-cluster:dpc=20-2-*:mode=full
```

```
rept-stat-cluster:dpc=20-2-5
```

## Dependencies

If the **mode=full** parameter is specified, the **dpc/dpca** parameter must be specified.

The **stat** parameter cannot be specified with the **dpc/dpca** parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\*\** or *ni-nc-\*\*\** cannot be specified for the **rept-stat-cluster** command.

In this command, the point codes support only the private (internal) point code subtype prefix (**p-**).

## Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the **dpc/dpca** parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the **mode=full** parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format hh:mm is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "-----" are displayed.

## Output

When no parameters are specified, summary information for all of the defined cluster DPCs is shown. Note that the report shows the number of provisioned and x-list members of each cluster.

### rept-stat-cluster

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0
  DPCA      ORIG   PST    SST      AST      PROV  XLIST
  020-002-*  CLUST  IS-NR   Allowed  ACCESS    2     3
  020-020-*  CLUST  IS-NR   Allowed  ACCESS    3     5
  020-021-*  CLUST  OOS-MT  Prohibit INACCESS   5     2
  020-022-*  CLUST  IS-NR   Allowed  ALMINH    2     3
```

Command Completed.

;

When a provisioned cluster member DPC is specified, the report shows status information for the specified DPC plus route information.

### rept-stat-cluster:dpc=20-2-1

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0
  DPCA      ORIG   PST    SST      AST

Command Completed.

;

If a circular routing alarm is raised for a cluster DPC (that is, no x-list entry could be created for the cluster member), then specifying the **dpc** and **mode=full** parameters displays information pertinent to the cluster member that is experiencing the circular routing condition. This information may be useful in correcting the problem. The value for the MEMBER field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

**NOTE:** The circular routing member information shown in this output report displays as \*\*\*-\*\*\*-\*\*\* if the specified destination point code is not a cluster destination point code or the information is not known by maintenance at the time the report is generated.

**rept-stat-cluster:dpc=20-2-\*:mode=full**

**Legend**

**ORIG**—Indicates the origination of the destination point code being reported. The possible values that can appear in the column are:

**CLUST**—Entry is a provisioned cluster (*ni-nc-\**) DPC

**PROV**—Entry is a provisioned cluster member (*ni-nc-nem*)

**X-LIST**—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member

**PST**—The primary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**X-REASON**—Indicates the reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:

**RT**—X-LIST entry created due to routing

**CG**—X-LIST entry created due to congestion

**CR**—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the **mode=full** detailed output report displays as "-----" if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

## rept-stat-db

## Report Status Database

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

When the G-Flex, G-Port, INP, or LNP ELAP Configuration feature is turned on, the status of the MPS databases and VSCCP cards is displayed.

**Keyword:** **rept-stat-db**

**Related Commands:** **chg-db, copy-meas, disp-disk-dir**

**Command Class:** Database Administration

### Parameters

**:db=** (optional)

The report section or sections to display in the output. The content of each section depends on the specified or default value of the **display** parameter, MPS output appears only if a feature that uses the MPS is turned on in the system (G-Flex, G-Port, INP, or the LNP ELAP Configuration controlled feature).

**Range:** **all, mps, stp**

**all**—Displays database and card output for both the STP and MPS report sections.

**mps**—Displays only the database and card output for the MPS report section.

**stp**—Displays only the database and card output for the STP report section.

**Default:** **all**

**:display=** (optional)

The type of output

**Range:** **all, brief, except, version**

**all**—Displays the operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

**brief**—Displays the operational status of the databases in the active and standby MASP, and of the MPS databases if a feature that uses the MPS is turned on.

**except**—Displays the operational status information contained in the **display=brief** output along with the cards whose database level does not match the active fixed disk current partition or active MPS database.

**version**—Displays all of the same information that is displayed with the **display=all** parameter except that the individual database status column is replaced with the database format version and status. In addition, details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the **rept-stat-mps** command.

**Default:** **brief**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1114, 1116, 1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

```
rept-stat-db
rept-stat-db:display=brief
rept-stat-db:display=except
rept-stat-db:display=all
rept-stat-db:display=version
rept-stat-db:loc=1207
rept-stat-db:db=all
rept-stat-db:db=stp
rept-stat-db:db=mps
```

### Dependencies

The **display** and **loc** parameters cannot be specified at the same time.

The **db** and **loc** parameters cannot be specified at the same time.

The following card locations are not valid for this command: 1113, 1115, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The G-Flex, G-Port, INP, EIR, or LNP ELAP Configuration feature must be turned on before the **db=mps** parameter can be specified.

### Notes

If the **display** parameter, the **db** parameter, or the **loc** parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the **rept-stat-db** command with no parameters specified or with the **display=brief** parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable cartridge (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the G-Flex, G-Port, EIR, or INP feature is turned on, EPAP A and EPAP B database status followed by VSCCP card database status
- If the LNP ELAP Configuration controlled feature feature is turned on, ELAP A and ELAP B database status followed by VSCCP card database status

The output of the **rept-stat-db** command with the **display=except** parameter shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=all** parameter shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=version** parameter shows the coherency and the number of updates for the active and standby databases, along with the database version and the operational status of each of these databases. If the LNP feature is turned on (see the **enable-ctrl-feat** command), the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the **rept-stat-mps** command to display version information for these databases.

The output of the **rept-stat-db** command with the **loc** parameter specifying an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The **db** parameter is used to limit the output of the **rept-stat-db** command to either just the EAGLE STP information or just the MPS information. The information is displayed as indicated by the **display** parameter value (**display=version** is not valid for **db=mps**; the command does not display the MPS database versions). The default **db** parameter value is **all**, which displays the information for the STP and MPS databases and cards as indicated by the **display** parameter value.

## Output

The report for the specified card is displayed. The report shows that the disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

### rept-stat-db:loc=1114

| CARD/APPL | LOC  | C | T | LEVEL | TIME LAST UPDATE | EXCEPTION |
|-----------|------|---|---|-------|------------------|-----------|
| TDM-CRNT  | 1114 | - | - | -     | -                | OFF-LINE  |
| TDM-BKUP  | 1114 | - | - | -     | -                | -         |

;

The report for the specified VSCCP (DSM) card used for EPAP or ELAP is displayed. The G-Flex, G-Port, EIR, INP or LNP ELAP Configuration feature is turned on in the system.

### rept-stat-db:loc=1201

| CARD/APPL | LOC  | C | T | LEVEL | TIME LAST UPDATE  | EXCEPTION |
|-----------|------|---|---|-------|-------------------|-----------|
| VSCCP     | 1201 | Y | N | 12    | 02-01-29 08:53:48 | -         |

| EAGLE RTDB REPORT |      |   |                   |       |           |  |
|-------------------|------|---|-------------------|-------|-----------|--|
| CARD/APPL         | LOC  | C | BIRTHDATE         | LEVEL | EXCEPTION |  |

;

```

The LNP ELAP Configuration controlled feature is enabled and turned on (see the **enable-ctrl-feat** command) in the system, and ELAP is being used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

#### Legend

**DATABASE STATUS**—An indication of any database alarms on the MASPs. This indicator is not used with the **loc** parameter output.

>> **OK**<<—There are no database alarms

>>**NOT OK**<<—Database alarms are present

**(ACTV MASP)**—The specified MASP is the active processor. This is not used with the **loc** parameter output.

**(STDBY MASP)**—The specified MASP is the standby processor. This is not used with the **loc** parameter output.

**(NOACCS)**—The specified processor is not accessible. This is not used with the **loc** parameter output.

**C**—An indicator of whether the database is coherent.

**LEVEL**—The number of updates made to the database partitions.

**TIME LAST BACKUP**—The date and time the last change was performed on the removable cartridges (if inserted) and the backup partition of the fixed disk. This field is not used with the **loc** parameter output.

**RD BKUP**—Removable cartridge backup partition.

**FD BKUP**—Fixed disk backup partition.

**FD CRNT**—Fixed disk current partition. This field is not used with the **loc** parameter output.

**DIFF CONTENTS**—The specified database's contents are different when compared to the other database in that partition.

**DIFF LEVEL**—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).

**DIFF TIME**—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, when compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.

**CORRUPTED**—The specified database is corrupted.

**INCOHERENT**—The specified database is incoherent.

**EXCEPTION**—The following values can appear:

- The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A “-” indicates that the database was not accessible. A blank entry indicates that the database has no problems. This field is used with the **display=except**, **display=all**, and **loc** parameter outputs.
- A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.

**IN-SRVC**—The length of time that the card has been in service.

**CARD/APPL**—The card type or the application assigned to the card specified in the **LOC** field. This field is not used with the **display=brief** (default) parameter output.

**TDM-BKUP**—Backup partition on the fixed disk on the TDM.

**TDM-CRNT**—Current partition on the fixed disk on the TDM.

**LOC**—The card location of the database. This field is not used with the **display=brief** (default) parameter output.

**T**—An indicator of whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM) or TSM is in the process of being loaded with the new screen set information after an update to the database, and the database has not reached the

current reported database level. This field is not used with the **display=brief** (default) parameter output.

**TIME LAST BACKUP**—The date and time the last change was performed on the specified card and its associated database. A dash (–) in this field for the fixed drive (FD) or removable drive (RD) indicates that no backup has been created on that drive. This field is not used with the **display=brief** (default) parameter output.

**VERSION**—The version number of each database (including the LNP database if the LNP feature is on).

xxx-xxx-xxx—The version number of the database.

**UNKNOWN**—The **rept-stat-db** command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.

A dash “-” —The database is not available. This field is used only with the **display=version** parameter output.

**STATUS**—The operational status of the database version. This field is used only with the **display=version** parameter output.

**NORMAL**—The database version is fully operational.

Blank entry—A blank entry indicates that the database is not available or is unknown.  
A numeric value indicates that the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.

**BIRTHDATE**—The date and time of creation for the database.

**EPAP A (ACTV)**—The active EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, or INP features are turned on.

**PDB**—The provisioning database status information.

**RTDB**—The provisioning database status information that was used to create the resident real-time database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—The EPAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm. The RTDB database is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires DSM cards to be reloaded.

**EPAP B (STDBY)**—The standby EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, or INP features are turned on.

**PDB**—The provisioning database status information.

**RTDB**—The provisioning database status information that was used to create the resident real-time database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—The EPAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM

card, then the DSM card generates an alarm. The RTDB database is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires DSM cards to be reloaded.

**ELAP A (ACTV)**—The active EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

**RTDB-EAGLE**—The ELAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm.

**TIME LAST UPDATE**—The date and time of the last update of the RTDB database from the LSMS.

**ELAP B (STDBY)**—The standby EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

**RTDB-EAGLE**—The ELAP resident real-time database status information. This database is downloaded to DSM cards. If the birthdate or level do not match the DSM card, then the DSM card generates an alarm.

**TIME LAST UPDATE**—The date and time of the last update of the RTDB database from the LSMS.

## rept-stat-dlk

## Report Status Data Link

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

**Keyword:** **rept-stat-dlk**

**Related Commands:** **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rtrv-dlk, tst-dlk**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All data links are shown.

### Example

```
rept-stat-dlk
```

```
rept-stat-dlk:loc=1104
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

Only one data link port on the ACM is supported. Reports are generated only on port A of the card.

## Notes

None

## Output

### rept-stat-dlk

```
rlghncxa03w 04-02-27 17:00:36 EST EAGLE 31.3.0
DLK          PST          SST          AST
1104         IS-NR        Avail        ----
1206         IS-NR        Avail        ALMINH
Command Completed.
```

;

### rept-stat-dlk:loc=1104

```
rlghncxa03w 04-02-27 17:00:36 EST EAGLE 31.3.0
DLK          PST          SST          AST
1104         IS-NR        Avail        ----
ALARM STATUS = No Alarms.
Command Completed.
```

;

## Legend

**DLK**—The card location of the TCP/IP data link

**PST**—The primary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-dstn

## Report Status Destination

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-\**) or a network destination (*ni-\*-\**).

**Keyword:** **rept-stat-dstn**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-rte, rtrv-dstn, rtrv-rte**

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:mode=** (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

**Range:**        **full, rtx**

**full**—Comprehensive display of point code status, including rtx. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, the status of all routesets is displayed.

**rtx**—Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:**     A summary report is displayed.

**:stat=** (optional)

The primary state filter. This parameter lets you choose the state of the destination for which you want a report. In other words, if you want a report for all destinations whose state is DSBLD, specify **:stat=dsbld**.

**Range:**        **all, alminh, anr, dsbld, mt, nr**

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In service abnormal (IS-ANR)

**dsbld**—Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**—Out of service maintenance (OOS-MT)

**nr**—In service normal (IS-NR)

**Default:**     **all**

### Example

```
rept-stat-dstn
rept-stat-dstn:dpci=2-004-1:mode=full
rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc=9-4-***:stat=alminh
rept-stat-dstn:dpc=9-3-*:mode=rtx
rept-stat-dstn:mode=full
rept-stat-dstn:mode=rtx
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

A summary report is displayed if the **stat** parameter is specified.

The **stat** parameter can be specified with the **dpc** parameter only if the **dpc** parameter specifies one of the *ni-nc-\** formats.

An x-list DPC cannot be specified in the **dpc** parameter.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-62 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-62.** Summary of DPC Parameter Syntaxes

| DPC format                              | Meaning                                                                                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-dstn:dpc=ni-nc-ncm</b>     | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                                                               |
| <b>rept-stat-dstn:dpc= ni-*-*</b>       | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.                                         |
| <b>rept-stat-dstn:dpc= ni-**-*</b>      | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                                                         |
| <b>rept-stat-dstn:dpc= ni-***_*</b>     | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                                                |
| <b>rept-stat-dstn:dpc= ni-nc-*</b>      | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                                                               |
| <b>rept-stat-dstn:dpc= ni-nc-**</b>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |
| <b>rept-stat-dstn:dpc= ni-nc-***</b>    | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.                       |
| <b>rept-stat-dstn:dpcn24=msa-ssa-sp</b> | Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                           |

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the **mode=full** parameter is specified without a specific DPC, then status provided for all regular and exception route sets.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned DPCs (route sets) in the system,
- If the **mode=rtx** parameter is specified, the command output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, and the status of all provisioned exception route sets associated with that DPC.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows a private adjacent point code:

```

The following example shows how specifying either an FPC or cluster destination for which circular routing has been detected, along with the **mode=full** parameter, displays the name of the linkset on which the circular routing test message was transmitted. It also displays the linkset on which the circularly routed message was received. This information may be useful in correcting the circular routing situation.

**rept-stat-dstn:dpc=9-3-6:mode=full**

```

The following example shows how **rept-stat-dstn** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for an FPC destination.

#### rept-stat-dstn:dpc=9-3-\*

```

rlghncxa03w 04-07-07 14:59:11 EST  EAGLE 31.9.0

```

The following example shows how **rept-stat-dstn** displays a subsystem information header but no subsystem information, just as it would if an FPC is specified for which no subsystems are defined. In addition, because aliases cannot be defined for cluster destinations, this report shows only an empty header, just as it does when an FPC is specified for which no aliases are defined. Note that the circular routing information portion of the **mode=full** report displays “-----” for the linkset names when no circular routing condition exists for the DPC.

**rept-stat-dstn:dpc=9-3-\*:mode=full**

```

**Legend**

**DPC/DPCA**—The ANSI destination point code of the route

**DPCN**—The ITU-TSS national destination point code of the route

**DPCN24**—The 24-bit ITU national destination point code of the route

**DPCI**—The ITU-TSS international destination point code of the route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-e1

## Report Status E1

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

**Keyword:** **rept-stat-e1**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:e1port=** (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

**Range:** **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

**:loc=** (optional)

Card location. The unique identifier of a specific **line1** card located in the STP.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** Information for all **line1** cards is reported.

### Example

```
rept-stat-e1
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **e1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where *x* is the frame and *y* is the shelf) cannot be specified in the **loc** parameter.

### Notes

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the **loc** parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the **loc** and **e1port** parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

**Output**

When no parameters are specified in the command, E1 port status is displayed for all cards with provisioned E1 ports. Ports 3 through 8 are on HC-MIM cards only.

**rept-stat-e1**

```

**Legend**

**LOC**—Card location

**E1PORT**—Number of the E1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**SST**—The secondary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**AST**—The associated state of the card. The possible values are described in “Possible Values for PST/SST/AST”. The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the E1 port being unavailable

**SLK**—Signaling link assigned to the E1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-eroute

## Report Status EROUTE

Use this command to display the status of the STC cards that run the **eroute** application for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** **rept-stat-eroute**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card location. The unique identifier of a specific STC card located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All STC cards are reported.

**:mode=** (optional)

Mode of reporting for the command. When **mode=perf** is specified, only subsystem performance information is displayed.

**Range:** **perf**

**Default:** None.

### Example

```
rept-stat-eroute
```

```
rept-stat-eroute:mode=perf
```

```
rept-stat-eroute:loc=1213
```

### Dependencies

The **mode** and **loc** parameters cannot be specified in the same command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one STC card running the **eroute** application must be configured before this command can be entered.

### Notes

When the **loc** parameter is specified, only the card information for the specified card is displayed.

When the **mode=perf** parameter is specified, only subsystem performance information is displayed.

### Output

When no parameters are specified in the command, the report shows card, subsystem, and alarm information.

**EROUTE SUBSYSTEM REPORT**—State of the subsystem

**STC CARDS CONFIGURED**—Number of STC cards configured in the system

**CARDS IS-NR**—Number of STC cards in IS-NR state

**EISCOPY BIT**—Indicates whether EIS copy function is turned On or Off

**SYSTEM THRESHOLD**—% of system total capacity being used

**SYSTEM PEAK EROUTE LOAD**—Current load in Buffers/Sec

**SYSTEM TOTAL EROUTE CAPACITY**—Total capacity in Buffers/Sec

**SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text

**CARD**—Card location

**VERSION**—The version number of the GPL loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:

- The card does not run a GPL, such as TDM or MDAL cards.
- The card is configured but is not physically present in the system.
- The card is IS-ANR or is in the process of being loaded.

**TYPE**—The card type entered in the database.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**EROUTE SERVICE AVERAGE TVG CAPACITY**—%

**AVERAGE CPU CAPACITY**—%

When **mode=perf** is specified, the following performance statistics are displayed:

### **STATISTICS**

**CARD**—Card location

**CPU USAGE**—%

**TVG RATE**

**AVERAGE TVG USAGE**—%

**AVERAGE CPU CAPACITY**—%

**TOTAL TVG RATE**

**STATISTICS FOR PAST 30 SECONDS**

**TOTAL TVG**

**TOTAL EROUTE**

When the **loc** parameter is specified in the command, only card information for the specified card is displayed: CARD, VERSION, TYPE, PST, SST, and AST as shown above, and the following information:

**CARD ALARM STATUS**—Either “No alarms” or current alarm number and text

**TOTAL CPU USAGE**—%

**rept-stat-gpl****Report Status Generic Program Load**

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

**Keyword:** **rept-stat-gpl**

**Related Commands:** **act-gpl, alw-card, chg-gpl, copy-gpl, init-card, init-sys, rtrv-gpl**

**Command Class:** Program Update

**Parameters**

**:display=** (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

**Range:** **all, brief**

**Default:** **brief**

**:gpl=** (optional)

The type of GPL to report on.

**Range:** *ayyyyyy*

**atmansi**—The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

**atmitu**—The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

**blbios**—A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

**blcpld**—A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

**bldiag**—A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

**blvxw**—A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

**bpdcem**—This GPL is used in communications in the **init-flash** process.

**bphcap**—This GPL is used to support Board PROM for HCAP flash memory.

**bphcapt**—This GPL is used to support Board PROM for HCAP-T flash memory.

**bphmux**—This GPL is used to support Board PROM for HMUX flash memory.

**bpmpl**—This GPL is used to support Board PROM for MPL flash memory.

**bpmp1t**—This GPL is used to support Board PROM for E1/T1 flash memory and Board PROM for the MPL-T flash memory.

**ccs7itu**—This GPL is used by the LIM cards for ITU-TSS MTP functionality.

**cdu**—This GPL is used in the card manufacturing process for testing, and when directed by Tekelec Technical Services.

**ebdablm**—This GPL is used by the TSM cards for enhanced bulk download.

**ebdaclm**—This GPL is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 SAS at high speed over an Ethernet connection for enhanced bulk download.

**emap**—This GPL is the software that is running on the EOAP used for the GR-376 feature. This GPL transfers the System Release ID table from the removable cartridge to the fixed disk. This GPL is used to alert the craftsperson when the EOAP GPLs are not compatible with an EAGLE 5 SAS release.

**emdc**—This GPL is used by the DCM card for CMIP/OSI measurement collection interface as defined by Telcordia GR-376.

**eroute**—This GPL is used by the STC cards for for the EAGLE Support for Integrated Sentinel feature.

**gls**—This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

**hipr**—The communication software used on the High Speed IMT Packet Router (HIPR) card.

**imt**—This GPL is the communication processor on the logical processing element (LPE).

**imtpci**—The communication software that operates the IMT bus on HC-MIM cards.

**ipgwi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**iplim**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

**iplimi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**ips**—This GPL is used by the IPSM card for the IP User Interface feature.

**mcp**—This GPL is used by the MCPM card for the Measurements Platform feature.

**plde1t1**—This GPL is used to support Board PROM for HC-MIM flash memory.

**pldpmc1**—This GPL is used to support Board PROM for HC-MIM flash memory.

**sccp**—This GPL is used by the TSM cards for the global title translation application.

**ss7ansi**—This GPL is used by the LIM cards for the MTP functionality.

**ss7gx25**—This GPL is used by the LIM cards to support X.25 functionality.

**ss7hc**—This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the **ss7ansi** or **cc7itu** application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functionality.

**ss7ipgw**—This GPL is used by the DCM card to support TCP/IP point-to-multipoint connectivity.

**ss7ml**—This GPL is used to support the functionality for the multi-port LIM (MPL or MPL-T) card. The MPL cards run only the **ss7ansi** application on a LIMDS0 card (as specified with the **ent-card:type=limds0:appl=ss7ansi** command); the **ss7ml** GPL allows the card to support eight signaling link ports rather than the usual two ports for LIM cards. The MPL cards support only the DS0 interface.

**stplan**—This GPL is used by the ACM card to support the STPLAN application.

**vcdu**—This GPL is used in the card manufacturing process for testing, and when directed by Tekelec Technical Services.

**vsccp**—This GPL is used by the DSM card to support the G-Flex, G-Port, LNP ELAP Configuration, and INP features. If the G-Flex, G-Port, LNP ELAP Configuration, or INP feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

**vxwslan**—This GPL is used by the DCM card to support the STPLAN application.

**iplhc**—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

**ipghc**—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

**ss7epm**—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications; the **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

**blbepm**—A flash GPL containing the BIOS ROM image on EPM cards.

**blvxw6**—A flash GPL containing the VxWorks operating system on EPM cards.

**bldiag6**—A flash GPL containing the diagnostic code on EPM cards.

**Default:** **all GPL types**

**:loc=** (optional)

Target card address. Displays the versions of all GPLs running at the specified card location. For HC-MIM cards this includes all non-activated flash GPLs. For non-HC-MIM cards, there is no additional data; this parameter simply limits the report to the target card address.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:appl=** (obsolete)

This parameter is obsolete; use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value.

### Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=ss7ansi
rept-stat-gpl:gpl=oam
rept-stat-gpl:gpl=imt
```

**rept-stat-gpl:gpl=bphmux**  
**rept-stat-gpl:gpl=ss7ml**  
**rept-stat-gpl:gpl=hipr**  
**rept-stat-gpl:gpl=ss7hc**  
**rept-stat-gpl:gpl=iplhc**  
**rept-stat-gpl:gpl=ipghc**  
**rept-stat-gpl:gpl=ss7epm**  
**rept-stat-gpl:gpl=blbepm**  
**rept-stat-gpl:gpl=blvxw6**  
**rept-stat-gpl:gpl=bldiag6**

### Dependencies

No other **rept-stat-xxxx** command can be in progress when this command is entered.

None of the following parameters can be specified together in the same command: **display=all** parameter, **loc** parameter, **gpl** parameter.

### Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the **chg-gpl** command to turn auditing on and off.

Use the **rtrv-gpl** command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, “ALM” is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and “ALM” is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. If GPL auditing is off, the minor alarm is not activated, but “ALM” is displayed for each GPL that does not match the GPL in the RELEASE column.

If no **gpl** parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of “-----” is displayed. This should happen only for utility and OAM GPLs when the cartridge is not inserted. A utility trial version is never displayed because it can never be run.

If the removable cartridge is inserted, an “\*” (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, “-----” is displayed for the running version.

When the **gpl** parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using the **init-flash** command) are not displayed.

When the **gpl=imt** parameter is specified, only the IMT GPLs for each configured card connected to the IMT are displayed.

A plus (+) symbol in the output when the **gpl** parameter value **blbios**, **blcpld**, **bldiag**, **blvxw**, **bphcap**, **bphcapt**, **bpmpl**, **bpmpit**, **bpdcn**, **imtpci**, **plde1t1**, **pldpmc1**, **blbepm**, **blvxw6**, and **blidag6** is specified indicates that the GPL currently being run has not yet been activated on the card.

When a GPL is specified in the **gpl** parameter, the specified GPL for each card connected to the IMT is displayed.

## Output

The output of the **rept-stat-gpl** command is site-specific and configuration-specific. The following output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

The following example shows output that includes an MPL or MPL-T (multi-port LIM) card at location 1105. The GPL column, which displays the GPL running on the card, enables you to differentiate between the two-port LIMDS0 card and the multi-port LIM card. If an MPL or MPL-T card is running in the system, SS7ML appears in the GPL column. If a two-port LIMDS0 card is running in the system, SS7ANSI appears in the GPL column.

This output appears when no parameters are defined. All GPLs for the card are listed.

Command Completed.

```

;

The following example shows the EOAM GPL that is running on the cards in locations 1113 and 1115.

#### rept-stat-gpl:gpl=eoam

```

rlghncxa03w 05-01-07 10:23:93 EST EAGLE 33.0.0
GPL      CARD      RUNNING      APPROVED      TRIAL
EOAM     1113      028-002-000      028-002-000      -
EOAM     1115      028-002-000      028-002-000      -

```

Command Completed.

;

The following example specifies the **display=all** parameter to display both IMT and application GPL information.

The example also contains asterisks with the following meanings:

- \* The SS7ML entry in the GPL column at location 1105 indicates that a multi-port LIM, as opposed to a two-port LIM, is running on the system. Both cards are provisioned in the database with the **ss7ansi** application so that the two-port LIM can be replaced without having to reprovision the database, but the MPL and MPL-T run the **ss7ml** GPL to support 8 signaling link ports.
- \*\* The OAP entries appear only if an OAP is provisioned and running. Systems that use two OAPs show two entries for the OAP: OAP A and OAP B.

#### rept-stat-gpl:display=all

```

```

The following example shows output when the **loc** parameter is specified for an HC-MIM card.

The following notes explain the last six lines of this example:

1. IMTPCI has been downloaded with the **init-flash** command, the card has reset, and IMTPCI was activated normally with the **act-flash** command.
2. BLBIOS has been downloaded with the **init-flash** command, but the card has not been initialized. The inactive version will load when the card is next initialized.
3. BLVXW has been downloaded with the **init-flash** command, the card has been reset. BLVXW was activated with the **act-flash** command, but it is not the approved version on the TDM.
4. BLDIAG has been downloaded with the **init-flash** command, and the card has been reset; the inactive version is running. The ALM indicates that it is not the approved version and the '+' indicates that it has not been activated yet. The '\*' next to the active version indicates that if the card resets again, the active version will run.
5. PLDE1T1 has been downloaded with the **init-flash** command and the card has been reset, but the GPL has not been activated yet. This is the same condition as Note 4, except that there is no alarm condition.

**Legend**

**GPL**—The type of GPL associated with the cards in the display.

**CARD**—The card location.

**RUNNING**—The GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.

**APPROVED**—The GPL version that is the approved GPL.

**TRIAL**—The GPL version that is the trial GPL.

**ACTIVE**—The GPL version that has been downloaded using the **init-flash** command and activated using the **act-flash** command..

**INACTIVE**—The GPL version that has been downloaded using the **init-flash** command but has not been activated using the **act-flash** command..

----- (dashes)—GPL is not present at the specified location.

\*—The trial version will run if the card boots. (Shown to the right of the TRIAL column)

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

+—The currently running flash GPL has not been activated. (Shown between the RUNNING and APPROVED columns)

**rept-stat-imt****Report IMT Status**

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

**Keyword:** **rept-stat-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rmv-imt**, **rst-imt**

**Command Class:** System Maintenance

**Parameters**

**:mode=** (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

**Range:** **full**

**Default:** **"not full"**

**Example**

**rept-stat-imt**

**rept-stat-imt:mode=full**

**Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Notes**

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

**Output****rept-stat-imt**

### Legend

**IMT**—IMT bus A or IMT bus B.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the specified IMT bus.

\*—Minor Alarm

\*\*—Major Alarm

\*C—Critical Alarm

The states of the IMT bus are combined from the PST and the SST as shown in Table 5-63.

**Table 5-63.** IMT Bus States

| PST          | SST    | Definition                                                          |
|--------------|--------|---------------------------------------------------------------------|
| IS-NR        | Active | The IMT bus is operating normally.                                  |
| IS-ANR       | Fault  | The IMT bus has had a failure on at least one but not all cards.    |
| IS-ANR       | Manual | The IMT bus is inhibited, but some cards have been connected to it. |
| OOS-MT       | Fault  | The IMT bus has a failure on all cards.                             |
| OOS-MT-DSBLD | Manual | The IMT bus is inhibited and no cards are connected to it.          |

## rept-stat-iptps

### Report Status IPGWx TPS Utilization

Use this command to display current and peak IPGWx TPS usage for each IPGWx linkset in the system or for each IPGWx link in the IPGWx linkset.

**Keyword:** rept-stat-iptps

**Related Commands:** chg-ctrl-feat, chg-ls, chg-sg-opts, enable-ctrl-feat, ent-ls, rtrv-ctrl-feat, rtrv-ls, rtrv-sg-opts

**Command Class:** System Maintenance

## Parameters

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:peakreset=** (optional)

Reset peak values to the current TPS values.

**Range:** **yes, no**

**Default:** **no**

## Example

**rept-stat-iptps**

**rept-stat-iptps:lsn=lsgw1101**

**rept-stat-iptps:peakreset=yes**

## Dependencies

This command cannot be entered for linksets that are not IPGWx linksets.

The specified linkset name must exist in the database.

## Notes

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

## Output

The **rept-stat-iptps** command reports on IPGWx system and linkset IP TPS. The report includes the following information for the system and for each IPGWx linkset:

- Configured IPGWx IP TPS alarm threshold
- Configured IPGWx IP TPS
- Current IPGWx IP TPS transmit and receive usage for 15 seconds
- Peak IPGWx IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

When **lsn** is specified, the command reports the same information for the individual links in the linkset.

When **peakreset=yes** is specified, the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

When **lsn** is specified with **peakreset=yes**, the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

**NOTE: The peaks for transmit and receive, and for link, linkset and system IPGWx IP TPS may all occur at different times.**

**NOTE: The IP TPS System value shown in the rept-stat-iptps command may contain one extra MSU. Because the alarm calculations are implemented using integer math, there is the potential for rounding to occur at each entity (link, linkset, system) when the IP TPS value for the entity**

**is not evenly divisible by 15. This could occur when performing an IPTPS report for multiple linksets in the system or a linkset that has more than one link configured.**

*Legend*

**SYSTEM**—CLLI of the EAGLE 5 ISS

**THRESH**—The system threshold at which an alarm will be generated to indicate that the actual system TPS is approaching the enabled system TPS quantity (**iptpsalmthresh** value as shown in **rtrv-sg-opts** output).

**CONFIG**—The enabled system IP Signaling TPS quantity as shown in **rtrv-ctrl-feat** output.

**TPS**—The current transmit (TX) and receive (RCV) TPS for 15 seconds.

**PEAK**—The peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset.

**PEAKTIMESTAMP**—The date and time that the displayed transmit and receive TPS peaks occurred.

**LSN**—The linkset name.

**THRESH**—The threshold at which an alarm will be generated to indicate that the actual linkset TPS is approaching the configured linkset **iptps** value (**lsusealm** value as shown in **rtrv-ls** output).

**CONFIG**—The **iptps** value as shown in **rtrv-ls** output.

**TPS**—The current transmit (TX) and receive (RCV) TPS for 15 seconds.

**PEAK**—The peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset.

**PEAKTIMESTAMP**—The date and time that the displayed transmit and receive TPS peaks occurred.

When a linkset name is specified (**lsn**), the IPGWx TPS information is displayed for the specified linkset and for each link in the linkset.

**LSN**—The linkset name.

**THRESH**—The threshold at which an alarm will be generated to indicate that the actual linkset TPS is approaching the configured linkset **iptps** value (**lsusealm** value as shown in **rtrv-ls** output).

**CONFIG**—The **iptps** value as shown in **rtrv-ls** output

**TPS**—The current transmit (TX) and receive (RCV) TPS for 15 seconds.

**PEAK**—The peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset.

**PEAKTIMESTAMP**—The date and time that the displayed transmit and receive TPS peaks occurred.

**LOC**—Location of the card that contains a displayed link in the linkset.

**PORT**—A signaling link in the linkset.

**THRESH**—The **slkusetthresh** value as shown in **rtrv-ls** output

**CONFIG**—Dashes (-----). There is no configurable TPS for links.

**TPS**—The current transmit (TX) and receive (RCV) TPS for 15 seconds.

**PEAK**—The peak transmit (TX) and receive (RCV) TPS usage for all 15 second periods since the last peak reset.

**PEAKTIMESTAMP**—The date and time that the displayed transmit and receive TPS peaks occurred.

## rept-stat-lfs

## Report LFS Test Status

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

**Keyword:** **rept-stat-lfs**

**Related Commands:** **rept-stat-slk**

**Command Class:** Link Maintenance

### Parameters

**:link=** (optional)

The signaling link port on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**:loc=** (optional)

This parameter is mandatory when the **port** parameter is specified.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

### Example

**rept-stat-lfs**

**rept-stat-lfs:loc=1201**

**rept-stat-lfs:loc=1201:link=a1**

### Dependencies

The LFS feature must be turned on before this command can be entered.

The card location specified in the **loc** parameter must be equipped.

The signaling link that is specified in the **link** parameter must be assigned to the card in the **loc** parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all *xy09* and *xy10* locations (x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

The card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

If the **link** parameter is specified, the **loc** parameter must be specified.

This command cannot be entered during upgrade.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

If no parameters are specified, all links that are in LFS test are displayed.

**rept-stat-lfs**

```

**Legend**

**SLK**—The signaling link identifier; same as **loc** and **link** parameters of **act-lbp** command.

**LBP**—The loopback point of this test; same as **lbp** parameter of **act-lbp** command.

**PATTERN**—The test pattern; same as **pattern** parameter of **act-lbp** command.

**MAX-ERRORS**—The bit-error threshold allowed for this LFS test; same as **maxerr** parameter of **act-lbp** command.

**BIT\_ERRORS**—Number of bit-errors since the beginning of this test.

**MAX-TIME**—The time window for testing each loop-back point; same as **time** parameter of **act-lbp** command.

**TEST-TIME**—Amount of time the test has run.

**rept-stat-lnp****LNP Status Report**

Use this command to generate a report of the local number portability (LNP) status information.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the **loc** parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS), Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), and Automatic Call Gap (ACG).

When the **card=sccp all** parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

**Keyword:** **rept-stat-lnp**

**Related Commands:** **chg-th-alm, rept-stat-sccp, rtrv-th-alm**

**Command Class:** System Maintenance

### Parameters

**:card=** (optional)

Specify **card=sccp-all** to display a report of the LNP status of all equipped SCCP cards. The **card** parameter is not valid with the **loc** parameter.

**Range:** **sccp-all**

**:loc=** (optional)

The card location as stenciled on the shelf of the EAGLE 5 ISS. The **loc** parameter is not valid with the **card** parameter.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** A summary for all cards is displayed.

### Example

**rept-stat-lnp**

**rept-stat-lnp:card=sccp-all**

**rept-stat-lnp:loc=1106**

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Only one optional parameter can be specified in the command. The **card** and **loc** parameters cannot be specified together in the same command.

The only valid value for the **card** parameter is **sccp-all**.

No other **rept-stat-xxx** command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The card location (**loc** parameter) must identify a configured TSM card running the **sccp** application.

## Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The **rept-stat-lnp** command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPMR usage is expressed as the average percentage of LNPMR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMR, LNPQS, WNPQS (if turned on), TLNP (if turned on), and PLNPQS (if turned on) errors for corresponding messages received across all cards.

When the **rept-stat-lnp** command is entered for a specific card (for example, **rept-stat-lnp:loc=xxxx**), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.
- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.

- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.
- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

**NOTE:** IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

**NOTE:** PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

**NOTE:** The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the **:card=sccp-all** parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the **:loc=xxxx** parameter.

## Output

In the following example, the WNP, PLNP, and TLNP features are off.

**rept-stat-lnp**

**Legend**

**CARD**—The locations of the SCCP cards.

**VERSION**—The version number of the GPL the cards are running.

**TYPE**—The type of SCCP card.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**rept-stat-ls****Report Status Linkset**

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC).

**Keyword:** **rept-stat-ls**

**Related Commands:** **chg-l3t, dlt-ls, ent-ls, rtrv-ls**

**Command Class:** System Maintenance

**Parameters**

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:stat=** (optional)

The primary state filter. This parameter indicates the state of the linksets for which a report will be displayed. For example, to display a report for all linksets whose state is DSBLD, specify the **stat=dsbld** parameter.

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In-Service-Abnormal (IS-ANR)

**dsbld**—Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

**mt**—Out-of-Service-Maintenance (OOS-MT)

**nr**—In-Service-Normal (IS-NR)

**Default:** **all**

**Example**

**rept-stat-ls**

**rept-stat-ls:lsn=lsnstopa**

## Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If no link is equipped for the SLC, the output is “\_\_\_\_ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

**Legend**

**LSN**—The name of the linkset

**APCA/APCI/APCN/APCN24**—The adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**PST**—The primary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the specified card.

**SCRN**—The name of the gateway screening screen set associated with the linkset.

**GWSA**—Shows whether gateway screening is used for the specified linkset.

**GWSM**—Shows whether gateway screening messaging is turned on for the specified linkset.

**GWSD**—Shows whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is turned on.

**SLC**—The signaling link codes associated with the links that are contained in the specified linkset.

**SLK**—The signaling links that are contained in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link.

## rept-stat-lsms

## Report the Status of LSMS

Use this command to generate a summary report of the status of the Local Service Management System (LSMS) subsystem on the EAGLE 5 ISS.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on in the system, the rept-stat-lsms command is no longer available. Instead, use the rept-stat-mps command.**

**Keyword:** rept-stat-lsms

**Related Commands:** alw-trm, chg-trm, inh-trm, rept-stat-seas, rept-stat-sys, rept-stat-trbl, rept-stat-trm

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-lsms**

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The **rept-stat-lsms** command is not available when the LNP ELAP Configuration feature is turned on. The **rept-stat-mps** command must be entered.

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

### Output

#### rept-stat-lsms

```

### Legend

**GPL**—Generic program load number of the subsystem component.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-meas

### Report Measurement Status

Use this command to report the status of the Measurements Subsystem, including card location and state, alarm level, and subsystem state.

**Keyword:** **rept-stat-meas**

**Related Commands:** **rept-stat-card**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-meas**

### Dependencies

The Measurements Platform feature must be turned on prior to issuing this command.

At least one MCPM card must be configured in the system.

No other **rept-stat-xxx** commands can be in progress when this command is issued.

### Notes

The MCPM card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the MCPM card is in the IS-NR or IS-ANR state. (The **rept-stat-card** command will not show the GPL version if the card is ISANR.)

### Output

**rept-stat-meas**

```

;

### **Legend**

**VERSION**—The version number of the GPL that the specified MCPM card is running. The version is shown if the card is in the IS-NR or IS-ANR state.

**TYPE**—MCPM; the card that is running the Measurements Subsystem application.

**PST**—The primary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**MEAS SS**—The Measurements Subsystem application running on the MCPM card.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MCPM and the applications running on the MCPM.

**CARD**—The location of the MCPM card. The MCPM card with the letter "P" to the right of its card location is the primary MCPM. The primary MCPM transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the MCPM is IS-NR, the secondary state (SST) indicates whether the MCPM is active or standby.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

## **rept-stat-mps**

### **Report the MPS Status**

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is turned on, the status of the ELAP (EAGLE LNP Application Processor) subsystem is displayed.
- If the INP (INAP number portability) feature is turned on, the status of the EPAP (EAGLE Provisioning Application Processor) subsystem is displayed.
- If the G-Port (GSM mobile number portability) feature or G-Flex (GSM flexible numbering) feature is turned on, the status of the GSM (Global System for Mobile Telecommunications) and the EPAP (EAGLE Provisioning Application Processor) is displayed.
- If the EIR (Equipment Identity Register) feature is enabled and turned on, the status of the EIR component on the card is displayed.

**Keyword:** **rept-stat-mps**

**Related Commands:** **rept-stat-card**, **rept-stat-sccp**

**Command Class:** System Maintenance

### **Parameters**

**:loc=** (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE 5 ISS.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

**rept-stat-mps:loc=1106**

### Dependencies

The card location specified in the **loc** parameter, must contain a VSCCP card.

The INP, G-Port, G-Flex, Equipment Identity Register (EIR), or LNP ELAP Configuration feature must be on before this command can be entered.

At least one VSCCP card must be configured in the system before this command can be entered.

To specify the **rept-stat-mps** command, no other **rept-stat-xxxx** command can be in progress.

### Notes

When the MPS does not have an alarm on it, the **rept-stat-mps** report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

### Output

The following example shows the possible system response if the G-Flex or G-Port feature and the INP feature are turned on:

#### rept-stat-mps

Command Completed.

;

**Legend**

**CARD**—The location of the VSCCP card. The VSCCP card with the designator “P” to the right of its card location is the primary DSM as selected by the active ELAP/EPAP. The primary DSM

provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.

**VERSION**—The version number of the GPL that the specified ELAP/EPAP or card is running.

**PST**—The primary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**EPAP/ELAP A/B**—The application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, or G-Port is turned on, the output shows EPAP A/B.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the EPAP Administration Manual or the *ELAP Administration Manual*. There are 6 categories of MPS alarms:

- Critical platform alarm data
- Major platform alarm data
- Minor platform alarm data
- Critical application alarm data
- Major application alarm data
- Minor application alarm data

**GSM STAT**—The possible states are either ACT (active) or SWDL (indicates that the GSM component on that card is currently inactive until the software download completes). The GSM STAT information is not displayed if the G-Port and G-Flex features are turned off.

**INP STAT**—The possible states of INP status include ACT (active), OFFL (offline) and SWDL (indicates that the INP component on that card is currently inactive until the software download completes). The INP STAT information is not displayed if the INP feature is turned off.

**LNP STAT**—The possible states of LNP status include ACT (active), OFFL (offline) and SWDL (indicates that the LNP component on that card is currently inactive until the software download completes). The LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.

**EIR STAT**—The possible states of EIR Status include ACT (active), OFFL (offline), and SWDL (Indicates the EIR component on that card is currently inactive until software download completes). The EIR STAT information is not displayed if the EIR feature is not enabled.

**DSM MEMORY USAGE**—The percentage of DSM memory used to store the ELAP/EPAP database.

For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on a 2G DSM card means that 1G is used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the **rtrv-ctrl-feat** command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

**DSM PORT A/B**—A listing of any trouble text alarm messages that have been generated for the port on the card.

**IP CONNECTION UNAVAILABLE**—Indicates the failed channels on those ports with IP Connection Unavailable alarms. The possible channels reported are:

- Prov—RTDB Provisioning Channel
- Dnld—RTDB Download Channel
- TCP—Transmission Control Protocol Channel
- UDP—User Datagram Protocol Channel

## rept-stat-mux

## Report the MPS Status

Use this command to list all the HMUX and HIPR cards, their location, and their status.

**Keyword:** rept-stat-mux

**Related Commands:** rept-stat-card

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-mux**

### Dependencies

None

### Notes

None

### Output

**rept-stat-mux**

rlghncxa03w 04-09-07 10:23:93 EST EAGLE 32.0.0

| CARD | TYPE | PST   | SST    | AST    |

| 1109 | HMUX | IS-NR | Active | ALMINH |
| 1110 | HMUX | IS-NR | Active | -----  |
| 1209 | HIPR | IS-NR | Active | ALMINH |
| 1210 | HIPR | IS-NR | Active | -----  |

Command Completed.

;

### Legend

**CARD**—The HMUX or HIPR card location.

**TYPE**—The type of card (HMUX or HIPR).

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

## rept-stat-ndc

## Report Status of NDC system

Use this command to generate a summary report of the status of the NDC subsystem on the EAGLE 5 ISS. The connectivity status for each DCM and its mated EMAP/NDC QAF devices are reported. Additionally, an alarm status summary is printed if any alarms exist.

The status summary includes the status of the following:

- EMDC-DCM to EMAP IP link(s)
- The NDC agent
- The NDC agent-to-manager association and IP link

**NOTE: This command is obsolete.**

**Keyword:** rept-stat-ndc

**Related Commands:** rept-stat-alm, rept-stat-card, rept-stat-trbl

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-ndc**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is issued.

The NDC system must be configured with the EMDC cards defined in the system.

### Notes

If the direct DCM to EMAP IP connection is unavailable the EMAP related statuses (NDC Agent, EMAP IP connection, and Q.3 association) are unknown and are shown in the output as dashes.

### Output

**rept-stat-ndc**

```

**rept-stat-rte****Report Status Route**

This command displays the signaling route status for a particular destination.

**Keyword:** **rept-stat-rte**

**Related Commands:** **dlt-rte**, **ent-rte**, **rept-stat-dstn**, **rtrv-rte**

**Command Class:** System Maintenance

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**, **p-**, **ps-**  
*zone*—**0-7**  
*area*—**000-255**  
*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**, **p-**, **ps-**  
*nnnnn*—**0-16383**  
*gc*—**aa-zz**  
*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**  
*msa*—**000-255**  
*ssa*—**000-255**  
*sp*—**000-255**

**:mode=** (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

**Range:** **full, rtx**

**full**—Comprehensive display of point code status, including rtx. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, status of all routesets is displayed.

**rtx**—Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:** The point code's subsystem status is not displayed.

**:stat=** (optional)

The primary state filter. This parameter displays all entries with the specified primary state filter.

**Range:** **nr, anr, mt, dsbld, all**

**nr**—In service normal

**anr**—In service abnormal

**mt**—Out of service maintenance

**dsbld**—Out of service maintenance disabled

**all**—All primary states

**Default:** All primary states are displayed.

### Example

```
rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25-**
```

### Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

An x-list DPC cannot be specified in the **dpc** parameter.

The **mode** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameters cannot be specified together in the command if the point code parameter specifies one of the *nnn-ccc-\*\** or *nnn-ccc-\*\*\** formats.

The **stat** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified together in the command only if the point code parameter specifies one of the *nnn-ccc-\*\** or *nnn-ccc-\*\*\** formats.

The **mode** parameter can be specified only if a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified.

No other **rept-stat-xxxx** command can be in progress when this command is entered.

If a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified, the value must be the true point code of the destination and the value must already be defined in the database.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

### Notes

Each DPC can have up to six routes associated with it.

This command's functions are now performed by **rept-stat-dstn** and this command will be deleted in a future software release.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-64 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-64.** Summary of DPC Parameter Syntaxes

| DPC format                         | Meaning                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc=ni-nc-ncm</b> | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                       |
| <b>rept-stat-rte:dpc= ni-*-*</b>   | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field. |

Table 5-64. Summary of DPC Parameter Syntaxes

| DPC format                                     | Meaning                                                                                                                                                                                                                               |
|------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc=</b> <i>ni</i> -**-*      | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                                                          |
| <b>rept-stat-rte:dpc=</b> <i>ni</i> -***-*     | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                                                 |
| <b>rept-stat-rte:dpc=</b> <i>ni-nc</i> -*      | Requests a report for provisioned cluster destination <i>ni-nc</i> -*.                                                                                                                                                                |
| <b>rept-stat-rte:dpc=</b> <i>ni-nc</i> -**     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc</i> -* (if it exists) is not reported. |
| <b>rept-stat-rte:dpc=</b> <i>ni-nc</i> -***    | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc</i> -* (if it exists) is also reported.                       |
| <b>rept-stat-rte:dpcn24=</b> <i>msa-ssa-sp</i> | Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                            |

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned DPCs (route sets) in the system,
- If the **mode=rtx** parameter is specified, the command output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, and the status of all provisioned exception route sets associated with that DPC.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, the status of all provisioned exception route sets

associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows how, when no parameters are specified, summary information for all provisioned cluster and noncluster DPCs is reported.

#### rept-stat-rte

```

  02096          IS-NR       Allowed    ACCESS
  02097          IS-ANR      Allowed    ACCESS
  02098          OOS-MT      Prohibit  INACCESS
  02099          OOS-MT      Prohibit  INACCESS
```

Command Completed.

;

The following example shows that specifying a cluster destination on the **dpc** parameter shows the cluster status and routeset information. Note that information on cluster members (both provisioned and x-list) is not shown. Use **rept-stat-cluster** to obtain this information.

#### rept-stat-rte:dpc=9-3-\*

```
rlghncxa03w 04-07-07 14:59:11 EST EAGLE 31.9.0
  DPCA          PST          SST          AST

6   --  -----  ***-***-***  -----  -----  -----
```

;

The following example shows how specifying either an FPC or cluster destination for which circular routing has been detected, along with the **mode=full** parameter, displays the name of the linkset on which the circular routing test message was transmitted. It also displays the linkset on which the circularly routed message was received. This information may be useful in correcting the circular routing situation.

#### rept-stat-rte:dpc=9-3-6:mode=full

```
rlghncxa03w 04-01-07 14:59:11 EST EAGLE 31.3.0
  DPCA          PST          SST          AST
```

```

009-003-006      OOS-MT      Prohibit  INACCESS
ALARM STATUS      = = *C  xxxx Circular routing detected

Command Completed.
;

```

The following example shows how **rept-stat-rte** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

#### rept-stat-rte:dpc=9-3-\*

```

rlghncxa03w 04-01-07 14:59:11 EST  EAGLE 31.3.0
DPCA      PST      SST      AST

```

```

6  --  -----  ***-***-***  -----  -----  -----
Command Completed.
;

```

The following example shows how **rept-stat-rte** displays a subsystem information header but no subsystem information, just as it would if an FPC is specified for which no subsystems are defined. In addition, because aliases cannot be defined for cluster destinations, this report shows only an empty header, just as it does when an FPC is specified for which no aliases are defined. Note that the circular routing information portion of the **mode=full** report displays “-----” for the linkset names when no circular routing condition exists for the DPC.

#### rept-stat-rte:dpc=9-3-\*:mode=full

| ILSN        |       |         |        |
| lsnstpy     | IS-NR | Allowed | ACCESS |

Command Completed.

;

If the Origin-Based MTP Routing feature supporting exception routes is enabled and on and **full** mode is specified, all provisioned exception route sets are displayed in addition to the regular route sets, as shown by the following example:

#### rept-stat-rte:mode=full

```
tekelecstp 06-06-01 14:06:10 EST EAGLE 35.0.0
  DPCA          PST          SST          AST
  004-004-004   OOS-MT      Idle         INACCESS

  OPCA          PST          SST          AST
  001-001-001   IS-NR      Allowed      ACCESS

  ILSN          PST          SST          AST
  lsnstpy       IS-NR      Allowed      ACCESS

  DPCN          PST          SST          AST
  00001         IS-NR      Allowed      ACCESS

  SI            PST          SST          AST
  10            IS-NR      Allowed      ACCESS

  00002         IS-NR      Allowed      ACCESS
  00005         OOS-MT     Prohibit    INACCESS
  00004         OOS-MT     Prohibit    INACCESS

  DPCN24        PST          SST          AST

  DPCI          PST          SST          AST
```

Command Completed.

;

If the Origin-Based MTP Routing feature is enabled and on, then **rtx** mode is permitted for the command, and all provisioned exception routes are displayed, as shown by the following example:

#### rept-stat-rte:mode=rtx

```
tekelecstp 06-06-01 14:06:10 EST EAGLE 35.0.0
  DPCA          PST          SST          AST
  004-004-004   OOS-MT      Idle         INACCESS

  OPCA          PST          SST          AST
  001-001-001   IS-NR      Allowed      ACCESS

  ILSN          PST          SST          AST
  lsnstpy       IS-NR      Allowed      ACCESS

  DPCN          PST          SST          AST
  00001         IS-NR      Allowed      ACCESS

  SI            PST          SST          AST
  10            IS-NR      Allowed      ACCESS
```

Command Completed.

;

### **Legend**

**DPCN**—The ITU-TSS national destination point code of the route

**DPCN24**—The 24-bit ITU national destination point code of the route

**DPCI**—The ITU-TSS international destination point code of the route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILS**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## **rept-stat-rtkey**

## **Report the Status of Routing Keys**

Use this command to generate a summary report of the status of the system routing keys.

**Keyword:** **rept-stat-rtkey**

**Related Commands:** **chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey, rtrv-appl-rtkey**

**Command Class:** System Maintenance

### **Parameters**

This command has no parameters.

### **Example**

**rept-stat-rtkey**

### **Dependencies**

None

### **Notes**

The report generated by the **rept-stat-rtkey** command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table

- The current number of static routing key entries and socket associations provisioned in the routing key table
- The percentage of the static routing key table entries that is provisioned
- The maximum number of dynamic entries of each SS7IPGW or IPGWI card's routing key table (DRKQ) and maximum number of socket associations available in each SS7IPGW or IPGWI card's dynamic routing key table
- The current number of routing key entries and socket associations provisioned in each SS7IPGW or IPGWI card's dynamic routing key table
- The percentage of each SS7IPGW or IPGWI card's dynamic routing key table that is provisioned

## Output

### rept-stat-rtkey

```
rlghncxa03w 04-02-17 14:59:11 EST EAGLE 31.3.0
SRKQ = 250   DRKQ = 300

Static Route Key table is (50 of 250) 20% full
1105   Route Key table is (25 of 250) 10% full
1107   Route Key table is (25 of 250) 10% full

Static Route Key Socket Association table is (80 of 4000) 2% full
1105   Route Key Socket Association table is (40 of 4000) 1% full
1107   Route Key Socket Association table is (40 of 4000) 1% full

Command Completed.
```

## rept-stat-rtx

## Report Status Exception Route

Use this command to display the signaling route status for one or more exception routes to a particular destination.

**Keyword:** rept-stat-rtx

**Related Commands:** dlt-rtx, ent-rtx, rtrv-rtx

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** p-, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-*\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:**       **0-16383**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**       ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/open24=** (optional)

Origination point code.

**:opci=** (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**       **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** **0-15**

### Example

**rept-stat-rtx**

**rept-stat-rtx:dpc=1-101-1**

**rept-stat-rtx:dpc=1-101-1:opc=1-2-1**

### Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

### Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The following table provides a summary description of the reports that are produced by specifying various **rept-stat-rtx** parameters.

| Format                                   | Meaning                                                                                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rtx:dpc=ni-nc-ncm :si=n</b> | Requests a status report of the exception route set for fully provisioned destination <i>ni-nc-ncm</i> , which uses the specified value <i>n</i> of the exception route class <b>si</b> as criterion. |
| <b>rept-stat-rtx:dpc= ni-nc-ncm</b>      | Requests a status report of all exception route sets for fully provisioned destination <i>ni-nc-ncm</i> , regardless of the exception route class(es) used as criterion.                              |

| Format                            | Meaning                                                                                                                                                                  |
|-----------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rtx:dpc= ni-nc-*</b> | Requests a status report of all exception route sets for provisioned cluster destination <i>ni-nc-*</i> , regardless of the exception route class(es) used as criterion. |
| <b>rept-stat-rtx</b>              | Requests a status report of all exception route sets for provisioned destinations, regardless of the exception route class(es) used as criterion                         |

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

### Output

The following command provides the status of all exception route sets provisioned in the system, sorted by DPC.

#### rept-stat-rtx

```
stdcfg2b 06-03-24 01:54:32 EST EAGLE 35.0.0

      DPCA          PST          SST          AST
      001-101-001    IS-NR        Allowed    ACCESS

      OPCA
      001-002-001    IS-ANR        Restrict  ACCESS

      SI
      10             OOS-MT        Prohibit  ACCESS
      12             OOS-MT        Prohibit  ACCESS

      DPCA          PST          SST          AST
      004-101-001    IS-NR        Allowed    ACCESS

      SI
      10             IS-NR        Allowed    ACCESS

      DPCA          PST          SST          AST
      007-101-001    OOS-MT        Prohibit  INACCESS

      OPCA
      003-001-020    OOS-MT        Prohibit  INACCESS
```

Command Completed.

The following command displays the status of exception route sets provisioned against a particular DPC.

#### rept-stat-rtx:dpc=1-101-1

```
stdcfg2b 06-03-24 01:54:32 EST EAGLE 35.0.0

      DPCA          PST          SST          AST
      001-101-001    IS-NR        Allowed    ACCESS

      OPCA
      001-002-001    IS-ANR        Restrict  ACCESS

      SI
      10             OOS-MT        Prohibit  ACCESS
      12             OOS-MT        Prohibit  ACCESS
```

Command Completed.

The following command displays detailed status and alarm information for a specific exception route set provisioned against a DPC.

**rept-stat-rtx:dpc=1-101-1:opc=1-2-1**

```
stdcfg2b 06-03-24 02:11:31 EST EAGLE 35.0.0

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**SI**—Service Indicator used as the exception routing criterion for this exception route

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**rept-stat-sccp**

**Report Status SCCP**

Use this command to display the following types of reports:

- **rept-stat-sccp** (with no parameters)—displays the status of the SCCP and VSCCP cards and the GTT (Global Title Translation), G-Flex (GSM Flexible Numbering), G-Port (GSM Mobile Number Portability), INP (INAP-based Number Portability), and EIR (Equipment Identity Register) services executing on those cards. This command also displays any cards that are denied SCCP service.
- **rept-stat-sccp:mode=perf**—targets the general SCCP traffic performance for both SCCP and VSCCP cards. The report supplies message rates for group ticket voucher (TVG) performance.
- **rept-stat-sccp:loc=nnnn**—provides a detailed view of the status of SCCP services provided by a specific SCCP/VSCCP card. Fields are omitted if an associated feature is not turned on.

**NOTE:** The **rept-stat-sccp** and **rept-stat-sccp:mode=perf** reports include the status of TSM and DSM cards but do not differentiate between these card types.

**NOTE:** To retrieve traffic statistics for the LNP feature, use the **rept-stat-lnp** command.

**Keyword:** **rept-stat-sccp**

**Related Commands:** **chg-th-sccp**, **rtrv-th-sccp**

**Command Class:** System Maintenance

## Parameters

**:loc=** (optional)

Card Address. Use this parameter to specify the location of the SCCP/VSCCP card to be reported on.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Report a summary of all cards.

**:mode=** (optional)

Use this parameter to provide extended performance information, including output about group ticket voucher (TVG) performance and message rates for direct assignments.

**Range:** **perf**

**Default:** No extended performance information is displayed.

## Example

**rept-stat-sccp**

**rept-stat-sccp:mode=perf**

**rept-stat-sccp:loc=1106**

## Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one SCCP or VSCCP card must be configured in the system before this command can be entered.

Only one optional parameter at a time can be specified in the command.

If the **loc** parameter is specified, the **loc** parameter value must be the card location of a VSCCP card.

## Notes

None

## Output

The following example shows the output of the **rept-stat-sccp** command with the G-Flex, G-Port, and INP features off and the EIR feature not enabled. The **ansigflex** system option is disabled:

### Legend

This section defines the fields of the three **rept-stat-sccp** reports:

- **rept-stat-sccp** with no parameters
- **rept-stat-sccp:mode=perf**
- **rept-stat-sccp:loc=nnnn**

A dash (-) in an output field indicates that the statistic does not apply.

**NOTE: The ERRORS and TOTAL ERRORS fields indicate that errors have occurred for SCCP cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the *Maintenance Manual* for error explanations and recovery procedures.**

*Report Type: rept-stat-sccp with no parameters*

**SCCP SUBSYSTEM REPORT, INPQ/EIR SUBSYSTEM REPORT**—The summaries of the SCCP subsystem, INPQ (INP Query) subsystem, and EIR subsystem status. Information about the status of GSM, INPMR (INP Message Relay), and EIR services is provided in the SCCP subsystem status summary report. The INPQ subsystem status is displayed only if the INP feature bit is turned on. The EIR subsystem status is displayed only if the EIR feature key is enabled and turned on. The ALARM STATUS for the SCCP and INPQ/EIR Subsystems is displayed in this section of the report.

**SCCP CARDS CONFIGURED**—The number of SCCP/VSCCP cards provisioned.

**CARD IS-NR**—The number of SCCP/VSCCP cards that can be used by the system (status is in-service normal, IS-NR).

**SYSTEM TPS ALARM THRESHOLD**—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-sccp** command.

**SYSTEM PEAK SCCP LOAD**—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

**SYSTEM TOTAL SCCP CAPACITY**—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP cards. When the ansigflex system option is enabled in an ANSI system, the maximum capacity of each DSM is 1700 TPS.

**CARD**—The card location of the TSMs running the SCCP application and of the DSMs running the VSCCP application.

**P**—When G-Flex, G-Port, or INP is turned on or EIR is enabled and turned on, a P indicates the primary DSM. The primary DSM provides the MPS status to the EAGLE 5 ISS. This indicator is displayed between the card location and the GPL version.

**VERSION**—The version number of the SCCP/VSCCP GPL the card is running.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**MSU USAGE**—The percentage of the maximum number of MSUS (850 MSUS per second) received by each card during the last 30 seconds.

**CPU USAGE**—The percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks.

**SCCP SERVICE AVERAGE MSU CAPACITY**—The average MSU capacity used over the last 30-second interval. This field includes all services provided by the SCCP/VSCCP cards.

**AVERAGE CPU CAPACITY**—The average CPU capacity used over the last 30-second interval. This field includes all services provided by the SCCP/VSCCP cards.

**AVERAGE CPU USAGE PER SERVICE**—A system-wide view of the service traffic composition. This report is available only if the G-Flex, G-Port, or INP feature is turned on or if the EIR feature is enabled and turned on. Fields are omitted if the associated feature is not turned on. The services include GTT, EIR, G-Flex, INPQ, G-Port, and INPMR.

**TOTAL SERVICE STATISTICS**—A system-wide view of per-service statistics. This report is available only if the G-Flex, G-Port, or INP feature is turned on or if the EIR feature is enabled and turned on. Fields are omitted if the associated feature is not turned on.

An "A" in the field indicates that the statistic does not apply.

The report tracks the following information:

**SERVICE**—The services include GTT, EIR, G-Flex, INPQ, G-Port, and INPMR.

**SUCCESS**—The total number of successful messages processed by the specified card for each service. Applies to all services.

**ERRORS**—The total number of messages with errors for each service. Applies to all services.

**WARNINGS**—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, G-Port, and INPMR.

**FORWARD TO GTT**—The total number of messages that could not find a match in the MPS (Multi-Purpose Server) database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, G-Port, and INPMR.

*Report Type:* **rept-stat-sccp:mode=perf**

The report displays general SCCP traffic performance for both SCCP and VSCCP cards and supplies message rates for TVG.

**NOTE: This report includes the status of TSM and DSM cards, but does not differentiate between these card types.**

**SCCP SUBSYSTEM REPORT**—The summary status of the SCCP subsystem, and the SCCP Alarm Status.

**SCCP CARDS CONFIGURED**—The number of SCCP/VSCCP cards provisioned.

**CARD IS-NR**—The number of SCCP/VSCCP cards that can be used by the system (status is in-service normal, IS-NR).

**SYSTEM TPS ALARM THRESHOLD**—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-sccp** command.

**SYSTEM PEAK SCCP LOAD**—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

**SYSTEM TOTAL SCCP CAPACITY**—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP cards.

**TPS STATISTICS**—The section of the report that provides TPS statistics on each SCCP or VSCCP card.

**CARD**—The card location of the TSM cards running the SCCP application and of the DSMs running the VSCCP application.

**CPU USAGE**—The percentage of the amount of CPU used to process messages by each card during the last 30 seconds.

**TOTAL MSU RATE**—The total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the SCCP or VSCCP card for the last 30-second period.

**CLASS 0 AND CLASS 1 TVG RATE**—The number of messages per second received.

The next section of the **rept-stat-sccp:mode=perf** report provides system-wide SCCP traffic statistics.

**AVERAGE MSU USAGE**—The total of the MSU usage fields from each SCCP card divided by the number of active SCCP cards.

**AVERAGE CPU USAGE**—The total of the CPU usage fields from each SCCP card divided by the number of active SCCP cards.

**TOTAL MSU RATE**—The sum of all GTT, EIR, G-Flex, G-Port, and INP MSUs processed by all active SCCP cards.

**STATISTICS FOR PAST 30 SECONDS**—statistics that represent the last 30-second period.

**TOTAL MSUS**—The sum of all transactions on all active SCCP cards.

**TOTAL ERRORS**—The sum of all errors on all active SCCP cards.

*Report Type:* **rept-stat-sccp:loc=nnnn**

**CARD**—The card location of the TSM running the SCCP application or of the DSM running the VSCCP application.

**VERSION**—The version number of the GPL the card is running.

**TYPE**—The type (TSM/DSM) of the card.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**CARD ALARM STATUS**—If there are no card alarms present, this field displays No Alarms.

The next section of the **rept-stat-sccp:loc=nnnn** report supplies the status of the individual services provided by the card and the associated CPU usage for the service. Fields are omitted if the associated feature is not turned on.

**GTT: STAT**—Possible values are ACTIVE and SWDL (software loading).

**GFLEX: STAT**—Possible values are ACTIVE and SWDL (software loading).

**GPORT: STAT**—Possible values are ACTIVE and SWDL (software loading).

**INPMR: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

**INPQ: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

**EIR: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading).

**TOTAL**—The sum of the CPU usage for the services running over the previous 30-second period.

**CARD SERVICE STATISTICS**—The card service statistics for the specified card. This report is available only if the G-Flex, G-Port, or INP feature is turned on, or the EIR feature is enabled and turned on. Fields are omitted if their associated feature is not turned on. The report tracks the following:

**SERVICE**—The services include GTT, EIR, G-Flex, G-Port, INPQ, and INPMR.

**SUCCESS**—The total number of successful messages processed by the specified card for each service. Applies to all services.

**ERRORS**—The total number of messages with errors for each service. Applies to all services.

**WARNINGS**—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for EIR, G-Flex, G-Port, and INPMR.

**FORWARD TO GTT**—The total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for EIR, G-Flex, G-Port, and INPMR.

## rept-stat-seas

## Report Status SEAS Command

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE 5 ISS. This command reports single OSS/Application Processor (OAP) or dual OAP configuration status, depending on the OAP hardware configuration used. See the *Maintenance Manual* for information about the SEAS alarms.

**Keyword:** **rept-stat-seas**

**Related Commands:** **alw-trm, chg-trm, inh-trm, rept-stat-sys, rept-stat-trbl, rept-stat-trm**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-seas**

### Dependencies

The SEAS feature must be turned on prior to using this command.

At least one OAP terminal must be defined using the **chg-trm** command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Notes**

None

**Output****rept-stat-seas**

```

rlghncxa03w 04-02-04 15:59:06 EST  EAGLE 31.3.0

**Legend**

**SEAS COMPONENT**—The name of the subsystem component.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**rept-stat-seculog****Display Security Log Status Information**

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries

- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

**Keyword:** rept-stat-seculog

**Related Commands:** chg-attr-seculog, rtrv-attr-seculog

**Command Class:** Security Administration

## Parameters

This command has no parameters.

## Example

**rept-stat-seculog**

## Dependencies

No other security log command can be in progress when this command is entered.

## Notes

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are not *necessarily* displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format of *hh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

## Output

The following example shows the normal security log state. All of the un-uploaded records appear in the log on the active OAM.

**rept-stat-seculog**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE  ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active 8312    84   No   No  96-08-12 05-07-04 05-07-16
                               11:23:56 15:59:06 14:02:22

1116 Standby 0      0   No   No  96-09-12 05-07-30 05-07-30
                               11:24:12 14:00:06 14:02:13
```

;

The following example shows an abnormal situation. The active security log is full and has overflowed.

#### rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  10000   100   Yes  No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0     No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
;
```

The following example shows what happens when both logs contain un-uploaded entries. The standby log on 1116 should be uploaded.

#### rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 693      7     No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
;
```

The following example shows how, if data cannot be retrieved from the standby OAM (for example, in simplex mode), blanks (-----) are displayed.

#### rept-stat-seculog

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST

1114 Active  8312     83    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby ----- --- --- --- -----
                                     -----
;
```

#### Legend

**LOC**—The address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.

**ROLE**—The current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: **active** or **standby**.

**-- SINCE LAST UPLOAD**—This heading applies to the four columns directly below it on the output. It indicates that the fields below display information obtained since the last upload.

**ENTRIES**—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using **copy-seculog**.

**%FULL**—Shows, as a percentage, how much space in the log the ENTRIES field value occupies.

**OFLO**—The overflow indicator. Overflow is what happens if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. This field displays **No** if no overflow has occurred and **Yes** if overflow has occurred.

**FAIL**—The failed indicator. This field displays **No** if no logging failure has occurred. It displays **Yes** to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

**NOTE:** Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a **copy-disk** command is processing, the system sets the flag when the **copy-disk** command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

**OLDEST RECORD/NEWEST RECORD**—The date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The **NEWEST RECORD** for the active log is the current date, because the log will have recorded the **rept-stat-seculog** command that was just entered to produce the report.

**LAST UPLOAD**—The date and time when the log was last uploaded successfully. That is, the **copy-seculog** command successfully copied the log to the FTA.

## rept-stat-slan

## Report Status of the STPLAN

Use this command to generate a summary report of the status of the ACMs that make up the STPLAN subsystem.

**Keyword:** **rept-stat-slan**

**Related Commands:** **rept-stat-alm, rept-stat-card, rept-stat-dlk, rept-stat-imt, rept-stat-sys, rept-stat-trbl**

**Command Class:** System Maintenance

### Parameters

**:mode=** (optional)

Use this parameter to provide extended performance information, including group ticket voucher (TVG) message rates.

**Range:** **perf**

**Default:** No extended performance information is displayed

### Example

**rept-stat-slan**

**rept-stat-slan:mode=perf**

### Dependencies

No other **rept-stat-xxx** commands can be in progress when this command is entered.

A warning is issued if at least one ACM is not configured.

### Notes

The **HOST CAP.** field value is obtained by averaging the usage percentages for the data links from each ACM to the host.

The **EAGLE CAP.** field value is obtained by averaging the usage percentages for the ACM traffic received from LIMs.

The system level usage for host capacity (the **AVERAGE USAGE PER HOST CAPACITY** field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the data links to the host from each ACM.

The **EAGLE 5 ISS** level usage for ACM capacity (the **AVERAGE USAGE PER EAGLE CAPACITY** field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the ACM traffic received from LIMs.

**Output**

The following example shows output with at least one ACM in an IS-NR state:

**rept-stat-slan**

```
rlghncxa03w 04-02-27 16:53:22 EST EAGLE 31.3.0
SLAN Subsystem Report IS-NR Active -----
SLAN Cards Configured= 2 Cards IS-NR= 2
CARD VERSION PST SST AST HOST Cap. EAGLE Cap.
-----
1206 021-010-000 IS-NR Active ---- 42% 16%
1104 021-010-000 IS-NR Active ALMINH 36% 12%
-----
AVERAGE USAGE per HOST CAPACITY = 39%
AVERAGE USAGE per EAGLE CAPACITY = 14%
CARDS DENIED SLAN SEVICE:
1101, 1204
Command Completed.
```

;

**rept-stat-slan:mode=perf**

```
rlghncxa03w 04-02-04 13:36:07 EST EAGLE 31.3.0
SLAN Subsystem Report IS-NR Active -----
SLAN Cards Configured= 3 Cards IS-NR= 3
CARD HOST EAGLE TVG
CAP CAP RATE
-----
1101 50% 30% 140
1102 55% 33% 435
1103 47% 28% 435
-----
AVERAGE USAGE per HOST CAPACITY = 51%
AVERAGE USAGE per EAGLE CAPACITY = 30%
Command Completed.
```

;

**Legend**

**SLAN SUBSYSTEM REPORT**—The status of the STPLAN subsystem.

**STPLAN CARDS CONFIGURED**—The number of ACMs, used by the STPLAN, contained in the system.

**CARDS IS\_NR**—The number of ACMs contained in the system whose status is in service normal (IS-NR).

**CARD**—The locations of the ACMs.

**VERSION**—The version number of the STPLAN GPL the cards are running.

**PST**—The primary state of the ACMs. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the ACMs. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the ACMs. The possible values are described in "Possible Values for PST/SST/AST".

**HOST CAP**—The amount of traffic being sent to the host from each ACM, expressed as a percentage of the total amount of traffic that can be sent to the host.

**EAGLE CAP**—The amount of traffic being sent to each ACM that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to the ACM.

**AVERAGE USAGE PER HOST CAPACITY** The amount of traffic being sent to all hosts from all ACMs, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACMs.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all ACMs that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACMs.

**CARDS DENIED SLAN SERVICE**—The card locations that cannot use the STPLAN application.

**CARDS DISABLED COPY SERVICE**—The card locations that cannot use the stop and copy action of the gateway screening feature.

Instead of displaying the VERSION , PST , SST , AST , HOST CAP , EAGLE CAP, and CARDS DENIED SLAN SERVICE fields, the report displayed with the **rept-stat-slan:mode=perf** command shows these fields:

**HOST CAP**—The average of the usage percentages for the TCP/IP data links to the host from each ACM.

**EAGLE CAP**—The average of the usage percentages for the ACM traffic received from the LIMs.

**TVG RATE**—The number of messages per second received from all SS7 links, and any other group ticket voucher paced message source. It is obtained from statistics maintained by the ACM for the last 30-second period.

**AVERAGE USAGE PER HOST CAPACITY**—The amount of traffic being sent to all hosts from all ACMs, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACMs.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all ACMs that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACMs.

## rept-stat-slk

## Report Status Signaling Link

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the **e1loc** parameter (card location of the E1 card) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the **t1loc** parameter (card location of the T1 card) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is generated.

**Keyword:** **rept-stat-slk**

**Related Commands:** **act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk**

**Command Class:** System Maintenance

### Parameters

**:l2stats=** (optional)

Report L2 status

**Range:** **align, both, brief, no, service**

**align**—Display alignment data only

**both**—Display alignment and service data

**brief**—Display up to 10 alignment events only  
**no**—Do not display level 2 status information  
**service**—Display service data only

**Default:** **no**

**:link=** (optional)

The signaling link on the card specified in the **loc** parameter. The linkss can be specified in any sequence or pattern.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All cards containing signaling links are displayed.

**:stat=** (optional)

A report on cards whose status is the same as the state indicated by the parameter

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In-Service-Abnormal (IS-ANR)

**dsbld**—Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

**mt**—Out-of-Service-Maintenance (OOS-MT)

**nr**—In-Service-Normal (IS-NR)

**Default:** Display all

### Example

```
rept-stat-slk
```

```
rept-stat-slk:loc=1201:link=a
```

```
rept-stat-slk:stat=alminh
```

```
rept-stat-slk:loc=1203:link=b:L2stats=both
```

```
rept-stat-slk:loc=1203:link=b:L2stats=brief
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If the **loc** parameter or the **link** parameter is specified, the **stat** parameter cannot be specified.

When the **loc** parameter is specified, the **link** parameter must be specified.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application

- A DCM or SSEDCCM or E5-ENET card running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application
- An E1/T1 MIM card or HC MIM card running the **ss7ansi** or **ccs7itu** application

The location specified by the **loc** parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (**l2stats**).

On TCP/IP point-to-multipoint links (DCM cards equipped as SS7IPGW or IPGWI links), **l2stats** output is not available.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a7**, and **b7** can be specified only for the following cards:

- A multi-port LIM
- An SSEDCCM running the **iplim** or **iplimi** application that supports 8 points
- An E1/T1 MIM or HC MIM
- An E5-ENET running **iplim** or **iplimi** application that supports 16 links (**a**, **b**, **a1-a7**, **b1-b7**)

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

## Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

### rept-stat-slk

```

### ***Legend***

**SLK**—The card location and the signaling link.

**LSN**—The name of the linkset that contains the signaling link.

**CLLI**—The CLLI code of the destination STP of the signaling link.

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—The trouble text alarm message that was generated for the specified signaling link.

**UNAVAIL REASON**—The reason that the signaling link is unavailable. More than one unavailable reason may be listed:

**BSNR**—The signaling link received 2 of 3 invalid BSNs.

**CNGT**—The signaling link has a remote congestion time-out.

**COO**—A changeover order was received.

**FC**—The signaling link is unavailable because of false congestion restart.

**FE**—The signaling link is in far end loopback mode.

**FIBR**—The signaling link received 2 of 3 invalid FIBs.

**INTR**—Too many link interrupts were received.

**LB**—The signaling link has been blocked locally.

**LD**—The signaling link received incomplete data.

**LI**—The signaling link has been inhibited locally.

**NA**—The signaling link is not aligned.

**PF**—The signaling link failed the proving period.

**RB**—The signaling link has been blocked remotely.

**RD(xx.xxx)**—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.

**RL**—The signaling link is in remote near end loopback mode.

**RMI**—The signaling link has been inhibited remotely.

**SIE**—An unexpected SIE was received.

**SIN**—An unexpected SIN was received.

**SIO**—An unexpected SIO was received.

**SIOS**—An unexpected SIOS was received.

**SLTF**—Link test failed.

**T1NR**—The level-2 T1 (not ready) timer expired.

**T1R**—The level-2 T1 (ready) timer expired.

**T2**—The level-2 T2 timer expired.

**T3**—The level-2 T3 timer expired.

**X25FL**—An X25 link failed.

**XDA**—The signaling link did not receive an acknowledgment in time.

**XER**—The SUERM threshold was exceeded.—

—The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

**TNC**—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.

**TNR**—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.

**LPO**—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.

**RPO**—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.

**ROOS**—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.

**RPE**—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.

**RMIR**—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.

**LCD**—Level 1 facility outage: Loss of Cell Delineation

**LOF**—Level 1 facility outage: Loss of Frame

**LOS**—Level 1 facility outage: Loss of Signal

**EVENT TYPE**—The type of event being logged:

**RECEIVE**—When a signal unit is received.

**TRANSMIT**—When a signal unit is transmitted.

**STATE**—When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail.

**EVENT**—The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

**SERVICE EVENT**—The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

**TIMESTAMP**—The time event processed by the system as follows:

**YY-MM-DD HH:MM:SS.TTT**, where

**YY**—The last 2 digits of the year (range 00–99)

**MM**—The month (range 01–12)

**DD**—The day of month (range 00–31)

**HH**—The hour of day (range 00–59)

**MM**—The minute of the hour (range 00–59)

**ss**—The seconds of the minute (range 00–59)

**TTT**—Milliseconds of the second (range 000–995 in increments of 5)

**E1 STATUS**—The status of the E1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is displayed.

**T1 STATUS**—The status of the T1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is displayed.

## rept-stat-sys

## Report Status System

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

**NOTE:** VSCCP cards are included in SCCP card status.

**Keyword:** rept-stat-sys

**Related Commands:** rept-stat-alm, rept-stat-applsock, rept-stat-card, rept-stat-clk, rept-stat-cluster, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-meas, rept-stat-mps, rept-stat-seas, rept-stat-slk, rept-stat-trbl, rept-stat-xlist

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-sys**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

### Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

**rept-stat-sys**

```

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.
- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.
- When the Measurements Platform collection function has been enabled (**chg-measopts=platformenable=on**), the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.

- When the MTP Origin Based Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.

;

**Legend**

**INH**—The number of devices within each device type that have their alarms inhibited.

**ALARMS**—The number of critical (**CRIT**), major (**MAJR**), and minor (**MINR**) alarms on the system when this command was executed and the count of alarm inhibited (**INH**) devices for cards, links, linksets, terminals, and SEAS X.25 links and terminals.

**OAM**—The status of each of the cards that are running the OAM (1113 and 1115).

**LIM CARD**—The status of the LIM cards.

**X25 CARD**—The status of the SS7GX25 cards.

**SCCP CARD**—The status of the SCCP subsystem cards. VSCCP cards are included in the SCCP card status.

**GLS CARD**—The status of the GLS subsystem cards.

**SLAN CARD**—The status of the STPLAN subsystem cards.

**VXWSLAN CARD**—The status of the VXW STPLAN subsystem cards.

**EMDC CARD**—The status of the EMDC cards.

**SS7IPGW CARD**—The status of the SS7IPGW cards.

**IPGWI CARD**—The status of the IPGWI cards.

**IPLIM CARD**—The status of the IPLIM cards.

**IPLIMI CARD**—The status of the IPLIMI cards.

**HMUX CARD**—The status of the HMUX cards.

**HIPR CARD**—The status of the HIPR cards.

**MCPM CARD**—The status of the MCPM cards.

**EROUTE CARD**—The status of the EROUTE cards.

**CLOCK**—The status of the system clocks.

**HS CLOCK**—The status of the high-speed clocks.

**IMT**—The status of the IMT system.

**SLK**—The status of the SS7, IPGWI, and X.25 signaling links in the system.

**DLK**—The status of the TCP/IP data links in the system.

**LINK SET**—The status of the linksets in the system.

**NDC IP LK**—The status of the NDC IP linksets.

**DSM IP LK**—The status of the DSM IP linksets.

**MCPM IP LK**—The status of the MCPM IP links.

**APPLSOCK**—The status of the application sockets.

**SCTP ASSOC**—The status of the SCTP associations.

**APPL SERVER**—The status of the Application Servers.

**SS7 DPC**—Summary information only for provisioned DPCs that are not in clusters.

**X25 DPC**—The status of the destination point codes in the X.25 domain.

**CLUST DPC**—Summary information for provisioned cluster DPCs only.

**RTX**—Summary information for provisioned exception routes only.

**XLIST DPC**—Summary information for X-LIST DPC entries only.

**DPC SS**—Summary information for the DPC subsystem.

**SCCP SS**—The status of the SCCP subsystem.

**XLIST SS**—Summary information for SEAS Subsystem X.25 Links to SEAC.

**SEAS SS**—The status of the SEAS subsystem.

**LSMS SS**—The status of the LSMS subsystem.

**MEAS SS**—The status of the Measurements subsystem (for Measurements Platform).

**SEAS X25**—The status of the SEAS X.25 signaling links.

**LSMS Conn**—Summary information on the communication link between the LSMS and the EMS.

**NDC SS**—The status of the NDC subsystem.

**NDC Q3**—Summary information on Q.3 association status.

**MPS**—Summary information on the MPS.

**TERMINAL**—The status of the terminals.

**SECURITY SS**—EAGLE OA&M IP Security subsystem status.

**EIR SS**—Equipment Identity Register subsystem status.

## rept-stat-t1

## Report Status T1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

**Keyword:** **rept-stat-t1**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card address. The unique identifier of a specific **limt1** card located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Information for all **limt1** cards is reported.

**:t1port=** (optional)

The T1 port number. When this parameter is specified, information is displayed only for the specified T1 port on the card in the specified card location.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

### Example

**rept-stat-t1**

**rept-stat-t1:loc=1203**

**rept-stat-t1:loc=1203:t1port=1**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **t1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where *x* is the frame and *y* is the shelf) cannot be specified in the **loc** parameter.

## Notes

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the **loc** parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the **loc** and **t1port** parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

## Output

When no parameters are specified in the command, T1 port status is displayed for all cards with provisioned T1 ports. Ports 3 through 8 are on HC-MIM cards only.

1207   2       IS-NR         Avail         -----
Command Completed.
```

;

When the **loc** parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

### rept-stat-t1:loc=1203

```
rlghncxa03w 05-01-04 07:01:08 EST EAGLE5 33.0.0
LOC   T1PORT   PST           SST           AST
1203   1       IS-NR         Avail         BRGD MSTR
1203   2       IS-NR         Avail         BRGD SLAV
1203   3       IS-NR         Avail         -----
1203   7       OOS-MT        Unavail       -----
Command Completed.
```

;

When the **loc** and **t1port** parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

### rept-stat-t1:loc=1203:t1port=1

```

        UNAVAIL REASON      = --
        Command Completed.
;

```

### Legend

**LOC**—Card location

**T1PORT**—Number of the T1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST". The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the T1 port being unavailable

**SLK**—Signaling link assigned to the T1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-trbl

## Report Status Trouble

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

**Keyword:** **rept-stat-trbl**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:display=** (optional)

Display type of alarms to be reported.

**Range:** **act**, **all**, **inhb**, **timestamp**

**act**—Display only active alarms

**all**—Display all alarms with no timestamps

**inhb**—Display only inhibited alarms

**timestamp**—Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the display=timestamp parameter is specified.

**Default:** **all**

**:level=** (optional)

The alarm level of the alarms to be displayed

**Range:** **crit**, **majr**, **minor**

**Default:** All alarms are displayed

### Example

```
rept-stat-trbl
rept-stat-trbl:level=majr
rept-stat-trbl:display=inhb
rept-stat-trbl:display=timestamp
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

### Output

The following example lists all devices that could appear. Your output will not be exactly the same; all devices and alarms cannot coexist in the system.

```
rept-stat-trbl

**Legend**

**TRM**—The ID of the terminal port.

**PST**—The primary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

**rept-stat-tstslk****Report Signaling Link Test Status**

Use this command to generate a report of the status of the MTP signaling links currently under test.

**Keyword:** **rept-stat-tstslk**

**Related Commands:** **tst-slkl**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:loopback=** (optional)

Loopback test type.

**Range:** **sltc, lxvr, oam, line, payload**

**Example**

```
rept-stat-tstslk
```

```
rept-stat-tstslk:loc=1201
```

```
rept-stat-tstslk:loc=1203:link=a
```

```
rept-stat-tstslk:loopback=lxvr
```

### Dependencies

- The card location specified in the **loc** parameter must be equipped.
- The signaling link specified in the **link** parameter must be equipped.
- If the **link** parameter is specified, the **loc** parameter must be specified.
- The signaling link specified in the **link** parameter must be an SS7 signaling link.
- This command cannot be entered for cards with **ss7ipgw** signaling links.
- This command cannot be entered for cards with **ipgwi** signaling links.
- The card location specified in the **loc** parameter cannot be reserved by the system.
- This command cannot be entered during upgrade.

### Notes

None

### Output

- If no parameters are specified, all links in test are displayed.
- If only the **loc** parameter is specified, all links in test on the specified card are displayed.
- If the **loc** and **link** parameters are specified, the specified link on the specified card is displayed.
- If the **loopback** parameter is specified, all links in the specified type of loopback test are displayed.

#### rept-stat-tstslk

```
tekelecstp 04-01-07 10:05:28 EST EAGLE 31.3.0
SLK      LOOPBACK  MAX-TIME  TEST-TIME
1102,A1   SLTC      01:00:00  00:04:01
1201,A     OAM       02:00:00  01:04:11
1203,A     LXVR      00:50:00  00:22:21
1203,B     LXVR      24:00:00  20:04:01
1208,A     PAYLOAD   01:10:00  01:05:22
1211,A     LINE      21:30:00  00:14:01
;
```

#### Legend

- SLK**—Card and signaling link that are being tested.
- LOOPBACK**—Type of loopback test being run.
- MAX-TIME**—Maximum length of time for the test to run, as specified in the **tst-slk** command **time** parameter.
- TEST-TIME**—The length of time that the test has been running when this command was entered.

### rept-stat-user

#### Report Status User

Use this command to show which users are logged into the system. It shows user names, terminal identification numbers, when the last valid command was issued, and the current state of the last command entered.

**Keyword:** **rept-stat-user**

**Related Commands:** **act-user**, **chg-pid**, **chg-user**, **dact-user**, **dlt-user**, **ent-user**, **login**, **logout**, **rtrv-secu-user**, **rtrv-user**

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**rept-stat-user**

**Dependencies**

None

**Notes**

None

**Output****rept-stat-user**

```
rlghncxa03w 04-01-07 09:12:15 EST EAGLE 31.3.0
REPT-STAT-USER COMPLTD
USER ID      TERM#  IDLE SINCE      COMMAND      STATE
frodo        3      04-01-07 08:12:23  rept-stat-card  IDLE
jethro       5      04-01-07 09:15:14  rtrv-bip      IDLE
obadiah      7      04-01-07 10:06:22  rept-stat-user PROCESSING
;
```

**Legend**

**USER ID**—The user ID of the users logged onto the system.

**TERM #**—The OAP terminal that the user's terminal is connected to.

**IDLE SINCE**—The date and time of day that the user last entered a command.

**COMMAND**—The last command the user entered.

**STATE**—The state of the command the user last entered.

**rept-stat-xlist****Report Status X-List Storage Area Statistics**

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries
- The percentage of space in the x-list reserved area currently in use
- The percentage of x-list space that must be in use before an alarm is issued

**Keyword:** rept-stat-xlist

**Related Commands:** chg-stpopts, rept-stat-cluster, rtrv-stpopts

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

**rept-stat-xlist**

**Dependencies**

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

**Notes**

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:  

$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated X-LIST space (for example, 99.1% is not rounded up to 100%).

**Output****rept-stat-xlist**

```
rlghncxa03w 04-02-18 03:32:42 EST   EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries      = 156
Current X-LIST occupancy   = 31 % (see "Notes")
X-LIST occupancy threshold = 80 %
;
```

**rept-x25-meas****Report X.25 Measurements**

Use this command to display the X.25 signaling link measurements. The X.25 signaling link is used in cellular networks to transport TCAP signaling messages from one mobile switching center (MSC) to another.

**Keyword:** rept-x25-meas

**Related Commands:** rept-stat-alm, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-slk, rept-stat-sys, rept-stat-trbl

**Command Class:** Link Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

(Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.)

**:action=** (optional)

This parameter is used to reset the measurements counters for an X25 link.

**Range:** reset, none

**Default:** none

**:port=** (optional)

The port on the card specified in the **loc** parameter

**Range:** a

### Example

```
rept-x25-meas:loc=1211:port=a
```

```
rept-x25-meas:loc=1211:port=a:action=reset
```

### Dependencies

No other action command can be in progress when this command is entered.

The specified signaling link must be equipped and assigned to a LIM configured with the ss7gx25 GPL.

### Notes

None

### Output

```
rept-x25-meas:loc=1211:port=a
```

```
rlghncxa03w 04-02-18 03:32:42 EST EAGLE 31.3.0

Command Completed.
```

```
;
```

### Legend

#### Link Counts

**HARDWARE ERRORS**—The number of signaling link hardware errors.

**CRC ERRORS**—The number of signaling link CRC errors.

**INITS**—The number of signaling link initializations.

#### Level 2 Counts

**TOTAL RECVD**—The total number of frames received.

**FRMR RECVD**—The number of frame reject frames received.

**DISC RECVD**—The number of disconnect frames received.

**TOTAL XMIT**—The total number of frames transmitted.

**RE-XMIT**—The number of frames re-transmitted.

#### Level 3 Counts

**TOTAL RECVD**—The total number of packets received.

**RESTART RECVD**—The number of restarts received.

**DIAG/INT/REJ RECVD**—The number of diagnostic, interrupt, or reject packets received.

**TOTAL XMIT**—The total number of packets transmitted.

**RE-XMIT**—The number of packets retransmitted.

**DISCARDED**—The number of messages discarded because the transmit queue is full.

#### Logical Channel Status and Counts

**#SVC DEFINED**—The total number of switched virtual circuits (SVCs).

**#SVC IN USE**—The number of SVCs being used.

**SVCs ALL IN USE**—The number of times that all SVCs have been in use.

**#PVC DEFINED**—The total number of permanent virtual circuits (PVCs).

**#PVC IN USE**—The number of PVCs being used.

#### Number of times SVC control timers have expired

**T1**—SVC control timer T1

**T2**—SVC control timer T2

**T4**—SVC control timer T4

**T5**—SVC control timer T5

**T6**—SVC control timer T6

**T7**—SVC control timer T7

**T8**—SVC control timer T8

## rls-alm

### Release Alarm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

**Keyword:** rls-alm

**Related Commands:** act-alm-trns, dact-alm-trns, rept-stat-alm, rept-stat-clk, rept-stat-trbl, rtrv-obit, rtrv-trbl

**Command Class:** System Maintenance

**Parameters**

**:lvl=** (optional)  
 The alarm level  
**Range:**     **crit, majr, minor**  
**Default:**   All alarms are cleared

**Example**

```
rls-alm
rls-alm : lvl = crit
```

**Dependencies**

No other action command can be in progress when this command is entered.

**Notes**

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

**Output**

```
rls-alm
rlghncxa03w 04-01-07 09:27:24 EST  EAGLE 31.3.0
rls-alm
Command entered at terminal #8.
;
```

**rmv-card****Remove Card**

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM, TSM, or ACM, or physically remove it from the shelf.

**Keyword:** **rmv-card**

**Related Commands:** **dlt-card, ent-card, init-card, rept-stat-card, rst-card, rtrv-card**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)  
 The card location as stenciled on the shelf of the system.  
**Range:**     **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**  
 Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.

**:force=** (optional)  
 This parameter is required if the card is the last GLS or SCCP card.  
**Range:**     **yes, no**  
**Default:**   **no**

**Example**

```
rmv-card:loc=1101
```

**rmv-card:loc=1201:force=yes**

### Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all *xy09* and *xy10* locations (where *x* is the frame and *y* is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The **force** parameter is required to force the last GLS or SCCP out of service.

If the card is an ACM, all TCP/IP data links assigned to it must be placed out of service.

### Notes

The function of this command is the same as the **inh-card** command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the **dact-slk** command, before the command is accepted.

Inhibiting an TSM running the SCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit an ACM that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the **canc-dlk** command, before the command is accepted.

### Output

**rmv-card:loc=1101**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been inhibited.
```

;

## rmv-imt

## Remove IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

**CAUTION:** Use this command only when directed by Tekelec Technical Services at (888) FOR-TKLC.

**Keyword:** **rmv-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rst-imt**

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)

The IMT bus to be inhibited.

**Range:** **a, b**

**Example****rmv-imt:bus=a****Dependencies**

The function of this command is the same as the **inh-imt** command.

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.

This command cannot be entered during an IMT Fault Isolation Test.

**Notes**

Cards that are not connected to the other IMT bus will reinitialize.

All traffic is rerouted to the other IMT bus.

**rmv-trm****Remove Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (OUT-OF-SERVICE-MAINTENANCE-DISABLED), and to set the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

**Keyword:** **rmv-trm**

**Related Commands:** **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rst-trm, rtrv-trm**

**Command Class:** System Maintenance

**Parameters****:trm=** (mandatory)

The ID of the serial port to be inhibited.

**Range:** 1-40**:force=** (optional)

Force the removal of this terminal, even if it is the last in-service OAP terminal available.

**Range:** yes, no**Default:** no**Example****rmv-trm:port=5****rmv-trm:trm=1:force=yes****Dependencies**

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.The terminal specified by the **trm** parameter must be equipped.To inhibit the last in-service OAP terminal, the **force=yes** parameter must be specified.

You cannot inhibit the terminal from which this command was entered.

**Notes**

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

**Output****rmv-trm**

rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0

Inhibit message sent to terminal

;

**rst-card****Reset Card**

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful. If the loading fails, the card status is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** rst-card**Related Commands:** dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rtrv-card**Command Class:** System Maintenance**Parameters****:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:code=** (optional)

The GPL type to be loaded.

**Range:** **appr, trial, utility**

**appr**—Approved GPL

**trial**—Trial GPL

**utility**—Utility GPL, used primarily by the factory for loading special GPLs for testing purposes

**Default:** No GPL type is given.

**:data=** (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload LNP data if the LNP feature is on. This parameter is applicable only to network cards containing the LNP database (SCCP, EBDABLM).

Various conditions in the system may prevent the persistence of the LNP data on the SCCP/EBDABLM cards.

**Range:** **refresh, persist**

**refresh**—Causes data to be reloaded to the specified card.

**persist**—Indicates that the LNP database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place (for example, that the TSM/BLM card is present and ready and that the downloaded LNP database is coherent. The LNP database audit cannot be performed prior to the card reset). During the card initialization and loading sequence, a warm restart is performed if the card meets the warm restart conditions.

**Default:** **refresh**

## Example

**rst-card:loc=2301:code=trial**

**rst-card:loc=1101:data=persist**

## Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all *xy09* and *xy10* locations (where *x* is the frame and *y* is the shelf).

The shelf and card must be equipped.

If the card is a LIM, it must have a signaling link assigned to it before it can be allowed.

No other action command can be in progress when this command is entered.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **data** parameter can be specified.

The **data** parameter is valid ONLY for SCCP and EBDABLM card locations or GPLs.

## Notes

The function of this command is the same as the **alw-card** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of the warm restart feature.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the

secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0 0021.1493 CARD 1111 INFO
SSH Host Keys Regenerated DSA Server Host Key FTRA-formatted Fingerprint=

```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```

Card has been allowed.
```

;

## rst-dstn

## Reset Destination Circular Routing Status

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-\**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

**NOTE: This command does not support 24-bit ITU national point codes.**

**Keyword:** **rst-dstn**

**Related Commands:** **chg-stpopts**, **rept-stat-cluster**, **rept-stat-dstn**, **rtrv-stpopts**

**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpc**

**Range:** **p-, 000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

## Example

**rst-dstn:dpc=1-2-\***

**rst-dstn:dpc=20-2-5**

**rst-dstn:dpc=p-20-2-5**

### Dependencies

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\** or *ni-nc-\*\*\** cannot be specified for the **rst-dstn** command.

### Notes

In this command, the point codes support only the private (internal) point code subtype prefix (**p**).

### Output

**rst-dstn:dpc=1-2-\***

```

## rst-imt

## Reset IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

**Keyword:** **rst-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)

The IMT bus to be returned to service.

**Range:** **a, b**

### Example

**rst-imt:bus=a**

### Dependencies

None

### Notes

The function of this command is the same as the **alw-imt** command.

This command returns an inhibited IMT bus to service.

**Output**

```

rst-imt:bus=a
rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
Allow IMT Bus A command issued.

rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
0100.0097      IMT      BUS A      IMT allowed
;

```

**rst-trm****Reset Terminal**

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** rst-trm

**Related Commands:** act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rtrv-trm

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)  
ID of the serial port to be put into service.  
**Range:** 1-40

**Example**

```

rst-trm:trm=5
rst-trm:trm=12

```

**Dependencies**

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

**Notes**

The function of this command is the same as the **alw-trm** command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

**Output**

```

rst-trm:trm=12
rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
Allow message sent to terminal

rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
;

```

**rtrv-acg-mic****Display ACG Manually Initiated Control**

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A set of controls is selected to be displayed by specifying the type of controls (**type** parameter), the service (**serv** parameter), and the digits (**dgts** parameter).

**Keyword:** rtrv-acg-mic

**Related Commands:** chg-acg-mic, dlt-acg-mic, ent-acg-mic, rept-stat-lnp

**Command Class:** Database Administration

**Parameters**

**:dgts=** (optional)

Digits

**Range:** 3 digits, 6-10 digits

Valid values are **000-999, 000000-9999999999**

**:serv=** (optional)

Query service

**Range:** **ain, in**

**:type=** (optional)

Type of control

**Range:** **all, sd**

**Example**

Display all MICs:

**rtrv-acg-mic**

Display the MIC(s) that apply to particular services and digits:

**rtrv-acg-mic:type=sd**

Display the MIC(s) that apply to AIN queries:

**rtrv-acg-mic:serv=ain**

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

**rtrv-acg-mic:serv=in:dgts=919460**

**Dependencies**

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** cannot be specified.

The **dgts** parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-acg-mic** command can be entered.

**Notes**

None

**Output**

**rtrv-acg-mic:type=sd**

```
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0

```

;

**Legend**

**LVL**—Overload level

**QR**—Query rate

**AND**—AIN number of digits

**IND**—IN number of digits

**INTVL**—Interval index

**DRTN**—Duration index

**rtrv-appl-rtkey****Retrieve Application Route Key Table**

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 1000 routing keys per system (if there are any dual-slot DCMs) or 2500 routing keys per system (if there are SSED CMs).

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

**Keyword:** **rtrv-appl-rtkey**

**Related Commands:** **chg-appl-rtkey**, **dlt-appl-rtkey**, **ent-appl-rtkey**

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:asname=** (mandatory)

Application Server (AS) name assigned to this routing key.

**Range:** *aaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**:cice=** (optional)

The end range of circuit identification codes assigned to the routing key.

**Range:** See Table A-4 for valid CIC values for specified SI and MSU types.

**:cics=** (optional)

The start range of circuit identification codes assigned to the routing key.

**Range:** See Table A-4 for valid CIC values for specified SI and MSU types.

**:display=** (optional)

Indicates the scope of the display, whether it is a brief display or full display. The output includes the type and location of the card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

**Range:** **all, brief**

**all**—The KEY and the ATTRIBUTE sections of the routing key are displayed

**brief**—Only the KEY section of the routing key is displayed

**Default:** **brief**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **dpca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:loc=** (optional)

Card location for retrieval of dynamic routing key entries.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:mode=** (optional)

Specifies whether to retrieve static keys only, dynamic keys only, or both static and dynamic keys.

**Range:** **static, dynamic, both**

**Default:** **both**

**:norm=** (optional)

Normalization process enabled/disabled indicator for MSUs using the routing key

**Range:** **yes, no**

**:num=** (optional)

The number of entries to display.

**Range:** **1-10000**

**Default:** **50**

**:opc=** (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **opca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Originating point code.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opcn24=** (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:pstncat=** (optional)

PSTN Category assigned to the routing key

**Range:** **0-65535**

**:pstnid=** (optional)

PSTN ID assigned to the routing key

**Range:**      **0-65535**

**:rcontext=** (optional)

Routing Context. The **rcontext** parameter is used to display the routing key with the specified routing context.

**Range:**      **0-4294967295**

**:si=** (optional)

Service indicator.

**Range:**      **0-15**

The following equivalent text values can be specified:

**Number = Text—Description**

**0 = snm**—Signaling network management messages

**1 = regtest**—Signaling network testing and maintenance regular

**2 = spltest**—Signaling network testing and maintenance special

**3 = sccp**—SCCP

**4 = tup**—Telephone user part

**5 = isup**—ISDN user part

**13 = qbicc**

**:sname=** (optional)

Socket name as provisioned in the Socket table and associated with this routing key.

**Range:**      *aaaaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**:ssn=** (optional)

Subsystem number.

**Range:**      **0-255**

**:type=** (optional)

The type of routing key.

**Range:**      **all, full, partial, default**

**Default:**    **all**

## Example

**rtrv-appl-rtkey**

**rtrv-appl-rtkey:dpc=123-234-255:si=3:ssn=123:sname=socket1**

**rtrv-appl-rtkey:sname=socket2**

**rtrv-appl-rtkey:dpc=123-234-255:si=3:mode=static**

**rtrv-appl-rtkey:dpc=123-234-255**

**rtrv-appl-rtkey:cics=1:cice=1000:num=3**

**rtrv-appl-rtkey:cice=19:mode=dynamic:loc=1107**

**rtrv-appl-rtkey:opc=122-124-125:mode=static**

**rtrv-appl-rtkey:type=partial:mode=both:loc=1107**

**rtrv-appl-rtkey:display=all**

**rtrv-appl-rtkey:rcontext=7**

### Dependencies

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. If the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value specified for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

The **ssn** parameter cannot be specified when **opc**, **cics**, and **cice** are specified. See Table 5-8 on page 5-72 for valid parameter combinations.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are allowed with the **si** parameter only when **si** equals **4**, **5**, or **13** (or **tup**, **isup**, or **qbicc**). Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The following card locations (**loc** parameter) are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf). The card must be equipped and in service.

When the **mode=static** parameter is specified, the **loc** parameter cannot be specified.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

When a default routing key is specified, only the **sname** parameter is allowed.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card. Dynamic routing key entries are provisioned through IP requests and are unique to each SS7IPGW card. The type of routing key entries to be retrieved (static or dynamic) is controlled by the **loc** and **mode** parameters. Specifying a card location (**loc**) causes dynamic routing key entries to be retrieved from that location only. If **mode=both** is specified, specifying **loc** has no effect on the retrieval of static routing key entries.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The **display=all** parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (**s-**).

## Output

**rtrv-appl-rtkey**

```

## rtrv-appl-sock

## Retrieve Application Socket

Use this command to retrieve the configuration data from the Socket table. The Socket table is used to associate the local host/local port to a remote host/remote port.

**Keyword:** **rtrv-appl-sock**

**Related Commands:** **chg-appl-sock, dlt-appl-sock, ent-appl-sock**

**Command Class:** Database Administration

### Parameters

**:lhost=** (optional)

Local host name. The logical name assigned to the local host device.

**Range:** *////////////////////////////////////*

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**Default:** Retrieve all

**:link=** (optional)

The signaling link associated with this socket.

**Synonym:** **port**

**Range:** **a, b, a1, b1, a2, b2, a3, b3**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

**Default:** Retrieve all

**:rhost=** (optional)

Remote host name. The logical name assigned to the remote host device.

**Range:** *////////////////////////////////////*

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**Default:** Retrieve all

**:sname=** (optional)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

**Range:** *aaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**Default:** All information for all sockets is retrieved

### Example

**rtrv-appl-sock:sname=swbel32**

### Dependencies

The **lhost**, **rhost**, and **sname** parameters must conform to the specified naming conventions.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

## Output

### Legend

**ALW**—Whether or not to the socket is allowed to carry SS7 traffic, **YES** or **NO**.

**DCMPS**—The parameter set used by this socket, 1 to **10**.

**LHOST**—The local host name.

**LINK**—The signaling link associated with this socket.

**LPORT**—The local port name.

**OPEN**—Whether or not the connection manager is to open this socket if the socket is operational, YES or NO.

**REXMIT**—Retransmission mode to use on socket when packet loss is detected; BSD, FIXED or MOD.

**RHOST**—The remote host name.

**RPORT**—The remote port name.

**RTT**—Expected Round Trip Time for socket when REXMIT is FIXED or MOD.

**SERVER**—The role of the local socket in the client/server relationship. If YES, the server is the local side. If NO, the client is the local side.

**SNAME**—The socket name.

## rtrv-as

## Retrieve Application Server

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

**Keyword:** rtrv-as

**Related Commands:** chg-as, dlt-as, ent-as, rept-stat-as

**Command Class:** Database Administration

### Parameters

**:aname=** (optional)

Name of the association.

**Range:** aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

**Default:** Retrieve all

**:asname=** (optional)

Name of the Application Server.

**Range:** aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

### Example

rtrv-as

rtrv-as:aname=as1

### Dependencies

None

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

### Output

```

**rtrv-asp****Retrieve Application Server Process**

Use this command to retrieve the characteristics of one or all Application Server Processes from the ASP table.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-asp

**Related Commands:** chg-asp, dlt-asp, ent-asp,

**Command Class:** Database Administration

**Parameters**

**:aspname=** (mandatory)

Name of the Application Server Process (ASP).

**Range:** aaaaaaaaaaaaaa

Up to 15 alphanumeric characters; the first character must be a letter.

**Example**

**rtrv-asp**

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

**rtrv-asp**

```
rlghncxa03w 03-07-04 08:40:18 EST EAGLE 31.6.0
ASP          Association          UAPS
ASP1         sock1                1
ASP2         sock2                1
ASP3         sock3                1
```

ASP Table is (3 of 4000) 1% full

;

**rtrv-assoc****Retrieve Association**

Use this command to retrieve the configuration data from the IP Socket/Association (IPAPSOCK) table.

**Keyword:** rtrv-assoc

**Related Commands:** chg-assoc, dlt-assoc, ent-assoc, rept-stat-assoc

**Command Class:** Database Administration

**Parameters****:adapter=** (optional)

The adapter layer for this association.

**Range:** **m3ua, sua, m2pa****Default:** Retrieve all**:alhost=** (optional)

Alternate local host name as defined in the IP Host table.

**Range:** **////////////////////////////////////****a–z, A–Z, 0–9, -, .** —any string of characters beginning with a letter and comprising up to 60 characters in length.**Default:** Retrieve all**:aname=** (optional)

Name assigned to this association (in IPAPSOCK table).

**Range:** **aaaaaaaaaaaaaaaa**

Up to 15 alphanumeric characters; the first character must be a letter.

**Default:** Retrieve all**:display=** (optional)

An optional display parameter can be specified in order to display either all or brief reports for associations. The default mode is “brief” if this parameter is not entered at the command line.

**Range:** **brief, all****:lhost=** (optional)

The local host name as defined in the IP Host table.

**Range:** **////////////////////////////////////****a–z, A–Z, 0–9, -, .** —any string of characters beginning with a letter and comprising up to 60 characters in length**Default:** Retrieve all**:link=** (optional)

The signaling link for this association.

**Range:** **a, b, a1, b1, a2, b2, a7, b7**Not all card types support all **link** parameter values.See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.**:loc=** (optional)

Card location that is stenciled on the shelf of the EAGLE 5 ISS..

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118****:rhost=** (optional)

Name of Remote Host as defined in the IP Host table.

**Range:** **////////////////////////////////////****a–z, A–Z, 0–9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)**Default:** Retrieve all

**Example**

```
rtrv-assoc
```

```
rtrv-assoc:aname=swbel32
```

```
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=sua
```

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. When the command is entered with the **aname**, **lhost**, or **alhost** parameters, the output displays SCTP buffer usage information (used and total buffer space on the card).

**Output**

The following example with the **aname** parameter shows buffer usage (used and total buffer space) and card location information.

```
rtrv-assoc:aname=ipl1311a
```

```
eagle10115 06-03-27 09:48:36 EST EAGLE 35.0.0

### Legend

**LPSET**—The link parameter set being changed, **1** to **30**. The system default value for this parameter is **1** for ANSI and **21** for ITU.

**ACTION**—Copy a set of ATM signaling link parameters from one parameter set to another. The value of this parameter is **copy**. If this parameter is not specified, then the copy action cannot take place.

**SCRLPSET**—The ATM signaling link parameter set used as a source for the **action=copy** parameter. This parameter can only be specified with the **action=copy** parameter.

**MAXCC**—The maximum number of transmissions of a BGN, END, ER, or RS PDU. The value of this parameter is from 1 to 10 PDUs. The system default value is 4 PDUs.

**MAXPD**—The maximum number of SD PDUs that can be sent before a POLL is sent. The value of this parameter is from 5 to 2120 PDUs. The system default value is 500 PDUs.

**MAXSTAT**—The maximum number of list elements in a STAT PDU. The value of this parameter is from 3 to 67 PDUs. The system default value is 67 PDUs.

**TMRCC**—The timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs. The value of this parameter is from .1 to 2 seconds. The system default value is .2 seconds.

**TMRKALIVE**—The timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRNOSP**—The timer, in seconds, used to check that STAT PDUs are arriving often enough. The value of this parameter is from .5 to 2 seconds. The system default value is 1.5 seconds.

**TMRPOLL**—The timer, in seconds, used to guarantee that POLL PDUs are sent often enough. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRIDLE**—The timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase. The value of this parameter is from .025 to 1 seconds. The system default value is .1 seconds.

**TMRT1**—The time, in seconds, between a link release action and the next link reestablish action during alignment. The value of this parameter is from 1 to 15 seconds. The system default value is 5 seconds.

**TMRT2**—The total time, in seconds, that SSCF will attempt alignment. The value of this parameter is from 15 to 180 seconds. The system default value is 120 seconds for ANSI and 30 seconds for ITU.

**TMRT3**—The time, in seconds, between proving PDUs. The value of this parameter is from .00045 to .023 seconds. The system default value is .000925 seconds.

**N1**—The number of PDUs sent during proving. The value of this parameter is from 500 to 64552 PDUs. The system default value is 64552 PDUs for ANSI and 1000 PDUs for ITU.

**MAXNRP**—The maximum number of retransmitted PDUs during proving. The value of this parameter is from 1 to 10 PDUs. The system default value is 1 PDU for ANSI and 0 PDUs for ITU.

**TMRREC**—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring. The value of this parameter from is 60 to 10800 seconds. The system default value is 3600 seconds.

**TMRNOCRED**—The timer, in seconds, used when the no credit exists and PDUs are available to be sent. The value of this parameter is from 1 to 6 seconds. The system default value is 1.5 seconds.

**TMRERM**—The error rate monitor interval, in seconds. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**NBLK**—The number of monitoring intervals per block. The value of this parameter is from 1 to 10. The system default value is 3.

**TMRPROV**—The timer, in seconds, used to monitor the status of a link after it is placed into service. The value of this parameter from 60 to 1200 seconds. The system default value is 600 seconds.

**SDU SIZE**—The SSCOP SDU size (set to 272 octets).

**UU SIZE**—The SCOP UU size (set to 4 octets).

**N**—The monitoring intervals spanning a .4 second error event (set to 9).

**FC NR**—The fixed credit increment value.

**FC BC**—The fixed credit allocation frequency.

**TSUP**—The superblock timer for layer management, in seconds.

**TLOSS**—The loss timer for layer management, in seconds.

**ERMSM**—The error rate monitor smoothing factor.

**THRES**—The error rate monitor threshold.

## rtrv-atm-prm

## Retrieve ATM Parameters

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

**Keyword:** rtrv-atm-prm

**Related Commands:** rtrv-atm-lps

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-atm-prm**

### Dependencies

None

### Notes

None

### Output

**rtrv-atm-prm**

```
tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
3622 3622 4528 4528 210 100 3 0 1 16 12
;
```

### Legend

The ATM traffic descriptors are displayed in the following fields:

**BT**—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.

**CDVT**—The amount of cell delay variation for the VCL in the network ingress direction.

**PCR**—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.

**QOS**—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.

**SCR**—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.

The ATM interface parameters are displayed in the following fields:

**MAX VCCs**—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.

**MAX VPCs**—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).

**VCI BITS**—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.

**VPI BITS**—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

## rtrv-attr-seculog

## Display Security Log Characteristic

Use this command to display security log attributes that were configured using the **chg-attr-seculog** command.

**Keyword:** **rtrv-attr-seculog**

**Related Commands:** **chg-attr-seculog**

**Command Class:** Security Administration

### Parameters

This command has no parameters.

### Example

**rtrv-bip****Retrieve Board Identification PROMs**

Use this command to show the board identification PROM (BIP) data for a specified card (main assembly or applique) and location.

The following information is displayed for both main assemblies and appliques: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing location and date, and the software match ID.

For main assemblies, the port A ethernet address (if ENT01 record exists) and port B ethernet address (if ENT02 record exists) is also displayed.

For appliques, the applique type and ethernet address (if the applique type is ENET and ENT01 record exists) are also displayed.

**CAUTION:** To have the **rtrv-bip** command display MAC addresses, the daughterboard must have a type of ENET.

**Keyword:** **rtrv-bip**

**Related Commands:** **chg-bip-fld**, **chg-bip-rec**, **tst-bip**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118  
HMUX and HIPR locations are not valid.

**:type=** (mandatory)

The type of board at the specified location whose BIP information is to be displayed.

**Range:** **mbd**, **dbd**  
**mbd**—Main assembly  
**dbd**—Applique

**Example**

**rtrv-bip:loc=1201:type=mbd**

**rtrv-bip:loc=1201:type=dbd**

**Dependencies**

The card location frame, shelf, and slot must be within the allowed range.

The card location must be valid for the command.

The board type **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

**Notes**

The **tst-bip** command verifies that the PROM is good by writing to and reading from the PROM. The **rtrv-bip** command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communication to

the card has failed, and you might need to replace the card. Contact Tekelec Technical Service at (888) FOR-TKLC to find out if the card can be reprogrammed.

## Output

**SOFTWARE MATCH ID**—This field is used to check hardware and software compatibility.

**DAUGHTERBOARD TYPE**—The type of applique.

**MANUFACTURED AT**—The factory location where the card was manufactured.

**WEEK/YEAR**—The week (1–52) and the year (4 digits) that the card was manufactured.

## rtrv-card

### Retrieve Card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined by the **ent-card** command. If the **loc** parameter is specified, the command displays information for the specified card only.

**Keyword:** rtrv-card

**Related Commands:** dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card

**Command Class:** Database Administration

## Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Retrieve all

**:links=** (optional)

Links Provision Status. For the card in the location specified by the **loc** parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

**Range:** all, equip, unequip

**all**—Display all possible links for the card.

**equip**—Display only links that are equipped on the card.

**unequip**—Display only links that are allowed but not equipped on the card.

**Default:** equip

## Example

```
rtrv-card
```

```
rtrv-card:loc=1205
```

## Dependencies

The card location slot must be between **1** and **16** and not **9** or **10**.

The card location cannot be **1114**, **1116**, **1117**, or **1118**.

The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

The specified card location must be equipped in the database.

## Notes

The provisioning method of an MPL or MPL-T (multi-port LIM) and a two-port LIM running the **ss7ansi** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** application to allow the MPLs to replace a two-port LIM without having to reprovision the LIM in the database. The MPLs support only the LIMDS0 interface, and the **appl** value must be **ss7ansi**. The MPLs run the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the MPL cards to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the MPL card and displays its application as **ss7ansi**.

The provisioning method of an E1/T1 MIM (Multi-Channel Interface Module) and a two-port E1 card running the **ss7ansi** or **ccs7itu** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** or **ccs7itu** application to allow the E1/T1 MIM card to replace a two-port E1 card without having to reprovision the E1 card in the database. The **appl** value can be **ss7ansi** or **ccs7itu**. The E1/T1 MIM runs the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the card to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the E1/T1 card and displays its application as **ss7ansi** or **ccs7itu**.

;

```

**Legend**

**CARD**—The card location as stenciled on the shelf of the system.

**TYPE**—The type of card. (The DCM and SSED CM cards are card type DCM).

**APPL**—The application associated with each card in the display.

**LSET NAME**—The linkset name associated with the cards in the display.

**LINK**—The signaling link associated with the linkset. If the card is an MPL or MPL-T (TYPE is **limds0**, APPL is **ss7ansi**) or an E1/T1 MIM (TYPE can be **lime1**, **limt1**, or **limch**; APPL can be **ss7ansi** or **ccs7itu**), the card can support 8 ports (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, and **b3**).

**SLC**—The signaling link code.

**rtrv-cmd****Retrieve Command Attributes**

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

**Keyword:** **rtrv-cmd**

**Related Commands:** **chg-cmd**

**Command Class:** Basic

**Parameters**

**:class=** (optional)

The command class whose attributes are to be retrieved.

**Range:** *ayyyyy*

One alphabetic character followed by up to 5 additional alphanumeric characters.

**:cmd=** (optional)

The command whose attributes are to be retrieved.

**Range:** *xxxxxxxxxxxxxxxxxxxx*

One alphabetic character followed by up to 19 additional alphanumeric characters, enclosed in double quotes.

**Example**

```
rtrv-cmd:cmd="ent-rte"
```

```
rtrv-cmd:class=dab
```

```
rtrv-cmd
```

**Dependencies**

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before:

- A command from classes LNPBAS, LNPDB, and LNPSUB can be specified in the **cmd** parameter
- Command classes LNPBAS, LNPDB, and LNPSUB can be specified in the **class** parameter

The value of the **cmd** parameter must be a valid system command.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following example shows the command classes to which the **rept-stat-slk** command is assigned (non-configurable class **sys** and user-configured classes **u01**, **u02**, **krb**, and **u11**):

```
rtrv-cmd:cmd="rept-stat-slk"
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
cmd CLASS
rept-stat-slk sys, u01, u02, krb, u11
;
```

The following example shows the commands assigned to user-configured command class **krb**:

```
rtrv-cmd:class=krb
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
CMD CLASS

**rtrv-cmdclass****Retrieve Command Class**

Use this command to retrieve the name and description of one command class or all command classes.

**Keyword:** rtrv-cmdclass

**Related Commands:** chg-cmdclass

**Command Class:** Basic

## Parameters

**:class=** (optional)

The command class whose name and description are to be retrieved.

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters

## Example

```
rtrv-cmdclass:class=krb
```

```
rtrv-cmdclass
```

## Dependencies

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before command classes LNPBAS, LNPDB, and LNPSUB can be specified in the **class** parameter.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

## Notes

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before classes LNPBAS, LNPDB, and LNPSUB will appear in the command output.

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

## Output

In the following examples, the classes u01, u03, u05, and u32 are default configurable command class names. The classes krb and dab are user-assigned configurable command class names; the user changed default configurable command class name u02 to krb and changed default configurable command class name u04 to dab. The descriptions of classes krb and dab were entered with the **descr** parameter when the class names were changed with the **chg-cmdclass** command.

```
rtrv-cmdclass:class=krb
```

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
class          descr

```

        .
        u32                configurable command class 32
    ;

```

**rtrv-csl****Retrieve Common Screening List**

Use this command to retrieve all Common Screening List (CSL) entries for a specified feature, a list of screening entries for the specified feature and screening list name, or a specific DS or PC value for a particular feature and screening list name. The Common Screening List commands are used to tailor certain types of general screening information to specific features.

**Keyword:** **rtrv-csl**

**Related Commands:** **dlt-csl**, **ent-csl**, **rtrv-csl**, **rtrv-ctrl-feat**

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:ds=** (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command.

**Range:** 1-15 digits

Valid digits are **0-9**, **a-f**, **A-F**.

1-15 digits—Prepaid IDP Query Relay **ccnc** list

1-5 digits—Prepaid IDP Query Relay **delpfx** list

1-6 digits—Prepaid IDP Query Relay **gta** list

1-4 digits—Prepaid IDP Query Relay **skbcsn** list

4 digits—IDP Screening for Prepaid **skts** list

1-15 digits—IDP Screening for Prepaid **insl** list

**:feature=** (optional)

Feature Name. The name of the enabled screening feature for which the command is entered. Enter the name as it appears in the **rtrv-ctrl-feat** command description output example.

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:** *a*xxxxxxxxxxxxxxxxxxxxxxxxxxxxxxxx

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

Enter enough of the feature name to make the name unique if two features begin with the same word or acronym.

The following feature names are valid for this command:

- Prepaid IDP Query Relay
- IDP Screening for Prepaid.

**:list=** (optional)

The name of the Common Screening List that is associated with the feature.

The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

**Range:** **delpfx, gt, skbcm, ccnc, skts, insl**

**delpfx**—Delete Prefix List

**gt**—Global Title List

**skbcm**—SK+BCSM List

**ccnc**—CC+NC List

**skts**—SK+TS List

**insl**—In Network Subscriber List

The following screening lists are valid for the indicated features:

- **ccnc, delpfx, gt, skbcm**—Prepaid IDP Query Relay
- **skts, insl**—IDP Screening for Prepaid feature

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code. Either the *ds* or *pc* parameter must be specified for the command. Currently, there are no common screening list features that use point codes.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*.

**Range:** **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

**:pcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:pn=** (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example. Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:** 893000000-893999999

The first 3 digits are **893**. Do not separate the digits with dashes or spaces.

The following part numbers are valid for this command:

- **893016001**—Prepaid IDP Query Relay feature
- **893015501**—IDP Screening for Prepaid feature

## Example

**rtrv-csl**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc**

**rtrv-csl:feature="IDP Screening for Prepaid":list=insl:ds=123456789bcdEF**

## Dependencies

The specified feature name must be for a feature that uses a Common Screening List. The feature name must be specified as it appears in the **rtrv-ctrl-feat** command output example. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The following features use a Common Screening List:

- IDP Screening for Prepaid
- Prepaid IDP Query Relay

The **list** parameter value must be valid for the specified screening feature. The following **list** parameter values are valid for the indicated feature:

- **skts** , **insl** —IDP Screening for Prepaid
- **gt**, **ccndc**, **delpfx**, **skbcm**—Prepaid IDP Query Relay

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccndc—ds** parameter
- **list=delpfx—ds** and **p1** parameters
- **list=skbcm—ds** parameter
- **list=skts—ds** parameter
- **list=insl—ds** parameter

## Notes

None

## Output

Retrieve all screening entries for all screening lists for all enabled screening list features.

## rtrv-cspc

## Retrieve Concerned Signaling Point Code

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

**Keyword:** **rtrv-cspc**

**Related Commands:** **dlt-cspc, ent-cspc**

**Command Class:** Database Administration

### Parameters

**:grp=** (optional)

Group name

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** Retrieve all.

### Example

**rtrv-cspc**

**rtrv-cspc:grp=grp01**

### Dependencies

If specified, the group name must exist in the database.

### Notes

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

### Output

When the ANSI-ITU-China SCCP Conversion feature is on, point codes from mixed domains are allowed in a group.

#### rtrv-cspc

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp02 ANSI, ITU, ITU-N24 3%
Grp03 ITU 2%
```

```
;
```

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-** prefix. The ANSI-ITU-China SCCP Conversion feature is on in this example.

#### rtrv-cspc:grp=grp02

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PC Type
GRP02 001-012-123 A
      001-012-124 A
      7-089-0 I
      s-2-021-4 I
      s-00789 N
```

```
;
```

When the ANSI-ITU-China SCCP Conversion feature is not on, point codes from only one domain are allowed in a group.

#### rtrv-cspc

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp03 ITU 2%
```

;

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-** prefix. The ANSI-ITU-China SCCP Conversion feature is not on in this example.

#### rtrv-cspc:grp=groupi

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PCI
groupi 7-089-0
s-2-021-4
```

;

#### Legend

**CSPC PC TABLE IS 15% FULL**—The relative size of the CSPC point code tables.

**CSPC GRP**—The name of the CSPC broadcast group.

**NETWORK**—The network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The **grp** parameter must be specified to list the point codes in the specified group.)

**PERCENT FULL**—The relative size of the CSPC broadcast group.

**PC**—The point codes that make up the CSPC broadcast group.

**TYPE**—The network type of the point code in the group. (The **grp** parameter is specified in the command to list the point codes in the specified group.)

## rtrv-ctrl-feat

## Retrieve Controlled Feature

Use this command to retrieve the status of feature access key controlled features that are purchased and enabled in the system.

**Keyword:** rtrv-ctrl-feat

**Related Commands:** chg-ctrl-feat, enable-ctrl-feat

**Command Class:** Database Administration

### Parameters

**:enable=** (optional)

Retrieve controlled features that are enabled with either temporary feature access keys or permanent feature access keys.

**Range:** temp, perm

**Default:** Retrieve controlled features for both temporary and permanent feature access keys

**:expired=** (optional)

Retrieve controlled features with expired temporary feature access keys.

**Range:** yes, no

**Default:** no

**:partnum=** (optional)

The Part Number to retrieve or the command.

**Range:** 893000000 - 893999999

Do not include dashes in the 9-digit number.

**Default:** Retrieve all controlled features

**:status=** (optional)

Retrieve features with the specified status (On or Off).

**Range:** on, off

**Default:** Retrieve features with On and Off status

### Example

**rtrv-ctrl-feat**

**rtrv-ctrl-feat:partnum=893000110**

**rtrv-ctrl-feat:enable=perm**

### Dependencies

None

### Notes

When the **enable=perm** parameter is specified, the **expired** parameter value is understood to be **no**.

The product feature access keys (EAGLE5, EAGLE, and IP<sup>7</sup>) are not mutually exclusive. The hierarchy for product feature access keys is EAGLE5, then EAGLE, then IP<sup>7</sup>. This means that if the EAGLE5 feature access key is on, the product is EAGLE5 regardless of the setting of the other product feature access keys. Some features require that a specific product feature access key is enabled and turned on.

For systems being upgraded, the product feature access key for the specific product is turned on. For example, upgrading from an EAGLE 5 ISS release in a system that uses no EAGLE 5 features to a release that uses at least one EAGLE 5 feature causes the EAGLE 5 product key to be enabled and turned on during the conversion.

For new installation, no product feature access keys are on. The appropriate key for the highest required product in the hierarchy must be enabled and turned on.

### Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. A feature must be purchased before you can enable the feature and turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

If a Part Number (**partnum** parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part Number is for a different quantity. The output will also include the temporary enabled information, if applicable.

#### **rtrv-ctrl-feat**

**rtrv-dcmps****Retrieve Database Communication Module  
Parameter Set**

Use this command to retrieve the sets of generic timers and parameters that can be used by any system application.

**Keyword:** rtrv-dcmps**Related Commands:** chg-dcmps**Command Class:** Database Administration**Parameters****:set=** (optional)

The set number.

**Range:** 1-10  
**Default:** All parameter sets are displayed

### Example

**rtrv-dcmps:set=1**

### Dependencies

None

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

### Output

**rtrv-dcmps:set=1**

rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

| SET | TIMER | TVALUE     | PARM | PVALUE     |

;

**rtrv-dlk****Retrieve Data Link**

Use this command to show the parameters of a TCP/IP data link.

**Keyword:** **rtrv-dlk**

**Related Commands:** **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, tst-dlk**

**Command Class:** Database Administration

**Parameters**

**:ipaddr=** (mandatory)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** **1-223, 0-255**

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All TCP/IP data links are shown.

**Example**

**rtrv-dlk**

**rtrv-dlk:loc=1201**

**rtrv-dlk:ipaddr=193.4.201.34**

**Dependencies**

This command can be entered with no parameters or with one of the optional parameters **loc** or **ipaddr**; however, both **loc** and **ipaddr** cannot be specified in the same command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If the **ipaddr** parameter is specified, the IP address must be assigned to a TCP/IP data link.

**Notes**

None

**Output**

**rtrv-dlk**

```
rlghncxa03w 04-02-19 21:16:37 EST EAGLE 31.3.0
LOC  IPADDR
1201 193.4.201.34
1202 193.4.201.35
1203 193.4.201.36
1204 193.4.201.37
```

```

1205 193.4.201.38
1206 193.4.201.39
1301 193.4.201.40
;
rtrv-dlk:loc=1201
rlghncxa03w 04-02-19 21:16:37 EST EAGLE 31.3.0
LOC IPADDR
1201 193.4.201.34
;
rtrv-dlk:ipaddr=193.4.201.38

LOC IPADDR
1205 193.4.201.38
;

```

In the following example, the specified IP address is not assigned to a TCP/IP data link.

```

rtrv-dlk:ipaddr=193.4.201.28
rlghncxa03w 04-02-19 21:16:48 EST EAGLE 31.3.0
LOC IPADDR
IPADDR not assigned to a TCP/IP Link.
;

```

In the following example, there are no TCP/IP data links in the database.

```

rtrv-dlk
rlghncxa03w 04-02-19 21:16:48 EST EAGLE 31.3.0
LOC IPADDR
No TCP/IP Links are defined in the database.
;

```

In the following example, the specified IP address is assigned to a TCP/IP node instead of a TCP/IP data link.

```

rtrv-dlk:ipaddr=193.4.201.63
rlghncxa03w 04-02-19 21:16:48 EST EAGLE 31.3.0
LOC IPADDR
IPADDR assigned to a TCP/IP Node.
;

```

### ***Legend***

**IPADDR**—The IP address associated with the interface on the data link.

**LOC**—The card location containing the data link.

## **rtrv-dstn**

## **Retrieve Destination**

Use this command to show the destination point code entries in the Destination point code table.

**Keyword:** **rtrv-dstn**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-rte**

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:aliasa=** (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:** 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:aliasa/aliasi/aliasn/aliasn24=** (optional)

Alias point code.

**:aliasi=** (optional)

ITU international alias point code with subfields *zone-area-id*. This parameter is not valid if an ITU international (**dpci**) point code is entered. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:aliasn=** (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:aliasn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:clli= (optional)**

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

**Default:** none**:dpc= (optional)**

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** *dpca***Range:** *p-*, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*p-*

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24= (optional)**

Destination point code.

**:dpci= (optional)**

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** *s-*, *p-*, *ps-*, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—*s-*, *p-*, *ps-*

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:dpcn= (optional)**

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-*

*gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or **\*-\*-\*-\*** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:msar=** (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The **summary** report or the **detail** report appears following the destination information that is requested by entering the command with or without other parameters. The **only** parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

**Range:** **detail, only, summary**

**Default:** **detail**—if **rtrv-dstn** is entered with no parameters

**summary**—if **rtrv-dstn** is entered with parameters

**:ncai=** (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes (**ncai=yes**), or clusters that do not allow nested cluster point codes (**ncai=no**) are displayed.

**Range:** **yes, no**

**yes**—Display clusters with the *ncai* set to yes

**no**—Display clusters with the *ncai* set to no

**:pct=** (optional)

Point code subtype. If selected, this parameter causes the command to display only point codes with no subtype prefix or only point codes of a specified subtype.

**Range:** **none, p, ps, s**

**none**—Display only point codes without subtype prefixes

**p**—Display only private point codes (subtype prefix p-)

**ps**—Display only private and spare point codes (subtype prefix ps-)

**s**—Display only spare point codes (subtype prefix s-)

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:**     **ansi, itui, itun, itun24**

**ansi**—Display only ANSI point codes

**itui**—Display only ITU International point codes

**itun**—Display only ITU National point codes

**itun24**—Display only 24-bit ITU National point codes

**:spc=** (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **spca**

**Range:**     **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**     **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**     **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-**, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

## Example

The following example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

**rtrv-dstn:dpc=20-2-\*\*\***

The following example displays the destination with an ANSI alias of 222-200-200:

**rtrv-dstn:aliasa=222-200-200**

The following example displays all encountered ANSI alias destination point codes that have a network indicator (ni) of 222 and a network cluster (nc) of 200:

**rtrv-dstn:aliasa=222-200-\*\***

The following example displays the destination with a CLLI of rlghncbb001:

**rtrv-dstn:clli=rlghncbb001**

The following example displays the secondary point code 6-6-6:

**rtrv-dstn:spc=6-6-6**

The following example displays the retrieval of clusters with ncai set to yes:

**rtrv-dstn:ncai=yes**

The following example displays a single cluster (the NRT feature must be turned on):

**rtrv-dstn:dpc=010-\*-\***

The following example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

**rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr**

The following example displays all ITU national group codes by duplicate point code:

**rtrv-dstn:dpcn=2050-\***

The following example displays all ITU national point codes within a group code:

**rtrv-dstn:dpcn=\*-fr**

The following example displays 24-bit ITU national point code 15-100-10:

**rtrv-dstn:dpcn24=15-100-10**

The following example displays 24-bit ITU national secondary point code 99-99-99:

**rtrv-dstn:spcn24=99-99-99**

The following example displays 24-bit ITU national alias point code 4-4-4:

**rtrv-dstn:aliasn24=4-4-4**

The following example displays a private point code:

**rtrv-dstn:dpcn=p-12-12-12**

The following examples display a private and spare point code:

**rtrv-dstn:dpcn=ps-123**

**rtrv-dstn:dpci=ps-1-234-1**

The following example displays all ANSI private point codes:

**rtrv-dstn:pctype=ansi:pcst=p**

The following example displays all ITU international spare point codes:

**rtrv-dstn:pctype=itui:pcst=s**

The following example displays all ITU national private and spare point codes:

**rtrv-dstn:pctype=itun:pcst=ps**

The following example displays all 24-bit ITU national private point codes:

**rtrv-dstn:pctype=itun24:pcst=p**

The following example displays all ANSI point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=ansi**

The following example displays all ITU international point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itui**

The following example displays all ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun**

The following example displays all 24-bit ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun24**

The following example displays all point codes that do not have point code subtype prefixes:

**rtrv-dstn:pcst=none**

The following example displays all private point codes:

**rtrv-dstn:pcst=p**

The following example displays all spare point codes:

**rtrv-dstn:pcst=s**

The following example displays all private and spare point codes:

**rtrv-dstn:pcst=ps**

## Dependencies

**NOTE:** A *full point code* contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLLI parameter can be specified in the command; these parameters cannot be specified together in the command.

The specified destination address must already be defined in the Destination point code table.

If the **dpcn** parameter or the **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If specified (except when **spc=none**), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

If specified, the **cli** parameter value must already be defined in the Route table.

When the **msar=only** parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of \* in the *nc* subfield, the *ncm* subfield must also be \* (for example, **dpc=21-\*-\***).

The **pctest** parameter value **s** or **ps** cannot be specified when the **pctype** value **ansi** or **itun24** is specified.

The **pctype** and **pctest** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **cli**, **msar=only**, and **ncal** parameters.

The **cli** parameter value cannot be **none**.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Table 5-66 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-66.** Summary of DPC Parameter Syntaxes

| DPC format                     | Meaning                                                                                                                                                                                                                              |
|--------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rtrv-dstn:dpc=ni-nc-ncm</b> | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                                                               |
| <b>rtrv-dstn:dpc= ni-*-*</b>   | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.                                         |
| <b>rtrv-dstn:dpc= ni-***</b>   | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                                                         |
| <b>rtrv-dstn:dpc= ni-***-</b>  | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                                                |
| <b>rtrv-dstn:dpc= ni-nc-*</b>  | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                                                               |
| <b>rtrv-dstn:dpc= ni-nc-**</b> | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |

Table 5-66. Summary of DPC Parameter Syntaxes

| DPC format                                 | Meaning                                                                                                                                                                                                        |
|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rtrv-dstn:dpc=</b> <i>ni-nc-***</i>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported. |
| <b>rtrv-dstn:dpcn24=</b> <i>msa-ssa-sp</i> | Requests a report for fully provisioned 24-bit ITU-N destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                               |

***Asterisks in ANSI Point Codes***

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-\*\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

***Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes***

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-\*ab** is valid; **\*-15-\*-\*-\*ab** is not valid).

**Output*****Destination Table Memory Space Accounting Information***

Each output example for this command shows the display of destination table memory space accounting information. The **msar** parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

***Summary Report***

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the **msar** parameter values. The detail report cannot be displayed. The summary information appears at

the end of the requested destination information, or appears without any other destination information when the **msar=only** parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The **msar=summary** parameter value is the default in this case.)
- When the command is entered with only the **msar=summary** parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The **chg-stpopts** command **mtpdpcq** parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the value *x*, the allowed maximum is the value *y*, and the table percent full is the value *z* shown in the following first line of the summary report:

Destination table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, or 8000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The number currently provisioned is the *x* value, the allowed maximum is the *y* value, and the table percent full is the *z* value shown in the following second line of the summary report:

Alias table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.
- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.
- When the 7000, or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.

#### *Detail Report*

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The **msar=detail** parameter value is the default in this case.)

- When the **msar=detail** parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.
- When the **msar=only** parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat dstn5000** entry and the **rtrv-ctrl-feat Routesets** entry). The **chg-stpopts mtpdpcq** parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the DESTINATION ENTRIES ALLOCATED value. The list of values under the allocated value includes the TOTAL DPCs currently provisioned and the Destination table CAPACITY (% FULL).

The allowed maximum number of aliases is the ALIASES ALLOCATED value. The list of values under the allocated value include the current number of ALIASES USED and the Aliases table CAPACITY (% FULL). The possible maximum numbers of aliases are described in the *Summary Report* section.

The following example shows destination table memory space accounting information contained in a summary report. In the example, the **msar=only** parameter is specified and the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

### Legend

**DPC/DPCA/DPCI/DPCN/DPCN24**—Destination point code.

**CLLI**—Command Language Location Indicator.

**BEI**—Broadcast Exception Indicator.

**ELEI**—Cluster Exception-List Exclusion Indicator.

**NCAI**—Nested Cluster Allowed Indicator.

**ALIASA/ALIASI/ALIASN/ALIASN24**—Alias point code.

**SPC**—Secondary point code.

**DOMAIN**—Destination Entity Domain.

## rtrv-e1

### Retrieve E1 Information

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the **ent-e1** command for a 2-port E1 card, an E1/T1 card, an HC-MIM card, an E5-E1T1 card that is used as an E1 card, or an HC-MIM card or E5-E1T1 card used as an SE-HSL card. The following information can be retrieved: card location, E1 port number, CRC4, CAS/CCS, encoding/decoding, channel bridging, timing source, international NFAS data, and national NFAS data.

**Keyword:** **rtrv-e1**

**Related Commands:** **chg-e1**, **dlt-e1**, **ent-e1**, **tst-e1**

**Command Class:** Database Administration

### Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If not specified, all E1 card locations are listed.

**:e1port=** (optional)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card.

**Range:** 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**Default:** If not specified, all E1 ports are listed.

### Example

**rtrv-e1**

**rtrv-e1:loc=1307:e1port=2**

**rtrv-e1:loc=1311:e1port=1**

### Dependencies

The **loc** and **e1port** parameters must both be specified if any parameters are specified for the command.

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **lime1** card type.

The port specified by the **e1port** parameter must be already equipped with an E1 interface.

### Notes

None.

### Output

In the following example,

- Cards with E1 ports greater than 2 are HC-MIM cards used as E1 cards.
- Cards with LINKCLASS=CHAN are E1 cards.
- Cards with CHANBRDG=MASTER or CHANBRDG=SLAVE are HC-MIM cards used as E1 cards, with 2 ports configured in channel bridging mode to allow non-signaling data pass-through.

;

**Legend**

**LOC**—E1 card location in an EAGLE 5 ISS shelf.

**E1PORT**—E1 port number on an E1 card.

**CRC4**—CRC4 indicator.

**CAS**—CAS/CRC indicator (**on** = CAS is used; **off** = CRC is used).

**ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding.

**E1TSEL**—E1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair.)

**SI**—Value of two Spare International bits of NFAS data.

**SN**—Value of five Spare National bits of NFAS data.

**CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

**LINKCHAN**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN).

**MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCHAN field value is UNCHAN.

**TSx**—Timeslot.

**rtrv-eisopts****Retrieve EAGLE Support for Integrated Sentinel Options**

Use this command to retrieve the status (on or off) of the copy function for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** **rtrv-eisopts**

**Related Commands:** **chg-eisopts**

**Command Class:** Security Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-eisopts**

**Dependencies**

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

**Notes**

None

**Output**

**rtrv-eisopts**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0

;

```

**rtrv-feat****Retrieve Feature**

Use this command to show the status of optional features in the system that are controlled with the **chg-feat** command.

**Keyword:** **rtrv-feat**

**Related Commands:** **chg-feat**

**Command Class:** Program Update

**Parameters**

This command has no parameters.

**Example**

**rtrv-feat**

**Dependencies**

None

**Notes**

None

**Output**

**CAUTION:** The following output example may differ from the output shown at your terminal and may include unsupported features. A feature must be purchased before you turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative. After you turn on a feature with the **chg-feat** command, you cannot turn it off.

## rtrv-frm-pwr

## Retrieve Frame Power Threshold

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

**Keyword:** rtrv-frm-pwr

**Related Commands:** chg-frm-pwr, dlt-frm-pwr, ent-frm-pwr, rtrv-stp

**Command Class:** Database Administration

## Parameters

**:frm=** (optional)

Frame ID. The command displays the FPT table entry for the specified provisioned frame.

**Range:** **cf00, ef00, ef01, ef02, ef03, ef04**

**cf00**—Control frame

**ef00**—First extension frame

**ef01**—Second extension frame

**ef02**—Third extension frame

**ef03**—Fourth extension frame

**ef04**—Fifth extension frame

## Example

Retrieve all provisioned Frame Power Threshold table entries.

**rtrv-frm-pwr**

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00)..

**rtrv-frm-pwr:frm=cf00**

## Dependencies

The **frm** parameter value must specify a provisioned frame.

The **frm** parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

## Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

## Output

Retrieve all Frame Power Threshold table entries.

**rtrv-frm-pwr**

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0
```

```

;

**rtrv-ftp-serv****Retrieve FTP Server Entry**

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

**Keyword:** **rtrv-ftp-serv**

**Related Commands:** **chg-ftp-serv**, **dlt-ftp-serv**, **ent-ftp-serv**

**Command Class:** Database Administration

**Parameters**

**:app=** (optional)

The FTP Client application that interfaces with the FTP Server.

**Range:** **meas**, **user**

**meas**—the Measurements Platform application

**user**—the FTP-based Table Retrieve Application (FTRA)

**:ipaddr=** (optional)

IP Address of the FTP Server.

**Range:** 4 numbers separated by dots, with each number in the range of **0-255**.

4 numbers separated by dots, with each number in the range of **000-255**.

**:mode=** (optional)

Full or brief report indicator.

**Range:** **full**, **brief**

**Default:** **brief**

**Example**

**rtrv-ftp-serv**

**rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100**

**rtrv-ftp-serv:mode=brief**

**rtrv-ftp-serv:app-meas**

**rtrv-ftp-serv:ipaddr=1.255.0.100**

**rtrv-ftp-serv:mode=full**

**Dependencies**

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **mode** parameter allows you to display either the full 100 characters of the path string for each entry (**mode=full**), or the first 29 characters of the path string for each entry (**mode=brief**). The default is **brief**.

**Notes**

The LOGIN and PATH are displayed in mixed case.

**Output**

The following examples show output when the EAGLE OA&M IP Security feature is not enabled:

## rtrv-gpl

### Retrieve Generic Program Load

Use this command to show the version numbers of the GPLs stored on each fixed disk (TDM) or removable cartridge (MDAL, if available) and the system release table stored on each fixed disk

**Keyword:** rtrv-gpl

**Related Commands:** act-gpl, act-gpl, chg-gpl, chg-gpl, copy-gpl, rept-stat-gpl, rept-stat-gpl

**Command Class:** Program Update

#### Parameters

**:gpl=** (optional)

The type of GPL to report on.

**Range:** ayyyyyy

**atmansi**—The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

**atmitu**—The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

**blbios**—A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

**blepld**—A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

**bldiag**—A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

**blvxw**—A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

**bpdcm**—This GPL is used in communications in the **init-flash** process.

**bphcap**—This GPL is used to support Board PROM for HCAP flash memory.

**bphcapt**—This GPL is used to support Board PROM for HCAP-T flash memory.

**bphmux**—This GPL is used to support Board PROM for HMUX flash memory.

**bpmpl**—This GPL is used to support Board PROM for MPL flash memory.

**bpmplt**—This GPL is used to support Board PROM for E1/T1 flash memory and Board PROM for the MPL-T flash memory.

**ccs7itu**—This GPL is used by the LIM cards for ITU-TSS MTP functionality.

**cdu**—This GPL is used in the card manufacturing process for testing, and when directed by Tekelec Technical Services.

**ebdablm**—This GPL is used by the TSM cards for enhanced bulk download.

**ebdaclm**—This GPL is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 ISS at high speed over an Ethernet connection for enhanced bulk download.

**eroute**—This GPL is used by the STC cards for for the EAGLE 5 Integrated Monitoring Support feature.

**gls**—This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

**hipr**—The communication software used on the High Speed IMT Packet Router (HIPR) card.

**imt**—This GPL is the communication processor on the logical processing element (LPE).

**imtpci**—The communication software that operates the IMT bus on HC-MIM cards.

**ipgwi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**iplim**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

**iplimi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**ips**—This GPL is used by the IPSM card for the IP User Interface feature.

**mcp**—This GPL is used by the MCPM card for the Measurements Platform feature.

**plde1t1**—This GPL is used to support Board PROM for HC-MIM flash memory.

**pldpmc1**—This GPL is used to support Board PROM for HC-MIM flash memory.

**sccp**—This GPL is used by the TSM cards for the global title translation application.

**ss7ansi**—This GPL is used by the LIM cards for the MTP functionality.

**ss7gx25**—This GPL is used by the LIM cards to support X.25 functionality.

**ss7hc**—This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the **ss7ansi** or **cc7itu** application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functionality.

**ss7ipgw**—This GPL is used by the DCM card to support TCP/IP point-to-multipoint connectivity.

**ss7ml**—This GPL is used to support the functionality for the multi-port LIM (MPL or MPL-T) card. The MPL cards run only the **ss7ansi** application on a LIMDS0 card (as specified with the **ent-card:type=limds0:appl=ss7ansi** command); the **ss7ml** GPL allows the card to support eight signaling link ports rather than the usual two ports for LIM cards. The MPL cards support only the DS0 interface.

**stplan**—This GPL is used by the ACM card to support the STPLAN application.

**vedu**—This GPL is used in the card manufacturing process for testing, and when directed by Tekelec Technical Services.

**vsccp**—This GPL is used by the DSM card to support the G-Flex, G-Port, LNP ELAP Configuration, and INP features. If the G-Flex, G-Port, LNP ELAP Configuration, or INP feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

**vxwslan**—This GPL is used by the DCM card to support the STPLAN application.

**iplhc**—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

**ipghc**—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

**ss7epm**—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications; the **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

**blbepm**—A flash GPL containing the BIOS ROM image on EPM cards.

**blvxw6**—A flash GPL containing the VxWorks operating system on EPM cards.

**bldiag6**—A flash GPL containing the diagnostic code on EPM cards.

**iplhc**—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

**ipghc**—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

**ss7epm**—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications. The **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

**blbepm**—A flash GPL containing the BIOS ROM image on EPM cards.

**blvxw6**—A flash GPL containing the VxWorks operating system on EPM cards.

**bldiag6**—A flash GPL containing the diagnostic code on EPM cards.

**Default:** Display all

**:appl=** (obsolete)

This parameter is obsolete. Use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value

### Example

```
rtrv-gpl
rtrv-gpl:gpl=vsccp
rtrv-gpl:gpl=ss7hc
rtrv-gpl:gpl=atmansi
rtrv-gpl:gpl=vsccp
rtrv-gpl:gpl=bpmpl
rtrv-gpl:gpl=bphmux
rtrv-gpl:gpl=hipr
rtrv-gpl:gpl=ss7ml
rtrv-gpl:gpl=mcp
rtrv-gpl:gpl=bpmplt
rtrv-gpl:gpl=atmitu
rtrv-gpl:gpl=bphcapt
rtrv-gpl:gpl=ss7hc
rtrv-gpl:gpl=blbios
rtrv-gpl:gpl=blcpld
rtrv-gpl:gpl=bldiag
rtrv-gpl:gpl=intpci
rtrv-gpl:gpl=pldeltl
```

**rtrv-gpl:gpl=pldpmc1**

**rtrv-gpl:gpl=blvxw**

**rtrv-gpl:gpl=ss7ansi**

**rtrv-gpl:gpl=gl**

## Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

If no application is specified, the approved and trial versions for all GPLs are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the utility and OAM GPL trial versions on the fixed disk and for all GPLs on the removable when the removable cartridge is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the **rept-stat-gpl** command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

## Output

The following example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

\* The entries marked with an asterisk appear in the output only if an OAP is provisioned and running. Systems that use two OAPs will show two entries for the OAP: OAP A and OAP B.

**Legend**

**GPL**—The type of GPL associated with each card in the display

**APPROVED**—The GPL version that is the approved GPL.

**CARD**—The card location.

**RELEASE**—version number of each GPL that is required to be installed and approved for a specific release of software for the system.

**REMOVE TRIAL**—The GPL version that is on the removable cartridge.

**TRIAL**—THE GPL VERSION THAT IS THE TRIAL GPL.

-----GPL is not present at the specified location.

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

**CORRUPTED**—Data audit has determined that the GPL is corrupted.

**rtrv-gsmmap-scrn****Retrieve GSM MAP Screening Entry**

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

**Keyword:** rtrv-gsmmap-scrn

**Related Commands:** chg-gsmmap-scrn, dlt-gsmmap-scrn, ent-gsmmap-scrn

**Command Class:** Database Administration

## Parameters

**:opname=** (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command.

**Range:** *ayyyyyyy*  
Up to 8 alphanumeric characters

**:action=** (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

**Range:** **pass**, **discard**, **atierr**, **route**, **forward**, **duplicate**, **dupdisc**

**pass**—Route the message as normal to the destination.

**discard**—The MSU is to be discarded.

**atierr**—An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

**route**—Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

**forward**—Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

**duplicate**—Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

**dupdisc**—Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

**Default:** Display all screening actions

**:cdsr=** (optional)

CdPA Screening Reference.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 optional alphanumeric characters

**:cgsr=** (optional)

CgPA Screening Reference.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 optional alphanumeric characters

**:caddr=** (optional)

The ending origination address, in association with **npv** and **naiv** for the CGPA address to be screened.

**Range:** 1-15 digits  
1-15 hexadecimal digits. Valid digits are **0-9**, **a-f**, **A-F**

**:forbid=** (optional)

The forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter.

**Range:** **all**, **location**, **none**, **state**

**all**—All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.

**location**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **location** as the forbidden parameter value

for the entered address/operation code combination. Note: The **location** value is valid only for GSM ATI messages.

**none**—None of the parameters are forbidden. Route the message to its destination.

**state**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **state** as the forbidden parameter value for the entered address/operation code combination. Note: The **state** value is valid only for GSM ATI messages.

**Default:** Display all forbidden parameter values

**:mapset=** (optional)

The MAP set ID.

**Range:** 1-36000 dflt

**dflt**—Default MAP set

**:naiv=** (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. When this parameter is specified, the **npv** parameter must be specified.

**Range:** 0-127, \*

**:npv=** (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

When this parameter is specified, the **naiv** parameter must be specified.

**Range:** 0-15 \*

**:saddr=** (optional)

The starting origination address. in association with **npv** and **naiv** for the single entry or range of entries of the CGPA address to be screened.

**Range:** 1-15 digits, \*

1-15 hexadecimal digits. Valid digits are 0-9, a-f, and A-F

**Default:** \*

## Example

The following example retrieves all CgPA entries for the specified opname:

**rtrv-gsmmap-scrn:opname=ati**

The following example retrieves the specified CgPA range entry for the specified opname:

**rtrv-gsmmap-scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000**

The following example retrieves all CdPA entries for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela**

The following example retrieves the specified cdsr entry for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4**

The following example retrieves a MAP set when the Flexible GTT Load Sharing feature is on.

**rtrv-gsmmap-scrn:opname=abc:mapset=9**

## Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The **cgsr** parameter can be specified.
- The **cdsr** parameter can be specified.

- The **saddr=\*** parameter can be specified.
- The **saddr** and **eaddr** parameters can contain hexadecimal digits.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

If the **eaddr** parameter is specified, its value must contain the same number of digits as the **saddr** parameter value.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **saddr=\*** parameter is specified, then the **eaddr** parameter cannot be specified.

If the **saddr** parameter is specified, the **cgsr** and **cdsr** parameters cannot be specified.

The **saddr**, **npv**, and **naiv** parameters must be specified together in the command.

If any of the **saddr/eaddr/npv/naiv** and **cdsr** parameters are specified, then the **forbid** and **action** parameters cannot be specified.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code referenced by the **opname** parameter is **71**. The **forbid** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The **action=atierr** parameter cannot be specified unless the operation code referenced by the **opname** parameter is **71**. The **atierr** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If the **cdsr** parameter is specified, then the **cgsr** parameter must be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

## Notes

None

## Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

**Legend**

**SINGLE ENTRIES/RANGE ENTRIES**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.

**CgPA**—Calling Party Address entry

**CdPA**—Called Party Address entry

**OPNAME**—User-defined MAP operation code name.

**SADDR**—Start origination address.

**EADDR**—End origination address. This column is displayed for range entries only.

**NPV**—Numbering plan value.

**NAIV**—Nature of address indicator value.

**FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter. (Some values are abbreviated; for example, locat means **location**.)

**ACTION** or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atterr, route, forward, duplicate (dupl), and dupdisc.

**PC** or **PCA**—ANSI Point Code

**PCI**—ITU International Point Code

**PCN**—ITU National Point Code

**PCN24**—24-bit ITU National Point Code

**SSN**—Subsystem Number

**CGSR**—CgPA Screening Reference

**CDSR**—CdPA Screening Reference

**MAPSET**—MAP set

**rtrv-gsmopts****Retrieve GSM System Options**

Use this command to display all GSM (Global System for Mobile Telecommunication) system options from the database.

**Keyword:** **rtrv-gsmopts**

**Related Commands:** **chg-gsmopts**

**Command Class:** Database Administration

## Parameters

This command has no parameters.

## Example

**rtrv-gsmopts**

## Dependencies

The G-Flex feature or G-Port feature must be turned on, or the Equipment Identity Register (EIR) feature must be enabled, before this command can be entered.

## Notes

None

## Output

The following examples show the output if the G-Flex feature is turned on. The second example includes values for CCNC and MCCMNC.

### rtrv-gsmopts

### ***Legend***

**DEFMCC**—E212 default mobile country code.

**DEFMNC**—E212 default mobile network code.

**CCNC**—E214 country code and network code.

**MCCMNC**—E212 mobile country code and mobile network code.

**SRFADDR**—Entity address of the MNP\_SRF node.

**SRFNAI**—The nature of address indicator value of the MNP\_SRF.

**SRFNP**—The numbering plan value of the MNP\_SRF.

**MSRNDIG**—The routing number to be used as is or to be concatenated with the MSISDN.

**MSRNNAI**—The nature of address indicator value for the MSRN.

**MSRNNP**—The numbering plan value for the MSRN.

**SRIDN**—Send Routing Information Dialed Number location.

**PPSMSRI1**—A routing indicator for an Intelligent Network (IN) platform used by Prepaid Short Message Service Intercept (PPSMS) for credit checking.

**PPSMSRI2**—A routing indicator for an Intelligent Network (IN) platform used by Prepaid Short Message Service Intercept (PPSMS).

**PPSMSPCI1**—An ITU international point code for an IN platform used by PPSMS.

**PPSMSPCI2**—An ITU international point code for an IN platform used by PPSMS.

**PPSMSPCN1**—An ITU national point code for an IN platform used by PPSMS.

**PPSMSPCN2**—An ITU national point code for an IN platform used by PPSMS.

**PPSMMSGTA**—Entity addresses for up to 3 IN platforms used by PPSMS.

**IS412GSM**—IS-41 to GSM Migration prefix.

**EIRGRSP**—Equipment Identity Register Global Response status.

**EIRRSPTYPE**—Equipment Identity Register Global Response Type.

**EIRIMSICCHK**—Equipment Identity Register IMSI Check status.

**MULTCC**—Multiple country code list entry.

**MSISDNTRUNC**—Number of digits to delete from the beginning of the National MSISDN (MSISDN without Country Code) before formulating the MSRN parameter of the SRI-ack response.

**SERVERPFX**—Server prefix for IS-41 to GSM Migration SRI Redirect.

## rtrv-gsms-opcode

## Retrieve GSM MAP Screening Operation Code

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsperson to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

**Keyword:** **rtrv-gsms-opcode**

**Related Commands:** **chg-gsms-opcode**, **dlt-gsms-opcode**, **ent-gsms-opcode**

**Command Class:** Database Administration

### Parameters

**:mapset=** (optional)

The MAP set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**:opcode=** (optional)

MAP operation code.

**Range:** **0-255 \***

**Default:** Display all MAP operation codes

**:opname=** (optional)

The user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

**Range:** *ayyyyyyy*

Up to 8 alphanumeric characters

**Default:** Display all operation code names

### Example

**rtrv-gsms-opcode**

**rtrv-gsms-opcode:opname=ati**

### Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The **opcode=\*** can be specified.
- An **opname** parameter can be specified that refers to an **opcode=\*** parameter.

The **opcode** parameter and the **opname** parameter cannot be specified together in the same command.

The specified **opname** parameter must exist in the GSM MAP Op-Code table.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

## Notes

None

## Output

### rtrv-gsms-opcode

```
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0

### Legend

**OPCODE**—MAP operation code.

**OPNAME**—The user-defined name of operation code.

**DFLTACT**—The default screening action.

**PCA**—ANSI Point Code.

**PCI**—ITU International Point Code.

**PCN**—ITU National Point Code.

**PCN24**—24-bit ITU National Point Code.

**SSN**—Subsystem Number.

**MAPSET**—MAP set.

## rtrv-gsmssn-scrn

## Retrieve GSM Subsystem Number Screening Entry

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

**Keyword:** rtrv-gsmssn-scrn

**Related Commands:** dlt-gsmssn-scrn, ent-gsmssn-scrn

**Command Class:** Database Administration

### Parameters

**:ssn=** (optional)

Subsystem number.

**Range:** 000-255

**Default:** Display all

**:type=** (optional)

Subsystem type.

**Range:** orig, dest

**orig**—The origination SSN

**dest**—The destination SSN

**Default:** Display all

### Example

```
rtrv-gsmssn-scrn
```

```
rtrv-gsmssn-scrn:ssn=0:type=dest
```

### Dependencies

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

### Notes

If specified, the **ssn/type** parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
No matching entries with the specified criteria found.
```

## Output

### **rtrv-gsmssn-scrn:ssn=2:type=dest**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 No Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

### **rtrv-gsmssn-scrn:ssn=10:type=orig**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
010 Yes Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

### **rtrv-gsmssn-scrn**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 Yes No
010 Yes Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

## **Legend**

**SSN**—Subsystem number.

**ORIG**—Specifies whether the subsystem type is origination (yes) or not (no).

**DEST**—Specifies whether the subsystem type is destination (yes) or not (no).

## **rtrv-gta**

## **Retrieve Global Title Address Information**

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

**NOTE:** When the ANSI-ITU-China SCCP Conversion feature is enabled, entries that are provisioned with the **xlat=dpc** parameter, and that have specified the **ntt** parameter, are displayed with a **xlat** parameter value of **dpcngt**.

**Keyword:** **rtrv-gta**

**Related Commands:** **chg-gta, dlt-gta, ent-gta**

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cgpc=** (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **cgpa**

**Range:** **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:cgpci=** (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:cgpcn=** (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:cgpcn24=** (optional)

24-bit ITU national CgPA point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:cgssn=** (optional)

Starting CgPA subsystem number.

**Range:**     **0-255**

**:ecgssn=** (optional)

Ending CgPA subsystem number.

**Range:**     **0-255**

**:egta=** (optional)

End Global Title Address.

**Range:**     1-21 digits

**Default:**   The first **gta** entry for the given GTT selector

**:force=** (optional)

Display more than 1000 entries.

**Range:**     **yes, no**

**Default:**   **no**

**:gta=** (optional)

Start global title address.

**Range:**     1-21 digits

**Default:**   The first **gta** entry for the given GTT selector

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:**     aaaaaaaa

1 leading alphabetic and up to 8 following alphanumeric characters.

**:num=** (optional)

Number of entries to display.

**Range:**     **1-65535**

**Default:**   **1**—if **gta** is specified

**20**—if **gta** is not specified

**:opc=** (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **opca**

**Range:**     **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU originating point code with subfields main signaling *area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*.

**Synonym:** **pca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pci=** (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:pctype=** (optional)

Point code type. This parameter can be specified only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24, ituis, ituns**

**Default:** Display all point code types

**:ssn=** (optional)

Subsystem number.

**Range:** **002-255**

**Default:** Display all

### Example

```

```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

The **ssn**, **cgssn**, and **ecgssn** parameters cannot have a wildcard (\*) value.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing **gttsn**.

When the ANSI-ITU-China SCCP Conversion feature is not on and the specified GTT set is an ANSI set, the **pc/pca** parameter must be a valid ANSI point code.

When the ANSI-ITU-China SCCP Conversion feature is not on and the specified GTT set is an ITU set, the **pci/pcn/pcn24** parameter must be a valid ITU point code.

If the **egta** parameter is specified, the **gta** parameter must be specified. The **gta** and **egta** parameters must be the same length, and the value for the **egta** parameter must be greater than the value for the **gta** parameter.

If the specified **num** parameter value is greater than **1000**, the **force=yes** parameter must be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the specified GTT set (**gttsn**). If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per GTT set. When the **ent-gta** command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

The **(e)gta**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, and **opc/opca/opci/opcn/opcn24**, and **(e)cgssn** parameters are mutually exclusive.

If the **ecgssn** parameter is specified, the **cgssn** parameter must be specified, and the **ecgssn** parameter must be greater than the **cgssn** parameter.

The Origin-based SCCP Routing feature must be enabled when specifying the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters or when specifying the **xlat** parameter with a value of **udts** or **discard**.

The **gta** parameter can be specified only if the GTTSN set type has a value of **cdgta** or **cgta**.

The **cgpc/cgpcac/cgpci/cgpcn/cgpcn24** parameter may be specified only if the GTTSN set type has a value of **cgpc**.

The **opc/opca/opci/opcn/opcn24** parameter may be specified only if the GTTSN set type has a value of **opc**.

The **cgssn** parameter may be specified only if the GTTSN set type has a value of **cgssn**.

If the specified GTT Set is an ANSI set, the **cgpc/cgpcac** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT Set is an ITU set, the **cgpci/cgpcn/cgpcn24** and **opci/opcn/opcn24** parameters must be valid ITU point codes.

The range specified by the **(e)cgssn** parameters must exist for the specified GTT set. An exact match is not required.

## Notes

The percentage full and number of cells used report that is provided with a **rtrv-gta** command reflects the total entries in the GTA table without regard to the selector specified.

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the **rtrv-gta** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if **gta=8005556666** is specified, the six-digit GTT set **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

## Output

**NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.**

Retrieve all GTAs for the specified GTT Set:

**NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. **Legend**

**GTTSN**—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**NETDOM**—The network domain.

**NDGT**—The number of digits required for GTAs associated with this set.

**START GTA**—The start global title address.

**END GTA**—The end global title address.

**XLAT**—The translate indicator.

**RI**—The routing indicator.

**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Translated point code.

**SSN**—The translated subsystem number.

**CCGT**—The cancel called global title indicator.

**NNP**—New Numbering Plan.

**NNAI**—New Nature of Address Indicator.

**NPDD**—New Prefix Digits to be Deleted.

**NPDS**—New Prefix Digits String.

**NTT**—The new translation type.

**MRN**—Mated Relay Node.

MRNSET —MRN set.

## rtrv-gtcnv

## Retrieve Global Title Conversion

Use this command to display entries in the Default Global Title Conversion table.

**Keyword:** rtrv-gtcnv

**Related Commands:** chg-gtcnv, dlt-gtcnv, ent-gtcnv

**Command Class:** Database Administration

### Parameters

**:dir=** (optional)

Direction of conversion.

**Range:** atoi, itoa, both

**atoi**—ANSI to ITU conversion

**itoa**—ITU to ANSI conversion

**both**—Conversion in both directions

**:gtixlat=** (optional)

Global Title Indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

**Range:** 22, 24

**22**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

**24**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

**:nai=** (optional)

Nature of Address Indicator.

**Range:** 0-63 \*

**:np=** (optional)

Numbering Plan.

**Range:** 0-15 \*

**:tta=** (optional)

ANSI translation type.

**Range:** 0-255 \*

**:tti=** (optional)

ITU translation type.

**Range:** 0-255 \*

### Example

rtrv-gtcnv

### Dependencies

The ANSI-ITU-China SCCP Conversion feature must be enabled before the command can be entered.

### Notes

None

**Output**

```

**Legend**

**TYPE/TYPER/TYPEI/TYPEN /TYPEN24** —The translation type.

**TTN**—The translation name.

**NDGT**—The number of digits.

**rtrv-gtt****Retrieve Global Title Translation**

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the **type** parameter specified.

If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept **-gtt** (Global Title Translation) and **-tt** (Translation Type) commands. Refer to the new command sets that replace the **-gtt** and **-tt** commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gttset**)
- GTT Set commands (**ent/dlt/rtrv-gttset**)
- GTA commands (**ent/chg/dlt/rtrv-gta**)

**Keyword:** **rtrv-gtt**

**Related Commands:** **chg-gtt, dlt-gtt, ent-gtt**

**Command Class:** Database Administration

**Parameters**

At least one of these parameters must be specified: **ttn, type/typea/typei/typen/typen24**.

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:egta=** (optional)

Global title end address.

**Range:** 1-21 digits

**Default:** If the **gta** parameter is specified, the **egta** parameter default value is the specified **gta** parameter value.

**:force=** (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

**Range:**     **yes, no**

**Default:**   **no**

**:gta=** (optional)

Global title start address.

**Range:**     1-21 digits

**Default:**   The first GTT entry for the given translation type.

**:mapset=** (optional)

The MAP set ID.

**Range:**     **1-36000 dflt**

**dflt**—Default MAP set

**:num=** (optional)

This parameter allows the user to specify the number of entries to be shown.

**Range:**     **1-65535**

**1-1000**—If **force=yes** is not specified

**1-65535**—If **force=yes** is specified

**Default:**   **1** (if **gta** is specified),

**20** (if **gta** is not specified).

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **pca**

**Range:**     **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**Default:**   Display all

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**     **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**Default:** Display all

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**Default:** Display all

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm* (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** Display all

**:pctype=** (optional)

Point code type. This parameter can be specified, only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24**

**Default:** Display all

**:ssn=** (optional)

Subsystem number. This parameter identifies the subsystem address that is to receive the message.

**Range:** **002-255**

**Default:** Display all

**:ttn=** (optional)

Translation name.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** None given

**:type/typea/typei/typen/typen24=** (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value can be entered as ANSI (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

**Range:** 0-255

**Default:** None given

### Example

```
rtrv-gtt:type=5:ttn=lidb1:gta=919555
rtrv-gtt:type=5:gta=919555
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
rtrv-gtt:typen24=0
rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui
rtrv-gtt:type=55:pctype=itun
rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:ttn=tbla
rtrv-gtt:ttn=tbla:mapset=1
```

### Dependencies

If the EGTT feature is turned on, then the **rtrv-gtt** command cannot be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the TT is specified, then it must already exist.

If the TTN is specified, then it must correspond to a given type entry. If both the TT and TTN are specified, the TTN must correspond to the given TT.

If the **gta** parameter is not specified, the first entry in the global title translation table corresponding to the translation type is the first entry shown.

If the **gta** and **egta** parameters are specified, then the entry that matches the **gta** parameter, or is the nearest entry below the **gta** parameter, is the first entry shown for the specified range.

The number of entries to be shown (the **num** parameter) can be specified for any valid combination of parameters.

If the **num** and **gta** parameters are not specified, then up to 20 entries are shown.

If the **gta** parameter is specified, but the **num** parameter is not specified, then only one entry is shown, if it is in the database.

If the **num** parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the **num** parameter.

If the value of the **num** parameter exceeds **1000**, then the **force=yes** parameter must be specified.

Either the **type** parameter or the **ttn** parameter must be specified.

An asterisk cannot be specified for the **ssn** parameter value.

The translated point code (**pc/pca/pci/pcn /pcn24** parameter) must be a full point code.

If the **egta** parameter is specified, the **gta** parameter must be specified.

If the system is defined as an ANSI system, the **pc/pca** parameter must be specified as a valid ANSI point code.

The network type (ANSI, ITU-I, ITU-N, or 24-bit ITU-N) of the Translation Type and the Translated Point Code must be the same.

The ANSI-ITU-China SCCP Conversion feature must be on before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The TT cannot be an alias.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

## Notes

If the **rtrv-gtt** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if **gta=8005556666** is specified, the six-digit translation type **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If you do not know either the translation type or the translation type name, use the **rtrv-tt** command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

**rtrv-gtt:type=10:num=65535:force=yes**

```

### Legend

**TYPE/TYEA/TYPEI/TYPEN /TYPEN24** —The translation type.

**TTN**—The translation name.

**NDGT**—The number of digits.

**GTT TABLE IS 10% FULL**—The relative size of the GTT table.

**X OF Y**—Number of entries in the table (x) and the maximum number of entries configured for the table (y)

**START GTA**—Global title start address.

**END GTA**—Global title end address.

**XLAT**—Translate indicator.

**RI**—Route indicator.

**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Point code.

**SSN**—Subsystem number.

**NGT**—New global title translation type. This field identifies the type of global title translation that replaces the original type.

**NNP**—New Numbering Plan.

**NNAI**—New Nature of Address Indicator.

**NPDD**—New Prefix Digits to be Deleted.

**NPDS**—New Prefix Digits String.

**NSDD**—New Suffix Digits to be Deleted.

**NSDS**—New Suffix Digits String

**NGTI**—New GTI code. When the ANSI-ITU-China SCCP Conversion and MGTT features are on and the Translated Point Code is of a different network type, the *NGTI* value indicates whether the new GTI translation format is GTI type 2 or GTI type 4.

**MRN**— Mated Relay Node

**MRNSET** —MRN set

**MAPSET**—MAP set

## rtrv-gtttsel

### Retrieve GTT Selectors

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

**Keyword:** rtrv-gtttsel

**Related Commands:** chg-gtttsel, dlt-gtttsel, ent-gtttsel

**Command Class:** Database Administration

## Parameters

**:gti/gtia/gtii/gtin/gtin24=** (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin /gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry of **gtin=2** and **tt=4** cannot be entered.

**Range:** Supported value for ANSI: **gti=2** and **gtia=2**  
Supported values for ITU: **gtii=2, 4** and **gtin /gtin24=2, 4**

**Default:** Display all

**:cdgtasn=** (optional)

CdPA GTA GTT set name.

**Range:** *ayyyyyyy*  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cggtasn=** (optional)

CgPA GTA GTT set name.

**Range:** *ayyyyyyy*  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cgpcsn=** (optional)

CdPA PC GTT set name.

**Range:** *ayyyyyyy*  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cgssn=** (optional)

CgPA subsystem number.

**Range:** **0-255**

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned. The **gttsn** parameter can only be specified if the Origin-based SCCP Routing feature is off.

**Range:** *ayyyyyyy*  
1 leading alphabetic and up to 8 following alphanumeric characters.

**Default:** Display all

**:nai=** (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** **sub, rsvd, natl, intl, dflt**

**Default:** Display all

**:naiv=** (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** **0-127**

**Default:** Display all

**:np=** (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** e164, generic, x121, f69, e210, e212, e214, private, dflt

**Default:** Display all

**:npv=** (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** 0-15

**Default:** Display all

**:selid=** (optional)

Selector ID.

**Range:** 0-65534

**:tt=** (optional)

Translation type.

**Range:** 0-255

**Default:** Display all

**Example**

```
rtrv-gttsel
```

```
rtrv-gttsel:gtii=2
```

```
rtrv-gttsel:tt=0:np=e164
```

```
rtrv-gttsel:gti=2:tt=10
```

```
rtrv-gttsel:gttsn=setint000
```

**Dependencies**

The EGTT feature must be turned on before this command can be entered.

An entry that matches exactly the specified combination of **gti**, **tt**, **np**/**npv**, **nai**/**naiv**, and **gttsn** must be specified. If no match is found, the following message is displayed in the scroll area of the terminal: No GTT Selectors matching the specified criteria were found.

The specified **gttsn** value must exist for the specified **gtin24**, **tt**, **np**/**npv**/**nai**/**naiv** parameter combination.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The parameter values **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** cannot be specified.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np**/**npv** and **nai**/**naiv** parameter combinations cannot be specified.

If the **cgssn** parameter and/or the **selid** parameter is specified, neither the **cggtasn** parameter nor the **cgpcsn** parameter can be specified.

The Origin-based SCCP Routing feature must be enabled if the **cggtasn**, **cgpcsn**, **cgssn**, **cdgtasn**, or **selid** parameters are specified.

The GTT set specified by the **cggtasn** or **cgpcsn** parameter must exist in the database before it is assigned to a GTT selector.

The set type of the **cggtasn** parameter or the **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggt**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The **cdgtasn** parameter cannot be specified if the **gti=2** and **tt** parameters are specified, or if the **gti=4** and the **tt**, **np/npv**, and **nai/naiv** parameters are specified.

## Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

## Output

Retrieve all GTT selectors:

### rtrv-gttset

```

### Legend

**GTI/GTIA/GTII/GTIN/GTIN24**—The global title indicator.

**TT**—The translation type.

**NP**—The number plan.

**NAI**—The nature of address indicator.

**GTTSN**—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

## rtrv-gttset

## Retrieve GTT Set

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

**Keyword:** **rtrv-gttset**

**Related Commands:** **chg-gttset, dlt-gttset, ent-gttset**

**Command Class:** Database Administration

### Parameters

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:** *aaaaaaaa*

1 leading alphabetic and up to 8 following alphanumeric characters.

**:netdom=** (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

**Range:** **ansi, itu, cross**

**Default:** Display all

**:settype=** (optional)

GTT set type.

**Range:** **cdgta, cggta, cgpc, cgssn, opc**

**Default:** Display all

### Example

```
rtrv-gttset
```

```
rtrv-gttset:netdom=ansi
```

```
rtrv-gttset:gttsn=t800
```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

If the **gttsn** parameter is specified, it cannot have a value of **none**, and must match an existing **gttsn**.

If the **netdom** parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

No GTT Sets matching the specified criteria were found.

The **netdom=cross** parameter is valid only if the **settype=cdgta** parameter is specified.

If the **gttsn** parameter is specified, the **settype** and **netdom** parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the **settype** parameter is **cggtta**, **cgssn**, **opc**, or **cgpc**.

The ANSI-ITU-China SCCP Conversion feature must be turned on before the **netdom=cross** parameter can be specified.

## Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

When the Origin-based SCCP Routing feature is turned on, the **settype** parameter is displayed regardless of feature key status. If the feature key is not enabled, the **settype=cdgta** parameter (default value) is displayed.

## Output

Retrieve all GTT sets:

### rtrv-gttset

```
rlghncxa03w 04-02-19 08:16:15 EST EAGLE 31.3.0

```

**Legend**

**GTTSN**—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**NETDOM**—The network domain.

**SETTYPE**—The GTT set type.

**NDGT**—The number of digits required for GTAs associated with this set.

**rtrv-gtw-stp****Retrieve Gateway STP Parameters**

Use this command to display the level 3 ANSI transfer control status (TFCSTAT) parameter. This value is the level 3 control status used on a TFC message received from an ITU node destined for an ANSI node.

**Keyword:** **rtrv-gtw-stp**

**Related Commands:** **chg-gtw-stp**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gtw-stp**

**Dependencies**

None

**Notes**

None

**Output**

```
rtrv-gtw-stp
rlghncxa03w 03-03-11 11:34:04 EST EAGLE 31.3.0
TFCSTAT
1
;
```

**rtrv-gtwy-acthresh****Retrieve the Gateway Screening Activity Threshold**

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

**Keyword:** **rtrv-gtwy-acthresh**

**Related Commands:** **set-gtwy-acthresh**

**Command Class:** Database Administration

**Parameters**

**:lsn=** (optional)

Linkset name.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

**Example**

**rtrv-gtwy-acthresh:lsn=wy644368**

**rtrv-gtwy-acthresh**

**Dependencies**

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

**Notes**

None

**Output**

The following example shows the display of the thresholds of all linksets:

**rtrv-gtwy-acthresh**

```

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN          REJ      RECV      INTRVL
WY644368     10       1000     10

:

```

**Legend**

**LSN**—Linkset name.

**REJ**—Reject threshold.

**RECV**—Received message threshold.

**INTRVL**—Monitor interval.

**rtrv-gtwy-prmtrs****Retrieve Gateway Parameters**

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the **set-scrrej-prmtrs** command are displayed.

**Keyword:** **rtrv-gtwy-prmtrs**

**Related Commands:** **set-scrrej-prmtrs**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-gtwy-prmtrs
```

**Dependencies**

None

**Notes**

None

**Output**

```
rtrv-gtwy-prmtrs
```

```

rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LIMIT INTRVL
1000 15
;

```

**Legend**

**LIMIT**—The threshold not to be exceeded.

**INTRVL**—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

## rtrv-gws-actset

## Retrieve Gateway Screening Stop Action Sets

Use this command to display the values defined for gateway screening stop actions.

**Keyword:** rtrv-gws-actset

**Related Commands:** chg-gws-actset

**Command Class:** Database Administration

### Parameters

**:actid=** (optional)

The identification number of the gateway screening stop action.

**Range:** 4-16

**Default:** Display all

**:actname=** (optional)

The name of the gateway screening stop action set.

**Range:** ayyyyy

One alphabetic character followed by up to five alphanumeric characters.

**Default:** Display all

### Example

```
rtrv-gws-actset
```

```
rtrv-gws-actset:actname=cr
```

```
rtrv-gws-actset:actid=6
```

### Dependencies

Either **actname** or **actid** can be specified, but not both.

### Notes

If neither **actname** nor **actid** are specified with the **rtrv-gws-actset** command, all gateway screening stop actions are displayed.

### Output

(with 6 gateway screening stop action sets defined)

```
rtrv-gws-actset
```

```

**rtrv-gws-redirect****Retrieve Gateway Screening Redirect**

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

**Keyword:** rtrv-gws-redirect

**Related Commands:** chg-gws-redirect, dlt-gws-redirect, ent-gws-redirect

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gws-redirect**

**Dependencies**

None

**Notes**

None

**Output**

```

rtrv-gws-redirect
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA      RI  SSN  TT  GTA
on      001-030-001 SSN  10   25  1800833

```

```

on      001-030-001  SSN 10      25      1800833
;

```

In the following example, the gateway screening redirect function is not enabled.

#### **rtrv-gws-redirect**

```

rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA      RI  SSN  TT      GTA
Redirect function data is not provisioned.
;

```

#### **Legend**

**ENABLED**—Indicates whether the gateway screening redirect function is on or off

**DPCA/DPCI/DPCN/DPCN24**—The destination point code that the message is being redirected to.

**RI**—The routing indicator for the redirected message

**SSN**—The subsystem to which the redirected message is bound for.

**TT**—The translation type of the global title translation

**GTA**—The global title translation address

## **rtrv-home-smsc**

## **Retrieve HOME SMSC Address**

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

**Keyword:** **rtrv-home-smsc**

**Related Commands:** **dlt-home-smsc, ent-home-smsc**

**Command Class:** Database Administration

### **Parameters**

**:force=** (optional)

Display more than 50 entries.

**Range:**       **yes, no**

**Default:**     **no**

**:num=** (optional)

Number of entries to display. The **force** parameter must also be specified to display more than 50 entries.

**Range:**       **0-500**

**Default:**     **50**

**:smc=** (optional)

Short Message Service Center address.

**Range:**       1-21 digits

1-21 hexadecimal digits

### **Example**

```
rtrv-home-smsc
```

```
rtrv-home-smsc:smc=552611646
```

```
rtrv-home-smsc:num=100:force=yes
```

**Dependencies**

The Portability Check for Mobile Originated SMS (MNP SMS) feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered. (This controlled feature can be turned off with the **chg-ctrl-feat** command and the **rtrv-home-smsc** command will still execute.)

When the specified **num** parameter value is greater than 50, the **force=yes** parameter must also be specified.

**Notes**

None

**Output****rtrv-home-smsc**

```

## rtrv-inpopts

## Retrieve INP Options

Use this command to retrieve INP-specific options.

**Keyword:** rtrv-inpopts

**Related Commands:** chg-inpopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-inpopts**

### Dependencies

The INP feature must be turned on before this command can be entered.

### Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

### Output

The following example shows output with default INP options.

#### rtrv-inpopts

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE 34.1.0
INP OPTIONS
-----
DRANAIV      = 126
DRANP        = E164
DRA          = RNDN
SPRESTYPE    = CONTINUE

CDPNPFX      DLTPFX
-----
CDPNNAI      SNAI
---
```

The following example shows output with some INP options provisioned.

**rtrv-inpopts**

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE 34.1.0
INP OPTIONS
```

```
-----
DRANAIV      = 126
DRANP        = E164
DRA          = CCRNDN
SPRESTYPE    = CONTINUE
```

```
CDPNPFX      DLTPFX
-----      ---
```

```
CDPNNAI      SNAI
---          ----
127          unknown
```

;

The following example shows the provisioned DRANAI value of UNKNOWN.

**rtrv-inpopts**

```
tekelecstp 05-02-16 09:41:29 EST EAGLE 34.1.0
INP OPTIONS
```

```
-----
DRANAI       = UNKNOWN
DRANP        = E164
DRA          = RNDN
SPRESTYPE    = CONTINUE
```

```
CDPNPFX      DLTPFX
-----      ---
```

```
CDPNNAI      SNAI
---          ----
```

;

**Legend**

**DRANAI**—The nature of address indicator for the destination routing address.

**DRANPV**—The numbering plan value for the destination routing address.

**DRA**—The destination routing address.

**CDPNPFX**—The Called Party Number Prefix.

**DLTPFX**—The Delete Prefix

**CDPNNAI**—The Called Party Number Nature of Address Indicator.

**SNAI**—The Service Nature of Address Indicator

**SPRESTYPE**—The INP option to send a "Connect" message or a "Continue" message when IDP messages are received for INP services, the DN digits match, and the HLR ID is present.

**rtrv-ip-card**

**Retrieve Internet Protocol Card**

Use this command to retrieve IP networking parameters for a given card.

**Keyword:** rtrv-ip-card

**Related Commands:** chg-ip-card

**Command Class:** Database Administration

## Parameters

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

## Example

```
rtrv-ip-card:loc=1211
```

```
rtrv-ip-card
```

## Dependencies

The **loc** parameter value must correspond to a DCM card in the card table.

## Notes

None

## Output

```
rtrv-ip-card:loc=1211
```

```
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

## Legend

**LOC**—The card location.

**SRCHORDR**—The Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVONLY indicates that only the Domain server is searched.

**DNSA**—The IP address of Domain Server A.

**DNSB**—The IP address of Domain Server B.

**DEFROUTER**—The IP address for the default router.

**DOMAIN**—The Domain name of the Domain server.

## rtrv-ip-host

## Retrieve Internet Protocol Hostname

Use this command to retrieve the IP Host table. The Host table defines local host names for IP addresses.

**Keyword:** rtrv-ip-host

**Related Commands:** dlt-ip-host, ent-ip-host

**Command Class:** Database Administration

### Parameters

**:host=** (optional)

Host name. The logical name of the device associated with the indicated IP address.

**Range:** Any string of characters beginning with a letter and comprising up to 60 characters in length. Valid characters are a–z, A–Z, 0–9, - (dash), . (period)

**:ipaddr=** (optional)

The IP address associated with the hostname. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 4 numbers separated by dots, with each number in the range of **0-255**.

### Example

```
rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1
```

```
rtrv-ip-host:host=gw100-nc.tekelec.com
```

```
rtrv-ip-host:ipaddr=150.1.1.1
```

```
rtrv-ip-host
```

### Dependencies

The host name, if entered, must exist.

The IP address, if entered, must exist.

### Notes

If optional parameters are specified, only the entries that match the entered parameters are retrieved.

### Output

```
rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0

;

```

## rtrv-ip-lnk

## Retrieve Internet Protocol Link

Use this command to retrieve the IP link table.

**Keyword:** rtrv-ip-lnk

**Related Commands:** chg-ip-lnk

**Command Class:** Database Administration

### Parameters

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card location link data are displayed.

**:port=** (optional)

Ethernet interface port ID.

**Range:** a, b

**Default:** All IP link port data associated with all ports on the card are displayed.

### Example

```
rtrv-ip-lnk:loc=1211:port=a
```

```
rtrv-ip-lnk:loc=1211
```

```
rtrv-ip-lnk
```

### Dependencies

The **loc** parameter value must correspond to a DCM card in the card table.

### Notes

None

**Output****rtrv-ip-lnk**

```

```

;

**Legend**

**LOC**—The card location.

**PORT**—The Ethernet interface port ID, **A** or **B**.

**IPADDR**—The IP address for the specified port.

**SUBMASK**—The subnet mask of the IP interface.

**DUPLEX**—The mode of operation of the interface, **HALF** or **FULL**.

**SPEED**—The bandwidth for the interface in megabits per second, **10** or **100**.

**MACTYPE**—The Media Access Control Type of the interface, **DIX** or **802.3**, where **DIX** indicates the Digital/Inter/Xerox *de facto* standard for ethernet and **802.3** indicates the IEEE standard number 802.3.

**AUTO**—Whether or not to automatically determine duplex and speed. If **YES**, duplex and speed are automatically determined. If **NO**, duplex and speed are not automatically determined.

**MCAST**—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the DSM card to the MPS system.

**rtrv-ip-node****Retrieve IP Node**

Use this command to display one or more nodes that are directly connected to a TCP/IP data link. A particular connection can be displayed, a particular application on a node can be displayed, or an entire node can be displayed. If an entire node is displayed, no parameters are required to perform this action. A particular application can be specified by giving either the application's name or its IP port on the node.

**Keyword:** **rtrv-ip-node**

**Related Commands:** dlt-ip-node, ent-ip-node

**Command Class:** Database Administration

## Parameters

**:ipaddr=** (optional)

The remote host's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:ipappl=** (optional)

The IP application supported by the node.

**Range:** stplan

**:ipport=** (optional)

The logical IP port that addresses the application on the node.

**Range:** 1024-5000

**Default:** Display all

**:iprte=** (optional)

The default router's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Display all

## Example

rtrv-ip-node

rtrv-ip-node:ipappl=stplan

rtrv-ip-node:ipaddr=193.4.201.50

rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024

rtrv-ip-node:loc=1201

**rtrv-ip-node:ipaddr=193.4.201.50:ipport=1022**

**rtrv-ip-node:ipaddr=193.4.111.55**

### Dependencies

If the **ipappl**, **ipport**, or **loc** parameter is specified, the others cannot be specified.

The **ipport** parameter can be specified only if the **ipaddr** parameter is specified.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

If the **loc** parameter is specified, the card location must be equipped with a TCP/IP data link.

If the **ipaddr** parameter is specified, that IP address must be in the TCP/IP data link table.

If the **ipappl** parameter is specified, that IP application must be in the TCP/IP data link table.

If the **iprte** parameter is not specified, then all TCP/IP nodes meeting the display criteria are displayed. If the TCP/IP node has no TCP/IP router assigned to it, dashes are displayed in the IPRTE field.

### Notes

None

### Output

;

**Legend**

**IPADDR**—The remote host's IP address.

**IPPORT**—The logical IP port to address the application on the node.

**IPAPPL**—The IP application supported by the node.

**LOC**—The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**CAP**—The maximum percentage of ethernet capacity for this node connection.

**IPRTE**—The default router's IP address.

**rtrv-ip-rte****Retrieve IP Route**

Use this command to display all static IP route entries in the Static IP Route table, or the entries for a specific card (destination IP addresses, subnet masks, and gateway IP addresses), or the entries for a specific destination IP address, or the entries for a specific gateway IP address.

**Keyword:** rtrv-ip-rte

**Related Commands:** , ent-ip-rte

**Command Class:** Database Administration

**Parameters**

**:dest=** (optional)

Destination IP Address. The IP Address of a remote destination host or network.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

**:gtwy=** (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

**:loc=** (optional)

Card location. The unique identifier of a specific IP card in the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118,**

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208,  
4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,  
5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

```
rtrv-ip-rte
rtrv-ip-rte:loc=1301
rtrv-ip-rte:dest=128.252.10.5
rtrv-ip-rte:gtwy=140.190.15.3
```

### Dependencies

Only one optional parameter can be specified in a single command.

The **loc** parameter value must correspond to a DCM card or SSED CM card in the card table that is running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application. The B network is used only on SSED CM cards.

The specified destination IP address (**dest** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

### Notes

## rtrv-isupvar-attrib

## Retrieve ISUP Variant Attribute

Use this command to retrieve the attributes of ISUP variant table entries.

**Keyword:** **rtrv-isupvar-attrib**

**Related Commands:** **chg-isupvar-attrib**, **copy-isupvar-attrib**, **rtrv-pstn-pres**

**Command Class:** Database Administration

### Parameters

**:display=** (optional)

Display indicates which information in the variant entry will be displayed.

**Range:** **brief**, **full**

**Default:** **brief**

**:msgcode=** (optional)

The ISUP message type code entered to identify a specific ISUP message that is going to have its attributes changed.

**Range:** **0-255**

The value can be specified in decimal (**0-255**) or hexadecimal (**h'00-h'ff**).

**:parmcode=** (optional)

The ISUP parameter code entered to identify a specific ISUP parameter that is going to have its attributes changed.

**Range:** **0-255**

The value can be specified in decimal (**0-255**) or hexadecimal (**h'00-h'ff**).

**:pstncat=** (optional)

The PSTN category assigned to the variant entry being retrieved.

**Range:** **0-65535**

**:pstnid=** (optional)

The PSTN ID identifying the sourcevariant table entry being copied.

**Range:** **0-65535**

### Example

**rtrv-isupvar-attrib:pstncat=65535:pstnid=65535:msgcode=4**

**rtrv-isupvar-attrib:pstncat=1:pstnid=5:parmcode=h'20**

### Dependencies

The **pstncat=1** and **pstnid=2** parameter combination is invalid.

Required controlled features must be enabled.

- ISUP Normalization controlled feature
- ON/OFF controlled feature for Tekelec-defined Variant

The Tekelec-defined Variants are listed in "Tekelec-defined ISUP Normalization Variants".

- Quantity controlled feature for user-defined Variant

The **pstncat** and **pstnid** values must have been previously defined with **ent-pstn-pres**.

The **dpstncat** and **dpstnid** values must have been previously defined with **ent-pstn-pres**.

## Notes

The **copy-isupvar-attrib** command provides the user with an easy way to provision a new ISUP variant table entry by copying all the data from another entry. Then the user changes the entry with the **chg-isupvar-attrib** command.

An ISUP variant table entry exists for each variant defined in the SG. Each entry contains ISUP message and parameter data specific to the ISUP protocol that variant uses. A variant is uniquely defined by its PSTN presentation value, consisting of a PSTN category and a PSTN ID.

The PSTN presentation is used to identify both the source and destination table entries. Both entries **must** be previously defined PSTN presentation values, such as either a Tekelec-defined PSTN or a user-defined PSTN by the **ent-pstn-pres** commands. Use the **rtrv-pstn-pres** command to display the **only** allowed values for the source and destination PSTNs.

If the source or destination variant is a Tekelec-defined PSTN value, then its associated ON/OFF control feature must be ENABLED.

The following is an example of a possible output displaying all supported parameters for a specified message in a variant.

```
PSTNCAT PSTNID MSGCODE ATTRIB ACTION 00001 00005 04h DEFINED CONVERT
MSGCODE PARMCODE TYPE ORDER ACTION 04h --- --- - CONVERT 10h MF 1 NONE 08h
MF 2 NONE 09h MV 1 CONVERT FEh MV 2 NONE 00h OPT - NONE 01h OPT - NONE 04h
OPT - NONE 0Fh OPT - PASSTHRU
```

## Output

The following example displays one message in the specified variant.

**rtrv-isupvar-attrib:pstncat=65535:pstnid=65535:msgcode=4**

```
PSTNCAT PSTNID MSGCODE ATTRIB ACTION
65535 65535 04h DEFINED PASSTHRU
```

```
ISUP variant table is (5 of 20) 25% full
```

```
;
```

## Legend

**PSTNCAT**—The PSTN category identifying the source variant table entry being copied.

**PSTNID**—The PSTN ID identifying the source variant table entry being copied.

**DPSTNCAT** —The PSTN category identifying the destination variant table entry where the source variant table is being copied.

**DPSTNID**—The PSTN ID identifying the destination variant table entry where the source variant table is being copied.

## rtrv-l2t

## Retrieve Level 2 Timers

Use this command to display the values of the SS7 MTP Level 2 timers. The SS7 MTP level 2 timers are organized in 30 timer sets of 8 timer values each. The 30 timer sets have been grouped and system default values have been initialized by specification (ANSI, ITU, High Speed for China, and High

Speed for Q.703 Annex A). Each timer set is administered individually by the **chg-l2t** command. The **ent-slk** command associates links with timer sets. Each assigned link is associated with one of the 30 timer sets.

**Keyword:** **rtrv-l2t**

**Related Commands:** , **rtrv-slk**

**Command Class:** Database Administration

## Parameters

**:l2set=** (optional)

Level 2 timer set identifier, or timer set number. Up to 30 different sets of SS7 MTP Level 2 timer sets can be defined. The **ent-slk** command can be used to assign an SS7 signaling link to any one of the 30 timer sets.

**Range:** **1-30**

**Default:** Display all timer sets.

## Example

**rtrv-l2t**

**rtrv-l2t:l2set=3**

## Dependencies

None

## Notes

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the **chg-l2t** command.

## Output

**rtrv-l2t**

**T2**—Not aligned

**T3**—Aligned

**T4NPP**—Proving period normal

**T4EPP**—Proving period Emergency

**T5**—Sending SIB

**T6**—Remote congestion

**T7**—Excessive delay of acknowledgment

**rtrv-l3t****Retrieve Level 3 Timers**

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

**Keyword:** **rtrv-l3t**

**Related Commands:** **chg-l2t**, **chg-l3t**, **ent-ls**, **rtrv-l2t**, **rtrv-ls**

**Command Class:** Database Administration

**Parameters**

**:l3set=** (optional)

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the **ent-ls** or **chg-l3t** command.

**Range:** **1**

**Default:** Display table

**Example**

**rtrv-l3t:l3tset=1**

**Dependencies**

Only one timer set is supported in this release.

**Notes**

The timer output for this command is in seconds, even though it could have been entered in milliseconds on the **chg-l3t** command.

**Output****rtrv-l3t:l3tset=1**

```

rlghncxa03w 04-02-17 16:03:12 EST EAGLE 31.3.0
LEVEL 3 TIMERS (IN SECONDS)

**Legend**

**L3TSET**—The level 3 timer set table.

**T1**—The delay, in seconds, to avoid message missequencing on changeover. Also used as the ITU MTP restart isolation timer.

**T2**—The amount of time, in seconds, to wait for changeover acknowledgment.

**T3**—Time controlled diversion – the delay, in seconds, to avoid missequencing on changeback.

**T4**—The amount of time, in seconds, to wait for changeback acknowledgment, first attempt.

**T5**—The amount of time, in seconds, to wait for changeback acknowledgment, second attempt.

**T6**—The delay, in seconds, to avoid message missequencing on controlled rerouting.

**T7**—The amount of time, in seconds, to wait for signaling data link connection acknowledgment.

**T8**—The transfer-prohibited inhibited timer (transient solution).

**T10**—The amount of time, in seconds, to wait before repeating the signaling-route-set-test message.

**T11**—The transfer-restricted timer.

**T12**—The amount of time, in seconds, to wait for uninhibit acknowledgment.

**T13**—The amount of time, in seconds, to wait for force uninhibit.

**T14**—The amount of time, in seconds, to wait for inhibition acknowledgment.

**T15**—The amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test.

**T16**—The amount of time, in seconds, to wait for route-set-congestion status update.

**T17**—The delay, in seconds, to avoid oscillation of initial alignment failure and link restart.

**T18**—The repeat TFR once by response method timers.

**IT18**—The timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.

**T19**—The failed link craft referral timer.

**IT19**—The amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages.

**T20/IT22**—The amount of time, in seconds, to wait before repeating the local inhibit test.

**IT20**—The amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts.

**T21/IT23**—The amount of time, in seconds, to wait before repeating the remote inhibit test.

**IT21**—The overall MTP restart timer at a signaling point adjacent to one whose MTP restarts.

**T22**—The timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available.

**T23**—The timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.

**T24**—The timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.

**T25**—The timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).

**T26**—The timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.

**T28**—The timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.

**T29**—The timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.

**T30**—The timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message.

**T31**—The false link congestion detection timer.

**T32**—The link oscillation timer—Procedure A.

## rtrv-lbp

## Retrieve Loopback Point Attributes

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

**Keyword:** rtrv-lbp

**Related Commands:** act-lbp, chg-lbp, dact-lbp, dlt-lbp, ent-lbp

**Command Class:** Database Administration

### Parameters

**:lbp=** (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

**Range:** 1-32

**Default:** Display all

**:link=** (optional)

SS7 signaling link. The SS7 signaling link that is to be tested.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**Default:** Display all

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card locations.

### Example

**rtrv-lbp**

**rtrv-lbp:loc=1202**

**rtrv-lbp:loc=1202:link=a**

**rtrv-lbp:loc=1202:link=a:lbp=3**

### Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the **loc** parameter cannot be reserved by the system.

If the **link** parameter is specified, the **loc** parameter must be specified. If the **lbp** parameter is specified, both the **loc** parameter and the **link** parameter must be specified.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

### Output

The following example displays the attributes for all the loopback points for SS7 links assigned to the STP:

**rtrv-lbp**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  PORTLINK  LBP  RLE  REP  CLLI  LFST
1101  A        1   DS0  0   -----  LLT
          7   OCU  0   -----  NLT
          9   NEI  0   -----  LLT
1102  A        2   DS0  0   -----  LLT
          3   DS0  4   -----  LLT
          4   NEI  0   -----  LLT
1102  B        1   DS0  0   -----  LLT
          6   NEI  0   -----  LLT
1215  A        1   DS0  0   -----  LLT
          3   DS0  4   -----  LLT
          5   DS0  5   -----  LLT
          7   DS0  8   -----  LLT
          9   NEI  0   -----  LLT
```

;

The following example displays the attributes for all the loopback points for the SS7 links A and B of the LIM card residing in the first frame, first shelf, and second slot of the STP:

**rtrv-lbp:loc=1202**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST
1102  A      2   DS0  0   -----  LLT
      3   DS0  4   -----  LLT
      4   NEI  0   -----  LLT

1102  B      1   DS0  0   -----  LLT
      6   NEI  0   -----  LLT
;
```

The following example displays the attributes for all the loopback points for the SS7 link A of the LIM card residing in the first frame, first shelf, and second slot of the STP:

**rtrv-lbp:loc=1202:link=a**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST
1102  A      2   DS0  0   -----  LLT
      3   DS0  4   -----  LLT
      4   NEI  0   -----  LLT
;
```

The following example displays the attributes for loopback point 3 for the SS7 link A of the LIM card residing in the first frame, first shelf, and second slot of the STP:

**rtrv-lbp:loc=1202:link=a:lbp=3**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST
1102  A      3   DS0  4   -----  LLT
;
```

The following example displays the attributes for all the loopback points for the SS7 link A of the LIM card residing in the first frame, first shelf, and second slot of the STP. However, no loopback points have been provisioned.

**rtrv-lbp:loc=1202:link=a**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
LOC  LINK  LBP  RLE  REP  CLLI  LFST

No loopback points meeting the requested criteria were found
;
```

## rtrv-lnp-dbts

## Retrieve LNP Database Time Stamp

Use this command to retrieve the LNP database time stamp corresponding to the latest LNP Database update applied by the LSMS.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-lnp-dbts

**Related Commands:**

**Command Class:** LNP Database

### Parameters

This command has no parameters.

### Example

**rtrv-lnp-dbts**

## Dependencies

The LNP feature must be turned on prior to using this command (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

## Notes

The timestamp that this command displays is updated during the importation of an LNP database created by the LSMS (using the command and parameter **chg-db:action=import**). It is also updated whenever the database is modified as a result of an **upd-lnp-10dt** command received from the LSMS. Note that not all LNP DB update commands received from the LSMS cause the timestamp to be updated (only **upd-lnp-10dt**). LNP database updates caused by commands issued from EAGLE 5 ISS terminals do not cause the timestamp to be updated.

ACTV (active) or STDBY (standby) is displayed for the 1114/1116 disks to indicate the role of the associated MASP. If the disk is not accessible, then NOACCS is displayed.

The timestamp that is displayed is the verbatim timestamp as provided by the LSMS. This timestamp is normally a 14-character date/time in the format: *yyyymmddhhmmss*. The timestamp is displayed exactly as received by the LSMS without additional reformatting.

## Output

### rtrv-lnp-dbts

|         | TDM 1114 (ACTV)<br>TIME LAST UPDATE<br>----- | TDM 1116 (STDBY)<br>TIME LAST UPDATE<br>----- |
|---------|----------------------------------------------|-----------------------------------------------|
| FD BKUP | 19971218114204                               | 19971218114204                                |
| FD CRNT | 19971218114204                               | 19971218114204                                |
|         | MDAL 1117<br>-----                           |                                               |
| RD BKUP | 19971218104204                               |                                               |
|         | ;                                            |                                               |

(with the standby MASP and removable cartridge not available)

### rtrv-lnp-dbts

|         | TDM 1114 (ACTV)<br>TIME LAST UPDATE<br>----- | TDM 1116 (NOACCS)<br>TIME LAST UPDATE<br>----- |

### Legend

( ACTV )—The specified MASP is the active processor.

( STDBY )—The specified MASP is the standby processor.

(NOACCS)—The specified processor is not accessible.

RD BKUP—Removable cartridge backup partition.

FD BKUP—Fixed disk backup partition.

FD CRNT—Fixed disk current partition.

TIME LAST UPDATE—The date and time the last change was performed on the specified card and its associated database.

—The database is not available.

**rtrv-lnp-dpcer****Retrieve LNP DPC Exception Report**

Use this command to generate a report of LNP subscriptions in the database that have not been assigned to a route. If **tn** is specified, the generated report shows telephone number (TN) subscriptions accepted from the Local Service Management System (LSMS) which contain a translation type (TT) for which no destination point code (DPC) exists in the LNP database. If **tn** is not specified, the report shows a list of TT-DPCs that have not been assigned a route.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available.**

**Keyword:** rtrv-lnp-dpcer

**Related Commands:** canc-lnp-dpcer

**Command Class:** LNP Basic

**Parameters**

**NOTE: This command does not support 24-bit ITU national point codes.**

**:dpc=** (optional)

The ANSI destination point code, in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*, associated with a **tn** that does not have a route assigned to it.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**Default:** Information is displayed for all DPCs associated with the specified parameters.

**:etn=** (optional)

The end number of the range of telephone numbers on which to base the report.

**Range:** 10 digits

To specify a single TN subscription—10 digits

To pool a block of 1000 TNs— 7 digits with 3 asterisks (\*\*\*) appended

**:force=** (optional)

Allows for the report to be displayed when **num** is specified as greater than 50, or when the range of numbers specified with **tn** and **etn** results in output of over 50 entries.

**Range:** yes, no

**Default:** no

**:num=** (optional)

The maximum number of database entries to display.

**Range:** 1-12000000

**Default:** 50

**:tn=** (optional)

The telephone number, or start number of the range of telephone numbers, on which to base the report.

**Range:** 10 digits  
 To specify a single TN subscription—10 digits  
 To pool a block of 1000 TNs— 7 digits with 3 asterisks (\*\*\*) appended

**:tt=** (optional)

The translation type on which to base the report.

**Range:** 0-255

**Default:** Information is displayed for all translation types associated with the specified parameters.

### Example

**rtrv-lnp-dpcer**

**rtrv-lnp-dpcer:tn=9191234567:tt=16:dpc=100-100-100**

**rtrv-lnp-dpcer:tn=1111111000:etn=1999999999:num=250:force=yes**

**rtrv-lnp-dpcer:tn-9194605\*\*\***

### Dependencies

The LNP feature must be turned on prior to using this command (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands).

If **tn** is specified, the generated report shows TN subscriptions accepted from the LSMS which contain a TT for which no DPC exists in the LNP database. If **tn** is not specified, the report shows a list of TT-DPCs that have not been assigned a route.

If translation type (**tt**) is specified along with **tn**, the TT value must not be associated with an AIN or IN query service.

If **tt** is specified, the TT value must not be a WNP or LNPQS query service, or an LNP alias.

If the **tt** and **dpc** parameters are both specified, output is reported only if both criteria are matched.

If a single subscription contains multiple TTs with a missing DPC, multiple entries are displayed in the report.

### Notes

Specifying a **tn** of **tn/etn** range is not recommended when using the **rtrv-lnp-dpcer** command. When a **tn** or **tn/etn** range is not specified, a report is generated based on translation types. The execution time of a translation type based report is much shorter, and the data is more useful for identifying DPCs in the LNP entries that do not have routes assigned.

Because the processing time for this report can be extremely long, the **canc-lnp-dpcer** command can be entered to cancel the report.

The REFCNT field in the output indicates the number of DPCs being referenced or used in the database.

By specifying a **tn/etn** range, it is possible for the Numbering Plan Area (NPANXX) ranges to cross boundaries (for example, 9195551111–9605551111).

### Output

The following example shows a specific telephone number with a specific translation type whose destination point code is not assigned to a route.

```
rtrv-lnp-dpcer:tn=9191234567:tt=16:dpc=100-100-100
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
TN          TT      DPC
9191234567  16      100-100-100
;
```

## Commands

The following example shows the first 250 telephone numbers found in the specified range that have translation types whose destination point codes are not assigned to a route.

**rtrv-lnp-dpcer:tn=111111000:etn=1999999999:num=250:force=yes**

```
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
```

| TN         | TT | DPC         |
|------------|----|-------------|
| 1111111110 | 10 | 100-100-100 |
|            | 25 | 100-130-105 |
| 1111111111 | 35 | 200-123-434 |
| 1111111*** | 10 | 100-100-100 |
|            | 35 | 200-123-434 |
| 1111111200 | 13 | 001-001-002 |
| . . .      |    |             |
| 1234567890 | 45 | 003-002-001 |

Report terminated - output length limitation (NUM=250) reached.

;

The following example shows the first 20 entries of a specified translation type whose destination point code is not assigned to a route.

**rtrv-lnp-dpcer:tt=15:num=20**

```
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
```

| TT | DPC         | REFCNT |
|----|-------------|--------|

**rtrv-lnp-lrn****Retrieve LNP Location Routing Number**

Use this command to display all LRNs and their associated final overriding message relay global title translations from the database.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS or using the ELAP user interface.**

**Keyword:** rtrv-lnp-lrn

**Related Commands:** chg-lnp-lrn, dlt-lnp-lrn, ent-lnp-lrn

**Command Class:** LNP Basic

**Parameters**

**:elrn=** (optional)

End range location routing number.

**Range:** 10 digits

**Default:** Same value as the **lrn** parameter

**:force=** (optional)

This parameter is used to display more than 50 entries in the report.

**Range:** yes, no

**Default:** no

**:lrn=** (optional)

Location routing number.

**Range:** 10 digits

**:num=** (optional)

Number of entries to be displayed. This parameter specifies how many records you want to display (potentially within a given range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:** 1-100, 000

**Default:** 1, 50

1—If the **lrn** parameter is specified and the **elrn** parameter is not specified.

50—In all other cases.

**:sp=** (optional)

Service provider. Use this parameter to limit the displays to LRN records found matching the specified value.

**Range:** xyyy

Four alphanumeric characters.

**Default:** Display all LRNs in the database.

**Example**

**rtrv-lnp-lrn:num=30**

**rtrv-lnp-lrn:lrn=9093350000**

**rtrv-lnp-lrn:lrn=9093350000:elrn=9093359999:num=80:force=yes**

**rtrv-lnp-lrn:lrn=1234567890:elrn=1234569999:num=80:force=yes:sp=1234**

## Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The **num** parameter value defaults to **50** if not specified.

If the specified **num** parameter value is greater than 50, the **force=yes** parameter must be specified.

If the **elrn** parameter is specified, the **lrn** parameter value must be specified.

The **elrn** parameter value must be greater than the **lrn** parameter value.

## Notes

None

## Output

The following example shows how to display the first 30 LRNs in the database:

### rtrv-lnp-lrn:num=30

```
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0

## **rtrv-lnp-npanxx**

### **Retrieve LNP NPANXX**

Use this command to retrieve all ported LNP NPANXXs and their associated message relay and LNP query default global title translations from the database. Use the **num** parameter to prevent inadvertent displays of extremely large amounts of information, because this action can require several hours.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed using the ELAP user interface.**

**Keyword:** rtrv-lnp-npanxx

**Related Commands:** chg-lnp-npanxx, dlt-lnp-npanxx, ent-lnp-npanxx

**Command Class:** LNP Basic

### **Parameters**

**:enpanxx=** (optional)

End range numbering plan area and exchange.

**Range:** 6 digits

**Default:** Display all npanxx entries

**:force=** (optional)

This parameter is used to display more than 50 entries.

**Range:** yes, no

**Default:** no

**:npanxx=** (optional)

Numbering plan area and exchange.

**Range:** 6 digits

**Default:** Display all npanxx entries

**:num=** (optional)

Number of entries to be shown. This parameter determines how many records you want to display (potentially within a given range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:**     **1–50** , if **force=yes** is not specified  
               **1–50000**, if **force=yes** is specified

**Default:**   **1**—if **npanxx** is specified and **enpanxx** is not specified  
               **50**—all other cases

## Example

**rtrv-lnp-npanxx:npanxx=909335**

## Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-lnp-npanxx** command can be entered.

If a value is specified for the **num** parameter that is greater than 50, the **force=yes** parameter must be specified.

If the **enpanxx** parameter is specified, the **npanxx** parameter must be specified.

The **enpanxx** parameter value must be greater than the **npanxx** parameter value.

## Notes

Translation type values cannot be retrieved that are associated with AIN or IN LNP queries as NPANXX default message relay global title translations.

## Output

To retrieve a single NPANXX:

**rtrv-lnp-npanxx:npanxx=909335**

```
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0

**Legend****SERV**—Reserved service type name.**TT**—Translation type**TTN**—Translation type name**DV**—Digits valid**ALIAS**—Alias translation type**rtrv-lnp-sp****Retrieve LNP Service Provider**

Use this command to retrieve all LNP service provider information from the database.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed using the ELAP user interface.**

**Keyword:** rtrv-lnp-sp

**Related Commands:** dlt-lnp-sp, ent-lnp-sp

**Command Class:** LNP Basic

**Parameters**

**:force=** (optional)

Use this parameter to prevent display of extremely large amounts of data. This parameter is required if a value greater than **50** is specified for the **num** parameter.

**Range:** yes, no

**Default:** no

**:num=** (optional)

The number of records to be displayed.

**Range:** 1-10000

**Default:** 1—if only the **sp** parameter is specified

50—if no parameters are specified

**:sp=** (optional)

The service provider ID.

**Range:** xyyy

1–4 alphanumeric characters.

**Default:** Display all

**Example**

```
rtrv-lnp-sp
```

```
rtrv-lnp-sp:sp=abjj
```

```
rtrv-lnp-sp:num=10:sp=a123
```

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-lnp-sp** command can be entered.

The **force=yes** parameter must be specified when the value of the **num** parameter is greater than 50.

### Notes

If the **num** and **sp** parameters are specified with the **rtrv-lnp-sp** command, the number of service provider IDs specified by the **num** parameter is displayed, with the service provider ID specified by the **sp** parameter displayed first.

### Output

In the following examples, the Service Provider ID table contains 11 entries.

#### **rtrv-lnp-sp**

### **rtrv-lnp-sub**

#### **Retrieve LNP 10-digit Subscription**

Use this command to retrieve all LNP 10-digit ported telephone numbers (TN), and their assigned services, from the database. Subscriptions cannot be retrieved across NPANXX boundaries.

**NOTE: This command is obsolete.**

**NOTE:** If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed using the ELAP user interface.

**CAUTION:** Using the rtrv-lnp-sub command to generate this report could affect the rate at which the LNP data can be updated in the EAGLE 5 ISS by two telephone numbers per second. To avoid the delay, use the rtrv-lnp-tnrpt command instead.

**NOTE:** This command displays the ptype value. For range or ptype-specific retrievals, use the rtrv-lnp-tnrpt command.

**Keyword:** rtrv-lnp-sub

**Related Commands:** chg-lnp-sub, dlt-lnp-sub, ent-lnp-sub

**Command Class:** LNP Basic

## Parameters

**:tn=** (mandatory)

Telephone number.

**Range:** 10 digits

To specify a single TN subscription

7 digits with 3 asterisks (\*\*\*) appended—To pool a block of 1000 TNs

**:etn=** (optional)

The end range telephone number.

**Range:** 10 digits

To specify a single TN subscription

7 digits with 3 asterisks (\*\*\*) appended—To pool a block of 1000 TNs

**Default:** Display same parameter value as the **tn** parameter.

**:force=** (optional)

This parameter is used to display more than 50 entries.

**Range:** yes, no

**Default:** no

**:lrn=** (optional)

Location routing number.

**Range:** 10 digits

**Default:** Display all

**:num=** (optional)

The number of entries to be shown. This parameter determines how many records you want to display (potentially within a given TN range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:** 1-10000

1-50, if the **force=yes** parameter is not specified

1-10000, if the **force=yes** parameter is specified

**Default:** 1—if only the **tn** parameter is specified and the **etn** parameter is not specified

50—if no parameters are specified

**:ptype=** (optional)

Local number portability type.

**Range:** none, pool

**none**—Displays entries of all non-pooled subscriptions

**pool**—Pooled block number port

**Default:** none

**:sp=** (optional)  
 The service provider.  
**Range:**     xyyy  
               4 alphanumeric characters.  
**Default:**   Display all

**:tt=** (optional)  
 The translation type.  
**Range:**     **0-255**  
**Default:**   Display all

### Example

```
rtrv-lnp-sub:tn=9093351111
rtrv-lnp-sub:tn=9093350000:etn=910933659999:num=60:force=yes
rtrv-lnp-sub:tn=1234567890:etn=1234569999:tt=16
rtrv-lnp-sub:tn=1234567890:etn=1234569999:sp=1234:num=20
rtrv-lnp-
sub:tn=1234567890:etn=1234569999:lrn=1234567891:num=100:force=yes :ptype=pool
```

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

The **num** parameter defaults to **50** if not specified.

When the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

Translation type values associated with AIN, IN, LNPQS, PCS, or WNP LNP queries are not allowed for retrievals.

The **etn** parameter value must be greater than the **tn** parameter value.

The **tn** parameter range must not cross NPANXX boundaries.

The translation type and service provider must be in the LNP database.

The translation type value must be a reserved service for LNP.

The LRN must exist in the database.

### Notes

The **tt**, **sp**, and **lrn** parameters are provided to limit the displays to subscription records found matching their specified values. Combinations of these parameters are allowed.

### Output

Retrieve a single TN:

```
rtrv-lnp-sub:tn=9093351111
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0

### **Legend**

**TN**—Telephone number  
**ETN**—The end range telephone number  
**SP**—The service provider  
**LRN**—The location routing number  
**PPTYPE**—The local number portability type  
**TT**—The translation type  
**XLAT**—Translate  
**RI**—The routing indicator  
**PCA**—The ANSI point code  
**SSN**—The subsystem number  
**NGT**—The new global title translation type  
**RGTA**—The replacement global title address (TN) with an LRN

## **rtrv-lnp-tnrpt**

## **Retrieve LNP Subscription Version Data**

Use this command to retrieve and display LNP subscription data based on the LNP type.

**NOTE: This command is obsolete.**

**NOTE:** If the LNP ELAP Configuration feature is turned on, this command is no longer available. Subscription data can be retrieved by TN using the ELAP user interface. The output indicates the LNP type.

**CAUTION:** The `rtrv-lnp-sub` command can also be used to generate this report, but doing so could impact updating the LNP data in the EAGLE 5 ISS at a rate of two telephone numbers per second. Using the `rtrv-lnp-tnrpt` command eliminates the impact on updating the LNP data.

**Keyword:** `rtrv-lnp-tnrpt`

**Related Commands:** `canc-lnp-tnrpt`

**Command Class:** LNP Basic

## Parameters

**:etn=** (optional)

The end range telephone number.

**Range:** 10 digits

To specify a single TN subscription

7 digits with 3 asterisks (\*\*\*) appended—To pool a block of 1000 TNs

**Default:** Display same parameter value as the `tn` parameter.

**:force=** (optional)

This parameter is used to display more than 50 entries.

**Range:** `yes`, `no`

**Default:** `no`

**:num=** (optional)

The number of entries to be shown. This parameter determines how many records you want to display (potentially within a given TN range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:** `1-12,000,000`

`1-50`—if the `force=yes` parameter is not specified

`1-12,000,000`—if the `force=yes` parameter is specified

**Default:** `1`—if only the `tn` parameter is specified and the `etn` parameter is not specified  
`50`—all other cases

**:ptype=** (optional)

Specifies the local number portability type to display.

**Range:** `none`, `pool`

`none`—Displays entries of all non-pooled subscriptions

`pool`—Pooled block number port

**Default:** Both pooled and non-pooled TNs are retrieved

**:tn=** (optional)

Telephone number.

**Range:** 10 digits

To specify a single TN subscription

7 digits with 3 asterisks (\*\*\*) appended—To pool a block of 1000 TNs

## Example

`rtrv-lnp-tnrpt:ptype=pool`

`rtrv-lnp-tnrpt:tn=9093350000:etn=9193369***:num=60:force=yes:ptype=pool`

## Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Another **rtrv-lnp-tnrpt** command cannot be in progress when this command is entered.

The **num** parameter defaults to **50** if not specified.

When the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

The **etn** parameter value must be greater than the **tn** parameter value.

If the **etn** parameter is specified, then the **tn** parameter must be specified.

## Notes

If a range of telephone numbers is specified, it is possible for the NPANXX ranges to cross boundaries.

## Output

Retrieve by **pctype**:

**rtrv-lnp-tnrpt:pctype=pool**

```
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TN          PTYPE
9093351***  pool
```

;

Retrieve the first 60 records in the given range with **pctype=pool**:

**rtrv-lnp-tnrpt:tn=9093350000:etn=9193369999:num=60:force=yes:pctype=pool**

```
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TN          PTYPE
9093351***  pool
9193361***  pool
```

;

Retrieve first 60 records in the given TN range:

**rtrv-lnp-tnrpt:tn=9093350000:etn=9193369999:num=60:force=yes**

```
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TN          PTYPE
9093351***  pool
9093358123  none
9193361432  none
9193361***  pool
```

;

## rtrv-lnp-ttmap

## Retrieve LNP Translation Type Mapping

Use this command to retrieve all LNP MRGTs or all LNP MRGTs for a given TT, TT-PC-SSN, or TT-DPC combination.

**NOTE: This command does not support 24-bit ITU national point codes.**

**Keyword:** **rtrv-lnp-ttmap**

**Related Commands:** **chg-lnp-ttmap**, **ent-lnp-sub**

**Command Class:** LNP Basic

## Parameters

**:force=** (optional)

Forcible value.

**Range:**     **yes, no**

**Default:**   **no**

**:num=** (optional)

Number of entries to be displayed. This parameter specifies how many records you want to display (potentially within a given range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:**     **1-52, 000**

**Default:**   **50**

**:pc=** (optional)

ANSI destination point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:**     **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**Default:**   Display all

**:tt=** (optional)

The translation type.

**Range:**     **0-255**

**Default:**   Display all

## Example

**rtrv-lnp-ttmap:tt=16:pc=100-100-100**

**rtrv-lnp-ttmap**

**rtrv-lnp-ttmap:tt=15:num=20**

**rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes**

## Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

If the **pc/pca** parameter is specified, the **tt** parameter must be specified.

The translation type must be in the LNP database.

If the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

Translation type values associated with AIN or IN LNP queries are not allowed for retrievals.

## Notes

Use the **tt** and **dpc** parameters to limit the displays to LNP MRGT records found matching their specified values. Combinations of these parameters are allowed.

## Commands

### Output

The following example shows how to retrieve an LNP GT:

```
rtrv-lnp-ttmap:tt=16:pc=100-100-100
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 100-100-100 28 YES

Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 50 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 001-001-001 0 YES
16 100-100-100 28 YES
.
.
18 002-002-002 10 NO
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 20 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap:tt=15:num=20
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
15 001-001-002 10 NO
.
.
15 001-001-005 10 YES
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 100 LNP GTs assigned to the specified DPC value:

```
rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 001-001-001 0 NO
18 001-001-001 10 NO
.
.
.
Message Relay Table is 75% full
;
```

### **Legend**

**TT**—The translation type.

**PCA**—The ANSI point code.

**NGT**—The new global title translation type.

**RGTA**—The replacement GTA treatment.

**rtrv-lnpopts****Retrieve LNP System Options**

Use this command to display all the LNP-specific system options from the database.

**Keyword:** **rtrv-lnpopts**

**Related Commands:** **chg-lnpopts**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-lnpopts**

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

None

**Output**

The following example shows the JIPPROV and JIPDIGITS fields that appear when the Triggerless LNP feature is turned on.

The WSMSC10DIG field appears when the LNP SMS feature is turned on.

**rtrv-lnpopts**

```

AMASLPID      = 123456789
INCSLP        = yes
AMATYPE       = 003
AMAFEATID     = 010
CIC           = 1369
AUD           = on
SP            = a123
FRCSMPLX     = no
ADMHIPRI     = yes
GTWYSTP      = yes
JIPPROV       = yes
JIPDIGITS     = 919460
CCP          = no
SERVPORT     = no
WQREDRCT     = off
WSMSC10DIG   = yes

```

;

**Legend**

**AMASLPID**—AMA slip ID

**INCSLP**—Whether the AMA slip ID included in the response

**AMATYPE**—AMA call type

**AMAFEATID**—AMA feature ID

**CIC**—Carrier identification code

**AUD**—Audit indicator

**SP**—Service provider ID

**FRCSMPLX**—Allow simplex database updates indicator

**ADMHIPRI**—Indicator that LNP database administration has the highest priority of all administration

**GTWYSTP**—Indicator that LNP system is also configured as a Gateway STP

**JIPPROV**—Indicator of whether a Jurisdictional Information Parameter (JIP) value is to be added to the IAM

**JIPDIGITS**—The Jurisdictional Information Parameter value

**CCP**—Copy Charge Parameters

**SERVPORT**—Service Portability

**WQREDRCT**—Wireless queries directed to default GTT

**WSMS10DIG**—SCCP GTA length indicator for 10 or 11 digits

## rtrv-log

## Display Records from the Log

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

**Keyword:** **rtrv-log**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:dir=** (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

**Range:** **fwd, bkwd**

**fwd**—Display entries from nearer the beginning of the log toward entries at the end of the log

**bkwd**—Display entries from nearer the end of the log toward entries at the beginning of the log

**Default:** **fwd**

**:edate=** (optional)

End date. Report only log entries that were created on or *before* the specified date (when **dir=fwd**), or only log entries that were created on or *after* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:** **000101-991231**

(in the form *yymdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:** Report log entries regardless of their creation date

**:enum=** (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

**Range:** **1-1499**

**1-999**—Alarms (UAMs)

**1000-1499**—UIMs

**Default:** If **enum** is not specified and:

If **snum** is specified, the default **enum** value is the same as the specified **snum** value.

If **snum** is not specified and **type** is **alarm** or not specified, **enum= 999**.

If **snum** is not specified and **type** is **all** or **uim**, **enum= 1499**.

**:etime=** (optional)

End time. Report only log entries that were created on or *before* the specified time (when **dir=fwd**), or only log entries that were created on or *after* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:**       **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**     Report log entries regardless of their creation time

**:mode=** (optional)

Log display mode; display all information or just summary information from each log entry.

**Range:**       **brief, full**

**brief**—Display only the first “Summary” line of the log entry

**full**—Display all information available in the log entry

**Default:**     **full**

**:next=** (optional)

Number of additional records to display using the same direction (**dir**) and filtering criteria of **outgrp**, **type**, **slog**, and **mode** that were used for the previous successful **rtrv-log** command at the same terminal. This parameter cannot be specified with any other parameters in the command. See the Dependencies and Notes sections for usage information.

**Range:**       **1-65500**

**:num=** (optional)

Number of records that can be displayed before the report is stopped.

**Range:**       **1-65500**

**Default:**     **15**

**:outgrp=** (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on. This parameter cannot be specified when the **snum** parameter is specified.

**Range:**       **all, appserv, appss, card, clk, db, dbg, gtt, gws, link, lnpsdb, lnpsub, meas, mon, mps, pu, sa, seas, slan, sys, traf**

**all**—Retrieve information for all Output Groups

**appserv**—Application Server

**appss**—Application Subsystem

**card**—Card

**clk**—Clock

**db**—Database

**dbg**—Debug

**gtt**—GTT Maintenance

**gws**—GWS Maintenance

**link**—Link Maintenance

**lnpsdb**—LNP Database

**lnpsub**—LNP Subsystem

**meas**—Measurements Maintenance

**mon**—Monitoring (Sentinel or IMF) Maintenance

**mps**—MPS Maintenance

**pu**—Program Update

**sa**—System Administration

**seas**—SEAS (Sentinel or IMF)

**slan**—SLAN Maintenance

**sys**—System Maintenance

**traf**—Traffic

**Default:**     If the **next** parameter is not specified, the default is **all**.

If the **next** parameter is specified, the output is the same as the immediately previous successful **rtrv-log** command that was entered at the same terminal (and no **rtrv-log** command was entered at another terminal).

**:sdate=** (optional)

Start date. Report only log entries that were created on or *after* the specified date (when **dir=fwd**), or only log entries that were created on or *before* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:**       **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**     Report log entries regardless of their creation date

**:slog=** (optional)

Source of log. Which OAM's Maintenance log to access: active or standby.

**Range:**       **act, stb**

**act**—Active OAM

**stb**—Standby OAM

**Default:**     **act**

**:snum=** (optional)

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the **outgrp** parameter is specified.

**Range:**       **1-1499**

**1-999**—Alarms (UAMs)

**1000-1499**—UIMs

**Default:**     All entries for the specified **type** are displayed.

If **type** is **all**, **alarm**, or not specified, **snum=1**.

If **type** is **uim**, **snum=1000**.

**:stime=** (optional)

Start time. Report only log entries that were created on or *after* the specified time (when **dir=fwd**), or only log entries that were created on or *before* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:**       **000000-235959**

*hhmmss*—*hh*=hours (**00-23**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

**Default:**     Report log entries regardless of their creation time

**:type=** (optional)

Type of Maintenance log to access for the report: alarms (UAMs), UIMs, or both logs (**all**).

**Range:**       **all, alarm, uim**

**Default:**     **alarm**

### Example

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

### Dependencies

No other **rtrv-log** command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the **rtrv-log** command can be entered.

If both the **sdate** and **edate** parameters are specified,

- In the forward direction, the **sdate** value must be less than or equal to the **edate** value.
- In the backward direction, the **sdate** value must be greater than or equal to the **edate** value.

The month component of the **sdate** and **edate** parameters must be in the range **1–12**.

The day component of the **sdate** and **edate** parameters must be in the range **1–31** and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the **stime** and **etime** parameters must be in the range **00–59**.

The minutes component of the **stime** and **etime** parameters must be in the range **00–59**.

If the **sdate** parameter value is equal to the **edate** parameter value,

- In the forward direction, the **stime** value must be less than or equal to the **etime** value.
- In the backward direction, the **stime** value must be greater than or equal to the **etime** value.

The **sdate** parameter value plus the **stime** parameter value must be less than the current time and date combination.

If **dir=bkwd** is specified with a date and time range, **sdate/stime** must be greater than **edate/etime**.

When the **enum** parameter is specified, the **snum** parameter must be specified with a value less than or equal to the specified **enum** value.

The specified **enum** parameter value and the specified **snum** value must be within the same range: **1-999** for Alarms (UAMs) and **1000-1499** for UIMs.

The **type** parameter and the **snum/enum** parameters cannot be specified together in the command.

The **rtrv-log:next=** command must be entered on the same terminal where the previous successful **rtrv-log** command was entered in the system. No other parameters can be entered with the **next** parameter in the command.

The **rtrv-log:next=** command cannot be entered following a **rtrv-log** command that contained the **type=all** parameter. A **rtrv-log** command without the **type=all** parameter must be entered before the **rtrv-log::next=** command can be entered.

Because entries can be overwritten between the entry of a **rtrv-log** command without the **next** parameter and the entry of a **rtrv-log:next=** command, the **rtrv-log:next:** command might not execute successfully. Another **rtrv-log** command without the **next** parameter must be entered before the **rtrv-log:next:** command can be entered again,

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999  
years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any **sdate/edate** value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is

not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of two other parameters: **num** and **dir**. The **num** parameter determines the maximum number of entries to display, and the **dir** parameter determines whether entries are displayed from the oldest end (**dir=fwd** or not specified) or the newest end (**dir=bkwd**).

When **sdate** is specified and **edate** is not specified in the forward direction, **edate** is defaulted to be the end of the log.

When **edate** is specified and **sdate** is not specified in the forward direction, **sdate** is defaulted to be the beginning of the log.

When **sdate** is specified and **edate** is not specified in the backward direction, **edate** is defaulted to be the beginning of the log.

When **edate** is specified and **sdate** is not specified in the backward direction, **sdate** is defaulted to be the end of the log.

When **stime** is specified and **etime** is not specified in the forward direction, **etime** is defaulted to **235959**.

When **etime** is specified and **stime** is not specified in the forward direction, **stime** is defaulted to **000000**.

When **stime** is specified and **etime** is not specified in the backward direction, **etime** is defaulted to **000000**.

When **etime** is specified and **stime** is not specified in the backward direction, **stime** is defaulted to **235959**.

When **stime** or **etime** is specified but neither the **sdate** or **edate** parameters are specified, **sdate** and **edate** are each defaulted to the value **today**.

The **num** parameter is used to control the maximum number of entries to be displayed by one command.

The **dir** parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the **dir** parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (**outgrp**) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group (**outgrp**) is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When **outgrp=all** is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The **next** parameter is used to display a specified number of additional log records after the previous **rtrv-log** entry at the terminal. New records that are logged after the previous **rtrv-log**

command was entered will not be displayed when the **rtrv-log:next=** command is entered. The **next** parameter is valid only under the following conditions:

- The **rtrv-log:next=** command is entered at the same terminal from which the previous **rtrv-log** command was entered. The previous **rtrv-log** command must not include the **type=all** parameter.
- No other terminal has issued a **rtrv-log** command after the **rtrv-log** command entered at the terminal from which the **rtrv-log:next=** command is entered.
- The **next** parameter is the only parameter specified in the **rtrv-log** command.
- There are still logs present that match the conditions (except **time/date/num**) specified in the previous **rtrv-log** command.

When either a single **snum** or range of **snum/enum** is specified, only those Alarms or UIMs within the specified range are displayed.

When **snum** is specified and **enum** is not specified, the **enum** value defaults to the specified **snum** value.

When **enum** is specified, an **snum** value must be specified that is less than or equal to the specified **enum** value.

If an **snum** is specified within the range **1-999**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1-999**.

If an **snum** is specified within the range **1000-1499**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1000-1499**.

When **enum** is not specified and the specified **snum** Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the **snum** value is out of range.

If **snum** and **enum** are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

## Output

In the following example, the sequence numbers that are replaced by the dashes (---) represent the UIMs that were discarded due to the UIM thresholding feature.

## rtrv-ls

## Retrieve Linkset

Use this command to show the linkset information.

**Keyword:** rtrv-ls

**Related Commands:** chg-ls, dlt-ls, rtrv-ls

**Command Class:** Database Administration

### Parameters

**:itutfr=** (optional)

ITU TFR (Transfer Restricted) procedure indicator. Display only the linksets that have the specified value of the **itutfr** parameter. This parameter is valid for ITU national linksets only.

**Range:** on, off

**Default:** Display all link sets

**:lsn=** (optional)

Linkset name

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all link sets

**:mtprese=** (optional)

ANSI or ITU MTP Restart equipped. This parameter indicates whether the node adjacent to the linkset is equipped with MTP Restart.

**Range:** yes, no

**yes**—equipped

**no**—not equipped

**Default:** Display all link sets

**:slsocbit=** (optional)

Other CIC (Circuit Identification Code) Bit. Display all the linksets that have the **slsocbit** parameter set to a value from **5** to **16**.

**Range:** \*

\*—Specifies all possible values ( 5-16 )

**Default:** Display all link sets

**:slrsrb=** (optional)

Rotated SLS (Signaling Link Selection) Bit. Display only the linksets with the specified rotated bit.

**Range:** **1-4**

**Default:** Display all link sets

## Example

Display the attributes of all link sets:

**rtrv-ls**

Retrieve link set ls1:

**rtrv-ls:lsn=ls1**

Retrieve all link sets with the mtrprse parameter set to yes:

**rtrv-ls:mtrprse=yes**

Retrieve all link sets that use the slsocbit parameter with a value from 5 to 16:

**rtrv-ls:slsocbit=\***

Display a specified ITU linkset to view the settings for the slrsrb or slsocbit parameters:

**rtrv-ls:lsn=lsitu**

Retrieve all ITU national linksets that have the itutfr parameter set to on:

**rtrv-ls:itutfr=on**

Retrieve the specified ITU national linkset and display its setting for the itutfr parameter:

**rtrv-ls:lsn=lsitun**

## Dependencies

The specified linkset must be in the database.

The **mtrprse** parameter cannot be specified with the **slsocbit** or **slrsrb** parameter.

If the **lsn** parameter or the **itutfr** parameter is specified, the linkset name must be an ITU national linkset.

If the **lsn** parameter is specified, all other optional parameters are ignored. If the **lsn** parameter is not specified, only 1 optional parameter can be specified per command except for the combination of the **slsocbit** and **slrsrb** parameters.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The CLLI, TFATCABMLQ, MTPRSE, and ASL8 fields are displayed only when a specific linkset is specified. The SLSOCBIT and SLSRSB fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the **tfatcabmlq** parameter database value is **0** for a linkset, the value displayed is one-half the number of links assigned to the given linkset (or **1** if there are 3 or fewer links in the linkset).

When the **tfatcabmlq** parameter database value is **0**, the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be either a minimum of **1** for linksets containing 3 or fewer links, or half of the number of links configured in the linkset for linksets containing more than 3 links. The calculated value is displayed in the **rtrv-ls** command output.

When the **tfatcabmlq** parameter value is set to a specific value greater than **0**, the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the **rtrv-ls** command output.

The EAGLE 5 ISS **ent-ls** command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE 5 ISS command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS **vfy-ls** command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS **vfy-ls** output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

The following example displays the attributes of all linksets.

### rtrv-ls

```
tekelecstp 04-09-05 01:33:29 EST EAGLE 31.9.0

;

**Legend**

**LSN**—The name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the **apentype=ituchina** parameter specified.

**APC/APCI/APCN/APCN24**—The adjacent DPC of the linkset.

**SCRN**—The screen set assigned to the linkset.

**L3TSET**—The level 3 timer set value assigned to the linkset.

**SLTSET**—The SLTM record associated with the linkset.

**BEI**—The broadcast exception indicator. This field indicates whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.

**LST**—The type of links in the linkset (access links, bridge links, etc.).

**LNKS**—The number of links in the linkset.

**GWSA**—Shows whether gateway screening is used on the specified linkset.

**GWSM**—Shows whether the display of messages generated for each screened message is turned on or off.

**GWSD**—Shows whether the gateway screening message discard function is turned on or off.

**SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset.

**NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset.

**CLLI**—The far end Common Language Location Identifier (CLLI).

**TFATCABMLQ**—Displays the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted.

**MTPRSE**—Shows whether the adjacent node is equipped with MTP restart.

**ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs.

**MULTGC**—Shows whether multiple group codes are allowed.

**IPGWAPC**—Shows whether the adjacent point code is an IP Gateway adjacent point code.

**MATELSN**—The name of the mate IP Gateway linkset.

**IPTPS**—Provisioned or default TPS for the specific IPGWx linkset. This value is a user-defined or default portion of the total enabled system IP Signaling TPS.

**LSUSEALM**—The percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

**SLKUSEALM**—The percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

**LOC**—The location of the card containing the signaling links that make up the linkset.

**PORT**—The port on the card containing the signaling link.

**SLSOCBIT**—The setting of the Other CIC (Circuit Identification Code) Bit.

**SLRSRB**—The setting of the Rotated SLS (Signaling Link Selection) Bit.

**GMSMCRN**—Shows whether the GSM MAP screening indicator is turned on or off.

**ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off.

**L2TSET**—The level 2 timer set value associated with the signaling link.

**SLC**—The signaling link code of the signaling link.

**TYPE**—The type of card.

**BPS**—The transmission rate for the link in bits per second.

**L1MODE**—The mode of operation used to select the link clocking source at layer 1.

**TSET**—An indicator of whether the transmitter signal element timing is on or off.

**E1PORT**—The E1 port with the E1 interface that services the link.

**E1LOC**—The card location of the E1 card with the E1 interface that services the link.

**T1PORT**—The T1 port with the T1 interface that services the link.

**T1LOC**—The card location of the T1 card with the T1 interface that services the link.

**TS**—The timeslot assigned to the link that is serviced by the E1 or T1 interface.

**E1ATMCRC4**—The indicator of whether CRC4 multi-frame structure is enabled or disabled.

**E1ATMSI**—Value of two Spare International bits of NFAS data.

**E1ATMSN**—Value of five Spare National bits of NFAS data.

## rtrv-m2pa-tset

## Retrieve M2PA Timer Set

Use this command to retrieve either one M2PA timer set or all M2PA timer sets

**Keyword:** rtrv-m2pa-tset

**Related Commands:** chg-m2pa-tset

**Command Class:** Database Administration

### Parameters

**:tset=** (optional)

The name of the M2PA timer set to be retrieved.

**Range:** 1-20

**:ver=** (optional)

The M2PA version supported by the association.

**Range:** d6, rfc

### Example

rtrv-m2pa-tset

rtrv-m2pa-tset:tset=1

### Dependencies

None

### Notes

If a timer set is not specified in the command, all timer sets are retrieved.

### Output

**rtrv-m2pa-tset:tset=1:ver=d6**

## rtrv-map

## Retrieve Mate Applications

Use this command to show the mated application relationship information maintained by the system. This information is used to support the routing of SCCP management SSP/SSA messages.

**Keyword:** rtrv-map

**Related Commands:** chg-map, dlt-map, ent-map

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mapset=** (optional)

The MAP set ID.

**Range:** 1-36000 dflt  
dflt—Default MAP set

**Default:** **dflt** - The default value of the **mapset** parameter is **dflt** only when the Flexible GTT Load Sharing feature is not enabled.

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code in the form of *zone-area-id*.

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc—aa-zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000–255*ssa*—000–255*sp*—000–255

:ssn= (optional)

Subsystem number

**Range:** 2-255**Default:** All subsystem numbers and their mates are shown for the given point code.**Example****rtrv-map:pc=10-10-10:ssn=10****rtrv-map:pcn=12345:ssn=5****rtrv-map:pc=10-10-10:ssn=10****rtrv-map:pcn=12345:ssn=5****rtrv-map:pcn24=12-12-12****rtrv-map****rtrv-map:mapset=dflt****rtrv-map:pc=1-1-3****rtrv-map:pc=1-1-3:ssn=10****rtrv-map:pc=1-1-1:ssn=10:mapset=362****rtrv-map:pc=1-1-2:ssn=10:mapset=dflt****rtrv-map:mapset=2****rtrv-map:pc=1-1-3:mapset=12****Dependencies**

The value of the **pc/pca/pci/pcn/pcn24** parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See the **canc-cmd** command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

When the Flexible GTT Load Sharing feature is enabled, MAP Load Sharing sets are supported. Each set is identified by a MAPSET field.

When the Flexible GTT Load Sharing feature is not enabled, the MAP set is not displayed and the display remains unchanged.

## Output

All subsystem numbers for the specified point code and its mates are shown.

If no parameters are entered, all defined remote point codes (up to 1024) are shown.

### rtrv-map

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
MAP TABLE IS 1 % FULL (1 of 3000)

PCA          SSN  RC  MPCA          MSSN  MATERC  SRM  MRC  GRP NAME
001-001-001    5  10
;

```

For the PCN, the **chg-stpopts** command **npcfmti** parameter is set to a one-part format.

### rtrv-map

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
MAP TABLE IS 1 % FULL (1 of 3000)

PCN          SSN  RC  MPCN          MSSN  MATERC  SRM  MRC  GRP NAME
12345        5   10  12347          5    20
;

```

In the following example, the ITUDUPPC (ITU National Duplicate Point Code) feature is on and the Flexible ITU Nnational Point Code STP option is enabled.

### rtrv-map

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
MAP TABLE IS 1 % FULL (2 of 3000)

PCI          SSN  RC  MPCI          MSSN  MATERC  SRM  MRC  GRP NAME

**Legend**

**PC/PCA/PCI/PCN/PCN24**—This field identifies the point code of the SCP where the primary application resides.

**SSN**—This field identifies the applications subsystem number.

**RC**—This field identifies the relative cost of the point code/subsystem.

**MPC**—This field identifies the point code of the SCP where the mate application resides.

**MSSN**—This field identifies the mate applications subsystem number.

**MATERC**—This field identifies the mate relative cost.

**SRM**—This field specifies whether subsystem routing messages are transmitted.

**MRC**—This field specifies whether message routing under congestion is on or off.

**GRP NAME**—This field identifies the name of a group of point codes (the broadcast list group name) that should be notified of the subsystem status.

**SSO**—Subsystem Status Option. Indicates the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries.

**MAPSET**—MAP set

**rtrv-meas-sched****Retrieve Measurements Schedule**

Use this command to retrieve the current scheduled measurement report(s) and collection settings.

**Keyword:** rtrv-meas-sched

**Related Commands:** chg-meas, rept-meas

**Command Class:** Link Maintenance

**Parameters**

This command has no parameters.

**Example**

**rtrv-meas-sched**

**Dependencies**

None

**Notes**

None

**Output**

Output with measurement collection on.

**rtrv-meas-sched**

```
rlghncxa03w 04-02-27 07:19:51 EST EAGLE 31.3.0
COLLECT                = on
GTWYLSFLTR             = both
-----
SYSTOT-STP             = on
SYSTOT-TT              = off
SYSTOT-STPLAN          = off
COMP-LNKSET            = on
COMP-LINK              = on
```

```

GTWY-STP      = on
GTWY-LNKSET   = on
MTCD-STP      = on
MTCD-LINK     = on
MTCD-STPLAN   = on
MTCD-LNKSET   = on
;

```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

#### rtrv-meas-sched

```

#### Legend

**COLLECT**—Shows whether measurement collection is on or off.

**GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:

**both**—Only gateway linksets are included in the report to the terminal and SEAS.

**stp**—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.

**seas**—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.

**none**—All defined linksets are included in the report to the terminal and SEAS.

**SYSTOT-STP**—System total–STP measurement collection is on or off.

**SYSTOT-TT**—System total–translation type measurement collection is on or off.

**SYSTOT-STPLAN**—System total–STP LAN measurement collection is on or off.

**COMP-LNKSET**—Component–linkset measurement collection is on or off.

**COMP-LINK**—Component–link measurement collection is on or off.

**GTWY-STP**—Gateway administration–STP measurement report is on or off.

**GTWY-LNKSET**—Gateway administration–LNKSET measurement report is on or off.

**MTCD-STP**—Maintenance daily–STP measurement collection is on or off.

**MTCD-LINK**—Maintenance daily–link measurement collection is on or off.

**MTCD-STPLAN**—Maintenance daily–STP LAN measurement collection is on or off.

**MTCD-LNKSET**—Maintenance daily–LNKSET measurement report is on or off.

Refer to the *Maintenance Manual* for specific details on measurement reports.

**rtrv-measopts****Retrieve Measurement Options**

Use this command for the following functions:

- Show the enabled/disabled status of all FTP scheduled measurements reports
- Verify that the Measurements Platform has been enabled (PLATFORMENABLE setting)
- Verify that the 15 Minute Measurements collection option has been turned on (COLLECT15MIN setting)
- Verify that the CLLI-based report file name option is turned on or off (CLLIBASEDNAME setting)

**Keyword:** rtrv-measopts

**Related Commands:** chg-measopts

**Command Class:** Link Maintenance

**Parameters**

This command has no parameters.

**Example**

**rtrv-measopts**

**Dependencies**

The Measurements Platform feature must be on before this command can be entered.

This command cannot be entered while in upgrade mode.

**Notes**

None

**Output**

### ***Legend***

**PLATFORMENABLE**—Indicator that measurements collection is enabled or disabled when the Measurements Platform feature is turned on. See the **chg-measopts** command.

**COLLECT15MIN**—Indicator that 15 Minute Measurements collection is enabled or disabled when the 15 Minute Measurements feature is turned on. See the **chg-measopts** command **collect15min** parameter.

**CLLIBASEDNAME**—Indicator that the CLI-based file name option is turned on or off.

**SYSTOTSTP**—System Total measurements report for the entire STP.

**SYSTOTTT**—System Total report for Translation Type measurements.

**SYSTOTSTPLAN**—System Total report STP LAN measurements.

**COMPLINK**—Component measurements report for a single link.

**COMPLNKSET**—Component measurements report for a link set.

**GTWYORIGNI**—Gateway Administration measurements report per originating network (large network uniquely identified by NI only).

**GTWYORIGNINC**—Gateway Administration measurements report per originating network (small network identified by NI-NC).

**GTWYLSORIGNI**—Gateway Administration measurements report per link set and originating network.

**GTWYLSDESTNI**—Gateway Administration measurements report per link set and destination network.

**GTWYLSONISMT**—Gateway Administration measurements report per link set, per originating network, per ISUP message type.

**MTCHEIR**—Maintenance Hourly (marginal) measurements report for Equipment Identity Register

**MTCHNP**—Maintenance Hourly (marginal) measurements report for INP or G-Port.

**MTCHLNP**—Maintenance Hourly (marginal) measurements report for LNP.

**MTCHMAP**—Maintenance Hourly (marginal) measurements report for GSM Map Screening.

**MTCDEIR**—Maintenance Daily measurements report for Equipment Identity Register

**MTCNSTP**—Maintenance Daily measurements report for STP.

**MTCNLNK**—Maintenance Daily measurements report for links.

**MTCNLNKSET**—Maintenance Daily measurements report for linksets.

**MTCNSTPLAN**—Maintenance Daily measurements report for STPLAN.

**MTCDLNP**—Maintenance Daily measurements report for LNP.

**MTCDNP**—Maintenance Daily measurements report for INP or G-Port.

**MTCDMAP**—Maintenance Daily measurements report for GSM Map Screening.

**NMLINK**—Network Management measurements report for a single link.

**NMLNKSET**—Network Management measurements report for a link set.

**NMSTP**—Network Management measurements report for the entire STP.

**AVLINK**—Hourly Availability report for a single link.

**AVLSTPLAN**—Hourly Availability report for STP LAN.

**AVLDLINK**—Daily Availability report for a single link.

## rtrv-mem

## Retrieve Allocated Memory

Use this command to display the objects in the EAGLE 5 ISS database.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed using the ELAP user interface to View RTDB Status.**

**Keyword:** rtrv-mem

**Related Commands:** alloc-mem

**Command Class:** System Maintenance

### Parameters

**:obj=** (mandatory)

The type of database object to create.

**Range:** lnp4digit, all

**Default:** all

### Example

rtrv-mem:obj=lnp4digit

### Dependencies

The LNP feature must be on (see the **enable-ctrl-feat** command) before the **rtrv-mem** command can be executed.

### Notes

None

### Output

```
rtrv-mem
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
LNP 4DIGIT OBJECT %FULL
-----
LNP_4DIG.TBL          100
LNP4DIG1.TBL          100
LNP4DIG2.TBL          100
LNP4DIG3.TBL          100
LNP4DIG4.TBL          100
LNP4DIG5.TBL           50

LNP 4DIGIT database is (11000000 of 12000000) 92% full
```

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
Memory retrieval complete.
;
```

### Legend

**LNP 4DIGIT OBJECT**—The name of each LNP 4DIGIT database object

**%FULL**—The capacity of each LNP 4DIGIT database object expressed as a percentage of the maximum number of ported telephone numbers each LNP 4DIGIT database object can contain.

## rtrv-mrn

## Retrieve Mated Relay Node

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE 5 ISS. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing Feature and the Flexible GTT Load-Sharing feature are enabled, use this command to retrieve MRN set information.

**Keyword:** rtrv-mrn

**Related Commands:** chg-mrn, dlt-mrn, ent-mrn

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mrnset=** (optional)

The MRN set ID.

**Range:** 1-3000 dflt

dflt—Default MRN set

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** pca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Post-GTT-translated point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

## Example

The following example retrieves the stored information for all point code groups in the MRN table.

**rtrv-mrn**

The following example retrieves the stored information for the point code group that contains the specified point code.

**rtrv-mrn:pc=1-1-2**

**rtrv-mrn:pci=s-2-2-1**

**rtrv-mrn:pcn=s-1-1-1-123-aa**

**rtrv-mrn**

**rtrv-mrn:mrnset=dflt**

**rtrv-mrn:pc=1-1-3:mrnset=dflt**

**rtrv-mrn:pc=1-1-3:mrnset=111**

## Dependencies

A point code that is specified in the command must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled. If the Flexible GTT Load-Sharing feature is ON, then the PC and MRN set must be specified together. The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

In the following example, the MRN table limit is 3000 entries; 768 entries are used as Mated Relay Nodes and 12 entries are used for SCCP-SERV reroute.

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service. Note for this example only a few of the 768 entries are reported to conserve space.

**rtrv-oap-config**

**Dependencies**

The Local Number Portability feature or the SEAS feature must be on (an LNP ported TNs quantity of up to 12000000 in the **rtrv-ctrl-feat** command output or **seas=on** in the **rtrv-feat** command output) before the **rtrv-oap-config** command can be entered.

**Notes**

None

## Output

The output of the **rtrv-oap-config** command displays different fields depending on whether the SEAS feature is on, the LNP feature is on, or both features are on as shown in the following output examples.

In the following example, the SEAS feature is on.

### **rtrv-oap-config**

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0

;
```

### **Legend**

**HOSTNAME**—Host name of OAP A or OAP B.

**IP ADDRESS**—IP address of OAP A or OAP B.

**IP NETMASK**—The netmask for OAP A or OAP B.

**DEFAULT ROUTER**—The IP address of the default router assigned to OAP A or OAP B.

**CONFIG**—The number of OAPs configured (single or dual).

**SEAC CLLI**—The common language location identifier (CLLI) of the SEAC to which the OAP connects.

**X25 PACKET SIZE**—The X.25 package size for the link to the SEAC (7 or 8).

**X25 MODE**—The mode of the X.25 link to the SEAC (DTE or DTC).

**ACTIVE LSMS**—The LSMS associated with the OAP (main or shadow).

**MAIN LSMS NSAP**—The network service access point of the main LSMS.

**MAIN LSMS SSEL**—The session selector of the main LSMS.

**MAIN LSMS PSEL**—The presentation selector of the main LSMS.

**SHADOW LSMS NSAP**—The network service access point of the shadow LSMS.

**SHADOW LSMS SSEL**—The session selector of the shadow LSMS.

**SHADOW LSMS PSEL**—The presentation selector of the shadow LSMS.

## rtrv-obit

## Retrieve Obituary Report

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

**Keyword:** **rtrv-obit**

**Related Commands:** act-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-trbl

**Command Class:** System Maintenance

### Parameters

**:loc=** (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

**Range:** 1113, 1115

**:mode=** (optional)

Display mode

**Range:** c, m

**c**—Continuous mode; shows obituaries already logged and new obituaries as they occur.

**m**—Manual mode; shows obituaries on demand only, when this command is entered.

**Default:** c

**:num=** (optional)

This parameter indicates how many obituaries to display.

**Range:** 1-150

**Default:** 150

### Example

**rtrv-obit:loc=1115:num=2**

### Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

Only one **rtrv-obit** or **rtrv-trbl** command at a time can be in progress throughout the entire system.

The card location specified by the **loc** parameter must be either **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command when the command is entered for the active OAM. See **canc-cmd** for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the **mode=m** parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which include HIPR and HC MIM cards) contains significantly more information than an obituary from an x86-based processor card. The data in an IXP obituary will be spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

## Output

The following example shows output for two obituaries from an x86-based card.

**rtrv-obit:loc=1115:num=2**

```

## rtrv-prefix

## Retrieve Prefix

Use this command to retrieve provisioned prefix information for all supported features or for a specified feature.

**Keyword:** rtrv-prefix

**Related Commands:** `chg-prefix`, `dlt-prefix`, `rtrv-ctrl-feat`

**Command Class:** Database Administration

## Parameters

**:feature=** (optional)

**Feature Name.** This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtv-ctrl-feat** command output.

**Range:** *abcdefghijklmnopqrstuvwxyz*

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with “GSM MAP.” Enough additional characters to identify which GSM MAP feature is being entered (at least “GSM MAP SR” to identify the “GSM MAP SRI Redirect” feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

### Example

Retrieve provisioned prefix information for all supported features.

#### **rtrv-prefix**

Retrieve prefix information for the GSM MAP SRI Redirect feature.

**rtrv-prefix:feature="GSM MAP SRI Redirect"**

### Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output; The specified feature must be one of the following features that are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP
- Prepaid IDP Query Relay

### Notes

None

### Output

For all features, retrieve the provisioned prefix information. There is additional information displayed in the function column for prefix numbers 6 and 7 of the “ISUP NP with EPAP” feature and for all prefix numbers for the “Prepaid IDP Query Relay” feature.

#### **rtrv-prefix**

rlghncxa03w 04-09-20 09:04:14 EST EAGLE 34.1.0

| Feature                 | NUM | Prefix | Function               |
|-------------------------|-----|--------|------------------------|
| GSM MAP SRI Redirect    | 1   | 1a1a   |                        |

**rtrv-pstn-pres****Retrieve PSTN Presentation Parameters**

Use this command to display PSTN Presentation parameters supported by the IP<sup>7</sup> Secure Gateway. This command provides a summary of the available values for the PSTNCAT and PSTNID parameters used in SS7 routing key commands and ISUP Normalization Administration commands.

**Keyword:** rtrv-pstn-pres**Related Commands:** chg-appl-rtkey, chg-isupvar-attrib, chg-pstn-pres, dlt-pstn-pres, ent-pstn-pres, rtrv-appl-rtkey**Command Class:** Database Administration**Parameters**

This command has no parameters.

**Example****rtrv-pstn-pres****Dependencies**

The ISUP Normalization controlled feature must be enabled.

**Notes**

All the *Tekelec-defined* and *user-defined* PSTNs will be displayed.

An asterisk (\*) will be displayed next to the PSTN Category for the following reasons:

- The ETSIV3 Variant before it has its controlled feature enabled
- Variants that are no longer useable. These are Variants that are disabled because their temporary feature key expired. The user should either get a permanent feature key for the Variant or use the **dlt-pstn-pres** command to remove the Variant.

**Output****rtrv-pstn-pres**

Point code subtype prefixes—

**s-** Spare point code**p-** Private point code**ps-** Private and spare point code**rtrv-rte****Retrieve Route**

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the Notes section for this command for details.

**Keyword:** rtrv-rte**Related Commands:** dlt-rte, ent-rte, rept-stat-dstn**Command Class:** Database Administration**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:clli=** (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:** aaaaaaaaaa

1 alphabetic character followed by 10 alphanumeric characters

**Default:** No value given**:dpc=** (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca**Range:** p-, 000-255, \*, \*\*, \*\*\*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = 006-255.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or **\*-\*-\*** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (optional)

Linkset name

**Range:** **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

**Range:**     **none, s, p, ps**

**none**—Display all point codes that do not have subtype prefixes

**s**—Display only spare point codes

**p**—Display only private point codes

**ps**—Display only private and spare point codes

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:**     **ansi, itui, itun, itun24**

### Example

```

rtrv-rte
rtrv-rte:lsn=ls000001

rtrv-rte:dpc=1-1-***
rtrv-rte:dpc=1-**-*
rtrv-rte:dpc=1-***-*
rtrv-rte:dpc=1-**-*:lsn=ab64
rtrv-rte:dpc=1-**-*:lsn=xx64
rtrv-rte:dpcn=1000-*
rtrv-rte:dpcn=1000-*:lsn=dpcn64
rtrv-rte:dpcn=p-*-aa
rtrv-rte:dpcn=s-9000-*

```

### Dependencies

The DPC must be in the destination point code table.

If the **dpc** and **lsn** parameters are specified, the linkset name must be defined as a route.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts** command **npcfmti** parameter.

The **pctest** parameter value **s** or **ps** cannot be specified when the **pctype** parameter value **ansi** or **itun24** is specified.

The **pctype** and **pctest** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters.

Network routing is valid only if the NRT feature is on. The NRT feature is turned on with the **chg-feat** command.

When using network routing, if the destination point code has a value of \* in the NC field, the NCM field must also be \* (for example, **dpc=21-\*-\***).

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

### *Asterisks in ANSI Point Codes*

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-\*\*\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

### *Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes*

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-ab** is valid; **\*-15-\*-\*-ab** is not valid).

## Output

In the **rtrv-rte** command output examples, the point code prefixes **s-**, **p-**, and **ps-** indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

**rtrv-rte**

**Legend**

**DPC, DPCA, DPCI, DPCN, DPCN24**—The destination point code to be reached through this route.

**ALIAS, ALIASA, ALIASI, ALIASN/N24**—The alias associated with the route.

**CLLI**—The CLI associated with the route.

**LSN**—The name of the linkset assigned to this route.

**RC**—The relative cost (priority) assigned to the route.

**APC, APCA, APCI, APCN, APCN24**—The point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

**rtrv-rtx****Retrieve Exception Route**

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the **cic** and **ecic** parameters are displayed.

**Keyword:** rtrv-rtx

**Related Commands:** dlt-rtx, ent-rtx

**Command Class:** Database Administration

**Parameters**

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:class=** (optional)

Exception routing class. This parameter causes all exception route sets provisioned for the specified class to be displayed.

**Range:** opc, ilsn, cic, si

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpci=** (optional)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** **0-16383**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:lsn=** (optional)

Link Set Name. The linkset associated with the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-**\*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:open=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—s-, p-, ps-

*nnnnn*—0-16383, \*

*gc*—aa-zz, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:open24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** **3-15**

### Example

**rtrv-rtx:dpc=1-1-1**

**rtrv-rtx:opca=6-\*. \***

**rtrv-rtx:ilsn=lset4**

**rtrv-rtx:si=5**

**rtrv-rtx:cic=0:ecic=16383**

### Dependencies

Only one of the **opc**, **ilsn**, **cic**, **si**, or **class** parameters can be specified.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

## Notes

\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network (*ni*).

\*\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca/opc/opca** to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*), and the network cluster address (if any).

\*\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

\* is allowed only for retrieves (for example, **rtrv-rtx:dpcn=\*-aa** or **rtrv-rtx:opc=\*-xy**) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on. \*\* and \*\*\* is not allowed for ITU-N DPCs and OPCs (for example, **dpcn=\*-xy** is rejected). The node and group code cannot both be \* (**dpcn=\*-\*** is rejected).

## Output

Retrieve all provisioned exception routes.

### rtrv-rtx

**rtrv-sccp-serv****Retrieve SCCP Service**

Use this command to display the SCCP Service application relationship information maintained by the EAGLE 5 ISS.

**Keyword:** rtrv-sccp-serv

**Related Commands:** chg-sccp-serv, dlt-sccp-serv

**Command Class:** Basic

**Parameters**

**:serv=** (optional)

Name of the service to be retrieved.

**Range:** gflex, gport

**Dependencies**

The feature associated with the **serv** parameter must be enabled and turned on.

**Notes**

Point codes are grouped by service in the output.

**Output**

The following example displays output when no supporting features are turned on and the SCCP Service table is empty:

**rtrv-sccp-serv**

```
tekelecstp 05-12-20 08:28:48 EST EAGLE 34.3.0
No Entries Found.
```

```
;
```

The following example displays output when the G-Port feature is turned on and the SCCP Service table is empty:

**rtrv-sccp-serv**

```
tekelecstp 05-12-20 08:31:24 EST EAGLE 34.3.0
```

```

## rtrv-sccpopts

## Retrieve SCCP Options

Use this command to display the current value of one or more of the SCCP option indicators maintained in the STP options table.

**Keyword:** **rtrv-sccpopts**

**Related Commands:** **chg-sccpopts**

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

```

rtrv-sccpopts

```

### Dependencies

None

### Notes

The **dfltcgpcasn** and **dfltcgpcisn** parameters display only when the Origin-based SCCP Routing feature is enabled.

### Output

The MORBSCCPOPC option is displayed only if the Origin-based MTP Routing feature is enabled and turned on.

## rtrv-scr-aftpc

## Retrieve Allowed Affected Point Code

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

**Keyword:** **rtrv-scr-aftpc**

**Related Commands:** **chg-scr-aftpc**, **dlt-scr-aftpc**, **ent-scr-aftpc**

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all AFTPC screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255** \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0-7** \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255** \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255** \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255 \***

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:** **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **stop**

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none, s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:sr=** (optional)

The AFTPC screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **1-255**

**Default:** Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0–7.

**Range:** 0-7, \*

### Example

**rtrv-scr-aftpc**

**rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012**

**rtrv-scr-aftpc:sr=iec**

**rtrv-scr-aftpc:all=yes**

**rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy**

**rtrv-scr-aftpc:sr=aft1**

**rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s**

### Dependencies

If the **nsfi** parameter is specified, the parameter value must be **stop**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **nc=\*** is specified, **ncm=\*** must be specified. If **ni=\*** is specified, **nc=\*** and **nc=\*** must be specified. If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **npc**, **nsfi**, and **nsr** parameters must already exist in the AFTPC entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If no parameters are specified, a list of allowed AFTP references is produced indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every allowed AFTP screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED AFTPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI-NC-NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by *ni-nc-ncm*.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR—up to four characters) or action to be taken (ACT—up to six characters), if the message passes this screen.

**rtrv-scr-blkdpc****Retrieve Blocked DPC**

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

**Keyword:** **rtrv-scr-blkdpc**

**Related Commands:** **chg-scr-blkdpc, dlt-scr-blkdpc, ent-scr-blkdpc**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all blocked DPC screening references.

**Range:** **yes, no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255** \*, C

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7, \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **000-255 \*, C**

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \*, C**

**Default:**    Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \***

**Default:**    Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**      **0-255 \*, C**

**Default:**    Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:**      **00000-16383 \*, C**

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**      **cgpa, destfld, fail, isup, stop**

**cgpa**—Allowed calling party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**fail**—The received message should be discarded.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**    Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if

**nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none**, **s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*, **C**

**:sr=** (optional)

The BLKDPC screening reference name

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255** \*, **C**

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*, **C**

### Example

**rtrv-scr-blkdpc**

**rtrv-scr-blkdpc:sr=iec:ni=240:nc=001:ncm=010&&018:nsfi=stop:actname=rdct**

**rtrv-scr-blkdpc:sr=iec**

**rtrv-scr-blkdpc:all=yes**

**rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s**

### Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

If **ni=c** is specified, either the character **c** must also be specified for the **nc** and **ncm** parameters or the **nc** and **ncm** parameters must not be specified. If the **nc** and **ncm** parameters are not specified when **ni=c** is specified, the **nc** and **ncm** values default to the character **c** in the database.

If **zone=c** is specified, either the character **c** must also be specified for the **area** and **id** parameters or the **area** and **id** parameters must not be specified. If the **area** and **id** parameters are not specified when **ni=c** is specified, the **area** and **id** values default to the character **c** in the database.

If **msa=c** is specified, either the character **c** must also be specified for the **ssa** and **sp** parameters or the **ssa** and **sp** parameters must not be specified. If the **ssa** and **sp** parameters are not specified when **ni=c** is specified, the **ssa** and **sp** values default to the character **c** in the database.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **nc=\*** is specified, **ncm=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

The **nsr** parameter cannot be specified if the specified **nsfi** parameter is **stop** or **fail**.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The **actname** parameter can be specified only when the **nsfi** parameter value is **stop**.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If specified, the **sr** must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **id** or **sp** parameter must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **nc** parameter must already exist in the database

Any specified **ncm** parameter must already exist in the database

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database

Any specified **nsr** parameter must already exist in the database

Any specified **nsfi** parameter must already exist in the database

Any specified **npc** parameter must already exist in the database

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database

## Notes

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code has the value **c-c-c**.

If the character **c** is specified for any subfield of a three-subfield point code, all three subfields must have the value **c**. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

In all cases, if **c** for "continue" is entered for the first subfield in the point code, the other subfields default to **c** in the database.

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Output

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = BLOCKED DPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-blkopc****Retrieve Blocked OPC**

Use this command to show the blocked originating point code (BLKOPC) screening references in the BLKOPC entity set.

**Keyword:** **rtrv-scr-blkopc**

**Related Commands:** **chg-scr-blkopc, dlt-scr-blkopc, ent-scr-blkopc**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy, none*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all blocked OPC screening references.

**Range:**     **yes, no**

**Default:**   **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**     **000-255 \*, C**

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**     **0-7, \*, C**

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**     **000-255 \*, C**

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \*, C**

**Default:**   Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \*, C**

**Default:**   Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \*, C**

**Default:**   Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:**     **00000-16383 \*, C**

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**     **cgpa, stop, fail, sio, dpc, blkdp**

**cgpa**—Allowed calling party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**fail**—The received message should be discarded.

**sio**—Allowed SIO is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**blkdpc**—Blocked DPC is the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none**, **s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*, **C**

**:sr=** (optional)

The BLKOPC screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255** \*, **C**

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*, **C**

## Example

**rtrv-scr-blkopc**

**rtrv-scr-blkopc:sr=ieci:ni=240:nc=001:ncm=010&&018:actname=copy**

**rtrv-scr-blkopc:sr=ieci**

**rtrv-scr-blkopc:all=yes**

**rtrv-scr-blkopc:sr=bop1:npc=128:nsfi=fail**

**rtrv-scr-blkopc:sr=bop1:zone=2:area=2:id=3:nsfi=fail:pcst=s**

## Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **nep**, **nsfi**, and **nsr** parameters must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If **area=\*** is specified, **id=\*** must be specified. If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the specified **nsfi** parameter is **stop** or **fail**.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the character **c** is specified for any subfield of a three-subfield point code, all three subfields must have the value **c**. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

- If **ni=c** is specified, **nc** and **ncm** values must either be **c** or not entered.
- If **zone=c** is specified, **area** and **id** values must either be **c** or not entered.
- If **msa=c** is specified, **ssa** and **sp** must either be **c** or not entered.

In all cases, if **c** for "continue" is entered for the first subfield in the point code, the other subfields default to **c** in the database.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **nc=\*** is specified, **ncm=\*** must be specified. If **ni=\*** is specified, **nc=\*** and **ncm=\*** must be specified.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of blocked OPC references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked OPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

For point codes with three subfields, the value **c** (continue) is used as a place holder. In the event the point code is not found in this screen set, the continue value points to the **nsfi** and **nsr** to be applied next.

The character **c** is used in the blocked OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked OPC screens. When screening for a blocked OPC and the point code being screened does not match any of the point codes in the blocked OPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code **c-c-c**.

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkopc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = BLOCKED OPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-cdpa

### Retrieve Allowed Called Party Address

Use this command to show the allowed called party address (CDPA) screening references in the CDPA entity set.

**Keyword:** rtrv-scr-cdpa

**Related Commands:** chg-scr-cdpa, dlt-scr-cdpa, ent-scr-cdpa

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed CDPA screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255** \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255** \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** **0-255** \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000-16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:** 00000-16383 \*

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** aftpc, stop

**aftpc**—Allowed affected point code is the next screening category

**stop**—The gateway screening process ends and the message proceeds through normal routing

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:scmgfid=** (optional)

The SCCP management (SCMG) format ID, which consists of a 1-octet field and uniquely defines the function and format of each SCMG message. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **1-255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS

**Range:** 1-255 \*

**Default:** All SCMG format IDs are shown.

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:sr=** (optional)

Displays all allowed CDPA screening references.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:** 1-255

**Default:** Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0–7.

**Range:** 0-7, \*

### Example

**rtrv-scr-cdpa**

**rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ncm=010:ssn=001**

**rtrv-scr-cdpa:sr=iec:ni=240:nc=001:ssn=002&&005**

**rtrv-scr-cdpa:sr=iec**

**rtrv-scr-cdpa:sr=iec:actname=copy**

**rtrv-scr-cdpa:sr=cdp1:zone=1:area=2:id=3:ssn=1:nsfi=stop:scmgfid=1:pcst=s**

**rtrv-scr-cdpa:sr=cdp1**

### Dependencies

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified when **nsfi=stop**.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area** is specified or respecified as an asterisk, **id** must also be an asterisk. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **nep**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

The specified screening reference (**sr**) must be in the allowed CDPA entity set.

## Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cdpa:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED CDPA**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by the **ni-nc-ncm**.

**SCMGFID**—The SCMGFID format ID.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-cgpa****Retrieve Allowed Calling Party Address**

Use this command to show the allowed calling party address (CGPA) screening references in the CGPA entity set.

**Keyword:** **rtrv-scr-cgpa**

**Related Commands:** **chg-scr-cgpa, dlt-scr-cgpa, ent-scr-cgpa**

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed CGPA screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0–7** \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:** 00000-16383 \*

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cdpa, stop, tt

**cdpa**—Allowed called party address point code is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**tt**—Allowed translation type point code is the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:ri=** (optional)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

**Range:** gt, dpc, \*

**gt**—Allow a called party address with a routing indicator value of "global title."

**dpc**—Allow a called party address with a routing indicator value of "DPC/SSN."

**\***—Allow both routing indicator values.

**Default:** Display all

**:sccpmt=** (optional)

The SCCP message type. An asterisk (\*) indicates all possible allowed values; that is, **9**, **10**, **17**, and **18**.

**Range:** 9, \* 10, \* 17, \* 18 \*

**9**—UDT

**10**—UDTS

**17**—XUDT

**18**—XUDTS

**Default:** Display all SCCP message types

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:sr=** (optional)

The CGPA screening reference name

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0-255**.

**Range:**       **0-255**

**Default:**     Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:**       **0-7, \***

### Example

```
rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:ssn=012
```

```
rtrv-scr-cgpa:sr=iec:ni=240:nc=001:ncm=010:actname=copy
```

```
rtrv-scr-cgpa:sr=cgp1
```

```
rtrv-scr-cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

### Dependencies

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified or re-specified, **sp=\*** must also be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **ncp**, **nsfi**, **ri**, **ssn**, and **nsr** parameters must already exist in the CGPA entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

The specified screening reference (**sr**) must be in the allowed CGPA entity set.

## Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-cgpa:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED CGPA**—This is the screen type.

**SR** —This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by the *ni-nc-ncm* .

**RI**—The routing indicator in the called party address.

**SCCPMT**—The SCCP message type.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-destfld****Retrieve Allowed DESTFLDs**

Use this command to show the attributes of one or more allowed affected destination field (DESTFLD) screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

**Keyword:** rtrv-scr-destfld

**Related Commands:** chg-scr-destfld, dlt-scr-destfld, ent-scr-destfld

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed DPC screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**Default:** Display all

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0–7** \*

**Default:** Display all

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:**       **00000-16383 \***

**:nsfi=** (optional)

This parameter indicates that the gateway screening process should stop. If specified for this command, the parameter must have the value of **stop**. The value of **stop** means that the gateway screening process ends and the message proceeds through normal routing.

**Range:**       **stop**

**Default:**     Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

**Range:**       *yyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:**       **none, s**

**Default:**     **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:sr=** (optional)

The name of the individual DESTFLD screen to be displayed.

**Range:**       *yyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **0-255 \*, C**

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**       **0-7 \*, C**

**Example**

**rtrv-scr-destfld**

**rtrv-scr-destfld:sr=iec:ni=240:nc=001:ncm=010&&018**

**rtrv-scr-destfld:sr=iec:id=4:actname=cncf**

**rtrv-scr-destfld:all=yes**

**rtrv-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s**

**rtrv-scr-destfld:sr=dst1**

### Dependencies

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If specified, the **nsfi** parameter value must equal **stop**.

The **nsr** parameter cannot be specified in the command.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified.

If **area=\*** is specified, **id=\*** must be specified.

If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified.

If **ssa=\*** is specified, **sp=\*** must be specified.

The specified screening reference (**sr**) must be in the allowed DESTFLD entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **id** or **sp** parameter must already exist in the database.

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **nc** parameter must already exist in the database.

Any specified **ncm** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database.

Any specified **npc** parameter must already exist in the database.

Any specified **nsfi** parameter must already exist in the database.

Any specified **nsr** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database.

### Notes

If no parameters are specified, the system displays a summary output.

If only the **all=yes** parameter is specified, the system displays a detailed output.

If the **all** parameter and any point code parameter are specified, the **all** parameter is ignored.

The REF column of the output of this command displays **YES** when the screen is referenced by another screen; otherwise, it displays **NO**.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## rtrv-scr-dpc

### Retrieve Allowed DPC

Use this command to show the attributes of one or more allowed DPC screening references and associated attributes (destination point code, next screening function identifier, next screening function reference) that are allowed to receive SS7 messages from another network.

**Keyword:** **rtrv-scr-dpc**

**Related Commands:** **chg-scr-dpc, dlt-scr-dpc, ent-scr-dpc**

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *yyyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed DPC screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0–7** \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000–255** \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*, **C**

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0–255** \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:** 00000-16383 \*

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** blkdp, cgpa, destfld, isup, stop

**blkdp**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all screen references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pct=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:sr=** (optional)

The allowed DPC screening reference name

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7 \*

## Example

rtrv-scr-dpc

```

rtrv-scr-dpc:sr=iec:ni=240:nc=001:ncm=010&&018
rtrv-scr-dpc:sr=iec:id=4
rtrv-scr-dpc:all=yes
rtrv-scr-dpc:all=yes:actname=cncf
rtrv-scr-dpc:sr=dpc1:npc=128:nsfi=stop:pcst=s

```

### Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The specified screening reference (**sr**) must be in the allowed DPC entity set.

Any specified **ni** parameter must already exist in the allowed DPC entity for the screening reference.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

If **ni**=\* is specified, **nc**=\* and **ncm**=\* must be specified.

If **nc**=\* is specified, **ncm**=\* must be specified.

If **zone**=\* is specified, **area**=\* and **id**=\* must be specified.

If **area**=\* is specified, **id**=\* must be specified.

If **msa**=\* is specified, **ssa**=\* and **sp**=\* must be specified.

If **ssa**=\* is specified, **sp**=\* must be specified.

The **nsr** parameter cannot be specified if the specified **nsfi** parameter is **stop**.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

Any specified **npc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **pcst** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed DPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed DPC entity for the screening reference.

## Notes

If no parameters are specified, a list of allowed DPC references is displayed indicating whether they are referenced or not.

If a single allowed DPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed DPC entity set are shown.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### ***Legend***

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-dpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED DPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## **rtrv-scr-isup**

### **Retrieve Allowed ISUP Screening Reference**

Use this command to display one allowed ISUP screening reference or all allowed ISUP screening references in the Allowed ISUP entity set.

**Keyword:** rtrv-scr-isup

**Related Commands:** chg-scr-isup, dlt-scr-isup, ent-scr-isup

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:all=** (optional)

This parameter is specified to display all allowed ISUP screening references in the Allowed ISUP entity set.

**Range:** **yes, no**

**Default:** **no**

**:isupmt/tupmt=** (optional)

ISUP message type or TUP message type in the specified entry. The **tupmt** parameter is not valid for SEAS. A single value or range of values can be entered. An asterisk (\*) indicates the entire range of 0-255.

**Range:** **000-255 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter must have the value of **stop**.

**Range:** **stop**

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**:nsr=** (optional)

Next screening reference. The **nsr** parameter cannot be specified if **nsfi=stop** is specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

**:sr=** (optional)

The individual ISUP screen to be displayed.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

## Example

**rtrv-scr-isup:sr=iec:isupmt=1:nisupmt=1&&2**

**rtrv-scr-isup:sr=tu01:tupmt=0&&255**

## Dependencies

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

If **sr** is specified, the value must exist in the database.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

## Notes

A range of values for the **isupmt** parameter or **tupmt** parameter can be specified by separating the values that define the range by two ampersands (**&&**); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the **&&** must be less than the value to the right of the **&&** in the range.

An asterisk can be used for a parameter value in the **chg-scr-isup**, **rtrv-scr-isup**, and **rtrv-scr-isup** commands only if that parameter value was specified as an asterisk in the **ent-scr-isup** command to define the parameter value.

If no parameters are specified, a list of allowed ISUP references is produced indicating whether they are referenced or not.

## Output

### Legend

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-isup:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED ISUP**— This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**ISUPMT/TUPMT**—The ISUP message type or TUP Message type in the entry.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

## rtrv-scr-opc

### Retrieve Allowed OPC

Use this command to show an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference).

**Keyword:** **rtrv-scr-opc**

**Related Commands:** **chg-scr-opc**, **dlt-scr-opc**, **ent-scr-opc**

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**  
1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed OPC screening references.

**Range:**     **yes, no**

**Default:**    Display all

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**     **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**     **0-7, \***

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**     **000-255 \***

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \***

**Default:**    Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \***

**Default:**    Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**     **0-255 \***

**Default:**    Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**. Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Point Code Formats and Conversion" for information on converting the point code format.

**Range:**     **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**     **blkopc, sio, dpc, blkdpc, cgpa, stop**

**blkopc**—Blocked OPC is the next screening category.

**sio**—Allowed SIO is the next screening category

**dpc**—Allowed DPC is the next screening category.

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all screening referenes

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none**, **s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:sr=** (optional)

The allowed OPC screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7, \*, C**

## Example

**rtrv-scr-opc**

**rtrv-scr-opc:sr=iec:ni=240:nc=001:ncm=010&&018**

**rtrv-scr-opc:sr=iec:id=4**

**rtrv-scr-opc:all=yes**

**rtrv-scr-opc:sr=opc1:actname=cr**

**rtrv-scr-opc:sr=opc1:npc=128:nsfi=fail:pcst=s**

## Dependencies

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **ni=\*** is specified, **nc=\*** and **ncm=\*** must be specified.

If **nc=\*** is specified, **ncm=\*** must be specified.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified.

If **area=\*** is specified, **id=\*** must be specified.

If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified.

If **ssa=\*** is specified, **sp=\*** must be specified.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The **nsr** parameter cannot be specified if the specified **nsfi** parameter is **stop**.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The specified screening reference (**sr**) must be in the allowed OPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **ni** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **ncm** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **npc** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsfi** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **nsr** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **pcst** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **area** or **ssa** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **id** or **sp** parameter must already exist in the allowed OPC entity for the screening reference.

Any specified **zone** or **msa** parameter must already exist in the allowed OPC entity for the screening reference.

## Notes

If no parameters are specified, a list of allowed OPC references is produced indicating whether they are referenced or not.

If a single allowed OPC screening reference is specified, the specified entity set requested is shown.

If **all=yes** and no other parameter is specified, detailed information for all of the screening reference entities in the allowed OPC entity set are shown.

If **all** is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk specified as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

### Legend

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-opc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED OPC**— This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI - NC - NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA-SSA-SP. For national point codes, these columns become the single column NPC.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scr-sio****Retrieve Allowed SIO**

Use this command to show the attributes of one or more **nic/si/h0/h1** combinations that are allowed for SS7 messages from another network.

**Keyword:** **rtrv-scr-sio**

**Related Commands:** **chg-scr-sio, dlt-scr-sio, ent-scr-sio**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed SIO screening references.

**Range:** **yes, no**

**Default:** **no**

**:h0=** (optional)

H0 heading code. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–15**.

**Range:** **0-15 \***

**Default:** Display all

**:h1=** (optional)

H1 heading code. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–15**.

**Range:** **0-15 \***

**Default:** Display all

**:nic=** (optional)

The network indicator code. An asterisk (\*) indicates all possible values; that is, the entire range of **0–3**.

**Range:** **0-3 \***

**Default:** Display all

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **blkdpc, cgpa, cdpa, destfld, dpc, isup, stop**

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed calling party address is the next screening category.

**cdpa**—Allowed called party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

(optional; mandatory if **nsfi** is other than **stop**; cannot be entered if **nsfi=stop**)

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pri=** (optional)

Message priority. A single value or a range of values can be specified. An asterisk (\*) indicates all possible values; that is, the entire range of **0–3**.

**Range:** **0-3** \*

**Default:** Display all

**:si=** (optional)

The service indicator.

**Range:** **0-15**, \* ;\*

**Default:** Display all

**:sr=** (optional)

The allowed SIO screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**Example**

**rtrv-scr-sio**

**rtrv-scr-sio:sr=iec:nic=1:si=3:pri=2&&3**

**rtrv-scr-sio:sr=sio1:nic=1:si=1**

**rtrv-scr-sio:sr=sio1:nic=1:si=1:h0=1:h1=\***

**rtrv-scr-sio:sr=sio1:si=1:h0=1:h1=1**

**rtrv-scr-sio:all=yes**

**rtrv-scr-sio:sr=iec:nic=1:si=1:actname=crncf**

**Dependencies**

If the **si** parameter is not equal to **00**, **01**, or **02**, the **h0** and **h1** parameters cannot be specified.

If the **nic**, **si**, and **h0/h1** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

The network indicator code (**nic**) must be specified if the service indicator is specified.

The network indicator code (**nic**) and the service indicator (**si**) must be specified if the **h0** and **h1** parameters are specified.

If an asterisk value is specified for the **h0** parameter, the **h1** parameter cannot be specified.

If the **nsr** parameter is specified, **nsfi=stop** cannot be specified.

If the **actname** parameter is specified, **nsfi=stop** must be specified.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **sr** parameters are specified, the SIO screening reference must be in the allowed SIO entity set.

## Notes

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed SIO references is output indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed SIO screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

## Output

### rtrv-scr-sio

```
SCREEN = ALLOWED SIO

### Legend

For a summary report:

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-sio:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED SIO**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NIC**—The network indicator code in the service information octet.

**PRI**—The priority of a single message or the beginning message priority in a range of priorities in the service information octet.

**SI**—The service indicator for the service information octet, which are the last two bits of the subservice field.

**H0**—The H0 heading code.

**H1**—The H1 heading code.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (**NSR** - up to four characters) or action to be taken (**ACT** - up to six characters), if the message passes this screen.

**rtrv-scr-tt****Retrieve Allowed Translation Type**

Use this command to show the allowed translation type (TT) screening reference in the TT entity set.

**Keyword:** **rtrv-scr-tt**

**Related Commands:** **chg-scr-tt**, **dlt-scr-tt**, **ent-scr-tt**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all allowed TT screening references.

**Range:** **yes, no**

**Default:** **no**

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **cdpa, stop**

**cdpa**—Allowed called party address is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all screening references

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**, or the **copy=yes** parameter is specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:sr=** (optional)

The TT screening reference name

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:type=** (optional)

The translation type. The translation type identifies the global title translation type value in the called party address. It is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified.

**Range:** **1-255 \***

**Default:** Display all.

**Example**

```

rtrv-scr-tt
rtrv-scr-tt:sr=iec
rtrv-scr-tt:all=yes
rtrv-scr-tt:sr=iec:type=1&&15:actname=copy

```

**Dependencies**

If the **nsr** parameter is specified, **nsfi=stop** cannot be specified.

If the **actname** parameter is specified and **nsfi** is specified, the value specified for **nsfi** must be **stop**.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screening reference name parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The **copy** parameter is obsolete. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Notes**

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

If no parameters are specified, a list of allowed TT references is produced indicating whether they are referenced or not.

If only the **all** parameter is specified and is **yes**, detailed information for every rule in every allowed TT screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

**Output****rtrv-scr-tt**

```

;

```

**Legend**

**SCREEN = ALLOWED TT**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If a more detailed output is needed, the **rtrv-scr-tt:all=yes** command should be used, or specify the specific screening reference.

**TYPE**—The translation type of that is allowed for global title translation.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**rtrv-scrset****Retrieve Screen Set**

Use this command to show the attributes of one or more screen sets in the screen set entity set.

**Keyword:** **rtrv-scrset**

**Related Commands:** **chg-scrset, dlt-scrset, ent-scrset**

**Command Class:** Database Administration

**Parameters**

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all screen sets (except “placeholder” screen sets that contain only one rule with **nsfi=stop** specified in the rule).

**Range:** **yes, no**

**Default:** **no**

**:destfld=** (optional)

This parameter displays the indicator that specifies whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes,

and capability point codes. When this parameter is on in the screen set rule, the automatic screening is applied at the end of the provisioned screen set.

**Range:** yes, no

**Default:** Display all

**:nsfi=** (optional)

The values of this parameter indicate in the screen set rules the next screening category that is used in the gateway screening process, or that the gateway screening process should stop. In this command, information is displayed for one or more screen sets containing rules with the specified **nsfi** parameter value.

**NOTE:** When **nsfi=stop** is specified for this command, the command displays only the “placeholder” screen sets that have only one rule, with **nsfi=stop** specified in the rule. This is a way to locate those “placeholder” screen sets, so that you can add or change the rules to accomplish appropriate screening.

**Range:** opc, blkopc, sio, dpc, blkdpc, stop

**opc**—Display rules with Allowed OPC as the next screening category.

**blkopc**—Display rules with Blocked OPC as the next screening category.

**sio**—Display rules with Allowed SIO as the next screening category.

**dpc**—Display rules with Allowed DPC as the next screening category.

**blkdpc**—Display rules with Blocked DPC as the next screening category.

**stop**—Display only “placeholder” screen sets that have only one rule in the screen set, with **nsfi=stop** specified as the next screening category.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. In this command, the **nsr** parameter is used to display information for one or more screen sets with rules that have the specified **nsr** parameter value.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:scrn=** (optional)

The screen set name. When this parameter is specified, the information for only the specified screen set is displayed.

**Range:** xyyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

### Example

```
rtrv-scrset
```

```
rtrv-scrset:scrn=scr1
```

```
rtrv-scrset:nsr=opc4
```

```
rtrv-scrset:nsfi=dpc
```

```
rtrv-scrset:actname=copy
```

### Dependencies

The screen set name must already exist.

When the **actname** parameter is specified and the **nsfi** parameter is specified, the value specified for the **nsfi** parameter must be **stop**.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

If the **actname** parameter is specified with the screen set name parameter, the specified value for the **actname** parameter must be assigned to that screen set name.

The **nsr** parameter is required if the **nsfi** parameter value does not equal **stop**.

The **nsr** parameter cannot be entered if the **nsfi** parameter value equals **stop**.

## Notes

If no parameters are specified for the **rtrv-scrset** command, the output shows all the screen sets, the screening function identifier of the root screening table, the screening reference of the root screening table, the memory usage (percentage), the number of entries in the screen set and the overall gateway screening statistics, followed by a summary of statistics for each screen set.

For the **rtrv-scrset:all=yes** command, the output consists of every screen set and every screening reference in each screen set (except “placeholder” screen sets that have only one rule with **nsfi=stop** specified in the rule). The **all=yes** and **nsfi=stop** parameters cannot be specified in the same command.

If the **scrn**, **nsfi**, or **nsr** parameter is entered, summary information for all screens that match the specified parameters is shown.

When the % FULL is over 100%, the screen is inaccessible. A screenset over 100% capacity size will not bind correctly. A screenset can become provisioned over capacity when linking one screen reference to another causes the size to become too large. To reduce a screenset that is over 100% capacity, screen rules must be deleted (see the **dlt-scr-xxx** commands)

## Output

In the following example the % full is over 100% and the screen is inaccessible.

### rtrv-scrset

```
rlghncxa03w 03-03-14 16:37:05 EST EAGLE 31.3.0
ENTIRE GWS DATABASE IS 1% FULL

**Legend**

**SCRN**—The name of the screen set.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR - up to four characters) or action to be taken (ACT - up to six characters), if the message passes this screen.

**FULL**—The capacity of allowed memory a given screen set occupies, expressed as a percentage.

**RULES**—The number of entries in the screen set.

**TABLES**—The number of tables in the screen set.

**DESTFLD**—Displays whether to apply the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is on, the automatic screening is applied at the end of the provisioned screen set.

**rtrv-secu-dflt****Display System-Wide Security-Related Defaults**

Use this command to display the current values of the various security-related parameters that have been configured with the **chg-secu-dflt** command.

**Keyword:** **rtrv-secu-dflt**

**Related Commands:** **chg-pid**, **chg-secu-dflt**

**Command Class:** Security Administration

**Parameters**

**:msg=** (optional)

Use this parameter to specify whether the text of the login warning message is to be displayed also.

**Range:** **yes, no**

**Default:** **no**

**Example**

**rtrv-secu-dflt**

**rtrv-secu-dflt:msg=yes**

**Dependencies**

None

**Notes**

None

**Output**

**rtrv-secu-dflt:msg=yes**

PUNC                1
;

```

### Legend

**PAGE**—The default password aging interval for newly created user IDs

**UOUT**—The number of successive days a user ID can go unused (no successful login) before the system denies login.

**MULTLOG**—Indicates whether users can be logged on to multiple terminals at the same time

**MINLEN**—The minimum password length.

**ALPHA**—The minimum number of alphabetic characters (a–z) required in a new password.

**NUM**—The minimum number of numeric characters (0–9) required in a new password.

**PUNC**—The minimum number of punctuation characters required in a new password. A punctuation character is any character that is not an alphabetic or numeric character.

**WARNING MESSAGE**—The message displayed when a user has successfully logged in.

## rtrv-secu-trm

### Display Terminal Access Rights

Use this command to display the access rights for a terminal. Only a user with system security administration authority can change a terminal's access rights. Access rights determine whether a terminal or port has command access to the system.

**Keyword:** rtrv-secu-trm

**Related Commands:** chg-secu-trm

**Command Class:** Security Administration

### Parameters

**:trm=** (optional)

Specifies the port about which information will be displayed.

**Range:** 1-16

**Default:** Display all

### Example

```
rtrv-secu-trm
```

```
rtrv-secu-trm:trm=9
```

### Dependencies

None

### Notes

None

**Output**

The following example shows attributes of all terminals when the Command Class Management feature is off.

**rtrv-secu-trm**

```

**Legend**

**TRM**—The ID number of the terminal whose characteristics are to be changed.

**LINK**—Shows whether the Link Maintenance class of commands is allowed for this terminal.

**SA**—Shows whether the Security Administration class of commands is allowed for this terminal.

**SYS**—Shows whether the System Maintenance class of commands is allowed for this terminal.

**PU**—Shows whether the Program Update class of commands is allowed for this terminal.

**DB**—Shows whether the Database class of commands is allowed for this terminal.

**DBG**—Shows whether the Debug class of commands is allowed for this terminal.

**\*\*\***—Denotes a Security Administration port whose port type has been configured with a value of **oap**, **none**, or **printer**. These terminal types do not allow you to enter commands.

**LNPBAS**—Shows whether the LNP BASIC class of commands is allowed for this terminal.

(Appears only if LNP is turned on.)

**LNPDDB**—Shows whether the LNP Database class of commands is allowed for this terminal.

(Appears only if LNP is turned on.)

**LNPSUB**—Shows whether the LNP Subscription class of commands is allowed for this terminal.

(Appears only if LNP is turned on.)

**U01 - U32**—Configurable command class default names. (If configured with a user-specified name, that name appears.)

**rtrv-secu-user**

**Retrieve Security User**

Use this command to show the security information for all users in the system.

**Keyword:** rtrv-secu-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-user

**Command Class:** Security Administration

**Parameters****:uid=** (optional)

User ID

**Range:** *a*xxxxxxxxxxxxx

1 alphabetic character followed by up to 15 alphanumeric characters

**Default:** Display all**Example****rtrv-secu-user : uid = rogers****Dependencies**

If a user ID is specified, the user ID must exist in the UserID table.

**Notes**

Only the system administrator should have access to this command.

Passwords cannot be shown.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.**Output**

The following example shows a display when the LNP feature is turned on and the Command Class Management feature is not enabled:

jack        10  30   30   NO  YES  YES  YES  YES  YES  YES

```

;

**Legend**

**USER-ID**—The name of the user

**AGE**—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.

**PAGE**—Shows the maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**UOUT**—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default **uout** parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**REV**—Shows whether the user ID is denied login (revoked). YES indicates that the user ID is revoked, NO indicates that the user ID is not revoked.

**LINK** —Shows whether the user has access to all commands in the Link Maintenance command class.

**SA** —Shows whether the user has access to all commands in the Security Administration command class.

**SYS** —Shows whether the user has access to all commands in the System Maintenance command class.

**PU**—Shows whether the user has access to all commands in the Program Update command class.

**DB** —Shows whether the user has access to all commands in the Database Administration command class.

**DBG**—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled, the following fields appear:

**U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following fields are displayed:

**LNPBAS**—Shows whether the user has access to all commands in the LNP Basic command class.

**LNPDB**—Shows whether the user has access to all commands in the LNP Database command class.

**LNPSUB**—Shows whether the user has access to all commands in the LNP Subscription command class.

## rtrv-seculog

## Generate Report from Security Log Contents

Use this command to retrieve the contents of a security log and display it to the user in the scroll area. Various reports can be produced by varying the values of the command parameters. By default, the report is generated from the log on the active fixed disk, although the **slog** parameter can be used to generate the report from the log on the standby fixed disk.

**Keyword:** rtrv-seculog

**Related Commands:**

**Command Class:** Security Administration

### Parameters

**:edate=** (optional)

End date. Use this parameter to report log entries only if they were created on or before the specified date. If the **sdate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

**Range:** 000101-991231

(in the form *yyymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

**Default:** Report log entries regardless of their creation date

**:etime=** (optional)

End time. Use this parameter to report log entries only if they were created between midnight (00:00:00) and the time specified on this parameter. If the **stime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

**Range:**       **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The time must be specified with 6 digits in a 24-hour format. For example, enter 1:05:03 P.M. as **130503**.

**Default:**     Report log entries regardless of their creation time

**:mode=** (optional)

Use this parameter to produce a either full log report or an abbreviated log report.

**Range:**       **brief, full**

**brief**—Causes only one line of output to be generated for each log entry reported. Some information in each reported log entry is not shown.

**full**—Produces a report showing multiple lines of output for each log record that is reported. This report displays more information from each log record (including the entire command) than the **mode=brief** report.

**Default:**     **brief**

**:num=** (optional)

Maximum number of records to be displayed. This parameter specifies how many records are to be displayed before the report is terminated.

**Range:**       **1-50, 000**

**Default:**     **500**—if **mode=brief** is specified

**250**—if **mode=full** is not specified

**:rectype=** (optional)

Use this parameter to specify whether you want all records in the log to be considered for reporting or only new (that is, un-uploaded) records.

**Range:**       **new, both**

**new**—The report generator scans only new (that is, un-uploaded) records when generating the report. Old records are not considered for reporting, even if they match the reporting criteria.

**both**—All records in the log are considered for reporting.

**Default:**     **new**

**:sdate=** (optional)

Start date. Use this parameter to report log entries only if they were created on or after the specified date. If the **edate** parameter is also specified, log entries are reported only if they were created for the date period specified by the **sdate** and **edate** combination.

**Range:**       **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

The date must be specified with 6 digits. For example, enter 1/1/96 as **960101**.

**Default:**     Report log entries regardless of their creation date

**:slog=** (optional)

Source log indicator. This parameter specifies which log is to be copied to the FTA.

**Range:**       **act, stb**

**act**—Specify **act** to produce the report from the log on the active MASP

**stb**—Specify **stb** to produce the report from the log on the standby MASP

**Default:**     **act**

**:stime=** (optional)

Start time. Use this parameter to report log entries only if they were created between the time specified on this parameter and the end of the day (23:59:59) inclusive. If the **etime** parameter is also specified, log entries are reported only if they were created in the time period specified by the **stime** and **etime** combination.

**Range:**       **000000-235959**

The time must be specified with 6 digits in a 24-hour format (*hhmmss*). For example, enter 1:05:03 p.m. as **130503**.

*hhmmss*—*hh*=hours (**00-23**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

**Default:**     Report log entries regardless of their creation time

**:trm=** (optional)

Terminal ID. Use this parameter to report only those log entries created by the specified terminal.

**Range:**       **1-16**

**Default:**     Report log entries regardless of the associated terminal

**:uid=** (optional)

User ID. Use this parameter to report only those log entries created by the specified user ID.

Specify **uid=seas** to report only those commands received on a SEAS terminal. Specify **uid=none** to report only those commands not associated with a user ID. For example, commands issued prior to login.

**Range:**       *abcdefghijklmnopqrstuvwxyz*

1 alphabetic character followed by up to 15 alphanumeric characters

**Default:**     Display all

**Example**

**rtrv-seculog:sdate=021496:edate=021596:num=7**

**rtrv-seculog:mode=full:sdate=021496:edate=021496:stime=062900:etime=063200**

**Dependencies**

If both the **sdate** and **edate** parameters are specified, the date that is specified for the **sdate** parameter must be earlier than or equal to the date specified for the **edate** parameter.

If both the **stime** and **etime** parameters are specified, the time that is specified for the **stime** parameter must be earlier than or equal to the time specified for the **etime** parameter.

The month component of the **sdate** and **edate** parameter combination must be specified in the range **1-12**.

The day component of **sdate** and **edate** parameter combination must be specified in the range **1-31**. This value must accurately reflect the number of days in the month and year indicated. For example, **sdate=960631** is not a valid parameter value because June has only 30 days.

The second component of the **stime** and **etime** parameter combination must be specified in the range **00-59**.

The minute component of the **stime** and **etime** parameter combination must be specified in the range **00-59**.

No other security log command can be in progress when this command is entered.

**Notes**

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95-99 = 1995 through 1999

years 00–36 = 2000 through 2036

A consequence of this is that date 000101 (Jan 1, 2000) is greater than 991231 (December 31, 1999).

If the **mode=brief** parameter is specified and the output report has a plus (+) symbol appearing at the end of the command, the plus symbol indicates that more command characters are available to be displayed. Specify the **mode=full** parameter to see these additional characters.

In the **mode=full** output report, a plus (+) symbol appearing at the end of the command indicates the command is longer than 150 characters. Note that even in the uploaded log, each record in the log has room to record only 150 characters of the entered command. If the command is longer than 150 characters, then only the first 149 characters of the command and the plus symbol (to indicate that truncation has occurred) are recorded.

Security log size is limited to 50,000 records. Data from a query that exceeds the size limit of the security log cannot be displayed.

The system checks to ensure that the day portion of any **sdate/edate** value entered is in agreement with the month and year. It issues error message E2252 if the day is found to be invalid (for example, **960631** is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

The system uses the **sdate/edate** and **stime/etime** parameters to select log records for reporting as follows:

- If the date on which the log record was created is not in the date range specified by the **sdate/edate** parameters, the record is not reported. The default **sdate** is the date of the oldest record in the log, and the default **edate** is the current date.
- If the time of day at which the log record was created is not in the time range specified by the **stime/etime** parameters, the record is not reported. The default **stime** is 00:00:00 (midnight), and the default **etime** is 23:59:59.
- Otherwise, the log record is reported, unless it is disqualified by other parameters such as **uid** or **trm**.

As an example, if the following command is entered, records are displayed for October 10, 1996 from 2:00 p.m. until 4:00 p.m., for October 11, 1996, from 2:00 p.m. until 4:00 p.m., and for October 12, 1996, from 2:00 p.m. until 4:00 p.m.

**rtrv-seculog:sdate=961010:edate=961012:stime=140000:etime=160000**

It takes the system approximately one minute to display 500 lines of data in the scroll area. To output a complete **mode=full** report (150,000 lines maximum) takes approximately 300 minutes. For this reason, the **num** parameter defaults to either **125 (mode=full)** or **500 (mode=brief)**, to prevent an excessively long process time, unless you deliberately choose a longer report.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The following message appears in the scroll area if the **slog=stb** parameter is specified (either explicitly or by default) and the standby fixed disk is not available (for example, simplex mode).

Command Failed - unable to read security log

When the **rtrv-seculog** command is entered, one of the first things that the reporting function does is to examine the log overflowed and logging failure flags in the header of the specified log. Depending on the nature of the information found, one of the following notices is displayed in the output:

Notice: Log overflow has occurred -- report may be incomplete.

Notice: Logging failure -- report may be incomplete.

## Output

The following example shows how all records in the log created between 2/14/96 and 2/15/96 are to be displayed, up to a maximum of 9 records.

**rtrv-seculog:sdate=960214:edate=960215:num=9**

```
rlghncxa03w 96-02-14 06:32:20 EST EAGLE Release 34.0

## Legend

**uid**—The user ID that issued the command. The value **SEAS** appears if the command was received on a SEAS port. The value **NONE** appears if no user ID was associated with the port at the time the command was logged.

**TRM**—The terminal ID of the terminal where the command was received.

**DATE**—The date when the log entry was made; that is, the date on which the command was received for execution.

**TIME**—The time when the log entry was made; that is, the time the command was received for execution. A 24-hour time format is used (for example, 1:00 p.m. = 130000).

**ST**—The two-letter shorthand notation of the command's status. The complete status can be obtained by re-entering the **rtrv-seculog** command and specifying the **mode=full** parameter. The status abbreviations are as follows:

- **AB**—Command aborted. Displayed when the **canc-cmd:trm** command is issued to abort the following commands: **rept-stat-card**, **rept-stat-dstn**, **rept-stat-ls**, **rept-stat-slk**, **rtrv-dstn**, **rtrv-gta**, **rtrv-gtt**, **rtrv-ls**, **rtrv-map**, **rtrv-rte**, **rtrv-seculog**, and **rtrv-slk**. An AB status indicates that processing and output of the command have been halted. This status is also displayed for SEAS flow-thru commands that are canceled with the **canc-cmd** (without the **trm** parameter).
- **RJ**—Command rejected. Displayed whenever the results value that would be displayed in the **mode=full** report would be one of the following:

Edddd

FAILED

rrrrrr/mmmm

- **RL**—Retry later. The system is busy.
- **IP**—In Progress
- **OK**—Command successfully executed
- **TO**—Timed out.

**CMD**—The command that was recorded. In the **mode=brief** report, if the length of the recorded command is greater than or equal to 35 characters (as this much as can be displayed on a single line of the output report), then only the first 34 characters of the command are displayed, and the 35th character is displayed as a plus symbol (+) to indicate that more information is available in the log. Re-enter the **rtrv-seculog** command with the **mode=full** parameter to see the additional information. In the **mode=full** report, a plus symbol at the end of a command indicates that the command is longer than 150 characters.

## rtrv-serial-num

## Retrieve Serial Number

Use this command to retrieve the NT serial number for the system.

**Keyword:** **rtrv-serial-num**

**Related Commands:** **ent-serial-num**

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-serial-num**

### Dependencies

None

**Notes**

None

**Output**

Dashes appear if the serial number has not yet been entered into the database.

**rtrv-serial-num**

```
rlghncxa03w 03-03-29 16:40:40 EST EAGLE 31.3.0
System serial number = nt00001231
```

```
System serial number is locked.
```

```

**rtrv-sg-opts****Retrieve IP7 Secure Gateway Options**

Use this command to retrieve information about the currently chosen IP<sup>7</sup> Secure Gateway protocol options.

**Keyword:** rtrv-sg-opts

**Related Commands:** chg-sg-opts, rtrv-appl-rtkey

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-sg-opts**

**Dependencies**

None

**Notes**

None

**Output****rtrv-sg-opts**

```
rlghncxa03w 03-07-07 09:50:17 EST EAGLE 31.6.0
SYNC:                TALI
SRKQ:                 250
DRKQ:                 750
SNMPCONT:             john doe 555-123-4567
GETCOMM:              public
SETCOMM:              private
TRAPCOMM:             public
INHFEFALM:            YES
SCTPCSUM:             adler32
IPGWABATE:            NO
IPLIMABATE:           NO
IPTPSALMTHRESH:       100%
```

```
;
```

**Legend**

**SYNC**—The synchronization opcode used for messages sent by SS7IPGW cards (TALI or SASSI).

**SRKQ**—The static routing key quantity. The maximum number of routing key entries in the Static Routing Key table.

**DRKQ**—The dynamic routing key quantity. The maximum number of routing key entries in the Dynamic Routing Key table of each SS7IPGW card.

**SNMPCONT**—The system contact information for each DCM and SSED CM SNMP agent.

**GETCOMM**—The community name used for SNMP Get and GetNext request validations. This value applies for each DCM and SSED CM SNMP agent in the system.

**SETCOMM**—The community name used for SNMP Set request validation. This value applies for each DCM and SSED CM SNMP agent in the system.

**TRAPCOMM**—The community name to use when SNMP traps are generated. This value applies for each DCM and SSED CM SNMP agent in the system.

**SCTPCSUM**—SCTP checksum algorithm type (adler32 or crc32c).

**IPGWABATE**—Enabled (YES) or disabled (NO) IPGWx SS7 congestion abatement procedures.

**IPLIMABATE**—Enabled (YES) or disabled (NO) IPLIMx SS7 congestion abatement procedures.

**IPTPSALMTHRESH**—Alarm threshold percent at which system IPTPS alarms are generated. Can be set below 100 percent if "early warning" is desired.

**rtrv-shlf****Retrieve Shelf**

Use this command to display the frames and shelves that are currently provisioned in the system. The type of shelf is also shown.

**Keyword:** **rtrv-shlf**

**Related Commands:** **dlt-shlf**, **ent-shlf**

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

The shelf location.

**Range:** **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**Default:** Display all configured locations

**Example**

**rtrv-shlf**

**rtrv-shlf:loc=1300**

**rtrv-shlf:loc=2100**

**Dependencies**

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

**Notes**

None

**Output**

The following example displays all configured STP equipment shelves.

**rtrv-shlf**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY
FRAME SHELF      TYPE
  1      1      CONTROL
  1      2      EXTENSION
  1      3      EXTENSION
  2      3      EXTENSION
```

;

The following example displays a specific STP equipment shelf.

**rtrv-shlf:loc=1300**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=1300
FRAME SHELF      TYPE
  1      3      EXTENSION
CARD  TYPE      APPL      LSET NAME      PORT SLC LSET NAME      PORT SLC
1301  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1302  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1303  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1304  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
1305  LIMDS0    SS7ANSI  -----  --  --  -----  --  --
```

;

The following example displays a specific STP equipment shelf that is not configured (unequipped).

**rtrv-shlf:loc=2100**

```
rlghncxa03w 04-01-07 09:50:17 EST EAGLE 31.3.0
SHELF DISPLAY LOCATION=2100
FRAME SHELF      TYPE
```

This shelf is UNEQUIPPED in the database.

;

**Legend**

**FRAME**—The frame location of the shelf.

**SHELF** —The location of the shelf within the frame.

**TYPE** —The type of shelf.

**CARD**—Card location in the specified shelf.

**TYPE**—Card type

**APPL**—Application running on the card.

**LSET NAME**—Linkset name defined for the port on the card.

**PORT**—Port used by the linkset defined on the card.

**SLC**—Signaling link code for the linkset.

**rtrv-sid****Retrieve Self Identification**

Use this command to retrieve site identification characteristics of the system. It shows the point code assigned to this system, the CLLI code of the system, the capability code of the STP, and the type of point codes supported by the system.

**Keyword:** **rtrv-sid**

**Related Commands:** chg-sid, ent-sid

**Command Class:** Security Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cpc=** (optional)

ANSI capability point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** cpc

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**Default:** Display all

**:cpc/cpc/cpci/cpcn/cpcn24=** (optional)

Capability point code. The code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network to which the STP belongs.

**:cpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**Default:** Display all

**:cpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**Default:** Display all

**:cpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** Display all

**:cpctype=** (optional)

Capability point code type. Specify whether the CPC is for the STP or for LNP, INP, EIR, G-Port, or G-Flex.

**Range:** **stp, lnp, inp, eir, gport, gflex**

**Default:** **stp**

### Example

**rtrv-sid**

**rtrv-sid:cpcn=002-002-007**

**rtrv-sid:cpc=3-3-3**

**rtrv-sid:cpcn=001-001-001**

**rtrv-sid:cpctype=inp**

**rtrv-sid:cpci=2-100-4**

**rtrv-sid:cpcn24=33-33-33**

**rtrv-sid:cpcn=s-00456**

### Dependencies

The STP destination point codes and capability point codes can be specified only as full point codes.

The ANSI point code **0-0-0** and the ITU-I point code **0-000-0** are invalid for STP capability point codes.

If **cpctype** is **lnp**, the LNP feature must be turned on (see the **enable-ctrl-feat** command).

If **cpctype** is **inp**, the INP feature must be turned on.

If **cpctype** is **eir**, the Equipment Identity Register (EIR) feature must be enabled.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be retrieved.

If the **cpcn** parameter is specified, the format of the specified point code must match the format that was assigned with the **chg-stpopts** command **npcfmti** parameter.

### Notes

If the **cpc/cpca/cpci/cpcn/cpcn24** parameter is not specified, all site identification characteristics are displayed.

If the STP capability point code is specified and not provisioned, the report contains only the PCA, PCI, PCN or PCN24, CLLI, and PCTYPE fields, with the message:

Compatibility Point Code specified is not provisioned.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

## Output

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The **s-** point code prefix indicates an ITU national or international spare point code or spare capability point code.
- INP, LNP, and EIR capability point codes are indicated in parentheses after the capability point code header. STP capability point codes have no parentheses after the header.

The **rtrv-sid** command CPC output is sorted using three sort keys.

- The first sort key is by the **cpctype** service, ordered by: **stp** (own STP; unlabeled, **inp**, **eir**, **gflex**, then **gport**.
- The second sort key is by network type, ordered by: ANSI, ITU-I, ITU-N, then ITU-N24.
- The third sort key is by point code value, ordered low to high.

In the following output examples:

- When a 24-bit ITU-N site identification STP point code is configured, the PCN header is changed to PCN24.
- The **s-** point code prefix indicates an ITU national or international spare point code or spare capability point code.
- INP, LNP, EIR, G-Flex, and G-Port capability point codes are indicated in parentheses after the capability point code header.
- STP capability point codes have no parentheses after the header.

The examples show all site identification characteristics provisioned in the system at the time the command was entered.

The following example includes a 24-bit ITU-N site ID and a 24-bit ITU-N capability point code.

**Legend**

**PCA**—The ANSI point code of the STP.

**PCI**—The ITU-TSS international point code of the STP.

**PCN**—The ITU-TSS national point code of the STP.

**PCN24**—The 24-bit ITU national point code of the STP.

**CPCA**—The ANSI capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCN**—The ITU-TSS national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCI**—The ITU-TSS international capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**CPCN24**—The ITU-TSS 24-bit national capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**(EIR)**—The identified point code is an Equipment Identity Register (EIR) point code.

**(INP)**—The identified point code is an INAP Number Portability (INP) point code.

**(LNP)**—The identified point code is a local number portability (LNP) point code.

**(GFLEX)**—The identified point code is a G-Flex (GFLEX) point code.

**(GPORT)**—The identified point code is a G-Port (GPORT) point code.

**CLLI**—The common language location identifier of the STP

**PCTYPE**—The type of point code used by the STP. There are two types of point codes that the EAGLE 5 ISS STP can use, ANSI and OTHER. The value ANSI means the EAGLE 5 ISS STP supports point codes that meet the ANSI standard. The value OTHER means that the EAGLE 5 ISS STP supports point codes that do not meet the ANSI standard.

**rtrv-slk****Retrieve Signaling Link**

Use this command to show the parameters for low-speed signaling links, ATM high-speed signaling links, or both.

**Keyword:** **rtrv-slk**

**Related Commands:** **act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, tst-slk, ublk-slk, unhb-slk**

**Command Class:** Database Administration

**Parameters**

**:class=** (optional)

The class of links to be displayed.

**Range:** **mtp2, saal, e1, t1**

**mtp2**—Displays low-speed signaling link information only.

**saal**—Displays ATM high-speed signaling link information only.

**e1**—Displays signaling link information only for 2-port E1 cards, and E1/T1 cards and HC-MIM cards used as E1 cards or as SE-HSL cards.

**t1**—Displays signaling link information only for E1/T1 MIM cards and HC-MIM cards used as T1 cards.

**Default:** Display all signaling links

**:link=** (optional)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have assigned signaling links.

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All signaling links are shown.

**Example**

```
rtrv-slk
rtrv-slk:loc=1202:link=a
rtrv-slk:class=saal
rtrv-slk:loc=1302:link=a
rtrv-slk:class=e1
rtrv-slk:loc=1302:link=b2
rtrv-slk:class=mtp2
rtrv-slk:class=t1
rtrv-slk:loc=1303:link=a31
```

**Dependencies**

If the **link** parameter is specified, the **loc** parameter must be specified. The **loc** parameter can be specified without the **link** parameter.

The **loc** parameter or the **class** parameter, but not both, can be specified in the command.

The slot portion of the specified **loc** parameter must be **01** through **18**, except **09** and **10** cannot be specified (**loc**= *xyss*, where *x* is the frame, *y* is the shelf, and *ss* is the slot).

Card locations **1113** through **1118** cannot be specified for the **loc** parameter.

The frame and shelf portion of the specified **loc** parameter must be **11, 12, 13, 21, 22, 23, 31, 32, 33, 41, 42, 43, 51, 52, 53, or 61** (**loc**= *xyss*, where *x* is the frame, *y* is the shelf, and *ss* is the slot).

The **limatm**, **lime1atm**, **limds0**, **limocu**, **limv35**, **lime1**, **limt1**, **limch**, and **dcm** card types are the only valid card types for this command.

The card must be a LIM, an E1/T1 MIM, or an HC-MIM.

The specified card location must be equipped.

The **link** parameter values **a1, b1, a2, b2, a7, and b7** can be specified only for the following cards:

- A multi-port LIM card
- An SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**

- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card.
- An E5-ENET card running the **iplim** or **iplimi** application that supports 16 links (**a, b, a1-a7, b1-b7**)

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card.

The **link** parameter values **a4-a31** and **b4-b31** can be specified only for the HC-MIM card that is used as an E1 card or a T1 card. The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for Channel cards.

The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for even-numbered card locations.

If the card application is **ss7gx25**, **link=a** must be specified.

If the card application is **atmansi** or **atmitu**, **link=a** must be specified.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of the card locations.

;

Command Executed

**Legend**

**LOC**—The location of the card containing the signaling link.

**LINK**—The signaling link assigned to the card.

**LSN**—The name of the linkset containing the signaling link.

**SLC**—The signaling link code of the signaling link.

**TYPE**—The type of card.

**L2TSET**—The number of the level 2 timer set associated with the signaling link.

**BPS**—The transmission rate of the signaling link in bits per second.

**L1MODE**—The mode of operation used to select the link clocking source at layer 1.

**TSET**—An indicator of whether the transmitter signal element timing is on or off.

**ECM**—The basic of PC for transmission.

**PCRN1**—The MSU number.

**PCRN2**—The octet number.

**LPSET**—The ATM link parameter set identifier.

**ATMTSEL**—The ATM timing selector. Possible values are as follows:

**INTERNAL**—Derived from an internal clock source operating at 1.544 MHz  $\pm$  200 Hz (ANSI) or 2.048 MHz  $\pm$  103 Hz (ITU).

**EXTERNAL**—Derived from the High-Speed Master Clock (T1 or E1).

**LINE**—Derived from its received data stream, if present.

**VCI**—The ATM virtual channel identifier.

**VPI**—The ATM virtual path identifier.

**LL**—The ATM line length.

**E1PORT**—The E1 card port that has an E1 interface assigned to it.

**E1LOC**—The card location of an E1 card with an E1 interface assigned to it.

**T1PORT**—The T1 card port that has a T1 interface assigned to it.

**T1LOC**—The card location of a T1 card with a T1 interface assigned to it.

**TS**—The timeslot associated with the signaling link that is serviced by the E1 or T1 interface.

**E1ATMCRC4**—E1 ATM card CRC4 multi-frame structure enable/disable indicator.

**E1ATMSI**—Value of two Spare International bits of NFAS data for the E1 ATM card.

**E1ATMSN**—Value of five Spare National bits of NFAS data for the E1 ATM card.

**IPLIML2**—IPLIM Level 2 stack (SAALTALI, M2PA, or M3UA)

## rtrv-slt

## Retrieve Signaling Link Test Message

Use this command to display the fields of an SLTM (signaling link test message) record in the SLTM table.

**Keyword:** rtrv-slt

**Related Commands:** chg-l3t, chg-slt, ent-ls, rtrv-ls

**Command Class:** Database Administration

### Parameters

**:enabled=** (optional)

Displays the SLTM records that are either enabled (**on**) or disabled (**off**).

**Range:** on, off

**Default:** All SLTM records with the specified value for the enabled parameter are shown.

**:sltset=** (optional)

The signaling link test message (SLTM) record number in the SLTM table.

**Range:** 1-20

**Default:** Display all

### Example

```
rtrv-slt
```

```
rtrv-slt:sltset=1
```

```
rtrv-slt:enabled=off
```

### Dependencies

None

### Notes

**Legend**

**SLTSET**—The signaling link test message record number in the SLTM table.

**T1**—The T1 timer value for the SLTM record.

**T2**—The T2 timer value for the SLTM record.

**MODE**—The SLTM mode to be used when sending test messages.

**ENABLED**—Indicates whether the signaling link test message is enabled.

**PATTERN**—The test pattern to be sent with a signaling link test message.

**rtrv-spc****Retrieve Secondary Point Code**

Use this command to retrieve an SPC (secondary point code) from the active database.

**Keyword:** rtrv-spc

**Related Commands:** dlt-spc, ent-spc

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:spc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** spca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

The secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:spcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

### Example

**rtrv-spc**

**rtrv-spc:spc=5-3-3**

**rtrv-spc:spcn24=98-98-98**

**rtrv-spc:spcn=s-00345**

### Dependencies

The MPC feature must be turned on before this command can be entered.

The Spare Point Code Support feature must be enabled before a spare point code (prefix **s-**) can be specified in the command.

### Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

### Output

The following example shows the output for all provisioned secondary point codes. (SPC-N is a flexible point code format as defined with the **chg-stpopts:npcfmti** parameter).

**rtrv-spc**

```
rlghncxa03w 03-03-18 08:50:12 EST EAGLE 31.0.0

## rtrv-split-npa

## Retrieve Split NPANXX

Use this command to display all NPANXXs existing in a split mode in the database.

**NOTE: This command is obsolete.**

**NOTE: If the LNP ELAP Configuration feature is turned on, this command is no longer available. This function can be performed at the LSMS or using the ELAP user interface.**

**Keyword:** rtrv-split-npa

**Related Commands:** dlt-split-npa, ent-split-npa

**Command Class:** LNP Basic

### Parameters

**:enpanxx=** (optional)

End range numbering plan area and exchange.

**Range:** 6 digits

**Default:** Display all npanxx existing in a split mode in the database

**:force=** (optional)

Force command execution. The **force=yes** parameter must be specified when a value greater than **50** is specified for the **num** parameter, to display more than 50 entries in the command output.

**Range:**     **yes, no**

**Default:**   **no**

**:npanxx=** (optional)

Numbering plan area and exchange.

**Range:**     6 digits

**Default:**   Display all npanxx existing in a split mode in the database

**:num=** (optional)

Number of entries to be shown.

**Range:**     **1-50,000**

**Default:**   **1**—if the **npanxx** parameter is specified  
**50**—all other cases

**Example**

**rtrv-split-npa**

**rtrv-split-npa:npanxx=909335**

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

When the **enpanxx** parameter is specified, the **npanxx** parameter must be specified.

The **enpanxx** parameter value must be greater than the **npanxx** parameter value.

The **force=yes** parameter must be specified when the specified **num** parameter value is greater than **50**.

**Notes**

None

**Output****rtrv-split-npa**

```
rlghncxa03w 03-03-28 14:23:37 EST  EAGLE 31.3.0
NPANXX  NNPNANXX
909335  919336
919321  920461
```

;

**rtrv-split-npa:npanxx=9093355**

```
rlghncxa03w 03-03-28 14:23:37 EST  EAGLE 31.3.0
NPANXX  NEW NPANXX
9093355  9193366
```

;

**Legend**

**NPANXX**—The NPANXXs currently in the database.

**NEW NPANXX**—The new NPANXXs in the database.

**rtrv-srvsel****Retrieve Service Selector**

Use this command to display a list of administered service selector combinations. The list can be filtered using various parameter combinations.

**NOTE: The rtrv-srvsel operation may be lengthy because the service selector table can contain over 1,000 entries.**

**Keyword:** rtrv-srvsel

**Related Commands:** chg-srvsel, dlt-srvsel, ent-srvsel

**Command Class:** Database Administration

**Parameters**

**:force=** (optional)

The **force=yes** parameter must be specified when a **num** parameter value greater than **50** is specified to display more than 50 entries.

**Range:** yes, no

**Default:** no

**:gti/gtia/gtii/gtin/gtin24=** (optional)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national) and **gtin24** (24-bit ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

**Range:** Supported value for ANSI: **gti=2** and **gtia=2**

Supported values for ITU: **gtii=2, 4; gtin=2, 4, gtin24=2, 4**

**Default:** Display all

**:nai=** (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** sub, rsvd, natl, intl

**Default:** Display all

**:naiv=** (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** 0-127

**Default:** Display all

**:np=** (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** e164, generic, x121, f69, e210, e212, e214, private

**Default:** Display all

**:npv=** (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv**

parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** 0-15

**Default:** Display all

**:num=** (optional)

Number of entries to display. The **force=yes** parameter is required when this parameter value is specified greater than 50 entries.

**Range:** 0-20, 992

**Default:** 50

**:serv=** (optional)

The DSM service.

**Range:** **eir, gflex, gport, inpq, inpmr, mnpsms, smsmr, idps, idpr**

**eir**—Equipment Identity Register

**gflex**—GSM flexible numbering

**gport**—GSM number portability

**inpq**—INP query

**inpmr**—INP message relay

**mnpsms**—Portability Check for Mobile Originated SMS

**smsmr**—Prepaid SMS Intercept

**idps**—IDP Screening for Prepaid

**idpr**—Prepaid IDP Query Relay

**Default:** Display all

**:snai=** (optional)

The service nature of address indicator.

**Range:** **sub, natl, intl, rnidn, rncdn, rnsdn, ccrndn**

**sub**—Subscriber number

**natl**—National significant number

**intl**—International number

**rnidn**—Routing number prefix and international dialed/directory number

**rncdn**—Routing number prefix and national dialed/directory number

**rnsdn**—Routing number prefix and subscriber dialed/directory number

**ccrndn**—Country code, routing number, and national directory number

**Default:** Display all

**:snp=** (optional)

The service numbering plan.

**Range:** **e164, e212, e214**

**e164**—E.164 numbering plan

**e212**—E.212 numbering plan

**e214**—E.214 numbering plan

**Default:** Display all

**:ssn=** (optional)

Subsystem number.

**Range:** 0-255 \*

**:tt=** (optional)

Translation type.

**Range:** 0-255

**Default:** Display all

**Example**

```
rtrv-srvsel
rtrv-srvsel:gtii=2
rtrv-srvsel:tt=0:np=e164
```

**Dependencies**

The G-Flex, G-Port, or INP feature must be turned on, or the Equipment Identity Register (EIR) feature must be enabled before this command can be entered.

The INP feature must be turned on before the **serv=inp** or **serv=inpq** parameter can be specified.

The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

The value **4** is not valid for the **gti/gtia** parameters.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, no **np(v)** and **nai(v)** parameter combinations can be specified.

When a **serv** parameter value of **inp**, **inpq**, **gport**, **eir**, **smsmr**, or **mnpsms** is specified, the **gtia** and **gti** parameters cannot be specified.

When the **serv=inp** parameter is specified, the **snp** parameter must be **e164** if it is specified.

When an **snai** parameter value of **rnidn**, **rndn**, or **rnsdn** is specified, the **serv** parameter value must be **inp**, **gport**, **smsmr**, or **mnpsms** if it is specified.

When the **serv=inpq** parameter is specified, the **gtii** parameter cannot be specified.

When an **snai** parameter value of **rnidn**, **rndn**, or **rnsdn** is specified, the **serv=gflex** parameter cannot be specified.

When a **serv** parameter value of **inpq** or **eir** is specified, the **snp** and **snai** parameters cannot be specified.

When the **snai=ccrndn** parameter is specified, a **serv** parameter value of **gport**, **smsmr**, or **mnpsms** must be specified.

When the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

When the **serv=idpr** parameter is specified, the only valid mandatory service parameters are **tt**, **ssn** and **gti/gtia/gtin/gtii**. When the **serv=idpr** parameter is specified, the only valid optional parameters are **np** and **nai**.

The IDP Screening for Prepaid feature must be turned on before the **serv=idps** parameter can be specified.

**Notes**

None

**Output**

The following example displays all provisioned service selectors:

**rtrv-stp****Retrieve STP Information**

Use this command to retrieve information related to the STP at which the command is entered.

The command can retrieve frame and card power consumption and threshold values (in Amps or milliAmps and Watts) for all provisioned frames or for a specified frame. (See the **ent-frm-pwr** command.)

The command can retrieve hardware configuration information (card location, board part number, revision, serial number, card type, card memory, GPL, and GPL version):

- For all provisioned STP frames and shelves
- For a specific provisioned frame
- For a specific provisioned shelf
- For a specific equipped card
- For all cards of the specified card type
- For all cards that contain the specified Board Part Number
- For all cards that are running the specified GPL or GPL version.

**Keyword:** **rtrv-stp**

**Related Commands:** **chg-frm-pwr**, **dlt-frm-pwr**, **ent-frm-pwr**, **rtrv-frm-pwr**

**Command Class:** Database Administration

## Parameters

### **:display=** (optional)

Display the power consumption and power threshold value for all provisioned frames or for one specific provisioned frame.

This parameter must be specified when the **frm** parameter is specified, to display the power information for one frame.

#### **Range:**      **power**

**power**—Display frame power information in the command output.

### **:frm=** (optional)

Frame ID. The command displays information for the specified provisioned frame.

#### **Range:**      **cf00, ef00, ef01, ef02, ef03, ef04**

**cf00**—Control Frame identifier

**ef00**—Identifier for the first Extension Frame

**ef01**—Identifier for the second Extension Frame

**ef02**—Identifier for the third Extension Frame

**ef03**—Identifier for the fourth Extension Frame

**ef04**—Identifier for the fifth Extension Frame

### **:gpl=** (optional)

Display hardware configuration information for all card locations equipped with cards that are running the specified GPL.

This parameter must be specified when the **ver** parameter is specified, to display information for a specific version of the GPL.

#### **Range:**      *xyyyyyy*

**atmansi**—The GPL is used by the LIM cards to support the high-speed ATM signaling link feature.

**atmitu**—The GPL is used by the E1 ATM cards to support the high-speed E1 ATM signaling link feature.

**blbepm**—A flash GPL containing the BIOS ROM image on EPM cards.

**blbios**—A flash GPL containing the BIOS ROM image on HC-MIM cards that are used for E1 or T1 signaling links.

**blepld**—A flash GPL containing the bit files for the CPLD on HC-MIM cards that are used for E1 or T1 signaling links.

**bldiag**—A flash GPL containing the diagnostic code on HC-MIM cards that are used for E1 or T1 signaling links.

**bldiag6**—A flash GPL containing the diagnostic code on E5-E1T1 cards and E5-ENET cards.

**blvxw**—A flash GPL containing the VxWorks operating system on HC-MIM cards that are used for E1 or T1 signaling links.

**blvxw6**—A flash GPL containing the VxWorks operating system on E5-E1T1 cards and E5-ENET cards

**bphmux**—This GPL is used to support Board PROM for HMUX flash memory.

**bphcap**—This GPL is used to support Board PROM for HCAP flash memory.

**bphcapt**—This GPL is used to support Board PROM for HCAP-T flash memory.

**bphmux**—This GPL is used to support Board PROM for HMUX flash memory.

**bpmpl**—This GPL is used to support Board PROM for MPL flash memory.

**bpmp1t**—This GPL is used to support Board PROM for E1/T1 flash memory and Board Prom for MPL-T flash memory.

**ccs7itu**—This GPL is used by the LIM cards for ITU-TSS MTP functions.

**cdu**—This GPL is used in the card manufacturing process.

**ebdablm**—This GPL is used by the TSM card for enhanced bulk download.

**ebdadcm**—This GPL is used by the DCM card to transmit the LSMS LNP database to the EAGLE 5 SAS at high speed over an ethernet connection for enhanced bulk download.

**emdc**—This GPL is used by the DCM card for CMIP/OSI measurement collection interface as defined by Telcordia GR-376.

**eoam**—This GPL is used by the GPSM-II card for enhanced OAM functions.

**eroute**—This GPL is used by the STC card to support integrated data acquisition for Sentinel and Integrated Message Feeder.

**gls**—This GPL is used by the TSM cards for downloading gateway screening to LIM cards.

**hipr**—The communication software used on the High Speed IMT Packet Router (HIPR) card.

**imt**—This GPL is the communication processor on the logical processing element (LPE).

**imtpci**—The communication software that operates the IMT bus on HC-MIM cards.

**ipghc**—This GPL is used by the E5-ENET card to support TCP/IP point-to-multipoint connectivity for both ANSI and ITU point codes.

**ipgwi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**iplhc**—This GPL is used by the E5-ENET card for TCP/IP point-to-point connectivity for both ANSI and ITU point codes.

**iplim**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes.

**iplimi**—This GPL is used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes.

**ips**—This GPL is used by the IPSM card for the IP User Interface feature.

**mcp**—This GPL is used by the MCPM card for the Measurements Platform feature.

**plde1t1**—A flash GPL that is used on HC-MIM cards for E1 and T1 signaling links.

**pldpmc1**—A flash GPL that is used on HC-MIM cards for E1 and T1 signaling links.

**sccp**—This GPL is used by the TSM card for the global title translation application.

**ss7ansi**—This GPL is used by the LIM cards for the MTP functionality.

**ss7epm**—This GPL is used by the E5-E1T1 cards to support the MTP functionality for both ANSI and ITU applications. The **ss7epm** GPL allows the card to support up to 32 signaling links for E1 and T1 functionality.

**ss7gx25**—This GPL is used by the LIM cards to support X.25 functionality.

**ss7hc**—This GPL is used to support the functionality for the HC-MIM (High Capacity Multi-Channel Interface Module) card. The HC-MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7hc** GPL allows the card to support up to 64 signaling links for E1 and T1 functions.

**ss7ipgw**—This GPL is used by the system to support TCP/IP point-to-multipoint connectivity.

**ss7ml**—This GPL is used to support the functionality for the multi-port LIM (MPL or MPL-T) card and the E1/T1 MIM (Multi-Channel Interface Module) card. The MPL cards run only the **ss7ansi** application on a LIMDS0 card (as in the command **ent-card:type=limds0:appl=ss7ansi**); the **ss7ml** GPL allows the card to support 8 signaling links rather than the usual 2 links for LIM cards. The MPL cards support only the DS0 interface. The E1/T1 MIM card runs either the **ss7ansi** or **ccs7itu** application; the **ss7ml** GPL allows the card to support 8 signaling links for E1 and T1 functions. The older E1 card supports 2 signaling links for E1 functions.

**stplan**—This GPL is used by the ACM card to support the STP LAN application.

**utility**—This GPL is used by the factory for testing, and when directed by Tekelec Technical Services.

**vcdu**—This GPL is used in the card manufacturing process.

**vsccp**—This GPL is used by the DSM card to support the G-Flex, G-Port, INP, and LNP ELAP Configuration features. If the G-Flex, G-Port, INP, or LNP ELAP Configuration feature is not turned on, and a DSM card is present, the VSCCP GPL processes normal GTT traffic.

**vxwslan**—This GPL is used by the SSEDCCM card to support the STP LAN application.

**:partnum=** (optional)

Display the hardware configuration for all card locations that contain a card with the specified Board Part Number.

**Range:** *zzz-zzzz-zz*

Specify the Board Part Number in the format *xxx-xxxx-xx*. See the Hardware Baseline appendix in the Feature Notice for a list of Board Part Numbers that are supported for the EAGLE release.

**:shelf=** (optional)

Display the hardware configuration information for all card locations in the specified EAGLE shelf.

**Range:** **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**:type=** (optional)

Display the hardware configuration information for all card locations that contain cards of the specified card type.

**Range:** **acmenet, dcm, dsm, ipsm, limatm, limatm, limch, limds0, lime1, lime1atm, limocu, limt1, limv35, mcpm, stc, tsm**

**:ver=** (optional)

Display the hardware configuration information for all the card locations that have cards with the specified GPL Type and the specified GPL Version. The version format is *major-minor-fix*.

**Range:** *major-minor-fix*

*major*—Range **0-255**

*minor*—Range **0-255**

*fix*—Range **0-255**

## Example

Retrieve the frame power information for all provisioned frames of the STP.

**rtrv-stp:display=power**

Retrieve the card level power information for the control frame in the STP

**rtrv-stp:display=power:frm=cf00**

Retrieve the hardware configuration information for the STP control shelf (shelf 1100).

**rtrv-stp:shelf=1100**

Retrieve the hardware configuration information for all cards equipped in the STP that have the specified Board Part Number.

**rtrv-stp:partnum=870-1275-01**

Retrieve the hardware configuration information for all provisioned TSM cards in the STP.

**rtrv-stp:type=tsm**

Retrieve the hardware configuration information for all cards in the STP that are running the ss7ansi GPL..

**rtrv-stp:gpl=ss7ansi**

Retrieve the hardware configuration information for all cards in the STP that are running the ss7ansi GPL version 027-010-001..

**rtrv-stp:gpl=ss7ansi:ver=027-010-000**

Retrieve the hardware configuration information for all provisioned frames in the STP.

**rtrv-stp****Dependencies**

The **display** parameter must be specified when the **frm** parameter is specified.

The **gpl** parameter must be specified when the **ver** parameter is specified.

Only one optional parameter can be specified in the command, except for the following parameter combinations:

- The **display** parameter must be specified when the **frm** parameter is specified.
- The **gpl** parameter must be specified when the **ver** parameter is specified.

The **frm** parameter value must specify a provisioned frame.

**Notes**

When the power threshold value has not been provisioned for a provisioned frame, the default frame power threshold value is displayed and prefixed with a plus sign (+).

For an un-provisioned card that is present in the frame, the card power consumption value is displayed prefixed with a plus sign (+).

For the TDM and MDAL cards in the Control Frame and for the MUX cards in all the frames, "TDM", "MDAL", or "MUX", respectively, is displayed as the Part Number of the card.

If the Board Part Number that is received in the BIP response from a particular card is not present in the Assembly Power table,

- The Part Number for the card is displayed prefixed by a plus sign (+)
- The default card power value of 1563 milliAmps is assumed and displayed for the card.

If board information is not available from a card,

- Dashes (-----) are displayed as the Part number for the card
- The default card power value of 1563 milliAmps is assumed and displayed for the card.

If a particular card location is empty (no card is present in that slot),

- "Empty" is displayed as the Part Number for the card

- A card power value of 0 is assumed and displayed.

For Standby GPSM and TDM cards, “Unavailable” is displayed as the Part Number if either the Standby GPSM card or TDM card is absent. In this case, the card power of the Active GPSM card is shown for the card power of the Standby GPSM card also.

## Output

The following example shows the hardware configuration information for a specific shelf.

### rtrv-stp:shelf=1100

```
tekelecstp 06-04-30 11:07:17 EST EAGLE 35.0.0

**Legend**

**FRAME**—Frame ID for the control shelf or an extension shelf

**POWER THRESHOLD**—The power threshold (in Amps or Milliamps and Watts) at which an alarm is generated to indicate that power consumption is approaching a maximum allowed level. (See the **ent-frm-pwr** command.)

**POWER CONSUMPTION**—The current calculated power consumption (in Amps or Milliamps and Watts) of the frame or card

**CARD**—Card Location

**PART NUMBER**—Board Part Number

**REV**—Board Part Number revision

**SERIAL NUMBER**—Card serial number

**TYPE**—Card type

**DB**—Daughterboard memory

**GPL**—The GPL that is running on the card

**GPL VERSION**—The version of the GPL that is running on the card

**rtrv-stpopts****Retrieve STP Options**

Use this command to retrieve the current value of the system's node-level processing option indicators maintained in the system's options table.

**Keyword:** **rtrv-stpopts**

**Related Commands:** **chg-stpopts**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-stpopts
```

**Dependencies**

None

**Notes**

The timer output for this command is in milliseconds, even though the timer could have been entered in seconds on the **chg-stpopts** command.

**Output**

The following example displays MTP STP options with no affecting features on. Certain features that are shown in other examples control changes and additional options in this option list:

The following example displays all MTP STP options. The following list indicates which options appear in the output when the associated features are on:

**NOTE: All options will not appear in actual output, because all features that cause these options to appear cannot be on in the system at the same time.**

- Cluster Routing and Management Diversity (CRMD) feature—MTPXLQ, MTPXLET, MTPXLOT
- MTP Restart (MTPRS or ITUMTPRS) feature—MTPRSI, MTPRSIT
- 6000, 7000, or 8000 Routesets feature—MTPDPCQ=6000 or 7000 or 8000
- GSM MAP Screening (GSMSCRN) feature—GSMDFLT, GSMDECERR
- GSM Mobile Number Portability (G-Port) feature, INAP Number Portability (INP) feature, or GSM Flexible Numbering (G-Flex) feature—DEFCC, DEFNDC, DSMAUD
- GSM Flexible Numbering (G-Flex) feature—ANSIGFLEX
- Network Security (NSE) feature—SECMTPMATE, SECMTPSID, SECMTPSNM, SECSCCPSCMG
- ANSI-ITU-China SCCP Conversion (SCCP Conversion) feature—CNVCGDA, CNVCGDI, CNVCGDN, CNVCGDN24, GTCNVDFLT

### ***Legend***

**MTPT31CTL**—MTP T31 congestion trigger level. The signaling link congestion level at which the system starts the level 3 t31 timer. When the level 3 t31 timer expires, the associated signaling link is removed from service for realignment.

**MTPLTI**—MTP loop test indicator. Specifies whether the MTP loop detection procedures are enabled or disabled at the system.

**MTPLTCTDPCQ**—MTP loop test congestion trigger DPC quantity. The number of most frequently occurring DPCs to which the MTP loop test messages are to be sent when the MTP loop test is triggered by congestion.

**MTPLTST**—MTP loop test supervision timer. The amount of time, in milliseconds, that the MTP loop test detection procedures run when started.

**MTPXLQ**—MTP x-list quantity. The number of dynamic status exception list (x-list) entries the system maintains.

**MTPXLET**—MTP x-list expiration time. The maximum amount of time the system maintains an unreferenced dynamic status exception list (x-list) entry.

**MTPXLOT**—MTP x-list occupancy threshold. The dynamic status exception list (x-list) occupancy threshold at which the system raises a minor alarm. The threshold is expressed as a percentage of space available.

**MTPDPCQ**—MTP destination point code quantity. The maximum number of DPCs that can be provisioned in the system.

**TFATFRPR**—TFA/TFR pacing rate. The amount of time, in milliseconds, between partial broadcasts of up to 20 percent increments of the number of TFAs/TCAs or TFRs/TCRs to be broadcast by the STP when an affected destination becomes accessible using its primary route rather

than an alternate route. The STP uses this pacing to prevent congestion on the newly-recovered linksets.

**MTPRSIT**—MTP Restart isolation timer. The minimum duration of node isolation, in milliseconds, before the MTP Restart procedure is deemed necessary.

**MTPRSI**—MTP Restart indicator. Specifies whether ANSI or ITU MTP Restart procedures are enabled or disabled at the STP.

**MTPLPRST**—MTP low priority route set test. Specifies whether low priority route set polling is enabled or disabled at the STP.

**MTPT10ALT**—MTP T10 alternate timer. Specifies the interval at which the STP performs a route set test on low priority routes.

**SLSCNV**—Per node SLS conversion indicator. Specifies whether SLS conversion is on, off, or performed per linkset (perls).

**UIMRD**—Unsolicited Information Message (UIM) redirect. Specifies whether specific UIMs are redirected to this output group.

**CRITALMINH**—Indicates whether the option that allows the inhibiting of critical alarms is enabled (yes) or disabled (no).

**DISPACTALMS**—Indicates whether to display active or total alarms in the alarm status area of the VT320 screen.

**NPCFMTI**—Defines how the ITU national point code is entered into the database and how it is displayed in any outputs from the system.

**GSMDFLT**—Indicates whether the GSM MAP screening default action is set to pass or discard.

**GSMDECERR**—Indicates whether the GSM MAP screening decode error action is set to pass or discard.

**DEFCC**—Defines the default country code.

**DEFNDC**—Defines the default network destination code.

**DSMAUD**—Indicates whether the DSM audit is running (on) or disabled (off).

**RANDSLS**—Displays the Random SLS setting.

**RTPLNPMRSS**—Displays the setting for reporting or suppressing UIM 1049 for LNP MR with missing subsystems.

**GR2878RGLBL**—Yes = use GR-2878-CORE HSL labels and data in SEAS output. No = HSL labels and data are not supported to SEAS.

**RSTRDEV**—Allow or disable restoration of device states when an **init-sys** command is executed, an OAM role changes, or a card reload occurs.

**SECMTPMATE**—Indicates Network Security screening for MTP messages received by an STP on a non-C-Link, with an OPC equal to the SID (True, Adjacent, or Capability) point code of its mate.

**SECMTPSID**—Indicates Network Security screening for MTP messages received at MTP3 containing an OPC equal to its own SID (OPC that is the True, Secondary, or Capability point code entered in the **chg-sid** command) that is not a route-set-congestion-message. The EAGLE 5 ISS should not receive a message with its own OPC unless the message is a result of a circular route test or is an SLTM when the far end is in loopback. (SLTM messages are not checked.)

**SECMTPSNM**—Indicates Network Security screening for MTP SNM messages. The EAGLE 5 ISS should not receive an MTP network management message unless:

- The OPC is an adjacent point code. (For all link types, this rule does not apply to UPU, TFC, and RCT messages.)

- The EAGLE 5 ISS has a route to the OPC of the MTP network management message on the linkset which the message was received.
- The EAGLE 5 ISS has a route to the destination field in the message (if applicable to the concerned message) on the linkset which the message was received. (For all link types, this rule is not applicable to RST messages.)

**SECSCCPSCMG**—Indicates Network Security screening for SCCP SCMG messages. This value applies only to SSP and SOR messages. SSA, SST, SOG, SBR, SNR and SRT messages are not affected. The EAGLE 5 ISS should not receive an SCCP network management message unless:

- The EAGLE 5 ISS has a route to the OPC of the SCMG message on the linkset on which the message was received.
- The EAGLE 5 ISS has a route to the Affected Point Code (also called the Concerned Point Code in EAGLE 5 ISS) in the message on the linkset on which the message was received.

**CNVCGDA**—Indicates whether or not to discard the CGPA PC in ANSI SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDI**—Indicates whether or not to discard the CGPA PC in ITU-I SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDN**—Indicates whether or not to discard the CGPA PC in ITU-N SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

**CNVCGDN24**—Indicates whether or not to discard the CGPA PC in 24-bit ITU-N SCCP messages if the PC or ALIAS PC of the destination network type is not defined.

**ANSIGFLEX**—Indicates enable or disable of ANSI G-Flex to execute at 1700 TPS per DSM card

**GT CNVDFLT**—Indicates enable or disable of routing of SCCP messages using system defaults when an appropriate entry is not found in the Default GT Conversion table.

**HSCLKLL**—High speed master clock line length option (SHORTHAUL, LONGHAUL)

**HSCLKSRC**—High speed master clock source

## rtrv-subnetid

## Retrieve Subnet ID

Use this command to retrieve a list of Subnet ID entries from the SUBNETID table, for the ISUP NP with EPAP feature.

**Keyword:** rtrv-subnetid

**Related Commands:** dlt-subnetid, ent-subnetid

**Command Class:** Database Administration

### Parameters

**:subnetnum=** (optional)

Subnet Number

**Range:** 1-5

### Example

rtrv-subnetid

rtrv-subnetid : subnetnum = 1

### Dependencies

The ISUP NP with EPAP feature must be enabled before this command can be entered.

**Notes**

None.

**Output**

When the command is entered with no parameter, the Subnet IDs for Subnet number 1 are listed in numerical order, followed by the Subnet IDs for Subnet number 2 in numerical order, and so on.

**rtrv-subnetid**

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
      Subnet
      ID      Number
-----
      886932      1
      886936      1
      886935      2
      886938      2
      886939      2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full
```

;

When a Subnet number is specified, the Subnet IDs for the specified Subnet number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

**rtrv-subnetid:subnetnum=2**

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0
      Subnet
      ID      Number
-----
      886935      2
      886938      2
      886939      2

Subnetidlen = 6

SUBNETID table is (5 of 50) 3% full
```

;

**rtrv-t1****Retrieve T1 Information**

Use this command to retrieve information for a specified T1 interface or for all T1 interfaces that have been defined by the **ent-t1** command for an E1/T1 card, an HC MIM card, or an E5-E1T1 card that is used as a T1 card. The following information can be retrieved: T1 port number, encoding/decoding, timing source, framing, channel bridging, and line length.

**Keyword:** **rtrv-t1**

**Related Commands:** **chg-t1, dlt-t1, ent-t1, tst-t1**

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

The card location of a T1 card, as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118,**

3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If not specified, all T1 card locations are listed.

**:t1port=** (optional)

T1 port number. The value must be a T1 port that has already been configured on the T1 card specified in the **loc** parameter.

**Range:** 1-8

Ports 3-8 are valid only for HC-MIM and E5-E1T1 cards.

**Default:** If not specified, all T1 ports are listed.

### Example

**rtrv-t1**

**rtrv-t1:loc=1307:t1port=2**

**rtrv-t1:loc=1311:t1port=1**

### Dependencies

The **loc** and **t1port** parameters must be specified together, if any parameters are specified for the command.

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The specified port (**t1port** parameter) on the card in the specified card location (**loc** parameter) must already have a defined T1 interface.

### Notes

None.

### Output

**rtrv-t1**

```
rlghncxa03w 03-03-20 09:07:58 EST EAGLE 31.3.0

1311  6      B8ZS    recovered SF      135  SLAVE
```

Card 1311, port 6 is channel bridged with port 5 for data pass through.

;

**Legend**

**LOC**—T1 card location in an EAGLE 5 ISS shelf.

**T1PORT**—T1 port number on an T1 card.

**ENCODE**—Indicator for use of B8ZS or AMI encoding/decoding.

**T1TSEL**—T1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair).

**FRAMING**—Framing format (SF or ESF).

**LL**—Line length; T1 cable length in feet between the EAGLE 5 ISS and the connecting node

**CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

**TSx**—Timeslot.

## rtrv-tbl-capacity

## Retrieve Table Capacity

Use this command to retrieve table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value.

**Keyword:** rtrv-tbl-capacity

**Related Commands:** rept-stat-xlist, rtrv-appl-rtkey, rtrv-appl-sock, rtrv-as, rtrv-asp, rtrv-assoc, rtrv-dstn, rtrv-gta,, rtrv-ls, rtrv-map, rtrv-scrset, rtrv-slk, rtrv-spc, rtrv-x25-dstn, rtrv-x25-slk

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-tbl-capacity**

### Dependencies

None

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

XLIST table information is shown only if the CRMD feature is ON.

Secondary Point Code (SPC) table information is shown only if the MPC feature is ON.

If the EGTT feature is ON then table name is GTA instead of GTT.

Additional information for each listed table can be displayed using the commands listed in Table 5-67.

Though the ASP table entries are now part of the IPAPSOCK table, EAGLE 5 ISS command entry and output still appear as though they are separate tables. The **rtrv-tbl-capacity** command shows the number of ASPs in the 4000-entry IPAPSOCK table.

**Table 5-67.** Retrieve Commands for Additional Table Information

| Command                | Table name | Description of table                     |
|------------------------|------------|------------------------------------------|
| <b>rept-stat-xlist</b> | XLIST      | Destination - Routeset Extension         |
| <b>rtrv-appl-sock</b>  | IPAPSOCK   | IP Socket/Association                    |
| <b>rtrv-appl-rtkey</b> | IPRTKEY    | IP Routing Key                           |
| <b>rtrv-as</b>         | AS         | Application Server                       |
| <b>rtrv-assoc</b>      | IPAPSOCK   | IP Socket/Association                    |
| <b>rtrv-dstn</b>       | DSTN       | Destination Routeset, Exception Routeset |
| <b>rtrv-gta</b>        | GTA        | Global Title Address                     |
| <b>rtrv-gtt</b>        | GTT        | Global Title Translation                 |
| <b>rtrv-ip-lnk</b>     | IP-LNK     | Internet Process Link                    |
| <b>rtrv-ls</b>         | LS         | Link Set                                 |
| <b>rtrv-map</b>        | MAP        | Mated Application                        |
| <b>rtrv-mrn</b>        | MRN        | Mated Relay Node                         |
| <b>rtrv-scrset</b>     | SCRSET     | Gateway Screening Screen Set             |
| <b>rtrv-slk</b>        | SLK        | Signal Link                              |
| <b>rtrv-spc</b>        | SPC        | Secondary Point Code                     |
| <b>rtrv-x25-dstn</b>   | X25-DSTN   | X.25 Destination                         |
| <b>rtrv-x25-slk</b>    | X25-SLK    | X.25 Signal Link                         |

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP-SERV reroute service.

## Output

The following example shows the output for the minimum table sizes in the system:

```
rtrv-tbl-capacity
tekelecstp 04-04-02 07:35:33 EST EAGLE 31.6.0
```

```

DSTN      table is (    200 of    2000) 10% full
XLIST     table is (      0 of     500)  0% full
X25-DSTN  table is (      0 of    1024)  0% full
SPC       table is (      0 of     40)  0% full
LS        table is (   512 of    1024) 50% full
SLK       table is (    48 of    1200)  4% full
X25-SLK   table is (      0 of    256)  0% full
IP-LNK    table is (    10 of     500)  2% full
MAP       table is (   256 of    1025) 25% full
GTT       table is ( 2700 of 270000)  1% full
SCRSET    table is (    50 of    255) 20% full
AS        table is (     5 of    250)  2% full
ASP       table is (     5 of   4000)  2% full
RTEKEY    table is (     2 of   2500)  1% full
IPAPSOCK  table is (   324 of   4000)  8% full
;

```

The following example shows the output for the maximum table sizes in the system. For the DSTN, SLK, GTT, and MAP tables, maximum values depend on the enabled feature quantity value applicable to the table in the system.

### rtrv-tbl-capacity

```

tekelecstp 04-04-02 07:35:33 EST  EAGLE 31.8.0

DSTN      table is (    600 of    8000) 10% full
XLIST     table is (      0 of     500)  0% full
X25-DSTN  table is (      0 of    1024)  0% full
SPC       table is (      0 of     40)  0% full
LS        table is (   512 of    1024) 50% full
SLK       table is (  1501 of    1500) 75% full
X25-SLK   table is (      0 of    256)  0% full
IP-LNK    table is (    10 of     500)  2% full
MAP       table is (  1500 of    3000) 50% full
GTT       table is (1000000 of 1000000) 100% full
SCRSET    table is (    25 of    255) 10% full
AS        table is (     5 of    250)  2% full
ASP       table is (     5 of   4000)  2% full
RTEKEY    table is (     2 of   2500)  1% full
IPAPSOCK  table is (   324 of   4000)  8% full
;

```

In the following example, the MRN table limit is 3000 entries and 12 entries are used for SCCP-SERV reroute.

### rtrv-tbl-capacity

```

tklc1090701 06-05-24 14:22:01 EST  EAGLE 34.3.0

DSTN      table is (   5940 of    6000) 99% full
XLIST     table is (      0 of     500)  0% full
X25-DSTN  table is (      0 of    1024)  0% full

;

Trm(#4) GPSM Enter UI command or 'exit':

**rtrv-th-alm****Retrieve Alarm Thresholds**

Use this command to retrieve following values

- Alarm threshold values for the system SCCP TPS
- Level 1 and Level 2 thresholds for generating alarms when provisioning levels of the TN, LRN, and LNP databases approach or exceed predetermined occupancy limits
- Thermal thresholds for generating alarms when HC-MIM, E5-E1T1, and E5-ENET card thermal limits are approached or exceeded

**Keyword:** rtrv-th-alm

**Related Commands:** chg-th-alm, rept-stat-sccp

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-th-alm**

**Dependencies**

Level 1 threshold values must be less than their corresponding level 2 threshold values

**Notes**

None

**Output****rtrv-th-alm**

```

tekelecstp 06-05-23 13:14:44 EST  EAGLE 35.0.0
Thermal Alarm Level 1:             92%
Thermal Alarm Level 2:             99%
SCCP TPS Threshold:                 80%
SCCP Calculation Method:            N
LNP TN  DB Alarm Level 1:           80%
LNP TN  DB Alarm Level 2:           95%
GTT SCCP Service Alarm Level 1:     10%
GTT SCCP Service Alarm Level 2:     20%
Non-GTT SCCP Service Alarm Level 1: 10%
Non-GTT SCCP Service Alarm Level 2: 20%
RTRV-TH-ALM: MASP A - COMPLTD.

```

;

**rtrv-th-sccp****Retrieve SCCP Alarm Thresholds**

Use this command to retrieve the value used for the system SCCP TPS (transactions-per-second) threshold alarm. An alarm triggers when the TPS for the EAGLE 5 ISS system is greater than the value set by the **chg-th-sccp** command.

**Keyword:** rtrv-th-sccp

**Related Commands:** chg-th-sccp, rept-stat-sccp

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-th-sccp**

**Dependencies**

None

**Notes**

None

**Output****rtrv-th-sccp**

```

rlghncxa03w 03-03-07 11:43:13 EST  EAGLE 31.3.0
Command entered at terminal #4.
SCCP TPS Threshold:  80 %
RTRV-TH-SCCP: MASP A - COMPLTD.

```

;

**rtrv-trbl****Retrieve Trouble**

Use this command to display detailed information for one or more troubles that are currently logged into the system.

**Keyword:** rtrv-trbl

**Related Commands:** act-alm-trns, dact-alm-trns, rept-stat-alm, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit

**Command Class:** System Maintenance

## Parameters

**:loc=** (mandatory)

The address of the card that is running the OAM from which logged trouble reports are to be displayed.

**Range:** 1113, 1115

**:mode=** (optional)

Display mode

**Range:** c, m

c—Continuous mode; shows troubles already logged and new troubles as they occur.

m—Manual mode; shows troubles on demand only

**Default:** c

**:num=** (optional)

The number of entries to be shown. This parameter determines how many records you want to display (potentially within a given TN range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:** 1-12000000

1-50 if the **force=yes** parameter is not specified

1-12000000 if the **force=yes** parameter is specified

**Default:** 1—if only the **tn** parameter is specified and the **etn** parameter is not specified

50—all other cases

**:num=** (optional)

Indicates how many troubles to display.

**Range:** 1-99

**Default:** 99

## Example

```
rtrv-trbl:loc=1113:num=2
```

## Dependencies

At least one trouble must be in the trouble log, or the command is rejected.

Only one **rtrv-trbl** or **rtrv-obit** command can be in progress at a time.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

The card specified by the **loc** parameter must be **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

## Notes

When a trouble is generated in the system, it is logged into the RAM storage area of the active OAM. Each OAM can store up to 99 troubles in a queue. If the OAM resets, logged troubles are lost.

## Output

The output from this command should be reviewed with a member of the Tekelec Technical Services Team. You can contact Tekelec Technical Services at (888) FOR-TKLC.

```
rtrv-trbl:loc=1113:num=2
```

## rtrv-trbltx

## Retrieve Trouble Text Table Entries

Use this command to retrieve Alarm and UIM message information including MRN (message reference number), level (for Alarms), Output Group, and text.

The default report displays all Alarms (in numerical order) and then all UIMs.

The optional parameters can be used to:

- Display a range of Alarms or UIMs (ranges spanning both Alarms and UIMs are not supported)
- Search for Alarms, UIMs, or both message types matching a specific Output Group
- Sort all entries by Output Group

**Keyword:** rtrv-trbltx

**Related Commands:**

**Command Class:** Database Administration

### Parameters

**:enum=** (optional)

The ending Message Reference Number (MRN) when specifying a range.

**Range:** 1-999 for Alarms, 1000-1499 for UIMs

**Default:** when **enum** is not specified,

If **snum** is specified, the **enum** value defaults to the specified **snum** value.

If **snum** is not specified and **type=all**, **type=uim**, or **type** not specified, the **enum** value defaults to 1499

If **snum** is not specified and **type=alarm**, the **enum** value defaults to 999

**:outgrp=** (optional)

The Output Group to sort or filter the Alarm/UIMs on.

**Range:** appserv, appss, card, clk, db, dbg, gtt, gws, link, lnpsdb, lnpsub, meas, mon, mps, pu, sa, seas, slan, sys, traf

**appserv**—Application Server

**appss**—Application Subsystem

**card**—Card

**clk**—Clock

**db**—Database

**dbg**—Debug

**gtt**—GTT Maintenance

**gws**—GWS Maintenance

**link**—Link Maintenance

**lnpsdb**—LNP Database

**lnpsub**—LNP Subsystem

**meas**—Measurements Maintenance

**mon**—Monitoring (Sentinel or IMF) Maintenance

**mps**—MPS Maintenance

**pu**—Program Update

**sa**—System Administration

**seas**—SEAS (Sentinel or IMF)  
**slan**—SLAN Maintenance  
**sys**—System Maintenance  
**traf**—Traffic  
**all**—retrieve information for all Output Groups  
**Default:** No sorting or filtering is done on Output Groups.

**:snum=** (optional)

A single Message Reference Number (MRN), or the starting MRN when specifying a range.

**Range:** **1-999 for Alarms, 1000-1499 for UIMs.**

**Default:** All message entries for the specified **type** are displayed.  
 For **type=all**, **type=alarm**, or **type** not specified—**snum** Default: **1**  
 For **type=uim**—**snum** Default: **1000**

**:type=** (optional)

The type of trouble text entry—Alarm, UIM, or both types—to display.

**Range:** **all, alarm, uim**

**all**—Both types are displayed

**alarm**—Only Alarm entries are displayed

**uim**—Only UIM entries are displayed

**Default:** **all**

### Example

```

rtrv-trbltx
rtrv-trbltx:type=alarm
rtrv-trbltx:type=uim
rtrv-trbltx:outgrp=sys
rtrv-trbltx:type=alarm:outgrp=all
rtrv-trbltx:snum=3
rtrv-trbltx:snum=1002
  
```

### Dependencies

If **enum** is specified, **snum** must be specified in the command.

The specified **enum** value must be greater than the specified **snum** value.

The specified **enum** value must be in the same range as the specified **snum** value (**1-999** for Alarms and **1000-1499** for UIMs). The range cannot span both types.

The specified **snum** and **enum** values must be in the range of the specified **type** (**1-999** for Alarms and **1000-1499** for UIMs).

When the **outgrp** parameter is specified, the **snum** and **enum** parameters cannot be specified.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To display a single Alarm or UIM, enter the Alarm or UIM MRN as the value of the **snum** parameter. Either do not specify the **enum** parameter or specify the **enum** parameter with the same value as the **snum** value.

If an unused MRN is specified as an **snum** parameter value, the header information is displayed without any Output Group header or MRN information.

If an **snum/enum** range is specified, and there are unused MRNs within that range, only the used MRNs are displayed.

## Output

The following example shows output when the command has no parameters. All entries are not shown; the list is long:

### rtrv-trbltx

**rtrv-trm****Retrieve Terminal**

Use this command to show the port configuration for all TDM terminals or a specified terminal. These ports are used to connect modems, printers, and terminals to the system. This command displays the following information: device type, data transmission rate, parity, type of flow control used, number of stop bits, number of data bits, and the type of unsolicited messages to be received.

**Keyword:** rtrv-trm**Related Commands:** act-echo, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rmv-trm, rst-trm**Command Class:** Database Administration

## Parameters

**:trm=** (optional)

Specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

**Range:** 1-40

**Default:** Display all

## Example

```
rtrv-trm:trm=3
```

```
rtrv-trm
```

## Dependencies

The IP User Interface feature must be enabled and turned on, and at least one IPSM card must be equipped, before **telnet** or **emsalm** type terminals with IDs 17 - 40 can be specified.

The specified terminal must be equipped.

## Notes

The LNPDB and LNPSUP columns in the output report will be displayed only if the LNP feature has been turned on (see the **enable-ctrl-feat** command).

## Output

The following example, with the LNP feature turned on, shows the display of the terminal settings for terminal port 3, which is configured for a terminal:

**Legend**

Part one of the **rtrv-trm** report contains these fields:

**TRM**—The TDM terminal port number associated with the output device.

**TYPE**—The type of output device that is connected.

**COMM**—This field is composed of four communication attributes in the format *baud-dbts-prty-sb*. The parts are:

**BAUD**—The serial port baud rate of the output device

**DBTS**—The number of data bits used by the output device

**PRTY**—The parity of the output device

**SB**—The number of stop bits used in communications with the output device

**FC**—The type of protocol used between the system and the output devices.

**TMOUT**—Shows the maximum amount of time (in minutes) that a login session can remain idle.

**MXINV**—Shows the login/unlock failure threshold.

**DURAL**—Shows the length of time (in seconds, minutes, and hours) the terminal is disabled after each failed login/unlock attempt in excess of the threshold configured with the **mxinv** parameter.

**SECURE**—Indicates whether the OA&M IP Security Enhancements feature is turned on or off for Telnet terminals.

Part two of the **rtrv-trm** report contains these fields:

**TRM**—The TDM terminal associated with the output device.

**TRAF**—Shows whether traffic-related unsolicited messages are received by the output device.

**LINK**—Shows whether link-related unsolicited messages are received by the output device.

**SA**—Shows whether security administration-related unsolicited messages are received by the output device.

**SYS**—Shows whether system maintenance-related unsolicited messages are received by the output device.

**PU**—Shows whether program update-related unsolicited messages are received by the output device.

**DB**—Shows whether database-related unsolicited messages are received by the output device.

**UIMRD**—Shows whether Unsolicited Information Messages (UIMs) specific to the group are received by the output device.

If the LNP feature is turned on, the following fields are displayed:

**LNPDDB**—Shows whether LNP database-related unsolicited messages are received by the output device.

**LNPSUB**—Shows whether LNP subscription-related unsolicited messages are received by the output device.

Part three of the **rtrv-trm** report contains these fields:

**APP SERV**—Shows whether Application Server unsolicited messages are received by the output device.

**APP SS**—Shows whether Application Subsystem unsolicited messages are received by the output device.

**CARD**—Shows whether Card unsolicited messages are received by the output device.

**CLK**—Shows whether Clock unsolicited messages are received by the output device.

**DBG**—Shows whether Debug unsolicited messages are received by the output device.

**GTT**—Shows whether GTT unsolicited messages are received by the output device.

**GWS**—Shows whether GWS unsolicited messages are received by the output device.

**MEAS**—Shows whether Measurements Maintenance unsolicited messages are received by the output device.

**MON**—Shows whether Monitor unsolicited messages are received by the output device.

**MPS**—Shows whether MPS unsolicited messages are received by the output device.

**SEAS**—Shows whether SEAS Maintenance unsolicited messages are received by the output device.

**SLAN**—Shows whether STP LAN unsolicited messages are received by the output device.

## **rtrv-tt**

## **Retrieve Translation Type**

Use this command to show the translation types that are currently defined in the system database for global title translations.

**NOTE:** If the EGTT (Enhanced Global Title Translation) feature is turned on in your system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).

**Keyword:** rtrv-tt

**Related Commands:** dlt-tt, ent-tt

**Command Class:** Database Administration

## Parameters

**:alias=** (optional)

The alias of the global title translation type

**Range:** 0-255

**Default:** Display all

**:ttn=** (optional)

Translation type name.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** Display all

**:type/typea/typei/typen/typen24=** (optional)

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

**Range:** 0-255

**Default:** No translation type is specified

## Example

**rtrv-tt**

**rtrv-tt:type=230**

**rtrv-tt:ttn=lidb**

**rtrv-tt:type=230:ttn=lidb**

**rtrv-tt:type=230:ttn=lidb:alias=012**

## Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (\*) parameter values are not allowed for this command.

The translation type must exist in the translation table. If either or both parameters are given, they must be the same as the values entered with the **ent-tt** command. If the translation name is specified, it must be associated with a translation type.

If a translation type is specified, it must already exist in the database for the network type and cannot be an alias.

If both translation type and translation type name are specified, the translation type name must correspond to the specified translation type.

If an alias is specified with a translation type and/or translation type name, the alias must exist in the database for the specified network type, and it cannot be a translation type.

If an alias is specified without a translation type or translation type name, the alias must exist in the database for at least one of the network types. If it exists, the entries and the mapped translation type entries that exist in the database for all network types are displayed.

**Notes**

If a translation type, translation type name, or both, are specified, the translation type entry and all aliases mapped to that translation type are displayed.

**Output****rtrv-tt**

### Legend

**TYPEA/TYPEI/TYPEN/TYPEN24**—The global title translation type.

**TTN**—The name of the global title translation type.

**NDGT**—The number of digits in the global title translation type

**ALIAS**—The alias global title translation type.

## rtrv-ttmap

## Display Translation Type Mapping

Use this command to display a mapped SS7 message translation type (TT) for a given gateway linkset name. This command can be used to display the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping, see which linkset the mapping applies to, and see whether the mapping applies to incoming or outgoing messages.

**Keyword:** **rtrv-ttmap**

**Related Commands:** **chg-ttmap, dlt-ttmap, ent-ttmap**

**Command Class:** Database Administration

### Parameters

**:ett=** (optional)

Translation type before mapping. The identification of the type of allowed global title translation in the SS7 message *prior to* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** **0-255**

**Default:** Display all types allowed

**:io=** (optional)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

**Range:** **i, o**

**i**—incoming

**o**—outgoing

**Default:** Both incoming and outgoing

**:lsn=** (optional)

Linkset name

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

### Example

```
rtrv-ttmap
rtrv-ttmap:lsn=nc001
rtrv-ttmap:lsn=nc001:io=i:ett=128
rtrv-ttmap:io=i:ett=128
rtrv-ttmap:ett=128
rtrv-ttmap:ett=40
```

### Dependencies

The linkset must be defined.

The memory space accounting report (MSAR) is not produced when the **io** parameter, **ett** parameter, or both are specified, because the statistics presented may be misleading.

### Notes

The order of display is by linkset index + I/O + ETT.

### Output

```

## rtrv-uim-acthresh

## Retrieve Activity Level Threshold for STP UIM Activity Reporting

Use this command to query the UIM number, limit, and interval period parameters that are used to report the thresholding of UIM messages.

**Keyword:** **rtrv-uim-acthresh**

**Related Commands:** **dlt-uim-acthresh**, **set-uim-acthresh**

**Command Class:** Database Administration

### Parameters

**:uimn=** (optional)  
The UIM number.  
**Range:** **1000-1499**  
**Default:** Display all

### Example

Display UIM number 1333 threshold:

**rtrv-uim-acthresh:uimn=1333**

Display the threshold for all UIMs that have been set:

**rtrv-uim-acthresh**

### Dependencies

If specified, the **uimn** parameter value must be four numeric characters in the range **1000–1499**.

The **uimn** parameter value, if specified, must exist in the system Trouble Text Table.

### Notes

None

### Output

```

rtrv-uim-acthresh:uimn=1333
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100        5
The UIM Threshold Table is (1 of 499) 1% full.

```

```

rtrv-uim-acthresh
rlghncxa03w 03-11-01 08:50:12 EST  EAGLE 31.3.0
UIMN      LIMIT      INTRVL
1333      100        5
1444      200       15
1155      50         30
The UIM Threshold Table is (3 of 499) 1% full.

```

**rtrv-user****Retrieve User**

Use this command to show the information about the user currently logged on to the terminal from which this command was entered.

**Keyword:** rtrv-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rept-stat-user, rtrv-secu-user

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**rtrv-user**

**Dependencies**

This command cannot be entered from a SEAS terminal, because a SEAS terminal has no user ID associated with it.

**Notes**

The password is not shown.

This command shows the command class privileges for the user logged onto the system. No other users are shown.

All users have access to this command.

**Output**

The following example shows the display when the LNP feature is turned on and the Command Class Management feature is turned on:

**rtrv-user**

```
rlghncxca03w 03-11-07 09:50:17 EST EAGLE 31.3.0
user id      age page uout rev link sa sys pu db dbg
manny        36 60 60 NO YES YES YES YES YES YES YES

u01 u02 u03 u04 u05 u06 u07 u08 u09 u10 u11 u12 u13 u14 u15 u16
NO NO NO NO YES YES YES YES YES YES YES YES YES YES YES YES

u17 u18 u19 u20 u21 u22 u23 u24 u25 u26 u27 u28 u29 u30 u31 u32
YES YES YES YES YES YES YES YES YES YES YES YES YES YES YES YES
```

;

The following example shows the display when the LNP feature is not turned on and the Command Class Management feature is not turned on:

**rtrv-user**

```
rlghncxca03w 03-11-07 09:50:17 EST EAGLE 31.3.0
USER ID      LINK SA SYS PU DB DBG
eagle        YES YES YES YES YES YES

USER ID      AGE PAGE UOUT REV
eagle        750 0 0 NO
```

;

**Legend**

**USER ID**—The name of the user.

**AGE**—Shows the current age, in days, of the password associated with this user ID. If the password age is greater than 999 days, the value **999** is displayed.

**PAGE**—Shows the maximum password age established for this user ID. When AGE becomes greater than PAGE, the system forces the user to change the password at the next login. An asterisk (\*) displayed after the value indicates that the system-wide default page parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**UOUT**—Shows the user ID aging interval, in days. If the user ID is not used (that is, no successful login) for longer than this interval, the system does not allow a login. An asterisk (\*) displayed after the value indicates that the system-wide default uout parameter value, as configured on the **chg-secu-dflt** command, is in effect for the user ID.

**REV**—Shows whether the user ID is denied login (revoked). **YES** indicates that the user ID is revoked, **NO** indicates that the user ID is not revoked.

**LINK** —Shows whether the user has access to all commands in the Link Maintenance command class.

**SA** —Shows whether the user has access to all commands in the Security Administration command class.

**SYS** —Shows whether the user has access to all commands in the System Maintenance command class.

**PU**—Shows whether the user has access to all commands in the Program Update command class.

**DB** —Shows whether the user has access to all commands in the Database Administration command class.

**DBG**—Shows whether the user has access to all commands in the Debug command class.

If the Command Class Management feature is enabled and turned on, the following fields are displayed:

**U01 - U32**—Default configurable command class names. If user-defined names have been provisioned, they will appear instead of the default names.

If the LNP feature is turned on, the following fields are displayed:

**LNPBAS**—Shows whether the user has access to all commands in the LNP Basic command class.

**LNPDDB**—Shows whether the user has access to all commands in the LNP Database command class.

**LNPSUB**—Shows whether the user has access to all commands in the LNP Subscription command class.

**rtrv-vendid****Retrieve Vendor ID**

Use this command to retrieve a list of Vendor ID entries from the VENDID table, for the GSM MAP SRI Redirect to Serving HLR feature.

**Keyword:** **rtrv-vendid**

**Related Commands:** **dlt-vendid**,

**Command Class:** Database Administration

**Parameters**

**:vendnum=** (optional)  
Vendor Number

**Range:** 1-3

### Example

**rtrv-vendid**

**rtrv-vendid:vendnum=1**

### Dependencies

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

### Notes

None.

### Output

When the command is entered with no parameter, the Vendor Types are listed in numerical order. The Vendor Numbers for each Vendor Type are listed in numerical order, followed by the Vendor ID for each Vendor Number.

#### rtrv-vendid

```
tekelecstp 04-09-21 16:11:21 EST EAGLE 31.11.0
Vendor      Vendor      Vendor
Type        Number      ID
-----
1           1          123123123456789
1           1          1234567890abcde
1           2          112233445566778
1           2          214365870912543
2           3          098765432112345
2           3          098767890143251
```

VENDID table is (5 of 200) 3% full

;

When a Vendor number is specified, the Vendor Type and Vendor IDs for the specified Vendor number are listed in numerical order. The table capacity line shows the total number of entries in use, not just the number of entries displayed.

#### rtrv-vendid:vendnum=2

```
tekelecstp 04-09-21 16:13:54 EST EAGLE 31.11.0

## rtrv-x25-dstn

### Retrieve X.25 Destination

Use this command to show the associations between X.25 network addresses and SS7 point codes. If the node is actually in the X.25 domain, the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address. X.25 destinations are shown in order of entry.

**Keyword:** rtrv-x25-dstn

**Related Commands:** chg-x25-dstn, dlt-x25-dstn, ent-x25-dstn

**Command Class:** Database Administration

## Parameters

**:dpc=** (optional)

Specifies the value used to set the destination point code field in the routing label of the MSU. The point code is an ANSI point code in the format of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **dpca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:xaddr=** (optional)

The X.25 network address of the X.25 destination entity or the SS7 node

**Range:** 1-15 digits

**Default:** Display all

## Example

**rtrv-x25-dstn**

**rtrv-x25-dstn:xaddr=220525586456772**

**rtrv-x25-dstn:dpc=133-13-1**

## Dependencies

If an X.25 address is specified, it must contain a minimum of four digits and must be in the X.25 destination table.

If a destination point code is specified, it must be assigned to at least one X.25 address.

The X.25 SS7 ANSI destination point code must be a full point code (ni-nc-ncm).

## Notes

None

## Output

**rtrv-x25-dstn**

### Legend

**X25 ADDR**—The X.25 address of the X.25 destination or the SS7 node

**SS7 DPC**—The SS7 destination point code.

**SSN**—The subsystem number associated with the SS7 DPC.

## rtrv-x25-rte

### Retrieve X.25 Route

Use this command to show the routing parameters needed by the gateway portion of the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system.

**Keyword:** **rtrv-x25-rte**

**Related Commands:** **chg-x25-rte**, **dlt-x25-rte**, **ent-x25-rte**

**Command Class:** Database Administration

### Parameters

**:lc=** (optional)

The number of the logical channel on the X.25 signaling link that the PVC connection is assigned to. For automatic virtual circuits and remote virtual circuits, the logical channel number is arbitrary and cannot be specified.

**Range:** **1-255**

**Default:** Display all

**:lc2nm=** (optional)

Generates network management for failures and recoveries of logical channels. When the logical channel being used to carry data fails, the Database Transport Access (DTA) feature requires that traffic be diverted to alternate routes. The Logical Channel to Network Management Mapping (LC2NM) feature handles this process.

**Range:** **yes, no**

**Default:** Display all

**:loc=** (optional)

The card location containing the X.25 signaling link that will sustain the connection. For an automatic virtual circuit, this link is the link on which the system initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All card locations are shown.

**:port=** (optional)

The port on the card containing the X.25 signaling link.

**Range:** **a**

**Default:** **a**

**:rt=** (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) route on X.25 destination point code (XPC), and (2) route using X.25 origination and destination point code combinations (PC).

**Range:** **xpc, pc**

**Default:** Display all

**:saddr=** (optional)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

**Range:** 1-15 digits

**Default:** All X.25 addresses assigned to the SS7 destination entity are shown.

**:type=** (optional)

The type of X.25 connection that the link is expected to maintain.

**Range:** **pvc, svca, sver**

**pvc**—Permanent virtual circuit

**svca**—automatic virtual circuit

**sver**—remote virtual circuit

**Default:** Display all

**:xaddr=** (optional)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

**Range:** 1-15 digits

**Default:** All X.25 addresses assigned to the SS7 destination entity are shown.

### Example

**rtrv-x25-rte**

**rtrv-x25-rte:xaddr=345454**

**rtrv-x25-rte:saddr=4545434**

**rtrv-x25-rte:xaddr=345454:saddr=4545434**

**rtrv-x25-rte:loc=1201:port=a:lc=2**

**rtrv-x25-rte:loc=1201:port=a**

**rtrv-x25-rte:type=avc**

**rtrv-x25-rte:rt=xpc**

**rtrv-x25-rte:lc2nm=no**

### Dependencies

Each X.25 address must have at least four digits.

If the **port** parameter is specified, the **loc** parameter must be specified.

If the **lc** parameter is specified, both the **loc** and **port** parameters must be specified.

The **limds0**, **limocu**, and **limv35** card types are the only valid card types for this command. These card types must be running the ss7gx25 GPL type.

The shelf and card must be equipped.

If **lc2nm=yes** is specified, **rt=pc** cannot be specified.

### Notes

None

## Output

**set-gtwy-acthresh****Set Gateway Thresholds**

Use this command to set or change the level of activity thresholds to be used when reporting gateway screening activity. The STP reports screening activity only if the threshold is set and only if the threshold is reached. The thresholds are set on a linkset basis.

**Keyword:** **set-gtwy-acthresh****Related Commands:** **rtrv-gtwy-acthresh****Command Class:** Database Administration**Parameters****:intrvl=** (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:**       **5, 10, 15, 20, 30**System Default: **0** (this value indicates that thresholds are not set)**:lsn=** (mandatory)

Linkset name

**Range:**       *aaaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**:recv=** (optional)

Received message threshold. The threshold for MSUs received on the gateway linkset.

**Range:**       **0-999999****Default:**     The current value**:rej=** (optional)

Reject threshold. The threshold for MSUs rejected on the gateway linkset because of screening.

**Range:**       **0-999999****Default:**     The current value

**Example**

The following example shows how to set the linkset wy644368 rejection threshold to 100, with a 15 minute interval.

**set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15**

The following example shows how to set the linkset wy644368 message threshold to 1000 and the rejection threshold to 300, with an interval of 20 minutes.

**set-gtwy-acthresh:lsn=wy644368:intrv=20:rej=300:recv=1000**

The following example shows how to set the linkset wy644368 so that no activity messages are produced.

**set-gtwy-acthresh:lsn=wy644368:intrv=5:rej=0:recv=0**

**Dependencies**

At least one optional parameter must be specified.

The linkset specified must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

The value specified for INTRVL parameter is not one of **5, 10, 15, 20** or **30** minutes.

**Notes**

None

**Output**

**set-gtwy-acthresh:lsn=wy644368:rej=100:intrvl=15**

**set-scrrej-prmtrs****Set Parameters for SS7 Message-Rejection Reporting**

Use this command to change the STP values that limit the display of MSUs rejected because of gateway screening notification messages that could become excessive. The new values overwrite the existing values.

**Keyword:** set-scrrej-prmtrs

**Related Commands:** rtrv-gtwy-acthresh, rtrv-gtwy-prmtrs, set-gtwy-acthresh

**Command Class:** Database Administration

**Parameters**

**:intrvl=** (mandatory)

Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**Range:** 5, 10, 15, 20, 30

**:limit=** (mandatory)

Threshold not to be exceeded.

**Range:** 0-999999

**Example**

**set-scrrej-prmtrs:limit=200:intrvl=10**

**Dependencies**

The value specified for INTRVL parameter is not one of 5, 10, 15, 20 or 30 minutes.

**Notes**

None

**Output**

**set-scrrej-prmtrs:limit=200:intrvl=10**

```

**set-time****Set Time**

Use this command to set the system clock. The clock is used to determine when measurements collection takes place as well as several other time-driven events.

**Keyword:** **set-time**

**Related Commands:** **set-date**

**Command Class:** Security Administration

**Parameters**

**:time=** (mandatory)

The system time that is to be reflected on all reports and output messages.

**Range:** **0000-2359**

*hhmm* where *hh* = **00-23** (hour) and *mm* = **00-59** (minute)

**:tz=** (optional)

The time zone

**Range:** **est, edt, cst, cdt, mst, mdt, pst, pdt, hst, hdt, ast, adt, gmt, wet, west, utc, bst, cet, cest, met, mest, fwt, fst, eet, eest, sast, msk, msd, ist, idt, cct, awst, awdt, rok, acst, acdt, aest, aedt, nzst, nzdt, akst, akdt, nst, ndt, bra**

The time zones are described in Table 5-68.

**Default:** Current value

**Table 5-68.** Time Zones Set by the **set-time** command

| Abbreviation | Time Zone              | Abbreviation | Time Zone              |

**Example**

```
set-time:time=1432:tz=est
```

**Dependencies**

None

**Notes**

None

**Output**

```
set-time:time=1432:tz=est
rlghncxa03w 02-11-07 14:32:28 EST EAGLE 30.0.0
Time set complete.
;
```

**set-uim-acthresh****Set Activity Level Thresholds for STP UIM  
Activity Reporting**

Use this command to set or change the level-of-activity threshold for reporting UIM messages. The system suppresses the generation of UIM messages when message generation exceeds the threshold that was defined for the interval period. The values are set within five seconds after the command was entered. Any previous count is cleared and the new or changed threshold and limit is enforced. Refer to “Configuring the UIM Threshold” in the *Database Administration Manual – System Management* for more information about UIM threshold configuration.

**Keyword:** set-uim-acthresh

**Related Commands:** dlt-uim-acthresh, rtrv-uim-acthresh

**Command Class:** Database Administration

**Parameters**

**:intrvl=** (mandatory)

The monitor interval in minutes.

**Range:** 5, 10, 15, 20, 25, 30

**Default:** Current value

**:uimn=** (mandatory)

The UIM number.

**Range:** 1000-1499

**:force=** (optional)

Required to set the **limit** parameter to **0** for a given interval.

**CAUTION:** Setting the limit to 0 turns off all occurrences of the specified UIM. Use this manner of creating thresholds only if you are certain you have specified the correct UIM.

**Range:** yes, no

**Default:** no force specified

**:limit=** (optional)

The message threshold.

**CAUTION:** Setting the limit to 0 will turn off all occurrences of the specified UIM. This can be dangerous if the wrong UIM number is specified by mistake. It is highly recommended that thresholds for UIMs are not set in this manner, but the ability is provided for certain extreme cases. The force parameter must be specified to set the limit to 0, and an additional scroll area message is issued.

**Range:** 0-9999

**Default:** Current value

### Example

Sets UIM number 1333 threshold to 100 in a 5-minute interval:

**set-uim-acthresh:uimn=1333:limit=100:intrvl=5**

Sets UIM number 1444 threshold to 200 in a 15-minute interval:

**set-uim-acthresh:uimn=1444:limit=200:intrvl=15**

### Dependencies

At least one optional parameter must be specified.

The **uimn** parameter value must be a numeric value in the range **1000–1499**.

The **limit** parameter value must be a numeric value in the range **0–9999**.

The **intrvl** parameter value must be one or two numeric characters with the following values: **5, 10, 15, 20, 25, 30**.

The **force=yes** parameter must be specified to set the **limit** parameter to **0** for a given interval. Setting the **limit** to **0** turns off all occurrences of the specified UIM. See the cautions under the **force** and **limit** parameters.

When creating a new UIM threshold, both the **limit** and **intrvl** parameters must be specified.

The specified **uimn** parameter value must exist in the system Trouble Text table.

### Notes

None

### Output

**set-uim-acthresh:uimn=1333:limit=100:intrvl=5**

```
rlghncxa03w 03-11-01 08:50:12 EST EAGLE 31.3.0
SET-UIM-ACTHRESH: MASP A - COMPLTD
;
```

**tst-bip****Test Board Identification PROM**

Use this command to test each byte of the specified board identification PROM (BIP) by reading and writing to the PROM. The test is performed for both the main assembly and applique BIPs.

**Keyword:** **tst-bip**

**Related Commands:** **chg-bip-fld**, **chg-bip-rec**, **rtrv-bip**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

HMUX and HIPR locations are not valid.

**Example**

**tst-bip:loc=1211**

**Dependencies**

The card location, frame, shelf, or slot must be within the allowed range.

The card location must be valid for the command.

The board type **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

The card specified by the **loc** parameter must be equipped in the database.

The card specified by the **loc** parameter must be in the OOS-MT-DSBLD state prior to BIP testing.

**Notes**

The specified card must be inhibited.

The **tst-bip** command verifies that the PROM is good by writing and reading to the PROM. The **rtrv-bip** command show the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communications to the card has failed, and the card should be replaced.

**Output**

**tst-bip:loc=1211**

```
rlghncxa03w 03-11-07 16:19:08 EST EAGLE 31.3.0

```

**tst-disk****Test Disk**

Use this command prior to an upgrade, or as a diagnostic tool, to test the integrity of an EAGLE 5 ISS disk, fixed (TDM) or removable (MDAL), at the specified location. The test is non-intrusive and non-destructive to the disk. A read-only test is executed for all logical blocks (LBAs) used on the specified target disk and a report identifying any bad or questionable LBAs is output.

**Keyword:** **tst-disk**

**Related Commands:** **copy-disk**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The location of the disk to be tested.

**Range:** **1114, 1116, 1117**

**:partition=** (optional)

Portion of disk to be tested. This parameter specifies the individual physical disk partition (1, 2, 3, or 4) or all defined partitions for a given disk size up to a maximum of 4 partitions.

**Range:** **1, 2, 3, 4, all**

**1, 2, 3, 4**—Tests the specified existing partition on the disk. Only the number or numbers for the partition or partitions that exist on the disk are valid. (For example, if the disk size allows only 2 partitions, **partition=3** and **partition=4** are invalid for that disk.)

**all**—Tests all existing partitions on the fixed disk or on one side of the removable disk

**Default:** **all**

**Example**

**tst-disk:loc=1116**

**Dependencies**

The card in the specified location (**loc**) must be a TDM or MDAL card.

The disk to be tested must be in service.

If a TDM location is specified, the TDM cannot be reserved (as when a **copy-disk** command is running).

The target drive must have low level format.

The **tst-disk** command can be run simultaneously on both TDMs, if entered from different terminals.

The removable disk can be tested simultaneously with the standby TDM but not with the active TDM.

To test the removable disk when **loc=1117** is specified, the disk must be inserted in the removable cartridge drive on the MDAL card.

The **partition=3** and **partition=4** values are invalid for a 4GB fixed drive. The only valid value for the 2.3 GB and 4.1 GB removable disks is **partition=1**. An error message will be generated for a disk that has been Formatted (**format-disk** command) but does not yet contain a DOS directory structure (created with the **copy-disk** command) when **partition= 1, 2, 3, 4, or all** is specified.

**Notes**

A physical fixed (TDM) or removable (MDAL) disk is formatted and given a DOS directory structure to define the number of physical partitions that the disk size can accommodate. (The logical partitions that contain database, backup, GPL, and measurements files are placed in these physical partitions, with no correlation between the physical numbers and the logical contents.)

For a fixed TDM disk, the **partition** parameter specifies the individual partition (1, 2, 3, or 4) or all existing partitions to be tested.

- One partition = 2 GB.
- The 4 GB drive contains two 2 GB partitions.
- The 9 GB drive and the 18 GB drive each contain four 2 GB partitions.
- The 9 GB drive contains four 2 GB partitions.
- Any disk space beyond the four 2 GB partitions is unused disk space (and always has been due to EAGLE DISK FAT structure used).

For a removable MDAL disk, each side of the disk will contain the maximum number of partitions (up to 4) that the disk size can accommodate. Only one side of the disk is tested with one **tst-disk** command. For example, a 2.3 GB removable disk has one partition on each side that is slightly larger than 1 GB. A 4.1 GB removable disk has one 2 GB partition on each side. Only **tst-disk:partition=1** is valid for either of these disks.

The **partition=all** value implies that testing starts with the first partition, then second, and so on, until the last existing disk partition is detected without skipping any non-existing or defined partitions.

Table 5-69 outlines execution time estimates based on disk capacity.

**Table 5-69.** Test Disk Execution Times

| Capacity                         | Nominal Execution Time                                                                                                           | Maximum Execution Time for 100% Errors |
|----------------------------------|----------------------------------------------------------------------------------------------------------------------------------|----------------------------------------|
| 4.0 GB                           | 40 minutes                                                                                                                       | 27.5 hours                             |
| 9.0 GB                           | 1 hour 45 minutes                                                                                                                | (Not determined)                       |
| 18 GB                            | 30 minutes (partition=1)<br>5 hours (partition=disk)<br>depending on amount of disk tested and EAGLE 5 ISS provisioning/activity | (Not determined)                       |
| 2.3 GB Magneto Optical Removable | 18 minutes                                                                                                                       | 7.4 hours                              |
| 4.1 GB Magneto Optical Removable | 25 minutes<br>(requires 806 MDAL)                                                                                                | 7.4 hours                              |
| 507 MB                           | 5 minutes                                                                                                                        | 3.4 hours                              |
| 2.0 GB                           | 20 minutes                                                                                                                       | 13.5 hours                             |
| 4.0 GB                           | 40 minutes                                                                                                                       | 27.5 hours                             |
| Magneto Optical Removable        | 20 minutes                                                                                                                       | 7.4 hours                              |

**Table 5-69.** Test Disk Execution Times

| Capacity          | Nominal Execution Time | Maximum Execution Time for 100% Errors |
|-------------------|------------------------|----------------------------------------|
| SyQuest Removable | 10 minutes             | 2 hours                                |

Nominal times for **tst-disk** command execution depend on the capacity of the disk being tested and assume that few or no errors are found. Maximum execution times are based on disk capacity, retry count, and retry delay. Each read error and retry may cause a delay of up to three seconds. If a TDM has 100% error sectors, the MASP will likely reset, terminating the disk test. A termination and reset will not occur, however, when testing the removable cartridge.

Because of the intense, sustained disk activity created when **tst-disk** is executed, concurrently performing other disk-based activities, such as prolonged LNP command entry or database backups, will result in performance degradation up to twice the usual execution time.

Because of the extended processing time required for large disks, a progress message is displayed every five minutes providing the current LBA and the total LBA count for the partition.

Specific errors are reported for the first 10 error occurrences. Thereafter, only the error count is tracked and summary results are reported upon completion.

## Output

### **tst-disk:loc=1116**

**tst-dlk****Test Data Link**

Use this command to test the specified TCP/IP data link. The TCP/IP data link is tested with an ethernet test that is an echo test type called ping.

**Keyword:** **tst-dlk**

**Related Commands:** **act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, rtrv-dlk**

**Command Class:** Link Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:type=** (mandatory)

The type of test to run.

**Range:** **ping**

**:ipaddr=** (optional)

The IP address of the remote host. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** **1-223, 0-255**

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Host IP

**:rc=** (optional)

The number of times the test is repeated.

**Range:** **1-15**

**Default:** **1**

**Example**

**tst-dlk: loc=1206:type=ping**

**Dependencies**

No other action command can be in progress when this command is entered.

The card location must contain an ACM.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If a test repeat count (**rc**) is not entered, the test is not repeated.

If a data link test is in progress, another data link test cannot be started.

**Notes**

None

**tst-e1****Test E1 Port**

Use this command to test HC-MIM and E5-E1T1 E1 ports. The loopback parameter provides the ability to select local transceiver (**lxvr**) and line loopback tests.

The **tst-e1** command is rejected if a loopback test is not compatible with the port type.

**Keyword:** **tst-e1**

**Related Commands:** **chg-e1, dlt-e1, ent-e1, rtrv-e1**

**Command Class:** System Maintenance

**Parameters**

**:e1port=** (mandatory)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified HC-MIM or E5-E1T1 E1 card.

**Range:** **1-8**

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:loc=** (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:** **start, stop**

**Default:** **start**

**:loopback=** (optional)

Select loopback test type.

**Range:** **line, lxvr**

**Default:** **lxvr**

**Example**

**tst-e1:e1port=1:loc=1203:loopback=lxvr**

**tst-e1:e1port=1:loc=1203:action=stop**

## Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **lime1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified E1 port (**e1port** parameter) on the card (**loc** parameter) must have a defined E1 interface.

All signaling links that provide timeslots serviced by E1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl**) when this command is entered.

Only one port test can be running on an E1 port (**e1port** parameter) at one time.

When the **action=stop** parameter is specified, the **loopback** parameter cannot be specified.

The **action=stop** parameter can be specified only when a port test is running.

## Notes

This command can be used for only HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on an E1 port. When a port test is in progress on an E1 port, subsequent test requests are rejected.

## Output

**tst-e1:e1port=1:loc=1203:loopback=lxvr**

```
rlghncxa03w 05-01-07 16:19:08 EST  EAGLE5 33.0.0
Command Accepted: Test Port message is sent.

rlghncxa03w 05-01-07 16:19:08 EST  EAGLE5 33.0.0
Command Completed.
;
```

## tst-imt

## Test IMT Bus

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to determine the location of faults on a failed or abnormal IMT bus. The alternate bus state must be IS-NR. The target bus state must be OOS-MT-DSBLD. Notice: IMT Fault test terminated. Non-Standard cabling or IMT Bus-X state change detected.

**NOTE:** At least one card must be populated in each EAGLE 5 ISS shelf to allow **tst-imt** the opportunity to successfully execute. The card does not need to be a provisioned card; the card must be in IS-NR state on both IMT busses before the **tst-imt** command is entered. If an empty shelf does exist in the EAGLE 5 ISS, the following text is displayed when you try to run **tst-imt**:

**Keyword:** **tst-imt**

**Related Commands:** **clr-imt-stats**, **init-imt-gpl**, **rept-imt-lvl1**, **rept-imt-lvl2**

**Command Class:** System Maintenance

## Parameters

**:bus=** (mandatory)

The IMT bus to test.

**Range:**     **a, b**

## Example

**tst-imt:bus=a**

**tst-imt:bus=b**

## Dependencies

A related IMT command must not be in progress. Only one fault isolation test can be active at a time.

This command cannot be entered if the alternate bus is other than in service - normal (IS-NR).

This command cannot be entered if the target bus is other than out of service - maintenance disabled (OOS-MT-DSBLD).

This command cannot be entered during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

## Notes

Probable causes are listed in order of most probable to least probable. The listed components should be replaced in order listed by the output of the **tst-imt** command.

Multiple, masking points of failure can occur in the same bus segment. Such faults are reported as a single bus segment fault. Because running this command on a system with no IMT bus faults prints an indication that no faults were found, you can iteratively replace components and run this test until all components in the segment are ruled out.

A detection of an IMT address mismatch indicates a faulty backplane or card.

A detection of an inconsistency with a particular card's IMT card list indicates an error of unknown origin, probably due to one or more lost messages.

When the **tst-imt** command completes, either through normal termination of the command or because the command was ended for another reason, you must administratively enable the target bus. If all faults have meanwhile been isolated and corrected, the target bus becomes operational.

When a fault is detected, the possible error sources are listed in order from the most likely to the least likely. This ordering is based on operational experience.

## Output

Connectivity test fails

**tst-imt:bus=a**

rlghncxa03w 03-11-27 12:47:07 EST EAGLE 31.3.0

## tst-slk

## Test Signaling Link

Use this command for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select from among the following loopback tests: local transceiver (**lxvr**), **oam**, **line**, **payload**, and either low-speed signaling links or ATM high-speed signaling links (**sltc**).

- The **tst-slk** command is not valid on TCP/IP point-to-multipoint links (DCM cards equipped as SS7IPGW and IPGWI links).
- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- On LIM-ATMs, the **lxvr**, **sltc**, **payload**, **line**, and **oam** tests are allowed.
- On TCP/IP point-to-point links (DCM cards equipped as IPLIM or IPLIMI links), **sltc** is the only supported test. The **sltc** test is allowed only for links configured with **ipliml2=saaltali** or **ipliml2-m2pa**.
- On E1/T1 MIM cards, the **sltc** test is the only supported test.
- On E1 ATM card (**atmitu** application), the **lxvr**, **oam**, and **sltc** tests are allowed.

See "Reference Information" for information about loopback testing commands and functions.

**Keyword:** **tst-slk**

**Related Commands:** **act-lpo**, **act-slk**, **blk-slk**, **canc-lpo**, **canc-slk**, **dact-slk**, **inh-slk**, **rept-stat-tstslk**, **rtrv-slk**, **ublk-slk**, **unhb-slk**

**Command Class:** Link Maintenance

### Parameters

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** **port**

**Range:**     **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:**     **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:**     **start, stop**

**Default:**   **start**

**:force=** (optional)

The **force=yes** parameter must be specified to start a test when there are 256 or more tests already running.

**Range:**     **yes, no**

**Default:**   **no**

**:loopback=** (optional)

Specifies the type of loopback test to run.

**Range:**     **line, lxvr, oam, payload, sltc**

**line**—This test is similar to the payload loopback test, but the data transmitted to the remote system is received by the remote system's ATM driver. This test is prohibited for the E1 ATM card.

**lxvr**—Loopback at the local transceiver without involving the remote STP. For the ADS0, AINF, AOCU, and AV35 appliques, the MTP-2 protocol stack and ISCC hardware are tested. For AATM applique and DS1 interface, the AATM hardware, ATM level 2 protocol stack, and AAL5CP portion of ATM driver are tested.

**oam**—Messages are passed between local and remote systems to guarantee that the ATMM portion of ATM driver is functioning.

**payload**—This test is similar to the local transceiver loopback test. The wire is also tested because the loopback is at the remote's DS1 interface instead of the local's DS1 interface. This test is prohibited for the E1 ATM card.

**sltc**—This test can be run on either the low-speed signaling links or the ATM high-speed signaling links. This is the only test that is supported for links on the E1/T1 MIM card, and for saaltali and m2pa links on IPLIMx cards.

**Default:**   **sltc**

**:time=** (optional)

The time duration for testing the link.

**Range:**     **1-240000**

*hhmmss*—*hh*=hours (**00-24**), *mm*=minutes (**00-59**), *ss*=seconds (**00-59**)

For example, **time=1** or **time=000001** is one second; **time=240000** is 24 hours;

**time=200** or **time=000200** is 2 minutes.

**Default:**   **1**

### Example

**tst-slk:loc=1203:link=a**

**tst-slk:loc=1203:link=a:loopback=lxvr**

**tst-slk:loc=1205:link=b:time=000200:force=yes:action=start**

**tst-slk:loc=1205:link=b:action=stop**

**tst-slk:loc=1205:link=b:time=200**

## Dependencies

A card location that is valid and defined in the database must be specified.

The card must be equipped and in service, and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- A dual-slot DCM or EDCM card running the **iplim** or **iplimi** application with links having **ipliml2=saaltali**
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM card or an HC-MIM card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim** or **iplimi** application

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a7**, and **b7** can be specified only for the following cards:

- A multi-port LIM card
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card.
- An E5-ENET card running the **iplim** or **iplimi** application that supports 16 links (**a**, **b**, **a1-a7**, **b1-b7**)

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card.

If the signaling link is an ATM HSL signaling link, only the **link=a** parameter can be specified.

This command is not supported for cards running the **ss7ipgw** and **ipgwi** applications.

This command cannot be entered for an IPLIMx signaling link that has an **ipliml2** parameter setting of **m3ua**.

For IPLIMx signaling links having an **ipliml2** parameter setting of **saaltali** or **m2pa**, only the **loopback=sltc** test is allowed.

The **payload** and **line** values are not valid for the **loopback** parameter when the card is an E1 ATM.

Only the **sltc** test can be run on card types **lime1**, **limt1**, and **limch**.

The card must contain the specified signaling link.

The specified signaling link must be provisioned in the database.

The specified signaling link must be an SS7 signaling link.

The signaling link that is used for LFS (Link Fault Sectionalization) testing cannot be active.

The previously entered command for a link test must be accepted before another link test command can be entered.

This command cannot be entered if the LFS test is running on the specified link.

The specified link cannot be in Command Driven Loopback (CDL) when this command is entered. The link must be removed from CDL before this command can be entered for the link. (See the **act-cdl** and **dact-cdl** commands).

The **force=yes** parameter must be specified to start a test when 256 or more tests are already running in the system.

This command cannot be entered if the maximum number of LFS or link tests are already running in the system. At least one active test must complete before the command can be entered again.

Only one link test can be running on a signaling link at one time.

The **action=stop** parameter cannot be specified when there is no active link test running on the specified link.

When the **action=stop** parameter is specified, the **loopback**, **time**, and **force** parameters cannot be specified.

## Notes

The **lxvr** and **sltc** loopback tests can be run on low-speed signaling links. All the loopback tests can be run on the ATM high-speed signaling links.

This command cannot be used with X.25 signaling links.

## Output

If the card is inhibited, not in service, the following message appears when you try to test the links on the card:

**tst-slk:loc=1203:link=a**

```

### Legend

**LOC**—Card location that contains the signaling being tested.

**LINK**—Signaling link being tested on the card.

**LSN**—Name of the linkset that contains the link being tested.

**START TIME**—Time that the test started.

**LOOPBACK**—Type of loopback test being run.

**TIME**—Length of time that the test ran. This value can exceed the value that was specified in the **time** parameter if the test requires more than the specified time to complete.

**TEST STATUS**—

- When a **tst-slk** command with **action=start** (specified or default) is entered, any one of the following *TEST STATUS* values can appear:
  - Loopback success
  - Loopback failed
  - Loopback aborted
  - Loopback in-progress
  - Loopback prevented
  - Loopback invalid
- When a **tst-slk** command with **action=stop** is entered, any one of the following *TEST STATUS* values can appear:
  - Loopback cleared
  - Loopback could not be cleared

## tst-t1

## Test T1 Port

Use this command to test T1 Ports on the HC-MIM and E5-E1T1 cards. The loopback parameter provides the ability to select local transceiver (**lxvr**) and line loopback tests.

The **tst-t1** command is rejected if a loopback test is not compatible with the port type.

**Keyword:** **tst-t1**

**Related Commands:** chg-t1, dlt-t1, ent-t1, rtrv-t1

**Command Class:** System Maintenance

## Parameters

**:loc=** (mandatory)

Card location. The HC-MIM or E5-E1T1 card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:t1port=** (mandatory)

T1 port number. The value must be a T1 port that has already been configured with a T1 interface on the specified HC-MIM or E5-E1T1 T1 card.

**Range:** 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:action=** (optional)

Indicator of command action to stop or start a test.

**Range:** start, stop

**Default:** start

**:loopback=** (optional)

Select loopback test type.

**Range:** line, lxvr

**Default:** lxvr

## Example

**tst-t1:t1port=1:loc=1203:loopback=lxvr**

**tst-t1:t1port=1:loc=1203:action=stop**

## Dependencies

This command cannot be entered during upgrade.

The card in the specified card location (**loc** parameter) must be an HC-MIM or E5-E1T1 card with card type **limt1**.

The card in the specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be in service.

The specified T1 port (**t1port** parameter) on the card (**loc** parameter) must have a defined T1 interface.

All signaling links that provide timeslots serviced by T1 interfaces on the specified card (**loc** parameter) must be deactivated before this command can be entered. None of the signaling links can be running link diagnostic tests (**tst-slk** and **act-cdl** commands) when this command is entered.

Only one port test can be running on a T1 port (**t1port** parameter) at one time.

When the **action=stop** parameter is specified, the **loopback** parameter cannot be specified.

The **action=stop** parameter can be specified only when a port test is running.

## Notes

This command can be used only for HC-MIM and E5-E1T1 card ports.

Only one port test can be performed at a time on a T1 port. When a port test is in progress on a T1 port, subsequent test requests are rejected.

**Output**

**tst-t1:t1port=1:loc=1203:loopback=lxvr**

```

Command Completed.
;
```

**ublk-slk****Unblock Signaling Link**

Use this command to cancel a local processor outage (LPO) and restore the link to its previous state. Link status signal units (LSSU) with status of processor outage are stopped, and the link begins sending MSUs again.

**NOTE: The signaling link's blocked status is not preserved across a LIM reboot.**

**Keyword:** ublk-slk

**Related Commands:** act-lpo, blk-slk, canc-lpo

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

**ublk-slk:loc=2311:link=b**

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application
- An E1 ATM card running the **atmitu** application
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- An E1/T1 MIM card or an HC-MIM card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim** or **iplimi** application
- An E1/T1 MIM, an HC-MIM or and E5-E1T1 card running the **ss7ansi** or **ccs7itu** application

This command can be entered only for IPLIMx signaling links that have an **ipliml2** parameter setting of **m2pa**.

The **ublk-slk** command is not valid for DCM cards with **ss7ipgw** or **ipgwi** TCP/IP links.

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a7**, and **b7** can be specified only for the following cards:

- A multi-port LIM card
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card.
- An E5-ENET card running the **iplim** or **iplimi** application that supports 16 links (**a**, **b**, **a1-a7**, **b1-b7**)

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card.

## Notes

Unblocking a signaling link removes a Level 2 failure resulting from a **blk-slk** of an ATM high-speed signaling link.

The function of this command is the same as the **canc-lpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

```
ublk-slk:loc=2311:link=b
  rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
  Local processor outage being cleared.
;
ublk-slk:loc=1113:link=a
  rlghncxa03w 03-03-07 11:11:28 EST EAGLE 31.3.0
  Command Rejected : Location is not valid for command.
;
```

## unhb-alm

## Restore Alarm Reporting

Use this command to restore the reporting of alarms for the given device.

**Keyword:** **unhb-alm**

**Related Commands:** `inh-alm`, `rept-stat-alm`, `rept-stat-card`, `rept-stat-cdt`, `rept-stat-dlk`, `rept-stat-dstn`, `rept-stat-ls`, `rept-stat-lsms`, `rept-stat-rte`, `rept-stat-rtx`, `rept-stat-seas`, `rept-stat-slk`, `rept-stat-sys`, `rept-stat-trbl`, `rept-stat-trm`, `rtrv-log`  
**Command Class:** System Maintenance

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dev=** (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be restored.

**Range:** `applsock`, `as`, `card`, `cdt`, `clock`, `dlk`, `e1port`, `ls`, `lsmsconn`, `route`, `seasx25`, `slk`, `t1port`, `trm`, `rtx`  
**applsock**—IP gateway application socket  
**as**—IP gateway application Application Server  
**card**—Cards in the database  
**cdt**—Customer defined troubles  
**clock**—System clock  
**dlk**—The IP ports on the VSCCP, EROUTE, SLAN, VXWSLAN and MCP application cards.  
**e1port**—E1 port on E1/T1 MIM or HC-MIM cards  
**ls**—Linksets  
**lsmsconn**—Communication link between the LSMS and the EMS  
**route**—Route  
**seasx25**—SEAS X.25 links  
**slk**—Signaling links  
**t1port**—T1 port on E1/T1 MIM or HC-MIM cards  
**trm**—Terminals  
**rtx**—Exception Route

**:asname=** (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to uninhibit alarms for the named Application Server.

**Range:** `ayyyyyyyyyyyyy`  
 Up to 15 alphanumeric characters; the first character must be a letter

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

**Range:** `0-16383`

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** `dpca`

**Range:** `p-, 000-255, *`

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code for inhibiting alarms for routes.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:e1port=** (optional)

Port ID. This parameter specifies the E1 port on the specified HC-MIM card. This parameter is mandatory if **dev=e1port** is specified.

**Range:** **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter is used with the **cic** parameter to define the CIC range, which is used as an exception routing criterion for the specified exception route.

**Range:**       **0-16383**

**:id=** (optional)

Customer Defined Trouble (CDT) ID. Customer Defined Trouble IDs 1 through 4 are generated critical alarms. Because critical alarms cannot be turned off, Customer Defined Trouble IDs 1 through 4 cannot be specified as values for the **id** parameter. This parameter is mandatory if **dev=cdt** is specified.

**Range:**       **5-16**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**       `ayyyyyyy`

1 alphabetic character followed by up to 9 alphanumeric characters

**:link=** (optional)

Signaling link on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:**       **a, b, a1-a31, b1-b31**

**a, b**—For **dev=dlk**, **dev=slk** for a two-port LIM

**a1, a2, b1, b2**—For **dev=seasx25/lmsconn**

**a, b, a1, b1, a2, b2, a3, b3**—For **dev=slk** for a multi-port LIM

**a, b, a1-a31, b1-b31**—For **dev=slk** for an HC-MIM

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:**       **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:lsn=** (optional)

Linkset name. The name of the linkset containing the device where alarm reporting is to be restored.

**Range:**       `ayyyyyyy`

1 alphabetic character followed by up to 9 alphanumeric characters

**:opc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Origination point code

**:opci=** (optional)

ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national origination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

**Range:** **0-15**

**:sname=** (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to uninhibit alarms for the named IP<sup>7</sup> application socket.

**Range:** *aaaaaaaaaaaaa*

1 to 15 alphanumeric characters

**:t1port=** (optional)

Port ID. T1 port on the specified HC-MIM card. This parameter is mandatory if **dev=t1port** is specified.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

**:trm=** (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose alarms are to be uninhibited.

**Range:** 1-40

**Default:** Report displays on the terminal where the command was issued.

### Example

```
unhb-alm:dev=route:dpc=1-1-1
```

```
unhb-alm:dpc=1-101-1:opc=4-4-4:dev=rtx
```

### Dependencies

This command is not allowed in upgrade mode.

No other action command can be in progress when this command is entered.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=seasx25** parameter is specified, the **link** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

Table 5-70 shows the valid parameter combinations for the **unhb-alm** command.

Table 5-70. Parameter Combinations for the **unhb-alm** command

| Value (:dev)                       | a | a | c | c | d | e | l | l | n | n | r | s | s | t | t |
|------------------------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Device Parameter                   | p | s | a | d | l | l | s | s | d | d | o | e | l | r | m |
|                                    | p | r | t | o | k | p | m | c | c | u | a | k | p | m |   |
|                                    | l | d | c | o | s | l | q | t | s |   |   |   |   |   |   |
|                                    | s |   | k | r | c | k | 3 | e | x |   |   |   |   |   |   |
|                                    | o |   |   | t | o |   |   |   | 2 |   |   |   |   |   |   |
|                                    | c |   |   |   | n |   |   |   | 5 |   |   |   |   |   |   |
|                                    | k |   |   |   | n |   |   |   |   |   |   |   |   |   |   |
| No Parameters                      |   |   |   | x |   |   |   |   | x |   |   |   |   |   |   |
| :asname                            | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :dpc/dpca/dpci/dpcn/dpcn24         |   |   |   |   |   |   |   |   |   | x |   |   |   |   |   |
| :id                                |   |   | x |   |   |   |   |   |   |   |   |   |   |   |   |
| :loc                               |   | x |   |   | x | x |   |   |   |   |   |   | x | x |   |
| :lsn                               |   |   |   |   |   |   | x |   |   |   |   |   |   |   |   |
| :elport=1-8                        |   |   |   |   |   | x |   |   |   |   |   |   |   |   |   |
| :link=a, b                         |   |   |   |   | x |   |   |   |   |   |   |   | x |   |   |
| :link=a, b, a1, a2, b1, b2, a3, a3 |   |   |   |   |   |   |   |   |   |   |   |   | x |   |   |
| :link=a1, a2, b1, b2               |   |   |   |   |   |   |   | x | x |   |   | x |   |   |   |
| :link=a, b, a1-a31, b1-b31         |   |   |   |   |   | x |   |   |   |   |   |   |   | x |   |
| :sname                             | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :t1port=1-8                        |   |   |   |   |   |   |   |   |   |   |   |   |   | x |   |
| :trm                               |   |   |   |   |   |   |   |   |   |   |   |   |   |   | x |

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be enabled and turned on before specifying the **dev=rtx** parameter.

### Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

**Output**

```

**unhb-slk****Uninhibit Signaling Link**

Use this command to return an inhibited signaling link to service. If the link was aligned when it was inhibited, a changeover occurred. This command causes a changeback on the specified link. MSUs are transmitted on the link after the changeback is issued.

**NOTE:** The signaling link's inhibited status is not preserved across a LIM reboot.

**Keyword:** unhb-slk

**Related Commands:** act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The signaling links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See Table A-1 for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

```
unhb-slk:loc=1301:link=a
```

**Dependencies**

A card location that is valid and defined in the database must be specified.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- A LIM card running the **ss7ansi**, **ss7gx25**, **atmansi**, or **ccs7itu** application

- An E1 ATM card running the **atmitu** application
- A dual-slot DCM or EDCM card running the **iplim** or **iplimi** application with links having **ipliml2=saaltali**
- An SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa** or **ipliml2=saaltali**
- An E1/T1 MIM, an HC-MIM or an E5-E1T1 card running the **ss7ansi** or **ccs7itu** application
- An E5-ENET card running the **iplim** or **iplimi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only for the following cards:

- A multi-port LIM card
- An SSEDCCM card running the **iplim** or **iplimi** application that supports 8 points
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card

The inhibit and uninhibit actions are valid for links on IPLIMx SSEDCCMs that have **ipliml2=m2pa** or **ipliml2=saaltali**, and for links on IPLIMx EDCMs and DCMs that have **ipliml2=saaltali**.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only for the following cards:

- A multi-port LIM card
- An SSEDCCM card running the **iplim** or **iplimi** application that supports 8 points
- An E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card
- An E5-ENET running the **iplim** or **iplimi** application that supports 16 links (**a**, **b**, **a1-a7**, **b1-b7**)

## Notes

This command is not valid on TCP/IP point to multipoint links (DCM cards equipped as SS7IPGW or IPGWI links). TCP/IP point to point links (IPLIM and IPLIMI) can be uninhibited.

The function of this command is the same as the **cancelpo** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

```
unhb-slk:loc=1301:link=a
rlghncxa03w 03-03-23 13:20:59 EST EAGLE 31.3.0
Allow Link message sent to card
;
```

## unlock

## Unlock Keyboard

Use this command to unlock a previously locked terminal keyboard. Anyone attempting to use the keyboard is prompted to enter the password of the currently logged-in user.

**Keyword:** **unlock**

**Related Commands:** **lock**

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**unlock**

**Dependencies**

You must enter the password of the logged in user to unlock the keyboard.

This command is valid only if the keyboard is locked.

The port must not be in an unlock disabled state because of excessive successive unlock failures.

**Notes**

None

**Output**

**unlock**

```
Enter LOGIN password to unlock keyboard  :
```

# Debug Commands

## Introduction

This chapter contains information about debug commands used in troubleshooting and debugging the system. These commands are intended only for Tekelec Technical Services personnel and authorized engineering personnel in the operating companies. The use of these commands is restricted to personnel who have access to the command class Debug.

**CAUTION:** These commands are to be used precisely as they are described in this chapter, and only under the direction of Tekelec Technical Services personnel. Any other use of these commands can result in a system failure.

This chapter contains the debug commands in alphabetical order.

## act-upgrade

### Activate Upgrade

Use this command to perform a software upgrade on an in-service system from a source release to the target release.

It is strongly recommended that this command be used only in conjunction with the system Upgrade Procedure for your target release. The Upgrade Procedure provides step-by-step information on performing an upgrade.

**Keyword:** act-upgrade

**Related Commands:** rept-stat-db

**Command Class:** Debug

## Parameters

**:action=** (mandatory)

The kind of action to be performed for the upgrade process.

**Range:** converttoam, convertnet, convertstp, dbstatus, netcomplete, oamcomplete

**converttoam**—Converts the standby OAM database. Sets the disk's upgrade phase number to 1.

**convertnet**—Performs an inhibit/allow sequence for each network card. This sequence effects the controlled loading of the new release generic program load (GPL) and of the converted database. Requires upgrade phase indicator of 3.

**convertstp**—Performs all OAM and network conversions necessary for an upgrade. This command transitions through all of the upgrade phases to upgrade completion. If

measurement collection is turned on, this command automatically inhibits measurements during the upgrade. Upon completion of the upgrade, this command returns the MASPs to full-function mode with measurement collection turned back on.

**dbstatus**—Reports the status of all database partitions on the TDM fixed disks and the MDAL removable disk (similar to **rept-stat-db:display=version**).

**netcomplete**—Indicates upgrade completion and places system in a fully functional mode.

**oamcomplete**—Sets the upgrade phase number to 3, enables the beginning of controlled card loading, and allows OAP terminals to be attached.

**:appl=** (optional)

The name of the GPL on which to perform the network upgrade.

**Range:**

ayyyyyyy

Valid values are **atmansi**, **bpdcm**, **bphcap**, **ccs7itu**, **ebdatism**, **gls**, **imt**, **sccp**, **ss7ansi**, **ss7gx25**, **stplan**, **utility**, **all**.

**Default:** all

**:disk=** (optional)

Specifies which disk is to be used as the work area required for the conversion of the database.

**Range:** **fixed**, **remove**

**fixed**—The TDM fixed disk

**remove**—The removable disk

**Default:**

**fixed**—if the TDM has available partitions

**remove**—if the TDM does not have available partitions

**:force=** (optional)

Force a command with the **convertnet** action specified to be executed. The **force** parameter is ignored for actions other than **convertnet**.

For **action=convertnet**, if all cards of the specified GPL type are not in the In-Service Normal state or Out-Of-Service Maintenance-Disabled state, the **force** parameter is required. In this case,

minimum service may not be maintained when the command is executed with the force parameter.

**Range:** **yes**, **no**

**Default:** no

**:thres=** (optional)

Network Threshold value. Specifies the percentage of signaling links that are to remain in service (IS) during the network conversion phase. Use of this parameter also enables SCCP thresholding and flashing on non-provisioned cards during the upgrade.

**Range:** 50 - 90

**Default:** The network cards are updated serially.

### Example

**act-upgrade:action=convertstp**

**act-upgrade :action=converttoam**

**act-upgrade :action=oamcomplete**

**act-upgrade:action=convertnet:appl=gls:force=yes**

**act-upgrade:action=convertnet:appl=sccp**

**act-upgrade :action=netcomplete**

**act-upgrade :action=dbstatus**

**act-upgrade:action=convertstp:disk=remove**

**act-upgrade:action=convertstp:thres=75**

## Dependencies

Upgrade conversion cannot be initiated from a telnet-type terminal (terminal IDs 17-40).

Table 6-1 lists the actions (**action** parameter values) that correspond to a given upgrade mode. An action is accepted only when the system is in the corresponding upgrade mode.

**Table 6-1.** Actions with Corresponding Upgrade Phase

| Action                    | Corresponding Upgrade Phase |
|---------------------------|-----------------------------|
| <b>action=converttoam</b> | 0 and 1                     |
| <b>action=oamcomplete</b> | 2                           |
| <b>action=convertnet</b>  | 3                           |
| <b>action=netcomplete</b> | 3                           |
| <b>action=convertstp</b>  | 0 through 3                 |

If measurement collection is enabled, the **act-upgrade:action=convertstp** command automatically inhibits measurement collection during the upgrade. Before returning to full function mode, measurements are turned back on. The following actions require that you manually inhibit measurements: **converttoam**, **oamcomplete**, **convertnet**, and **netcomplete**.

The valid release upgrade disk must be inserted in the MDAL drive.

The standby OAM database must be the source release.

The current OAM database must be the source release.

The database partition must be coherent.

The database partition must be in the correct functional mode.

The **appl** parameter is valid only with **action=convertnet**. The **appl** parameter is required with **action=convertnet**.

The **force** parameter is valid only with **action=convertnet**.

For **action=convertnet**, if all cards of the specified GPL type are not in the In-Service Normal state or Out-Of-Service Maintenance-Disabled state, the **force** parameter is required. In such cases, minimum service may not be maintained.

The MTP Restart Indicator STP option must be set to **no** (see the **chg-stpopts** command) before the **act-upgrade** command can be entered.

The **thres** parameter is valid only with **action=convertnet** and **action=convertstp**.

The destination of a static IP route or the local interface network address of an IP card cannot be the same as the EAGLE 5 ISS PVN network address.

## Notes

For the **appl** parameter, the list of valid GPLs varies from release to release. The **rtrv-gpl** command can be used (when in full function mode) to obtain a list of the GPLs currently resident on the TDMs.

The **rept-stat-gpl** command can be used to obtain a list of the GPLs currently active on provisioned network cards.

The **disk** parameter is to be used to override the decision logic of the upgrade processing that selects the disk to be used in the database conversion. The parameter is intended to be used in the command re-issue scenario where a problem was encountered using the disk chosen by the upgrade process and you want to attempt to execute the upgrade using the alternate disk.

Each upgrade phase will only accept the next upgrade phase command. There are four phases. For example, the command **act-upgrade:action=converttoam** (phases 0 and 1) can be followed only by the command **act-upgrade:action=oamcomplete** (phase 2). The **act-upgrade:action=oamcomplete** command can be followed only by **act-upgrade:action=netcomplete** (phase 3).

The **act-upgrade:action=convertstp** command executes all four upgrade phases consecutively.

If the **act-upgrade:action=convertstp** command is entered following a command abort, the upgrade processing determines the last upgrade phase that was successfully completed. The upgrade processing then attempts to restart from that point to successful completion. Re-entering the **act-upgrade:action=convertstp** command following a command abort is the recommended method for recovery.

The TDMs and removable cartridge have upgrade phase indicators. The upgrade command expects the disks to be in certain phases before executing a specific action. If the disks are not in the correct phases, an error is generated.

The command **act-upgrade:action=dbstatus** generates output similar to that provided by the command **rept-stat-db:display=version**.

The parameter **action=convertnet** results in the following actions:

- The sequential canceling of any assigned links.
- The inhibiting of each card.
- The allowing of each card.
- The activating of the canceled links.

The **convertnet** action proceeds to the next card after the current card has returned to the in-service normal (IS-NR) state or a timeout is reached. If 10% of the cards initially IS-NR are in an abnormal state, the command is aborted. Cards that do not return to the IS-NR state are left inhibited (OOS-MT-DSBLD). Cards that are not in the IS-NR or OOS-MT-DSBLD state when the **convertnet** action is issued are allowed during execution of the command. If such cards do not return to the IS-NR state, they are inhibited and left in the OOS-MT-DSBLD state when **force=yes** is specified.

For the **convertnet** action, if all cards of the specified GPL type are not in the IS-NR or OOS-MT-DSBLD state, the **force** parameter is required. In such case minimum service may not be maintained, and execution of the command must be forced by the craftsperson. The **force** parameter is ignored for actions other than **convertnet**.

The **convertnet** action completes with no action performed if there are no cards of the specified GPL type defined in the database.

The **thres** parameter is used for the following purposes:

- Allows for multiple cards to be upgraded together, as long as the specified percentage of links remain in service. If no **thres** parameter is specified, the cards are upgraded serially. The value is applied to groups of links based upon the link-supporting GPL being upgraded.

- Enables SCCP thresholding, which allows multiple SCCP or VSCCP cards to be upgraded together. The specified **thres** parameter value is not used to determine the number of SCCP cards to upgrade. The peak SCCP load since the last OAM boot is used to determine the number of cards that must remain in service (at least half of the cards must remain in service).
- Enables the non-provisioned flash function, which flash-downloads any boot-prom type card if the card is in the system but not provisioned.

The **appl=all** parameter initiates the **action=convertnet** sequence on all GPL types in the order defined in Table 6-2 on page 6-6. The actions performed are subject to the conditions of the above notes.

**Controlled Card Loading:** During upgrade phase 3 (after **action=oamcomplete** and before **action=netcomplete**), card loading is controlled by a card's GPL type to prevent service interruption of the node. Table 6-2 shows the dependencies in card loading.

**Table 6-2.** Dependencies in Card Loading

| Prior to Loading This Card . . . | These Cards Must Be Loaded                     |
|----------------------------------|------------------------------------------------|
| GLS                              | None                                           |
| SCCP                             | All GLS cards                                  |
| SS7                              | All GLS and SCCP cards                         |
| CCS7ITU                          | All GLS, SCCP, and SS7 cards                   |
| ATMANSI                          | All GLS, SCCP, SS7, and CCS7ITU cards          |
| GX25                             | All GLS, SCCP, SS7, CCS7ITU, and ATMANSI cards |
| STPLAN                           | All other card types                           |

## Output

### act-upgrade:action=convertstp

The **act-upgrade:action=convertstp** command performs the OAM conversion and the network conversion. During the conversion, it broadcasts the current activity in the scroll area. This example shows some, but not all, of the messages that might appear.

```

Command complete: Network conversion complete.
```

*i*

**act-upgrade:action=netcomplete**

The action **netcomplete** marks the end of the upgrade and returns the system to full functional mode.

*i*

**cdu****CAP Downloadable Utility (CDU)**

The CAP Downloadable Utility (CDU) is a diagnostic program that can be downloaded to any card including the DSM/DCM cards on the system by entering the **alw/rst-card:loc=xxxx :code=utility** command.

This command is used to enter commands to perform diagnostic functions. The command syntax is as follows: **cdu:loc=xxxx:cmd="command string"**

where the **loc** and **cmd** parameters are mandatory parameters for the **cdu** command. The command string, which is enclosed in double quotes (" "), specifies the diagnostic function to perform and includes any optional or mandatory parameters for the specified **cmd** keyword.

The **cdu** command uses the VCDU or CDU GPL. The DSM board can hold up to 4 GB of memory. The CDU or the VCDU utility is downloaded automatically depending on the type of the board. For the DSM the VCDU utility is downloaded; for the TSM the CDU utility is downloaded.

**Keyword:** **cdu**

**Related Commands:** None

**Command Class:** Debug

**Parameters**

**:loc=** (mandatory)

The card location of the card as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

**:cmd=** (mandatory)

The commands that are used to perform diagnostic functions. The command string contains a keyword (listed in the following Range section) and one or more parameters (listed in the Subrange section that follows the Range section). The command string must be enclosed in double quotes (" ").

**Range:**

////////////////

The keywords used in the command strings are:

**act-memtst**—Starts the memory test.

**canc-memtst**—Stops the memory test. This command has no parameters.

**dump-memtst**—Displays the memory test results continuously without any other output messages. This command has no parameters.

**rtrv-memtst**—Displays the memory test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.

**act-qcktst**—Implements a quick go/no-go test to check the basic integrity of the memory within ten minutes. The VDCU utility verifies the address, the data lines to memory, and the accessibility of each memory chip of 4 GB. This command applies to the DSM card only.

**canc-qcktst**—Aborts the quick test. This command applies to the DSM card only and has no parameters.

**rtrv-qcktst**—Displays the quick test results. This command applies to the DSM card only and has no parameters.

**fill-mempat**—Fills a section of memory with a specific data pattern.

**tst-mempat**—Tests the memory pattern that was initialized by the **fill-mempat** command.

**dump-mempat**—Displays the memory pattern test results continuously without any other output messages. This command has no parameters.

**rtrv-mempat**—Displays the memory pattern test results. This command can be entered while the test is still running or as soon as a failure occurs. This command has no parameters.

**act-checkbit**—Tests the M256 checkbit DRAM.

**rtrv-checkbit**—Displays the M256 checkbit test results. This command has no parameters.

**act-memflt**—Tests M256 error detection and correction capabilities (fault insertion test).

**rtrv-memflt**—Displays the fault insertion test results. This command has no parameters.

**act-cachetst**—Starts the cache test on the specified memory range.

**dump-cachetst**—Displays the results of the cache test. This command has no parameters.

**act-pingtst**—Implements a network test in the VCDU utility only. The ping test is applicable to DCM/DSM cards only and will not work in the other cards.

**canc-pingtst**—Aborts the ping test. This command has no parameters.

**rtrv-pingtst**—Displays the results of the ping test. This command has no parameters.

**Subrange:**

The keywords used in the command strings use the following parameters.

**:beg=** (mandatory)

The start address of the physical memory range to be tested. The value is a hexadecimal number. This parameter is used with the keywords **act-cachetst**, **act-checkbit**, **act-memtst**, **fill-mempat**, and **tst-mempat**.

**Range:**

For cards other than the DSM—**h'00100000–h'bfffffff**

For **act-checkbit** only—**h'80000000–h'bfffffff**

For **act-cachetst** only—**h'01400000–h'ffd40000**

For **1GB** DSM card only—**h'01400000–h'3fffffff**

For **2GB** DSM card only—**h'01400000–h'7fffffff**

For **3GB** DSM card only—**h'01400000–h'bfffffff**

For **4GB** DSM card only—**h'01400000–h'ffdfffff**

**:end=** (mandatory)

The first address beyond the last address of the physical memory range to be tested. The value is a hexadecimal number. This parameter is used with the following keywords: **act-checkbit**, **act-cachetst**, **act-memtst**, **fill-mempat**, and **tst-mempat**.

**Range:**

For cards other than the DSM—**h'00100002–h'c0000000**

For **act-checkbit** only—**h'80000004–h'c0000000**

For **act-cachetst** only—**h'01440000–h'ffdfffff**

For **act-memtst** on 1GB DSM card only—**h'01400000–h'40000000**

For **act-memtst** on 2GB DSM card only—**h'01400000–h'80000000**

For **act-memtst** on 3GB DSM card only—**h'01400000–h'c0000000**

For **act-memtst** on 4GB DSM card only—**h'01400000–h'fe000000**

**:loop=** (optional)

The number of times a test is performed. The value is a hexadecimal or a decimal number. This parameter is used with the following keywords: **act-memtst**, **act-cachetst**, **act-memflt**, **act-checkbit**, **act-qcktst**, and **act-pingtst**.

**Range: h'0–h'ffff**

The value **h'0** indicates that an infinite number of tests is performed.

**Default: h'1****:data=** (mandatory)

The hexadecimal of the data pattern. This parameter is used only with the keywords **act-cachetst**, **fill-mempat**, and **tst-mempat**.

**Range:** h'0000–h'ffff

**:port=** (mandatory)

The port address from which to start the ping. This parameter is used **only** with the keyword **act-pingtst**.)

**Range:** a, b

**:dest=** (mandatory)

The destination IP address to be pinged. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number. This parameter is used **only** with the keyword **act-pingtst**.

**Range:**

4 numbers separated by dots, with each number in the range of **0–255**.

**:router=** (optional)

The router through which the network interface can be tested. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is 192.126.100.5, where 192.126.100 is the network number and 5 is the machine's host number. This parameter is used **only** with the keyword **act-pingtst**.

**Range:**

4 numbers separated by dots, with each number in the range of **0–255**.

**:type=** (optional)

Indicates the type of memory test to perform: a comprehensive high-memory test or a fast high-memory test. The fast test performs two tests: the Write/Read block and the Address Write/Read. The comprehensive test performs the fast test as well as a Write/Read Walking 1/0s. This parameter is used **only** with the **act-memtst** keyword.

**Range:** full, fast

**Default:** full

**:addr=** (mandatory)

Indicates the physical address to test. This parameter must be dword aligned and must not be the first or last dword of the installed M256 expansion DRAM. This parameter is used **only** with the **act-memflt** keyword.

**Range:** h'80000004–h'bffffff8

### Example

```
cdu:loc=1215:cmd="act-memtst:beg=h'00100000:end=h'00100002:loop=3:type=fast"
cdu:loc=1215:cmd="canc-memtst"
cdu:loc=1215:cmd="rtrv-memtst"
cdu:loc=1215:cmd="fill-mempat:beg=h'00100000:end=h'c0000000:data=h'ffff"
cdu:loc=1215:cmd="tst-mempat:beg=h'00100000:end=h'c0000000:data=h'ffff"
cdu:loc=1215:cmd="act-qcktst:loop=h'2"
cdu:loc=1215:cmd="canc-qcktst"
cdu:loc=1215:cmd="rtrv-qcktst"
cdu:loc=1215:cmd="act-pingtst:port=a:dest=215:200:100.6:router=150.1.1.105:loop=h'2"
cdu:loc=1215:cmd="canc-pingtst"
```

```

cdu:loc=1215:cmd="rtrv-pingtst"
cdu:loc=1107:cmd="act-cachetst:beg=h'01400000:end=h'01440000:data=h'ffff"
cdu:loc=1107:cmd="dump-cachetst"
cdu:loc=1215:cmd="act-checkbit:beg=h'80000000:end=h'80000004:loop=h'2"
cdu:loc=1215:cmd="rtrv-checkbit"
cdu:loc=1215:cmd="act-memflt:addr=h'80000004:loop=h'3"
cdu:loc=1215:cmd="rtrv-memflt"

```

## Dependencies

If the **act-cachetst** keyword is entered, the address range should not be less than 256 KB.

The **fill-mempat** keyword must be entered before the **act-cachetst** keyword can be entered.

The quick memory test commands can be entered only on DSM cards.

The ping test commands can be entered only on DSM or DCM cards.

## Notes

The **act-memtst:type=full** test takes approximately 21 hours to run on a 1GB TSM. The **act-memtst:type=fast** test takes approximately 1 hour. The VCDU utility has the capability to test the 4 GB of memory in 4 hours if the **act-memtst** command is entered with the **type** parameter set to **fast**.

## Output

```
cdu:loc=1107:cmd="dump-memtst"
```

```

cdu: paced memtst output begins

## chg-bip-fld

## Change Board Identification Field

Initial programming of the board identification PROMs is done at the time of manufacturing. Field upgrades may require a technician to use this command to manually update the data on a prom.

**Keyword:** chg-bip-fld

**Related Commands:** chg-bip-rec, disp-bip, rtrv-bip

**Command Class:** Debug

### Parameters

**:data=** (mandatory)

Board identification data.

**Range:**

////////////////////////////////////

A patterned character string.

**:fld=** (mandatory)

Board identification field.

**Range:** rev, sm

rev—Revision

sm—Software match

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

HMUX and HIPR locations are not valid.

**:type=** (mandatory)

The type of board.

**Range:** mbd, dbd, gbd

mbd—Main assembly

dbd—Applique

gbd—Guest card BIP

**Example**

**chg-bip-fld:loc=1202:type=gbd:fld=rev:data="B"**

**chg-bip-fld:loc=1201:type=dbd:fld=sm:data="001"**

**Dependencies**

The card location must be valid for the command.

The specified card location must be equipped.

The **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

**Notes**

The card in the specified card location must be inhibited.

For accessing a guest card BIP (**type=gbd**), specify the location of the host card (see the "Example" section for this command).

**Output**

**chg-bip-fld:loc=1202:type=gbd:fld=rev:data="B"**

```
rlghncxa03w 04-04-31 12:05:44 EST EAGLE 31.6.0
Board ID Prom updated.
;
```

**chg-bip-rec****Change Board Identification PROMs Record**

Even though initial programming of the board identification PROMs is done at manufacturing, field upgrades may require a technician to use the **chg-bip-rec** command to update the data on a PROM manually.

**Keyword:** chg-bip-rec

**Related Commands:** chg-bip-fld, disp-bip, rtrv-bip

**Command Class:** Debug

**Parameters**

**:data=** (mandatory)

Board identification data.

**Range:**

////////////////

A patterned character string (7, 8, 11, 12, or 14 digits).

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:**

(HMUX and HIPR locations are not valid): **1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118**

**:type=** (mandatory)

The type of board.

**Range:** mbd, dbd

**mbd**—Main assembly

**dbd**—Applique

**:init=** (optional)

This parameter initializes the contents of a PROM to contain only the record specified in the **data** parameter, if that record is a board identification record.

**Range:** yes, no

**Default:** no

### Example

```
chg-bip-rec:loc=1107:type=mbd:data=xxx:init=yes
```

### Dependencies

To program the applique (**type=dbd**), the card must be inhibited.

The card location must be valid for the command.

The board type **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

### Notes

The card in the specified card location must be inhibited.

### Output

```
chg-bip-rec:loc=1107:type=mbd:data=xxx:init=yes
```

```
rlghncxa03w 04-04-31 12:05:44 EST EAGLE 31.6.0
Board ID Prom updated.
;
```

## chg-lnp-refnum

## LNP Change Reference Number

**NOTE:** This command is obsolete.

This command is used to change the table entry reference number. The change is updated on both OAMs and on all equipped TSM cards.

**NOTE:** If the LNP ELAP Configuration feature is enabled, this command is no longer available, and all LNP provisioning is performed at the LSMS.

**Keyword:** chg-lnp-refnum

**Related Commands:** vfy-lnp-refnum

**Command Class:** Debug

### Parameters

**:ref=** (mandatory)

Reference number

**Range:** 0–4294967280

**:gtt=** (optional)

Global title translation value with the following mandatory arguments: **tt**, **pc**, **ssn**.

When the **gtt** parameter is specified, the constituent values must *all* be entered and separated by a comma (,) or a dash (-) in the order **tt-pc-ssn**.

**tt-**

Translation type

**Range= 000–255**

**pc-**

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**ssn-**

Subsystem number

**Range: 000–255**

**:lrn=** (optional)

Location routing number

**Range:**

10 digits

**:npanxx=** (optional)

Numbering plan area and exchange

**Range:**

6 digits

**:sp=** (optional)

Service provider

**Range:**

4 alphanumeric characters

**:tt=** (optional)

Translation type

**Range: 0–255**

### Example

**chg-lnp-refnum:ref=12:npanxx=919223:tt=20**

### Dependencies

Only one optional parameter can be specified, with the exception that when **npanxx** is specified, **tt** must also be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** commands) before the **chg-lnp-refnum** command can be entered.

The translation type (**tt**) value must be a reserved service for LNP and must be a true translation type, not an LNP alias.

A translation type cannot be associated with WNP or PCS query services.

**Notes**

None

**Output****chg-lnp-refnum:ref=12:npanxx=919223:tt=20**

```

rlghncxa03w 01-03-22 21:14:41 EST Rel 28.1.0
CHH-LNP-REFNUM: MASP A - COMPLTD
;

```

**chg-tbl****Change Table**

This command is used to create, rename, or reset any table on a fixed disk or removable cartridge.

**Keyword:** **chg-tbl**

**Related Commands:** **disp-disk-dir**

**Command Class:** Debug

**Parameters**

**:action=** (mandatory)

The desired action to perform on the table.

**Range:** **create, rename, reset**

**create**—Creates a DOS entry in the FAT table and updates the DOS directory table.

**rename**—Changes the name of an existing system table to a new DOS file name (does not update the **dms.cfg** file).

**reset**—Initializes an existing table to the value designated by the **resetchar** parameter.

**:disk=** (mandatory)

The disk that contains the file.

**Range:** **remove, fixed**

**:ext=** (optional)

The three character DOS filename extension.

**Range:**

**0–3** ASCII characters

**Default:** No file name extension is specified

**:filelength=** (optional)

The amount of space the file occupies on the disk, in bytes.

**Range:**

**1–7.75** (removable cartridge)

**1–31** (fixed disk)

**Default:** The file length is not specified

**:id=** (optional)

The table identification number.

**Range:** **0–499**

**Default:** No table identification number is specified

**:name=** (optional)

The name of the file.

**Range:**

1–8 ASCII characters.

**Default:** No file name is specified

**:prtnggrp=** (optional)

The disk partition group to be displayed.

**Range active, inactive**

**Default active**

**:resetchar=** (optional)

The table reset character that is written to every byte of the table.

**Range: 0–255**

**Example**

```
chg-tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000
```

```
chg-tbl:action=reset:disk=remove:id=0
```

```
chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old
```

**Dependencies**

If **action=create** is specified, the following parameters must be specified: **name**, **ext**, **filelength**. All other parameters are ignored or defaulted.

If the file type is a directory, the **filelength** parameter is not required. The directory entry file length is always 1 cluster in length.

The attributes used during file creation are: current date and time of the active MASP, readable/writable, files are allocated contiguously from the last free FAT cluster.

If **action=reset** is specified, the **id** parameter must be specified. All other parameters are ignored or defaulted.

If **action=rename** is requested the following parameters must be entered: **id**, **name**, **ext**. All other parameters are ignored or defaulted.

This command cannot be used to modify the security log.

**Notes**

None

**Output**

```
chg-tbl:action=create:disk=remove:name=test:ext=sys:filelength=150000
```

```
chg-tbl: CREATE OK : filename = test.sys, byte length = 150000
chg-tbl: command complete
;
```

```
chg-tbl:action=reset:disk=remove:id=0
```

```
chg-tbl: RESET OK : Table 0, DMS.CFG
chg-tbl: command complete
;
```

**chg-tbl:action=rename:disk=remove:id=0:name=dms:ext=old**

```
chg-tbl: RENAME OK : Table 0, DMS.CFG to DMS.OLD
chg-tbl: command complete
;
```

## clr-disk-stats

## Clear Disk Statistics

This command clears the disk performance statistics. All associated disk statistics are zeroed.

**Keyword:** clr-disk-stats

**Related Commands:** disp-disk-state

**Command Class:** Debug

### Parameters

**:loc=** (mandatory)  
The location of the card.

**Range:** 1113, 1115

**Default:** None

### Example

**clr-disk-stats:loc=1113**

### Dependencies

The specified card location must contain a card that is running an OAM (1113 or 1115).

A related command must not be in progress.

### Notes

None

### Output

**clr-disk-stats:loc=1113**

```
rlghncxa03w 01-03-01 14:14:05 EST Rel 28.1.0
Disk performance statistics cleared.
;
```

## copy-tbl

## Copy Table

This command allows a single table to be copied from one source to another. A table can be copied to any verifiable location in the system but the source and destination tables must have identical configurations (same number of entries, same entry size, both 1- dimensional and 2-dimensional). Also, a table cannot be copied onto itself.

**Keyword:** copy-tbl

**Related Commands:** None

**Command Class:** Debug

### Parameters

**:dloc=** (mandatory)

The fixed disk or removable cartridge card location of the destination table.

**Range:**

**1114, 1116** (TDM), **1117** (MDAL)

**:sloc=** (mandatory)

The fixed disk or removable cartridge card location of the source table.

**Range:**

**1114, 1116** (TDM), **1117** (MDAL)

**:stbl=** (mandatory)

The identifying number of the source table.

**Range: 0–511**

**:ddrv=** (optional)

The disk drive that contains the destination table.

**Range: fixed, remove**

**Default: fixed**

**:dprtnggrp=** (optional)

The disk partition group of the destination table.

**Range active, inactive**

**Default active**

**:dtbl=** (optional)

The identifying number of the destination table.

**Range: 0–511**

**Default:** The **stbl** parameter value

**:sdrv=** (optional)

The disk drive that contains the source table.

**Range: fixed, remove**

**Default: fixed**

**:sprtnggrp=** (optional)

The disk partition group of the source table.

**Range active, inactive**

**Default active**

### Example

**copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed**

### Dependencies

Only one table copy command can be executed at a time.

The source and destination tables must exist and be compatible.

The specified card locations must be valid disk locations.

This command cannot be used to modify the security log.

### Notes

None

**Output**

**copy-tbl:stbl=25:dtbl=24:sloc=1114:dloc=1116:sdrv=fixed**

```
rlghncxa03w 01-03-04 16:11:53 EST Rel 28.1.0
Table copy command complete.
;
```

**disp-bip****Display Board Identification PROM**

This command displays the board identification PROM (BIP) data (hex and ASCII) in its entirety for the specified card type and location. The PROM data consists of the board ID, part number, revision, date of manufacture, the location where the board was manufactured, serial number, software match ID, and check sums.

**Keyword:** **disp-bip**

**Related Commands:** **chg-bip-fld, chg-bip-rec, rtrv-bip**

**Command Class:** Debug

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:**

(HMUX and HIPR locations are not valid): **1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118**

**:type=** (optional)

The board type to be displayed.

**Range:** **mbd, dbd, both**

**mbd**—Main assembly

**dbd**—Applique

**both**—The main assembly and the applique

**Default:** **both**

**Example**

**disp-bip:loc=1101:type=mbd**

**Dependencies**

The card location frame, shelf, and slot must be within the allowed range.

The card location must be valid for the command.

The board type **type=dbd** parameter is not valid for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

The specified card location must be equipped.

**Notes**

None

**Output****disp-bp:loc=1105:type=mbd**

**disp-bp****Display Breakpoint**

This command displays currently active breakpoints in the communication and application processors.

**Keyword:** disp-bp**Related Commands:** dlt-bp, ent-bp**Command Class:** Debug**Parameters****:card=** (optional)Card location, in the form of *GPLID-Subsystem ID*.**Range:***GPLID-Subsystem ID*

*GPLID*—atmansi, atmitu, bpdcm, bphcap, bphcapt, bpmpl, bpmplt, ccs7itu, ebdablm, ebdadcm, eroute, gls, hipr, imt, ipgwi, iplim, iplimi, ips, mcp, oam, sccp, ss7ansi, ss7gx25, ss7ipgw, stplan, utility, vsccp, vxutil, vxwslan

*Subsystem ID*—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:imt=** (optional)

IMT address of the card.

**Range:** 0–255**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1113, 1115, 1201–1218, 1301–1318, 2101–2118, 2201–2218, 2301–2318, 3101–3118, 3201–3218, 3301–3318, 4101–4118, 4201–4218, 4301–4318, 5101–5118, 5201–5218, 5301–5318, 6101–6118

Locations *xy* **09** and *xy* **10** (*x* = the frame, *y* = the shelf) are valid only for IXP-based cards (such as HIPR cards).

**:proc=** (optional)

Processor type.

**Range:** appl, com

**appl**—Application processor

**com**—Communication processor

**Default:** appl

**:ueng=** (optional)

Microengine number. This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

**Range:** 0–5

### Example

**disp-bp:card=ss7ansi-all**

**disp-bp:loc=1214**

**disp-bp:loc=1109**

**disp-bp:loc=1109:ueng=3**

### Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

The **ueng** parameter can be specified only for IXP-based cards (such as HIPR cards).

The **eoam** GPLID accepts all subsystem values; all other GPLIDs accept only the **all** subsystem value.

The card location specified by the **loc** parameter must be in the database.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the HMUX locations (*xy* **09** and *xy* **10** where *x* is the frame and *y* is the shelf) are not valid for break point commands.

### Notes

Card locations (**loc** parameter) *xy* **09** and *xy* **10** (*x* is the frame and *y* is the shelf) for HMUX cards are not valid for break point commands.

### Output

The following examples are for x86-based cards:

**disp-bp:card=ss7ansi-all**

**disp-disk-dir****Display Disk Directory**

This command displays the DOS directory on the specified disk. It can be used to see the creation date for each file, or for selected files. This command allows a user to verify that the correct version of files are on the disk. This command applies to the fixed disks and removable cartridges.

**Keyword:** disp-disk-dir

**Related Commands:** act-gpl, chg-db, chg-gpl, copy-gpl, copy-meas, init-sys, rept-stat-db

**Command Class:** Debug

**Parameters**

**:file=** (optional)

The name of the file to be displayed.

**Range:**

**1–12** ASCII characters

**Default:** All files are displayed

**:loc=** (optional)

The card location in the system. A fixed disk or removable cartridge location must be specified.

**Range:**

**1114, 1116** (TDM), **1117** (MDAL)

**Default:** The active fixed disk

**:prtnggrp=** (optional)

The disk partition group to be displayed.

**Range** active, inactive

**Default** active

**:src=** (optional)

The identification of the disk containing the files to be displayed.

**Range:** fixed, remove

**fixed**—The fixed disk

**remove**—The removable cartridge

**Default:** The fixed disk

### Example

**disp-disk-dir:loc=1117:file="dms.cfg"**

**disp-disk-dir:src=remove:file="fta"**

**disp-disk-dir:src=remove:file="\*.\*)"**

### Dependencies

Valid filenames must be in the format, *filename.extension*, with the following requirements:

File name—**1–8** ASCII Characters

Extension—**0–3** ASCII Characters

Wildcards (asterisks) are also allowed when the wildcard pattern is enclosed in parentheses.

**\***—Matches all characters in either filename or extension

**?**—Matches one character in either filename or extension

**file="\*.\*"**—Matches all files on disk

**file="\*.tbl"**—Matches all files on disk with **.tbl** as a extension

### Notes

None

### Output

## Legend

**FILENAME**—The name of the file in the directory

**EXT**—The extension of the file name (for example, for the file MFC.BIN, MFC is the file name and BIN is the extension of the file name).

**LENGTH**—The amount of space, in bytes, the file occupies on the disk.

**LAST MODIFIED**—The data and time the file was changed.

**CLUSTER**—A 2-byte, 16-digit binary number that represents the first section of the disk occupied by the file.

**LBA**—The starting logical block address that corresponds to the **CLUSTER**.

**FILE(S)**—The number of files on the disk that match the search criteria.

**BYTES**—The amount of space, in bytes, the displayed files occupy on the disk

**VOLUME**—An 11-character name for the disk.

**BYTES FREE**—The number of bytes that are available on the disk for file storage.

**DISK SIZE**—The total capacity of the specified disk.

## disp-disk-stats

### Display Disk Performance Statistics

This command displays the disk performance statistics. The OAMs maintain disk read/writer access times as well as per table and per application statistics on the number of disk accesses and cache accesses. Per application and per table statistics that have zero values are not output if an application ID or table ID is not specified; only nonzero statistics are displayed in the default report.

**Keyword:** **disp-disk-stats**

**Related Commands:** **None**

**Command Class:** Debug

## Parameters

**:loc=** (mandatory)

The card location in the system.

**Range:** **1113, 1115**

**:applid=** (optional)

Application IDs used system wide to define tasks within system.

**Range:** **0–255**

**Default:** **all**

**:tblid=** (optional)

Table IDs used system wide to define tables within system.

**Range:** **0–511**

**Default:** **all**

**Example****disp-disk-stats:loc=1113:applid=29****disp-disk-stats:loc=1113:applid=29****disp-disk-stats:loc=1113****Dependencies**

The specified card location must contain a card that is running an OAM (1113 or 1115).

**Notes**

None

## disp-lba

## Display Logical Block Access

This command displays the contents of a logical block of data at a specified logical block address of a fixed disk or removable cartridge.

**Keyword:** disp-lba

**Related Commands:** None

**Command Class:** Debug

### Parameters

**:lba=** (mandatory)  
Logical block address.

**Range:** 0–1953125

**:loc=** (mandatory)  
The card location in the system. A fixed disk or removable cartridge location must be specified.

**Range:**  
1114, 1116 (TDM), 1117 (MDAL)

**Default:** Active fixed disk

### Example

**disp-lba:lba=676:loc=1117**

### Dependencies

The requested disk must be available.

The logical block address specified must be within the valid range for the disk specified.

### Notes

None

### Output

**disp-lba:lba=676:loc=1117**

```

## disp-mem

## Display Memory

This command is used to display memory in communication and application processors. This display is in byte format.

**Keyword:** disp-mem

**Related Commands:** set-mem

**Command Class:** Debug

### Parameters

**:addr=** (optional)

The address, in the form of *segment-offset*.

**Range:**

*segment-offset*

*segment*—h'00–h'ffff

*offset*—h'00–h'ffff

**:bc=** (optional)

The number of data bytes to display.

**Range:** 0–65535

**Default:** 96

**:card=** (optional)

Card location, in the form of *GPLID-Subsystem ID*.

**Range:**

*GPLID-Subsystem ID*

*GPLID*—atmansi, atmitu, bphcap, bpdcm, ccs7itu, ebdablm, ebdadcm, gls, imt, iplim,  
iplimi, oam, sccp, ss7ansi, ss7gx25, ss7ipgw, ss7ml, stplan, utility, vxwslan

*Subsystem ID*—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:dformat=** (optional)

Memory dump format.

**Range:** byte, word, dword

**Default:** byte

**:imt=** (optional)

IMT address.

**Range: 0–255**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range: 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118**

**:paddr=** (optional)

The physical offset of the memory address.

**Range: h'00–h'ffffff**

**:proc=** (optional)

Processor type.

**Range: appl, com**

**appl**—Application processor)

**com**—Communication processor)

**Default: appl**

### Example

**disp-mem:card=ss7ansi-all:addr=h'03a-h'001:bc=8**

**disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word**

**disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=dword**

### Dependencies

Either the **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

Either the **addr** or **paddr** parameter can be specified, but not both, in the command.

The **bc** parameter value must not exceed **2000**.

The card location specified by the **loc** parameter must be in the database.

All of the *subsystem* values can be specified with the **oam GPLID**. The other *GPLID* values can be specified only with the **all subsystem** value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, **1118**, and the HMUX and HIPR locations (*xy* **09** and *xy* **10** where *x* is the frame and *y* is shelf) are not valid for memory commands.

### Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

### Output

**disp-mem:card=psm-a:addr=h'03a-h'001:bc=8**

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0
SDS Memory Dump from IMT Address H'00f6
Source-Address = H'003a0001          Length = 8 bytes
```

```
0000 04 0d 3d 1c 04 0d 3d 1c      ..=...=.
;
```

**disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=word**

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0
SDS Memory Dump from IMT Address H'000a
Source-Address = H'00103abc      Length = 8 bytes
0000 ffff 00ff 00ff 0000      .....
;
```

**disp-mem:loc=1204:paddr=h'103abc:bc=8:dformat=dword**

```
rlghncxa03w 01-03-22 21:13:50 EST Rel 28.1.0
SDS Memory Dump from IMT Address H'000a
Source-Address = H'00103abc      Length = 8 bytes
0000 00ffffff 000000ff      .....
;
```

## dlt-bp

## Delete Breakpoint

This command deletes breakpoints in the communication or application processors.

**Keyword:** dlt-bp

**Related Commands:** disp-bp, ent-bp

**Command Class:** Debug

### Parameters

**:addr=** (optional)

The address, in the form of *segment-offset*.

**Range:**

*segment-offset*

*segment*—h'00–h'ffff

*offset*—h'00–h'ffff

**:card=** (optional)

Card location, in the form of *GPLID-Subsystem ID*.

**Range:**

*GPLID-Subsystem ID*

*GPLID*—atmansi, atmitu, bphcap, bpdcm, ccs7itu, ebdablm, ebdadcm, gls, hipr, imt,

iplim, iplimi, oam, sccp, ss7ansi, ss7gx25, ss7ipgw, stplan, utility, vxwslan

*Subsystem ID*—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:imt=** (optional)

The card's IMT address.

**Range:** 0–255

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1113, 1115, 1201–1218, 1301–1318, 2101–2118, 2201–2218, 2301–2318, 3101–3118, 3201–3218, 3301–3318, 4101–4118, 4201–4218, 4301–4318, 5101–5118, 5201–5218, 5301–5318, 6101–6118

Locations *xy 09* and *xy 10* (*x* = the frame, *y* = the shelf) are valid only for IXP-based cards (such as HIPR cards).

**:paddr=** (optional)

The physical offset of the memory address.

**Range:** h'00–h'ffffff

**:proc=** (optional)

Card's processor type.

**Range:** appl, com

**appl**—Application processor)

**com**—Communication processor)

**Default:** appl

**:ueng=** (optional)

Microengine number. This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

**Range:** 0–5

### Example

**dlt-bp:card=ss7gx25-all**

**dlt-bp:loc=1109**

**dlt-bp:loc=1209:ueng=2**

**dlt-bp:card=hipr-all**

### Dependencies

Either the **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

Either the **addr** or **paddr** parameter, but not both, must be specified in the command.

The **ueng** parameter can be specified only on an IXP-based card (such as a HIPR card).

The card location specified by the **loc** parameter must be in the database.

All of the *subsystem* values can be specified with the **oam GPLID**. The other *GPLID* values can be specified only with the **all subsystem** value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, and **1118** are not valid for break point commands.

### Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Card locations *xy 09* and *xy 10* (*x* is the frame and *y* is the shelf) are valid only for IXP-based cards (such as HIPR cards).

## ent-bp

## Enter Breakpoint

This command is used to add breakpoints in communications and application processors in the system.

**Keyword:** ent-bp

**Related Commands:** disp-bp, dlt-bp

**Command Class:** Debug

## Parameters

**:access=** (optional)

The access type, in the form of *access type-format*.

**NOTE:** Use the **data** parameter to set the format on IXP-based cards (such as HIPR cards).

### Range:

*access type-format*

*access type*—**r, w, rw**

*format*—**byte, word, dword, any**

The *access type* is read, write, read-write.

The *format* is byte, word, doubleword, any.

**Default:** For x86-based cards—**rw-byte**  
For IXP-based cards—**rw-any**

**:addr=** (optional)

The memory location in the form of *segment-offset*.

### Range:

*segment-offset*

*segment*—**h'00–h'ffff**

*offset*—**h'00–h'ffff**

**:bc=** (optional)

The number of data bytes to display.

For x86-based cards, the maximum number of bytes is 96.

For IXP-based cards, the maximum number of bytes is 256.

For IXP-based cards, **bc** represents the number of bytes of memory. The number of bytes of stack to be displayed will be 256 – **bc**. For example, if **bc=128**, 128 bytes of memory and 128 bytes of stack will be displayed. If **bc=0**, 0 bytes of memory and 256 bytes of stack will be displayed. The exception to this rule is that 1 byte of stack will never be displayed.

### Range:

For x86-based cards—**0–96**

For IXP-based cards—**0–255**

**:ca=** (optional)

Condition “a” in the form of *register-condition-integer*.

### Range:

*register-condition-integer*

*register*—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r1-r15**

*condition*—**eq, neq, gt, lt, gte, lte**

*integer*—**h'00–h'ffffff**

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

**:card=** (optional)

Card location, in the form of *GPLID-Subsystem ID*.

### Range:

*GPLID-Subsystem ID*

*GPLID*—atmansi, atmitu, bpdcm, bphcap, bphcapt, bpmpl, bpmplt, ccs7itu, ebdablm, ebdadcm, eroute, gls, hipr, imt, ipgwi, iplim, iplimi, ips, mcp, oam, sccp, ss7ansi, ss7gx25, ss7ipgw, stplan, utility, vsccp, vxutil, vxwslan

*Subsystem ID*—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:cb=** (optional)

Condition “b” in the form of *register-condition-integer*.

**Range:**

*register-condition-integer*

*register*—sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx, lr, pc, r0-r15

*condition*—eq, neq, gt, lt, gte, lte

*integer*—h'00–h'ffffff

The value *register* is the CPU internal register.

The value *condition* is the comparison condition (equal, not equal, less than, greater than, greater than or equal, less than or equal).

The value *integer* is the value for comparison.

**:ctx=** (optional)

Bit-mapped microengine context mask.

**Range: 1-15**

**:da=** (optional)

Dump address, in the form of *segment-offset*.

**Range:**

*segment-offset*

*segment*—h'00–h'ffff

*offset*—h'00–h'ffff

**:data=** (optional)

Instructs a data breakpoint to qualify on a match of the data. This parameter is valid only on IXP-based cards (such as HIPR cards).

**Range:**

*value-mask*

*value*—0-0xFFFFFFFF

*mask*—0-0xFFFFFFFF

**Default: 0-0**

**:dformat=** (optional)

Memory dump format (byte, doubleword, word).

**Range: byte, dword, word**

**Default: byte**

**:dpaddr=** (optional)

Memory dump address (physical offset).

**Range: h'00–h'ffffff**

**:dr=** (optional)

The data register indirect memory dump, in the form *register-register-integer*.

The *register-register* value is the CPU internal register.

The *integer* value is the offset value.

**Range:**

*register-register-integer*

*register*—**sp, bp, ss, ds, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx**

*register*—**sp, bp, ds, ss, es, cs, fl, ax, ah, al, bx, bh, bl, cx, ch, cl, dx, dh, dl, di, si, ip, fs, gs, esi, edi, ebp, esp, eip, efl, eax, ebx, ecx, edx**

*integer*—**h'00–h'ffffff**

**:drarm=** (optional)

ARM register indirect memory dump.

**Range:**

*ARM register-integer*

*ARM register*—**r0–r15, sp, lr, pc**

*mask*—**0–65535**

The value *ARM register* is the CPU internal register.

The value *integer* is the offset value.

**Default:** 0–0

**:dur** (optional)

Breakpoint duration.

**Range:** temp, perm

**Default:** temp

**:imt** (optional)

Card's IMT address.

**Range:** 0–255

**:ind** (optional)

Indirection count.

**Range:** 0–3

**Default:** 0

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1113, 1115, 1201–1218, 1301–1318, 2101–2118, 2201–2218, 2301–2318, 3101–3118, 3201–3218, 3301–3318, 4101–4118, 4201–4218, 4301–4318, 5101–5118, 5201–5218, 5301–5318, 6101–6118

Locations *xy 09* and *xy 10* (*x* = the frame, *y* = the shelf) are valid only for IXP-based cards (such as HIPR cards).

**:paddr=** (optional)

The physical offset of the memory address.

**Range:** h'00–h'ffffff

**:proc=** (optional)

Card's processor type.

**Range:** appl, com

**appl**—Application processor

**com**—Communication processor

**Default:** appl

**:rep=** (optional)

Repetitions for this break point.

**Range:** 0–255

**Default:** 0

**:type=** (optional)

Breakpoint type in the form of *processor type-breakpoint type*

**Range:**

*processor type-breakpoint type*

*processor type*—**p186, p286, p486, arm, ixp**

*breakpoint type*—**code, codehw, codesw, data**

**Default:** For x46-based cards—**p486-code**

For IXP-based cards—**arm-codesw**

**:ueng=** (optional)

Microengine number. This parameter is valid only on IXP-based cards. If this parameter is not specified, the card processor type is assumed to be ARM.

**Range:** 0–5

### Example

```
ent-bp:loc=1113:addr=h'03a-0001
```

```
ent-bp:loc=1204:paddr=h'27c3c:type=p486-data:access=rw-word
```

```
ent-bp:loc=1109:paddr=h'401000:type=arm-codesw:access=rw-any:ca=r7-eq-0
```

```
ent-bp:loc=1209:paddr=h'402000:type=arm-data:access=w-any:data=h'1111-h'ff
```

```
ent-bp:loc=1309:paddr=h'403000:type=ixp-codesw:ueng=2:ctx=1
```

```
ent-bp:card=hipr-all:paddr=h'404000:type=arm-codehw:drarm=r3-0:bc=64
```

### Dependencies

All of the *subsystem* values can be specified with the **oam** *GPLID*. The other *GPLID* values can be specified only with the **all** *subsystem* value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, and **1118** are not valid for break point commands.

The **loc** parameter, the **imt** parameter, or the **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **dr** parameter and the **da** parameter cannot be specified together in the command.

The **dur=perm** parameter and the **rep** parameter cannot be specified together in the command.

The **dur=perm** parameter cannot be specified when the value of the *processor type* portion of the **type** parameter is **p186** or **p286**.

Either the **addr** parameter or the **paddr** parameter, but not both, must be specified in the command.

When the **da** parameter, the **dr** parameter, or the **drarm** parameter is specified, the **dpaddr** parameter cannot be specified.

When the **paddr** parameter and the **bc** parameter are specified, either the **dpaddr** or **dr** parameter must be specified in the command.

The **access** parameter can be specified only when the **type** parameter value is **p486-data** or **arm-data**.

The **bc** parameter value cannot be greater than **96** for x86-based cards.

The **ind** parameter value cannot be greater than **3**.

The specified card must be in use.

For 80286 processors, registers for 80386 processors cannot be specified.

For 80286 processors, *integer* values for *registers* and *conditions* must be less than **65535**.

The **ueng** parameter is valid only on IXP-based cards (the value **ixp** is specified for the *processor type* portion of the **type** parameter).

The **cts** parameter is valid only on IXP-based cards (the value **ixp** is specified for the *processor type* portion of the **type** parameter).

The **data** parameter is valid only on IXP-based cards.

The **data** parameter is valid only when the value is **data** for the *breakpoint type* portion of the **type** parameter.

The *register* values **sp**, **lr**, **pc**, and **r0-r15** for the **ca**, **cb**, and **drarm** parameters are valid on an IXP-based card ARM processor. An ARM register value must be specified for an IXP-based card with an ARM processor.

The **ca** and **cb** parameters cannot be specified when the value **ixp** is specified for the *processor type* portion of the **type** parameter.

The **drarm** parameter can be specified only on IXP-based cards.

The **drarm** parameter can be specified only when the value **arm** is specified for the *processor type* portion of the **type** parameter.

The **dr** parameter and the **da** parameter cannot be specified for IXP-based cards.

The **data** and **codesw** values for the *breakpoint type* portion of the **type** parameter cannot be specified when the value **ixp** is specified for the *processor type* portion of the **type** parameter.

The **arm** and **ixp** values for the *processor type* portion of the **type** parameter are valid only on IXP-based cards.

The value **any** for the *format* portion of the **access** parameter can be specified only on IXP-based cards. The *format* value must be set to **any** on IXP-based cards.

When the value **ixp** is specified for the *processor type* portion of the **type** parameter, the **ueng** and **cts** parameters must be specified.

The **addr** parameter can be specified only when the **proc=com** parameter is specified for DS0 cards with PROM-based COM processors (such as TSMs).

When the **ca**, **cb**, and **dr** parameters are used with 80186 and 80286 processors, the *register* values **ip**, **fs**, **gs**, **esi**, **edi**, **ebp**, **esp**, **eip**, **efl**, **eax**, **ebx**, **ecx**, and **edx** cannot be specified. These registers can be used only with 80486 processors. The *integer* values for these parameters when used with 80186 and 80286 processors must be less than **h'ffff** (**65535**).

The **data** value for the *breakpoint type* portion of the **type** parameter cannot be specified with the values **p186**, **p286**, and **ixp** for the *processor type* portion of the **type** parameter.

## Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

Card locations **xy 09** and **xy 10** (*x* is the frame and *y* is the shelf) are valid only for IXP-based cards (such as HIPR cards).

**ent-trace****Enter Trace**

This debug command is used to trace MSUs sent to SCCP, VSCCP, or SS7 cards running the following GPLs: **ss7ansi**, **ccs7itu**, **sccp**, **vsccp**, **atmitu**, **atmansi**, **iplim**, **iplimi** or **ss7ipgw**.

Table 6-3 lists by card type the parameters that can be used to filter an MSU.

**Table 6-3.** Parameter/Card Type Filters for MSUs

| An MSU for this card type...                                                                  | Can be filtered using one or more of the following parameters...                                                                                   |
|-----------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| SCCP (running GPL <b>sccp</b> )                                                               | <b>error</b> , <b>gt</b> , <b>lrn</b> , <b>tn</b> , <b>ssp</b> , and <b>sspa</b>                                                                   |
| VSCCP (running GPL <b>vsccp</b> )                                                             | <b>error</b> , <b>gt</b> , <b>lrn</b> , <b>tn</b> , <b>ssp/sspa/sspi/sspn/sspn24</b> , <b>dn</b> , <b>entityid</b> , <b>imei</b> , and <b>imsi</b> |
| ANSI SS7 (running the <b>ss7ansi</b> , <b>atmansi</b> , <b>iplim</b> , or <b>ss7ipgw</b> GPL) | <b>error</b> , <b>ssp/sspa</b> , <b>opc/opca</b> , <b>dpc/dpca</b> , and <b>tlnpisuptype</b>                                                       |
| ITU SS7 (running the <b>atmitu</b> , <b>ccs7itu</b> or <b>iplimi</b> GPL)                     | <b>error</b> , <b>sspi/sspn/sspn24</b> , <b>opci/opcn/opcn24</b> , and <b>dpci/dpcn/opcn24</b>                                                     |

For all cards supported by **ent-trace**, the **error** parameter can be provisioned as the only optional parameter or in addition to any other optional parameter to trace any messages that fail verification or processing. If not specified, the default is **error=yes**.

Invalid MSUs can be filtered using repetition (**rep**) as the only optional parameter.

INP messages are traced based on the triggers **gt**, **sspi**, **sspn**, **dn** and/or **entityid**.

**CAUTION:** If your system's configuration approaches the maximum number of 25 provisioned SCCP cards, entering this command might cause an OAM to reset because of the amount of information that may be returned.

**Keyword:** ent-trace

**Related Commands:** None

**Command Class:** Debug

**Parameters**

**NOTE:** See “Point Code Formats and Conversion” in Appendix A for a detailed description of point code formats, rules for specification, and examples.

**:card=** (mandatory)

Card location in the form of *APPL CLASS-Subsystem ID*

**Range:**

*APPL CLASS-Subsystem ID*

*APPL CLASS—atmansi, atmitu, ccs7itu, iplim, iplimi, sccp, ss7ansi, ssripgw, vsccp*

*Subsystem ID—all*

**:dn=** (optional)

Directory Number. The **dn** parameter is used for INP, G-Port, and G-Flex, and the **tn** parameter is used for LNP.

**Range:** 00000–ffffffffffff

5–15 characters; allowed characters are 0–9, A–F, a–f.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpc= or :dpca=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code 0-000-0 is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-*

*nnnnn—0-16383*

*gc—aa - zz*

*m1-m2-m3-m4—0-14* for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*— 000–255

*ssa*— 000–255

*sp*— 000–255

**:entityid=** (optional)

The entity ID.

**Range: 0–ffffffffffffff**

1 to 15 characters. Allowed characters are **0-9, a-f, A-F**.

**:error=** (optional)

Trace on any message verification error and message processing error.

**Range: yes, no**

**Default: yes**

**:gt=** (optional)

The global title digits.

**Range: 0–ffffffffffffff**

1 to 15 characters. Allowed characters are **0-9, a-f, A-F**.

**:imei=** (optional)

The International Mobile Equipment Identifier.

**Range: 00000000000000–ffffffffffff**

Exactly 14 digits. Allowed characters are **0-9, a-f, A-F**.

**:imsi=** (optional)

The International Mobile Station Identifier.

**Range: 00000–ffffffffffff**

5 to 15 characters. Allowed characters are **0-9, a-f, A-F**.

**:lrn=** (optional)

The location routing number.

**Range: 0000000000–9999999999**

**:opc/opca/opci/opcn/opcn24=** (optional)

The originating point code.

**:opc= or :opca=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:opcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-*

*gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa - zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:open24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*— 000-255

*ssa*— 000-255

*sp*— 000-255

**:rep=** (optional)

The number of MSUs to trap.

A number greater than 1 includes multiple traps on the same message and traps on different messages, until the specified number is reached or the card reboots or another command is entered to change the parameter values.

To trap incoming and outgoing messages, the value of the **rep** parameter must be 2 or greater. For example, specifying **rep=10** could mean that for EIR queries the command displays 5 incoming MAP\_CHECK\_IMEI messages and the 5 outbound MAP\_CHECK\_IMEI\_ack messages that the EAGLE 5 ISS sends back to the querying node.

For Message Relay and Query Service Response messages, the parameter that was traced on is not always contained in the outbound message (such as **dn**, **imei**, or **imsi**), but the trace parameter does appear in the inbound message. When the **rep** parameter value is 2 or greater, the outbound message is included in the trace output.

**Range:** 0-255

**Default:** 1

**:ssp/sspa/sspi/sspn/sspn24=** (optional)

The SSP point code.

**:ssp= or :sspa=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:sspi=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000–255

*id*—0–7

The point code **0-000-0** is not a valid point code.

**:sspn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range: s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0–16383

*gc*—aa - zz

*m1-m2-m3-m4*—0–14 for each member; values must sum to 14

**:sspn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*— 000–255

*ssa*— 000–255

*sp*— 000–255

**:tlnpisuptype=** (optional)

The ISUP message type.

**Range: 0–255**

**:tn=** (optional)

The directory number. The **tn** parameter is used for LNP, and the **dn** parameter is used INP, G-Port, and G-Flex.

**Range: 000000000–999999999**

## Example

ent-trace:gt=919460:card=sccp-all

ent-trace:gt=919460:lrn=9105551234:ssp=10-10-10:card=sccp-all:rep=2

ent-trace:opc=1-1-1:card=ss7ansi-all:rep=2

ent-trace:tlnpisuptype=01:card=ss7ansi-all

ent-trace:dn=12345:entityid=c123:card=vsccp-all

ent-trace:dn=abcde:imsi=c122d:card=vsccp-all

ent-trace:card=ccs7itu-all:dpc=2-7-5:error=no

ent-trace:card=vsccp-all:error=yes

ent-trace:card=ccs7itu-all:sspn24=10-11-12:opcn24=10-10-10:dpcn24=10-101-11

ent-trace:dn=abcde:imei=123456789101234:card=vsccp-all

ent-trace:card=ccs7itu-all:opci=s-1-17-3:dpci=s-1-23-4:rep=10

## Dependencies

At least one optional parameter must be specified. The **error** parameter can be specified as the only optional parameter or with any other optional parameters in the command.

A value of **none** cannot be specified for the following parameters: **gt**, **entityid**, **dn**, **imei**, or **imsi**.

For the **card** parameter, only the following values are allowed: **sccp**, **vsccp**, **ss7ansi**, **atmitu**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, or **ccs7itu**.

The only qualifier allowed for the **card** parameter is **-all**.

The following parameters are invalid for SCCP cards: **entityid**, **dn**, **imei**, **imsi**, **opc**, **dpc**, **tlnpisuptype**, **sspi**, **sspn**, and **sspn24**.

The following parameters are invalid for ANSI SS7 cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, and **tn**.

The following ITU point code parameters are invalid for ANSI SS7 cards running the **ss7ansi**, **atmansi**, **iplim**, or **ss7ipgw** GPLs: **opci**, **opcn**, **open24**, **dpci**, **dpcn**, **dpcn24**, **sspi**, **sspn**, and **sspn24**.

The following parameters are invalid for ITU SS7 cards running the **ccs7itu**, **atmitu**, or **iplimi** GPLs: **gt**, **entityid**, **dn**, **imei**, **imsi**, **lrn**, **tn**, and **tlnpisuptype**.

The following ANSI point code parameters are invalid for ITU SS7 cards running the **ccs7itu** or **iplimi** GPLs: **opc**, **opca**, **dpc**, **dpca**, **ssp**, and **sspa**.

The following parameters are invalid for VSCCP cards: **opc**, **dpc**, and **tlnpisuptype**.

The G-Flex, G-Port, or INP feature must be turned on before the **dn** and **entityid** parameters can be specified.

The G-Flex feature or the Equipment Identity Register feature must be turned on before the **imsi** parameter can be specified.

If the ITU Duplicate Point Code (ITUDUPPC) feature is turned on, the ITU national point code must be specified as a full point code.

The Equipment Identity Register (EIR) feature must be turned on before the **imei** parameter can be specified.

## Notes

The **card** parameter is input as two fields separated by a dash '-'.

## Output

## send-msg

## Send Message

This debug command is used to manually simulate a system generated message from a user terminal. The parameters (not entered by the user) are defaulted to:

- Origination subsystem = **cam\_active**
- Destination subsystem = **orig application ID=appl\_ID\_ui**
- Violation= **no report**
- Bus = **imt choice**
- Message length = **computed**

**Keyword:** send-msg

**Related Commands:** None

**Command Class:** Debug

### Parameters

**:da=** (mandatory)  
Destination application ID

**Range:** 0–255

**:ds=** (mandatory)  
Destination subsystem.

**Range:** 0–255

**:f=** (mandatory)  
Function ID.

**Range:** 0–255

**:loc=** (mandatory)  
The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

**:alt=** (optional)  
Use the alternate bus bit.

**Range:** on, off

**Default:** on

**:bus=** (optional)

The IMT bus.

**Range:** a, b

**Default:** a

**:oa=** (optional)

Originating application ID.

**Range:** 0–255

**Default:** 2

**:os=** (optional)

Originating subsystem.

**Range:** 0–255

**Default:** 0

**:d0=** (optional)

Application Data.

**Range:** 0–255

**:d1=** (optional)

Application Data.

**Range:** 0–255

**:d2=** (optional)

Application Data.

**Range:** 0–255

**:d3=** (optional)

Application Data.

**Range:** 0–255

**:d4=** (optional)

Application Data.

**Range:** 0–255

**:d5=** (optional)

Application Data.

**Range:** 0–255

**:d6=** (optional)

Application Data.

**Range:** 0–255

**:d7=** (optional)

Application Data.

**Range:** 0–255

**:d8=** (optional)

Application Data.

**Range:** 0–255

**:d9=** (optional)

Application Data.

**Range: 0–255**

**:len=** (optional)

Message length in bytes.

**Range: 0–65535**

**Default:** Calculated

### Example

```
send-msg:loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

```
send-msg:loc=1113:ds=2:oa=h'17:da=h'30:f=11
```

### Dependencies

The destination application ID and subsystem must be valid.

The destination location must be equipped to receive messages.

### Notes

None

### Output

```
send-msg:loc=1113:os=2:oa=h'28:ds=2:da=h'28:f=7
```

```

## set-mem

## Set Memory

This command sets values in memory in the communication and application processors. If a card is reloaded, these memory changes are lost.

**Keyword:** set-mem

**Related Commands:** disp-mem

**Command Class:** Debug

### Parameters

**:addr=** (optional)

The address, in the form of *segment–offset*

**Range:**

*segment-offset*

*segment*—h'00–h'ffff

*offset*—h'00–h'ffff

**:byte**= (optional)

The number of data bytes to display.

**Range:** 0–h'00–h'ff

**:card**= (optional)

Card location, in the form of *GPLID–Subsystem ID*.

**Range:**

*GPLID–Subsystem ID*

*GPLID*—atmansi, atmitu, bphcap, bpdcm, ccs7itu, ebdablm, ebdadcm, gls, hipr, imt,

iplim, iplimi, oam, sccp, ss7ansi, ss7gx25, ss7ipgw, stplan, utility, vsccp, vxwslan

*Subsystem ID*—a, b, act, stby, all

The **oam** GPL can be specified with any of the subsystem IDs.

For all other GPLs, only the **all** subsystem ID is valid.

**:dword**= (optional)

A double word value.

**Range:** 0–h'00–h'ffffff

**:fill**= (optional)

The number of times that the value is to be written to successive addresses.

**Range:** 0–65535

**Default:** 1

**:imt**= (optional)

IMT address.

**Range:** 0–254

**:loc**= (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

**:mask**=(optional)The mask that selects the bits that are to be included in the operation

(**op**).**Range:**0–0xFFFFFFFF**Default:**0xFFFFFFFF**op**=(optional)The operation that is

performed in order to arrive at the final value in the memory location.**Range:**replace, and, or, xor**Default:**replace**:paddr**= (optional)

The physical offset of the memory address.

**Range:** 0–h'00–h'ffffff

**:proc**= (optional)

Processor type.

**Range:** appl, com

**appl**—Application processor)

**com**—Communication processor)

**Default:** appl

**:word**= (optional)

A word value.

**Range:** h'00–h'ffff

### Example

```
set-mem:card=ss7ansi-all:addr=h'03a-h'001:byte=4
```

```
set-mem:loc=1109:paddr=h'201000:byte=0:fill=1024
```

```
set-mem:card=hipr-all:paddr=h'202000:word=h'2a:op=and:mask=h'fff
```

### Dependencies

The **loc**, **imt**, or **card** parameter must be specified.

Only one of the **loc**, **imt**, and **card** parameters can be specified in the command.

The **byte**, **word**, or **dword** parameter must be specified.

Only one of the **byte**, **word**, and **dword** parameter can be specified.

Either the **addr** parameter or the **paddr** parameter, but not both, can be specified.

The **paddr** parameter cannot be specified for an SS7 LIM card.

The card location specified by the **loc** parameter must be in the database.

All of the *subsystem* values can be specified with the **oam GPLID**. The other *GPLID* values can be specified only with the **all subsystem** value.

Card locations (**loc** parameter) **1114**, **1116**, **1117**, and **1118** are not valid for break point commands.

### Notes

The **imt** parameter allows this command to be entered for a card that has not been configured in the system.

### Output

```
set-mem:card=ss7ansi-all:addr=h'03a-h'001:byte=4
```

```
rlghncxa03w 01-03-22 21:14:03 EST Rel 28.1.0
SDS Response Code 22 from IMT Address H'00f6 - command complete.
```

;

## vfy-lnp-refnum

## LNP Verify Reference Number

**NOTE:** This command is obsolete.

This command is used for automated test purposes only to compare the entered reference number to the table entry reference number. No output is provided by this command.

**NOTE:** If the LNP ELAP Configuration feature is turned on, this command is no longer available, and all LNP provisioning is performed at the LSMS.

**Keyword:** vfy-lnp-refnum

**Related Commands:** chg-lnp-refnum

**Command Class:** Debug

### Parameters

**:ref=** (mandatory)

Reference number

**Range: 0–4294967280**

**:gtt=** (optional)

Global title translation value with the following mandatory arguments: **tt**, **pc**, **ssn**.

When the **gtt** parameter is specified, the constituent values must *all* be entered and separated by a comma (,) or a dash (-) in the order **tt-pc-ssn**.

tt-

Translation type

**Range: 000–255**

pc-

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range: 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*ni* = **000** is not valid.

*nc* = **000** is not valid if *ni* = **001–005**.

*nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

ssn-

Subsystem number

**Range: 000–255**

**:lrn=** (optional)

Location routing number

**Range:**

10 digits

**:npanxx=** (optional)

Numbering plan area and exchange

**Range:**

6 digits

**:sp=** (optional)

Service provider

**Range:**

4 alphanumeric characters

**:tt=** (optional)

Translation type

**Range: 0–255**

### Example

**vfy-lnp-refnum:ref=12:npanxx=919223:tt=20**

### Dependencies

Only one optional parameter can be specified, with the following exception: when **npanxx** is specified, **tt** must also be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **vfy-lnp-refnum** command can be entered

The translation type (**tt**) value must be a reserved service for LNP and must be a true translation type, not an LNP alias.

A translation type cannot be specified that is associated with WNP or PCS query services.

**Notes**

None

**Output**

**vfy-lnp-refnum:ref=12:npanxx=919223:tt=20**

```

# Pass-Through Commands

This chapter introduces the pass-through commands and describes the command conventions. The pass-through commands are listed in alphabetical order starting on page 7-2.

## Introduction

The pass-through commands are used within the **pass** command (see Chapter 5). Pass-through commands are passed through the OAM and sent to individual cards for processing. Pass-through commands reduce the need to add card-specific and application-specific code to the OAM build.

## Command Conventions

The following is an example of a **pass** command:

```
pass:loc=1201:cmd="connmgr -c"
```

The **cmd** parameter contains the pass-through command (**connmgr -c**) within the double quotes.

Pass-through commands consist of two types of tokens: command name and command options. Tokens are whitespace-delimited and null-terminated. The generalized format of a pass-through command is:

```
command_name option1 option2....option n-1.... option n
```

In the example, the **command\_name** is '**connmgr**' and the option is '**-c**'.

Options and option parameters are made up of a specific character string or a variable. The variable is to be replaced with a value selected from a range of values. Option variables and option parameter variables are underlined. For example, the **arp** command option **-d** has the parameter variable **IP address**. Specify the IP address as in the command **arp -d 192.9.200.44**. Do not enter the underlined text; enter a value instead.

Help information for each pass-through command can be obtained by using the option **-h** on any command.

**arp****Address Resolution Protocol**

This command is used to display and modify the internet to ethernet address translation tables used by the address resolution protocol.

**Keyword:** arp

**Command Class:** IP Stack Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the arp command option **-d** has the parameter IP address. The IP address must be specified for which an ARP entry will be deleted, as in the command **arp -d 192.9.200.44**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a**

This option displays all entries in the ARP table.

**-d IP address**

This option deletes an ARP entry for the specified IP address.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

**-f**

This option flushes all entries from the ARP table.

**-h**

This option displays help (usage) information for the command.

**-s IP address MAC address**

This option creates an ARP entry for the specified IP address and ethernet address.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. For example, **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

6 hexadecimal numbers separated by colons; each number in the range **0 - FF**.

The MAC (media access control) address is an ethernet address with the format **x:x:x:x:x:x**, where **x** is a hexadecimal integer from **0** to **FF**. For example, **08:00:20:1b:0f:f2**.

**Example**

```
arp -a
```

```
arp -s 192.9.200.44 08:00:20:1b:0f:f2
```

```
arp -d 192.9.200.44
```

```
arp -f
```

**Dependencies**

Only one of the options can be specified at a time.

The **arp** command with no options displays all of the current ARP cache entries.

## Notes

The **arp** command is executed through the **pass** command.

## Output

**pass:loc=1105:cmd="arp" or**

**pass:loc=1105:cmd="arp -h"**

```

This command is used to display the state changes for a specified Application Server (AS).

**Keyword:** aslog

**Command Class:** Application Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **aslog** command has the parameter asname. The Application Server name must be specified for which the log will be displayed, as in the command **asloc as1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asname

This option specifies the Association Server name for the display.

**-h**

This option displays help (usage) information for the command.

### Example

**aslog as1**

### Dependencies

## asplog

## SCTP Application Server Process Log

**NOTE: This command is obsolete. The functions have been updated and moved to the ualog command.**

This command is used to display the UA state history for a specified Application Server Process (ASP).

**Keyword:** **asplog**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **asplog** command has the parameter **asp name**. The Application Server Process must be specified for which the log will be displayed, as in the command **asplog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

asp name

This option specifies the Application Server Process name for the display.

**-h**

This option displays help (usage) information for the command.

**-i event group**

This option includes groups of events in the state machine history.

**Range:** service, ua

**-x event group**

This option excludes groups of events from the state machine history.

**Range:** service, ua

### Example

**asplog s7000**

### Dependencies

None

### Notes

None

### Output

In this example, transmitted notification, ASP Inactivation (RFC Extension) , ASP Activation (RFC Extension) and ASP Failure Notification events are shown.

**pass:loc=1105:cmd="asplog s7000"**

ASPLOG: command complete

```

```

;

```

When a received M3UA or SUA PDU contains errors, a response error message is transmitted containing an error code. Error codes are recorded to and displayed in the **asplog** output only when the UA peer-to-peer message logging option (**-i ua**) is enabled.

The following output example shows error code 0x00000015:

**pass:loc=1303:cmd="asplog asp1303a"**

```

## Error Codes

**NOTE:** The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18

The following error codes can appear in the error messages:

### 0x01—Invalid Version

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

### 0x03—Unsupported Message Class

A message was received with an unexpected or unsupported Message Class.

### 0x04—Unsupported Message Type

A message was received with an unexpected or unsupported Message Type.

**0x05—Unsupported Traffic Handling Mode**

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

**0x06—Unexpected Message**

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

**0x07—Protocol Error**

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

**0x09—Invalid Stream Identifier**

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

**0x0d—Refused - Management Blocking**

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

**0x0e—ASP Identifier Required**

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

**0x0f—Invalid ASP Identifier**

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier

**0x11—Invalid Parameter Value**

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

**0x12—Parameter Field Error**

A message is received with a parameter that has a wrong length field.

**0x13—Unexpected Parameter**

A message contains an invalid parameter.

**0x14—Destination Status Unknown**

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each invalid or unauthorized Point Code is included along with the Network Appearance and/or Routing Context associated with the Point Code.

**0x15—Invalid Network Appearance**

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is included in the Network Appearance parameter.

**0x16—Missing Parameter**

A message is received, and a mandatory parameter is not included in the message.

**0x19—Invalid Routing Context**

A message is received from a peer with an invalid (unconfigured) Routing Context value.  
The invalid Routing Context is included in the error message.

**0x1a—No Configured AS for ASP**

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

## assocrtt

## SCTP Association Round Trip Time

This command is used to display the SCTP round trip times for a specified association. Minimum, maximum, and average times are kept for each open association. The Retransmission Mode (RFC or LIN) and the configured Minimum and Maximum Retransmission Timeout limits are also displayed.

**Keyword:** **assocrtt**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **assocrtt** command has the parameter aname. The association name must be specified for which the information will be displayed, as in the command **assocrtt c7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

aname

This option specifies the association name for the display.

**-r**

This option resets all statistics for the specified association name.

### Example

**assocrtt c7000**

**assocrtt c7000 -r**

### Dependencies

None

### Notes

This command does not indicate whether or not the socket is congested.

### Output

**pass:loc=1105:cmd="assocrtt" or**

**pass:loc=1105:cmd="assocrtt -h"**

## connmgr

## Connection Manager

This command is used to generate reports about the status of the connection manager.

**Keyword:** **connmgr**

**Command Class:** Application Maintenance

### Options

**-c**

This option displays client information for all client connections.

**-d**

This option displays a connection manager data summary.

**-h**

This option displays help (usage) information for the command.

**-i**

This option displays SCTP instance and association data.

**-l**

This option displays the connection manager event log.

**-n**

This option displays the SCTP notification log.

**-r**

This option resets the connection manager event log.

**-s**

This option displays information for all server sockets.

### Example

```
connmgr -r
```

```
connmgr -c
```

```
connmgr -s
```

### Dependencies

Only one of the options can be specified at a time.

If no options are specified, usage information is displayed.

### Notes

The **connmgr** command is executed through the **pass** command.

**Output****pass:loc=1107:cmd="connmgr" or****pass:loc=1107:cmd="connmgr -h"**

Command Accepted - Processing

```

## drklog

## Dynamic Routing Key History Log

Use this command to report the dynamic routing key provisioning history. The most recent 100 dynamic routing key provisioning events are kept in a log.

The default mode of operation for this command, with no options specified, is to print all available entries in the log (up to 100 entries) regardless of the sockets and routing keys involved. The **-n**, **-k**, and **-s** options can act as filters that affect which entries are displayed as output.

**NOTE: The drklog command is supported only on DCM cards running the ss7ipgw or ipgwi application.**

**NOTE: The drklog command does not support spare point codes.**

**Keyword:** drklog

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **drklog** command option **-p** has the parameter **point code type**. Specify the point code type of the routing key that follows the **-k** option, as in the command

**drklog -p 100-100-100.** Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-h**

This option is used to provide help information for the command.

**-k rtkey**

This option is used to display only entries pertaining to a specified routing key.

The rtkey variable is optional when used with **-t default**, and mandatory for all other cases.

The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to **3**.

The following are valid formats for the routing key that follows the **-k** option in the command:

n-c-m:s:n - For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.

n-c-m:s - For DPC, SI, type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is in the range **0-2**, **4**, or **6-15**. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.

n-c-m:s:no-co-mo:cs:ce - For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range **0** to **16363**.

**NOTE: ISUP routing keys can be specified using the same CIC value for CICS and CICE. All entries in the log for the specified CIC value (or any portion of the CIC range) will be displayed.**

**-n number**

This option is used to display a specific number of the most recent entries.

**-p**

This option is used to display the point code type.

**-s socket name**

This option is used to display entries for the specified socket name only.

**Range:**

Up to 15 alphanumeric characters

**Default:** Counts for all IP application sockets within the option combination

**-t**

keytype

This option is used to display the type of routing key.

**Example**

**drklog**

**drklog -s socyellow**

**drklog -k 5-5-5:3:4**

**drklog -n 3**

**drklog -k 7-7-7:5:8-8-8:175:200 -s socket25 -n 1**

**drklog -c itun24 -k 12-145-10:5:12-145-12:100:300 -n 2**

## Dependencies

At least one option must be specified.

## Notes

The **drklog** command is executed through the **pass** command.

The **drklog** command is valid for **ss7ipgw** and **ipgwi** cards; it is not valid for **iplim** and **iplimi** cards.

Combinations of the **-k**, **-n**, and **-s** options provide log information based on the entered combination. These options do not affect the contents of the log; they affect only what is displayed by the command.

TALI routing key registration and deregistration requests that are discarded because of a full request queue are not stored in the log. The total number of discards can be reported using the **msucount** command.

## Output

The output for each **drklog** entry consists of the following components:

- Date and time: when the registration or deregistration event occurred
- Type of operation (including Enter, Delete, Resize, and Split)
- Socket involved
- Success/Failure Indication
- Routing key involved (with indication of the point code type - ANSI/ITUI/ITUN/ITUN24, and the type of key - full/partial/default)
- Other pertinent routing key information (such as split CIC value or resize CIC values)
- Routing key attribute values (PSTN Category, PSTN ID, Norm flag) specified in the registration request. Only values that are specified in the registration request are shown in the **drklog** entry. No value is shown if the registration does not specify a change to these routing key attribute values.

**NOTE: Either brief or full help reports can be displayed. A full help report is generated by adding the -h full option to the command line.**

Example of a brief help report:

**pass:loc=1105:cmd="drklog -h"**

```

0          1          2          3          4          5          6          7

1234567890123456789012345678901234567890123456789012345678901234567890123456789012345678;
Usage: DRKLOG [-n number] [-s socket name]
              [-k [rtkey] [-p pctype] [-t keytype]]
              [[-h [full]]]

Options:
-n number      Displays most recent 'number' of entries

-s socket name Displays entries affecting specified socket name
-k rtkey       routing key report using MTP3 parameters
               rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
-p             pctype:: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t            routing key type
               keytype :: (<full>, partial, default)

```

-h display command help (brief or full)

Example of a full report

**pass:loc=1105:cmd="drklog -h full"**

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: drklog [-n number] [-s socket name]
           [-k [rtkey] [-p pctype] [-t keytype]]
           [[-h [full]]]

```

Options: -n displays most recent 'number' of entries  
 -s displays entries affecting specified socket name  
 -k routing key report using MTP3 parameters  
     rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])  
 -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)  
 -t routing key type  
     keytype :: (<full>, partial, default)  
 -h display command help (brief or full)

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

| SS7 Traffic Partition             | RTKEY Parameter Example      |
|-----------------------------------|------------------------------|
| Any User Part to DPC 1-1-1        | -k 1-1-1 -t partial          |
| SCCP to DPC 1-1-1                 | -k 1-1-1:3 -t partial        |
| ISUP to DPC 1-1-1                 | -k 1-1-1:5 -t partial        |
| TUP to DPC 1-1-1                  | -k 1-1-1:4 -t partial        |
| QBICC to DPC 1-1-1                | -k 1-1-1:13 -t partial       |
| SI [0-2,6-12,14,15] to DPC 1-1-1  | -k 1-1-1:<SI>                |
| SCCP SSN 5 to DPC 1-1-1           | -k 1-1-1:3:5                 |
| ISUP to DPC 1-1-1 from OPC 2-2-2  | -k 1-1-1:5:2-2-2 -t partial  |
| TUP to DPC 1-1-1 from OPC 2-2-2   | -k 1-1-1:4:2-2-2 -t partial  |
| QBICC to DPC 1-1-1 from OPC 2-2-2 | -k 1-1-1:13:2-2-2 -t partial |
| ISUP CIC 1 to 1-1-1 from 2-2-2    | -k 1-1-1:5:2-2-2:1           |
| TUP CIC 1 to 1-1-1 from 2-2-2     | -k 1-1-1:4:2-2-2:1           |
| QBICC CIC 1 to 1-1-1 from 2-2-2   | -k 1-1-1:13:2-2-2:1          |
| ISUP CIC 0-5 to 1-1-1 from 2-2-2  | -k 1-1-1:5:2-2-2:0:5         |
| TUP CIC 0-5 to 1-1-1 from 2-2-2   | -k 1-1-1:4:2-2-2:0:5         |
| QBICC CIC 0-5 to 1-1-1 from 2-2-2 | -k 1-1-1:13:2-2-2:0:5        |
| Default Routing Key               | -k -t default                |

Example of basic **drklog** with no filtering options, including entries for ANSI fully specified routing keys, partial keys, and default keys:

**pass:loc=1105:cmd="drklog"**

Command Accepted - Processing

## ftptest

## FTP Test

Use this command to send a test file to a configured FTP server that is used for the Measurements Platform feature

**Keyword:** **ftptest**

**Command Class:** System Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ftptest** command option **-a** has the parameter **appl**. The FTP registered application to be tested can be specified, as in the command **ftptest -a meas**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option provides help information for the command.

#### **-a appl**

This option specifies the FTP registered application to be tested.

#### **Range: meas**

**meas**—The Measurements Platform application

### Example

```
ftptest
```

```
ftptest -h
```

```
ftptest -a meas
```

### Dependencies

None

### Notes

The **ftptest** command is executed through the **pass** command.

The specified card location must have an IP port configured to an FTP server using the **ent-ftp-serv** command, and the card must have its IP port configured using the **chg-ip-lnk** command.

### Output

```
pass:loc=1105:cmd="ftptest-h"
```

or

```
pass:loc=1105:cmd="ftptest"
```

```
Command Accepted - Processing
```

```

## linkinfo

## Link State and Event Log

This command is used to display the state of a signaling link and to retrieve/clear a specified event log for a signaling link. The signaling link is any valid signaling link provisioned for the card, and can be any one of the following: **a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, or **b3**. This command is supported only for the IPLIMx GPLs.

**Keyword:** linkinfo

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **linkinfo** command option **-i** has the parameter event. The event to be included in the report can be specified, as in the command **linkinfo a -a -i m2pa**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-h**

This option provides help information for the command.

#### **port**

This option specifies the signaling link port.

**Range:** **a**, **b**, **a1**, **b1**, **a2**, **b2**, **a3**, **b3**

#### **-a**

This option displays the adapter layer interface (ALI) log for the specified signaling link.

#### **-i event**

This option includes (does not filter) a link event in the log.

**Range:** **ali**, **all**, **data**, **l2l3**, **l3l2**, **m2pa**, **state**

**all**—include all events

#### **-l**

This option displays the IPLIM ALI event log for the specified signaling link

#### **-m**

This option displays acknowledgment times on an M2PA connection (minimum, maximum, weighted average, last recorded).

#### **-r**

This option resets (clears) the event log for the specified signaling link. This option is valid only with the **-a** option or **-l** option.

#### **-s**

This option displays the state information for the specified signaling link

#### **-v**

This option displays the link event filter configuration.

#### **-x event**

This option excludes (filters) a link event in the log.

**Range:** **ali**, **all**, **data**, **l2l3**, **l3l2**, **m2pa**, **state**

**all**—exclude all events

### Example

Provide help information for the command.

**pass:loc=1301:cmd="linkinfo -h"**

Display the ALI event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -a"**

Display the IPLIM application event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -l"**

Reset/clear the link event log for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -l -r"**

Display the state information for signaling link **a1**.

**pass:loc=1301:cmd="linkinfo a1 -s"**

Display acknowledgement times for an M2PA connection on signaling link **b1**.

**pass:loc=3315:cmd="linkinfo b1 -m"**

### Dependencies

None

### Notes

None

### Output

Example of help for using the command:

**pass:loc=1301:cmd="linkinfo" or**

**pass:loc=1301:cmd="linkinfo -h"**

```
rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0
PASS: Command sent to card
;

rlghncxa03w 04-07-29 11:31:09 EST  EAGLE5 31.6.0
Usage: LINKINFO port [-a [-r]] [-h] [-l [-r]] [-m [-r]] [-s] [-v]
Options:
  port      Signaling link port: a, b, a1, b1, a2, b2, a3, b3
  -a        Display the ALI event log for a signaling link
  -h        Displays this message
  -i event  Include (do not filter) a link event type in the log
             where 'event' is: ali, all, data, l2l3, l3l2,
             m2pa, state
  -l        Displays the event log for a signaling link
  -m        Display Link Measurements
  -r        Resets the specified event log for a signaling link
  -s        Displays the state information for a signaling link
  -v        View the link event filter configuration
  -x event  Exclude (filter) a link event type from the log
             where 'event' is: ali, all, data, l2l3, l3l2,
             m2pa, state

**msucount****Message Signaling Unit (MSU) Count**

This command is used to report the count of SS7 MSUs and bytes that pass through links, routing keys, and IP connections. These counts can be reported and reset at the same time to get accurate counts for longer periods of time. In addition to MSUs transmitted and received, the **msucount** command also reports statistics on packets related to MTP Primitives and on discarded transmit and receive data.

**Keyword:** **msucount**

**Command Class:** Application Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msucount** command option **-l** has the parameter port. The link for which counts will be displayed can be specified, as in the command **msucount -l a1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a**

This option is used to display IP connection statistics for a specific association. When **-a aname** is specified on the same line as **-k rtkey**, the output is assumed to be routing key output. When **-a aname** is specified on the command line without **-k rtkey**, association statistics output is generated.

**-h**

This option is used to provide help information for the command.

**-d**

This option is used to report dynamic routing keys (IPGWx application only).

**Default:** Static

**-f**

This option is used to display a full report (IPGWx application only).

**-k rtkey**

This option is used to specify the routing key for which the counts will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to 3.

The **-p** modifier can be specified to identify the point code type of the routing key that follows the **-k** option in the command.

The **rtkey** variable is optional when used with **-t default**, and mandatory for all other cases.

If the same routing key exists as both a static and dynamic routing key, the **-k** option will report the counts associated with the dynamic entry in the Routing Key table only.

The following formats are valid for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.
- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is in the range **0-2**, **4**, or **6-15**. There is no subsystem. As a default, counts for all routing keys within the option combination are displayed.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range **0** to **16363**.

#### **-l link**

This option is used to display counts for links. The link report optionally allows display of link statistics for a specified port.

The link report contains data, per link, for MSUs (tx/rcv), MSU bytes (tx/rcv), MGMT msgs (tx/rcv), and discarded data (tx/rcv).

#### **Range: a, b, a1, b1, a2, b2, a3, b3**

Ports **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** are allowed only on SSED CM IPLIMx cards.

If a port is not specified, **msucount** displays link statistics for port **a** for IPGWx links, and port **a** and port **b** for IPLIMx links.

The **msucount** link statistics report contains all zeros for a port that is valid for the card and application type but is unequipped.

#### **-p point code type**

This option modifier can be specified along with the **-k** option to identify the point code type (ANSI, ITU international, ITU-national, 24-bit ITU national, ITU international spare, and ITU national spare) in the routing key that follows the **-k** option in the command.

#### **Range: ansi, itui, itun, itun24, ituis, ituns**

#### **-r**

This option is used with other options to reset counts at the same time of reporting them.

#### **-s name**

This option is used to display socket reports for the specified IP connection.

#### **Range:**

Up to 15 alphanumeric characters

**Default:** Counts for all IP connections within the option combination

#### **-t keytype**

This option is used to display the routing key type (IPGWx only).

#### **-x rc**

The routing context is an index that uniquely defines a routing key associated with an SUA or M3UA AS. The **-x** option is used as an alternative to the **-k** option to identify the routing key by specifying its routing context in the command line.

**NOTE: The -x rc option can only be used to specify routing keys containing M3UA/SUA associations.**

### Example

Link counts only. Displays brief count for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

**msucount -l**

Link counts only, for signaling link port **a1**.

**msucount -l a1**

Full/detail report for signaling link **a** for IPGWx.

**msucount -l -f**

Counts for the specified socket only.

**msucount -s socyellow**

Counts for the specified association only.

**msucount -a association name**

Counts for first matching routing key

**msucount -k 10-10-10:3:16**

Counts for matching dynamic routing key

**msucount -k 10-10-10:3:16 -d**

Counts for the routing key report using the routing context.

**msucount -x 5**

Counts for the first matching routing key and an associated socket

**msucount -s socket name -k rtkey**

Counts for first matching routing key and an associated association.

**msucount -a association name -k rtkey**

Counts for the default routing key

**msucount -k -t default**

Counts for a matching partial routing key.

**msucount -k 3-3-3 -t partial**

Counts for counts for link only. Displays brief report for signaling link a for IPGWx. Displays counts for all equipped signaling links for IPLIMx.

**msucount**

Full/detail report for signaling link A for IPGWx.

**msucount -h full**

Resets the signaling link count measurements.

**msucount -r**

Brief version of help text.

**msucount -h**

Full version of help text.

**msucount -h full**

Counts for link and first matching routing key

**msucount -l -k 10-10-10:3:16**

Counts for first matching routing key and an associated IP connection

**msucount -s socyellow -k 10-10-10:3:16**

Use with other parameters to display and reset counts. Valid with the above combinations.

**msucount -l -r****msucount -r****msucount -s sock1 -r****msucount -x 5 -r**

The following examples provide a correct syntax to specify partial or default keys, or to specify a key by routing context.

```
pass:loc=1105:cmd="msucount -k 5-5-1:5:6-6-6 -t partial
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:5 -t partial"
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:3 -t partial
```

```
pass:loc=1105:cmd="msucount -p ITUI -t partial -k 1-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351"
```

```
pass:loc=1105:cmd="msucount -p ITUN -t partial -k 2351-gr
```

```
pass:loc=1105:cmd="msucount -t partial -k :2 "
```

```
pass:loc=1105:cmd="msucount -k -t default"
```

```
pass:loc=1105:cmd="msucount -d -k -t default "
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

```
pass:loc=1105:cmd="msucount -p ITUN24 -t partial -k 10-235-1"
```

Examples of other valid routing key inputs:

```
pass:loc=1105:cmd="msucount -r -k 5-5-6:5:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:4:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -r -p ITUI -k 5-5-6:5:5-5-7:1:1000"
```

```
pass:loc=1105:cmd="msucount -p ITUI -k 5-5-1:3:5 -s c7000 -r"
```

```
pass:loc=1105:cmd="msucount -r -s c7050 -p ITUN -k 2860:3:5 -l"
```

```
pass:loc=1105:cmd="msucount -k 5-5-1:3:5 -a assoc1"
```

```
pass:loc=1105:cmd="msucount -p ITUN -k 3838:3:5 -s c7000"
```

```
pass:loc=1105:cmd="msucount -p ITUI -k 1-34-4:3:105 -s c7001"
```

```
pass:loc=1105:cmd="msucount -r -p ITUN24 -k 15-105-16:5:15-105-17:1:1000"
```

## Dependencies

At least one option must be specified.

## Notes

The **msucount** command is executed through the **pass** command.

Combinations of the **-l**, **-a**, **-s**, **-k**, **-t** and **-x** options provide count information based on the entered combination.

If no parameters are specified, then the **-l** brief report is output.

Multiple reports are not supported with the IP Signaling Serviceability feature.

For the SS7IPGW and IPGWI GPLs, 3 types of reports can be generated: the link report, the routing key report, and the IP connection statistics report. For the IPLIM/IPLIMI card, the routing key report is not supported.

The 3 reports are the following:

1. The link report (**-l** option) contains statistics per link—data about MSUs (transmit/receive), MSU bytes (transmit/receive), MGMT messages (transmit/receive), and discarded data (transmit/receive).
2. The routing key report (**-k** option) contains statistics for a specific routing key—data about MSUs (transmit), MSU bytes (transmit), and discards on the transmit path for the routing key. A list of one or more IP connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also displayed. If **-s sname** or **-a aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. When **-s sname** and **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed.  
The **-p** (point code type) modifier option can be used with the **-k** option to specify the point code type of the routing key that follows the **-k** option in the command.  
For the **-k** options, the routing key must be an exact match of a routing key that exists in the static or dynamic Routing Key tables. If the same routing key exists in both the static and dynamic Routing Key tables, the **-k** option displays the counts associated with the entry in the dynamic Routing Key table only.
3. The IP connection statistic report (**-s sname** or **-a aname** option) contains statistics for a specified IP connection—data about MSUs (transmit/receive), MSU bytes (transmit/receive), and discarded data (transmit/receive).  
When the **-s sname** or **-a aname** option is specified in the command with the **-k** option, the output type is assumed to be routing key output.  
When the **-s sname** option is specified in the command without the **-k** option, the IP connection statistic report is generated.  
When **-a aname** is specified on the command line without **-k**, association statistics output is generated.

All 3 report types (IPGWx only) can display individual transmit MSUs that were discarded at layer 2. The first 32 bytes of the MSU transmit data that is discarded is stored beginning at the SIO bytes. If the MSU is not 32 bytes long, the remaining bytes are set to 0.

The link and IP connection statistics reports can display individual receive packets that were discarded at layer 2. Portions of the TALI packets for the receive MSUs that the SS7IPGW application discards are stored beginning with the 12 bytes of the TALI header., and followed by the service

data. If the storage space is larger than the service data, the extra bytes are set to 0. The TALI packet is stored instead of the MSU so that it is not necessary to construct an MTP3 header for packets that are discarded for reasons such as bad link state, bad SCCP message type, no calling or called party, or bad SIO for an ISUP message.

The reset option (**-r**) resets the specified measurements. This option can be added to any command.

## Output

In the examples that follow, the hexadecimal output for discarded *transmit* data represents data stored beginning at the SIO bytes through the first 32 bytes of the MSU. If the MSU was less than 32 bytes, the remaining bytes are represented by zeros.

Hexadecimal output for discarded *receive* data represents data stored beginning at the TALI header. (A TALI header can have a sync code of either TALI or SASI). This data is used to store portions of the TALI packets for received MSUs that the SS7IPGW APPL layer decides to discard.

Stored *receive* data takes the following format:

First 12 bytes = TALI header.

Bytes 13-x = Service data, beginning with the first byte of service data based on the received TALI operations code. If the storage space is greater than the size of the service data, the remaining bytes are zeroed.

## Output Specific to SS7IPGW and IPGWI

Either brief or full help reports can be displayed. A full help report is generated by adding the **full** (**-f**) option to the command line.

Example of a brief help report:

```
pass:loc=1105:cmd="msucount -h"
```

```

0          1          2          3          4          5          6          7

        -h display command help (brief or full)

```

#### -k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

| SS7 Traffic Partition             | RTKEY Parameter Example      |
|-----------------------------------|------------------------------|
| Any User Part to DPC 1-1-1        | -k 1-1-1 -t partial          |

A brief version for the link measurement report can be specified for IPGWx. If no parameters are specified for a link measurements report, then a brief report is displayed. The brief report does not display the transmit/receive discard counts.

Example of a brief link measurements report:

**pass:loc=1305:cmd="msucount"**

or

**pass:loc=1305:cmd="msucount -l"**

```

### Routing Key Report Output Examples

The routing key report contains data about MSUs (tx), MSU bytes (tx), and discards on the transmit path for the routing key. A list of one or more connections associated with the routing key, with the MSU and MSU bytes counts for each connection, is also presented. If **-s sname** or **-a aname** is in the same input command with **-k rtkey**, only the connection association data for the specified connection is displayed. When **-s sname** and **-a aname** is not specified with **-k rtkey**, all connection associations are listed. If **-x rc** is specified, only the connection association data for the specified routing context is displayed.

**NOTE: For IPGWx, -k rtkey is optional when used with -t default, and mandatory for all other cases.**

The report output itself does not display the routing key that was entered, other than an exact copy of the command line being generated as part of the output. The only indication in the output as to which key was found is the indication as to whether the key was in the dynamic Routing Key table or the static Routing Key table.

Partial routing keys (where some fields in the MSU are ignored with respect to finding a routing key to use for the MSU) and default keys can be specified in the command. The output does not change for these key types; the only difference is the routing key syntax (**-p**, **-d**) that must be processed as part of identifying the partial and default keys. (See the Example section of this command description for syntax examples.)

Example of a routing key report for an ANSI routing key that specifies the dynamic Routing Key table:

```
pass:loc=1105:cmd="msucount -k 5-5-1:3: -t partial -d"
```

or

```
pass:loc=1105:cmd="msucount -k 5-5-1:3 -p ANSI -t partial -d"
```

```

0          1          2          3          4          5          6          7

END of Report

;

Example of an ITU-N routing key report:

- Command when the ITUDUPPC feature is OFF (default)

**pass:loc=1105:cmd="msucount -p -k 2860:3:5"**

Command Accepted - Processing

```

rlghncxa03w 06-06-01 11:33:40 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msucount -p ITUN -k 2860-aa:3:5"
Command entered at terminal #1.

```

;

- Command when the ITUDUPPC feature is ON (a 2-letter group code must be specified)

**pass:loc=1105:cmd="msucount -p ITUN - k 2860-gr:3:5"**

## Command Accepted - Processing

```
rlghncxa03w 06-06-01 11:33:40 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msucount -p ITUN -k 2860-gr:3:5"
Command entered at terminal #1.
```

;

- The remainder of the ITUN routing key report is the same for both the **on** and **off** settings of the ITUDUPPC feature:

```
rlghncxa03w 06-06-01 11:33:40 EST EAGLE5 35.0.0
PASS: Command sent to card
```

### Output Specific to IPLIM and IPLIMI

**NOTE:** The routing key report is not supported for IPLIMx applications. The -k, -t, -p, -d, -x options are not supported because the IPLIMx card does not use routing keys and does not support dynamic routing key registration.

**NOTE:** The IPLIM reports include all equipped signaling links instead of just ports A and B. These reports include the transmit/receive counts alongside each other for the link case.

Example of help for using the command:

**pass:loc=1103:cmd="msucount -h" or**

**pass:loc=1103:cmd="msucount"**

```
Usage: msucount [ [-l [link]] |
                 [[-a aname] | [-s sname]] ]
                 [-r] [-h]
```

```
Options: -l  display signaling link report
          -a  display association report
          -s  display socket report
          -r  resets the specified counts
          -h  display command help
```

MSUCOUNT command complete

;

Example of a link report for an IPLIMx card with 2 SAALTALI or M2PA links:

The report does not contain MTPP or RKRP MGMT statistics, because those capabilities are not supported on the IPLIMx applications. The report also does not contain tx/rcv discard data, because there are no discards performed at layer 2 of the IPLIMx applications. The IPLIMx card can also contain 2 links per card; the output contains link data for each link.

**pass:loc=1301:cmd="msucount"**

or

**pass:loc=1301:cmd="msucount -l"**

MSUCOUNT: MSU Count Report

| SLK Transmit counts |      |            |            | SLK Receive counts |            |            |
|---------------------|------|------------|------------|--------------------|------------|------------|
| slk                 | rate | msus       | bytes      | rate               | msus       | bytes      |
| A                   | 2000 | 4294967295 | 4294967295 | 2000               | 4294967295 | 4294967295 |
| B                   | 2000 | 4294967295 | 4294967295 | 2000               | 4294967295 | 4294967295 |
| A1                  | 2000 | 4294967295 | 4294967295 | 2000               | 4294967295 | 4294967295 |

### Enhanced Reset Option

The reset option resets the specified measurements without displaying **msucount** output. The default is to reset the link measurements report.

Example displays resetting link measurements:

**pass:loc=1305:cmd="msucount -l -r"**

or

**pass:loc=1305:cmd="msucount -r"**

```

eagle10212 06-06-01 08:50:47 EST  EAGLE 35.0.0

MSUCOUNT: MSU Count Report

Link measurements have been reset.

MSUCOUNT: command complete

```

Example displays resetting IP connections:

**pass:loc=1305:cmd="msucount -s - sock1 -r"**

```

eagle10212 06-01-05 08:50:47 EST  EAGLE 35.0.0

MSUCOUNT: MSU Count Report

IP Connection measurements have been reset.

MSUCOUNT: command complete

```

Example displays resetting Routing Key measurements:

```
pass:loc=1305:cmd="msucount -x -5 -r"
```

```
eagle10212 06-01-05 08:50:47 EST EAGLE 35.0.0
```

```
MSUCOUNT: MSU Count Report
```

```
Routing Key measurements have been reset.
```

```
MSUCOUNT: command complete
```

## msuroute

## Message Signaling Unit (MSU) Routing Information

This command is used to provide a list of all routing keys currently configured on an SS7IPGW/ IPGWI card that could be used to route a particular MSU. With 3 types of routing keys (fully specified, partial and default) and 2 types of routing key tables (static and dynamic) the complexity associated with figuring out how a particular MSU would be routed at any point in time is not trivial. This command provides output to help determine how MSUs will be routed based on current conditions.

**Keyword:** **msuroute**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msuroute** command option **-k** has the parameter rtkey. The *full routing key* must be specified for the MSU for which the summary will be displayed, as in the command **msuroute -k 5-5-5:5:6-6-6:1100**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-d**

This option is used to report dynamic routing keys.

#### **-h**

This option is used to provide help information for the command.

#### **-k rtkey**

This option is mandatory in the command to specify the full routing key for the MSU for which the summary will be displayed. The routing key is specified as a single parameter with up to five colon-separated fields. The subsystem is not specified when SI is not equal to **3**.

The **-p point code type** modifier is used to identify the format of the routing key that follows the **-k** option in the command.

The following are valid formats for the routing key that follows the **-k** option in the command:

- **n-c-m:s:n**—For DPC, SI, SSN type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **3** or **sccp**. The subsystem (n) is in the range **0-255**.
- **n-c-m:s**—For DPC, SI, type routing keys. The network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is in the range **0-2**, **4**, or **6-15**. There is no subsystem.
- **n-c-m:s:no-co-mo:cs:ce**—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (n-c-m) are in the range **0-255**. The service indicator (s) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (no-co-mo) are in the range **0-255**. The starting circuit identification code (cs) and ending circuit identification code (ce) are in the range **0** to **16363**.

**-p point code type**

This option modifier is used to identify the point code type (ANSI, ITU international, ITU national, ITU international spare, ITU national spare) in the routing key that follows the **-k** option in the command.

**Range:** ansi, itui, itun, itun24, ituis, ituns

**Default:** ansi

**-x routing context**

This option modifier is used to display the routing key report using routing context.

**Example**

```
msuroute -h
msuroute -p ansi -k 5-5-5:5:6-6-6:1100
msuroute -p ansi -k 5-5-5:5:6-6-6:1100:1100
msuroute -k 5-5-5:5:6-6-6:1100
msuroute -k 5-5-5:5:6-6-6:1100:1100
msuroute -p ansi -k 5-5-5:8
msuroute -p itun -k 345:5:678:100:200
msuroute -p itun -k 345-gr:5:678-gr:100:200
msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100
```

**Dependencies**

The **-k** option must be specified in the command, and must specify a full routing key.

This command is not supported for IPLIM/IPLIMI cards.

**Notes**

The **msuroute** command is executed through the pass command.

The **-p point code type** modifier option can be used with the **-k** option to specify the format of the routing key that follows the **-k** option in the command.

**Output**

The output for each **msuroute** command consists of a list of all of the routing keys that exist on the IPGWx card that could be used to route the MSU. The list of routing keys is presented in the hierarchical search order in which the keys would be used. The list of routing keys indicates keys that have IP connections available for traffic, and indicates which routing key would currently be used to route the MSU (marked with \*\*\*).

For the routing key that is selected to route the MSU, the list of IP connections associated with the key is also displayed.

**NOTE: Most of the following output examples show command entries for ANSI MSUs. Because, other than echoing the input command back to the screen, there is nothing in the output that contains specific fields from any configured keys. The output would not be different if the user entered ITUI MSUs instead of ANSI MSUs.**

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h full** option to the command line.

Example of a brief help report:

```
pass:loc=1105:cmd="msuroute -h"
```

```
Command Accepted - Processing
```

```
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] [-d]] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: ([dpc][:si][:opc | :ssn][:cics][:cice])
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
        -d display dynamic routing key
        -h display command help (brief or full)
```

```
;
```

Example of a full help report:

```
pass:loc=1305:cmd="msuroute -h full"
```

```
0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: msuroute [ [-x rc] | [-k [rtkey] [-p pctype] [-d]] ]
        [-h [full]]
```

```
Options: -x routing key report using routing context
        -k routing key report using MTP3 parameters
           rtkey :: dpc:si:opc:cics:cice | dpc:si:ssn | dpc:si
        -p pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
        -d display dynamic routing key
        -h display command help (brief or full)
```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI default pctype is ITUI.

| Network | PC Format | Notes                                  |

MSURROUTE command complete

;

Examples of **msuroute** output for an ITUN and an ITUN24 MSU with SI=5. The output format is the same for all four commands.

The ITUDUPPC feature is OFF (default):

**pass:loc=1105:cmd="msuroute -p itun -k 345:5:678:100:200"**

The ITUDUPPC feature is ON (the 2-letter group code must be specified with the DPC and OPC)

**pass:loc=1105:cmd="msuroute -p itun -k 345-gr:5:678-gr:100:200"**

An ITUN24 MSU with SI=5:

**pass:loc=1105:cmd="msuroute -p itun24 -k 10-200-10:5:10-200-1:1:100"**

An ITU-I Spare MSU with SI=5:

**msuroute -p ituis -k 3-11-1:5:4-11-1:5:5**

## msutrace

## MSU Trace

This command provides filter and trace capability for MSUs passing through the IP<sup>7</sup> GPLs. This command provides a view of MSU data as it exists in the PSTN network and its corresponding format as it exists in the IP network.

**Keyword:** **msutrace**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **msutrace** command option **-a** has the parameter action. The action that the command is to take can be specified, as in the command **msutrace -a acttrace**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-a action**

Action option.

#### **Range: acttrace, clrtrace, dacttrace, chgfilter**

**acttrace**—Activate (turn on) MSU tracing

**clrtrace**—Clear all data from trace buffers

**dacttrace**—Deactivate (turn off) MSU tracing

**chgfilter**—Change filter used to indicate which MSUs are placed in the trace buffers

#### **-g get option**

The get option.

#### **Range: config, trace**

**config**—Displays the current **msutrace** settings: trace ON/OFF status, filter settings, and trace buffers used/available

**trace**—Displays contents of trace buffers containing captured MSU data

#### **-h help**

This option is used to display help information about this command.

#### **Range: full**

If **full** is specified, the detailed version of the help information is displayed.

If **full** is not specified (just **-h**), the simple version of the help information is displayed.

#### **-m mode**

This option is used to indicate which MSUs are captured.

#### **Range: normerr, all**

**normerr**—trace only MSUs with normalization errors

**all**—trace all MSUs regardless of MSU contents

#### **-p point code type**

This option is used to specify which type of point code (ANSI, ITU international, ITU national, 24-bit ITU national, ITU-I spare, or ITU-N spare) is contained in the filter key, when the key contains a DPC or OPC.

#### **Range: ansi, itui, itun, itun24, ituis, ituns**

**Default:** ansi

#### **-k filter key**

The **-k**, **-c**, and **-p** options are used to specify the filter key used to determine which MSUs will have data placed in the trace buffers.

**Range:**

**-k filter key [-p] [-c pcType]**

The syntax for the **filter key** portion of the **-k filter key** option is specified as a single string parameter with up to five colon-separated fields. The **filter key** can contain one or more of the following fields:

*n-c-m*—represents an ANSI DPC in the format *network-cluster-member*

*no-co-mo*—represents an ANSI OPC in the format *network-cluster-member*

*z-a-i*—represents an ITU-I DPC in the format *zone-area-id*

*zo-ao-io zone-area-id*—represents an ITU-I OPC in the format

*msa-ssa-sp*—represents a 24-bit ITU-N DPC in the format *main signaling area-sub signaling area-signaling point*

*nnnnn*—represents an ITU-N DPC

*nnnnn-gc*—represents an ITU-N DPC with Group Code when the Duplicate Point Code feature is ON

*no*—represents an ITU-N OPC

*no-gc*—represents an ITU-N OPC with Group Code when the Duplicate Point Code feature is ON

*s*—represents an SI (Service Indicator)

*cs*—represents a CIC Start value (start of the CIC range)

*ce*—represents a CIC End value (end of the CIC range)

*n*—represents an SSN (Subsystem Number)

The following examples show valid formats:

- *n-c-m:s:n*—For DPC, SI, SSN type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **3** or **sccp**. The subsystem (*n*) is in the range **0-255**.
- *n-c-m:s*—For DPC, SI type routing keys. The network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is in the range **0-2**, **4**, or **6-15**. There is no subsystem number. As a default, counts for all routing keys within the option combination are displayed.
- *n-c-m:s:no-co-mo:cs:ce*—For DPC, SI, CIC type routing keys. The DPC network, cluster and member (*n-c-m*) are in the range **0-255**. The service indicator (*s*) is **5** or **isup**. There is no subsystem. The OPC network, cluster and member (*no-co-mo*) are in the range **0-255**. The starting circuit identification code (*cs*) and ending circuit identification code (*ce*) are in the range **0** to **16363**.
- *z-a-i*—For DPCN and DPCI routing keys, the zone, area and ID (*z-a-i*) are in the range of **000-007** (zone and ID) and **000-255** (area).
- *msa-ssa-sp*—For 24-bit DPCN routing keys, the main signaling area, sub signaling area and signaling point (*msa-ssa-sp*) are in the range of **000-255**.

**-t**

This option is used to denote the routing key type (IPGWx only).

**-x rc**

This option is used to generate a routing key report using routing context.

**Example**

```
pass:loc=1105:cmd="msutrace -h"
```

```
pass:loc=1105:cmd="msutrace -h full"
```

```
pass:loc=1105:cmd="msutrace -g config"
```

```

pass:loc=1315:cmd="msutrace -g trace"
pass:loc=1105:cmd="msutrace -a clrtrace"
pass:loc=1105:cmd="msutrace -a acttrace"
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
pass:loc=1105:cmd="msutrace -a chgfilter -p itui -t partial -k 1-3-3:5:2-4-4"
pass:loc=1105:cmd="msutrace -a chgfilter -p itun -t partial -k 1536:5"
pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"
pass:loc=1105:cmd="msutrace -a chgfilter -m all"

```

## Dependencies

If no options are specified, the simple version of the help information is displayed.

The point code type defaults to ANSI when the **-p** option is not specified.

The **-p** option is allowed only on key types that contain a DPC or OPC.

## Notes

The **msutrace** command is executed through the **pass** command.

The **mustrace** command captures the data portion of the PSTN packet, starting at the SIO bytes.

The **msutrace** command captures the entire TALI, M3UA, or SUA packet. This includes the TALI, M3UA, or SUA header and additional data stored inside system buffer chain elements. The **msutrace** command currently does not support the trace and capture of TALI MTP Primitives or M3UA / SUA SSNM (Class 2) messages.

The **msutrace** command captures data in trace buffers. If the set of trace buffers becomes full with captured MSU data after MSU tracing is activated, no more data capturing will take place. The **-a clrtrace** option must be specified to reset (clear) the content of the trace buffers. After the trace buffers are empty again, **msutrace** will restart capturing qualified MSUs.

If MSU tracing is activated with the **-a acttrace** option before a properly formatted filter key is entered, **msutrace** will not capture any data due to lack of a proper filter. When the **-a chgfilter** option is specified to enter a properly formatted filter, **msutrace** will start capturing qualified MSUs.

## Output

**NOTE: The msutrace pass command exists on the IPLIM/IPLIMI cards as a debug-only pass command. All command syntax and output are identical to the SS7IPGW and IPGWI commands described in this section.**

Both brief and full versions of IPGW reports can be requested. A full report is requested by including the **-f** in the command line.

Example of a brief help report:

```
pass:loc=1305:cmd="msutrace -h"
```

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: msutrace [-a action_cmd] [-g get_cmd]
               [-x rc] | [-k rtkey] [-p pctype] [-t keytype]] ]
               [-m mode] [-h [full]]

Options:
-a      action_cmd: an Action Command

```

```

-g    get_cmd: a Get Command
-x    routing key report using routing context
-k    routing key report using MTP3 parameters
      rtkey :: ([dpc][:sil][:opc | :ssn][:cics][:cice])
-p    pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t    routing key type
      keytype :: (<full>, partial, default)
-m    mode: mode for qualifying MSUs captured=[normerr | all]
-h    displays this message (brief or full)

get_cmd:      [config | trace]
config        config
trace         trace

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
acttrace      acttrace
chgfilter     chgfilter [<fltrkey>] | [-m mode] (at least 1 required)
clrtrace      clrtrace
dacttrace     dacttrace

<fltrkey>:    [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              (see 'msutrace -h full' for complete description)

```

MSUTRACE command complete

;

Example of a full help report:

**pass:loc=1305:cmd="msutrace -h full"**

```

0          1          2          3          4          5          6          7

Usage: msutrace [-a action_cmd] [-g get_cmd]
              [ [-x rc] | [-k [rtkey] [-p pctype] [-t keytype]] ]
              [-m mode] [-h [full]]

```

#### Options:

```

-a    action_cmd: an Action Command
-g    get_cmd: a Get Command
-x    routing key report using routing context
-k    routing key report using MTP3 parameters
      rtkey :: ([dpc][:sil][:opc | :ssn][:cics][:cice])
-p    pctype :: (ANSI, ITUI, ITUN, ITUN24, ITUIS, ITUNS)
-t    routing key type
      keytype :: (<full>, partial, default)
-m    mode: mode for qualifying MSUs captured=[normerr | all]
-h    displays this message (brief or full)

get_cmd:      [config | trace]
config        Display the current MSUTRACE settings:
              trace On/Off status, filter settings, and
              trace buffers used/available.
              ex: msutrace -g config

trace         Display content of trace buffers containing captured
              MSU data
              ex: msutrace -g trace

action_cmd:   [acttrace | chgfilter | clrtrace | dacttrace]
acttrace      Activate (turn-on) MSU-tracing.
              ex: msutrace -a acttrace

chgfilter     Change filter used to qualify which MSUs are placed in
              trace buffers:

```

```

ex: To only trace MSUs with Normalization errors.
    msutrace -a chgfilter -m normerr
ex: To trace all MSUs regardless of error conditions:
    msutrace -a chgfilter -m all
ex: To trace MSUs based on MSU content:
    msutrace -a chgfilter <fltrkey>

```

```

clrtrace    Clear all data from trace buffers.
ex: msutrace -a clrtrace

```

```

dacttrace   Deactivate (turn-off) MSU-tracing.
ex: msutrace -a dacttrace

```

-k option details:

Use the -p option along with -k to specify the SS7 network domain and point code format for the network. The SS7IPGW default pctype is ANSI. The IPGWI and IPLIMI default pctype is ITUI.

| Network | PC Format | Notes                                  |
|---------|-----------|----------------------------------------|
| -----   | -----     | -----                                  |
| ANSI    | N-C-M     |                                        |
| ITUN    | N         | Non-Spare ITU National, no group code  |
| ITUN    | N-GC      | Non-Spare ITU National with group code |
| ITUI    | Z-A-I     | Non-Spare ITU International            |
| ITUN24  | N-C-M     | Non-Spare ITU National, 24-bits        |
| ITUNS   | N         | Spare ITU National, no group code      |
| ITUNS   | N-GC      | Spare ITU National with group code     |
| ITUIS   | Z-A-I     | Spare ITU International                |

Use the -t option along with -k to specify certain MTP3 and user part MSU fields as wildcards for the routing key.

| SS7 Traffic Partition             | RTKEY Parameter Example      |
|-----------------------------------|------------------------------|
| -----                             | -----                        |

### Examples for Entering a Filter Key

The output shown at the end of the following command examples is the same for each example, except for the echo of the entered command.

Command with the **-a chgfilter** option to insert a fully specified ANSI PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 5
- OPC = 4-4-4 (ANSI)
- CIC = [10..1000]

**pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"**

Command with the **-a chgfilter** option to insert a fully specified ANSI SCCP filter.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 3
- SSN = 230

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:3:230"**

Command with the **-a chgfilter** option to insert a fully specified ANSI DPC SI filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)
- SI = 6

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3:6"**

Command with the **-a chgfilter** option to insert a fully specified ITUN24 PC CIC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-103-3 (ITUN24)
- SI = 5
- OPC = 14-104-4 (ITUN24)
- CIC = [10..1000]

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-103-3:5:14-104-4:10:1000"**

Command with the **-a chgfilter** option to insert a partial ITUI DPC SI OPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1-3-3 (ITUI)
- SI = 5
- OPC = 2-4-4 (ITUI)

**pass:loc=1105:cmd="msutrace -a chgfilter -p itui -k 1-3-3:5:2-4-4"**

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned off:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536 (ITUN)
- SI = 5

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536:5"**

Command with the **-a chgfilter** option to insert a partial DPC SI ITUN PC filter key, with the Duplicate Point Code feature turned on:

This filter key qualifies for capture MSUs with the following properties:

- DPC = 1536-bb (ITUN)
- SI = 5

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun -k 1536-bb:5"**

Command with the **-a chgfilter** option to insert a partial ANSI DPC filter key.

This filter key qualifies for capture MSUs with the following properties:

- DPC = 3-3-3 (ANSI)

**pass:loc=1105:cmd="msutrace -a chgfilter -k 3-3-3"**

Command with the **-a chgfilter** option to insert a partial SI filter key. Because no DPC or OPC field is specified, point code type does not have to be indicated.

This filter key qualifies for capture MSUs with the following properties:

- SI = 5

This filter key qualifies for capture MSUs with the following properties:

- DPC = 13-113-3 (ITUN24)

**pass:loc=1105:cmd="msutrace -a chgfilter -p itun24 -k 13-113-3"**

Command Accepted - Processing

```
eagle20003 06-06-01 10:16:57 EST EAGLE5 35.0.0
pass:loc=1105:cmd="msutrace -a chgfilter -p ansi -k 3-3-3:5:4-4-4:10:1000"
Command entered at terminal #1.
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
PASS: Command sent to card
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command in progress
;
eagle20003 99-11-27 10:16:57 EST EAGLE5 31.6.0
MSUTRACE command completed
;
```

The following commands include the **-m mode** option to change the trace capture mode.

Mode to have a 'capture-on-normalization error' property such that only MSUs with normalization processing errors are traced:

**pass:loc=1105:cmd="msutrace -a chgfilter -m normerr"**

Set a default filter key and the filter's mode at the same time:

**pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"**

```
Command Accepted - Processing
eagle20003 99-11-27 10:16:57 EST  EAGLE5 31.6.0
pass:loc=1105:cmd="msutrace -a chgfilter -k -t default -m all"
Command entered at terminal #1.

;
eagle20003 99-11-27 10:16:57 EST  EAGLE5 31.6.0
MSUTRACE command completed
;
```

The following commands insert a partial DPC-SI filter key with ITU-I spare point code and show the **msutrace getfilter** command output with the filter key after the **chgfilter** command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPCI = (ITU-I Spare) 2-11-1
- SI=5

**pass:loc=1317:cmd="msutrace -a chgfilter -p ituis -k 2-11-1:5"**

```
Command Accepted - Processing

The following commands insert a full DPC-SI-OPC filter key with an ITU-N spare point code when the Duplicate Point Code feature is on, and show the **msutrace getfilter** command output with the filter key after the **chgfilter** command is processed to completion.

This filter key will qualify MSUs with at least the following properties:

- DPC = (ITU-N Spare) 6234-aa
- SI=5
- OPC=(ITU-N Spare) 6233-aa
- CICS=1
- CICE=200

**pass:loc=1315:cmd="msutrace -a chgfilter -p ITUNS -k 6234-aa:5:6233-aa:1:200"**

## netstat

## Network Statistics

This command is used to display network statistics from the TCP/IP stack. This command allows troubleshooting of network interface and routing configuration problems within the private EPAP-DSM IP network.

**Keyword:** netstat

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **netstat** command option **-m** has the parameter buffer pool. The pool for which information will be displayed can be specified, as in the command **netstat -m sys**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**-a**

This option displays socket information for all protocols.

**-h**

This options provides help information for the command.

**-i**

This option displays interface information for all interfaces.

**-m buffer pool**

This option displays buffer pool information for the specified pool.

**Range:** data, sys, dd

**data**—SENS protocol stack data buffer pool

**sys**—system buffer pool

**dd**—Ethernet device driver buffer pool

**Default:** All three buffer pools are displayed.

**-p protocol**

This option displays information for the specified protocol.

**Rnage:** tcp, udp, ip, icmp, sctp

**tcp**—transmission control protocol

**udp**—user datagram protocol

**ip**—internet protocol  
**icmp**—internet control message protocol  
**sctp**—stream control transmission protocol

**Default:** None

**-r**

This option displays the Route table.

### Example

```
netstat -i
netstat -a
netstat -p tcp
netstat -m
netstat -m sys
netstat -r
```

### Dependencies

Only one of the options can be specified at a time.

### Notes

The **netstat** command is executed through the **pass** command.

### Output

**pass: loc=1105: cmd="netstat" or**

**pass: loc=1105: cmd="netstat -h"**

Command Accepted - Processing

```
rlghncxa03w 03-07-27 07:58:52 EST  EAGLE5 30.0.0
pass: loc=1105: cmd="netstat"
Command entered at terminal #1.

PASS: Command sent to card
;
rlghncxa03w 03-07-27 07:58:52 EST  EAGLE5 30.0.0
Usage: netstat [-a] [-i] [-h] [-m data|sys|dd] [-p icmp|ip|tcp|udp|sctp] [-r]

Options:
-a      display socket information for all protocols
-h      Displays this message
-i      display interface information for all interfaces
-m      display buffer pool information for 1 of the system pools
-p      display socket information for 1 of the protocols
-r      display the route table information
;

## nslookup

## Nameserver Lookup

This command returns the IP address for a given hostname, or returns a hostname for a given IP address.

**Keyword:** nslookup

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **nslookup** command has the option destination. An IP address or hostname can be specified for the destination, as in the commands **nslookup 192.168.100.3** and **nslookup dcm1107a**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard "dot notation." IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine's host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

**Range:**

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**-h**

This options provides help information for the command.

**Example**

**nslookup 192.9.200.44**

**nslookup nc.tekelec.com**

**Dependencies**

The actual **nslookup** text string must be followed by a destination (either a hostname or IP address).

**Notes**

The **nslookup** command is executed through the **pass** command.

**Output**

**pass:loc=1105:cmd="nslookup"**

or

**pass:loc=1105:cmd="nslookup -h"**

```

## ping

## Packet Internetwork Groper

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

**Keyword:** ping

**Command Class:** IP Stack Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ping** command has the option destination. An IP address or hostname can be specified for the destination, as in the commands **ping 192.9.200.44** and **ping nc.tekelec.com**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

destination

The destination can be either an IP address or hostname.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

**Range:**

any string of characters beginning with a letter and comprising ('a'..'z', 'A'..'Z', '0'..'9', '-', '.') up to 120 characters in length.

**-i**

This option specifies the number of ping requests to send.

**Range: 1 - 5**

**Default: 3**

**-n**

This option specifies the size of message to use in test.

**Range: 12 - 2048**

**Default: 64**

**-h**

This options provides help information for the command.

**Example**

**ping 192.9.200.44**

**ping nc.tekelec.com**

**ping 192.9.200.44 -i 5 -n 2048**

**Dependencies**

The actual **ping** text string must be followed by a destination (either a hostname or IP address) prior to the options.

**Notes**

The **ping** command is executed through the **pass** command.

**Output****pass:loc=1105:cmd="ping" or****pass:loc=1105:cmd="ping -h"**

```

**NOTE:** In the above example, the response shows eight bytes less than the entry (192 as opposed to 200) because the ping command may use eight bytes automatically.

## sctp

## Packet Internetwork Groper

This command is used to test for the presence of hosts on the network. This command is invoked with a destination (either a hostname or IP address).

**Keyword:** sctp

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **sctp** command option **-g** has the parameter command flag **pegs -p port**. The local port can be specified for the association for which peg counts are retrieved, as in the command **sctp -g pegs -p 200 -i 1**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

#### **-a aname**

This option is used to retrieve the measurements and information for a specific association..

#### **-r**

This option is used to reset specified measurements. The associated report is not displayed.

#### **-h**

This option is used to display help information for the command. Either brief or full help reports can be generated.

### Example

**sctp -a -aname**

**sctp -p port**

**sctp -r -a aname**

**sctp**

## Dependencies

Only one of the options can be specified at a time.

## Notes

None

## Output

Either brief or full help reports can be displayed. A full help report is generated by adding the **-h full** option to the command line.

Example brief help report:

**pass:loc=1305:cmd="sctp -h"**

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: sctp [ [[-a aname] | [-p port]] [-r] [-h [full]] ]

```

### Options:

```

(no parameters) display list of Sctp ports
-a aname         display association report
-p port          display Sctp port report
-r              reset specified Sctp measurements
-h              display command help (brief or full)

```

Example of a full help report:

**pass:loc=1307:cmd="sctp -h full"**

```

0          1          2          3          4          5          6          7
12345678901234567890123456789012345678901234567890123456789012345678
Usage: sctp [ [[-a aname] | [-p port]] [-r] [-h [full]] ]

```

### Options:

```

(no parameters) display list of Sctp ports
-a aname         display association report
-p port          display Sctp port report
-r              reset specified Sctp measurements
-h              display command help (brief or full)

```

### no parameters

Summary list of all Sctp ports. To list all the Sctp ports issue the following command:

```
sctp
```

### -a aname option details

Retrieves detailed information and measurements for a specific association. For example the following Sctp command will get the measurements and detailed information for the association with association name=assoc1.

```
sctp -a assoc1
```

### -p port option details

Retrieves detailed information for a specified Sctp port. For example the following Sctp command will get the detailed information for local Sctp port 200.

```

sctp -p 200

-r option details
  Resets specified SCTP Measurements. See examples below.
  Resets measurements for specified association:
    sctp -r -a assoc
  Resets measurements for all associations with local SCTP port 2000:
    sctp -r -p 2000
  Resets measurements for all ports/associations:
    sctp -r

```

Example summary list of all SCTP ports. All SCTP ports and number of associations associated with each port is displayed.

**pass:loc=1307:cmd="sctp"**

## sockrtrt

## Socket Round Trip Time

This command is used to report and reset the round-trip time statistics for application sockets. Minimum, maximum, and average times are kept for each open socket. The Retransmission Mode (BSD, FIXED, or MOD) and the Fixed Round Trip Time are also displayed.

**Keyword:** sockrtrt

**Command Class:** Application Maintenance

**Options**

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **sockrtt** command has the option socket name. The socket name must be specified for which statistics will be displayed, as in the command **sockrtt socyellow**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

socket name

This option is **mandatory** and specifies the socket name for which statistics are to be displayed.

**Range:**

up to 15 alphanumeric characters.

**-r**

This option resets all statistics for the given socket name.

**-h**

This option provides help information for the command.

**Example**

**sockrtt**

**sockrtt -h**

**sockrtt socyellow**

**sockrtt socyellow -r**

**Dependencies**

None

**Notes**

The **sockrtt** command is executed through the **pass** command.

**Output**

**pass:loc=1105:cmd="sockrtt" or**

**pass:loc=1105:cmd="sockrtt -h"**

```

## sockstate

## Socket State

This command is used to report the TALI state machine history for the specified socket name.

**Keyword:** sockstate

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **sockstate** command has the option socket name. The socket name must be specified for which history will be displayed, as in the command **sockstate c7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

socket name

This **mandatory** option specifies the socket name for which the history is to be displayed.

### Range:

Up to 15 alphanumeric characters

### -i service

This option is used to include SS7 service messages in the display of the TALI state machine history.

### -i tali

This option is used to include TALI peer-to-peer messages in the display of the TALI state machine history.

### -x service

This option is used to exclude SS7 service messages in the display of the TALI state machine history.

### -x tali

This option is used to exclude TALI peer-to-peer messages in the display of the TALI state machine history.

### -h

This option provides help information for the command.

## Example

**sockstate**

**sockstate c7000**

**sockstate c7000 -i tali**

## Dependencies

None

## Notes

The **sockstate** command is executed through the **pass** command.

State machine history is kept in a circular buffer in memory.

**Output****pass:loc=1105:cmd="sockstate" or****pass:loc=1105:cmd="sockstate -h"**

SOCKSTATE command complete

## traceroute

## IP Tracing Utility

This command is used to determine the path taken by a UDP message to a specified remote host. The command can be invoked with either a hostname or IP address.

**Keyword:** traceroute

**Command Class:** IP Stack Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **traceroute** command has the option **IP address**. The IP address can be specified for the remote host to which the UDP message is sent, as in the command **traceroute 208.55.20.177**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

IP address

The IP address is a TCP/IP address expressed in standard “dot notation.” IP addresses consist of the system’s network number and the machine’s unique host number. An example IP address is **192.9.200.44**, where **192.9.200** is the network number and **44** is the machine’s host number.

**Range:**

4 numbers separated by dots, with each number in the range of **0-255**.

hostname

Hostname. This parameter identifies the logical name assigned to the device with the IP address indicated.

**Range:**

String of characters, beginning with a letter, up to 120 characters in length. Valid characters are **a-z**, **A-Z**, **0-9**, **-** (hyphen), **.** (period)

**-h**

This option provides help information for the command.

**-m maximum hops**

This option specifies the maximum number of hops before the trace is terminated.

**Range: 1-30**

**Default: 10**

**-n**

This option specifies that only the IP Address of each host will be displayed (not the hostname).

**-p port**

This option provides the user port number.

**Range: 1-65535**

**Default: 33434**

### Example

**traceroute**

**traceroute www.remotedest.com**

**traceroute www.remotedest.com -m 20**

**traceroute www.remotedest.com -m 20 -n**

**traceroute 208.55.20.177**

**traceroute 208.55.20.177 -m 20 -p 40000**

### Dependencies

If a Domain Name is specified, either the Domain Name must exist in the IP Host table or the Domain Name Server A or B must be provisioned.

### Notes

The **traceroute** command is executed through the **pass** command.

### Output

The following example illustrates the help information for the command.

**pass:loc=1103:cmd="traceroute" or**

**pass:loc=1103:cmd="traceroute -h"**

```

Command entered at terminal #1.
;

rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0
PASS: Command sent to card
;

rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0

Usage: traceroute <hostname | ipaddr> [-h] [-m maxhops] [-n] [-p port]
Options:
  -h           Displays this message
  -m maxhops   Maximum number of hops to destination.  Range=1..30. Default= 10.
  -n names     Inhibits the display of intermediate host names
  -p port      Port number. Range=1..65535. Default=33434.
  hostname    Name of machine to trace
  ipaddr      IP Address of machine to trace (d.d.d.d)
Errors:
  *           Timeout
  !N          Unreachable Network
  !H          Unreachable Host
  !?nn       Unknown Failure (nn = ICMP Code)
;

rlghncxa03w 04-07-27 08:32:34 EST  EAGLE5 31.6.0

TRACEROUTE command complete

```

The following example illustrates a **traceroute** request to host **www.remotedest.com**. A maximum of 20 hops has been specified. Three packets are sent to each hop, with the time for each sample displayed. Intermediate host names are also displayed.

**pass:loc=1103:cmd="traceroute www.remotedest.com -m 20"**

```

Command entered at terminal #1.

## ualog

## User Adapter Log

Use this command to report on the user adapter (UA) state machine history for a specified association name. State machine history is kept in a circular buffer in memory. The **-i** and **-x** options are used to include or exclude groups of events from the state machine history.

**Keyword:** **ualog**

**Command Class:** Application Maintenance

### Options

Options and option parameters that are underlined indicate that a value must be specified for that option or parameter. For example, the **ualog** command has the parameter **aname**. The association name must be specified for which the user adapter log will be displayed, as in the command **ualog s7000**. Do not enter the underlined option or parameter; enter a value for the information represented by the underlined option or parameter.

**aname**

This option specifies the association name for the display.

**-h**

This option displays help (usage) information for the command.

**-i event group**

This option includes groups of events in the state machine history.

**Range:** service, ua

**-x event group**

This option excludes groups of events from the state machine history.

**Range:** service, ua

### Example

```
pass:loc=1105:cmd="ualog s7000"
```

### Dependencies

None

### Notes

None

### Output

```
pass:loc=1105:cmd="ualog s7000"
```

UALOG: command complete

;

When a M3UA or SUA PDU is received that contains one or more errors, a response error message is transmitted containing an error code. Error codes are recorded to and displayed in the UALOG only when the UA peer-to-peer message logging option is enabled (**-i ua**), as shown in the following example.:

**pass:loc=1315:cmd="ualog assoc1315a1"**

## Error Codes

**NOTE:** The following error codes are not used in M3UA: 0x02, 0x08, 0x1a, 0x1b, 0x1c, 0x10, 0x17, and 0x18

The following error codes can appear in the error messages:

**0x01—Invalid Version**

A message was received with an invalid or unsupported version. The error message contains the supported version in the Common Header.

**0x03—Unsupported Message Class**

A message was received with an unexpected or unsupported Message Class.

**0x04—Unsupported Message Type**

A message was received with an unexpected or unsupported Message Type.

**0x05—Unsupported Traffic Handling Mode**

This error is sent by a Signaling Gateway Process (SGP) if an Application Server Process (ASP) sends an ASP Active message with an unsupported Traffic Mode Type or a Traffic Mode Type that is inconsistent with the currently configured mode for the Application Server (AS).

**0x06—Unexpected Message**

This error message can be sent if a defined and recognized message is received that is not expected in the current state. In some cases the ASP might silently discard the message and not send an error message. Silent discard is used by an ASP if it received a DATA message from a signaling point while the ASP is in the ASP-INACTIVE state. If the unexpected message contains Routing Context, the Routing Context can be included in the error message.

**0x07—Protocol Error**

This error message is sent for any protocol anomaly, such as reception of a parameter that is syntactically correct but unexpected in the current situation.

**0x09—Invalid Stream Identifier**

A message is received on an unexpected SCTP stream (for example, a Management message was received on a stream other than 0).

**0x0d—Refused - Management Blocking**

An ASP Up or ASP Active message is received and the request is refused for management reasons (such as management lockout). If this error is in response to an ASP Active message, the Routing Context in the ASP Active message can be included in the error message.

**0x0e—ASP Identifier Required**

This error message is sent by an SGP in response to an ASP Up message that does not contain an ASP Identifier parameter when the SGP requires one. The ASP should resend the ASP Up message with an ASP Identifier.

**0x0f—Invalid ASP Identifier**

This error message is sent by an SGP in response to an ASP Up message with an invalid (for example, non-unique) ASP Identifier

**0x11—Invalid Parameter Value**

A message is received with an invalid parameter value (for example, a DUPU message was received with a Mask value other than 0).

**0x12—Parameter Field Error**

A message is received with a parameter that has a wrong length field.

**0x13—Unexpected Parameter**

A message contains an invalid parameter.

**0x14—Destination Status Unknown**

This error message can be sent if a DAUD is received at a Signaling Gateway (SG) asking for the availability/congestion status of a destination, and the SG does not provide the status (as in the case when the sender is not authorized to know the status). For this error, each

invalid or unauthorized Point Code is be included along with the Network Appearance and/or Routing Context associated with the Point Code.

**0x15**—Invalid Network Appearance

This error message is sent by an SGP if an ASP sends a message with an invalid (unconfigured) Network Appearance value. For this error, the invalid (unconfigured) Network Appearance is be included in the Network Appearance parameter.

**0x16**—Missing Parameter

A message is received, and a mandatory parameter is not included in the message.

**0x19**—Invalid Routing Context

A message is received from a peer with an invalid (unconfigured) Routing Context value. The invalid Routing Context is included in the error message.

**0x1a**—No Configured AS for ASP

A message is received from a peer without a Routing Context parameter, and it is not known by configuration data which Application Servers are referenced.

### Summary of Range Values for :link Parameter

Table A-1 lists the valid **link** parameter range values signaling links assigned to each type of card for which a location can be specified in the command **loc** parameter. The commands that use these values refer to this table in their **link** parameter description.

**NOTE:** The **link** parameter is a synonym for the **port** parameter in signaling link definitions for a few EAGLE 5 ISS releases. Then the **port** parameter will be removed.

Table A-1. Summary of Ranges for **link** Parameter

| Card         | Link | Supported Application                                             |
|--------------|------|-------------------------------------------------------------------|
| Two-port LIM | A    | All supported link applications.<br>The two-port LIM supports the |

## Possible Values for PST/SST/AST

This section lists the possible values for the primary state (PST), secondary state (SST), and associated state (AST) shown in the output of Report Status (rept-stat-) and Retrieve (rtrv-) commands.

Status can apply to the following types of entities (not all values are possible for every entity type):

|                                 |               |
|---------------------------------|---------------|
| card                            | terminal port |
| clock                           | serial port   |
| cluster                         | but           |
| TCP/IP data link signaling link |               |
| subsystem                       | linkset       |
| EPAP/ELAP                       | ACM           |

### PST

Primary state possible values are the following:

**IS-ANR**—(In Service - Abnormal) The entity is in service but only able to perform a limited subset of its normal service functions.

**IS-NR**—(In Service - Normal) The entity is in service and handling all its normal service functions.

**OOS-MA**—(Out Of Service - Memory Administration) The entity is out of service because it has not been equipped.

**OOS-MT**—(Out Of Service - Maintenance) The entity is out of service and is not available to perform its normal service function. The maintenance system is actively working to restore the entity to service.

**OOS-MT-DSBLD**—(Out Of Service - Maintenance -Disabled) The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

## SST

Secondary state possible values are the following:

**ACTIVE**—(Active) The entity is currently in use and is handling its normal service function as the primary service provider. (Master) The entity is currently in a master state in relation to its redundant unit.

**ALLOWED**—(Allowed) The entity is handling its normal service function.

**AVAIL**—(Available) Entity service is available to another entity.

**BLOCKED**—(Blocked) The entity has been manually prohibited from handling traffic.

**BUSY**—(Busy) The entity is handling the maximum traffic capacity and has no spare capacity for new service requests.

**CONN**—(Connect) The card's entity status is in connected state.

**DISC**—(Disconnect) The card's entity status is in disconnected state.

**FAULT**—(Fault) The entity has failed.

**IDLE**—(Idle) The entity is in use and has spare capacity for service. For a telnet terminal, this indicates a "ready for connection" status.

**INHIBITED**—(Inhibited) The entity has been manually prevented from performing its normal service function.

**ISOLATED**—(Isolated) The entity cannot be detected through software or hardware.

**MANUAL**—(Manual) The entity has manually been removed from service and is not carrying any traffic.

**OVFLW-1**—(Overflow) One entity cannot provide service to another entity due to service denial.

**PROHIBIT**—(Prohibited) The entity is not handling traffic because of a failure in the network.

**RESTRICT**—(Restricted) The traffic the entity is handling is restricted. The normal capacity or configuration is not being used because of a failure in the network. The normal capacity, functionality or configuration of an entity may be restricted during loading or synching of data. This can occur when the Measurements Platform has not yet been enabled.

**STANDBY**—(Standby) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. For an IPSM card, Standby is the state just prior to Ready, while the card completes initializations.

**STANDBY**—(Slave) The entity is currently in a slave state in relation to its redundant unit.

**TEST**—(Test) The entity is currently in a test state.

**UNAVAIL**—(Unavailable) Entity service is unavailable to another entity.

**UEQ**—(Unequipped) The entity is not equipped.

**UNBLOCKED**—(Unblocked) The entity is handling its normal service function.

## AST

Associated state possible values are the following:

---- (Blank)—The field may be left blank.

**ACCESS**—(Accessible) Traffic is being carried between the local entity and an adjacent, or remote, service provider. A full connection has been completed.

**ACTIVE**—(Active) The entity is currently in use and is handling its normal service function as the primary service provider. (This appears as an AST for the MPS when there is an alarm on it.)

**ALMINH**—(Alarm Inhibited) The alarm has been inhibited.

**BIP ERROR**—(Board Identity Prom) The entity has both daughterboard and motherboard prom error.

**DB DIFF**—(Database Different) The entity has a database difference.

**D BIP ERR**—(Daughterboard Identity Prom) The entity has a daughterboard prom error.

**ENET FLT**—(Ethernet fault) An Ethernet fault exists.

**GWS**—(Gateway Screening) Linkset has gateway screening. See the **rept-stat-ls** command.

**INACCESS**—(Inaccessible) Traffic is not being carried from the local entity to another service provider. A breakdown in a complete circuit has been detected.

**LOCAL**—(Local) Entity has become locally isolated.

**M BIP ERR**—(Motherboard Identity Prom) The entity has a motherboard prom error.

**MPS UNAVL**—The DSM card cannot communicate to an MPS.

**STANDBY**—(Standby) The entity is currently in use and is handling its normal service function as an alternate service provider if the primary service provider failed. (This appears as an AST for the MPS when there is an alarm on it.)

**XX%**—(Progress indicator for cards that are performing a warm restart and are currently data loading. Shows the percentage of tables that have been downloaded for GPLs that support a persistent LNP database (**sccp**, **ebdablm**).

## Point Code Formats and Conversion

Many of the commands used for database configuration use point codes. This section describes the point code formats that the system supports. If you need additional information or procedural information, refer to the *Database Administration Manual - SS7*.

The system supports four different point code formats:

- ANSI point codes
- ITU International point codes
- ITU National point codes
- ITU National 24-bit point codes

Each format is described in further detail in the following sections.

### ANSI Point Codes

ANSI point codes are made up of three groups of digits called the network indicator (*ni*), network cluster (*nc*), and network cluster member (*ncm*). The values for ANSI point codes depend on the value of the **pctype** parameter of the **chg-sid** command, either **ansi** or **other**.

If the **chg-sid:pctype** parameter is set to **ansi**, the range of values for an ANSI point code is as follows:

*ni*—**001-255**

*nc*—**001-255** (if *ni* = **001-005**)

—000-255, \* (if *ni* = 006-255)  
*ncm*—000-255

The following rules apply to provisioning ANSI point codes if the **chg-sid:pctype=ansi** parameter is specified:

- An *ni* value of **0** is not allowed (for example, **dpc=0-1-1** and **dpc=0-0-0** are not valid point codes).
- If the *ni* value is **1, 2, 3, 4, or 5**, then the *nc* value cannot be **0** (for example, **dpc=5-0-1** is rejected).
- If the *ni* value is **1, 2, 3, 4, or 5**, then network routing point codes are not allowed (for example, **dpc=4-\*-\*** is rejected).

If the **chg-sid:pctype** parameter is set to **other**, the ANSI point codes do not meet ANSI standards. The range of values for these ANSI point codes is as follows:

*ni*—000-255  
*nc*—000-255, \*  
*ncm* —000-255, \*

The following rules apply to provisioning ANSI point code if the **chg-sid:pctype=other** parameter is specified:

- An *ni* value of **0** is allowed, however **dpc=0-0-0** is rejected (for example, **dpc=0-1-1** is accepted).
- The *nc* value can be **0** for all values of *ni* (for example, **dpc=5-0-1** is accepted).
- Network routing point codes are allowed for all values of *ni* (for example, **dpc=4-\*-\*** is accepted).

An ANSI point code containing all zeros (**0-0-0**) is not a valid point code and cannot be entered into the database.

ANSI point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code subfield values to indicate a Private Point Code (**p-5-0-1**, for example). See “Spare and Private Point Code Subtype Prefixes” on page A-12.

**NOTE: Point codes specified by many commands, including those for site identification, routing keys, and LNP, are required to be full point codes. The asterisk values are not valid in the commands that specify these point codes. The command Dependencies sections identify the point codes that must be full point codes in the commands.**

A range of values for a subfield is specified by separating the values that define the range by two ampersands (**&&**); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** through **100**.

The asterisk (\*) point code value indicates a single cluster address for a cluster point code (for example, **20-2-\***) or a network routing destination (**20-\*-\***). If \* is used for the *nc* subfield, then \* must be also be used for the *ncm* subfield.

A double asterisk (\*\*) and a triple asterisk (\*\*\*) can also be used for the *nc* and *ncm* subfields of the ANSI point code, but only for the **rtrv-dstn**, **rept-stat-dstn**, **rtrv-rte**, and **rept-stat-rte** commands. If \*, \*\*, or \*\*\* is used for the *nc* subfield, then \*, \*\*, or \*\*\* must be used for the *ncm* field

A double asterisk in the *nc* subfield of a network routing point code produces a summary report that shows all point code destinations that are members of the given network (**20-\*\*-\***). This includes the specified network routing point code (**20-002-\***). The following example shows a report generated using two asterisks in the *nc* field of a network routing point code.

**rtrv-dstn:dpc=20-\*\*-\***

```
rlghncxa03w 04-02-30 21:16:37 GMT EAGLE5 35.0.0

## ITU International Point Codes

The ITU international point codes are made up of three groups of digits called *zone*, *area*, and *id*. The range of values for ITU International point codes are:

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

An ITU international point code containing all zeros (**0-000-0**) is not a valid point code and cannot be entered into the database.

ITU international point codes support the Spare Point Code subtype prefix (**s-**). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-5-222-1**, for example). See “Spare and Private Point Code Subtype Prefixes” on page A-12.

## ITU National Point Codes

The ITU national point code is a 14-bit integer. The point codes can be a single number up to five digits, or two, three, or four numbers (members) separated by dashes.

If the ITU National Duplicate Point Code (ITUDUPPC) feature is on, ITU national point codes can have group codes assigned to them. The point code is a 1- to 5-digit number. The group code is a two-character field ranging from **aa** to **zz** that is entered as the last subfield of the point code and is separated by a dash from the rest of the point code. An example is **12345-az**.

If the flexible point codes option is enabled (see the **chg-stpopts** command, **:npcfmti** parameter), an ITU national point code format consists of 2, 3, or 4 numbers separated by dashes (formatted as *m1-m2-m3-m4*). When the ITUDUPPC feature is also on, the format is *m1-m2-m3-m4-gc* with a

group code. If one of the *m1*, *m2*, *m3*, *m4* members is set to zero bits, no value is entered for that position in the point code. For example, if the **npfcm** parameter value is set to **3-8-3-0**, valid point codes would be **1-100-1-aa** with a group code, or **7-255-7** with no group code. See the tables in the **chg-stpopts** command description for valid member values and additional examples.

The following ranges of values are valid:

*nnnnn*—**0–16383**

*nnnnn-gc*—**0–16363**; group code is *aa-zz* (the ITUDUPPC feature must be on)

*m1-m2-m3-m4*—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14.

*m1-m2-m3-m4-gc*—Each member represents the number of bits allowed in the corresponding position for a flexible ITU national point code. The range of each member is from **0** to **14**. Each member must be specified; the member value of **0** indicates that the position is not specified in the flexible point code. The sum of the member values must equal 14. Group code is *aa-zz* (the ITUDUPPC feature must be on).

An asterisk value (\*) is allowed only for for the **rtrv-dstn** and **rtrv-rte** commands to retrieve ITU-N DPCs if the ITUDUPPC feature is on (for point codes with group codes). The node and group code cannot both be \*. For example, **dpcn=12345-\*** and **dpcn=\****aa* are allowed, but **dpcn=\*-\*** is not allowed.

If flexible point codes are also used, all valid *m1*, *m2*, *m3*, and *m4* must all be either a number or an \*. For example, **1-100-1-aa** and **\*-\*-\*-aa** are allowed, but **1-\*-\*-aa** is not allowed.

ITU national point codes support the Spare Point Code subtype prefix (**s-**). The prefix can be specified before the point code subfield values to indicate a Spare Point Code (**s-12345** or **s-1-3-5-5-gc**, for example). See “Spare and Private Point Code Subtype Prefixes” on page A-12.

## Converting ITU National Point Code Formats

### Introduction

Gateway screening only allows ITU national point codes to be provisioned in the database by the enter, delete, or change gateway screening commands, and displayed by the gateway screening retrieve commands as a single number. If a format other than a single number (**14-0-0-0**) for the ITU national point code has been defined by the **npfcm** parameter of the **chg-stpopts** command, the ITU national point code must be converted into a single number so that it can be used by gateway screening.

For example, the format of the ITU national point code is **4-4-4-2** and you would like to add point code **7-7-7-1** into the allowed OPC screen. The point code **7-7-7-1** would have to be converted to a single number so that the point code can be added to the allowed OPC screen. To determine what multiple-part ITU national point code is represented by the single number ITU national point code in the gateway screening table, the single number point code must be converted to a multiple-part point code.

To convert a single number ITU national point code to a multiple-part point code, go to “Converting Single Number ITU National Point Codes” on page A-10.

To convert a multiple-part ITU national point code to a single number point code, go to “Converting Multiple-Part ITU National Point Codes” on page A-11.

For a definition of the different formats that can be used for ITU national point codes, see “ITU National Point Codes” on page A-8.

### Converting Single Number ITU National Point Codes

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the NPCFMTI field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **14781** and **695** are converted to point codes using the **3-8-3-0** format.

Convert a single number ITU national point code to a multiple-part ITU national point code as follows.

#### Procedure - Converting a Single Number ITU national point code to a multiple-part ITU national point code

---

- 1 Convert the point code to a binary number. This can be done with most scientific calculators. The number **14781** converts to the binary number 11100110111101.  
The number **695** converts to the binary number 1010110111.

**NOTE: Make sure the binary number contains 14 digits. If it does not, add leading zeros to the binary number to bring the total number of digits in the number to 14.**

In this example, the binary equivalent for the decimal number 695 (1010110111) contains 10 digits; four zeros must be added to the beginning of the binary number. The resulting binary number is now 00001010110111.

- 
- 2 Divide the binary number into the number of parts required by the format of the ITU national point code. For this example, the format is **3-8-3-0**. Because the last part of the point code format is **0**, the point code format contains only three parts. Divide the point code into three parts, the first part of the point code contains the first three digits of the 14-digit binary number, the second part of the point code contains the next eight digits of the 14-digit binary number, and the third part of the point code contains the last three digits of the 14-digit binary number.

For this example, the binary numbers would be divided like this:

11100110111101 = 111 00110111 101

00001010110111 = 000 01010110 111

- 
- 3 Convert each part of the point code into a decimal number using the same scientific calculator used in step 1 and separate each part of the point code with dashes. The results are as follows.

111 00110111 101 = **7-55-5**

000 01010110 111 = **0-86-7**

---

When the ITU national point codes are converted from single numbers to multiple-part point codes, the resulting value of the multiple-part point code depends on the point code format specified by the **npcfnti** parameter of the **chg-stpopts** command. When converting the single number point code **14781** to the point code format **3-8-3-0**, the resulting point code value is **7-55-5**. If point code **14781** is converted to the point code format **4-4-4-2**, the resulting point code value is **14-6-15-1**.

**Converting Multiple-Part ITU National Point Codes**

To make this conversion, you will need to know the format of the ITU national point code. This can be verified in the **npcfnti** field of the **rtrv-stpopts** command output. For this example, the ITU national point codes **7-55-5** and **0-86-7**, using the **3-8-3-0** point code format, are converted into a single number.

Convert multiple-part ITU national point codes to a single number as follows.

**Procedure - Converting Multiple-Part ITU National Point Codes to a Single Number**

---

- 1 Convert each part of the point code into a binary number using a scientific calculator. The results are as follows.

**7-55-5** = 111 00110111 101

**0-86-7** = 000 01010110 111

- 2 Combine each part of the point code into a single binary number as follows.

111 00110111 101 = 11100110111101

000 01010110 111 = 00001010110111

**NOTE: If the binary number has any zeros at the beginning of the number, remove these zeros as they are not necessary.**

In this example, the binary equivalent for the point code **0-86-7** (00001010110111) contains four zeros at the beginning of the binary number. When the leading zeros are removed from the binary number, the resulting binary number is now 1010110111.

- 3 Convert the binary number to a decimal number using the same scientific calculator used in step 1.

The binary number 11100110111101 converts to the decimal number **14781**.

The binary number 1010110111 converts to the decimal number **695**.

---

**24-bit ITU-National Point Codes**

The 24-bit ITU national point codes are made up of three groups of digits called *main signaling area*, *sub signaling area*, and *signaling point*. The valid values for 24-bit ITU national point codes are:

*main signaling area* —**000-255**

*sub signaling area* —**000-255**

*signaling point*—**000-255**

24-bit ITU national point codes support the Private (Internal) Point Code subtype prefix (**p-**). The prefix can be specified before the point code field values to indicate a Private Point Code (**p-2055-222-2011**, for example). See “Spare and Private Point Code Subtype Prefixes” on page A-12.

## Spare and Private Point Code Subtype Prefixes

The Spare Point Code Support feature and the Internal Point Code Support feature provide optional point code subtype prefixes. The Spare Point Code feature must be enabled before a point code subtype prefix can be specified for a point code.

**NOTE: The SEAS interface does not support point code subtype prefixes.**

The values **p-**, **s-**, and **ps-** are valid point code subtype prefixes. The dash “-” separates the point code subtype prefix from the remainder of the point code. The prefixes are displayed in lower case. The syntax for the remainder of the point code remains the same.

The Spare Point Code prefix (**s-**) applies only to ITU-I and ITU-N point code domains (ITU-N24 point codes do not support the Spare Point Code prefix), to allow the EAGLE 5 ISS to fully support ITU National and International Spare Point Codes. Table A-3 lists the commands that support the Spare Point Code subtype prefix.

The Private (Internal) Point Code prefix (**p-**) applies to all point code domain types (including ITU-N24 point codes), to allow messages destined to the End Office Node to be routed from the inbound LIM to the outbound IPGWx. Table A-3 on page A-14 lists the commands that support the Private Point Code subtype prefix.

The subtype prefix **ps-** can be specified when the point code parameter supports both the spare and private point code prefixes.

**Table A-2.** Commands that support the Spare Point Code Prefix

| Command            | Description                                   | Applicable Point Code Parameters                                                                             |
|--------------------|-----------------------------------------------|--------------------------------------------------------------------------------------------------------------|
| <b>alm</b>         | Alarm                                         | <b>dpci</b> and <b>dpcn</b>                                                                                  |
| <b>appl-rtkey</b>  | Application Route Key                         | <b>dpci</b> and <b>dpcn</b> ; <b>opci</b> and <b>open</b>                                                    |
| <b>cspc</b>        | Concerned Signaling Point Code                | <b>pci</b> and <b>pcn</b>                                                                                    |
| <b>dstn</b>        | Destination                                   | <b>spci</b> and <b>spcn</b> ; <b>dpci</b> and <b>dpcn</b> ; and to Alias combinations, as shown in Figure 1. |
| <b>ent-trace</b>   | Enter Trace                                   | <b>dpci</b> and <b>dpcn</b> ; <b>opci</b> and <b>open</b>                                                    |
| <b>gsmmap-scrn</b> | GSM MAP Screening                             | <b>npci</b> and <b>npcn</b>                                                                                  |
| <b>gsmopts</b>     | GSM Options                                   | <b>ppmspci1</b> , <b>ppmspci2</b> ,<br><b>ppmspcn1</b> , <b>ppmspcn2</b>                                     |
| <b>gsms-opcode</b> | GSM Short Message Services OP-Code            | <b>pci</b> and <b>pcn</b>                                                                                    |
| <b>gtt/gta</b>     | Global Title Translation/Global Title Address | <b>pci</b> and <b>pcn</b>                                                                                    |
| <b>ls</b>          | Linkset                                       | <b>apci</b> and <b>apcn</b>                                                                                  |
| <b>map</b>         | Mated Application                             | <b>pci</b> and <b>pcn</b> ; <b>mpci</b> and <b>mpcn</b>                                                      |

**Table A-2.** Commands that support the Spare Point Code Prefix

| <b>Command</b>     | <b>Description</b>                                              | <b>Applicable Point Code Parameters</b>                                                                                                           |
|--------------------|-----------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|

## Valid CIC Ranges for SI and MSU Types in Routing Key Static Entries

Table A-4 lists the valid CIC ranges for use with SI and MSU types in Routing Key table static entries.

**Table A-4.** Valid CIC Ranges for SI and MSU Types

| SI         | MSU for ANSI DPC                          | MSU for ITU DPC                     | Comments                                       |
|------------|-------------------------------------------|-------------------------------------|------------------------------------------------|
| 4 (TUP)    | N/A                                       | CIC is 12 bits.<br>Range is 0-4095. | The TUP protocol is used only in ITU networks. |
| 5 (ISUP)   | CIC is 14 bits.<br>Range is 0-16383.      | CIC is 12 bits.<br>Range is 0-4095. |                                                |
| 13 (QBICC) | CIC is 32 bits.<br>Range is 0-4294967295. |                                     |                                                |

## NAIV/NAI Mapping

Table A-5 shows the mapping between the **naiv** and the **nai** parameters.

**Table A-5.** NAIV/NAI Mapping

| NAIV | NAI  | Description                 |
|------|------|-----------------------------|
| 0    | –    | Unknown                     |
| 1    | Sub  | Subscriber Number           |
| 2    | Rsvd | Reserved for national use   |
| 3    | Natl | National significant number |

**Table A-5.** NAIV/NAI Mapping

| NAIV  | NAI  | Description          |
|-------|------|----------------------|
| 4     | Intl | International number |
| 5–127 | –    | Spare                |

## NPV/NP Mapping

Table A-6 shows the mapping between the **npv** and the **np** parameters.

**Table A-6.** NPV/NP Mapping

| NPV  | NP      | Description                                        |
|------|---------|----------------------------------------------------|
| 0    | –       | Unknown                                            |
| 1    | E164    | ISDN/telephony numbering plan                      |
| 2    | Generic | Generic numbering plan                             |
| 3    | X121    | Data numbering plan                                |
| 4    | F69     | Telex numbering plan                               |
| 5    | E210    | Maritime mobile numbering plan                     |
| 6    | E212    | Land mobile numbering plan                         |
| 7    | E214    | ISDN/mobile numbering plan                         |
| 8    | Private | Private network or network-specific numbering plan |
| 9–15 | –       | Spare                                              |

## Cards that use the ent-card Command

Table A-7 contains information about cards that use the **ent-card** command for provisioning.

**Table A-7.** Valid **ent-card** Applications (**appl**) and Card Types (**type**)

| Card Name<br>(as shown on<br>card label) | Part Number                | Card Type<br>(:type) | Application<br>Type (:appl) | Maximum<br>Cards in the<br>Database |
|------------------------------------------|----------------------------|----------------------|-----------------------------|-------------------------------------|
| ACM-ENET                                 | 870-1008-XX                | acmenet              | stplan                      | 32                                  |

\*Though the system allows 250 MCPM cards, practical usage is 2.

\*\* A LIM, EILA, or ILA is a link interface module using the AINF interface and can be installed in place of the LIM-DS0A, LIM-OCU, or LIM-V.35. It is configured in the database as either a LIM-DS0A, LIM-OCU, or LIM-V.35 card.

† TSMs or DSMs are required for the LNP feature. For more information about turning the LNP feature on, refer to the *LNP Feature Activation Guide* and the *Database Administration - LNP Manual*.

† †For the E1 or T1 interface, either SS7 application (SS7ANSI or CCS7ITU) can be assigned to these cards. For more information on the E1 or T1 interface go to Chapter 3 “System Administration Procedures” in the *Database Administration Manual - SS7*.

## Summary of Loopback Testing Commands and Functions

The following section, Table A-8 on page A-18, Table A-9 on page A-22, and Figure A-1 on page A-26 summarize the loopback testing commands and functions in the system.

The **tst-slk** command provides several methods for testing signaling links. The **loopback** parameter on the **tst-slk** command provides the ability to select **lxvr** (local transceiver), **oam**, **line**, **payload**, and **sltc** loopback tests. The **tst-slk** command will be rejected if a loopback test is not compatible with the link type.

- For low-speed links, the **lxvr** and **sltc** tests are allowed.
- For high-speed links (ATM), the **lxvr**, **oam**, **line**, **payload**, and **sltc** tests are allowed.
- For SS7IPGW and IPGWI DCMs, the **tst-slk** command is not supported.
- For IPLIMx DCMs, only the **loopback=sltc** test is allowed, and is allowed only for links having IPLIML2 types of SAALTALI or M2PA.
- For LIME1, LIMT1 and LIMCH cards, only the **loopback=sltc** test is allowed.

The **act-lbp** command activates test on one or more loopback points for testing data signaling link elements in one CCS7 transmission path. The maximum number of loopback points is 32.

For a single loopback point test, the parameters can be entered on the command line. If the parameters are not entered at the command line, the LFS database is used. For multiple loopback point tests, the LFS database must be used.

The **ent-lbp** command is used to create the loopback points in the LFS database. The LBPs may be entered in any order.

See the command descriptions in this manual for details on entering parameters and using the commands.

| <b>INP</b>              | INAP-based Number Portability                                                                              |
| <b>INSL</b>             | In-Network Subscriber List                                                                                 |
| <b>IP</b>               | Internet Protocol                                                                                          |
| <b>IPGWI</b>            | An ITU version of SS7IPGW                                                                                  |
| <b>IPGW<sub>x</sub></b> | Point to multi-point IP Transport GPL, referring to SS7IPGW (ANSI) and IPGWI (ITU)ÆE                       |
| <b>IPLIM</b>            | The application software used by the DCM card for TCP/IP point-to-point connectivity for ANSI point codes. |

|                 |                                                                                                           |
|-----------------|-----------------------------------------------------------------------------------------------------------|
| <b>IPLIMI</b>   | The application software used by the DCM card for TCP/IP point-to-point connectivity for ITU point codes. |
| <b>IPLIMx</b>   | Point to point IP Transport GPL, referring to IPLIM (ANSI) and IPLIMI (ITU)                               |
| <b>IPMX</b>     | IMT Power and Multiplexer                                                                                 |
| <b>IPS</b>      | Internet Protocol Services                                                                                |
| <b>IPSM</b>     | Internet Protocol Services Module                                                                         |
| <b>IS-41</b>    | Interim Standard 41, same as and interchangeable with ANSI-41                                             |
| <b>IS-ANR</b>   | In Service - Abnormal                                                                                     |
| <b>ISDN</b>     | Integrated Services Digital Network                                                                       |
| <b>IS-NR</b>    | In Service - Normal                                                                                       |
| <b>ISUP</b>     | ISDN User Part                                                                                            |
| <b>ITU</b>      | International Telecommunications Union                                                                    |
| <b>ITUDUPPC</b> | ITU National Duplicate Point Code                                                                         |
| <b>JIP</b>      | Jurisdiction Indicator Parameter                                                                          |
| <b>LAN</b>      | Local Area Network                                                                                        |
| <b>LB</b>       | Load Balancing                                                                                            |
| <b>LBP</b>      | Loop Back Point                                                                                           |
| <b>LC</b>       | Logical channel                                                                                           |
| <b>LED</b>      | Light Emitting Diode                                                                                      |
| <b>LFS</b>      | Link Fault Sectionalization                                                                               |
| <b>LIM</b>      | Link Interface Module                                                                                     |
| <b>LIM-AINF</b> | Link Interface Module with the AINF interface                                                             |
| <b>LIM-ATM</b>  | LIM with ATM interface                                                                                    |
| <b>LIM-DS0</b>  | LIM with DS0 Applique                                                                                     |
| <b>LIM-E1</b>   | LIM with E1 Applique                                                                                      |
| <b>LIM-OCU</b>  | LIM with Office Channel Unit Applique                                                                     |
| <b>LIM-V35</b>  | LIM with V35 Interface                                                                                    |
| <b>LNP</b>      | Local Number Portability                                                                                  |
| <b>LNPMR</b>    | LNP Message Relay                                                                                         |
| <b>LNPQS</b>    | LNP Query Service                                                                                         |
| <b>LNP SMS</b>  | LNP Short Message Service                                                                                 |
| <b>LPE</b>      | Logical Processing Element                                                                                |
| <b>LPO</b>      | Link Processor Outage                                                                                     |
| <b>LRN</b>      | Location Routing Number                                                                                   |
| <b>LS</b>       | Link Set                                                                                                  |
| <b>LSA</b>      | Link Status Alignment                                                                                     |
| <b>LSB</b>      | Least Significant Bit (bit 1)                                                                             |
| <b>LSL</b>      | Low-Speed Link                                                                                            |
| <b>LSMS</b>     | Local Service Management System                                                                           |
| <b>LSN</b>      | Link Set Name                                                                                             |
| <b>LSO</b>      | Link Status out of Service                                                                                |
| <b>LSPE</b>     | Link Status Proving Emergency                                                                             |
