

Oracle® Communications Session Delivery Manager

Quick Start Guide

Release 7.4

Formerly Net-Net Central

2014

Notices

Copyright ©2014, 2011, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information on content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

About this Guide

The Oracle Communications Session Delivery Manager Quick Start Guide contains a brief description of the GUI, along with information you need to login to the Session Delivery Manager and to add a managed device (Net-Net SBC) for configuration. This guide contains brief instructions to aide you with creating and configuring:

- physical interfaces
- network interfaces
- HIP interfaces
- realms and steering pools

For information about installing the Session Delivery Manager, see the Session Delivery Manager Installation Guide. For more detailed information about using the Session Delivery Manager, and about the GUI, see the Core Functionality Guide, the Element Manager Guide, or the Configuration Guide.

Related Session Delivery Manager Documentation

The following table lists related documents for the Session Delivery Manager

Document Name	Document Description
Release Notes	Contains information about the administration and software configuration of the Session Delivery Manager feature support new to this release.
Installation Guide	Contains graphical and next mode installation information.
High Availability Guide	Describes Session Delivery Manager High Availability (HA) and the HA cluster, which is a network of tightly-linked servers. HA provides continuous management of the SDM system.
Web Services SOAP XML Provisioning API Guide	Provides a full description of the individual interface definitions that make up the Application Programming Interface (API).
Core Functionality Guide	Contains an overview of the Session Delivery Manager graphical user interface (GUI), detailed information about managing devices in Net-Net Central, and Net-Net Central licenses.
Session Element Manager Guide	Contains detailed information pertaining to the Session Element Manager application and describes the dashboard summary view, audit log, fault, and performance views.
Session Route Manager Guide	Contains detailed information about centrally automating the management and distribution of routing data.
Quick Start Guide	Contains a brief description of the GUI, along with information on how to add a device and perform basic configuration tasks.
Administration Guide	Contains information about security administration, which lets you create new users and new user groups, and set group-based authorization.

About this Guide

Document Name	Document Description
Report Manager Installation Guide	Contains instructions for installing Report Manager's dependencies and registering BI Publisher.
Report Manager User Guide	Contains information about configuring collection groups and creating reports.

Quick Start Guide

Overview

This document describes the basic steps you take to perform the following tasks:

- Logging into the Session Delivery Manager graphical user interface (GUI)
- Viewing license information
- Accessing Session Delivery Manager version information
- Adding device groups
- Adding devices (Net-Net SBC)
- Configuring devices (from configuring the physical interface to choosing a signaling service)
- Saving and activating configurations to the Net-Net SBC
- Viewing key performance indicators
- Viewing audit logs

The Session Delivery Manager Quick Start Guide does not go into details about configuration or describe configuration parameters. Also, it does not include detailed information about configuring the different signaling services. It is intended to provide you with the steps to login to Session Delivery Manager and some information to get you acquainted with the framework. For detailed information, refer to the Session Delivery Manager Core Functionality Guide, the Session Delivery Manager Element Manager Guide, or the Session Delivery Manager Configuration Guides, ACLI View or Default View.

Accessing Session Delivery Manager

You can access the Session Delivery Manager server by using two address formats (as shown in step 2.)

To access Session Delivery Manager:

1. Open a Web browser.
2. Connect to the Session Delivery Manager server using one of the following address formats:

```
http://<Session Delivery Manager server IP address>:8080  
https://<Session Delivery Manager server IP address>:8443
```

The Login screen appears.

Welcome to Acme Packet Net-Net Central 7.0

The programs included herein are subject to a restricted use license and can only be used in conjunction with this application.

Username

Password

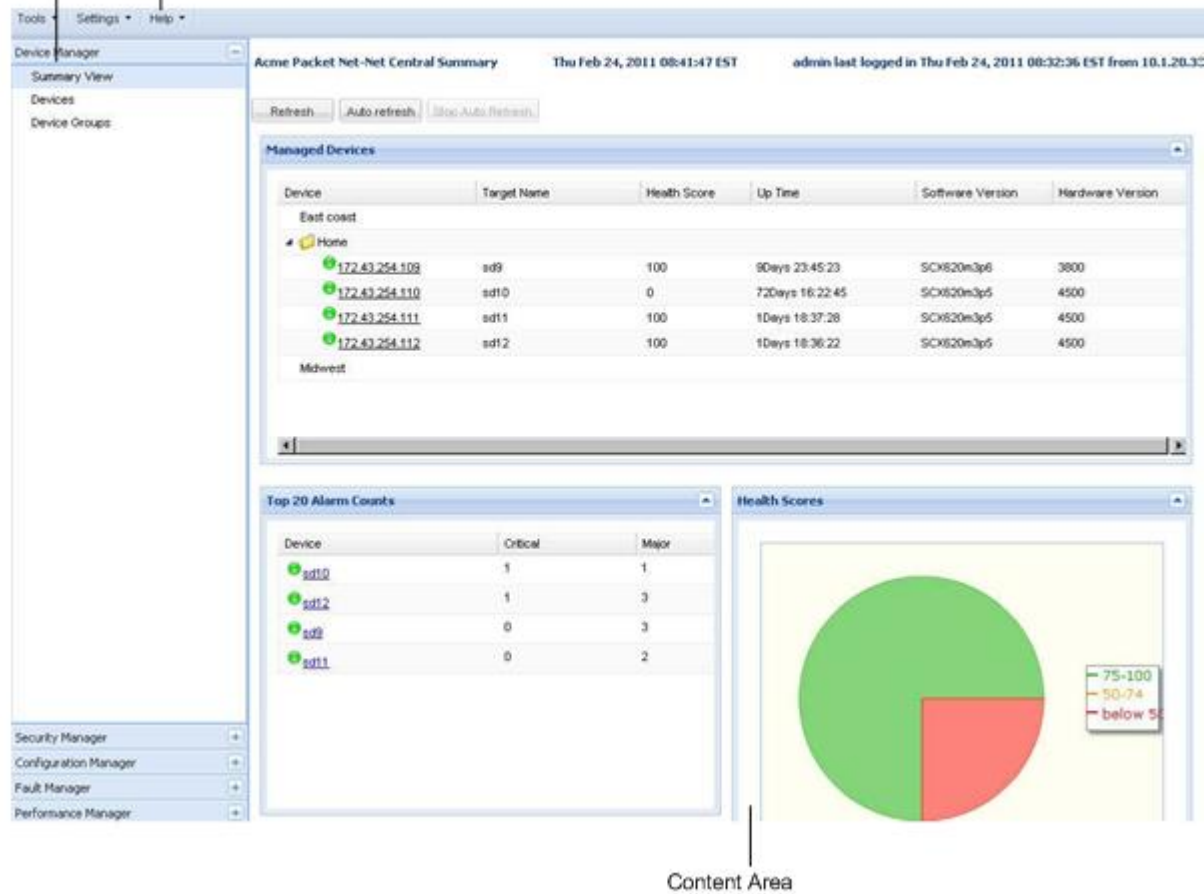

Login

3. Enter your user name and password and click Login. (The default username is admin, with a default password of admin.)

You have now accessed Session Delivery Manager.

Navigation Bar

Menu Bar

Note: When you login to Session Delivery Manager, your display will differ based on your licensed applications.

About the GUI

The top-level screen is divided into the following areas:

- Menu bar across the top of the window, which houses the drop down lists for administration, help, and monitoring tools
- Navigation bar in the left pane of the window, which contains sliders: Device Manager, Security Manager, Configuration Manager, Fault Manager, Performance Manager, and with appropriate licenses, Route Manager
- Content area on the right side of the window, where information pertaining to each slider in the navigation bar is displayed

Navigation Bar

The left pane is called the Navigation bar. The Navigation bar is divided into categories, represented by sliders. Each slider contains information specific to its slider category. The sliders found under the Navigation bar are:

- Dashboard Manager: View a summary of key performance indicators, fault, performance, and alarm statistics in a dashboard view
- Device Manager: Add and manage the device groups and devices you will work with in Session Delivery Manager
- Security Manager: Create groups of users, users, set password rules, configure the inactivity timer, and configure the password interval. View the audit log and/or save it to a file locally
- Configuration Manager: Load and configure your devices. Save and update your configuration changes
- Fault Manager: Monitor events, alarms, or trap data for your devices
- Performance Manager: View real-time, on-demand performance statistics for monitoring performance and utilization
- Route Manager (only if licensed): Update local route table (LRT) data on a single device or on multiple devices

Note: Some sliders will be invisible if not licensed.

Viewing Net-Net SBC License Information

There are two ways to access license information for your Session Delivery Manager servers:

- Select License information from the Help menu in the top tool bar (shown below)
- Select License from the Device Manager navigation slider

Note: No privilege is required to view license information.

Accessing License Information

To access license information:

1. Click Help in the top tool bar. A drop-down menu appears.
2. Click License information.

The license information window appears.

Quick Start Guide

License information

Select source:

172.30.80.197

License number 102356-1-43

Expiration Date

License Type permanent

/OKw==

3. Select source:—Click the source IP address of the Session Delivery Manager server you want to view license information for in the drop-down list.

The license information for this Session Delivery Manager server appears.

For more information about the Session Delivery Manager license, please see the Session Delivery Manager Core Functionality Guide.

Accessing Session Delivery Manager Version Information

You might want to confirm the version of Session Delivery Manager you are using. You do this from the Help menu.

To access Session Delivery Manager version information:

1. From the top tool bar, click Help to open a drop down menu.
2. Click About. The About Oracle Session Delivery Manager dialog box appears.

About Acme Packet Net-Net Central

- Click OK to close this dialog box.

Identifying Net-Net SBC Versions

You can identify the specific type of Net-Net SBC you are managing by viewing the Managed Devices table under Device Manager, Devices option. The software version and hardware version are listed, as in the example below.

Managed Devices

Device	Target Name	Health Score	Up Time	Software Version	Hardware Version
Home					
172.43.254.109	sd9	100	0Days 5:4:1	SCX620m3p6	3800
172.43.254.110	sd10	50	62Days 21:42:11	SCX620m3p5	4500
172.43.254.111	sd11	100	62Days 21:40:59	SCX620m3p5	4500
172.43.254.112	sd12	100	18Days 1:12:32	SCX620m3p5	4500

Adding Device Groups

All devices must belong to a device group. Ideally, you create your device groups prior to adding your devices. Subsequently, when adding a device, you select the device group you want this device to belong to. When you add a new device group, the name you choose:

- Must start with an alphabetic character
- Can contain a minimum of three characters and a maximum of 50 characters
- Can contain the following characters: alphabetic, numeric, hyphens (-), and underscores (_)
- Can be a mix of upper-case and lower-case characters
- Cannot contain symbols
- Cannot be the same name as an existing group name within the same level in the hierarchy (sibling)

To add a device group:

1. Expand the Device Manager slider and click Device Groups. The Device Groups appear in the content area.
2. Click Add. The Add device group dialog box appears.
3. *Device group name:—Enter the name for this device group.
4. Click OK. The device group, Midwest, appears in the device groups.

Device Groups

East coast
Home
Midwest
West coast

Once you create a device group, you can move devices into the device group by:

- Specifying a device group when adding this device to be managed in Session Delivery Manager
- Moving devices or device groups from one device group to another device group by clicking the Move button

Adding Devices

Devices are the Net-Net SBCs that you manage using Session Delivery Manager. You create your device group, add your device, and then select the device group this device will belong to. You can add a single device or multiple devices in succession.

Adding a Single Device

When adding devices in Session Delivery Manager, you have the ability to add a single device, or to add more than one device in a row. To add one device only, complete the required parameters in the Add Device dialog box and click the OK button at the bottom of the window.

To add a single device:

1. Expand the Device Manager slider and click Devices.
The Device table appears in the content area.
2. Click Add. The Add Device dialog box appears.
3. Device type:—Click one of two device type choices for this device in the drop down list.

Note: The Net-Net SBC 2600 is also known as the E-series.

4. IP address 1:—Enter the IP address for this device.
5. IP address 2:—Enter the IP address for the second device, if this device is part of a cluster.

6. **SNMP community name:**—Enter the SNMP community name for this device. The SNMP community name is the name of an active community where this Net-Net SBC can send or receive SNMP information (performance and fault).

Note: The Session Delivery Manager server must be configured on the Net-Net SBC as a valid community name/IP address before adding the Net-Net SBC to Session Delivery Manager.

7. **SNMP port:**—Enter the SNMP port number for this device, or retain the default value of 161.
8. **User name:**—Enter an SNMP username for this device, if necessary.
9. **Password:**—Enter the SNMP password associated with the user name you entered.

IP address 1:	<input type="text" value="172.30.80.201"/>
IP address 2:	<input type="text"/>
SNMP community name:	<input type="text" value="public"/>
SNMP port:	<input type="text" value="161"/>
User name:	<input type="text" value="admin"/>
Password:	<input type="password" value="•••••"/>

10. **Web protocol:**—(Net-Net SBC 2600 only) Click the web protocol, HTTP or HTTPS, in the drop down list. The default value is HTTP.
11. **Web port:**—(Net-Net SBC 2600 only) Enter the web port for this device. The default value is 80.
12. **Web Services protocol:**—(Net-Net SBC 2600 only) Click the web protocol, HTTP or HTTPS, in the drop down list. The default value is HTTP.
13. **Web Services port:**—(Net-Net SBC 2600 only) Enter the web port for this device. The default value is 80.

Web protocol:	<input type="text" value="HTTP"/>
Web port:	<input type="text" value="80"/>
Web Services protocol:	<input type="text" value="HTTP"/>
Web Services port:	<input type="text" value="80"/>

From here, you set the device group for this device.

14. **Device Group**—Click Set device group. The Set device group dialog box appears.
15. Click the device group you want this device to belong to.
16. Click OK to add the device group.
17. Click OK to add this single device. Your device appears in the device group and the dialog box closes.

Adding Multiple Devices

To add multiple devices, once you complete the required parameters in the Add Device dialog box for the first device, you retain most of the original information you entered by clicking the Apply. Add more? button.

When you click Apply. Add more?, the Add Device dialog box remains open with your originally-entered values, but the last octet of the management IP address is deleted so you can rapidly add another device, for example, 172.30.80.112, 172.30.80.125, and so on.

To add multiple devices:

1. Perform steps 1 through 17 in [Adding a Single Device](#) above.
2. Click Apply. Add More? to add this device. A Success box appears.
3. Click OK. Your device is added to the device group.

The Add Device dialog box remains open with the same values, except for the IP address 1 field. The last octet in the IP address 1 field is removed.

The 'Add Device' dialog box contains the following fields and controls:

- Device type: 3800/4250/4500/9200 (dropdown)
- IP address 1: 172.30.80. (text)
- IP address 2: (text)
- SNMP community name: public (text)
- SNMP port: 161 (text)
- User name: admin (text)
- Password: (password)
- Web protocol: HTTP (dropdown)
- Web port: 80 (text)
- Web Services protocol: HTTP (dropdown)
- Web Services port: 80 (text)
- Device Group: Home (text)
- Buttons: Set device group, OK, Apply, Add more?, Cancel

4. IP address 1—Enter the last octet of the IP address.

If required, revise other fields in the Add Device dialog box.

5. Click OK to add this device and no more.
6. Click Apply. Add more? to add this device and keep this Add Device dialog box open to add additional devices.

Adding a Device Group

If while adding a device, you notice that the device group you want is not in the list, you can add it from the Set Device Group dialog box.

1. From the Set device group dialog box, click Add. The Add Device group dialog box appears.
2. *Device group name:—Enter the name for this device group.

For more information about naming criteria, see [Adding Device Groups](#)

3. Click OK. A dialog box appears.
4. Click OK.

You are ready to load and configure your device.

Note: For additional information about adding and managing devices, please see the Managing Devices chapter of the Session Delivery Manager Core Functionality Guide.

Loading and Configuring Devices

This section provides an overview of the Net-Net SBC configuration process. The recommended configuration order consists of the following:

- Physical layer
- Network interface
- Realm and steering pool/media manager
- Signaling services (SIP, H.323, MGCP)

The configuration process is the same for C-series, D-series, and E-series Net-Net SBCs.

Note: The specific Net-Net SBC features supported by this release of Session Delivery Manager differs depending on which version of a Net-Net SBC you are configuring. Refer to the specific Configuration Guides for details.

Configuration Process

Once you have added a device, the following steps represent an overview of the configuration tasks performed in Configuration Manager:

1. Associate your added devices with your Element Manager license.
2. Load a device configuration (Net-Net SBC).
3. Edit device parameters.
4. Apply your changes.
5. Update the configuration (with your changes) by selecting one of three choices:
 - Save & activate configuration (default)
 - Save configuration
 - Activate configuration

Associating Devices

You must associate the devices you added in [Adding Devices](#) before you can load your device configurations. When you associate a device you link it to your Element Manager license. Your license allows you to configure a set number of devices at one time.

For more information about licensing, see the Session Delivery Manager Core Functionality Guide, Viewing Session Delivery Manager License Information.

You can associate one device at-a-time, or you can associate all devices within a device group, if your license permits.

To associate a device to the Element Manager License:

1. Expand the Configuration Manager slider.
2. Click Devices. The Device table appears in the content area.
3. Click Add devices. The Devices associated with Element Manager license appears in the content area.
4. From the Device list, expand your device group folder and click the device you want to associate.
5. Click  to move your device to the Maximum Element Manager licensed device count table.

Devices associated with Element Management license

Select a device group or device from the Device list tree. Click Add to associate it with the Element Manager. Click Remove to cancel the association. You can only associate device groups and devices with the Element Manager if they have the required permissions.

6. Click OK. A success dialog box appears.
7. Click OK.

Your device is associated with your Element Manager license so you can load your device configuration.

Loading Device Configurations

You load a device's configuration by retrieving the device's configuration from the Net-Net SBC and loading it into the Session Delivery Manager database. To do this, you target the specific device you want to load from the Configuration Manager device table. This process is called loading a local configuration copy. It is an on-demand process, whereby you do not have to replicate large device configurations and retains the Net-Net SBC as the master database.

To load a device for configuration:

Quick Start Guide

1. Expand the Configuration Manager slider.
2. Click Devices. The Device table appears in the content area.
3. Click the arrow next to the device group folder to expand the list of devices within this device group.

The list of devices appears for this device group.

Device	Target Name	Software Version	Hardware Version
USA			
West			
East			
172.30.80.100	sd100	SC620m3	NN 4250
172.30.80.210-1	sd210_sd211	SC620m3	NN 4250

4. Click the device you want to load and click Load.

A Progress dialog box appears.

5. A Success dialog box appears. Click OK.

Your device's configuration is loaded and appears as a heading above the Devices table.

sd100(172.30.80.100)					
Device	Target Name	Software Version	Hardware Version	Device Co	
USA					
West					
East					
172.30.80.100	sd100	SC620m3	NN 4250	211	
172.30.80.210-1	sd210_sd211	SC620m3	NN 4250	9	

 **Note:** For detailed configuration instructions, please see the Session Delivery Manager Configuration Guide.

Removing an Associated Device

You can remove a device from the Maximum Element Manager licensed device count table, thereby removing the association to the Element Manager license.

To remove a device from the Element Manager License:

1. Expand the Configuration Manager slider.
2. Click Devices. The Device table appears in the content area.
3. Click Add devices. The Devices associated with Element Manager license appears in the content area.
4. From the Device list, expand your device group folder and click the device you want to remove.
5. Click  to move your device from the Maximum Element Manager licensed device count table back to the Device List.

Devices associated with Element Management license

Select a device group or device from the Device list tree. Click Add to associate it with the Element Manager. Click Remove to cancel the association. You can only associate device groups and devices with the Element Manager if they have the required permissions.

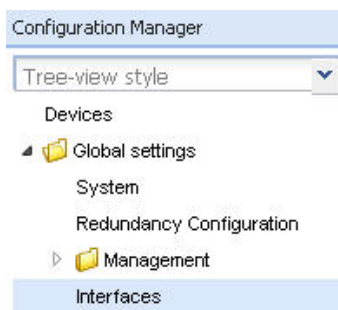

Your device is removed from the Maximum Element Manager licensed device count table. If you remove the last device in a device group, the device group folder is also removed.

Creating Physical Interfaces

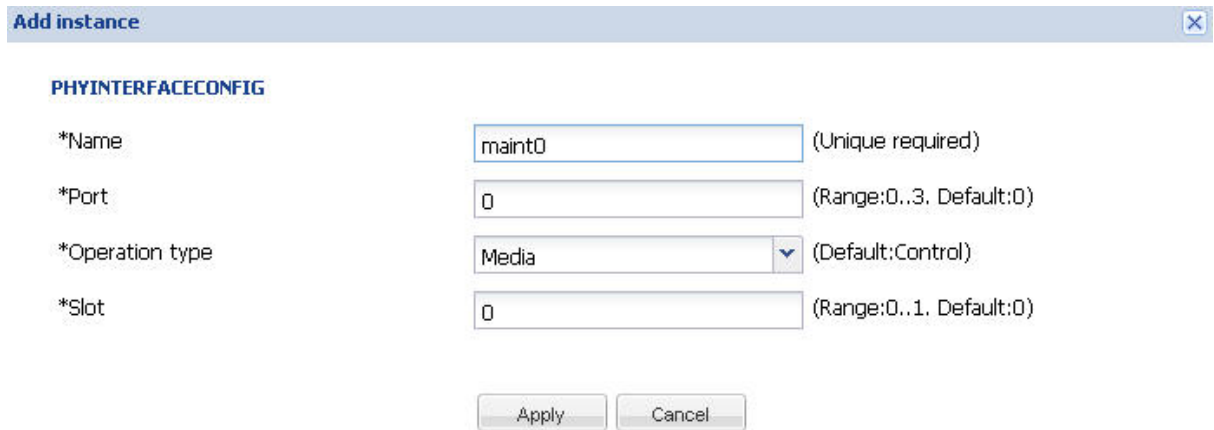

This section describes how to create physical interfaces on your Net-Net SBC using Session Delivery Manager.

To create a physical interface:

1. Expand Configuration Manager.
2. Expand the Global Settings folder.
3. Click Interfaces. The interfaces tables appear in the content area.

4. Click Add under the Physical interface table. The Add instance dialog box appears.
5. *Name—Enter a name for this interface using any combination of characters entered without spaces. For example, Internet (for a Fast Ethernet media and signaling interface) or maint0 (for a maintenance interface).
6. *Port—Enter the port of this physical interface. From left to right as you face the chassis, the possible values are:
 - Front interfaces—0 - 3
 - Rear interfaces—0 - 2
7. *Operation type—Click the type of physical interface in the drop down list. For a front media and signaling interface, set this parameter to Media. For a rear management interface, set this parameter to Maintenance or Control.
8. *Slot—Enter the slot of this physical interface: 0 or 1
 - Front interfaces—0 is the left and 1 is the right
 - Rear interfaces—0 is the only valid value

The image shows a dialog box titled "Add instance" with a close button (X) in the top right corner. Below the title bar, the text "PHYINTERFACECONFIG" is displayed. There are four input fields, each with a label starting with an asterisk (*):

- *Name: A text box containing "maint0" with the note "(Unique required)" to its right.
- *Port: A text box containing "0" with the note "(Range:0..3, Default:0)" to its right.
- *Operation type: A dropdown menu showing "Media" with a downward arrow, and the note "(Default:Control)" to its right.
- *Slot: A text box containing "0" with the note "(Range:0..1, Default:0)" to its right.

At the bottom of the dialog box are two buttons: "Apply" and "Cancel".

9. Click Apply. A success window appears indicating the successful addition of the physical interface appears.
10. Click OK. The newly-added physical interface appears in the Physical interface table.

Configuring Physical Interfaces

This section describes how to configure physical interfaces using Session Delivery Manager.

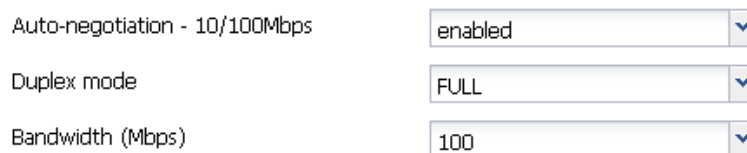

To configure the physical interface:

1. Click the new physical interface in the Physical interface table and click Edit. The content area displays the physical interface parameters you can configure for this physical interface (as indicated by the *Name parameter).
2. Scroll to Auto-negotiation - 10/100Mbps
3. Auto-negotiation - 10/100Mbps—Click enabled or disabled in the drop down list. If you retain the default value, enabled, the Net-Net SBC and the device to which it is linked can automatically negotiate the duplex mode and speed for the link.

If auto-negotiation is enabled, the Net-Net SBC begins to negotiate the link to the connected device at the duplex mode you configure. If auto-negotiation is disabled, then the Net-Net SBC will not engage in a negotiation of the link and will operate only at the duplex mode and speed you set.

4. Duplex mode—Click the duplex mode in the drop down list.
 - FULL: Given an operating speed of 100 Mbps, full duplex mode lets both devices on a link send and receive packets simultaneously using a total bandwidth of 200 Mbps.
 - HALF: Given the same operating speed, half duplex mode limits the devices to one channel with a total bandwidth of 100 Mbps.
5. Bandwidth (Mbps)—Click a value in the drop down list to set the bandwidth for this physical interface.

Auto-negotiation - 10/100Mbps

The image shows three configuration fields for "Auto-negotiation - 10/100Mbps":

- Auto-negotiation - 10/100Mbps: A dropdown menu showing "enabled" with a downward arrow.
- Duplex mode: A dropdown menu showing "FULL" with a downward arrow.
- Bandwidth (Mbps): A dropdown menu showing "100" with a downward arrow.

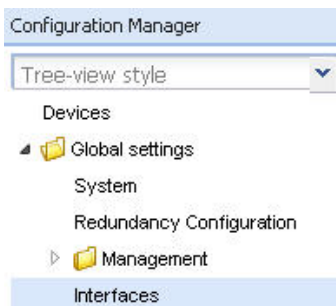

6. Click Apply.

Creating Network Interfaces

You need to create and configure the network interface(s) associated with your physical interface. You must have one default network interface for your physical interface.

To create a network interface:

1. Expand Configuration Manager.
2. Expand the Global settings folder.
3. Click Interfaces. The Interfaces window appears in the content area.

4. Click Add under the Network Interface table. The Add instance dialog box appears.
5. *Physical interface—Click the physical interface to which this network interface corresponds in the drop down list.
6. *VLAN number—Enter the subport ID as the VLAN number. If this network interface is not channelized, leave this set to 0. If this network interface is channelized, enter the appropriate VLAN tag.

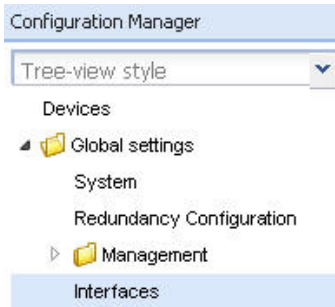

7. Click Apply. A success message appears.
8. Click OK.
9. To view this network interface in the Network interface table, click the physical interface (in the Physical interface table) this network interface belongs to.

The network interface appears in the Network interface table.

Configuring Network Interfaces

To configure a network interface:

1. Expand Configuration Manager.
2. Expand the Global settings folder.
3. Click Interfaces. The Interfaces window appears in the content area.

4. In the Physical interface table, click the physical interface this network interface belongs to.

The network interface belonging to the selected physical interface appears in the Network interface table.

5. Select the network interface you want to configure and click Edit. The content area displays the network interface parameters you can configure for this network interface.
6. Scroll to Host.
7. IP address—Enter the IP Address of this network interface.
8. Subnet mask—Enter the subnet mask of this network interface.

Host

Host name	<input type="text" value="phyTest"/>
IP address	<input type="text" value="172.43.30.220"/>
Subnet mask	<input type="text" value="255.255.255.0"/>

9. Scroll to Gateways.
10. Primary IP Address—Enter the primary gateway that this network interface uses to communicate with the next hop.
11. Secondary IP Address—If needed, enter the secondary gateway of this network interface.

Gateways

Primary IP Address	<input type="text" value="172.43.30.221"/>
Secondary IP Address	<input type="text" value="0.0.0.0"/>

12. Scroll to DNS.
13. Primary—Enter the DNS server of this network interface.
14. First backup—If needed, enter the secondary DNS server of this network interface.
15. Second backup—If needed, enter the third DNS server of this network interface.
16. Default domain name—Enter the default domain for use with DNS queries.
17. DNS timeout—Enter the DNS timeout value.

DNS

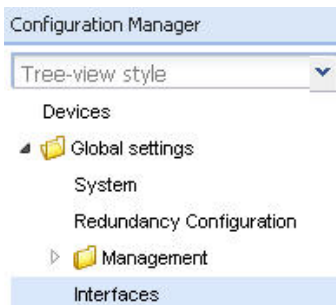

Primary	<input type="text" value="192.168.44.55"/>
First backup	<input type="text" value="0.0.0.0"/>
Second backup	<input type="text" value="0.0.0.0"/>
Default domain name	<input type="text" value="acmepacket.com"/>
DNS timeout	<input type="text" value="11"/>

18. Click Apply.

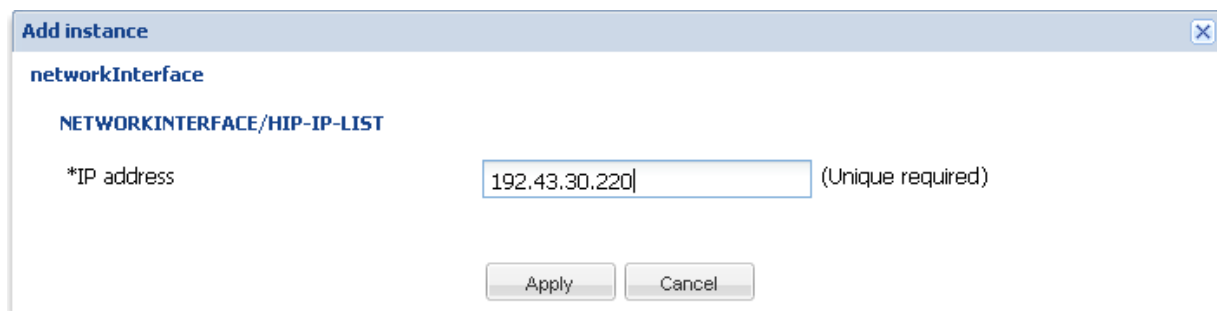

Configuring HIP Interfaces

To configure administrative service functionality on a front interface, you must define the IPv4 addresses on the front physical interfaces of your Net-Net SBC where you will receive administrative traffic. Adding Host-in-Path (HIP) entries automatically opens the well-known port associated with a service.

1. Expand Configuration Manager.
2. Expand the Global settings folder.
3. Click Interfaces. The Interfaces window appears in the content area.

4. In the Physical interface table, click the physical interface this network interface belongs to.
The network interface belonging to the selected physical interface appears in the Network interface table.
5. Select the network interface you want to configure and click Edit. The content area displays the network interface parameters you can configure for this network interface.
6. Scroll to Host-In-Path.
7. Click Add. The Add instance window appears.
8. *IP address—Enter the IPv4 address on this network interface that is allowed to pass traffic to the host. Entries are IPv4 addresses of front panel network interfaces. Enter the appropriate IPV4 address that corresponds to the type of traffic. For:
 - SNMP: Set the IPv4 address where port 161 is opened. This lets SNMP traffic enter the Net-Net SBC and reach the host.
 - Telnet: Set the IPv4 address where port 23 is opened for Telnet access.
 - FTP: Set the IPv4 address where ports 20 and 21 are opened. This lets standard FTP packets enter the Net-Net SBC and reach the host.
 - ICMP: Set the IPv4 address to pass standard ping packets to the host.

9. Click Apply.
10. Click Apply at the bottom of the network interface window to complete network interface configuration.

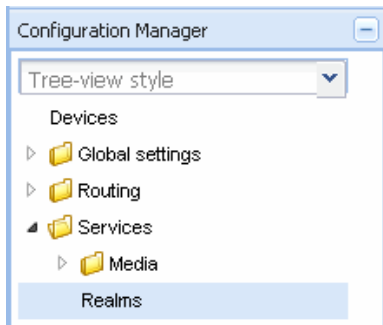

Configuring Realms and Steering Pools

You can assign multiple realms to a network interface. This section describes how to create and configure realms on your Net-Net SBC from Session Delivery Manager.

Creating Realms

To create a realm:

1. Expand Configuration Manager.

2. Expand the Services folder.
3. Click Realms. The Realm window appears in the content area.
4. Click Add. The Add instance window appears.
5. Under REALMCONFIG, *Name—Enter the name of the new realm you are creating. The name uniquely identifies the realm. You will use this parameter in other configurations when asked for a realm identifier value.
6. Under NETWORKINTERFACEID, *name—Click a physical interface in the drop down list.
7. *subPortId—Click the sub port ID in the drop down list for the network interface to which you are assigning this realm. The default value is 0.

This is the interface and subport through which this realm can be reached by ingress traffic, and through which this traffic exits the system as egress traffic.

 A screenshot of the 'Add instance' window. It has a title bar with a close button. The window is divided into two sections: 'REALMCONFIG' and 'NETWORKINTERFACEID'. Under 'REALMCONFIG', there is a label '*Name' and a text input field containing 'realm2', with '(Unique required)' to its right. Under 'NETWORKINTERFACEID', there is a label '*name' and a dropdown menu showing 'm10'. Below that is a label '*subPortId' and a dropdown menu showing '0', with '(Default:0)' to its right. At the bottom are 'Apply' and 'Cancel' buttons.

8. Click Apply. A Success message appears.
9. Click OK.

Configuring the IP address prefix

The newly created realm appears in the Realm window. From here, you configure the IP address prefix.

1. Click the realm you created in the Realm table.
2. Click Edit. The realmConfig window appears in the content area.

- Click the Realm tab.
- IP address prefix—Enter the IP address prefix and subnet mask combination to set the criteria the Net-Net SBC uses to match packets sent or received on the network interface associated with this realm. This matching determines the realm, and subsequently what resources are used for that traffic.

This parameter must be entered in the correct format where the IP address comes first and is separated by a slash (/) from the subnet mask value. For example, 172.16.0.0/24.

If you leave this parameter set to its default, 0.0.0.0/0, then all addresses will match.

IP address prefix (Enter IP and port in the format: x.x.x.x/0-32. Default:0.0.0.0)

- Click Apply.

Configuring Realms

To configure the realm:

- In the Realm tab of the Realm window, scroll to Realm services profiles.
- Bandwidth limit (kilobits per second), Session admission control—Enter the maximum bandwidth resources available for this realm.

Realm services profiles

Bandwidth limit(kilobits per second),Session admission control (Range:0..999999999. Default:0)

- Scroll to Manage media between endpoints.
- Within this realm serviced by this Net-Net system only—Click enabled in the drop down list to set the behavior of media steering when endpoints within the same realm are communicating.
- Within different realms in the same subnet serviced by this Net-Net system only—Click enabled in the drop down list to set the behavior of media steering when endpoints located in different realms, but that are connected to the same network interface, are communicating.
- Within this realm serviced by different Net-Net systems (SIP only)—Click enabled in the drop down list to include multi-system release information in SIP requests sent to this realm.

Manage media between endpoints

Within this realm serviced by this Net-Net system only (Default:disabled)

Within different realms in same subnet serviced by this Net-Net system only (Default:enabled)

Within this realm serviced by different Net-Net systems (SIP only) (Default:disabled)

- Scroll to Address translation profiles.
- Set the number translations that you want to apply to this realm. Refer the Session Delivery Manager Configuration Guide, Number Translations section for realm-specific information about using address translations on your Net-Net SBC. If you are not using this feature, you can leave these parameters blank.

Inbound—Click an inbound number translation profile in the drop down list.

Outbound—Click an outbound number translation profile in the drop down list.

Address translation profiles

Inbound	<input type="text"/>
Outbound	<input type="text"/>

9. Use DNS Server in this realm—Click the realm in the drop down list whose network interface's DNS server should be used to resolve this realm's FQDN lookup.

If you do not configure this parameter, then the realm will use the DNS information configured in its associated network interface.

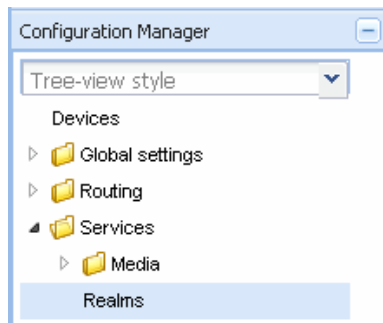

10. Click Apply.

Configuring Steering Pools

This section describes how to configure steering pools on your Net-Net SBC from the Session Delivery Manager. Steering pools are configured within realm objects in the Session Delivery Manager. Therefore, you do not need to explicitly set the realm when creating a steering pool.

To configure the steering pool:

1. Expand Configuration Manager.

2. Expand the Services folder and click Realms. The realmConfig window appears in the content area.
3. Click the Media interface tab.
4. Click Add. The Add instance dialog box appears.
5. Under STEERINGPOOL, *IP Address—Enter the target IP address of the steering pool.
6. *Start port—Enter the start port of the steering pool; this is the value that begins the range of ports available to this steering pool.

You must enter a valid port number or the steering pool will not function properly.

STEERINGPOOL

*IP Address	<input type="text" value="172.30.80.73"/>	(Unique required)
*Start port	<input type="text" value="0"/>	(Unique required. Range:1025..65535,..0..0. Default:0)

7. *End port—Enter the end port of the steering pool; this is the value that ends the range of ports available to this steering pool.

*End port	<input type="text" value="65535"/>	(Range:1025..65535,..0..0. Default:0)
-----------	------------------------------------	--

You must enter a valid port number or the steering pool will not function properly.

8. Click Apply. Your entry will appear in the Realm media address section.

Configuring Signaling Services

Configure the signaling service you chose. See the Session Delivery Manager Configuration Guides for details.

Using Tool Tips

When configuring your device in Configuration Manager, position your cursor over a parameter field or checkbox to view a tool tip. Tool tips display the complete path to, and name of, the corresponding ACLI parameter.

Saving Net-Net SBC Configurations

This section explains how to save the configuration changes to the Net-Net SBC and activate it. During the save process, other users are locked out of making changes to the Net-Net SBC.

To save configuration changes to the Net-Net SBC:

1. Expand Configuration Manager and click Devices.

The Device table appears in the content area.

2. Click the device group folder in which your device belongs to view the list of devices.
3. Click the device whose configuration changes you want to save to select it.

Note: The device must already be loaded in Configuration Manager otherwise you will get an error message: Please load the device first.

4. Click Update. The Update configuration for SD dialog box appears.
5. Check the update operations you want to perform:—Click one of the following:
 - Save & activate configuration (default): Invokes the save/activate process
 - Save configuration: Invokes the save process
 - Activate configuration: Invokes the activate process

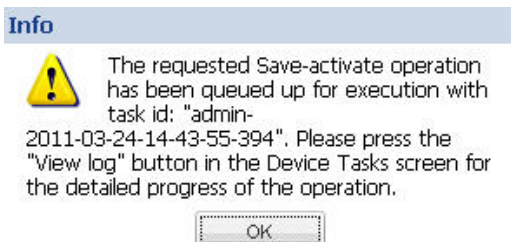

Update configuration for sd10(172.43.254.110) ✕

Check the update operations you want to perform:

- ☒ Save & activate configuration
☐ Save configuration
☐ Activate configuration

OK Cancel

6. Click OK. An Info message appears, for example:

7. Click OK. The operation you selected, for example, SaveActivate, appears in the Device tasks table.

sd100(172.30.80.100)

Device tasks

Operation	Task identifier	Time stamp	Status	User name
SaveActivate	admin-2011-03-24-14-43	Thu Mar 24 10:43:56 EDT 2011	inprogress	admin

- Click the operation row and View log for more information. The task log for this operation appears.

Task log for sd100(172.30.80.100)

On host 172.30.80.12, SaveActivate task with id "admin-2011-03-24-14-43-55-394" is submitted @ Thu Mar 24 10:43:55 EDT 2011
 Configuration version 32 from device 172.30.80.100 was loaded onto host 172.30.80.12 @ Thu Mar 24 10:43:55 EDT 2011

Performing Xsd model annotation validation on user changes in database, validation started @ Thu Mar 24 10:43:55 EDT 2011

Xsd model annotation validation completed, Status: SUCCESS @ Thu Mar 24 10:43:56 EDT 2011

publishing update task (SaveActivate) to processing queue, Publish to queue started @ Thu Mar 24 10:43:56 EDT 2011

On host 172.30.80.12, task thread is started to process "admin-2011-03-24-14-43-55-394" @ Thu Mar 24 10:43:56 EDT 2011

Configuration version 32 from device 172.30.80.100 was loaded onto host 172.30.80.12 @ Thu Mar 24 10:43:56 EDT 2011

Performing LOCK-DEVICE in SBC, lock device started @ Thu Mar 24 10:43:56 EDT 2011

Locked device completed, Status: SUCCESS @ Thu Mar 24 10:43:56 EDT 2011

Performing RESTORE-CONFIG, restore config started @ Thu Mar 24 10:43:56 EDT 2011
 This may task few minutes, Please wait ...

RESTORE-CONFIG completed, Status: SUCCESS @ Thu Mar 24 10:43:57 EDT 2011

Update user changes to device started @ Thu Mar 24 10:43:58 EDT 2011

Element Type	Operation	Object Name	Status
enforcementProfile	ADD	Enforce1	SUCCESS
mediaPolicy	ADD	MedPo1	SUCCESS
systemConfig	MODIFY	systemConfig	SUCCESS

Updated total of 3 elements to device Completed, Status: SUCCESS @ Thu Mar 24 10:43:58 EDT 2011

Performing data integrity check on elements updated to device @ Thu Mar 24 10:43:58 EDT 2011

Data integrity check completed, Status: SUCCESS @ Thu Mar 24 10:44:30 EDT 2011

Performing SAVE-CONFIG, save config started @ Thu Mar 24 10:44:30 EDT 2011
 This may task few minutes, Please wait ...

SAVE-CONFIG completed, Status: SUCCESS @ Thu Mar 24 10:44:31 EDT 2011

Performing ACTIVATE-CONFIG, activate config started @ Thu Mar 24 10:44:31 EDT 2011
 This may task few minutes, Please wait ...

Refresh
 Save to file
 Close

- Click one of the action buttons:

- Refresh: Refresh the data in the task log
- Save to file: Save the data to a file locally
- Close: Close the task log

Accessing Key Performance Indicators

This section shows you how to access key performance indicators found in the Summary View under the Dashboard Manager slider. The information displayed is a combination of fault, performance, and other statistics gathered for the Net-Net SBC, and is displayed in a dashboard format. The information includes:

- Date and time of login
- Local date and time (with time zone adjustment) of the Session Delivery Manager server
- A list of all devices by either IP address or host name
- Alarm status summary
- Key performance indicators (KPI): top 20 alarm counts, health scores, top 20 CPU usage, top 20 memory usage, and top 20 call rate
- A list of logged-in users with session start times and locations (IP addresses)

Summary View for Clusters

For clusters, the top-level displays and the device-specific summaries are shown for the active Net-Net SBC in the cluster. Statistics are not shown for the Net-Net SBC in standby mode.

Accessing Summary View

To access summary view information:

Expand the Dashboard Manager slider and click Summary View.

The summary view appears in the content area.

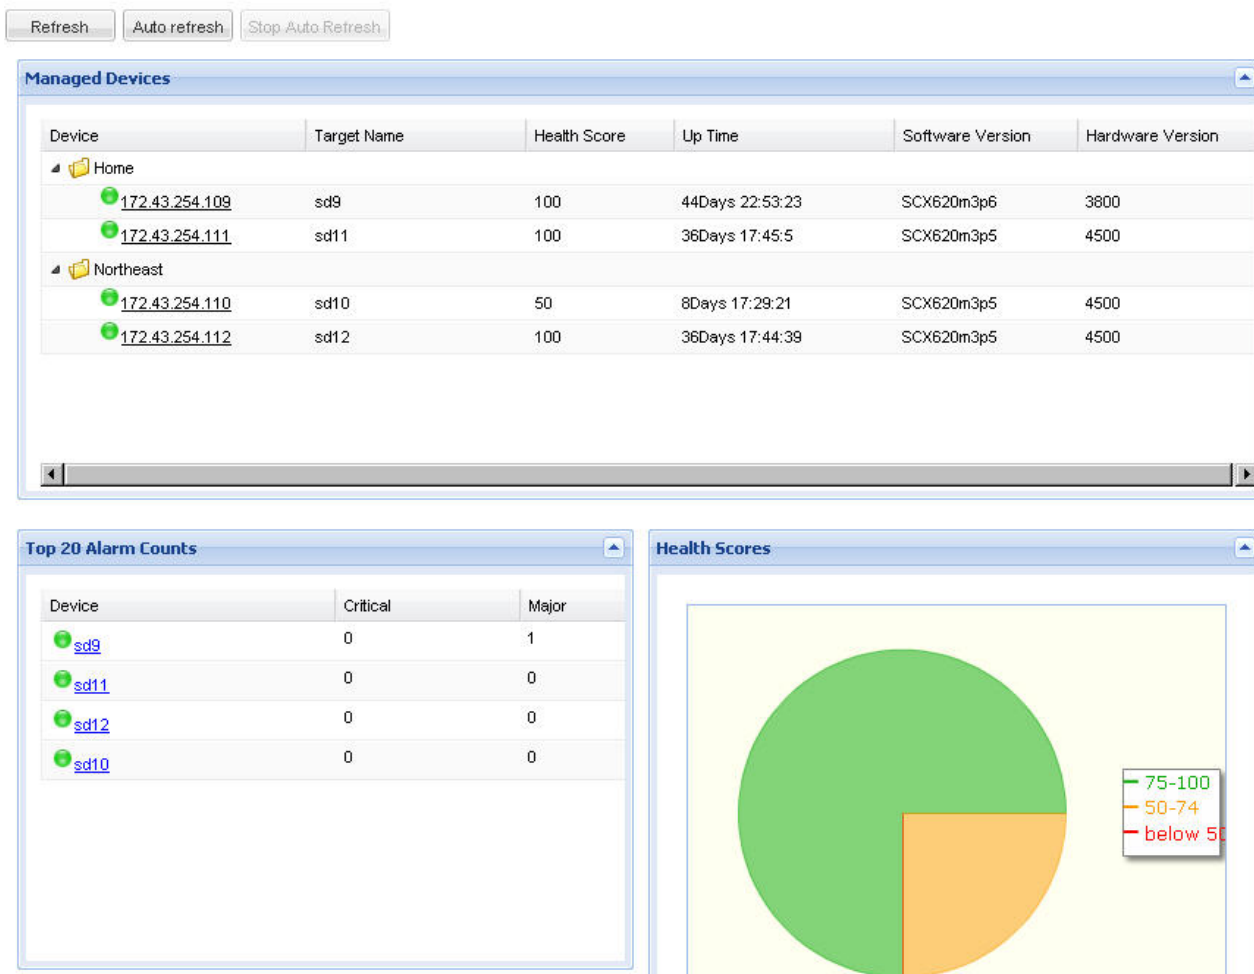

Below is a partial image of the summary view display. You must scroll down in the content area to see all of the summary view data. The top of the content area contains a title bar with the current local time of the Session Delivery Manager server and the IP address and time of the last successful login.

Quick Start Guide

Acme Packet Net-Net Central Summary

Thu Mar 31, 2011 08:42:36 EDT

admin last logged in Thu Mar 31, 2011 08:42:31 EDT from 10.1.20.33

For detailed information about key performance indicators, see the Summary View chapter of the Session Delivery Manager Element Manager Guide.

Viewing Audit Logs

This section explains how to access the audit log's data. The audit log provides information about the changes made using the Session Delivery Manager. Audit trails enable you to view all operations that have been performed, the time they were performed, whether they were successful and who performed them. All users can access the Audit logs from the Security Manager slider, under Audit log.

To access audit logs:

1. Expand the Security Manager slider.
2. Click Audit log to expand the folder.

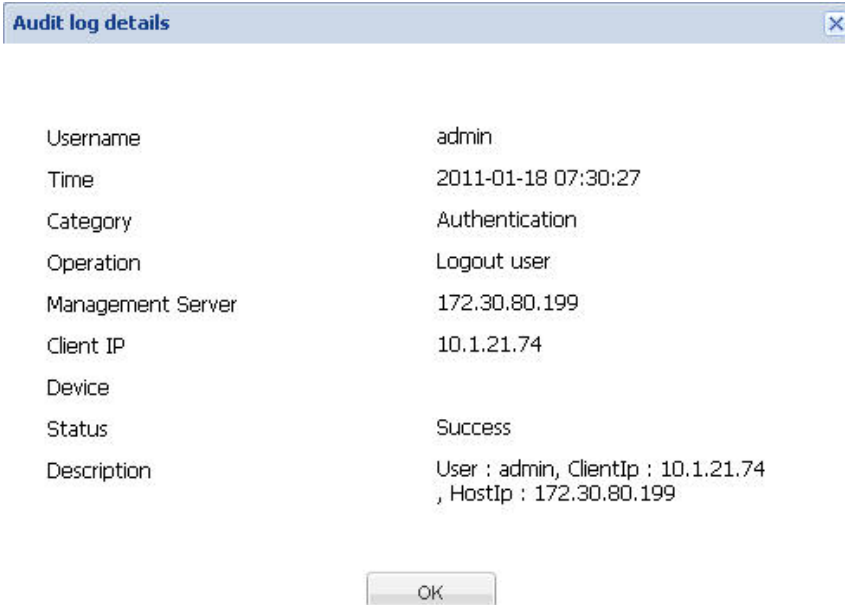

3. Click View. The Audit log table appears in the content area. For example:

Audit log

Details	Save to file					

- Click a row in the Audit log table and click Details. The Audit log details window appears.

Audit trails include the following information:

- Name of the user who performed the operation
 - Time the operation was performed by the user
 - Category of operation performed by the user
 - Specific operation performed by the user
 - Address of the management server accessed
 - IP address of the client that was used
 - Device the user performed operation upon
 - Status of the operation performed by the user, whether it was successful or failed
 - Description of the operation
5. Click OK to exit the window.
 6. Click Save to file to save it to a file locally.
 7. Click Refresh to refresh the data in the audit log.
