This chapter provides a brief description of the A-Port feature of the EAGLE 5 Integrated Signaling System. The chapter also includes the scope, audience, and organization of the manual; how to find related publications; and how to contact Tekelec for assistance.

## Overview

This manual provides feature descriptions, commands, maintenance, measurements, and configuration details associated with the ANSI-41 Mobile Number Portability (A-Port) feature of the EAGLE 5 Integrated Signaling System (ISS) and other features related to the A-Port feature. A-Port provides number portability functionality using a triggerless solution. Although the A-Port feature applies to ITU and ANSI networks, the A-Port feature focuses on service provider number portability on ANSI networks.

A-Port minimizes the challenges for network operators while enabling them to meet their regulatory obligations. A-Port supports the Signaling Relay Function (SRF) for direct and indirect routing. SRF-based MNP processing examines MAP messages for ported numbers. For call-related messages, A-Port acts as an “NP HLR” for exported number by responding with a MAP SRI message; A-Port performs a message relay function for calls to imported numbers and non-call related messages.

A-Port optimizes the use of subscriber numbers and number ranges in a Mobile Network by providing a Mobile Directory Number (MDN) and any International Mobile Station Identifier (IMSI). The feature allows subscribers to be moved easily from one Home Location Register (HLR) to another.

A-Port is an optional feature on the EAGLE 5 ISS, and can be enabled and turned on, but not off, via a feature access key. Note that A-Port requires the Global Title Translation (GTT) feature and that A-Port and North American LNP (Local Number Portability) are mutually exclusive on an EAGLE 5 ISS node.

## Scope and Audience

This manual is intended for anyone responsible for installing, maintaining, and using the A-Port feature in the EAGLE 5 ISS. Users of this manual and the others in the EAGLE 5 ISS family of documents must have a working knowledge of telecommunications and network installations.

## Manual Organization

This document is organized into the following chapters:

- [Introduction](#) contains general information about the A-Port documentation, the organization of this manual, and how to request technical assistance.
- [Feature Description](#) provides a functional description of the A-Port and MT-Based IS41 SMS NP features, including network perspectives, assumptions and limitations, database overview, Service Module card provisioning and reloading, and A-Port user interface.
- [Commands](#) describes the commands that support the A-Port and MT-Based IS41 SMS NP features.
- [Feature Configuration](#) describes how to activate the A-Port and MT-Based IS41 SMS NP features.
- [Measurements](#) describes the measurements available for A-Port.

- [Maintenance](#) describes A-Port maintenance information including EPAP status and alarms, hardware verification messages, system status reports and commands, code and application data loading, and alarms.

## Documentation Admonishments

Admonishments are icons and text throughout this manual that alert the reader to assure personal safety, to minimize possible service interruptions, and to warn of the potential for equipment damage.

**Table 1: Admonishments**

	<b>DANGER:</b> (This icon and text indicate the possibility of <i>personal injury</i> .)
	<b>WARNING:</b> (This icon and text indicate the possibility of <i>equipment damage</i> .)
	<b>CAUTION:</b> (This icon and text indicate the possibility of <i>service interruption</i> .)

## Customer Care Center

The Tekelec Customer Care Center is your initial point of contact for all product support needs. A representative takes your call or email, creates a Customer Service Request (CSR) and directs your requests to the Tekelec Technical Assistance Center (TAC). Each CSR includes an individual tracking number. Together with TAC Engineers, the representative will help you resolve your request.

The Customer Care Center is available 24 hours a day, 7 days a week, 365 days a year, and is linked to TAC Engineers around the globe.

Tekelec TAC Engineers are available to provide solutions to your technical questions and issues 7 days a week, 24 hours a day. After a CSR is issued, the TAC Engineer determines the classification of the trouble. If a critical problem exists, emergency procedures are initiated. If the problem is not critical, normal support procedures apply. A primary Technical Engineer is assigned to work on the CSR and provide a solution to the problem. The CSR is closed when the problem is resolved.

Tekelec Technical Assistance Centers are located around the globe in the following locations:

### Tekelec - Global

## Emergency Response

In the event of a critical service situation, emergency response is offered by the Tekelec Customer Care Center 24 hours a day, 7 days a week. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical problems affect service and/or system operation resulting in:

- A total system failure that results in loss of all transaction processing capability

- Significant reduction in system capacity or traffic handling capability
- Loss of the system's ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions
- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity / traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with the Tekelec Customer Care Center.

## Related Publications

For information about additional publications that are related to this document, refer to the *Related Publications* document. The *Related Publications* document is published as a part of the *Release Documentation* and is also published as a separate document on the Tekelec Customer Support Site.

## Documentation Availability, Packaging, and Updates

Tekelec provides documentation with each system and in accordance with contractual agreements. For General Availability (GA) releases, Tekelec publishes a complete EAGLE 5 ISS documentation set. For Limited Availability (LA) releases, Tekelec may publish a documentation subset tailored to specific feature content or hardware requirements. Documentation Bulletins announce a new or updated release.

The Tekelec EAGLE 5 ISS documentation set is released on an optical disc. This format allows for easy searches through all parts of the documentation set.

The electronic file of each manual is also available from the [Tekelec Customer Support](#) site. This site allows for 24-hour access to the most up-to-date documentation, including the latest versions of Feature Notices.

Printed documentation is available for GA releases on request only and with a lead time of six weeks. The printed documentation set includes pocket guides for commands and alarms. Pocket guides may also be ordered separately. Exceptions to printed documentation are:

- Hardware or Installation manuals are printed without the linked attachments found in the electronic version of the manuals.
- The Release Notice is available only on the Customer Support site.

**Note:** Customers may print a reasonable number of each manual for their own use.

Documentation is updated when significant changes are made that affect system operation. Updates resulting from Severity 1 and 2 Problem Reports (PRs) are made to existing manuals. Other changes are included in the documentation for the next scheduled release. Updates are made by re-issuing an electronic file to the customer support site. Customers with printed documentation should contact their Sales Representative for an addendum. Occasionally, changes are communicated first with a Documentation Bulletin to provide customers with an advanced notice of the issue until officially

released in the documentation. Documentation Bulletins are posted on the Customer Support site and can be viewed per product and release.

## Locate Product Documentation on the Customer Support Site

Access to Tekelec's Customer Support site is restricted to current Tekelec customers only. This section describes how to log into the Tekelec Customer Support site and locate a document. Viewing the document requires Adobe Acrobat Reader, which can be downloaded at [www.adobe.com](http://www.adobe.com).

1. Log into the [Tekelec Customer Support](#) site.

**Note:** If you have not registered for this new site, click the **Register Here** link. Have your customer number available. The response time for registration requests is 24 to 48 hours.

2. Click the **Product Support** tab.
3. Use the Search field to locate a document by its part number, release number, document name, or document type. The Search field accepts both full and partial entries.
4. Click a subject folder to browse through a list of related files.
5. To download a file to your location, right-click the file name and select **Save Target As**.

# Chapter 2

## Feature Description

- *MPS/EPAP Platform.....42*

This chapter describes the A-Port feature and the MT-Based IS41 SMS NP feature.

## Introduction

Throughout the world, an increasing number of governments are mandating that telecommunications network operators support service provider number portability. Number portability is primarily intended to promote competition among service providers, and applies to both wireline and mobile phone networks. In particular, the A-Port (IS41 Mobile Number Portability) feature provides the ability for IS41 subscribers to change service providers while retaining their current Mobile Directory Number (MDN).

A-Port utilizes the EPAP database to derive the portability status of a subscriber. This feature supports LOCREQ messages as well as SMSREQ messages, if the option is selected, for number portability handling. LOCREQ messages generate a LOCREQ response if the MDN is ported and also relays the LOCREQ if the MDN is not ported. Non-porting or porting are handled the same way.

A-Port MNP is based on the EAGLE 5 ISS platform. It is deployed in a node that is also performing the STP function.

### MTP Routed SCCP Traffic

When the MTP Msgs for SCCP Apps feature is turned on, all MTP routed UDT/non-segmented XUDT SCCP messages are routed to Service Module cards. When the MTP Routed GWS Stop Action feature is turned on, messages are filtered based on the provisioned Gateway Screening rules on a per linkset basis. The MTP Routed GWS Stop Action feature forwards only UDT, UDTs, XUDT and XUDTs SCCP messages to the Service Module cards for processing. The Service Module cards then perform SCCP decode and verification on the MTP routed messages.

### MNP Circular Route Prevention

The MNP Circular Route Prevention (MNPCRP) feature is an extension of the A-Port feature which detects and prevents circular routing caused by incorrect information in one or more of the network number portability databases. For example, a subscriber may have ported from network A to network B. Network A has the correct routing information, indicating the subscriber now belongs to network B. However, network B may have incorrect routing information, indicating that the subscriber still belongs to network A. Based on its portability data, network A routes the call to network B, but network B routes the call back to network A, based on the incorrect data of network B. This results in a circular route. The MNPCRP feature provides the logic to prevent this circular routing scenario for all messages that receive A-Port service, including LOCREQ and SMSREQ. This feature is enabled and turned on using Feature Key Control commands.

### DigitAction Expansion

The DigitAction Expansion feature provides more flexibility to formulate the SCCP Called Party Address (SCCP) Global Title Address (GTA) field of the MAP messages relayed by A-Port. DigitAction Expansion is provisioned via the PDBI Enter Network Entity or Update Network Entity commands. DigitAction Expansion can also be modified via the Add an NE and Update an NE GUI screens.

### MNP SCCP Service Re-Route

The MNP SCCP Service Re-Route feature is used when the A-Port subscriber database is incoherent with MPS data and the GTT data is valid. The A-Port SCCP Service Re-Route feature provides the

capability to re-route the traffic from the EAGLE 5 ISS to other A-Port subscriber database nodes and inform the originating nodes to re-route the A-Port service related traffic to other A-Port service nodes.

The MNP SCCP Service Re-Route feature is designed to handle and control re-routing of A-Port traffic from an affected node to alternate nodes within the network of an operator. This feature is an optional feature and does not affect the normal A-Port functionality. This feature also provides the option to mark A-Port OFFLINE to perform a controlled re-routing during this state.

### MO-Based IS41 SMS NP

The Mobile Originated Based IS41 SMS NP (MO-Based IS41 SMS NP) feature allows wireless operators to route Short Message Service (SMS) messages originating from a mobile subscriber within a Number Portability (NP) environment. For additional information about the MO-Based IS41 SMS NP feature, refer to *Feature Manual - MO SMS*.

### MT-Based IS41 SMS NP

The Mobile Terminated Based IS41 SMS NP (MT-Based IS41 SMS NP) feature allows wireless operators to route Short Message Service (SMS) messages destined to mobile subscribers within a Number Portability (NP) environment. If the MT-Based IS41 SMS NP feature is not enabled and turned on, then messages are processed by the A-Port feature.

Two types of messages occur with respect to number portability: call related and non-call related. The call-related messages (LOCREQ) query the HLR in real time for delivering the call to the subscriber. The A-port feature handles these.

Non-call related messaging involves the short message service center (SMSC) querying the HLR for the destination subscriber for SMS delivery. For SMS, these query messages are called SMSREQ. The HLR responds to these messages with routing information that can be used by the querying node (SMSC) to deliver the SMS message. In this feature, the Eagle 5 ISS intercepts these SMSREQ messages destined to the HLR and replies with routing information for out-of-network destination subscribers.

The MT-Based SMS feature with A-Port functionality will:

- Intercept SMS routing information request from the SMSC before it reaches the HLR (A-Port function).
- Extract message destination address (SCCP Called Party GTA), condition the digits and perform lookup in the Real Time Database (RTDB) (A-Port function).
- For destination address/subscribers belonging to foreign networks, send reply message to the SMSC with routing information. This information can be used by the SMSC to route the message to their recipient networks.
- For in-network destination addresses, the SMS routing information request is relayed to the HLR according to the options set for normal A-Port routing.

### Signaling Relay Function

Standards are defined such that carriers can choose to implement either Signaling Relay Function (SRF)-based (using MAP protocol) MNP or IN-based (using INAP protocol) MNP. A-Port supports only the SRF-based solution for MNP. INAP-based MNP processing is similar to wireline networks; this function is supported by the INP feature.

SRF-based MNP processing involves the “intercepting” of existing MAP messages to check for ported numbers. For call-related messages, A-Port acts as a number portability home location register (HLR) when the number has been exported by responding to the switch with a LOCREQ ACK message. For

calls to imported numbers and non-call related messages not selected for MT-Based IS41 SMS NP, A-Port performs message relay.

### Routing Options

The ETSI standards for SRF-based MNP define two routing options, direct routing and indirect routing. A-Port supports both options:

- With direct routing, the network where the call is originated is responsible for determining whether the called party has ported and routing the call to the new subscription network.
- With indirect routing, this is the responsibility of the network that originally owned the number.

### Number Length Differences

Number lengths vary between countries and may even vary within a country. As a result, the A-Port subscriber database structure supports numbers of varying length in a flexible way without necessitating software modifications. A maximum number length of 15 digits for ported numbers is supported.

### A-Port Considerations

1. GTT must be on before the A-Port feature can be enabled.
2. The A-Port feature requires 4 GB Service Module cards.
3. A-Port can be turned on, but not turned off.
4. The A-Port, IGM, G-Port MNP, G-Flex C7 Relay, AINPQ, and INP features can run concurrently on an EAGLE 5 ISS node.
5. When A-Port and G-Flex are run on the same node, interactions between the two features must be addressed.
6. A-Port and North American LNP are mutually exclusive on an EAGLE 5 ISS node.

## A-Port Protocol

A-Port supports both Message Transfer Part (MTP) routed, if enabled, and Global Title (GT) routed messages. Service selection (SRVSEL) lookup is performed on GT-routed messages after Signaling Connection Control Part (SCCP) verification. GT routed messages support Unit Data Transfer (UDT) and non-segmented Extended Unit data (XUDT) message types.

## Main Functions

A-Port and MNPCRP provide the following main functions:

- *Message Discrimination*
- *RN Prefix Deletion - SCCP*
- *RN Prefix Deletion - TCAP*
- *Number Conditioning*
- *Database Lookup*
- *Message Relay*
- *Returning Acknowledgement*

### Message Discrimination

Because A-Port provides translation of ported numbers, it provides a method to identify which messages should receive A-Port and which should receive GTT processing. This task of identification is provided via a service selector table (SRVSEL) in which the user can define A-Port service for messages matching a combination of selectors. If a selector match is not found, then the message falls through to GTT- or MTP- routing (in case of MTP routing).

### RN Prefix Deletion - SCCP

The decoded SCCP CdPA digits can have a Routing Number (RN) concatenated with the Mobile Directory Number (MDN) number in two forms:

- RN + DN
- CC+RN+DN (where CC is the Country Code)

When the Service Nature of Address Indicator (SNAI) is one of the following, A-Port compares the decoded MDN number with the list of provisioned home RN prefixes defined in the Real Time Database (RTDB).

- RNIDN (Routing Number, International Directory Number)
- RNNNDN (Routing Number, National Directory Number)
- RNSDN (Routing Number, Subscriber Directory Number)
- CCRNDN (Country Code, Routing Number, National Directory Number)

If a match is found, A-Port strips off the RN digits from the number. Number conditioning, if required, is performed after deleting the RN.

When the SNAI is CCRNDN, A-Port first compares the CC to the DEFCC (Default Country Code) list:

- If CC is not equal to the DEFCC, the message falls through to GTT.
- If CC=DEFCC, then A-Port compares the digits after CC with the list of provisioned Home RN prefixes that are defined in the RTDB. If a match is found, then A-Port strips off the RN digits from the number. If no match is found, the no-prefix deletion is performed and A-Port processing continues.

### RN Prefix Deletion - TCAP

The decoded MAP MDN digits can have a RN concatenated with the MDN number in two forms:

- RN + DN
- CC+RN+DN

The MAP NAI (Nature of Address Indicator) is used to determine the type: International, National, or Subscriber. If MNPCRP is OFF, RN prefix deletion is not attempted. If MNPCRP is ON, then RN prefix deletion is attempted on all MDNs. If the MAP NAI indicates International, then a check is performed for the DEFCC prefix on the MDN, as follows:

- If DEFCC is detected, then Home RN deletion is attempted using the CC+RN+DN format.
- All other MDNs will use the RN+DN format.

A-Port compares the decoded MDN number with the list of provisioned home RN prefixes defined in the RTDB. If a match is found, the A-Port strips off the RN digits from the number. If no match is found, then no prefix deletion is performed and A-Port processing continues with number conditioning.

Number conditioning, if required, is performed after deleting the RN.

### Number Conditioning

The RTDB stores international MDNs only. The received MDN number or SCCP CdPA digits may need to be converted to an international number to perform a database lookup.

A-Port performs number conditioning upon successful decode and verification of the message. Home RN and IEC (International Escape Code) or NEC (National Escape Code) prefixes are removed. The MDN is conditioned to international number format based on the service Nature of Address Indicator: SNAI for SCCP, TCAP SNAI for TCAP, or MTP Location Request Message (LOCREQ) NAI for MTP.

### Database Lookup

A-Port performs database lookup using the conditioned DN digits encoded in Called Party. The database lookup yields one of four possible outcomes:

- **Match is Found with Network Entity (NE) Assigned**

For subscriber entries with an RN and any Portability Type (PT), LOCREQ is returned with an RN and any IS41 messages are relayed. GTT is applied to any GSM or non-TCAP messages.

For subscriber entries with a Signalling Point (SP) and any Portability Type (PT), LOCREQ and any IS41 messages are relayed. GTT is applied to any GSM or non-TCAP messages.
- **Match is Found Without NE**

A data entry in the database is found if a subscriber entry in the database, either an individual DN entry or a DN block, matches the conditioned Called Party.

If an entry is found without an NE assigned and PT= **0, 1, 2, 36**, or **no PT**, the LOCREQ is returned without an NE. GTT is applied to any IS41 message

If an entry is found without an NE assigned and PT= **5 or 6**, the LOCREQ is routed via GTT.

GTT is applied to any IS41 message if an entry is found without an NE assigned. The EAGLE modifies only the MTP and SCCP information as required by standard GTT and keeps the TCAP portion of the message intact.
- **Number conditioning fails. The DN is not found in the RTDB, or the DN is found with non-A-Port data.**

Either the number has never been ported or is an unknown number. The EAGLE 5 ISS routes the message by normal GTT/MTP routing. The EAGLE 5 ISS modifies only the MTP and SCCP information as required by normal GTT/MTP routing, if required, as follows:

  - Perform GTT if the incoming message is sent to the EAGLE 5 ISS Self Point Code.
  - Route the message to the MTP Destination Point Code (DPC) if the incoming message is MTP-routed. (The MTP DPC of the message is not the EAGLE 5 ISS Self Point Code.)

The TCAP portion of the message remains intact.

Normal routing is performing GTT if the incoming message is sent to the EAGLE 5 ISS Self Point Code. Normal routing is routing the message to the MTPDPC if the incoming message is MTP-routed. (The MTPDPC of the message is not the EAGLE 5 ISS Self Point Code.)
- A-Port modifies the TCAP information for LOCREQ messages only when a HomeRN was deleted from the TCAP DN and LOCREQ RMHRN = **YES**. Any gaps in the data caused by a change in

field length will be resolved by shifting the remaining information up. Any IEC or NEC code is left.

Because a DN may be the target of A-Port, G-Port, or Migration message processing in a hybrid network where an operator owns both GSM and IS41 network, message processing call disposition is based on which applications are turned on. [Table 2: A-Port Message Processing](#) summarizes A-Port message processing.

**Table 2: A-Port Message Processing**

NE/ PT	LOCREQ	Any IS41	Any GSM or non-TCAP
RN and any PT	ReturnResult (RN from RTDB)	Relay	GTT
SP and any PT	Relay	Relay	GTT
No NE and PT= 0, 1, 2, 36, or no PT	ReturnResult (no NE)	GTT	GTT
No NE and PT= 5 or 6	GTT	GTT	GTT
No DN entry found	GTT	GTT	GTT

Database lookup results in the following:

1. Applying GTT or
2. Relaying the message to the destination as noted in the database or
3. Returning an acknowledge message to the originating switch.

[Message Relay](#) describes how the EAGLE 5 ISS formulates a relayed message or a returned ACK.

### Message Relay

The rules for formatting the SCCP CdPA GTA field are based on the value specified in the DigitAction field. When a received IS41 message is relayed, the EAGLE formulates the SCCP CdPA GTA field of the outgoing message according to DigitAction specified:

- If DigitAction = none, the EAGLE 5 ISS does not overwrite the SCCP CdPA GTA.
- For all other values, the EAGLE 5 ISS formats the SCCP CdPA GTA according to the value assigned to DigitAction.

[Table 3: DigitAction Applications](#) identifies the required DigitAction options as well as examples of how the SCCP CdPA GTA of an outgoing message is formatted for each of the options. The example assumes the RN / SP ID is 1404 and default country code is 886.

Table 3: DigitAction Applications

DigitAction	Value in Incoming CdPA GTA	Value in Outgoing CdPA GTA	Meaning
none	886944000213	886944000213	No change to the Called Party GTA (default)
prefix	886944000213	1404886944000213	Prefix Called Party GTA with the entity id
replace	886944000213	1404	Replace Called Party GTA with the entity id
insert	886944000213	8861404944000213	Insert entity id after country code. (CC + Entity Id + NDC + SN)
delccprefix	886944000213	1404944000213	Delete country code and add prefix (No action is taken if country code is not present.)
delcc	886944000213	944000213	Delete country code
spare1	886944000213	treated as none	No change to the Called Party GTA (default)
spare2	886944000213	treated as none	No change to the Called Party GTA (default)

### Returning Acknowledgement

When a LOCREQ response/ACK is returned, the EAGLE 5 ISS follows the LOCREQ encoding rules along with the following enhancements for added flexibility:

- Allow users to specify which TCAP LOCREQ parameter (the TCAP Outgoing Called Party parameter) encodes the RN (and/or DN) information
- Allow users to specify the Digit Type value to encode the TCAP Outgoing Called Party parameter
- Allow users to specify the value to encode the Nature of Number field of the TCAP Outgoing Called Party parameter
- Allow users to specify the value to encode the Numbering Plan field of the TCAP Outgoing Called Party parameter
- Allow users to specify the digit encoding format of the LOCREQ TCAP Outgoing Called Party parameter;
- Allow users to specify the MSCID values to be encoded in the LOCREQ message
- Allow users to specify the Electronic Serial Number (ESN) values to be encoded in the LOCREQ message
- Allow users to specify how the digits of the LOCREQ MIN parameter shall be encoded

## LOCREQ Query Response

The LOCREQ Query Response feature allows EAGLE 5 ISS to respond to LOCREQ query messages with a LOCREQ response message containing routing information for both ported and non-porting subscribers. Service Portability (S-Port) processing is used to control whether Generic Routing Number (GRN) or default Routing Number (RN) digits are used for the routing information in the LOCREQ response message.

The LOCREQ Query Response feature is applied to LOCREQ query messages received by EAGLE 5 ISS for local subsystem processing; however, EAGLE 5 ISS does not provide true subsystem support for these queries. Any LOCREQ query message to a True, Secondary, or Capability Point Code of the EAGLE 5 ISS is considered a potential candidate for LOCREQ Query Response feature. The query message is selected for LOCREQ Query Response processing if all of these conditions are met:

- The MTP DPC is a True, Secondary, or Capability Point Code of EAGLE 5 ISS.
- The message is a UDT or non-segmented XUDT message.
- The SCCP Called Party Address RI = SSN.
- The SCCP Called Party Address GTI is 0, 2, or 4. (GTI=4 is supported for only ITU SCCP messages.)
- The SCCP Calling Party Address RI = SSN.
- The TCAP variant is ANSI.
- The TCAP Operation Code is LocReq.

If all conditions are met and the MNP service state is `online`, then the LOCREQ query message is delivered to the MNP service handler for LOCREQ Query Response processing. If any of the conditions is not true, the LOCREQ query message is processed without LOCREQ Query Response processing.

If all conditions are met but the MNP service state is `offline`, then these actions occur:

- A UIM is issued.
- A TFP concerning the CPC is returned if the DPC in the original message was an MNP CPC.
- (X)UDTS:Subsystem Unavailable is returned, if Return on Error is set.
- The message is discarded.

### LOCREQ Query Response Processing

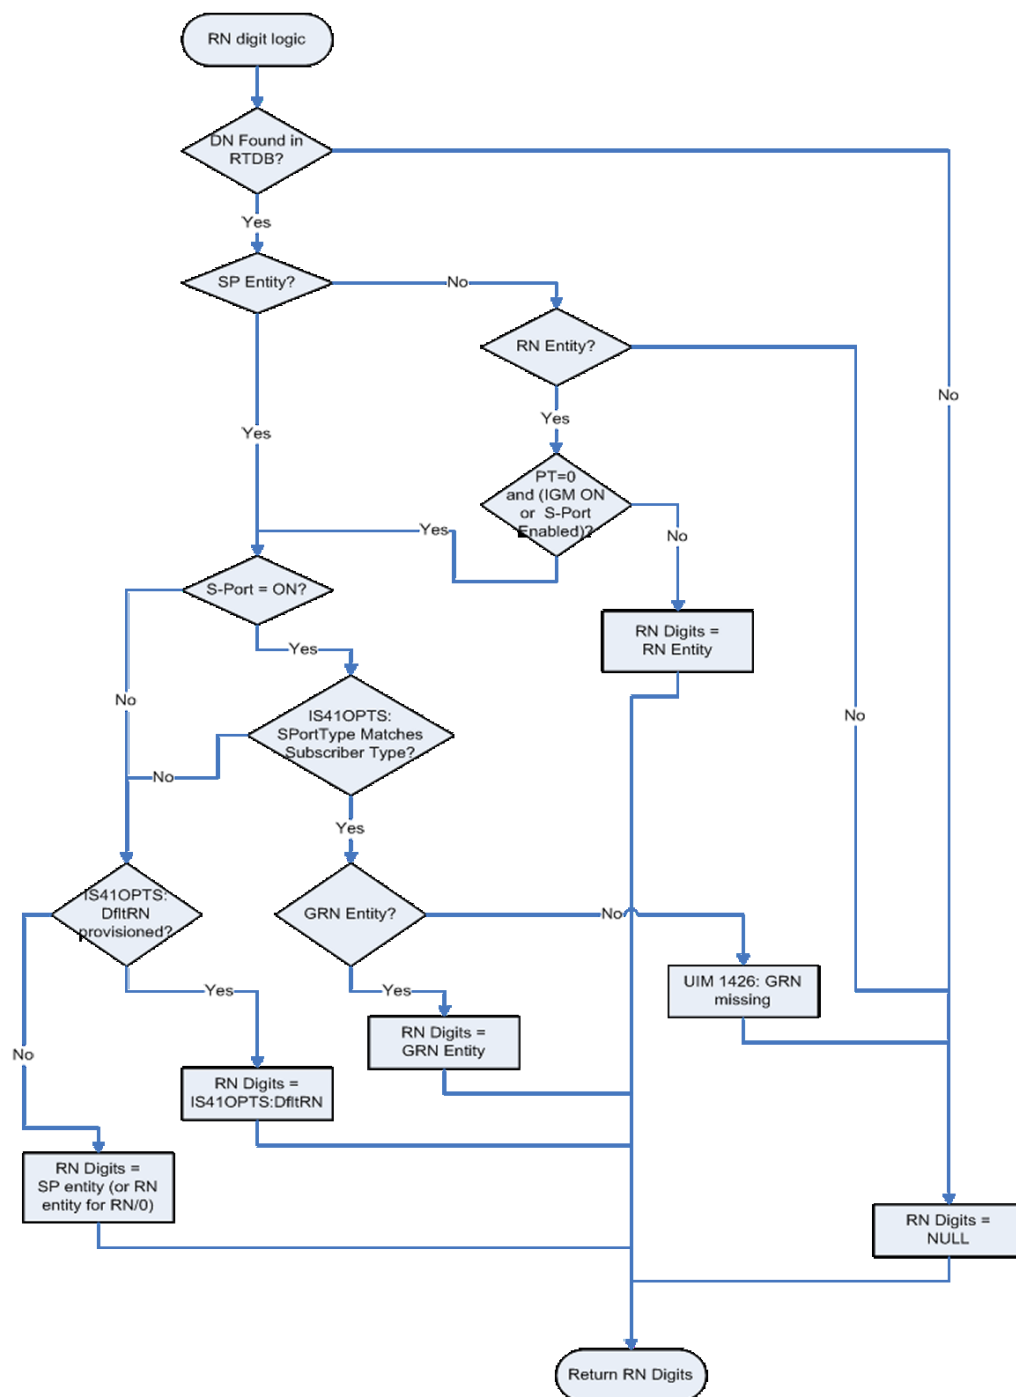

For LOCREQ Query Response processing to occur, the LOCREQ Query Response feature must be enabled and turned on and the IS41OPTS option LOCREQRSPND must be set to `on`. The LOCREQ Query Response feature processes only ANSI TCAP Query with Permission messages with an Operation Code of LocReq.

LOCREQ Query Response processing functions include:

- The DN is retrieved from the TCAP portion.
- The NAI is determined based on the MTPLOCREQNAI value provisioned in the IS41OPTS table.
- A-Port or IGM number conditioning (for example, HomeRN Deletion and IEC/NEC Deletion) is applied to the DN.
- MNP Circular Route Prevention is not applied to LOCREQ query messages processed by the LOCREQ Query Response feature.

- Every LOCREQ query message processed by the LOCREQ Query Response feature is acknowledged with a response message.

*Figure 1: LOCREQ Query Reponse RN Determination* shows the logic to determine the RN digits used in the LOCREQ query response.

**Figure 1: LOCREQ Query Reponse RN Determination**

### LOCREQ Query Response Errors

The LOCREQ Query Response feature responds to LOCREQ queries unless one of these errors occurs.

#### Decode Errors

*Error result* - (X)UDTS:Unqualified is generated; UIM is issued; MSU is discarded.

- The TCAP message is incorrectly formatted (invalid parameter tag or length).
- Called Party Number or Dialed Digits parameter does not exist.
- Digits parameter is less than 4 bytes.
- Number of digits is greater than 21.
- Encoding scheme is not BCD.
- Numbering Plan is not Telephony or ISDN.

#### Number Conditioning Errors

*Error result* - (X)UDTS:Unqualified is generated; UIM is issued; MSU is discarded.

- Default country code (DEFCC) parameter is required, but is not provisioned.
- Default Network Destination Code (DEFNDC) parameter is required, but is not provisioned.
- International (conditioned) digits are less than 5 or greater than 15.

#### Encode Errors

*Error result* - No response message is generated; UIM is issued; MSU is discarded.

- CgPA PC/OPC is not in the route table. CgPA PC is used if present in message,;otherwise OPC is used.
- CgPA PC/OPC is an Alias. No conversion is allowed.

### LOCREQ Query Response Maintenance and Measurements

The LOCREQ Query Response feature increments counters against MNP service in the `rept-stat-sccp` output.

- *Failure* counter is incremented if a Return Result cannot be generated because of decode errors, number conditioning errors or encode errors.
- *Failure* counter is incremented if a message is received and MNP service state is `offline`.
- *Warning* counter is incremented if GRN was required but was missing, and the Return Result was sent.
- *Success* counter is incremented if a Return Result is generated, except if the Warning counter was incremented for missing GRN.

LOCREQ Query Response feature increments these Measurement registers, also used by A-Port and IGM features, if a LOCREQ query response message generates successfully:

- IS41LRMRCV
- IS41LRRTRN
- APLRACK (per SSP)

LOCREQ Query Response feature increments these Measurement registers, also used by A-Port and IGM features, if a LOCREQ query response message fails to be generated:

- IS41LRMRCV
- IS41LRERR

### Service Portability for LOCREQ Query Response

Service Portability (S-Port) processing supports LOCREQ Query Response by controlling whether Generic Routing Number (GRN) or default Routing Number (RN) digits are used for the RN in the LOCREQ response message. Parameter SPORTTYPE (Service Portability Type) is provisioned in IS41OPTS table to specify the application of Service Portability that is to be applied to the associated feature. Parameter DFLTRN (Default Routing Number) is provisioned in IS41OPTS table to provide the RN digits if Service Portability is not turned on or the SPORTTYPE does not match the subscriber type.

Number Portability functions use the Network Entity Type (RN/SP) from the RTDB when formatting outgoing Called Party digits in the LOCREQ response message. The S-Port feature allows RTDB GRN Entity digits to be used for own-network GSM and IS41 subscribers in response digit formats. The GRN field in the RTDB is used to provision Service Portability prefixes on a per subscriber basis.

When Service Portability is applied, the LOCREQ response message is prefixed with the Generic Routing Number associated with the DN, instead of the Network Entity Type (RN/SP) that is used by number portability. The GRN digits can indicate the protocol (IS41 or GSM), calling area, and Operator network as defined by individual operators.

*Table 4: Service Portability vs Number Portability by Destination Subscriber Type* shows whether Service Portability or Number Portability is applied when Service Portability is turned on and RTDB lookup is successful based on the value of the IS41OPTS parameters SPORTTYPE and DFLTRN.

**Table 4: Service Portability vs Number Portability by Destination Subscriber Type**

SPORTTYPE	Own-Network GSM Entity Type = SP, any Portability Type	Own-Network IS41 Entity Type = RN, Portability Type = 0	Foreign (OLO) and others Entity Type = RN, Portability Type $\neq$ 0  -or- No Entity Type , any Portability Type
None	Apply Number Portability	Apply Number Portability	Apply Number Portability
GSM	Apply Service Portability - use GRN	Apply Number Portability	Apply Number Portability
IS41	Apply Number Portability	Apply Service Portability - use GRN	Apply Number Portability

<b>SPORTTYPE</b>	<b>Own-Network GSM</b> <b>Entity Type = SP, any</b> <b>Portability Type</b>	<b>Own-Network IS41</b> <b>Entity Type = RN,</b> <b>Portability Type = 0</b>	<b>Foreign (OLO) and</b> <b>others</b> <b>Entity Type = RN,</b> <b>Portability Type <math>\neq</math> 0</b>  <b>-or-</b> <b>No Entity Type , any</b> <b>Portability Type</b>
ALL	Apply Service Portability - use GRN	Apply Service Portability - use GRN	Apply Number Portability

## MTP Routed SCCP Traffic

The MTP Msgs for SCCP Apps and MTP Routed GWS Stop Action features forward MTP routed SCCP messages to the Service Module cards. The SCCP messages forwarded by either feature are processed in the same way on the Service Module cards. The difference between the two features is that the MTP Routed GWS Stop Action feature filters messages based on provisioned Gateway Screening rules on a per linkset basis and forwards only UDT, UDTS, XUDT and XUDTS SCCP messages to Service Module cards, while the MTP Msgs for SCCP Apps feature forwards all MTP routed SCCP messages to the Service Module card without filtering. Because the MTP Routed GWS Stop Action feature selectively forwards the messages to the Service Module card, the feature has less impact on SCCP performance than the MTP Msgs for SCCP Apps feature. The features can coexist, which means that both features can be turned on in the same system.

### MTP Msgs for SCCP Apps

MTP routed SCCP messages are supported with the MTP Msgs for SCCP Apps feature. LOCREQ and SMSREQ messages are supported. A Feature Access Key (FAK) for part number 893-0174-01 is required to enable the MTP Msgs for SCCP Apps feature. This feature can be turned on and off, but cannot be enabled with a temporary FAK. GTT must be on to enable the MTP Msgs for SCCP Apps feature.

After the MTP Msgs for SCCP Apps feature is turned on, all SCCP messages are routed to Service Module cards. The Service Module card then performs SCCP decode/verification. Use of the MTP Msgs for SCCP Apps feature adversely affects the SCCP capacity because all of these messages are counted under SCCP capacity.

If the MTP routed messages have CdPA RI=GT or SSN and GTI  $\neq$  0 (GTI = 2 or 4), then a service selection (SRVSEL) lookup is performed using the SCCP CdPA information. If the result of the lookup is MNP service, then the message is sent to MNP handling. If a service selector does not match or the service is OFFLINE, then MTP routing is performed on the messages. MNP SCCP Service re-route is not performed on MTP routed messages.

If the MTP routed messages have CdPA GTI=0, the TCAP portion of ANSI TCAP messages is decoded. SMSMR service is invoked for SMDPP messages; IAR Base feature is invoked for Analyzed messages. For all other messages, MNP service is invoked.

MNP handling checks whether the TCAP portion of the message is ITU or ANSI.

If the message has ANSI TCAP, then:

- General TCAP/MAP verification for A-Port is performed if the A-Port or IGM feature is turned on. Only LOCREQ and SMSREQ messages are handled by A-Port or IGM for MTP routed messages.
- When  $GTI \neq 0$ , message relay is performed on non-LOCREQ and non-SMSREQ ANSI TCAP messages based on the SCCP CdPA portion of the message.
- When  $GTI = 0$ , MTP routing is performed on non-LOCREQ ANSI TCAP messages.

If the message has ITU TCAP, the IGM feature is on, and  $GTI \neq 0$ , then:

- The message is considered for relaying based on the RTDB lookup results. General TCAP/MAP verification is not performed on the message.
- Message relay is performed based on the SCCP CdPA portion of the message with  $GTI = 2$  or  $4$ .

If the message has ITU TCAP, the IGM feature is on, and  $GTI = 0$ , then MTP routing of the message is performed.

ITUN-ANSI SMS Conversion is not affected by the MTP Msgs for SCCP Apps feature; ITUN-ANSI SMS Conversion handles only Registration Notification and SMS Notification messages.

### MTP Routed GWS Stop Action

The MTP Routed GWS Stop Action feature provides a Gateway Screening (GWS) stop action: `sccp`. This stop action allows IS41-based features to process MTP routed traffic. GWS rules are used to filter MTP routed SCCP messages (UDT, UDTs, XUDT, and XUDTs) on a per linkset basis. The messages are then forwarded to Service Module cards for processing by features that support MTP routed messages based on Service Selection criteria. A Feature Access Key (FAK) for part number 893-0356-01 is required to enable the MTP Routed GWS Stop Action feature. This feature can be turned on and off, but cannot be enabled with a temporary FAK. GTT must be on to enable the MTP Routed GWS Stop Action feature. The MTP Routed GWS Stop Action feature must be enabled before the `sccp` stop action can be provisioned, and before message processing can occur. The `sccp` stop action must be the last stop action in the GWS action set.

If the MTP Msgs for SCCP Apps feature is turned on, all SCCP messages are forwarded to Service Module cards without the `sccp` GWS stop action being executed, regardless of whether the MTP Routed GWS Stop Action feature is turned on.

After provisioning, the `sccp` stop action can be used by these features:

- A-Port
- G-Flex
- Info Analyzed Relay ASD
- Info Analyzed Relay Base
- Info Analyzed Relay GRN
- Info Analyzed Relay NP
- IS41 GSM Migration (IGM)
- ITUN-ANSI SMS Conversion
- MNP Circular Route Prevention
- MO-Based IS41SMS NP
- MO SMS ASD
- MO SMS B-Party Routing

- MO SMS GRN
- MO SMS IS41 to GSM Migration
- MTP MAP Screening
- MT-Based IS41 SMS NP

Refer to *Database Administration Manual – Gateway Screening* for additional information and provisioning procedures for the MTP Routed GWS Stop Action feature.

### SMSREQ Handling for Migrated or Ported Subscribers

The SMSREQ Handling for Migrated or Ported Subscribers enhancement allows MTP routed SMSREQ messages to be supported by A-Port, IGM, MNPCRP, and MT-Based IS41 SMS NP features. Service selection criteria for MTP routed SMSREQ messages is the same for MTP routed LOCREQ messages. The MNP service processing for MTP routed SMSREQ messages is the same for Global Title (GT) routed SMSREQ messages. However, MTP routing is performed on MTP routed messages when these messages fall through from the MNP service. Feature precedence is applied for SMSREQ messages as shown:

1. MNPCRP - If a circular route condition is detected, a UIM is generated and MTP routing is performed on the message.
2. IGM - If the DN is own-network GSM subscriber (Portability Type = 5) and SMSREQBYPASS = No, then send an SMSREQ Error Response (Return Result message) to the originator with SMS Access Denied Reason = 5.
3. MT-Based IS41 SMS NP - If the DN matches the MT-Based IS41 SMS NP feature criteria (IS41SMSOPTS:MTSMSTYPE), the SMSREQ response is generated.
4. A-Port - A-Port relays the message based on the RTDB lookup result. If relay information is not present in the RTDB data associated with the DN, then the message is MTP routed.
5. If A-Port is not turned on, then IGM relays the SMSREQ message for only own-network subscribers if the SMSREQ response is not previously sent for subscribers not handled by IGM. If relay information is not present in the Network Entity Type (RN/SP) associated with the DN or if Network Entity Type indicates an Other Licensed Operator (OLO) subscriber, then the message is MTP routed.
6. If none of the feature processing in the previous items is performed, then the message is MTP routed.

If a feature in the precedence list is off, processing by that feature is not performed.

**Table 5: Subscriber Portability Type**

Network Entity Type (NE)	Portability Type (PT)	Subscriber Type
RN	0	Own-network subscriber, if IGM or Service Portability is on Otherwise, Other Licensed Operator (OLO) subscriber
RN	any value other than 0	OLO subscriber

Network Entity Type (NE)	Portability Type (PT)	Subscriber Type
SP	any	Own-network subscriber
No entity, or any entity other than RN or SP	0, 1, 2, 36, or none (255)	OLO subscriber
No entity, or any entity other than RN or SP	any value other than 0, 1, 2, 36, or none (255)	Own-network subscriber

## MNP SCCP Service Re-Route Capability

This feature is designed to handle and control re-routing of MNP traffic from an affected node to alternate nodes within an operator's network. This feature is an optional feature and does not affect the normal MNP functionality. This feature consists of these main functions:

- [Service State Management](#)
- [MNP Re-Routing](#)
- [MNP Capability Point Codes](#)

### Service State Management

Service state management is part of the MNP SCCP Service Re-Route Capability. Service state is used to indicate the current state of MNP, either *ONLINE* or *OFFLINE*. Service state also gives the user the option to mark MNP as *OFFLINE* or *ONLINE* based on the current behavior. If a MNP problem is identified, MNP can be marked *OFFLINE* to initiate the re-routing procedure. When Service Module cards need to be reloaded, MNP can be marked *OFFLINE* until enough cards are in-service and then bring MNP *ONLINE* in a controlled fashion.

When the MNP feature is turned on and the MNP service state is set to *OFFLINE*, the user can change the service to *ONLINE* at any point. Once the feature is turned *ONLINE*, MNP will start processing messages if at least one Service Module card is IS-NR (In Service - Normal).

The MNP service can be set to *OFFLINE* at any point. This causes the EAGLE 5 ISS to stop processing MNP traffic and re-routing is performed.

The MNP service state is persistent. Booting the OAM or all Service Module cards will not change the service state. Commands must be used to change the service state.

### MNP Re-Routing

MNP Re-Routing is an optional feature and is enabled by defining a list of alternate PCs or by defining the GTT option. MNP re-routing is activated by marking MNP *OFFLINE*. When MNP is *OFFLINE* and alternate PCs are provisioned, any messages destined for MNP are re-routed to the available alternate PCs that are defined for MNP. If alternate PCs are not provisioned or none are available, then the GTT option is used. If the GTT option is set to YES, then messages destined for MNP will fall through to GTT as part of the re-routing procedure.

Re-Routing is applied to all MNP messages (based on SRVSEL). There is no distinction of Destination Point Code (DPC) of the messages. The DPC of the message can be either True, Secondary, or Capability Point code.

### MNP Capability Point Codes

Capability Point Codes (CPC) are supported for MNP. The use of MNP capability point code allows the adjacent nodes to know about MNP outages. When MNP is taken offline through administrative commands, all traffic destined to that MNP node will result in a Transfer Prohibited (TFP) message being sent to the adjacent node about the MNP CPC. The TFP response to the adjacent node causes the traffic originating nodes to stop sending MNP traffic to this node. All MNP traffic coming into this node is sent to the alternate MNP nodes. Adjacent nodes will initiate route-set-test procedures after receipt of the TFP response.

If the messages are destined to the EAGLE 5 ISS true point code, then TFP messages are not generated when the MNP service is *OFFLINE*. The originator would not be aware of the outage.

Once MNP is back in service on the EAGLE 5 ISS, a Transfer Allowed (TFA) message is sent to the traffic adjacent nodes in response to route-set-test message. The traffic originating nodes will then start sending MNP traffic to the original MNP node.

MNP Capability point codes can be provisioned when the MNP feature is ON. There can be more than one Capability Point Code assigned to MNP CPC Type.

MNP supports up to seven alternate PCs per domain. All six domains (ANSI, ITU-I, ITU-I Spare, ITU-N, ITU-N Spare, and ITU-N24) are supported. An entire set of alternate PCs is considered as a re-route set. A GTT option is supported for MNP re-route. When the MNP service is *OFFLINE*, MNP messages fall through to GTT based on the GTT option. This option is set to YES by default.

### MNP SCCP Service Re-Route Capability Summary

If the MNP service is not normal (because the RTDB is not in sync with MPS or if cards are misrouting MNP messages) then the MNP service state should be changed to *OFFLINE*.

Before changing MNP service to *OFFLINE*, it should be decided what kind of re-routing will be used during the outage. The EAGLE 5 ISS supports re-routing data to alternate point codes or falling through to GTT as two possible options. Rerouting to alternate point code has priority over falling through to GTT. Examples of these two options follow:

#### Option 1

Define alternate point codes to re-route MNP traffic. This is the recommended option. Up to 7 alternate MNP nodes can be provisioned to re-route all the incoming MNP traffic. Once provisioned, the MNP service can be changed to *OFFLINE*. This example has any incoming being MNP traffic being load-shared to point codes based on the relative cost.

```
chg-sccp-serv:serv=mnp:pci1=1-1-1:rc1=10:pci2=2-2-2:rc2=10:pci3=3-3-3:rc3=10:pci4=4-4-4:rc4=10
chg-sccp-serv:serv=mnp:pci1=1-1-1:rc1=10:pci2=2-2-2:rc2=10:pci3=3-3-3:rc3=10:pci4=4-4-4:rc4=10
chg-sccp-serv:serv=mnp:pci1=1-1-1:rc1=10:pci2=2-2-2:rc2=10:pci3=3-3-3:rc3=10:pci4=4-4-4:rc4=10
chg-sccp-serv:serv=mnp:pci1=5-5-5:rc1=10:pci2=6-6-6:rc2=10:pci3=7-7-7:rc3=10:pci4=8-8-8:rc4=10
chg-sccp-serv:serv=mnp:state=offline
```

#### Option 2

With this option, default GTT translations are provisioned for MNP service. Then the chg-sccp-serv command is used to provision GTT=YES. All MNP messages will fall through to GTT. An example command follows:

```
chg-sccp-serv:serv=mnp:grr=yes
```

Once the MNP re-routing data is provisioned, MNP service can be changed to *OFFLINE*. At this point all MNP traffic will be re-routed. The user can take necessary steps to correct the MNP service on the

node. Until all the cards or enough cards are in active state with valid MNP database, MNP service should not be changed to *ONLINE*.

[Table 6: MNP SCCP Service Re-Route Capability Summary](#) shows the actions taken when the MNP service is offline, a message arrives at the affected node requiring MNP service, and Service Module cards are available.

**Table 6: MNP SCCP Service Re-Route Capability Summary**

Result of service selector	DPC	Alternate point code defined and available	GTT to be performed as fall through	Message Handling	Network Management
MNP	MNP Capability PC	Yes	N/A	Re-Route to alternate point code based on relative cost	TFP concerning CPC
MNP	MNP Capability PC	No	Yes	Fall through to GTT and perform GTT	TFP concerning CPC
MNP	MNP Capability PC	No	No	Generate UDTS (return cause = network failure)	TFP concerning CPC
MNP	MNP Capability PC	Not Defined	Yes	Fall through to GTT and perform GTT	TFP concerning CPC
MNP	MNP Capability PC	Not Defined	No	Generate UDTS (return cause = no translation for this addr)	TFP concerning CPC
Not MNP	MNP Capability PC	N/A	N/A	Perform appropriate Service / GTT	None
MNP	True or Secondary PC or non-MNPCPC	Yes	N/A	Re-Route to alternate point code based on relative cost	None
MNP	True or Secondary PC or non-MNPCPC	No	No	Generate UDTS (return cause = network failure)	None
MNP	True or Secondary PC or non-MNP CPC	No	Yes	Fall through to GTT and perform GTT	None
MNP	True or Secondary PC or non-MNPCPC	Not Defined	Yes	Fall through to GTT and perform GTT	None
MNP	True or Secondary PC or non-MNP CPC	Not Defined	No	Generate UDTS (return cause = no translation for this addr)	None

Result of service selector	DPC	Alternate point code defined and available	GTT to be performed as fall through	Message Handling	Network Management
Not MNP	True or Secondary PC or non-MNP CPC	N/A	N/A	Perform appropriate Service/GTT	None
*Alternate point codes are defined and unavailable (prohibited or congested).					

## A-Port Considerations

The following list should be considered before installing and operating the A-Port feature.

1. SRI responses are routed by both MTP and Global Title Translation.
2. The maximum length of the Application Context Name Object Identifier is 32 digits.
3. For A-Port Message Relay messages with E.164 numbers in the SCCP CdPA, it is assumed that no truncation occurred if and when the routing number was prepended and that SCCP CdPA contains the full Directory Number of the subscriber.
4. A-Port Message Relay to the EAGLE 5 ISS local subsystem is not supported.
5. Only the first 21 digits of the CdPA are decoded for A-Port Message Relay. For example, if the CdPA contains an RN prefixed to a DN, the RN is seven digits, and the DN is 15 digits, then the total is 22 digits. The DN used for processing will be only 14 digits (21 total digits less 7 RN digits).
6. With the Hex Digit Support for GTT feature enabled and turned on, Message Signaling Units (MSUs) containing either decimal or hexadecimal digits in the Called Party Address (CdPA) are processed. Unless the Hex Digit Support for GTT feature is enabled and turned on, GTT processes decimal digits only.

If the Hex Digit Support for GTT feature is not enabled and not turned on and an operator or country is using hexadecimal digits A through F in RNs and the operator is providing GTT to messages that have RN prefixes other than its own prefixes, then the operator must enter the RN + DN number ranges as DN ranges in the A-Port subscriber database. The beginning and ending DNs can be only 15 digits, which may not be sufficient for an RN + DN.

7. MNP applies within a single portability cluster. This is defined as a set of networks in a country or multi-country region having a common numbering plan and across which a subscriber, who is already inside the cluster, can port. Any individual A-Port node is required to support only an MNP within such a portability cluster.
8. The routing number found in the NP database is either prefixed to the dialed number to form a new concatenated Roaming Number that is returned to the switch, or is sent on its own as the Roaming Number.
9. All non-call related messages impacted by MNP contain the MSISDN number in the SCCP CdPA. In the case of the SRI message, A-Port may get the number from the MAP level.
10. TCAP operation codes uniquely distinguish Loc\_req messages and do not change from one phase (or version) of MAP to another.

11. PCs and/or PC + SSNs that are in the entity table of the database and referenced by subscriber entries do not necessarily have the required data present on the EAGLE 5 ISS to route messages to them. For example, the point code may not have a route or the PC + SSN may not be in the MAP table for a final GTT. In this event, a UIM is output only when a message is discarded because of the lack of data.
12. The parameters of the SRI Ack message generated by A-Port are solely based on the provisioned data/options; they are not based on the MAP phase of the SRI message. For example, if the message received is phase 1 or 2, "MSRNDIG=RN", and the portability status is "NotKnownToBePorted", A-Port generates an SRI Ack contains IMSI, MSRN, MDN, and NPS parameters, despite the MDN and NPS parameters not being defined for phase 1 or 2.
13. If SRF IMSI is not provisioned with an RN entity and an incoming message is an SRI message, A-Port sets IMSI parameter as zero digits when the MAP phase is 1 or 2.
14. A-Port uses the MTP route for the SRI Ack message, even when the final GTT is performed on the response.
15. When the concatenated number (RN + MDN) option is selected for encoding the Routing Info (MSRN) in the SRI Ack message, A-Port encodes the complete concatenated number, because the concatenated number length may otherwise exceed 16 digits, which is the maximum allowed in MSRN.

## General Numbering Requirements

Incoming called party numbers, from the SCCP portion, destined for A-Port processing are conditioned to fit the GDB requirements where possible. The following factors are used to condition the SCCP numbers.

- Based on provisioning: If the GTT selectors available in the incoming message match an entry in the A-Port selector table, then the service numbering plan from the selector table entry uses that number's numbering plan. Further conditioning is applied based on this new numbering plan.
- Based on configurable options: If the GTT selectors available in the incoming message match an entry in the A-Port selector table, then the service nature of address from the selector table entry uses that number's nature of address. Further conditioning is applied based on this new nature of address.
- If the nature of address is Subscriber, the default CC + default NC (network code for E.164) are prepended to the number. The default codes to be used by the EAGLE 5 ISS must be previously provisioned by the EAGLE 5 ISS operator. If not, a UIM is issued, and the message falls through to GTT.

Numbers with fewer than five digits after the above conditioning are not used for A-Port. In this case, a UIM is issued, and the message falls through to GTT.

Numbers with more than fifteen digits after the above conditioning are not used for A-Port. In this case, a UIM is issued, and the message falls through to GTT.

## Maintenance

The following sections describe the maintenance consideration for A-Port, as follows:

- [Validation of A-Port Hardware Configuration](#)
- [A-Port Loading Mode Support](#)
- [Audit Requirements](#)

### Validation of A-Port Hardware Configuration

Service Module card loading has been modified to verify the validity of the hardware configuration for the Service Module cards. Hardware verification includes the following:

- **Service Module card Verification**

An AMD-K6 (or better) main board is required to support the A-PortVSCCP application on the Service Module card. EAGLE 5 ISS maintenance stores the validity status of the main board configuration of the Service Module card.

**Note:**

The system does not allow the A-Port feature to be turned on if the hardware configuration is invalid.

When the VSCCP application is initializing, it determines the main board type. The SCCP maintenance block is the mechanism used to relay the main board information to OAM. This requires that the application software be loaded to the Service Module card and then the main board information received in the SCCP maintenance block must be verified. If the main board is determined to be invalid for the A-Port application, loading of the Service Module card is automatically inhibited.

- **Service Module card Applique Memory Verification**

The VSCCP application performs two types of memory validation to determine whether or not a Service Module card has sufficient memory to run A-Port:

**CAUTION**

**CAUTION:** A-Port cannot be enabled if any of the Service Module cards have less than 4 GB of memory installed. Refer to *Dimensioning Guide for EPAP Advanced DB Features* for important information on the dimensioning rules and the DSM database capacity requirements.

- *Local Memory Validation.* When the A-Port feature is first enabled, or any time the A-Port feature is enabled and the Service Module card is initializing, VSCCP checks to see if the Service Module card has at least 4 GB of memory installed.
- *Real-Time Memory Validation (during card initialization).* Once communications between the Service Module card and EPAP have been established, and the Service Module card has joined the RMTP Tree, the EPAP starts downloading the RTDB to the Service Module card. After the Service Module card has downloaded the RTDB, it continues to receive database updates as necessary. The EPAP includes the size of the current RTDB in all records sent to the Service Module card. The Service Module card compares the size required to the amount of memory installed, and issues a minor alarm when the database exceeds 80% of the Service Module card memory. If the database completely fills the Service Module card memory, a major alarm is

issued, the Service Module card leaves the RMTP tree, and the status of the Service Module card changes to IS-ANR/Restricted. The Service Module card continues to carry traffic.

- **Actions Taken When Hardware is Determined to be Invalid**

When the hardware configuration for a Service Module card is determined to be invalid for the A-Port application, SCM automatically inhibits loading for that specific Service Module card. A major alarm is generated indicating that card loading for that Service Module card has failed and has been automatically inhibited, which means it is prevented from reloading. See [A-Port-Related Alarms](#) for the specific alarm that is generated. When card loading has been inhibited, the primary state of the card is set to `oos-mt-dsbl'd`, and the secondary state of the card is set to MEA (Mismatch of Equipment and Attributes).

The following constraints apply to a Service Module card that is determined to be invalid:

- The Service Module card will not download the EAGLE 5 ISS databases.
- The Service Module card will not download the real-time RTDB from the EPAP.
- The Service Module card will not accept RTDB updates (including add, change, or delete) from the EPAP, nor will it accept STP database updates.

To activate loading of a Service Module card that has been automatically inhibited, the craftsman must enter the `alw-card` command (`alw-card:loc=xxxx`).

- **Unstable Loading Mode**

At some point, having a number of invalid Service Module cards results in some of the LIMs (Link Interface Module) being denied SCCP services. A threshold must be monitored; if the number of valid Service Module cards is insufficient to provide service to at least 80% of the IS-NR LIMs, the system is said to be in an unstable loading mode. For other reasons why an EAGLE 5 ISS might be in an unstable loading mode, see [Status Reporting and Problem Identification](#).

### ***A-Port Loading Mode Support***

Loading mode support is not applicable for RTDB updates, since Service Module cards use incremental loading from the EPAP. STP Administrative updates are allowed while a Service Module card is loading and the system is above the 80% card stability threshold. If it is below the 80% threshold, loading mode support allows STP administrative updates to be rejected while cards finish loading and cross the 80% or greater threshold.

For A-Port, loading mode support is applicable for database updates originating from the EAGLE 5 ISSGSPM-II cards (General Purpose Service Module II cards) destined for the Service Module cards.

### ***Audit Requirements***

The A-Port audit does not change EAGLE 5 ISS compliance to STP audit requirements, to which EAGLE 5 ISS currently adheres. A-Port subscriber database tables residing on the EAGLE 5 ISSTD fixed disks are audited by the existing STP audit, which only verifies tables on the EAGLE 5 ISS active and standby TDMs. Audit mechanisms for A-Port tables residing on the EPAP platform are downloaded to the Service Module cards. The audit mechanisms consist of the following.

- On each Service Module card and on the standby EPAP, a background audit calculates checksums for each A-Port RTDB table record and compares the calculated checksum against the checksum value stored in each record. If the checksums are not the same, then a *database corrupt* alarm is issued.

- A process that runs approximately every five seconds or less on the active EPAP sends the latest RTDB database level to all the Service Module cards and the standby EPAP. If the database levels do not match, the standby EPAP or Service Module card issues a *diff level* alarm.

For more information on the audit mechanisms, refer to *EPAP Administration Manual*.

## MT-Based IS41 SMS NP

The Mobile Terminated (MT)-Based IS41 SMS NP feature allows wireless operators to route short message service (SMS) messages destined to mobile subscriber within a number portability (NP) environment. If the MT-Based IS41 SMS NP feature is not enabled and turned on, then messages are processed by the A-Port feature.

The MT-Based IS41 SMS NP feature acts as follows:

1. Intercepts an SMSREQ message from the SMSC before the message reaches the home location register (HLR).
2. Extracts the message destination address (SCCP Called Party GTA), conditions the digits, and performs a lookup in the NP database.
3. If the destination address/subscribers belongs to a foreign network, then a reply message is sent to the SMSC with routing information. If the destination address/subscribers belongs to a local network, then the SMSREQ message is relayed to the HLR according to the options set for normal A-Port routing.

## Options

The MT-Based IS41 SMS NP feature provides the following configurable options for controlling processing of SMS routing request messages and the content of the response:

- Selecting the Short Message Service Center (SMSC) response message type and digit format
- Specifying when an NP database lookup is considered to be successful
- Specifying the format of digits encoded in the response message.

## Feature Control Requirements

The MT-Based IS41 SMS NP feature has the following control requirements:

- The `defcc` parameter in the `chg-stpopts` command must be set to a value other than **none** before the feature can be turned on.
- A FAK for part number 893-0199-01
- The A-Port feature must be enabled before the MT-Based IS41 SMS NP feature can be enabled.
- The A-Port feature must be turned on before the MT-Based IS41 SMS NP feature can be turned on.
- The feature cannot be enabled if the LNP feature is enabled.
- A temporary FAK cannot be used to enable the feature.
- The feature cannot be turned off after it has been turned on.

## System Options for MT-Based IS41 SMS NP

The system level options that control the MT-Based IS41 SMS NP feature are stored in the IS41SMSOPTS database table. The MT-Based IS41 SMS NP feature must be enabled before the IS41SMSOPTS table can be provisioned.

The content of the IS41SMSOPTS table is used to help perform number conditioning, response generation, and other feature-specific options. [Table 7: MT-Based IS41 SMS NP Options](#) shows the options stored in the IS41SMSOPTS table, their possible values, and the action taken for each value.

**Table 7: MT-Based IS41 SMS NP Options**

IS41SMSOPTS Option	Value	Action in the EAGLE 5 ISS
MTSMSDNFMT	RN	This setting specifies the required format of digits which will be encoded in the "SMS_Address" parameter of the SMSREQ ACK return result response.
	RNDN (default)	
	CCRNDN	
	SRFIMSI	<b>Note:</b> <ol style="list-style-type: none"> <li>1. This feature requires STPOPTS:DefCC to be set before it can be activated. Also, DefCC is not be allowed to change to "NONE" as long as this feature is active.</li> <li>2. MTSMSDNFMT is only used to handle digits if MTSMSPARM = DIGIT and MTSMSACKN = ACK.</li> </ol> SMS_Address is encoded from the "SRFIMSI" parameter from the NPDB entity.
MTSMSTYPE	SP	When the lookup in the NPDB has entitytype=SP, then the lookup is considered successful.
	RN (default)	When the lookup in the NPDB has entitytype=RN, then the lookup is considered successful.
	SPRN	When the lookup in the NPDB has entitytype=SP or RN, then the lookup is considered successful.
	ALL	When the lookup in the NPDB has entitytype=SP or RN or no_entity, then the lookup is considered successful.
	NONSP	When the lookup in the NPDB has entitytype!=SP (not SP), then the lookup is considered successful.
MTSMSPARM	DIGIT (default)	This specifies that the encoding of the SMS_ADDRESS parameter is in DIGIT format, as follows:  Digit_type=IS41SMSOPTS:MTSMSDIGTYPE NAI=International NP=E164 Encoding=BCD

IS41SMSOPTS Option	Value	Action in the EAGLE 5 ISS
	PCSSN	This specifies that the encoding of the SMS_ADDRESS parameter is in PCSSN format. The PCSSN is taken from the entity_data (point code). If no data is present or if the entity data has a non-ANSI point code, then the EAGLE 5 ISS ANSI Point Code is encoded, if available. If no ANSI SID is available, the point code will be encoded as 0 (0-0-0). If SSN is not available from entity data, then the SSN is encoded as MTSMSSSN .
MTSMSDLTR	NO (default)	This option specifies if delimiter digit(s) need to be inserted in the MTSMSDNFMT digits. A value of NO means that no delimiter is inserted.
	PRERN	This option specifies if delimiter digit(s) need to be inserted in the MTSMSDNFMT digits. A value of PRERN means that this delimiter is inserted before the RN. That is, RN is considered as being DLT+RN.
	POSTRN	This specifies if a delimiter needs to be inserted in the MTSMSDNFMT digits. POSTRN means that this delimiter is inserted after the RN. That is, RN is considered as being RN + DLT.
MTSMSDLTRV	1-5 hex digits	<p>This specifies the delimiter digit string that is inserted in the MTSMSDNFMT digits. This value can consist of 1-5 hexadecimal digits. A value must be defined here before MTSMSDLTR can be set to PRERN or POSTRN.</p> <p>The system default is "NONE". Once set, the MTSMSDLTRV can never be configured to "NONE" again.</p>
MTSMSACKN	ACK (default)	This indicates that when the SMSREQ lookup is considered successful, a SMSREQ ACK is returned.
	NACK	This indicates that when SMSREQ look is considered successful, a SMSREQ NACK is returned.
MTSMSESN	NO (default)	This indicates that NO ESN parameter be encoded when generating the SMSREQ return result message
	YES	<p>This indicates that the ESN parameter should be encoded when generating the SMSREQ return result message. The ESN is obtained from IS41OPTS:ESNMFG and IS41OPTS:ESNSN.</p> <p><b>Note:</b> The default value of the ESNMFG (0x00) and ESNSN options is 0 (0x00,00,00).</p>
MTSMSSSN	2-255	<p>This specifies the SSN to be encoded if the MTSMSPARM is set to PCSSN. The default value is 6.</p> <p><b>Note:</b> SSN 0 is considered to be invalid. SSN 1 is reserved for SCCP management.</p>

IS41SMSOPTS Option	Value	Action in the EAGLE 5 ISS
MTSMSNAKERR	0-255 (default value is 5)	This specifies the TCAP Access Denied Reason to be included in the SMSREQ NACK generated by SMS-MT. The default value is 0x5 (Reserved).
MTSMSDIGTYPE	0-255 (default value is 6)	This specifies the Type of Digits to be encoded in the SMS_ADDRESS parameter "Type of Digits" field in the SMSREQ ACK message. The default value is 6 (Destination Number).
MTSMSCHKSRC	YES (default value is NO)	<p>This specifies that the SCCP CgPA GTA of the message will be used to determine whether the source of the message is a Home SMSC.</p> <p>If this option is YES and SCCP CgPA GTA is absent, then the source is assumed to be the Home SMSC.</p> <p>This is the recommended setting if it is necessary to ensure that the MT-Based SMS NP responses are received only by in-network SMSCs.</p>
	NO	<p>This specifies that Eagle will not validate the SCCP CgPA GTA. Effectively, the source of the message is considered to be Home SMSC without checking SCCP CgPA GTA.</p> <p>This may be used by the service provider to disable SCCP CgPA checking, if the service provide ensures that only in-network nodes will send SMSREQ and receive the response generated by this feature.</p>

## MT-Based IS41 SMS NP Call Flows

This section illustrates the sequence of messages that occur in the processing of SMS messages destined for mobile-terminated subscribers in a number portability environment. Two scenarios exist:

- The called subscriber who is in the same network as the calling subscriber
- The called subscriber who is in a different network from the calling subscriber

### MT-Based IS41 SMS NP Call Flow for In-Network Subscriber

*Figure 2: MT-Based IS41 SMS NP Call Flow for In-Network Subscriber* depicts the message and control flows for a called subscriber who is in the same network as the calling subscriber.

**Figure 2: MT-Based IS41 SMS NP Call Flow for In-Network Subscriber**

Call considerations:

- The TCAP calling party is a wireless IS41 subscriber.
- The TCAP called party is a non-porting or ported-in wireless subscriber that belongs to the same carrier as the TCAP calling party.
- The call type is SMS.
- SMSC has to be reconfigured to generate SMSReq to the HLR, regardless of called subscriber number being in or out of its own numbering range.
- If the called subscriber is ported-in, it has to be provisioned individually.
- If the called subscriber is GSM, Eagle Migration feature ensures that the message is delivered in the GSM network.

#### **MT-Based IS41 SMS NP Call Flow for Other-Network Subscriber**

*Figure 3: MT-Based IS41 SMS NP Call Flow for Other-Network Subscriber* depicts the message and control flows for a called subscriber who is in a different network from the calling subscriber.

**Figure 3: MT-Based IS41 SMS NP Call Flow for Other-Network Subscriber**

Call considerations:

- The TCAP calling party is a wireless TDMA subscriber.
- The TCAP called party is a non-ported or ported-out wireless subscriber that belongs to a different carrier from the TCAP calling party.
- The call type is SMS.
- The SMSC (Short Message Service Center) has to be configured to associate the RNs to their respective carriers.
- The called subscriber must be provisioned individually.

## Hardware Requirements

EPAP-related features that perform an RTDB lookup require Service Module cards (DSM cards or E5-SM4G cards) running the VSCCP application. The EAGLE 5 ISS can be equipped with up to 32 (31+1) Service Module cards.

Features that do not perform an RTDB lookup require Service Module cards only for GTT processing that might be performed for the feature. These features can coexist in systems with EPAP, but do not require an EPAP connection.

## MPS/EPAP Platform

Tekelec provides the Multi-Purpose Server (MPS) platform as a subsystem of the EAGLE 5 ISS. The MPS provides support for EPAP-related features that perform Real Time Database (RTDB) lookups.

The MPS is composed of hardware and software components that interact to create a secure and reliable platform. For details about the MPS hardware, refer to the *Tekelec 1200 Application Server Hardware Manual*. The MPS provides the means of connecting the customer provisioning application with the EAGLE 5 ISS and accepts the customer number portability data, while accommodating numbers of varying lengths.

The EAGLE Provisioning Application Processor (EPAP) is software that runs on the MPS hardware platform. It collects and organizes customer provisioning data, and forwards the data to the EAGLE 5 ISS Service Module cards. [Figure 4: MPS/EPAP Platform Architecture](#) shows the overall system architecture from customer provisioning through the MPS subsystem to the EAGLE 5 ISS Service Module card databases.

**Note:** In this manual, Service Module card refers to either a DSM card or an E5-SM4G card unless a specific card is required. For more information about the supported cards, refer to the *EAGLE 5 ISS Hardware Manual*.

**Figure 4: MPS/EPAP Platform Architecture**

### Design Overview and System Layout

*Figure 4: MPS/EPAP Platform Architecture* identifies the tasks, databases and interfaces which constitute the overall system architecture. The system consists of two mated MPS servers. Each MPS contains two EPAP platforms - EPAP A and EPAP B with each containing a Real Time Database (RTDB), Provisioning Database (PDB), servers, optical media, modems, and network switches when using a T1200 AS system. Each MPS and its associated EPAPs is an *EPAP system*; the EPAP system and the mated EAGLE 5 ISS are the *mated EPAP system*. Each EPAP system is a T1200 AS system with a total of four Ethernet interfaces: one from each EPAP to the 100BASE-T Ethernet and one from each EPAP to either a 10BASE-T or a 100BASE-T Ethernet. See [Table 8: Service Module Card Provisioning and Reload Settings](#) for the link speed.

On the EAGLE 5 ISS, a set of Service Module cards, which hold the RTDB, is part of the STP. Two high-speed Ethernet links connect the Service Module cards and the EPAPs. One of the links is a 100BASE-T Ethernet bus, and the other is either a 10BASE-T or a 100BASE-T Ethernet bus. See [Table 8: Service Module Card Provisioning and Reload Settings](#) for the link speed.

The RTDB is provisioned and maintained through the EPAPs. EPAP A and EPAP B act as the active EPAP and the standby EPAP. One link serves as the active link, and the other link as the standby link. Only one EPAP and one link are active at a time. The database is provisioned through the active link by the active EPAP; the other EPAP provides redundancy.

If the active EPAP fails, the standby EPAP takes over the role of active EPAP and continues to provision the subscriber database. If the active link fails, the active EPAP switches to the standby link to continue provisioning the Service Module cards. The two Ethernet links are part of the DSM network.

Another 100BASE-T Ethernet link exists between the EPAPs; that link is called the EPAP Sync Network.

The major modules on the EPAP are:

- Service Module card provisioning module
- Maintenance module
- RTDB module
- PDB module

The Service Module card provisioning module is responsible for updating subscriber databases on the EAGLE 5 ISS Service Module cards using the Reliable Multicast Transport Protocol (RMTP) multicast. The maintenance module is responsible for the proper functioning of the EPAP platform. The PDB module is responsible for preparing and maintaining the Real Time Database, which is the *golden copy* of the subscriber database. The PDB module can run on one of the EPAPs of either mated EAGLE 5 ISS.

### Functional Overview

The main function of the MPS/EPAP platform is to provision data from the customer network to the Service Module cards on the EAGLE 5 ISS. Subscriber database records are continuously updated from the customer network to the PDB. The PDB module communicates with the maintenance module and the RTDB task over a TCP/IP connection to provision the Service Module cards on the EAGLE 5 ISS. The maintenance module is responsible for the overall stability and performance of the system.

The RTDB on the EPAP contains a coherent, current copy of the subscriber database. If the current copy of the RTDB on the Service Module cards becomes *out-of-sync* because of missed provisioning or card rebooting, the EPAP Service Module card provisioning module sends database information through the provisioning link to the Service Module cards. The Service Module cards are reprovisioned with current subscriber information.

### EPAP/PDBA Overview

The EAGLE Provisioning Application Processor (EPAP) platform and the Provisioning Database Application (PDBA), coupled with the Provisioning Database Interface (PDBI) facilitate the user database required for EAGLE 5 ISS EPAP-related features. The following functions are supported:

- Accept and store subscription data provisioned by the customer
- Update and reload subscriber databases on the Service Module cards

The PDBA operates on the master Provisioning Database (PDB). The EPAP and PDBA are both installed on the MPS hardware platform.

The EPAP platform performs the following:

- Maintains an exact copy of the real time database (RTDB) on the EPAP

- Distributes the subscription database to the Service Module cards
- Maintains a redundant copy of the RTDB database

The EPAP platform is a mated pair of processors (the upper processor, called EPAP A, and the lower processor, EPAP B) contained in one frame.

During normal operation, information flows through the EPAP/PDBA software with no intervention. Subscription data is generated at one or more operations centers and is delivered to the PDBA through a TCP socket interface (PDBI). The PDBA software stores and replicates data on EPAP A on the mated EPAP system. The data is then transmitted by the EPAPs across a private network to the Service Module cards located in the EAGLE 5 ISS frame.

The primary interface to the PDBA consists of machine-to-machine messages. The interface is defined by Tekelec and is described in the *Provisioning Database Interface Manual*. Provisioning software compatible with the EPAP socket interface can be created or updated using the interface described in that manual.

Additionally, a direct user interface is provided on each EPAP to allow for configuration, maintenance, debugging, and platform operations. A direct user interface is also provided by the PDBA for configuration and database maintenance.

The MPS/EPAP is an open-systems platform and easily accommodates the required high provisioning rates. Compared to the traditional OAM platform, the persistent database and provisioning in an open systems platform provides these benefits:

- Variety of hardware components and vendors
- Availability of third party communication and database tools
- Standard communication protocols
- Availability of personnel with related experience

Each EPAP server maintains a copy of the Real Time Database (RTDB) in order to provision the EAGLE 5 ISS Service Module cards. The EPAP server must comply with the hardware requirements in the *Tekelec 1200 Application Server Hardware Manual*. [Figure 4: MPS/EPAP Platform Architecture](#) illustrates the EPAP architecture contained in the MPS subsystem.

Each EPAP has a dedicated optical media drive. One EPAP per EAGLE 5 ISS platform has a modem capable of supporting remote diagnostics, configuration, and maintenance. These remote operations are performed through EPAP login sessions and are accessible across the customer network as well as through a direct terminal connection to the EPAP using an RS232 connection. Refer to the *Tekelec 1200 Application Server Hardware Manual* for details about the hardware devices and network connections.

## Subscriber Data Provisioning

[Figure 5: Subscriber Data Provisioning Architecture \(High Level\)](#) shows a high-level view of the subscriber data provisioning architecture. Only those parts of the EAGLE 5 ISS platform that are relevant to subscriber data provisioning are shown. This section defines requirements for the Provisioning Database Interface (PDBI) between the EPAP and the operator's provisioning system (OPS). Provisioning clients connect to the EPAPs using the PDBI. This interface contains commands that allow all of the provisioning and retrieval of subscription data. The PDBI is used for real-time provisioning of subscriber and network entity data only. Refer to the *Provisioning Database Interface Manual* for more details.

**Figure 5: Subscriber Data Provisioning Architecture (High Level)**

A pair of active/standby EPAP servers provides the interface between the Real Time Database (RTDB) of the EAGLE 5 ISS Service Module cards and the OPS. EPAP A is equipped with both the PDB (Provisioning Database) and the RTDB, and EPAP B has only the RTDB. An EPAP with only the RTDB must be updated by the EPAP that is equipped with the PDB.

For more information about the EPAP, refer to the *EPAP Administration Manual*. For more information about the MPS hardware, refer to the *Tekelec 1200 Application Server Hardware Manual*.

### Distributed Administrative Architecture

This section describes, at a high level, the distributed administrative architecture for the EAGLE 5 ISS, including the EPAP.

Databases requiring high update and retrieval rates, such as the EPAP RTDB, are populated using redundant Ethernet connections to Service Module cards from an EPAP MPS platform.

An EPAP consists of a combined Provisioning (MySQL) and Real Time Database (RTDB). The Provisioning Database (PDB) responds to requests for updates by the active and standby RTDBs on both mated EAGLE 5 ISSs. The active EPAP RTDB is responsible for initiating multi-cast updates of changed database records to the Service Module cards after the data has been committed to the EPAP disks. Furthermore, the PDB may accept and commit more database updates while the RTDBs are completing their previous updates.

It is this overlapping of database updates, coupled with an RTDB transactional database engine and fast download time, that allows larger amounts of data at a time to be transferred from the PDB. Committing larger amounts of data at a time to the RTDB (versus a single update at a time) allows faster overall transaction rates to be achieved. The boundaries of the transaction rates become more closely related to cache size and disk cache flush time than the disk access time of a single update. Thus, successful completion of EPAP database updates only guarantees that the PDB has been updated, but it does not mean the RTDB has completed the update and sent the new subscription data to the Service Module card.

The EPAP architecture contains a local provisioning terminal and a modem for remote access, as well as other functions. A backup device can be used to back up or restore the provisioning database. The local provisioning terminal is used to manually repair the standby EPAP RTDB or to turn the subscriber database audit on or off. For additional information, refer to the *Tekelec 1200 Application Server Hardware Manual* and the *EPAP Administration Manual*.

## EPAP (EAGLE Provisioning Application Processor)

As shown in [Figure 4: MPS/EPAP Platform Architecture](#), a single MPS system contains two EAGLE Provisioning Application Processor (EPAP) servers. At any given time, only one EPAP actively communicates with the Service Module cards on the EAGLE 5 ISS. The other EPAP server is in standby mode. In addition, two MPS systems can be deployed in a mated pair configuration.

The primary purpose of the EPAP system is to maintain the Real Time Database (RTDB) and Provisioning Database (PDB), and to download copies of the RTDB to the Service Module cards.

The PDB on the active EPAP receives subscription data from the customer network through the Provisioning Database Interface (PDBI), the external source of provisioning information. The Provisioning Database Application (PDBA) continually updates the PDB of the active EPAP. The PDB uses MySQL database software. After an update is applied to the active PDB, the data is sent to the RTDBs on the active and standby EPAPs.

Both the active and standby EPAPs maintain copies of the RTDB. Periodically, the Service Module card polls the active EPAP RTDB for any new updates. The active EPAP downloads the updates to the Service Module card which stores a resident copy of the RTDB.

A mated pair configuration has two mated MPS Systems, as shown in [Figure 4: MPS/EPAP Platform Architecture](#). The PDB on the active EPAP automatically updates the PDB on the mate platform. The PDB on the mate platform then updates RTDBs on its EPAPs, which in turn update the RTDBs on the associated Service Module cards.

Provisioning of the EAGLE 5 ISS Service Module cards is performed through two interfaces using two different sets of commands. Provisioning is accomplished by the STP updates from EAGLE 5 ISS terminals and by updates from the customer's external provisioning system. This system of dual provisioning is illustrated in [Figure 6: Database Administrative Architecture](#).

Figure 6: Database Administrative Architecture

## Service Module Cards

Up to 32 cards (31+1) Service Module cards can be provisioned with one or more EPAP-related features enabled and EPAP running on a T1200 AS.

EPAP-related features require that all Service Module cards contain 4 GB of memory. [Figure 6: Database Administrative Architecture](#) illustrates each Service Module card having two Ethernet links, the main DSM network on the 100BASE-T link and the backup DSM network. See [Table 8: Service Module Card Provisioning and Reload Settings](#) for the link speed. The Service Module cards run the VSCCP software application.

The Service Module card Ethernet ports are linked to the EPAP system to receive the downloaded Real Time Database (RTDB). Multiple Service Module cards provide a means of load balancing in high-traffic situations. The RTDB on the Service Module card is in a format that facilitates rapid lookups.

Though the Service Module card copies of the RTDB are intended to be identical, the various databases may not be identical at all times for the following reasons:

- When a Service Module card is initialized, the card downloads the current copy of the database from the EPAP. While that card is being loaded, it cannot receive new updates that have arrived at the EPAP since reload began.

- Card databases can become out-of-sync with the EPAP RTDB when the EPAP receives updates from its provisioning source, but it has not yet sent the updates down to the Service Module cards. Updates are applied to the Provisioning Database (PDB) as they are received.

Two possible scenarios contribute to a condition where a Service Module card may not have enough memory to hold the entire database:

- The database is downloaded successfully to the Service Module card, but subsequent updates eventually increase the size of the database beyond the capacity of the Service Module card memory. In this situation, it is desirable for EPAP-related features to continue processing transactions, even though the database might not be up-to-date.
- When a Service Module card is booted and it is determined then that the card does not have enough memory for the entire database, the database is not loaded on that card. Each Service Module card is responsible for recognizing and reporting its out-of-memory conditions by means of alarms.

### Overview of EPAP to Service Module Card Communications

Before discussing Service Module card status reporting or EPAP status reporting, it is helpful to understand the communications between the Service Module cards and the EPAP in broad terms.

- UDP - sending Service Module card status messages

The Service Module cards and EPAPs create a UDP (User Datagram Protocol) socket which is used for status messages. One of the last things a Service Module card does when it is initialized is to send a status message to the EPAP, containing the Service Module ID, database level, and memory size. The EPAP maintains tables containing the last known status of each Service Module card. EPAP uses these to determine whether or not the Service Module card needs to download the database.

- IP - reporting EPAP maintenance data

The Service Module cards create a TCP socket when they are initialized, and listen for connection requests. During initialization or after a loss of connectivity, the active EPAP chooses one of the Service Module cards and issues a *Connect* to establish the TCP/IP connection with that Service Module card which is referred to as the primary Service Module card. The purpose of this link is to provide a path for reporting EPAP alarms and to forward maintenance blocks to the Service Module card.

- IP Multicast - downloading GSM database

Because of the large size of the database and the need to download it quickly on up to 32 Service Module cards, EPAP-related features use a technique known as IP multicasting. This technique is based on Reliable Multicast Transport Protocol-II (RMTP-II), a product of Globalcast Communications. IP multicasting downloads the RTDB and database updates to all of the Service Module cards simultaneously.

The administration of IP multicasting is based on the concept of a “tree”, or stream of data, which is constantly being broadcast by the EPAP. Service Module cards that need to download the real time database or to receive database updates “join the tree”. Service Module cards can also “leave the tree”, typically when the database fills their available memory.

### Service Module Card Provisioning and Reload

One of the core functions of the EPAP is to provision the Service Module cards with the Real Time Database (RTDB) updates. In order to provide redundancy for this feature, separate RMTP channels are created on each interface from each EPAP:

Table 8: Service Module Card Provisioning and Reload Settings

RMTP Channel	T1200 Running Only DSM cards	T1200 Running Only E5-SM4G cards	T1200 Running both DSM and E5-SM4G cards
EPAP A, Link A (on the main DSM network)	100BASE-T	100BASE-T	100BASE-T
EPAP A, Link B (on the backup DSM network)	10BASE-T	100BASE-T	10BASE-T
EPAP B, Link A (on the main DSM network)	100BASE-T	100BASE-T	100BASE-T
EPAP B, Link B (on the backup DSM network)	10BASE-T	100BASE-T	10BASE-T
<b>Note:</b> Full duplex mode is supported only when running all E5-SM4G cards on the T1200. In all other cases, half duplex mode is supported.			

Provisioning and other data is broadcast on one of these channels to all of the Service Module cards. Provisioning is done by database level in order to leave tables coherent between updates.

The Service Module cards do the following:

- Detect the need for incremental updates and send a status message to the EPAP.
- Discriminate between the various streams according to the database level contained in each message and accept updates based on the Service Module card database level.

### *Service Module Card Reload Model*

Service Module cards may require a complete database reload in the event of reboot or loss of connectivity for a significant amount of time. The EPAP provides a mechanism to quickly load a number of Service Module cards with the current database. The database on the EPAP is large and may be updated constantly. The database sent to the Service Module card or cards will likely be missing some of these updates making it corrupt, in addition to being "back level."

### **EPAP Continuous Reload**

It is important to understand how the EPAP handles reloading of multiple Service Module cards from different starting points. Reload begins when the first Service Module card requires it. Records are read sequentially from the Real Time Database (RTDB) from an arbitrary starting point, wrapping back to the beginning. If another Service Module card requires reloading at this time, it uses the existing

record stream and notifies the Service Module card provisioning task of the first record it read. This continues until all Service Module cards are satisfied.

### Service Module Card Database Levels and Reloading

The current database level when the reload started is of special importance during reload. When a Service Module card detects that the last record has been received, it sends a status message back to the EPAP indicating the database level at the start of reload. This action starts incremental loading. The Service Module card continues to reload until it is completely caught up with the current level of the RTDB. As database records are sent to the Service Module cards during reload, normal provisioning can change those records. All records changed between the start and end of reloading must be incrementally loaded before the database is coherent and usable by the Service Module card.

The following terminology is used here for the stages of database reload for a given Service Module card.

- **Stage 1 loading:** The database is being copied record for record from the golden RTDB in the EPAP to the Service Module card RTDB. The database is incoherent during stage 1 loading.
- **Incremental update:** The database is receiving all of the updates missed during stage 1 loading or some other reason, such as network outage, processor limitation, or lost communication. The database is coherent, but back-level during incremental update.
- **Current:** The database is receiving current updates from the Service Module card provisioning task.
- **Coherent:** The database is at a whole database level which means not currently updating records belonging to a database level.

### EPAP Status and Error Reporting via Maintenance Blocks

The EPAP forwards all status and error messages to the Service Module cards in maintenance blocks. Maintenance blocks are asynchronously sent whenever the EPAP has something to report. The maintenance blocks eventually update EPAP Device Control Blocks (DCBs) located on the EAGLE 5 ISS. The DCBs provide the status information that is received when a `rept-stat-mps` command is issued.

## Network Connections

Several customer and Tekelec-installed private networks are required to support the provisioning of subscription data. These networks are:

- [Customer Provisioning Network](#)
- [EPAP Sync Network](#)
- [DSM Networks](#)
- [Dial-Up PPP Network](#)

The following discussion is an overview of these private networks. It expands on the networks in the architecture diagram shown in [Figure 7: Customer Provisioning Network](#). (For details about configuring these networks, refer to the [EPAP Administration Manual](#).)

### Customer Provisioning Network

The customer network carries the following traffic:

- Customer queries and responses to the PDB via the PDBI from the customer provisioning network

- Updates between PDBs of a mated EAGLE 5 ISS pair
- Updates between a PDB on one EAGLE 5 ISS and RTDBs on a mated EAGLE 5 ISS
- PDBA import/export (file transfer) traffic
- Traffic from a PDBA reloading from its mate
- EPAP and PDBA user interface traffic.

A typical customer network is shown in *Figure 7: Customer Provisioning Network*.

**Figure 7: Customer Provisioning Network**

Although a dedicated network is recommended, it is possible that unrelated customer traffic can use the network as well. The determination, either to have a dedicated network or to allow other customer traffic, should be based on available external Ethernet bandwidth and network performance considerations.

### EPAP Sync Network

The EPAP sync network carries RTDB and maintenance application traffic between active and standby EPAP servers on an MPS system. It synchronizes the contents of the RTDBs of both EPAP A and B. The EPAP Sync network is a single Ethernet connection between EPAP A and EPAP B running at 100BASE-T, as shown in [Figure 8: EPAP Sync Network](#). The T1200 EPAP Sync network is truncated with the EPAP backup DSM connection and communicates through the switch.

**Figure 8: EPAP Sync Network**

### DSM Networks

The DSM networks are shown in [Figure 9: DSM Networks](#). They carry provisioning data from the active EPAP RTDB to the Service Module cards. They also carry reload and maintenance traffic to the Service Module cards.

The DSM networks consist of two Ethernet networks: the main DSM network running at 100BASE-T, and the backup DSM network running at either 10BASE-T or 100Base-T. See [Table 9: EPAP IP Addresses in the DSM Network](#) for the link speed. Both Ethernet networks connect EPAP A and EPAP B with every Service Module card on a single EAGLE 5 ISS platform.

Figure 9: DSM Networks

Maintenance information is sent from the active EPAP to an arbitrarily selected Service Module card. The selected Service Module card is known as the primary Service Module card. Static information is exchanged across this interface at initialization, and dynamic information is exchanged on occasion.

While much of the traditional OAM provisioning and database functionality is implemented on the EPAP, the maintenance reporting mechanism is still the OAM.

The first and second octets of the EPAP network addresses for this network are 192.168. (The first two octets for private class C networks are defined in RFC 1918.)

The third octet is customer specifiable for each DSM network. It is important to select values that do not interfere with the customer's network addressing scheme.

The fourth octet of the address is specified as follows:

- If the EPAP is configured as “EPAP A”, the fourth octet has a value of 100.
- If the EPAP is configured as “EPAP B”, the fourth octet has a value of 200.

[Table 9: EPAP IP Addresses in the DSM Network](#) summarizes the contents of each octet.

Table 9: EPAP IP Addresses in the DSM Network

Octet	Value
1	192
2	168
3	One customer-provisioned value for DSM network A and another for DSM network B

Octet	Value
4	100 for EPAP A and 200 for EPAP B

### Dial-Up PPP Network

The dial-up PPP network allows multiple user-interface sessions to be established with the EPAP. The network connects a remote EPAP/PDBA user interface terminal with the EPAP in the EAGLE 5 ISS's MPS subsystem. The dial-up PPP network is illustrated in [Figure 10: Dial-Up PPP Network](#).

Figure 10: Dial-Up PPP Network

- [\*EAGLE 5 ISS IS41 SMS Options Commands...60\*](#)
- [\*EAGLE 5 ISS A-Port Service Selector  
Commands.....62\*](#)
- [\*EAGLE 5 ISS Feature Control Commands.....64\*](#)
- [\*EAGLE 5 ISS MNP SCCP Service  
Commands.....65\*](#)

This chapter contains brief descriptions of the EAGLE 5 ISS commands that are used for the configuration, control, maintenance, and measurements of the A-Port feature and the MT-Based IS 41 SMS NP feature.

## Introduction

This chapter describes the EAGLE 5 ISS commands used to administer the A-Port feature. The command descriptions include parameters that are used with the A-Port feature. Refer to *Commands Manual* for complete command descriptions including parameter names, valid parameter values, examples, and dependencies.

## EAGLE 5 ISS IS41 Options Commands

The A-Port system options (is41opts) commands are used to change and report on the values of one or more of the STP node level processing option indicators maintained in the IS41OPTS table. All values are assigned initially to system defaults at STP installation time. The values can be updated later using the `chg-is41opts` command.

- **chg-is41opts: Change IS41 Options Command** – The `chg-is41opts` command changes IS41-specific options in the database. This command updates the IS41OPTS table. The default parameter values are always overwritten when specified. Refer to *Commands Manual* for detailed information about this command

**Table 10: chg-is41opts Parameters - Class = DATABASE**

Parameter	Range	Description
dfltrn	1-15 hexadecimal digits (0-9, a-f, A-F), none	Default Routing Number. This parameter specifies the routing digits when Service Portability is not applicable. This parameter can be modified only when the LOCREQ Query Response feature is enabled. Default value is none.
esnmfg	0-255, none	TCAP LOCREQ ESN Manufacturer Code. This parameter specifies the value to be encoded in the TCAP LOCREQ ESN parameter in manufacturer code section.
esnsn	0-16777215	TCAP LOCREQ ESN Serial Number. This parameter specifies the value to be encoded in the TCAP LOCREQ ESN parameter in serial number section.
iec	digit string 1-5 digits, none	International Escape Code
locreqdn	tcap, sccp	LOCREQ DN. This parameter specifies whether to obtain the Called Party, used for database lookup, from the SCCP layer or the TCAP layer of a received LOCREQ message.
locreqrmhrn	yes, no	LOCREQ Remove HomeRN. This parameter specifies whether to remove the HomeRN from the TCAP Outgoing Called party for a relayed LOCREQ message.

Parameter	Range	Description
		This parameter cannot be specified in the same command entry as the <code>on</code> and <code>off</code> parameters.
<code>mscmktid</code>	0-65535	LOCREQ MSCID Market ID. This parameter specifies the value to be encoded in LOCREQ MSCID parameter for Market ID.
<code>mscswitch</code>	0-255	LOCREQ MSCID Market ID Switch. This parameter specifies the value to be encoded in LOCREQ MSCID parameter in the market id switch section.
<code>mtplocreqlen</code>	5-15	The parameter specifies the number of terminating called party digits to extract from the LOCREQ message.
<code>mtplocreqnai</code>	<code>ccrndn</code> , <code>frmsg</code> , <code>intl</code> , <code>natl</code> , <code>rnidn</code> , <code>rnndn</code> , <code>rnsdn</code> , <code>sub</code> }, <code>none</code>	Message Translation Part LOCREQ Nature of Address Indicator. This parameter defines how Called Party obtained from the TCAP layer of a received MTP-routed LOCREQ message is interpreted.
<code>nec</code>	digit string 1-5 digits, <code>none</code>	National Escape Code
<code>off</code>	<code>locreqrmhrn</code> , <code>locreqrspnd</code> , <code>smsreqbypass</code>	<p>This parameter turns off the specified options. Up to 8 comma-separated unique options can be specified.</p> <ul style="list-style-type: none"> <li><code>locreqrmhrn</code> - LOCREQ Remove HomeRN. This option specifies whether to remove the HomeRN from the TCAP Outgoing Called party for a relayed LOCREQ message. Option default is <code>off</code>.</li> <li><code>locreqrspnd</code> - LOCREQ Query Response. This option specifies whether to always respond to a LOCREQ query. This option can be changed only if the LOCREQ Query Response feature is turned on. Option default is <code>off</code>.</li> <li><code>smsreqbypass</code> - SMSREQ Bypass. This option specifies whether a received SMSREQ message that passes the MNP Service Selector (<code>serv=mnp</code> parameter of <code>chg-sccp-serv</code>) will undergo A-Port message processing. Option default is <code>off</code>.</li> </ul> <p>This parameter cannot be specified in the same command entry as the <code>locreqrmhrn</code> and <code>smsreqbypass</code> parameters.</p>
<code>on</code>	<code>locreqrmhrn</code> , <code>locreqrspnd</code> , <code>smsreqbypass</code>	<p>This parameter turns on the specified options. Up to 8 comma-separated unique options can be specified. See <code>off</code> parameter for option descriptions. This parameter cannot be specified in the same command entry as the <code>locreqrmhrn</code> and <code>smsreqbypass</code> parameters.</p>

Parameter	Range	Description
rspcdpapcp	off, on, frmsg	Response Called Party Point Present. This parameter specifies the point code present bit that will encode the SCCP CdPA GTA of a LOCREQ response message.
rspcdpari	frmsg, gt, ssn	Response Called Party Routing Indicator. This parameter specifies the value of the Routing Indicator bit to encode the SCCP CdPA GTA of a returned LOCREQ message.
rspcgpanai	ccrndn, frmsg, intl, natl, rnidn, rnndn, rnsdn, sub}, none	Response Calling Party Nature of Address Indicator (NAI). This parameter specifies a new NAI value to override the NAI value specified in the SCCP CdPA of a received LOCREQ/SMSREQ if the message is to be relayed after database lookup.
rspcgpanp	0-15, none	Response Calling Party Numbering Plan. This parameter specifies a new Numbering Plan value to override the Numbering Plan value specified in the SCCP CdPA of a received LOCREQ/SMSREQ if the message is to be relayed after database lookup.
rspcgpapcp	frmsg, included, notincluded	Response Calling Party Point Code Present. This parameter specifies the value of the Point Code Present bit to encode the SCCP CgPA GTA of a returned LOCREQ message.
rspcgpari	frmsg, gt, ssn	Response Calling Party Routing Indicator. This parameter specifies the value of the Routing Indicator bit to encode the SCCP CgPA GTA of a returned LOCREQ message.
rspcgpatt	0-255, none	Response Calling Party Translation Type (TT). This parameter specifies a new TT value to override the TT value specified in the SCCP CdPA of a received LOCREQ/SMSREQ if the message is to be relayed after database lookup.
rspdig	ccrndn, hrnrndn, rn, rndn	Routing Number. This parameter specifies the digit encoding format of the TCAP Outgoing Called Party parameter for a LOCREQ response message on a per EAGLE 5 ISS node basis.
rspdigtype	0-255	Response Digit Type. This parameter specifies the value that will encode the DigitType field in the TCAP Outgoing Called Party parameter of a LOCREQ response message.
rspmin	homern, nothomern, tendelhomern, tenhomern, tenzero	Response LOCREQ MIN Parameter Encoding. This parameter specifies how the digits of the LOCREQ MIN parameter will be encoded.
rspnon	0-255, none	MSRN Nature of Number. This parameter specifies the Nature of Number value of the TCAP Outgoing Called Party parameter.

Parameter	Range	Description
rspnp	0-15, none	MSRN Numbering Plan. This parameter specifies the Numbering Plan values of the TCAP Outgoing Called Party parameter.
rspparm	ddigit, rtdigit, tlist	Response Parameter. This parameter specifies which TCAP LOCREQ parameter (TCAP Outgoing Called Party) will encode the RN and/or DN information.
smsreqbypass	yes, no	SMSREQ Bypass. This parameter specifies whether a received SMSREQ message that passes the MNP Service Selector ( <code>serv=mnp</code> parameter of <code>chg-sccp-serv</code> ) will undergo A-Port message processing. This parameter cannot be specified in the same command entry as the <code>on</code> and <code>off</code> parameters.  The MT-Based IS41 SMS NP feature does not consider the value of this parameter. If <code>smsreqbypass</code> has a value of <code>yes</code> , the A-Port processing will not be applied but the message will be considered for MT-Based IS41 SMS NP processing.
sporttype	none, gsm, is41, all	Service Portability Type. This parameter specifies the application of Service Portability that is applied to the associated feature. This parameter can be modified only when the Service Portability and LOCREQ Query Response features are enabled. Default value is none.
tcapsnai	ccrndn, frmmsg, intl, natl, rnidn, rnndn, rnsdn, sub}, none	This parameter specifies how the Called Party from the TCAP layer of a received LOCREQ message is interpreted.

- **rtrv-is41opts: Retrieve IS41 Options Command** The `rtrv-is41opts` command displays the IS41 option indicators maintained in the IS41OPTS table.

## EAGLE 5 ISS IS41 SMS Options Commands

The IS41 SMS options (`is41smsopts`) commands change and display SMS options in the EAGLE 5 ISS database for the MT-based IS41 SMS NP feature. The following sections describe the two variations: `chg-is41smsopts` and `rtrv-is41smsopts`. For details about these commands, refer to *Commands Manual*.

### chg-is41smsopts

**Change IS41 SMS Options Command** - The `chg-is41smsopts` command changes the IS41 SMS system options in the database. This command updates the IS41SMSOPTS table. The default parameters are always overwritten when specified.

Command: `chg-is41smsopts`                      Class = DATABASE

Table 11: `chg-is41smsopts` Parameters - Class = DATABASE

Parameter	Optional/ Mandatory	Range	Description
mtsmsackn	Optional	ack, nack	MT-based SMS acknowledgement
mtsmschksrc	Optional	yes, no	MT-based SMS check source
mtsmsdigtype	Optional	0-255	MT-based SMS digit type
mtsmsdltr	Optional	no, prern, postrn	MT-based SMS delimiter
mtsmsdltrv	Optional	1-5 digits	MT-based SMS delimiter value
mtsmsdnfmt	Optional	rn, rndn, ccrndn, dn, srfimsi	MT-based SMS DN format
mtsmsesn	Optional	no, yes	MT-based SMS electronic serial number
mtsmsnakerr	Optional	0-255	MT-based SMS negative acknowledgement error
mtsmsparm	Optional	digit, pcssn	MT-based SMS parameter
mtsmsssn	Optional	2-255	MT-based SMS subsystem number
mtsmstype	Optional	sp, rn, sprn, all, nonsp	MT-based SMS type

The following command examples set the IS41 SMS options when the MT-based IS41 SMS NP feature is enabled.

- `chg-is41smsopts:mtsmsdnfmt=dn:mtsmstype=sp`
- `chg-is41smsopts:mtsmsdltr=no:mtsmsparm=digit`
- `chg-is41smsopts:mtsmsssn=2:mtsmsnakerr=55:mtsmsdigtype=25`

### **rtrv-is41smsopts**

**Retrieve IS41 SMS Options Command** - The `rtrv-is41smsopts` command displays all IS41 SMS options from the database.

The following IS41 SMS options are displayed if the MT-based IS41 SMS NP feature is enabled.

```
tekelecstp 08-04-08 19:38:30 EST  EAGLE 39.0.0

IS41 SMS OPTIONS
-----
MTSMSDNFMT      = RNDN
MTSMSTYPE       = RN
MTSMSPARM       = DIGIT
MTSMSDLTR       = NO
MTSMSDLTRV      = NONE
MTSMSACKN       = ACK
MTSMSASN        = NO
MTSMSSSN        = 6
MTSMSNAKERR     = 5
MTSMSDIGTYPE    = 6
MTSMSSCHKSR     = NO
;
```

## EAGLE 5 ISS A-Port Service Selector Commands

The A-Port service selector (srvsel) commands are used to provision, remove, change, and report on the applicable service selectors required to change a service entry for Service Module card services. These commands provide flexibility when provisioning the type of messages that require A-Port processing. Four variants of the service selector commands are described in the following sections: `ent-srvsel`, `chg-srvsel`, `dlt-srvsel`, and `rtrv-srvsel`. For further details on the EAGLE 5 ISS service selector commands, such as command rules and output format, refer to *Commands Manual*.

- **ent-srvsel: Enter A-Port Service Selectors Command**

The `ent-srvsel` command specifies that the applicable A-Port service selectors indicating A-Port processing are required. The A-Port feature must be enabled before entering this command. The available parameters are:

**Table 12: ent-srvsel Parameters - Class = DATABASE**

Parameter	Optional/ Mandatory	Range	Description
gti, gtia, gtii, gtin, gtin24	Mandatory	2, 4	Global Title Indicator
serv	Mandatory	mnp	Service Module card service
ssn	Mandatory	0-255, *	Subsystem number
tt	Mandatory	0-255	Translation Type
nai	Optional	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	Optional	0-127	NAI Value
np	Optional	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	Optional	0-15	Numbering Plan Value
snai	Optional	sub, natl, intl, rnidn, rnndn, rnsdn, ccndn	Service Nature of Address Indicator
snp	Optional	e164, e212, e214	Service Numbering Plan

- **chg-srvsel: Change A-Port Service Selector Command**

The `chg-srvsel` command specifies the applicable A-Port selectors required to change an existing A-Port selector entry. The available parameters are:

Table 13: `chg-srvsel` Parameters - Class = DATABASE

Parameter	Optional/ Mandatory	Range	Description
gti, gtia, gtii, gtin, gtin24	Mandatory	2, 4	Global Title Indicator
ssn	Mandatory	0-255, *	Subsystem number
tt	Mandatory	0-255	Translation Type
nai	Optional	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	Optional	0-127	NAI Value
np	Optional	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	Optional	0-15	Numbering Plan Value
nserv	Mandatory	eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp	New Service Module card service to be selected
nsnai	Optional	sub, natl, intl, rnidn, rndn, rnsdn, ccndn	New Service Nature of Address Indicator
nsnp	Optional	e164, e212, e214	New Service Numbering Plan

- **dlt-srvsel: Delete A-Port Service Selector Command**

The `dlt-srvsel` command deletes a A-Port service selector. The available parameters are:

Table 14: `dlt-srvsel` Parameters - Class = DATABASE

Parameter	Optional/ Mandatory	Range	Description
gti, gtia, gtii, gtin, gtin24	Mandatory	2, 4	Global Title Indicator
tt	Mandatory	0-255	Translation Type
ssn	Mandatory	0-255, *	Subsystem number
nai	Optional	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	Optional	0-127	NAI Value
np	Optional	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	Optional	0-15	Numbering Plan Value

- **rtrv-srvsel: Retrieve A-Port Service Selector Command**

The `rtrv-srvsel` command displays a list of administered A-Port service selector combinations. All output is sorted first by service, then by global title domain (ANSI first, followed by ITU), GTI,

translation type, numbering plan, and by the nature of address indicator. The output can be filtered by specifying any optional parameter. The available parameters are:

**Table 15: rtrv-srvsel Parameters - Class = DATABASE**

Parameter	Optional/ Mandatory	Range	Description
gti, gtia, gtii, gtin, gtin24	Optional	2, 4	Global Title Indicator
nai	Optional	sub, rsvd, natl, intl	Nature Of Address Indicator
naiv	Optional	0-127	NAI Value
np	Optional	e164, generic, x121, f69, e210, e212, e214, private	Numbering Plan
npv	Optional	0-15	Numbering Plan Value
serv	Optional	mnp	Service Module card service
snai	Optional	sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn	Service Nature of Address Indicator
snp	Optional	e164, e212, e214	Service Numbering Plan
ssn	Mandatory	0-255, *	Subsystem number
tt	Optional	0-255	Translation Type

## EAGLE 5 ISS Feature Control Commands

The `ent/chg/rtrv-ctrl-feat` commands are used to enable, turn on, and display the feature status of the A-Port feature. A Feature Access Key is used to enable the A-Port feature. The feature must be purchased to receive a Feature Access Key for the feature.

No temporary key is associated with the A-Port feature. After the feature is on, it cannot be turned off.

Additional verifications are performed to ensure that the correct hardware is present in the system.

Refer to *Commands Manual* for a complete description of these commands.

- **enable-ctrl-feat: Enable Control Feature Command**

The `enable-ctrl-feat` command is used for the permanent enabling of the A-Port feature.

```
enable-ctrl-feat:partnum=893016601:fak=<Feature Access Key>
```

- **chg-ctrl-feat: Change Control Feature Command**

The `chg-ctrl-feat` command is used to turn on the A-Port feature. The A-Port feature must be enabled before it can be turned on.

```
chg-ctrl-feat:partnum=893016601:status=on
```

- **rtrv-ctrl-feat: Retrieve Control Feature Command**

The `rtrv-ctrl-feat` command is used display the status of the feature.

## EAGLE 5 ISS MNP SCCP Service Commands

The MNP SCCP Service commands (`chg/dlt/rtrv-sccp-serv`) allow services to be taken online and offline and allow their processing load to be shifted to other designated nodes. These commands also support the assignment of PCs to PC groups used for MNP re-route assignment.

Entries are provisioned in the SCCP-SERV table using the **chg-sccp-serv** command, and are shown by the **rtrv-sccp-serv** command output. The maximum number of entries that the MRN table can contain is reduced by the number of entries shown in the **rtrv-sccp-serv** command output. For more information on provisioning MRN tables, refer to *Database Administration Manual - Global Title Translations*.

Refer to *Commands Manual* for completed descriptions of the MNP SCCP service commands, including parameter names and valid values, rules for using the commands correctly, and output examples.

The `chg-sccp-serv` command is used to add point codes to an existing service group or to change the Relative Cost (RC) of existing point codes in a group. SCCP Service groups are organized by service (G-Flex, G-Port, MNP) and point code network type (ANSI, ITU-I, ITU-I Spare, ITU-N, ITU-N, ITU-N Spare, or ITU-N24). Up to seven PCs can be in a network type grouping for service re-route load sharing. The command allows for additions/modifications of up to four PCs at one time. The point code parameters support the Spare Point Code subtype prefix **s-** for ITU-I and ITU-N point codes. [Table 16: MNP SCCP Service Configuration Options](#) describes the MNP SCCP Service configuration options that are contained in the SCCP-SERV table.

**Table 16: MNP SCCP Service Configuration Options**

Parameter	Range	Description
serv	gport, gflex, mnp	Service
state	offline, online	Status
gtt	no, yes	Global Title Translation
pc1, pca1, pci1, pcn1, pcn241	Refer to <i>Commands Manual</i>	Post GTT-translated PC
rc1	00-99	Relative Cost
pc2, pca2, pci2, pcn2, pcn242	Refer to <i>Commands Manual</i>	Post GTT-translated PC

## Feature Configuration

---

### Topics:

- *Introduction.....67*
- *EPAP Entity Provisioning.....68*
- *Prerequisites.....68*
- *HLR Configuration.....69*
- *A-Port Feature Activation Procedure.....75*
- *MT-Based IS41 SMS NP Feature Activation Procedure.....78*
- *LOCREQ Query Response Activation Procedure.....80*
- *Service Portability Activation Procedure.....82*
- *MTP Routed Messages for SCCP Applications Activation Procedure.....83*
- *Adding a Service Module Card.....85*
- *The 1100 TPS/DSM for ITU NP Feature.....92*
- *Activating the E5-SM4G Throughput Capacity Feature.....96*

This chapter describes the prerequisites, considerations, and steps to configure and activate the ANSI-41 Mobile Number Portability (A-Port) feature. This chapter also includes feature activation procedures for the following features:

- MT-Based IS41 SMS NP
- 1100 TPS/DSM for ITU NP
- E5-SM4G Throughput Capacity
- MTP Msgs for SCCP Apps

## Introduction

This chapter identifies prerequisites for the A-Port feature activation procedure and provides the feature activation procedures performed at the EAGLE 5 ISS for the following features and functions:

- HLR Configuration
- A-Port
- MT-Based IS41 SMS NP
- LOCREQ Query Response
- Service Portability
- MTP Msgs for SCCP Apps
- 1100 TPS/DSM for ITU NP
- E5-SM4G Throughput Capacity

The A-Port feature and other related features are optional and are purchased from Tekelec. Contact your Tekelec Sales or Account Representative to determine whether you have purchased a specific feature or for additional information. The following features are related to the A-Port feature:

- Global Title Translation (GTT)
- Enhanced Global Title Translation (EGTT)
- Variable-Length Global Title Translation (VGTT)
- Mobile Number Portability Circular Route Prevention (MNPCRP)

### Summary of Feature Activation

This table summarizes the feature activation attributes for features in this chapter.

**Table 17: Feature Activation Summary**

Feature Name	Part Number	Temporary FAK Available?	Permanently On?
ANSI-41 Mobile Number Portability (A-Port)	893016601	No	Yes
MT-Based IS41 SMS NP	893019901	No	Yes
LOCREQ Query Response	893038501	No	Yes
Service Portability	893034301	No	No
MTP Msgs for SCCP Apps	893017401	No	No
1100 TPS/DSM for ITU NP	893018001	No	No

Feature Name	Part Number	Temporary FAK Available?	Permanently On?
E5-SM4G Throughput Capacity	893019101 893019102	No	Yes
MNP Circular Route Prevention	893007001	Yes	No

### Feature Activation Considerations

- After a permanently-on feature has been enabled and turned on with the `enable-ctrl-feat` and `chg-ctrl-feat` commands, the feature cannot be turned off. Because this feature may affect other features or system databases, confirm that a feature license and technical support from Tekelec are available before turning on this feature. Contact your Tekelec Sales or Account Representative to verify whether the feature has been purchased.
- Refer to *Dimensioning Guide for EPAP Advanced DB Features* for information about the dimensioning rules and the Service Module database capacity requirements.

## EPAP Entity Provisioning

It is recommended that EPAP entity (SP or RN) administration not be done until after the point code and/or subsystem number has been entered into the EAGLE 5 ISS MAP table.

- EPAP-administered entity data can possibly become out-of-sync with the EAGLE 5 ISS MAP table when the creation of point codes and/or subsystem numbers in the MAP table is performed after EPAP database administration.
- If this mismatch is discovered in real-time operations, a UIM (such as `SCCP did not route - DPC not in MAP tbl` or `SCCP did not route - SS not in MAP tbl`) is sent to the EAGLE 5 ISS maintenance terminal.

## Prerequisites

The A-Port feature activation assumes that Global Title Translation (GTT), Enhanced Global Title Translation (EGTT), or Variable-Length Global Title Translation (VGTT) is already provisioned. Refer to *Database Administration Manual - Global Title Translation* for provisioning procedures.

The A-Port feature activation assumes that the EPAP software is already configured; refer to EPAP Software Configuration in *EPAP Administration Manual*.

The NT serial number (`ent-serial-num`) must be entered and locked before A-Port can be enabled and turned-on.

The A-Port feature requires a Service Module card running the VSCCP application prior to turning on the A-Port feature. The A-Port feature cannot be turned on if any of the Service Module cards have less than 4 GB of memory installed.

The A-Port feature activation assumes that the Service Module cards to be installed are identified.

- Note installed Service Module card locations, if any.
- Note available odd-even card slots for Service Module card installation.
- Determine Service Module card IP addresses and have the addresses available during the activation procedure.

For in-service systems, schedule Service Module card replacement in a maintenance window that allows the reboot of Service Module cards (`init-card:loc=<Service Module card location>`) one at a time.

For in-service systems that have another EPAP-related feature enabled, perform only [A-Port Feature Activation Procedure](#) to enable and turn on the A-Port feature. With another EPAP-related feature enabled, the Service Module cards already contain the Real Time Database (RTDB).

For new systems, Service Module cards may be rebooted all at one time using the `init-card:appl=vsccp` command. The GTT, EGTT, or VGTT feature must be turned on prior to the reboot of all Service Module cards.

## HLR Configuration

This procedure configures the EAGLE 5 ISS system for Home Location Register (HLR) destinations before activating the ANSI-41 Mobile Number Portability (A-Port) feature. This procedure assumes that the EAGLE 5 ISS is an existing system in which the A-Port feature is being activated. The route to the HLR database may already be configured. Perform this procedure to verify that all HLR destinations for the feature are provisioned and to configure changes, as needed.

Refer to *Commands Manual* for detailed descriptions of the commands used in this procedure.

### Procedure Overview

- Display current PCs, CPCs, DPCs, routes, and linksets using [Step 1](#) through [Step 6](#).
- Change current PCs, CPCs, DPCs, routes, linksets, and LIM cards using [Step 7](#) through [Step 25](#).

For detailed information about specific configuration activities in this procedure, refer these topics in *Database Administration Manual - SS7*:

- Point Code Formats
  - Adding a Point Code to the Self-Identification of the EAGLE 5 ISS
  - Changing the Self-Identification of the EAGLE 5 ISS
  - Adding a Destination Point Code
  - Adding an SS7 Linkset
  - Adding an SS7 Signaling Link
  - Adding a Route Containing an SS7 DPC
1. Display the current self-identification characteristics (PC and CPC) of the system using the `rtrv-sid` command.

The self-identification characteristics of the system displayed by the `rtrv-sid` command include the point code (PC) assigned to the system, the CLLI code of the system, the capability point code of the STP (CPC), and the type of point codes supported by the system.

If the ITUDUPPC (ITU national duplicate point code) feature is on, the ITU national point code also contains a group code. The group code is a two-character field from *aa* to *zz* that is entered as the last subfield of an ITU national point code, *nnnnn-gc* (for example, 2112-aa).

2. Display the current destination point codes (DPC) in the Destination point code table (`dpc/dpca/dpcn`) using the `rtrv-dstn` command.
3. Display the current route and linkset configuration using the `rtrv-rte` command.
4. If the system point code (`pc/pca/pci/pcn/pcn24`) or capability point code (`cpc/cpca/cpcn`) to be configured in this procedure is shown in [Step 1](#), [Step 2](#), or [Step 3](#), choose another point code to configure with this procedure. If configuring an ITU-N network, continue to [Step 5](#). If configuring a mated application but not configuring an ITU-N, network proceed to [Step 6](#). Otherwise, proceed to [Step 7](#).
5. Use the `rtrv-stpopts` command to display the PC or CPC format when configuring the system point code or capability point code (`pcn` or `cpcn`) of an ITU-N network.

The ITU-N point code format option `npcfmt.i` determines the format of the ITU-N point code in the database and how it is displayed in all system outputs. The defined value is shown in the `NPCFMTI` field displayed in the output of the `rtrv-stpopts` command.

To change the format of the ITU-N point code, refer to "Point Code Formats" in *EAGLE 5 ISS Database Administration Manual - SS7*.

Continue to [Step 6](#) to display mated applications in the database. Otherwise, proceed to [Step 7](#).

6. Display the mated applications in the database using the `rtrv-map` command.
  - a) If the point code of the system is displayed in the `rtrv-map` command output (`PCA`, `PCI`, `PCN`, `MPCA`, `MPCI`, or `MPCN` fields), remove the system point code from the mated application table. Refer to procedure "Removing a Mated Application" in *EAGLE 5 ISS Database Administration Manual - Features*.
  - b) If the point code of the system or capability point code is a destination point code of a route, select a point code that is not in the destination point code table (refer to output in [Step 2](#)) and not the destination point code of a route (refer to output in [Step 3](#)).
7. Change the point code of the system and capability point code by network type using procedures "Adding a Point Code to the Self-Identification of the EAGLE 5 ISS" and "Changing the Self-Identification of the EAGLE 5 ISS" in *Database Administration Manual - SS7*.
8. Enter a destination point code for the HLR location in the Destination table by network type using the `ent-dstn` command.

Command examples:

```
ent-dstn:dpc=002-100-002
ent-dstn:dpca=002-111-002
```

where:

**:dpc/dpca/dpcn**

Destination point code to add to the database

9. Verify the changes using the `rtrv-dstn` command and specifying the DPC entered in [Step 8](#).

Command examples:

```
rtrv-dstn:dpc=002-100-002
```

```
rtrv-dstn:dpca=002-111-002
```

Example of possible output for the **DPC** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

DPC	CLLI	BEI	ELEI	ALIASA	ALIASN/N24	DMN
002-100-002	-----	no	---	-----	002-111-002	SS7

Example of possible output for the **DPCA** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

DPCN	CLLI	BEI	ELEI	ALIASA	ALIASI	DMN
002-111-002	-----	no	---	-----	002-100-002	SS7

10. Enter a linkset with the **ent-ls** command and assign the linkset to the destination point code by network type.

Command examples:

```
ent-ls:apc=002-200-002:lsn=ls400001:lst=c
```

```
ent-ls:apcn=002-112-002:lsn=ls500001:lst=c
```

where:

**:apc/apca/apcn**

Adjacent point code - the DPC of the adjacent signaling node at the far end of the linkset

**:lsn**

Linkset name

**:lst**

Linkset type

11. Verify the changes using the **rtrv-ls** command and specifying the linkset name.

Command example:

```
rtrv-ls:lsn=ls400001
```

```
rtrv-ls:lsn=ls500001
```

Example of possible output for **lsn400001** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

LSN	APC	(SS7)	SCRN	L3T	SLT	BEI	LST	LNKS	ACT	MES	DIS	SLSCI	NIS
ls400001	002-200-002		scr1	1	2	no	a	0	on	off	off	no	on
CLLI	TFATCABMLQ		MTPRSE	ASL8									
RLGHNCXA03W	1		no	no									
LOC	PORT	SLC	TYPE	L2T	L1	MODE	TSET	ECM	PCR	PCR			
				SET	BPS				N1	N2			

Example of possible output for **lsn500001** command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

LSN	APCN	(SS7)	SCRN	L3T	SLT	BEI	LST	LNKS	ACT	MES	DIS	SLSCI	NIS
ls500001	002-112-002		scr3	1	2	no	a	0	on	off	off	no	on

CLLI	TFATCABMLQ	MTPRSE	ASL8
RLGHNCXA03W	1	no	no
LOC	PORT	SLC	TYPE
SET	BPS	MODE	TSET
ECM	PCR	PCR	
N1	N2		

12. Add the LIM cards to the database using the `ent-card` command.

Command examples:

```
ent-card:appl=ccs7itu:loc=1105:type=limt1
```

```
ent-card:appl=ccs7itu:loc=1106:type=limt1
```

where:

**:appl**

Specifies that the application is CCS7ITU.

**:loc**

Specifies the slot number for the card.

**:type**

Specifies that the card is a LIMT1 card.

13. Enter the T1 interface using the `ent-t1` command.

Command examples:

```
ent-e1:loc=1105:t1port=1
```

```
ent-e1:loc=1106:t1port=1
```

where:

**:loc**

Card location or slot as stenciled on the shelf

**:t1port**

T1 card port number

14. Verify the changes using the `rtrv-card` command with the card location specified.

Command examples:

```
rtrv-card:loc=1105
```

```
rtrv-card:loc=1106
```

Example of possible output for command example:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
```

CARD	TYPE	APPL	LSET NAME	LINK	SLC	LSET NAME	LINK	SLC
1105	LIMT1	CCS7ITU	ls400001	A	00	-----	B	--
1106	LIMT1	CCS7ITU	ls500001	A	00	-----	B	--

15. Assign signaling links to the LIM cards using the `ent-slk` command.

Command example:

```
ent-slk:l2tset=1:link=a:loc=1105:lsn=ls400001:slc=0:t1port=1:ts=1
```

```
ent-slk:l2tset=1:link=a:loc=1106:lsn=ls500001:slc=0:t1port=1:ts=1
```

where:

**:l2tset**

Level 2 timer set. A signaling link can be assigned to any of the thirty timer sets.

**:link**

Signaling link assigned on the card specified in the `loc` parameter

**:loc**

Card location to which the signaling link is assigned

**:lsn**

Unique linkset name

**:slc**

Signaling link code. The `slc` must be unique within the linkset, and must be the same at both the system location and the distant node.

**t1port**

Port for T1 interface on the T1 card to which the signaling link and timeslot are being assigned

**ts**

T1 timeslot for the assigned signaling link

Signaling links are the only elements in the database supported directly by a hardware device. When a link is added to a linkset, the link remains in Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD) state until it is activated; see [Step 23](#).

16. Verify the changes using the `rtrv-slkc` command, specifying the card location and ID of the signaling link entered in [Step 15](#).

Command examples:

```
rtrv-slkc:loc=1105:link=a
```

```
rtrv-slkc:loc=1106:link=a
```

17. Add a route for the new DPC by network type using the `ent-rte` command.

Command examples:

```
ent-rte:dpc=002-100-002:lsn=ls400001:rc=10
```

```
ent-rte:dpca=002-111-002:lsn=ls500001:rc=10
```

where:

**:dpc/dpca/dpcn**

Destination point code of the node to which the traffic is bound

**:lsn**

Linkset name associated with this route

**:rc**

Relative cost or priority of this route

18. Verify the changes using the `rtrv-rte` command and specifying the destination point code of the route.
19. Add a mated application by network type to the database using the `ent-map` command.

Command examples:

```
ent-map:grp=grp03:materc=99:mpc=003-200-001:mssn=50:pc=002-100-001:ssn=12:rc=20
```

```
ent-map:grp=grp07:materc=99:mpca=001-111-004:mssn=250:pca=001-111-002:ssn=12:rc=10
```

where:

**:grp**

Concerned point code broadcast list (CSPC) group name. This parameter specifies the name of a group of point codes that should be notified of the subsystem status. A different CSPC group can be assigned to each mated PC/SSN.

**:materc**

Mate relative cost

**:mpc/mpca/mpci/mpcn**

Mate remote point code.

**:mssn**

Mate subsystem number – the subsystem address of the backup point code that is to receive the message

**:pci/pcn**

ITU international/national point code

**:rc**

Relative cost

**:ssn**

Subsystem number – the subsystem address of the primary point code that is to receive the message

20. Verify the changes using the `rtrv-map` command.
21. Allow the LIM cards that were entered in [Step 12](#) using the `alw-card` command.

Command examples:

```
alw-card:loc=1105
```

```
alw-card:loc=1106
```

This message appears:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
Card has been allowed.
```

22. Verify In-Service-Normal (IS-NR) state of the cards using the `rept-stat-card` command.
23. Activate the signaling links entered in [Step 15](#) using the `act-slk` command.

Command examples:

```
act-slk:loc=1105:link=a
```

```
act-slk:loc=1106:link=a
```

The link changes state from Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD) to In-Service-Normal (IS-NR). The output confirms the activation.

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
Activate Link message sent to card
```

24. Verify In-Service-Normal (IS-NR) state of the signaling link using the `rept-stat-slk` command.

Command examples:

```
rept-stat-slk:loc=1105
```

```
rept-stat-slk:loc=1106
```

25. Display the new LIM cards in the database using the `rtrv-card` command.

Example of a possible output:

```
tekelecstp51 09-08-24 21:16:37 GMT EAGLE 41.0.0
CARD   TYPE      APPL      LSET NAME      LINK SLC LSET NAME      LINK SLC
1105   LIMT1      CCS7ITU    ls400001       A    00  -----      B    --
1106   LIMT1      CCS7ITU    ls500001       A    00  -----      B    --
```

26. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

The HLR destinations are now configured and ready for A-Port feature activation.

## A-Port Feature Activation Procedure

Use this procedure to enable, turn on, and configure the ANSI-41 Mobile Number Portability (A-Port) feature. Refer to *Commands Manual* for detailed descriptions of the commands that are used in this procedure.

### CAUTION

**CAUTION:** Before starting this procedure, contact the [Customer Care Center](#) for assistance in performing the feature activation procedure. Do not proceed without consulting with Technical Services.

1. Enter the `enable-ctrl-feat` command to enable the A-Port feature:  
`enable-ctrl-feat:partnum=893016601:fak=<Feature Access Key>`
2. Enter the `chg-ctrl-feat` command to turn on the A-Port feature:  
`chg-ctrl-feat:partnum=893016601:status=on`
3. Change the IS41 system options in the database using the `chg-is41opts` command.
4. Verify the changes using the `rtrv-is41opts` command to display all IS41 system options from the database.

5. Add routing number prefixes for the operating network using the `ent-homern` command. Add Home RNs that are prefixed to DNS for incoming messages. Up to 100 routing number prefixes for the operating network can be added to the HOMERN table.

Command example:

```
ent-homern:rn=34
```

where:

**:rn**

Home routing number prefix. Parameter value is 1 to 15 hex digits (0-F).

6. Verify the changes using the `rtrv-homern` command to retrieve a list of routing number prefixes that belong to the operating network.
7. Display the list of administered service selector combinations using the `rtrv-srvsel` command. Avoid lengthy output by filtering the list using various parameter combinations. The service selector table can have over 1,000 entries.
8. Enter the A-Port service selectors by network type, if necessary, using the `ent-srvsel` command. This command assigns applicable service selectors required to specify the service entry for Service Module card services.

Command example:

```
ent-srvsel:gtia=2:nai=intl:np=e164:serv=mdp:snai=intl:snp=e164:ssn=9:tt=1
```

where:

**:gtia**

Global title indicator, ANSI

**:nai**

Nature of address indicator

**:np**

Numbering plan

**:serv**

Service feature

**:snai**

International Service Nature of Address Indicator

**:snp**

Service numbering plan

**:ssn**

Subsystem number

**:tt**

Translation type

9. Verify the changes using the `rtrv-srvsel` command to retrieve the list of administered service selector combinations.

Avoid lengthy output by filtering the list using various parameter combinations. The service selector table can have over 1,000 entries.

Command examples:

```
rtrv-srvsel:gtia=2
```

where:

**gtia**

Global title indicator, ANSI

**CAUTION**

**CAUTION:** GTT, EGTT, and VGTT traffic is routed based on the global titles in the OAM database while G-Flex, G-Port, A-Port, and INP traffic is routed based on the global title in the RTDB. Rebooting a Service Module card running the VSCCP application causes both the OAM databases and the RTDB on the Service Module card to reload.

10. Verify that the Service Module card returns to In-Service-Normal (IS-NR) state using the `rept-stat-card` command.

**WARNING**

**WARNING:** Do not proceed until In-Service-Normal (IS-NR) state of the Service Module card is restored.

11. After In-Service-Normal (IS-NR) state of the Service Module card is restored and verified using the `rept-stat-card` command, repeat [Step 10](#) for each Service Module card in the system.
12. Set the MNP service state online using `chg-sccp-serv:serv=mnps:state=online`.
13. Confirm that the activation steps were successful by performing the following verifications:
  - Verify that all Service Module cards are loaded and are in In-Service-Normal (IS-NR) state using the `rept-stat-sccp` command.
  - Verify that all Service Module cards and the EPAP are connected and operational using the `rept-stat-mps` command.
  - Verify that database levels are identical for the EPAP PDB and RTDB. Display the RTDBs on the Service Module cards using `rept-stat-db:display=all`.
14. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

The ANSI-41 Mobile Number Portability (A-Port) feature is now enabled, turned on, and operating in the system.

## MT-Based IS41 SMS NP Feature Activation Procedure

This procedure is used to activate the MT-Based IS41 SMS NP feature.

Before this feature can be enabled, the A-Port feature must be enabled.

Before the MT-Based IS41 SMS NP feature can be turned on, the A-Port Feature must be turned on.

The MT-Based IS41 SMS NP feature can be enabled before the A-Port feature is turned on.

For details about the commands used in this procedure, see the *Commands Manual*.

1. Verify that the A-Port feature is enabled using the `rtrv-ctrl-feat` command.
2. If the A-Port feature is not enabled, enable it using [A-Port Feature Activation Procedure](#) before proceeding to [Step 3](#).
3. Enter the `enable-ctrl-feat` command to enable the MT-Based IS41 SMS NP feature.  
`enable-ctrl-feat:partnum=893019901:fak=<Feature Access Key>`
4. Enter the `chg-stpopts` command to set the default country code to convert the nature of address indicator (NAI) of MDNs to the international format (`nai=intl`).

The parameters in this command are used for number conditioning.

For example, enter this command:

```
chg-stpopts:defcc=49
```

where:

**defcc**

The default country code.

5. Verify the new country code using the `rtrv-stpopts` command.
6. Enter the `rtrv-is41smsopts` command to view the values of the IS41SMSOPTS options.
7. If desired, change the IS41 SMS options in the database for the MT-Based IS41 SMS NP feature using the `chg-is41smsopts` command.

**Note:** `MTSMSDLTRV` must be set to a value other than `NONE` before `MTSMSDLTR` can be set to either `PRERN` or `POSTRN`. Details about the parameters that can be changed using this command can be found in the *Commands Manual*.

For example, enter this command:

```
chg-is41smsopts:mtsmsdnfmt=rn:mtsmstype=rn
```

where:

**mtsmsdnfmt**

Specifies the format of the `SMS_Address` parameter of the `SMSREQ ACK` response.

**mtsmstype**

Indicates the entity type for which a database lookup is considered successful.

8. Verify the changes using the `rtrv-is41smsopts` command.  
 This command displays all IS41 SMS options from the database.

This is an example of the possible output:

```
tekelecstp 08-04-08 19:38:30 EST EAGLE 39.0.0
```

```
IS41 OPTIONS
-----
MTSMSDNFMT      = RNDN
MTSMSTYPE       = RN
MTSMSPARM       = DIGIT
MTSMSDLTR       = NO
MTSMSDLTRV      = NONE
MTSMSACKN       = ACK
MTSMSESN        = NO
MTSMSSSN        = 6
MTSMSNAKERR     = 5
MTMSDIGTYPE     = 6
MTSMSCHKSRC     = NO
```

9. If the value of IS41SMSOPTS:MTSMSCHKSRC=YES, then provision the Home SMSC Table entries using the `ent-home-smsc` command.

For example, enter this command:

```
ent-home-smsc:smc=552611646
```

10. Verify the SMSC table contents using the `rtrv-home-smsc` command.

This command retrieves the HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database.

This is an example of the possible output:

```
rtrv-home-smsc

rlghncxa03w 03-03-28 08:50:12 EST EAGLE 31.3.0
SMSC ADDRESS

13214564894498
55231465465434
5465455655656456

HOME SMSC ADDRESS TABLE IS 1 % FULL (3 of 500)
```

11. Verify that the A-Port feature is turned on using the `rtrv-ctrl-feat` command.
12. If the A-Port feature is not turned on, turn it on using [A-Port Feature Activation Procedure](#) before proceeding to [Step 13](#).
13. Enter the `chg-ctrl-feat` command to turn on the MT-Based IS41 SMS NP feature.
14. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

The MT-Based IS41 SMS NP feature is now enabled, turned on, and operating in the system.

## LOCREQ Query Response Activation Procedure

This procedure is used to enable and turn on the LOCREQ Query Response feature in the EAGLE 5 ISS.

### Prerequisites

- A-Port or IS41 GSM Migration (IGM) must be enabled and turn on before the LOCREQ Query Response feature can be enabled.
- The LOCREQ Query Response feature is optional and must be purchased from Tekelec. The feature must be purchased to receive the Feature Access Key (FAK) that is required to enable the feature. Contact your Tekelec Sales Representative or Account Representative to determine whether the LOCREQ Query Response feature has been purchased and for additional information.

The LOCREQ Query Response feature is enabled using part number 893038501 and the Feature Access Key (FAK). The LOCREQ Query Response feature cannot be disabled after it is enabled and cannot be enabled with a temporary FAK. After the LOCREQ Query Response feature is enabled and turned on, the LOCREQ Query Response feature cannot be turned off.

Some parameters and options used with the LOCREQ Query Response feature can be provisioned after the LOCREQ Query Response feature is enabled, but before the LOCREQ Query Response feature is turned on. The `locreqrspnd` option of the `chg-is41opts` command can be modified only if the LOCREQ Query Response feature is enabled and turned on. The `dfltrn` parameter of the `chg-is41opts` command can be modified only if the LOCREQ Query Response feature is enabled. The `sporttype` parameter of the `chg-is41opts` command can be modified only if both the Service Portability feature and the LOCREQ Query Response feature are enabled.

LOCREQ Query Response processing cannot occur until:

- The LOCREQ Query Response feature is enabled and turned on.
- The `locreqrspnd` option of the `chg-is41opts` command is set to on.

For details about the commands used in this procedure, see *Commands Manual*.

1. Display the status of features controlled by Feature Access Keys (FAKs). The resulting output displays the features that are enabled in the system and the `on/off` status for each feature.

Command example:

```
rtrv-ctrl-feat
```

Output example:

```
rlghncxa03w 10-06-29 16:40:40 EST EAGLE5 42.0.0
The following features have been permanently enabled:
Feature Name          Partnum   Status   Quantity
HC-MIM SLK Capacity   893012707 on        64
APORT                 893016601 on         ---
Service Portability   893034301 on         ---
;
```

The output shows the enabled features and the on/off status for each enabled feature in the EAGLE 5 ISS.

- If the LOCREQ Query Response entry appears in the `rtrv-ctrl-feat` output with status = on, this procedure does not need to be performed.

- If an entry for either APORT or IGM with a status of on does not appear in the `rtrv-ctrl-feat` output, then this procedure cannot be performed until either the A-Port or IS41 GSM Migration (IGM) feature is enabled and turned on.
- If the LOCREQ Query Response entry appears in the `rtrv-ctrl-feat` output with status = off, go to [Step 4](#) to turn on the LOCREQ Query Response feature.
- To enable and turn on the LOCREQ Query Response feature, continue to [Step 2](#).

2. Enable the LOCREQ Query Response feature.

Command example:

```
enable-ctrl-feat:partnum=893038501:fak=<Feature Access Key>
```

3. Verify that the LOCREQ Query Response feature is enabled.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:40:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name      Partnum  Status  Quantity
HC-MIM SLK Capacity 893012707 on       64
APORT              893016601 on       ----
Service Portability 893034301 on       ----
LOCREQ Query Response 893038501 off      ----
;
```

Some parameters and options can be provisioned after the feature is enabled but is turned off. LOCREQ Query Response processing cannot occur until the feature is enabled and turned on and the `locreqrspnd` option of the `chg-is41opts` command is set to on.

4. Turn on the LOCREQ Query Response feature.

Command example:

```
chg-ctrl-feat:partnum=893038501:status=on
```

5. Verify that the LOCREQ Query Response is enabled and turned on.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:40:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name      Partnum  Status  Quantity
HC-MIM SLK Capacity 893012707 on       64
APORT              893016601 on       ----
Service Portability 893034301 on       ----
LOCREQ Query Response 893038501 on       ----
;
```

LOCREQ Query Response processing cannot occur until the `locreqrspnd` option of the `chg-is41opts` command is set to on.

6. Specify the parameters `dfltrn` and `sporttype` used with LOCREQ Query Response and .Service Portability features

Command example:

```
chg-is41opts:dfltrn=48607:sporttype=is41
```

7. Set the `locreqrspnd` option of the `chg-is41opts` command to on.

Command example:

```
chg-is41opts:on=locreqrspnd
```

8. Verify that the IS41OPTS parameter setting are correct.

Command example:

```
rtrv-is41opts
```

The LOCREQ Query Response feature is now enabled, turned on, and operating in the system. The feature cannot be disabled and cannot be turned off. LOCREQ Query Response processing can be halted by setting the `locreqrspnd` option of the `chg-is41opts` command to `off`.

9. Back up the database changes using the `chg-db:action=backup:dest=fixed` command. The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

## Service Portability Activation Procedure

This procedure is used to enable and turn on the Service Portability (S-Port) feature in the EAGLE 5 ISS.

The Service Portability feature is optional and must be purchased from Tekelec. The feature must be purchased to receive the Feature Access Key (FAK) that is required to enable the feature. Contact your Tekelec Sales Representative or Account Representative to determine whether the Service Portability feature has been purchased and for additional information.

The Service Portability (S-Port) feature is enabled using part number 893034301 and the Feature Access Key (FAK). The S-Port feature cannot be disabled after it is enabled and cannot be enabled with a temporary FAK. After the S-Port feature is enabled and turned on, the S-Port feature can be turned off.

S-Port options can be provisioned after the S-Port feature is enabled and before the S-Port feature is turned on. After the S-Port feature is enabled and provisioning is complete, the S-Port feature must be turned on (status set to *on*), before S-Port processing will occur.

For details about the commands used in this procedure, refer to *Commands Manual*.

1. Display the status of the features that are controlled with Feature Access Keys (FAKs).

Command example:

```
rtrv-ctrl-feat
```

The output shows the enabled features and the on/off status for each enabled feature in the EAGLE 5 ISS. If the `rtrv-ctrl-feat` output shows an LNP ported TNs quantity entry, this procedure cannot be performed. If the Service Portability entry appears in the `rtrv-ctrl-feat` output with status = *on*, this procedure does not need to be performed. If the Service Portability entry appears in the `rtrv-ctrl-feat` output with status = *off*, go to [Step 4](#) to turn on the S-Port feature. To enable and turn on the S-Port feature, continue to [Step 2](#).

2. Enable the S-Port feature.

Command example:

```
enable-ctrl-feat:partnum=893034301:fak=<Feature Access Key>
```

3. Verify that the S-Port feature is enabled.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:40:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name          Partnum    Status    Quantity
HC-MIM SLK Capacity    893012707  on        64
Service Portability    893034301  off       ----
;
```

S-Port options can be provisioned after the feature is enabled. S-Port processing will not occur until the feature is enabled and turned on.

4. Turn on the S-Port feature.

Command example:

```
chg-ctrl-feat:partnum=893034301:status=on
```

5. Verify that the S-Port feature is enabled and turned on.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:43:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name          Partnum    Status    Quantity
HC-MIM SLK Capacity    893012707  on        64
Service Portability    893034301  on        ----
;
```

S-Port processing can occur after the feature is enabled and turned on.

6. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

The Service Portability (S-Port) feature is now enabled, turned on, and operating in the system. The feature can be turned off using the `chg-ctrl-feat` command, but cannot be disabled.

## MTP Routed Messages for SCCP Applications Activation Procedure

This procedure is used to enable and turn on the MTP Routed Messages for SCCP Applications (MTP Msgs for SCCP Apps) feature in the EAGLE 5 ISS.

- Before the MTP Msgs for SCCP Apps feature can be enabled, GTT must be on.
- The MTP Msgs for SCCP Apps feature is optional and must be purchased from Tekelec. The feature must be purchased to receive the Feature Access Key (FAK) that is required to enable the feature. Contact your Tekelec Sales Representative or Account Representative to determine whether the MTP Msgs for SCCP Apps feature has been purchased and for additional information.

The MTP Msgs for SCCP Apps feature is enabled using part number 893017401 and the Feature Access Key (FAK). The MTP Msgs for SCCP Apps feature cannot be disabled after it is enabled and cannot be enabled with a temporary FAK. After the MTP Msgs for SCCP Apps feature is enabled and turned on, the feature can be turned off.

The MTP Msgs for SCCP Apps feature must be enabled and turned on (status set to *on*) before MTP Msgs for SCCP Apps processing will occur.

For details about the commands used in this procedure, see *Commands Manual*.

1. Display the status of the features that are controlled with Feature Access Keys (FAKs).

Command example:

```
rtrv-ctrl-feat
```

The output shows the enabled features and the on/off status for each enabled feature in the EAGLE 5 ISS.

- If the MTP Msgs for SCCP Apps entry appears in the `rtrv-ctrl-feat` output with status = on, this procedure does not need to be performed.
- If the MTP Msgs for SCCP Apps entry appears in the `rtrv-ctrl-feat` output with status = off, go to [Step 4](#) to turn on the MTP Msgs for SCCP Apps feature.
- If the MTP Msgs for SCCP Apps entry does not appear in the `rtrv-ctrl-feat` output, continue with [Step 2](#).

2. Enable the MTP Msgs for SCCP Apps feature.

Command example:

```
enable-ctrl-feat:partnum=893017401:fak=<Feature Access Key>
```

3. Verify that the MTP Msgs for SCCP Apps feature is enabled.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:40:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name          Partnum   Status   Quantity
HC-MIM SLK Capacity   893012707 on       64
MO-based IS41 SMS NP   893019501 on       ----
MTP Msgs for SCCP Apps 893017401 off      ----
;
```

MTP Msgs for SCCP Apps processing will not occur until the feature is enabled and turned on.

4. Turn on the MTP Msgs for SCCP Apps feature.

Command example:

```
chg-ctrl-feat:partnum=893017401:status=on
```

5. Verify that the MTP Msgs for SCCP Apps feature is enabled and turned on.

Command example:

```
rtrv-ctrl-feat
```

```
rlghncxa03w 09-06-29 16:43:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name          Partnum   Status   Quantity
HC-MIM SLK Capacity   893012707 on       64
MO-based IS41 SMS NP   893019501 on       ----
```

```
MTP Msgs for SCCP Apps      893017401  on      ----
;
```

MTP Msgs for SCCP Apps processing can occur after the feature is enabled and turned on.

6. Back up the database changes using the `chg-db:action=backup:dest=fixed` command. The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

The MTP Msgs for SCCP feature is now enabled, turned on, and operating in the system. The feature can be turned off using the `chg-ctrl-feat` command, but cannot be disabled.

## Adding a Service Module Card

This procedure is used to add Service Module cards to the database to support GTT-related features and EPAP-related features.

EPAP-related features require Service Module cards running the VSCCP application. The following cards can be used as Service Module cards running the VSCCP application in the system:

- DSM 4G – a DSM card with 4 gigabytes of memory
- E5-SM4G - an EPM-based card with 4 gigabytes of memory

The system can contain a maximum of 32 (31+1) Service Module cards for EPAP-related features with EPAP running on a T1200 AS:

- The following Warning appears when more than 25 Service Module cards have been provisioned in the system and the `enable-ctrl-feat` command is entered to enable the first EPAP-related feature in the system:

```
Warning: The Eagle must be connected to an EPAP T1200 or higher
```

- The following Caution appears when the `ent-card` command is entered to add the 26th Service Module card to the database and any EPAP-related feature is enabled in the system:

```
CAUTION: Please ensure EPAP Application Server is running on
hardware supporting 32 SCCP cards e.g.: T1200.
Re-enter command within 30 seconds to confirm change.
```

Refer to the *Dimensioning Guide for EPAP Advanced DB Features* for important information on the dimensioning rules and the Service Module card database capacity requirements.

A Service Module card occupies two card slots. A Service Module card can be inserted only in an odd/even numbered pair of empty card slots of an EAGLE 5 ISS shelf. The even-numbered card slot to the right of the odd-numbered slot where the Service Module card is to be inserted must be empty. A Service Module card cannot be inserted in slots 09 and 10 because slots 09 and 10 of each shelf contain HMUX cards, HIPR cards, or HIPR2 cards. The Service Module card is connected to the network through the odd-numbered card slot connector.

**Note:** Service Module cards can be inserted only in slots 01, 03, 05, 07, and 11 of the control shelf (1100).

**Table 18: Service Module Card Locations**

Location of the Service Module Card	Empty Card Location
Slot 01	Slot 02
Slot 03	Slot 04
Slot 05	Slot 06
Slot 07	Slot 08
Slot 11	Slot 12
Slot 13	Slot 14
Slot 15	Slot 16
Slot 17	Slot 18

### Prerequisites

Before a Service Module card can be added, the prerequisites in [Table 19: System Prerequisites for Adding a Service Module Card](#) must be present in the system.

**Table 19: System Prerequisites for Adding a Service Module Card**

Prerequisite	Verification and Actions
The shelf to which the card is to be added must already be provisioned in the database.	Enter the <code>rtrv-shlf</code> command. If the shelf is not in the database, refer to the procedure for adding a shelf in the <i>Database Administration Manual – System Management</i> .
The odd/even slots in which the card will be inserted must not have a card already assigned in the database.	Enter the <code>rtrv-card</code> command. If a slot has a card assigned to it, use the <code>dlt-card</code> command to remove the card from the database. Refer to the <code>dlt-card</code> command description in the <i>Commands Manual</i> .
The GTT feature must be on.	Enter the <code>rtrv-feat</code> command to display the GTT feature status.

Prerequisite	Verification and Actions
	<p>If the GTT feature is on, the gtt=on entry appears in the output.</p> <p>If the gtt=off entry appears in the output, use the procedures in the <i>Database Administration Manual - GTT</i> to turn on and provision the GTT feature and any other GTT-related features and functions that will be used in the system.</p>
To add more than 25 Service Module cards to the database, the EPAP that is connected to the EAGLE 5 ISS must be running on a T1200 AS.	Use visual inspection or contact the <a href="#">Customer Care Center</a> for assistance to determine the EPAP hardware type.

Before an E5-SM4G Service Module card can be added, the prerequisite in [Table 20: Prerequisite for Adding an E5-SM4G Service Module Card](#) must be present in the system.

**Table 20: Prerequisite for Adding an E5-SM4G Service Module Card**

Prerequisite	Verification and Actions
Slots 09 and 10 in the shelf to which the E5-SM4G card will be added must contain either HIPR cards or HIPR2 cards.	<p>Enter the <code>rept-stat-gpl:gpl=hipr</code> command and the <code>rept-stat-gpl:gpl=hipr2</code> command to list the installed HIPR cards and HIPR2 cards in the system.</p> <p>If the shelf does not contain HIPR cards or HIPR2 cards, refer to procedures in the <i>Installation Manual - EAGLE 5 ISS</i> to install HIPR cards or HIPR2 cards in the shelf.</p>

Refer to the *Commands Manual* for complete descriptions of the commands that are used in this procedure. The complete descriptions include all valid parameter values and output examples.

1. Display the cards in the system by entering the `rtrv-card` command. Odd-even pairs of card locations that do not contain cards (are not listed in the output) and do not contain HMUX, HIPR, or HIPR2 cards can be used for Service Module cards.

```

rlghncxa03w 08-03-15 16:34:56 EST EAGLE 39.2.0
CARD  TYPE      APPL      LSET NAME      LINK SLC LSET NAME      LINK SLC
1201  LIMDS0     SS7ANSI  LS1             A    0    LS1             B
1102  DSM         VSCCP    -----      A    --  -----      B    --
1113  GPSM         OAM
1114  TDM-A
1115  GPSM         OAM
1116  TDM-B
1117  MDAL
;

```

2. Verify that the Service Module card to be added has been physically installed in the correct card location, and that the required cabling is installed to connect the card to the EPAP..

**CAUTION:** If the version of the BPDCM GPL on the Service Module card does not match the BPDCM GPL version in the database when the Service Module card is inserted into the card slot, UAM 0002 is generated indicating that these GPL versions do not match. If UAM 0002 has been generated, perform the alarm clearing procedure for UAM 0002 in the *Unsolicited Alarm and Information Messages* manual before proceeding with this procedure.

3. Perform this step only if the card being added will be the 26th Service Module card in the system.

If the card is NOT the 26th Service Module card, continue to [Step 4](#).

**Note:** The same ent-card command must be entered twice within 30 seconds to complete the provisioning of the card.

- a) Enter the ent-card command the first time for the 26th card.

```
ent-card:loc=<card location>:type=dsm:appl=vsccp
```

When the command executes the first time and any EPAP-related feature is enabled, the following caution appears :

```
CAUTION: Please ensure EPAP Application Server is running on
          hardware supporting 32 SCCP cards e.g.: T1200.
          Re-enter command within 30 seconds to confirm change.
```

- b) Enter the same ent-card command the second time for the 26th card to complete the provisioning of the card.
- c) Go to [Step 5](#).

4. Add the Service Module card to the database, using the ent-card command.

```
ent-card:loc=<card location>:type=dsm:appl=vsccp
```

5. For an E5-SM4G card, verify the temperature threshold settings by performing the “Changing the High-Capacity Card Temperature Alarm Thresholds” procedure in *Database Administration Manual - SS7*.

6. Verify the change by entering the rtrv-card command with the card location specified.

```
rtrv-card:loc=<card location>
```

```
rlghncxa03w 08-03-15 16:34:56 EST EAGLE 39.2.0
CARD   TYPE      APPL      LSET NAME      LINK SLC LSET NAME      LINK SLC
1301   DSM        VSCCP      -----      A    --  -----      B
;
```

7. Display the current IP link parameters associated with the Service Module card in the database by entering the rtrv-ip-lnk command.

```
RLGHNCXA03W 09-08-24 21:14:37 GMT EAGLE 41.0.0
LOC PORT IPADDR  SUBMASK  DUPLEX  SPEED  MACTYPE  AUTO  MCAST
1107 A  -----  -----  HALF    10     DIX      NO    NO
1107 B  -----  -----  HALF    10     DIX      NO    NO
```

8. Enter the IP address and other parameter values associated with the Service Module card in the database using the chg-ip-lnk command.

For example, enter commands like these:

```
chg-ip-lnk:loc=1107:port=a:duplex=half:ipaddr=192.168.122.1:mactype=dix:speed=100:
mcast=yes:submask=255.255.255.0
```

```
chg-ip-lnk:loc=1107:port=b:duplex=half:ipaddr=192.168.123.1:mactype=dix:speed=10:
mcast=yes:submask=255.255.255.0
```

where:

**:loc**

Card location or slot number of the Service Module card in the EAGLE 5 ISS

**:port**

Ethernet interface Port ID - the physical interface of the Service Module card

**:ipaddr**

IP address for the specified port. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the network number of the system and the unique host number.

**:submask**

Subnet mask of the IP interface in the form of an IP address with a restricted range of values

**:duplex**

Mode of operation of the interface

**:speed**

Interface bandwidth in megabits per second. The speed is either 100 Mbps for main Service Module network or 10 Mbps for backup Service Module network.

**:mactype**

Media Access Control Type of the interface. Specify *dix* for the Digital/Inter/Xerox *de facto* standard for Ethernet 2.

**:mcast**

Multicast Control to enable or disable multicast support for the interface. This parameter value must be *yes* to establish the connection from the Service Module card to the MPS system.

9. Verify the IP address and other parameter values associated with the Service Module card in the database by entering the `rtrv-ip-lnk` command.

```
RLGHNCXA03W 09-08-24 21:14:37 GMT EAGLE 41.0.0
LOC  PORT  IPADDR      SUBMASK      DUPLEX  SPEED  MACTYPE  AUTO  MCAST
1107 A    192.168.122.1 255.255.255.0 HALF    100    DIX      NO    YES
1107 B    192.168.123.1 255.255.255.0 HALF    10     DIX      NO    YES
```

10. Display the current IP host information in the database by entering the `rtrv-ip-host` command.

```
RLGHNCXA03W 09-08-24 21:17:37 GMT EAGLE 41.0.0
IPADDR      HOST
192.1.1.32   KC_HLR2
192.1.1.50   DN_MSC1
192.1.1.52   DN_MSC2
```

11. Add the host name and IP address for each VSCCP link, using the `ent-ip-host` command.

Command examples:

```
ent-ip-host:host=vsccp_1107_a:ipaddr=192.168.122.1
```

```
ent-ip-host:host=vsccp_1107_b:ipaddr=192.168.123.1
```

where:

**:host**

Host name. Each VSCCP link must be specified separately.

**:ipaddr**

IP network address for each EPAP. The first three octets of the IP address must be the same as MPS A and B ports, respectively. The fourth octet identifies the Service Module card and must have a unique octet identifier for the card IP address.

12. Verify the new IP host information in the database by entering the `rtrv-ip-host` command.

```
RLGHNCXA03W 09-08-24 21:19:37 GMT EAGLE 41.0.0
IPADDR      HOST
192.1.1.32   KC_HLR2
192.1.1.50   DN_MSC1
192.1.1.52   DN_MSC2
192.168.122.1 VSCCP_1107_A
192.168.123.1 VSCCP_1107_B
```

13. Enter local domain and IP router address for the Service Module card, using the `chg-ip-card` command.

**Note:** Most customer private networks do not require setting up a default router for the Service Module card. If your network configuration requires a default router to connect the Service Module card communication to the EPAP, then only one default router is assignable to each Service Module card. Assign the default router address to each Service Module card as shown in this step.

For example:

```
chg-ip-card:defrouter=192.168.122.250:domain=nc.tekelec.com:loc=<card
location>
```

where:

**:defrouter**

Default router IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the network number of the system and the unique host number.

**:domain**

Domain name of domain server

**:loc**

Card location or slot number of the Service Module card in the EAGLE 5 ISS

14. Verify the new TCP/IP parameters associated with the Service Module card in the database by entering the `rtrv-ip-card` command.

```
RLGHNCXA03W 09-08-24 21:21:37 GMT EAGLE 41.0.0
LOC 1107
SRCHORDR  LOCAL
DNSA      -----
DNSB      -----
DEFROUTER 192.168.122.250
DOMAIN    NC.TEKELEC.COM
```

15. Allow the Service Module card that was added to operate in the system, using the `alw-card` command.

```
alw-card:loc=<card location>
```

16. Verify the In-Service-Normal (IS-NR) status of the Service Module card, using the `rept-stat-card` command.
17. Test the presence of the EPAP hosts on the network using the `pass` command with the `ping` parameter. This command is invoked with a destination that is either a hostname or IP address.

Command examples:

```
pass:loc=1107:cmd="ping 192.168.122.100".
```

```
pass:loc=1107:cmd="ping 192.168.122.200".
```

```
pass:loc=1107:cmd="ping 192.168.123.100".
```

```
pass:loc=1107:cmd="ping 192.168.123.200".
```

where:

**:loc**

Card location or slot number in the EAGLE 5 ISS

**:cmd**

Command string passed to Service Module card for processing

After successful completion of each command, the system response is similar to the following output:

```
rlghncxa03w 09-08-24 08:30:44 GMT EAGLE 41.0.0
pass: loc=1107: cmd="ping 192.168.122.100"
Command entered at terminal #1.
;
rlghncxa03w 09-08-24 08:30:44 GMT EAGLE 41.0.0
PASS: Command sent to card
;
rlghncxa03w 09-08-24 08:30:44 GMT EAGLE 41.0.0
PING command in progress
;
rlghncxa03w 09-08-24 08:30:46 GMT EAGLE 41.0.0
PING 192.168.122.100: 56 data bytes
64 bytes from tekral.nc.tekelec.com (192.168.122.100):icmp_seq=0.time=5. ms
64 bytes from tekral.nc.tekelec.com (192.168.122.100):icmp_seq=1.time=0. ms
64 bytes from tekral.nc.tekelec.com (192.168.122.100):icmp_seq=2.time=0. ms
---192.168.100.3 PING Statistics---
3 packets transmitted, 3 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/1/5
PING command complete
```

If the `pass` commands with the `ping` parameter are not successful, verify the correct connection of the hardware cabling and repeat this step. If the command fails again, contact [Customer Care Center](#).

18. Back up the database changes, by entering the following command.

```
chg-db:action=backup:dest=fixed
```

The following messages should appear; the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED) : MASP A - Backup starts on active MASP.
BACKUP (FIXED) : MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED) : MASP A - Backup starts on standby MASP.
BACKUP (FIXED) : MASP A - Backup on standby MASP to fixed disk complete.
```

19. Repeat this procedure for each Service Module card that needs to be added to the system.

## The 1100 TPS/DSM for ITU NP Feature

When only DSM cards or a mixture of DSM cards and E5-SM4G cards (Service Module cards) are equipped in the system, all of the cards are normally rated at 850 transactions per second (TPS). The 1100 TPS/DSM for ITU NP feature increases the TPS rate for a Service Module card from 850 TPS to 1100 TPS.

The feature can be enabled when the equipped Service Module cards include DSM cards and one or more of the EPAP-related features listed in [Table 22: Feature Prerequisites](#) are enabled and turned on.

When the maximum number of Service Module cards is installed in the EAGLE 5 ISS, the maximum processing capacity of SCCP traffic for an EAGLE 5 ISS processing traffic for EPAP-related features is increased to 34,100 TPS.

**Note:** The increased capacity to 1100 TPS per DSM card assumes incoming traffic consists of at least 30% of GTT routed traffic that does not require EPAP-based lookup. If more than 70% of incoming traffic requires EPAP-based lookup, Group Ticket Voucher (TVG) may shut down and overall TVG capacity of 1100 for the card may not be met.

The 1100 TPS/DSM for ITU NP feature must be enabled using the feature part number 893018001 and a feature access key (FAK). Based on the feature part number and the serial number of the EAGLE 5 ISS, the feature access key is site-specific.

**Note:** The feature access key for the 1100 TPS/DSM for ITU NP feature is provided by Tekelec when the feature is purchased. Contact your Tekelec Sales Representative or Account Representative before beginning the feature configuration procedure if you do not have the feature access key for this feature. The 1100 TPS/DSM for ITU NP feature cannot be enabled with a temporary feature access key.

After the 1100 TPS/DSM for ITU NP feature has been enabled, the feature must be turned on to begin operation in the system. The feature is an On/Off feature, it can be turned off again after it has been turned on.

### System Prerequisites

Before the 1100 TPS/DSM for ITU NP feature can be enabled, the prerequisites listed in [Table 21: System Prerequisites](#) are required in the system.

**Table 21: System Prerequisites**

Prerequisite	Verification and Provisioning
For new installations, the system serial number must be verified and locked. The system is shipped with an unlocked serial number. The serial number can be changed if necessary and must be locked after the system is on-site.  For systems that are being upgraded, the serial number has already been verified and locked.	Enter the <code>rtrv-serial-num</code> command to display the serial number and its lock status.  If a serial number is displayed, verify that the serial number is correct for the system. The system serial number is shown on a label affixed to the control shelf (shelf 1100).  If the displayed serial number is correct and locked, no action is necessary.

Prerequisite	Verification and Provisioning
	<p>If the displayed serial number is correct and not locked, enter the <code>ent-serial-num</code> command WITH the <code>lock=yes</code> parameter, and specify the serial number that is shown on the control shelf label.</p> <p>If no serial number is displayed,</p> <ul style="list-style-type: none"> <li>• Enter the <code>ent-serial-num</code> command WITHOUT the <code>lock</code> parameter, and specify the serial number that is shown on the control shelf label.</li> <li>• Enter the <code>rtrv-serial-num</code> command and verify that the correct serial number was entered.</li> <li>• Enter the <code>ent-serial-num</code> command again WITH the correct serial number and the <code>lock=yes</code> parameter.</li> </ul> <p>If a serial number is displayed or entered and locked that does not match the number on the control shelf, contact the <a href="#">Customer Care Center</a> for assistance.</p>
The GTT feature must on in the system.	<p>Enter the <code>rtrv-feat</code> command.</p> <p>If the GTT feature is on, the <code>gtt=on</code> entry appears in the output.</p> <p>If the <code>gtt=off</code> entry appears in the output, use the procedures in <i>Database Administration Manual – Global Title Translation</i> to turn on and provision the GTT feature and any related features and functions.</p>

### Feature Prerequisites

Before the 1100 TPS/DSM for ITU NP feature can be enabled, the prerequisites shown in [Table 22: Feature Prerequisites](#) are required in the system.

**Table 22: Feature Prerequisites**

Prerequisite	Verification and Provisioning
Service Module cards running the VSCCP application must be equipped. The cards can be all DSM cards, or a mixture of DSM cards and E5-SM4G cards. There must be at least one DSM card.	Enter the <code>rept-stat-gpl:gpl=vsccp</code> command and the <code>rept-stat-gpl:gpl=sccphc</code> command to list the Service Module cards in the system.

Prerequisite	Verification and Provisioning
	If the number of cards is not sufficient, use the procedure <a href="#">Adding a Service Module Card</a> to add Service Module cards.
The ANSIGFLEX system option cannot be set to Yes.	Enter the <code>rtrv-stpopts</code> command.  Verify that the ANSIGFLEX entry does not appear in the command output or that the ANSIGFLEX entry shows a value of no.
The LNP feature cannot be on in the system.	Enter the <code>rtrv-ctrl-feat</code> command.  If the LNP feature is on, shown with a quantity greater than zero for the <code>LNP ported TNs</code> entry in the command output, the 1100 TPS/DSM for ITU NP feature cannot be enabled.
At least one of the following EPAP-related features must be enabled and turned on: <ul style="list-style-type: none"> <li>• G-Port</li> <li>• A-Port</li> <li>• INP</li> <li>• AINPQ</li> <li>• IGM</li> <li>• EIR</li> <li>• IDP Relay</li> <li>• V-Flex</li> <li>• IAR (NP, ASD, GRN)</li> <li>• MO-based GSM SMS NP</li> <li>• MO-based IS41SMS NP</li> <li>• TIF (NP, ASD, GRN, Number Substitution)</li> </ul>	Enter the <code>rtrv-ctrl-feat</code> command and verify that an entry for at least one of the listed EPAP-related features with Status on is present in the output.  If no listed EPAP-related features are on, use the procedures in this manual or another Feature Manual for an EPAP-related feature that you will use in the system, to enable and turn on the EPAP-related feature.

This section provides the following procedures for the 1100 TPS/DSM for ITU NP feature:

- [Enable the 1100 TPS/DSM for ITU NP Feature](#)
- [Turn On the 1100 TPS/DSM for ITU NP Feature](#)
- [Turn Off the 1100 TPS/DSM for ITU NP Feature](#)

Refer to the *Commands Manual* for descriptions of the commands used in the procedures, including parameter names and valid values, rules for using the command correctly, and output examples.

## Enable the 1100 TPS/DSM for ITU NP Feature

This procedure is used to enable the 1100 TPS/DSM for ITU NP feature.

1. Enable the 1100 TPS/DSM for ITU NP feature with part number 893018001 and the feature access key.

```
enable-ctrl-feat:partnum=893018001:fak=<feature access key>
```

2. Verify the change by entering the `rtrv-ctrl-feat` command with the 1100 TPS/DSM for ITU NP feature part number 893018001.

```
rtrv-ctrl-feat:partnum=893018001
rlghncxa03w 09-08-24 21:15:37 EST EAGLE 40.1.0
The following features have been permanently enabled:
Feature Name          Partnum    Status    Quantity
HC-MIM SLK Capacity   893012707  on        64
Prepaid SMS Intercept Ph1 893006701  on        ----
1100 TPS/DSM for ITU NP 893018001  off       ----
;
```

3. Back up the changes using the `chg-db:action=backup:dest=fixed` command. The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED) : MASP A - Backup starts on active MASP.
BACKUP (FIXED) : MASP A - Backup on active MASP to fixed disk complete. BACKUP
(FIXED) : MASP A - Backup starts on standby MASP.
BACKUP (FIXED) : MASP A - Backup on standby MASP to fixed disk complete.
```

## Turn On the 1100 TPS/DSM for ITU NP Feature

This procedure is used to turn on the 1100 TPS/DSM for ITU NP feature, after it has been enabled or turned off.

**Note:** If the EPAP-based traffic is higher than 70% of all traffic on the EAGLE 5 ISS, the DSM card performance may not reach 1100 TPS per DSM card.

1. Enter the `chg-ctrl-feat` command the first time and specify the 1100 TPS/DSM for ITU NP feature part number 893018001 and the `status=on` parameter value.

```
chg-ctrl-feat:partnum=893018001:status=on
```

The following message is displayed:

```
CAUTION: Rated TPS for this feature supports an engineered GTT
traffic mix of no more than 70 percent EPAP-based traffic.
Re-enter the command within 30 seconds to confirm change.
```

2. Re-enter the command the second time within 30 seconds to turn on the 1100 TPS/DSM for ITU NP feature.

```
chg-ctrl-feat:partnum=893018001:status=on
```

3. Verify the change by entering the `rtrv-ctrl-feat` command with the 1100 TPS/DSM for ITU NP feature part number.

```
rtrv-ctrl-feat:partnum=893018001
rlghncxa03w 09-08-24 21:15:37 EST EAGLE 40.1.0
The following features have been permanently enabled:
Feature Name          Partnum    Status    Quantity
HC-MIM SLK Capacity   893012707  on        64
Prepaid SMS Intercept Ph1 893006701  on        ----
1100 TPS/DSM for ITU NP 893018001  on       ----
;
```

4. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

## Turn Off the 1100 TPS/DSM for ITU NP Feature

This procedure is used to turn off the 1100 TPS/DSM for ITU NP feature, after it has been enabled and turned on.

1. Enter the `chg-ctrl-feat` command the first time and specify the 1100 TPS/DSM for ITU NP feature part number 893018001 and the `status=off` parameter value.

```
chg-ctrl-feat:partnum=893018001:status=off
```

The following message is displayed:

```
CAUTION: This command decreases the total TPS of the SCCP system from 1100 to
850 TPS for each DSM card.
```

2. Re-enter the command the second time within 30 seconds to turn off the 1100 TPS/DSM for ITU NP feature.
3. Back up the database changes using the `chg-db:action=backup:dest=fixed` command.

The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```
BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.
```

## Activating the E5-SM4G Throughput Capacity Feature

The E5-SM4G Throughput Capacity feature quantities are used to increase the processing capacity of the E5-SM4G card and of system SCCP traffic for an EAGLE 5 ISS that contains E5-SM4G cards only (no DSM cards). The achievable TPS maximums are shown in [Table 23: Maximum E5-SM4G Card and System TPS Capacity](#).

**Table 23: Maximum E5-SM4G Card and System TPS Capacity**

Feature Quantity Part Number	Maximum TPS Capacity per E5-SM4G Card	Maximum System TPS Capacity
893019101 - Feature Quantity 5000	3125	<ul style="list-style-type: none"> <li>96,875 TPS with one or more EPAP-related features and 31+1 cards with EPAP running on T1200 AS</li> </ul>

Feature Quantity Part Number	Maximum TPS Capacity per E5-SM4G Card	Maximum System TPS Capacity
	5000	<ul style="list-style-type: none"> <li>• 150,000 TPS with no EPAP-related or ELAP-related feature traffic and 31+1 cards</li> <li>• 120,000 TPS with G-Flex and the ANSIGFLEX STP option and 24+1 cards</li> <li>• 155,00 TPS with G-Flex and the ANSIGFLEX STP option and 31+1 cards with EPAP running on T1200 AS</li> <li>• 40,000 TPS with ELAP and 8+1 cards</li> <li>• 85,000 TPS with ELAP and 17+1 cards</li> </ul>
893019102 - Feature Quantity 6800	6800	<ul style="list-style-type: none"> <li>• 210,800 TPS with no EPAP-related or ELAP-related feature traffic and 31+1 cards</li> <li>• 210,800 TPS with one or more EPAP-related features and 31+1 cards with EPAP running on T1200 AS</li> <li>• 54,400 TPS with ELAP and 8+1 cards</li> <li>• 115,600 TPS with ELAP and 17+1 cards</li> </ul>

An E5-SM4G Throughput Capacity quantity feature must be enabled using an E5-SM4G Throughput Capacity feature part number (893019101 or 893019102) and a feature access key.

The feature access key is based on the feature part number and the serial number of the EAGLE 5 ISS, making the feature access key site-specific.

**Note:** The E5-SM4G Throughput Capacity quantity feature must be purchased to receive the feature access key used to enable the feature. Contact your Tekelec Sales Representative or Account Representative before beginning this procedure if you have purchased the E5-SM4G Throughput Capacity quantity feature, but do not have the feature access key. A temporary feature access key is not available for this feature.

After an E5-SM4G Throughput Capacity feature is enabled and turned on, the E5-SM4G Throughput Capacity feature cannot be turned off. When the E5-SM4G Throughput Capacity feature is enabled, it is permanently enabled. The E5-SM4G Throughput Capacity feature cannot be temporarily enabled.

### System Prerequisites

Before the E5-SM4G Throughput Capacity feature can be enabled, the prerequisites listed in [Table 24: System Prerequisites](#) are required in the system.

**Table 24: System Prerequisites**

Prerequisite	Verification and Provisioning
For new installations, the system serial number must be verified and locked. The system is shipped with an unlocked serial number. The	Enter the <code>rtrv-serial-num</code> command to display the serial number and its lock status.

Prerequisite	Verification and Provisioning
<p>serial number can be changed if necessary and must be locked after the system is on-site.</p> <p>For systems that are being upgraded, the serial number has already been verified and locked.</p>	<p>Verify that the displayed serial number is correct for the system. The serial number is shown on a label affixed to the control shelf (shelf 1100).</p> <p>If no serial number is displayed, or if the displayed serial number is not locked, refer to the <code>ent-serial-num</code> command description in the <i>Commands Manual</i> for instructions to enter and lock the serial number.</p>
<p>The GTT feature must on in the system.</p>	<p>Enter the <code>rtrv-feat</code> command.</p> <p>If the GTT feature is on, the <code>gtt=on</code> entry appears in the output.</p> <p>If the <code>gtt=off</code> entry appears in the output, use the procedures in the <i>Database Administration Manual – Global Title Translation</i> to turn on and provision the GTT feature and any related features and functions.</p>

### E5-SM4G Throughput Capacity Feature Prerequisite

Before the E5-SM4G Throughput Capacity feature can be enabled, the prerequisite shown in [Table 25: E5-SM4G Throughput Capacity Feature Prerequisite](#) is required in the system.

**Table 25: E5-SM4G Throughput Capacity Feature Prerequisite**

Prerequisite	Verification and Provisioning
<p>E5-SM4G cards running the VSCCP application must be equipped.</p> <p>The required number of cards depends on the desired total system TPS to be achieved by the cards. See <a href="#">Table 23: Maximum E5-SM4G Card and System TPS Capacity</a>.</p>	<p>Enter the <code>rept-stat-gpl:gpl=sccphc</code> command to list the E5-SM4G cards in the system.</p> <p>If the number of cards is not sufficient, use the procedure in <a href="#">Adding a Service Module Card</a> to add E5-SM4G cards.</p>

The following procedure explains how to enable an E5-SM4G Throughput Capacity quantity feature.

**Note:** After a quantity feature has been enabled, a feature for a higher quantity can be enabled; a feature for a lower quantity cannot be enabled. Quantity features are automatically turned on when they are enabled.

Refer to the *Commands Manual* for descriptions of the commands used in the procedure, including parameter names and valid values, rules for using the command correctly, and output examples.

1. Display the status of the features that are controlled by feature access keys. Enter the `rtrv-ctrl-feat` command.

```
rlghncxa03w 09-07-29 16:40:40 EST EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name          Partnum    Status    Quantity
```

```

      HC-MIM SLK Capacity      893012707  on          64
      E5-SM4G Throughput Cap  893019101  on         5000
;

```

- If the `rtrv-ctrl-feat` output shows that the correct E5-SM4G Throughput Capacity quantity feature is enabled and its status is on, no further action is necessary.
  - If no E5-SM4G Throughput Capacity feature quantity is enabled or a higher quantity needs to be enabled, continue with step [Step 2](#).
2. Enable the E5-SM4G Throughput Capacity quantity feature by entering the `enable-ctrl-feat` command with the correct part number and FAK for the desired quantity.
  3. Verify the status of the E5-SM4G Throughput Capacity quantity feature by entering the `rtrv-ctrl-feat` command with the feature part number that was just enabled (893033501 or 893019102).
- ```

rtrv-ctrl-feat:partnum=893019102

```

```

rlghncxa03w 09-08-29 16:40:40 EST  EAGLE5 41.1.0
The following features have been permanently enabled:
Feature Name      Partnum    Status    Quantity
HC-MIM SLK Capacity      893012707  on         64
E5-SM4G Throughput Cap  893019102  on        6800
;

```

4. Back up the changes using the `chg-db:action=backup:dest=fixed` command.
- The following messages appear, the active Maintenance and Administration Subsystem Processor (MASP) appears first.

```

BACKUP (FIXED): MASP A - Backup starts on active MASP.
BACKUP (FIXED): MASP A - Backup on active MASP to fixed disk complete.
BACKUP (FIXED): MASP A - Backup starts on standby MASP.
BACKUP (FIXED): MASP A - Backup on standby MASP to fixed disk complete.

```

# Chapter 5

## Measurements

---

### Topics:

- [\*A-Port Measurements.....101\*](#)

This chapter describes the measurements information available from the EAGLE 5 ISS for the A-Port feature.

## A-Port Measurements

Refer to *EAGLE 5 ISS Measurements* for information about measurement systems and reporting.

Refer to *EAGLE 5 ISS Commands Manual* for descriptions of commands used to generate, schedule, and transfer measurements reports.

Refer to *Database Administration Manual - System Management* for provisioning information and procedures for these measurement systems:

- OAM-based Measurements - A-Port measurements are available using the File Transfer Area (FTA) feature and not directly by EAGLE 5 ISS terminals.
- Measurements Platform
- E5-OAM Integrated Measurements

[Table 26: Pegs for Per System A-Port Measurements](#) describes the peg counts of Message Signalling Units (MSUs) supported per-system for the A-Port feature.

**Table 26: Pegs for Per System A-Port Measurements**

| Event Name | Description                                                                                                                                                                                                                                                                                                                                                         | Type   | Unit      |
|------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|-----------|
| APSMSREL   | Number of SMS Request messages relayed                                                                                                                                                                                                                                                                                                                              | System | Peg count |
| APSMRQREP  | Number of SMSREQ messages received that result in SMSREQ ACK or SMSREQ NACK responses<br><br>This count includes any SMSREQ NACKs generated by the Migration feature.                                                                                                                                                                                               | System | Peg count |
| APSMRQERR  | Number of SMSREQ messages received that resulted in error<br><br>This count is applicable only when the incoming message is SMSREQ . The peg count is incremented only when the MT-Based IS-41 SMS NP feature is turned on. If the IGM feature is also turned on and the IGM feature handles the message resulting in an error, this peg count will be incremented. | System | Peg count |
| IS41LRERR  | Number of IS-41 Location Request - Error response messages sent                                                                                                                                                                                                                                                                                                     | System | Peg count |
| IS41LRMRCV | Number of IS-41 Location Request messages received                                                                                                                                                                                                                                                                                                                  | System | Peg count |
| IS41LRRTN  | Number of IS-41 Location Request - Return Result messages sent                                                                                                                                                                                                                                                                                                      | System | Peg count |

[Table 27: Pegs for Per SSP A-Port Measurements](#) describes the peg counts of Message Signalling Units (MSUs) supported per-SSP for the A-Port feature.

**Table 27: Pegs for Per SSP A-Port Measurements**

| Event Name | Description                                                                                                                                                                                                                                                                                                                                                                            | Type       | Unit      |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------|-----------|
| APLRACK    | Number of call related LOCREQ messages acknowledged                                                                                                                                                                                                                                                                                                                                    | Point Code | Peg count |
| APLRRLY    | Number of call related LOCREQ messages relayed                                                                                                                                                                                                                                                                                                                                         | Point Code | Peg count |
| APNOCL     | Number of non-call non-LOCREQ related messages relayed                                                                                                                                                                                                                                                                                                                                 | Point Code | Peg count |
| APNOCLGT   | Number of non-call non-LOCREQ related messages that fell through to GTT                                                                                                                                                                                                                                                                                                                | Point Code | Peg count |
| APSMRQREP  | Number of SMSREQ messages received from a specific SSP that resulted in SMSREQ ACK or SMSREQ NACK responses<br><br>This count will include any SMSREQ NACKs generated by the IGM feature.                                                                                                                                                                                              | Point Code | Peg count |
| APSMRQERR  | Number of SMSREQ messages received from a specific SSP that resulted in error<br><br>This count is applicable only when the incoming message is SMSREQ. The peg count is incremented only when the MT-Based IS-41 SMS NP feature is turned on. If the IGM feature is also turned on and the IGM feature handles the message resulting in an error, this peg count will be incremented. | Point Code | Peg count |
| GPSRACK    | Number of call-related SRI responses                                                                                                                                                                                                                                                                                                                                                   | Point Code | Peg count |
| GPSRRLY    | Number of call-related SRI messages relayed                                                                                                                                                                                                                                                                                                                                            | Point Code | Peg count |

*Table 28: Pegs for Per System and Per SSP A-Port Measurements* describes the peg counts of Message Signalling Units (MSUs) supported both per-system and per-SSP for the A-Port feature.

**Table 28: Pegs for Per System and Per SSP A-Port Measurements**

| Event Name | Description                                | Type               | Unit      |
|------------|--------------------------------------------|--------------------|-----------|
| APSMSRCV   | Number of SMS Request messages received    | System, Point Code | Peg count |
| MNPCRCD    | Number of times Circular Route is detected | System, Point Code | Peg count |

# Chapter 6

## Maintenance

---

### Topics:

- [\*Introduction.....104\*](#)
- [\*A-Port-Related Alarms.....104\*](#)
- [\*A-Port UIMs.....106\*](#)
- [\*Maintenance Commands.....109\*](#)
- [\*EAGLE 5 ISS Debug Commands.....111\*](#)
- [\*Status Reporting and Problem Identification...112\*](#)

This chapter describes the maintenance information available from the EAGLE 5 ISS for the A-Port feature. The information includes status, alarm messages (UAMs), and information messages (UIMs).

## Introduction

This chapter describes the following EAGLE 5 ISS maintenance functions and information that are available for EPAP-related features. Feature-specific information is indicated as needed.

- Feature-related Unsolicited Alarm Messages (UAMs) and Unsolicited Information Messages (UIMs)
- EAGLE 5 ISS maintenance and debug commands
- Status reporting for the EAGLE 5 ISS, EPAP, Service Module cards, and features

## A-Port-Related Alarms

All A-Port related Unsolicited Alarm Messages (UAMs) are output to the Maintenance Output Group. *Unsolicited Alarm and Information Messages* contains a complete description of all UAMs. [Table 29: A-Port Related UAMs](#) lists UAMs used to support the A-Port feature.

Refer to the *Unsolicited Alarm and Information Messages* manual for more information and corrective procedures for the EAGLE 5 ISS related alarms.

Refer to the *T1200 Integrated Application Platform Maintenance Manual* or the *EPAP Alarms on T1200 Platform* manual for descriptions and corrective procedures for MPS-related alarms.

**Table 29: A-Port Related UAMs**

| UAM  | Severity | Message Text                         | MPS or EAGLE 5 ISS |
|------|----------|--------------------------------------|--------------------|
| 0013 | Major    | Card is isolated from system         | EAGLE 5 ISS        |
| 0084 | Major    | IP Connection Unavailable            | EAGLE 5 ISS        |
| 0085 | None     | IP Connection Available              | EAGLE 5 ISS        |
| 0099 | Major    | Incompatible HW for provisioned slot | EAGLE 5 ISS        |
| 0250 | None     | MPS available                        | MPS                |
| 0261 | Critical | MPS unavailable                      | MPS                |
| 0328 | None     | SCCP is available                    | EAGLE 5 ISS        |
| 0329 | None     | SCCP capacity normal, cards abnormal | EAGLE 5 ISS        |
| 0330 | Major    | SCCP TPS Threshold exceeded          | EAGLE 5 ISS        |

| UAM  | Severity | Message Text                         | MPS or EAGLE 5 ISS |
|------|----------|--------------------------------------|--------------------|
| 0331 | Critical | SCCP is not available                | EAGLE 5 ISS        |
| 0335 | None     | SCCP is removed                      | EAGLE 5 ISS        |
| 0336 | Major    | LIMs have been denied SCCP service   | EAGLE 5 ISS        |
| 0370 | Critical | Critical Platform Failures           | MPS                |
| 0371 | Critical | Critical Application Failures        | MPS                |
| 0372 | Major    | Major Platform Failures              | MPS                |
| 0373 | Major    | Major Application Failures           | MPS                |
| 0374 | Minor    | Minor Platform Failures              | MPS                |
| 0375 | Minor    | Minor Application Failures           | MPS                |
| 0422 | Major    | Insufficient extended memory         | EAGLE 5 ISS        |
| 0423 | None     | Card reload attempted                | EAGLE 5 ISS        |
| 0441 | Major    | Incorrect MBD - CPU                  | EAGLE 5 ISS        |
| 0442 | Critical | RTDB database capacity is 95% full   | EAGLE 5 ISS        |
| 0443 | Major    | RTDB database is corrupted           | EAGLE 5 ISS        |
| 0444 | Minor    | RTDB database is inconsistent        | EAGLE 5 ISS        |
| 0445 | None     | RTDB database has been corrected     | EAGLE 5 ISS        |
| 0446 | Major    | RTDB database capacity is 80% full   | EAGLE 5 ISS        |
| 0447 | None     | RTDB database capacity alarm cleared | EAGLE 5 ISS        |
| 0448 | Minor    | RTDB database is incoherent          | EAGLE 5 ISS        |
| 0449 | Major    | RTDB resynchronization in progress   | EAGLE 5 ISS        |
| 0451 | Major    | RTDB reload is required              | EAGLE 5 ISS        |

| UAM  | Severity | Message Text             | MPS or EAGLE 5 ISS |
|------|----------|--------------------------|--------------------|
| 0526 | None     | Service is available     | EAGLE 5 ISS        |
| 0527 | Minor    | Service abnormal         | EAGLE 5 ISS        |
| 0528 | Critical | Service is not available | EAGLE 5 ISS        |
| 0529 | Critical | Service is disabled      | EAGLE 5 ISS        |
| 0530 | None     | Service is removed       | EAGLE 5 ISS        |

## A-Port UIMs

*Unsolicited Alarm and Information Messages* contains a complete description of all UIM text and formats. [Table 30: A-Port UIMs](#) lists UIMs used to support the A-Port feature.

**Table 30: A-Port UIMs**

| UIM  | Text                                     | Description                                                       | Action                                                             | Output Group (UI Output Direction) |
|------|------------------------------------------|-------------------------------------------------------------------|--------------------------------------------------------------------|------------------------------------|
| 1035 | SCCP rsp did not route - invalid GTI     | The SCCP response did not route due to an invalid GTI             | Use a valid GTI in the CGPA part of the query                      | ggt                                |
| 1036 | SCCP rsp did not route - invalid TT      | The SCCP response did not route due to an invalid TT              | Provision the CGPA TT in the GTT TT table                          | ggt                                |
| 1037 | SCCP rsp did not route - bad Xlation     | The SCCP response did not route due to a bad translation          | Provision the CGPAGTA address in the GTT database                  | ggt                                |
| 1038 | SCCP rsp did not route - SSP not True PC | The SCCP response did not route due to SSP is not true point code | Use the true point code in the CGPA point code or OPC of the query | ggt                                |

| UIM  | Text                                    | Description                                                                                                                                                          | Action                                                                                       | Output Group (UI Output Direction) |

| 1297 | Invalid length of prefix/suffix digits   | Attempted digit action of prefixing entity ID is invalid because combined length of entity ID and GT digits was greater than 21 digits | Change the attempted digit action or decrease the length of the entity ID and/or GT digits                                     | application subsystem              |
| 1341 | SRI rcvd - GSM2IS41 not provisioned      | MIGRPFX=SINGLE and GSM2IS41 prefix is NONE. The GSM to IS-41 Migration prefix is not provisioned on this system.                       | The GSM2IS41 prefix must be specified in the GSMOPTS table.                                                                    | gtt                                |
| 1374 | SMS NP destination address decode failed | An error was detected during decode of SMS message destination address.                                                                | The message should be analyzed to determine the error, and the originating node should be contacted to send corrected message. | application subsystem              |

| UIM  | Text                                       | Description                                                                                                          | Action                                                                                                                                                                                                                    | Output Group (UI Output Direction) |
|------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------|
| 1375 | SMS NP failed to modify TCAP message       | The formatted outbound digit string length generated by SMS NP for encoding the TCAP message exceeded system limits. | The message and outbound digits formatting options should be analyzed to determine the error and the originating node or the requested outbound digit formatting option should be modified to correct the encoding error. | application subsystem              |
| 1376 | SMS NP outbound digits length exceed limit | During processing of SMS message, the formatted outbound digit string length exceeded limit for number of digits.    | The message and the digit format provisioning should be analyzed to determine the error and the originating node or the requested outbound digit formatting option should be modified to correct the encoding error.      | application subsystem              |

## Maintenance Commands

The following commands can be used for maintenance when an EPAP-related feature is on.

Refer to the *Commands Manual* for complete descriptions of the commands, including parameters, valid values, rules for using the commands correctly, and output examples.

**Table 31: Maintenance Commands**

| Command       | Description                                                                                                                                                                                                  |
|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rept-stat-sys | Reports the status of system entities, including cards. The output includes the number of Service Module cards that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD). |

| Command           | Description                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| rept-stat-sccp    | Reports operating status of services and subsystems, CPU usage, and Service Module card status. When the loc parameter is specified, the command displays detailed card traffic statistics, including cards that are denied SCCP service. See the section in this manual that describes the use of the <code>rept-stat-sccp</code> command.                                                                                                         |
| rept-stat-mps     | Displays the overall status of the EPAP application running on the MPS (multi-purpose server). Command output for the various reports of this command include overall MPS alarm status and card status, and status for a specific Service Module card when a feature is on.                                                                                                                                                                         |
| rept-stat-trbl    | Includes a summary of any trouble notifications (UAMs) for local subsystems, cards, and linksets. The severity of each alarm is indicated in the output report.                                                                                                                                                                                                                                                                                     |
| rept-stat-alm     | Displays the alarm counts and totals for local subsystems and Service Module card/EPAP IP links.                                                                                                                                                                                                                                                                                                                                                    |
| rept-stat-db      | Displays the status information for the EAGLE 5 ISS databases. This includes the level information for each Service Module card, and for the active and standby EPAP RTDB. The command reports database exception status such as corrupted, incoherent, or inconsistent, as well as providing the birth dates and levels. It shows the status of each PDB and RTDB when an EPAP-related feature is enabled.                                         |
| rtrv-tbl capacity | Retrieves table use capacity summary information. For each table listed, the number of table entry elements in use and the total allowed number of table elements is presented, along with a percent (%) full value. Information is shown for some tables only if the feature that uses the table is enabled.                                                                                                                                       |
| inh-card/alw-card | <p>The <code>inh-card</code> command is used to change the operating state of the card from In-Service Normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A craftsman then can test the card or physically remove it from the shelf.</p> <p>The <code>alw-card</code> command is used to change the card from OOS-MT-DSBLD (Out-of-Service Maintenance-Disabled) to IS-NR (In-Service Normal) if card loading is successful.</p> |
| inh-alm/unhb-alm  | Used to allow and inhibit reporting of alarms for a given device, including the Service Module card ports. The commands allow both Port A and Port B to be specified. Inhibited alarms will not generate UAMs or cause alarm indicators to be turned on. All <code>rept-stat-xxx</code> commands continue to display the alarms with an indication that the device has its alarms inhibited.                                                        |
| rtrv-data-rtdb    | <p>Retrieves Entity data, DN data, IMEI data, IMSI data, TN data, NPANXX data, and LRN data from the RTDB on an active Service Module card.</p> <p>If the loc parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card.</p> <p>If the loc parameter is not specified, the RTDB data is retrieved on the active Service Module card that has the lowest IMT address.</p>               |

| Command | Description                                                                      |
|---------|----------------------------------------------------------------------------------|
|         | The RTDB status on the active Service Module card can be coherent or incoherent. |

## rept-stat-sccp

The `rept-stat-sccp` command provides statistics for local subsystem operating status, CPU usage related to the subsystem, and Service Module cards and the services that execute on the cards. Statistics can be displayed for all Service Module cards, or detailed card traffic statistics can be displayed for a single card when the `loc` parameter is specified.

In general, the text "GPORT" is displayed in `rept-stat-sccp` section headings if the G-Port feature is turned ON without the additional feature of IGM or A-Port being turned ON. If the IGM or A-Port feature is turned ON the text "GPORT" is replaced with the text "MNP".

Refer to the *Commands Manual* for a complete description of the `rept-stat-sccp` command, including parameters and valid values, rules for using the command correctly, and output examples.

### A-Port Feature Statistics

The `rept-stat-sccp` command counts include the following statistics when the MNP service is used:

- SUCCESS = for the LOCREQ Query Response feature, incremented when a Return Result is generated (except in the no-GRN case).
- WARNINGS = incremented when
  - The Circular Route condition is detected
  - For the LOCREQ Query Response feature, GRN was required but missing, and Return Result was sent
- FAILURE = incremented when
  - SRI\_SM Digit modification fails for modified DN > 21 digits
  - For the LOCREQ Query Response feature, a Return Result cannot be generated due to decode errors, number conditioning errors or encode errors
  - For the LOCREQ Query Response feature, a message is received and MNP service is Offline
- FORWARD TO GTT = incremented when
  - A GT-routed message is sent for GTT processing by the feature processing

FORWARD to GTT is NOT incremented for messages that are MTP routed after MNP service processing.

## EAGLE 5 ISS Debug Commands

Chapter 6 of the *Commands Manual* contains descriptions of commands that can be used in assessing and modifying system status and operation. The debug commands are used only under the direction of Tekelec support personnel.

The `ent-trace` command traps A-Port MSUs (Message Signaling Units) based on the point code of the switch that generated the MSU (SSP), a particular DN and entity ID. For MDN and entity ID, the comparison is based on the search key built from the CdPA GTAI (Global Title Address Information) after any conditioning. The existing GT SCCP trigger also applies to A-Port messages.

## Status Reporting and Problem Identification

EAGLE 5 ISS commands can be used to obtain status and statistics for the EAGLE 5 ISS system, the EPAP systems, system devices including Service Module cards, EPAP-related features, local subsystems, and SCCP services.

Refer to the *Commands Manual* for complete descriptions of the commands, including parameters and valid values, rules for using the commands correctly, and output examples.

Refer to the *Unsolicited Alarm and Information Messages* manual for descriptions and recovery procedures for UAMs and UIMs.

Refer to the *EPAP Administration Manual* for descriptions of EPAP functions and operation.

Refer to the *EPAP Alarms on the T1200 Platform* manual for descriptions and recovery procedures for EPAP alarms.

Refer to the appropriate *Feature Manual* for information about the functions and operation of EPAP-related features.

**Table 32: Status Reporting for EPAP-Related Features**

| Reports, Status, and Statistics                                                                               | Command                                                   |
|---------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------|
| <b>EAGLE 5 ISS</b>                                                                                            |                                                           |
| Maintenance Status Report - indicates whether Maintenance, Routing, and SCCP Baselines have been established. | <code>rept-stat-sys</code>                                |
| Alarms and operating state for system devices, including Service Module ( "SCCP") cards.                      | <code>rept-stat-sys</code>                                |

|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------|
| Operating state and alarm status of equipped Service Module cards and their DSM ports and IP connections.                                                                                                                   | rept-stat-mps<br>rept-stat-mps:loc=<Service Module card location> |
| Amount of memory used by the RTDB on the specified card, as a percent of available Service Module card memory.                                                                                                              | rept-stat-mps:loc=<Service Module card location>                  |
| EPAP Provisioning Database (PDB), EPAP Real Time Database (RTDB), and Service Module card RTDB status information - Coherent, birthdate (date and time of creation), and exception (condition when a problem was detected). | rept-stat-db<br>rept-stat-db:db=mps                               |
| <b>Service Module Cards, EPAP-Related Features, Services, Local Subsystems</b>                                                                                                                                              |                                                                   |
| Status of the Service Module cards, and the services executing on the cards for EPAP-related features that are turned on. Includes Service Report, Subsystem Report, and Alarm Status; Total Service Statistics.            | rept-stat-sccp                                                    |
| Operating state and alarm status of equipped Service Module cards and their DSM ports and IP connections; EPAP-related feature status per card.                                                                             | rept-stat-mps:loc=<Service Module card location>                  |
| Alarms and operating state for Service Module ("SCCP") cards.                                                                                                                                                               | rept-stat-sys<br>rept-stat-mps                                    |
| Any cards that are denied SCCP service.                                                                                                                                                                                     | rept-stat-sccp                                                    |
| Detailed view of the status of SCCP services provided by the specified Service Module card. Includes Card Alarm Status, Card Service Statistics                                                                             | rept-stat-sccp:loc=<Service Module card location>                 |
| General SCCP traffic performance for Service Module cards. Message rates for TVG performance.                                                                                                                               | rept-stat-sccp:mode=perf                                          |
| Statistics for EPAP-related feature local subsystems - Subsystem Report                                                                                                                                                     | rept-stat-sccp                                                    |
| Statistics for EPAP-related features                                                                                                                                                                                        | rept-stat-sccp                                                    |

## EPAP Status and Alarm Reporting

Because EPAP has no direct means of accepting user input or displaying output messages on EAGLE 5 ISS terminals, EPAP maintenance, measurements, and status information are routed through a Service Module card. EPAP sends two types of messages to the Service Module card: *EPAP Maintenance Blocks* and *DSM Status Requests and DSM Status Messages*. Each message type is discussed in the following sections.

### EPAP Maintenance Blocks

The EPAP forwards all status and error messages to the Service Module cards in maintenance blocks. Maintenance blocks are asynchronously sent whenever the EPAP has something to report. The status information that is displayed when a `rept-stat-mps` command is issued includes information that came from the maintenance blocks.

The active EPAP generates and sends maintenance blocks to the primary Service Module card. One maintenance block is sent as soon as the IP link is established between the active EPAP and the primary Service Module card. Additional maintenance blocks are sent whenever the EPAP needs to report any change in status or error conditions. The information returned in maintenance blocks is included in the output of the `rept-stat-mps` and `rept-stat-sccp` commands.

The EPAP sends maintenance blocks that contain at least the following information:

- Status of EPAP 'A' - actual states are active, standby, and down (inoperative). Maintenance blocks include a field for this information so that it can be available for the output of the `rept-stat-mps` command.
- Status of EPAP 'B' - actual states are active, standby, and down (inoperative). Maintenance blocks include a field for this information so that it can be available for the output of the `rept-stat-mps` command.
- Identification of Active EPAP - a field to identify the active EPAP.
- Congestion Indicator - an indicator showing provisioning link congestion. The link between the EPAPs and the external source of provisioning data can become congested in high-provisioning traffic situations. When this occurs and subsequently as the congestion clears, the EPAP sends maintenance blocks to the Service Module card.
- Alarm Conditions - an error code field. If the EPAP needs to report an alarm condition, it puts an appropriate UAM identifier in this field.
- Current MPS Database Size - a field indicating the current RTDB size. The Service Module card uses this information to calculate the percentage of memory used by the RTDB.

### DSM Status Requests and DSM Status Messages

When the EPAP needs to know the status of a Service Module card, it sends a DSM Status Request to all Service Module cards, and each Service Module card returns its status to the EPAP.

Service Module cards send a DSM Status Message to the EPAP when any the following events occur in the Service Module card:

- The Service Module card is booted.
- The Service Module card receives a DSM Status Request message from the EPAP

- The Service Module card determines that it needs to download the entire RTDB; for example, the Service Module card determines that the RTDB needs to be downloaded because it is totally corrupted, or a craftsperson requests that the RTDB be reloaded. The Service Module card sends a Full Download Request message to the EPAP
- The Service Module card starts receiving RTDB downloads or updates. When a Service Module card starts downloading the RTDB or accepting updates, it sends a DSM Status Message informing the EPAP of the first record received. This helps the EPAP keep track of downloads in progress.

The DSM Status Message provides the following information to the EPAP:

- **DSM Memory Size.** When the Service Module card is initialized, it determines the amount of memory present. The EPAP uses the value to determine if the Service Module card has enough memory to hold the RTDB.

Refer to the *Dimensioning Guide for EPAP Advanced DB Features* for important information on the dimensioning rules and the Service Module card database capacity requirements.

- **Load Mode Status.** This indicator indicates whether or not a sufficient number of the IS-NR (In-Service Normal) LIMs have access to SCCP services.

| CdPA    | Called Party Address<br><br>The field in the SCCP portion of the MSU that contains the additional addressing information of the destination of the MSU. Gateway screening uses this additional |

**C**

information to determine if MSUs that contain the DPC in the routing label and the subsystem number in the called party address portion of the MSU are allowed in the network where the EAGLE 5 ISS is located.

Circular Route Prevention

See CRP.

CLLI

Common Language Location Identifier

The CLLI uniquely identifies the STP in terms of its physical location. It is usually comprised of a combination of identifiers for the STP's city (or locality), state (or province), building, and traffic unit identity. The format of the CLLI is:

The first four characters identify the city, town, or locality.

The first character of the CLLI must be an alphabetical character.

The fifth and sixth characters identify state or province.

The seventh and eighth characters identify the building.

The last three characters identify the traffic unit.

CPC

Capability Point Code

A capability point code used by the SS7 protocol to identify a group of functionally related STPs in the signaling network.

**D**

Database

All data that can be administered by the user, including cards, destination point codes, gateway screening tables, global title translation tables, links, LNP services, LNP service

**D**

providers, location routing numbers, routes, shelves, subsystem applications, and 10 digit telephone numbers.

DB

Database

Daughter Board

Documentation Bulletin

DCB

Device Control Block

DEFCC

Default Country Code

Destination

The node to which the signaling link traffic is routed. This destination is identified by a point code, either a full point code or a cluster point code.

DN

Directory number

A DN can refer to any mobile or wireline subscriber number, and can include MSISDN, MDN, MIN, or the wireline Dialed Number.

DPC

Destination Point Code

DPC refers to the scheme in SS7 signaling to identify the receiving signaling point. In the SS7 network, the point codes are numeric addresses which uniquely identify each signaling point. This point code can be adjacent to the EAGLE 5 ISS, but does not have to be.

DPCA

Destination Point Code ANSI

**E**

EGTT

Enhanced Global Title Translation

## E

A feature that is designed for the signaling connection control part (SCCP) of the SS7 protocol. The EAGLE 5 ISS uses this feature to determine to which service database to send the query message when a Message Signaling Unit (MSU) enters the system.

Enhanced Global Title Translation

See EGTT.

EPAP

EAGLE Provisioning Application Processor

EPAP-related features

Features that require EPAP connection and use the Real Time Database (RTDB) for lookup of subscriber information.

- ANSI Number Portability Query (AINPQ)
- ANSI-41 AnalyzedInformation Query – no EPAP/ELAP (ANSI41 AIQ)
- Anytime Interrogation Number Portability (ATI Number Portability, ATINP)
- AINPQ, INP, G-Port SRI Query for Prepaid, GSM MAP SRI Redirect, IGM, and ATINP Support for ROP
- A-Port Circular Route Prevention (A-Port CRP)
- Equipment Identity Register (EIR)
- G-Flex C7 Relay (G-Flex)
- G-Flex MAP Layer Routing (G-Flex MLR)
- G-Port SRI Query for Prepaid
- GSM MAP SRI Redirect to Serving HLR (GSM MAP SRI Redirect)
- GSM Number Portability (G-Port)
- IDP A-Party Blacklist

## E

| GTA    | Global Title Address                                                                                                                                                                                                                                                                                                     |
| GTI    | Global Title Indicator                                                                                                                                                                                                                                                                                                   |
| GTT    | <p>Global Title Translation</p> <p>A feature of the signaling connection control part (SCCP) of the SS7 protocol that the EAGLE 5 ISS uses to determine which service database to send the query message when an MSU enters the EAGLE 5 ISS and more information is needed to route the MSU. These service databases</p> |

**G**

also verify calling card numbers and credit card numbers. The service databases are identified in the SS7 network by a point code and a subsystem number.

GUI

Graphical User Interface

The term given to that set of items and facilities which provide the user with a graphic means for manipulating screen data rather than being limited to character based commands.

**H**

HLR

Home Location Register

HOMERN

Home Network Routing Number Prefix

**I**

ID

Identity, identifier

IEC

International Escape Code

IGM

See IS41 GSM Migration

IMSI

International Mobile Subscriber Identity

IN

Intelligent Network

A network design that provides an open platform for developing, providing and managing services.

INAP

Intelligent Network Application Part

INP

INAP-based Number Portability

**I**

Tekelec's INP can be deployed as a stand-alone or an integrated signal transfer point/number portability solution. With Tekelec's stand-alone NP server, no network reconfiguration is required to implement number portability. The NP server delivers a much greater signaling capability than the conventional SCP-based approach.

Intelligent Network (IN) Portability

**IP**

Internet Protocol

IP specifies the format of packets, also called datagrams, and the addressing scheme. The network layer for the TCP/IP protocol suite widely used on Ethernet networks, defined in STD 5, RFC 791. IP is a connectionless, best-effort packet switching protocol. It provides packet routing, fragmentation and re-assembly through the data link layer.

**IS-ANR**

In Service - Abnormal

The entity is in service but only able to perform a limited subset of its normal service functions.

**IS-NR**

In Service - Normal

**ISS**

Integrated Signaling System

**ITU**

International Telecommunications Union

**ITUDUPPC**

ITU National Duplicate Point Code

This feature applies only to 14-bit ITU national point codes. This feature allows an EAGLE 5 ISS

**I**

mated pair to route traffic for two or more countries that may have overlapping point code values.

**L****LIM****Link Interface Module**

Provides access to remote SS7, IP and other network elements, such as a Signaling Control Point (SCP) through a variety of signaling interfaces (DS0, MPL, E1/T1 MIM, LIM-ATM, E1-ATM, IPLIMx, IPGWx). The LIMs consist of a main assembly and possibly, an interface appliqué board. These appliqués provide level one and some level two functionality on SS7 signaling links.

**Link****Signaling Link****Signaling Link**

Carries signaling within a Link Set using a specific Association. A Link can belong to only one Link Set and one Association. There is generally one Link per Association in a Link Set.

**LNP****Local Number Portability****LOCREQ****Location Request Message**

A TDMA/CDMA MSC query to an HLR for retrieving subscription/location information about a subscriber to terminate a voice call.

**M****MAP****Mobile Application Part****MDN****Mobile Dialed Number**

**M**

|        |                                                                                                                                                                                                                                                                                                                                                                                                                                |

| MNP    | Mobile Number Portability                                                                                                                                                                                                                                                                                                                                                                                                      |
| MPS    | Multi-Purpose Server<br>The Multi-Purpose Server provides database/reload functionality and a variety of high capacity/high speed offboard database functions for applications. The MPS resides in the General Purpose Frame.<br>Messages Per Second<br>A measure of a message processor's performance capacity. A message is any Diameter message (Request or Answer) which is received and processed by a message processor. |
| MSISDN | Mobile Station International Subscriber Directory Number<br>The MSISDN is the network specific subscriber number of a mobile communications subscriber. This is normally the phone number that is used to reach the subscriber.                                                                                                                                                                                                |
| MSRN   | Mobile Station Roaming Number                                                                                                                                                                                                                                                                                                                                                                                                  |
| MT     | Mobile Terminated<br>All transmissions that reach the mobile station and are accepted by it, such as calls or short messages.                                                                                                                                                                                                                                                                                                  |
| MTP    | Message Transfer Part                                                                                                                                                                                                                                                                                                                                                                                                          |

**M**

The levels 1, 2, and 3 of the SS7 protocol that control all the functions necessary to route an SS7 MSU through the network

MTP Msgs for SCCP Apps

MTP Routed Messages for SCCP Applications feature

A feature that supports MTP-routed SCCP message processing for features that normally do not MTP route messages. The feature supports both LOCREQ and SMSREQ messages.

**N**

NAI

Nature of Address Indicator

Standard method of identifying users who request access to a network.

Network Access Identifier

NC

Network Cluster

Network Code

Not Compliant

NDC

Network destination code

NE

Network Element

An independent and identifiable piece of equipment closely associated with at least one processor, and within a single location.

Network Entity

NEC

National Escape Code

NP

Number Plan

**N**

NPS

Non-Provisionable Service

Short message service that cannot be enabled nor disabled on a per-subscriber basis, and does not allow subscriber-specific data to be configured.

**O**

OAM

Operations, Administration, and Maintenance

The application that operates the Maintenance and Administration Subsystem which controls the operation of the EAGLE 5 ISS.

OOS-MT-DSBLD

Out of Service - Maintenance Disabled

The entity is out of service and the maintenance system is preventing the entity from performing its normal service function.

OPC

Originating Point Code

OPS

Operator Provisioning System

own-network

Belonging to or assigned to this operator.

**P**

PC

Point Code

The identifier of a signaling point or service control point in a network. The format of the point code can be one of the following types:

- ANSI point codes in the format network indicator-network cluster-network cluster member (**ni-nc-ncm**).

**P**

- Non-ANSI domestic point codes in the format network indicator-network cluster-network cluster member (**ni-nc-ncm**).
- Cluster point codes in the format network indicator-network cluster-\* or network indicator-\*-\*.
- ITU international point codes in the format **zone-area-id**.
- ITU national point codes in the format of a 5-digit number (**nnnnn**), or 2, 3, or 4 numbers (members) separated by dashes (**m1-m2-m3-m4**) as defined by the Flexible Point Code system option. A group code is required (**m1-m2-m3-m4-gc**) when the ITUDUPPC feature is turned on.
- 24-bit ITU national point codes in the format main signaling area-subsignaling area-service point (**msa-ssa-sp**).

PDB

Provisioning Database

PDBA

Provisioning Database Application

There are two Provisioning Database Applications (PDBAs), one in EPAP A on each EAGLE 5 ISS. They follow an Active/Standby model. These processes are responsible for updating and maintaining the Provisioning Database (PDB).

PDBI

Provisioning Database Interface

The interface consists of the definition of provisioning messages only. The customer must write a client application that uses the PDBI request/response messages to communicate with the PDBA.

**P**

PPP Point-to-Point Protocol

PT Portability Type

**R**

Restricted The network management state of a route, link set, or signaling link that is not operating properly and cannot carry all of its traffic. This condition only allows the highest priority messages to sent to the database entity first, and if space allows, followed by the other traffic. Traffic that cannot be sent on the restricted database entity must be rerouted or the traffic is discarded.

RFC Request for Comment  
RFCs are standards-track documents, which are official specifications of the Internet protocol suite defined by the Internet Engineering Task Force (IETF) and its steering group the IESG.

RMTP Reliable Multicast Transport Protocol

RN Routing Number

RNIDN Routing Number - International DN

RNNDN Routing Number - National DN

RNSDN Routing Number - Subscriber DN

Route A signaling path from an LSP to an RSP using a specified Link Set

**R**

RTDB Real Time Database

**S**

SCCP Signaling Connection Control Part

SCM System Configuration Manager  
System Configuration Matrix.

Self Point Code The True, Secondary, or Capability Point Code of the EAGLE.

Service Module card DSM card or E5-SM4G card that contains the Real Time Database (RTDB) downloaded from an EPAP or ELAP system.

Service Nature of Address Indicator See SNAI.

Service Portability See S-Port.

SMS Short Message Service

SMSC Short Message Service Center

SMSREQ SMS Request Message

SNAI Service Nature of Address Indicator  
An internal G-Port parameter that allows a user to specify how to interpret the signaling connection control part (SCCP) called party address (CdPA) GTA of a LOCREQ/SMSREQ message.

SN service node

**S**

|        |                                                                                                                                                                                                                                                                                                                                                                                                              |
|--------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| S-Port | <p><b>Service Portability</b></p> <p>A number portability extension which allows a subscriber to retain the same subscriber number when moving from one network type or service technology to another within the network of a single operator. Service Portability provides different routing number digits for formats that require routing numbers. Service Portability does not affect message flows.</p> |
| SP     | <p><b>Signaling Point</b></p> <p>A set of signaling equipment represented by a unique point code within an SS7 domain.</p>                                                                                                                                                                                                                                                                                   |
| SRF    | <p><b>Service Resource Function</b></p> <p>Provide resources to a call, such as announcements, voice prompting, and voice recognition. An example of a SRF is a Voice Recognition Unit (VRU).</p>                                                                                                                                                                                                            |
| SRI    | <p><b>Send_Route_Information Message</b></p>                                                                                                                                                                                                                                                                                                                                                                 |
| SS     | <p><b>Subsystem</b></p>                                                                                                                                                                                                                                                                                                                                                                                      |
| SSN    | <p><b>Subsystem Number</b></p> <p>The subsystem number of a given point code. The subsystem number identifies the SCP application that should receive the message, or the subsystem number of the destination point code to be assigned to the LNP subsystem of the EAGLE 5 ISS.</p> <p>A value of the routing indicator portion of the global title translation data commands indicating that no</p>        |

**S**

further global title translation is required for the specified entry.

Subsystem Number

Used to update the CdPA.

SSP

Subsystem Prohibited network management message.

Subsystem Prohibited SCCP (SCMG) management message. (CER)

STP

Signal Transfer Point

The STP is a special high-speed switch for signaling messages in SS7 networks. The STP routes core INAP communication between the Service Switching Point (SSP) and the Service Control Point (SCP) over the network.

**T**

TCAP

Transaction Capabilities Application Part

TCP

Transfer Control Protocol

TCP/IP

Transmission Control Protocol/Internet Protocol

TDM

Terminal Disk Module

Time Division Multiplexing

TFA

TransFer Allowed (Msg)

TFP

TransFer Prohibited (Msg)

A procedure included in the signaling route management (functionality) used to inform a

**T**

signaling point of the unavailability of a signaling route.

Translation Type

See TT.

TT

Translation Type.

Resides in the Called Party Address (CdPA) field of the MSU and determines which service database is to receive query messages. The translation type indicates which Global Title Translation table determines the routing to a particular service database.

**U**

UAM

Unsolicited Alarm Message

A message sent to a user interface whenever there is a fault that is service-affecting or when a previous problem is corrected. Each message has a trouble code and text associated with the trouble condition.

UDP

User Datagram Protocol

UDT

Unitdata Transfer

UDTS

Unitdata Transfer Service

An error response to a UDT message.

UI

User Interface

UIM

Unsolicited Information Message

A message sent to a user interface whenever there is a fault that is not service-affecting or when a previous

**U**

problem is corrected. Each message has a trouble code and text associated with the trouble condition.

**V****VGTT****Variable Length GTT**

A feature that provides the ability to provision global title entries of varying lengths to a single translation type or GTT set. Users are able to assign global title entries of up to 10 different lengths to a single translation type or GTT set.

**VSCCP****VxWorks Signaling Connection Control Part**

The application used by the Service Module card to support EPAP-related features and LNP features. If an EPAP-related or LNP feature is not turned on, and a Service Module card is present, the VSCCP application processes normal GTT traffic.

**X****XUDT****Extended User Data****XUDTS****Extended Unitdata Service message**

An error response to an XUDT message.
