- When a PC/SSN pair is not replicated, the pair is in *solitary* mode. The subsystem acts as the only application, with no backup. If this subsystem fails, messages routed to it are discarded and SCCP management returns “Subsystem Unavailable” messages to the originator.
- A group of replicated PC/SSN pairs are in *dominant* mode if each PC/SSN pair in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PC/SSN pairs are in *load sharing* mode if each PC/SSN pair in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PC/SSN pairs are in combined load sharing/dominant mode when at least two of the PC/SSN pairs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC/SSN.

If the XMAP feature is enabled, the MAP table can have up to either 2000 or 3000 entries, depending on the controlled feature Part Number that is enabled. If XMAP is not enabled, the MAP table can contain up to 1024 user entries.

The **sso** parameter changes the initialization of the subsystem status (“prohibited” or “allowed”) for PC/SSN MAP entries. The EAGLE 5 ISS previously marked the subsystem status “allowed” for each PC/SSN entry. The **sso** parameter marks the subsystem status “prohibited” for each new entry that has **sso=on**. This causes the EAGLE 5 ISS to generate an SST to the remote point-code when an MTP-RESUME is received. Upon reception of an SSA, the subsystem status is marked “allowed”.

When the ANSI-ITU-China SCCP Conversion feature is turned on, the Concerned Point Code (CSPC) Group’s network type can be of a different network than the mated application’s network type. For example, the mated application’s network type could be ANSI and the CSPC Group could be ITU or mixed with ANSI, ITU, and ITUN concerned point codes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

When the Flexible GTT Load Sharing feature is on, MAP load sharing sets are supported. Each set is identified by the **mapset** parameter.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC/SSN.

## Output

```
ent-map:pc=1-1-1:ssn=10:grp=xyz
  rlgncxa03w 04-01-07 11:43:04 EST  EAGLE 31.3.0

**ent-mrn****Enter Mated Relay Node**

Use this command to assign point codes to groups in the Mated Relay Node (MRN) table. The Intermediate GTT Loadsharing feature must be on before this command can be entered.

If the Flexible GTT Loadsharing feature is enabled, use this command to create a new MRN set, or to add entries to an existing MRN set in the MRN table. When the Flexible GTT Loadsharing feature is turned on, MRN sets are used.

**NOTE: If only the Intermediate GTT Loadsharing feature is turned on, the MRN table can contain a maximum of 3000 entries. If the Intermediate GTT Loadsharing feature is on and the Flexible GTT Loadsharing feature is enabled, the MRN table can contain a maximum of 6000 entries.**

**CAUTION:** If any entries are provisioned in the SCCP-SERV table, the maximum number of entries that the MRN table can contain is reduced by that amount. Check the `rtrv-sccp-serv` command output to see if entries exist in the SCCP-SERV table.

**NOTE:** An MRN set is a logical grouping of PCs that already exist in the EAGLE 5 ISS MRN table. The Intermediate GTT Loadsharing feature allows PCs to be part of more than one load-sharing group, with each PC defined by a different MRN set. When the Intermediate GTT Loadsharing feature is enabled, all existing entries in the MRN table and all existing GTA translations in the GTT table with `ri=gt` are stored in default MRN sets. Additional MRN sets can be provisioned, and GTT entries can be associated to the MRN sets.

**Keyword:** `ent-mrn`

**Related Commands:** `chg-mrn`, `dlt-mrn`, `rtrv-mrn`

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

If a point code is being added to an existing weighted entity set, and the `dflwt` parameter is not specified, the `wt1/wt2/wt3/wt4` parameter must be specified.

The `wt1/wt2/wt3/wt4` parameter can only be specified if at least two of the `rc/rc1/rc2/rc3/rc4` parameters are equal, creating a weighted entity set.

**:pc=** (mandatory)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** `pca`

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When `chg-sid:pctype=ansi` is specified, *ni* = **000** is not valid.

When `chg-sid:pctype=ansi` is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When `chg-sid:pctype=ansi` is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (mandatory)

Post-GTT-translated point code.

**:pci=** (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pcn=** (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:dfltwt=** (optional)

Default weight. This parameter specifies the weight to be assigned to a specified PC that is not assigned a weight with the **wt/wt1/wt2/wt3/wt4** parameter.

If a PC weight is specified with the **wt/wt1/wt2/wt3/wt4** parameter and the **dfltwt** parameter is specified, the default weight is ignored, and the PC is assigned the weight specified by its respective weight parameter.

**Range:** 1-99

**:mrnset=** (optional)

MRN set ID.

**Range:** 1-3000 dflt, new

**dflt**—Default MRN set.

**new**—Create a new MRN set

**:pc1=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca1**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:pc1/pca1/pci1/pcn1/pcn241=** (optional)

Alternate post-GTT-translated point code.

**:pc2=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca2**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:pc2/pca2/pci2/pcn2/pcn242=** (optional)

Alternate post-GTT-translated point code.

**:pc3=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca3**

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:pc3/pca3/pci3/pcn3/pcn243=** (optional)

Alternate post-GTT-translated point code.

**:pc4=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca4**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pc4/pca4/pci4/pcn4/pcn244=** (optional)

Alternate post-GTT-translated point code.

**:pci1=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pci2=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pci3=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pci4=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:pcn1=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn2=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn241=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—**000–255**

*sp*—**000–255**

**:pcn242=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:pcn243=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:pcn244=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:pcn3=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn4=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code

option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:rc=** (optional)

Relative cost. This parameter specifies the relative cost of the route for the primary PC.

**Range:** **0-99**

**:rc1=** (optional)

Relative cost 1. This parameter specifies the relative cost of the route for mate PC 1.

**Range:** **0-99**

**:rc2=** (optional)

Relative cost 2. This parameter specifies the relative cost of the route for mate PC 2.

**Range:** **0-99**

**:rc3=** (optional)

Relative cost 3. This parameter specifies the relative cost of the route for mate PC 3.

**Range:** **0-99**

**:rc4=** (optional)

Relative cost 4. This parameter specifies the relative cost of the route for mate PC 4.

**Range:** **0-99**

**:thr=** (optional)

Threshold. This parameter specifies the in-service threshold of all PCs in a weighted entity set or RC group. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If a threshold value is not specified when creating a new RC group in an existing entity set, the new RC group is assigned a threshold value of **1%**.

**Range:** **1-100**

**:wt=** (optional)

Weight. This parameter specifies the weight assigned to the primary PC. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

If PCs are being added to an existing entity set, the **wt** parameter cannot be specified. If a new entity set is being created, the **wt** parameter can only be specified if at least two of the specified RC values are equal, which creates a weighted entity set.

**Range:** **1-99**

**:wt1=** (optional)

Weight 1. This parameter specifies the weight assigned to the mate PC 1 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

**Range:** **1-99**

**:wt2=** (optional)

Weight 2. This parameter specifies the weight assigned to the mate PC 2 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

**Range:** 1-99

**:wt3=** (optional)

Weight 3. This parameter specifies the weight assigned to the mate PC 3 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

**Range:** 1-99

**:wt4=** (optional)

Weight 4. This parameter specifies the weight assigned to the mate PC 4 that is being added to the weighted entity set. The Weighted GTT Loadsharing feature must be turned on before this parameter can be specified.

**Range:** 1-99

### Example

The following example enters point code 1-1-0 into the MRN table with a relative cost of 10 and associates point code 1-1-1 with it as a point code with a relative cost of 20.

**ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20**

The following example updates the group containing point code 1-1-0 in the MRN table, to add point code 1-1-2 with relative cost of 20 and point code 1-1-10 with relative cost of 30 to the group.

**ent-mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=20:pc2=1-1-10:rc2=30**

The following examples include spare point codes.

**ent-mrn:pci=s-2-2-1:rc=10:pci1=s-2-2-2:rc1=11:pci2=2-100-1:rc2=12**

**ent-mrn:pcn=s-1-1-1-123-aa:rc=1:pcn1=1-1-1-235-**

**aa:rc1=2:pcn2=s-1-1-1-235-aa:rc2=3**

**ent-mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=10:mrnset=dflt**

**ent -**

**mrn:pc=1-1-1:rc=10:pc1=1-1-2:rc1=20:pc2=1-1-3:rc2=30:apc3=1-1-4:r  
c3=40:apc4=1-1-5:rc4=50:mrnset=new**

**ent-mrn:pc=1-1-3:pc1=1-1-6:rc1=60:pc2=1-1-7:rc2=70:mrnset=111**

The following examples create a new weighted entity set.

**ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10**

**ent-mrn:pc=1-1-0:rc=10:wt=30:pc1=1-1-1:rc1=10:wt1=10:thr=50**

**ent -**

**mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:pc2=1-3-2:rc2=20:wt2=30:pc3=1  
-10-2:rc3=20:dfwtwt=20**

**ent -**

**mrn:pc=1-1-0:rc=10:pc1=1-1-1:rc1=10:wt1=30:pc2=1-3-2:rc2=10:dfwtw  
t=20:thr=60**

The following examples add new PCs to the weighted entity set containing PC 1-1-0.

**ent-mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=30:wt2=40**

```

ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:pc2=1-1-10:rc2=30:pc3=1-3-2:rc3=10:
wt3=20:dfltw=30
ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=10:pc2=1-1-10:rc2=20:wt2=40:thr
=30
ent-
mrn:pc=1-1-0:pc1=2-2-2:rc1=20:wt1=40:pc2=1-1-10:rc2=20:pc3=1-3-2:
rc3=20:dfltw=25:thr=30

```

## Dependencies

The Intermediate Global Title Translation Loadsharing feature must be turned on before this command can be entered.

A new point code must have the same network type as existing point codes.

When a point code parameter is specified, its relative cost parameter must be specified.

Point codes cannot have the same value as the EAGLE 5 ISS SID.

The same point code value cannot be entered more than once in the MRN table.

ITU-N point codes must be in the format set by the **npcfmti** parameter of the **chg-stpopts** command. (Use the **rtrv-stpopts** command to display the STP option settings.)

Remote point codes must already exist as destinations in the Ordered Route entity set or reside in a cluster destination for which ordered routes are specified.

A maximum of 3000 point codes can be entered into the MRN table.

The Flexible GTT Load-Sharing feature must be enabled before the **mrnset** parameter can be specified.

If the Flexible GTT Loadsharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The specified MRN set must already exist in the MRN table.

When creating a new weighted entity set, the **mrnset=new** or **mrnset=dflt** parameter must be specified.

Each point code group can contain a maximum of 8 point codes.

The Weighted GTT Loadsharing feature must be turned on before the **wt/wt1/wt2/wt3/wt4**, **thr**, and **dfltw** parameters can be specified.

If the **wt/wt1/wt2/wt3/wt4** parameter is specified, the corresponding **pc/pc1/pc2/pc3/pc4** parameter must be specified.

When creating or modifying a weighted entity set, the **dfltw** parameter must be specified, or an individual weight must be specified for each PC.

Entity sets in a solitary or dominant loadsharing mode cannot have weights assigned to the PCs. When creating an entity set, if all of the RC values are unique, the **wt/wt1/wt2/wt3/wt4** and **thr** parameters cannot be specified.

If the **thr** parameter is specified, the **rc1**, **rc2**, **rc3**, and **rc4** parameters must be of equal value.

If the **thr** parameter is specified, the associated **wt/wt1/wt2/wt3/wt4** parameter or the **dfltw** parameter must be specified.

At least one additional point code must be specified.

Any specified point code must be a full point code.

If the **chg-sid:pctype=ansi** command is entered, a value of *ni=000* cannot be specified. If the **chg-sid:pctype=ansi** command is entered, and a value of *ni=001 – 005* is specified, a value of *nc=000* cannot be specified.

If a new point code is being added to the MRN table, the **pc** and **rc** parameters must be specified together in the command. If the Flexible GTT Loadsharing feature is enabled, and the **mrnset=new** parameter is specified, the **pc** and **rc** parameters must be specified together in the command.

If the **pc1/pc2/pc3/pc4** parameter is specified, the **pc** parameter value must already exist in the MRN table.

A new point code that is specified in the command must not already exist in the MRN table.

If the **rc** parameter is not specified, the **wt** parameter cannot be specified.

If PCs are being added to a weighted entity set, the **wt/wt1/wt2/wt3/wt4** parameter or the **dflwt** parameter must be specified.

If PCs are being added to a non-weighted entity set, the **wt/wt1/wt2/wt3/wt4** and the **dflwt** parameters cannot be specified.

At least one optional parameter must be specified.

If the **wt/wt1/wt2/wt3/wt4** parameters are specified, the **dflwt** parameter cannot be specified.

The value specified for the **pc/pc1/pc2/pc3/pc4** parameter cannot be associated with a proxy point code.

## Notes

For the **-mrn** commands, an entity set consists of a group of PCs that are used for traffic distribution, and an RC group consists of PCs within an entity set that have the same RC. In loadsharing mode, an entity set contains 1 RC group. In combined/dominant loadsharing mode, an entity set can contain multiple loadsharing groups.

The EAGLE 5 ISS supports the following modes for nodes and subsystems:

- A group of replicated PCs are in *dominant* mode if each PC in the group has a unique RC. The specified subsystem with the lowest RC acts as the primary subsystem, while the mate subsystem acts as a backup. In the event of congestion, messages route to the mate subsystem. When the congestion subsides, messages are again routed to the primary (dominant) subsystem.
- A group of replicated PCs are in *load sharing* mode if each PC in the group has the same RC. All messages are evenly distributed at the SCCP level to all nodes/subsystems in the group. In the event of congestion or failure, the non-affected subsystem assumes the load of its failed or congested mate.
- The *combined load sharing/dominant* mode supports a combination of load sharing and dominant mode. A group of PCs are in combined load sharing/dominant mode when at least two of the PCs have the same RC and another node subsystem in the group has a different RC. A combination of node accessibility and RC determines the preferred PC.

The **ent-mrn** command cannot be used to change the relative cost value for a point code; the **chg-mrn** command must be used.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

If the **ent-mrn** command is used to add PCs to an existing weighted entity set, and the threshold is specified, all RC group values specified with **rc**, **rc1**, **rc2**, **rc3** and **rc4** parameters for the alternate post-GTT-translated point codes must be equal.

The following rules apply when the **ent-mrn** command is used to add PCs to RC groups:

- If a threshold value is specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold is changed to the specified threshold value and both pre-existing and new PCs in the RC group assume the new threshold value.
- If a threshold value is specified and the PCs are creating a new RC group in the existing entity set, the new RC group assumes the specified threshold value.
- If a threshold value is not specified and the PCs are being added to an existing RC group in the existing entity set, the RC group threshold does not change and the PC assumes the threshold value of the existing RC group.

When the Weighted GTT Loadsharing feature is turned on, weighted entity sets and RC groups are supported, and threshold values can be assigned to each PC.

Entries cannot be provisioned in the MRN table unless routes are also provisioned for corresponding point codes. However, an entry without a configured route may result from upgrading to a new EAGLE 5 ISS release. If such an entry occurs, then traffic will not be routed to the corresponding point code. The entry can be deleted, or a route for the entry can be configured.

## Output

```

## ent-na

## Enter Network Appearance

Use this command to enter a new network appearance in the Network Appearance table.

**Keyword:** ent-na

**Related Commands:** dlt-na, rtrv-na

**Command Class:** Database Administration

## Parameters

**:na=** (mandatory)  
Network appearance.  
**Range:** 0-4294967295

**:type=** (mandatory)  
Type of the network appearance.  
**Range:** ansi, itu, ituis, itun, ituns, itun24

**:gc=** (optional)  
Group Code of the network appearance.  
**Range:** yy

## Example

```
ent-na:type=ansi:na=10
```

```

ent-na:type=itui:na=11
ent-na:type=itun:na=10
ent-na:type=itun:na=11:gc=fr
ent-na:type=itun24:na=3
ent-na:type=ituis:na=4

```

### Dependencies

The network appearance (**na**) must not already exist in the Network appearance table.

The Network Appearance table can contain a maximum of 45 entries.

Group Code (**gc**) must not already be equipped.

Group Code (**gc**) is not allowed with network types **ansi** , **itui**, **ituis**, and **itun24**.

Group Code (**gc**) is required for network type **itun** or **ituns** when the ITUDUPPC feature is turned on.

Group Code (**gc**) is not allowed for network type **itui** when the ITUDUPPC feature is turned off.

Group Code (**gc**) must be in the SID or SPC table.

The Spare Point Code Support feature must be enabled before the **ituis** or **ituns** network type can be specified.

The specified network appearance must exist in the Network Appearance table.

### Notes

Network Appearance identifies the SS7 network context of the message, for the purposes of logically separating signaling traffic between the SGP and ASP over a common SCTP association. A unique network appearance value can be associated with ANSI, ITUI, 14-bit ITU-N or 24-bit ITU-N networks. When the ITUDUPPC (ITU National Duplicate Point Code) feature is turned on, network appearance can be associated with a specific 14-bit ITU-N group code.

### Output

```

ent-na:type=ansi:na=10
  rlgncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0
  ENT-NA: MASP A - COMPLTD

## ent-npp-as

### Enter an NPP Action Set

Use this command to enter a Numbering Plan Processor (NPP) Action Set (AS). An AS is a collection of Conditioning Actions (CAs), Service Actions (SAs), and Formatting Actions (FAs).

**NOTE: All Additional Subscriber Data actions will be available in a future release.**

**Keyword:** ent-npp-as

**Related Commands:** chg-npp-as, dlt-npp-as, rtrv-npp-as

**Command Class:** Database Administration

### Parameters

**NOTE: The CAs, SAs, and FAs are processed in the order that they are provisioned within an AS.**

**NOTE: Definitions for the CA, FA, and SA parameter values are located in the Notes section.**

**:asn=** (mandatory)

Action set name. This parameter specifies the name of the AS.

**Range:**        *zzzzzzzzzz*  
                  10 alphanumeric characters

**:ca1=** (optional)

Conditioning action 1. This parameter specifies the first CA that can be applied to an incoming digit string.

**Range:**        ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca10=** (optional)

Conditioning action 10. This parameter specifies the tenth CA that can be applied to an incoming digit string.

**Range:**        ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca11=** (optional)

Conditioning action 11. This parameter specifies the eleventh CA that can be applied to an incoming digit string.

**Range:**        ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca12=** (optional)

Conditioning action 12. This parameter specifies the twelfth CA that can be applied to an incoming digit string.

**Range:**        ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca2=** (optional)

Conditioning action 2. This parameter specifies the second CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca3=** (optional)

Conditioning action 3. This parameter specifies the third CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca4=** (optional)

Conditioning action 4. This parameter specifies the fourth CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca5=** (optional)

Conditioning action 5. This parameter specifies the fifth CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfb1, pfb2, pfb3, pfb4, pfb5, pfb6, pfb7, pfb8, pfc1, pfc2, pfc3, pfc4, pfc5, pfc6, pfc7, pfc8, pfd1, pfd2, pfd3, pfd4, pfd5, pfd6, pfd7, pfd8, pxe1, pxe2, pxe3, pxe4, pxe5, pxe6, pxe7, pxe8, pxf1, pxf2, pxf3, pxf4, pxf5, pxf6, pxf7, pxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca6=** (optional)

Conditioning action 6. This parameter specifies the sixth CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca7=** (optional)

Conditioning action 7. This parameter specifies the seventh CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca8=** (optional)

Conditioning action 8. This parameter specifies the eighth CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:ca9=** (optional)

Conditioning action 9. This parameter specifies the ninth CA that can be applied to an incoming digit string.

**Range:** ign1, ign2, ign3, ign4, ign5, ign6, ign7, ign8, ign9, ign10, fpx, pfxa1, pfxa2, pfxa3, pfxa4, pfxa5, pfxa6, pfxa7, pfxa8, pfxb1, pfxb2, pfxb3, pfxb4, pfxb5, pfxb6, pfxb7, pfxb8, pfxc1, pfxc2, pfxc3, pfxc4, pfxc5, pfxc6, pfxc7, pfxc8, pfxd1, pfxd2, pfxd3, pfxd4, pfxd5, pfxd6, pfxd7, pfxd8, pfxe1, pfxe2, pfxe3, pfxe4, pfxe5, pfxe6, pfxe7, pfxe8, pfxf1, pfxf2, pfxf3, pfxf4, pfxf5, pfxf6, pfxf7, pfxf8, cc1, cc2, cc3, ccdef, ac1, ac2, ac3, ac4, ac5, ac6, ac7, ac8, sn1, sn2, sn3, sn4, sn5, sn6, sn7, sn8, sn9, sn10, sn11, sn12, sn13, sn14, sn15, snx, dn1, dn2, dn3, dn4, dn5, dn6, dn7, dn8, dn9, dn10, dn11, dn12, dn13, dn14, dn15, dnx, znx, aclac, accgpn

**:fa1=** (optional)

Formatting action 1. This parameter specifies the first FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**  
              **none**—Formatting is not performed

**Default:**   **orig**

**:fa10=** (optional)

Formatting action 10. This parameter specifies the tenth FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa11=** (optional)

Formatting Action 11. This parameter specifies the eleventh FA that can be applied to the outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa12=** (optional)

Formatting action 12. This parameter specifies the twelfth FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa2=** (optional)

Formatting action 2. This parameter specifies the second FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa3=** (optional)

Formatting action 3. This parameter specifies the third FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa4=** (optional)

Formatting action 4. This parameter specifies the fourth FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:**   **orig**

**:fa5=** (optional)

Formatting action 5. This parameter specifies the fifth FA that can be applied to an outgoing digit string.

**Range:**     **sn, dn, zn, ac, rn, sp, cc, fpfx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid**

**Default:** orig

**:fa6=** (optional)

Formatting action 6. This parameter specifies the sixth FA that can be applied to an outgoing digit string.

**Range:** sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid

**Default:** orig

**:fa7=** (optional)

Formatting action 7. This parameter specifies the seventh FA that can be applied to an outgoing digit string.

**Range:** sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid

**Default:** orig

**:fa8=** (optional)

Formatting action 8. This parameter specifies the eighth FA that can be applied to an outgoing digit string.

**Range:** sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid

**Default:** orig

**:fa9=** (optional)

Formatting action 9. This parameter specifies the ninth FA that can be applied to an outgoing digit string.

**Range:** sn, dn, zn, ac, rn, sp, cc, fpx, pfxa, pfxb, pfxc, pfxd, pfxe, pfxf, dlma, dlmb, dlmc, asd, orig, grn, vmid

**Default:** orig

**:ofnai=** (optional)

Outgoing filter nature of address indicator. This parameter specifies the filter nature of address indicator (FNAI) class of the outgoing digit string.

**Range:** intl, natl, nai1, nai2, nai3, unkn, inc  
**intl** — intl value provisioned in the **chg-npp-serv** command  
**natl** — natl value provisioned in the **chg-npp-serv** command  
**nai1** — nai1 value provisioned in the **chg-npp-serv** command  
**nai2** — nai2 value provisioned in the **chg-npp-serv** command  
**nai3** — nai3 value provisioned in the **chg-npp-serv** command  
**unkn** — unkn value provisioned in the **chg-npp-serv** command  
**inc** — NAI of the incoming digit string

**Default:** inc

**:sa1=** (optional)

Service action 1. This parameter specifies the first SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnpnp, cgpnpnpqrd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnpnpqrd, snsngpn, none  
**none**—terminates the list of SAs. If the **sa1=none** parameter is specified, then no other SAs are processed.

**:sa2=** (optional)

Service action 2. This parameter specifies the second SA that can be applied to an incoming digit string.

SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa2=none** parameter is specified, then any subsequent SA is not processed.

**:sa3=** (optional)

Service action 3. This parameter specifies the third SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa3=none** parameter is specified, then any subsequent SA is not processed.

**:sa4=** (optional)

Service action 4. This parameter specifies the fourth SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa4=none** parameter is specified, then any subsequent SA is not processed.

**:sa5=** (optional)

Service action 5. This parameter specifies the fifth SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa5=none** parameter is specified, then any subsequent SA is not processed.

**:sa6=** (optional)

Service action 6. This parameter specifies the sixth SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa6=none** parameter is specified, then any subsequent SA is not processed.

**:sa7=** (optional)

Service action 7. This parameter specifies the seventh SA that can be applied to an incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs. If the **sa7=none** parameter is specified, then any subsequent SA is not processed.

**:sa8=** (optional)

Service action 8. This parameter specifies the eighth SA that can be applied to the incoming digit string. SAs are service-specific.

**Range:** **rtdbtrn, rtdbtsp, rtdbtrnsp, cdial, ccncchk, cdpnnp, cgpnnp, cgpnnprqd, lacck, fwdscs, npnrls, nprelay, nprls, crp, cgpnnprqd, snsngpn, none**  
**none**-terminates the list of SAs.

**Example**

```
ent-npp-as:asn=asn1:ca1=ign1:ca2=ign2:fa1=zn:ca3=ign4:ca4=znx
```

```
ent-npp-
```

```
as:asn=asn4:ca1=fpfx:ca2=cc2:ca3=ign3:ca4=dn4:fa1=dn:fa2=cc
```

```
ent-npp-
```

```
as:asn=asn5:fa1=sn:ca1=ac8:ca2=sn8:ca3=cc3:fa2=ac:fa3=cc:sa1=rtdb
```

```
trn:sa2=rtdbtsp:sa3=rtdbtrnsp:sa4=cdial
```

**Dependencies**

The value specified for the **asn** parameter cannot already exist in the NPP AS table.

One of the following combinations of CA values must be specified for the AS:

- **znx**
- **cc, dn**
- **cc, ac, sn**

The FAs specified for the AS must contain the corresponding FA that a CA will populate or load.

The AS must contain a CA that can load or populate the specified FA.

The CA parameters must be entered in sequential order (**ca1, ca2, ca3...**).

The SA parameters must be entered in sequential order (**sa1, sa2, sa3...**).

The FA parameters must be entered in sequential order (**fa1, fa2, fa3...**).

The CAs within an AS cannot condition more than 32 digits.

The AS cannot contain CAs that load or populate the same FA.

The AS cannot contain the following combinations of CAs:

- If the **ca X =znx** parameter is specified, then **ac X** and **cc X** cannot be specified as values for the **ca X** parameter.
- If the **ca X =dnx** parameter is specified, then the **ca X =ac X** parameter cannot be specified.

The same value cannot be specified for the **fa X** parameters within an AS.

The AS cannot contain FAs that load or populate the following combinations of the outgoing digit string:

- If the **fa X =dn** parameter is specified, then **ac**, **sn**, and **zn** cannot be specified as values for the **fa X** parameter.
- If the **fa X =zn** parameter is specified, then **ac**, **cc**, **sn**, and **dn** cannot be specified as values for the **fa X** parameter.

If specified, the filter prefix must be the first CA (the **ca1=fpfx** parameter must be specified).

If specified, the **znx**, **snx**, and **dnx** values must be the final CAs in the **ca X** sequence.

A maximum of 1024 (1K) AS entries can be specified in the NPP system.

The same value cannot be specified for the **sa X** parameters within an AS.

**Notes*****Conditioning Action Value Definitions***

- **ac1-ac8**—Stores the specified number of digits from the incoming digit string as the Area Code
- **alac**—Stores the location area code from the location area information in IDP as the Area Code
- **cc1-cc3**—Stores the specified number of digits from the incoming digit string as the Country Code (CC)
- **ccdef**—Stores the **stpopts:defcc** value as the CC
- **dn1-dn15**—Stores the specified number of digits from the incoming digit string as the Dialed Number
- **dnx**—Stores the remaining digits in the digit string as the Dialed Number
- **fpx**—Stores the filter prefix
- **ign1-ign10**—Ignores the specified number of digits on the incoming digit string
- **pfxa1-pfxa8**—Stores the specified number of digits from the incoming digit string as Prefix A
- **pfxb1-pfxb8**—Stores the specified number of digits from the incoming digit string as Prefix B
- **pfxc1-pfxc8**—Stores the specified number of digits from the incoming digit string as Prefix C
- **pfxd1-pfxd8**—Stores the specified number of digits from the incoming digit string as Prefix D
- **pfxe1-pfxe8**—Stores the specified number of digits from the incoming digit string as Prefix E
- **pfxf1-pfxf8**—Stores the specified number of digits from the incoming digit string as Prefix F
- **sn1-sn15**—Stores the specified number of digits from the incoming digit string as the Subscriber Number
- **snx**—Stores the remaining digits in the digit string as the Subscriber Number
- **znx**—Stores the remaining digits in the digit string as the internationally formatted Dialed Number

#### *Formatting Action Value Definitions*

- **ac**—Area code
- **asd**—Additional subscriber data
- **cc**—Country code
- **dlma**—Delimiter A
- **dlmb**—Delimiter B
- **dlmc**—Delimiter C
- **dn**—Dialed number
- **fpx**—Filter prefix
- **grn**—Generic routing number
- **orig**—Incoming digit string

- **pfxa**—Prefix A
- **pfxb**—Prefix B
- **pfxc**—Prefix C
- **pfxd**—Prefix D
- **pfxe**—Prefix E
- **pfxf**—Prefix F
- **rn**—Routing number
- **sn**—Subscriber number
- **sp**—Service provider
- **vmid**—Voice mail identifier
- **zn**—Internationally formatted dialed number

***Service Action Value Definitions: NPP Test Service***

- **cdial**—CDIAL service action handler algorithm
- **rtdbtrn**—RTDBTRN service action handler algorithm
- **rtdbtrnsp**—RTDBTRNSP service action handler algorithm
- **rtdbtsp**—RTDBSP service action handler algorithm

***Service Action Value Definitions: Prepaid IDP Relay***

IDPRCDPN Service

- **ccncchk**—Verifies the conditioned number is available under CSL CCNDC screening list
- **cdpnp**—Performs an RTDB lookup for the conditioned number and analyses success criteria
- **cgpnnp**—Sets a flag in IDPR feature logic to indicate whether IDPRCGPN service is to be invoked
- **lacck**—Formats the outgoing number by removing the digit and length prefixes from the outgoing digit string if LAC=AC

IDPRCGPN Service

- **cgpnnp**—Performs an RTDB lookup for the conditioned number and analyses success criteria

***Service Action Value Definitions: TIF Number Portability***

- **cdial**—Performs corrective dialing
- **cgpnnp**—Performs an NP lookup on the CgPN
- **crp**—Performs an NP lookup on the CdPN and attempts to detect a circular route
- **npnrts**—Performs an NP lookup on the CdPN and indicates release behavior on an unsuccessful lookup
- **nprelay**—Performs an NP lookup on the CdPN and indicates relay behavior

- **nprls**—Performs an NP lookup on the CdPN and indicates release behavior on a successful lookup

**Service Action Value Definitions: TIF SCS Forwarding**

- **cdial**—Performs corrective dialing
- **fwds**—Indicates that any relayed MSUs require database transport access (DTA) processing.

**Service Action Value Definitions: TIF Simple Number Substitution**

- **cdial**—Performs corrective dialing
- **sns**—Updates the outgoing calling party number (CgPN)

## Output

```

## ent-npp-srs

### Create a NPP Service Rule Set

Use this command to enter a Numbering Plan Processor (NPP) Service Rule Set entry. A Service Rule Set (SRS) is a collection of NPP Rules that are associated with a NPP Service. A NPP Rule is an association between a single NPP filter and a single NPP Action Set.

**Keyword:** ent-npp-srs

**Related Commands:** chg-npp-as, chg-npp-srs, dlt-npp-srs, ent-npp-as, rtrv-npp-as, rtrv-npp-srs

**Command Class:** Database Administration

## Parameters

**:asn=** (mandatory)

Action set name. This parameter specifies the name of the AS.

**Range:** aaaaaaaaa

1 alphabetic character followed by up to 9 alphanumeric characters

**:fdl=** (mandatory)

Filter digit length. This parameter specifies the number of digits on the incoming digit string that is filtered by the NPP.

**Range:** 1-32 \*

\*—multiple lengths of digit strings can be filtered

**:fnai=** (mandatory)

Filter nature of address indicator. This parameter specifies the filter Nature of Address Indicator (NAI) class.

**Range:** intl, natl, nai1, nai2, nai3, unkn

**intl**— filter messages with NAI=INTL

**natl**— filter messages with NAI=NATL

**nai1**— filter messages with NAI=NAI1

**nai2**— filter messages with NAI=NAI2

**nai3**— filter messages with NAI=NAI3

**unkn** — filter messages when NAI=UNKN

The **chg-npp-serv** command is used to assign values to the various FNAI classes.

**:fpx=** (mandatory)

Filter prefix. This parameter specifies the prefix used to filter incoming digit strings.

**Range:** 1-16 digits, \*

1 - 16 hexadecimal digits or a wildcard (\*); valid digits are **0-9, a-f, A-F**.

**:srvn=** (mandatory)

Service name. This parameter specifies the name of the NPP service.

**Range:** **nppt, idprcdpn, idprcgpn, tif, tif2, tif3**

**nppt** — NPP Test Service Rule Set

**idprcdpn** — IDPRCDPN Service Rule Set

**idprcgpn** — IDPRCGPN Service Rule Set

**tif** — TIF NPP Service Rule Set

**tif2** — TIF2 NPP Service Rule Set

**tif3** — TIF3 NPP Service Rule Set

### Example

**ent-npp-srs:srvn=nppt:fpx=a:fdl=10:fnai=intl:asn=asn2**

**ent-npp-srs:srvn=nppt:fpx=abc:fdl=16:fnai=intl:asn=asn3**

### Dependencies

The value specified for the **asn** parameter must exist in the NPP AS table.

The AS specified by the **asn** parameter cannot contain CAs that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain SAs that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain FAs that are not supported by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain SAs that do not conform to the precedence order that is supported by the service specified by the **srvn** parameter.

The CAs in the AS specified by the **asn** parameter cannot condition more digits than allowed by the **fdl** parameter.

If the **fdl=\*** parameter is specified, then the AS specified by the **asn** parameter must contain CAs that support variable digit string conditioning.

A maximum of 8192 (8K) rules can be specified in the NPP system.

A maximum of 4096 (4K) service rules can be specified in the NPP system.

The NPP Rule cannot already exist within the NPP Rule table.

If the values specified for the **fpx** and the **fdl** parameters are not **\***, then the value specified for the **fpx** parameter cannot be greater than the value specified for the **fdl** parameter.

An EPAP-based feature must be enabled before this command can be entered.

The SAs in the AS specified by the **asn** parameter cannot violate mutual exclusivity rules defined by the service specified by the **srvn** parameter.

The AS specified by the **asn** parameter cannot contain an OFNAI class with a value of **none**.

At least one TIF feature must be turned on before an AS containing the **cdial** SA can be specified.

The TIF SCS Forwarding feature must be turned on before an AS containing the **fwds** SA can be specified.

The TIF Simple Number Substitution feature must be turned on before an AS containing the **sns** SA can be specified.

The TIF Number Portability feature must be turned on before an AS containing the **crp**, **npnrls**, **cgpnnpqrd**, **nprelay**, or **nprls** SAs can be specified.

## Output

```
ent-npp-srs:svrn=nppt:fpfx=abc:fdl=16:fnai=intl:asn=asn3
tekelecstp 08-05-17 15:23:24 EAGLE 39.0.0
ent-npp-srs:svrn=nppt:fpfx=abc:fdl=16:fnai=intl:asn=asn3
ENT-NPP-SRS: MASP A - COMPLTD
```

## ent-pstn-pres

## Enter PSTN Presentation

Use this command to define new Public Switched Telephone Network (PSTN) presentation values.

**NOTE:** This command is obsolete.

**Keyword:** ent-pstn-pres

**Related Commands:** `chg-appl-rtkey`, `chg-isupvar-attrib`, `copy-isupvar-attrib`, `dlt-pstn-pres`, `rtrv-appl-rtkey`, `rtrv-isupvar-attrib`, `rtrv-pstn-pres`

**Command Class:** Database Administration

## Parameters

**:pstncat=** (mandatory)

PSTN category identifying the new Variant being defined.

**Range:** 0-65535

**:pstnid=** (mandatory)

PSTN ID identifying the new Variant being defined.

**Range:** 0-65535

**:pstndesc=** (optional)

A test description of the PSTN presentation value.

[illegible]

Any alphanumeric string of 0-31 characters in length, in double quotes

**Default:** Blank spaces

### Example

ent-pstn-pres:pstncat=5000:pstndesc="Mexican ISUP vl.8"

## Dependencies

Required controlled features must be enabled.

- ISUP Normalization feature
- ON/OFF controlled feature for *Tekelec-defined* Variant
- The Tekelec-defined Variants are listed in “Tekelec-defined ISUP Normalization Variants” in Appendix A.
- Quantity controlled feature for *user-defined* Variant

The combination of **pstncat** and **pstnid** values must be valid.

- A controlled feature must exist for the **pstncat/pstnid** combination.
- The **pstncat** and **pstnid** must not already be defined.

- The maximum number of Variants the system supports cannot be exceeded.

The quantity controlled feature must have available capacity.

You cannot exceed the maximum number of *user-defined* Variants associated with the quantity controlled feature.

## Notes

The system uses the PSTN presentation value, consisting of a PSTN category and a PSTN ID, to uniquely define an ISUP Variant. The assignment of a new PSTN value also creates a new entry in the ISUP Variant table. The new PSTN value **must** be unique.

The **ent-pstn-pres** command is used to define values within the Tekelec-defined range (PSTN category 0-4095) as long as an associated ON/OFF control feature exists and its status is ENABLED.

The **ent-pstn-pres** command is used to define values within the user-defined range (PSTN category 4096-65535) as long as an associated ISUP normalization quantity control feature exists and its status is ENABLED and its capacity is not going to be exceeded.

The **ent-pstn-pres** command also creates a new entry in the ISUP Variant table initialized to default values. There **must** be an available entry in the table or this command will be rejected.

## Output

The following output example defines a new *user-defined* PSTN presentation value.

```
ent-pstn-pres:pstncat=5000:pstnid=1:pstndesc="mexican isup v1.8"
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-PSTN-PRES: MASP A - COMPLTD
;
```

## ent-rmt-appl

## Enter Remote Application

Use this command to assign user parts to an internal point code that, in turn, assigns user parts to an End Office node.

**Keyword:** ent-rmt-appl

**Related Commands:** dlt-rmt-appl, rtrv-rmt-appl

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:ipc=** (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

**Synonym:** ipca

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:ipc/ipca/ipci/ipcn/ipcn24=** (mandatory)

End Node's internal point code.

**:ipci=** (mandatory)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:ipcn=** (mandatory)

ITU national point code with subfield ITU number (*nnnnn*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:ipcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (mandatory)

Service indicator value that designates which user part is assigned to the IPC.

**Range:** **3-15**

**:ssn=** (optional)

SCCP subsystem number. Valid **only** if **si=3**. Use **ssn** as the starting value of the range if **ssne** is specified.

**Range:** **0-255**

**:ssne=** (optional)

Specifies the end of the range of subsystem numbers.

**Range:** **0-255**

**Example**

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5:ssne=100
ent-rmt-appl:ipc=0-0-1:si=5
ent-rmt-appl:ipcn24=1-100-1:si=5
ent-rmt-appl:ipc=p-1-1-1:si=3:ssn=5:ssne=102
ent-rmt-appl:ipci=ps-2-2-2:si=5
```

**Dependencies**

Partial point codes are not allowed.

The **ssn** parameter is required if **si=3**.

The **ssn** and **ssne** parameters are not allowed unless **si=3**.

The **ssne** parameter value must be greater than the **ssn** parameter value.

The specified IPC **must** be previously defined in the destination table.

The new entry cannot conflict with an existing entry.

**Notes**

To specify a range of subsystem numbers, specify the **ssn** parameter value as the start of the range and the **ssne** parameter value as the end of the range.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

**Output**

```
ent-rmt-appl:ipc=0-0-1:si=3:ssn=5
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-RMT-APPL: MASP A - COMPLTD
;
```

**ent-rte****Enter Route**

Use this command to add a route to the system.

**CAUTION:** When using the Network Routing feature, limited network management is provided for point codes not covered by full point code routing, Cluster Routing, or Nested Cluster Routing.

**Keyword:** ent-rte

**Related Commands:** dlt-rte, rept-stat-dstn, rtrv-rte

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** **p-, 000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn=** (mandatory)

Destination point code.

**:dpci=** (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:lsn=** (mandatory)

The linkset name associated with this route.

**Range:**        *ayyyyyyyyy*  
                  1 alphabetic character followed by 9 alphanumeric characters

**:rc=** (mandatory)

The relative cost of the route

**Range:**        **0-99**

**:force=** (optional)

This parameter allows a route to be added to the database even if the linkset to be assigned to the route does not have any signaling links in it.

**Range:**        **yes, no**

**Default:**      **no**

### Example

Adds route for dpc1-1-1 to linkset we123642:

**ent-rte:dpc=1-1-1:lsn=we123642:rc=25**

Adds route for dpc21-\*-\* to linkset we123642:

**ent-rte:dpc=21-\*-\*:lsn=we123642:rc=25**

Adds route for dpcn2410-100-14 to linkset we123624:

**ent-rte:dpcn24=10-100-14:lsn=we123624:rc=10**

Adds route for private dpcp-1-1-1 to linkset we123642.

**ent-rte:dpc=p-1-1-1:lsn=we123642:rc=25**

Adds route for private and spare dpcnps-4082-ge to linkset e1ntitun.

**ent-rte:dpc=ps-4082-ge:lsn=e1ntitun:rc=10**

Adds route for private dpcn24p-10-100-14 to linkset we123642.

**ent-rte:dpcn24=p-10-100-1:lsn=we123642:rc=10**

Adds route for private and spare dpcis-1-100-1 to linkset ue123642.

**ent-rte:dpci=s-10-100-1:lsn=ue123642:rc=10**

### Dependencies

The value of the **lsn** parameter must exist in the STP database.

The **force=yes** parameter must be specified if a linkset is assigned to a route that has no links in it.

The DPC must be in the Destination Point Code table.

The destination point code of a route must be a full point code (*ni-nc-ncm*), a cluster point code (*ni-nc-\**), or a network point code (*ni-\*-\**).

If the specified destination address is a full point code address (*ni-nc-ncm*) and is a member of a provisioned cluster (*ni-nc-\**), whether ordered routes can be assigned is determined by the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, destinations comprising a cluster inherit their ordered routes from the cluster.
- If the **ncai=yes** parameter is specified, then the destination address is a member of a provisioned nested cluster where ordered routes can be assigned to a provisioned member.

If the specified destination address is a network cluster address (*ni-nc-\**), the assignment of the specified ordered route attributes is determined by the setting of the destination address's NCAI (nested cluster allowed indicator). The **ncai= yes/no** parameter is set with the **ncai** parameter of the **ent/chg-dstn** commands.

- If the **ncai=no** parameter is specified, the collection of signaling point codes having the same network identifier (the **ni** parameter) and network cluster (the **nc** parameter) code are assigned the specified ordered route.
- If the **ncai=yes** parameter is specified, then the specified destination is a network cluster address where provisioned members's signaling point codes can be assigned the same or different ordered routes from the cluster.

If the **dpcn** parameter is specified, the format of the point code(s) must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be specified with a private point code (**-p**) unless the route is an IPGW route.

The route destination's type must match the route's linkset adjacent point code or the route's linkset secondary adjacent point code type.

If the **ipgwapc=yes** parameter is specified for the linkset, then the associated **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot have a cluster route assigned.

The linkset must be defined with at least one link.

The value of the **rc** parameter cannot be assigned to more than two linksets.

A linkset can be entered only once as a route for each destination.

If the specified destination address is a network address (*ni-\*-\**), or network cluster address (*ni-nc-\**), the linkset type (see the **chg-ls** command) used in the route must be **b**, **c**, or **d**.

Combined linksets are not allowed for X.25 destinations. Routes of equal cost destined for X.25 domains are not allowed.

If the value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter is assigned to an X.25 domain, then the **lsn** parameter cannot be assigned to an adjacent point code that is assigned to the SS7 domain.

If the value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter is assigned to an SS7 domain, then the **lsn** parameter cannot be assigned to an adjacent point code that is assigned to the X.25 domain.

All routes with ANSI DPCs must use ANSI linkset APCs. A route with an ITU-I DPC can go over an ITU-N APC and an ITU-N DPC can go over an ITU-I APC.

If the link set name (the **lsn** parameter) references a link set that has the **ipgwapc=yes** parameter specified, the DPC must not be a cluster route.

The NRT feature must be turned on before the **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the DPC has a value of **\*** in the *nc* field, the *ncm* field must also be **\*** (for example, **dpc= 21-\*-\***).

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be the same as the EAGLE 5 ISS capability point code.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot be the same as the EAGLE 5 ISS capability point code.

The value of the **dpc/dpca/dpci/dpcn/dpcn24** parameter cannot have already been assigned to an APC or SAPC for an IPGWx linkset. The entered route must include the APC or SAPC's linkset with the destination equal to the APC or SAPC.

If **dpcn** is specified then the format of **dpcn** must match the format dictated by the **npcfmti** parameter via the **chg-stpropts** command

The STP shall ensure that the ITU-N ordered route destination's group code must match the route's Link Set Adjacent PC's group code for all linksets other than IPGWI and IPLIMI.

The group code must match for all linksets because the ITU Duplicate Point Code feature is on.

If multiple routes are defined for the destination point code, and if a proxy point code is assigned to the destination point code, then the first route defined in the **ent-rte** command must use the proxy linkset.

If the **dpc** parameter has a network cluster address (*ni-nc-\**) or network address (*ni-\*-\**), then the **lst=prx** parameter cannot be specified.

## Notes

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

```
ent-rte:dpc=1-1-1:lsn=we123642:rc=25
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-RTE: MASP A - COMPLTD

```

## ent-rtx

## Enter Exception Route

Use this command to enter an exception route entry. An exception route is associated with an entry in the Routing table. When the Origin-Based MTP Routing feature is enabled and turned on, the least cost route available for an MSU to be routed to a Destination Point Code over a specified linkset is used. See the *Database Administration - Features* manual for more information about determining routes for linksets.

Up to 6 routes can be defined to a single entry in the Routing table. Up to 8000 routesets can be defined for an STP. This total must include at least one normal route (not an exception route). The remaining 7999 routesets can include any combination of normal and exception routes.

**NOTE: A routeset is a collection of routes to a destination. Each routeset can have up to 6 routes, with 16 links on each route. An exception routeset is a collection of up to 6 exception routes that have the same DPC, exception class, and criteria.**

**Keyword:** ent-rtx

**Related Commands:** chg-rtx, dlt-rtx, rtrv-rtx

**Command Class:** Database Administration

## Parameters

**:dpc=** (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:dpci=** (mandatory)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (mandatory)

Linkset Name. This parameter specifies the name of the linkset that is associated with the specified exception route.

**Range:** **aaaaaaaa**

1 alphabetic character followed by up to 9 alphanumeric characters.

**:rc=** (mandatory)

Relative Cost. This parameter is the relative cost associated with the specified exception route.

**Range:** **0-99**

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:**       **0-16383**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:**       **0-16383**

**:force=** (optional)

The **force=yes** parameter must be specified when the **ilsn** parameter value is the same as the **lsn** parameter value.

**Range:**       **yes**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**       `ayyyyyyyyy`

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:**       **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**       **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcni=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmit** flexible point code option. A group code must be specified when the ITUDUPPDC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, p-, ps-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:opc<sub>n</sub>24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** 3-15

### Example

**ent-rtx:dpc<sub>a</sub>=1-1-1:opc<sub>a</sub>=2-3-3:lsn=ls<sub>et</sub>1:rc=30**

**ent-rtx:dpc<sub>a</sub>=1-3-1:ilsn=ls<sub>et</sub>2:lsn=ls<sub>et</sub>3:rc=20**

**ent-rtx:dpc<sub>a</sub>=2-100-1:si=5:lsn=ls<sub>et</sub>5:rc=50**

### Dependencies

Only one of the **opc**, **ilns**, **cic**, or **si** parameters can be specified for a exception route entry.

For an ANSI origination point code that is defined using asterisks (**nnn-\*-\***), the value of the *network identifier* subfield (*nnn*) must be greater than 5.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The **opc** parameter value cannot be the same as the **dpc** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The **dpc** parameter must already exist in the Route table.

A destination point code cannot be specified if it is already being used as an adjacent point code.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

An exception route entry cannot already exist with the same input parameter values, other than the relative cost..

For the **opc**, **ilsn**, CIC range (**cic** and **ecic** parameter values are not identical), and **si** criteria, only one pair of identical exception route conditions, differing only in **lsn** assignment, can exist for a given DPC. For exception route conditions with a single CIC, there can be only one exception route per CIC value per DPC per route cost.

A maximum of 6 exception routes can be associated with the specified DPC and criteria.

A maximum total of 8000 exception routes and normal routes can be defined for the EAGLE 5 ISS. At least one route must be a normal (not exception) route. The remaining routes (up to 7999) can be all normal routes, all exception routes, or any combination of normal and exception routes.

The network domain of the APC/SAPC in the linkset specified by the **lsn** parameter must be the same network domain of the specified DPC or its alias.

The APC/SAPC type and group code in the linkset specified by the **lsn** parameter must match the **dpc** parameter.

The specified CIC/ECIC range must not overlap an existing range.

The **force=yes** parameter must be specified in the following cases:

- The value specified for the **ilsn** parameter is the same as the value specified for the **lsn** parameter.
- The value specified for the **ilsn** parameter is the same as any of the linkset names within the routeset specified by the **rsn** parameter.
- The value specified for the **opc** parameter is the same as the APC of the linkset specified by the **lsn** parameter
- The value specified for the **opc** parameter is the same as the APC of any of the linksets within the routeset specified by the **rsn** parameter.

The **opcn** parameter must be in the same ITU-N group as the **dpcn** parameter.

The Group Code of the APCN in the **ilsn** parameter must be the same as the Group Code of the **dpcn** parameter.

ANSI network routing and cluster point codes as OPC exception route criteria are not allowed for ITU destinations.

ITU point codes as OPC exception route criteria are not allowed for ANSI Network and Cluster destination.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

## Output

```
ent-rtx:dpci=2-100-1:si=5:lsn=lset5:rc=50
stdcfg2b 06-05-19 18:20:11 EST EAGLE 35.0.0
ENT-RTX: MASP A - COMPLTD
```

## ent-scr-aftpc

### Enter Allowed Affected Point Code

Use this command to add a specific allowed affected point code (AFTPC) screening reference in the AFTPC entity set.

**Keyword:** ent-scr-aftpc

**Related Commands:** chg-scr-aftpc, dlt-scr-aftpc, rtrv-scr-aftpc

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

**Range:** stop

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**:ssn=** (mandatory)

The subsystem number. An asterisk (\*) indicates the full range of values from **1-255**.

**Range:** **1-255 \***

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7 \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:nc=** (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:ncm=** (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:ni=** (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **0-255 \***

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000-16383**.

**NOTE:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

**Range:** 00000-16383 \*

**:nsp=** (optional)

The new 24-bit ITU national signaling point (sp). It specifies the new **sp** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 0-255 \*

**:nsr=** (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Current value

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 000-255 \*

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 000-255 \*

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0-7.

**Range:** 0-7, \*

### Example

```
ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop
```

```
ent-scr-
```

```
aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop:actname=copy
```

```
ent-scr-aftpc:nsfi=stop:sr=af01:ssn=1:msa=255:ssa=255:sp=255
```

```
ent-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s
```

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified.

If **area=\*** is specified, **id=\*** must be specified.

If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified.

If **ssa=\*** is specified, **sp=\*** must be specified.

If specified, the **nsfi** parameter value must be **stop**.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the screening reference exists (**sr**), the new affected point code and subsystem number to be added cannot already exist in the AFTPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

## Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screening reference is valid, but does not exist, a new AFTPC screen is created.

If the screening reference exists, a new rule is added to the AFTPC screening table.

If asterisks or ranges are specified for the allowed AFTPCs, nothing that matches the specified range of AFTPCs can already exist in the AFTPC screen for the screening reference.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-aftpc** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix to has the spare point code prefix.

## Output

**ent-scr-aftpc:sr=iec:ni=240:nc=010:ncm=010:ssn=012:nsfi=stop**

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-AFTPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-AFTPC: MASP A - COMPLTD
```

;

## Legend

**ENT-SCR-AFTPC**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

## ent-scr-blkdpc

## Enter Blocked DPC

Use this command to add a specific blocked destination point code (BLKDPC) screening reference, and associated attributes, to the BLKDPC's table. The associated attributes are: destination point code, next screening function identifier, and next screening reference. The destination point codes listed on this screen are prohibited from sending SS7 messages to the network.

**Keyword:** **ent-scr-blkdpc**

**Related Commands:** **chg-scr-blkdpc**, **dlt-scr-blkdpc**, **rtrv-scr-blkdpc**

**Command Class:** Database Administration

## Parameters

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **cgpa**, **destfld**, **fail**, **isup**, **stop**

**cgpa**— Allowed CGPA is the next screening category.

**destfld**— Allowed destination field (DESTFLD) is the next screening category.

**fail**— Discard the received message.

**isup**— ISUP message type (ISUP) is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:**        *ayyyyy*  
                  1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**        **0-7, \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \*, C**

**:nc=** (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \*, C**

**:ncm=** (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **0-255 \*, C**

**:ni=** (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **0-255 \*, C**

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.**

**Range:**        **00000-16383 \*, C**

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be specified if **nsfi** is **stop** or **fail**.

**Range:**        *ayyy*  
                  1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**      No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*, C

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*, C

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7, \*, C

**Example**

```
ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds5
```

```
ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop
```

```
ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=stop:actname=copy
```

```
ent-scr-blkdpc:sr=iec:ni=240:nc=:ncm=:nsfi=fail
```

```
ent-scr-blkdpc:sr=bdp1:zone=1:area=2:id=3:nsfi=fail:pcst=none
```

```
ent-scr-blkdpc:sr=bdp1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

```
ent-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s
```

**Dependencies**

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gws=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362, 700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

When a blocked DPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **sr** does not exist, then the **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** parameters must equal **c-c-c**, or the **npc=c** parameter must be specified, and the **nsfi=fail** parameter cannot be specified.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm zone-area-id** , or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail** .
- The **nsr** parameter cannot be specified.
- The blocked DPC, given by **ni-nc-ncm** (or **zone-area-id** or **npc**), to be added to the BLKDPC screening table for the blocked DPC screening reference cannot exist as defined or within an existing range of DPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

The value of the **nsfi** parameter must be valid for the BLKDPC entity type.

If a blocked screen reference exists, then the **ni**, **zone**, **msa**, and **npc** parameters cannot have a value of **c**.

## Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or of subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** parameters can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkdpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Output**

```

ent-scr-blkdpc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds

**Legend**

**ENT-SCR-BLKDPC**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - SS01**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

**ent-scr-blkopc****Enter Blocked OPC**

Use this command to add a specific blocked originating point code (BLKOPC) screening reference and associated attributes OPC, **nsfi**, and **nsr** to the BLKOPC entity set. Any messages received on the link assigned to this screening reference that match the attributes in this table are blocked from entering the network.

**Keyword:** ent-scr-blkopc

**Related Commands:** chg-scr-blkopc, dlt-scr-blkopc, rtrv-scr-blkopc

**Command Class:** Database Administration

**Parameters**

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** blkdpc, cgpa, dpc, fail, sio, stop

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed CGPA is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**fail**—Discard the received message.

**sio**—Allowed SIO is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*, C

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from 0–7.

**Range:** 0-7, \*, C

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000–255.

**Range:** 000-255 \*, C

**:nc=** (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 000–255.

**Range:** 000-255 \*, C, && (Allow intervals)

**:ncm=** (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 000–255.

**Range:** 0-255 \*, C, && (Allow intervals)

**:ni=** (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 000–255.

**Range:** 0-255 \*, C, && (Allow intervals)

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from 00000–16383.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.**

**Range:** 00000-16383 \*, C

**:nsr=** (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*, C

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*, C

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7** \*, C

```

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set will be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The ANSI point code value **000-000-000** and the ITU-International point code value **0-000-0** cannot be specified.

At least one optional parameter must be specified.

When a blocked OPC screen is created, the first entry for the **ni-nc-ncm zone-area-id**, or **msa-ssa-sp** must be **c-c-c** or **npc** must be **c**. Subsequent entries can be specific point codes.

If asterisks or ranges are specified for the blocked OPCs, nothing that matches the specified range of blocked OPCs can already exist in the BLKOPC screening table for the screening reference.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must exist in the Gateway Screening Stop Action table.

If **area=\*** is specified, **id=\*** must be specified.

If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the specified **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** is not equal to **c-c-c**, or if the **npc=c** parameter is not specified, then the **nsfi=fail** parameter must be specified, and the **nsr** parameter cannot be specified.

If the value of the **nsfi** parameter is not **stop** or **fail**, then the **nsr** parameter must be specified.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **sr** does not exist, then the **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** parameters must equal **c-c-c**, or the **npc=c** parameter must be specified, and the **nsfi=fail** parameter cannot be specified.

If the specified screening reference (**sr**) exists:

- The **ni-nc-ncm**, **zone-area-id**, or **msa-ssa-sp** must equal **c-c-c** or **npc** must not equal **c**.
- The **nsfi** parameter must be **fail**.
- The **nsr** parameter cannot be specified.
- The blocked OPC, specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc**, to be added to the BLKOPC screening table for the blocked OPC screening reference cannot exist as defined or within an existing range of OPCs.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The **pcst** parameter cannot be specified with **c** for a blocked screen reference (**sr**).

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If **ssa=\*** is specified, **sp=\*** must be specified.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

The specified **nsfi** parameter value must be valid for the BLKOPC entity type.

If a blocked screen reference exists, then the **ni**, **zone**, **msa**, and **npc** parameters cannot have a value of **c**.

## Notes

When a blocked DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-blkopc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Output**

```

ent-scr-blkopc:sr=iec:ni=c:nc=c:ncm=c:nsfi=cgpa:nsr=wrds
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-BLKOPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-BLKOPC: MASP A - COMPLTD
;

```

**Legend**

**ENT-SCR-BLKOPC**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

**ent-scr-cdpa****Enter Allowed Called Party Address**

Use this command to add a specific allowed called party address (CDPA) screening reference in the CDPA entity set.

**Keyword:** ent-scr-cdpa

**Related Commands:** chg-scr-cdpa, dlt-scr-cdpa, rtrv-scr-cdpa

**Command Class:** Database Administration

**Parameters**

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** aftp, stop

**afpc**— Allowed affected point code is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

**:ssn=** (mandatory)

The subsystem number. An asterisk (\*) indicates the full range of values from **1-255**.

**Range:** 1-255 \*

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** 0-7, \*

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:nc=** (optional)

The network cluster (nc) value. This parameter specifies one or more nc values for the network indicator (ni) and network cluster member (ncm) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 000-255 \*

**:ncm=** (optional)

The network cluster member (ncm) value. This parameter specifies one or more ncm values for the network indicator (ni) and network cluster (nc) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*

**:ni=** (optional)

The network indicator (ni) value. This parameter specifies one or more ni values for the network cluster (nc) and network cluster member (ncm) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** 0-255 \*

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000-16383**.

**NOTE:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

**Range:** 00000-16383 \*

**:nsr=** (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:scmgfid=** (optional)

The SCMG Format ID. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **1-255**. The following SCCP message types are screened against the Allowed CDPA table and all others are passed: UDT, UDTS, XUDT, XUDTS.

**Range:** 1-255 \*

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (ssa) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:**       **0-7, \***

### Example

**ent-scr-**

**cdpa: sr=iec: ni=240: nc=010: ncm=: ssn=224: nsfi=aftp: nsr=wrds**

**ent-scr-**

**cdpa: sr=iec: ni=240: nc=010: ncm=: ssn=224: nsfi=stop: actname=copy**

**ent-scr-**

**cdpa: sr=cdp1: zone=1: area=2: id=3: ssn=1: nsfi=stop: scmgfid=1: pcst=s**

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

At least one optional parameter must be specified.

The new CDPA entry to be added cannot match any specific, range, or asterisk entry already existing in the specified screening table.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

If the **nnc** parameter is specified as a range, the **nncm** parameter must be specified as an asterisk or as the full range **000–255**.

When **nsfi=aftpc** is specified, the **ssn=1** parameter must be specified.

When **nsfi** is a value other than **stop**, the **nsr** parameter must be specified.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

When **ssn=1** is specified, the **scmgfid** parameter must be specified.

When **ssn** is not **1**, the **scmgfid** parameter cannot be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The specified value for the **nsfi** parameter is not valid for **cdpa** screen.

The next screening function identifier (**nsfi**) and the next screening reference (**nsr**) must point to an existing screen, or the **nsfi** must be equal to **stop** and the **nsr** must not be specified.

## Notes

If the screening reference is valid, but does not exist, a new CDPA screen is created.

If the screening reference exists, a new rule is added to the CDPA screening table.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cdpa** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Output**

```

ent-scr-
cdpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-CDPA: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-CDPA: MASP A - COMPLTD
;

```

**Legend**

**ENT-SCR-CDPA**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

**ent-scr-cgpa****Enter Allowed Calling Party Address**

Use this command to add a specific allowed calling party address (CGPA) screening reference in the CGPA entity set.

**Keyword:** ent-scr-cgpa

**Related Commands:** chg-scr-cgpa, dlt-scr-cgpa, rtrv-scr-cgpa

**Command Class:** Database Administration

**Parameters**

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cdpa, stop, tt

**cdpa**— Allowed called party address is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**tt**— Allowed translation type is the next screening category.

**:ri=** (mandatory)

The routing indicator provides routing instructions to the receiving signaling point. In gateway screening, messages may be screened based on the value of the routing indicator.

**Range:** dpc, gt, \*

**dpc**— Allow a called party address with a routing indicator value of “DPC/SSN.”

**gt**— Screening stops and gateway screening is bypassed as a forced pass.

**\***— A full range of values.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code’s unique screening reference name.

**Range:** ayyy

1 alphabetic character followed by up to 3 optional alphanumeric characters

**:ssn=** (mandatory)

The subsystem number. An asterisk (\*) indicates the full range of values from 1-255.

**Range:** 1-255 \*

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:**        *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**        **0-7, \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \***

**:nc=** (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **000-255 \***

**:ncm=** (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **0-255 \***

**:ni=** (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**        **0-255 \***

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.**

**Range:**        **00000-16383 \***

**:nsr=** (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given.

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** **none, s**

**Default:** **none**

**:sccpmt=** (optional)

The SCCP message type. An asterisk (\*) indicates all possible allowed values.

**Range:** **9, 10, 17, 18, \***  
**9, \*** — UDT  
**10, \*** — UDTS  
**17, \*** — XUDT  
**18, \*** — XUDTS

**Default:** **\***

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7, \***

**Example**

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrds:ri=dpc
```

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=stop:ri=dpc:actname=copy
```

```
ent-scr-
cgpa:sr=cdp1:ni=5:nc=5:ncm=5:ssn=1:ri=dpc:sccpmt=9:nsfi=sdpa:nsr=cdp1
```

```
ent-scr-
cgpa:sr=cgpa:zone=1:area=2:id=3:ssn=1:sccpmt=9:ri=*:nsfi=stop:pcst=s
```

**Dependencies**

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters *gwsa=off* and *gwsn=on*, the gateway screening action in the stop action set specified by the *actname* parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 372,600 rules.

A complete point code must be specified, and must be one, and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The new CGPA point code, **ri**, **sccpmt**, and subsystem number (**ssn**) to be added can not already exist in the CGPA entity set.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

When the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

If **area=\*** is specified, **id=\*** must be specified.

If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

The screen referenced by **nsfi** and **nsr** must already exist.

The **nsr** parameter must be specified, if **nsfi** is not equal to **stop**.

When **nsfi=stop** is specified, the **nsr** parameter cannot be specified.

The **nsfi=tt** parameter can be specified only if the **ri=gt** parameter or the **ri=\*** parameter is specified.

The **nsfi=cdpa** parameter can be specified only if the **ri=dpc** parameter or the **ri=\*** parameter is specified.

If **ssa=\*** is specified, **sp=\*** must be specified.

If **zone=\*** is specified, **area=\*** and **id=\*** must be specified.

The specified value for the **nsfi** parameter is not valid for **cgpa** screen.

The **nsccpmt** and **sccpmt** parameter value must be specified in the range of {**9**, **10**, **17**, **18**, and **\***}.

## Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If the screening reference is valid, but does not exist, a new CGPA screening table is created.

If the screening reference exists, a new rule is added to the CGPA screening table. Only one rule may exist for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**) combination. This implies that for a given **ni-nc-ncm/ssn/ri/sccpmt** (or **zone-area-id** or **npc**), only one value of **ri** may be specified. The **ri** for a given combination can be **dpc**, **gt**, or **\***, but not **dpc** and **gt** independently.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-cgpa** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Output

```
ent-scr-
cgpa:sr=iec:ni=240:nc=010:ncm=*:ssn=224:nsfi=aftpc:nsr=wrld5:ri=dp

ENT-SCR-CGPA: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-CGPA: MASP A - COMPLTD
;
```

## Legend

**ENT-SCR-CGPA**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

## ent-scr-destfld

## Add an Allowed DESTFLD

Use this command to add an allowed affected destination field (DESTFLD) screening reference and associated attributes (destination point code, next screening function identifier, and next screening reference) to the allowed DESTFLD entity set. One or more point codes can be associated with the allowed DESTFLD screening reference. MTP Network Management messages regarding the DESTFLDs listed in this entity set are accepted from another network.

**Keyword:** **ent-scr-destfld**

**Related Commands:** **chg-scr-destfld**, **dlt-scr-destfld**, **rtrv-scr-destfld**

**Command Class:** Database Administration

## Parameters

**:nsfi=** (mandatory)

This parameter indicates that the gateway screening process should stop. If this parameter is specified for this command, it must have the value of **stop**.

**Range:** **stop**

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter specifies the point code's unique screening reference name.

**Range:** *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters.

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*  
1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0-7, \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:nc=** (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:ncm=** (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **0-255 \***

**:ni=** (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **0-255 \***

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.**

**Range:** **00000-16383 \***

**:nsr=** (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (**s-**).

**Range:** **none**, **s**

**Default:** **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (**sp**) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:** **0-7 \***

**Example**

**ent-scr-destfld:sr=iec:ni=240:nc=010:ncm=010-012:nsfi=stop**

**ent-scr-destfld:sr=iec1:ni=1:nc=1:ncm=1:nsfi=stop:actname=copy**

**ent-scr-destfld:sr=dst1:zone=1:area=2:id=3:nsfi=stop:pcst=s**

**Dependencies**

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the **ACT NAME** field of the **rtrv-gws-actset** command output.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000–255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000–255**.

The **nsfi=stop** parameter must be specified in the command.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** and **npcst** parameters cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

## Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-destfld** command.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Output

## ent-scr-dpc

## Enter Allowed DPC

Use this command to add an allowed DPC screening reference and associated attributes (destination point code, next screening function identifier, next screening function reference) to the allowed DPC entity set. One or more DPCs may be associated with the allowed DPC screening reference. The DPCs listed in this entity set are allowed to receive SS7 messages from another network.

**Keyword:** **ent-scr-dpc**

**Related Commands:** **chg-scr-dpc**, **dlt-scr-dpc**, **rtrv-scr-dpc**

**Command Class:** Database Administration

## Parameters

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **blkdpc, cgpa, destfld, isup, stop**

**blkdpc**—Blocked DPC is the next screening category.

**cgpa**—Allowed CGPA is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

The allowed DPC screening reference name. This parameter identifies a set of one or more allowed destination point codes.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters.

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0-7 \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (msa) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:nc=** (optional)

The network cluster (*nc*) value. This parameter specifies one or more *nc* values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:ncm=** (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more *ncm* values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **0-255 \***

**:ni=** (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **0-255 \***

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" for information on converting the point code format.**

**Range:**      **00000-16383 \***

**:nsr=** (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:**      *ayyy*  
1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**    No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**      **none, s**

**Default:**    **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **000-255 \***

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **000-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7, \*, C**

**Example**

**ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=cncf**

**ent-scr-dpc:sr=iec:ni=240:nc=010:ncm=010:nsfi=blkdpc:nsr=bdp1**

**ent-scr-dpc:sr=dpc1:zone=1:area=2:id=3:nsfi=fail:pcst=none**

**ent-scr-dpc:sr=dpc1:zone=2:area=2:id=3:nsfi=fail:pcst=s**

**ent-scr-dpc:sr=dpc1:npc=128:nsfi=fail:pcst=s**

## Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

The destination point code specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must not already exist in the screening reference or within an existing range of DPCs.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The value of the **nsfi** parameter must be valid for the BLKDPC entity type.

## Notes

When a DPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the **npc** parameter. Subsequent entries must be specific point codes.

The character **c** is used in the DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the DPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of **npc=c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

When the point code does not match any entries in the blocked DPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the blocked DPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-dpc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Output

```
ent-scr-dpc: sr=iec: ni=240: nc=010: ncm=010: nsfi=stop: actname=cncf
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-DPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-DPC: MASP A - COMPLTD
;
```

## Legend

**ENT-SCR-DPC**—Command entered that caused this output. This is echoed to the printer.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

## ent-scr-isup

## Enter Allowed ISUP Screening Reference

Use this command to add an allowed ISUP or TUP screening reference to the Allowed ISUP entity set. One or more message types can be associated with the allowed ISUP screening reference. The ISUP message types listed in this entity set are accepted from another network.

**Keyword:** **ent-scr-isup**

**Related Commands:** **chg-scr-isup**, **dlt-scr-isup**, **rtrv-scr-isup**

**Command Class:** Database Administration

## Parameters

**:isupmt/tupmt=** (mandatory)

ISUP message type or TUP message type. A single value or range of values can be entered. An asterisk (\*) indicates the entire range of **000-255**. TUP is not valid for SEAS.

**Range:**       **000-255 \***

**:sr=** (mandatory)

The the individual ISUP screening reference to which this rule will be added. If the specified **sr** does not exist, it will be created

**Range:**       `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters.

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:**       `ayyyyy`

1 alphabetic character followed by up to 5 alphanumeric characters.

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process. If specified, the parameter value must be **stop**.

**Range:**       **stop**

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:nsr=** (optional)

Next screening reference. The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:**       `ayyy`

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     No value given

## Example

**ent-scr-isup:sr=iec:isupmt=1:nsfi=stop**

**ent-scr-isup:sr=iec:isupmt=9:nsfi=stop**

**ent-scr-isup:sr=ibig:isupmt=1&&128:nsfi=stop**

**ent-scr-isup:sr=iall:isupmt=\*:nsfi=stop**

**ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop**

## Dependencies

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

The specified **isupmt** parameter or **tupmt** parameter value must not already exist in the specified **sr**.

If the **nsfi** parameter is specified, the value must be **stop**.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

## Notes

A range of values can be specified for the **isupmt** parameter or **tupmt** parameter, by separating the values that define the range by two ampersands (&&); for example, **:isupmt=025&&100** specifies all ISUP message types from **25** to **100**. The value to the left of the && must be less than the value to the right of the && in the range.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-isup** command.

TUP does not apply to SEAS. ISUP Message Type is the default.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must exist in the SIO table. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value.

To use ISUP message type screening, an SIO screening reference with **si=05** (ISUP) must exist in the SIO table. The ISUP screening reference specifies the ISUP SIO screening reference as the next screening reference parameter (**nsr**) value.

To screen for TUP and ISUP message types using a combined ISUP/TUP screen set, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references. The TUP screening reference specifies the SIO screening reference as the next screening reference parameter (**nsr**) value, and the ISUP screening reference specifies the SIO ISUP screening reference as the next screening reference parameter (**nsr**) value.

## Output

When a screen reference is specified that is not yet associated with a screen set, the following output appears:

```
ent-scr-isup:sr=iec:isupmt=1:nsfi=stop
tekelecstp 04-09-02 09:39:13 EST EAGLE 31.3.0
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

When a screen reference is specified that is already associated with one or more screen sets, the following output appears:

```
ent-scr-isup:tupmt=20:sr=tu01:nsfi=stop
tekelecstp 04-11-17 16:22:27 EST EAGLE 31.4.0
Extended Processing Time Required -- Please Wait
Notice: The number of screensets affected is 2.
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist1 1% FULL
ENT-SCR-ISUP: SCREEN SET AFFECTED - ist2 1% FULL
ENT-SCR-ISUP: MASP A - COMPLTD
;
```

## ent-scr-opc

### Enter Allowed OPC

Use this command to add an allowed OPC screening reference and associated attributes (originating point code, next screening function identifier, next screening function reference) to the allowed OPC entity set. One or more OPCs may be associated with the allowed OPC screening reference. Each OPC listed in this entity set is allowed to send SS7 messages to the customer's network.

**Keyword:** ent-scr-opc

**Related Commands:** chg-scr-opc, dlt-scr-dpc, rtrv-scr-dpc

**Command Class:** Database Administration

## Parameters

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** **blkdpc, blkopc, cgpa, dpc, sio, stop**

**blkdpc**— Blocked DPC is the next screening category.

**blkopc**— Blocked OPC is the next screening category.

**cgpa**— Allowed CGPA is the next screening category.

**dpc**— Allowed DPC is the next screening category.

**sio**— Allowed SIO is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Screening reference. This parameter identifies a set of one or more allowed OPCs.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0-7 \***

**:msa=** (optional)

The 24-bit ITU-national main signaling area (*msa*) value. It specifies the **msa** of the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:nc=** (optional)

The network cluster (*nc*) value. This parameter specifies one or more nc values for the network indicator (*ni*) and network cluster member (*ncm*) values specified in the **ni** and **ncm** parameters. It specifies the *nc* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255 \***

**:ncm=** (optional)

The network cluster member (*ncm*) value. This parameter specifies one or more ncm values for the network indicator (*ni*) and network cluster (*nc*) values identified in the **ni** and **nc** parameters. It specifies the *ncm* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **0-255 \***

**:ni=** (optional)

The network indicator (*ni*) value. This parameter specifies one or more *ni* values for the network cluster (*nc*) and network cluster member (*ncm*) values identified in the **nc** and **ncm** parameters. It specifies the *ni* of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:**      **0-255 \***

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE:** Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A for information on converting the point code format.

**Range:**      **00000-16383 \***

**:nsr=** (optional)

Next screening reference (*nsr*). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:**      *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**    No value given

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**      **none, s**

**Default:**    **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (*sp*) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **000-255 \***

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. This parameter specifies the sub signaling area (*ssa*) in the point code represented by the format *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **000-255 \***

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**      **0-7, \***

**Example**

```
ent-scr-opc:sr=iec:nsfi=stop
```

```
ent-scr-opc:sr=iec:ni=240:nsfi=sio:nsr=iec
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=stop:actname=copy
```

```
ent-scr-opc:sr=iec:ni=240:nc=010:ncm=010:nsfi=dpc:nsr=iec
```

```
ent-scr-opc:sr=opc1:zone=1:area=2:id=3:nsfi=fail:pcst=none
```

```
ent-scr-opc:sr=opc1:zone=2:area=2:id=3:nsfi=fail:pcst=s
```

**ent-scr-opc: sr=opc1: npc=128: nsfi=fail: pcst=s**

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

A complete point code must be specified, using the **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or **npc** combination unless a value of **c** for “continue” is specified.

The OPC specified by **ni-nc-ncm**, **zone-area-id**, **msa-ssa-sp**, or the **npc** parameter must already exist in the screening reference or within an existing range of OPCs.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as an asterisk (**nc=\***), the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000-255**, the **ni** and the **nc** parameters must be specified with a single value.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The **nsr** parameter must be specified if **nsfi** is not equal to **stop**.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

If the **nsfi=fail** parameter is specified, then the **nni**, **nc**, **nncm**, **narea**, **nzone**, **nid**, **nmsa**, **nssa**, **nsp**, and **npc** parameters cannot have a value of **c**.

The value of the **nsfi** parameter must be valid for the OPC entity type.

The Gateway Screening Stop Action table is corrupt or cannot be found.

## Notes

When an OPC screening reference is created, the first entry for a point code must be **c-c-c**, or **c** for the npc parameter. Subsequent entries must be specific point codes.

The character **c** is used in the OPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the OPC screens. When screening for a DPC and the point code being screened does not match any of the point codes in the DPC screens, the message is not rejected and the screening process continues.

There must be an entry in the OPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code is in the form of npc=**c** or subfields equal to **c-c-c**. When the character **c** is specified, the **nsfi** and **nsr** parameters must be specified.

If the character **c** is specified for the parameters **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp**, the character **c** is the only value that can be specified for all three parameters. No other values can be used. For example, a point code **c-c-255** is not allowed. The point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

When the point code does not match any entries in the blocked OPC screens, the screening process is directed to the screening reference with the point code **c-c-c** or **npc=c**. The **nsfi** and **nsr** in this entry are examined to determine the next step in the screening process.

If the current **ni-nc-ncm** or **zone-area-id** or **msa-ssa-sp** is equal to **c-c-c** or **npc=c**, only the **nsfi** and **nsr** can be changed. Otherwise, only the OPC can be changed.

A range of values is specified by separating the values that define the range by two ampersands (&&); for example, **: ni=025&&100** specifies all network indicators for ANSI point codes from 25 to 100.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-opc** command.

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system allows subsequent entries. An error occurs, however, when downloading the screen set to an LIM. Ensure that screen sets do not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

## Output

```
ent-scr-opc:sr=iec:nsfi=stop
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-OPC: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-OPC: MASP A - COMPLTD
;
```

## Legend

**ENT-SCR-OPC**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

**ent-scr-sio****Enter Allowed SIO**

Use this command to add an allowed SIO screening reference and associated attributes (network indicator, service indicator, message priority, H0 heading code, H1 heading code, next screening function identifier, next screening function reference) to the allowed SIO entity set.

**NOTE: To use TUP message type screening, an SIO screening reference with si=04 (TUP) must be defined in the SIO table. This SIO screening reference is specified in the ent-scr-isup command as the next screening reference (nsr) value in a screening reference for TUP message types**

**Keyword:** ent-scr-sio

**Related Commands:** chg-scr-sio, dlt-scr-sio, rtrv-scr-sio

**Command Class:** Database Administration

**Parameters**

**:nic=** (mandatory)

Network indicator code (NIC). This parameter specifies an NIC for the SIO screening reference specified in the **sr** parameter. The NIC is the last 2 bits of the subservice field of an SIO. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–3.

**Range:** 0-3 \*

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** blkdp, cdpa, cgpa, destfld, dpc, isup, stop

**blkdp**— Blocked DPC is the next screening category.

**cgpa**— Allowed CGPA is the next screening category.

**destfld**— Allowed destination field (DESTFLD) is the next screening category.

**dpc**— Allowed DPC is the next screening category.

**isup**— ISUP message type (ISUP) is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:pri=** (mandatory)

Message priority. This parameter specifies a single priority, or the beginning of a range of priorities for the SIO screening reference specified by the **sr** parameter. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–3.

**Range:** 0-3 \*

**:si=** (mandatory)

Service indicator. This parameter specifies an SI for the SIO screening reference specified in the **sr** parameter. The SI is the first 4 bits of an SIO. The SS7 code directs the message to the MTP-user at the destination code.

**Range:** 00-15

**:sr=** (mandatory)

The allowed SIO screening reference name. This parameter identifies a set of one or more **si/nic/pri** combinations.

**Range:** ayyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyy*

1 alphabetic character followed by up to 5 alphanumeric characters.

**:h0=** (optional)

H0 heading code. This parameter specifies a new H0 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–15**.

**Range:** **0–15 \***

**Default:** Value given if **si** value is **00**, **01**, or **02**

**:h1=** (optional)

H1 Heading Code. This parameter specifies an H1 heading code for the screening reference specified in the **sr** parameter. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–15**.

**Range:** **0–15 \***

**Default:** Value given if **si** value is **00**, **01**, or **02**

**:nsr=** (optional)

Next screening reference (NSR). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

### Example

**ent-scr-**

**sio:sr=iec:nic=1:si=1:h0=01&&03:h1=\*:pri=\*:nsfi=dpc:nsr=abc**

**ent-scr-sio:sr=iec:nic=1:si=3:pri=2:nsfi=stop**

**ent-scr-sio:sr=iec:nic=1:si=4:pri=3:nsfi=stop:actname=cncf**

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gws=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **si** parameter is equal to **00**, **01**, or **02**, the **h0** and **h1** parameters must be specified. Otherwise, the **h0** parameter cannot be specified.

Table 5-47 shows the valid combinations of the **h0/h1** parameters:

**Table 5-47.** Valid Combinations for the **h0/h1** Parameters (**ent-scr-sio**)

| If the <b>h0</b> parameter is specified as: | The <b>h1</b> parameter can be specified as: |
|---------------------------------------------|----------------------------------------------|
| A single value                              | A single value                               |
| A single value                              | A range                                      |
| A single value                              | An asterisk (*) entry                        |
| A range                                     | An asterisk (*) entry                        |
| An asterisk (*) entry                       | An asterisk (*) entry                        |

When the **chg-scr-sio** command is entered with the **nh0** or **nh1** parameters, the specified values must be valid with the **h0** or **h1** values currently in the database.

If the screening reference exists, the **nic**, **si**, **h0/h1**, and priorities to be added to the allowed SIO entity set for the SIO screening reference cannot exist in that allowed SIO entity set.

If asterisks or ranges are specified for the heading codes, nothing that matches the combination of **nic**, **si**, and the specified heading codes can already exist in the allowed SIO entity set for the screening reference.

If the screening reference does not exist, a new screening reference for the allowed SIO entity set is created.

The **nsfi** and **nsr** parameters must point to an existing screen, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

Use Table 5-48 to determine an acceptable combination of the **nsfi** and **si** parameters:

**Table 5-48.** Valid **ent-scr-sio nsfi** and **si** Parameter Combinations

| If the <b>nsfi</b> parameter is... | ...the <b>si</b> parameter must be: |
|------------------------------------|-------------------------------------|
| destfld                            | 00                                  |
| cdpa                               | 03                                  |
| cgpa                               | 03                                  |
| isup                               | 05                                  |

Use Table 5-49 to determine the acceptable combination of the specified parameter values:

**Table 5-49.** Additional Valid **ent-scr-sio** Parameter Combinations

| <b>si value:</b> | <b>nic value</b> | <b>pri value</b> | <b>h0 value:</b> | <b>h1 value:</b> |
|------------------|------------------|------------------|------------------|------------------|
| 00               | s, *             | s, *, r          | s                | s, *, r          |
| 00               | s, *             | s, *, r          | *, r             | *                |
| 01, 02           | s, *             | s, *, r          | s                | s, *, r          |
| 01, 02           | s, *             | s, *, r          | *, r             | *                |

**Table 5-49.** Additional Valid **ent-scr-sio** Parameter Combinations

| <b>si value:</b>                                                                  | <b>nic value</b> | <b>pri value</b> | <b>h0 value:</b> | <b>h1 value:</b> |
|-----------------------------------------------------------------------------------|------------------|------------------|------------------|------------------|
| 03-15                                                                             | s, *             | s, *, r          | u                | u                |
| <b>Legend</b><br>s = single value<br>r = range<br>* = asterisk<br>u = unspecified |                  |                  |                  |                  |

If the **nsfi** parameter has a value other than **stop** or **fail**, the **nsr** parameter must be specified and must exist.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter must be specified.

If the **si** parameter is greater than **2**, the **h0** and **h1** parameters must not be specified.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

## Notes

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **pri=0&&2** specifies all message priorities for the range **0** to **2**.

If the screen set reaches 100% capacity (indicated by the **100% Full** message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

To use TUP message type screening, an SIO screening reference with **si=04** (TUP) must be defined in the SIO table. To use ISUP message type screening, a rule with **si=05** (ISUP) must be defined in the SIO table. To use a combined ISUP/TUP screen set for TUP and ISUP message screening, the SIO screening reference with **si=4** and the SIO screening reference with **si=5** must be two different screening references.

The **h0** and **h1** parameters cannot be specified if **si** is not equal to **00**, **01**, or **02**.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-sio** command.

## Output

```

### Legend

**ENT-SCR-SIO**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - SS01**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

## ent-scr-tt

### Enter Allowed Translation Type

Use this command to add a specific allowed translation type (TT) screening reference in the TT entity set.

**Keyword:** ent-scr-tt

**Related Commands:** chg-scr-tt, dlt-scr-tt, rtrv-scr-tt

**Command Class:** Database Administration

### Parameters

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cdpa, stop

**cdpa**— Allowed CDPA is the next screening category.

**stop**— The gateway screening process ends and the message proceeds through normal routing.

**:sr=** (mandatory)

Name of the screening reference.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**:type=** (mandatory)

Translation type. The translation type identifies the global title translation type value in the called party address. It is the decimal representation of the 1-byte field used in SS7. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–255.

**Range:** 000-255 \*

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:nsr=** (optional)

Next screening reference (nsr). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop**. The **nsr** parameter cannot be entered if **nsfi** is **stop**. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** No value given

### Example

```
ent-scr-tt:sr=iec:type=012:nsfi=cdpa:nsr=wr5
```

```
ent-scr-tt:sr=iec:type=012:nsfi=stop:actname=copy
```

### Dependencies

**CAUTION:** Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

If the screening reference is valid, but does not exist, a new TT screen is created.

If the screening reference exists, a new rule is added to the TT screening table.

An asterisk cannot not be specified for a parameter value in this command unless an asterisk was specified for the parameter value in the original **ent-scr-tt** command.

If the **actname** parameter is specified, the **nsfi=stop** parameter must be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **nsfi=stop** parameter is specified, the **nsr** parameter cannot be specified.

If the **nsfi** parameter has a value other than **stop**, the **nsr** parameter must be specified.

If the **nsr** parameter is specified, the specified screening reference must exist.

If the screening reference (**sr**) exists, the single value or range specified for the allowed **type** to be added to the TT screen for the allowed TT screening reference must not already exist in that TT screen.

If an asterisk is specified for the allowed **type**, nothing can already exist in the TT screen for the screening reference.

The specified value for the **nsfi** parameter is not valid for TT screen.

The screen referenced by **nsfi** and **nsr** must already exist.

The Gateway Screening Rules table can contain a maximum of 362,700 rules.

### Notes

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

**Output**

```

ent-scr-tt: sr=iec: type=012: nsfi=cdpa: nsr=wrds
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCR-TT: SCREEN SET AFFECTED - IEC 25% FULL
ENT-SCR-TT: MASP A - COMPLTD
;

```

**Legend**

**ENT-SCR-TT**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED - IEC**—Identifies the screen set that was affected by the command. The screen set name is provided.

**25% FULL**—Indicates the relative size of the screen set.

**ent-scrset****Enter Screen Set**

Use this command to create a new screen set and point it to its first screen. A screen set is a set of screens (filters) that can be assigned to a linkset. SS7 messages transmitted on a linkset assigned to a screen set require screening by the system, if screening is enabled.

**Keyword:** ent-scrset

**Related Commands:** chg-scrset, dlt-scrset, rtrv-scrset

**Command Class:** Database Administration

**Parameters**

**:nsfi=** (mandatory)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** blkdp, blkopc, dpc, opc, sio, stop

**blkdp**—Blocked DPC is the next screening category.

**blkopc**—Blocked OPC is the next screening category.

**dpc**—Allowed DPC is the next screening category.

**opc**—Allowed OPC is the next screening category.

**sio**—Allowed SIO is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**:scrn=** (mandatory)

Screenset name.

**Range:** ayyy

1 alphabetic character followed by up to 3 alphanumeric characters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy

1 alphabetic character followed by up to 5 alphanumeric characters.

**:destfld=** (optional)

This parameter turns on and off the automatic allowed affected destination screening for network management messages against the routing table, self point codes, and capability point codes. When this parameter is **on**, the automatic screening is applied at the end of the provisioned screen set.

**Range:**     yes, no  
**Default:**   yes

**:nsr=** (optional)

Next screening reference (**nsr**). The parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. If **nsfi=stop**, the **nsr** parameter cannot be specified.

**Range:**     ayyy  
               1 alphabetic character followed by up to 3 alphanumeric characters  
**Default:**   No value given

### Example

```
ent-scrset:scrn=ss01:nsfi=opc:nsr=iec
ent-scrset:scrn=ss02:nsfi=stop
ent-scrset:scrn=empt:nsfi=stop:destfld=yes
ent-scrset:scrn=scr1:nsfi=stop:actname=copy
```

### Dependencies

Even though gateway screening is in the screen test mode, as defined by the parameters **gwsa=off** and **gwsn=on**, the gateway screening action in the stop action set specified by the **actname** parameter of the screen set *will* be performed at the end of the screening process.

The **nsfi=stop** parameter must be specified before the **actname** parameter can be specified.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the *ACT NAME* field of the **rtrv-gws-actset** command output.

If the **nsfi=stop** parameter is specified, then the **nsr** parameter cannot be specified.

The specified screen set name cannot be in use by another screen set.

A maximum of 63 user-defined screen sets can be defined in the database.

The **nsfi** and **nsr** parameters must point to one or more existing entities in another entity set, or the **nsfi=stop** parameter must be specified, and the **nsr** parameter cannot be specified.

If the **nsfi=stop** parameter is not specified, then the **nsr** parameter must be specified.

The Gateway Screening (GWS)/Global Title Translation (GTT) shared database resource (DBMM.TBL) may not be full.

### Notes

Entering a new screen set may take a few minutes of processor time. The following message appears in the scroll area:

```
Extended processing time required-please wait
```

If the screen set reaches 100% capacity (indicated by the 100% Full message), the system will allow subsequent entries. An error will occur, however, when downloading the screen set to a LIM. Screen sets should not exceed 100% capacity. Remove screen set entries until the capacity is below 100%.

**Output**

```
ent -scrset:scrn=ss01:nsfi=opc:nsr=iec
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
ENT-SCRSET: SCREEN SET AFFECTED - SS01 25% FULL
ENT-SCRSET: MASP A - COMPLTD
;
```

**Legend**

**ENT-SCRSET**—The command entered that caused this output. This is echoed to the printer as a reference.

**SCREEN SET AFFECTED**—Identifies the screen set that was affected by the command. The screen set name is shown.

**% FULL**—Indicates the relative size of the screen set.

**ent-serial-num****Enter Serial Number**

Use this command to enter and lock the NT serial number into the database for an EAGLE 5 ISS STP.

You must enter the serial number at least once without specifying the **lock** parameter. As long as you enter the command without the **lock** parameter, you can enter the system serial number as many times as needed. After the correct serial number is entered, you must use the **lock=yes** parameter to lock the serial number table. You cannot change the serial number with administration commands after the table is locked.

**Keyword:** ent-serial-num

**Related Commands:** rtrv-serial-num

**Command Class:** Database Administration

**Parameters**

**:serial=** (mandatory)

The system NT Serial Number.

**Range:** aayyyyyyy

Up to 15 alphanumeric characters; mixed case is allowed.

The first two characters (the prefix) must be letters.

The remaining characters must be numbers.

The serial number cannot contain spaces or special characters.

**:lock=** (optional)

This parameter is used to lock the Serial Number table when the serial number is entered for the system.

**CAUTION**

**CAUTION:** After the serial number is locked, you cannot enter it again or change it in the database. You can use the command without the lock parameter to enter the serial number as many times as needed; then enter the command with the lock parameter and the correct serial number to lock the serial number table.

**Range:** yes

**Default:** Not locked

**Example**

```
ent-serial-num:serial=nt00000123
```

```
ent-serial-num:serial=nt00000123:lock=yes
```

### Dependencies

The serial number must be entered at least once without specifying the **lock** parameter.

The system serial number that is entered when the **lock** parameter is specified must match the serial number that was previously entered in the Serial Number table by using the command without the **lock** parameter.

The system serial number cannot be entered again after the Serial Number table is locked.

### Notes

None

### Output

```
ent - serial - num : serial = nt000000123
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
ENT-SERIAL-NUM: MASP A - COMPLTD
;
```

## ent-shlf

## Enter Shelf

Use this command to add an equipment shelf to the database.

**Keyword:** ent-shlf

**Related Commands:** dlt-shlf, rtrv-shlf

**Command Class:** Database Administration

### Parameters

**:loc=** (mandatory)

The shelf location.

**Range:** 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

**:type=** (mandatory)

The type of equipment shelf to be configured.

**Range:** ext

### Example

```
ent - shlf : type = ext : loc = 1200
```

### Dependencies

The frame and shelf values of the shelf location parameter (**loc**) must be within the valid range (xyzz, where x=frame and y=shelf; zz is always 00 for this command).

The specified shelf location must not have been configured previously.

### Notes

None

### Output

```
ent - shlf : type = ext : loc = 1200
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-SHLF: MASP A - COMPLTD
;
```

**ent-sid****Enter Self Identification**

Use this command to define additional true point codes for an STP. This command allows newly defined true point codes to be distributed to the cards without requiring system initialization.

**Keyword:** **ent-sid**

**Related Commands:** **chg-sid, rtrv-sid**

**Command Class:** Database Administration

**Parameters**

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

STP true point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

### Example

To create a site identification STP PC for ITU-N and ITU-I:

**ent-sid:pcn=123:pci=1-1-1**

To create a site identification STP PC for ITU-N Spare and ITU-I Spare:

**ent-sid:pcn=s-123:pci=s-1-1-1**

### Dependencies

At least one optional parameter must be specified.

The Spare Point Code Support feature must be enabled before an ITU-I or ITU-N spare point code can be specified.

If the system is configured for ANSI format point codes, the specified network indicator value (*ni*) of the **pc** parameter must be **6** or greater when the specified cluster value is **0** (*nc*).

The **pcn** and **pcn24** parameters cannot be specified together in the command.

The specified STP point code must not have been previously defined as a capability point code.

An STP point code cannot exist that is the same type (ANSI, ITU-I, ITU-N, ITU-N24, ITU-ISpare, or ITU-NSpare) as the specified STP point code or must not have been previously defined as a capability point code.

The value of the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

ITU-N STP destination point codes can be specified only as full point codes.

Invalid parameter was specified.

### Notes

The SID Table can simultaneously contain the node's true point codes of any following point code types: ANSI, ITU-I, ITU-N or ITU-N24, ITU-ISpare, and ITU-NSpare. (Only ITU-N or ITU-N24, not both, can be defined in the SID Table.)

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

### Output

**ent-sid:pcn=123:pci=1-1-1**

rlghncxa03w 05-01-07 11:11:28 EST EAGLE 31.12.0

ENT-SID: MASP A - COMPLTD

;

**ent-slk****Enter Signaling Link**

Use this command to add a low-speed or high-speed (ATM or IP) signaling link to a linkset in the database.

For 2-port E1 cards, E1/T1 MIM cards, HC-MIM cards, Channel cards, or E5-E1T1 cards, use this command to associate a signaling link and a timeslot with the E1 or T1 interface that will service the timeslot.

For HC-MIM cards used for SE-HSL links, use this command to assign links **a** and **b** on any 2 of the 8 HC-MIM card ports. For E5-E1T1 cards used for SE-HSL links, use this command to assign link **a** on any 1 of the 8 E5-E1T1 card ports.

Signaling links are the only elements in the database directly supported by a hardware device. When a link is added to a linkset, the link remains in the state OOS-MT-DSBLD (out of service maintenance disabled) until it is activated.

Up to 64 signaling links can be assigned to one HC-MIM card, allowing links **a**, **a1** through **a31**, **b**, and **b1** through **b31** to be provisioned. Up to 32 signaling links can be assigned to one E5-E1T1 card, allowing links **a**, **a1** through **a15**, **b**, and **b1** through **b15** to be provisioned.

**NOTE: The link parameter has been added as a synonym for the port parameter. Either port or link can be used for a few more EAGLE 5 ISS releases; then the port parameter will be removed.**

**Keyword:** ent-slk

**Related Commands:** act-slk, blk-slk, canc-slk, dact-slk, dlt-slk, inh-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

**Command Class:** Database Administration

**Parameters**

The following parameters are valid for all types of links: **loc**, **lsn**, **link**, **slc**, **bps**, **ecm**

The following parameters are valid for low-speed links: **llmode**, **l2tset**, **pcrn1**, **pcrn2**, **tset**

The following parameter is valid only for IP links: **ipliml2**

The following parameters are valid for ATM ANSI high-speed links: **atmtsel**, **ll**, **lpset**, **vci**, **vpi**

The following parameters are valid for E1 ATM links: **atmtsel**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **lpset**, **vci**, **vpi**

The following parameters are valid for E1 links: **l2tset**, **pcrn1**, **pcrn2**, **e1loc**, **e1port**, **ts**

The following parameters are valid for T1 links: **l2tset**, **ecm**, **pcrn1**, **pcrn2**, **t1loc**, **t1port**, **ts**

The following parameters are valid for SE-HSL links: **l2tset**, **e1port**

The following parameter is valid only for IPSG links: **aname**

**:link=** (mandatory)

The signaling link on the card specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** **a**, **b**, **a1-a31**, **b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

If the signaling link is being assigned to an E1 or T1 card for a Channel card, specify the location of the Channel card. If the link is being assigned for the E1 or T1 card itself, specify the location of the E1 or T1 card.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:lsn=** (mandatory)

The name of the linkset. The linkset name must be unique.

**Range:** ayyyyyyyyy  
1 alphabetic character followed by up to 9 alphanumeric characters

**:slc=** (mandatory)

The signaling link code.

The SLC must be unique within the linkset. It must be the same at both the system location and the distant node.

**Range:** 0-15

**:aname=** (optional)

Association name. This parameter specifies the association assigned to the signaling link added in an IPSG linkset.

**Range:** ayyyyyyyyyyyyy  
Up to 15 alphanumeric characters; the first character must be a letter

**:atmtsel=** (optional)

ATM timing selector. The timing source for the ATM signaling link—internal, line, or external. Internal timing is derived from an internal clock source operating at 1.544 MHz  $\pm$  200 Hz for ANSI links and 2.048 MHz  $\pm$  103 Hz for ITU links. External timing is derived from the High-Speed Master Clock (T1 or E1). Line timing is derived from its received data stream, if present.

**CAUTION: The internal timing source is used for debug purposes only, and is not to be used for production operation.**

If you are using the 2.048 MHz reference clock as the timing source for E1 signaling links, the **atmtsel=external** parameter must be specified for high-speed ATM signaling links. The **atmtsel** parameter is not valid in the command when the **e1loc** or **e1port** parameter is specified for an E1 signaling link. For information on the E1 interface, see Appendix A, “E1 Interface” in the *Database Administration Manual - SS7*.

**Range:** external, internal, line  
**Default:** line

**:bps=** (optional)

The transmission rate for the link in bits per second. E1 links running at 56000 bps and 64000 bps are allowed in linksets with other links running at 56000 bps or 64000 bps, or both, in the same linkset. T1 links running at 56000 bps or 64000 bps are allowed in linksets with other links that are running at 56000 bps or 64000 bps, or both. All other types of links in one linkset are required to have the same provisioned link speed. See Table 5-50.

**Range:** 4800, 9600, 19200, 56000, 64000, 1544000, 1984000, 2048000

**Default: 56000**

**:e1atmcrc4=** (optional)

CRC4 multi-frame structure enable/disable indicator.

**Range: on, off**

**Default: on**

**:e1atmsi=** (optional)

Value of two Spare International bits of NFAS data.

**Range: 0-3**

**Default: 3**

**:e1atmsn=** (optional)

Value of five Spare National bits of NFAS data.

**Range: 0-31**

**Default: 0**

**:e1loc=** (optional)

Card location of an E1 card with an E1 interface that will service the link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.

**Range: 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:e1port=** (optional)

The port for the E1 interface on the E1 card to which a signaling link and timeslot are being assigned, or to which an SE-HSL link is being assigned.

**Range: 1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

Any 2, but no more than 2, of the 8 ports on an HC-MIM card can be specified when the card is used as an SE-HSL card.

**Default: 1**

**:ecm=** (optional)

Error correction method.

**Range: basic, pcr**

**Default: basic**

**:ipliml2=** (optional)

IPLIM level 2 stack.

**Range: m2pa**

**Default: m2pa**

**:l1mode=** (optional)

The mode of operation used to select the link clocking source at layer 1. One end of a V.35 link must be DTE and the other end must be DCE.

**Range: dte, dce**

**Default: dte**

**:l2tset=** (optional)

Level 2 timer set. A signaling link can be assigned to any of the thirty timer sets.

**Range: 1-30**

**1-10** for ANSI low speed links

**11-20** for ITU low speed links

**21-25** for ITUN China high speed links

- Default:** **26-30** for ITUN Q703.A high speed links  
**1** for ANSI low speed links  
**11** for ITU low speed links  
**21** for ITUN China high speed links (SE-HSL link in a linkset defined with the **apcntype=ituchina** parameter)  
**26** for ITUN Q703.A high speed links (SE-HSL link in a linkset defined with the **apcntype=itun** parameter)
- :ll=** (optional)  
 ATM line length in feet.  
**Range:** **0-7**  
**0**—0-110 feet  
**1**—110-220 feet  
**2**—220-330 feet  
**3**—330-440 feet  
**4**—440-550 feet  
**5**—550-660 feet  
**6**—More than 660 feet  
**7**—Allows use of external line buildout networks  
**Default:** **0**
- :lpset=** (optional)  
 Link parameter set identifier.  
**Range:** **1-30**  
**Default:** **1**—for ANSI  
**21**—for ITU
- :pcrn1=** (optional)  
 The threshold of the number of MSUs available for retransmission. If the error correction method being used is PCR and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.  
**Range:** **1-127**  
**Default:** **76**
- :pcrn2=** (optional)  
 The threshold of the number of MSU octets available for retransmission. If the error correction method being used is PCR, and this threshold is reached, no new MSUs or FISUs are sent. The retransmission cycle is continued up to the last MSU entered into the retransmission buffer in the order in which they were originally transmitted.  
**Range:** **300-35500**  
**Default:** **3800**
- :t1loc=** (optional)  
 Card location of a T1 card with a T1 interface that will service the signaling link assigned for a Channel card. This parameter cannot be specified for an HC-MIM card.  
**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:t1port=** (optional)

The port for the T1 interface on the T1 card to which a signaling link and timeslot are being assigned.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM cards.

**Default:** 1

**:ts=** (optional)

E1 or T1 timeslot for the assigned signaling link.

**Range:** 1-31

E1 range: 1—31

T1 range: 1—24

**:tset=** (optional)

Transmitter signal element timing.

**Range:** on, off

**Default:** off

**:vci=** (optional)

Virtual channel identifier.

**Range:** 5, 32-65535

0-4 and 6-31 are reserved values; they cannot be specified in the command.

**Default:** 5

**:vpi=** (optional)

Virtual path identifier.

**Range:** 0-4095

**Default:** 0

### Example

**ent -**

**slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:l1mode=dte:bps=64  
000:ecm=basic**

**ent -**

**slk:loc=1201:link=a:slc=3:lsn=c1201001:l2tset=3:ecm=pcr:pcrn1=50:  
pcrn2=4000**

The following example adds signalling link a to linkset lshcap on an HCAP card.

**ent-slk:loc=1304:link=a:slc=0:lsn=lshcap:lpset=3:vci=5:vpi=15**

**ent -**

**slk:loc=1302:link=a:slc=5:lsn=atm1302a:lpset=3:vci=10:vpi=15 :ll=0  
:atmtsel=external**

The following example adds a link to linkset ls1 at 56 KB for a multi-port LIM:

**ent-slk:loc=1205:link=a1:slc=0:lsn=ls1**

The following example assigns a timeslot for the signaling link on an E1 card that uses E1 port 1.

**ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=1**

The following example assigns a timeslot for a signaling link on an E1 card that uses E1 port 2.

**ent-slk:loc=1205:link=b:slc=0:lsn=e1typ:ts=1:e1port=2**

The following example assigns a timeslot for a signaling link on a Channel card in the location specified by the loc parameter. The Channel card is serviced by the E1 assigned to the E1 card in the location specified by the e1loc parameter.

**ent-slk:loc=1206:link=a:slc=0:lsn=e1jwk:ts=2:e1loc=1205**

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using E1 port 2 and signaling link b2.

**ent-slk:loc=1205:link=b2:slc=0:lsn=e1typ:ts=1:e1port=2**

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an E1 Channel card in card location 1206. The command specifies signaling link port a1. The E1 interface that services the Channel card is on the E1 card in card location 1205 (e1loc parameter).

**ent-slk:loc=1206:link=a1:slc=1:lsn=e1jwk:ts=2:e1loc=1205**

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using signaling link a2. The T1 interface defaults to the interface defined for T1 port 1 (t1port parameter not specified)

**ent-slk:loc=1207:link=a2:slc=0:lsn=t1jwk:bps=64000:ts=1**

The following example adds a timeslot for a signaling link on an E1/T1 MIM card using T1 port 2 and signaling link b2.

**ent-slk:loc=1207:link=b2:slc=0:lsn=t1typ:ts=1:t1port=2**

The following example adds a timeslot for a signaling link on an E1/T1 MIM card used as an T1 Channel card in card location 1208. The command specifies signaling link a1. The T1 interface that services the Channel card is on the T1 card in card location 1207 (t1loc parameter).

**ent-**

**slk:loc=1208:link=a3:slc=1:lsn=t1jwk:bps=64000:ts=2:t1loc=1207**

The following example adds a signaling link to linkset ls1 at 2048000 bps for an E1 ATM card that will use the CRC4 multi-frame structure

**ent-**

**slk:loc=1205:link=a:slc=0:lsn=ls1:bps=2048000:atmsel=line:e1atmcrc4=on**

The following example adds a link to link set ls1 at 56 Kbps for an HC-MIM card that is provisioned as an E1 card:

**ent-slk:loc=1205:link=a31:slc=0:lsn=ls1:e1port=4:ts=4**

The following example adds a link to link set l21 at 64 Kbps for an HC-MIM card that is provisioned as a T1 card:

**ent-slk:loc=1207:link=b27:slc=3:lsn=ls2:t1port=8:ts=6:bps=64000**

The following example adds signalling link b to linkset lse5atm on an E5-ATM card.

**ent-slk:loc=1305:link=b:slc=1:lsn=lse5atm:lpset=3:vci=5:vpi=15**

The following example adds a signaling link to an IPSG linkset for an E5-ENET card that is running the ipsg application and hosting an association.

**ent-slk:loc=1204:port=b:lsn=lsipsg:slc=3:aname=assocsg1204**

## Dependencies

The slot portion of the specified card location (**loc**) can be **1 - 8** and **11 - 18**. Slots **09** and **10** cannot be specified. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

Card locations **1113 - 1118** cannot be specified.

The frame and shelf portions of the specified card location (**loc**) can be **11 - 13**, **21 - 23**; **31 - 33**; **41 - 43**; **51 - 53**; and **61**. (The card location is xyss, where x is the frame, y is the shelf, and ss is the slot.)

The **pcrn1** parameter and the **pcrn2** parameter can be specified for the **ss7ansi** and **ccs7itu** applications only when the **ecm=pcr** parameter is specified.

Use Table 5-50 to select a valid transmission rate for the **bps** parameter.

**Table 5-50.** Transmission Rate for the **bps** Parameter

| Card Application                       | bps Transmission Rate              | Domain |
|----------------------------------------|------------------------------------|--------|
| <b>ss7ansi</b>                         | 56000 or 64000                     | SS7    |
| <b>ss7gx25</b>                         | 4800, 9600, 19200, 56000, or 64000 | X.25   |
| <b>ccs7itu</b>                         | 56000 or 64000                     | SS7    |
| <b>atmansi</b>                         | 1544000                            | SS7    |
| <b>ss7ansi, ccs7itu</b> (SE-HSL cards) | 1984000                            | SS7    |
| <b>atmitu</b>                          | 2048000                            | SS7    |

The value of the **bps** parameter must be **56000** or **64000** if the card application is **ss7ansi** or **ccs7itu** (except for SE-HSL cards, for which the **bps** parameter must be **1984000**).

The value of the **bps** parameter must be **56000** if the card type is either **limds0** or **limocu**.

The value of the **bps** parameter must be **1544000** if the card application is **atmansi**.

The value of the **bps** parameter can be **1544000** only if the card application is **atmansi**.

The value of the **bps** parameter must be **56000** if the card is a multi-port LIM.

The value of the **bps** parameter must be **2048000** if the card type is **lime1atm**.

The value of the **bps** parameter can be **2048000** only if the card application is **atmitu**.

The value of the **bps** parameter must be **1984000** if the card is an HC-MIM or E5-E1T1 card used for SE-HSL links (**linkclass=unchan** is specified in the E1 interface definition).

E1 links running at 56000 bps and 64000 bps are allowed in linksets with other links running at 56000 bps and 64000 bps in the same linkset. T1 links running at 56000 bps and 64000 bps are allowed in linksets with other links that are running at 56000 bps and 64000 bps links in the same linkset. In linksets that contain other types of links, all links in one linkset must use the same transmission rate.

The values **0 - 4** and **6 - 31** cannot be specified for the **vci** parameter; these values are reserved system values.

The linkset adjacent point code (APC) type must be the same as the card application type (ANSI or ITU).

The specified linkset name must exist in the database.

The value of the **slc** parameter cannot be used by more than one link in the linkset.

A card must be equipped in the specified card location.

The card in the specified card location must be a LIM or MIM and must exist.

The **e1port** parameter must be specified.

If the **e1port** parameter is not specified for an SE-HSL link, the value defaults to **1**. If the value of **1** has already been specified for a link, the error message will result.

The parameters that are specified for the command must be valid for the type of card in the specified card location.

When a low-speed link is assigned to a card (card application is not **atmansi** or **atmitu**), the ATM high-speed link and E1 ATM parameters (**atmtsel**, **e1atmcrc4**, **etatmsi**, **e1atmsn**, **ll**, **lpset**, **vci**, and **vpi**) cannot be specified.

If an ATM high-speed link is assigned to a card (card application is **atmansi**), then the low-speed link parameters (**ecm**, **l1mode**, **l2set**, **pcrn1**, **pcrn2**, and **tset**) cannot be specified.

When an E1 ATM high-speed link is assigned to a card (card application is **atmitu**), the low-speed link parameters (**ecm**, **l1mode**, **l2set**, **pcrn1**, **pcrn2**, and **tset**) cannot be specified.

When an IP link is assigned to a card (card application is **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi**), the following low-speed link parameters, ATM high-speed link parameters, and E1 ATM high-speed link parameters cannot be specified: **lpset**, **vci**, **vpi**, **ll**, **atmtsel**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **ecm**, **l1mode**, **l2tset**, **pcrn1**, **pcrn2**, and **tset**.

If the card application is **ss7gx25**, the **l2tset** parameter cannot be specified.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSED CM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application.

The **link** parameter values **a1**, **b1**, **a2**, **b2**, **a3**, and **b3** can be specified only when:

- The card type is **limds0**, and the card application is **ss7ansi**.
- The card type is **lime1**, **limt1**, or **limch**, and the card application is **ss7ansi** or **ccs7itu**.
- The card is an SSED CM, and the card application is **iplim** or **iplimi**.
- The card type is **lime1**, **limt1**, or **limch** (and the card is not an SE-HSL card), and the card application is **ss7ansi** or **ccs7itu**.
- The card type is E5-ENET, and the card application is **iplim**, **iplimi**, or **ipsg**.

The **link** parameter values **a4-a7** and **b4-b7** can be specified for E5-ENET cards running the **iplim** or **iplimi** application. The **link** parameter values **a4-a15** and **b4-b15** can be specified only when the card type is **lime1** or **limt1** for HC-MIM and E5-E1T1 cards and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a4-a31** and **b4-b31** can be specified only when the card type is **lime1** or **limt1** for an HC-MIM card and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a4-a15** and **b4-b15** can be specified for E5-ENET cards running the **ipsg** application.

The **link** parameter values **a4-a15** and **b4-b15** are valid when the card type is **lime1** or **limt1** for either an E5-E1T1 card or an HC-MIM card that is used as an E1 or T1 card, and the card application is **ss7ansi** or **ccs7itu**. The link parameter values **a**, **a1-a15** and **b**, **b1-b15** are valid for E5-ENET cards running the **ipsg** application. The **link** parameter values **a16-a31** and **b16-b31** can be specified only when the card type is **lime1** or **limt1** for an HC-MIM card that is used as an E1 or T1 card, and the card application is **ss7ansi** or **ccs7itu**. The **link** parameter values **a4-a31** and **b4-b31** cannot be specified for a Channel card or for an SE-HSL card. The **link** parameter values **a**, **b**, **a1-a7**, **b1-b7** are valid for E5-ENET cards running **iplim** or **iplimi** application.

HIPR cards must be in card locations xy **09** and xy **10** on any shelf that contains one or more HC-MIM, E5-E1T1, or E5-ENET cards. When **link** parameter values **a4-a31** and **b4-b31** are specified, the system verifies that HIPR cards are in card locations xy **09** and xy **10** on the same shelf with the specified HC-MIM, E5-E1T1, or E5-ENET card.

Links **a16-a31** and **b16-b31** cannot be specified for even-numbered card locations. HC-MIM cards are dual-slot cards. The links are assigned only to the cards in odd-numbered locations.

If the card application is **ss7gx25**, only the **link=a** parameter can be specified.

If the card application is **ss7ipgw** or **ipgwi**, then the **link=a** parameter must be specified.

The **tset** parameter can be specified only when the **l1mode=dce** parameter is specified. When the **l1mode=dce** parameter is specified and the **tset** parameter is not specified, the **tset** parameter value is set to **off**.

If the card is an HC-MIM used for SE-HSL links, only the **link=a** parameter or **link=b** parameter can be specified. If the card is an E5-E1T1 used for SE-HSL links, only the **link=a** parameter can be specified.

If the specified linkset has a mate linkset, only 1 SS7IPGW or IPGWI signaling link can be assigned to the specified linkset. The assigned link must be an SS7IPGW or IPGWI link.

Up to 8 IPGWx signaling links can be assigned to one linkset if the linkset is not mated.

The associated location must be empty, or an E5-ATM card must be provisioned in the location before the **link=b** parameter can be specified. Upon initialization, the E5-ATM card is in **boot phase-0** for up to 30 secs. During this period, the E5-ATM hardware is not detected, which may result in a lack of support for signalling link **b**.

When an IP link is assigned to a card running card application **ss7ipgw**, the **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

When an IP link is assigned to a card running card application **ipgwi**, the **lsn** parameter must reference a linkset that specifies an IP gateway adjacent point code (**ent-ls:ipgwapc=yes**).

When an IP link is assigned to a card running card application **ipgwi**, the specified link set must be empty; only 1 IPGWI link can be assigned to a link set.

When the specified linkset name (**lsn**) is defined with the **ipgwapc=yes** parameter, the card application must be **ss7ipgw** or **ipgwi**.

If the **multgc=yes** parameter is specified, then all links assigned to the linkset must be of the same type.

If **multgc=yes** parameter is specified, then the card in the specified card location must be running the **ipgwi**, **iplimi**, or **ipsg** application.

The **ipliml2** parameter can be specified only for IPLIM signaling links.

All IPLIM links assigned to the same linkset must be defined with the same **ipliml2** parameter value.

Linksets containing 24-bit ITU-N APCs or SAPCs cannot contain E1 ATM links. These links do not support 24-bit ITU-N traffic.

Linksets with both 14-bit ITU-N and 24-bit ITU-N APCs or SAPCs can contain only IPGWI or IPLIMI M3UA links. These links support 14-bit ITU-N and 24-bit ITU-N traffic simultaneously.

A maximum of 1200, 1500, or 2000 links is allowed in the system. The maximum depends on the enabled Large System # Links quantity (see the **rtrv-ctrl-feat** command output). A feature access key is required to enable support for more than 1200 links. A mixture of ATM high-speed, E1 ATM high-speed, and low-speed signaling links is supported. If the addition of either a low-speed signaling link or an ATM high-speed signaling link exceeds the total number of low-speed and ATM high-speed signaling links allowed in the system, the **ent-slk** command is rejected.

HC-MIM and E5-E1T1 cards cannot be used as or with Channel cards. The **e1loc** and **t1loc** parameters cannot be specified for HC-MIM or E5-E1T1 cards.

When a card location is specified in the **loc** parameter for an E1 card, a T1 card, or a Channel card (card type **lime1**, **limt1**, or **limch**), a timeslot (**ts**) must be specified for the link. When a card location is specified for a Channel card (card type **limch**) assigned to an E1 interface, the **e1loc** parameter must be specified. When a card location is specified for a Channel card (card type **limch**) assigned to a T1 interface, the **t1loc** parameter must be specified.

A specific timeslot can be assigned in the **ts** parameter to only one E1 signaling link for the E1 interface that services that timeslot.

A specific timeslot can be assigned in the **ts** parameter to only one T1 signaling link for the T1 interface that services that timeslot.

The **ts** parameter value for a T1 link must be in the range **1-24**.

The **ts** parameter cannot be specified for HC-MIM or E5-E1T1 cards that are used for SE-HSL links (**linkclass=unchan** is specified in the E1 interface definition).

If the E1 interface has CAS multi-framing enabled for an E1 card or a Channel card, timeslot 16 cannot be specified.

When the **e1loc** parameter and the **e1port** parameter are specified together in the command, the **atmtsel** parameter cannot be specified.

If a card location is specified in the **loc** parameter for a Channel card (card type **limch**),

- The card in the location specified by the **e1loc** parameter must be an E1 card (card type **lime1**).
- When a Channel card location is specified in the **loc** parameter, the **e1loc** parameter must be specified to identify the associated E1 card. The specified E1 card must be equipped.
- The port specified in the **e1port** parameter must be equipped with an E1 interface for the card specified in the **e1loc** parameter.
- Port 1 must be specified (**e1port=1**) for the associated E1 card port.
- A Channel card (**e1loc** parameter) must be located on the same shelf with its associated E1 card (**loc** parameter).

If a card location is specified in the **loc** parameter for an E1 card (card type **lime1**),

- The **e1port** parameter can be specified to select either port 1 or port 2 for the E1 interface to service the signaling link on a 2-port E1 card or an E1/T1 MIM card. The default is port 1.
- The **e1port** parameter can be specified to select ports 1 - 8 for the E1 interface to service the signaling link on an HC-MIM or an E5-E1T1 card. The default is port 1.
- The E1 interface for the specified or default port must already be defined (see the **ent-e1** command).

The parameters **t1loc**, **t1port**, and **ts** are allowed only when entering a signaling link for an E1/T1 MIM used as a T1 or Channel card or for either an HC-MIM card or an E5-E1T1 card used as a T1 card. All V.35 and HSL parameters (**l1mode**, **l2tset**, **atmtsel**, **vci**, **vpi**, **ll**, and **tset**) are invalid when entering T1 parameters.

If a card location is specified in the **loc** parameter for a T1 Channel card (card type **limch**),

- The card in the location specified by the **t1loc** parameter must be an E1/T1 MIM card used as a T1 card (card type **limt1**).
- When a Channel card location is specified in the **loc** parameter, the **t1loc** parameter must be specified to identify the associated T1 card. The specified T1 card must be equipped.
- The port specified in the **t1port** parameter must be equipped with a T1 interface for the card specified in the **t1loc** parameter.
- Port 1 must be specified (**t1port=1**) for the associated T1 card port.

- A Channel card (**t1loc** parameter) must be located on the same shelf with its associated T1 card (**loc** parameter).

If a card location is specified in the **loc** parameter for a T1 card (card type **limt1**),

- The **t1port** parameter can be specified to select either port 1 or port 2 for the T1 interface to service the signaling link on a 2-port E1 card or an E1/T1 MIM card. The default is port 1.
- The **t1port** parameter can be specified to select ports 1 - 8 for the T1 interface to service the signaling link on an HC-MIM or an E5-E1T1 card. The default is port 1.
- The T1 interface for the specified or default port must already be defined (see the **ent-t1** command).

If a card location is specified in the **loc** parameter for an HC-MIM card,

- A maximum of 64 links can be assigned to one HC-MIM card (see Table A-1).
- Signaling links cannot be assigned to channel-bridged even-numbered ports.
- An even-numbered port that is in channel-bridged to an odd-numbered port cannot be specified for assigning a signaling link.
- The fan feature bit must be turned on before links can be assigned to HC-MIM cards (see the **chg-feat** command). The system verifies that the fan feature bit is on when links **a4-a31** and **b4-b31** are assigned.
- HIPR cards must be in the xy09 and xy10 card locations (x is the frame, y is the shelf) in each shelf that contains one or more HC-MIM cards.

If a card location is specified in the **loc** parameter for an E5-E1T1 card,

- A maximum of 32 links can be assigned to one E5-E1T1 card (see Table A-1 in Appendix A).
- Signaling links cannot be assigned to channel-bridged even-numbered ports.
- An even-numbered port that is channel-bridged to an odd-numbered port cannot be specified for assigning a signaling link.
- HIPR cards must be in the xy09 and xy10 card locations (x is the frame, y is the shelf) in each shelf that contains one or more E5-E1T1 cards.

An ANSI link (low-speed link) cannot be assigned to a card that is configured to support Synchronous E1 High Speed links (SE-HSL).

A maximum of 180 ATM links (E1-ATM, LIM-ATM, E5-ATM, etc.) can be provisioned in the system.

If the card is an IPSPG card, then the **ipsg=yes** parameter must be specified (see the **ent-ls** command).

If an IPSPG linkset and card are used, then the **aname** parameter must be specified.

A maximum of 32 signaling links can be provisioned on an IPSPG card.

If the **aname=m3ua** parameter is specified, then a maximum of 16 signaling links can be assigned.

If the **aname=m2pa** parameter is specified, then only one signaling link can be assigned.

The resulting total TPS of all signaling links configured for an IPSPG card cannot exceed 5000 TPS.

The total TPS of all signaling links configured in the EAGLE 5 ISS cannot exceed 500,000 TPS.

If the **ipsg=yes** parameter is specified (see the **ent-ls** command), then an IP SG card must be provisioned in the card location.

The value specified for the **aname** parameter must already exist in the database.

The adapter assigned to the association must be the same as the adapter assigned to the linkset.

The value specified for the **aname** parameter must be associated with the value specified for the **loc** parameter.

Linksets must have same routing context to share an association.

The **aname** parameter can be specified only for IP SG links.

## Notes

The **ll** parameter is not available in the SEAS database.

When a signaling link is assigned to a card that is running the **atmansi** application or the **atmitu** application, and the **bps**, **vci**, **vpi**, **e1atmcrc4**, **e1atmsi**, **e1atmsn**, **ll**, **atmsel**, and **lpset** parameters are not specified, the ATM default values are assigned for these parameters.

The MTP Level 2 timers (**l2tset** parameter) are not valid for IP links or for ATM links.

A link is *equipped* when it is physically operational, that is, when the hardware is in place that is needed to support the link .

### **Signaling Links for 2-port E1 Cards**

If you are configuring signaling links for an E1 or Channel card, each signaling link must be associated with a timeslot assigned in the command. Each signaling link/timeslot assigned for an E1 card or a Channel card must be associated with an E1 interface that has been defined for one of the ports on the E1 card (see the **ent-e1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot, the signaling link port (a or b), the timeslot number, and the card location and port for the servicing E1 interface on the E1 card (**e1port** and **e1loc** parameters). Timeslot numbers must be unique to the E1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 interface for different signaling links.

If the link and timeslot are for a Channel card, the Channel card location is specified in the **loc** parameter, and the associated E1 card is specified in the **e1loc** parameter.

If the link and timeslot are for the E1 card itself, the E1 card location is specified in the **loc** parameter, and the E1 interface port (1 or 2) that will service the link is specified in the **e1port** parameter.

The E1 card can service 2 timeslots assigned to signaling links for itself, and 1-31 timeslots assigned to signaling links for Channel cards on the same shelf. If the E1 card is not servicing any Channel cards, 2 links with associated timeslots can be defined—both on the interface on port 1, both on the interface on port 2, or 1 on the interface on each port. The links for any Channel cards serviced by the E1 card must be serviced by the interface on port 1. Each Channel card can have 1 or 2 links assigned to the E1 interface on port 1, for a total of 16 Channel cards and up to 31 links (Timeslot 0 cannot be used). All links for a Channel card must be assigned to the same E1 card. If the E1 card is servicing any Channel cards, the 2 links for the E1 card itself can be assigned to the interface on port 2 (which cannot service Channel card links and can service only 2 links).

### **Signaling Links for E1/T1 MIM Cards**

One E1/T1 MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

If you are configuring signaling links for an E1, T1, or Channel card, each signaling link must be associated with a timeslot assigned in the command. Each signaling link/timeslot assigned for an E1,

T1, or Channel card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E1/T1 MIM card (see the **ent-e1** or **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot, the signaling link port (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, or **b3**), the timeslot number, and the card location and port for the servicing E1 or T1 interface on the E1 or T1 card (**e1loc** and **e1port** or **t1loc** and **t1port** parameters). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for different signaling links.

If the link and timeslot are for a Channel card, the Channel card location is specified in the **loc** parameter, and the associated E1 or T1 card is specified in the **e1loc** or **t1loc** parameter.

If the link and timeslot are for the E1 or T1 card itself, the E1 or T1 card location is specified in the **loc** parameter, and the E1 or T1 interface port (1 or 2) that will service the link is specified in the **e1port** or **t1port** parameter.

The E1/T1 MIM used as an E1 card can service 8 timeslots assigned to signaling links for itself, and 1-31 timeslots assigned to signaling links for Channel cards on the same shelf. If the E1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the E1 card is servicing Channel card links, the links for the E1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each E1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by an the E1 card must be serviced by the interface on port 1. Each Channel card can have up to 8 links assigned to the E1 interface on port 1, for a total of up to 31 links (Timeslot 0 cannot be used). used.) All links for a Channel card must be assigned to the same E1 card. If the E1 card is servicing any Channel cards, the 8 links for the E1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

The E1/T1 MIM used as a T1 card can service 8 timeslots assigned to signaling links for itself, and 1-24 timeslots assigned to signaling links for Channel cards on the same shelf. If the T1 card is not servicing any Channel cards, 8 links with associated timeslots can be defined—all on the interface on port 1, all on the interface on port 2, or some on the interface on each port. If the T1 card is servicing Channel card links, the links for the T1 card itself can be assigned either to the port 1 interface or the port 2 interface. But for each T1 link assigned to the port 1 interface, the number of links is decreased by one that can be assigned to that port interface for a Channel card. All links for any Channel cards serviced by the T1 card must be serviced by the interface on port 1. Each Channel card can have up to 8 links assigned to the T1 interface on port 1, for a total of up to 24 links. All links for a Channel card must be assigned to the same T1 card. If the T1 card is servicing any Channel cards, the 8 links for the T1 card itself can all be assigned to the interface on port 2 (which cannot service Channel card links and can service only 8 links).

### ***Signaling Links for HC-MIM Cards***

An HC-MIM card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the HC-MIM card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a 1-a31**, **b**, **b1-b31**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot;

that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each HC-MIM used as an E1 card can have up to 64 signaling links assigned to the card. Each E1 interface on an HC-MIM card can service 1-31 timeslots.

Each HC-MIM used as a T1 card can have up to 64 signaling links assigned to the card. Each T1 interface on an HC-MIM card can service 1-24 timeslots.

#### ***Signaling Links for E5-E1T1 Cards***

An E5-E1T1 card can be used for E1 card functions or T1 card functions, but not both at the same time. E1 cards and T1 cards can coexist in the same EAGLE 5 ISS.

Each signaling link for an E1 card or a T1 card must be associated with a timeslot assigned in the **ent-slk** command. Each signaling link and timeslot assigned for an E1 card or a T1 card must be associated with an E1 or T1 interface that has been defined for one of the ports on the E5-E1T1 card (see the **ent-e1** command or the **ent-t1** command).

Timeslots and signaling links are defined in the **ent-slk** command by a combination of card location (**loc** parameter), the signaling link that uses the timeslot (**a**, **a 1-a15**, **b**, **b1-b15**), the timeslot number (**ts**), and the port for the servicing E1 or T1 interface on the E1 or T1 card (**e1port** or **t1port** parameter). Timeslot numbers must be unique to the E1 or T1 interface that services the timeslot; that is, the same timeslot cannot be assigned to the same E1 or T1 interface for more than one signaling link.

Each E5-E1T1 used as an E1 card can have up to 32 signaling links assigned to the card. Each E1 interface on an E5-E1T1 card can service 1-31 timeslots.

Each E5-E1T1 used as a T1 card can have up to 32 signaling links assigned to the card. Each T1 interface on an E5-E1T1 card can service 1-24 timeslots.

#### ***Signaling Links for E5-ATM Cards***

An E5-ATM card can support either E1 or T1 card functions; however, the card cannot support both functions at the same time. E5-ATM cards running E1 and T1 functions can coexist in the same EAGLE 5 ISS. Each E5-ATM card can have up to 2 signaling links assigned to the card. Only the **a** or **b** link can be used. The **a** and **b** links can be configured for a location if a card is not seated in that location. However, if a card other than the E5-ATM card is inserted in this location, the card is auto-inhibited.

#### ***Signaling Links for IPSG Cards***

An IPSG card supports both M2PA and M3UA signaling links.

The card supports up to 32 signaling links per card, 16 M3UA links per association, and 32 associations per card.

Multiple M3UA signaling links with routing context (different linksets/AS, up to 16) can use a single association.

Each M3UA AS-ASP instance maps to a signaling link. Signaling link state depends upon AS-ASP state, as well as administrative action.

The IPSG card **can** share M2PA linksets with IPLIM, IPLIMI, and IPLHC cards, but the card **cannot** share M3UA linksets with SS7IPGW, IPGWI, and IPGHC cards.

The IPSG card supports ANSI and ITU and ITUN/ITUN24 signaling links simultaneously on one card and on one association. Each signaling link resides in a set of networks determined by the APC and SAPCs of the assigned linkset.

The **slktps** parameter specified for the IPSG linkset (see the **ent-ls/chg-ls** command) specifies the TPS for each link provisioned for that linkset.

### Output

The following example adds signalling link **b** to linkset **lse5atm** on an E5-ATM card.

**ent-slk:loc=1305:link=b:slc=6:lsn=lse5atm:lpset=3:vci=5:vpi=15**

```
tekelecstp 08-02-14 13:17:13 EST EAGLE 38.0.0
ENT-SLK: MASP A - COMPLTD
```

## ent-spc

### Enter Secondary Point Code

Use this command to enter an SPC (secondary point code) into the database.

**Keyword:** **ent-spc**

**Related Commands:** **dlt-spc, rtrv-spc**

**Command Class:** Database Administration

### Parameters

**:spc=** (mandatory)

ANSI point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

**Synonym:** **spca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (mandatory)

Secondary point code.

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:spci=** (mandatory)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:spcn=** (mandatory)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code

option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:spcn24=** (mandatory)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

### Example

The following example adds a secondary point code:

**ent - spc : spc=10-20-30**

The following example adds a 24-bit ITU-N secondary point code:

**ent - spc : spcn24=99-99-99**

The following example adds a spare ITU-N secondary point code:

**ent - spc : spcn=s-12345**

### Dependencies

The Spare Point Code Support feature must be enabled before a spare point code (prefix s-) can be specified in the command.

The value specified for the **spc** parameter must be a full point code.

The ANSI point code range requirements have been violated for an ANSI SID. For the ANSI secondary point code with subfields *ni-nc-ncm*, the *ni* component cannot equal **000**, the *nc* component cannot equal **000** if the *ni* component is **001 - 005**.

The specified secondary point code to be added must not already exist as a secondary point code.

A maximum of 40 secondary point codes may be defined.

The MPC feature must be turned on before a secondary point code can be added using this command.

The value specified for the **spc** parameter cannot already exist in the Destination table as a destination point code, true point code, or concerned point code.

The specified secondary point code cannot match an existing true point code or capability point code in the Site Identification table.

### Notes

If the **spcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

### Output

**ent - spc: spc=10-20-30**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
Secondary Point Code table is (7 of 40) 17% full
ENT-SPC: MASP A - COMPLTD
;
```

## ent-srvsel

### Enter Service Selector

Use this command to assign the applicable service selectors required to specify a service entry for DSM services.

**Keyword:** ent-srvsel

**Related Commands:** chg-srvsel, dlt-srvsel, rtrv-srvsel

**Command Class:** Database Administration

### Parameters

**:gti/gtia/gtii/gtin/gtin24=** (mandatory)

Global title indicator. For all service selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), and **gtin** (ITU national). For the service selector commands, **gti** and **gtia** are equivalent.

**Range:** Supported value for ANSI: **gti=2** and **gtia=2**  
Supported values for ITU: **gtii= 2, 4 ; gtin= 2, 4 ; gtin24 = 2, 4**

**:serv=** (mandatory)

DSM service.

**NOTE:** The **gport** service cannot be used for the Prepaid SMS Intercept Phase 1 (PPSMS) or the Portability Check for Mobile Originated SMS feature; use the **smsmr** service. The **mnp** service includes the G-Port, A-Port, and IS41 GSM Migration services.

**Range:** **eir, gflex, gport, inpq, inpmr, smsmr, idps, idpr, mnp, vflex, atinp**

**eir** — Equipment Identity Register

**gflex** — GSM flexible numbering

**gport** — GSM number portability

**inpq** — INP query

**inpmr** — INP message relay

**smsmr** — Prepaid SMS Intercept Phase 1, Portability Check for Mobile Originated SMS, MO-based GSM SMS NP, MO-based IS41 SMS NP

**idps** — IDP Screening for Prepaid

**idpr** — Prepaid IDP Query Relay

**mnp** — Mobile Number Portability

**vflex** — Voice Mail Router

**atinp** — ATI Number Portability Query (ATINP)

**:ssn=** (mandatory)

Subsystem number.

**Range:** **0-255 \***

**:tt=** (mandatory)

Translation type.

**Range:** **0-255**

**:nai=** (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:**     **1sub, rsvd, natl, intl**

**:naiv=** (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:**     **0 -127**

**:np=** (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:**     **e164, generic, x121, f69, e210, e212, e214, private**

**:npv=** (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:**     **10-15**

**:snai=** (optional)

The service nature of address indicator.

**Range:**     **1sub, natl, intl, rnidn, rnndn, rnsdn, ccrndn**

**natl** — National significant number

**intl** — International number

**rnidn** — Routing number prefix and international dialed/directory number

**rnndn** — Routing number prefix and national dialed/directory number

**rnsdn** — Routing number prefix and subscriber dialed/directory number

**ccrndn** — Country code, routing number, and national directory number

**sub** —Subscriber number

**:snp=** (optional)

The service numbering plan.

**Range:**     **1e164, e212, e214**

**Example**

```
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*
```

```
ent-
```

```
srvsel:gtin24=4:tt=4:np=e164:nai=intl:serv=gport:snp=e164:snai=intl:ssn=9
```

```
ent-srvsel:gtii=4:tt=4:np=e164:nai=intl:serv=eir:ssn=11
```

```
ent-
```

```
srvsel:gtin=4:tt=9:np=e214:nai=natl:snp=e164:snai=intl:serv=gflex:ssn=250
```

```
ent-srvsel:gtii=4:tt=20:np=e164:nai=intl:serv=eir:ssn=*
```

**ent-srvsel:gtii=4:tt=0:np=e164:nai=intl:serv=atinp:ssn=11**  
**ent-srvsel:gtii=2:tt=6:snai=intl:snp=e164:serv=smsmr:ssn=10**

### Dependencies

The G-Flex feature must be turned on before the **serv=gflex** parameter can be specified.

The INP feature must be turned on before the **serv=inpmr** or **serv=inpq** parameter can be specified.

The G-Port feature must be turned on before the **serv=gport** parameter can be specified.

The Equipment Identity Register (EIR) feature must be turned on before the **serv=eir** parameter can be specified.

The **np** and **npv** parameters cannot be specified together in the command.

The **nai** and **naiv** parameters cannot be specified together in the command.

The **gtia=4** parameter cannot be specified. The value **4** is not valid for the **gtia** parameter.

The values **1** and **3** are not valid for the **gti/gtia/gtii/gtin/gtin24** parameters.

If the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, then the **np(v)** and **nai(v)** parameter combinations cannot be specified.

If the **gtii/gtin/gtin24=4** parameter is specified, then an **np(v)** and **nai(v)** parameter combination must be specified. The parameters can be specified in the following combinations: **np** and **naiv**, **npv** and **nai**, **np** and **nai**, or **npv** and **naiv**.

If the **nserv** parameter has a value of **inpmr**, **inpq**, **gport** or **eir**, then the **gtia** and **gti** parameters cannot be specified. The MO-based IS41 SMS NP or the MO-based GSM SMS NP feature must be enabled, and the **nserv=smsmr** parameter must be specified before the **gtia** and **gti** parameters can be specified.

If the **serv=inpmr** parameter is specified, then the **snp=e164** parameter must be specified.

If the **serv=inpq** parameter is specified, then the **gtii** parameter cannot be specified.

If the value specified for the **snai** parameter is **rnidn**, **rnndn**, or **rnsdn**, then the value specified for the **serv** parameter must be **inpmr**, **gport**, or **smsmr**.

If the value specified for the **serv** parameter is **gflex**, **gport**, **inpmr**, or **smsmr**, then the **snai** and **snp** parameters must be specified.

If the value specified for the **serv** parameter is **atinp**, **eir**, **idpr**, **inpq**, or **vfex**, then the **snai** and **snp** parameters cannot be specified.

If the **snai=ccrndn** parameter is specified, then the value specified for the **serv** parameter must be **gport** or **smsmr**.

If the value specified for the **serv** parameter is **gport** or **smsmr**, then the **snp=e164** parameter must be specified.

An entry cannot already exist that matches the new **gti/gtia/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn=\*** parameters, an entry matching a specific **ssn** cannot already exist.

For the specified **gti/gtia/gtii/gtin**, **tt**, **np(v)**, **nai(v)**, and **ssn** parameters, an entry matching the **ssn=\*** parameter cannot already exist.

If the **ansigflex** STP option is enabled (see the **chg-stpotps** command), then an ITU service selector cannot be entered.

The IDP Screening for Prepaid feature must be on before the **serv=idps** parameter can be specified.

If the **serv=idps** parameter is specified, then the supported mandatory parameters are **tt**, **serv**, **ssn**, **gtin**, and **gtii**. Supported optional parameters are **np** and **nai**.

The Prepaid IDP Query Relay feature must be turned on before the **serv=idpr** parameter can be specified.

If the **serv=idpr** parameter is specified, then the only valid mandatory service parameters are **tt**, **serv**, **ssn**, **gtii**, and **gtin**. If the **serv=idpr** parameter is specified, then the only valid optional parameters are **np** and **nai**.

The A-Port or IS41 GSM Migration (IGM) feature must be turned on before the **serv=mnp** parameter can be specified.

If the A-Port or IGM feature is enabled, then the **serv=gport** parameter cannot be specified.

An entry cannot already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry cannot already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

An entry cannot already exist that matches the new **gti/gtii/gtin/gtin24**, **tt**, **ssn**, **np(v)**, and **nai(v)** combination of parameters.

The V-Flex feature must be turned on before the **serv=vflex** parameter can be specified.

The MO-based IS41 SMS NP and/or MO-based GSM SMS NP feature must be enabled before the **nserv=smsmr** parameter can be specified for a service entry that has a **gti** or **gtia** value.

The ATINP feature must be enabled before the **serv=atinp** parameter can be specified.

The PPSMS or Portability Check for Mobile Originated SMS feature must be turned on, or the MO-based GSM SMS NP or MO-based IS41 SMS NP feature must be enabled before the **serv=smsmr** parameter can be specified.

If the **serv=atinp** parameter is specified, then the **gtin24** parameter cannot be specified.

### Output

```
ent -srvsel:gtia=2:tt=9:ssn=250:snp=e212:snai=natl:serv=gflex

## ent-ss-appl

### Enter Subsystem Application

Use this command to reserve a subsystem number for an application and set the application status to be online or offline. You can define only one subsystem per application. The application must be unique.

**Keyword:** ent-ss-appl

**Related Commands:** chg-ss-appl, dlt-ss-appl, rtrv-ss-appl

**Command Class:** Database Administration

### Parameters

**:appl=** (mandatory)

Application type.

**Range:** lnp, inp, eir, vflex, atinpq

**:ssn=** (mandatory)

Primary subsystem number.

**Range:** 2-255

**:stat=** (optional)

Status.

**Range:**     **offline, online**  
**Default:**   **offline**

### Example

**ent-ss-appl:appl=lnp:ssn=16:stat=online**  
**ent-ss-appl:appl=inp:ssn=15:stat=offline**

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **ent-ss-appl:appl=lnp** command can be entered.

The INP feature must be turned on before the **ent-ss-appl:appl=inp** command can be entered.

The Equipment Identity Register (EIR) feature must be turned on before the **ent-ss-appl:appl=eir** command can be entered.

The specified application (**appl** parameter) must not already be assigned.

The maximum number of applications must not already be assigned.

For LNP, the STP true point code and LNP subsystem must exist in the MAP table.

For INP, the STP true point code and INP subsystem must exist in the MAP table.

For EIR, the STP true point code and EIR subsystem must exist in the MAP table.

The **TF** feature must be on. (DBS 1.0 only)

STP True Point Code must exist in MAP table

STP True Point Code and TF subsystem must exist in MAP table

If the V-Flex feature is turned on, then the STP true point code and V-Flex subsystem must exist in the MAP table.

The V-Flex feature must be turned on before the **appl=vflex** parameter can be specified.

The RPC3 table is corrupt or cannot be found.

The ATINP feature must be enabled before the **appl=atinpq** parameter can be specified.

For ATINP, the STP true point code and ATINPQ subsystem must exist in the MAP table.

The value specified for the **ssn** parameter cannot already exist in the SS-APPL table.

The specified MAP table entry for the subsystem must be a valid point code type for that subsystem. The following point code types are not valid for the indicated subsystems:

- If the subsystem number is configured for the INP subsystem in the SS-APPL table, then the True Point code cannot be an ITU-I or ANSI point code.
- If the subsystem number is configured for the EIR subsystem in the SS-APPL table, then the True Point code cannot be an ANSI point code.
- If the subsystem number is configured for the ATINPQ or VFLEX subsystem in the SS-APPL table, then the True Point code can not be an ITU-N24 point code.

### Notes

If not specified, the application subsystem status defaults to **offline**. When the application is **offline**, the application subsystem is down.

The LNP application status applies to both message relay and LNP query.

**Output**

```
ent-ss-appl:appl=lnp:ssn=16:stat=online
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
ENT-SS-APPL: MASP A - COMPLTD
;
```

**ent-subnetid****Enter Subnet ID**

Use this command to enter elements into the Subnet ID list, for the ISUP NP with EPAP feature. Each entry is identified by the Subnet ID and the Subnet number.

The Subnet ID length (**subnetidlen** parameter) must be entered first, before the command is entered the second time to enter the Subnet ID and Subnet Number.

**Keyword:** ent-subnetid

**Related Commands:** dlt-subnetid, rtrv-subnetid

**Command Class:** Database Administration

**Parameters**

**:subnetid=** (optional)

Vendor Subnet ID

**Range:** 1-15 digits

This number must contain the number of digits defined by the **subnetidlen** parameter value.

Valid digits are **0-9, a-f, A-F**.

**:subnetidlen=** (optional)

Subnet ID Length.

**Range:** 1-15

All Subnet IDs defined for the ISUP NP with EPAP feature must contain this number of digits.

**:subnetnum=** (optional)

Subnet Number. The Subnet Number is used as a reference to the prefix number for the ISUP NP with EPAP feature.

**Range:** 1-5

**1**—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

**2**—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

**3**—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

**4**—Corresponds to the prefix defined with prefix number 4 (see the **chg-prefix** command).

**5**—Corresponds to the prefix defined with prefix number 5 (see the **chg-prefix** command).

**Example**

```
ent-subnetid:subnetidlen=6
```

```
ent-subnetid:subnetid=886933:subnetnum=1
```

**Dependencies**

The value **none** cannot be specified for the **subnetid** parameter.

The ISUP NP with EPAP feature must be enabled before this command can be entered.

The SUBNETID table can contain a maximum of 50 entries.

The specified ID entry cannot already exist in the SUBNETID table.

All SUBNETID table entries must have the number of digits defined by the **subnetidlen** parameter value.

The prefix with the same prefix number as the specified Subnet Number must already be provisioned for the ISUP NP with EPA feature.

The Subnet ID length cannot be changed unless the SUBNETID table is empty. All Subnet IDs must be deleted from the table before a different Subnet ID length can be entered.

The Subnet ID length must be entered before any Subnet IDs can be defined.

The **subnetidlen** parameter cannot be specified in the same command with the **subnetid** and **subnetnum** parameters.

Either the **subnetidlen** parameter, or the **subnetid** and **subnetnum** parameters can be specified in one command.

## Notes

None.

## Output

The Subnet ID length must be entered first.

### **ent-subnetid:subnetidlen=6**

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
ENT-SUBNETID: MASP A - COMPLTD
;
```

The first Subnet ID and Subnet number can be entered after the Subnet ID length has been entered.

### **ent-subnetid:subnetid=886933:subnetnum=1**

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0
VENDID table is (6 of 50) 11% full
ENT-SUBNETID: MASP A - COMPLTD
;
```

## ent-t1

## Enter T1 Interface

Use this command to enter an interface for an E1/T1 MIM card, an HC-MIM card, or an E5-E1T1 card used as a T1 card. The T1 port number on the card and the T1 card location in the EAGLE 5 ISS must be specified.

Framing, line length, encoding, master/slave clocking options, and the signaling bit setting can be specified.

On an HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) T1 ports 2, 4, 6, and 8 to allow non-signaling data pass-through. Any of the 8 ports on an HC-MIM or E5-E1T1 card can be specified.

**Keyword:** ent-t1

**Related Commands:** chg-t1, dlt-t1, rtrv-t1, tst-t1

**Command Class:** Database Administration

## Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:t1port=** (mandatory)

T1 card port number. The value must be a T1 port for which an interface has not been configured on the specified T1 card.

**Range:** 1-8

Ports 3 through 8 can be specified only for HC-MIM and E5-E1T1 cards.

**:chanbrdg=** (optional)

Indicates whether an odd numbered port on an HC-MIM or E5-E1T1 card is channel bridged with its adjacent even numbered port for non-signaling data pass through.

**Range:** on, off

**Default:** off

**:encode=** (optional)

Indicator for use of B8ZS or AMI encoding/decoding.

**Range:** b8zs, ami

**Default:**

**:framing=** (optional)

Indicator for framing format.

**Range:** sf, esf

**Default:**

**:ll=** (optional)

T1 cable length in feet between the EAGLE 5 ISS and the connecting node.

**Range:** 0-655

**Default:** 133

**:t1tsel=** (optional)

Timing source. Indicates master (external) or slave (line) timing source, or timing source recovered from the paired master port for the channel bridged slave port.

**Range:** line, external, recovered

**Default:** line

## Example

**ent -**

**t1: loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100**

**ent -t1: loc=1205:t1port=2:encode=b8zs:t1tsel=external:framing=esf**

**ent -t1: loc=1203:t1port=1:chanbrdg=on:t1tsel=recovered**

**ent -t1: loc=1203:t1port=3:chanbrdg=on:t1tsel=external**

## Dependencies

The specified card location (**loc** parameter) must be equipped.

The card specified by the **loc** parameter must be a **limt1** card type.

The port specified by the **t1port** parameter must not be already equipped with a T1 interface.

The **chanbrdg=on** parameter can be specified only for HC-MIM and E5-E1T1 cards.

The **chanbrdg=on** parameter cannot be specified for even-numbered T1 ports (**t1port** parameter).

The timing source parameter **t1tsel** must be specified if the **chanbrdg=on** parameter is specified.

The **t1tsel=line** parameter cannot be specified for a T1 port (**t1port** parameter) when the **chanbrdg=on** parameter is specified.

The **t1tsel=recovered** parameter cannot be specified for a T1 port (**t1port** parameter) unless the **chanbrdg=on** parameter is specified.

When provisioning an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card to channel bridging mode using the **chanbrdg=on** parameter, the **force=yes** parameter must be specified if the adjacent even-numbered port is already provisioned with a T1 interface.

All signaling links assigned to adjacent even-numbered T1 ports must be deleted before an odd-numbered T1 port (**t1port** parameter) on an HC-MIM or E5-E1T1 card can be provisioned into channel bridging mode using the **chanbrdg=on** parameter. See the **dlt-slk** command to delete the signaling links.

The fan feature bit must be on before HC-MIM cards can be used in an EAGLE 5 ISS shelf (see the **chg-feat** command). The system checks the fan feature bit when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified and an HC-MIM card is present in the specified odd card location (**loc** parameter).

HIPR cards must be equipped in card locations xy09 and xy10 (x is the frame, y is the shelf) on each EAGLE 5 ISS shelf that contains one or more HC-MIM or E5-E1T1 cards. The system checks for HIPR cards when T1 ports **3 - 8** (**t1port** parameter) or **chanbrdg=on** parameter is specified for HC-MIM and E5-E1T1 cards.

T1 ports **3 - 8** (**t1port** parameter) can be specified only for HC-MIM and E5-E1T1 cards.

## Notes

One or two T1 interfaces must be defined on an E1/T1 MIM card used as a T1 card after the T1 and any associated Channel card types (**limt1** and **limch**) are defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card and any associated Channel cards (with the **ent-slk** command).

External timing is derived from the EAGLE 5 ISS High-Speed Master Clock (1.544 MHz for T1 or 2.048 MHz for E1); therefore, the Master Timing feature is required. Line timing is derived from its received data stream, if present.

Up to 8 T1 interfaces can be defined on an HC-MIM or E5-E1T1 card used as a T1 card after the T1 card type (**limt1**) is defined in the database (with the **ent-card** command), and before the signaling links and associated timeslots are defined for the T1 card.

On a HC-MIM or E5-E1T1 card, T1 ports 1, 3, 5, and 7 (master ports) can be independently channel bridged with their adjacent even-numbered (slave) ports 2, 4, 6, and 8 to allow non-signaling data pass-through. The **chanbrdg** parameter must be specified for the odd-numbered T1 port.

## Output

```
ent -
t1:loc=1205:t1port=1:encode=ami:t1tsel=external:framing=sf:ll=100
    rlgncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
    ENT-T1: MASP A - COMPLTD
;
```

## ent-tt

## Enter Translation Type

Use this command to add a translation type to the system database.

**NOTE:** If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept GTT (Global Title Translation) and TT (Translation Type) commands. Refer to the new command sets that replace the GTT and TT commands: GTT Selector commands (ent/chg/dlt/rtrv-gttset), GTT Set commands (ent/dlt/rtrv-gttset), and GTA commands (ent/chg/dlt/rtrv-gta).

**Keyword:** ent-tt

**Related Commands:** dlt-tt, rtrv-tt

**Command Class:** Database Administration

### Parameters

**:type/typea/typei/typen/typen24=** (mandatory)

A translation type numeric value may be entered as ANSI type (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

**Range:** 000-255

**Default:** No translation type is specified

**:alias=** (optional)

The alias of the global title translation type

**Range:** 000-255

**Default:** No alias assignment is made.

**:ndgt=** (optional)

The number of digits contained in the global title translation. This parameter is not valid if the VGTT (variable length GTT) feature is turned on.

**Range:** 1-21

**Default:** 6

(not applicable if the VGTT feature is on)

**:ttn=** (optional)

Translation type name.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** No translation name is given

### Example

**ent-tt:type=230:ttn=lidb:ndgt=5**

**ent-tt:type=230:ttn=lidb:alias=007**

**ent-tt:type=2:ndgt=5**

**ent-tt:type=3**

### Dependencies

This command is not valid when the EGTT feature is turned on.

Asterisk (\*) parameter values are not allowed for this command.

The translation type specified by **type** or **typea** cannot already exist in the database containing the ANSI types. A translation type specified by **typei**, **typen**, or **typen24** cannot already exist in the database containing the ITU types.

The translation name cannot already exist in either the ANSI or ITU database.

If an alias is specified, the translation type must be specified and must already exist in the database for the network type. If the translation name is specified when defining an alias, the name must already be associated with the translation type.

The translated signaling point code must be a full point code (*ni-nc-ncm*).

The translated signaling point code must have been specified previously as a full point code destination, or it must be a member of a previously specified cluster.

The **alias** parameter and the **ndgt** parameter cannot be specified together in the command.

If an alias is specified, the **alias** value cannot already be defined as either a translation type or an alias for the respective (ANSI or ITU) type.

The translation type name must be unique.

The **ndgt** parameter is not valid if the VGTT (variable length GTT) feature is turned on.

## Notes

The new translation type is entered into the translation type table along with the translation name and the number of digits used by the translation type.

The **ttn** parameter always refers to a translation type. Aliases do not have translation type names.

## Output

```
ent -
t1:loc=1205:t1port=1:encode=ami:t1tsel=internal:external:framing=s
f:ll=100
    rlgncxa03w 04-01-07 11:43:04 EST  EAGLE 31.3.0
    ENT-TT: MASP A - COMPLTD
;
```

## ent-ttmap

## Enter Translation Type Mapping

Use this command to add a mapped SS7 message translation type (TT) for a given gateway linkset name. With this command you can add to the database the identification of the type of allowed global title translation in the SS7 message before and after translation type mapping. For example, you can use this command to add to the database that you want the SS7 message translation type 001 (before TT mapping) mapped to 254 (after TT mapping).

**Keyword:** ent-ttmap

**Related Commands:** chg-ttmap, dlt-ttmap, rtrv-ttmap

**Command Class:** Database Administration

## Parameters

**:ett=** (mandatory)

Translation type before mapping. The identification of the type of global title translation in the SS7 message *before* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** 000-255

**:io=** (mandatory)

Incoming or outgoing. The system uses this parameter to indicate whether the translation type mapping data provisioned for the gateway linkset is for SS7 messages *received* or *sent* on the linkset.

**Range:** i, o  
**i** — incoming  
**o** — outgoing

**:lsn=** (mandatory)

Linkset name. The unique network identifier for the gateway linkset.

**Range:** ayyyyyyyyy  
 1 alphabetic character followed by 9 alphanumeric characters

**:mtt=** (mandatory)

Mapped translation type. The identification of the type of global title translation in the SS7 message *after* translation type mapping. This attribute is the decimal representation of the 1-octet binary field used by the SS7 protocol to identify the translation type.

**Range:** 000-255

### Example

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
```

### Dependencies

The linkset must be defined.

The Translation Type Mapping table must not be full for the linkset specified in the **lsn** parameter.

### Notes

None

### Output

```
ent-ttmap:lsn=nc001:io=i:ett=128:mtt=16
rlghncxa03w 04-02-21 13:09:27 EST EAGLE 31.3.0
ENT-TTMAP: MASP A - COMPLTD

TTMAP table for nc001 is (2 of 64) 3% full
;
```

## ent-user

## Enter User

Use this command to add a user to the database. When you first enter the command, the system prompts you for the user's password, which must follow the administered password guidelines. For security reasons, the password is not displayed. After successfully entering a user password, you are prompted to verify it by entering it again.

**Keyword:** ent-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, login, logout, rept-stat-user, rtrv-secu-user, rtrv-user

**Command Class:** Security Administration

### Parameters

**NOTE:** As of EAGLE 5 ISS Release 38.0, the following parameters can no longer be used:  
**lnpdb, lnpsub**

**:uid=** (mandatory)

User ID

**Range:** azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters (including asterisks, single quotes, and commas)

**:all=** (optional)

Specifies whether or not the user ID is assigned all non-configurable command classes (LINK, SA, SYS, PU, DB, DBG, LNP).

**Range:** yes, no

**Default:** no

**:cc1=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc2=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc3=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *configcmdclassname, bool*

*configcmdclass*—; value

*bool*—; value **yes, no**

**:cc4=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc5=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*

Specify the parameter value in the format *ayy* **-no** or *ayy* **-yes**.

*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters

**-no**—Indicates that the command class is not allowed.

**-yes**—Indicates that the command class is allowed.

**:cc6=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*  
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.  
*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters  
**-no**—Indicates that the command class is not allowed.  
**-yes**—Indicates that the command class is allowed.

**:cc7=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*  
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.  
*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters  
**-no**—Indicates that the command class is not allowed.  
**-yes**—Indicates that the command class is allowed.

**:cc8=** (optional)

Configurable command class name (*ayy*), and an indicator (**-yes** or **-no**) to specify whether the User ID can enter commands assigned to the specified command class.

**Range:** *ayy*  
 Specify the parameter value in the format *ayy -no* or *ayy -yes*.  
*ayy*—Configurable command class name of 1 alphabetic character followed by 2 alphanumeric characters  
**-no**—Indicates that the command class is not allowed.  
**-yes**—Indicates that the command class is allowed.

**:db=** (optional)

Access to all commands in command class Database Administration.

**Range:** **yes, no**  
**Default:** **no**

**:dbg=** (optional)

Access to all commands in command class Debug.

**Range:** **yes, no**  
**Default:** **no**

**:link=** (optional)

Access to all commands in command class Link Maintenance.

**Range:** **yes, no**  
**Default:** **no**

**:lnpbas=** (optional)

Access to all commands in the command class LNP Basic

**Range:** **yes, no**  
**Default:** **no**

**:page=** (optional)

The maximum age of the password, in days. The STP automatically prompts the user for a new password at login if the user's password is older than the value specified for the **page** parameter.

**Range:** **0-999** days  
**Default:** The value specified for the **page** parameter on the **chg-secu-dflt** command

**:pu=** (optional)

Access to all commands in command class Program Update.

**Range:**     **yes, no**

**Default:**   **no**

**:revoke=** (optional)

Revoke the user ID. The system rejects login attempts for a revoked user ID.

**Range:**     **yes, no**

**Default:**   **no**

**:sa=** (optional)

Access to all commands in command class Security Administration.

**Range:**     **yes, no**

**Default:**   **no**

**:sys=** (optional)

Access to all commands in command class System Maintenance.

**Range:**     **yes, no**

**Default:**   **no**

**:uout=** (optional)

User ID aging interval. The number of successive days a user ID can go unused (that is, no successful login) before the system denies login of that user ID.

**Range:**     **0-999**

**Default:**   The value specified for the **uout** parameter on the **chg-secu-dflt** command

**Example**

**ent-user:uid=john:db=yes**

**ent-user:uid=john\*mayer:db=yes**

**ent-user:uid=user123:cc5=u21-yes:cc8=u32-yes**

**Dependencies**

Passwords cannot be created or modified from a telnet terminal (terminal IDs 17-40) without the OA&M IP Security Enhancements feature turned on.

All new users are given access to the command class Basic as a default.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **lnpbas** parameter can be specified.

If the **all=yes** parameter is specified, and the LNP feature has not been turned on, then the **lnpbas** parameter value defaults to **no**.

The **revoke=yes** parameter cannot be specified for a user ID with system administration authorization.

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **cc1-cc8** parameters.

The **cc1-cc8** parameter values must have valid default or provisioned configurable command class names. Default names are **u01-u32**.

**Notes**

To disable user ID aging, specify the **uout=0** parameter.

The *Database Administration Manual - System Management* provides a list of all commands allowed within each command class.

Up to 8 configurable command class name parameters can be specified in one command. Additional commands can be entered to assign user access for more than 8 names. To assign user access for all 32 available configurable command class names, four commands could be entered with 8 names specified in each command.

A password must be entered for the newly-created userID. The system issues a separate prompt for this password and disables character echo at the terminal so that the entered password is not displayed on the screen.

After the password has been entered, the system issues a second prompt, and the password must be entered again. This ensures that no typing mistakes were made on the first entry.

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that is specified in the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that is specified in the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

## Output

```
ent-user:uid=john*mayer:db=yes
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
ENT-USER: MASP A - COMPLTD
;
```

## ent-vendid

### Enter Vendor ID

Use this command to enter elements into the Vendor ID list, for the GSM MAP SRI Redirect to Serving HLR (also called GSM MAP SRI Redirect) feature. Each entry is identified by the Vendor ID and the Vendor number.

The Vendor ID length (**vendidlen** parameter) must be entered first, before the command is entered the second time to enter the Vendor ID and Vendor Number.

**Keyword:** ent-vendid

**Related Commands:** dlt-vendid, rtrv-vendid

**Command Class:** Database Administration

## Parameters

**:vendid=** (optional)

Vendor ID

**Range:** 1-15 digits

**:vendidlen=** (optional)

Vendor ID Length. All Vendor IDs defined for the GSM MAP SRI Redirect for Serving HLR feature must contain this number of digits.

**Range:** 0-15

**:vendnum=** (optional)

Vendor Number. The Vendor Number is used as a reference to the prefix for the GSM MAP SRI Redirect for Serving HLR feature.

**Range:** 1-3

1—Corresponds to the prefix defined with prefix number 1 (see the **chg-prefix** command).

2—Corresponds to the prefix defined with prefix number 2 (see the **chg-prefix** command).

3—Corresponds to the prefix defined with prefix number 3 (see the **chg-prefix** command).

**:vendtype=** (optional)

Vendor Type. The Vendor Type is used with the GSM MAP SRI Redirect for Serving HLR feature to allow multiple networks for the same equipment vendor.

**Range:** 1-2

### Example

```
ent-vendidvend:len=6
```

```
ent-vendid:vendid=886933:vendnum=1:vendtype=1
```

### Dependencies

The value **none** cannot be specified for the **vendid** parameter.

The GSM MAP SRI Redirect feature must be enabled before this command can be entered.

The VENDID table can contain a maximum of 200 entries.

The specified ID entry cannot already exist in the VENDID table.

All VENDID table entries must have the number of digits defined by the **vendidlen** parameter value.

The prefix with the same prefix number as the specified Vendor Number must already be provisioned for the GSM MAP SRI Redirect feature.

The Vendor ID length cannot be changed unless the VENDID table is empty. All Vendor IDs must be deleted from the table before a different Vendor ID length can be entered.

The Vendor ID length must be entered before any Vendor IDs can be defined.

The **vendidlen** parameter cannot be specified in the same command with the **vendid**, **vendidlen**, and **vendtype** parameters. Either the **vendidlen** parameter, or the **vendid**, **vendidlen**, and **vendtype** parameters can be specified in one command.

### Notes

None.

### Output

The Vendor ID length must be entered first, before any Vendor IDs can be entered.

```
ent-vendid:vendidlen=6
```

```
rlghncxa03w 04-10-07 11:11:28 EST EAGLE 31.11.0

## ent-vflx-cd

### Enter VFLEX Call Decision Entry

Use this command to provision the call decision criteria that is used to create a voice mail routing number. This command creates a new entry in the V-Flex Call Decision Table.

**NOTE:** The V-Flex feature must be enabled before this command can be entered.

**Keyword:** ent-vflx-cd

**Related Commands:** chg-vflx-cd, dlt-vflx-cd, rtrv-vflx-cd

**Command Class:** Database Administration

## Parameters

**:bcap=** (mandatory)

This parameter specifies the INAP/CAP bearer capabilities for the call.

The INAP/CAP bearer capabilities are used to determine the type of mail that is used by the call, such as voice, video, multimedia, etc.

**Range:** 0-31, none

none—BCAP is not present in the incoming MSU.

**:cdn=** (mandatory)

Call decision name. This parameter specifies an entry in the call decision table.

**Range:** ayyy

1 alphabetic character followed by 3 alphanumeric characters

**:dnstat=** (mandatory)

Dialed number status. This parameter specifies whether the MSISDN is found in the EPAP RTDB.

**Range:** fnd, nfnd, \*

fnd—DN found in RTDB

nfnd—DN not found in RTDB

\*—It does not matter whether the DN is found in RTDB

**:rnidx=** (mandatory)

Routing number index. This parameter specifies the index associated with the generated voice mail routing number.

**Range:** 0-9

**:vmdig=** (mandatory)

Voice mail number or voice mail prefix digits. This parameter specifies a voice mail number or voice mail digits for the call decision entry.

If the call is redirected (the **rdi=redir** parameter is specified), then the value specified for the **vmdig** parameter represents a voice mail number. If the call is not redirected (the **rdi=dir** parameter is specified), then the value specified for the **vmdig** parameter represents a set of voice mail digits.

**Range:** 1-15 digits

Valid digits are 0-9, A-F, a-f.

**:rdi=** (optional)

Redirection indicator. This parameter specifies whether the call is redirected.

**Range:** dir, redir

dir—call is not redirected

redir—call is redirected

**Default:** dir

## Example

```
ent-vflx-  
cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn  
=cdn1
```

## Dependencies

The V-Flex feature must be enabled before this command can be entered.

The value specified for the **cdn** parameter cannot be a reserved word, such as **none**.

The value specified for the **cdn** parameter cannot already exist in the Call Decision table.

An entry with the specified **dnstat**, **rdi**, **bcap** and **vmdig** parameters cannot already exist in the Call Decision table.

The value specified for the **vmdig** parameter cannot differ from a value that already exists in the Call Decision table by only the value of the **dnstat** parameter. The values specified for the **rdi** and **bcap** parameters must differ as well.

The maximum number of 25 entries cannot already be provisioned for a given **rdi**, **dnstat**, and **bcap**.

## Output

**ent-vflx-**

**cd:dnstat=fnd:rdi=redir:bcap=31:vmdig=abcdef123456abc:rnidx=0:cdn=cdn1**

```
rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0
ENT-VFLX-CD: MASP A - COMPLTD
```

;

**ent-vflx-**

**cd:dnstat=nfnd:bcap=none:vmdig=dadbeefeed:rnidx=9:cdn=cdn2**

```
rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0
ENT-VFLX-CD: MASP A - COMPLTD
```

;

## ent-vflx-rn

## Enter VFLEX Routing Number

Use this command to associate a routing number name to a set of voice mail routing numbers. This command creates an entry in the Routing Number table.

**NOTE: The V-Flex feature must be enabled before this command can be entered.**

**Keyword:** ent-vflx-rn

**Related Commands:** chg-vflx-rn, dlt-vflx-rn, rtrv-vflx-rn

**Command Class:** Database Administration

## Parameters

**:rn=** (mandatory)

Routing number. This parameter specifies the voice mail routing number.

**Range:** 1-15 digits  
Valid digits are **0-9, A-F, a-f**.

**:rnname=** (mandatory)

Routing number name. This parameter specifies the name associated with the voice mail routing number.

**Range:** ayyyyyyy  
1 alphabetic character followed by 7 alphanumeric characters.

## Example

**ent-vflx-rn:rnname=rn01:rn=123ABCD012**

## Dependencies

The V-Flex feature must be enabled before this command can be specified.

The Routing Number table cannot contain more than 10,000 entries.

The value specified for the **rnname** parameter cannot already exist in the database.

The value specified for the **rn** parameter cannot already exist in the database.

The value specified for the **rnname** parameter cannot be a reserved word, such as **none**.

## Output

```
ent-vflx-rn:rnname=rn01:rn=1234ABCD56
rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0
ENT-VFLX-RN: MASP A - COMPLTD
;
```

## ent-vflx-vmsid

### Enter VFLEX VMS ID Entry

Use this command to provision a voice mail server ID and associate up to 10 routing number names with the ID. This command creates an entry in the VMSID table.

**NOTE: The V-Flex feature must be enabled before this command can be entered.**

**Keyword:** ent-vflx-vmsid

**Related Commands:** chg-vflx-vmsid, dlt-vflx-vmsid, rtrv-vflx-vmsid

**Command Class:** Database Administration

## Parameters

**:id=** (mandatory)

This parameter specifies the ID of the voice mail server.

**Range:** 1-15 digits, **dflt**

Valid digits are **0-9, A-F, a-f**.

**dflt**—a set of routing numbers that is used when a query is received with an invalid MSISDN or an MSISDN that is not found in the RTDB.

**:idx0=** (optional)

Index 0. This parameter specifies the routing number name for index 0.

**Range:** ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**:idx1=** (optional)

Index 1. This parameter specifies the routing number name for index 1.

**Range:** ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**:idx2=** (optional)

Index 2. This parameter specifies the routing number name for index 2.

**Range:** ayyyyyyy

1 alphabetic character followed by upto 7 alphanumeric characters

**:idx3=** (optional)

Index 3. This parameter specifies the routing number name for index 3.

**Range:** ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**:idx4=** (optional)

Index 4. This parameter specifies the routing number name for index 4.

**Range:** ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**:idx5=** (optional)

Index 5. This parameter specifies the routing number name for index 5.

**Range:**        *ayyyyyyy*  
                  1 alphabetic character followed by up to 7 alphanumeric characters

**:idx6=** (optional)

Index 6. This parameter specifies the routing number name for index 6.

**Range:**        *ayyyyyyy*  
                  1 alphabetic character followed by up to 7 alphanumeric characters

**:idx7=** (optional)

Index 7. This parameter specifies the routing number name for index 7.

**Range:**        *ayyyyyyy*  
                  1 alphabetic character followed by up to 7 alphanumeric characters

**:idx8=** (optional)

Index 8. This parameter specifies the routing number name for index 8.

**Range:**        *ayyyyyyy*  
                  1 alphabetic character followed by up to 7 alphanumeric characters

**:idx9=** (optional)

Index 9. This parameter specifies the routing number name for index 9.

**Range:**        *ayyyyyyy*  
                  1 alphabetic character followed by up to 7 alphanumeric characters

### Example

The following command provisions a VMS ID and associates a routing number name with index 0.

**ent-vflx-vmsid:id=123456abcdef123:idx0=RN45**

The following command provisions a VMS ID and associates routing number names with index 0 and index 5.

**ent-vflx-vmsid:id=DADBEEFEED:idx0=rn15:idx5=rn30**

### Dependencies

The V-Flex feature must be enabled before this command can be entered.

The values specified for the **idx\*** parameters must already exist in the Routing Number table.

The value specified for the **id** parameter cannot already exist in the VMSID table.

The **idx\*=none** parameter cannot be specified.

The VMSID table contains a maximum of 1000 entries.

The value specified for the **rnname** parameter must already exist in the Routing Number table.

### Output

**ent-vflx-vmsid:id=123456abcdef123:idx0=rn45**

rlghncxa03w 08-05-07 11:11:28 EST EAGLE 39.0.0

## ent-x25-dstn

### Enter X.25 Destination

Use this command to associate an X.25 network address with an existing SS7 point code in the routing table, and optionally, a subsystem within that point code. If the node is actually in the X.25 domain,

the X.25 address is a real network address and the point code is a dummy point code. If the node is in the SS7 domain, the point code is a real SS7 point code and the X.25 address is a dummy address.

**Keyword:** ent-x25-dstn

**Related Commands:** chg-x25-dstn, dlt-x25-dstn, rtrv-x25-dstn

**Command Class:** Database Administration

## Parameters

**:dpc=** (mandatory)

This parameter is the real SS7 point code assigned to a real SS7 node or the dummy point code for an X.25 destination entity. The value for this parameter is a point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*).

**Synonym:** dpca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:xaddr=** (mandatory)

The X.25 network address of the X.25 destination entity or the SS7 node.

**Range:** 1-15 digits

**:ssn=** (optional)

The subsystem number of the destination that is assigned to the X.25 address or the SS7 address.

**Range:** 1-255

**Default:** 5

## Example

```
ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123
```

```
ent-x25-dstn:xaddr=255864567:dpc=033-001-013
```

## Dependencies

Each X.25 address must have at least four digits.

The DPC must exist in the destination table.

The X.25 SS7 ANSI destination point code must be a full point code (*ni-nc-ncm*).

The X.25 address cannot exist in X.25 destination table.

The maximum number of X.25 destinations is 1024.

## Notes

None

## Output

```
ent-x25-dstn:xaddr=220525586456772:dpc=133-013-001:ssn=123
```

```
rlghncxa03w 04-02-10 11:43:04 EST EAGLE 31.3.0
```

```
X.25 DSTN TABLE 45 % FULL
```

```
ENT-X25-DSTN: MASP A - COMPLTD
```

```
;
```

**ent-x25-rte****Enter X.25 Route**

Use this command to define the routing parameters needed by the gateway portion of the LIMs with the LIMs with the **ss7gx25** application for establishing a virtual circuit that is permanently maintained by the system STP.

**Keyword:** **ent-x25-rte**

**Related Commands:** **chg-x25-rte, dlt-x25-rte, rtrv-x25-rte**

**Command Class:** Database Administration

**Parameters**

**:saddr=** (mandatory)

The alias X.25 address assigned to the SS7 destination entity on the SS7 side of the circuit.

**Range:** 1-15 digits

**:type=** (mandatory)

The type of X.25 connection that the link is expected to maintain.

**Range:** **pvc, svca, svcr**

**pvc** — Permanent virtual circuit

**svca** — automatic virtual circuit

**svcr** — remote virtual circuit

**:xaddr=** (mandatory)

The X.25 address assigned to the X.25 destination entity on the X.25 side of the circuit.

**Range:** 1-15 digits

**:lc=** (optional)

The number of the logical channel on the X.25 signaling link to which the PVC connection is assigned.

This parameter is mandatory if the **type=pvc** parameter is specified. If the **type=svca** or **type=svcr** parameters are specified, the logical channel number is arbitrary and cannot be specified.

**Range:** 1-255

**Default:** The logical channel is not given.

**:lc2nm=** (optional)

Invokes SS7 MTP network management for failures and recoveries of logical channels.

**Range:** **yes, no**

**Default:** **yes**—if **rt=xpc** is specified

**no**—if **rt=pc** is specified

**no**—if **rt** is not specified

**:loc=** (optional)

The card location containing the X.25 signaling link that will maintain the connection. For an automatic virtual circuit, this link is the link on which the system STP initially attempts the connection. However, if this attempt fails, the connection may be established by the X.25 destination entity on any other link in this link's linkset.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** The card location is not given

**:port=** (optional)

The port on the card containing the X.25 signaling link.

**Range:** **a**

**Default:** The port is not given

**:rt=** (optional)

The type of routing to perform for messages originating in the SS7 domain and destined for the X.25 domain. Two types of routing are available: (1) Route on X.25 destination point code (XPC) and (2) Route using X.25 origination and destination point code combinations (PC).

**Range:** xpc, pc

**Default:** pc

### Example

**ent-x25-**

**rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svca:loc=1201:port=a**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svcr**

**ent-x25-rte:xaddr=225255:saddr=133132:type=svcr:rt=xpc:lc2nm=yes**

### Dependencies

Each X.25 address must have at least four digits.

The **limds0**, **limdscs**, **limocu** and **limv35** card types are the only valid card types for this command. These card types must be running the **ss7gx25** GPL type.

The shelf and card must be equipped.

The logical channel number cannot be specified if the connection type is an automatic virtual circuit or a remote virtual circuit (**type=svca** or **type=svcr**).

The logical channel number must be specified if the connection type is PVC (**type=pvc**).

If **lc2nm=yes** is specified, **rt=xpc** must be specified.

If the X.25 domain destination is an adjacent entity, **lc2nm=no** must be specified.

The **loc** and **port** parameters cannot be specified if the connection type is a remote switched virtual circuit (**type=svcr**). The far end initiates a remote switched virtual circuit and sends the system the location and port information.

The card location (**loc**) must be specified if the connection type is a permanent virtual circuit or an automatic virtual circuit (**type=pvc** or **type=svca**).

Each X.25 address must exist in X.25 destination table.

The X.25 address must be assigned to a destination in the X.25 domain.

The SS7 address must be assigned to a destination in the SS7 domain.

The combination of the two X.25 addresses must be unique in the X.25 route table.

The combination of point code/SSNs assigned to the two X.25 addresses must be unique in the X.25 route table.

The maximum number of X.25 routes in a system is 1024.

The point codes assigned to each of the X.25 destinations must also be assigned to routes.

The signaling link must be assigned to a LIM with the **ss7gx25** application.

The signaling link assigned to the X.25 route must be in the database and must be assigned to a linkset. The linkset must be assigned to a route associated with an X.25 destination and must contain an APC in the X.25 domain. This can be verified by entering the following commands:

- **rtrv-sl**—Displays the signaling links
- **rtrv-ls**—Displays the linksets

- **rtrv-rte**—Displays the routes
- **rtrv-x25-dstn**—Displays the X.25 destinations
- **rtrv-dstn**—Displays the destination point codes.

The logical channel number cannot be greater than the maximum number of permanent virtual circuits allowed for the signaling link. For example, if the total number of permanent virtual circuits allowed for the signaling link is 15, the logical channel number for this signaling link cannot be greater than 15.

The logical channel of the signaling link cannot already be assigned to an X.25 route.

The number of permanent virtual circuits cannot exceed the maximum number of permanent virtual circuits defined for the signaling link.

The number of automatic virtual circuits cannot exceed the maximum number of switched virtual circuits defined for the signaling link.

If **rt=xpc** is specified, the **xaddr** parameter's alias SS7 point code must be unique in the X.25 route table.

## Notes

The connection can be one of three types, a permanent virtual circuit, an automatic virtual circuit, or a remote virtual circuit.

Permanent virtual circuits are permanent X.25 virtual connections between two signaling points established on one of the logical channels of an X.25 signaling link. This connection is setup by the network, therefore no setup is required by the system to establish a permanent virtual circuit connection.

Automatic virtual circuits are essentially the same as permanent virtual circuits, except that the connection must be established by either the system or the X.25 destination entity.

Remote virtual circuits are also essentially the same as automatic virtual circuits, except that the connection can be established only by the X.25 destination entity.

All LIMs with the **ss7gx25** application share this information. Even though these connections apply to only one card, they are used by all cards.

## Output

**ent-x25-**

**rte:xaddr=225255:saddr=133131:type=pvc:loc=1201:port=a:lc=3**

## flash-card

## Flash-Card

Use this command to load all flash images (GPL) supported by a specified card. This command performs the same functions as the **init-flash** and the **act-flash** commands.

**Keyword:** flash-card

**Related Commands:** act-flash, init-flash

**Command Class:** System Maintenance

## Parameters

**:code=** (mandatory)

The GPL type to be loaded.

**Range:**     **appr, trial**  
               **appr** — Approved GPL  
               **trial** — Trial GPL

**:loc=** (mandatory)

Card address. The location of the card as stenciled on the shelf of the system.

**Range:**     **1101-1112, (1113 and 1115 OAM), 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:force=** (optional)

This parameter is used to force the command to work on an IS-NR card. Links provisioned on the card are inhibited during command execution. The card and inhibited links are restored to their previous state when the command is completed.

**Range:**     **yes, no**

**Default:**   **no**

### Example

```
flash-card:loc=1105:code=trial
```

```
flash-card:loc=1105:code=appr:force=yes
```

### Dependencies

Cards do not have to be provisioned to use the **flash-card** command. However, if the specified card is provisioned and not inhibited, use of the **force** parameter is required.

The specified card locations must be running a flashable software image.

HMUX or HIPR cards are not supported.

If the even-numbered TDM (1114,1116) is specified, the flash occurs on the odd-numbered GPSM-II running OAM (1113,1115).

The specified card location cannot be the active MASP (either the active GPSM-II or the active TDM).

No other action command can be in progress when this command is entered.

The card specified in the location parameter must be present and able to communicate over the IMT. The card do not have to be provisioned in the database.

If the card is already running the specified code load, it cannot be loaded by this command.

### Notes

The specified card must be present and able to communicate over the IMT.

A card that is already running the specified code load cannot be reflashed using the **force** parameter. The **act-flash** and **init-flash** commands must then be used to reload the same code level.

## Output

**flash-card: loc=1105:code=appr:force=yes**

**format-disk****Format Disk**

Use this command to format and initialize a system removable cartridge or standby Terminal Disk Module (TDM).

**NOTE:** The **format-disk** command leaves the disk unusable until the **chg-db** and **copy-gpl** commands are entered.

**Keyword:** **format-disk**

**Related Commands:** **chg-db**, **copy-disk**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**, **rtrv-gpl**

**Command Class:** System Maintenance

### Parameters

**:type=** (mandatory)

The type of removable cartridge to format.

**Range:** **fixed**, **meas**, **system**

**fixed** — The standby fixed disk on the standby TDM

**meas** — The measurement cartridge

**system** — The system cartridge

**:force=** (optional)

This parameter provides some protection against data loss due to reformatting a used system removable cartridge.

**Range:** **yes**, **no**

**Default:** **no**

**:low=** (optional)

This parameter provides control over whether a low-level format will be performed on the target disk. Specifying **low=no** can be used to decrease formatting time.

**Range:** **yes**, **no**

**Default:** **yes**

**:prtnggrp=** (optional)

Partition group. This parameter indicates which disk partition group is to be formatted. Specifying the inactive group is relevant only when **type=fixed** is specified.

CAUTION

**CAUTION:** Do not enter the **format-disk:prtnggrp=inactive** command unless directed to by Tekelec Technical Services to avoid possible loss of a previously archived software release.

**Range:** **active**, **inactive**

**Default:** **active**

### Example

**format-disk:type=system**

**format-disk:type=meas:force=yes**

### Dependencies

The EOAM GPL version that is running in the active OAM card location must be the same GPL version that is running in the standby OAM card location.

To format a cartridge that already contains system data, the **force=yes** parameter must be specified.

The **force=yes** parameter must be specified if the cartridge to be formatted is recognized as a system removable cartridge. This parameter is optional if the cartridge is not recognized as a system removable cartridge. Only cartridges that have a **dms.cfg** file are recognized as system removable cartridges. A removable cartridge must be inserted and made ready before the **type=meas** or **type=system** parameter can be specified in the command.

Measurements collection must be inhibited during execution of the **format-disk** command. If measurements are not inhibited, **format-disk** cannot be executed.

- Do not enter the **chg-measopts:collect=on** command while the **format-disk** command is in progress. This results in read and write errors, because the standby disk is not accessible.
- Do not enter **format-disk** until the 30 minute measurements processing or the midnight measurements processing has completed, because inhibiting measurements during these periods results in the loss of measurement data for the period being processed.

OAM Measurements collection cannot be in progress when this command is entered. Retry the command after a period of waiting for the measurements collection to complete.

If the **force=yes** parameter is specified, the disk should not require low-level formatting, and the **format=no** parameter should be specified.

The card with the standby OAM must be available when this command is entered.

The standby fixed disk contains security log entries that have not yet been uploaded. Upload the log entries before formatting the disk to avoid loss of log data.

The **low=no** parameter must be specified when the **prtnggrp** parameter is specified.

## Notes

The **low=no** parameter should be specified when upgrading a spare TDM. The **low=yes** parameter should be specified when there is a suspected hardware problem.

When the **type=meas** parameter is specified, a measurements removable cartridge is built.

When the **type=system** parameter is specified, a system removable cartridge is built.

A system removable cartridge can contain only GPLs and the database. Measurement data cannot be placed on a system removable cartridge. After a system removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-gpl** and **chg-db:action=backup:dest=remove** commands. The **copy-gpl** command copies all approved GPLs from the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the approved GPLs. The **chg-db:action=backup:dest=remove** command copies the database from the current partition of the fixed disk on the active TDM to a system removable cartridge, providing a backup copy of the database.

A measurements removable cartridge can contain only measurement data. Database information and GPLs cannot be placed on a measurements removable cartridge. After a measurements removable cartridge is formatted, the cartridge does not contain any data, but is ready to be used as the destination disk of the **copy-meas** command. The **copy-meas** command copies all measurement data from the fixed disk on the active TDM to a measurements removable cartridge for offline processing of the measurement data.

The database audit and GPL audit facilities are automatically disabled during execution of this command. When this command has completed (successful or not), the database and GPL audit facilities are automatically re-enabled.

All commands that affect the database are disallowed for the duration of the command. Attempts to use such commands are rejected, and an error message is displayed explaining that the command has been rejected.

During the upgrade process, files made obsolete by the upgrade process are deleted, freeing up disk space.

The format of magneto-optical removable cartridges allows the cartridges to be used in DOS/Windows environments in addition to being used on the system.

If the **format-disk** command is initiated and the standby OAM initialization is not complete, command processing is delayed. If standby initialization fails, the command proceeds to allow the standby TDM to recover from a previous **format-disk** or **copy-disk** failure. In such cases, the following messages appear:

Standby MASP has not finished initializing - please wait...

Standby MASP initialization timed out - continuing...

The **dms.cfg** file on either the active TDM or a system formatted removable cartridge is used by the **format-disk** command when formatting the target disk. The location of the **dms.cfg** file cannot be specified by the **format-disk** command. The value of the **type** parameter is used to determine the target disk to format and the location of the **dms.cfg** file on which to base the format. Table 5-51 shows the location of the **dms.cfg** file based on the value of the **type** parameter for the **format-disk** command.

**Table 5-51. DMS.CFG File Location for format-disk Command**

| Value of the type Parameter | Target Disk (Card Location) | Location of the DMS.CFG File |
|-----------------------------|-----------------------------|------------------------------|
| <b>fixed</b>                | Standby TDM (1114 or 1116)  | Removable Cartridge (1117)   |
| <b>system</b>               | Removable Cartridge (1117)  | Active TDM (1114 or 1116)    |
| <b>meas</b>                 | Removable Cartridge (1117)  | Active TDM (1114 or 1116)    |

The **format-disk** command can create a maximum disk partition size of 2047 Mbytes, based on a 16-bit cluster size. A cluster is composed of 64 512-Kilobyte sectors. The physical capacity of the disk being formatted determines the formatted size of the disk and the number of partitions created on the disk.

Table 5-52 shows the format capacities of each type of disk used on the system and the number of partitions created on each disk.

**Table 5-52. Disk Format Capacity**

| Target Disk Type                    | Disk Location | Target Capacity | Number of Partitions | Formatted Size of the Partition |
|-------------------------------------|---------------|-----------------|----------------------|---------------------------------|
| SyQuest Removable Cartridge         | 1117          | 256 Mbytes      | 1                    | 256 Mbytes                      |
| Magneto-Optical Removable Cartridge | 1117          | 1096 Mbytes*    | 1                    | 1024 Mbytes                     |
| TDM                                 | 1114 or 1116  | 540 Mbytes      | 1                    | 507 Mbytes                      |
| TDM                                 | 1114 or 1116  | 2 Gigabytes     | 1                    | 2014 Mbytes                     |

Table 5-52. Disk Format Capacity

| Target Disk Type                                                                                                                                                                                                                                                                                                                                                                                                                              | Disk Location | Target Capacity | Number of Partitions | Formatted Size of the Partition |
|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------|-----------------|----------------------|---------------------------------|
| TDM                                                                                                                                                                                                                                                                                                                                                                                                                                           | 1114 or 1116  | 4 Gigabytes     | 2                    | 2047 Mbytes                     |
| * The magneto-optical removable cartridge is a double-sided cartridge that contains 2.3 gigabytes of data, but only one side of the disk can be formatted and used when it is inserted into the removable cartridge drive. The target capacity given for the magneto-optical removable cartridge is for one side of the disk in the cartridge and is approximately one half of the total capacity of the magneto-optical removable cartridge. |               |                 |                      |                                 |

**inh-alm****Inhibit Alarm Reporting**

Use this command to inhibit the reporting of alarms for the given device. Inhibited alarms will not generate unsolicited output or cause alarm indicators to be turned on. All **rept-stat-xxx** commands continue to display the alarm with an indication that the device has its alarms inhibited.

The frame alarm LEDs are off for the inhibited alarm. This command does not affect the alarm counts on the VT320 banner. The fourth box on the right of the VT320 Control Area indicates the number of devices in the system with inhibited alarms.

**Keyword:** inh-alm

**Related Commands:** rept-stat-alm, rept-stat-card, rept-stat-cdt, rept-stat-dlk, rept-stat-dstn, rept-stat-ls,, rept-stat-rte, rept-stat-rtx, rept-stat-seas, rept-stat-slk, rept-stat-sys, rept-stat-trbl, rept-stat-trm, rtrv-log, unhb-alm

**Command Class:** System Maintenance

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dev=** (mandatory)

Device. This parameter specifies the device where the reporting of alarms is to be inhibited.

**Range:** **applsock, as, card, cdt, clock, dlk, e1port, ls, lsmsconn, route, seasx25, slk, t1port, trm, rtx, enet**  
**applsock** — IP gateway application socket  
**as** — IP gateway application Application Server  
**card** — Cards in the database  
**cdt** — Customer defined troubles  
**clock** — System clock  
**dlk** — TCP/IP data links  
**e1port** — E1 port on E1/T1 MIM or HC MIM cards  
**ls** — Linksets  
**lsmsconn** — Communication link between the LSMS and the EMS  
**route** — Route  
**seasx25** — The SEAS X.25 links  
**slk** — Signaling links  
**t1port** — T1 port on E1/T1 MIM or HC MIM cards  
**trm** — Terminals  
**rtx** — Exception Route  
**enet** — Ethernet

**:asname=** (optional)

Gateway Application Server name. When used with the **dev=as** parameter, this parameter can be used to inhibit alarms for the named Application Server.

**Range:** *aaaaaaaaaaaaaa*  
 Up to 15 alphanumeric characters; the first character must be a letter.

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used with the **ecic** parameter to define the CIC range that is used as an exception routing criterion for the specified exception route.

**Range:** **0-16383**

**:dpc=** (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym: dpca****Range:** **p-, 000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination Point Code

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point*. The *prefix* subfield indicates a private point code.

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—000–255

**:dur=** (optional)

Duration. The period for which the alarms are inhibited. If the **dur=temp** parameter is specified, the clearing of the event that caused an alarm also clears the alarm inhibit, and the alarms become uninhibited on the device.

**Range:**      **perm, temp, timed**

**perm** — A permanent inhibition of an alarm.

**temp** — A temporary inhibition of an alarm.

**timed** — An inhibition of an alarm for a specified duration.

**Default:**    **perm**

**:e1port=** (optional)

Port ID. The E1 port on the specified E1 card.

The **e1port** parameter is mandatory if the **dev=e1port** parameter is specified.

**Range:**      **1-8**

Ports **3 - 8** can be specified only for HC-MIM cards and E5-E1T1 cards.

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:**      **0-16383**

**:edate=** (optional)

Expiry date. The date on which a timed alarm inhibit expires, at the time specified in the **etime** parameter value.

The **edate** parameter is valid and required when the **dur=timed** parameter is specified.

**Range:**      **101-991231**

Specify the date in the format of *year*, followed by *month*, followed by *day* (*yymmdd*).

**:etime=** (optional)

Expiry time. The time at which a timed alarm inhibit expires, on the date specified in the **edate** parameter value.

The **etime** parameter is valid and required when the **dur=timed** parameter is specified.

**Range:**      **0-2359**

Specify the time in the format of *hour* followed by *minute* (*hhmm*).

**:force=** (optional)

Allows critical alarms to be inhibited on a device.

The **force** parameter is mandatory if the **lvl=crit** parameter is specified.

The **criticalminh** STP option must be turned on before the **force** parameter can be specified.

**Range:**      **yes, no**

**Default:**    **no**

**:id=** (optional)

Identification number of the customer-defined trouble (**5 - 16**). Customer-defined troubles **1 - 4** are generated critical alarms and cannot be specified as values for the **id** parameter.

**Range:**      **5-16**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:**      *ayyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**:link=** (optional)

Signaling link on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

**a, b**—For **dev=dlk**, **dev=slk** for a two-port LIM

**a1, a2, b1, b2**—For **dev=ndclk/seasx25/lsmconn**

**a, b, a1, b1, a2, b2, a3, b3**—For **dev=slk** for a multi-port LIM

**a, b, a1-a31, b1-b31**—For **dev=slk** for an HC MIM

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** **ayyyyyyyyy**

1 alphabetic character followed by up to 9 alphanumeric characters.

**:lvl=** (optional)

The alarm severity level (critical, major, or minor).

**Range:** **crit, majr, minr**

**Default:** **majr**

**:opc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **opca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Origination point code.

**:opci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opc=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opc24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as the exception routing criterion for the specified exception route.

**Range:** **0-15**

**:sname=** (optional)

Gateway application socket. When used with the **dev=applsock** parameter, this parameter can be used to inhibit alarms for the named application socket.

**Range:** *aaaaaaaaaaaaaaaa*

1 to 15 alphanumeric characters.

**:t1port=** (optional)

Port ID. This parameter is mandatory if the **dev=t1port** parameter is specified.

**Range:** **1-8**

Ports **3 - 8** can be specified only for HC MIM cards.

**:trm=** (optional)

Terminal ID. This parameter specifies the ID number of the terminal whose characteristics are to be retrieved and displayed.

**Range:** **1-40**

**Example**

**inh-alm:dev=route:dpc=1-1-1:dur=perm:lvl=crit:force=yes**

**inh-alm:dev=rtx:dpc=1-101-1:opc=4-4-4**

```

inh-
alm:dev=route:dpc=1-1-1:dur=timed:lvl=crit:edate=050515:etime=230
0:force=yes
inh-alm:dev=enet:loc=1201:port=a
inh-alm:dev=enet:loc=1101:port=a:dur=temp:lvl=minr

```

### Dependencies

This command is not allowed in upgrade mode.

Table 5-53 shows the valid parameter combinations for the **inh-alm** command. The **dur** and **lvl** parameters are valid with all **dev** parameter values.

**Table 5-53.** Parameter Combinations for the **inh-alm** command

| Value (:dev)                       | a | a | c | c | d | e | l | l | n | n | r | s | s | t | t | e | r |
|------------------------------------|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|---|
| Device Parameter                   | p | s | a | d | l | l | s | s | d | d | o | e | l | l | r | n | s |
|                                    | p | r | t | o | k | p | m | c | c | u | a | k | p | m | e |   |   |
|                                    | l | d | c | o | s | l | q | t | s | o | r | t |   |   |   |   |   |
|                                    | s |   | k | r | c | k | 3 | e | x |   |   |   |   |   |   |   |   |
|                                    | o |   |   | t |   |   |   |   | 2 |   |   |   |   |   |   |   |   |
|                                    | c |   |   |   |   |   |   |   | 5 |   |   |   |   |   |   |   |   |
|                                    | k |   |   |   |   |   | n |   |   |   |   |   |   |   |   |   |   |
| No Parameters                      |   |   |   | x |   |   |   |   | x |   |   |   |   |   |   |   |   |
| :asname                            |   | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :dpc/dpca/dpci/dpcn/dpcn24         |   |   |   |   |   |   |   |   |   | x |   |   |   |   |   |   |   |
| :id                                |   |   | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :loc                               |   |   | x |   | x | x |   |   |   |   |   | x | x |   | x |   |   |
| :lsn                               |   |   |   |   |   | x |   |   |   |   |   |   |   |   |   |   |   |
| :e1port=1-8                        |   |   |   |   | x |   |   |   |   |   |   |   |   |   |   |   |   |
| :link=a, b                         |   |   |   |   | x |   |   |   |   |   |   | x |   |   | x |   |   |
| :link=a, b, a1, a2, b1, b2, a3, a3 |   |   |   |   |   |   |   |   |   |   |   | x |   |   |   |   |   |
| :link=a1, a2, b1, b2               |   |   |   |   |   |   | x | x |   | x |   |   |   |   |   |   |   |
| :sname                             |   | x |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |
| :t1port=1-8                        |   |   |   |   |   |   |   |   |   |   |   |   | x |   |   |   |   |
| :trm                               |   |   |   |   |   |   |   |   |   |   |   |   |   | x |   |   |   |
| :rsn                               |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   |   | x |

No other action command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

This command will not execute while the signaling link is running either a Link Fault Sectionalization test or a Loopback test. An AST of LFS or LPBK must be cleared before signaling link alarms can be inhibited.

This command cannot be used to permanently inhibit XLIST point codes.

Before critical alarms can be inhibited, the STP option **criticalminh** must be enabled. The **chg-stpopts:criticalminh=yes** command enables this option.

Alarms cannot already be inhibited for the specified device.

When the **lvl=crit** parameter is specified, the **force=yes** parameter must be specified.

When the **dev=card** parameter is specified, the **loc** parameter must be specified.

When the **dev=dlk** parameter is specified, the **loc** parameter must be specified.

When the **dev=slk** parameter is specified, the **loc** parameter and the **link** parameter must be specified.

When the **dev=e1port** parameter is specified, the **loc** parameter and the **e1port** parameter must be specified.

When the **dev=t1port** parameter is specified, the **loc** parameter and the **t1port** parameter must be specified.

When the **dev=ls** parameter is specified, the **lsn** parameter must be specified.

When the **dev=trm** parameter is specified, the **trm** parameter must be specified.

When the **dev=cdt** parameter is specified, the **id** parameter must be specified.

When the **dev=seasx25** parameter is specified, the **link** parameter must be specified.

When the **dev=lsmsconn** parameter is specified, the **link** parameter must be specified.

When the **dev=route** parameter is specified, a **dpc/dpca/dpci/dpcn/dpcn24** parameter must be specified.

When the **dev=applsock** parameter is specified, the **sname** parameter must be specified.

When the **dev=as** parameter is specified, the **asname** parameter must be specified.

If the **sname** parameter is specified, the socket name must exist in the IPAPSOCK table.

If a point code parameter is specified, the point code must exist in the Routing table.

If the **dev=slk** parameter or **dev=dlk** parameter is specified, the specified **link** must exist in the database.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The card location that is specified in the **loc** parameter must be equipped.

The specified device type must be supported by the card in the specified card location.

The Origin-Based MTP Routing feature must be on before the **dev=rtx** parameter can be specified.

Permanent alarm inhibit is not allowed on the cluster PC because either the cluster or a member PC of the cluster is already alarm inhibited.

When the **dur=timed** parameter is specified, the **edate** and **etime** parameters must be specified.

When a **dur** parameter value other than **timed** is specified, the **edate** and **etime** parameters cannot be specified.

The **edate** parameter value must be a date equal to or later than the current system date. If the current system date is specified, then the **etime** parameter value must be a time later than the current system time. If a date later than the current system date is specified, then the **etime** parameter value can be any valid time in the format *hhmm*.

The **inh-alm** command cannot be used to change the level of inhibition on a device.

If the **dev=enet** parameter is specified, then the **loc** parameter and the **port** parameter must be specified.

The card must be an IPLIMx or IPGWx card.

The value specified for the **port** parameter is out of range.

When the **dev=ndclk** parameter is specified, the **link** parameter must be specified.

The **link** parameter must be valid for the selected device type.

## Notes

If critical alarms are inhibited, all alarms (critical, major, and minor) are disabled. Likewise, if major alarms are inhibited, both major and minor alarms are disabled.

The **dur** parameter allows alarms to be inhibited on a temporary basis. If a device has its alarms temporarily disabled, the device's alarms are automatically enabled after the alarm clears.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

## Output

```
inh-a l m : dev = route : dpc = 1-1-1 : dur = perm : lvl = crit
rlghncxa03w 04-02-23 13:20:59 EST EAGLE 31.3.0
Alarms are permanently inhibited.
;

## inh-card

## Inhibit Card

Use this command to change the state of the card from in-service normal (IS-NR) to Out-of-Service Maintenance-Disabled (OOS-MT-DSBLD). A user can then test the card or physically remove it from the shelf.

**Keyword:** inh-card

**Related Commands:** alw-card, dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

## Parameters

**:loc=** (mandatory)

Card address. The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:force=** (optional)

Force indicator. This parameter is required for the following conditions:

- The specified card is the last card supporting a linkset, SCCP subsystem, MPS-to-DSM connection, E1, T1, Measurements Platform subsystem, or GLS
- The TDM contains a security log with un-uploaded entries or any other TDM process in progress
- The specified HC MIM card or E5-E1T1 card is in channel bridging mode
- The specified card has the last in-service SEAS terminal configured.

**Range:** yes, no

**Default:** no

## Example

**inh-card:loc=1101**

**inh-card:loc=1201:force=yes**

## Dependencies

No other action commands can be in progress when this command is entered.

The card must be a TSM, ACM, DCM, Service Module, LIM, GPSM-II, E1/T1 MIM, HC MIM, E5-E1T1, or E5-ATM. The card location cannot be 1114, 1116, or 1117.

If the card is the only linkset, SCCP, Service Module, or GLS card remaining, the **force=yes** parameter must be specified in the command to inhibit the card.

If the card contains signaling or data links, all links must be out of service (OOS-MT-DSBLD) before the card can be inhibited.

If the card is type **lime1**, all signaling links providing timeslots serviced by the E1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

If the card is type **limt1**, all signaling links providing timeslots serviced by the T1 interfaces assigned to the card must be deactivated, unless **force=yes** is specified.

The shelf and card must be equipped.

If the specified card is the only in-service MPS-DSM, the **force=yes** parameter must be specified.

If the specified card is the only in-service TSM, LIM, or MCPM, the **force=yes** parameter is required.

If the specified HC-MIM or E5-E1T1 card is in channel bridging mode, the **force=yes** parameter is required.

If inhibiting the Service Module card would cause less than 80% of the in-service normal (IS-NR) LIM cards to have VSCCP service (i.e., cause the system to enter an unstable loading mode), the **force=yes** parameter must be specified.

The card that is specified cannot be running the active OAM.

If the specified card has the last in-service SEAS Terminal configured, then the **force=yes** parameter must be specified to inhibit the card.

The card location (**loc**) must be within the allowed range.

The standby fixed disk cannot be initialized while un-uploaded security log entries exist.

The card cannot be inhibited as the terminals are still in use.

### Notes

The function of this command is the same as the **rmv-card** command.

When this command is entered, the card is initialized and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

CAUTION

**CAUTION: This command can be used to disable Measurements Platform measurements collection after the collection function has been enabled with the chg-measopts:platformenable=on command. To disable collection, ALL MPCM cards in the system must be inhibited. THIS CAN RESULT IN LOSING ALL PAST MEASUREMENT DATA ON THE CARDS. Use the alw-card command to enable measurements collection after the MPCM cards have been inhibited.**

When an E5-IPSM Card is inhibited, the active SEAS terminals are set to the state OOS-MT/FLT.

### Output

**inh-card: loc=1101**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been inhibited.
```

;

## inh-imt

### Inhibit IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. This command removes the IMT bus from service.

CAUTION

**CAUTION: Use this command only when directed by the Tekelec Customer Care Center at (888) FOR-TKLC.**

**Keyword:** inh-imt

**Related Commands:** alw-imt, clr-imt-stats, conn-imt, disc-imt, rept-imt-lvl1, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)  
IMT bus to be inhibited  
**Range:** a, b

### Example

**inh-imt:bus=a**

### Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.  
This command cannot be entered during an IMT Fault Isolation Test.

### Notes

Cards not connected to the other IMT bus will reinitialize.  
All traffic is rerouted to the alternate IMT bus.  
The function of this command is the same as the **rmv-imt** command.

### Output

```
inh-imt:bus=a
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit IMT Bus A command issued

rlghncxa03w 04-01-07 13:12:41 EST EAGLE 31.3.0
3116.0098      IMT BUS A          IMT inhibited
;
```

## inh-map-ss

### Inhibit Mated Application Subsystem

Use this command to shut down (inhibit) a mated application subsystem. The command requires a parameter specifying the SSN to be inhibited. Currently, the LNP, INP, INPQS, Equipment Identity Register (EIR), Voice Mail Router (V-Flex), and ATI Number Portability Query (ATINPQ) subsystems can be inhibited. The specified subsystem attempts a coordinated shutdown. If the coordinated shutdown fails, a UIM is issued indicating the shutdown failed. If the **force** parameter is specified, the subsystem is forced to shut down, and a coordinated shutdown is not performed.

**Keyword:** inh-map-ss

**Related Commands:** alw-map-ss, rept-stat-lnp, rept-stat-sccp

**Command Class:** System Maintenance

### Parameters

**:ssn=** (mandatory)

This parameter specifies the ATINPQ, EIR, INP, LNP, or V-Flex subsystem number.

**Range:** 2-255

**:force=** (optional)

This parameter forces the shutdown of the ATINPQ, EIR, INP, LNP, or V-Flex subsystem.

**Range:** yes, no

**Default:** no

### Example

```
inh-map-ss:ssn=10
```

```
inh-map-ss:ssn=10:force=yes
```

### Dependencies

The EIR, INP, LNP, or V-Flex feature must be turned on, or the ATINP feature must be enabled before this command can be entered.

No other action command can be in progress when this command is entered.

The specified **ssn** parameter value must represent the ATINPQ, EIR, INP, LNP, or V-Flex subsystem.

The EAGLE 5 ISS must be configured with at least one card running the **sccp** application.

**Notes**

If the LNPQS subsystem is disabled, any GTT requiring Message Relay is also disabled because they both use the same database. This causes the EAGLE 5 ISS to generate a TFP for the EAGLE 5 ISS CPCs. Traffic is then routed to the mate. If both Message Relay GTT and non Message Relay GTT use the same CPC, this could affect the GTT.

**Table 5-54.** Route Set Test When LNP is Offline

| <b>Network Management</b> | <b>Concerned PC</b> | <b>Network Management</b> |
|---------------------------|---------------------|---------------------------|
| RSP                       | CPC                 | TFA concerning CPC        |
| RSP                       | LNP CPC             | None                      |
| RSP                       | TPC                 | TFA concerning TPC        |
| RSR                       | CPC                 | TFA concerning CPC        |
| RSR                       | LNP CPC             | TFP concerning LNP CPC    |
| RSR                       | TPC                 | TFA concerning TPC        |

Table 5-55 shows what actions EAGLE 5 ISS takes when LNP is offline and a message arrives requiring LNP. This table assumes that SCCP cards are available.

**Table 5-55.** Receiving Messages when LNP is Offline

| <b>Routing Indicator in Incoming Message</b> | <b>DPC</b>    | <b>Result of GTT</b>     | <b>Message Handling</b> | <b>Network Management</b> |
|----------------------------------------------|---------------|--------------------------|-------------------------|---------------------------|
| rt-on-gt                                     | Capability PC | rt-on-ssn, LNP subsystem | Reroute to mate         | TFP concerning CPC        |
| rt-on-gt                                     | True PC       | rt-on-ssn, LNP subsystem | Reroute to mate         | None                      |
| rt-on-gt                                     | Capability PC | Message Relay required   | Generate UDTS           | TFP concerning CPC        |
| rt-on-gt                                     | True PC       | Message Relay required   | Generate UDTS           | None                      |
| rt-on-ssn                                    | Capability PC | Not applicable           | Generate UDTS           | None                      |
| rt-on-ssn                                    | True PC       | Not applicable           | Generate UDTS           | SSP concerning True PC    |

**Output**

```

inh-map-ss:ssn=30

;

```

**inh-slk****Inhibit Signaling Link**

Use this command to prevent message signal units (MSU) from being transmitted on a specified, previously uninhibited signaling link.

**NOTE:** The signaling link's inhibited status is not preserved across a LIM reboot.

**Keyword:** inh-slk

**Related Commands:** act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, rept-stat-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk

**Command Class:** Link Maintenance

**Parameters**

**:link=** (mandatory)

The signaling link on the card that is specified in the **loc** parameter. The links can be specified in any sequence or pattern.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" in Appendix A for valid **link** parameter range values for each type of card that can have a location specified in the **loc** parameter.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

```
inh-slk:loc=1307:link=b
```

**Dependencies**

A card location must be specified that is valid and defined in the database.

No other action command can be in progress when this command is entered.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application

- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The card must contain signaling links.

The signaling link must be equipped in the database.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL, MPL-T), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The link parameter values **a4-a15** and **b4-b15** can be specified only for the HC-MIM card and the E5-E1T1 card. The link parameter values **a16-a31** and **b16-b31** can be specified only for the HC MIM card. The link parameter values **a4-a15** and **b4-b15** can be specified only for the E5-ENET card.

If an IPSEG-M3UA signaling link is used, then this command cannot be entered.

This command is not valid on TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as IPGWI links).

## Notes

If the link is already inhibited, the system does not execute the command.

If the link is aligned, it attempts to perform a changeover to alternate links. If it is not aligned, it cannot carry traffic.

If the link is the last link in the linkset, or if the node assigned to the link is inaccessible by another route, the inhibit request is denied. If a command request is denied, it is because the SS7 changeover procedure cannot take place.

If the **inh-slk** command is followed by the **init-card** command, the inhibition of the signaling link is not preserved after the **init-card** command completes.

Card locations are illustrated in the *Installation Manual – EAGLE 5 ISS*.

The **inh-slk** command might time out if a far-end remote does not respond to the inhibit message.

## Output

```
inh-slk: loc=1301: link=a
rlghncxa03w 05-01-07 11:11:28 EST  EAGLE5 33.0.0
Inhibit Link message sent to card
;
```

**inh-trm****Inhibit Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD. It sets the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port, and all incoming traffic is ignored.

**Keyword:** inh-trm

**Related Commands:** act-echo, alw-trm, canc-echo, chg-trm, dact-echo, rept-stat-trm, rmv-trm, rst-trm, rtrv-trm

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)

The ID of serial port to be inhibited

**Range:** 1-40

**:force=** (optional)

The parameter forces the removal of a specified terminal, even if it is the last in-service OAP port or last in-service SEAS terminal available.

**Range:** yes, no

**Default:** no

**Example**

```
inh-trm:trm=5
```

```
inh-trm:trm=1:force=yes
```

**Dependencies**

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

The **force=yes** parameter must be specified to inhibit the last in-service OAP port.

This command cannot be used to inhibit the terminal from which the command is entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

**Notes**

When inhibiting an already inhibited terminal, a warning message is echoed to the scroll area, but no action is taken.

**Output**

```
inh-trm:trm=5
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Inhibit message sent to terminal
```

```
;
```

```
inh-trm:trm=17:force=yes
```

```
tekelecstp 07-01-23 18:46:01 EST EAGLE 37.5.0
Inhibit message sent to terminal
```

```
;
```

**init-card****Initialize Card**

Use this command to cause a soft reset of a card. It has the same result as a hard reset (card boots, application, and data load), except that connect status is not affected; that is, if a card is not connected, it stays that way.

When the command is issued to the OAM software, there is a 10-second wait before the card is reset. This wait period is intended to ensure that all database updates are complete before the card is reset.

**CAUTION: When a LIME1 or LIMT1 card has associated channel cards (LIMCH) with provisioned links, the init-card command entered for the LIME1 or LIMT1 card causes all links on the associated channel cards to go out of service.**

**Keyword:** init-card

**Related Commands:** dlt-card, ent-card, init-sys, rept-stat-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

**Parameters**

**:appl=** (optional)

Application. This parameter specifies the type of application residing on the card.

**CAUTION: Because the appl parameter causes all LIMs running the assigned application to reload, it should be used only during periods of low traffic.**

**Range:**

xyyyyyy

1 alphabetic character followed by up to 6 alphanumeric characters.

**atmansi**—This application is used by the LIM cards to support the high-speed ATM signaling link feature. It is also used by the E5-ATM card to support T1 functionality.

**atmitu**—This application is used by the E1-ATM cards to support the high-speed E1 ATM signaling link. It is also used by the E5-ATM card to support E1 functionality.

**ccs7itu**—This application is used by the LIM cards for ITU-TSS MTP functionality. It is also used for the 2-port E1 card, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card.

**eroute**—This application is used by the STC card for EAGLE 5 Integrated Monitoring Support functions.

**gls**—This application is used by the TSM cards for downloading gateway screening to LIM cards.

**ipgwi**—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 64 cards to be assigned the **ipgwi** application.

**iplim**—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ANSI point codes.

**iplimi**—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes.

**ips**—This application is used by the IPSM card or E5-IPSM card for the IP User Interface feature.

**ipsg**—This application is used by the E5-ENET card to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

**mcp**—This application is used by the MCPM card for the Measurements Platform feature.

**sccp**—This application is used by the TSM cards for the global title translation application.

**ss7ansi**—This application is used by the LIM cards, the E1/T1 MIM card, the HC MIM card, and the E5-E1T1 card for the MTP functionality.

**ss7gx25**—This application is used by the LIM cards to support X.25 functionality.

**ss7ipgw**—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 64 cards to be assigned the **ss7ipgw** application.

**stplan**—This application is used by the ACM, DCM, and E5-ENET cards to support the STP LAN functionality.

**vsccp**—This application is used by the Service Module cards to support EPAP-based features and LNP features. If no EPAP-based features or LNP features are turned on, and a Service Module card is present, the **vsccp** GPL processes normal GTT traffic.

**Default:** The application assigned to the card

**:data=** (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the LNP feature or an EPAP-based feature is on or the ATINP feature is enabled. This parameter is applicable only to Service Module cards that run the **vsccp** application and contain an RTDB.

**Range:** **refresh, persist**

**refresh**— Causes data to be reloaded to the specified card.

**persist**— Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place. The **force** parameter is required if all of the specified cards do not meet the warm restart requirements. During the card initialization and loading sequence, a warm restart is performed for all cards that meet the warm restart conditions.

**Default:** **refresh**

**:force=** (optional)

Force indicator. Enables the command to be processed under the following conditions:

- If **serial=yes** and all cards of the specified GPL type are not IS-NR or OOS-MT-DSBLD.
- If **initclk=yes** and the TDM card specified in the **loc** parameter is the only good HS clock source that is currently active. A temporary clock outage will occur.
- If **initclk=yes** and **appl=eoam** is specified (bitfiles on both TDMs will be initialized). A temporary clock outage will occur.

**Range:** **yes, no**

**Default:** **no**

**:initclk=** (optional)

Initialize TDM Bitfile indicator. If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION: The resulting clock outage will probably cause loss of traffic on all links.**

The following scenarios will cause such clock outages:

- Simplex MASP configuration (a system with a single TDM).
- Bad clock status on the remaining TDM.

**Range:**     **yes, no**

If **initclk=yes** is specified with a single TDM card location, the bitfile for the specified TDM reloads.

If **initclk=yes** is specified with **appl=eoam** and **force=yes**, the bitfile reloads on both TDMs.

**:loc=** (optional)

Card address. The card location as stenciled on the shelf of the system.

**Range:**     **1101-1108, 1111-1116, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2301-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

When the **initclk** parameter is not specified, the listed card locations are valid.

When the **initclk** parameter is specified with the **loc** parameter, only card locations **1113, 1114, 1115, and 1116** are valid. Entering locations **1114** and **1116** results in the same action as entering **1113** and **1115**.

**Default:**   All valid card locations are initialized.

**:prtnggrp=** (optional)

Partition group. This parameter specifies the disk partition group that is used as the source for downloading the appropriate GPL.

A value of **1113** or **1115** must be specified for the **loc** parameter before this parameter can be specified.

**Range:**     **active, inactive**  
               **active** — the active partition group  
               **inactive** — the inactive partition group

**Default:**   **active**

**:serial=** (optional)

Controls the manner in which cards are initialized. If **serial=yes** is specified, cards of the specified APPL type are initialized one at a time. If **serial=no** is specified, cards of the specified APPL type are initialized simultaneously.

**Range:**     **yes, no**

**Default:**   **no**

### Example

```
init-card:loc=1113:prtnggrp=inactive
init-card:loc=1101:data=persist
init-card:loc=1113:initclk=yes
init-card:appl=eoam:initclk=yes:force=yes
init-card:appl=ipsg
```

### Dependencies

The shelf and card must be equipped.

Either the **loc** or **appl** parameter, but not both parameters, must be specified in the command.

The following card locations (**loc** parameter) are not allowed for this command: **1117, 1118**, and all **xy09** and **xy10** card locations (where **x** is the frame and **y** is the shelf).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

If TDM reload would cause system clocks to fail that are required to keep links active or TSCSYNC available, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION: The resulting clock outage will probably cause loss of traffic on all links.**

Clocks are required in the following situations:

- When at least one DS0 card is provisioned, one BITS clocks is required.
- When a high speed link is being master-timed, at least one high speed clock is required.
- When TSCSYNC is turned on, both SYSTEM clocks (A&B) are required.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

The **force** parameter must be specified for the cards that are not in the In-service Normal state.

The **serial** parameter is valid only when used with the **appl** parameter.

The **appl=all** parameter can be specified only when the **serial=yes** parameter is also specified.

The following applications are valid for the **appl** parameter: **ss7ansi**, **sccp**, **gls**, **ccs7itu**, **ss7gx25**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vscdp**, **atmitu**, **ipgwi**, **ips**, **eroute**, **ipsg**, or **mcp**.

The **force** parameter can be specified only when the **initclk**, **appl**, and **data** parameters are specified.

The **data** parameter is valid only for SCCP card locations or GPLs, or MPS database (VSCCP) card locations or GPLs.

The card location (**loc**) must be within the allowed range.

The specified card does not exist or is not a logical processing element.

An EPAP-based feature or an LNP feature that is warm-restart-capable must be enabled before this command can be entered with the **data=persist** parameter.

If the **serial=yes** parameter is specified, the **appl** parameter must specify a network type application value or must be equal to **all**.

The A-Port, EIR, G-Flex, G-Port, INP, IS41 GSM Migration (IGM), LNP ELAP Configuration, PPSMS, Prepaid IDP Relay Query (IDP Relay), or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **data** parameter can be specified.

If a removable cartridge is inserted in the system, then the **prtngrp=inactive** parameter cannot be specified.

The **loc** parameter must be specified with a value of **1113** or **1115** before the **prtngrp** parameter can be specified.

## Notes

The TDM card has a processor but no application.

## Output

**init-card:loc=1201**

Init Card command issued to card 1201

## init-flash

### Initialize Flash

Use this command to load the Board PROM to the inactive FLASH memory of a specified card or range of cards. When a card is reinitialized, it runs this version of the GPL in the card's inactive FLASH memory.

**Keyword:** **init-flash**

**Related Commands:** **act-flash**, **clr-imt-stats**, **flash-card**, **init-imt-gpl**, **rept-imt-info**, **rept-imt-lvl1**, **rept-imt-lvl2**, **tst-imt**

**Command Class:** System Maintenance

### Parameters

**:code=** (mandatory)

The version of the GPL being loaded onto the card.

**Range:**     **appr**, **trial**

**appr** — The approved GPL version

**trial** — The trial GPL version

**:boot=** (optional)

This parameter indicates whether the HC-MIM or EPM based card should boot or not boot after the command successfully completes.

Multiple images can be flashed without having to boot after each flash. If multiple images are being flashed to the HC-MIM or EPM based card, this parameter can be used to prevent the card from booting after each image is flashed. If multiple images are being flashed and the card is allowed to boot after each flash, an image that is not activated after the card boots will be lost on a subsequent reset of the card.

**Range:**     **yes**, **no**

**yes** — Reboot the card after the command completes successfully

**no** — Do not reboot the card after the command completes successfully.

**Default:**   **yes**

**:eloc=** (optional)

End location. Location of the last card of a range of cards to be initialized.

**Range:**     **1101-1113**, **1115**, **1201-1218**, **1301-1318**, **2101-2118**, **2201-2218**, **2301-2318**,  
**3101-3118**, **3201-3218**, **3301-3318**, **4101-4118**, **4201-4218**, **4301-4318**, **5101-5118**,  
**5201-5218**, **5301-5318**, **6101-6118**

**:force=** (optional)

This parameter is required to force the TDM-GTI bitfile reload if a clock outage will occur when **initclk=yes** is specified.

**Range:**        **yes, no**

**Default:**     **no**

**:gpl=** (optional)

Generic program load. This parameter specifies the flash GPL type that is running on the cards in the specified range of cards.

**Range:**        **xyyyyyy**

1 alphabetic character followed by up to 6 alphanumeric characters.

Valid GPLs are: **blbios**, **blbepm**, **blbsmg**, **blcpld**, **bldiag6**, **blrom1**, **blvxw6**, **bpdcm**, **bpdcm2**, **bphcap**, **bphcapt**, **bphmux**, **bpmpl**, **bpmplt**, **hipr**, **imtpci**, and **pldpmc1**.

The **bldiag** and **blvxw** flash GPLs are no longer supported.

**:initclk=** (optional)

If this parameter is specified for an EOAM card location (1113 or 1115), it determines whether or not the TDM-GTI bitfile should be reloaded, causing a clock initialization.

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

**Range:**        **yes, no**

**Default:**     **no**

**:loc=** (optional)

The location of a single card to be initialized.

**Range:**        **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**:sloc=** (optional)

Start location. Location of the first card of a range of cards to be initialized.

**Range:**        **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Example**

```
init-flash:loc=1105:code=trial
init-flash:sloc=1101:eloc=1112:gpl=bpdcm:code=appr
init-flash:loc=1113:code=appr:initclk=yes
init-flash:loc=1115:code=appr:initclk=yes:force=yes
init-flash:loc=1115:code=trial:initclk=no
```

**Dependencies**

The specified card for this command must be an HCAP, HCAP-T, DCM, E1/T1 MIM, HC-MIM, E5-E1T1, E5-ENET, GPSM-II, MPL, or Service Module card. An HMUX card or a HIPR card can be specified, but only for locations xy09 and xy10 (x is the frame and y is the shelf).

Each specified card does not have to be defined in the database, but it does have to be aligned on the IMT bus.

If the card in the specified card location is provisioned, the card must be inhibited before this command is entered (unless the card is an HMUX card or a HIPR card).

If the target card is HMUX or HIPR, both of the card locations specified in the **sloc** and **eloc** parameters must contain HMUX cards or HIPR cards on the same IMT bus. For HMUX or HIPR the bus is implicit based on the specified location. Location xy09 specifies HMUX or HIPR A Bus, and location xy10 specifies HMUX or HIPR B Bus (where x is the frame and y is the shelf). For example, **sloc=1109:eloc=6109** specifies all HMUX cards or HIPR cards on the A Bus only; **sloc=1110:eloc=6110** specifies all HMUX cards or HIPR cards on the B Bus only. HMUX cards or HIPR cards from both the A bus and B bus cannot be flash downloaded simultaneously.

If the target card is an HC-MIM or EPM based card, the **gpl** parameter must be specified when the **loc** parameter is specified.

The **boot** parameter can be specified only if the target is an HC-MIM or EPM based card.

The **boot** parameter cannot be specified for the **blcpld** HC-MIM GPL.

A card location that contains the active MASP cannot be specified for the **loc**, **sloc**, or **eloc** parameter.

The provisioning subsystem mode (simple, duplex) must be established prior to executing the command.

The **loc** parameter cannot be specified with the **eloc** and **sloc** parameters.

Either the **loc** parameter or the **eloc** and **sloc** parameters must be specified.

If the **eloc** and **sloc** parameters are specified, the **gpl** parameter must be specified. The cards in the locations specified in the **sloc** and **eloc** parameters must be running the specified general program load (**gpl**). Other cards in the range of card locations can be running other GPLs, but will not be initialized. Only the cards within the range that are running the specified GPL will be initialized.

The **sloc** parameter value must be less than the **eloc** parameter value, when the two parameters are specified.

The specified card cannot be running an inactive flash GPL when the command is executed.

If **initclk** is specified, the card location parameter value must be **1113** or **1115**.

If TDM reload would cause a system clock outage, the **initclk** parameter cannot be specified unless **force=yes** is also specified.

**CAUTION: The resulting clock outage will probably cause loss of traffic on all links.**

The command will be accepted if the TDM being initialized is a TDM-GTI and the following conditions are true:

- The card being flashed is in location 1113 or 1115.
- Any required clocks from the mate OAM are valid, or the **force=yes** parameter is used.

The **initclk** parameter can be specified only for TDM cards that support bitfile reloading (TDM-15 or later).

EPM-based cards cannot support a valid trial version of the **blbepm** GPL and **blcpld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded. The HC-MIM card cannot support a valid trial version of the **blbios** GPL and **blcpld** GPL at the same time. One of these GPLs must be downloaded and activated before the other one can be downloaded.

No other related command can be in progress when this command is entered.

A card location that is valid and defined in the database must be specified.

The **eloc** and **sloc** parameters must be specified together in the command; one parameter cannot be specified without the other parameter.

The cards specified in the **sloc** and **eloc** location parameters must be running the specified general program load (gpl).

If the **loc** parameter is specified with the **initclk** parameter, the **loc** parameter value must be card location **1113** or **1115**. If the **appl** parameter is specified with the **initclk** parameter, the **appl** parameter value must be **eoam**.

## Notes

Card locations **1114**, **1116**, and **1117** are not valid and cannot be specified.

For the HC-MIM or EPM based cards, multiple images can be flashed without having to boot the card after each flash. If multiple images are being flashed to the card the **boot=no** parameter can be used to prevent the card from booting after each image is flashed. After flashing any number of images, the card can be reset either by entering the **init-flash** command with the **boot=yes** parameter or by entering the **init-card** command. If multiple images are being flashed and the card is allowed to boot after each flash, any images that are not activated after the card boots will be lost on a subsequent reset of the card.

## Output

### **init-flash:loc=1105:code=trial**

```
rlghncxa03w 04-01-05 13:05:05 EST EAGLE 31.3.0

**init-imt-gpl****Initialize IMT GPL**

Use this command to load the specified IMT GPL software to the specified card and to reset that card. The application software is reloaded following IMT reset.

**Keyword:** **init-imt-gpl**

**Related Commands:** **alw-card, inh-card, init-card, rept-stat-card**

**Command Class:** System Maintenance

**Parameters**

**:code=** (mandatory)

Specifies which IMT GPL to load to the card.

**Range:** **appr, refresh, trial**

**appr** — The approved GPL version

**refresh** — Reload approved GPL version without card reset

**trial** — The trial GPL version

**:loc=** (optional)

Specifies the address of the card to be initialized.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All locations

**Example**

```
init-imt-gpl:loc=1201:code=trial
```

```
init-imt-gpl:code=refresh
```

```
init-imt-gpl:code=appr
```

**Dependencies**

The card location shelf must be within the allowed ranges as specified on the **loc** parameter. The shelf is the first two digits of the **loc** parameter.

The card location slot must be within the allowed ranges as specified on the **loc** parameter. The slot is the second two digits of the **loc** parameter.

The card location cannot contain a card with flash memory (HCAP, HCAP-T, DCM, MPL, HC MIM, HIPR, or HMUX).

When this command is entered, no other action command can be in progress.

If the **code=appr** or **code=trial** parameter is specified, the **loc** parameter must be specified.

If the **code=trial** parameter is specified, the **loc** parameter must be specified, and the specified card location must be equipped and in service.

If the **code=appr** or the **code=refresh** parameter is specified, the card must be connected to at least one IMT bus and communicating with the active MASP when the command is entered.

The **init-imt-gpl** command cannot be entered if any of the following commands is running: **clr-imt-stats, rept-imt-info, rept-imt-lvl1, rept-imt-lvl2, tst-imt**.

This command must not be entered during IMT statistics collection following an hourly boundary.

A card location that is valid and defined in the database must be specified.

**Notes**

None

**Output**

```

init-imt-gpl:loc=1201:code=trial
rlghncxa03w 04-02-27 16:53:22 EST    EAGLE 31.3.0
Initializing IMT GPL for card 1201.

0193.0014   CARD 1201 SS7ANSI      Card is present

rlghncxa03w 04-02-27 16:53:22 EST    EAGLE 31.3.0
0194.0096   CARD 1201 SS7ANSI      Card has been reloaded
;

```

**init-mux****Initialize High-Speed Multiplexer**

Use this command to reset a single HMUX or HIPR card or all HMUX or HIPR cards on the specified HMUX or HIPR bus.

If the command is entered between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor and brings down the respective IMT bus temporarily (approximately 10 seconds) until the HMUX or HIPR card or cards come back into service.

If the command entry is not between the **init-flash** command and the **act-flash** command, the command boots the HMUX or HIPR processor without bringing down the respective IMT bus.

**Keyword:** **init-mux**

**Related Commands:** **act-flash**, **init-flash**

**Command Class:** System Maintenance

**Parameters**

**:bus=** (optional)

The HMUX or HIPR bus to be reset. All HMUX or HIPR cards on the specified bus will be reset.

**Range:**     **a, b**

**Default:**   **a**

**:force=** (optional)

Use this parameter to override normal safeguards. The **force=yes** parameter can be used to:

- Reset an entire HMUX or HIPR bus when the alternate bus is non-functional
- Reset one HMUX or HIPR card during a fault isolation test (**tst-imt**) command

**Range:**     **yes, no**

**Default:**   **no**

**:loc=** (optional)

The card location of a single HMUX or HIPR card to be reset.

**Range:**     **1109-1110, 1209-1210, 1309-1310, 2109-2110, 2209-2210, 2309-2310, 3109-3110, 3209-3210, 3309-3310, 4109-4110, 4209-4210, 4309-4310, 5109-5110, 5209-5210, 5309-5310, 6109-6110**

**Default:**   If not specified, all HMUX or HIPR cards on bus A or bus B are reset

**Example**

```
init-mux:bus=a
init-mux:loc=1109
```

**Dependencies**

An **act-flash** or **init-flash** command cannot be in progress when this command is entered.

Either the **bus** parameter or the **loc** parameter, but not both, must be specified.

This command is not allowed during an IMT Fault Isolation test (**tst-imt**), unless the **force=yes** parameter is specified.

This command is not allowed during the IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The STP options **hmuxabus** or **hmuxbbus** must have their value set to **yes** before this command can be executed.

**Notes**

None

**Output**

```
init-mux:loc=1109
rlghncxa03w 05-07-13 08:15:10 EST EAGLE 31.3.0
Command Completed.
;
```

**init-network****Initialize the Network**

Use this command to reset all the network cards. The network cards are ACMs, TSMs, and LIMs; that is, anything not part of the Maintenance and Administration Subsystem (MAS). This command resets all the network cards by reloading GPLs and data to the cards. Use of this command requires maintenance personnel to be located at the site.

**CAUTION:** Using this command causes network nodal isolation; however, if the network nodal isolation is less than two seconds, it may not be detected and may not be reported. Also, in some cases when network nodal isolation has been detected and a large number of maintenance troubles are being reported, the network nodal isolation message may not be reported. An alarm is generated, however.

**Keyword:** **init-network**

**Related Commands:**

**Command Class:** System Maintenance

**Parameters**

**:force=** (optional)  
Force the resetting of all the network cards.  
**Range:**      **yes, no**  
**Default:**    **no**

**Example**

```
init-network
```

**Dependencies**

The MASP must be in either *Upgrade Phase 3* mode or *Full Function* mode. (See the “Notes” section for this command for more information.)

The system database must be coherent when this command is entered.

At least one card with either the **ss7ansi** or the **ccs7itu** application installed must exist with an in-service active signaling link.

The **force=yes** parameter must be specified to override the required four-card **ss7ansi** or **ccs7itu** configuration. The system then selects the best available of the remaining **ss7ansi** or **ccs7itu** cards.

## Notes

### ***Upgrade Phase 3***

*Upgrade Phase 3* mode means that the MASPs are running GPLs that match the major revision defined for the approved GPLs, but the other network processors are only prepared to be upgraded.

### ***Full Function***

*Full Function* mode means that all MASPs are running GPLs that match the major revision defined for the approved GPLs. *Full Function* mode is the normal operating mode for the MASP.

**Output**

The command output scrolls into the scroll area of your display contiguously. However, for purposes of this example, each part has an explanation preceding it.

## **init-oap**

### **Initialize OAP Processor**

Use this command to send a hardware signal to the indicated OSS/Application Processor (OAP), causing it to reset and reinitialize its operational software.

**NOTE: This command cannot be used for EOAPs (Enhanced Operation System Support Application Processes).**

**Keyword:** **init-oap**

**Related Commands:** **chg-trm, rept-stat-seas**

**Command Class:** System Maintenance

## Parameters

**:oap=** (mandatory)

The OAP that is to be initialized. Any value (**a**, **b**, or **both**) can be specified, regardless of the actual or intended OAP configuration.

**Range:**     **a, b, both**

**:force=** (optional)

If the specified OAP is operational (that is, if its state is IS-NR or IS-ANR), and it is the only operational OAP, then the **force=yes** parameter must be specified to reset it. If the specified OAP is not operational, then **force=yes** is not required.

**Range:**     **yes, no**

**Default:**   **no**

## Example

```
init-oap:oap=a
```

```
init-oap:oap=both:force=yes
```

## Dependencies

The SEAS feature must be turned on before this command can be entered.

No other action command can be in progress when this command is entered.

The **force=yes** parameter must be specified to reset the last OAP.

The SEAS Over IP feature must be turned off before this command can be entered.

## Notes

The EAGLE 5 ISS determines the OAP configuration (single vs. dual) by querying the OAP. If one or both of the OAPs are not operational, then the EAGLE 5 ISS might receive incorrect information about the OAP configuration. Furthermore, if no OAP terminals are defined, no OAP queries are sent, the OAM defaults to a single configuration, and this information may be incorrect.

To allow an OAP to be reset by an OAM not configured for it or when no OAP terminals are yet defined, the **init-oap** command can be used to specify either OAP or both OAPs, even if doing so conflicts with the actual OAP configuration.

## Output

```
init-oap:oap=a
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Command Completed.
```

```
init-oap:oap=both:force=yes
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Initialization signal sent to OAP A
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

In the following example, assume that the MDAL is malfunctioning when the command is entered.

```
init-oap:oap=b
```

```
rlghncxa03w 05-07-01 16:40:40 EST  EAGLE 31.3.0
```

```
Info: MDAL is not operational. OAP initialization may not occur.
```

```
Initialization signal sent to OAP B
```

```
Command Completed.
```

```
;
```

**init-sys****Initialize System**

Use this command to reset all cards in the system (except HMUX and HIPR cards). When you first enter this command, a caution message is displayed in the scroll area requesting that you re-enter the command to confirm the operation. You have 30 seconds to re-enter the command. The only valid commands that you can enter after entering the **init-sys** command the *second* time are the commands **login** and **act-user**.

**CAUTION:** This command causes a complete system reload, and you should use it only during periods of low traffic. Use this command only when directed by Tekelec Technical Service at (888) FOR-TKLC.

**CAUTION:** When the **init-sys** command executes, the system does not retain the manually initiated state (for example, OOS-MT-DSBLD) for the signaling link, card, or the terminal. After the command executes, the system attempts to bring all provisioned links, cards, and terminals on line, including those that were previously out of service. You will need to manually put each device back into its previous state after the system is back on line. It is, therefore, advisable to print or electronically capture the output of the **rept-stat-slk**, **rept-stat-card**, and **rept-stat-trm** commands for reference prior to issuing the **init-sys** command. To restore a device to its previous state, issue the appropriate inhibit/deactivate command listed in this manual in the section for each of the above **rept-stat** commands.

**Keyword:** **init-sys**

**Related Commands:** **act-gpl**, **chg-db**, **chg-gpl**, **copy-gpl**, **copy-meas**, **disp-disk-dir**, **rept-stat-db**

**Command Class:** System Maintenance

**Parameters**

**NOTE:** The **force** parameter is no longer available.

**:data=** (optional)

High memory refresh. This parameter causes data to be reloaded to the specified card. This parameter is used to reload data if the G-Flex, G-Port, INP, or LNP feature is on, or the ATINP feature is enabled. This parameter is applicable only to network cards containing the MPS database (VSCCP).

**Range:** **refresh**, **persist**

**refresh** — Causes data to be reloaded to the specified card.

**persist** — Indicates that the database is not to be reloaded to the card. Used to request that the EAGLE 5 ISS perform a warm restart of the requested cards. The EAGLE 5 ISS performs various checks to ensure that all conditions necessary to initiate the warm restart are in place.

**Default:** **refresh**

**Example**

**init-sys**

**init-sys:data=persist**

**Dependencies**

When this command is entered, another **init-sys** command cannot be in progress on another port.

The G-Flex, G-Port, INP, LNP, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **data** parameter can be specified.

The value specified for the **data** parameter for the confirmation command must be the same value that was specified the first time.

## Notes

When the **init-sys** command is entered the first time, you have 30 seconds to enter the command again. After the command is accepted, a delay of 10 seconds gives the system time to broadcast the information message regarding the system initialization.

From the time that the **init-sys** command is accepted, you must wait approximately two minutes before you can log into the system. If the system terminal is in the VT-100/VT-320 mode, the terminal display will be refreshed with nonzero alarm counts. During this 2-minute interval, an intermediate screen refresh caused by the MASPs' role change from active to standby, and from standby to active. This screen refresh is typically a partial refresh and the alarm indicators are set to zero.

If you are logged into the system in the KSR mode, you receive UAM 0009 (MASP became active) to indicates that you are now able to log into the system. UAM 0009 could be issued twice due to possible transient MASP role change (switching from active to standby). Following the execution of the **init-sys** command, the MASP that was active before the **init-sys** command was entered will be the active MASP when the system has finished reinitializing. TSM cards are reloaded only in the event of power failure or hardware reboot. The execution of this command does not require the TSM cards to be reloaded.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Regenerated
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 01-07-11 07:05:00 EST EAGLE 30.2.0
0021.1493 CARD 1111 INFO SSH Host Keys Loaded
DSA Server Host Key FTRA-formatted Fingerprint=
84 7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d
Report Date:03-07-11 Time:22:27:36
```

**Output**

The following example shows what happens when you enter the **init-sys** command once and enter the **init-sys** command a second time within 30 seconds, causing the system to start resetting all of its cards.

**init-sys**

```
rlghncxa03w 04-01-07 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
init-sys
```

```
rlghncxa03w 04-01-07 07:05:16 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-07 07:05:17 EST  EAGLE 31.3.0
Init System command issued at terminal #3
```

The following example shows what happens when you enter the **init-sys** command once and allow more than 30 seconds to pass with no other keyboard entry.

**init-sys**

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3.

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when you enter the **init-sys** command once and enter a different command (**rls-alm:lvl=minr**), letting the 30-second timer expire for the second entry of the **init-sys** command.

**init-sys**

```
rlghncxa03w 04-01-05 07:05:00 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:01 EST  EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and
will result in traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
rls-alm:lvl=minr
```

```
rlghncxa03w 04-01-05 07:05:10 EST  EAGLE 31.3.0
Command entered at terminal #3

rlghncxa03w 04-01-05 07:05:11 EST  EAGLE 31.3.0
All the minor alarms are released

rlghncxa03w 04-01-05 07:05:12 EST  EAGLE 31.3.0
Command Completed

rlghncxa03w 04-01-05 07:05:31 EST  EAGLE 31.3.0
Init System command aborted due to confirmation timeout
```

The following example shows what happens when the **init-sys** command is entered twice within 30 seconds, and specifies the **data=persist** parameter to perform a warm restart of the requested cards without reloading the database to the cards.

#### **init-sys:data=persist**

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
```

```
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
CAUTION: This command causes a complete system reload, and will result in
traffic loss.
Re-enter command within 30 seconds to confirm.
```

```
init-sys:data=persist
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Command entered at terminal #3
rlghncxa03w 04-01-05 07:05:31 EST EAGLE 31.3.0
Init System command issued at terminal #3
```

## lock

### Lock Keyboard

Use this command to lock a terminal's keyboard. When the keyboard is locked, the system accepts no keyboard commands other than the **unlock** command. The keyboard remains locked until the logged on user's login password is entered at the UNLOCK prompt. When the keyboard is locked, any idle terminal monitor in effect for the terminal is suspended temporarily.

**Keyword:** lock

**Related Commands:** unlock

**Command Class:** Basic

#### Parameters

This command has no parameters.

#### Example

**lock**

#### Dependencies

The terminal cannot be an OAP terminal.

The terminal cannot be an **mgmt** terminal used for Network Surveillance.

The terminal cannot be a **telnet** terminal (terminal IDs 17-40).

#### Notes

As an alternative, you can unlock a locked terminal by entering the **inh-trm** command, followed by the **alw-trm** command.

#### Output

**lock**

```
rlghncxa03w 04-02-17 16:02:05 EST EAGLE 31.3.0
Terminal keyboard is locked. Enter UNLOCK command to unlock.
;
```

## login

### Login

Use this command to log into the system. After you enter this command, the system requests a password. For security reasons, the password is not displayed at the terminal.

**Keyword:** login

**Related Commands:** act-user, chg-pid, chg-secu-dflt, chg-user, dact-user, dlt-user, ent-user, logout, rept-stat-user, rtrv-secu-dflt, rtrv-secu-user, rtrv-user

**Command Class:** Basic

### Parameters

**:uid=** (mandatory)

User ID. The system prompts the user for a valid password after entering in this ID.

**Range:** azzzzzzzzzzzzzzzz

1 alphabetic character followed by up to 15 alphanumeric characters

### Example

**login:uid=john**

### Dependencies

All the following dependencies assume the appropriate features are turned **on**.

The user ID must not be logged in to another port already, and it must not be revoked.

The user ID must have been logged in successfully within the number of days specified on the **uout** parameter of the **ent-user** command.

If the OA&M IP Security Enhancements feature is not turned on, you cannot change the password at the prompt from an IP User Interface telnet terminal (IDs 17-40) when:

- It is the first time the user is logging in with the assigned Userid and password
- The password has expired because of aging out.  
You must log in with a new Userid and password for the first time or change an expired password from a serial terminal (terminal IDs 1-16).

Use the following rules for creating passwords:

- A new password cannot contain more than 12 characters.
- A new password must contain at least the number of characters that you specify on the **minlen** parameter of the **chg-secu-dflt** command.
- A new password must contain at least the number of alphabetic (**alpha** parameter), numeric (**num** parameter), and punctuation (**punc** parameter) characters that you specify on the **chg-secu-dflt** command.
- A new password cannot contain the associated user ID.

### Notes

The **act-user** command can be used in place of **login**. The **act-user** command has been provided in compliance with TL1 standards.

When a new system is shipped, the user ID and password are set to the system. These should be changed immediately to ensure system security.

### Output

Not applicable.

## logout

## Logout

Use this command to end a user session. The **logout** command has the same affect as the **dact-user** and **canc-user** commands.

4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218,  
5301-5308, 5311-5318, 6101-6108, 6111-6118

**Example**

```
pass:loc=1201:cmd="ping 198.89.1.2"
```

```
pass:loc=1201:cmd="help"
```

```
pass:loc=1111:cmd="soipdata -f"
```

**Dependencies**

The **loc** parameter value must correspond to a card location for:

- An SSEDCM or E5-ENET card that runs the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application
- An STC card or E5-STC card that runs the **eroute** application
- An IPSM card or E5-IPSM card that runs the **ips** application
- An SSEDCM card or E5-SLAN card that runs the **stplan** application
- A Service Module card that runs the **vsccp** application

The specified card location is out of range.

Syntax error found in the **pass** command.

Card is not in service

**Pass** command not found.

**Notes**

See "Pass-Through Commands" for information on pass-through commands.

## Output

The following example is not definitive of the output of the **ping** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1201:cmd="ping 198.89.1.2"
rlghncxa03w 04-02-17 15:35:05 EST EAGLE 31.3.0
ping - Command Accepted by 1201.
PASS: MASP A - COMPLTD
;
OUTPUT FROM 1201:
Pinging 192.168.100.4 with 32 bytes of data:
Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
Reply from 192.168.100.3: bytes=32 time<10ms TTL=255
Reply from 192.168.100.3: bytes=32 time=140ms TTL=255
Reply from 192.168.100.3: bytes=32 time=10ms TTL=255
ping - Command Completed.
END OUTPUT FROM 1201.
;
```

The following example is not definitive of the output of the **soipdata** command. It is intended to show how **pass** command output from a card might appear.

```
pass:loc=1111:cmd="soipdata -f"
tekelecstp 02-12-18 22:14:02 IST EAGLE 37.5.0

## rept-ftp-meas

## Report Measurements to FTP

Use this command to manually initiate generation and FTP transfer of a measurements report from the Measurements Platform MCPM to the customer's FTP server.

**Keyword:** rept-ftp-meas

**Related Commands:** rept-meas

**Command Class:** Link Maintenance

## Parameters

**:enttype=** (mandatory)

Entity type to report on in the measurements report.

**Range:** **eir**, **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **origninc**, **stp**, **stplan**, **tt**, **sctpasoc**, **sctpcard**, **ua**, **vflex**, **atinpq**  
**eir** — Measurements for Equipment Identity Register  
**link** — Measurements for signaling links  
**lnkset** — Measurements for linksets  
**lnp** — Measurements for local number portability  
**lsdestni** — Measurements for linkset destination network identifiers

**lsonismt** — Measurements for ISUP message type screening  
**lsorigni** — Measurements for linkset originating network identifiers  
**mapscrn** — Measurements for GSM MAP message screening  
**np** — Measurements for INP, G-Port, A-Port, and IGM  
**origni** — Measurements for originating network identifiers greater than 5  
**origninc** — Measurements for originating network identifiers (less than 5, small networks) for network clusters  
**stp** — Measurements for all nodes  
**stplan** — Measurements for TCP/IP links.  
**tt** — Measurements for translation types  
**sctpasoc** — Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)  
**sctpcard** — Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)  
**ua** — Measurements per application server/association for the M3UA and SUA protocols  
**vflex** — Measurements for V-Flex  
**atinpq** — Measurements for ATINP

**:type=** (mandatory)

The measurement report type.

**Range:** **avl, avld, avldth, comp, gtwy, mtcd, mtcdth, mtch, mtcs, nm, rbase, systot**

**avl** — Availability measurements

**avld** — Daily availability measurements

**avldth** — Day to hour availability measurements.

**comp** — Component measurements

**gtwy** — Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

**mtcd** — Daily maintenance measurements

**mtcdth** — Day-to-hour maintenance measurements

**mtch** — Hourly maintenance measurements

**mtcs** — Link/linkset maintenance status

**nm** — Network management, on-demand

**rbase** — Schedule-report type record base measurements

**systot** — STP system totals

**:day=** (optional)

Day of the week for the specified daily measurement report.

**Range:** **mon, tue, wed, thu, fri, sat, sun**

**Default:** If not specified, the previous single day is reported.

**:hh=** (optional)

The specific half-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **hh=0300** generates a report for the interval 2:30-3:00.

**Range:** **0000-2400**

*hhmm* where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

**:period=** (optional)

The relative period for the report.

**Range:** **active, last, specific**

**:qh=** (optional)

The specific quarter-hour for the specified report. The entry implies the ending time for the collection interval. For example, the parameter **qh=0315** generates a report for the interval **3:00-3:15**.

**Range:**        **0000-2400**  
*hhmm* where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

### Example

**rept-ftp-meas:type=systot:enttype=stp**  
**rept-ftp-meas:type=mtch:enttype=lnp**  
**rept-ftp-meas:type=mtcd:enttype=sctpasoc**

### Dependencies

The **rept-ftp-meas** command cannot be used to specify a report type if that report type is currently printing.

The Measurements Platform feature must be turned on (**chg-feat** command) before this command can be entered.

A primary MCPM card must be available when this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option (**chg-measopts:collect15min=on** command) must be on before the **qh** parameter can be specified.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before:

- The **mtchlnp=on** parameter or the **mtcdlnp=on** parameter can be specified
- Entity type **lnp** can be specified

The GSM Map Screening feature (see the **enable-ctrl-feat** and **chg-ctrl-feat** commands) must be turned on before:

- The **mtcdmap=on** parameter can be specified.
- Entity type **mapscrn** can be specified

The Equipment Identity Register (EIR) feature must be enabled and turned on before the **enttype=eir** parameter can be specified.

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**avld(th)**, **mtcd(th)**, **mtch**, **nm**, **rbase**, and **mtcs** are excluded with message “E2307: QH or HH is not valid for this TYPE”).

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld(th)**, **mtcd(th)**, **mtch**, **nm**, **rbase**, and **mtcs** cannot be specified.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Day-to-hour collection and report processing cannot be in progress

- When report type **mtcd** is specified
- When report type **mtcdth** is specified

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

The **day** parameter can be specified only for report type **mtcd** and entity types **eir**, **lnp**, **np**, **vflex**, and **mapscrn**.

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=active** parameter is specified, the **hh** parameter, the **qh** parameter, and the **day** parameter cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch**.

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**.

Table 5-56 indicates with an X valid parameter combinations for measurements reports; invalid combinations will generate an error message.

**Table 5-56. rept-ftp-meas Valid and Invalid Parameter Combinations**

| Parameter Value | :type Parameter Values |      |        |      |      |      |        |      |      |    |        |       |
|-----------------|------------------------|------|--------|------|------|------|--------|------|------|----|--------|-------|
|                 | avl                    | avld | avldth | comp | gtwy | mtcd | mtcdth | mtch | mtcs | nm | systot | rbase |
| :entity         |                        |      |        |      |      |      |        |      |      |    |        |       |
| atinq           |                        |      |        |      |      | X    |        | X    |      |    |        |       |
| eir             |                        |      |        |      |      | X    |        | X    |      |    |        |       |
| link            | X                      | X    | X      | X    |      | X    | X      |      | X    | X  |        | X     |

The G-Port, INP, A-Port, or IS41 GSM Migration feature must be turned on before the **mtchnp=on** parameter, **mtcdnp=on** parameter, or **enttype=np** parameter can be specified.

An hourly boundary must be specified for report type **mtch**.

The Measurements Platform collection function (**chg-measopts:platformenable=on** command) must be enabled before this command can be entered.

The V-Flex feature must be turned on before the **enttype=vflex** parameter can be specified.

The ATI Number Portability Query (ATINP) feature must be enabled before the **mtchatinpq=on** parameter or the **mtcdatinpq=on** parameter can be specified.

## Notes

None

## Output

### rept-ftp-meas:type=mtcd:enttype=vflex

```
tekelecstp 07-08-29 15:31:25 EST EAGLE 37.6.0
FTP measurement report request sent to primary MCP.
```

```
tekelecstp 07-08-29 15:31:26 EST EAGLE 37.6.0
Measurement Server Connection Successful
```

```
tekelecstp 07-08-29 15:31:29 EST EAGLE 37.6.0
REPT-FTP-MEAS request was successful.
```

;

### rept-ftp-meas:type=mtch:enttype=atinpq

```
tekelecstp 08-08-01 15:31:25 EST EAGLE 39.2.0
FTP measurement report request sent to primary MCP.
```

```

## rept-imt-info

## Display IMT Error and Use Statistics

Use this command to display the following statistics:

- The IMT bus error statistics currently stored in the IMT fault isolation hourly statistics
- The current IMT bus use statistics (Bus use is the percentage of the capacity of the IMT bus that is used for data during a particular time.)
- The HMUX and HIPR card error statistics

**Keyword:** rept-imt-info

**Related Commands:** clr-imt-stats, init-imt-gpl, rept-imt-lvl1, rept-imt-lvl2, tst-imt

**Command Class:** System Maintenance

## Parameters

**:report=** (mandatory)

Type of report to generate.

**Range:** **err, util, hmutexerr, hiprerr**

**err**— Produces a report of the IMT bus error statistics

**util**— Produces a report of the IMT bus use (utilization) statistics

**hmutexerr**— Produces a report of the HMUX card error statistics

**hiprerr**— Produces a report of the HIPR card error statistics

**:ebucket=** (optional)

End bucket. Specifies the last one-hour time period (*bucket*) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

**Range:** **0-15**

**Default:** If **sbucket** is specified—current **sbucket** value; information for only that time period is displayed.

If **sbucket** is not specified—**15**, the report includes statistics for all 16 time periods

**:eloc=** (optional)

End location. Specifies the card location of the last card in the range for the report.

**Range:** **1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Default:** If **sloc** is specified—current **sloc** value; displays information for one card

If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

**:erronly=** (optional)

Use this parameter to filter output to display only non-zero counts in the error report.

This parameter can be specified only if **report=err** is specified.

**Range:** **yes, no**

**Default:** **yes**

**:eshelf=** (optional)

End shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the last shelf in the range.

This parameter can be specified only if **report=hmutexerr** or **report=hiprerr** is specified.

**Range:** **1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100**

**Default:** If **sshelf** is specified—current **sshelf** value.

If **sshelf** is not specified—**6100**, displays information for entire range of shelves.

**:eslot=** (optional)

Ending slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

**Range:** 1-8, 11-18

**Default:** If **sslot** is specified—current **sslot** value.

If **sslot** is not specified—not used.

**:mode=** (optional)

Display mode to use for error report.

This parameter can be specified only if **report=err** is specified.

**Range:** full, stats, summary

**full**—Displays information for each card along with a summary report

**stats**—Displays only individual card statistics

**summary**—Displays the summary portion of the report

**Default:** summary

**:sbucket=** (optional)

Start bucket. Specifies the first one-hour time period (bucket) for which error statistics are reported.

This parameter cannot be specified when **report=util** is specified.

**Range:** 0-15

**Default:** 0

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range for the report.

**Range:** 1101-1113, 1115, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118

**Default:** If **eloc** is specified—current **eloc** value.

If **eloc** is not specified—1201, which corresponds to IMT address 0; displays information for entire range of card locations.

**:sshelf=** (optional)

Start shelf location for HMUX or HIPR statistics. This parameter specifies the shelf location of the first shelf in the range.

This parameter can be specified only if **report=hmuxerr** or **report=hiprerr** is specified.

**Range:** 1100, 1200, 1300, 2100, 2200, 2300, 3100, 3200, 3300, 4100, 4200, 4300, 5100, 5200, 5300, 6100

**Default:** If **eshelf** is specified—current **eshelf** value.

If **eshelf** is not specified—1100, displays information for entire range of shelves.

**:sslot=** (optional)

Starting slot location for HIPR statistics for the cards in the HIPR shelf.

This parameter can be specified only if **report=hiprerr** is specified.

**Range:** 1-8, 11-18

**Default:** If **eslot** is specified—current **eslot** value.

If **eslot** is not specified—not used.

**:trm=** (optional)

The serial port (printer location) to which the report is to be sent.

**Range:** 1-16

**Default:** Report displays on the terminal where the command is issued

**Example**

```

rept-imt-info:report=err
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=stats
rept-imt-info:report=err:sloc=1101:eloc=1102:mode=full:erronly=no
rept-imt-info:report=util
rept-imt-info:report=hmuxerr
rept-imt-info:report=hiprerr:sbucket=0
rept-imt-info:
report=hiprerr:sshelf=1100:sslot=1:eslot=2:sbucket=0

```

**Dependencies**

No related IMT command can be in progress when the **rept-imt-info** command is entered. Only one report can be active at a time.

This command cannot be entered at a telnet terminal (terminal ID 17-40).

The **rept-imt-info** command cannot be entered during an IMT statistics collection period following an hourly boundary (IMT performance monitoring).

The following **report** parameter combinations are not valid in the command:

- When the **report=util** parameter is specified, the **ebucket**, **erronly**, **mode**, and **sbucket** parameters cannot be specified.
- When the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified, the **erronly** and **mode** parameters cannot be specified.
- When the **report** parameter values **err**, **util**, and **hmuxerr** are specified, the **sslot** and **eslot** parameters cannot be specified.

The ending hourly time period cannot be less than the starting hourly time period. For example, **rept-imt-info:report=err:sbucket=5:ebucket=3** cannot be specified.

When the **sslot** and **eslot** parameters are specified, the **sshelf** parameter must be specified and the **eshelf** parameter cannot be specified (slot information is reported for a single shelf).

The **sshelf** and **eshelf** parameters can be specified only when the **report=hmuxerr** parameter or the **report=hiprerr** parameter is specified.

The HIPR card slots (**09** and **10**) cannot be specified for the **sslot** and **eslot** parameter values.

The STP options **hmuxabus** or **hmuxbbus** must have their value set to **yes** when the **sshelf** and **eshelf** parameters are specified.

A card location that is valid and defined in the database must be specified.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**IMT Bus Error Statistics:** Each hourly time period (*bucket*) contains the IMT bus error statistics for a single hour. A total of 16 hourly time periods, numbered **0** to **15**, exist. Hourly time period **0** is the most-recent (current), and hourly time period **15** is the least-recent (oldest).

Each hour the statistics for the current hourly time period expire, and the hourly time periods advance. That is, after the advance, the statistics previously reported in hourly time period **0** are now reported in the hourly time period **1**, and so on. The statistics reported in the hourly time period **15** are no longer available after the change.

When a card is reinitialized, it begins collecting statistics in hourly time period **0** and changes to hourly time period **1** at the start of the next hour. Thus, the first statistics that a card collects after being reinitialized may be for a partial hour.

**IMT Bus Use Statistics:** The statistics are calculated for all cards in the specified range and summarized. Only the summarized statistics are displayed. *IMT bus use* is the percentage of the capacity of the IMT bus that is used for data during a particular time.

**HMUX or HIPR Statistics (Bucket Summary):** Each hourly time period (*bucket*) contains the HMUX or HIPR statistics for a single hour. A total of 16 hourly buckets, numbered **0** to **15**, exist. Bucket **0** is the most-recent (current) bucket; bucket **15** is the least-recent (oldest).

Each hour on the hour, the least-recent bucket expires and the hourly time periods advance. That is, after the advance, the statistics previously reported in bucket **0** are now reported in bucket **1**, and so on. The statistics that were reported in bucket **15** are no longer available after the change.

If a card booted within the past 16 hours, a message is displayed indicating that no data is available for that card. When a card boots, it starts to collect statistics in bucket **0**. It changes to bucket **1** at the start of the next hour. Thus, the first bucket of statistics that a card collects after booting might be for part of an hour.

A HIPR card stores the statistics separately for each card on its shelf. When the **sloc** and **eloc** parameters are specified, the HIPR card sends the statistics for each card to the OAM application for display. When the **sloc** and **eloc** parameters are not specified, the HIPR card sends an aggregate number to the OAM application to represent statistics for all cards on its shelf.

**HMUX or HIPR Statistics (Cumulative):** HMUX or HIPR cumulative statistics maintain running totals of the error count for each parameter from card initialization. The error counts can be cleared by entering a **clr-imt-stats:all=yes** command to clear all HMUX and HIPR cards, or a **clr-imt-stats** command to clear a specific card.

Table 5-57 explains the **rept-imt-info:report=hmuxerr** statistics.

"Excessive" is primarily determined by the operator, based upon:

- Overall system behavior
- Duration of time since the last statistics were taken
- Statistics of an individual card in relation to other cards

**Table 5-57.** Explanation of **rept-imt-info:report=hmuxerr** Statistics

| IMT Statistic           | Explanation Of Statistic                                                                     | Probable Causes                                                             | Recommended Action                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LOW SPEED STATS</b>  |                                                                                              |                                                                             |                                                                                                                                            |
| IMT Rx Packet CRC Error | Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware. | Card insertion/ removal or boot. May occur infrequently in a normal system. | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards. |
| IMT Rx Packet           | Occurs when the Start of Message byte of the IMT packet is followed by                       | Card insertion/removal or boot.                                             | None if card has booted or was just inserted. Otherwise call Tekelec                                                                       |

| IMT Rx Violation Error       | Received an illegal character from the IMT.<br>Detected by hardware.                                                                                                    | Card insertion/removal or boot.                                                                                                       | None if card has booted or was just inserted.<br>Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.                                                                       |
| CPU Rx FIFO Full             | HMUX's IMT interface is congested. Detected by hardware.                                                                                                                | Indicates that data was received at a higher rate than could be processed                                                             | Call Tekelec Technical Services if count is excessive in relation to other HMUX cards.                                                                                                                             |
| CPU Rx FIFO Half Full        | HMUX's IMT interface is becoming congested. Detected by hardware.                                                                                                       | Indicates that data was received at a higher rate than could be switched for a short period.                                          | None. FIFO half full is just an indication; no action is required.                                                                                                                                                 |
| CPU Rx FIFO Empty Before SOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the beginning (SOM) of the packet before all the data was read. | The SOM was corrupted while being written into the CPU Rx FIFO from the low speed link.                                               | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA problem that requires further investigation. |
| CPU Rx FIFO Empty Before EOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.    | The SOM was corrupted while being written into the CPU Rx FIFO or a partial packet was written into the FIFO from the low speed link. | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If the problem persists, some type of FPGA or high-speed link problem might require further investigation.      |
| CPU Rx Packet SOM Before EOM | A Start of Message was received when an End of Message was expected from the IMT bus.                                                                                   | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                                                  | None.                                                                                                                                                                                                              |

|------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU Rx Packet CRC Error      | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA and transferred to the processor memory, and the FPGA calculated CRC does NOT match the CRC word at the end of the packet. | The data was corrupted while being written into the CPU Rx FIFO, or data coming from the low speed link is corrupted.                          | None. If the problem persists, some type of FPGA or high-speed link problem might require further investigation.                                                 |
| DMA Terminal Count Interrupt | Received IMT packet length is longer than the max allowed. Detected by hardware.                                                                                                                  | Card insertion/removal or boot.                                                                                                                | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards.                       |
| CPU Tx Buffer EOB            | A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted.                                                | The data was corrupted while being written into or being read from the FIFO.                                                                   | None. If the problem persists, some type of FPGA problem might require further investigation.                                                                    |
| CPU Tx Buffer Full           | The Tx Buffer has had 512 bytes written to it and can accept no more.                                                                                                                             | A packet is being sent that is too large.                                                                                                      | Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor. |
| CPU Tx Buffer Half Full      | The Tx Buffer has had 256 bytes written to it.                                                                                                                                                    | 256 bytes have been written to the Tx Buffer.                                                                                                  | None.                                                                                                                                                            |
| IMT Bypass FIFO Full         | The IMT Bypass FIFO has 32K bytes of data in it.                                                                                                                                                  | The low-speed link is experiencing very heavy traffic conditions, or the HMUX IMT Transmitter has been disabled or is not operating correctly. | Determine why IMT traffic is so heavy. Make sure the HMUX IMT Transmitter is enabled.                                                                            |

Table 5-57. Explanation of **rept-imt-info:report=hmuxerr** Statistics

| IMT Statistic              | Explanation Of Statistic                                             | Probable Causes                                                                                                                                | Recommended Action                                                                                                                               |
|----------------------------|----------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| IMT Bypass FIFO Half Full  | The IMT Bypass FIFO has 16K bytes of data in it.                     | The low-speed link is experiencing very heavy traffic conditions, or the HMUX IMT Transmitter has been disabled or is not operating correctly. | Determine why IMT traffic is so heavy. Make sure the HMUX IMT Transmitter is enabled. Under normal operation this condition should clear itself. |
| IMT Tx FIFO Full           | HMUX's IMT Transmitter FIFO Full                                     | TAXI transmitter logic for this channel is not operating properly.                                                                             | Reset Tx FIFO. If all channels exhibit this problem, there might be an internal FPGA problem with the 125MHz clock.                              |
| IMT Tx FIFO Half Full      | HMUX's IMT Transmitter Half FIFO Full                                | High burst rate or multiple large packet transmissions from IXP1250.                                                                           | None                                                                                                                                             |
| <b>HIGH SPEED STATS</b>    |                                                                      |                                                                                                                                                |                                                                                                                                                  |
| IMT Rx Packet Format Error | Packet was received with a format error (for example, no EOM)        | Packet was transmitted incorrectly or was corrupted by another device in the system.                                                           | None                                                                                                                                             |
| IMT Rx Disparity Error     | Fibre Channel transceiver received a disparity error on a character. | Noisy high-speed ring.                                                                                                                         | This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.                                        |
| IMT Rx Sync Lost Error     | Fibre Channel transceiver is not receiving sync characters           | Noisy high-speed ring.<br>High-speed cable was disconnected.<br>One of the HMUXs in the ring was removed.                                      | This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.                                        |
| IMT Rx Code Word Error     | Fibre Channel transceiver has received an invalid code word.         | Noisy high-speed ring.<br>Wrong command transmitted.                                                                                           | This is a hardware level issue. If the error persists, more detailed high-speed bus analysis is required.                                        |
| CPU Receive FIFO Full      | Communication CPU on the card is congested. Detected by hardware     | Indicates that data was received at a higher rate than could be processed                                                                      | Call Tekelec Technical Services if count is                                                                                                      |

|                              |                                                                                                                                                                          | by the Communications processor.                                                                                                        | excessive in relation to other cards.                                                                                                                                                                              |
| CPU Receive FIFO Half Full   | Communication CPU on the card is becoming congested. Detected by hardware.                                                                                               | Indicates that data was received at a higher rate than could be processed for a short period.                                           | None. FIFO half full is just an indication; no action is required.                                                                                                                                                 |
| CPU Rx FIFO Empty Before SOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the beginning (SOM) of the packet before all the data was read. | The SOM was corrupted while being written into the CPU Rx FIFO from the high speed link.                                                | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. However, if the problem persists, there might be some type of FPGA problem that requires further investigation. |
| CPU Rx FIFO Empty Before EOM | Occurs when valid packet data is read from the CPU Rx FIFO by the FPGA, but the FPGA is unable to locate the end (EOM) of the packet before all of the data was read.    | The SOM was corrupted while being written into the CPU Rx FIFO, or a partial packet was written into the FIFO from the high speed link. | None. This error will automatically empty the FIFO so that it is ready to continue receiving data. If f the problem persists, some type of FPGA or low-speed link problem might require further investigation.     |
| CPU Rx Packet SOM Before EOM | A Start of Message was received when an End of Message was expected from the Fibre Channel bus.                                                                          | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                                                    | None.                                                                                                                                                                                                              |
| CPU Rx Packet CRC Error      | A packet received for this shelf contains a CRC error.                                                                                                                   | Packet was transmitted incorrectly or was corrupted by another device in the system.                                                    | Discard packet. If this problem persists, a more detailed analysis of the system is needed.                                                                                                                        |
| DMA Terminal Count Interrupt | Received IMT packet length (on Fibre Channel) is longer than the maximum allowed. Detected by hardware.                                                                  | Card insertion/removal or boot.                                                                                                         | None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.                                                                          |

| IMT Statistic                          | Explanation Of Statistic                                                                                                                           | Probable Causes                                                                                                                                                    | Recommended Action                                                                                                                                               |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| CPU Tx Buffer EOB                      | A packet that was being transmitted from the CPU Tx Buffer did not have an EOM. Therefore, the full 512 bytes from the Tx buffer were transmitted. | The data was corrupted while being written into or being read from the FIFO.                                                                                       | None. If the problem persists, some type of FPGA problem might require further investigation.                                                                    |
| CPU Tx Buffer Full                     | The Tx Buffer has had 512 bytes written to it and can accept no more.                                                                              | A packet is being sent that is too large.                                                                                                                          | Write the EOM insert command to send the packet, write an abort command to reset the Tx buffer control interface, or issue a Tx Buffer reset from the processor. |
| CPU Tx FIFO Half Full                  | The Tx Buffer has had 256 bytes written to it.                                                                                                     | 256 bytes have been written to the Tx Buffer.                                                                                                                      | None.                                                                                                                                                            |
| IMT (High-speed) Bypass FIFO Full      | The High-speed Bypass FIFO has 2K bytes of data in it.                                                                                             | The high-speed link is experiencing very heavy traffic conditions, or the HMUX High-speed Transmitter has been disabled or is not operating correctly.             | Determine why high-speed traffic is so heavy. Make sure the HMUX High-speed Transmitter is enabled.                                                              |
| IMT (High-speed) Bypass FIFO Half Full | The High-speed Bypass FIFO has 1K bytes of data in it.                                                                                             | The high-speed link is experiencing very heavy traffic conditions or the HMUX High-speed Transmitter has been disabled or is not operating correctly.              | Determine why high-speed traffic is so heavy. Make sure HMUX High-speed Transmitter is enabled. Under normal operation this condition should clear itself.       |
| IMT (High-speed) Rx FIFO Full          | The High-speed Rx FIFO has 128K bytes of data in it.                                                                                               | The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly. | Determine why high-speed traffic is so heavy. Determine why low-speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled.                  |

| IMT Statistic                      | Explanation Of Statistic                                                            | Probable Causes                                                                                                                                                    | Recommended Action                                                                                                                                            |
|------------------------------------|-------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------|
| IMT (High-speed) Rx FIFO Half Full | The High-speed Rx FIFO has 1K bytes of data in it.                                  | The high-speed link is experiencing heavy traffic conditions. The Low-speed Transmitter is disabled, experiencing heavy traffic loads, or not operating correctly. | Determine why high-speed traffic is so heavy. Make sure the HMUX Low-speed Transmitter is enabled. Under normal operation this condition should clear itself. |
| <b>MISC STATS</b>                  |                                                                                     |                                                                                                                                                                    |                                                                                                                                                               |
| Shelf ID<br>UART Framing Error     | UART Framing error received by HMUX in Shelf address data stream received from OAM. | Noisy or bad clock cable from Control Shelf to shelf in which error is reported.                                                                                   | Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.                     |
| Shelf ID<br>UART Overrun Error     | UART Overrun error received by HMUX in Shelf address data stream received from OAM. | Noisy or bad clock cable from Control Shelf to shelf in which error is reported.                                                                                   | Occasionally happens. This count should be low. Only if this count is VERY HIGH, bring it to the attention of Tekelec Technical Services.                     |

Table 5-58 explains the **rept-imt-info:report=hiprerr** statistics.

"Excessive" is primarily determined by the operator, based upon:

- Overall system behavior
- Duration of time since the last statistics were taken
- Statistics of an individual card in relation to other cards

Table 5-58. Explanation of **rept-imt-info:report=hiprerr** Statistics

| IMT Statistic           | Explanation Of Statistic                                                                     | Probable Causes                                                             | Recommended Action                                                                                                                         |
|-------------------------|----------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| <b>LOW SPEED STATS</b>  |                                                                                              |                                                                             |                                                                                                                                            |
| IMT Rx Packet CRC Error | Bad Checksum in received IMT packet. Usually caused by corrupted data. Detected by hardware. | Card insertion, removal or boot. May occur infrequently in a normal system. | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards. |

Table 5-58. Explanation of **rept-imt-info:report=hiprerr** Statistics

| IMT Statistic              | Explanation Of Statistic                                                                                      | Probable Causes                                                                              | Recommended Action                                                                                                                         |
|----------------------------|---------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------|
| IMT Rx Packet Format Error | Occurs when the Start of Message byte of the IMT packet is followed by unexpected data. Detected by hardware. | Card insertion/removal or boot.                                                              | None if card has booted or was just inserted. Otherwise call Tekelec Technical Services if count is excessive in relation to other cards.  |
| IMT Rx Violation Error     | Received an illegal character from the IMT. Detected by hardware.                                             | Card insertion/removal or boot.                                                              | None if card has booted or was just inserted. Otherwise, call Tekelec Technical Services if count is excessive in relation to other cards. |
| IMT Rx Command Error       | An invalid TAXI command detected in a received packet.                                                        | Packet was corrupted in the system.                                                          | None.                                                                                                                                      |
| IMT Rx FIFO Full           | HIPR's IMT interface is congested. Detected by hardware.                                                      | Indicates that data was received at a higher rate than could be processed                    | Call Tekelec Technical Services if count is excessive in relation to other HIPR cards.                                                     |
| IMT Rx FIFO Half Full      | HIPR's IMT interface is becoming congested. Detected by hardware.                                             | Indicates that data was received at a higher rate than could be switched for a short period. | None. FIFO half full is just an indication; no action is required.                                                                         |
| IMT Tx FIFO Full           | HIPR's IMT Transmitter FIFO Full                                                                              | TAXI transmitter logic for this channel is not operating properly.                           | Reset Tx FIFO. If all channels exhibit this problem, there might be an internal FPGA problem with the 125MHz clock.                        |
| IMT Tx FIFO Half Full      | HIPR's IMT Transmitter Half FIFO Full                                                                         | High burst rate or multiple large packet transmissions from IXP1250.                         | None                                                                                                                                       |
| <b>HIGH SPEED STATS</b>    |                                                                                                               |                                                                                              |                                                                                                                                            |
| IMT Rx Packet Format Error | Packet was received with a format error (for example, no EOM)                                                 | Packet was transmitted incorrectly or was corrupted by another device in the system.         | None                                                                                                                                       |

| <b>IMT Statistic</b>         | <b>Explanation Of Statistic</b>                                                                 | <b>Probable Causes</b>                                                                                                                                                           | <b>Recommended Action</b>                                                                               |
|------------------------------|-------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------|
| IMT Rx Disparity Error       | Fibre Channel transceiver received a disparity error on a character.                            | Noisy high-speed ring.                                                                                                                                                           | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required. |
| IMT Rx Sync Lost Error       | Fibre Channel transceiver is not receiving sync characters                                      | Noisy high-speed ring.<br>High-speed cable was disconnected.<br>One of the HIPRs in the ring was removed.                                                                        | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required. |
| IMT Rx Code Word Error       | Fibre Channel transceiver has received an invalid code word.                                    | Noisy high-speed ring.<br>Wrong command transmitted.                                                                                                                             | This is hardware level issue. If the error persists, more detailed high-speed bus analysis is required. |
| IMT Rx Packet SOM Before EOM | A Start of Message was received when an End of Message was expected from the Fibre Channel bus. | Packet was corrupted in the system (EOM lost) and has another packet appended to it.                                                                                             | None.                                                                                                   |
| IMT Rx Packet CRC Error      | A packet received for this shelf contains a CRC error.                                          | Packet was transmitted incorrectly or was corrupted by another device in the system                                                                                              | Discard packet. If this problem persists, a more detailed analysis of the system is needed.             |
| IMT Bypass FIFO Full         | The high-speed shelf bypass FIFO has been overflowed with data.                                 | Fibre Channel transmit logic not operating correctly. Very high simultaneous data traffic rates on the high-speed ring and on the low-speed to high-speed path within the shelf. | System is operating above limits.<br>Reduce data traffic.<br>Reset FIFO.                                |
| IMT Bypass FIFO Half Full    | The high-speed shelf bypass FIFO is half full.                                                  | Data traffic burst on the high-speed bus.                                                                                                                                        | None                                                                                                    |
| IMT Rx FIFO Full             | The 128k FIFO has been overflowed with data.                                                    | IXP1250 not removing data from FPGA.                                                                                                                                             | Reset FIFO. Determine why IXP1250 not removing data.                                                    |
| IMT Rx FIFO Half Full        | The 128k FIFO has gone half full with data.                                                     | Large burst of traffic on high-speed ring.                                                                                                                                       | None                                                                                                    |

**Legend**

IMT Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.**STATISTIC**—The error statistic type for the IMT buses A and B.

**BUS A VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

**BUS B VALUE**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**MISC SPEED STATISTICS**—Shelf ID Universal Asynchronous Receiver Transmitter (UART) error counts on the HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**BUCKET SUMMARY**—The error count for each parameter for one hour for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations). (The count is for the most recent part of an hour if the card was booted within an hour of executing the **rept-imt-info** command.)

**CUMULATIVE**—The running total error count for each parameter since card initialization for HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

HMUX Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.

**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**MISC SPEED STATISTIC**—The miscellaneous error statistic type.

**Bus A**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

**Bus B**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

HIPR Statistics:

**BUCKET**—The hourly time periods (*buckets*) for which a report was requested.

**LOC**—The card location (shelf and slot) for which information is displayed.

**LOW SPEED STATISTIC**—The error statistic type for the low speed 125 Mbps secondary rings with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**HIGH SPEED STATISTIC**—The error statistic type for the high-speed 1 Gbps primary ring with HMUX cards installed on buses A (xy09 card locations) and B (xy10 card locations).

**MISC SPEED STATISTIC**—The miscellaneous error statistic type.

**Bus A**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus A.

**Bus B**—The number of occurrences of the type of error displayed in the STATISTIC column for the IMT bus B.

## rept-imt-lvl1

## Report IMT Level 1

Use this command to display the IMT level 1 statistics for a card or a range of cards. If more than one card is specified, a summary report of totals for all cards can be generated.

**Keyword:** rept-imt-lvl1

**Related Commands:** clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl2, rept-stat-imt, rmv-imt, rst-imt, tst-imt

**Command Class:** System Maintenance

## Parameters

**:e=** (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-59 to map the values by card location).

**Range:** 0-251

The value can be specified in decimal (0-251) or hexadecimal (h'00-h'fb).

**Default:** If the start address (s) value is specified, the e parameter default value is the specified s parameter value.

If the s parameter is not specified, the e parameter is not specified and the sloc parameter must be specified.

**:eloc=** (optional)

End location. Specifies the card location of the last card in the range.

**Range:** 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If sloc is specified—current sloc value; displays information for one card

If sloc is not specified—1115, which corresponds to IMT address 251 (e=251); displays information for entire range of locations.

**:r=** (optional)

Report type value

**Range:** full, stats, summary

**full**—Displays information for each card along with a summary report.

**stats**—Displays only individual card statistics.

**summary**—Displays the summary portion of the report.

**Default:** full

**:s=** (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-59 to map the values by card location).

**Range:** 0-251

The value can be specified in decimal (0-251) or hexadecimal (h'00-h'fb).

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range.

**Range:** 1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If eloc is specified—current eloc value

If eloc is not specified—1201, which corresponds to IMT address 0 (s=0).

**:trm=** (optional)

The serial port (printer location) where the report is to be sent.

**Range:** 1-16

**Default:** Report displays on the terminal where the command was issued

### Example

**rept-imt-lvl1:s=00:e=01**

### Dependencies

Only one report status command can be in progress at a time.

Either the start address (**s** parameter) or the start location (**sloc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

The **rept-imt-lvl1** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl2**, **tst-imt**.

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

A card location that is valid and defined in the database must be specified.

### Notes

Table 5-59 maps each card location to the decimal and hexadecimal "Converting ITU National Point Code Formats" values that can be specified for the **s** and **e** parameters.

**Table 5-59.** Hexadecimal/Decimal Values for **s** and **e** parameters

| Card Location      | Hexadecimal Value | Decimal Value | Card Location | Hexadecimal Value | Decimal Value |
|--------------------|-------------------|---------------|---------------|-------------------|---------------|
| Control Shelf 11   |                   |               |               |                   |               |

### Legend

**CARD**—The IMT address of the card in hexadecimal

**ELAPSED TIME ( day - h:m:s )**—The amount of time that has elapsed since a card reset has occurred or the IMT statistics were cleared with the **clr-imt-stats** command. This is shown in the format **day - h:m:s**, where **day** is the number of days that have elapsed, and **h:m:s** is the amount of time in the current day in hours, minutes, and seconds (and tenths of seconds).

**COUNT**—The IMT level 1 statistics displayed in this report.

**BUS A VALUE** and **BUS B VALUE**—The values of the IMT level 1 statistics on IMT bus A and IMT bus B.

Table 5-60 describes the statistics that are shown in the report for each card and in the Summary of totals for all requested cards, and their possible causes and corrective actions.

"Excessive" count is primarily determined by the operator based upon:

- Overall system behavior
- Duration of time from when the last statistics were taken
- Statistics of an individual card in relation to other cards

The following types of Safety Packets are included in the counts:

**SAFETY PACKET**—When an IMT packet goes around the IMT, a pre determined value in the packet is decremented by each card. When this value reaches zero, the card that receives the value equal to zero logs this as a safety packet and removes the IMT packet from the IMT.

**MESSAGE SIGNALING UNIT (MSU)**—IMT packet containing data

**ACKNOWLEDGEMENT SIGNALING UNIT (ASU)**—**ack** for an MSU that is sent from the destination card back to the originating card.

**TEST SIGNALING UNIT (TSU)**—Typically used to keep the card on the bus. There are many types of TSU's one of which performs a heartbeat function.

**BROADCAST SIGNALING UNIT (BSU)**—Function is the same as an MSU except that each card will process the BSU and then copy it to the next card for processing. Used for IMT maintenance functions.

**SAFETY SIGNALING UNIT (SSU)**—Anytime a packet times out (Safety Packet), the card that logged a safety packet sends an SSU to make sure the originating card is still on the IMT bus.

**Table 5-60. rept-imt-lvl1 Statistics Explanation**

| IMT Statistic                    | Explanation Of Statistic                                                                                         | Probable Causes                                                                | Recommended Action                                                                                                                                                                                |

| SSU Safety Packet          | SSU Unit has timed out on the IMT. Detected by hardware                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               | Card insertion, removal, or boot                      | <ul style="list-style-type: none"> <li>None if card has booted or was just inserted.</li> <li>Contact Tekelec Technical Services if count is excessive in relation to other cards.</li> </ul> |
| MSU Returned On Error      | Number of MSUs returned to the application as undeliverable. These are usually rerouted by the application. Detected by software.                                                                                                                                                                                                                                                                                                                                                                                                                     | Destination card is not available to receive packets. | None.<br>MSU Returned is just an indication; no action is required.                                                                                                                           |
| MSU Dropped With No Report | <p>Number of MSUs discarded as undeliverable. Detected by software.</p> <p><b>Note:</b> The "MSU Dropped With No Report" statistic may be non-zero after executing the <b>rept-imt-lvl1</b> or <b>clr-imt-stats</b> command. During execution of these commands, the active MASP generates MSUs to unpopulated card slots. These MSUs result in an "MSU Dropped With No Report" count. To determine the number of unexpected "MSU Dropped With No Report" occurrences, the active MASP must be excluded from the <b>rept-imt-lvl1</b> card range.</p> | Destination card is not available to receive packets. | None.<br>MSU Dropped is just an indication; no action is required.                                                                                                                            |

**rept-imt-lvl2****Report IMT Level 2**

Use this command to display the IMT level 2 statistics for a card. This report displays IMT traffic statistics for either one or both IMT busses in the system. The report can be filtered as follows:

- Report statistics between the source card (specified with the **loc** or **l** parameters), whose statistics pool is queried for report information, and another card (specified with the **sloc** or **s** parameter).

- Report statistics between the source card and a range of cards (specified with both the **sloc** and **eloc** or the **s** and **e** parameter combinations).

**Keyword:** rept-imt-lvl2

**Related Commands:** clr-imt-stats, conn-imt, disc-imt, rept-imt-info, rept-imt-lvl1, rept-stat-imt, rmv-imt, rst-imt, tst-imt

**Command Class:** System Maintenance

## Parameters

**:b=** (optional)

IMT bus identification.

**Range:** **a, b, both**

**a** — Displays statistics for IMT bus A.

**b** — Displays statistics for IMT bus B.

**both** — Displays statistics for both IMT busses, A and B.

**Default:** **both**

**:e=** (optional)

End address. This parameter specifies the IMT address of the last card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-59 to map the values by card location).

**Range:** **0-251**

The value can be specified in decimal (**0-251**) or hexadecimal (**h'00-h'fb**).

**Default:** If the **s** parameter is specified, the default is the **s** parameter value.  
If the **s** parameter is not specified, the default is **251**.

**:eloc=** (optional)

End location. Specifies the card location of the last card in the range.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** If **sloc** is specified—current **sloc** value; displays information for one card  
If **sloc** is not specified—**1115**, which corresponds to IMT address 251 (**e=251**); displays information for entire range of locations.

**:l=** (optional)

Source card IMT address. The IMT address of the card whose statistics pool is to be queried for report information.

**Range:** **0-251**

(See the *Installation Manual – EAGLE 5 ISS* for an illustration of the card locations.)

**:loc=** (optional)

Source card location. The location of the card whose "statistics pool" is to be queried for report information.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:s=** (optional)

Start address. This parameter specifies the IMT address of the first (or only) card in the range. A decimal value or a hexadecimal value can be specified for this parameter (see Table 5-59 to map the values by card location).

**Range:**       **0-251**

The value can be specified in decimal (**0-251**) or hexadecimal (**h'00-h'fb**).

**Default:**     If **e** is specified—current **l** parameter value.  
                   If **e** is not specified—**0**.

**:sloc=** (optional)

Start location. Specifies the card location of the first card in the range.

**Range:**       **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:**     If **eloc** is specified—current **sloc** value.  
                   If **eloc** is not specified—IMT address 0 (**s=0**).

**:trm=** (optional)

The serial port (printer location) where the report is to be sent.

**Range:**       **1-40**

**Default:**     The report displays on the terminal where the command was issued.

### Example

```
rept-imt-lvl2:l=00:s=00:e=02:b=a
```

### Dependencies

If the **s** and **e** parameters are specified, the **sloc** and **eloc** parameters cannot be specified; conversely, if the **sloc** and **eloc** parameters are specified, the **s** and **e** parameters cannot be specified.

The **rept-imt-lvl2** command cannot be entered if any of the following commands is running: **clr-imt-stats**, **rept-imt-info**, **rept-imt-lvl1**, **tst-imt**.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified.

This command cannot be entered during IMT statistics collection following an hourly boundary.

Either the source address (**l** parameter) or the source location (**loc** parameter) must be specified; but not both at the same time.

A card location must be specified that is valid and defined in the database.

### Notes

None

## Output

If the source card location falls within the range of cards specified with the **sloc** and **eloc** parameters or the **s** and **e** parameters, the output report for the source card will show zeros. The zeros are reported because the source card location does not use the IMT to communicate with itself and, therefore, does not report any values or pegs for traffic routed to itself. This command reports only the values or pegs received or transmitted across the IMT bus.

In the following example, the output for the source card location (**loc=1213**) is shown in column 0a (the equivalent card location expressed as a hexadecimal digit). The 0a column displays zeros because **loc=1213**, falls within the range specified for the start and end card location (**sloc=1211** and **eloc=1215**). (Note that the Receive FSN row displays a value of **1**, which is not a count, but rather the initial sequence number of the FSN that the source card location expects to receive). Columns 09 and 0b display zeros because these slots are not provisioned with any card (the adjacent card slots (08 and 0c) contain DCM cards).

**rept -imt -lvl2:sloc=1211:eloc=1215:loc=1213**

**Legend**

**CARD**—The IMT address of the card location specified by the **I** parameter in this command in hexadecimal.

**BUS**—The IMT bus for which the IMT level 2 statistics are being reported.

**FIELD**—The IMT level 2 statistics displayed in this report.

**00 - EF**—The IMT address of the cards on the IMT bus in hexadecimal.

**LINK STATUS**—The status of the link, either ALGN (aligned) or OS (out of service).

**OS COUNT**—The number of times the link has cycled between being aligned and being out of service.

**TRANSMIT BSN**—The number of BSNs transmitted.

**TRANSMIT FSN**—The number of FSNs transmitted.

**RECEIVE BSN**—The number of BSNs received.

**RECEIVE FSN**—The sequence number for the next FSN that the source card location expects to receive.

**UNACK MESSAGES**—The number of unacknowledged messages received.

**INVALID LENGTH**—The number of messages received with invalid length indicators.

**INVALID RX BSN**—The number of invalid BSNs received.

**INVALID RX FSN**—The number of invalid FSNs received.

**INVALID LSSU**—The number of invalid LSSUs received.

**INVALID ASU**—The number of invalid ASUs received.

**RTB ADDRESS**—The address of the retransmission buffer, in hexadecimal.

**AVERAGE ACK TIME**—The average amount of time for an acknowledgment, in milliseconds.

**MINIMUM ACK TIME**—The minimum amount of time for an acknowledgment, in milliseconds.

**MAXIMUM ACK TIME**—The maximum amount of time for an acknowledgment, in milliseconds.

**rept-meas****Report Measurements**

Use this command to generate measurement reports on demand. The reports display on the UI terminal, and are not transferred to the customer FTP server when the Measurements Platform feature is enabled.

ITU gateway measurements are done for **stp** and, on a per-linkset basis, for **lnkset**, **lsonismt**, **lsdestni**, and **lsorigni** entity types.

**Keyword:** **rept-meas**

**Related Commands:** **chg-meas**, **copy-meas**, **rept-ftp-meas**, **rtrv-meas-sched**

**Command Class:** Link Maintenance

**Parameters**

**:enttype=** (mandatory)

The entity type to report on.

**Range:** **link**, **lnkset**, **lnp**, **lsdestni**, **lsonismt**, **lsorigni**, **mapscrn**, **np**, **origni**, **originnc**, **stp**, **stplan**, **tt**, **sctpasoc**, **sctpcard**, **ua**  
**link** — Measurements for signaling links  
**lnkset** — Measurements for linksets  
**lnp** — Measurements for local number portability  
**lsdestni** — Measurements for linkset destination network identifiers

**lsonismt** — Measurements for ISUP message type screening  
**lsorigni** — Measurements for linkset originating network identifiers  
**mapscrn** — Measurements for GSM MAP message screening  
**np** — Measurements for INP, G-Port, A-Port, and IGM  
**origni** — Measurements for originating network identifiers greater than 5  
**origninc** — Measurements for originating network identifiers (less than 5, small networks) for network clusters  
**stp** — Measurements for all nodes  
**stplan** — Measurements for TCP/IP links.  
**tt** — Measurements for translation types  
**sctpasoc** — Measurements per association for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)  
**sctpcard** — Measurements per card for the SCTP protocol (used to carry M3UA, M2PA, and SUA traffic)  
**ua** — Measurements per application server/association for the M3UA and SUA protocols

**:type=** (mandatory)

The type of measurement report.

**Range:** **avl, avld, avldth, comp, gtwy, mtcd, mtcddth, mtch, mtcs, nm, rbase, systot**

**avl** — Availability measurements

**avld** — Daily availability measurements

**avldth** — Day to hour availability measurements.

**comp** — Component measurements

**gtwy** — Internetwork gateway-related data from the STP for ANSI and ITU measurements. ANSI gateway measurements are pegged on a per-linkset, per-Network Indicator basis, whereas ITU measurements are pegged on a per-linkset basis.

**mtcd** — Daily maintenance measurements

**mtcddth** — Day-to-hour maintenance measurements

**mtch** — Hourly maintenance measurements

**mtcs** — Link/linkset maintenance status

**nm** — Network management, on-demand

**rbase** — Schedule-report type record base measurements

**systot** — STP system totals

**:aname=** (optional)

Association name. This parameter specifies the name assigned to the association in the IPAPSOCK table.

**Range:** *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

**:appl=** (optional)

The GPL to report measurements on. This parameter can be used only with the **stplan-avl (enttype=stplan:type=avl)** measurement report. The **rtrv-gpl:gpl=all** command can be entered to list all valid applications.

**Range:** *xyyyyyyy*

**Default:** No value given.

**:asname=** (optional)

Application server name. This parameter specifies the name of the application server.

**Range:** *aaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

**:day=** (optional)

The specific day of the week for daily LNP measurement reports.

**Range:** **mon, tue, wed, thu, fri, sat, sun**  
**Default:** The previous single day report is generated.

**:hh=** (optional)

The specific half-hour interval. The **hh** parameter implies the ending time for the collection interval; for example, **hh=0300** generates a report for **2:30-3:00**.

**Range:** **0000-2400**  
*hhmm* where *hh* = **00-24** (hour) and *mm* = **00** or **30** (minute)

**Default:** The **hh** parameter value is not given.

**:link=** (optional)

The link on the card specified in the **loc** parameter

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** The **link** parameter value is not given.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** The **loc** parameter value is not given.

**:lsn=** (optional)

The name of the linkset for which link or linkset measurements are reported.

**Range:** *aaaaaaaaa*  
 1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** The **lsn** value is not given.

**:nc=** (optional)

The network cluster for the specified GTWY measurement report.

**Range:** **0-255**

**Default:** The **nc** parameter value is not given.

**:ni=** (optional)

The network indicator for the specified GTWY measurement report.

**Range:** **1-255**

**Default:** The **ni** parameter value is not given.

**:nzo=** (optional)

Print non-zero measurements only.

**Range:** **yes, no**

**Default:** **yes** for types **avl**, **avld**, and **avldth**.  
 This parameter is not used with the other report types.

**:period=** (optional)

The relative time period to report.

**Range:** **last, specific, active, all**

**last** — The previous collection interval

**specific** — A specific half-hourly interval (specified with the **hh** parameter)

**active** — The current collection interval

**all** — All collection intervals.

**Default:** The **period** parameter value is not given.

**:qh=** (optional)  
The specific quarter-hour interval. The **qh** parameter implies the ending time for the collection interval; for example, **qh=0315** generates a report for **3:00-3:15**.

**Range:** **0000-2400**  
*hhmm* where *hh* = **00-24** (hour) and *mm* = **00, 15, 30, or 45** (minute)

**Default:** The **qh** value is not given.

**:trm=** (optional)  
The serial port (printer location) where the report is to be sent.

**Range:** **1-16**

**Default:** The **trm** value is not given.

**:tt=** (optional)  
A specific translation type to be reported.

**Range:** **0-255**

**Default:** The **tt** parameter value is not given.

### Example

```
rept-meas:type=comp:enttype=sctpcard:loc=2215
rept-meas:type=comp:enttype=lnkset:lsn=sp1

rept-meas:enttype=lnp:type=mtcd
rept-meas:enttype=lnp:type=mtch:period=last
rept-meas:enttype=lnp:type=mtch:period=specific:hh=1300
rept-meas:enttype=lnp:type=mtcd:period=specific:day=tue
rept-meas:enttype=stplan:type=avl:appl=atmansi
rept-meas:type=systot:enttype=tt:tt=26
rept-meas:type=mtcd:enttype=mapscrn
rept-meas:type=mtch:enttype=mapscrn
rept-meas:type=mtcd:enttype=sctpasoc:aname=assoc01
rept-meas:type=mtcdth:enttype=ua:aname=assoc01:asname=appserv01
```

### Dependencies

The **rept-meas** command cannot be used to specify a report type if that report type is currently printing.

The valid parameter combinations depend on the report type specified. These combinations are shown in Table 5-61. An X in a cell indicates that the parameter is valid for the report type shown.

When the Enhanced GSM MAP Screening (EGMS) feature is turned on, this command cannot be used to generate EGMS measurements reports.

The entity specified by the **loc**, **port**, or **lsn** parameter must be in the database.

The link specified by the **loc** and **link** parameters must already be defined in the database.

When **enttype=link** is specified, the card in the location specified by the **loc** parameter must be a LIM.

Hourly collection and report processing cannot be in progress when report type **mtch** is specified.

Quarter-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

The **mtcdth** report type is unavailable between midnight and 1:00 AM (0100).

Day-to-hour collection and report processing cannot be in progress when report type **mtcd** or **mtcdth** is specified.

Daily collection and report processing cannot be in progress when report type **mtcd** is specified.

Half-hourly collection and report processing cannot be in progress when report type **comp**, **systot**, **avl**, or **gtwy** is specified.

5-minute collection and report processing cannot be in progress when report type **nm** is specified.

When **enttype=lnp**, only **mtcd** and **mtch** can be specified for the **type** parameter.

If the **nc** parameter is specified for origininc reports, then the **ni** parameter must be specified.

If the **ni** parameter is specified for origin reports, then measurements data must be available at the time the command is entered.

The **day** parameter can be specified only for report type **mtcd** and entity types **lnp** and **mapscrn**.

The **period=all** parameter can be specified only for **type=avl** and **enttype=lnp:type=mtcd** reports.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **enttype=lnp** parameter can be specified.

The GSM Map Screening feature must be turned on before the **enttype=mapscrn** parameter can be specified.

The G-Port, INP, A-Port, or IS41 GSM Migration feature must be turned on before the **entity=np** parameter can be specified.

A primary MCPM card must be available when the Measurements Platform collection option is enabled and this command is entered.

The 15 Minute Measurements feature must be turned on and the 15 Minute Measurements collection option must be on before the **qh** parameter can be specified.

The **qh** parameter must specify a quarter-hourly boundary (the end of the requested quarter-hour for the report) for valid report types (**avld**, **mtcd**, **nm**, **rbase**, and **mtcs** cannot be specified).

The **hh** parameter must specify a half-hourly boundary (the end of the requested half-hour for the report) for valid report types (**mtcd** and **nm** are excluded with message "E2307: QH or HH is not valid for this TYPE").

The **hh** and **qh** parameters cannot be specified together in the command.

When the **period=last** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter cannot be specified.

When the **period=active** parameter or the **period=all** parameter is specified, the **hh** and **qh** parameters cannot be specified.

When the **period=specific** parameter is specified, the **hh** parameter, the **qh** parameter, or the **day** parameter must be specified. The **hh**, **qh**, and **day** parameters can be specified only if the **period=specific** parameter is specified.

A half-hour boundary must be specified for the **hh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only half hours ending in **00**, such as **0100**, **0200** or **0300**).

A quarter-hour boundary must be specified for the **qh** parameter, except for report type **mtch**; an hourly boundary must be specified for report type **mtch** (that is, only quarter hours ending in **00**, such as **0100**, **0200** or **0300**).

The **hh** parameter and the **qh** parameter cannot be specified when report type **avld**, **mtcd**, **nm**, **rbase**, or **mtcs** is specified.

If the **link** parameter is specified, the **loc** parameter must be specified.

The **lsn** parameter cannot be specified in the same command with the **loc** parameter or the **port** parameter.

When entity type **link** is specified, either the **loc** and **port** parameters or the **lsn** parameter must be specified.

The **appl** parameter can be specified only when the **enttype=stplan** and the **type=avl** parameters are specified.

When the **appl** parameter is specified, the **period=active** parameter and the **period=all** parameter cannot be specified.

The **period=active** parameter cannot be specified when the **enttype=stp** parameter or the **enttype=tt** parameter is specified.

The **lsn** parameter cannot be specified with the following parameters: **enttype=stp/tt/stplan/origni/origninc/lnp/np/mapscrn** or **type=systot**.

For entity type **lnkset**, the **lsn** parameter must be specified, regardless of whether the value of the **lsn** parameter is an ANSI or an ITU linkset.

For entity type **avl**, if **period=all** is specified, the **loc** and **port** parameters must be specified.

The **nzo** parameter is used only for entity types **avl**, **avld**, and **avldth**.

The **loc** and **lnkset** parameters cannot be specified in the same command. Either the **loc** parameter or the **lnkset** parameters can be specified, but not both. For example, the following command is not a valid parameter combination: **rept-meas:type=mtcd:enttype=link:loc=1211:link=a:lnkset=nc2785**

The **appl** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp**, the **trm** parameter cannot be specified because LNP measurements can be written only to the FTA. To retrieve this data, use the procedure described with the **act-file-trns** command information.

For the **stplan-avl** reports (**enttype=stplan** and **type=avl** parameters), if the **appl** parameter is specified, the **period=active** and **period=all** parameters cannot be specified.

The **type=systot** and **loc** parameters cannot be specified in the same command line.

When **enttype=lnp** and **type=mtch**, only **last** and **specific** can be specified for the **period** parameter.

When **enttype=lnp**, **nzo=yes** cannot be specified.

When **enttype=lnp**, the **appl**, **loc**, **port**, **lsn**, **ni**, and **nc** parameters cannot be specified.

The **tt** parameter must be specified when **enttype=tt**. The only time the **tt** parameter is valid is when it is specified with **enttype=tt**.

If the **type=gtwy** parameter is specified, and the value of the **enttype** parameter is **lsorigni**, **lsdestni**, or **lsonismt**, then the **ni** parameter cannot be specified for ITU linksets. The **ni** parameter is allowed only for ANSI linksets.

If the **type=gtwy:enttype=stp** parameter combination is specified, no additional parameters may be specified.

If the **type=gtwy:enttype=lsdestni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=lsorigni** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

If the **type=gtwy:enttype=lsonismt** parameter combination is specified for an ITU linkset, only the **lsn** parameter can be specified.

**Table 5-61.** Valid Parameter Combinations for the **type** Parameter

| Parameter Value | Report Types (type parameter) |      |      |        |      |      |    |     |      |        |      |       |  |
|-----------------|-------------------------------|------|------|--------|------|------|----|-----|------|--------|------|-------|--|
|                 | systot                        | comp | mtcd | mtcdth | mtch | mtcs | nm | avl | avld | avldth | gtwy | rbase |  |
| <b>enttype=</b> |                               |      |      |        |      |      |    |     |      |        |      |       |  |

| <b>period=</b>  |                               |      |      |        |      |      |    |     |      |        |      |       |  |
| last            | X                             | X    | X    | X      | X    |      | X  | X   | X    | X      | X    |       |  |
| specific        | X                             | X    |      |        | X    |      |    | X   |      |        | X    |       |  |
| active          |                               | X    |      |        |      | X    | X  | X   |      |        |      | X     |  |
| all             |                               |      | X    |        |      |      |    | X   |      |        |      |       |  |
| nzo             |                               |      |      |        |      |      |    | X   | X    | X      |      |       |  |

If the **enttype=sctpcard** parameter is specified, then the card in the location specified by the **loc** parameter must be an IPLIMx, IPGWx, or IPSG card.

The **enttype=sctpasoc** or **enttype=ua** parameter must be specified before the **aname** parameter can be specified.

The **enttype=ua** parameter must be specified before the **aname** parameter can be specified.

The G-Port, INP, or AINPQ feature must be turned on before the **entitytype=np** parameter can be specified.

If the **enttype=sctpcard** parameter is specified, then the **loc** parameter must be specified.

If the **enttype=sctpcard** parameter is specified, then a card must be installed in the location specified by the **loc** parameter.

The value of the **appl** parameter must apply to the reports specified in the **enttype** and **type** parameters.

The **enttype=link** parameter must be specified before the **link** parameter can be specified.

The linkset specified by the **lsn** parameter must contain the link specified by the **enttype=link** and **type** parameters.

The **type=gtway** parameter and the **enttype=origininc** parameter must be specified before the **nc** parameter can be specified.

The **type=gtway** parameter must be specified, and a value of **lsdestni**, **lsonismt**, **lsorigni**, **origni**, or **origininc** must be specified for the **enttype** parameter before the **ni** parameter can be specified.

The **enttype=tt** parameter must be specified before the **tt** parameter can be specified.

If a value of **sctpasoc** or **ua** is specified for the **enttype** parameter, then the **aname** parameter must be specified.

The association specified by the **aname** parameter must be provisioned in the system.

The card in the location specified by the **loc** parameter must match the type of card specified in the **enttype** parameter.

If the **enttype=ua** parameter is specified, then the **asname** parameter must be specified.

The application server specified by the **asname** parameter must be provisioned in the system.

The association specified by the **aname** parameter must be assigned to the application server specified by the **asname** parameter.

## Notes

The *Maintenance Manual* provides a description of all report parameters.

INP, GSM MAP screening, and LNP measurements are sent to the FTA (file transfer area) rather than to the EAGLE 5 ISS terminal. Refer to Chapter 2 of the *Maintenance Manual* for procedural information on accessing the FTA.

If an on-demand report is requested while the collection for that interval is in progress, the requested report will not be generated. The **rept-meas** command must be entered again.

For the entity types **avld** and **avldth**, if no link or linkset is specified, all links are reported.

When the **rept-meas** command is executed, the following warning message may appear:

"Measurement data represents an incomplete interval"

This message indicates that one or more cards did not respond to the request for measurements because the card was Out-Of-Service. The message does not indicate that data was lost.

## Output

**rept-meas:type=systot:enttype=stp**

```

**TYPE OF REPORT**—The type of report, defined by the **type** and **enttype** parameters.

**REPORT PERIOD**—The date and the time period for which the report is generated.

**REPORT INTERVAL**—The time period for which the report is generated.

**LINK-AVL MEASUREMENTS: LOC**—For the link reports (in this example the availability report), the card location, port, and linkset name of the link for which the report is generated.

**LINK-COMP MEASUREMENTS: LOC**—For the link reports (in this example the components report), the card location, port, and linkset name of the link for which the report is generated.

**LNKSET-COMP MEASUREMENTS**—For the linkset components report, the name of the linkset for which the report is generated.

**SCTPASOC-MTCDTH MEASUREMENTS**—For the SCTP day to hour report, the name of the association for which the report is generated.

**SCTPCARD-COMP MEASUREMENTS**—For the SCTP card components report, the name of the card for which the report is generated.

**STPLAN-AVL MEASUREMENTS: LOC**—For the STPLAN availability reports, the card location for which the report is generated.

**STP-NM MEASUREMENTS**—The STPLAN Network Management report (not supported).

**STP-SYSTOT MEASUREMENTS**—The STP System Total report

**<ENTITY>-GTWY MEASUREMENTS**—For Gateway Measurements reports, where the **entity** value will be one of the following: STP, LNKSET, LINKSET, ORIGNI, ORIGNINC, LSDESTNI, LSONISMT, LSORIGNI, depending on what is being reported.

UA-MTCD MEASUREMENTS

The remainder of the items displayed are the measurements that were made. For more information about these measurements, refer to the *Maintenance Manual*.

## rept-stat-alm

## Report Status Alarm

Use this command to provide status of all alarms.

**Keyword:** **rept-stat-alm**

**Related Commands:** **dact-alm-trns, rept-stat-clk, rept-stat-trbl, rtrv-obit, rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:cli=** (optional)

CLLI string. This parameter allows the user to see only alarms that pertain to a particular CLI.

**Range:** *aaaaaaaaaaaa*

**:dev=** (optional)

Device. This parameter provides the type of device for which alarms are displayed. The

**display=inhb** parameter must be specified when this parameter is specified.

**Range:** **applsock, as, card, cdt, clock, dlk, ls, lsmsconn, route, seasx25, slk, trm, rtx**

**:display=** (optional)

Type of alarms to be displayed. When the **disply=inhb** parameter is specified, the Alarm Inhibit Report appears in the command output and provides information about inhibited alarms in the system. The **dev** parameter can be specified with this parameter to display the Alarm Inhibit Report for a specific device type.

**Range:** **inhb**

**:dur=** (optional)

Duration. This parameter indicates whether to display permanently inhibited alarms, temporarily inhibited alarms, or timed inhibited alarms. This parameter is valid only when the **display=inhb** parameter is specified.

**Range:** **perm, temp, timed**

**:edate=** (optional)

Expiry date. This parameter allows the user to see timed alarm inhibits that will expire on the specified date.

**Range:**       **101-991231**

Specify the date in the format *year*, followed by *month*, followed by *day*.

### Example

**rept-stat-alm**

**rept-stat-alm:display=inhb:dev=card**

**rept-stat-alm:display=inhb:clli=slkset1:dev=ls**

**rept-stat-alm:display=inhb**

**rept-stat-alm:display=inhb:dur=timed**

**rept-stat-alm:display=inhb:dur=timed:edate=040520**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **dur** parameter can be specified only if the **display=inhb** parameter is specified.

The **edate** parameter can be specified only if the **dur=timed** parameter is specified.

The **dev** parameter can have only the values **slk**, **ls**, or **route** if the **clli** parameter is specified.

The **dur** parameter must be compatible with the specified device.

The **dev** parameter can be specified only if the **display=inhb** parameter is specified.

The specified **clli** parameter value must exist in the DSTN table.

The **dur** parameter value must be **timed** if the **edate** parameter is specified.

### Notes

None

## Output

The following example shows output when the system is clean and before a maintenance baseline has been established:

### rept-stat-alm

#### ALARM INHIBIT REPORT

```

-----
DEVICE  DEVICE IDENTIFIER  DURATION  INH LVL  ALM LVL  DATE  TIME
-----
CARD    1301              PERM      MAJR      MAJR      ---   ---

```

Command Completed.

;

The following example includes the Alarm Inhibit report for multiple device types. It includes point codes with point code subtype prefixes, and exception routes that require a second line of display to uniquely identify the exception class/criteria of the routes. A plus sign (+) following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

## ALARM INHIBIT REPORT

| DEVICE | DEVICE IDENTIFIER | DURATION | INH LVL | ALM LVL | DATE     | TIME |
|--------|-------------------|----------|---------|---------|----------|------|
| LS     | slkset1           | TIMED    | MAJR    | MAJR    | 06-10-01 | 1200 |

Command Completed.

**Legend**

**ALARM TRANSFER**—The destination of the alarms. LMC=Local Maintenance Center, RMC=Remote Maintenance Center.

**ALARM MODE**—Displays whether the critical, major, and minor alarms are silent or audible

**ALARM FRAME 1**—The number of critical, major, and minor alarms detected in the control frame CF-00 (frame 1).

**ALARM FRAME 2**—The number of critical, major, and minor alarms detected in extension frame EF-00 (frame 2).

**ALARM FRAME 3**—The number of critical, major, and minor alarms detected in extension frame EF-01 (frame 3).

**ALARM FRAME 4**—The number of critical, major, and minor alarms detected in extension frame EF-02 (frame 4).

**ALARM FRAME 5**—The number of critical, major, and minor alarms detected in extension frame EF-03 (frame 5).

**ALARM FRAME 6**—The number of critical, major, and minor alarms detected in extension frame EF-04 (frame 6).

**ALARM FRAME OAP**—The number of critical, major, and minor alarms detected in the OAP Frame.

**ALARM FRAME GPF**—The number of critical, major, and minor alarms detected at the MPS (multi-purpose server). If the LNP feature is turned on, the number includes alarms for any applications running on the MPS. If the G-Flex, G-Port, INP, or AINP Q feature is turned on, the number includes alarms for any applications running on the GSM subsystem and the DSM/EPAP links.

**PERM. INH. ALARMS**—The number of alarms that are permanently inhibited per alarm level.

**TEMP. INH. ALARMS**—The number of alarms that are temporarily inhibited per alarm level.

**TIMED. INH. ALARMS**—The number of alarms that are timed inhibited per alarm level.

**ACTIVE ALARMS**—The number of alarms still active per alarm level.

**TOTAL ALARMS**—The total number of alarms per alarm level. The inhibited alarm count plus the active alarm count equals the total alarm count.

**CRIT**—Critical alarms with silent/audible indicator.

**MAJOR**—Major alarms with silent/audible indicator.

**MINOR**—Minor alarms with silent/audible indicator.

Alarm Inhibit Report:

**DEVICE**—The device for which alarms are currently inhibited. Only devices that are alarm inhibited are shown.

**ELEMENT**—The element of the device for which alarms are inhibited (such as card location, port, routing key, socket or association name)

**DURATION**—Indicates whether the device is alarm inhibited permanently or temporarily or for a specific length of time

**INH LVL**—Level in which devices are alarm inhibited (Critical, Major, Minor). The **inh-alm** command defaults the level to Major. Devices cannot be alarm inhibited at a critical level unless the **chg-stpopt** command **critalminh** parameter is turned on.

**CUR LVL**—Level of the current alarm on the device (Critical, Major, Minor). "None" indicates that there is currently no alarm on the device (DUR should show "PERM." A plus sign (+) seen following the alarm level indicates that the current alarm is not inhibited because the level of the inhibit is less than the level of the alarm.

**DATE**—The date on which a timed inhibited alarm will automatically clear at the specified time

**TIME**—The time at which a timed inhibited alarm will automatically clear on the specified date

## rept-stat-applsock

## Report Status Application Socket

Use this command to display the status of the IP application sockets.

ALMINH—Alarm inhibited  
 OOS—Out-of-service  
 NEA—Near-end allowed  
 FEA—Far-end allowed  
 NEP—Near-end prohibited  
 FEP—Far-end prohibited

## Output

## rept-stat-as

## Report Status AS Association

Use this command to generate a report of the Application Server (AS) association status.

**Keyword:** **rept-stat-as**

**Related Commands:** **chg-as, ent-as, rtrv-as**

**Command Class:** System Maintenance

## Parameters

**:aname=** (optional)

Association name to report on. When the **aname** parameter is specified, the **rept-stat-as** command will report the ASP states for a given association in all of the AS's that it is assigned to.

**Range:** *aaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter.

**:asname=** (optional)

Application Server name; the AS name to report on. When the **asame** parameter is specified, the **rept-stat-as** command will report the PST, SST, ASP state, and ASP-ID for each association in the AS.

**Range:** *aaaaaaaaaaaaaa*

Up to 15 alphanumeric characters; the first character must be a letter

**Example****rept-stat-as****Dependencies**

If an association is specified in the command, the specified association must exist in the AS table.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the command is specified without a parameter, status for all AS associations is displayed.

This command displays the following states: ACTIVE, UP, DOWN, PENDING.

**Output****rept-stat-as**

```
rlghncxa03w 04-02-04 12:57:21 EST EAGLE 34.0.0
ASNAME          PST          SST
m3ua0001        OOS-MT        AS-INACTIVE
m3ua0002        IS-NR          AS-ACTIVE
m3ua0003        OOS-MT-DSBLD  AS-DOWN
m3ua0004        IS-ANR        AS-PENDING
```

Command Completed.

;

m3ua0003        m3ua_1303      ASP-DOWN
```

Command Completed.

;

**rept-stat-asp****Report Status ASP**

Use this command to generate a report of the Application Server Process (ASP) status.

**NOTE: This command is obsolete.**

**Keyword:** rept-stat-asp

**Related Commands:** ent-asp, rtrv-asp

**Command Class:** System Maintenance

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

**:rhost=** (optional)

Name of Remote Host as defined in the IP Host table.

[illegible]

A string of characters up to 60 characters in length. The first character must be a letter.

Valid characters are **a-z**, **A-Z**, **0-9**, - (dash), and . (period).

### Example

## rept-stat-assoc

```
rept-stat-assoc:aname= a23456789012345
```

## Dependencies

If an association is specified in the command, the specified association must exist in the AS table.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command displays the primary states (PST) and the secondary state (SST).

Primary states are:

IS-NR—In-service normal

IS-ANR—In-service abnormal (congested)

OOS-MT—Out of service

OOS-MT-DSBLD—Out-of-service maintenance-disabled (provisioned to be out of service by closing, prohibiting, or deactivation)

Connection states are:

RESTRICTED

OUT-OF-SERVICE

## CONNECTING

ESTABLISHED—Valid only for M2PA associations

The **LINK** field values in the output are displayed as:

- "\*\*\*"—If the association is assigned to multiple links.
- "--"—If the association is not assigned to any link.
- Appropriate LINK ID—If the association is assigned to only one link.

## Output

**rept-stat-assoc**

## rept-stat-card

## Report Status Card

Use this command to display the card status and maintenance activity states. The output includes card location, the GPL version being used by the card, device type, device primary state, device secondary state, and device associated state.

**Keyword:** rept-stat-card

**Related Commands:** dlt-card, ent-card, init-card, rmv-card, rst-card, rtrv-card

**Command Class:** System Maintenance

### Parameters

**:appl=** (optional)

Application. This parameter is specified to report the status of cards running the specified application.

**Range:** xxxxxxx

1 alphabetic character followed by up to 6 alphanumeric characters

**atmansi**—The application is used by the ATM cards to support the ATM high-speed signaling link feature. It is also used by the E5-ATM card to support T1 functionality.

**atmitu**—The application is used by the E1 ATM cards to support the E1 ATM high-speed signaling link feature. It is also used by the E5-ATM card to support E1 functionality.

**ccs7itu**—This application is used by the LIM cards, the E1/T1 MIM card, and the HC-MIM card for ITU MTP functionality.

**eroute**—This application is used by the STC cards for the EAGLE 5 Integrated Monitoring Support functions.

**gls**—This application is used by the TSM cards for downloading gateway screening to LIM cards.

**ipgwi**—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-multipoint connectivity for ITU point codes. The system allows a maximum of 2 cards to be assigned the **ipgwi** application.

**iplim**—This application is used by the SSEDCCM card and the E5-ENET card for TCP/IP point-to-point connectivity for ANSI point codes. The system allows a maximum of 41 cards to be assigned the **iplim** or **iplimi** application if a maximum of 700 links are assigned in the system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 2000 links are assigned in the system.

**iplimi**—This application is used by the SSED CM card and the E5-ENET card for TCP/IP point-to-point connectivity for ITU point codes. The system allows a maximum of 41 cards to be assigned the **iplimi** or **iplim** application if a maximum of 700 links are assigned in the system. The system allows a maximum of 100 cards to be assigned the **iplim** or **iplimi** application if between 701 and 2000 links are assigned in the system.

**ips**—This application is used by the IPSM card for the IP User Interface feature.

**ipsg**—This application is used by the E5-ENET card to support the combined functionality of IPLIMx M2PA and IPGWx M3UA.

**mcp**—This application is used by the MCPM card for the Measurements Platform application.

**sccp**—This application is used by the TSM cards for the global title translation application.

**ss7ansi**—This application is used by the LIM cards, the E1/T1 MIM card, the HC-MIM card, and the E5-E1T1 card for ANSI MTP functionality.

**ss7gx25**—This application is used by the LIM cards to support X.25 functionality.

**ss7ipgw**—The application software for TCP/IP point-to-multipoint connectivity. The system allows a maximum of 64 cards to be assigned the **ss7ipgw** application.

**stplan**—This application is used by the ACM card, the SSED CM card, and the E5-ENET card to support the STP LAN functions.

**vsccp**—This application is used by the Service Module cards for GTT, EPAP-based features, and the LNP feature.

**:links=** (optional)

Filter specification. Report the maximum number of links, only equipped links, or only unequipped links on the card in the specified card location (**loc**).

**Range:** **all, equip, unequip**

**all** — Reports the maximum number of links available on the card in the specified **loc**

**equip** — Reports only links that are equipped

**unequip** — Reports only links that are unequipped

**Default:** **equip**

**:loc=** (optional)

Card address. The card location as stenciled on the shelf of the system.

**Range:** **1101-1117, 1201-1218, 1301-1318, 2101-2118, 2201-2218, 2301-2318, 3101-3118, 3201-3218, 3301-3318, 4101-4118, 4201-4218, 4301-4318, 5101-5118, 5201-5218, 5301-5318, 6101-6118**

**Default:** A status of all cards is displayed.

**:mode=** (optional)

Mode. The type of report to display (full or summary).

**Range:** **full**

**Default:** A summary report is displayed.

**:stat=** (optional)

Primary state filter. This parameter cannot be used with the **loc** or **mode** parameters. This filter allows printing of cards in a specified state (all in-service cards, for example).

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all** — All of the primary states

**alminh** — Alarms inhibited

**anr** — In service abnormal (IS-ANR)

**dsbld** — Out of service maintenance disabled (OOS-MT-DSBLD)

**mt** — Out of service maintenance (OOS-MT)

**nr** — In service normal (IS-NR)

**Default:** **all**

### Example

```
rept-stat-card
```

```
rept-stat-card:loc=1201
```

```
rept-stat-card:loc=1201:mode=full
```

```
rept-stat-card:stat=alminh
```

```
rept-stat-card:appl=ss7ansi
```

```
rept-stat-card:loc=1205:links=equip:mode=full
```

### Dependencies

No other command can be in progress when this command is entered.

The **mode** parameter can be specified only when the **loc** parameter is specified.

Only one of the **loc** parameter, the **stat** parameter, and the **appl** parameter can be specified in the command.

The shelf and card must be equipped.

The card location (**loc**) must be within the allowed range.

The following applications are valid for the **appl** parameter: **ss7ansi**, **sccp**, **gls**, **ccs7itu**, **ss7gx25**, **stplan**, **atmansi**, **iplim**, **iplimi**, **ss7ipgw**, **vscdp**, **atmitu**, **ipgwi**, **ips**, **ipsg**, **eroute**, **mcp**.

### Notes

ATM, SS7 LIM, and X.25 cards show TVG results for SNM (signaling network management), SCCP, and SLAN traffic. SCCP cards show only SNM traffic statistics for TVG.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The **mode=full** parameter gives more information than the summary report.

In the output, the SCCP service card field shows which TSM is providing the specified card with GTT service.

The group ticket voucher (TVG) status for low-speed signaling links, ATM high-speed signaling links, and TSMs is displayed when the **mode=full** and **loc** parameters are specified. The status displayed is for the previous 5 minutes and the previous 24 hours.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

E1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each E1 interface on the card. For each E1 interface, the display shows the highest priority E1 failure that exists on that E1 card. When no E1 errors exist, the clearing E1 UAM text is displayed. When an E1 interface is not assigned to the card, no output is generated for that E1 position.

T1 alarms are displayed in the alarm status field. When the **mode=full** parameter is specified, separate fields display status information from the UAM for each T1 interface on the card. For each T1 interface, the display shows the highest priority T1 failure that exists on that T1 card. When no T1 errors exist, the clearing T1 UAM text is displayed. When an T1 interface is not assigned to the card, no output is generated for that T1 position.

If the **links** parameter is set to **all**, then 64 links are displayed.

If the **links=unequip** parameter is specified, but the card has not been installed or loaded, then 64 unequipped links are displayed.

If the **links=unequip** parameter is specified, and the card is or has been installed or loaded, then the number of links displayed is equal to 64 minus the provisioned links.

If the **links=equip** parameter is specified, then only provisioned links are displayed.

The CARD WARNING field in the command output indicates a specific condition that can hinder the normal functioning of a card. For HC-MIM and E5-E1T1 cards, the "Obsolete Framer" warning indicates that a port configured on the card may get stuck in a Loss of Frame (LOF) state. If an HC-MIM card or E5-E1T1 card displaying this warning is reloaded, and one of the ports on the card is reporting LOF, then the OAM reboots the card up to 5 times to attempt to clear the LOF condition when the card changes state from IS-ANR to IS-NR.

## Output

The clock status fields are reported when the **mode=full** report is selected. The clock status report includes a CLOCK A, CLOCK B, and CLOCK I status. The High Speed clock status report (displayed for ATM, E1 and T1 cards) includes HS CLOCK A, HS CLOCK B, and HS CLOCK I. The valid values for each clock status are ----, **Idle**, **Active**, and **Fault**. The meanings of these values are:

---- (dashes)—Undefined, card must be OOS

**Idle**—Clock is available but is not being used by the card

**Active**—Clock is available and is being used by the card

**Fault**—Clock is unavailable

**Idle** and **Active** are shown when the CLK or HS CLK distribution to the card is good. The **Active** value does not denote that the card is actually using the clock source for link alignment. Use the **rt rv-slk**, **rtrv-e1**, and **rtrv-t1** commands to determine what clock source each card is using for link alignment.

"ENET" is displayed as card type if an E5-ENET card is not plugged-in for an IPSG application.

The following example shows the output for a multi-port LIM (MPL) card. The GPL column, which displays the GPL running on the card, enables you to differentiate between the two-port LIMDS0 and the multi-port LIM. A multi-port LIM always displays SS7ML in the GPL column. When the parameter **mode=full** is specified, the mother board ID is displayed. The MIM type is displayed for multi-port LIM cards, while the PROM type is displayed for dual-port cards.

The following example shows a Hardware Verification Code for an auto-inhibited card. The HW VERIFICATION CODE field is shown only in the **mode=full** report. "-----" is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. A numerical value is shown when invalid hardware is detected, and all such cards will be auto-inhibited. The numerical values are listed in Table 5-62. The MDAL and HMUX cards do not display the field in **mode=full** reports on their locations.

### Legend

- **CARD**—The location of the card.

- **VERSION**—The version number of the application loaded on the card. Dashes ( - - - - ) in the version column indicate one of the following conditions about the card:
  - The card is configured but is not physically present in the system.
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- **APPL**—The application loaded on this card. **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

The group ticket voucher status is displayed in these fields: SCCP TVG RESULT (for SCCP messages), SLAN TVG RESULT (for STPLAN messages), and SNM TVG RESULT (for SNM messages). Group ticket voucher status output is displayed as a series of these letters:

**G**—Service Granted. Indicates normal system behavior.

**D**—Service Denied. Indicates an overload, but the group ticket voucher hardware and software are working correctly.

**N**—No granter in the system. For GTT or STPLAN traffic, there can be no SCCP cards or STPLAN in the system. If there are SCCP cards or STPLAN in the system, then a serious failure is indicated (hardware or software bug or hardware failure).

**H**—Hardware time-out. Indicates the hardware timed out waiting for a group ticket voucher packet to return. Group ticket voucher packets can be lost when a card is plugged in or booted. This is a serious condition if cards have not been connecting or disconnecting from the IMT. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced..

**S**—Software time-out. No result was ever returned from hardware, indicating a probable hardware failure.

**I**—Invalid result from hardware. If this occurs, the IMT must be scrubbed (see the Scrub IMT procedure in the *Maintenance Manual*) or the card must be replaced.

The HW VERIFICATION CODE field is shown only in the mode=full report. ----- is shown in the HW VERIFICATION CODE field for cards with valid hardware detected. One of the following numerical values is shown when invalid hardware is detected, and all such cards will be auto-inhibited.

\* It is possible that the card will continually boot in these cases, before the alarm is ever displayed.

**Table 5-62.** Auto-Inhibit Hardware Verification Codes

| <b>HW Verification Code</b> | <b>Card or Application Code</b> | <b>Description</b>                                                                                                                                                                                | <b>Associated UAM Code</b> |

**rept-stat-cdl****Report Command Driven Loopback Status**

Use this command to generate a report of the signaling links currently in Command Driven Loopback (CDL) testing, including the amount of time the link has been in CDL testing.

Command Driven Loopback is the ability to locally drive a signaling link into a manual line loopback. The data received on the signaling link is echoed (transmitted) back. This is effectively the reverse of the **tst-slk:loopback=lxvr**, which loops the transmitted data back to the receive.

**Keyword:** rept-stat-cdl

**Related Commands:** act-cdl, dact-cdl

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

SS7 signaling links. The signaling links that is being tested.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** All signaling links that are in CDL testing are displayed.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All cards containing signaling links that are in CDL testing are displayed.

**:loopback=** (optional)

Loopback test type.

**Range:** **line, payload**  
 The **payload** value is valid only on LIM-ATM and E1-ATM cards.

**Default:** All loopback tests are displayed.

**Example**

```
rept-stat-cdl
rept-stat-cdl:loc=1201
rept-stat-cdl:loc=1203:link=a
rept-stat-cdl:loopback=payload
```

**Dependencies**

If the **link** parameter is specified, the **loc** parameter must be specified.

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

This command is not available during upgrade.

The card location specified in the **loc** parameter cannot be reserved by the system.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information

**Output**

```
rept-stat-cdl
tekelecstp 03-11-27 01:29:06 EST EAGLE 31.3.0
SLK      CDL      CDL-TIME
1102,A1   LINE      00:04:01
1201,A    PAYLOAD   01:04:11
1203,A    LINE      00:22:21
1203,B    LINE      20:04:01
1208,A    LINE      01:05:22
1211,A    PAYLOAD   00:14:01
;
```

**Legend**

**SLK**—The card and assigned signaling link that is in CDL testing.

**CDL**—Command Driven Loopback test type (LINE or PAYLOAD).

**CDL-TIME**—The time that the signaling link has been in CDL testing. This value can be up to 99:59:59. The test can run longer than 100 hours, but this field will not record times longer than 100 hours.

**rept-stat-cdt****Report Status Customer Defined Troubles**

Use this command to display the customer-defined troubles. The Customer-Definable Alarms feature can be used to connect up to 10 external devices to the system for alarm reporting. These devices are defined in the system database as customer-defined troubles, and they are monitored so that any change in the state of these devices is reported as an unsolicited alarm message (UAM).

**Keyword:** **rept-stat-cdt**

**Related Commands:** **act-alm-trns, canc-alm-trns, dact-alm-trns, rept-stat-clk, rept-stat-trbl, rls-alm, rtrv-obit, rtrv-trbl**

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

**rept-stat-cdt**

**Dependencies**

No other status command can be in progress when this command is entered.

**Notes**

These troubles are customer-defined and configured by the factory.

**Output****rept-stat-cdt**

```
rlghncxa03w 04-01-07 20:20:43 EST EAGLE 31.3.0
ID          ALARM STATUS
1    *C 0058 Critical Customer Trouble detected
2    *C 0050 Critical Holdover Clock trouble detected
3    *C 0058 Critical Customer Trouble detected
4    *C 0058 Critical Customer Trouble detected
5  I ** 0059 Major Customer Trouble detected
6    ** 0052 Major Holdover Clock trouble detected
7    ** 0059 Major Customer Trouble detected
8    ** 0059 Major Customer Trouble detected
9  I * 0060 Minor Customer Trouble detected
10   * 0054 Minor Holdover Clock trouble detected
11   * 0060 Minor Customer Trouble detected
12   * 0060 Minor Customer Trouble detected
13   * 0060 Minor Customer Trouble detected
14  I * 0060 Minor Customer Trouble detected
15   * 0060 Minor Customer Trouble detected
16   * 0060 Minor Customer Trouble detected
;
```

**Legend**

**ID**—The customer defined trouble ID number followed by the status of the customer-defined trouble.

**ALARM STATUS**—The status of the alarm for the specified device.

**rept-stat-clk****Report Status Clock**

Use this command to display the clock status summary for cards in the system.

**Keyword:** **rept-stat-clk**

**Related Commands:** **rept-stat-card**, **rept-stat-dstn**, **rept-stat-imt**, **rept-stat-ls**, **rept-stat-sccp**, **rept-stat-slk**, **rept-stat-trbl**

**Command Class:** System Maintenance

**Parameters**

**:mode=** (optional)

Display mode. When **mode=full** is specified, the "Cards with bad clock source" section of the report is displayed

**Range:** **full**

**Example****rept-stat-clk****rept-stat-clk:mode=full****Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Notes**

The clock status report includes the status of all the clocks in the system (Clock A, Clock B, Clock I, High Speed (HS) Clock A, HS Clock B, etc).

The Time Slot Counter Synchronization (TSC) clock appears only if the Time Slot Counter Synchronization (TSCSYNC) feature is turned on. See the **chg-feat** command.

The Composite clock sections of the report are the *Primary Comp Clock (CLK)* and the *Secondary Comp CLK* fields in the COMPOSITE SYSTEM CLOCK section: the summary of the number of cards having bad status or using COMP CLKs; and the *CLK* columns in the "Cards with bad clock source" section that appears when the **mode=full** parameter is specified.

The HS clock sections of the report are the *Primary HS Clock (CLK)*, *Secondary HS CLK*, *HS CLK TYPE*, and *HS CLK LINELEN* fields in the HIGH SPEED SYSTEM CLOCK section: the summary of the number of cards having bad status or using HS CLKs; and the *HS CLK* columns in the "Cards with bad clock source" section that appears when the **mode=full** parameter is specified.

HS clock capable cards can support a link that is provisioned to use HS Master Timing. These cards include all cards with type **lime1** or **limt1** and all cards that run the **atmansi** or **atmitu** applications. The clock status values are the same as those listed in the **rept-stat-card:mode=full:loc=xxx** report.

For a complete list of the cards and their applications, see Table A-7.

If HS clock A and B status is included in the "Cards with bad clock source" section, then cards that cannot be provisioned to use HS Master Timing display dashes for HS clock A and B status.

The PST/SST for the Primary Composite Clock (Comp Clk) 1114, Primary Comp Clk 1116, Secondary Comp Clk 1114, Secondary Comp Clk 1116, Primary HS Clk 1114, Primary HS Clk 1116, Secondary HS Clk 1114, and Secondary HS Clk 1116 can be one of the following values:

- IS-NR/active—clock source is valid, clock chosen as source
- IS-NR/idle—clock source is valid, clock not chosen as source
- OOS-MT/fault—clock source is invalid

The PST/ SST for the Composite System Clock and High Speed System Clock can be one of the following values:

- IS-NR/Idle—all cards showing good clock, clock not required
- IS-ANR/Idle—some cards showing bad clock, clock not required
- OOS-MT/Idle—all cards showing bad clock, clock not required
- IS-NR/Active—all cards “requiring clocks” showing good clock, clocks required
- IS-ANR/Fault—some cards “requiring clocks” showing bad clock, clocks required
- OOS-MT/Fault—all cards “requiring clocks” showing bad clock, clocks required

**NOTE:** An asterisk (\*) indicates that the card requires the indicated clock.

## Output

**NOTE: A TDM card can use a local clock that is generated independently on each TDM as a clock source for the corresponding internal system clock. The system does not report the “cards bad” status for these internal clocks.**

**NOTE: The use of HS CLK I is not automatic when both the high-speed primary and secondary clocks are invalid. A LIM-ATM card must be provisioned (using the ent-slk:atmtsel=internal parameter) to use the high-speed internal clock.**

**NOTE: The *Using* field in the Composite Clock section describes all of the cards that are using the Composite Clock, not just LIM-DS0, MPL, or HS clock capable cards.**

The following example shows output when two GPSM-II cards are configured, and LIM-DS0 cards, MPL cards, and HS clock capable cards are not configured. The TSCSYNC feature is not turned on.

**rept-stat-clk**

### Legend

**COMPOSITE SYSTEM CLOCK** —Composite System clock status

**ALARM STATUS** —System clock alarms; "No alarms" is shown when there are no alarms.

**PRIMARY COMP CLK** —The status of the primary Composite clock input for a particular TDM

**SECONDARY COMP CLK** —The status of the secondary Composite clock input for a particular TDM

**CLK A** — Internal Eagle Clock sourced by the 1114 TDM from the selected clock source.

**CLK B** — Internal Eagle Clock sourced by the 1116 TDM from the selected clock source.

**CLK I** — Local clock generated independently on each LIM card.

**PREFER CLOCK X FOR TSC CLOCK** —The preferred clock source of the Time Slot Counter Synchronization (TSC) clock; appears only when the TSCSYNC feature is turned on.

**HIGH SPEED SYSTEM CLOCK** —HS system clock status

**ALARM STATUS** —HS System clock alarms; "No alarms" is shown when there are no alarms.

**PRIMARY HS CLK** —The status of the high-speed primary clock input for a particular TDM

**SECONDARY HS CLK** —The status of the high-speed secondary clock input for a particular TDM

**HS CLK TYPE** —HS clock source (see the chg-stpopts command) for a particular TDM

**HS CLK LINELEN** —HS clock line length (see the chg-stpopts command) for a particular TDM

**HS CLK A** — Internal Eagle High Speed Clock sourced by the 1114 TDM from the selected clock source.

**HS CLK B** — Internal Eagle High Speed Clock sourced by the 1116 TDM from the selected clock source.

**HS CLK I** — Local clock generated independently on each LIM card. The value for the internal high-speed clock (Cards using HSCLK I) is generated differently from the internal system clock (Cards using CLK I). The internal high speed clock is generated by the XILINX on the ATM applique's card. The internal system clock is generated by the Xilinx on the LIM main board when the LIM card does not have a valid system clock source (eg. both A system clock and B system clock are bad at the LIM card).

## rept-stat-cluster

### Report Status Cluster-Related DPC

Use this command to report summary status and statistical information for all provisioned clusters. Use this command also to report detailed routeset information for a specific cluster, provisioned cluster member, or dynamically-created x-list entry.

**NOTE: This command does not support 24-bit ITU national point codes.**

**Keyword:** rept-stat-cluster

**Related Commands:** chg-feat, chg-stpopts, rept-stat-cluster, rtrv-stpopts

**Command Class:** System Maintenance

## Parameters

**:dpc=** (optional)

ANSI destination point code of the cluster whose status is to be reported, with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (prefix-ni-nc-ncm).

**Synonym:** **dpca**

**Range:** **p-**, **000-255**, **\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**Default:** Display summary for all provisioned clusters

**:mode=** (optional)

The type of display. Specify **mode=full** to display additional information for the specified DPC.

**Range:** **full**

**Default:** Display summary report

**:stat=** (optional)

This parameter reports on destinations whose status is the same as the state indicated by the parameter.

**Range:** **all**, **alminh**, **anr**, **dsbld**, **mt**, **nr**

**all**—All of the primary states

**alminh**—Alarms inhibited

**anr**—In service abnormal (IS-ANR)

**dsbld**—Out of service maintenance disabled (OOS-MT-DSBLD)

**mt**—Out of service maintenance (OOS-MT)

**nr**—In service normal (IS-NR)

**Default:** **all**

## Example

```
rept-stat-cluster
```

```
rept-stat-cluster:stat=alminh
```

```
rept-stat-cluster:stat=MT
```

```
rept-stat-cluster:dpc=20-2-*
```

```
rept-stat-cluster:dpc=20-2-*:mode=full
```

```
rept-stat-cluster:dpc=20-2-5
```

## Dependencies

If the **mode=full** parameter is specified, the **dpc/dpca** parameter must be specified.

The **stat** parameter cannot be specified with the **dpc/dpca** parameter in the command.

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before this command can be entered.

The specified DPC must exist.

If a DPC is specified, it must be an x-list entry, a cluster DPC, or a member of a provisioned cluster.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\*\** or *ni-nc-\*\*\** cannot be specified for the **rept-stat-cluster** command.

In this command, the point codes support only the private (internal) point code subtype prefix (**p-**).

## Notes

If no parameters are specified, a summary report is produced, showing all provisioned clusters and their status.

If an FPC corresponding to a provisioned cluster member or an x-list entry is specified, then the status of only the specified FPC, along with routeset status, is displayed.

If a cluster destination is specified on the **dpc/dpca** parameter, then the status of the cluster and the routesets that have been defined for that cluster is displayed.

If the **mode=full** parameter and a DPC are specified, the Route/Destination table is searched, and all entries (cluster DPCs, provisioned cluster member DPCs, and x-list DPCs) belonging to the parent cluster are displayed along with their status. Also, if circular routing is in effect for the DPC, information useful in diagnosing and correcting the situation is displayed.

In the summary report, and in the detailed output when a cluster DPC is being reported, the number of provisioned members of the cluster, and the number of x-list entries that have been created for the cluster, are reported in the PROV and X-LIST columns, respectively.

When detailed information for an x-list entry is being reported, the reasons that the x-list entry was created, and the amount of time remaining on the x-list expiration timer, if applicable, in the format hh:mm is shown in the X-REASON and X-TIME columns, respectively. In x-list entries for which the expiration timer is not applicable, dashes "----" are displayed.

## Output

When no parameters are specified, summary information for all of the defined cluster DPCs is shown. Note that the report shows the number of provisioned and x-list members of each cluster.

### rept-stat-cluster

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0
  DPCA      ORIG   PST    SST      AST      PROV  XLIST
  020-002-* CLUST  IS-NR   Allowed ACCESS      2      3
  020-020-* CLUST  IS-NR   Allowed ACCESS      3      5
  020-021-* CLUST  OOS-MT  Prohibit INACCESS    5      2
  020-022-* CLUST  IS-NR   Allowed ALMINH     2      3
```

Command Completed.

;

When a provisioned cluster member DPC is specified, the report shows status information for the specified DPC plus route information.

### rept-stat-cluster:dpc=20-2-1

```
rlghncxa03w 04-01-07 08:51:31 EST EAGLE 34.0.0
  DPCA      ORIG   PST    SST      AST
  020-002-001 PROV  IS-ANR Restrict ACCESS
ALARM STATUS      = No Alarms.

Command Completed.

;

If a circular routing alarm is raised for a cluster DPC (that is, no x-list entry could be created for the cluster member), then specifying the **dpc** and **mode=full** parameters displays information pertinent to the cluster member that is experiencing the circular routing condition. This information may be useful in correcting the problem. The value for the MEMBER field in this example represents the cluster member that had the circular routing condition. This is the same member for which an x-list entry could not be created.

**NOTE: The circular routing member information shown in this output report displays as \*\*\*-\*\*\*-\*\*\* if the specified destination point code is not a cluster destination point code or the information is not known by maintenance at the time the report is generated.**

### Legend

**ORIG**—Indicates the origination of the destination point code being reported. The possible values that can appear in the column are:

**CLUST**—Entry is a provisioned cluster (*ni-nc-\**) DPC

**PROV**—Entry is a provisioned cluster member (*ni-nc-ncm*)

**X-LIST**—Entry is a non-provisioned (i.e. dynamically-created) x-list cluster member

**PST**—The primary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the cluster. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the cluster. The possible values are described in .

**X-REASON**—Indicates the reasons that the X-LIST entries currently exist. The two-letter indicator values that can appear in this column are:

**RT**—X-LIST entry created due to routing

**CG**—X-LIST entry created due to congestion

**CR**—X-LIST entry created due to circular routing

The circular routing transmit/receive linkset information shown in the **mode=full** detailed output report displays as "-----" if no circular routing alarm exists for the DPC or the information is not known by maintenance at the time the report is generated.

## rept-stat-db

## Report Status Database

Use this command to display a report showing various status indicators for the active and standby OAM database and the status of the database on each of the network cards.

If the AINPQ, G-Flex, G-Port, INP, LNP ELAP Configuration, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the status of the MPS databases and Service Module cards is displayed.

**Keyword:** rept-stat-db

**Related Commands:** chg-db, copy-meas, disp-disk-dir

**Command Class:** Database Administration

## Parameters

**:db=** (optional)

The report section or sections to display in the output. The content of each section depends on the specified or default value of the **display** parameter, MPS output appears only if a feature that uses the MPS is turned on in the system (G-Flex, G-Port, INP, PPSMS, or the LNP ELAP Configuration controlled feature) or the ATINP feature is enabled.

**Range:** **all, mps, stp**

**all** — Displays database and card output for both the STP and MPS report sections.

**mps** — Displays only the database and card output for the MPS report section.

**stp** — Displays only the database and card output for the STP report section.

**Default:** **all**

**:display=** (optional)

The type of output

**Range:** **all, brief, except, version**

**all** — Displays the operational status of all databases (MASP A, MASP B, and MDAL) and all cards equipped in the database on the system.

**brief** — Displays the operational status of the databases in the active and standby MASP, and of the MPS databases if a feature that uses the MPS is turned on.

**except** — Displays the operational status information contained in the **display=brief** output along with the cards whose database level does not match the active fixed disk current partition or active MPS database.

**version** — Displays all of the same information that is displayed with the **display=all** parameter except that the individual database status column is replaced with the database format version and status. In addition, details of the status of the backup databases are displayed for MASP cards. No version information is shown for MPS databases; use the **rept-stat-mps** command.

**Default:** **brief**

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1114, 1116, 1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

## Example

```
rept-stat-db
```

```
rept-stat-db:display=all
```

```
rept-stat-db:loc=1207
```

```
rept-stat-db:db=stp
```

## Dependencies

The **db** and **loc** parameters cannot be specified at the same time.

The following card locations are not valid for this command: 1113, 1115, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

One of the following features must be turned on, or the ATINP feature must be enabled before the **db=mps** parameter can be specified:

- A-Port
- AINPQ
- EIR
- G-Flex
- G-Port
- INP
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- V-Flex

The shelf and card must be equipped.

The card location slot must be between 1 and 18, but not 9 or 10.

The shelf location must be 11xx, 12xx, 13xx, 21xx, 22xx, 23xx, 31xx, 32xx, 33xx, 41xx, 42xx, 43xx, 51xx, 52xx, 53xx, or 61xx.

The frame value of the shelf location parameter (**loc**) must be within the valid range.

The **display** parameter can accept a value of **brief**, **all**, **version**, or **except** only.

## Notes

If the **display** parameter, the **db** parameter, or the **loc** parameter is specified and the database for a particular card location is not accessible, hyphens are displayed in place of the data.

The output of the **rept-stat-db** command with no parameters specified or with the **display=brief** parameter shows the following information:

- Activity status of both the active and standby MASP, the date and time the last backup was performed on the removable cartridge (if inserted) and the fixed disk backup partition, coherency, the number of updates (level) to the backup partition of the fixed disk, and the current partition of the fixed disk
- If the EIR, G-Flex, G-Port, INP, PPSMS, or V-Flex feature is turned on, or the ATINP feature is enabled, EPAP A and EPAP B database status followed by Service Module card database status
- If the LNP ELAP Configuration controlled feature is turned on, ELAP A and ELAP B database status followed by Service Module card database status

The output of the **rept-stat-db** command with the **display=except** parameter shows the coherency and the number of updates for all the cards whose database level does not match the active fixed disk current partition, reference database level, or is incoherent. All databases that are not accessible are also displayed. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=all** parameter shows the coherency and the number of updates for all of the distributed databases. In addition, the time stamp for the last database update is displayed for every card.

The output of the **rept-stat-db** command with the **display=version** parameter shows the coherency and the number of updates for the active and standby databases, along with the database version and

the operational status of each of these databases. If the LNP feature is turned on (see the **enable-ctrl-feat** command), the version of the LNP database is shown. No version is shown for EPAP or ELAP databases; use the **rept-stat-mps** command to display version information for these databases.

The output of the **rept-stat-db** command with the **loc** parameter specifying an equipped card shows the coherency and the number of updates to its database. In addition, the time stamp for the last database update is displayed for the specific card location.

The **db** parameter is used to limit the output of the **rept-stat-db** command to either just the EAGLE STP information or just the MPS information. The information is displayed as indicated by the **display** parameter value (**display=version** is not valid for **db=mps**; the command does not display the MPS database versions). The default **db** parameter value is **all**, which displays the information for the STP and MPS databases and cards as indicated by the **display** parameter value.

## Output

The report for the specified card is displayed. The report shows that the disk is OFF-LINE indicating the disk has been dismounted. This is not necessarily a problem.

**rept-stat-db:loc=1114**

```
tekelecstp 08-08-29 08:38:25 NZST EAGLE 39.2.0

```

The LNP ELAP Configuration controlled feature is enabled and turned on (see the **enable-ctrl-feat** command) in the system, and ELAP is being used. Card 1203 indicates a value 12 in the exception column. The value indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. More specifically, the card has encountered 12 corrupted records and has subsequently repaired them. This value persists until the card is reset.

### Legend

**DATABASE STATUS**—An indication of any database alarms on the MASPs. This indicator is not used with the **loc** parameter output.

>> **OK**<<—There are no database alarms

>>**NOT OK**<<—Database alarms are present

**(ACTV MASP)**—The specified MASP is the active processor. This is not used with the **loc** parameter output.

**(STDBY MASP)**—The specified MASP is the standby processor. This is not used with the **loc** parameter output.

**(NOACCS)**—The specified processor is not accessible. This is not used with the **loc** parameter output.

**C**—An indicator of whether the database is coherent.

**Y**—the database is coherent

**N**—the database is not coherent

Dash (-)—the database is not accessible.

**LEVEL**—The number of updates made to the database partitions.

**TIME LAST BACKUP**—The date and time the last change was performed on the removable cartridges (if inserted) and the backup partition of the fixed disk. This field is not used with the **loc** parameter output.

**RD BKUP**—Removable cartridge backup partition.

**FD BKUP**—Fixed disk backup partition.

**FD CRNT**—Fixed disk current partition. This field is not used with the **loc** parameter output.

**DIFF CONTENTS**—The specified database's contents are different when compared to the other database in that partition.

**DIFF LEVEL**—The specified database's level does not match the level of the current partition of the active fixed disk (**FD CRNT**).

**DIFF TIME**—The specified database's level matches the level of the current partition of the active fixed disk (**FD CRNT**), but the time that the database was updated, when compared to the current partition of the active fixed disk (**FD CRNT**), is different. This exception indicator appears only if the time and date stamp in an update packet or in memory becomes corrupted.

**CORRUPTED**—The specified database is corrupted.

**INCOHERENT**—The specified database is incoherent.

**EXCEPTION**—The following values can appear:

- The condition of the specified database with which the system has detected a problem. These conditions are: **DIFF CONTENTS**, **DIFF LEVEL**, **DIFF TIME**, **CORRUPTED**, and **INCOHERENT**. A "-" indicates that the database was not accessible. A blank entry indicates

that the database has no problems. This field is used with the **display=except**, **display=all**, and **loc** parameter outputs.

- A value that indicates the number of times that the Corruption Cross Correction function has corrected the card during the time that the card has been in service. This value persists until the card is reset.

**IN-SRVC**—The length of time that the card has been in service.

**CARD/APPL**—The card type or the application assigned to the card specified in the **LOC** field. This field is not used with the **display=brief** (default) parameter output.

**TDM-BKUP**—Backup partition on the fixed disk on the TDM.

**TDM-CRNT**—Current partition on the fixed disk on the TDM.

**LOC**—The card location of the database. This field is not used with the **display=brief** (default) parameter output.

**T**—An indicator of whether the specified database is in transition. A database is in transition when the database for the link interface module (LIM) or TSM is in the process of being loaded with the new screen set information after an update to the database, and the database has not reached the current reported database level. This field is not used with the **display=brief** (default) parameter output.

**Y**—the database is in transition

**N**—the database is not in transition.

**TIME LAST BACKUP**—The date and time the last change was performed on the specified card and its associated database. A dash (–) in this field for the fixed drive (FD) or removable drive (RD) indicates that no backup has been created on that drive. This field is not used with the **display=brief** (default) parameter output.

**VERSION**—The version number of each database (including the LNP database if the LNP feature is on).

xxx-xxx-xxx—The version number of the database.

**UNKNOWN**—The **rept-stat-db** command can show the version number only for a database that is version 20.0.0 or later. Any database version that is earlier than version 20.0.0 cannot be determined and UNKNOWN is displayed for the database version number.

A dash “-” —The database is not available. This field is used only with the **display=version** parameter output.

**STATUS**—The operational status of the database version. This field is used only with the **display=version** parameter output.

**NORMAL**—The database version is fully operational.

Blank entry—A blank entry indicates that the database is not available or is unknown. A numeric value indicates that the database is invalid. The value displayed is the status value found in the field and is for diagnostic purposes.

**BIRTHDATE**—The date and time of creation for the database.

**EPAP A (ACTV)**—The active EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on or the ATINP feature is enabled.

**PDB**—The provisioning database status information.

**RTDB**—The provisioning database status information that was used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—The EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.

**EPAP B (STDBY)**—The standby EAGLE Provisioning Application Processor. This section of the report appears only if the G-Port, G-Flex, EIR, INP, PPSMS, or V-Flex features are turned on, or the ATINP feature is enabled.

**PDB**—The provisioning database status information.

**RTDB**—The provisioning database status information that was used to create the resident Realtime Database. The RTDB information may be different than the PDB information if the PDB has been reloaded, or if the RTDB has not been loaded from the PDB. If the RTDB birthdate is different than the PDB or if the level is too old to be able to resynchronize the databases, then a "Reload Required" alarm is generated.

**RTDB-EAGLE**—The EPAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm. The RTDB is reloaded from the PDB, and the birthdate and level are reset and do not match the database status information. This database status mismatch condition indicates an abnormal condition that requires Service Module cards to be reloaded.

**ELAP A (ACTV)**—The active EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

**RTDB-EAGLE**—The ELAP resident Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

**TIME LAST UPDATE**—The date and time of the last update of the RTDB from the LSMS.

**ELAP B (STDBY)**—The standby EAGLE LNP Application Processor. This section of the report appears only if the LNP ELAP Configuration controlled feature (see the **enable-ctrl-feat** command) is turned on.

**RTDB-EAGLE**—The ELAP resident Realtime Database status information. This database is downloaded to Service Module cards. If the birthdate or level do not match the Service Module card, then the Service Module card generates an alarm.

**TIME LAST UPDATE**—The date and time of the last update of the RTDB from the LSMS.

## rept-stat-dlk

## Report Status Data Link

Use this command to show the status of the TCP/IP data links. The secondary state (SST) of the TCP/IP data links shows whether the link is available, unavailable, or manually removed from service.

**Keyword:** rept-stat-dlk

**Related Commands:** act-dlk, canc-dlk, dlt-dlk, ent-dlk, rtrv-dlk, tst-dlk

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All data links are shown.

### Example

**rept-stat-dlk**

**rept-stat-dlk:loc=1104**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

Only one data link port on the ACM is supported. Reports are generated only on port A of the card.

The card location, frame, shelf, or slot must be within the allowed range.

The data link must be equipped in the database.

A card location that is valid and defined in the database must be specified.

**Legend**

**DLK**—The card location of the TCP/IP data link

**PST**—The primary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the TCP/IP data link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the TCP/IP data link. The possible values are described in .

**rept-stat-dstn****Report Status Destination**

Use this command to generate a report of the MTP point code status for provisioned point codes. Any provisioned destination can be specified, including a cluster destination (*ni-nc-\**) or a network destination (*ni-\*-\**).

**Keyword:** **rept-stat-dstn**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-rte, rtrv-dstn, rtrv-rte**

**Command Class:** System Maintenance

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

When **chg-sid:pctype=ansi** is specified, **ni-\*-\*** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:mode=** (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

**Range:** **full, rtx**

**full**—Comprehensive display of point code status, including rtx. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, the status of all routesets is displayed.

**rtx** — Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:** A summary report is displayed.

**:stat=** (optional)

The primary state filter. This parameter lets you choose the state of the destination for which you want a report. In other words, if you want a report for all destinations whose state is DSBLD, specify **:stat=dsbld**.

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all** — All of the primary states

**alminh** — Alarms inhibited

**anr** — In service abnormal (IS-ANR)

**dsbld** — Out of service maintenance disabled (OOS-MT-DSBLD)

**mt** — Out of service maintenance (OOS-MT)

**nr** — In service normal (IS-NR)

**Default:** **all**

### Example

```
rept-stat-dstn
rept-stat-dstn:dpci=2-004-1:mode=full
rept-stat-dstn:dpc=9-3-6:mode=full
rept-stat-dstn:dpc=9-3-*:mode=full
rept-stat-dstn:dpc=9-3-*
rept-stat-dstn:dpc=9-3-**
rept-stat-dstn:dpc=9-3-***
rept-stat-dstn:dpc=9-3-***:stat=mt
rept-stat-dstn:dpc:9-4-***:stat=alminh
rept-stat-dstn:dpc=9-3-*:mode=rtx
rept-stat-dstn:mode=full
rept-stat-dstn:mode=rtx
rept-stat-dstn:dpc=1-1-1
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, it must be the true destination point code (not an alias) and it must be defined in the database.

A summary report is displayed if the **stat** parameter is specified.

The **stat** parameter can be specified with the **dpc** parameter only if the **dpc** parameter specifies one of the *ni-nc-\** formats.

An x-list DPC cannot be specified in the **dpc** parameter.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

The **mode** parameter cannot be specified with the **dpc** parameter if the **dpc** parameter specifies one of the *ni-nc-\** formats.

When the **mode=full** parameter is specified then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-) and the private and spare point code subtype prefix (ps-). All of the point code types support the private (internal) point code subtype prefix (p-).

Table 5-66 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-63.** Summary of DPC Parameter Syntaxes

| DPC format                              | Meaning                                                                                                                                                                                                                              |
|-----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-dstn:dpc=ni-nc-ncm</b>     | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                                                               |
| <b>rept-stat-dstn:dpc= ni-*-*</b>       | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.                                         |
| <b>rept-stat-dstn:dpc= ni-***_*</b>     | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                                                         |
| <b>rept-stat-dstn:dpc= ni-***_*</b>     | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                                                |
| <b>rept-stat-dstn:dpc= ni-nc-*</b>      | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                                                               |
| <b>rept-stat-dstn:dpc= ni-nc-**</b>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |
| <b>rept-stat-dstn:dpc= ni-nc-***</b>    | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.                       |
| <b>rept-stat-dstn:dpcn24=msa-ssa-sp</b> | Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                           |

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the **mode=full** parameter is specified without a specific DPC, then status provided for all regular and exception route sets.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned DPCs (route sets) in the system,
- If the **mode=rtx** parameter is specified, the command output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, the command output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, and the status of all provisioned exception route sets associated with that DPC.
- If the **mode=full** parameter is specified, the command output lists the status of all provisioned routes in the route set specified by that DPC, the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows a private adjacent point code:

### rept-stat-dstn:mode=full:dpc=1-1-2

The following example shows how specifying either an FPC or cluster destination for which circular routing has been detected, along with the **mode=full** parameter, displays the name of the linkset on which the circular routing test message was transmitted. It also displays the linkset on which the circularly routed message was received. This information may be useful in correcting the circular routing situation.

#### rept-stat-dstn:dpc=9-3-6:mode=full

```

The following example shows how **rept-stat-dstn** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for an FPC destination.

#### rept-stat-dstn:dpc=9-3-\*

```

Command Completed.
;

```

The following example shows how **rept-stat-dstn** displays a subsystem information header but no subsystem information, just as it would if an FPC is specified for which no subsystems are defined. In addition, because aliases cannot be defined for cluster destinations, this report shows only an empty header, just as it does when an FPC is specified for which no aliases are defined. Note that the circular

routing information portion of the **mode=full** report displays “-----” for the linkset names when no circular routing condition exists for the DPC.

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in .

**rept-stat-e1****Report Status E1**

Use this command to display the E1 port status and signaling link status for cards with provisioned E1 ports.

**Keyword:** **rept-stat-e1**

**Related Commands:**

**Command Class:** System Maintenance

**Parameters**

**:e1port=** (optional)

The E1 port number. When this parameter is specified, only the information for the specified E1 port on the card in the specified card location is displayed.

**Range:** **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

**:loc=** (optional)

Card location. The unique identifier of a specific **lime1** card located in the STP.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** Information for all **lime1** cards is reported.

**Example**

**rept-stat-e1**

**Dependencies**

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **e1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

**Notes**

Specifying the command without any parameters displays E1 port status for all cards with provisioned E1 ports.

If the **loc** parameter is specified, status is displayed for all E1 ports provisioned on the card in the specified location.

If the **loc** and **e1port** parameters are specified, the E1 port status summary is displayed for all E1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified E1 port on the card.

**Output**

When no parameters are specified in the command, E1 port status is displayed for all cards with provisioned E1 ports. Ports 3 through 8 are on HC-MIM cards only.

**rept-stat-e1**

**Legend**

**LOC**—Card location

**E1PORT**—Number of the E1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**SST**—The secondary state of the card. The possible values are described in “Possible Values for PST/SST/AST”.

**AST**—The associated state of the card. The possible values are described in “Possible Values for PST/SST/AST”. The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the E1 port being unavailable

**SLK**—Signaling link assigned to the E1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

## rept-stat-enet

## Report Status Ethernet

Use this command to display a summary report of Ethernet status for all configured Ethernet interfaces on IP<sup>7</sup> cards in the system.

**Keyword:** **rept-stat-enet**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

**Range:**     **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:**   All ENET data for the card location is displayed.

**:port=** (optional)

Ethernet interface port ID.

**Range:**     **a, b**

**Default:**   All port data for ENET is displayed.

### Example

**rept-stat-enet**

**rept-stat-enet:loc=1101:port=b**

### Dependencies

Another command is already in progress.

If the **loc** parameter is specified, then the **port** parameter must be specified. If the **port** parameter is specified, then the **loc** parameter must be specified.

The shelf and card must be equipped, and the card table entry **appl** must be IPLIM, IPLIMI, SS7IPGW or IPGWI.

**Notes**

None.

**Output**

The following example displays a report on the status of all configured Ethernet interfaces on IP<sup>7</sup> cards in the system.

**rept-stat-enet**

```
eagle10110 07-02-10 14:50:23 EST EAGLE 35.6.0
```

| LOC  | PORT | IPADDR          | PST    | SST    | AST    |
|------|------|-----------------|--------|--------|--------|
| 1101 | A    | 1.1.1.1         | OOS-MT | Fault  | ALMINH |
| 1101 | B    | 123.234.222.111 | IS-ANR | Active | -----  |
| 1201 | A    | 111.1.24.200    | IS-NR  | Active | -----  |
| 1201 | B    | 2.31.234.1      | OOS-MT | Fault  | -----  |

Command Completed.

;

The following example displays the summary for a specific card location and port.

**rept-stat-enet:loc=1101:port=b**

```
eagle10110 07-02-10 14:54:23 EST EAGLE 35.6.0
```

| LOC  | PORT | IPADDR          | PST    | SST    | AST   |
|------|------|-----------------|--------|--------|-------|
| 1101 | B    | 123.234.222.111 | IS-ANR | Active | ----- |

ALARM STATUS = \*\* 0537 Ethernet error threshold exceeded

Command Completed.

;

**Legend**

- **CARD**—The location of the card.
- **VERSION**—The version number of the application loaded on the card. Dashes (- - - -) in the version column indicate one of the following conditions about the card:
  - The card is configured but is not physically present in the system.
  - The card does not run a GPL, such as TDM or MDAL cards.
  - The card is IS-ANR or is in the process of being loaded.
- **TYPE**—The card type entered in the database. (The DCM and SSED CM cards show card type DCM.)
- **APPL**—The application loaded on this card.
- **PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".
- **AST**—The associated state of the card. The possible values are described in .

**rept-stat-eroute****Report Status EROUTE**

Use this command to display the status of STC cards and E5-STC cards (running the **eroute** application) for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** rept-stat-eroute

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Location. This parameter specifies the unique identifier of a specific STC card (STC card or E5-STC card) located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All STC cards are reported.

**:mode=** (optional)

Mode of reporting for the command. When **mode=perf** is specified, only subsystem performance information is displayed.

**Range:** perf

**Default:** None.

### Example

```
rept-stat-eroute
```

```
rept-stat-eroute:mode=perf
```

```
rept-stat-eroute:loc=1213
```

### Dependencies

The **mode** and **loc** parameters cannot be specified in the same command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one STC card (STC card or E5-STC card running the **eroute** application) must be configured before this command can be entered.

### Notes

When the **loc** parameter is specified, only the card information for the specified card is displayed.

When the **mode=perf** parameter is specified, only subsystem performance information is displayed.

## Output

If an **eroute** subsystem alarm is raised while the **rept-stat-eroute** command is processing, then the command output may not display the alarm. The alarm is displayed if the command is issued a second time.

When no parameters are specified in the command, the report shows card, subsystem, and alarm information.

### **Legend**

When no parameters are specified in the command, the following information appears in the report:

**EROUTE SUBSYSTEM REPORT**—State of the subsystem

**STC CARDS CONFIGURED**—Total number of STC cards and E5-STC cards configured in the system

**CARDS IS-NR**—Total number of STC cards and E5-STC cards in IS-NR state

**EISCOPY BIT**—Indicates whether EIS copy function is turned On or Off

**SYSTEM THRESHOLD**—% of system total capacity being used

**SYSTEM PEAK EROUTE LOAD**—Current load in Buffers/Sec

**SYSTEM TOTAL EROUTE CAPACITY**—Total capacity in Buffers/Sec

**SYSTEM ALARM STATUS**—Either "No Alarms" or current alarm number and text

**CARD**—Card location

**VERSION**—The version number of the GPL loaded on the card. Dashes ( - - - - ) in the version column indicate one of the following conditions about the card:

- The card does not run a GPL, such as TDM or MDAL cards.
- The card is configured but is not physically present in the system.
- The card is IS-ANR or is in the process of being loaded.

**TYPE**—The card type entered in the database.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in .

**EROUTE SERVICE AVERAGE TVG CAPACITY**—%

**AVERAGE CPU CAPACITY**—%

**TVG Usage** —% of system current TVG rate based on the Max TVG capacity of the E5-ENET card

**CPU usage**—% of system current CPU usage

When **mode=perf** is specified, the following performance statistics are displayed:

### **STATISTICS**

**CARD**—Card location

**CPU USAGE**—%

**TVG RATE**

**AVERAGE TVG USAGE**—%

**AVERAGE CPU CAPACITY**—%

**TOTAL TVG RATE**

When the **loc** parameter is specified in the command, only card information for the specified card is displayed: CARD, VERSION, TYPE, PST, SST, and AST as shown above, and the following information:

**CARD ALARM STATUS**—Either “No alarms” or current alarm number and text

**TOTAL CPU USAGE**—%

## rept-stat-gpl

## Report Status Generic Program Load

Use this command to display the version of GPLs currently running for an application, plus the approved and trial versions of the GPL that will run if the card is restarted.

**Keyword:** **rept-stat-gpl**

**Related Commands:** **act-gpl**, **alw-card**, **chg-gpl**, **copy-gpl**, **init-card**, **init-sys**, **rtrv-gpl**

**Command Class:** Program Update

### Parameters

**:display=** (optional)

Display mode. Specifies whether the report displays only application GPL data for all cards, or both IMT and application GPL data.

**Range:** **all**, **brief**

**Default:** **brief**

**:gpl=** (optional)

Generic program load. This parameter specifies the type of GPL to report on.

**:loc=** (optional)

Location. This parameter specifies the target card address and displays the versions of all GPLs running at the specified card location. For HC-MIM, E5-ENET, or STC cards, this information includes all non-activated flash GPLs. For cards that are not HC-MIM, STC, or E5-ENET or non E5-IPSM cards, there is no additional data: this parameter limits the report to the target card address.

**Range:** **1101-1108, 1111-1113, 1115, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

### Example

```
rept-stat-gpl
rept-stat-gpl:display=all
rept-stat-gpl:loc=1201
rept-stat-gpl:gpl=ipsg
```

### Dependencies

No other **rept-stat-xxxx** command can be in progress when this command is entered.

None of the following parameters can be specified together in the same command: **display=all** parameter, **loc** parameter, **gpl** parameter.

### Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

When this command is entered, information is displayed only for the cards that are IS-NR or IS-ANR.

Use the **chg-gpl** command to turn auditing on and off.

Use the **rtrv-gpl** command to display the audit state.

The approved GPL is the GPL that resides on the active fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If any card is not running the active MASP system release version of a GPL, "ALM" is displayed to indicate that the card is in GPL alarm condition.

If GPL auditing is on, a minor alarm is shown, and "ALM" is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. If GPL auditing is off, the minor alarm is not activated, but "ALM" is displayed for each GPL that does not match the GPL in the RELEASE column.

If no **gpl** parameter is specified, the approved and trial versions for all GPLs are displayed.

If a GPL is not found, a version of "-----" is displayed. This should happen only for utility and OAM GPLs when the cartridge is not inserted. A utility trial version is never displayed because it can never be run.

If the removable cartridge is inserted, an "\*" (asterisk) is displayed next to the OAM trial version. The asterisk serves as a reminder that the trial version of a GPL is loaded when the card that is running the OAM is restarted. All other cards load their approved versions of GPLs when they are restarted.

If a card is inhibited, "-----" is displayed for the running version.

When the **gpl** parameter is not specified, the default is to display all application GPLs that are running on provisioned cards. The flashable GPLs (those loaded on the card by using the **init-flash** command) are not displayed.

When the **gpl=imt** parameter is specified, only the IMT GPLs for each configured card connected to the IMT are displayed.

A plus (+) symbol in the output indicates that the flash GPL currently being run has not yet been activated on the card. See the **act-flash** or **init-flash** command for a list of flash GPLs.

When a GPL is specified in the **gpl** parameter, the specified GPL for each card connected to the IMT is displayed.

## Output

The output of the **rept-stat-gpl** command is site-specific and configuration-specific. The following output examples show typical output for the commands that are entered; the output that is shown can differ from output that appears for a particular system.

The following example shows output that includes an MPL or MPL-T (multi-port LIM) card at location 1105. The GPL column, which displays the GPL running on the card, enables you to differentiate between the two-port LIMDS0 card and the multi-port LIM card. If an MPL or MPL-T card is running in the system, SS7ML appears in the GPL column. If a two-port LIMDS0 card is running in the system, SS7ANSI appears in the GPL column.

This output appears when no parameters are defined. All GPLs for the card are listed.

The following example shows the EOAM GPL that is running on the cards in locations 1113 and 1115.

### rept-stat-gpl:gpl=eoam

```
rlghncxa03w 05-01-07 10:23:93 EST EAGLE 33.0.0
GPL      CARD      RUNNING      APPROVED      TRIAL
EOAM     1113      028-002-000      028-002-000      -
EOAM     1115      028-002-000      028-002-000      -
Command Completed.
```

;

The following example specifies the **display=all** parameter to display both IMT and application GPL information.

The example also contains asterisks with the following meanings:

- \* The SS7ML entry in the GPL column at location 1105 indicates that a multi-port LIM, as opposed to a two-port LIM, is running on the system. Both cards are provisioned in the database with the **ss7ansi** application so that the two-port LIM can be replaced without having

to reprovision the database, but the MPL and MPL-T run the **ss7ml** GPL to support 8 signaling link ports.

- \*\* The OAP entries appear only if an OAP is provisioned and running. Systems that use two OAPs show two entries for the OAP: OAP A and OAP B.

;

The following example shows output when the **loc** parameter is specified for an HC-MIM card.

The following notes explain the last 5 lines of this example:

1. IMTPCI has been downloaded with the **init-flash** command, the card has reset, and IMTPCI was activated normally with the **act-flash** command.
2. BLBIOS has been downloaded with the **init-flash** command, but the card has not been initialized. The inactive version will load when the card is next initialized.
3. BLVXW6 has been downloaded with the **init-flash** command, the card has been reset. BLVXW6 was activated with the **act-flash** command, but it is not the approved version on the TDM.
4. BLDIAG6 has been downloaded with the **init-flash** command, and the card has been reset; the inactive version is running. The ALM indicates that it is not the approved version and the '+' indicates that it has not been activated yet. The '\*' next to the active version indicates that if the card resets again, the active version will run.
5. PLDPMC1 has been downloaded with the **init-flash** command and the card has been reset, but the GPL has not been activated yet. This is the same condition as Note 4, except that there is no alarm condition.

**Legend****GPL**—The type of GPL associated with the cards in the display.**CARD**—The card location.

**RUNNING**—The GPL version the card is running. If the card is not running the active MASP system release GPL, ALM appears after the GPL version number in this column.

**APPROVED**—The GPL version that is the approved GPL.

**TRIAL**—The GPL version that is the trial GPL.

**ACTIVE**—The GPL version that has been downloaded using the **init-flash** command and activated using the **act-flash** command..

**INACTIVE**—The GPL version that has been downloaded using the **init-flash** command but has not been activated using the **act-flash** command..

----- (dashes)—GPL is not present at the specified location.

\*—The trial version will run if the card boots. (Shown to the right of the TRIAL column)

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

+—The currently running flash GPL has not been activated. (Shown between the RUNNING and APPROVED columns)

## rept-stat-imt

## Report IMT Status

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to display the primary, secondary, and associated maintenance states of the IMT bus. The primary state indicates whether the bus is normal, abnormal, or OOS for maintenance activity. The secondary state indicates the active/inhibited status of a card for a particular IMT bus.

**Keyword:** **rept-stat-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rmv-imt**, **rst-imt**

**Command Class:** System Maintenance

### Parameters

**:mode=** (optional)

Use this parameter to provide additional output listing the cards that currently have IMT alarm conditions outstanding. The additional output is repeated for each IMT bus following the bus status information. If no alarms are active on a given bus, no additional output is generated.

**Range:** **full**

**Default:** Do not display additional information.

### Example

```
rept-stat-imt
```

```
rept-stat-imt:mode=full
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

The card locations are stored only by the active MASP. The information is lost if the system switches from the active to the standby MASP.

The trouble locations are displayed sorted by card location.

**Output****rept-stat-imt**

```

rlghncxa03w 04-02-27 16:50:24 EST EAGLE 31.3.0
IMT  PST          SST          AST
A    IS-NR        Active       -----
ALARM STATUS      = No alarms

IMT  PST          SST          AST
B    IS-ANR       Fault        -----
ALARM STATUS      = ** 0108 Major IMT Failure Detected

```

Command Completed.

;

**Legend**

**IMT**—IMT bus A or IMT bus B.

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the specified IMT bus.

**\***—Minor Alarm

**\*\***—Major Alarm

**\*C**—Critical Alarm

The states of the IMT bus are combined from the PST and the SST as shown in Table 5-64.

**Table 5-64.** IMT Bus States

| PST          | SST    | Definition                                                          |
|--------------|--------|---------------------------------------------------------------------|
| IS-NR        | Active | The IMT bus is operating normally.                                  |
| IS-ANR       | Fault  | The IMT bus has had a failure on at least one but not all cards.    |
| IS-ANR       | Manual | The IMT bus is inhibited, but some cards have been connected to it. |
| OOS-MT       | Fault  | The IMT bus has a failure on all cards.                             |
| OOS-MT-DSBLD | Manual | The IMT bus is inhibited and no cards are connected to it.          |

**rept-stat-iptps****Report Status IPGWx TPS Utilization**

Use this command to display current and peak IPTPS usage for each IPSP / IPGWx linkset in the system or for each link in the IPSP / IPGWx linkset.

**Keyword:** **rept-stat-iptps**

**Related Commands:** **chg-ctrl-feat, chg-ls, chg-sg-opts, enable-ctrl-feat, ent-ls, rtrv-ctrl-feat, rtrv-ls, rtrv-sg-opts**

**Command Class:** System Maintenance

**Parameters**

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:peakreset=** (optional)

Reset peak values to the current TPS values.

**Range:** **yes, no**

**Default:** **no**

**Example**

**rept-stat-iptps**

**rept-stat-iptps:lsn=lsgw1101**

**rept-stat-iptps:peakreset=yes**

**Dependencies**

If the linksets are not IPGWx or IPSP, then this command cannot be entered.

The specified linkset name must exist in the database.

**Notes**

Traffic peak data are stored only in OAM memory and are not preserved when the card that is running the OAM boots, or in the case of an active/standby switchover.

IPSP linksets have SLKTPS linksets configured rather than IPTPS linksets. The **rept-stat-iptps** command uses (Number of IS-NR links \* SLKTPS) in place of the IPTPS setting for all calculations and alarms.

If the linksets are a mixture of IPLIMx M2PA and IP SG-M2PA, then the **rept-stat-iptps** command does not report any data or raise alarms.

## Output

The **rept-stat-iptps** command reports on IPSG and IPGWx linkset IP TPS. The report includes the following information for the system and for each IPSG or IPGWx linkset:

- Configured IP TPS alarm threshold
- Configured IP TPS
- Current IP TPS transmit and receive usage for 15 seconds
- Peak IP TPS transmit and receive usage and timestamp for all 15 second periods since last reset

If the linkset is specified, then the command reports the same information for the individual links in the linkset.

If the **peakreset=yes** parameter is specified, then the command resets all the stored peak values to the current actual usage for each link, and recalculates linkset and system peaks before reporting usage.

If the linkset is specified with the **peakreset=yes** parameter, then the command recalculates peaks for the specified linkset and resets all the stored peak values to the current actual usage for each link contained in the linkset before reporting usage.

**NOTE: The peaks for transmit and receive, and for link, and linkset IP TPS may all occur at different times.**

**NOTE: The IP TPS value shown in the command may contain one extra MSU if the linkset is specified. Because the alarm calculations are implemented using integer math, rounding may occur at each entity (link, linkset) if the IP TPS value for the entity is not evenly divisible by 15. This could occur when performing an IPTPS report for a linkset that has more than one link configured.**

**NOTE: For mixed IPLIMx-M2PA and IPSG-M2PA linksets, the command does not report any data or raise alarms.**

### Legend

**LSN**—THE LINKSET NAME.

**THRESH**—THE THRESHOLD AT WHICH AN ALARM WILL BE GENERATED TO INDICATE THAT THE ACTUAL LINKSET **TPS** IS APPROACHING THE CONFIGURED LINKSET **IPTPS** VALUE (LSUSEALM VALUE AS SHOWN IN RTRV-LS OUTPUT).

**CONFIG**—THE **IPTPS** VALUE AS SHOWN IN RTRV-LS OUTPUT.

**TPS**—THE CURRENT TRANSMIT (TX) AND RECEIVE (RCV) **TPS** FOR 15 SECONDS.

**PEAK**—THE PEAK TRANSMIT (TX) AND RECEIVE (RCV) **TPS** USAGE FOR ALL 15 SECOND PERIODS SINCE THE LAST PEAK RESET.

**PEAKTIMESTAMP**—THE DATE AND TIME THAT THE DISPLAYED TRANSMIT AND RECEIVE **TPS** PEAKS OCCURRED.

**LOC**—LOCATION OF THE CARD THAT CONTAINS A DISPLAYED LINK IN THE LINKSET.

**PORT**—A SIGNALING LINK IN THE LINKSET.

**THRESH**—THE SLKUSETHRESH VALUE AS SHOWN IN RTRV-LS OUTPUT

**CONFIG**—DASHES (----). THERE IS NO CONFIGURABLE **TPS** FOR LINKS.

**TPS**—THE CURRENT TRANSMIT (TX) AND RECEIVE (RCV) **TPS** FOR 15 SECONDS.

**PEAK**—THE PEAK TRANSMIT (TX) AND RECEIVE (RCV) **TPS** USAGE FOR ALL 15 SECOND PERIODS SINCE THE LAST PEAK RESET.

**PEAKTIMESTAMP**—THE DATE AND TIME THAT THE DISPLAYED TRANSMIT AND RECEIVE **TPS** PEAKS OCCURRED.

**rept-stat-lfs****Report LFS Test Status**

Use this command to generate a report of all the SS7 links that are under LFS test. Along with the link identification information, the command output lists the current LBP, the test pattern, the maximum bit-errors threshold, the bit-errors since the beginning of this test, the maximum test time, and the time elapsed since the beginning of the test.

**Keyword:** **rept-stat-lfs**

**Related Commands:** **rept-stat-slk**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

The signaling link port on the card specified in the **loc** parameter.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**:loc=** (optional)

This parameter is mandatory when the **port** parameter is specified.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1212, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Example**

**rept-stat-lfs**

**rept-stat-lfs:loc=1201**

**rept-stat-lfs:loc=1201:link=a1**

**Dependencies**

The LFS feature must be turned on before this command can be entered.

The card location specified in the **loc** parameter must be equipped.

The signaling link that is specified in the **link** parameter must be assigned to the card in the **loc** parameter location.

Card locations 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (x is the frame and y is the shelf) cannot be specified in the loc parameter.

The card location (**loc** parameter) must be a **limds0**, **limt1**, or **limch** (associated with a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

If the **link** parameter is specified, the **loc** parameter must be specified.

This command cannot be entered during upgrade.

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

If no parameters are specified, all links that are in LFS test are displayed.

**rept-stat-lfs**

```

**Legend**

**SLK**—The signaling link identifier; same as **loc** and **link** parameters of **act-lbp** command.

**LBP**—The loopback point of this test; same as **lbp** parameter of **act-lbp** command.

**PATTERN**—The test pattern; same as **pattern** parameter of **act-lbp** command.

**MAX-**

**ERRORS**—The bit-error threshold allowed for this LFS test; same as **maxerr** parameter of **act-lbp** command.

**BIT\_ERRORS**—Number of bit-errors since the beginning of this test.

**MAX-TIME**—The time window for testing each loop-back point; same as **time** parameter of **act-lbp** command.

**TEST-TIME**—Amount of time the test has run.

**rept-stat-lnp****LNP Status Report**

Use this command to generate a report of the local number portability (LNP) status information.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP status of all equipped SCCP cards is provided. This summary includes Global Title Translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information.

When the **loc** parameter is specified, a detailed status of LNP information for the specified SCCP card is provided. These detailed reports include information for each of the following functions: Global Title Translation (GTT), LNP Message Relay (LNPMR), LNP Query Service (LNPQS), Personal Communication Service LNP Query Service (PLNPQS) (if the PLNP feature is turned on), Wireless LNP Query Service (WNPQS) (if the WNP feature is turned on), Triggerless LNP (TLNP) (if the TLNP feature is turned on), and Automatic Call Gap (ACG).

When the **card=sccp all** parameter is specified, a detailed status of LNP information for all SCCP cards is provided.

**Keyword:** **rept-stat-lnp**

**Related Commands:** **chg-th-alm, rept-stat-sccp, rtrv-th-alm**

**Command Class:** System Maintenance

### Parameters

**:card=** (optional)

Specify **card=sccp-all** to display a report of the LNP status of all equipped SCCP cards. The **card** parameter is not valid with the **loc** parameter.

**Range:** **sccp-all**

**:loc=** (optional)

The card location as stenciled on the shelf of the EAGLE 5 ISS. The **loc** parameter is not valid with the **card** parameter.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** A summary for all cards is displayed.

### Example

```
rept-stat-lnp
```

```
rept-stat-lnp:card=sccp-all
```

```
rept-stat-lnp:loc=1106
```

### Dependencies

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

Only one optional parameter can be specified in the command. The **card** and **loc** parameters cannot be specified together in the same command.

The only valid value for the **card** parameter is **sccp-all**.

No other **rept-stat-xxx** command can be in progress when this command is issued.

At least one SCCP card must be configured in the system.

The card location (**loc** parameter) must identify a configured TSM card running the **sccp** application.

### Notes

The error information on this report is based on 30-second intervals. The values for number of errors and total messages are for the last 30-second period. The usage information is also updated once every 30 seconds.

When the **rept-stat-lnp** command is entered with no parameters, a summary of the LNP subsystem status is reported, followed by a summary of the LNP status of all equipped SCCP cards. This

summary includes global title translation (GTT) and LNP function status for every SCCP card, as well as LNPQS system information. The GTT status is either ACT (active) or SWDL (software loading). The LNP status is either ACT, OFFLINE, or SWDL. LNPQS system information is then provided in the following fields:

- The SSN STATUS and MATE SSN STATUS fields show the state of the LNP subsystems: Prohibited, Restricted, or Allowed.
- The ACG OVERLOAD LEVEL field shows the ACG node overload control level used by the system.
- The system average MIC usage is expressed as a percentage of the number of MICs sent by all cards, divided by the number of responses sent by all cards.

The **rept-stat-lnp** command also provides a summary of the following system-wide LNP statistics.

- The average GTT usage is expressed as the average percentage of GTT usage per card.
- The average LNPMR usage is expressed as the average percentage of LNPMR usage per card.
- The average LNPQS usage is expressed as the average percentage of LNPQS usage per card.
- The average WNPQS usage is expressed as the average percentage of WNPQS usage per card. WNPQS information is displayed only if the WNP feature is turned on.
- The average PLNPQS usage is expressed as the average percentage of PLNPQS usage per card. PLNPQS information is displayed only if the PCS 1900 Number Portability feature (PLNP) is turned on.
- The average CPU usage is expressed as the average percentage of CPU usage per card.
- The total number of GTT, LNPMR, LNPQS, WNPQS (if turned on), TLNP (if turned on), and PLNPQS (if turned on) errors for corresponding messages received across all cards.

When the **rept-stat-lnp** command is entered for a specific card (for example, **rept-stat-lnp:loc=xxxx**), status information for the card at the specified location is provided, followed by the alarm status and detailed LNP status information and statistics for each LNP function.

- GTT STATUS, either ACT (active) or SWDL (software loading).
- GTT USAGE, expressed as a percentage of the amount of CPU used to process GTT messages during the last 30 seconds by the specified card.
- GTT ERRORS, the number of GTT errors detected for the total number of GTT messages received by the specified card.
- LNPMR STATUS, either ACT (active), OFFLINE, or SWDL (software loading).
- LNPMR USAGE, expressed as a percentage of the amount of CPU used to process LNP message relay messages during the last 30 seconds by the specified card.
- LNPMR ERRORS, the number of LNP message relay errors detected for the total number of LNP message relay messages received by the specified card.
- LNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- LNPQS USAGE, expressed as a percentage of the amount of CPU used to process LNP query messages during the last 30 seconds by the specified card.
- LNPQS ERRORS, the number of LNP query errors detected for the total number of LNP query messages received by the specified card.
- WNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).

- WNPQS USAGE, expressed as a percentage of the amount of CPU used to process WNP query messages during the last 30 seconds by the specified card.
- WNPQS ERRORS, the number of WNP query errors detected for the total number of WNP query messages received by the specified card.

**NOTE:** IS-41 LNP Queries with a TT associated with the LNPQS service are pegged as IS-41 LNP Queries with a TT associated with the WNP service under the WNPQS counter. The WNPQS STATUS, WNPQS USAGE, and WNPQS ERRORS fields are displayed only if the Wireless Number Portability feature is ON.

- PLNPQS STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- PLNPQS USAGE, expressed as the amount of CPU used to process PCS 1900 LNP Query messages over the last 30-second period by the specific card.
- PLNPQS ERRORS, the number of PCS query errors detected for the total number of PCS query messages received by the specified card.

**NOTE:** PCS 1900 LNP Queries with a TT associated with the LNPQS service are processed and pegged as IN LNP Queries under the LNPQS counter. The PLNPQS STATUS, PLNPQS USAGE, and PLNPQS ERRORS fields are displayed only if the PCS 1900 Number Portability (PLNP) feature is ON.

- TLNP STATUS, either ACT (active), OFFLINE, and SWDL (software loading).
- TLNP USAGE, expressed as a percentage of the amount of CPU used to process Triggerless LNP Encapsulated IAM messages over the last 30-second period by the specific card.
- TLNP ERRORS, the number of TLNP query errors detected for the total number of TLNP query messages received by the specified card.

**NOTE:** The TLNP STATUS, TLNP USAGE, and TLNP ERRORS fields are displayed only if the Triggerless LNP (TLNP) feature is ON.

- ACG OVERLOAD LEVEL, the ACG node overload control level being used by the system.
- MIC USAGE, expressed as a percentage of the number of MICs sent by the specific card divided by the number of responses sent by the specified card during the last 30 seconds.
- CPU USAGE, expressed as a percentage of the amount of CPU used to process messages by the specified card during the last 30 seconds.

When the **:card=sccp-all** parameter is specified, detailed information is provided about the status of all SCCP cards. The information displayed in the output is the same as that displayed for the **:loc=xxxx** parameter.

## Output

In the following example, the WNP, PLNP, and TLNP features are off.

### Legend

**CARD**—The locations of the SCCP cards.

**VERSION**—The version number of the GPL the cards are running.

**TYPE**—The type of SCCP card.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.

**AST**—The associated state of the card. The possible values are described in in Appendix A.

## rept-stat-ls

### Report Status Linkset

Use this command to generate a report of the status of the MTP linksets. When a specific linkset is requested, the output displays a list of the links in the linkset and their secondary status. Output is generated for each of the 16 signaling link codes (SLC).

**NOTE:** If the Multiple Linksets to Single Adjacent Point Code (MLS) feature is turned on, and an adjacent destination point code is requested, then the output displays a summary status, including the secondary point codes, of the linksets that use that adjacent point code.

**Keyword:** rept-stat-ls

**Related Commands:** chg-ls, dlt-ls, ent-ls, rtrv-ls

**Command Class:** System Maintenance

### Parameters

**:apc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:apc/apca/apci/apcn/apcn24=** (optional)

Adjacent point code.

**:apci=** (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:apcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:apcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The prefix indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (optional)

Linkset name. The name of the linkset for which the report information is to be displayed.

**Range:** **aaaaaaaa**

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** All linksets are displayed

**:stat=** (optional)

The primary state filter. This parameter indicates the state of the linksets for which a report will be displayed. For example, to display a report for all linksets whose state is DSBLD, specify the

**stat=dsbld** parameter.

**Range:**     **all, alminh, anr, dsbld, mt, nr**  
               **all** — All of the primary states  
               **alminh** — Alarms inhibited  
               **anr** — In-Service-Abnormal (IS-ANR)  
               **dsbld** — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)  
               **mt** — Out-of-Service-Maintenance (OOS-MT)  
               **nr** — In-Service-Normal (IS-NR)  
**Default:**   **all**

### Example

```
rept-stat-ls
rept-stat-ls:lsn=lsnstpa
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The linkset specified by the **lsn** parameter must be equipped in the database.

If the stat parameter is specified, then the lsn parameter cannot be specified and vice versa.

The Multiple Linksets to a Single Adjacent Point Code (MLS) feature must be turned on before the **apc** parameter can be specified.

The **lsn**, **stat**, and **apc** parameters cannot be specified together in the command.

At least one linkset must be associated with the value of the **apc** parameter.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If no link is equipped for the SLC, the output is “\_\_\_\_, \_\_ UEQ.”

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

"ASP-STATE" is shown for only IPSTG-M3UA linksets.

## Output

If the Proxy Point Code feature is enabled, then proxy point code information is displayed.

```

Command Completed.

;

### Legend

**LSN**—The name of the linkset

**APCA/APCI/APCN/APCN24**—The adjacent point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**SPCA/SPCI/SPCN/SPCN24**—The secondary point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**PST**—The primary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the linkset. The possible values are described in "Possible Values for PST/SST/AST".

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the specified card.

**SCRN**—The name of the gateway screening screen set associated with the linkset.

**GWSA**—Shows whether gateway screening is used for the specified linkset.

**GWSM**—Shows whether gateway screening messaging is turned on for the specified linkset.

**GWSD**—Shows whether the discarding of MSUs that bypass the gateway screening function due to load-shedding is turned on.

**SLC**—The signaling link codes associated with the links that are contained in the specified linkset.

**SLK**—The signaling links that are contained in the linkset, shown by the card location containing the signaling link and the port on the card containing the signaling link.

**PPCA/PPCI/PPCN/PPCN24**—The proxy point code of the linkset (ANSI, ITU-I, ITU-N, ITU-N 24-bit)

**ASP STATE**—The state of AS associated with each signaling link of the IPSP-M3UA linkset. The states displayed are: ACTIVE, INACTIVE, or DOWN.

**rept-stat-meas****Report Measurement Status**

Use this command to report the status of the Measurements Subsystem (Measurements Platform), including card location and state, alarm level, and subsystem state.

**Keyword:** **rept-stat-meas**

**Related Commands:** **rept-stat-card**

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

**rept-stat-meas**

**Dependencies**

The Measurements Platform feature must be turned on prior to issuing this command.

At least one MCPM card must be configured in the system.

No other **rept-stat-xxx** commands can be in progress when this command is issued.

**Notes**

The MCPM card status is independent of the IP Network Link status (Port A). The card can be IS-NR even if the network link has failed.

The version of the GPL is shown in the command output if the MCPM card is in the IS-NR or IS-ANR state. (The **rept-stat-card** command will not show the GPL version if the card is ISANR.)

**Output**

Output example with one MCP card isolated:

**rept-stat-meas**

```

MEAS SS          PST          SST          AST
IS-ANR          Active        -----
ALARM STATUS =   * 0516 Degraded Mode - 1 card failed

CARD  VERSION    TYPE    PST          SST          AST
1107 P 101-009-000 MCPM    IS-NR          Active        -----
    IP Link A      IS-NR          Active        -----
1109 -----    MCPM    OOS-MT          Isolated      -----
    IP Link A      OOS-MT          Unavail       -----

CARD 1107 ALARM STATUS = No Alarms
CARD 1109 ALARM STATUS = Card is isolated from the system
Command Completed.
;

```

Output example with both MCP cards IS-NR:

**rept-stat-meas**

```

MEAS SS          PST          SST          AST
IS-NR          Active        -----
ALARM STATUS =   No Alarms

CARD  VERSION    TYPE    PST          SST          AST
1107 P 046-010-004 MCPM    IS-NR          Active        -----
    IP Link A      IS-NR          Active        -----
1109 046-010-004  MCPM    IS-NR          Active        -----
    IP Link A      OOS-MT          Unavail       -----

CARD 1105 ALARM STATUS = No Alarms
CARD 1106 ALARM STATUS = No Alarms

Command Completed.
;

```

**Legend**

**VERSION**—The version number of the GPL that the specified MCPM card is running. The version is shown if the card is in the IS-NR or IS-ANR state.

**TYPE**—MCPM; the card that is running the Measurements Subsystem application.

**PST**—The primary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the Measurements Subsystem or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the Measurements Subsystem or card. The possible values are described in .

**MEAS SS**—The Measurements Subsystem application running on the MCPM card.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MCPM and the applications running on the MCPM.

**CARD**—The location of the MCPM card. The MCPM card with the letter “P” to the right of its card location is the primary MCPM. The primary MCPM transfers scheduled measurements report files to the primary FTP server. When the primary state (PST) of the MCPM is IS-NR, the secondary state (SST) indicates whether the MCPM is active or standby.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

## rept-stat-mps

### Report the MPS Status

Use this command to display the overall status of the application running on the MPS (multi-purpose server).

- If the LNP ELAP Configuration feature is turned on, ELAP (EAGLE LNP Application Processor) subsystem status is displayed.
- If the INP/AINPQ feature is turned on, EPAP (EAGLE Provisioning Application Processor) subsystem status is displayed.
- If the G-Port (GSM mobile number portability) feature, G-Flex (GSM flexible numbering) feature or PPSMS (Prepaid SMS Intercept Ph1) feature is turned on, GSM (Global System for Mobile Telecommunications) and EPAP status is displayed.
- If the EIR (Equipment Identity Register) feature is enabled and turned on, the status of the EIR component on the card is displayed.
- If the V-Flex (Voice Mail Router) feature is enabled and turned on, the status of the V-Flex component on the card is displayed.
- If the ATINP (ATI Number Portability Query) feature is enabled, the status of the ATINPQ component on the card is displayed.

**Keyword:** `rept-stat-mps`

**Related Commands:** `rept-stat-card`, `rept-stat-sccp`

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

The card location of the VSCCP card to be reported on, as stenciled on the shelf of the EAGLE 5 ISS.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

### Example

`rept-stat-mps:loc=1106`

### Dependencies

The card location specified in the **loc** parameter must contain a Service Module card.

One of the following features must be turned on, or the ATINP feature must be enabled before this command can be entered:

- A-Port
- AINPQ
- G-Flex
- G-Port

- INP
- EIR
- LNP ELAP Configuration
- Prepaid SMS Intercept Ph1
- V-Flex

At least one Service Module card must be configured in the system before this command can be entered.

To specify the **rept-stat-mps** command, no other **rept-stat-xxxx** command can be in progress.

**Notes**

When the MPS does not have an alarm on it, the **rept-stat-mps** report indicates in the SST field of the report which MPS is the active and which is the standby. When the MPS has an alarm on it, the SST field shows "Fault," and the Active/Standby information is displayed in the AST field as long as there is an alarm. After the alarm clears, the Active/Standby information appears in the SST field as before.

## Output

The following example shows the possible system response if the G-Flex, G-Port, or PPSMS feature and the INP or AINPQ feature are turned on:

**rept-stat-mps**

```
rlghncxa03w 04-01-07 10:23:93 EST EAGLE 31.3.0

**Legend**

**CARD**—The location of the Service Module card. The Service Module card with the designator “P” to the right of its card location is the primary Service Module card as selected by the active ELAP/EPAP. The primary Service Module card provides the ELAP/EPAP status to the OAM. When the primary state (PST) of the ELAP/EPAP is IS-NR, the secondary state (SST) indicates whether the ELAP/EPAP is active or standby.

**VERSION**—The version number of the GPL that the specified ELAP/EPAP or card is running.

**PST**—The primary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the ELAP/EPAP or card. The possible values are described in "Possible Values for PST/SST/AST".

**EPAP/ELAP A/B**—The application running on the MPS (multi-purpose server) platform. If the LNP ELAP Configuration feature is turned on, the output shows ELAP A/B. If INP, G-Flex, G-Port, or V-Flex is turned on, the output shows EPAP A/B.

**ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the MPS and the applications running on the MPS. Each alarm is listed as a 16-character hexadecimal string where each bit represents a unique platform or application alarm. To decode the string, use the procedure in the EPAP Administration Manual or the *ELAP Administration Manual*. There are 6 categories of MPS alarms:

- Critical platform alarm data
- Major platform alarm data
- Minor platform alarm data
- Critical application alarm data
- Major application alarm data
- Minor application alarm data

**GSM STAT**—The possible states are either ACT (active) or SWDL (indicates that the GSM component on that card is currently inactive until the software download completes). The GSM STAT information is not displayed if the G-Port, G-Flex and Prepaid SMS Intercept Ph1 features are turned off.

**INP STAT**—The possible states of INP status include ACT (active), OFFL (offline) and SWDL (indicates that the INP component on that card is currently inactive until the software download completes). The INP STAT information is not displayed if the INP feature is turned off.

**LNP STAT**—The possible states of LNP status include ACT (active), OFFL (offline) and SWDL (indicates that the LNP component on that card is currently inactive until the software download completes). The LNP STAT information is not displayed if the LNP ELAP Configuration feature is turned off.

**EIR STAT**—The possible states of EIR Status include ACT (active), OFFL (offline), and SWDL (Indicates the EIR component on that card is currently inactive until software download completes). The EIR STAT information is not displayed if the EIR feature is not enabled.

**VFLEX STAT**—The possible states of V-Flex Status include ACT (active), OFFL (offline), and SWDL (Indicates the V-Flex component on that card is currently inactive until software download completes). The V-Flex Status information is not displayed if the V-Flex feature is not on.

**ATINPQ STAT**—The possible states of ATINPQ Status include ACT (active), OFFL (offline), and SWDL (Indicates the ATINPQ component on that card is currently inactive until software download completes). The ATINPQ STAT information is not displayed if the ATINP feature is not enabled.

**DSM MEMORY USAGE**—The percentage of DSM memory used to store the ELAP/EPAP database.

For EPAP, the percentage of the card memory is displayed. For example, 50% of the memory on a 2G DSM card means that 1G is used.

For ELAP/LNP, the percentage that is displayed depends on the enabled or default feature access key (FAK) quantity for LNP ported TNs, LNP ported LRNs, and LNP ported NPANXXs in the system (see the **rtrv-ctrl-feat** command output). The percentage is the greatest of: 1) TNs provisioned divided by LNP ported TNs FAK quantity, 2) LRNs provisioned divided by LNP ported LRNs FAK quantity, or 3) NPANXXs provisioned divided by LNP ported NPANXXs FAK quantity.

**CARD XXXX ALARM STATUS**—A listing of any trouble text alarm messages that have been generated for the card.

**DSM PORT A/B**—A listing of any trouble text alarm messages that have been generated for the port on the card.

**IP CONNECTION UNAVAILABLE**—Indicates the failed channels on those ports with IP Connection Unavailable alarms. The possible channels reported are:

- Prov—RTDB Provisioning Channel
- Dnld—RTDB Download Channel
- TCP—Transmission Control Protocol Channel
- UDP—User Datagram Protocol Channel

## rept-stat-mux

## Report the MPS Status

Use this command to list all the HMUX and HIPR cards, their location, and their status.

**Keyword:** **rept-stat-mux**

**Related Commands:** **rept-stat-card**

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-mux**

### Dependencies

None

### Notes

None

**Output****rept-stat-mux**

rlghncxa03w 04-09-07 10:23:93 EST EAGLE 32.0.0

| CARD | TYPE | PST   | SST    | AST    |
|------|------|-------|--------|--------|

| 1110 | HMUX | IS-NR | Active | -----  |
| 1209 | HIPR | IS-NR | Active | ALMINH |
| 1210 | HIPR | IS-NR | Active | -----  |

Command Completed.

;

**Legend****CARD**—The HMUX or HIPR card location.**TYPE**—The type of card (HMUX or HIPR).**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST" in Appendix A.**AST**—The associated state of the card. The possible values are described in in Appendix A.**rept-stat-rtd****Report Status RTD**

Use this command to report Run Time Diagnostics (RTD) for EAGLE 5 ISS cards, including the status of internal integrity checks and the RTD subsystem alarm. This display can help determine the cause when an RTD subsystem alarm occurs, or when associated issues are reported.

This command is also used to reset MSU validation statistics and clear the RTD subsystem alarm.

**Keyword:** rept-stat-rtd**Related Commands:****Command Class:** System Maintenance**Parameters****:force=** (optional)

The **force** parameter is used with the **reset=yes** parameter to clear statistics for a card when the RTD subsystem alarm is present.

**Range:** yes**:loc=** (optional)

Location. This parameter specifies the card location as stenciled on the shelf of the system.

The **loc** parameter can be used to either retrieve or reset statistics for a card location. To reset the statistics, the **loc** parameter and the **reset** parameter must be specified together in the command.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**:reset=** (optional)

This parameter clears the statistics by setting them to zero and resets the checksum card indicator error and RTD subsystem alarm.

**Range:** yes

**yes** — Clears the statistics.

If the **reset=yes** parameter is specified with the **loc** parameter, then statistics are cleared for the specified card. If the **reset=yes** parameter is specified, and the **loc** parameter is not specified, then statistics are cleared for all cards in the system.

### Example

```
rept-stat-rtd
rept-stat-rtd:loc=1107
rept-stat-rtd:reset=yes:force=yes
rept-stat-rtd:loc=1107:reset=yes
```

### Dependencies

If the **reset=yes** parameter is specified, then the **force=yes** parameter must be specified to clear the statistics and checksum failure indicators.

The card specified by the **loc** parameter must be an IPLIMx, IPGWx, SCCP, Service Module, E1/T1 MIM, HC-MIM, E5-E1T1, LIMATM, or E1 ATM card.

The card in the specified card location (**loc** parameter) must be in service.

The **reset=yes** parameter must be specified to clear the statistics.

The **force=yes** parameter must be specified.

The **loc** parameter cannot have a non-numeric value.

The card specified by the **loc** parameter must be an IPLIMx, IPGWx, SCCP, Service Module, E1/T1 MIM, HC-MIM, E5-E1T1, LIMATM, or E1-ATM card.

The card slot must be equipped and in service.

### Notes

The statistics from internal integrity checks are displayed for all in-service LIM and SCCP cards. The reported statistics are dynamic and are not maintained when a card is re-initialized.

The displayed reports contain message validation totals since the last time the diagnostic information for the cards was reset.

The individual statistics that are reported re-start at zero after the maximum values are reached and are cleared when reset by the **rept-stat-rtd** command.

The report displayed shows the summary statistics or overall totals for MSU validation statistics for all LIM and SCCP cards in the system. It also includes the status for the RTD subsystem and the RTD subsystem alarm.

When the **loc** parameter is specified in the **rept-stat-rtd** command, the report displayed shows the detailed MSU validation statistics report for the specified card. The report shows statistics from integrity checks performed by the specified card on MSUs transferred to and from LIM/SCCP cards and includes the timestamp when the card last detected an error during integrity checks. The statistics are only displayed for cards with non-zero totals.

The integrity checks are performed on a subset of the MSUs transferred between cards. When card (s) report errors during the integrity checks, the RTD subsystem alarm is activated. The error statistics reported should be used along with the UIMs or alarms to help identify the source of the problem.

The RTD subsystem alarm is triggered when a card reports that a checksum error was detected during internal card integrity checks.

The RTD subsystem alarm remains active in the system until the statistics are reset using the **rept-stat-rtd** command, and no further indications of checksum errors are reported during internal card integrity checks.

## Output

If the **rept-stat-rtd** command is entered with no parameters, then a summary status for the RTD subsystem and alarm and summary statistics for all of the LIM/SCCP cards in the system are displayed.

If the **loc** parameter is specified in the **rept-stat-rtd** command, then detailed statistics are displayed for the specified card location. Only cards with non-zero totals are reported in the location specific report.

The following example displays a summary report on the status of the RTD subsystem and RTD subsystem alarm with MSU validation statistics for all LIM/SCCP cards in the system.

;

The following example displays the option for resetting MSU validation statistics for card 1107.

**rept-stat-rtd:loc=1107:reset=yes**

```
eagle10110 07-02-22 20:32:58 EST EAGLE 35.6.0
Clear RTD Statistics command(s) issued...
Command Completed.
```

;

The following example displays the option for resetting MSU validation statistics and checksum failure indicators for all cards in the system and clearing the RTD subsystem alarm.

**rept-stat-card:reset=yes:force=yes**

```
eagle10110 07-02-22 20:34:06 EST EAGLE 35.6
Clear RTD Statistics command(s) issued...
Command Completed.

eagle10110 07-02-22 20:32:58 EST EAGLE 35.6.0
5501.0542 RTD SYSTEM MSU cksum error threshold cleared
```

;

The following example displays the option for resetting the MSU validation statistics and the checksum failure indicators for card 1311.

**rept-stat-rtd:reset=yes:loc=1311:force=yes**

```
eagle10110 07-02-22 20:32:58 EST EAGLE 35.6.0
Clear RTD Statistics command(s) issued...
Command Completed.
```

;

**Legend**

This section defines the fields of the **rept-stat-rtd** reports.

**PST**—The possible values are described in "Possible Values for PST/SST/AST". For this command, IS-NR specifically means no checksum errors were found during the last reporting period; IS-ANR specifically means that a card or cards reported checksum errors during MSU integrity checks when the RTD status was previously IS-NR, and the RTD System Alarm(s) was raised.

**TOTAL Rx ERROR** (for a Summary Report)—Total MSUs received with checksum errors, including MSUs with checksum errors received from all cards in the system.

**TOTAL Rx ERROR** (for a Location-Specified Report)—Total MSUs with checksum errors received at the card specified by the **loc** parameter from SRC/DEST CARD.

**TOTAL Rx VALIDATED** (for a Summary Report)—Total MSUs with checksum received and validated from all cards in the system.

**TOTAL Rx VALIDATED** (for a Location-Specified Report)—Total MSUs with checksum received and validated at the card specified by the **loc** parameter from SRC/DEST CARD.

**TOTAL Tx** (for a Summary Report)—Total MSUs with checksum applied and transmitted to all cards in the system.

**TOTAL Tx** (for a Location-Specified Report)—Total MSUs with checksums transmitted from the card specified in the **loc** parameter to SRC/DEST CARD.

**LAST ALARM TIMESTAMP**—Timestamp for last reported checksum error for the card specified in the **loc** parameter.

**SRC/DEST CARD**—Source card transmitting MSUs with checksums received by the card specified in the **loc** parameter. Destination card receiving MSUs with checksums transmitted from card specified in LOC parameter.

**RTD SUBSYSTEM**—Indicates RTD Device Status (IS-NR, etc).

**RTD ALARM STATUS**—Indicates whether an alarm is present for the RTD Device. The possible values are described in .

## rept-stat-rte

## Report Status Route

Use this command to display the signaling route status for a particular destination.

**Keyword:** **rept-stat-rte**

**Related Commands:** **chg-dstn, chg-rte, dlt-dstn,, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn,, rtrv-dstn, rtrv-rte**

**Command Class:** System Maintenance

### Parameters

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-**\*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc=** (optional)

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

When **chg-sid:pctype=ansi** is specified, **ni-\*-\*** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpci=** (optional)

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmi** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn=** (optional)

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s**-, **p**-, **ps**-

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p**-, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p**-

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:dpcn24=** (optional)

**Range:** **p**-, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p**-

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:mode=** (optional)

The type of display to produce. This parameter displays the point code's subsystem status along with the normal output.

**Range:** **full**, **rtx**

**full**— Comprehensive display of point code status, including **rtx**. If entered with a point code, status for that point code is displayed, including each route in the associated routeset. If specified without a point code, status of all routesets is displayed.

**rtx**— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:** The point code's subsystem status is not displayed.

**:mode=** (optional)

This parameter specifies the type of display to produce.

**Range:** **full**, **rtx**

**full**— Comprehensive display of point code status, including **rtx**. If specified with a point code, then the status for that point code is displayed. Routes from the associated routeset and destination table (historic routes) are displayed. If specified without a point code, then the status of all routesets is displayed.

**rtx**— Displays exception route status, other than circular routing, if the Origin-based MTP Routing feature is on.

**Default:** A summary report is displayed.

**:rsn=** (optional)

Routeset name. This parameter specifies the name of the routeset.

- Range:** *ayyyyyyyyy*  
1 alphabetic character followed by up to 9 alphanumeric characters
- :stat=** (optional)  
The primary state filter. This parameter displays all entries with the specified primary state filter.
- Range:** **nr, anr, mt, dsbld, all**  
**nr** — In service normal  
**anr** — In service abnormal  
**mt** — Out of service maintenance  
**dsbld** — Out of service maintenance disabled  
**all** — All primary states
- Default:** All primary states are displayed.
- :stat=** (optional)  
This parameter specifies the primary state filter.
- Range:** **all, alminh, anr, dsbld, mt, nr**  
**all** — All of the primary states  
**alminh** — Alarms inhibited  
**anr** — In service abnormal (IS-ANR)  
**dsbld** — Out of service maintenance disabled (OOS-MT-DSBLD)  
**mt** — Out of service maintenance (OOS-MT)  
**nr** — In service normal (IS-NR)
- Default:** **all**

### Example

```
rept-stat-rte
rept-stat-rte:dpc=5-25-0
rept-stat-rte:dpci=5-5-0:mode=full
rept-stat-rte:dpci=5-5-0:mode=rtx
rept-stat-rte:mode=rtx
rept-stat-rte:mode=full
rept-stat-rte:dpc=5-25-**
rept-stat-rte:rsn=rsf
```

### Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

An x-list DPC cannot be specified in the **dpc** parameter.

The **mode** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameters cannot be specified together in the command if the point code parameter specifies one of the *nnn-ccc-\*\** or *nnn-ccc-\*\*\** formats.

The **stat** parameter and a **dpc/dpca/dpci/dpcn/dpcn24** parameter can be specified together in the command only if the point code parameter specifies one of the *nnn-ccc-\*\** or *nnn-ccc-\*\*\** formats.

The **mode** parameter can be specified only if a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified.

No other **rept-stat-xxxx** command can be in progress when this command is entered.

If a **dpc/dpca/dpci/dpcn/dpcn24** parameter is specified, the value must be the true point code of the destination and the value must already be defined in the database.

The **mode=rtx** parameter cannot be specified unless the Origin-Based MTP Routing feature is enabled and on.

An x-list DPC cannot be specified in the **dpc** parameter.

If the **mode=full** parameter is specified, then the **dpc/dpca/dpcn/dpci/dpcn24** parameter must be specified.

If the **dpc** parameter specifies an *ni-nc-\** format, then the **mode** parameter cannot be specified.

The **dpc** parameter must specify an *ni-nc-\** format before the **stat** parameter can be specified with the **dpc** parameter.

If the **rsn** parameter is specified, then the **dpc**, **mode**, and **pst** parameters cannot be specified. The **pst** and **mode** parameters cannot be specified together in the command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

If a **dpc** parameter is specified, then the value must be the true destination point code (not an alias) and the value must be defined in the database.

The Origin-Based MTP Routing feature must be turned on before the **mode=rtx** parameter can be specified.

The destination address must be a full point code, a network destination, or a cluster point code.

The RSET feature must be turned on (see the **chg-feat** command) before the **rsn** parameter can be specified.

The value specified for the **rsn** parameter must already exist in the RSET table.

## Notes

Each DPC can have up to six routes associated with it.

This command's functions are now performed by **rept-stat-dstn** and this command will be deleted in a future software release.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-65 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-65.** Summary of DPC Parameter Syntaxes

| DPC format                         | Meaning                                                                                                                                                                                      |
|------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc=ni-nc-ncm</b> | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                       |
| <b>rept-stat-rte:dpc= ni-*.~*</b>  | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field. |
| <b>rept-stat-rte:dpc= ni-***~*</b> | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                 |
| <b>rept-stat-rte:dpc= ni-***~*</b> | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                        |
| <b>rept-stat-rte:dpc= ni-nc-*</b>  | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                       |

**Table 5-65.** Summary of DPC Parameter Syntaxes

| DPC format                             | Meaning                                                                                                                                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc= ni-nc-**</b>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |
| <b>rept-stat-rte:dpc= ni-nc-***</b>    | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.                       |
| <b>rept-stat-rte:dpcn24=msa-ssa-sp</b> | Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                           |

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

This command does not report the x-list point codes. Use the **rept-stat-cluster** command for a report of x-list point codes.

If the **mode=rtx** parameter is specified with a specific DPC, additional linkset, route and exception route information associated with the specified DPC is displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

Table 5-66 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-66.** Summary of DPC Parameter Syntaxes

| DPC format                         | Meaning                                                                                                                                                                                                    |
|------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc=ni-nc-ncm</b> | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                                     |
| <b>rept-stat-rte:dpc= ni-*. *</b>  | Requests a report for provisioned network destination with the specified network indicator. Note that if <i>*</i> is specified in the <i>nc</i> field, <i>*</i> must be specified in the <i>ncm</i> field. |
| <b>rept-stat-rte:dpc= ni-**-*</b>  | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                               |
| <b>rept-stat-rte:dpc= ni-***-*</b> | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                      |
| <b>rept-stat-rte:dpc= ni-nc-*</b>  | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                                     |

Table 5-66. Summary of DPC Parameter Syntaxes

| DPC format                                     | Meaning                                                                                                                                                                                                                              |
|------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rte:dpc=</b> <i>ni-nc-**</i>      | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |
| <b>rept-stat-rte:dpc=</b> <i>ni-nc-***</i>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.                       |
| <b>rept-stat-rte:dpcn24=</b> <i>msa-ssa-sp</i> | Requests a report for fully provisioned 24-bit destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                           |

If the **mode=rtx** parameter is specified without a specific DPC, then status is provided for all exception route sets.

If the **mode=full** parameter is specified with a specific destination point code, then additional linkset, route, and exception route information associated with the specified destination is displayed, along with information that can be used to correct circular routing. If the destination is attached with a routeset and has historic routes, then information on all of the routes is displayed. If the **mode=full** parameter is specified without a specific destination point code, then status is provided for all regular and exception route sets.

## Output

If the **dpc** parameter is not specified:

- If the **mode** parameter is not specified, then the command output lists the status of all provisioned destination point codes (DPCs) (routesets) in the system.
- If the **mode=rtx** parameter is specified, then the output lists the status of only those DPCs against which exception routes have been provisioned, and the status of the provisioned exception route sets associated with each DPCs.
- If the **mode=full** parameter is specified, then the command lists the status of all provisioned DPCs in the system, and the status of the provisioned exception route sets, if any, associated with each DPC.

If the **dpc** parameter is specified:

- If the **mode** parameter is not specified, then the output lists the status of all provisioned routes in the route set specified by that DPC.
- If the **mode=rtx** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, and the status of all provisioned exception routesets associated with that DPC.
- If the **mode=full** parameter is specified, then the output lists the status of all provisioned routes in the routeset specified by that DPC, the status of all routes from destination table (historic routes), the status of all provisioned exception route sets associated with that DPC, any aliases associated with that DPC, and circular routing alarm information if any for that DPC.

The following example shows how, when no parameters are specified, summary information for all provisioned cluster and noncluster DPCs is reported.

### rept-stat-rte

```
rlghncxa03w 04-01-07 14:59:11 EST EAGLE 31.3.0

02099           OOS-MT       Prohibit   INACCESS
Command Completed.
;
```

The following example shows that specifying a cluster destination on the **dpc** parameter shows the cluster status and routeset information. Note that information on cluster members (both provisioned and x-list) is not shown. Use **rept-stat-cluster** to obtain this information.

#### rept-stat-rte:dpc=9-3-\*

```
rlghncxa03w 04-07-07 14:59:11 EST EAGLE 31.9.0
  DPCA          PST          SST          AST
  009-003-*      IS-NR       Allowed     ACCESS

5   --  -----  ***-***-***  -----  -----  -----
6   --  -----  ***-***-***  -----  -----  -----
;
```

The following example shows how specifying either an FPC or cluster destination for which circular routing has been detected, along with the **mode=full** parameter, displays the name of the linkset on which the circular routing test message was transmitted. It also displays the linkset on which the circularly routed message was received. This information may be useful in correcting the circular routing situation.

#### rept-stat-rte:dpc=9-3-6:mode=full

```
rlghncxa03w 04-01-07 14:59:11 EST EAGLE 31.3.0
  DPCA          PST          SST          AST

RCV  LSN=lsn01a
MEMBER= 009-003-006
Command Completed.
;

```

The following example shows how **rept-stat-rte** displays the circular routing alarm for a cluster destination. Note that a circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Note, also, that circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

#### rept-stat-rte:dpc=9-3-\*

```

rlghncxa03w 04-01-07 14:59:11 EST  EAGLE 31.3.0
DPCA          PST          SST          AST
009-003-*     IS-NR        Allowed  ACCESS
ALARM STATUS   = *C  xxxx Circular routing detected
RTE COST  LSN      APCA          LS STAT  NON-ADJ  ROUTE STAT
1   10  lsnstpa    042-036-123  Allowed  Allowed  Allowed
2   20  lsnstpb    092-240-103  Allowed  Allowed  Allowed
3   30  lsnstpc    128-101-022  Allowed  Allowed  Allowed
4   --  -----  ***-***-***  -----  -----  -----
5   --  -----  ***-***-***  -----  -----  -----
6   --  -----  ***-***-***  -----  -----  -----
Command Completed.
;

```

The following example shows how **rept-stat-rte** displays a subsystem information header but no subsystem information, just as it would if an FPC is specified for which no subsystems are defined. In addition, because aliases cannot be defined for cluster destinations, this report shows only an empty header, just as it does when an FPC is specified for which no aliases are defined. Note that the circular routing information portion of the **mode=full** report displays “-----” for the linkset names when no circular routing condition exists for the DPC.

#### rept-stat-rte:dpc=9-3-\*:mode=full

```

The following example shows how the circular routing alarm for a cluster destination is displayed. A circular routing alarm for a cluster destination indicates that circular routing was detected for a member of the cluster, but no x-list entry could be created for that cluster. Circular routing detected on a cluster destination does not automatically force the output to display the status of the cluster as “OOS-MT Prohibit INACCESS” as it does for a full point code destination.

#### rept-stat-rte:dpc=9-3-\*

### Legend

**DPC/DPCA**—The ANSI destination point code of the route

**DPCN**—The ITU-TSS national destination point code of the route

**DPCN24**—The 24-bit ITU national destination point code of the route

**DPCI**—The ITU-TSS international destination point code of the route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC** —Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**RSN**—The name of the routeset

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in .

**rept-stat-rtkey****Report the Status of Routing Keys**

Use this command to generate a summary report of the status of the system routing keys.

**Keyword:** **rept-stat-rtkey**

**Related Commands:** **chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey, rtrv-appl-rtkey**

**Command Class:** System Maintenance

**Parameters**

This command has no parameters.

**Example**

**rept-stat-rtkey**

**Dependencies**

None

**Notes**

The report generated by the **rept-stat-rtkey** command contains the following information:

- The maximum of static entries (SRKQ) in the routing key table
- The current number of static routing key entries in the routing key table
- The percentage of the static routing key table entries that is provisioned

**Output****rept-stat-rtkey**

```
rlghncxa03w 04-02-17 14:59:11 EST EAGLE 31.3.0
SRKQ = 250
```

```
Static Route Key table is (50 of 250) 20% full
1105 Route Key table is (25 of 250) 10% full
1107 Route Key table is (25 of 250) 10% full
```

```
Static Route Key Socket Association table is (80 of 4000) 2% full
1105 Route Key Socket Association table is (40 of 4000) 1% full
1107 Route Key Socket Association table is (40 of 4000) 1% full
```

```
Command Completed.
```

```
;
```

**rept-stat-rtx****Report Status Exception Route**

Use this command to display the signaling route status for one or more exception routes to a particular destination.

**Keyword:** **rept-stat-rtx**

**Related Commands:** **dlt-rtx, ent-rtx, rtrv-rtx**

**Command Class:** System Maintenance

## Parameters

**NOTE: See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.**

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:**       **0-16383**

**:dpc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:**       **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-*\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**       **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:** ayyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

Origination point code. ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** opca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Origination point code.

**:opci=** (optional)

Origination Point Code. ITU international origination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opc=** (optional)

Origination Point Code. ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opc24=** (optional)

Origination Point Code. 24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** **0-15**

### Example

**rept-stat-rtx**

**rept-stat-rtx:dpc=1-101-1**

**rept-stat-rtx:dpc=1-101-1:opc=1-2-1**

### Dependencies

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

## Notes

Each exception route set can have up to 6 associated routes.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The following table provides a summary description of the reports that are produced by specifying various **rept-stat-rtx** parameters.

| Format                                   | Meaning                                                                                                                                                                                               |
|------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rept-stat-rtx:dpc=ni-nc-ncm :si=n</b> | Requests a status report of the exception route set for fully provisioned destination <i>ni-nc-ncm</i> , which uses the specified value <i>n</i> of the exception route class <b>si</b> as criterion. |
| <b>rept-stat-rtx:dpc= ni-nc-ncm</b>      | Requests a status report of all exception route sets for fully provisioned destination <i>ni-nc-ncm</i> , regardless of the exception route class(es) used as criterion.                              |
| <b>rept-stat-rtx:dpc= ni-nc-*</b>        | Requests a status report of all exception route sets for provisioned cluster destination <i>ni-nc-*</i> , regardless of the exception route class(es) used as criterion.                              |
| <b>rept-stat-rtx</b>                     | Requests a status report of all exception route sets for provisioned destinations, regardless of the exception route class(es) used as criterion                                                      |

This command can be cancelled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following command provides the status of all exception route sets provisioned in the system, sorted by DPC.

**rept-stat-rtx**

```
stdcfg2b 06-03-24 01:54:32 EST EAGLE 35.0.0
```

### Legend

**DPC/DPCA**—The ANSI destination point code of the exception route

**DPCN**—The ITU-TSS national destination point code of the exception route

**DPCN24**—The 24-bit ITU national destination point code of the exception route

**DPCI**—The ITU-TSS international destination point code of the exception route

**OPC/OPCA**—The ANSI origination point code as exception routing criterion of the exception route

**OPCN**—The ITU-TSS national origination point code as exception routing criterion of the exception route

**OPCN24**—The 24-bit ITU national origination point code as exception routing criterion of the exception route

**OPCI**—The ITU-TSS international origination point code as exception routing criterion of the exception route

**ILSN**—The originating linkset as exception routing criterion of the exception route

**CIC**—Starting Circuit Identification Code used as the exception routing criterion for this exception route

**ECIC**—Ending Circuit Identification Code together with CIC defines the CIC range that is used as exception routing criterion for this exception route.

**SI**—Service Indicator used as the exception routing criterion for this exception route

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

## rept-stat-sccp

## Report Status SCCP

Use this command to display the following types of reports:

- **rept-stat-sccp** (with no parameters)—displays the status of the SCCP, DSM, and E5-SM4G cards and the GTT (Global Title Translation), G-Flex (GSM Flexible Numbering), G-Port (GSM Mobile Number Portability), INP (INAP-based Number Portability), EIR (Equipment Identity Register), A-Port (IS41 Mobile Number Portability), V-Flex (Voice Mail Router), IDP Relay (Prepaid IDP Query Relay), ATINPQ (ATI Number Portability Query), and IGM (IS41 GSM Migration) services executing on those cards. This command also displays any cards that are denied SCCP service.
- **rept-stat-sccp:mode=perf**—targets the general SCCP traffic performance for SCCP and Service Module cards. The report supplies message rates for group ticket voucher (TVG) performance.
- **rept-stat-sccp:loc=nnnn**—provides a detailed view of the status of SCCP services provided by a specific SCCP card or Service Module card. Fields are omitted if an associated feature is not turned on.

**NOTE:** The **rept-stat-sccp** and **rept-stat-sccp:mode=perf** reports include the status of TSM and DSM cards but do not differentiate between these card types.

**NOTE:** To retrieve traffic statistics for the LNP feature, use the **rept-stat-lnp** command.

**NOTE:** When turned on, the A-Port, IS41 GSM Migration (IGM) and Prepaid SMS Intercept Ph1 (PPSMS) features share statistic status with the G-Port feature. If only the PPSMS feature is on, the display title for the statistic status is SMSMR. If the G-Port feature is on, with or without the PPSMS feature, the display title for the statistic status is GPORT. If the A-Port or IGM feature is on, with or without the G-Port and PPSMS features, the display title for the statistic status is MNP.

**Keyword:** **rept-stat-sccp**

**Related Commands:** **chg-th-alm, rtrv-th-alm**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card Address. Use this parameter to specify the location of the SCCP/VSCCP card to be reported on.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Report a summary of all cards.

**:mode=** (optional)

Use this parameter to provide extended performance information, including output about group ticket voucher (TVG) performance and message rates for direct assignments.

**Range:** **perf**

**Default:** No extended performance information is displayed.

**:peakreset=** (optional)

Reset all Peak values to zero.

**Range:** **yes**

### Example

**rept-stat-sccp**

**rept-stat-sccp:mode=perf**

**rept-stat-sccp:loc=1106**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

At least one TSM card running the **sccp** application, or one Service Module card running the **vsccp** application must be configured in the system before this command can be entered.

Only one optional parameter at a time can be specified in the command.

The value specified for the **loc** parameter must be the location of a Service Module card running the **vsccp** application.

### Notes

None

## Output

If the Equipment Identity Register (EIR), G-Port, INP, 1100 TPS/DSM for ITU NP, ANSI-41 INP Query (AINPQ), A-Port, IS41 GSM Migration (IGM), E5-SM4G Throughput Capacity, or V-Flex features are enabled, then the **ansigflex** system option is disabled.

The following example shows the output of the **rept-stat-sccp** command with the G-Flex, G-Port, INP, A-Port, and Prepaid SMS Intercept Ph1 features are on. The ATINP, EIR, and V-Flex features are not enabled:

The following example displays output when the GTT and TINP features are turned on and the G-Flex, G-Port, INP, EIR, LNP, WNP, TLNP, and PLNP features are turned off.

TINP services are tracked and displayed as part of the MNP average CPU usage. Turning on the TINP feature does not trigger the display of the MNP server alarm status. If the **loc** parameter is specified, and the TINP feature has an active MNP Alarm status, then the CPU usage and MNP statistics are displayed.

**Legend**

This section defines the fields of the three **rept-stat-sccp** reports:

- **rept-stat-sccp** with no parameters
- **rept-stat-sccp:mode=perf**
- **rept-stat-sccp:loc= nnnn**

A dash (-) in an output field indicates that the statistic does not apply.

**NOTE: The ERRORS and TOTAL ERRORS fields indicate that errors have occurred for SCCP cards in the system. Refer to UIMs generated by the system for the specific errors, and refer to the Maintenance Manual for error explanations and recovery procedures.**

*Report Type: rept-stat-sccp with no parameters*

**SCCP SUBSYSTEM REPORT, INPQ/EIR/VFLEX SUBSYSTEM REPORT**—The summaries of the ATINPQ, EIR, INPQ (INP Query), V-Flex, and SCCP subsystem status. Information about the status of ATINP, EIR, GSM, INPMR (INP Message Relay), AND V-Flex services is provided in the SCCP subsystem status summary report. The INPQ subsystem status is displayed only if the INP feature is turned on. The EIR subsystem status is displayed only if the EIR feature is enabled and turned on. The V-Flex subsystem status is displayed only if the V-Flex feature is enabled and turned on. The ATINPQ subsystem status is displayed only if the ATINP feature is enabled. The ALARM STATUS for the SCCP and INPQ/EIR/V-Flex/ATINPQ subsystems is displayed in this section of the report.

**SCCP CARDS CONFIGURED**—The number of SCCP and Service Module cards provisioned.

**CARD IS-NR**—The number of SCCP and Service Module cards that can be used by the system (status is In-Service Normal, IS-NR).

**SYSTEM TPS ALARM THRESHOLD**—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-alm** command.

**SYSTEM PEAK SCCP LOAD**—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

**SYSTEM TOTAL SCCP CAPACITY**—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP and Service Module cards. When the **ansigflex** system option is enabled in an ANSI system, the maximum capacity of each DSM card is 1700 TPS.

**CARD**—The card location of the TSM cards running the SCCP application and of the Service Module cards running the VSCCP application.

**P**—When G-Flex, G-Port, INP, A-Port, EIR, V-Flex, or IGM is turned on, a P indicates the primary Service Module card. The primary Service Module card provides the MPS status to the EAGLE 5 ISS. This indicator is displayed between the card location and the GPL version.

**VERSION**—The version number of the SCCP card or Service Module GPL that the card is running.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**MSU USAGE**—The percentage of the maximum number of MSUs (850 MSUs per second) received by each card during the last 30 seconds.

**CPU USAGE**—The percentage of the amount of CPU used by each card during the last 30 seconds to process messages and to handle other foreground and background tasks.

**SCCP SERVICE AVERAGE MSU CAPACITY**—The average MSU capacity used over the last 30-second interval. This field includes all services provided by the SCCP and Service Module cards.

**AVERAGE CPU CAPACITY**—The average CPU capacity used over the last 30-second interval. This field includes all services provided by the SCCP and Service Module cards.

**AVERAGE CPU USAGE PER SERVICE**—A system-wide view of the service traffic composition. This report is available only if the A-Port, EIR, G-Flex, G-Port, IGM, INP, or V-Flex feature is turned on, or the ATINP feature is enabled. Fields are omitted if the associated feature is not turned on. The services include ATINPQ, EIR, G-Flex, G-Port, GTT, INPMR, INPQ, MNP, and V-Flex.

**TOTAL SERVICE STATISTICS**—A system-wide view of per-service statistics. This report is available only if the A-Port, EIR, G-Flex, G-Port, IGM, INP, or V-Flex feature is turned on, or the ATINP feature is enabled. Fields are omitted if the associated feature is not turned on.

An "A" in the field indicates that the statistic does not apply.

The report tracks the following information:

**SERVICE**—The services are GTT, EIR, G-Flex, INPQ, G-Port, INPMR, V-Flex, and MNP.

**SUCCESS**—The total number of successful messages processed by the specified card for each service. Applies to all services.

**ERRORS**—The total number of messages with errors for each service. Applies to all services.

**WARNINGS**—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for G-Flex, G-Port, INPMR, A-Port, and IGM.

**FORWARD TO GTT**—The total number of messages that could not find a match in the MPS (Multi-Purpose Server) database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for G-Flex, G-Port, INPMR, A-Port, and IGM.

*Report Type:* **rept-stat-sccp:mode=perf**

The report displays general SCCP traffic performance for both SCCP and Service Module cards and supplies message rates for TVG.

**NOTE: This report includes the status of TSM and Service Module cards, but does not differentiate between these card types.**

**SCCP SUBSYSTEM REPORT**—The summary status of the SCCP subsystem, and the SCCP Alarm Status.

**SCCP CARDS CONFIGURED**—The number of SCCP and Service Module cards provisioned.

**CARD IS-NR**—The number of SCCP and Service Module cards that can be used by the system (status is in-service normal, IS-NR).

**SYSTEM TPS ALARM THRESHOLD**—The percentage of traffic that when reached triggers an alarm to warn that the EAGLE 5 ISS is approaching the total system SCCP transactions-per-second (TPS) capacity. This value is set by the **chg-th-alm** command.

**SYSTEM PEAK SCCP LOAD**—The highest SCCP transactions-per-second (TPS) processed by the EAGLE 5 ISS.

**SYSTEM TOTAL SCCP CAPACITY**—The current total system SCCP transactions-per-second (TPS) capacity. This value is the sum of the maximum capacity of all active SCCP and Service Module cards.

**TPS STATISTICS**—The section of the report that provides TPS statistics on each SCCP card or Service Module card.

**CARD**—The card location of the TSM cards running the SCCP application and of the Service Module cards running the VSCCP application.

**CPU USAGE**—The percentage of the amount of CPU used to process messages by each card during the last 30 seconds.

**TOTAL MSU RATE**—The total number of messages processed per second. This and the other message rates are obtained from statistics maintained by the SCCP card or Service Module card for the last 30-second period.

**CLASS 0 AND CLASS 1 TVG RATE**—The number of messages per second received.

The next section of the **rept-stat-sccp:mode=perf** report provides system-wide SCCP traffic statistics.

**AVERAGE MSU USAGE**—The total of the MSU usage fields from each SCCP card or Service Module card divided by the number of active SCCP cards and Service Module cards.

**AVERAGE CPU USAGE**—The total of the CPU usage fields from each SCCP card or Service Module card divided by the number of active SCCP cards and Service Module cards.

**TOTAL MSU RATE**—The sum of all GTT, EIR, G-Flex, G-Port, INP, A-Port, V-Flex, and IGM MSUs processed by all active SCCP cards and Service Module cards.

**STATISTICS FOR PAST 30 SECONDS**—statistics that represent the last 30-second period.

**TOTAL MSUS**—The sum of all transactions on all active SCCP cards and Service Module cards.

**TOTAL ERRORS**—The sum of all errors on all active SCCP cards and Service Module cards.

*Report Type:* **rept-stat-sccp:loc=nnnn**

**CARD**—The card location of the TSM card running the SCCP application or of the Service Module card running the VSCCP application.

**VERSION**—The version number of the GPL the card is running.

**TYPE**—The type (TSM or DSM) of the card.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**CARD ALARM STATUS**—If there are no card alarms present, this field displays No Alarms.

The next section of the **rept-stat-sccp:loc=nnnn** report supplies the status of the individual services provided by the card and the associated CPU usage for the service. Fields are omitted if the associated feature is not turned on.

**GTT: STAT**—Possible values are ACTIVE and SWDL (software loading).

**GFLEX: STAT**—Possible values are ACTIVE and SWDL (software loading).

**GPORT OR MNP: STAT**—Possible values are ACTIVE and SWDL (software loading).

**INPMR: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

**INPQ: STAT**—Possible values are ACTIVE, OFFLINE, and SWDL (software loading).

**EIR: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading).

**VFLEX: STAT**—Possible values are ACTIVE, OFFLINE and SWDL (software loading).

**TOTAL**—The sum of the CPU usage for the services running over the previous 30-second period.

**CARD SERVICE STATISTICS**—The card service statistics for the specified card. This report is available only if the G-Flex, G-Port, INP, A-Port, EIR, V-Flex, IGM feature is turned on, or the ATINP feature is enabled. Fields are omitted if their associated feature is not turned on (or not enabled for ATINP). The report tracks the following:

**SERVICE**—The services are ATINPQ, EIR, G-Flex, G-Port, GTT, INPMR, INPQ, MNP, and V-Flex.

**SUCCESS**—The total number of successful messages processed by the specified card for each service. Applies to all services.

**ERRORS**—The total number of messages with errors for each service. Applies to all services.

**WARNINGS**—The total number of messages that output UIM warnings and were forwarded to GTT by the specified card for EIR, G-Flex, G-Port, INPMR, A-Port, and IGM.

**FORWARD TO GTT**—The total number of messages that could not find a match in the MPS database (did not produce any errors or warnings) and were successfully forwarded to GTT by the specified card for EIR, G-Flex, G-Port, INPMR, A-Port, and IGM.

## rept-stat-seas

## Report Status SEAS Command

Use this command to generate a summary report of the status of the SEAS subsystem on the EAGLE 5 ISS. This command reports single OSS/Application Processor (OAP) or dual OAP configuration status, depending on the OAP hardware configuration used. See the *Maintenance Manual* for information about the SEAS alarms.

**NOTE: If the SEAS Over IP feature is turned on, then the status of the CCS MR connections is displayed. If the SEAS Over IP feature is turned off, then the X.25 connection status is displayed.**

**Keyword:** rept-stat-seas

**Related Commands:** alw-trm, chg-trm, inh-trm, rept-stat-sys, rept-stat-trbl, rept-stat-trm

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

```
rept-stat-seas
```

### Dependencies

At least one OAP terminal or one SEAS terminal must be defined using the **chg-trm** command.

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

**Output**

The following example shows the output of command when the SEAS feature is turned on and the SEAS Over IP feature is turned off.

**rept-stat-seas**

```
rlghncxa03w 07-02-04 15:59:06 EST EAGLE 37.5.0

**Legend**

**PST**—The primary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the subsystem. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the subsystem. The possible values are described in .

**SEAS SYSTEM**—The overall SEAS component.

## rept-stat-seculog

### Display Security Log Status Information

Use this command to display the following information about the security log on the active and standby OAMs:

- The active or standby status of each log
- The number of new (that is, not uploaded) entries in each log
- The percentage of log space used by those new entries
- Whether overflow has occurred since the last upload
- Whether a recording failure has occurred since the last upload
- The date and time of the oldest and newest records in the log
- The date and time when the last successful upload of the log occurred

**Keyword:** `rept-stat-seculog`

**Related Commands:** `chg-attr-seculog`, `rtrv-attr-seculog`

**Command Class:** Security Administration

### Parameters

This command has no parameters.

### Example

**`rept-stat-seculog`**

### Dependencies

No other security log command can be in progress when this command is entered.

### Notes

The %FULL field displays the amount of space in the log taken up by new (not uploaded) entries. That number is obtained by dividing the number displayed in the ENTRIES field by the overall storage capacity of the log (10,000 entries). Because the log stays full of entries at all times, new entries overwrite existing entries.

The percentage full computed is rounded up to the next integer with one exception: the value of 100 is not displayed until the log is truly 100% full.

The log capacity is 10,000 records. To determine how many more commands can be logged before an overflow condition occurs, subtract the value displayed in the ENTRIES field from 10,000.

The status of the active OAM's log is always reported first in the output report, followed by the status of the standby log; in other words, they are not *necessarily* displayed numerically by the location number.

The report displays dates in the format *yy-mm-dd*, where *yy* is the year, *mm* is the month, and *dd* is the date. The report displays times in the format of *hh:mm:ss*, where *hh* is hours, *mm* is minutes, and *ss* is seconds.

**Output**

The following example shows the normal security log state. All of the un-uploaded records appear in the log on the active OAM.

**rept-stat-secu log**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0    No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows an abnormal situation. The active security log is full and has overflowed.

**rept-stat-secu log**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active 10000    100  Yes  No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 0         0    No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows what happens when both logs contain un-uploaded entries. The standby log on 1116 should be uploaded.

**rept-stat-secu log**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     84    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby 693       7    No   No   96-09-12 05-07-30 05-07-30
                                     11:24:12 14:00:06 14:02:13
```

;

The following example shows how, if data cannot be retrieved from the standby OAM (for example, in simplex mode), blanks (-----) are displayed.

**rept-stat-secu log**

```
rlghncxa03w 05-07-29 16:40:40 EST EAGLE 28.1.0
-- SINCE LAST UPLOAD -- OLDEST NEWEST LAST
LOC  ROLE    ENTRIES %FULL OFLO FAIL RECORD  RECORD  UPLOAD
1114 Active  8312     83    No   No   96-08-12 05-07-04 05-07-16
                                     11:23:56 15:59:06 14:02:22

1116 Standby ----- --- --- --- -----
                                     -----
```

;

**Legend**

**LOC**—The address of the TDM card (with the hard disk on it) that contains the log. It is always the card at location 1114 or 1116.

**ROLE**—The current role of the security log at that location. This value is always the same as the role of the OAM associated with the TDM card: **active** or **standby**.

-- **SINCE LAST UPLOAD**—This heading applies to the four columns directly below it on the output. It indicates that the fields below display information obtained since the last upload.

**ENTRIES**—Shows how many un-uploaded commands are currently recorded in the log. This value resets to 0 (zero) when the log is uploaded using **copy-seculog**.

**%FULL**—Shows, as a percentage, how much space in the log the ENTRIES field value occupies.

**OFLO**—The overflow indicator. Overflow is what happens if the log is not uploaded periodically: new entries start overwriting un-uploaded entries. This field displays **No** if no overflow has occurred and **Yes** if overflow has occurred.

**FAIL**—The failed indicator. This field displays **No** if no logging failure has occurred. It displays **Yes** to indicate that a logging failure has occurred that has prevented one or more entries from being recorded in the log successfully.

**NOTE:** Whether the system is able to set the logging failure flag in the security log header depends on the nature of the failure. If a **copy-disk** command is processing, the system sets the flag when the **copy-disk** command finishes processing. However, if the active fixed disk fails for some reason, or the security log happens to be in a bad sector that develops, the system is unable to set the logging failure flag.

**OLDEST RECORD/NEWEST RECORD**—The date and time recorded in the oldest and newest record in the log. Allows the administrator to know the time period that the log covers. The log records all commands that were issued between 6/3/96 at 13:45:03 up to 8/5/96 at 06:58:55. The **NEWEST RECORD** for the active log is the current date, because the log will have recorded the **rept-stat-seculog** command that was just entered to produce the report.

**LAST UPLOAD**—The date and time when the log was last uploaded successfully. That is, the **copy-seculog** command successfully copied the log to the FTA.

## rept-stat-slan

## Report Status of the STPLAN

Use this command to generate a summary report of the status of the ACM, DCM, and E5-ENET cards that make up the STPLAN subsystem.

**Keyword:** **rept-stat-slan**

**Related Commands:** **rept-stat-alm**, **rept-stat-card**, **rept-stat-dlk**, **rept-stat-imt**, **rept-stat-sys**, **rept-stat-trbl**

**Command Class:** System Maintenance

### Parameters

**:mode=** (optional)

Use this parameter to provide extended performance information, including group ticket voucher (TVG) message rates.

**Range:** **perf**

**Default:** No extended performance information is displayed

### Example

```
rept-stat-slan
```

```
rept-stat-slan:mode=perf
```

### Dependencies

No other **rept-stat-xxx** commands can be in progress when this command is entered.

At least one ACM, DCM, or E5-ENET card that makes up the STPLAN must be configured.

**Notes**

The HOST CAP. field value is obtained by averaging the usage percentages for the data links from each ACM, DCM, and E5-ENET card to the host.

The EAGLE CAP. field value is obtained by averaging the usage percentages for the ACM, DCM, and E5-ENET traffic received from LIMs.

The system level usage for host capacity (the AVERAGE USAGE PER HOST CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the data links to the host from each ACM, DCM, and E5-ENET card.

The EAGLE 5 ISS level usage for ACM, DCM, and E5-ENET cards capacity (the AVERAGE USAGE PER EAGLE CAPACITY field in the **rept-stat-slan** output) is obtained by averaging the usage percentages for the ACM, DCM, and E5-ENET traffic received from LIMs.

## Output

The following example shows output with at least one ACM in an IS-NR state:

### rept-stat-slan

```
rlghncxa03w 04-02-27 16:53:22 EST EAGLE 31.3.0

SLAN Cards Configured= 2 Cards IS-NR= 2
CARD VERSION PST SST AST HOST Cap. EAGLE Cap.
-----
1206 021-010-000 IS-NR Active ---- 42% 16%
1104 021-010-000 IS-NR Active ALMINH 36% 12%
-----
AVERAGE USAGE per HOST CAPACITY = 39%
AVERAGE USAGE per EAGLE CAPACITY = 14%
CARDS DENIED SLAN SERVICE:
1101, 1204
Command Completed.
```

;

### rept-stat-slan:mode=perf

```
rlghncxa03w 04-02-04 13:36:07 EST EAGLE 31.3.0
SLAN Subsystem Report IS-NR Active -----
SLAN Cards Configured= 3 Cards IS-NR= 3
CARD HOST EAGLE TVG
CAP CAP RATE
-----
1101 50% 30% 140
1102 55% 33% 435
1103 47% 28% 435
-----
AVERAGE USAGE per HOST CAPACITY = 51%
AVERAGE USAGE per EAGLE CAPACITY = 30%
Command Completed.
```

;

## Legend

**SLAN SUBSYSTEM REPORT**—The status of the STPLAN subsystem.

**STPLAN CARDS CONFIGURED**—The number of ACM, DCM, and E5-ENET cards used by the STPLAN contained in the system.

**CARDS IS\_NR**—The number of ACM, DCM, and E5-ENET cards contained in the system whose status is in service normal (IS-NR).

**CARD**—The locations of the ACM, DCM, and E5-ENET cards.

**VERSION**—The version number of the STPLAN GPL the cards are running.

**PST**—The primary state of the ACM, DCM, and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the ACM, DCM, and E5-ENET cards. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the ACM, DCM, and E5-ENET cards. The possible values are described in .

**HOST CAP**—The amount of traffic being sent to the host from each ACM, DCM, and E5-ENET card, expressed as a percentage of the total amount of traffic that can be sent to the host.

**EAGLE CAP**—The amount of traffic being sent to each ACM, DCM, and E5-ENET card, that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to the ACM, DCM, and E5-ENET card.

**AVERAGE USAGE PER HOST CAPACITY** The amount of traffic being sent to all hosts from all ACM, DCM, and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACM, DCM, and E5-ENET cards.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all ACM, DCM, and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACM, DCM, and E5-ENET cards.

**CARDS DENIED SLAN SERVICE**—The card locations that cannot use the STPLAN application.

**CARDS DISABLED COPY SERVICE**—The card locations that cannot use the stop and copy action of the gateway screening feature.

Instead of displaying the VERSION , PST , SST , AST , HOST CAP , EAGLE CAP, and CARDS DENIED SLAN SERVICE fields, the report displayed with the **rept-stat-slan:mode=perf** command shows these fields:

**HOST CAP**—The average of the usage percentages for the TCP/IP data links to the host from each ACM, DCM, and E5-ENET card.

**EAGLE CAP**—The average of the usage percentages for the ACM, DCM, and E5-ENET traffic that is received from the LIMs.

**TVG RATE**—The number of messages per second received from all SS7 links, and any other group ticket voucher paced message source. It is obtained from statistics maintained by the ACM, DCM, and E5-ENET cards for the last 30-second period.

**AVERAGE USAGE PER HOST CAPACITY**—The amount of traffic being sent to all hosts from all ACM, DCM, and E5-ENET cards, expressed as a percentage of the total amount of traffic that can be sent to all hosts from all ACM, DCM, and E5-ENET cards.

**AVERAGE USAGE PER EAGLE CAPACITY**—The amount of traffic being sent to all ACM, DCM, and E5-ENET cards that is received from the LIMs, expressed as a percentage of the total amount of traffic that can be sent to all ACM, DCM, and E5-ENET cards.

## rept-stat-slk

## Report Status Signaling Link

Use this command to generate a report of the MTP signaling links status. The secondary state (SST) indicates whether the link is available, unavailable, or manually removed from service.

Use this command to generate a separate report of status of the E1 associated with a signaling link. The status includes the **e1loc** parameter (card location of the E1 card) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is generated.

Use this command to generate a separate report of status of the T1 associated with a signaling link. The status includes the **t1loc** parameter (card location of the T1 card) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is generated.

**Keyword:** **rept-stat-slk**

**Related Commands:** **act-slk, blk-slk, dact-slk, dlt-slk, ent-slk, inh-slk, rtrv-slk, tst-slk, ublk-slk, unhb-slk**

**Command Class:** System Maintenance

### Parameters

**:l2stats=** (optional)

Report L2 status

**Range:** **align, both, brief, no, service**

**align** — Display alignment data only

**both** — Display alignment and service data  
**brief** — Display up to 10 alignment events only  
**no** — Do not display level 2 status information  
**service** — Display service data only

**Default:** **no**

**:link=** (optional)

The signaling link on the card specified in the **loc** parameter. The linkss can be specified in any sequence or pattern.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling link ports.

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** All cards containing signaling links are displayed.

**:stat=** (optional)

A report on cards whose status is the same as the state indicated by the parameter

**Range:** **all, alminh, anr, dsbld, mt, nr**

**all** — All of the primary states

**alminh** — Alarms inhibited

**anr** — In-Service-Abnormal (IS-ANR)

**dsbld** — Out-of-Service-Maintenance-Disabled (OOS-MT-DSBLD)

**mt** — Out-of-Service-Maintenance (OOS-MT)

**nr** — In-Service-Normal (IS-NR)

**Default:** Display all

### Example

```
rept-stat-slk
```

```
rept-stat-slk:loc=1201:link=a
```

```
rept-stat-slk:stat=alminh
```

```
rept-stat-slk:loc=1203:link=b:l2stats=both
```

```
rept-stat-slk:loc=1203:link=b:l2stats=brief
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

If the **loc** parameter or the **link** parameter is specified, then the **stat** parameter cannot be specified.

When the **loc** parameter is specified, the **link** parameter must be specified.

The card must be equipped and must be one of the following cards:

- An E1 ATM card running the **atmitu** application
- An E1/T1 MIM, E5-E1T1, or HC MIM card running the **ss7ansi** or **ccs7itu** application

- An E5 ATM card running the **atmansi** or **atmitu** application
- An E5-ENET card running the **ipsg** application
- An E5-ENET card or SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**
- A LIM card running the **ss7ansi**, **ss7gx25**, or **ccs7itu** application
- A LIM ATM card running the **atmansi** application

The location specified by the **loc** parameter cannot be one of those reserved for non-LIM or non-DCM cards.

The signaling link must be an SS7 signaling link to display level 2 statistics (**l2stats**).

On TCP/IP point-to-multipoint links (SSEDCCM or E5-ENET cards equipped as SS7IPGW or IPGWI links), **l2stats** output is not available.

The following **link** parameter values can be specified for the following cards that support more than 2 links per card:

- **a1-a3, b1-b3**—Multi-port LIM (MPL), SSEDCCM card running the **iplim** or **iplimi** application with links having **ipliml2=m2pa**, E1/T1 MIM card
- **a1-a31, b1-b31**—HC-MIM card
- **a1-a15, b1-b15**—E5-E1T1 card
- **a1-a7, b1-b7**—E5-ENET card running the **iplim** or **iplimi** application that supports 16 links.
- **a1-a15, b1-b15**—E5-ENET card running the **ipsg** application

The specified signaling link must be provisioned in the database.

A card location that is valid and defined in the database must be specified.

The card in the specified card location (**loc** parameter) must be in service.

The **link=b** parameter cannot be specified for ss7ipgw TCP/IP links.

Neither the **stat** or **loc** and **port** parameters can be specified with this command.

## Notes

Not every card location represents a signaling link. Be sure to address a signaling link in this command.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

## Output

**rept-stat-slk**

```

ALARM STATUS      = ** 0224 REPT-LKS: not aligned
UNAVAIL REASON    = NA
Command Completed.
```

;

**Legend**

**SLK**—The card location and the signaling link.

**LSN**—The name of the linkset that contains the signaling link.

**CLLI**—The CLLI code of the destination STP of the signaling link.

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

**ALARM STATUS**—The trouble text alarm message that was generated for the specified signaling link.

**UNAVAIL REASON**—The reason that the signaling link is unavailable. More than one unavailable reason may be listed:

**BSNR**—The signaling link received 2 of 3 invalid BSNs.

**CNGT**—The signaling link has a remote congestion time-out.

**COO**—A changeover order was received.

**FC**—The signaling link is unavailable because of false congestion restart.

**FE**—The signaling link is in far end loopback mode.

**FIBR**—The signaling link received 2 of 3 invalid FIBs.

**INTR**—Too many link interrupts were received.

**LB**—The signaling link has been blocked locally.

**LD**—The signaling link received incomplete data.

**LI**—The signaling link has been inhibited locally.

**NA**—The signaling link is not aligned.

**PF**—The signaling link failed the proving period.

**RB**—The signaling link has been blocked remotely.

**RD(xx.xxx)**—The signaling link is unavailable because of a restart delay to prevent signaling link oscillation. The number in parentheses indicates the amount of time, in seconds, remaining in the restart delay period. The link is restarted automatically after this amount of time has elapsed.

**RL**—The signaling link is in remote near end loopback mode.

**RMI**—The signaling link has been inhibited remotely.

**SIE**—An unexpected SIE was received.

**SIN**—An unexpected SIN was received.

**SIO**—An unexpected SIO was received.

**SIOS**—An unexpected SIOS was received.

**SLTF**—Link test failed.

**T1NR**—The level-2 T1 (not ready) timer expired.

**T1R**—The level-2 T1 (ready) timer expired.

**T2**—The level-2 T2 timer expired.

**T3**—The level-2 T3 timer expired.

**X25FL**—An X25 link failed.

**XDA**—The signaling link did not receive an acknowledgment in time.

**XER**—The SUERM threshold was exceeded.—

---The card is ISOLATED or the links are available.

The following are reasons that the ATM high-speed signaling link is unavailable:

**TNC**—Timer No Credit expired - The remote node has held the node in a no-credit state for too long. The far end office should be contacted to determine the cause of the link congestion.

**TNR**—Timer No Response expired - The far end is taking too long to acknowledge the messages sent to it by the near end. The far end office should be contacted to determine the cause for the excessive delay in acknowledging PDUs.

**LPO**—Local Processor Outage - Indicates a spontaneous or management-initiated processor outage. The user needs to determine whether the outage was spontaneous or management-initiated on the near end.

**RPO**—Remote Processor Outage - The far end has sent PDUs causing processor outage. The far end office should be contacted to determine the reason for the processor outage.

**ROOS**—Remote Out of Service - The far end has sent PDUs causing a link to become out of service. The far end office should be contacted to determine the reason for taking the link out of service.

**RPE**—Remote Protocol Error - The far end has sent PDUs declaring a protocol error. The far end office should be contacted to determine the details about the protocol error.

**RMIR**—Remote Management Initiated Release - The far end has sent PDUs releasing the link. The far end office should be contacted to determine the reason for releasing the link.

**LCD**—Level 1 facility outage: Loss of Cell Delineation

**LOF**—Level 1 facility outage: Loss of Frame

**LOS**—Level 1 facility outage: Loss of Signal

**EVENT TYPE**—The type of event being logged:

**RECEIVE**—When a signal unit is received.

**TRANSMIT**—When a signal unit is transmitted.

**STATE**—When an internal SS7 Level 2 state changes or a special event occurs that would either end alignment or cause the link to fail.

**EVENT**—The specific event being logged: (1) if a signal unit is being received or transmitted, the specific signal unit is displayed; (2) if the event being logged is a state change, the new state is displayed; (3) If neither (1) nor (2) is displayed, the link or alignment failure reason is displayed.

**SERVICE EVENT**—The service activity of the link; for example, In Service. Anything other than In Service is a description of a link failure.

**TIMESTAMP**—The time event processed by the system as follows:

**YY-MM-DD HH:MM:SS.TTT**, where

**YY**—The last 2 digits of the year (range 00–99)

**MM**—The month (range 01–12)

**DD**—The day of month (range 00–31)

**HH**—The hour of day (range 00–59)

**MM**—The minute of the hour (range 00–59)

**ss**—The seconds of the minute (range 00–59)

**TTT**—Milliseconds of the second (range 000–995 in increments of 5)

**E1 STATUS**—The status of the E1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the E1 association is not provisioned, “E1 association unknown” is displayed. If the card is not type **lime1** or **limch**, no E1 output is displayed.

**T1 STATUS**—The status of the T1 interface associated with the link; the status includes the card location (**e1loc**) and the UAM text. If the card is not type **limt1** or **limch**, no T1 output is displayed.

## rept-stat-sys

## Report Status System

Use this command to display a summary report of the status of the main system entities. Use this display to determine where the troubles are in the system. The display shows the number of these items that are in service (IS-NR) and how many are in another state (IS-ANR, OOS-MT, OOS-MT-DSBLD).

**NOTE:** VSCCP cards are included in SCCP card status.

**Keyword:** rept-stat-sys

**Related Commands:** rept-stat-alm, rept-stat-card, rept-stat-clk, rept-stat-cluster, rept-stat-dstn, rept-stat-imt, rept-stat-ls, rept-stat-meas, rept-stat-mps, rept-stat-seas, rept-stat-slk, rept-stat-trbl, rept-stat-xlist

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**rept-stat-sys**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

### Notes

None

## Output

The following example shows the output when no features are turned on in the system and only the cards in locations 1109-1110 and 1113-1118 are installed.

### rept-stat-sys

;

The following example shows the output when various features are turned on in the system. (Your output will not show all of these entries; some features are mutually exclusive in the system.)

Some entries appear as follows:

- When the Measurements Platform feature is not turned on and no MCPM cards are in the IS-NR state in the system, the MCPM and MCPM IP LK values are zero and the MEAS SS entry does not appear.

- When one or more MCPM cards have been installed and allowed, the MCPM CARD entry shows the number of MCPM cards that are in each state.
- When the Measurements Platform feature is turned on and the Measurements Platform collection option is enabled, the MEAS SS entry appears.
- When the Measurements Platform collection function has been enabled (chg-measopts=platformenable=on), the MCPM IP LK entry shows the number of links that are functioning for the MCPM cards, and the MEAS SS entry appears.
- When the MTP Origin Based Routing (MOBR) feature is not turned on, and/or no exception routes have been provisioned, the RTX value is zero.
- When the OA&M IP Security Enhancement feature is turned on, the SECURITY SS entry appears.
- When the Equipment Identity Register (EIR) feature is turned on, the EIR SS entry appears.
- When the INAP Number Portability (INP) feature is turned on, the INP SS entry appears.

### ***Legend***

**INH**—The number of devices within each device type that have their alarms inhibited.

**ALARMS**—The number of critical (**CRIT**), major (**MAJR**), and minor (**MINR**) alarms on the system when this command was executed and the count of alarm inhibited (**INH**) devices for cards, links, linksets, terminals, and SEAS X.25 links and terminals.

**OAM**—The status of each of the cards that are running the OAM (1113 and 1115).

**LIM CARD**—The status of the LIM cards.

**X25 CARD**—The status of the SS7GX25 cards.

**SCCP CARD**—The status of the SCCP subsystem cards. VSCCP cards are included in the SCCP card status.

**GLS CARD**—The status of the GLS subsystem cards.

**SLAN CARD**—The status of the STPLAN subsystem cards.

**VXWSLAN CARD**—The status of the VXW STPLAN subsystem cards.

**SS7IPGW CARD**—The status of the SS7IPGW cards.

**IPGWI CARD**—The status of the IPGWI cards.

**IPLIM CARD**—The status of the IPLIM cards.

**IPLIMI CARD**—The status of the IPLIMI cards.

**HMUX CARD**—The status of the HMUX cards.

**HIPR CARD**—The status of the HIPR cards.

**MCPM CARD**—The status of the MCPM cards.

**EROUTE CARD**—The status of the EROUTE cards.

**CLOCK**—The status of the system clocks.

**HS CLOCK**—The status of the high-speed clocks.

**IMT**—The status of the IMT system.

**SLK**—The status of the SS7, IPGWI, and X.25 signaling links in the system.

**DLK**—The status of the TCP/IP data links in the system.

**LINK SET**—The status of the linksets in the system.

**DSM IP LK**—The status of the DSM IP linksets.

**MCPM IP LK**—The status of the MCPM IP links.

**APPLSOCK**—The status of the application sockets.

**SCTP ASSOC**—The status of the SCTP associations.

**APPL SERVER**—The status of the Application Servers.

**SS7 DPC**—Summary information only for provisioned DPCs that are not in clusters.

**X25 DPC**—The status of the destination point codes in the X.25 domain.

**CLUST DPC**—Summary information for provisioned cluster DPCs only.

**RTX**—Summary information for provisioned exception routes only.

**XLIST DPC**—Summary information for X-LIST DPC entries only.

**DPC SS**—Summary information for the DPC subsystem.

**SCCP SS**—The status of the SCCP subsystem.

**XLIST SS**—Summary information for SEAS Subsystem X.25 Links to SEAC.

**SEAS SS**—The status of the SEAS subsystem.

**MEAS SS**—The status of the Measurements subsystem (for Measurements Platform).

**SEAS X25**—The status of the SEAS X.25 signaling links.

**NDC SS**—The status of the NDC subsystem.

**NDC Q3**—Summary information on Q.3 association status.

**MPS**—Summary information on the MPS.

**TERMINAL**—The status of the terminals.

**SECURITY SS**—EAGLE OA&M IP Security subsystem status.

**EIR SS**—Equipment Identity Register subsystem status.

**RTD**—Run Time Diagnostic subsystem status.

**VFLEX SS**—V-Flex subsystem status.

**ATINPQ SS**—ATI Number Portability Query subsystem status.

**INP SS**—INAP Number Portability subsystem status.

## rept-stat-t1

## Report Status T1

Use this command to display the T1 port status and signaling link status for cards with provisioned T1 ports.

**Keyword:** **rept-stat-t1**

**Related Commands:**

**Command Class:** System Maintenance

### Parameters

**:loc=** (optional)

Card address. The unique identifier of a specific **limt1** card located in the STP.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Default:** Information for all **limt1** cards is reported.

**:t1port=** (optional)

The T1 port number. When this parameter is specified, information is displayed only for the specified T1 port on the card in the specified card location.

**Range:** **1-8**

Ports 3 through 8 can be specified only for HC-MIM cards.

### Example

**rept-stat-t1**

**rept-stat-t1:loc=1203**

**rept-stat-t1:loc=1203:t1port=1**

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

The **loc** parameter must be specified when the **t1port** parameter is specified.

The active TDM location cannot be specified in the **loc** parameter.

Card locations 1117 and 1118 and the HMUX or HIPR card locations (xy09 and xy10 where x is the frame and y is the shelf) cannot be specified in the **loc** parameter.

### Notes

Specifying the command without any parameters displays T1 port status for all cards with provisioned T1 ports.

If the **loc** parameter is specified, status is displayed for all T1 ports provisioned on the card in the specified location.

If the **loc** and **t1port** parameters are specified, the T1 port status summary is displayed for all T1 ports provisioned on the card in the specified location, followed by the status of all signaling links assigned to the specified T1 port on the card.

**Output**

When no parameters are specified in the command, T1 port status is displayed for all cards with provisioned T1 ports. Ports 3 through 8 are on HC-MIM cards only.

**rept-stat-t1**

**Legend**

**LOC**—Card location

**T1PORT**—Number of the T1 port provisioned on the card in the specified location.

**PST**—The primary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the card. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the card. The possible values are described in "Possible Values for PST/SST/AST". The values **PARENT** and **PAIRED** refer to odd and even adjacent ports on the card that are provisioned in channel bridging mode.

**ALARM STATUS**—Either "No Alarms" or current alarm number and text

**UNAVAIL REASON**—Reason for the T1 port being unavailable

**SLK**—Signaling link assigned to the T1 port

**TS**—Timeslot assigned to the signaling link

**PST**—The primary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the signaling link. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the signaling link. The possible values are described in .

## rept-stat-trbl

## Report Status Trouble

Use this command to display a summary report of all the device trouble notifications that are logged currently in the OAM's RAM storage area.

**Keyword:** **rept-stat-trbl**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rls-alm**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:display=** (optional)

Display type of alarms to be reported.

**Range:** **act**, **all**, **inhb**, **timestamp**

**act**— Display only active alarms

**all**— Display all alarms with no timestamps

**inhb**— Display only inhibited alarms

**timestamp**— Display all alarms with the date and time when the alarm was logged. Timestamps appear in the output only when the **display=timestamp** parameter is specified.

**Default:** **all**

**:level=** (optional)

The alarm level of the alarms to be displayed

**Range:** **crit**, **majr**, **minor**

**Default:** All alarms are displayed

### Example

```
rept-stat-trbl
```

```
rept-stat-trbl:level=majr
```

```
rept-stat-trbl:display=inhb
```

### Dependencies

No other **rept-stat-xxx** command can be in progress when this command is entered.

**Commands**

**rept-stat-trbl**

**Notes**

None

## Output

The following example lists all devices that could appear. Your output will not be exactly the same; all devices and alarms cannot coexist in the system.

## rept-stat-trbl

**Legend**

**TRM**—The ID of the terminal port.

**PST**—The primary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

**SST**—The secondary state of the terminal ports. The possible values are described in "Possible Values for PST/SST/AST".

**AST**—The associated state of the terminal ports. The possible values are described in .

**rept-stat-tstslk****Report Signaling Link Test Status**

Use this command to generate a report of the status of the MTP signaling links currently under test.

**Keyword:** **rept-stat-tstslk**

**Related Commands:** **tst-slk**

**Command Class:** Link Maintenance

**Parameters**

**:link=** (optional)

SS7 signaling links. The SS7 signaling link that is being tested.

**Synonym:** **port**

**Range:** **a, b, a1-a31, b1-b31**

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:loopback=** (optional)

Loopback test type.

**Range:** **sltc, lxvr, oam, line, payload**

**Example**

```
rept-stat-tstslk
rept-stat-tstslk:loc=1201
rept-stat-tstslk:loc=1203:link=a
rept-stat-tstslk:loopback=lxvr
```

**Dependencies**

The card location specified in the **loc** parameter must be equipped.

The signaling link specified in the **link** parameter must be equipped.

If the **link** parameter is specified, the **loc** parameter must be specified.

The signaling link specified in the **link** parameter must be an SS7 signaling link.

This command cannot be entered for SSED CM or E5-ENET cards that are running the **ss7ipgw**, **ipgwi**, or **ipsg** application, or that have SS7IPGW, IPGWI, or IP SG-M3UA links.

This command cannot be entered for cards with **ipgwi** signaling links.

The card location specified in the **loc** parameter cannot be reserved by the system.

This command cannot be entered during upgrade.

**Notes**

None

**Output**

If no parameters are specified, all links in test are displayed.

If only the **loc** parameter is specified, all links in test on the specified card are displayed.

If the **loc** and **link** parameters are specified, the specified link on the specified card is displayed.

If the **loopback** parameter is specified, all links in the specified type of loopback test are displayed.

**rept-stat-tstslk**

```
tekelecstp 04-01-07 10:05:28 EST EAGLE 31.3.0
SLK      LOOPBACK  MAX-TIME  TEST-TIME
1102,A1   SLTC      01:00:00  00:04:01
1201,A    OAM       02:00:00  01:04:11
1203,A    LXVR      00:50:00  00:22:21
1203,B    LXVR      24:00:00  20:04:01
1208,A    PAYLOAD   01:10:00  01:05:22
1211,A    LINE      21:30:00  00:14:01
;
```

**Legend**

**SLK**—Card and signaling link that are being tested.

**LOOPBACK**—Type of loopback test being run.

**MAX-TIME**—Maximum length of time for the test to run, as specified in the **tst-slk** command **time** parameter.

**TEST-TIME**—The length of time that the test has been running when this command was entered.

**rept-stat-user****Report Status User**

Use this command to show which users are logged into the system. The command shows user names, terminal identification numbers, the time that the last valid command was issued, and the current state of the last command entered.

**Keyword:** rept-stat-user

**Related Commands:** act-user, chg-pid, chg-user, dact-user, dlt-user, ent-user, login, logout, rtrv-secu-user, rtrv-user

**Command Class:** Basic

**Parameters**

This command has no parameters.

**Example**

**rept-stat-user**

**Dependencies**

None

**Notes**

None

**Output****rept-stat-user**

```
rlghncxa03w 04-01-07 09:12:15 EST EAGLE 31.3.0
REPT-STAT-USER COMPLTD
USER ID      TERM#  IDLE SINCE      COMMAND      STATE
frodo        3      04-01-07 08:12:23 rept-stat-card IDLE
jethro       5      04-01-07 09:15:14 rtrv-bip     IDLE
obadiah      7      04-01-07 10:06:22 rept-stat-user PROCESSING
;
```

**Legend**

**USER ID**—The user ID of the users logged onto the system.

**TERM #**—The OAP terminal that the user's terminal is connected to.

**IDLE SINCE**—The date and time of day that the user last entered a command.

**COMMAND**—The last command the user entered.

**STATE**—The state of the command the user last entered.

**rept-stat-xlist****Report Status X-List Storage Area Statistics**

Use this command to report statistics related to the storage of x-list entries. X-list entries reside in the routing table and are dynamically created for individual members of clusters whenever one or more routes to that cluster member become more restrictive than the corresponding routes to the cluster.

The following information is reported:

- The number of routing table positions reserved for x-list entries
- The current number of x-list entries

- The percentage of space in the x-list reserved area currently in use
- The percentage of x-list space that must be in use before an alarm is issued

**Keyword:** `rept-stat-xlist`

**Related Commands:** `chg-stpopts`, `rept-stat-cluster`, `rtrv-stpopts`

**Command Class:** System Maintenance

### Parameters

This command has no parameters.

### Example

**`rept-stat-xlist`**

### Dependencies

The Cluster Routing and Management Diversity (CRMD) feature must be turned on before using this command.

### Notes

The statistics reported by this command are those gathered during periodic polling by the maintenance subsystem. They might differ slightly from the instantaneous values at the time the command was issued.

The following rules are used to compute the *Current X-LIST occupancy* percentage value that is displayed in the output report:

- The percentage value that is displayed is computed as follows:  

$$[(\text{current x-list entries}) / (\text{allocated x-list space})] * 100$$
- Non-integer percentages will be rounded up to the next highest integer (for example, 23.5% becomes 24%), with the exception of the situation described in the next rule.
- 100% is not displayed until the current *X-LIST* entries value exactly equals the allocated *X-LIST* space (for example, 99.1% is not rounded up to 100%).

### Output

**`rept-stat-xlist`**

```
rlghncxa03w 04-02-18 03:32:42 EST    EAGLE 31.3.0
Allocated X-LIST space      = 500
Current X-LIST entries      = 156
Current X-LIST occupancy   = 31 % (see "Notes")
X-LIST occupancy threshold = 80 %
;
```

## rept-x25-meas

## Report X.25 Measurements

Use this command to display the X.25 signaling link measurements. The X.25 signaling link is used in cellular networks to transport TCAP signaling messages from one mobile switching center (MSC) to another.

**Keyword:** `rept-x25-meas`

**Related Commands:** `rept-stat-alm`, `rept-stat-dstn`, `rept-stat-imt`, `rept-stat-ls`, `rept-stat-slk`, `rept-stat-sys`, `rept-stat-trbl`

**Command Class:** Link Maintenance

## Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

(Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.)

**:action=** (optional)

This parameter is used to reset the measurements counters for an X25 link.

**Range:** reset, none

**Default:** none

**:port=** (optional)

The port on the card specified in the **loc** parameter

**Range:** a

## Example

**rept-x25-meas:loc=1211:port=a**

**rept-x25-meas:loc=1211:port=a:action=reset**

## Dependencies

No other action command can be in progress when this command is entered.

The specified signaling link must be equipped and assigned to a LIM configured with the ss7gx25 GPL.

The card location cannot be out of range - **loc**.

Location invalid for hardware configuration.

The card type must be valid.

The specified location of the card is not valid.

The card must be in service.

## Notes

None

**Output****rept-x25-meas: loc=1211:port=a**

```

**T7**—SVC control timer T7

**T8**—SVC control timer T8

## rls-alm

## Release Alarm

Use this command to silence audible alarms. Entering this command also causes the alarm status on terminals to stop blinking (though they continue showing an alarm condition).

**Keyword:** **rls-alm**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-alm**, **rept-stat-clk**, **rept-stat-trbl**, **rtrv-obit**, **rtrv-trbl**

**Command Class:** System Maintenance

### Parameters

**:lvl=** (optional)

The alarm level

**Range:** **crit**, **majr**, **minor**

**Default:** All alarms are cleared

### Example

```
rls-alm
```

```
rls-alm : lvl = crit
```

### Dependencies

No other action command can be in progress when this command is entered.

### Notes

This command has no effect on visual alarm indicators on the fuse and alarm panel (FAP) or on the cabinet side panel.

Any alarms that occur after the execution of this command activate audible alarms again.

### Output

```
rls-alm
```

```
rlghncxa03w 04-01-07 09:27:24 EST EAGLE 31.3.0
```

```
rls-alm
```

```
Command entered at terminal #8.
```

```
;
```

**rmv-card****Remove Card**

Use this command to change the state of the card to Out of Service - Maintenance Disabled (OOS-MT-DSBLD), enabling a technician to test a LIM, TSM, or ACM, or physically remove it from the shelf.

**Keyword:** **rmv-card**

**Related Commands:** **dlt-card, ent-card, init-card, rept-stat-card, rst-card, rtrv-card**

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

Refer to the *Installation Manual – EAGLE 5 ISS* for card location information.

**:force=** (optional)

This parameter is required if the card is the last GLS or SCCP card.

**Range:** **yes, no**

**Default:** **no**

**Example**

**rmv-card:loc=1101**

**rmv-card:loc=1201:force=yes**

**Dependencies**

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, all signaling links assigned to the card must be placed out of service before the command can be entered.

The **force** parameter is required to force the last GLS or SCCP out of service.

If the card is an ACM, all TCP/IP data links assigned to it must be placed out of service.

**Notes**

The function of this command is the same as the **inh-card** command.

When this command is executed, the card boots and enters the OOS-MT-DSBLD state. It has no affect if the card is already OOS-MT-DSBLD.

The command is rejected if you attempt to inhibit a LIM that has active signaling links. The links must be cancelled, using the **dact-slk** command, before the command is accepted.

Inhibiting an TSM running the SCCP application affects GTT service. SCCP messages requiring global title translation are not routed, and an error message is returned to the originator.

Inhibiting an TSM running the GLS application has no immediate affect on the system. These cards are used only when loading gateway screening to the LIMs.

The command is rejected if you attempt to inhibit an ACM that has active TCP/IP data links. The TCP/IP data links must be cancelled, using the **canc-dlk** command, before the command is accepted.

### Output

```
rmv-card:loc=1101  
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0  
Card has been inhibited.  
;
```

## rmv-imt

### Remove IMT

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to remove the IMT bus from service.

**CAUTION:** Use this command only when directed by Tekelec Technical Services at (888) FOR-TKLC.

**Keyword:** **rmv-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rst-imt**

**Command Class:** System Maintenance

### Parameters

**:bus=** (mandatory)  
The IMT bus to be inhibited.  
**Range:** a, b

### Example

```
rmv-imt:bus=a
```

### Dependencies

The alternate IMT bus must be in-service normal (IS-NR) in order for the specified bus to be inhibited.  
This command cannot be entered during an IMT Fault Isolation Test.

### Notes

Cards that are not connected to the other IMT bus will reinitialize.  
All traffic is rerouted to the other IMT bus.  
The function of this command is the same as the **inh-imt** command.

**Output****rmv-imt:bus=a**

**rmv-trm****Remove Terminal**

Use this command to set the primary state of a serial port to OOS-MT-DSBLD (OUT-OF-SERVICE-MAINTENANCE-DISABLED), and to set the secondary state to MANUAL. The serial port is not available to perform service functions. There is no outgoing traffic from the serial port; all incoming traffic is ignored.

**Keyword:** **rmv-trm**

**Related Commands:** **act-echo, alw-trm, canc-echo, chg-trm, dact-echo, inh-trm, rept-stat-trm, rst-trm, rtrv-trm**

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)

The ID of the serial port to be inhibited.

**Range:** **1-40**

**:force=** (optional)

This parameter forces the removal of the terminal, even if it is the last in-service OAP terminal or last in-service SEAS terminal available.

**Range:** **yes, no**

**Default:** **no**

**Example**

**rmv-trm:port=5**

**rmv-trm:trm=1:force=yes**

### Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

To inhibit the last in-service OAP terminal, the **force=yes** parameter must be specified.

You cannot inhibit the terminal from which this command was entered.

The **force=yes** parameter must be specified to inhibit the last in-service SEAS terminal.

### Notes

When removing a terminal that has already been removed, a warning message is echoed to the scroll area but no action is taken.

### Output

```
rmv-trm
  rlghncxa03w 04-01-07 11:11:28 EST  EAGLE 31.3.0
  Inhibit message sent to terminal
;

rmv-trm:trm=17:force=yes
  tekelecstp 07-01-11 13:42:16 EST  EAGLE 37.5.0
  Inhibit message sent to terminal
;
```

## rst-card

## Reset Card

Use this command to change the card from OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) to IS-NR (In-Service-Normal) if the loading is successful. If the loading fails, the card status is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** **rst-card**

**Related Commands:** **dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rtrv-card**

**Command Class:** System Maintenance

### Parameters

**NOTE:** As of EAGLE 5 ISS Release 38.0, the data parameter can no longer be used.

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:code=** (optional)

The GPL type to be loaded.

**Range:** **appr, trial, utility**

**appr**— Approved GPL

**trial**— Trial GPL

**utility**— Utility GPL, used primarily by the factory for loading special GPLs for testing purposes

**Default:** No GPL type is given.

### Example

```
rst-card:loc=2301:code=trial
rst-card:loc=1101:data=persist
```

### Dependencies

The following card locations are not valid for this command: 1113, 1114, 1115, 1116, 1117, 1118, and all xy09 and xy10 locations (where x is the frame and y is the shelf).

The shelf and card must be equipped.

If the card is a LIM, it must have a signaling link assigned to it before it can be allowed.

No other action command can be in progress when this command is entered.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **data** parameter can be specified.

### Notes

The function of this command is the same as the **alw-card** command.

The *Installation Manual – EAGLE 5 ISS* provides an illustration of card locations.

The system previously supported the **data** parameter for reloading GTT data. The system does not support persistent GTT data loading, and the **data** parameter is now used in support of the warm restart feature.

When the OA&M IP Security feature is turned on, and an IPSM card is inserted and initialized for the first time or is removed, inserted, and initialized again, the "SSH Host Keys Regenerated" UIM is displayed. The UIM shows the generated SSH Host Key fingerprint that must be provided at the secure client in order for secure information transfer to occur. The SSH Host Key fingerprint is changed whenever power is lost and restored to an IPSM card.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0 0021.1493 CARD 1111 INFO
SSH Host Keys Regenerated DSA Server Host Key FTRA-formatted Fingerprint=

22:27:36
```

When the OA&M IP Security feature is turned on, and an IPSM card is restarted with this command, the "SSH Host Keys Loaded" UIM is displayed. The UIM shows the current SSH Host Key fingerprint. The SSH Host Key fingerprint is not changed if the IPSM card does not lose power.

```
rlghncxa03 03-07-11 07:05:00 EST EAGLE 30.2.0 0021.1493 CARD 1111 INFO
SSH Host Keys Loaded DSA Server Host Key FTRA-formatted Fingerprint= 84
7c 92 8b c 7c ds 19 1c 6 4b de 5c 8f c5 4d Report Date:03-07-11 Time:
22:27:36
```

### Output

```
rst-card:loc=2301:code=trial
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Card has been allowed.
;
```

## rst-dstn

### Reset Destination Circular Routing Status

Use this command to request that the circular routing status for the specified destination be reset (turned OFF). The destination that is specified can be a full point code (FPC), a cluster point code (for example, *ni-nc-\**), or an x-list point code. The system clears the circular routing status for the specified destination and then clears any outstanding circular routing alarm for the destination.

**NOTE:** This command does not support 24-bit ITU national point codes.

**Keyword:** rst-dstn

**Related Commands:** chg-stpopts, rept-stat-cluster, rept-stat-dstn, rtrv-stpopts

**Command Class:** System Maintenance

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:dpc=** (mandatory)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** dpca

**Range:** p-, 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk value (\*) is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

### Example

**rst-dstn:dpc=1-2-\***

**rst-dstn:dpc=20-2-5**

**rst-dstn:dpc=p-20-2-5**

### Dependencies

The specified DPC must be either provisioned or an x-list entry.

The destination address must be a full point code or a cluster point code specified as *ni-nc-\**. A DPC as *ni-nc-\*\** or *ni-nc-\*\*\** cannot be specified for the **rst-dstn** command.

### Notes

In this command, the point codes support only the private (internal) point code subtype prefix (p-).

### Output

**rst-dstn:dpc=1-2-\***

```
rlghncxa03w 04-01-05 06:52:20 EST EAGLE 31.3.0
Destination reset command sent to SNM (scroll area)
```

```
rlghncxa03w 04-01-05 06:52:20 EST EAGLE 31.3.0
Command Completed.
```

;

**rst-dstn:dpc=20-2-5**

```
rlghncxa03w 04-02-29 16:40:40 EST EAGLE 31.3.0
Destination reset command sent to SNM (scroll area)
```

```
rlghncxa03w 04-01-05 16:40:40 EST EAGLE 31.3.0
Command Completed.
```

;

**rst-imt****Reset IMT**

The interprocessor message transport bus (IMT bus) is the main communications artery between all subsystems in the system. Use this command to change the state of the specified IMT bus from OOS-MT-DSBLD (out of service maintenance disabled) to IS-NR (in service normal), if the command is successful. If the command fails, the status is IS-ANR (in service abnormal).

**Keyword:** **rst-imt**

**Related Commands:** **clr-imt-stats**, **conn-imt**, **disc-imt**, **rept-imt-lvl1**, **rept-imt-lvl2**, **rept-stat-imt**, **rmv-imt**

**Command Class:** System Maintenance

**Parameters**

**:bus=** (mandatory)  
The IMT bus to be returned to service.  
**Range:**      **a, b**

**Example**

**rst-imt:bus=a**

**Dependencies**

None

**Notes**

The function of this command is the same as the **alw-imt** command.

This command returns an inhibited IMT bus to service.

**Output**

```
rst-imt:bus=a
rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
Allow IMT Bus A command issued.

rlghncxa03w 04-01-07 11:02:30 EST  EAGLE 31.3.0
0100.0097    IMT   BUS A           IMT allowed
;
```

**rst-trm****Reset Terminal**

Use this command to return the specified serial port to the state IS-NR (in-service-normal) from the state OOS-MT-DSBLD (Out-of-Service-Maintenance-Disabled) if the command is successful. If the command is not successful, the terminal's state is OOS-MT (Out-of-Service-Maintenance).

**Keyword:** **rst-trm**

**Related Commands:** **act-echo**, **alw-trm**, **canc-echo**, **chg-trm**, **dact-echo**, **inh-trm**, **rept-stat-trm**, **rmv-trm**, **rtrv-trm**

**Command Class:** System Maintenance

**Parameters**

**:trm=** (mandatory)  
ID of the serial port to be put into service.  
**Range:**      **1-40**

**Example**

**rst-trm:trm=5**

## Dependencies

No other action command can be in progress when this command is entered.

The IP User Interface feature must be enabled before terminal ports 17 through 40 can be specified in the **trm** parameter.

The terminal specified by the **trm** parameter must be equipped.

Anyone logged in to the terminal specified by this command is logged off when this command is executed. For the user to continue working on the specified terminal, the user must log on to that terminal again.

An E5-IPSM card must be provisioned for the specified SEAS terminal before this command can be entered.

The SEAS Over IP feature must be turned on before this command can be entered for a SEAS terminal.

If the SEAS terminal is auto-inhibited, then this command cannot be entered.

## Notes

The function of this command is the same as the **alw-trm** command.

When you attempt to return to service a terminal already in service, a warning message is echoed to the scroll area but no action is taken.

## Output

**rst-trm:trm=12**

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
Allow message sent to terminal
```

```
rlghncxa03w 04-01-07 11:11:28 EST EAGLE 31.3.0
1062.0046      TERMINAL      12      Terminal Enabled
```

;

## rtrv-acg-mic

## Display ACG Manually Initiated Control

Use this command to display the values of ACG controls assigned to certain queries. The control can apply to all queries or to specific query services and called party digits. A set of controls is selected to be displayed by specifying the type of controls (**type** parameter), the service (**serv** parameter), and the digits (**dgts** parameter).

**Keyword:** **rtrv-acg-mic**

**Related Commands:** **chg-acg-mic**, **dlt-acg-mic**, **ent-acg-mic**, **rept-stat-lnp**

**Command Class:** Database Administration

## Parameters

**:dgts=** (optional)

Digits

**Range:** 3 digits, 6-10 digits

Valid values are **000-999**, **000000-9999999999**

**:serv=** (optional)

Query service

**Range:** **ain**, **in**

**:type=** (optional)

Type of control

**Range:** **all**, **sd**

**Example**

Display all MICs:

**rtrv-acg-mic**

Display the MIC(s) that apply to particular services and digits:

**rtrv-acg-mic:type=sd**

Display the MIC(s) that apply to AIN queries:

**rtrv-acg-mic:serv=ain**

Display the MIC(s) that apply to IN queries for 919-460-xxxx:

**rtrv-acg-mic:serv=in:dgts=919460**

**Dependencies**

If the **type=all** parameter is specified, optional parameters **serv** and **dgts** cannot be specified.

The **dgts** parameter value must be specified as 3 digits or 6-10 digits.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **rtrv-acg-mic** command can be entered.

**Notes**

None

**Output****rtrv-acg-mic:type=sd**

```

rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
TYPE=ALL

**DRTN**—New duration index

**INTVL**—New IN interval index

**ND**—New number of digits

**SERV**—Query service

**rtrv-acg-noc****Display ACG Node Overload Control**

Use this command to display the definitions of node overload levels. The definition is comprised of the threshold LNP query rates for node overload levels and the values for the Automatic Call Gappings (ACG) to be sent when at the overload level.

**Keyword:** **rtrv-acg-noc**

**Related Commands:** **chg-acg-noc, dlt-acg-noc, ent-acg-noc, rept-stat-lnp**

**Command Class:** Database Administration

**Parameters**

**:lvl=** (optional)  
 Overload level  
**Range:**     **1-10**

**Example**

```
rtrv-acg-noc
rtrv-acg-noc:lvl=3
```

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

None

**Output**

The following example displays all defined overload levels:

```
rtrv-acg-noc
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
LVL  QR          AND  IND  INTVL  DRTN
3    600000      10    6    3      6
4    750000      6     6    5      7
10   2147483647  10    10   15     13
RTRV-ACG-NOC: MASP A - COMPLTD
;
```

The following example displays overload level 3:

```
rtrv-acg-noc:lvl=3
rlghncxa03w 04-01-28 08:50:12 EST EAGLE 31.3.0
LVL  QR          AND  IND  INTVL  DRTN
3    600000      10    10   3      6
RTRV-ACG-NOC: MASP A - COMPLTD
;
```

**Legend**

**LVL**—Overload level

**QR**—Query rate

**AND**—AIN number of digits

**IND**—IN number of digits

**INTVL**—Interval index

**DRTN**—Duration index

**rtrv-appl-rtkey****Retrieve Application Route Key Table**

Use this command to retrieve information from the Routing Key table. A routing key entry associates a routing key with up to 16 socket names with a limit of 2500 routing keys per system (if there are SSEDcMs).

- DPC, SI, SSN routing keys, which are used to route SCCP messages
- DPC, SI routing keys, which are used to route non-SCCP and non-ISUP messages
- DPC, SI, CIC routing keys, which are used to route ISUP messages

**Keyword:** rtrv-appl-rtkey

**Related Commands:** chg-appl-rtkey, dlt-appl-rtkey, ent-appl-rtkey

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**NOTE:** The following parameters are no longer available: loc, mode, norm, pstncat, pstnid, sname

**:asname=** (mandatory)

Application Server (AS) name assigned to this routing key.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter

**:cice=** (optional)

The end range of circuit identification codes assigned to the routing key.

**Range:** See Table A-4 for valid CIC values for specified SI and MSU types.

**:cics=** (optional)

The start range of circuit identification codes assigned to the routing key.

**Range:** See Table A-4 for valid CIC values for specified SI and MSU types.

**:display=** (optional)

This parameter specifies the type of output to display.

The output includes the type of card, the data collection being audited, and a message indicating the overall status. This parameter applies only to STP databases.

**Range:** all, brief

**all**— The KEY and the ATTRIBUTE sections of the routing key are displayed

**brief**— Only the KEY section of the routing key is displayed

**Default:** brief

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (ni-nc-ncm).

**Synonym:** dpca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:num=** (optional)

The number of entries to display.

**Range:** 1-10000

**Default:** 50

**:opc=** (optional)

ANSI originating point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** opca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Originating point code.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*)

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opcn=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opcn24=** (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:rcontext=** (optional)

Routing Context. The **rcontext** parameter is used to display the routing key with the specified routing context.

**Range:** **0-4294967295**

**:si=** (optional)

Service indicator.

**Range:** 0-15

The following equivalent text values can be specified:

**Number = Text—Description**

0 = **snm**—Signaling network management messages

1 = **regtest**—Signaling network testing and maintenance regular

2 = **spltest**—Signaling network testing and maintenance special

3 = **sccp**—SCCP

4 = **tup**—Telephone user part

5 = **isup**—ISDN user part

13 = **qbicc**

**:ssn=** (optional)

Subsystem number.

**Range:** 0-255

**:type=** (optional)

The type of routing key.

**Range:** all, full, partial, default

**Default:** all

### Example

```
rtrv-appl-rtkey
rtrv-appl-rtkey:dpc=123-234-255:si=3
rtrv-appl-rtkey:dpc=123-234-255

rtrv-appl-rtkey:type=partial
rtrv-appl-rtkey:display=all
rtrv-appl-rtkey:rcontext=7
```

### Dependencies

The **ssn** parameter is valid only when the **si=3** (or **sccp**) parameter is specified. If the **si=3** (or **sccp**) parameter is not specified, the **ssn** parameter cannot be specified.

The value specified for the starting circuit identification code (**cics**) must be less than or equal to the value entered for the ending circuit identification code (**cice**).

A circuit identification code range (**cics** to **cice**) that overlaps an existing routing key cannot be specified.

The **ssn** parameter cannot be specified when **opc**, **cics**, and **cice** are specified. See Table 5-5 for valid parameter combinations.

When the DPC is ANSI and the **si=4** parameter is specified, a DPC/SI routing key must be specified (TUP is used only in an ITU network).

The **opc**, **cics**, and **cice** parameters are allowed with the **si** parameter only when **si** equals 4, 5, or 13 (or **tup**, **isup**, or **qbicc**). Table A-4 shows valid CIC values for SI types 4, 5, and 13.

Table A-4 shows valid CIC values for SI types 4, 5, and 13.

The following types of partial routing keys are supported:

- The following types of partial routing keys are supported:
- DPC/SI/OPC (ignore CIC) can be used as a partial match key for CIC- based traffic.
- DPC/SI (ignore all other fields) can be used as a partial match key for CIC- based traffic or SCCP traffic.
- DPC only (ignore all other fields) can be used as a partial match for any type of traffic.
- SI only (ignore all other fields) can be used as a partial match for any type of traffic.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

Static routing keys are stored on disk and a copy of the table is loaded to each SS7IPGW card.

Group codes are required for ITU-N point codes (DPCN/OPCN) when the Duplicate Point Code feature is turned on.

The **display=all** parameter must be specified to display the assigned routing context value for the routing key.

In this command, the point codes support only the spare point code subtype prefix (**s-**).

## Output

**rtrv-appl-rtkey**

ANAMES

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links ports.

**Default:** Retrieve all

**:rhost=** (optional)

Remote host name. The logical name assigned to the remote host device.

[illegible]

**a-z, A-Z, 0-9, -, .** (any string of characters beginning with a letter and comprising up to 60 characters in length)

**Default:** Retrieve all

**:sname=** (optional)

Name of socket. The routing key table and maintenance commands use these names to reference individual sockets.

**Range:** *ayyyyyyyyyyyyyyy*

Up to 15 alphanumeric characters; the first character must be a letter

**Default:** All information for all sockets is retrieved

### Example

```
rtrv-appl-sock:sname=swbel32
```

## Dependencies

The **lhost**, **rhost**, and **sname** parameters must conform to the specified naming conventions.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

## Output

**rtrv-appl-sock:sname=swbel32**

### Legend

**ALW**—Whether or not to the socket is allowed to carry SS7 traffic, **YES** or **NO**.

**DCMPS**—The parameter set used by this socket, 1 to **10**.

**LHOST**—The local host name.

**LINK**—The signaling link associated with this socket.

**LPORT**—The local port name.

**OPEN**—Whether or not the connection manager is to open this socket if the socket is operational, YES or NO.

**REXMIT**—Retransmission mode to use on socket when packet loss is detected; BSD, FIXED or MOD.

**RHOST**—The remote host name.

**RPORT**—The remote port name.

**RTT**—Expected Round Trip Time for socket when REXMIT is FIXED or MOD.

**SERVER**—The role of the local socket in the client/server relationship. If YES, the server is the local side. If NO, the client is the local side.

**SNAME**—The socket name.

## rtrv-as

## Retrieve Application Server

Use this command to retrieve the characteristics of one or all Application Servers from the AS table.

**Keyword:** rtrv-as

**Related Commands:** chg-as, dlt-as, ent-as, rept-stat-as

**Command Class:** Database Administration

### Parameters

**:aname=** (optional)

Name of the association.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

**Default:** Retrieve all

**:asname=** (optional)

Name of the Application Server.

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

### Example

```
rtrv-as
```

```
rtrv-as:aname=as1
```

### Dependencies

None

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

### Output

```
rtrv-as
```

```
rlghncxa03w 05-06-05 08:40:18 EST EAGLE5 34.0.0
AS Name      Mode      Tr ms      Association Names

```

```
;
```

**rtrv-asp****Retrieve Application Server Process**

Use this command to retrieve the characteristics of one or all Application Server Processes from the ASP table.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-asp

**Related Commands:** chg-asp, dlt-asp, ent-asp,

**Command Class:** Database Administration

**Parameters**

**:aspname=** (mandatory)

Name of the Application Server Process (ASP).

**Range:** ayyyyyyyyyyyyyy

Up to 15 alphanumeric characters; the first character must be a letter.

**Example**

**rtrv-asp**

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

**rtrv-asp**

```
rlghncxa03w 03-07-04 08:40:18 EST EAGLE 31.6.0
ASP          Association          UAPS
ASP1         sock1                1
ASP2         sock2                1
ASP3         sock3                1
```

ASP Table is (3 of 4000) 1% full

;

**rtrv-asp**

```
rlghncxa03w 03-07-04 08:40:18 EST EAGLE 31.6.0

ASP          Association          UAPS
asp01        asoc01              10

```

ASP Table is (2 of 4000) 1% full

;

**rtrv-assoc****Retrieve Association**

Use this command to retrieve the configuration data from the IP Socket/Association (IPAPSOCK) table.

**Keyword:** rtrv-assoc

**Related Commands:** chg-assoc, dlt-assoc, ent-assoc, rept-stat-assoc

**Command Class:** Database Administration

**Example**

```
rtrv-assoc
```

```
rtrv-assoc:aname=swbel32
```

```
rtrv-assoc:lhost=gw105.nc.tekelec.com:adapter=sua
```

**Dependencies**

None

**Notes**

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The IPAPSOCK table is used to associate the Local Host/Local Port to a Remote Host/Remote Port. When the command is entered with the **aname**, **lhost**, or **alhost** parameters, the output displays SCTP buffer usage information (used and total buffer space on the card).

## Output

AS names are displayed for IPGWx-M3UA and SUA linksets.

LS names are displayed for IPSG linksets.

The following example with the **aname** parameter shows buffer usage (used and total buffer space) and card location information.

**rtrv-assoc:aname=m3ua03**

```
eagle101110 07-02-10 17:21:29 EST EAGLE 35.6.0

### rtrv-atinpqopts

### rtrv-atinpqopts

Use this command to retrieve the data that is used for ATI number conditioning.

**Keyword:** rtrv-atinpqopts

**Command Class:** Database Administration

#### Parameters

This command has no parameters.

#### Example

```
rtrv-atinpqopts
```

#### Dependencies

The ATINP feature must be enabled before this command can be specified.

The EGLEOPTS table is corrupt or cannot be found.

**Output**

The following example shows output with default ATINPQ options.

**rtrv-atinpqopts**

```
tekelecstp 08-08-04 07:53:46 EST EAGLE 39.2.0
```

```

ATINPQ OPTIONS
-----
ATIACKIMSI   = NONE
ATIACKMSISDN = MSISDN
ATIACKRN     = RN
SNAI         = INTL
ATIDLM       = NONE
ATIDFLTRN    = NONE
ATINPTYPE    = ANY

```

```
;
```

The following example shows output with some ATINPQ options provisioned.

**rtrv-atinpqopts**

```
tekelecstp 08-08-04 07:55:30 EST EAGLE 39.2.0
```

```

ATINPQ OPTIONS
-----
ATIACKIMSI   = IMSI
ATIACKMSISDN = NONE
ATIACKRN     = RNSP
SNAI         = NAT
ATIDLM       = 254565819324258
ATIDFLTRN    = 731964828246917
ATINPTYPE    = ALWAYS

```

```
;
```

**Legend**

- **ATIACKIMSI**—IMSI parameter for ACK response message.
- **ATIACKMSISDN**—MSISDN parameter for ACK response message.
- **ATIACKRN**—Routing Number format.
- **SNAI**—The NAI of the incoming MSISDN digits.
- **ATIDLM**—Outbound message delimiter.
- **ATIDFLTRN**—Default Routing Number.
- **ATINPTYPE**—Number Portability Type.

**rtrv-atm-lps****Retrieve ATM Link Parameter Set**

Use this command to display the parameter values for the ATM link parameter sets in the database configured with the **chg-atm-lps** command, along with the non-configurable ATM parameters.

**Keyword:** **rtrv-atm-lps**

**Related Commands:** **chg-atm-lps**

**Command Class:** Database Administration

**Parameters**

**:lpset=** (optional)

The ATM link parameter set to be displayed.

**Range:** **1-30**

**Default:** All ATM link parameter sets are displayed

**Example**

**rtrv-atm-lps:lpset=5**

**rtrv-atm-lps**

**Dependencies**

None

**Notes**

None

## Output

**NOTE: Dashes (--) in the FC NR and FC BC fields indicate that this implementation is not supported on ATM high-speed signaling links.**

**rtrv-atm-lps:lpset=5**

```

### Legend

**LPSET**—The link parameter set being changed, **1** to **30**. The system default value for this parameter is **1** for ANSI and **21** for ITU.

**ACTION**—Copy a set of ATM signaling link parameters from one parameter set to another. The value of this parameter is **copy**. If this parameter is not specified, then the copy action cannot take place.

**SCRLPSET**—The ATM signaling link parameter set used as a source for the **action=copy** parameter. This parameter can only be specified with the **action=copy** parameter.

**MAXCC**—The maximum number of transmissions of a BGN, END, ER, or RS PDU. The value of this parameter is from 1 to 10 PDUs. The system default value is 4 PDUs.

**MAXPD**—The maximum number of SD PDUs that can be sent before a POLL is sent. The value of this parameter is from 5 to 2120 PDUs. The system default value is 500 PDUs.

**MAXSTAT**—The maximum number of list elements in a STAT PDU. The value of this parameter is from 3 to 67 PDUs. The system default value is 67 PDUs.

**TMRCC**—The timer, in seconds, used during the connection phase to guard against unacknowledged BGN, END, ER or RS PDUs. The value of this parameter is from .1 to 2 seconds. The system default value is .2 seconds.

**TMRKALIVE**—The timer, in seconds, used during the transient phase when no SD PDUs are being sent to keep connection up. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRNOSP**—The timer, in seconds, used to check that STAT PDUs are arriving often enough. The value of this parameter is from .5 to 2 seconds. The system default value is 1.5 seconds.

**TMRPOLL**—The timer, in seconds, used to guarantee that POLL PDUs are sent often enough. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**TMRIDLE**—The timer, in seconds, used during the idle phase when no SD PDUs are being sent to limit time in the idle phase. The value of this parameter is from .025 to 1 seconds. The system default value is .1 seconds.

**TMRT1**—The time, in seconds, between a link release action and the next link reestablish action during alignment. The value of this parameter is from 1 to 15 seconds. The system default value is 5 seconds.

**TMRT2**—The total time, in seconds, that SSCF will attempt alignment. The value of this parameter is from 15 to 180 seconds. The system default value is 120 seconds for ANSI and 30 seconds for ITU.

**TMRT3**—The time, in seconds, between proving PDUs. The value of this parameter is from .00045 to .023 seconds. The system default value is .000925 seconds.

**N1**—The number of PDUs sent during proving. The value of this parameter is from 500 to 64552 PDUs. The system default value is 64552 PDUs for ANSI and 1000 PDUs for ITU.

**MAXNRP**—The maximum number of retransmitted PDUs during proving. The value of this parameter is from 1 to 10 PDUs. The system default value is 1 PDU for ANSI and 0 PDUs for ITU.

**TMRSREC**—The timer, in seconds, used to prohibit closely spaced SSCOP recoveries from occurring. The value of this parameter from is 60 to 10800 seconds. The system default value is 3600 seconds.

**TMRNOCRED**—The timer, in seconds, used when the no credit exists and PDUs are available to be sent. The value of this parameter is from 1 to 6 seconds. The system default value is 1.5 seconds.

**TMRERM**—The error rate monitor interval, in seconds. The value of this parameter is from .025 to .5 seconds. The system default value is .1 seconds.

**NBLK**—The number of monitoring intervals per block. The value of this parameter is from 1 to 10. The system default value is 3.

**TMRPROV**—The timer, in seconds, used to monitor the status of a link after it is placed into service. The value of this parameter from 60 to 1200 seconds. The system default value is 600 seconds.

**SDU SIZE**—The SSCOP SDU size (set to 272 octets).

**UU SIZE**—The SCOP UU size (set to 4 octets).

**N**—The monitoring intervals spanning a .4 second error event (set to 9).

**FC NR**—The fixed credit increment value.

**FC BC**—The fixed credit allocation frequency.

**TSUP**—The superblock timer for layer management, in seconds.

**TLOSS**—The loss timer for layer management, in seconds.

**ERMSM**—The error rate monitor smoothing factor.

**THRES**—The error rate monitor threshold.

## **rtrv-atm-prm**

### **Retrieve ATM Parameters**

Use this command to display system-wide non-configurable ATM layer parameters for each ATM high-speed signaling link. The data displayed includes the ATM interface parameters and the ATM traffic descriptor values.

**Keyword:** **rtrv-atm-prm**

**Related Commands:** **rtrv-atm-lps**

**Command Class:** Database Administration

#### **Parameters**

This command has no parameters.

#### **Example**

**rtrv-atm-prm**

#### **Dependencies**

None

#### **Notes**

None

**Output****rtrv-atm-prm**

```

tekelecstp 04-02-05 08:40:18 EST EAGLE 31.3.0
DS1 DS1 E1 E1 MAX MAX VCI VPI
PCR SCR PCR SCR BT CDVT QOS VPCs VCCs BITS BITS
3622 3622 4528 4528 210 100 3 0 1 16 12
;

```

**Legend**

The ATM traffic descriptors are displayed in the following fields:

**BT**—Burst tolerance. The number of consecutive cells on the VCL permitted on the ATM interface by the enforcement process, given the PCR and the line speed.

**CDVT**—The amount of cell delay variation for the VCL in the network ingress direction.

**PCR**—The maximum or peak cell rate for the VCL (virtual channel link) T1 is for ANSI and E1 is for ITU.

**QOS**—Quality of service. The performance objectives that must be met by the ATM VCL when it must discard cells during enforcement of the traffic parameters.

**SCR**—The average or sustainable cell rate supported on the VCL. T1 is for ANSI and E1 is for ITU.

The ATM interface parameters are displayed in the following fields:

**MAX VCCs**—The maximum number of simultaneously active Virtual Circuit Connections (VCCs) supported.

**MAX VPCs**—The maximum number of simultaneously active Virtual Path Connections (VPCs) supported (by the ATM interface).

**VCI BITS**—The number of allocated VCI bits to be used in the VPIs in the ATM cells for the VCLs supported on the ATM interface.

**VPI BITS**—The number of bits to be used in the VPIs in the ATM cells for the VPLs terminated on the ATM interface.

**rtrv-attr-seculog****Display Security Log Characteristic**

Use this command to display security log attributes that were configured using the **chg-attr-seculog** command.

**Keyword:** **rtrv-attr-seculog**

**Related Commands:** **chg-attr-seculog**

**Command Class:** Security Administration

**Parameters**

This command has no parameters.

**rtrv-bip****Retrieve Board Identification PROMs**

Use this command to show the board identification PROM (BIP) data for a specified card (main assembly or applique) and location.

The following information is displayed for both main assemblies and appliques: board part number, board revision, serial number (7, 8, 11, 12, or 14 digits), manufacturing date, and the software match ID.

For main assemblies, the port A ethernet address (if ENT01 record exists) and port B ethernet address (if ENT02 record exists) are also displayed.

For appliques, the applique type and ethernet address (if the applique type is ENET and ENT01 record exists) are also displayed.

**CAUTION**

**CAUTION: To have the rtrv-bip command display MAC addresses, the daughterboard must have a type of ENET.**

**Keyword:** rtrv-bip

**Related Commands:** chg-bip-fld, chg-bip-rec, disp-bip, tst-bip

**Command Class:** System Maintenance

**Parameters**

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101–1108, 1111–1113, 1115, 1201–1208, 1211–1218, 1301–1308, 1311–1318, 2101–2108, 2111–2118, 2201–2208, 2211–2218, 2301–2308, 2311–2318, 3101–3108, 3111–3118, 3201–3208, 3211–3218, 3301–3308, 3311–3318, 4101–4108, 4111–4118, 4201–4208, 4211–4218, 4301–4308, 4311–4318, 5101–5108, 5111–5118, 5201–5208, 5211–5218, 5301–5308, 5311–5318, 6101–6108, 6111–6118

HMUX and HIPR locations are not valid.

**:type=** (mandatory)

The type of board at the specified location whose BIP information is to be displayed.

**Range:** mbd, dbd

**mbd** — main assembly

**dbd** — applique

**:dbdloc=** (optional)

Applique location. This parameter specifies the location of the applique.

This parameter can be specified only for cards that support multiple appliques.

**Range:** 1-2

**Example**

The following example displays the BIP data for the main assembly.

**rtrv-bip:loc=1201:type=mbd**

The following example displays the BIP data for all appliques that are supported by the card.

**rtrv-bip:loc=1201:type=dbd**

The following example displays the BIP data for the first applique.

**rtrv-bip:loc=1103:type=dbd:dbdloc=1**

### Dependencies

The card location frame, shelf, and slot must be within the allowed range.

The card location must be valid for the command.

The **type=dbd** parameter cannot be specified for card type GPSM-II, HCAP, ATM or DCM. HMUX and HIPR cards do not contain BIP information.

The **dbdloc** parameter can be specified only for the cards that support multiple appliques.

If the **type=mbd** parameter is specified, then the **dbdloc** parameter cannot be specified.

### Notes

The **tst-bip** command verifies that the PROM is good by writing to and reading from the PROM. The **rtrv-bip** command shows the level of the BIP, as well as the board part number, the revision number, and the serial number. If the **rtrv-bip** command fails, this indicates that communication to the card has failed, and you might need to replace the card. Contact Tekelec Technical Service at (888) FOR-TKLC to find out if the card can be reprogrammed.

**Output**

The Max Power Rating is displayed only if the **type=mbd** parameter is specified. If the Card Power value is not present in BIP data, then the Max Power Rating is displayed as **Undef**.

The location of the applique is displayed only if the card supports multiple appliques.

The following example displays the 7-digit serial number of a main assembly card manufactured on the eleventh week of 1993).

**DBD TYPE**—Type of daughterboard applique.

**MAX POWER RATING**—The maximum power rating of the card.

**WEEK/YEAR**—The week (1–52) and the year (4 digits) that the card was manufactured.

## rtrv-card

## Retrieve Card

Use this command to display the information about a card. The command displays the card type, the application the card is running, the linkset name, the signaling links, and the signaling link codes. If no parameter is specified, the command displays information for all cards defined by the **ent-card** command. If the **loc** parameter is specified, the command displays information for the specified card only.

**Keyword:** rtrv-card

**Related Commands:** dlt-card, ent-card, init-card, rept-stat-card, rmv-card, rst-card

**Command Class:** Database Administration

### Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Retrieve all

**:links=** (optional)

Links Provision Status. For the card in the location specified by the **loc** parameter, all links, only equipped links, or only unequipped links are displayed. If the parameter is not specified, only the equipped links are displayed.

**Range:**       **all, equip, unequip, ipsg**

**all** — Display all possible links for the card.

**equip** — Display links that are equipped on the card.

**unequip** — Display links that are allowed but not equipped on the card.

**ipsg** — Display the SLKTPS and total card TPS used for a particular card or for all cards configured with the **ipsg** GPL.

**Default:**   **equip**

### Example

```
rtrv-card
```

```
rtrv-card:loc=1205
```

```
rtrv-card:links=ipsg
```

```
rtrv-card:loc=1111:links=ipsg
```

### Dependencies

The card location slot must be between **1** and **18** and not **9** or **10**.

The card location cannot be **1114**, **1116**, **1117**, or **1118**.

The shelf location must be **11xx**, **12xx**, **13xx**, **21xx**, **22xx**, **23xx**, **31xx**, **32xx**, **33xx**, **41xx**, **42xx**, **43xx**, **51xx**, **52xx**, **53xx**, or **61xx**.

The specified card location must be equipped in the database.

### Notes

The provisioning method of an MPL (multi-port LIM) and a two-port LIM running the **ss7ansi** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** application to allow the MPLs to replace a two-port LIM without having to reprovision the LIM in the database. The MPLs support only the LIMDS0 interface, and the **appl** value must be **ss7ansi**. The MPLs run the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the MPL cards to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the MPL card and displays its application as **ss7ansi**.

The provisioning method of an E1/T1 MIM (Multi-Channel Interface Module) and a two-port E1 card running the **ss7ansi** or **ccs7itu** application is the same, as is the function that the two cards perform. Both cards are provisioned with the **ss7ansi** or **ccs7itu** application to allow the E1/T1 MIM card to replace a two-port E1 card without having to reprovision the E1 card in the database. The **appl** value can be **ss7ansi** or **ccs7itu**. The E1/T1 MIM runs the **ss7ml** GPL (see the **rept-stat-gpl** command), which allows the card to support eight signaling link ports. The **rtrv-card** command displays the status of all ports of the E1/T1 card and displays its application as **ss7ansi** or **ccs7itu**.

## Output

**rtrv-card**

```

;

**Legend****CARD**—The card location as stenciled on the shelf of the system.**TYPE**—The type of card. (The DCM and SSEDCCM cards are card type DCM).**APPL**—The application associated with each card in the display.**LSET NAME**—The linkset name associated with the cards in the display.**LINK**

—The signaling link associated with the linkset. If the card is an MPL or MPL-T (TYPE is **limds0**, APPL is **ss7ansi**) or an E1/T1 MIM (TYPE can be **lime1**, **limt1**, or **limch**; APPL can be **ss7ansi** or **ccs7itu**), the card can support 8 ports (**a**, **a1**, **a2**, **a3**, **b**, **b1**, **b2**, and **b3**).

**SLC**—The signaling link code.**UNEQUIPPED LINKS**—Signaling links that are unequipped on the provisioned card.**SLKTPS**—Transactions Per Second configured for signaling links provisioned on the card.

## rtrv-cmd

## Retrieve Command Attributes

Use this command to retrieve the list of command classes to which a command is assigned. You can retrieve output for one command, commands in one command class, or all commands.

**Keyword:** rtrv-cmd

## Related Commands: `chg-cmd`

**Command Class:** Basic

## Parameters

**:class=** (optional)

The command class whose attributes are to be retrieved.

**Range:** *ayyyyyy*

One alphabetic character followed by up to 5 additional alphanumeric characters.

**:cmd=** (optional)

The command whose attributes are to be retrieved.

**Range:**            *zzzzzzzzzzzzzzzzzzzzzzzzzzzzzz*

One alphabetic character followed by up to 19 additional alphanumeric characters, enclosed in double quotes.

### Example

```
rtrv-cmd:cmd="ent-rte"
```

```
rtrv-cmd:class=dab
```

**rtrv-cmd**

## Dependencies

The Command Class Management feature must be enabled before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before a command from the LNPBAS class can be specified in the **cmd** parameter or before the **class=lnpbas** parameter can be specified.

The value of the **cmd** parameter must be a valid system command.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

The Command Class Management feature must be enabled before CHG-CMD or CHG-CMDCLASS command can be entered.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

## Output

The following example shows the command classes to which the **rept-stat-slk** command is assigned (non-configurable class **sys** and user-configured classes **u01**, **u02**, **krb**, and **u11**):

### **rtrv-cmd:cmd="rept-stat-slk"**

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
cmd CLASS
rept-stat-slk sys, u01, u02, krb, u11
```

;

The following example shows the commands assigned to user-configured command class **krb**:

### **rtrv-cmd:class=krb**

```
eagle10404 04-01-22 16:30:56 EST EAGLE 31.3.0
CMD CLASS
rept-stat-slk sys, u01, u02, krb, u11
act-slk link, u09, krb
ent-user sa, krb, abc, u23
alw-card sys, u09 dab, krb
```

;

### **rtrv-cmd:class=link**

## rtrv-cmdclass

## Retrieve Command Class

Use this command to retrieve the name and description of one command class or all command classes.

**Keyword:** `rtrv-cmdclass`

**Related Commands:** `chg-cmdclass`

**Command Class:** Basic

### Parameters

**:class=** (optional)

The command class whose name and description are to be retrieved.

**Range:** `ayyyyy`

1 alphabetic character followed by up to 5 alphanumeric characters

### Example

```
rtrv-cmdclass: class=krb
```

```
rtrv-cmdclass
```

### Dependencies

The Command Class Management feature must be enabled and turned on before a configurable command class name can be specified in the **class** parameter.

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before the **class=lnpbas** parameter can be specified.

The value of the **class** parameter must be a valid configurable or non-configurable command class name.

### Notes

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before class LNPBAS will appear in the command output.

The Command Class Management feature must be enabled and turned on before configurable command classes will appear in the command output.

## Output

In the following examples, the classes u01, u03, u05, and u32 are default configurable command class names. The classes krb and dab are user-assigned configurable command class names; the user changed default configurable command class name u02 to krb and changed default configurable command class name u04 to dab. The descriptions of classes krb and dab were entered with the **descr** parameter when the class names were changed with the **chg-cmdclass** command.

### **rtrv-cmdclass: class=krb**

```

## rtrv-csl

## Retrieve Common Screening List

Use this command to retrieve all Common Screening List (CSL) entries for a specified feature, a list of screening entries for the specified feature and screening list name, or a specific DS or PC value for a particular feature and screening list name. The Common Screening List commands are used to tailor certain types of general screening information to specific features.

**Keyword:** **rtrv-csl**

**Related Commands:** **dlt-csl, ent-csl, rtrv-csl, rtrv-ctrl-feat**

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:ds=** (optional)

Digit string. This parameter specifies a unique string of digits that is used by the specified screening feature.

**NOTE:** Either the **ds** parameter or the **pc** parameter must be specified. Both parameters cannot be specified in the same command.

**Range:** 1-15 digits

Valid digits are **0-9, a-f, A-F**.

1-15 digits—Prepaid IDP Query Relay **ccnc** list  
 1-6 digits—Prepaid IDP Query Relay **gta** list  
 1-10 digits—Prepaid IDP Query Relay **skbcsm** list  
 4 digits—IDP Screening for Prepaid **skts** list  
 1-15 digits—IDP Screening for Prepaid **insl** list  
 1-6 digits—TINP **acscode** and **escscode** lists  
 1-8 digits—MO-based GSM SMS NP **delpfx** list  
 1-8 digits—MO-based IS41 SMS NP **delpfx** list  
 1-15 digits—V-Flex **vmpfx** list

**:feature=** (optional)

Feature name. This parameter specifies the name of the screening feature for which the command is entered.

Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:** *abcdefghijklmnopqrstuvwxyz*

1 alphabetic character followed by up to 24 optional alphanumeric characters, including spaces and special characters, enclosed in double quotation marks (" ").

- Prepaid IDP Query Relay
- IDP Screening for Prepaid
- MO-based GSM SMS NP
- MO-based IS41 SMS NP
- TIF Number Portability
- V-Flex

**NOTE: If the TINP feature was enabled before upgrading to Release 39.2, then the TIF Number Portability value can be used to access functionality for the TINP feature. If TINP was not enabled prior to upgrade, then the TIF Number Portability value accesses functionality for only the TIF Number Portability feature.**

**:list=** (optional)

The name of the Common Screening List that is associated with the feature.

The **list** parameter must be specified when the feature uses more than one type of Common Screening List.

**Range:** **gt, skbcsm, ccnc, skts, insl, acscode, escscode, npflgrst, delpfx, vmpfx**

**gt**—Global Title List  
**skbcsm**—SK+BCSM List  
**ccnc**—CC+NC List  
**skts**—SK+TS List  
**insl**—In Network Subscriber List  
**acscode**—Access Code List  
**escscode**—Escape Code List  
**npflgrst**—NP Flag Reset List  
**delpfx**—Delete Prefix List  
**vmpfx**—Voice Mail Prefix List

The following screening lists are valid for the indicated features:

- **ccndc** , **gt**, **skbcsm**—Prepaid IDP Query Relay feature
- **skts**, **insl**—IDP Screening for Prepaid feature
- **acscode**, **esccode**, **npflgrst**—TINP feature
- **npflgrst**—TIF Number Portability feature
- **delpfx**—MO-based GSM SMS NP feature and MO-based IS41 SMS NP feature
- **vmpfx**—V-Flex feature

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code. Either the **ds** or a point code parameter must be specified.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*.

**Range:** **0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The point code **0-000-0** is not a valid point code.

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

**:pcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:pn=** (optional)

Part Number. The 9-digit "893xxxxxx" part number of the feature for which the command is entered. The **rtrv-ctrl-feat** command description shows the part number in the command output example. Either the **pn** parameter or the **feature** parameter must be specified to identify the feature.

**Range:**       **893000000-893999999**

The first 3 digits are **893**. Do not separate the digits with dashes or spaces. The following part numbers are valid for this command:

- **893016001**—Prepaid IDP Query Relay feature
- **893015501**—IDP Screening for Prepaid feature
- **893018901**—TIF Number Portability feature
- **893019401**—MO-based GSM SMS NP feature
- **893019501**—MO-based IS41 SMS NP feature
- **893016701**—V-Flex feature

**NOTE: If the TINP feature was enabled before upgrading to Release 39.2, then part number 893018901 can be used to access functionality for the TINP feature. If TINP was not enabled prior to upgrade, then part number 893018901 accesses functionality for only the TIF Number Portability feature.**

### Example

**rtrv-csl**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc:ds=456789**

**rtrv-csl:feature="Prepaid IDP Query Relay":list=ccnc**

**rtrv-csl:feature="IDP Screening for  
Prepaid":list=insl:ds=123456789abcDEF**

**rtrv-csl:feature="MO-based IS41 SMS NP"**

### Dependencies

The value specified for the **feature** parameter must be a valid feature name for a feature that uses a Common Screening List. The feature must be specified as it appears in the **rtrv-ctrl-feat** command output. Enough of the name must be specified to make the name unique when two features begin with the same word or acronym. The specified feature name must be valid for a feature that uses a Common Screening List.

The value specified for the **list** parameter value must be valid for the specified screening feature. The following **list** parameter values are valid for the indicated feature:

- **skts, insl**—IDP Screening for Prepaid feature

- **gt, ccndc, skbcsm**—Prepaid IDP Query Relay feature
  - **vmpfx**—V-Flex feature
  - **acscode, esccode, npflgrst**—TINP feature
  - **npflgrst**—TIF Number Portability feature
- delpfx**—MO-based GSM SMS NP feature and MO-based IS41 SMS NP feature

The following parameters are allowed with the indicated common screening list type:

- **list=gt—ds** parameter
- **list=ccndc—ds** parameter
- **list=delpfx—ds** and **p1** parameters
- **list=skbcsm—ds** parameter
- **list=skts—ds** parameter
- **list=insl—ds** parameter
- **list=vmpfx —ds** parameter
- **list=acscode—ds** parameter
- **list=esccode—ds** parameter
- **list=npflgrst—pc/pca/pci/pcn/pcn24** parameter

The **pc** and **ds** parameters cannot be specified together in the command.

#### Notes

None

**Output**

Retrieve the specified screening entry for the the specified feature and screening list.

## rtrv-cspc

## Retrieve Concerned Signaling Point Code

Use this command to show one or more lists of concerned signaling point codes that are to be notified when subsystem-prohibited or subsystem-allowed messages are received for an associated mate application.

**Keyword:** rtrv-cspc

**Related Commands:** dlt-cspc, ent-cspc

**Command Class:** Database Administration

### Parameters

**:grp=** (optional)

Group name

**Range:** ayyyyyyy

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** Retrieve all.

### Example

**rtrv-cspc**

**rtrv-cspc:grp=grp01**

### Dependencies

If specified, the group name must exist in the database.

### Notes

If no group parameter is specified, a summary list of group names is displayed with an indication of network type and a percent full indication for each group.

**Output**

When the ANSI-ITU-China SCCP Conversion feature is on, point codes from mixed domains are allowed in a group.

**rtrv-cspc**

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp02 ANSI, ITU, ITU-N24 3%
Grp03 ITU 2%
;
```

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-**prefix. The ANSI-ITU-China SCCP Conversion feature is on in this example.

**rtrv-cspc:grp=grp02**

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PC Type
GRP02 001-012-123 A
      001-012-124 A
      7-089-0 I
      s-2-021-4 I
      s-00789 N
;
```

When the ANSI-ITU-China SCCP Conversion feature is not on, point codes from only one domain are allowed in a group.

**rtrv-cspc**

```
rlghncxa03w 04-01-07 11:43:02 EST EAGLE 31.3.0
CSPC GRP NETWORK PERCENT FULL
Grp01 ANSI 2%
Grp03 ITU 2%
;
```

When the Spare Point Code Support feature is on, groups can include spare point codes with the **s-**prefix. The ANSI-ITU-China SCCP Conversion feature is not on in this example.

**rtrv-cspc:grp=groupi**

```
rlghncxa03w 05-01-07 11:43:02 EST EAGLE 31.12.0
CSPC GRP PCI
groupi 7-089-0
      s-2-021-4
;
```

**Legend**

**CSPC PC TABLE IS 15% FULL**—The relative size of the CSPC point code tables.

**CSPC GRP**—The name of the CSPC broadcast group.

**NETWORK**—The network type or types associated with the point code or codes in the group. (When no parameters are specified in the command, only the groups are listed. The **grp** parameter must be specified to list the point codes in the specified group.)

**PERCENT FULL**—The relative size of the CSPC broadcast group.

**PC**—The point codes that make up the CSPC broadcast group.

**TYPE**—The network type of the point code in the group. (The **grp** parameter is specified in the command to list the point codes in the specified group.)

**rtrv-ctrl-feat****Retrieve Controlled Feature**

Use this command to retrieve the status of feature access key controlled features that are purchased and enabled in the system.

**Keyword:** **rtrv-ctrl-feat**

**Related Commands:** **chg-ctrl-feat, enable-ctrl-feat**

**Command Class:** Database Administration

**Parameters**

**:enable=** (optional)

Retrieve controlled features that are enabled with either temporary feature access keys or permanent feature access keys.

**Range:** **temp, perm**

**Default:** Retrieve controlled features for both temporary and permanent feature access keys

**:expired=** (optional)

Retrieve controlled features with expired temporary feature access keys.

**Range:** **yes, no**

**Default:** **no**

**:partnum=** (optional)

The Part Number to retrieve or the command.

**Range:** **893000000 - 893999999**

Do not include dashes in the 9-digit number.

**Default:** Retrieve all controlled features

**:status=** (optional)

Retrieve features with the specified status (On or Off).

**Range:** **on, off**

**Default:** Retrieve features with On and Off status

**Example**

```
rtrv-ctrl-feat
```

```
rtrv-ctrl-feat:partnum=893000110
```

```
rtrv-ctrl-feat:enable=perm
```

**Dependencies**

None

**Notes**

When the **enable=perm** parameter is specified, the **expired** parameter value is understood to be **no**.

The product right-to-use features (EAGLE5, EAGLE, and IP<sup>7</sup>) are not mutually exclusive. The hierarchy for product right-to-use features is EAGLE5, then EAGLE, then IP<sup>7</sup>. This means that if the EAGLE5 feature is on, the product is EAGLE5 regardless of the setting of the other product right-to-use features. Some EAGLE 5 ISS features require that a specific product right-to-use feature is enabled and turned on.

For systems being upgraded, the product right-to-use feature for the specific product is turned on. For example, upgrading from an EAGLE 5 ISS release in a system that uses no EAGLE 5 features to a release that uses at least one EAGLE 5 feature causes the EAGLE 5 product right-to-use feature to be enabled and turned on during the conversion.

For new installation, no product right-to-use features are on. The appropriate product right-to-use feature for the highest required product in the hierarchy must be enabled and turned on.

## Output

The following output examples will differ from the output shown at your terminal and might include features that are not supported in your system. A feature must be purchased before you can enable the feature and turn the feature on. If you are not sure whether you have purchased a feature, contact your Tekelec Sales Representative or Account Representative.

If a Part Number (**partnum** parameter) is entered that belongs to a feature associated with quantity, the output will show which quantity is currently enabled on the system, even if the specified Part Number is for a different quantity. The output will also include the temporary enabled information, if applicable.

**rtrv-data-rtddb****Retrieve Data RTDB**

This command retrieves data from the RTDB on an active Service Module card. If the **loc** parameter is specified and the target card is an active Service Module card, the RTDB data is retrieved from that card. If the **loc** parameter is not specified, the data is retrieved on the active Service Module card that has the lowest IMT address. The RTDB status on the active Service Module card can be coherent or incoherent.

For LNP database items (TN) all Service Module cards are queried for the existence of the specified item. Either the Service Module card specified by the **loc** parameter or the Service Module card with the lowest IMT address returns full item information. Any remaining Service Module cards return either COHERENT or INCOHERENT if the item is found in the RTDB on the card.

**Keyword:** **rtrv-data-rtdb**

**Related Commands:**

**Command Class:** Database Administration

### Parameters

**:dn=** (optional)

Dialed Number.

**Range:** 5-15 digits

**:entity=** (optional)

Network Entity.

**Range:** 5-15 digits

**:entitytype=** (optional)

Entity Type.

**Range:** **sp, rn, vmsid, grn**

**sp**— Service Provider: Any 10-digit TN

**rn**— Routing Number: Any 10-digit TN

**vmsid**— Voice Mail Server ID: Any 1-15 digit hexadecimal number

**grn**— Generic Routing Number: Any 1-15 digit hexadecimal number

**:imei=** (optional)

International Mobile Equipment Identity.

**Range:** 14 digits

**:imsi=** (optional)

International Mobile Subscriber Identity.

**Range:** 5-15 digits

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** **1101-1108, 1111-1117, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**:lrn=** (optional)

Location Routing Number.

**Range:** 10 digits

**:npanxx=** (optional)

Numbering Plan Area.

**Range:** 6 digits

**:tn=** (optional)

Telephone Number.

**Range:** 10 digits

### Example

**rtrv-data-rtdb:tn=9194663133**

**rtrv-data-rtdb:npnxx=919466**

**rtrv-data-lrn=9194460000**

**rtrv-data-rtdb:imsi=12345**

**rtrv-data-rtdb:dn=12345**

**rtrv-data-rtdb:entity=abcdefghijklm**

Retrieve DN information from a specific Service Module card.

**rtrv-data-rtdb:dn=1919555444:loc=1107**

Retrieve entity data from a specific Service Module card.

**rtrv-data-rtdb:entity=12345:loc=1107**

## Dependencies

The specified card location must be equipped in the database.

At least one of the following parameters must be specified: **imsi**, **dn**, **entity**, **imei**, **entitytype**, **npnxx**, **lrn**, **tn**.

Only one of the **tn**, **lrn**, or **npnxx** parameters can be specified in the command.

If the **npnxx**, **lrn**, or **tn** parameter is specified, the LNP ELAP Configuration feature must be on.

If the AINPQ, EIR, G-Flex, G-Port, INP, Prepaid IDP Relay Query, Prepaid SMS Intercept Ph1 (PPSMS), or V-Flex feature is turned on, or the ATINP feature is enabled, then the **imsi**, **dn**, **entity**, **imei**, or **entitytype** parameter must be specified.

If the **imsi** parameter is specified, then the G-Flex feature or the EIR feature must be turned on.

The G-Flex, G-Port, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **entity** parameter can be specified.

If the **entitytype** parameter is specified, the **entity** parameter must be specified.

If the **imei** parameter is specified, the EIR feature must be turned on.

The destination specified by the **loc** parameter must correspond to a Service Module card running the **vsccp** application.

The destination specified by the **loc** parameter must correspond to a Service Module card that is IS-NR.

A primary Service Module card must be provisioned.

The G-Flex, G-Port, INP, Prepaid SMS Intercept Ph1, or V-Flex feature must be turned on, or the ATINP feature must be enabled before the **dn** parameter can be specified.

## Notes

For DN and DN Block entries, whichever entity is provisioned in the order of SP/RN, VMSID, GRN, will become EntIdx1.

**Output**

Retrieve LRN Data.

**NOTE: A value of "---" in the TT column indicates that the service does not have a translation type defined in the EAGLE 5 ISS and that call processing will ignore the override data displayed.**

### Legend

**CARD LOC**—Location of the card that contains the retrieved information.

**STATUS**—RTDB database status; Coherent or Incoherent.

**IMSI**—International Mobile Subscriber Identity.

**ENTIDX**, **ENTIDX1**, **ENTIDX2**—The hexadecimal index at which the Network Entity data is stored in the Entity Bucket on the Service Module card.

**IMEI INDEX**—The hexadecimal index at which the IMEI data is stored in the IMEI Bucket on the Service Module card.

**ENTITY ADDRESS**—Hexadecimal Network Entity address.

**Type**—Network Entity type; Service Provider (SP), Routing Number (RN), Voice Mail Server ID (VMSID) or Generic Routing Number (GRN).

**PC** (*type of PC*)—Point code and type of point code (ANSI; NATL - ITU National with or without group code (-gg)).

**RI**—Routing Indicator

**SSN**—Subsystem Number.

**TT**—Translation Type.

**NP**—Numbering Plan

**DA**—Digits action (Prefix, Suffix, or none)

**SRFIMSI**—Signaling Relay Function IMSI

**IMSI**—International Mobile Subscriber Identity.

**NSSN**—New Subsystem Number (yes or no)

**CCGT**—Cancel GT (yes or no)

**NTT**—New Translation Type

**NNP**—New Numbering Plan

**NNAI**—New Nature of Address Indicator.

**IMEI**—International Mobile Equipment Identity.

**VERSION**—IMEI data version.

**BLACK, WHITE, GRAY**—Equipment Identity Register search lists.

**DN**—Dialed Number.

**PORTABILITY TYPE** (*number*)—

- 0—Not known to be ported
- 1—Own number ported out
- 2—Foreign number ported to Foreign network
- 3—Prepaid Short Message Service (PPSMS) subscriber on server #1

## rtrv-dcmps

## Retrieve Database Communication Module Parameter Set

Use this command to retrieve the sets of generic timers and parameters that can be used by any system application.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-dcmps

**Related Commands:** chg-dcmps

**Command Class:** Database Administration

### Parameters

**:set=** (optional)

The set number.

**Range:** 1-10

**Default:** All parameter sets are displayed

### Example

```
rtrv-dcmps:set=1
```

### Dependencies

None

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output****rtrv-dcmps:set=1**

;

**rtrv-dlk****Retrieve Data Link**

Use this command to show the parameters of a TCP/IP data link.

**Keyword:** rtrv-dlk

**Related Commands:** act-dlk, canc-dlk, dlt-dlk, ent-dlk, rept-stat-dlk, tst-dlk

**Command Class:** Database Administration

**Parameters**

**:ipaddr=** (optional)

The TCP/IP data link's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255  
4 numbers separated by dots  
1-223—first number  
0-255—the other three numbers  
**Default:** Display all.

**:loc=** (optional)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118  
**Default:** All TCP/IP data links are shown.

### Example

```
rtrv-dlk
rtrv-dlk:loc=1201
rtrv-dlk:ipaddr=193.4.201.34
```

### Dependencies

This command can be entered with no parameters or with one of the optional parameters **loc** or **ipaddr**; however, both **loc** and **ipaddr** cannot be specified in the same command.

The shelf and card must be equipped.

The specified card must have a TCP/IP data link assigned to it.

If the **ipaddr** parameter is specified, the IP address must be assigned to a TCP/IP data link.

### Notes

None

## Output

In the following example, cards at location 1201 and 1203 are ACMENET cards running the **stplan** application. For these cards, the value of the auto parameter is defaulted to no, and the value of the duplex parameter is defaulted to half.

The cards at location 1101, 1103 and 1107 are DCM or E5-ENET cards running the **stplan** application. For these cards, if the **auto=yes** parameter is specified, then the values of **speed** and **duplex** parameters are not shown.

### rtrv-dlk

```
tekelecstp 07-02-06 11:12:47 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101  192.168.63.34   100Mbit  FULL    NO
1103  192.168.63.11   10Mbit   HALF    NO
1107  192.168.63.12   -----  ----    YES
1201  192.168.63.13   10Mbit   HALF    NO
1203  192.168.63.14   10Mbit   HALF    NO
```

;

### rtrv-dlk:loc=1101

```
tekelecstp 07-02-01 14:09:13 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1101  192.168.63.34   100Mbit  FULL    NO
```

;

### rtrv-dlk:ipaddr=192.168.63.11

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
1103  192.168.63.11   10Mbit   HALF    NO
```

;

In the following example, the specified IP address is not assigned to a TCP/IP data link.

### rtrv-dlk:ipaddr=193.4.201.28

```
tekelecstp 07-02-01 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR not assigned to a TCP/IP Link.
```

;

In the following example, there are no TCP/IP data links in the database.

### rtrv-dlk

```
tekelecstp 07-02-02 14:19:14 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
No TCP/IP Links are defined in the database.
```

;

In the following example, the specified IP address is assigned to a TCP/IP node instead of a TCP/IP data link.

### rtrv-dlk:ipaddr=193.4.201.63

```
tekelecstp 07-02-01 12:12:10 EST EAGLE 37.0.0
LOC  IPADDR          LINK SPEED  DUPLEX  AUTO
IPADDR assigned to a TCP/IP Node.
```

;

## Legend

**IPADDR**—The IP address associated with the interface on the data link.

**LOC**—The card location containing the data link.

**LINK SPEED**—The bandwidth for the interface in megabits per second, **10** or **100**.

**AUTO**—Whether or not to automatically determine duplex and speed. If the value is **yes**, then duplex and speed are automatically determined. If the value is **no**, then duplex and speed are not automatically determined.

**DUPLEX**—The mode of operation of the interface. Possible values are **half** and **full**.

## rtrv-dstn

## Retrieve Destination

Use this command to show the destination point code entries in the Destination point code table.

**Keyword:** rtrv-dstn

**Related Commands:** chg-dstn, chg-rte, dlt-dstn, dlt-rte, ent-dstn, ent-rte, rept-stat-dstn, rtrv-rte

**Command Class:** Database Administration

### Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:aliasa=** (optional)

ANSI alias point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Range:** 000-255, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:aliasa/aliasi/aliasn/aliasn24=** (optional)

Alias point code.

**:aliasi=** (optional)

ITU international alias point code with subfields *zone-area-id*. This parameter is not valid if an ITU international (**dpci**) point code is entered. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:aliasn=** (optional)

ITU national alias point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfcmfi** flexible

point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn, prefix-nnnnn-gc, prefix-m1-m2-m3-m4, prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:aliasn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:cli=** (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by 10 alphanumeric characters

**Default:** **none**

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international destination point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national destination point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, p-, ps-, 0-16383, aa-zz, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—s-, p-, ps-

*nnnnn*—0-16383, \*

*gc*—aa-zz, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national destination point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:msar=** (optional)

Memory space accounting report. When the NRT feature or the CRMD feature, or both, is turned on, this parameter specifies whether summary or detail destination table memory space accounting information is displayed. The **summary** report or the **detail** report appears following the destination information that is requested by entering the command with or without other parameters. The **only** parameter value displays a detail destination table memory space accounting report without any other destination information. If neither feature is on, only the summary report information is displayed; the detail report information cannot be displayed.

**Range:** detail, only, summary

**Default:** **detail**—if **rtrv-dstn** is entered with no parameters

**summary**—if **rtrv-dstn** is entered with parameters

**:ncai=** (optional)

Nested cluster allowed indicator. This parameter specifies whether the route to the cluster point code can be different for provisioned members of the cluster and whether clusters with nested cluster point codes (**ncai=yes**), or clusters that do not allow nested cluster point codes (**ncai=no**) are displayed.

**Range:**     **yes, no**

**yes** — Display clusters with the **ncai** set to **yes**

**no** — Display clusters with the **ncai** set to **no**

**:pcst=** (optional)

Point code subtype. If selected, this parameter causes the command to display only point codes with no subtype prefix or only point codes of a specified subtype.

**Range:**     **none, p, ps, s**

**none** — Display only point codes without subtype prefixes

**p** — Display only private point codes (subtype prefix **p-**)

**ps** — Display only private and spare point codes (subtype prefix **ps-**)

**s** — Display only spare point codes (subtype prefix **s-**)

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:**     **ansi, itui, itun, itun24**

**ansi** — Display only ANSI point codes

**itui** — Display only ITU International point codes

**itun** — Display only ITU National point codes

**itun24** — Display only 24-bit ITU National point codes

**:ppc=** (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

**Range:**     **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:ppc/ppca/ppci/ppcn/ppcn24=** (optional)

Proxy Point Code.

The proxy point code must be a full point code.

**:ppci=** (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**     **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:ppcn=** (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-**, **0-16383**, **aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:ppcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:prx=** (optional)

Proxy point code indicator.

**Range:** **yes**, **no**

**yes** — Will be used as a proxy point code

**no** — Will not be used a proxy point code.

**:spc=** (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **spca**

**Range:** **p-**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Example**

The following example displays all encountered destination point codes that are members of network cluster 20-2 as well as the cluster address:

**rtrv-dstn:dpca=20-2-\*\*\***

The following example displays the destination with an ANSI alias of 222-200-200:

**rtrv-dstn:aliasa=222-200-200**

The following example displays all encountered ANSI alias destination point codes that have a network indicator (ni) of 222 and a network cluster (nc) of 200:

**rtrv-dstn:aliasa=222-200-\*\***

The following example displays the destination with a CLLI of rlghncbb001:

**rtrv-dstn:clli=rlghncbb001**

The following example displays the secondary point code 6-6-6:

**rtrv-dstn:spc=6-6-6**

The following example displays the retrieval of clusters with ncai set to yes:

**rtrv-dstn:ncai=yes**

The following example displays a single cluster (the NRT feature must be turned on):

**rtrv-dstn:dpc=010- \*- \***

The following example displays a single ITU national destination (the ITUDUPPC feature must be turned on):

**rtrv-dstn:dpcn=3-15-15-15-fr:spc=1-15-15-15-fr**

The following example displays all ITU national group codes by duplicate point code:

**rtrv-dstn:dpcn=2050- \***

The following example displays all ITU national point codes within a group code:

**rtrv-dstn:dpcn=\*-fr**

The following example displays 24-bit ITU national point code 15-100-10:

**rtrv-dstn:dpcn24=15-100-10**

The following example displays 24-bit ITU national secondary point code 99-99-99:

**rtrv-dstn:spcn24=99-99-99**

The following example displays 24-bit ITU national alias point code 4-4-4:

**rtrv-dstn:aliasn24=4-4-4**

The following example displays a private point code:

**rtrv-dstn:dpca=p-12-12-12**

The following examples display a private and spare point code:

**rtrv-dstn:dpcn=ps-123**

**rtrv-dstn:dpci=ps-1-234-1**

The following example displays all ANSI private point codes:

**rtrv-dstn:pctype=ansi:pcst=p**

The following example displays all ITU international spare point codes:

**rtrv-dstn:pctype=itui:pcst=s**

The following example displays all ITU national private and spare point codes:

**rtrv-dstn:pctype=itun:pcst=ps**

The following example displays all 24-bit ITU national private point codes:

**rtrv-dstn:pctype=itun24:pcst=p**

The following example displays all ANSI point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=ansi**

The following example displays all ITU international point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itui**

The following example displays all ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun**

The following example displays all 24-bit ITU national point codes that do not have point code subtype prefixes:

**rtrv-dstn:pctype=itun24**

The following example displays all point codes that do not have point code subtype prefixes:

**rtrv-dstn:pcst=none**

The following example displays all private point codes:

**rtrv-dstn:pcst=p**

The following example displays all spare point codes:

**rtrv-dstn:pcst=s**

The following example displays all private and spare point codes:

**rtrv-dstn:pcst=ps**

The following example displays all proxy destinations.

**rtrv-dstn:prx=yes**

The following example displays all destinations using a specified proxy point code.

**rtrv-dstn:ppc=1-1-1**

## Dependencies

**NOTE:** A *full point code* contains numerical values for all three segments of the point code.

Only one destination point code parameter, or one alias point code parameter, or one CLLI parameter can be specified in the command; these parameters cannot be specified together in the command.

The specified destination address must already be defined in the Destination point code table.

If the **dpcn** parameter or the **aliasn** parameter is specified, the format must match the format that was assigned with the **chg-stpopts:npcfmti** parameter.

If specified (except when **spc=none**), the secondary point code must be a full point code.

Cluster destinations are allowed only if the Cluster Routing Management and Diversity (CRMD) feature is turned on.

Alias point codes must be specified as full point codes.

If specified, the **clli** parameter value must already be defined in the Route table.

When the **msar=only** parameter is specified, no other parameters can be specified in the command.

Network routing is valid only if the Network Routing (NRT) feature is turned on.

When using network routing, if the destination point code has a value of \* in the *nc* subfield, the *ncm* subfield must also be \* (for example, **dpc=21-\*-\***).

The **pcst** parameter value **s** or **ps** cannot be specified when the **pctype** value **ansi** or **itun24** is specified.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters.

The **clli** parameter value cannot be **none**.

DPC must be a valid point code.

The Proxy Point Code feature must be enabled before the **prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The **prx** parameter can be specified with only the **pctype**, **pcst**, or **msar** parameter.

The **ppc** parameter can be specified with only the **msar** parameter.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes and aliases support the spare point code subtype prefix (**s-**). Only ITU-international and ITU national point codes support the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**). Aliases do not support the private (internal) point code prefix.

Table 5-68 provides a summary description of the reports that are produced by the various DPC parameter syntaxes.

**Table 5-68.** Summary of DPC Parameter Syntaxes

| DPC format                                 | Meaning                                                                                                                                                                                                                              |
|--------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>rtrv-dstn:dpc=</b> <i>ni-nc-ncm</i>     | Requests a report for fully provisioned destination <i>ni-nc-ncm</i> .                                                                                                                                                               |
| <b>rtrv-dstn:dpc=</b> <i>ni-*-*</i>        | Requests a report for provisioned network destination with the specified network indicator. Note that if * is specified in the <i>nc</i> field, * must be specified in the <i>ncm</i> field.                                         |
| <b>rtrv-dstn:dpc=</b> <i>ni-**-*</i>       | Requests a report for the full network cluster for the specified <i>ni</i> .                                                                                                                                                         |
| <b>rtrv-dstn:dpc=</b> <i>ni-***-*</i>      | Requests a report for the full network cluster and the network cluster address (if any) for the specified <i>ni</i> .                                                                                                                |
| <b>rtrv-dstn:dpc=</b> <i>ni-nc-*</i>       | Requests a report for provisioned cluster destination <i>ni-nc-*</i> .                                                                                                                                                               |
| <b>rtrv-dstn:dpc=</b> <i>ni-nc-**-*</i>    | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. Note, however, that the network cluster address on <i>ni-nc-*</i> (if it exists) is not reported. |
| <b>rtrv-dstn:dpc=</b> <i>ni-nc-***</i>     | Requests a report showing all destinations whose network ( <i>ni</i> ) and cluster ( <i>nc</i> ) components match those specified. The network cluster address <i>ni-nc-*</i> (if it exists) is also reported.                       |
| <b>rtrv-dstn:dpcn24=</b> <i>msa-ssa-sp</i> | Requests a report for fully provisioned 24-bit ITU-N destination <i>main signaling area-sub signaling area-signaling point</i> .                                                                                                     |

#### Asterisks in ANSI Point Codes

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-\*\*-\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

#### ***Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes***

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfmti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-\*-ab** is valid; **\*-15-\*-\*-\*-ab** is not valid).

If the Proxy Point Code feature is enabled, then the values specified for the **ppc** and **dpc** parameters must be full point codes. Cluster point codes and private point codes are not supported.

## Output

### *Destination Table Memory Space Accounting Information*

Each output example for this command shows the display of destination table memory space accounting information. The **msar** parameter value and the NCR, NRT, CRMD, and Origin-based MTP Routing feature settings determine whether a summary report or a detail report is displayed.

#### *Summary Report*

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the summary report is displayed when the command is entered with and without parameters specified and for all of the **msar** parameter values. The detail report cannot be displayed. The summary information appears at the end of the requested destination information, or appears without any other destination information when the **msar=only** parameter is specified.

When one or more of the NCR, NRT, CRMD, and Origin-based MTP Routing features are on, the summary report is displayed:

- When the command is entered with one or more parameters to select the specific destination information to be displayed. The summary information appears at the end of the requested destination information. (The **msar=summary** parameter value is the default in this case.)
- When the command is entered with only the **msar=summary** parameter specified. The summary information appears at the end of the destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The **chg-stpopts** command **mtpdpcq** parameter must be set to the value of the Routes or Routesets quantity feature to allow the maximum number of destinations to be provisioned.

The number currently provisioned is the value *x*, the allowed maximum is the value *y*, and the table percent full is the value *z* shown in the following first line of the summary report:

Destination table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 2000 destinations can be provisioned.
- When the DSTN5000 (5000 Routes) feature bit is on, a maximum of 5000 destinations can be provisioned.
- When the 6000, 7000, or 8000 Routesets quantity feature is enabled, a maximum of the corresponding number of destinations can be provisioned.

The maximum number of aliases that can be provisioned depends on the quantity features that are on in the system (see the **rtrv-feat** dstn5000 entry and the **rtrv-ctrl-feat** Routesets entry). The number currently provisioned is the *x* value, the allowed maximum is the *y* value, and the table percent full is the *z* value shown in the following second line of the summary report:

Alias table is (*x* of *y*) *z*% full

- When no Routes or Routesets quantity features are on in the system, a maximum of 12000 aliases can be provisioned.
- When the DSTN5000 feature bit is on, a maximum of 12000 aliases can be provisioned.
- When the 6000 Routesets feature quantity is enabled, a maximum of 12000 aliases can be provisioned.

- When the 7000, or 8000 Routesets quantity feature is enabled, a maximum of 8000 aliases can be provisioned.

#### Detail Report

When the NCR, NRT, CRMD, and Origin-based MTP Routing features are off, the detail report cannot be displayed.

When one or more of the NCR, NRT, CRMD, or Origin-based MTP Routing features are on, the detail report is displayed:

- When the command is entered with no parameters. The detail report appears at the end of the destination information. (The **msar=detail** parameter value is the default in this case.)
- When the **msar=detail** parameter is specified with one or more other parameters to select the specific destination information to be displayed. The detail report appears at the end of the requested destination information.
- When the **msar=only** parameter is specified. The detail report appears with no other destination information.

The maximum number of destinations that can be provisioned depends on the Routes and Routesets quantity features that are on in the system (see the **rtrv-feat dstn5000** entry and the **rtrv-ctrl-feat Routesets** entry). The **chg-stpopts mtpdpcq** parameter must be set to the value of the quantity feature to allow the maximum number of destinations to be provisioned. The possible maximum numbers of destinations are described in the *Summary Report* section.

In the example of the detail report, the allowed maximum number of destinations is the DESTINATION ENTRIES ALLOCATED value. The list of values under the allocated value includes the TOTAL DPCs currently provisioned and the Destination table CAPACITY (% FULL).

The allowed maximum number of aliases is the ALIASES ALLOCATED value. The list of values under the allocated value include the current number of ALIASES USED and the Aliases table CAPACITY (% FULL). The possible maximum numbers of aliases are described in the *Summary Report* section.

The output for the **rtrv-dstn** command does not change when the Proxy Point Code feature is on.

The following example shows destination table memory space accounting information contained in a summary report. In the example, the **msar=only** parameter is specified and the NCR, NRT, CRMD, and Origin-based MTP Routing features are all off. The Summary Report information appears without any other destination information.

#### **rtrv-dstn:msar=only**

```
rlghncxa03w 06-06-01 16:02:05 EST  EAGLE 35.0.0
Destination table is (0 of 2000) 0% full
Alias table is (0 of 12000) 0% full
RTRV-DSTN: MASP A - COMPLTD
```

;

The following example shows the destination table memory space accounting information contained in a detail report. In the following example, the **msar=only** parameter is specified and one or more of the NCR, NRT, CRMD or Origin-based MTP Routing features are on. The Detail Report information appears without any other destination information.

**DOMAIN**—Destination Entity Domain.

**PPC**—Proxy Point Code.

**PRX**—Proxy Point Code Indicator.

**RSN**—Routeset Name.

## rtrv-e1

## Retrieve E1 Information

Use this command to retrieve information for a specified E1 interface or for all E1 interfaces that have been defined by the **ent-e1** command for a 2-port E1 card, an E1/T1 card, an HC-MIM card, an E5-E1T1 card that is used as an E1 card, or an HC-MIM card or E5-E1T1 card used as an SE-HSL card. The following information can be retrieved: card location, E1 port number, CRC4, CAS/CCS, encoding/decoding, channel bridging, timing source, international NFAS data, and national NFAS data.

**Keyword:** **rtrv-e1**

**Related Commands:** **chg-e1**, **dlt-e1**, **ent-e1**, **tst-e1**

**Command Class:** Database Administration

### Parameters

**:loc=** (mandatory)

The card location as stenciled on the shelf of the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** If not specified, all E1 card locations are listed.

**:e1port=** (optional)

E1 port number. The value must be an E1 port that has already been configured with an E1 interface on the specified E1 card.

**Range:** 1-8

Ports 3 - 8 can be specified only for HC-MIM and E5-E1T1 cards.

**Default:** If not specified, all E1 ports are listed.

### Example

```
rtrv-e1
```

```
rtrv-e1:loc=1307:e1port=2
```

```
rtrv-e1:loc=1311:e1port=1
```

### Dependencies

The **loc** and **e1port** parameters must both be specified if any parameters are specified for the command.

The specified card location (**loc** parameter) must be equipped.

The card in the specified card location (**loc** parameter) must be a **lime1** card type.

The port specified by the **e1port** parameter must be already equipped with an E1 interface.

**rtrv-e1**

**Commands**

**Notes**

None.

**Output**

The following example shows HC-MIM cards used as E1 cards. Cards with CHANBRDG=MASTER or CHANBRDG=SLAVE have 2 ports configured in channel bridging mode to allow non-signaling data pass-through.

**rtrv-e1**

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 33.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  CLASS  RATE

LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MINSU
1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
```

;

The following example shows HC-MIM cards used as E1 cards. Cards with LINKCLASS=UNCHAN have SE-HSL links.

**rtrv-e1**

```
rlghncxa03w 05-01-20 09:07:58 EST EAGLE5 34.0.0
E1
LOC  PORT  CRC4  CAS  ENCODE  E1TSEL  SI  SN  CHANBRDG  LINK  MINSU
1307  7      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 1000
1307  8      ON   ---  HDB3    LINE    -- --  -----  UNCHAN 2000
1311  1      OFF  ON   AMI     LINE    1  1  -----  CHAN   ----
```

;

**Legend**

**LOC**—E1 card location in an EAGLE 5 ISS shelf.

**E1PORT**—E1 port number on an E1 card.

**CRC4**—CRC4 indicator.

**CAS**—CAS/CRC indicator (**on** = CAS is used; **off** = CRC is used).

**ENCODE**—Indicator for use of HDB3 or AMI encoding/decoding.

**E1TSEL**—E1 timing source indicator (**external** = master timing source; **line** = slave timing source; **recovered** = the timing source for the even-numbered port in a channel bridged pair is recovered from the odd-numbered port of the pair.)

**SI**—Value of two Spare International bits of NFAS data.

**SN**—Value of five Spare National bits of NFAS data.

**CHANBRDG**—Indicates whether an odd numbered port is not channel bridged with its adjacent even numbered port for non-signaling data pass through (dashes), or the port is the odd-numbered channel bridged port on the card (MASTER), or the port is the even-numbered channel bridged port on the card (SLAVE) on an HC-MIM or E5-E1T1 card.

**LINKCHAN**—Indicates whether an HC-MIM or E5-E1T1 card is used as a "channelized" E1 Card (CHAN) or an "unchannelized" SE-HSL card (UNCHAN).

**MINSURATE**—Minimum number of signaling units present on a link uniformly distributed. A value appears in this field only when the LINKCHAN field value is UNCHAN.

**TSx**—Timeslot.

**rtrv-eisopts****Retrieve EAGLE Support for Integrated Sentinel Options**

Use this command to retrieve the status (on or off) of the copy function for the EAGLE 5 Integrated Monitoring Support (E5IS) feature.

**Keyword:** rtrv-eisopts  
**Related Commands:** chg-eisopts  
**Command Class:** Security Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-eisopts**

**Dependencies**

The EAGLE 5 Integrated Monitoring Support (E5IS) feature must be turned on before this command can be entered.

**Notes**

None

**Output**

**rtrv-eisopts**

```
rlghncxa03w 04-02-20 09:07:58 EST  EAGLE 31.3.0

**E5IS**—The EAGLE 5 Integrated Monitoring Support feature  
**MEASPLAT**—The Measurements Platform feature  
**RSET**—The RSET table feature

## rtrv-frm-pwr

## Retrieve Frame Power Threshold

Use this command to retrieve a list of entries for all provisioned frames or the entry for the specified frame from the Frame Power Threshold (FPT) table. The command displays only provisioned entries for provisioned frames.

**Keyword:** **rtrv-frm-pwr**

**Related Commands:** **chg-frm-pwr**, **dlt-frm-pwr**, **ent-frm-pwr**, **rtrv-stp**

**Command Class:** Database Administration

### Parameters

**:frm=** (optional)

Frame ID. The command displays the FPT table entry for the specified provisioned frame.

**Range:** **cf00, ef00, ef01, ef02, ef03, ef04**

**cf00** — Control frame

**ef00** — First extension frame

**ef01** — Second extension frame

**ef02** — Third extension frame

**ef03** — Fourth extension frame

**ef04** — Fifth extension frame

### Example

Retrieve all provisioned Frame Power Threshold table entries.

**rtrv-frm-pwr**

Retrieve Frame Power Threshold table entries for the control frame (frm=cf00)..

**rtrv-frm-pwr:frm=cf00**

### Dependencies

The **frm** parameter value must specify a provisioned frame.

The **frm** parameter value must specify a frame that has a Frame Power Threshold entry provisioned in the FPT table.

### Notes

If no parameter is specified in the command, all provisioned FPT table entries are displayed.

If the frm parameter is specified, the FPT entry corresponding to the specified frame is displayed.

**Output**

Retrieve all Frame Power Threshold table entries.

**rtrv-frm-pwr**

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |
|-------|------------------------|
| cf00  | 56                     |
| ef00  | 36                     |
| ef01  | 40                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

Retrieve the Frame Power Threshold table entry for the control shelf only.

**rtrv-frm-pwr:frm=cf00**

```
tekelecstp 06-04-11 12:38:01 EST EAGLE 35.0.0
```

| Frame | Power Threshold (Amps) |
|-------|------------------------|
| cf00  | 56                     |

```
FRAME POWER THRESHOLD table is (3 of 10) 30% full;
RTRV-FRM-PWR: MASP A - COMPLTD
```

```
;
```

**rtrv-ftp-serv****Retrieve FTP Server Entry**

Use this command to retrieve an entry for an FTP server from the FTP Server table or all entries in the FTP Server table.

**Keyword:** rtrv-ftp-serv

**Related Commands:** chg-ftp-serv, dlt-ftp-serv, ent-ftp-serv

**Command Class:** Database Administration

**Parameters**

**:app=** (optional)

Application. This parameter specifies the FTP Client application that interfaces with the FTP Server.

**Range:** meas, user, db, dist

**meas** — Measurements Platform application

**user** — FTP-based Table Retrieve Application (FTRA)

**db** — Database Backup\Restore application

**dist** — EAGLE 5 ISS Software Release Distribution application

**:ipaddr=** (optional)

IP Address of the FTP Server.

**Range:** 4 numbers separated by dots, with each number in the range of 0-255.

**:mode=** (optional)

Full or brief report indicator.

**Range:** full, brief

**Default:** brief

**Example**

```
rtrv-ftp-serv
```

```
rtrv-ftp-serv:app=meas:ipaddr=1.255.0.100
```

```
rtrv-ftp-serv:mode=brief  
rtrv-ftp-serv:app-meas  
rtrv-ftp-serv:ipaddr=1.255.0.100  
rtrv-ftp-serv:mode=full
```

### Dependencies

The **app** parameter must specify an application that uses the FTP Support feature.

The **ipaddr** parameter must specify a valid IP address for the FTP server.

The **mode** parameter allows you to display either the full 100 characters of the path string for each entry (**mode=full**), or the first 29 characters of the path string for each entry (**mode=brief**). The default is **brief**.

### Notes

The LOGIN and PATH are displayed in mixed case.

## Output

The following examples show output when the EAGLE OA&M IP Security feature is not enabled:

## rtrv-gpl

## Retrieve Generic Program Load

Use this command to show the version numbers of the GPLs stored on each fixed disk (TDM) or removable cartridge (MDAL, if available) and the system release table stored on each fixed disk

**Keyword:** **rtrv-gpl**

**Related Commands:** **act-gpl**, **chg-gpl**, **copy-gpl**, **rept-stat-gpl**

**Command Class:** Program Update

### Parameters

**:gpl=** (optional)

Generic program load. This parameter specifies the GPL for which to retrieve information.

**:appl=** (obsolete)

This parameter is obsolete. Use the **gpl** parameter.

The **appl** parameter has been replaced with the **gpl** parameter to more accurately indicate that a GPL, and not an application, is specified for the parameter value

### Example

```
rtrv-gpl
```

```
rtrv-gpl:gpl=ipshc
```

```
rtrv-gpl:gpl=ipsg
```

### Notes

To check the version of the EPAP or ELAP application, use the **rept-stat-mps** command.

If no application is specified, the approved and trial versions for all GPLS are shown, as well as the release table and removable GPL.

The approved GPL is the GPL that resides on the fixed disk and was made the approved version by specifying the GPL version number while executing the **act-gpl** command.

The trial GPL is the version of the GPL that was downloaded from the removable cartridge, but not activated by the **act-gpl** command.

When the **act-gpl** command is executed, the version specified in the command becomes the approved GPL and the previously approved GPL becomes the trial GPL.

If a GPL is not found, a version of "-----" is shown. This should happen only for the utility and OAM GPL trial versions on the fixed disk and for all GPLs on the removable when the removable cartridge is not inserted.

If the approved GPL version does not match the GPL version shown in the ACTIVE MASP RELEASE column, an alarm is activated.

A minor alarm is shown, and ALM is displayed for each APPROVED GPL (**rtrv-gpl**) and for each RUNNING GPL (**rept-stat-gpl**) that does not match the GPL in the RELEASE column of the **rtrv-gpl** command output. The minor alarm is not activated, but ALM is displayed for each GPL that does not match the GPL in the RELEASE column.

ALM is always displayed when the approved version does not match the release version. You cannot turn off *fixed disk auditing*. The auditing state shown here is for the **rept-stat-gpl** command. You can turn on and off *running version auditing*.

A GPL audit cannot be in progress when this command is entered.

## Output

The following example lists all possible GPLs that can be shown in the output when no GPL is specified. All of these GPLs will not appear in the output for your system, because all GPLs are not valid in the same system.

\* The entries marked with an asterisk appear in the output only if an OAP is provisioned and running. Systems that use two OAPs will show two entries for the OAP: OAP A and OAP B.

**rtrv-gpl**

```
e1080402 08-05-10 15:16:33 EST EAGLE 39.0.0

**Legend**

**GPL**—The type of GPL associated with each card in the display

**APPROVED**—The GPL version that is the approved GPL.

**CARD**—The card location.

**RELEASE**—version number of each GPL that is required to be installed and approved for a specific release of software for the system.

**REMOVE TRIAL**—The GPL version that is on the removable cartridge.

**TRIAL**—The GPL version that is the trial GPL.

-----GPL is not present at the specified location.

**ALM**—An alarm indicator showing that the system has an approved GPL that is not the GPL required for this software release according to the active MASP system release table.

**CORRUPTED**—Data audit has determined that the GPL is corrupted.

**rtrv-gserv-data****Retrieve G-Port Query for Prepaid Service Data**

Use this command to display all values in the GSERV table or to display specific translation type, originating point code, or global title address data. These values are used to determine whether a Send Routing Information (SRI) request should receive G-Port SRI Query for Prepaid service or normal G-Port service.

**Keyword:** rtrv-gserv-data

**Related Commands:** dlt-gserv-data, ent-gserv-data

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:display=** (optional)

Use this parameter to display a specified category of entries in the GSERV table.

**Range:** all, gta, opc, tt

**all**— Display all entries in the GSERV table.

**gta**— Display all calling party (CgPA) global title addresses in the GSERV table.

**opc**— Display all message transfer part (MTP) originating point codes in the GSERV table.

**tt**— Display all called party (CdPA) translation types in the GSERV table.

**:gta=** (optional)

Global title address. Use this parameter to specify a CgPA global title address.

**Range:** 1-21 digits

**:opc=** (optional)

ANSI originating point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*).

**Synonym:** opca

**Range:** p-, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opc/opca/opci/opcn/opcn24=** (optional)

Originating point code. Use these parameters to specify MTP originating point codes.

**:opci=** (optional)

ITU international originating point code with subfields *zone-area-id*.

**Range:** s-, p-, ps-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:opc=** (optional)

ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc, m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opc24=** (optional)

24-bit ITU national originating point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:tt=** (optional)

Translation type. Use this parameter to specify a CdPA translation type.

**Range:** **0-255**

### Example

```
rtrv-gserv-data:display=all
```

```
rtrv-gserv-data:tt=26
```

```
rtrv-gserv-data:display=opc
```

### Dependencies

The G-Port SRI Query for Prepaid feature must be enabled before this command can be entered.

The G-Port feature must be on before this command can be entered.

The **gta**, **opc/opca/opci/opcn/opcn24**, **tt**, or **display** parameter must be specified.

**Output****rtrv-gserv-data:display=all**

```

**rtrv-gsmmap-scrn****Retrieve GSM MAP Screening Entry**

Use this command to retrieve the GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) Screening CgPA and CdPA entries and their attributes from the active system database.

**Keyword:** rtrv-gsmmap-scrn

**Related Commands:** chg-gsmmap-scrn, dlt-gsmmap-scrn, ent-gsmmap-scrn

**Command Class:** Database Administration

## Parameters

**:opname=** (mandatory)

The user-defined name for the operation code. The **opname** value references the operation code (**opcode**) defined with the **ent-gsms-opcode** command.

**Range:**        *yyyyyyyy*  
Up to 8 alphanumeric characters

**:action=** (optional)

The screening action to take if a message is forbidden as defined by the **forbid** parameter.

**Range:**        **pass, discard, atierr, route, forward, duplicate, dupdisc**

**pass**— Route the message as normal to the destination.

**discard**— The MSU is to be discarded.

**atierr**— An ATI (Any Time Interrogation) reject message is generated. This option is only valid for ATI MAP operation codes.

**route**— Route the message as normal to the original destination node; no UIM will be generated. The original destination is the node to which normal GTT would be sent if no GSM MAP actions are taken.

**forward**— Route the original message to the forward node. The original message will not be sent to the original node. If, however, the forward node is not available for routing, the MSU is routed to the original node.

**duplicate**— Route the message as normal to the original destination and route a copy of the original message to the duplicate node. If the MSU fails to route to the duplicate node, a UIM is generated indicating the duplicate routing failure.

**dupdisc**— Route the original message to the duplicate node. The original message will not be sent to the original node. If, however, the duplicate node is not available for routing, the MSU is routed to the original node.

**Default:**     Display all screening actions

**:cdsr=** (optional)

CdPA Screening Reference.

**Range:**        *ayyy*  
1 alphabetic character followed by up to 3 optional alphanumeric characters

**:cgshr=** (optional)

CgPA Screening Reference.

**Range:**        *ayyy*  
1 alphabetic character followed by up to 3 optional alphanumeric characters

**:eaddr=** (optional)

The ending origination address, in association with **npv** and **naiv** for the CGPA address to be screened.

**Range:**        1-15 digits  
1–15 hexadecimal digits. Valid digits are **0–9, a-f, A-F**

**:forbid=** (optional)

The forbidden parameter value. Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter.

**Range:**        **all, location, none, state**

**all**—All parameters are forbidden. Take the specified screening action defined by the **action** parameter for messages arriving at the system.

**location**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **location** as the forbidden parameter value for the entered address/operation code combination. Note: The **location** value is valid only for GSM ATI messages.

**none**—None of the parameters are forbidden. Route the message to its destination.  
**state**—Take the specified screening action defined by the **action** parameter for messages arriving at the system that contain **state** as the forbidden parameter value for the entered address/operation code combination. Note: The **state** value is valid only for GSM ATI messages.

**Default:** Display all forbidden parameter values

**:mapset=** (optional)

The MAP set ID.

**Range:** 1-36000 **dflt**

**dflt**—Default MAP set

**:naiv=** (optional)

Nature of Address value for the address or range of CgPA and CdPA addresses. When this parameter is specified, the **npv** parameter must be specified.

**Range:** 0-127, \*

**:npv=** (optional)

Numbering Plan value for the address or range of CgPA and CdPA addresses.

When this parameter is specified, the **naiv** parameter must be specified.

**Range:** 0-15 \*

**:ri=** (optional)

Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:** gt, ssn

**:saddr=** (optional)

The starting origination address. in association with **npv** and **naiv** for the single entry or range of entries of the CGPA address to be screened.

**Range:** 1-15 digits, \*

1-15 hexadecimal digits. Valid digits are 0-9, a-f, and A-F

**Default:** \*

**:tt=** (optional)

Translation type. This parameter specifies the value that the CdPA translation type is set to as the result of Enhanced GSM Map Screening.

**Range:** 0-255 **none**

**Default:** Display all translation types

### Example

The following example retrieves all CgPA entries for the specified opname:

**rtrv-gsmmap-scrn:opname=e**

The following example retrieves the specified CgPA range entry for the specified opname:

**rtrv-gsmmap-scrn:opname=ati:saddr=9194620000000000:eaddr=9194630000000000**

The following example retrieves all CdPA entries for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela**

The following example retrieves the specified cdsr entry for the specified cgsr:

**rtrv-gsmmap-scrn:opname=xyz:cgsr=fela:cdsr=cal4**

The following examples retrieves the specified RI for the specified opname:

**rtrv-gsmmap-scrn:opname=e:ri=ssn**

**rtrv-gsmmap-scrn:opname=e:ri=gt**

```
rtrv-gsmmap-scrn:opname=e:mapset=df1t:ri=gt
rtrv-gsmmap-scrn:opname=rr:cgsr=au:cdsr=aj
rtrv-gsmmap-scrn:opname=dd:cgsr=ak
rtrv-gsmmap-scrn:opname=test4:tt=12
```

### Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The Enhanced GSM Map Screening (EGMS) feature must be enabled before:

- The **cgsr** parameter can be specified.
- The **cdsr** parameter can be specified.
- The **saddr=\*** parameter can be specified.
- The **saddr** and **eaddr** parameters can contain hexadecimal digits.

The specified **opname** parameter value must exist in the GSM Map Op-Code table.

If the **eaddr** parameter is specified, its value must contain the same number of digits as the **saddr** parameter value.

If the **eaddr** parameter is specified, its value must be greater than the **saddr** parameter value.

If the **eaddr** parameter is specified, the **saddr** parameter must be specified.

If the **saddr=\*** parameter is specified, then the **eaddr** parameter cannot be specified.

If the **saddr** parameter is specified, the **cgsr** and **cdsr** parameters cannot be specified.

The **saddr**, **npv**, and **naiv** parameters must be specified together in the command.

If any of the **saddr/eaddr/npv/naiv** and **cdsr** parameters are specified, then the **forbid** and **action** parameters cannot be specified.

A value of **state** or **location** cannot be specified for the **forbid** parameter unless the operation code referenced by the **opname** parameter is **71**. The **forbid** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

The **action=atierr** parameter cannot be specified unless the operation code referenced by the **opname** parameter is **71**. The **atierr** option is only valid for ATI MAP operation codes, and the **opcode=71** parameter signifies an ATI MAP operation code.

If the **cdsr** parameter is specified, then the **cgsr** parameter must be specified.

The specified **cgsr** parameter value must exist in the database.

The specified **cdsr** parameter value must exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

### Notes

None

## Output

GSM MAP Screening single entries and range entries shown in separate sections of the output. All single entries are shown first in a summary report; all range entries follow.

**Legend**

**SINGLE ENTRIES/RANGE ENTRIES**—GSM MAP screening single entries and range entries are output in separate sections of the retrieval report. All single entries are output first during a summary report and then all range entries follow.

**CgPA**—Calling Party Address entry

**CdPA**—Called Party Address entry

**OPNAME**—User-defined MAP operation code name.

**SADDR**—Start origination address.

**EADDR**—End origination address. This column is displayed for range entries only.

**NPV**—Numbering plan value.

**NAIV**—Nature of address indicator value.

**FORBID** or **FORBD**—Indicates a forbidden parameter for the entered address. If a forbidden parameter is detected the message is rejected by the action defined by the **action** parameter. (Some values are abbreviated; for example, locat means **location**.)

**ACTION** or **ACT**—Screening action, if forbidden. Possible actions are pass, discard (disc), atterr, route, forward, duplicate (dupl), and dupdisc.

**PC** or **PCA**—ANSI Point Code

**PCI**—ITU International Point Code

**PCN**—ITU National Point Code

**PCN24**—24-bit ITU National Point Code

**SSN**—Subsystem Number

**CGSR**—CgPA Screening Reference

**CDSR**—CdPA Screening Reference

**MAPSET**—MAP set

**RI**—Routing Indicator

**TT**—Translation Type

**rtrv-gsmopts****Retrieve GSM System Options**

Use this command to display all GSM (Global System for Mobile Telecommunication) system options from the database.

**Keyword:** **rtrv-gsmopts**

**Related Commands:** **chg-gsmopts, chg-gsmsmsopts, rtrv-gsmsmsopts**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gsmopts**

**Dependencies**

The G-Flex feature must be enabled and turned on, or the G-Port, EIR, IGM, or V-Flex feature must be enabled before this command can be entered.

The EGLEOPTS table is corrupt or cannot be found.

**Notes**

None

## Output

The following example shows the output if the G-Flex feature is turned on.

### rtrv-gsmopts

```
rlghncxa03w 08-09-02 09:04:14 EST EAGLE 39.2.0
```

#### GSM OPTIONS

```
-----
DEFMCC          = NONE
DEFMNC          = NONE
SRFADDR         = NONE
MSRNDIG         = RN
DEFMAPVR        = 1
IS412GSM        = NONE
SRIDNNOTFOUND   = GTT
```

;

The following example shows the output if the G-Flex feature is turned on and includes values for CCNC and MCCMNC.

### rtrv-gsmopts

```
rlghncxa03w 08-09-02 09:04:14 EST EAGLE 39.2.0
```

#### GSM OPTIONS

```
-----
DEFMCC          = NONE
DEFMNC          = NONE
SRFADDR         = NONE

**rtrv-gsms-opcode****Retrieve GSM MAP Screening Operation Code**

Use this command to retrieve the concerned GSM (Global System for Mobile Telecommunication) MAP (Mobile Application Part) screening operation codes and the default screening action for the operation code. This command allows the craftsman to verify a list of all operation codes or a single operation code that the system uses in performing GSM Map Screening.

**Keyword:** **rtrv-gsms-opcode**

**Related Commands:** **chg-gsms-opcode**, **dlt-gsms-opcode**, **ent-gsms-opcode**

**Command Class:** Database Administration

**Parameters**

**:mapset=** (optional)

The MAP set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**:opcode=** (optional)

MAP operation code.

**Range:** **0-255 \***

**Default:** Display all MAP operation codes

**:opname=** (optional)

The user-defined name for the operation code. The **opname** value is defined with the **ent-gsms-opcode** command.

**Range:**        *ayyyyyyy*  
Up to 8 alphanumeric characters

**Default:**     Display all operation code names

**:ri=** (optional)  
Routing indicator. This parameter specifies whether a subsequent global title translation is required.

**Range:**        **gt, ssn**

**:tt=** (optional)  
Translation type. This parameter specifies the value the CdPA TT is set to as the result of Enhanced GSM Map Screening.

**Range:**        **0-255 none**

**Default:**     Display all translation types

### Example

```
rtrv-gsms-opcode
rtrv-gsms-opcode:opname=ati
rtrv-gsms-opcode:ri=gt
rtrv-gsms-opcode:ri=ssn
rtrv-gsms-opcode:tt=11
```

### Dependencies

The GSM Map Screening feature (see the **enable-ctrl-feat** command) must be enabled before this command can be entered.

The EGMS feature must be enabled and turned on before:

- The **opcode=\*** can be specified.
- An **opname** parameter can be specified that refers to an **opcode=\*** parameter.

The **opcode** parameter and the **opname** parameter cannot be specified together in the same command.

The specified **opname** parameter must exist in the GSM MAP Op-Code table.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist.

### Notes

None

## Output

**rtrv-gsmsmsopts****Retrieve GSM SMS System Options**

Use this command to display all GSM SMS options from the database.

**Keyword:** rtrv-gsmsmsopts

**Related Commands:** chg-gsmopts, chg-gsmsmsopts, rtrv-gsmopts

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gsmsmsopts**

**Dependencies**

The MO-based GSM SMS NP, MT-based GSM SMS NP, MT-based GSM MMS NP, or Portability Check for MO SMS feature must be enabled before this command can be entered.

The EGLEOPTS table is corrupt or cannot be found.

**Notes**

None

## Output

**NOTE:** The mosmsdnfmt, mosmsdnai, mosmsfwd, mosmsgta, mosmsnai, mosmssa, and mosmstype parameters are displayed only if the MO-based GSM SMS NP feature is enabled.

**NOTE:** The mtsnsimsi, mtsmsnni, mtsmstype, mtsmsackn, mtsmsdltr, mtsmsdltrv, mtsmsnakerr, and mtsmschksrc parameters are displayed only if the MT-Based GSM SMS feature is enabled.

**NOTE:** The mtmmmsgta, mtmmstype, and mtmmssackn parameters are displayed only if the MT-based GSM MMS NP feature is enabled.

The following example shows the output if the MO-based GSM SMS NP feature is enabled.

### rtrv-gsmsmsopts

```
tekelecstp 08-04-16 11:49:33 EST EAGLE 39.0.0
GSM SMS OPTIONS
-----

## rtrv-gsmssn-scrn

## Retrieve GSM Subsystem Number Screening Entry

Use this command to retrieve all or single subsystem numbers in the GSM SSN screening table.

**Keyword:** rtrv-gsmssn-scrn

**Related Commands:** dlt-gsmssn-scrn, ent-gsmssn-scrn

**Command Class:** Database Administration

### Parameters

**:ssn=** (optional)

Subsystem number.

**Range:** 000-255

**Default:** Display all

**:type=** (optional)

Subsystem type.

**Range:** orig, dest

**orig**—The origination SSN

**dest**—The destination SSN

**Default:** Display all

### Example

```
rtrv-gsmssn-scrn
```

```
rtrv-gsmssn-scrn:ssn=0:type=dest
```

### Dependencies

The GSM Map Screening feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered.

### Notes

If specified, the **ssn/type** parameter combination must exist in the GSM SSN screening table. If the value does not exist, the following message is displayed:

```
SSN ORIG DEST
```

```
No matching entries with the specified criteria found.
```

**Output****rtrv-gsmssn-scrn:ssn=2:type=dest**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 No Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

**rtrv-gsmssn-scrn:ssn=10:type=orig**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
010 Yes Yes
GSMMS SSN table is (256 of 512) 50% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

**rtrv-gsmssn-scrn**

```
rlghncxa03w 04-02-20 09:07:58 EST EAGLE 31.3.0
SSN ORIG DEST
002 Yes No
010 Yes Yes
GSMMS SSN table is (2 of 512) 1% full
RTRV-GSMSSN-SCRN: MASP A - COMPLTD
```

;

**Legend**

**SSN**—Subsystem number.

**ORIG**—Specifies whether the subsystem type is origination (yes) or not (no).

**DEST**—Specifies whether the subsystem type is destination (yes) or not (no).

**rtrv-gta****Retrieve Global Title Address Information**

Use this command to display a list of the GTA (global title address) information applicable to the specified GTT set. This list can be filtered using a number of parameters. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the selector specified.

This command obtains the routing object (destination address and subsystem number), relative cost, and routing indicator assigned to that object for specified GTAs (global title addresses) or ranges of GTAs with a given GTT set.

**NOTE: When the ANSI-ITU-China SCCP Conversion feature is enabled, entries that are provisioned with the xlat=dpc parameter, and that have specified the ntt parameter, are displayed with a xlat parameter value of dpcngt.**

**Keyword:** rtrv-gta

**Related Commands:** chg-gta, dlt-gta, ent-gta

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cggtmod=** (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

**Range:**     **yes, no**

**:cgpc=** (optional)

ANSI CgPA point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Synonym:** **cgpa**

**Range:**     **000-255, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

The asterisk (\*) value is not valid for the *ni* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-*\** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:cgpci=** (optional)

ITU international CgPA point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:**     **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:cgpcn=** (optional)

ITU national CgPA point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**     **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:cgpcn24=** (optional)

24-bit ITU national CgPA point code with subfields main signaling *area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:**       **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:cgssn=** (optional)

Starting CgPA subsystem number.

**Range:**       **0-255**

**:ecgssn=** (optional)

Ending CgPA subsystem number.

**Range:**       **0-255**

**:egta=** (optional)

End global title address. This parameter specifies the end of a range of global title digits.

**Range:**       1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:**     The first **gta** entry for the given GTT selector

**:force=** (optional)

Display more than 1000 entries.

**Range:**       **yes, no**

**Default:**     **no**

**:gta=** (optional)

Global title address. This parameter specifies the beginning of a range of global title digits.

**Range:**       1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:**     The first **gta** entry for the given GTT selector

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:**       *aaaaaaaa*

1 leading alphabetic and up to 8 following alphanumeric characters.

**:loopset=** (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

**Range:**       *aaaaaaaa*, **none**

1 alphabetic character followed by up to 7 alphanumeric characters.

**none**—Translation entries with no association to any loopset.

**:mapset=** (optional)

MAP set ID. This parameter retrieves GTA information for a specified Mated Application set.

- Range:** 1-36,000 **dflt**  
**dflt**—Default MAP set
- Default:** Retrieves GTA information for the default MAP set.
- :mrnset=** (optional)  
 MRN set ID. This parameter retrieves GTA information for a specified Mated Relay Node set.
- Range:** 1-3000 **none**, **dflt**  
**dflt**—Default MRN set  
**none**—The GTA translation does not participate in any loadsharing.
- :num=** (optional)  
 Number of entries to display.
- Range:** 1-65535
- Default:** 1—if **gta** is specified  
 20—if **gta** is not specified
- :opc=** (optional)  
 ANSI originating point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*.
- Synonym:** **opca**
- Range:** 000-255, \*
- Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
- The asterisk (\*) value is not valid for the *ni* subfield.
- When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.
- When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.
- When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.
- When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = 006–255.
- The point code 000-000-000 is not a valid point code.
- :opci=** (optional)  
 ITU international originating point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).
- Range:** s-, 0-255
- Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
- prefix*—s-  
*zone*—0-7  
*area*—000-255  
*id*—0-7
- The point code 0-000-0 is not a valid point code.
- :opcn=** (optional)  
 ITU national originating point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfnti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).
- Range:** s-, 0-16383, aa-zz
- Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).
- prefix*—s-

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:opc***n24*= (optional)

24-bit ITU originating point code with subfields main signaling *area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:pc**= (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member* (*ni-nc-ncm*). . The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*).

**Synonym:** **pca**

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:pci**= (optional)

ITU international point code in the form of *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn**= (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-**, 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:pctype=** (optional)

Point code type. This parameter can be specified only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24, ituis, ituns**

**Default:** Display all point code types

**:ssn=** (optional)

Subsystem number.

**Range:** 002-255

**Default:** Display all

### Example

```
rtrv-gta:gttsn=t800:num=65535:force=yes
```

```
rtrv-gta:gttsn=t800:pc=8-1-1:ssn=222:gta=9195551212
```

```
rtrv-
```

```
gta:gttsn=t800:ssn=222:gta=9000000000:egta=9762429999:num=65535:force=yes
```

```
rtrv-gta:gttsn=ntoa23:pctype=ansi
```

```
rtrv-gta:gttsn=setnat003:pcn=s-129-aa
```

```
rtrv-gta:gttsn=setnat003:gta=987658321198765432101:pcn=s-128-aa
```

```
rtrv-gta:gttsn=tbla
```

```
rtrv-gta:gttsn=tbla:pc=1-1-1
```

```
rtrv-gta:gttsn=setssn:mapset=6
```

```
rtrv-gta:gttsn=setans006:mrnset=1
```

```
rtrv-gta:gttsn=setans004:cggmod=yes
```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

The **ssn**, **cgssn**, and **ecgssn** parameters cannot have a wildcard (\*) value.

The **gttsn** parameter must be specified, cannot have a value of **none**, and must match an existing **gttsn**.

The **pc/pca/pci/pcn/pcn24**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, and **opc/opca/opci/opcn/opcn24** parameters must be full point codes and must have valid values within the range for each subfield.

If the ANSI-ITU-China SCCP Conversion feature is not turned on, and the specified GTT set is an ANSI set, then the value specified for the **pc/pca** parameter must be a valid ANSI point code.

If the ANSI-ITU-China SCCP Conversion feature is not turned on, and the specified GTT set is an ITU set, then the value specified for the **pci/pcn/pcn24** parameter must be a valid ITU point code.

If the **egta** parameter is specified, the **gta** parameter must be specified. The **gta** and **egta** parameters must be the same length, and the value for the **egta** parameter must be greater than the value for the **gta** parameter.

If the specified **num** parameter value is greater than **1000**, the **force=yes** parameter must be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the specified GTT set (**gttsn**). If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per GTT set. When the **ent-gta** command is entered to create entries, the software keeps track of the lengths and allows only 10 different lengths.

If the Flexible GTT Load Sharing feature is not enabled, then the **mapset** parameter cannot be specified.

At least one entry must be provisioned in the specified MAP set in the MAP table.

The **(e)gta**, **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, and **opc/opca/opci/opcn/opcn24**, and **(e)cgssn** parameters are mutually exclusive.

If the **ecgssn** parameter is specified, the **cgssn** parameter must be specified, and the **ecgssn** parameter must be greater than the **cgssn** parameter.

The Origin-based SCCP Routing feature must be enabled when specifying the **cgpc/cgpca/cgpci/cgpcn/cgpcn24**, **opc/opca/opci/opcn/opcn24**, or **(e)cgssn** parameters or when specifying the **xlat** parameter with a value of **udts** or **discard**.

The **gta** parameter can be specified only if the GTTSN set type has a value of **cdgta** or **cggta**.

The **cgpc/cgpca/cgpci/cgpcn/cgpcn24** parameter may be specified only if the GTTSN set type has a value of **cgpc**.

The **opc/opca/opci/opcn/opcn24** parameter may be specified only if the GTTSN set type has a value of **opc**.

The **cgssn** parameter may be specified only if the GTTSN set type has a value of **cgssn**.

If the specified GTT Set is an ANSI set, the **cgpc/cgpca** and **opc/opca** parameters must be valid ANSI point codes. If the specified GTT Set is an ITU set, the **cgpci/cgpcn/cgpcn24** and **opci/opcn/opcn24** parameters must be valid ITU point codes.

The range specified by the **(e)cgssn** parameters must exist for the specified GTT set. An exact match is not required.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

The **mapset** parameter and the **mrnset** parameter cannot be specified together in the command.

## Notes

The percentage full and number of cells used report that is provided with a **rtrv-gta** command reflects the total entries in the GTA table without regard to the selector specified.

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gtt sel**), GTT Set (**ent/dlt/rtrv-gtt set**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If the **rtrv-gta** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the GTT set. For example, if **gta=8005556666** is specified, the six-digit GTT set **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The point code domain translation types for EGTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

## Output

**NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. It is not anticipated that more than 15 digits will be used in the immediate future, but displaying GTAs longer than 19 digits will cause the line to wrap around to the next line.**

Retrieve all GTAs for the specified GTT Set:

**NOTE: The Start GTA (gta) and End GTA (egta) fields are sized according to the ndgt parameter value. Because all GTAs for a GTT Set are the same size, this helps the appearance of the display. If all 21 digits are used, an entry will not fit on a single line. If two lines per entry are used, the size of the report would double, being inefficient for large reports. ### Legend

**GTTSN**—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**NETDOM**—The network domain.

**NDGT**—The number of digits required for GTAs associated with this set.

**START GTA**—The start global title address.  
**END GTA**—The end global title address.  
**XLAT**—The translate indicator.  
**RI**—The routing indicator.  
**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Translated point code.  
**SSN**—The translated subsystem number.  
**CCGT**—The cancel called global title indicator.  
**NNP**—New Numbering Plan.  
**NNAI**—New Nature of Address Indicator.  
**NPDD**—New Prefix Digits to be Deleted.  
**NPDS**—New Prefix Digits String.  
**NTT**—The new translation type.  
**MRN**—Mated Relay Node.  
**MRNSET**—MRN set ID.  
**MAPSET**—MAP set ID.  
**CCGTMOD**—Calling Party Global Title Modification Indicator.

## rtrv-gtcnv

## Retrieve Global Title Conversion

Use this command to display entries in the Default Global Title Conversion table.

**Keyword:** rtrv-gtcnv

**Related Commands:** chg-gtcnv, dlt-gtcnv, ent-gtcnv

**Command Class:** Database Administration

### Parameters

**:dir=** (optional)

Direction of conversion.

**Range:** atoi, itoa, both

**atoi**—ANSI to ITU conversion

**itoa**—ITU to ANSI conversion

**both**—Conversion in both directions

**:gtixlat=** (optional)

Global title indicator conversion. This parameter is expressed in the form of the ANSI GTI and the ITU GTI.

**Range:** 22, 24

**22**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 2 or an incoming ITU GTI 2 to an outgoing ANSI GTI 2

**24**—Converts an incoming ANSI GTI 2 to an outgoing ITU GTI 4 or an incoming ITU GTI 4 to an outgoing ANSI GTI 2

**:nai=** (optional)

Nature of address indicator.

**Range:** 0-63 \*

**:np=** (optional)

Numbering plan.

**Range:** 0-15 \*

**:tta=** (optional)  
ANSI translation type.  
**Range:**     **0-255 \***

**:tti=** (optional)  
ITU translation type.  
**Range:**     **0-255 \***

### Example

**rtrv-gtcnv**

### Dependencies

The ANSI-ITU-China SCCP Conversion feature must be enabled before the command can be entered.

### Notes

None

### Output

The following example displays output containing decimal global title digits.

**rtrv-gtcnv**

```
tekelecstp 06-11-07 13:44:12 EST  EAGLE 35.3.0
```

| DIR  | GTIXLAT | TTA | TTI | NP  | NAI | DEL | POS | ADD |
|------|---------|-----|-----|-----|-----|-----|-----|-----|
| atoi | 22      | 10  | 5   | --- | --- | 10  | pfx | 123 |

```
GTCNV      table is (1 of 1000) 1% full.
```

;

The following example shows output containing hexadecimal global title digits.

**rtrv-gtcnv**

```
tekelecstp 06-11-07 11:52:58 EST  EAGLE 35.3.0
```

| DIR  | GTIXLAT | TTA | TTI | NP  | NAI | DEL | POS | ADD                   |
|------|---------|-----|-----|-----|-----|-----|-----|-----------------------|
| atoi | 22      | 1   | 3   | --- | --- | --- | pfx | abcdef0123456789abcdf |
| itoa | 24      | 5   | 6   | 2   | 1   | --- | sfx | abcdef0123456789abcef |

```
GTCNV      table is (2 of 1000) 1% full.
```

;

### Legend

**DIR**—The direction of the translation: ANSI to ITU or ITU to ANSI.

**GTIXLAT**—The GTI translation.

**TTA**—The ANSI translation type

**TTI**—The ITU translation type

**NP**—The numbering plan

**NAI**—The nature of address indicator

**DEL**—The deletion status, listing the number of incoming MSUs that will be deleted prior to translation.

**POS**—The prefix or suffix.

**ADD**—The global title address

**rtrv-gtt****Retrieve Global Title Translation**

Use this command to show one or more entries from the GTT Data and the Translation Type tables. The report that is displayed contains two records (the percentage full and number-of-cells-used field) that give the total entries in the GTT table without regard to the **type** parameter specified.

If the EGTT (Enhanced Global Title Translation) feature is turned on in the system, the system will no longer accept **-gtt** (Global Title Translation) and **-tt** (Translation Type) commands. Refer to the new command sets that replace the **-gtt** and **-tt** commands:

- GTT Selector commands (**ent/chg/dlt/rtrv-gttset**)
- GTT Set commands (**ent/dlt/rtrv-gttset**)
- GTA commands (**ent/chg/dlt/rtrv-gta**)

**Keyword:** **rtrv-gtt**

**Related Commands:** **chg-gtt, dlt-gtt, ent-gtt**

**Command Class:** Database Administration

**Parameters**

At least one of these parameters must be specified: **ttn, type/typea/typei/typen/typen24**.

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cggmod=** (optional)

Calling party global title modification indicator. This parameter displays all translation entries that have the specified value of the calling party GT modification indicator.

**Range:** **yes, no**

**:egta=** (optional)

End global title address. This parameter specifies the end of a range of global title digits.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** If the **gta** parameter is specified, the **egta** parameter default value is the specified **gta** parameter value.

**:force=** (optional)

This parameter allows the user to display more than 1000 entries. This parameter is used to prevent inadvertent displays of extremely large amounts of information, which could take many hours.

**Range:** **yes, no**

**Default:** **no**

**:gta=** (optional)

Global title start address. This parameter specifies the beginning of a range of global title digits.

**Range:** 1-21 digits

If the Hex Digit Support for GTT feature is not enabled and on, the range is 1 - 21 decimal digits; valid digits are **0-9**.

If the Hex Digit Support for GTT feature is enabled and on, the range is 1 - 21 hexadecimal digits; valid digits are **0-9, a-f, A-F**.

**Default:** The first GTT entry for the given translation type.

**:loopset=** (optional)

SCCP loopset name. This parameter retrieves translation entries that are associated with the specified loopset.

**Range:**        *ayyyyyyy*, **none**

1 alphabetic character followed by up to 7 alphanumeric characters.

**none**—Translation entries with no association to any loopset.

**:mapset=** (optional)

MAP set ID.

**Range:**        **1-36000 dflt**

**dflt**—Default MAP set

**:mrnset=** (optional)

MRN set ID. This parameter retrieves GTT information for a specified Mated Relay Node set.

**Range:**        **1-3000 none, dflt**

**dflt**—Default MRN set

**none**—The GTA translation does not participate in any loadsharing.

**:num=** (optional)

This parameter specifies the number of entries to be shown.

**Range:**        **1-65535**

**1-1000**—If **force=yes** is not specified

**1-65535**—If **force=yes** is specified

**Default:**     **1** (if **gta** is specified),

**20** (if **gta** is not specified).

**:pc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **pca**

**Range:**        **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**Default:**     Display all

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**        **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**Default:** Display all

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**Default:** Display all

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code *prefix-ni-nc-ncm*(*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**Default:** Display all

**:pctype=** (optional)

Point code type. This parameter can be specified, only when the ANSI-ITU-China SCCP Conversion feature is enabled, to retrieve a single type of point code among mixed types of point code provisioned for a Translation Type.

**Range:** **ansi, itui, itun, itun24**

**Default:** Display all

**:ssn=** (optional)

Subsystem number. This parameter specifies the subsystem address that is to receive the message.

**Range:** **002-255**

**Default:** Display all

**:ttn=** (optional)

Translation name.

**Range:** *ayyyyyyy*

1 alphabetic character followed by up to 7 alphanumeric characters

**Default:** None given

**:type/typea/typei/typen/typen24=** (optional)

Translation type identifies the translation type and network type. This parameter is the decimal representation of the 1-byte field used in SS7.

The **type** and **typea** parameters specify an ANSI network.

The **typei** parameter specifies an ITU-international network.

The **typen** parameter specifies an ITU-national network.

The **typen24** parameter specifies a 24-bit ITU-national network.

A translation type numeric value can be entered as ANSI (**type** or **typea**) and also as an ITU type (**typei** or **typen**). However, they are separate entities.

The point code domain translation types for GTT are handled by the EAGLE 5 ISS protocol processing as either ANSI or ITU; therefore, ITU applies to ITU-I, ITU-I Spare, ITU-N, and ITU-N Spare. ITU-I includes ITU-I Spare, and ITU-N includes ITU-N Spare.

**Range:** 0-255

**Default:** None given

### Example

```
rtrv-gtt:type=5:tt=ldb1:gta=919555
rtrv-gtt:type=5:gta=919555
rtrv-gtt:type=5:gta=919555:num=2500:force=yes
rtrv-gtt:typen24=0
rtrv-gtt:typei=7:pctype=ansi
rtrv-gtt:typen=106:pctype=itui
rtrv-gtt:type=55:pctype=itun
rtrv-gtt:type=9:pctype=itun24
rtrv-gtt:typei=4:pci=s-1-24-1
rtrv-gtt:typen=3:pcn=s-124
rtrv-gtt:tt=tbla
rtrv-gtt:tt=tbla:mapset=1
rtrv-gtt:type=4:cggmod=yes
```

### Dependencies

If the EGTT feature is turned on, then the **rtrv-gtt** command cannot be entered.

The ANSI-ITU-China SCCP Conversion feature must be enabled before the **pctype** parameter can be specified.

If the **pcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts:npfmt** parameter.

The value of the **tt** parameter must exist in the Translation Type table.

The value of the **tt** parameter must correspond to a value of the **type/typea/typei/typen/typen24** parameter.

If the value of the **num** parameter exceeds **1000**, then the **force=yes** parameter must be specified.

Either the **type** parameter or the **tt** parameter must be specified.

The **ssn** parameter cannot have a value of **\***.

The value of the **pc/pca/pci/pcn/pcn24** parameter must be a full point code.

If the **egta** parameter is specified, the **gta** parameter must be specified.

If the system is defined as an ANSI system, the **pc/pca** parameter must be specified as a valid ANSI point code.

The **tt** parameter and the **pc/pca/pci/pcn/pcn24** parameter must have matching network types.

The ANSI-ITU-China SCCP Conversion feature must be on before a translated point code and a translation type in different network types can be specified.

The number of digits in the specified **gta** parameter must be at least the number of digits provisioned for the given translation type. If the VGTT (variable length GTT) feature is turned on, there can be up to 10 GTA lengths per translation type. When the **ent-gtt** command is entered to create entries, the software keeps track of the lengths and allows only ten different lengths.

The value of the **tt** parameter must not be defined as an alias.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

The Hex Digit Support for GTT feature must be enabled and on before hexadecimal digits can be specified for the **gta** and **egta** parameters.

The value of the **num** parameter must not exceed the maximum table size.

The length of the **egta** parameter must equal the length of the **gta** parameter.

The value of the **egta** parameter must be greater than the value of the **gta** parameter.

If the **tt** parameter is not specified, then the value of the **ttn** parameter must match the value of a **tt** parameter in the STP database.

The value of the **typen** parameter must exist in the Translation Type table.

The value of the **typei** parameter must exist in the Translation Type table.

The value of the **gta** parameter must exist.

The SCCP Loop Detection feature must be enabled before the **loopset** parameter can be specified.

The value of the **loopset** parameter must already exist in the database.

The Flexible GTT Load Sharing feature must be enabled before the **mrnset** parameter can be specified.

At least one entry must be provisioned in the MRN table for the MRN set that is specified by the **mrnset** parameter.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

The **mapset** parameter and the **mrnset** parameter cannot be specified together in the command.

## Notes

If the **rtrv-gtt** command is entered with only the **gta** parameter, a match would be an entry containing the same number of digits, or more digits, for the translation type. For example, if **gta=8005556666** is specified, the six-digit translation type **800555** would be a match. If the VGTT feature is turned on and the **egta** parameter is specified, all matching entries regardless of length are displayed.

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

If you do not know either the translation type or the translation type name, use the **rtrv-tt** command to obtain type and name.

Due to the size of these tables (up to 270,000 possible entries), a limit (65,535) is placed on the number of entries that can be printed at one time.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The number of entries to be shown (the **num** parameter) can be specified for any valid combination of parameters.

If the **gta** parameter is not specified, then the first entry in the global title translation table that corresponds to the translation type is the first entry shown.

If the **num** and **gta** parameters are not specified, then up to 20 entries are shown.

If the **gta** parameter is specified, but the **num** parameter is not specified, then only one entry is shown.

If the **num** parameter is specified, then the number of entries shown is the lesser of the number of entries in the table from the defined starting point to the end, or the value of the **num** parameter.

If the **gta** and **egta** parameters are specified, then the entry that matches the **gta** parameter, or is the nearest entry below the **gta** parameter, is the first entry shown for the specified range.

## Output

**rtrv-gtt:type=10:num=65535:force=yes**

```
rlghncxa03w 08-09-07 11:43:04 EST EAGLE 39.2.0
TYPEA      TTN      NDGT
  3        c800      10
```

GTT table is (9 of 269999) 1% full.

### Legend

**TYPE/TYPEA/TYPEI/TYPEN /TYPEN24**—The translation type.

**TTN**—The translation name.

**NDGT**—The number of digits.

**GTT TABLE IS 10% FULL**—The relative size of the GTT table.

**x OF y**—Number of entries in the table (x) and the maximum number of entries configured for the table (y)

**START GTA**—Global title start address.

**END GTA**—Global title end address.

**XLAT**—Translate indicator.

**RI**—Route indicator.

**PC, PCA, ITU PC, ITUI PC, ITUN PC, ITUN24 PC**—Point code.

**SSN**—Subsystem number.

**NGT**—New global title translation type. This field identifies the type of global title translation that replaces the original type.

**NNP**—New Numbering Plan.

**NNAI**—New Nature of Address Indicator.

**NPDD**—New Prefix Digits to be Deleted.

**NPDS**—New Prefix Digits String.

**NSDD**—New Suffix Digits to be Deleted.

**NSDS**—New Suffix Digits String

**NGTI**—New GTI code. When the ANSI-ITU-China SCCP Conversion and AMGTT features are on and the Translated Point Code is of a different network type, the *NGTI* value indicates whether the new GTI translation format is GTI type 2 or GTI type 4.

**MRN**—Mated Relay Node.

**MRNSET**—MRN set ID.

**MAPSET**—MAP set ID.

**CGGTMOD**—Calling Party GT Modification Indicator.

### rtrv-gttset

### Retrieve GTT Selectors

Use this command to display a list of administered global title selector combinations required for a global title entry. The list can be filtered by using various parameter combinations.

**Keyword:** rtrv-gttset

**Related Commands:** chg-gttset, dlt-gttset, ent-gttset

**Command Class:** Database Administration

## Parameters

**:gti/gtia/gtii/gtin/gtin24=** (mandatory)

Global title indicator. For all EGTT selector commands, the domain is defined as **gti** and **gtia** (ANSI), **gtii** (ITU international), **gtin** (ITU national), and **gtin24** (24-bit ITU national).

For the selector commands, **gti** and **gtia** are equivalent; **gtii** and **gtin/gtin24** are mutually exclusive because the EGTT database does not distinguish between ITU national and ITU international translations. This means that while ITU-I and ITU-N selectors are stored separately, two separate ITU-I and ITU-N entries with the same selector values cannot exist. For example, if an entry with **gtii=2** and **tt=4** already exists, an entry of **gtin=2** and **tt=4** cannot be entered.

**Range:** Supported value for ANSI: **gti=2** and **gtia=2**  
Supported values for ITU: **gtii=2, 4** and **gtin/gtin24=2, 4**

**Default:** Display all

**:cdgtasn=** (optional)

CdPA GTA GTT set name.

**Range:** ayyyyyyyy  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cggtasn=** (optional)

CgPA GTA GTT set name.

**Range:** ayyyyyyyy  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cgpcsn=** (optional)

CdPA PC GTT set name.

**Range:** ayyyyyyyy  
1 leading alphabetic character and up to 8 following alphanumeric characters.

**:cgssn=** (optional)

CgPA subsystem number.

**Range:** 0-255

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned. The **gttsn** parameter can only be specified if the Origin-based SCCP Routing feature is off.

**Range:** ayyyyyyyy  
1 leading alphabetic and up to 8 following alphanumeric characters.

**Default:** Display all

**:nai=** (optional)

Nature of Address indicator. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the **nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** sub, rsvd, natl, intl, dflt

**Default:** Display all

**:naiv=** (optional)

Nature of Address indicator value. The Nature of Address indicator can be specified by supplying either a mnemonic value (**nai** parameter) or an explicit numeric value (**naiv** parameter). Either the

**nai** parameter or the **naiv** parameter, but not both, can be specified in the command. Table A-5 shows the mapping between the **naiv** and the **nai** parameter values.

**Range:** 0-127

**Default:** Display all

**:np=** (optional)

Numbering Plan. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** e164, generic, x121, f69, e210, e212, e214, private, dflt

**Default:** Display all

**:npv=** (optional)

Numbering Plan value. The numbering plan can be specified by supplying either a mnemonic value (**np** parameter) or an explicit numeric value (**npv** parameter). Either the **np** parameter or the **npv** parameter, but not both, can be specified in the command. Table A-6 shows the mapping between the **npv** and the **np** parameter values.

**Range:** 0-15

**Default:** Display all

**:selid=** (optional)

Selector ID.

**Range:** 0-65534

**:tt=** (optional)

Translation type.

**Range:** 0-255

**Default:** Display all

### Example

```
rtrv-gtttsel
rtrv-gtttsel:gtii=2
rtrv-gtttsel:tt=0:np=e164
rtrv-gtttsel:gti=2:tt=10
rtrv-gtttsel:gttsn=setint000
```

### Dependencies

The EGTT feature must be turned on before this command can be entered.

An entry that matches exactly the specified combination of **gti**, **tt**, **np**/**npv**, **nai**/**naiv**, and **gttsn** must be specified. If no match is found, the following message is displayed in the scroll area of the terminal: No GTT Selectors matching the specified criteria were found.

The specified **gttsn** value must exist for the specified **gtin24**, **tt**, **np**/**npv**/**nai**/**naiv** parameter combination.

The **np** and **npv** parameters cannot be specified together in the same command.

The **nai** and **naiv** parameters cannot be specified together in the same command.

The parameter values **gtia=4**, **gti/gtia/gtii/gtin/gtin24=1**, and **gti/gtia/gtii/gtin/gtin24=3** cannot be specified.

When the **gti/gtia/gtii/gtin/gtin24=2** parameter is specified, the **np**/**npv** and **nai**/**naiv** parameter combinations cannot be specified.

If the **cgssn** parameter and/or the **selid** parameter is specified, neither the **cggtasn** parameter nor the **cgpcsn** parameter can be specified.

The Origin-based SCCP Routing feature must be enabled if the **cggtasn**, **cgpcsn**, **cgssn**, **cdgtasn**, or **selid** parameters are specified.

The GTT set specified by the **cggtasn** or **cgpcsn** parameter must exist in the database before it is assigned to a GTT selector.

The set type of the **cggtasn** parameter or the **cgpcsn** parameter must match the set type of the corresponding entry in the GTT set table. For example, the **cggtasn** parameter should have a set type of **cggtas**, and the **cgpcsn** parameter should have a set type of **cgpc**.

The **cdgtasn** parameter cannot be specified if the **gti=2** and **tt** parameters are specified, or if the **gti=4** and the **tt**, **np/npv**, and **nai/naiv** parameters are specified.

## Notes

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

**Output**

Retrieve all GTT selectors:

**rtrv-gttssel**

```

**Legend**

**GTI/GTIA/GTII/GTIN/GTIN24**—The global title indicator.

**TT**—The translation type.

**NP**—The number plan.

**NAI**—The nature of address indicator.

**GTTSN**—The GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**rtrv-gttset****Retrieve GTT Set**

Use this command to display a list of administered GTT sets. This list can be filtered by using the parameters shown.

**Keyword:** **rtrv-gttset**

**Related Commands:** **chg-gttset, dlt-gttset, ent-gttset**

**Command Class:** Database Administration

**Parameters**

**:gttsn=** (optional)

GTT set name. A GTT set is an entity to which global title addresses and selectors are assigned.

**Range:** *aaaaaaaa*

1 leading alphabetic and up to 8 following alphanumeric characters.

**:netdom=** (optional)

Network domain. This command does not distinguish between ITU National or ITU International because the Enhanced Global Title Translation feature does not discriminate between the ITU-I and ITU-N translations.

**Range:** **ansi, itu, cross**

**Default:** Display all

**:settype=** (optional)

GTT set type.

**Range:** **cdgta, cggta, cgpc, cgssn, opc**

**Default:** Display all

**Example**

```
rtrv-gttset
```

```
rtrv-gttset:netdom=ansi
```

```
rtrv-gttset:gttsn=t800
```

**Dependencies**

The EGTT feature must be turned on before this command can be entered.

If the **gttsn** parameter is specified, it cannot have a value of **none**, and must match an existing **gttsn**.

If the **netdom** parameter is specified, at least one entry must exist that exactly matches the specified value. Otherwise, the following error message appears in the scroll area:

```
No GTT Sets matching the specified criteria were found.
```

The **netdom=cross** parameter is valid only if the **settype=cdgta** parameter is specified.

If the **gttsn** parameter is specified, the **settype** and **netdom** parameters cannot be specified.

The Origin-based SCCP Routing feature must be enabled if the value of the **settype** parameter is **cggta, cgssn, opc, or cgpc**.

The ANSI-ITU-China SCCP Conversion feature must be turned on before the **netdom=cross** parameter can be specified.

**Notes**

When the EGTT feature is turned on, the GTT Selector (**ent/chg/dlt/rtrv-gttset**), GTT Set (**ent/dlt/rtrv-gttset**), and GTA (**ent/chg/dlt/rtrv-gta**) commands replace the Translation Type (**ent/dlt/rtrv-**

**tt**) and Global Title Translation (**ent/chg/dlt/rtrv-gtt**) commands. All data previously provisioned with these commands is maintained.

When the Origin-based SCCP Routing feature is turned on, the **settype** parameter is displayed regardless of feature key status. If the feature key is not enabled, the **settyp=cdgta** parameter (default value) is displayed.

**Output**

Retrieve all GTT sets:

**rtrv-gttset**

```

```

**rtrv-gtwy-acthresh****Retrieve the Gateway Screening Activity Threshold**

Use this command to display the current values for the SS7 message rejection thresholds occurring because of the gateway screening process.

**Keyword:** rtrv-gtwy-acthresh

**Related Commands:** set-gtwy-acthresh

**Command Class:** Database Administration

### Parameters

**:lsn=** (optional)

Linkset name.

**Range:** ayyyyyyyyy

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

### Example

**rtrv-gtwy-acthresh: lsn=wy644368**

**rtrv-gtwy-acthresh**

### Dependencies

The specified linkset must exist in the gateway linkset entity set of the requesting system.

The linkset specified must exist in the active database.

At least one optional parameter must be specified.

### Notes

None

### Output

The following example shows the display of the thresholds of all linksets:

**rtrv-gtwy-acthresh**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN      REJ      RECV      INTRVL
WY644368 10        1000      10
WY234456 25        2000      20
LN123445 -          -          -

```

;

The following example shows the display of the linkset **wy644368** rejection thresholds:

**rtrv-gtwy-acthresh: lsn=wy644368**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LSN      REJ      RECV      INTRVL
wy644368 10        1000      10
```

;

### Legend

**LSN**—Linkset name.

**REJ**—Reject threshold.

**RECV**—Received message threshold.

**INTRVL**—Monitor interval.

**rtrv-gtwy-prmtrs****Retrieve Gateway Parameters**

Use this command to display the STP values that limit the display of certain notification messages that could become excessive. Only the values set by the **set-scrrej-prmtrs** command are displayed.

**Keyword:** **rtrv-gtwy-prmtrs**

**Related Commands:** **set-scrrej-prmtrs**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gtwy-prmtrs**

**Dependencies**

None

**Notes**

None

**Output**

**rtrv-gtwy-prmtrs**

```
rlghncxa03w 04-02-18 08:50:12 EST EAGLE 31.3.0
LIMIT INTRVL
1000 15
;
```

**Legend**

**LIMIT**—The threshold not to be exceeded.

**INTRVL**—Monitor interval. The examination period, in minutes, during which the gateway screening activity thresholds are to be tested.

**rtrv-gws-actset****Retrieve Gateway Screening Stop Action Sets**

Use this command to display the values defined for gateway screening stop actions.

**Keyword:** **rtrv-gws-actset**

**Related Commands:** **chg-gws-actset**

**Command Class:** Database Administration

**Parameters**

**:actid=** (optional)

The identification number of the gateway screening stop action.

**Range:** **4-16**

**Default:** Display all

**:actname=** (optional)

The name of the gateway screening stop action set.

**Range:** *ayyyy*

One alphabetic character followed by up to five alphanumeric characters.

**Default:** Display all

**Example**

```

rtrv-gws-actset
rtrv-gws-actset:actname=cr
rtrv-gws-actset:actid=6

```

**Dependencies**

Either **actname** or **actid** can be specified, but not both.

**Notes**

If neither **actname** nor **actid** are specified with the **rtrv-gws-actset** command, all gateway screening stop actions are displayed.

**Output**

The following example displays output when 7 gateway screening stop action sets are defined.

**rtrv-gws-actset**

```

rlghncxa03w 03-03-07 00:57:31 EST EAGLE 37.2.0

**rtrv-gws-redirect****Retrieve Gateway Screening Redirect**

Use this command to display the provisioning data for the redirect function. The parameters and values that are retrieved using this command are stored in the Redirect table, and they are used to set the variable fields of the MSUs being redirected.

**Keyword:** **rtrv-gws-redirect**

**Related Commands:** **chg-gws-redirect, dlt-gws-redirect, ent-gws-redirect**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-gws-redirect**

**Dependencies**

None

**Notes**

None

**Output****rtrv-gws-redirect**

```
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA          RI  SSN  TT   GTA

;
```

In the following example, the gateway screening redirect function is not enabled.

**rtrv-gws-redirect**

```
rlghncxa03w 03-11-10 11:43:04 EST EAGLE 31.6.0
ENABLED DPCA          RI  SSN  TT   GTA
Redirect function data is not provisioned.
;
```

**Legend**

**ENABLED**—Indicates whether the gateway screening redirect function is on or off

**DPCA/DPCI/DPCN/DPCN24**—The destination point code that the message is being redirected to.

**RI**—The routing indicator for the redirected message

**SSN**—The subsystem to which the redirected message is bound for.

**TT**—The translation type of the global title translation

**GTA**—The global title translation address

**rtrv-home-smsc****Retrieve HOME SMSC Address**

Use this command to retrieve HOME SMSC specific addresses currently used to identify Short Message Service Centers in the database. This command reads the HOME SMSCADDR table.

**Keyword:** **rtrv-home-smsc**

**Related Commands:** **dlt-home-smsc**, **ent-home-smsc**

**Command Class:** Database Administration

**Parameters**

**:force=** (optional)

Display more than 50 entries.

**Range:** **yes, no**

**Default:** **no**

**:num=** (optional)

Number of entries to display. The **force** parameter must also be specified to display more than 50 entries.

**Range:** **0-500**

**Default:** **50**

**:smsc=** (optional)

Short Message Service Center address.

**Range:** 1-21 digits

1-21 hexadecimal digits

**Example**

**rtrv-home-smsc**

**rtrv-home-smsc:smsc=552611646**

**rtrv-home-smsc:num=100:force=yes**

**Dependencies**

The Portability Check for Mobile Originated SMS (MNP SMS), MO-based GSM SMS NP, MO-based IS41 SMS NP, MT-Based GSM SMS NP, or the MT-Based IS41 SMS NP feature must be enabled (see the **enable-ctrl-feat** command) before this command can be entered. (MNP SMS feature can be turned off with the **chg-ctrl-feat** command and the **rtrv-home-smsc** command will still execute.)

When the specified **num** parameter value is greater than 50, the **force=yes** parameter must also be specified.

**Notes**

None

**Output****rtrv-home-smsc**

```

**rtrv-inpopts****Retrieve INP Options**

Use this command to retrieve INP-specific options.

**Keyword:** rtrv-inpopts

**Related Commands:** chg-inpopts

**Command Class:** Database Administration

### Parameters

This command has no parameters.

### Example

**rtrv-inpopts**

### Dependencies

The INP feature or the ANSI-41 INP Query (AINPQ) feature must be turned on before this command can be entered.

### Notes

If no DRANAI value or DRANAIV value has been provisioned, the command output displays the DRANAIV default value of 126.

If either the DRANAI value or DRANAIV value has been provisioned, the DRANAI mnemonic string for the provisioned value is displayed.

If no DRANP value or DRANPV value has been provisioned, the command output displays the DRANP default mnemonic value of E164.

If either the DRANP value or DRANPV value has been provisioned, the DRANP mnemonic string for the provisioned value is displayed.

The command output displays each CDPNPFX value with its associated DLTPFX setting.

The command output displays each CDPNNAI value with its associated SNAI value.

If no NEC value has been provisioned, a value of **none** is displayed.

**Output**

The following example shows output with default INP options.

**rtrv-inpopts**

```
rlghncxa03w 05-02-17 15:35:05 EST EAGLE 34.1.0
INP OPTIONS
-----
NEC          = NONE
DRANAIV      = 126
DRANP        = E164
DRA          = RNDN
SPRESTYPE    = CONTINUE

CDPNPFX      DLTPFX
-----
CDPNNAI      SNAI
---
```

;

The following example shows output with some INP or AINPQ options provisioned.

**rtrv-inpopts**

```
rlghncxa03w 06-09-17 15:35:05 EST EAGLE 36.0.0
INP OPTIONS
-----
NEC          = abcd
DRANAIV      = 126

```

;

### Legend

- **ASD**—Additional Subscriber Data
- **CDPNNAI**—Called Party Number Nature of Address Indicator
- **CDPNPFX**—Called Party Number Prefix
- **DLTPFX**—Delete Prefix
- **DRA**—Destination Routing Address.
- **DRANAI**—Nature of Address Indicator for the Destination Routing Address
- **DRANPV**—Numbering Plan Value for the Destination Routing Address
- **NEC**—National Escape Code
- **SNAI**—Service Nature of Address Indicator
- **SPRESTYPE**—INP option to send a "Connect" message or a "Continue" message when IDP messages are received for INP services, the DN digits match, and the HLR ID is present

### rtrv-ip-card

### Retrieve Internet Protocol Card

Use this command to retrieve IP networking parameters for a given card.

**Keyword:** rtrv-ip-card

**Related Commands:** chg-ip-card

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:**     **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

**Example**

```
rtrv-ip-card:loc=1211
```

```
rtrv-ip-card
```

**Dependencies**

The **loc** parameter value must correspond to a DCM card in the card table.

**Notes**

None

## Output

*i*

### Legend

**LOC**—The card location.

**SRCHORDR**—The Host table search order. LOCAL indicates that the Local Host table is searched first. SRVR indicates that the Domain server is searched first. SRVROnly indicates that only the Domain server is searched.

**DNSA**—The IP address of Domain Server A.

**DNSB**—The IP address of Domain Server B.

**DEFROUTER**—The IP address for the default router.

**DOMAIN**—The Domain name of the Domain server.

**SCTPCSUM**—The SCTP checksum algorithm type.

**BPADDR**—The bonded port IP address.

**BPSUBMASK**—The bonded port IP submask.

## rtrv-ip-host

## Retrieve Internet Protocol Hostname

Use this command to retrieve the IP Host table. The Host table defines local host names for IP addresses.

**Keyword:** rtrv-ip-host

**Related Commands:** `dlt-ip-host`, `ent-ip-host`

**Command Class:** Database Administration

## Parameters

**:host=** (optional)

Host name. The logical name of the device associated with the indicated IP address.

[illegible]

Any string of characters beginning with a letter and comprising up to 60 characters in length. Valid characters are a–z, A–Z, 0–9, - (dash), . (period)

**:ipaddr=** (optional)

The IP address associated with the hostname. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 4 numbers separated by dots, with each number in the range of 0-255.

### Example

```
rtrv-ip-host:host=gw100-nc.tekelec.com:ipaddr=150.1.1.1
```

```
rtrv-ip-host:host=qw100.nc.tekelec.com
```

```
rtrv-ip-host:ipaddr=150.1.1.1
```

## rtrv-ip-host

**Dependencies**

The host name, if entered, must exist.

The IP address, if entered, must exist.

**Notes**

If optional parameters are specified, only the entries that match the entered parameters are retrieved.

**Output****rtrv-ip-host:host=gw100.nc.tekelec.com:ipaddr=150.1.1.1**

```

;

**rtrv-ip-lnk****Retrieve Internet Protocol Link**

Use this command to retrieve the IP link table.

**Keyword:** rtrv-ip-lnk

**Related Commands:** chg-ip-lnk

**Command Class:** Database Administration

**Parameters**

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the system.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card location link data are displayed.

**:port=** (optional)

Ethernet interface port ID.

**Range:** a, b

**Default:** All IP link port data associated with all ports on the card are displayed.

**Example**

```
rtrv-ip-lnk:loc=1211:port=a
```

```
rtrv-ip-lnk:loc=1211
```

```
rtrv-ip-lnk
```

**Dependencies**

The **loc** parameter value must correspond to a DCM card in the card table.

**Notes**

None

**Output****rtrv-ip-lnk**

```

```

;

**Legend**

**LOC**—The card location.

**PORT**—The Ethernet interface port ID, **A** or **B**.

**IPADDR**—The IP address for the specified port.

**SUBMASK**—The subnet mask of the IP interface.

**DUPLEX**—The mode of operation of the interface, **HALF** or **FULL**.

**SPEED**—The bandwidth for the interface in megabits per second, **10** or **100**.

**MACTYPE**—The Media Access Control Type of the interface, **802.3** or **DIX**. **802.3** indicates the IEEE standard number 802.3 for Ethernet 1, and **DIX** indicates the Digital/Inter/Xerox *de facto* standard for Ethernet 2.

**AUTO**—Whether or not to automatically determine duplex and speed. If **YES**, duplex and speed are automatically determined. If **NO**, duplex and speed are not automatically determined.

**MCAST**—Multicast Control. Enables or disables multicast support for the interface. This parameter is necessary for INP, G-Port, and G-Flex to establish the connection from the Service Module card to the MPS system.

**rtrv-ip-node****Retrieve IP Node**

Use this command to display one or more nodes that are directly connected to a TCP/IP data link. A particular connection can be displayed, a particular application on a node can be displayed, or an entire node can be displayed. If an entire node is displayed, no parameters are required to perform this action. A particular application can be specified by giving either the application's name or its IP port on the node.

**Keyword:** rtrv-ip-node

**Related Commands:** dlt-ip-node, ent-ip-node

**Command Class:** Database Administration

## Parameters

**:ipaddr=** (optional)

The remote host's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:ipappl=** (optional)

The IP application supported by the node.

**Range:** stplan

**:ipport=** (optional)

The logical IP port that addresses the application on the node.

**Range:** 1024-5000

**Default:** Display all

**:iprte=** (optional)

The default router's IP address. This is a TCP/IP address expressed in standard dot notation. IP addresses consist of the system's network number and the machine's unique host number. An example IP address is **192.126.100.5**, where **192.126.100** is the network number and **5** is the machine's host number.

**Range:** 1-223, 0-255

4 numbers separated by dots

**1-223**—first number

**0-255**—the other three numbers

**Default:** Display all

**:loc=** (optional)

The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** Display all

## Example

```
rtrv-ip-node
```

```
rtrv-ip-node:ipappl=stplan
```

```
rtrv-ip-node:ipaddr=193.4.201.50
```

```
rtrv-ip-node:ipaddr=193.4.201.50:ipport=1024
```

**rtrv-ip-node: loc=1201**

### Dependencies

If the **ipappl**, **ipport**, or **loc** parameter is specified, the others cannot be specified.

The **ipport** parameter can be specified only if the **ipaddr** parameter is specified.

The ACM is the only valid card type for this command.

The shelf and card must be equipped.

If the **loc** parameter is specified, the card location must be equipped with a TCP/IP data link.

If the **ipaddr** parameter is specified, that IP address must be in the TCP/IP data link table.

If the **ipappl** parameter is specified, that IP application must be in the TCP/IP data link table.

If the **iprte** parameter is not specified, then all TCP/IP nodes meeting the display criteria are displayed. If the TCP/IP node has no TCP/IP router assigned to it, dashes are displayed in the IPRTE field.

### Notes

None

## Output

**Legend****IPADDR**—The remote host's IP address.**IPPORT**—The logical IP port to address the application on the node.**IPAPPL**—The IP application supported by the node.

**LOC**—The card location as stenciled on the shelf of the system that contains the TCP/IP link that will be directly connected to the node.

**CAP**—The maximum percentage of ethernet capacity for this node connection.

**IPRTE**—The default router's IP address.

## rtrv-ip-rte

## Retrieve IP Route

Use this command to display all static IP route entries in the Static IP Route table, or the entries for a specific card (destination IP addresses, subnet masks, and gateway IP addresses), or the entries for a specific destination IP address, or the entries for a specific gateway IP address.

**Keyword:** **rtrv-ip-rte**

**Related Commands:** **, ent-ip-rte**

**Command Class:** Database Administration

### Parameters

**:dest=** (optional)

Destination IP Address. The IP Address of a remote destination host or network.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

**:gtwy=** (optional)

Gateway IP Address. The IP address assigned to the gateway router that will properly forward IP datagrams with the destination IP address (dest) to the next-hop gateway router or final destination host.

**Range:** 4 numbers separated by dots, with each number in the range of **0–255**.

The IP address **0.0.0.0** is not valid.

**:loc=** (optional)

Card location. The unique identifier of a specific IP card in the system.

**Range:** **1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118**

### Example

```
rtrv-ip-rte
```

```
rtrv-ip-rte:loc=1301
```

```
rtrv-ip-rte:dest=128.252.10.5
```

```
rtrv-ip-rte:gtwy=140.190.15.3
```

### Dependencies

Only one optional parameter can be specified in a single command.

The **loc** parameter value must correspond to a SSED CM card in the card table that is running the **ss7ipgw**, **ipgwi**, **iplim**, or **iplimi** application. The B network is used only on SSED CM cards.

The specified destination IP address (**dest** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

The specified gateway IP address (**gtwy** parameter):

- Must not be the default route (**0.0.0.0**)
- Must not correspond to any loopback address (i.e. 127.X.X.X)

**Legend****MSG**—ISUP Test Message number**ACTIVE**—Indicates whether the ISUP test message will be sent to the network card in the test (0=NO, 1=YES)**CGPN\_NAI**—Calling Party Number Nature of Address Indicator**CGPN\_CAT**—CgPN Category**CGPN**—Calling Party Number Digits**CDPN\_NAI**—Called Party Number Nature of Address Indicator**CDPN**—Called Party Number Digits**NMBITS**—Nm Bits that indicate whether a number portability lookup has already been performed in the network**rtrv-isupvar-attrb****Retrieve ISUP Variant Attribute**

Use this command to retrieve the attributes of ISUP variant table entries.

**NOTE: This command is obsolete.****Keyword:** rtrv-isupvar-attrb**Related Commands:** chg-isupvar-attrb, copy-isupvar-attrb, rtrv-pstn-pres**Command Class:** Database Administration**Parameters****:display=** (optional)

Display indicates which information in the variant entry will be displayed.

**Range:** brief, full**Default:** brief**:msgcode=** (optional)

The ISUP message type code entered to identify a specific ISUP message that is going to have its attributes changed.

**Range:** 0-255

The value can be specified in decimal (0–255) or hexadecimal (h'00–h'ff).

**:parmcde=** (optional)

The ISUP parameter code entered to identify a specific ISUP parameter that is going to have its attributes changed.

**Range:** 0-255

The value can be specified in decimal (0-255) or hexadecimal (h'00-h'ff).

**:pstncat=** (optional)

The PSTN category assigned to the variant entry being retrieved.

**Range:** 0-65535

**:pstnid=** (optional)

The PSTN ID identifying the sourcevariant table entry being copied.

**Range:** 0-65535

### Example

**rtrv-isupvar-attrb:pstncat=65535:pstnid=65535:msgcode=4**

**rtrv-isupvar-attrb:pstncat=1:pstnid=5:parmcde=h'20**

### Dependencies

The **pstncat=1** and **pstnid=2** parameter combination is invalid.

Required controlled features must be enabled.

- ISUP Normalization controlled feature
- ON/OFF controlled feature for Tekelec-defined Variant

The Tekelec-defined Variants are listed in .

- Quantity controlled feature for user-defined Variant

The **pstncat** and **pstnid** values must have been previously defined with **ent-pstn-pres**.

The **dpstncat** and **dpstnid** values must have been previously defined with **ent-pstn-pres**.

### Notes

The **copy-isupvar-attrb** command provides the user with an easy way to provision a new ISUP variant table entry by copying all the data from another entry. Then the user changes the entry with the **chg-isupvar-attrb** command.

An ISUP variant table entry exists for each variant defined in the SG. Each entry contains ISUP message and parameter data specific to the ISUP protocol that variant uses. A variant is uniquely defined by its PSTN presentation value, consisting of a PSTN category and a PSTN ID.

The PSTN presentation is used to identify both the source and destination table entries. Both entries **must** be previously defined PSTN presentation values, such as either a Tekelec-defined PSTN or a user-defined PSTN by the **ent-pstn-pres** commands. Use the **rtrv-pstn-pres** command to display the **only** allowed values for the source and destination PSTNs.

If the source or destination variant is a Tekelec-defined PSTN value, then its associated ON/OFF control feature must be ENABLED.

The following is an example of a possible output displaying all supported parameters for a specified message in a variant.

```
PSTNCAT PSTNID MSGCODE ATTRIB ACTION 00001 00005 04h DEFINED CONVERT
MSGCODE PARMCODE TYPE ORDER ACTION 04h --- --- - CONVERT 10h MF 1 NONE 08h
MF 2 NONE 09h MV 1 CONVERT FEh MV 2 NONE 00h OPT - NONE 01h OPT - NONE 04h
OPT - NONE 0Fh OPT - PASSTHRU
```

## Output

The following example displays one message in the specified variant.

**rtrv-isupvar-attrib:pstncat=65535:pstnid=65535:msgcode=4**

| PSTNCAT | PSTNID | MSGCODE | ATTRIB  | ACTION   |
|---------|--------|---------|---------|----------|
| 65535   | 65535  | 04h     | DEFINED | PASSTHRU |

ISUP variant table is (5 of 20) 25% full

;

## Legend

**PSTNCAT**—The PSTN category identifying the source variant table entry being copied.

**PSTNID**—The PSTN ID identifying the source variant table entry being copied.

**DPSTNCAT** —The PSTN category identifying the destination variant table entry where the source variant table is being copied.

**DPSTNID**—The PSTN ID identifying the destination variant table entry where the source variant table is being copied.

## rtrv-l2t

## Retrieve Level 2 Timers

Use this command to display the values of the SS7 MTP Level 2 timers. These timers are organized in 30 timer sets of 9 timer values each. The timer sets are grouped and system default values are initialized by specification (ANSI, ITU, High Speed for China, and High Speed for Q.703 Annex A). Each timer set is administered individually by the **chg-l2t** command. The **ent-slk** command is used to assign an SS7 signaling link to any of the timer sets. Each assigned link is associated with a timer set.

**Keyword:** **rtrv-l2t**

**Related Commands:** **chg-l2t**, **ent-slk**, **rtrv-slk**

**Command Class:** Database Administration

## Parameters

**:l2tset=** (mandatory)

This parameter specifies the Level 2 timer set identifier or timer set number.

Up to 30 different sets of SS7 MTP Level 2 timer sets can be defined.

**Range:** **1-30**

**Default:** Displays all timer sets

**:l2set=** (optional)

Level 2 timer set identifier, or timer set number. Up to 30 different sets of SS7 MTP Level 2 timer sets can be defined. The **ent-slk** command can be used to assign an SS7 signaling link to any one of the 30 timer sets.

## Example

**rtrv-l2t**

**rtrv-l2t:l2tset=3**

## Dependencies

**Notes**

The timer values are shown in the output for this command in seconds, even though they were specified in milliseconds in the **chg-l2t** command.

**Output**

The timer values are shown in the output for the **rtrv-l2t** command in seconds.

**rtrv-l2t**

## rtrv-l3t

### Retrieve Level 3 Timers

Use this command to show values of the SS7 level 3 timers. The timers are grouped into sets that are assigned to linksets.

**Keyword:** **rtrv-l3t**

**Related Commands:** **chg-l2t, chg-l3t, ent-ls, rtrv-l2t, rtrv-ls**

**Command Class:** Database Administration

### Parameters

**:l3set=** (optional)

Level 3 timer set table. Only one level 3 timer set table can be defined. The timer set can then be assigned to a linkset using the **ent-ls** or **chg-l3t** command.

**Range:** **1**

**Default:** Display table

### Example

```
rtrv-l3t:l3tset=1
```

### Dependencies

Only one timer set is supported in this release.

### Notes

The timer output for this command is in seconds, even though it could have been entered in milliseconds on the **chg-l3t** command.

**Output****rtrv-l3t:l3tset=1**

```

**Legend**

**L3TSET**—The level 3 timer set table.

**T1**—The delay, in seconds, to avoid message missequencing on changeover. Also used as the ITU MTP restart isolation timer.

**T2**—The amount of time, in seconds, to wait for changeover acknowledgment.

**T3**—Time controlled diversion – the delay, in seconds, to avoid missequencing on changeback.

**T4**—The amount of time, in seconds, to wait for changeback acknowledgment, first attempt.

**T5**—The amount of time, in seconds, to wait for changeback acknowledgment, second attempt.

**T6**—The delay, in seconds, to avoid message missequencing on controlled rerouting.

**T7**—The amount of time, in seconds, to wait for signaling data link connection acknowledgment.

**T8**—The transfer-prohibited inhibited timer (transient solution).

**T10**—The amount of time, in seconds, to wait before repeating the signaling-route-set-test message.

**T11**—The transfer-restricted timer.

**T12**—The amount of time, in seconds, to wait for uninhibit acknowledgment.

**T13**—The amount of time, in seconds, to wait for force uninhibit.

**T14**—The amount of time, in seconds, to wait for inhibition acknowledgment.

**T15**—The amount of time, in seconds, to wait before repeating the signaling-route-set-congestion test.

**T16**—The amount of time, in seconds, to wait for route-set-congestion status update.

**T17**—The delay, in seconds, to avoid oscillation of initial alignment failure and link restart.

**T18**—The repeat TFR once by response method timers.

**IT18**—The timer within an STP whose MTP restarts to supervise the receipt of routing information and the activation of the link and link set. The amount of time, in seconds, to wait for links to align and to receive TRAs from all adjacent nodes.

**T19**—The failed link craft referral timer.

**IT19**—The amount of time, in seconds, for the supervision timer to wait during MTP restart to avoid ping-pong of TFP, TFR1, and TRA messages.

**T20/IT22**—The amount of time, in seconds, to wait before repeating the local inhibit test.

**IT20**—The amount of time, in seconds, to wait overall for the MTP restart at the signaling point whose MTP restarts.

**T21/IT23**—The amount of time, in seconds, to wait before repeating the remote inhibit test.

**IT21**—The overall MTP restart timer at a signaling point adjacent to one whose MTP restarts.

**T22**—The timer at the restarting STP. The amount of time, in seconds, to wait for signaling links to become available.

**T23**—The timer at the restarting STP. Starting after T22, the amount of time, in seconds, to wait to receive all TRA messages.

**T24**—The timer at the restarting STP with transfer function. Starting after T23, the amount of time, in seconds, to wait to broadcast all TRA messages.

**T25**—The timer at the adjacent and restarting STPs. The amount of time, in seconds, to wait for a TRA message (may be started at level 2).

**T26**—The timer at the restarting STP. The amount of time, in seconds, to wait to repeat a TRW message.

**T28**—The timer at the STP adjacent to the restarting STP. The amount of time, in seconds, to wait for a TRW message.

**T29**—The timer started when a TRA message is sent in response to an unexpected TRA or TRW. Also, the timer started when traffic is resumed without receipt of a TRA message.

**T30**—The timer used to limit the sending of TFPs/TFRs in response to an unexpected TRA or TRW message.

**T31**—The false link congestion detection timer.

**T32**—The link oscillation timer—Procedure A.

## rtrv-lbp

## Retrieve Loopback Point Attributes

Use this command to retrieve the current value of a far-end loopback point maintained in the link fault sectionalization table.

**Keyword:** rtrv-lbp

**Related Commands:** act-lbp, chg-lbp, dact-lbp, dlt-lbp, ent-lbp

**Command Class:** Database Administration

### Parameters

**:lbp=** (optional)

Loopback point ID. This parameter identifies a far-end loopback point that lies along an SS7 signaling link path between the STP and the target device (up to and including the target device).

**Range:** 1-32

**Default:** Display all

**:link=** (optional)

SS7 signaling link. The SS7 signaling link that is to be tested.

**Synonym:** port

**Range:** a, b, a1-a31, b1-b31

Not all card types support all **link** parameter values.

See "Summary of Range Values for :link Parameter" for valid **link** parameter range values for each type of card that can have assigned signaling links.

**Default:** Display all

**:loc=** (optional)

Card location. The unique identifier of a specific application subsystem located in the STP.

**Range:** 1101-1108, 1111-1112, 1201-1208, 1211-1218, 1301-1308, 1311-1318, 2101-2108, 2111-2118, 2201-2208, 2211-2218, 2301-2308, 2311-2318, 3101-3108, 3111-3118, 3201-3208, 3211-3218, 3301-3308, 3311-3318, 4101-4108, 4111-4118, 4201-4208, 4211-4218, 4301-4308, 4311-4318, 5101-5108, 5111-5118, 5201-5208, 5211-5218, 5301-5308, 5311-5318, 6101-6108, 6111-6118

**Default:** All card locations.

### Example

**rtrv-lbp**

**rtrv-lbp:loc=1202**

**rtrv-lbp:loc=1202:link=a**

**rtrv-lbp:loc=1202:link=a:lbp=3**

### Dependencies

The Link Fault Sectionalization (LFS) feature must be on before this command can be entered.

The card location specified in the **loc** parameter cannot be reserved by the system.

If the **link** parameter is specified, the **loc** parameter must be specified. If the **lbp** parameter is specified, both the **loc** parameter and the **link** parameter must be specified.

The card location (**loc** parameter) must identify a provisioned **limds0**, **limt1**, or **limch** (associated to a **limt1**) card configured with either an **ss7ansi** or **ccs7itu** application.

The card location specified in the **loc** parameter must be equipped.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

**Output**

The following example displays the attributes for all the loopback points for SS7 links assigned to the STP:

**rtrv-lbp**

```

**rtrv-lnp-serv****Retrieve LNP Service**

Use this command to retrieve all LNP services. This command displays the assigned translation type, translation type name, service type, LNP digit validity indication, and TT aliases.

**Keyword:** rtrv-lnp-serv

**Related Commands:** chg-lnp-serv, dlt-lnp-serv, ent-lnp-serv

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-lnp-serv**

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

None

**Output****rtrv-lnp-serv**

```

rlghncxa03w 02-11-28 14:42:38 EST EAGLE 30.0.0
SERV  TT  TTN      DV  ALIAS
AIN    15  AINGTE   TCAP 235
                236

**TTN**—Translation type name

**DV**—Digits valid

**ALIAS**—Alias translation type

**rtrv-lnp-ttmap****Retrieve LNP Translation Type Mapping**

Use this command to retrieve all LNP MRGTs or all LNP MRGTs for a given TT, TT-PC-SSN, or TT-DPC combination.

**NOTE:** This command does not support 24-bit ITU national point codes.

**Keyword:** rtrv-lnp-ttmap

**Related Commands:** chg-lnp-ttmap

**Command Class:** LNP Basic

**Parameters**

**:force=** (optional)

Forcible value.

**Range:** yes, no

**Default:** no

**:num=** (optional)

Number of entries to be displayed. This parameter specifies how many records you want to display (potentially within a given range). Use this parameter to prevent inadvertent displays of extremely large amounts of information.

**Range:** 1-52, 000

**Default:** 50

**:pc=** (optional)

ANSI destination point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** pca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**Default:** Display all

**:tt=** (optional)

The translation type.

**Range:** 0-255

**Default:** Display all

**Example**

```
rtrv-lnp-ttmap:tt=16:pc=100-100-100
```

```
rtrv-lnp-ttmap
```

```
rtrv-lnp-ttmap:tt=15:num=20
```

```
rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes
```

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

If the **pc/pca** parameter is specified, the **tt** parameter must be specified.

The translation type must be in the LNP database.

If the specified **num** parameter value is greater than **50**, the **force=yes** parameter must be specified.

Translation type values associated with AIN or IN LNP queries are not allowed for retrievals.

The **tt** parameter cannot be specified if the value has already been specified as an alias for another translation type.

### Notes

Use the **tt** and **dpc** parameters to limit the displays to LNP MRGT records found matching their specified values. Combinations of these parameters are allowed.

**Output**

The following example shows how to retrieve an LNP GT:

```
rtrv-lnp-ttmap:tt=16:pc=100-100-100
rlghncxa03w 04-02-14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 100-100-100 28 YES

Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 50 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 001-001-001 0 YES
16 100-100-100 28 YES
.
.
18 002-002-002 10 NO
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 20 LNP GTs assigned to the specified TT value:

```
rtrv-lnp-ttmap:tt=15:num=20
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
15 001-001-002 10 NO
.
.
15 001-001-005 10 YES
Message Relay Table is 1% full
;
```

The following example shows how to retrieve the first 100 LNP GTs assigned to the specified DPC value:

```
rtrv-lnp-ttmap:dpc=1-1-1:num=100:force=yes
rlghncxa03w 04-02-28 14:23:37 EST EAGLE 31.3.0
TT PCA NGT RGTA
16 001-001-001 0 NO
18 001-001-001 10 NO
.
.
.
Message Relay Table is 75% full
;
```

**Legend**

**TT**—The translation type.

**PCA**—The ANSI point code.

**NGT**—The new global title translation type.

**RGTA**—The replacement GTA treatment.

**rtrv-lnpopts****Retrieve LNP System Options**

Use this command to display all the LNP-specific system options from the database.

**Keyword:** **rtrv-lnpopts**

**Related Commands:** **chg-lnpopts**

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-lnpopts**

**Dependencies**

The LNP feature must be turned on (see the **enable-ctrl-feat** command) before this command can be entered.

**Notes**

None

**Output**

The JIPPROV and JIPDIGITS fields appear in the output only when the Triggerless LNP feature is turned on.

**rtrv-lnpopts**

```

AMASLPID      = 123456789
INCSLP        = yes
AMACTYPE       = 003
AMAFEATID     = 010
CIC           = 1369
AUD           = on

CCP           = no
SERVPORT      = no
WQREDRCT      = off
WSMSC10DIG    = yes
;

```

**Legend**

**AMASLPID**—AMA slip ID

**INCSLP**—Whether the AMA slip ID included in the response

**AMACTYPE**—AMA call type

**AMAFEATID**—AMA feature ID

**CIC**—Carrier identification code

**AUD**—Audit indicator

**SP**—Service provider ID

**FRCSMPLX**—Allow simplex database updates indicator

**ADMHIPRI**—Indicator that LNP database administration has the highest priority of all administration

**GTWYSTP**—Indicator that LNP system is also configured as a Gateway STP

**JIPPROV**—Indicator of whether a Jurisdictional Information Parameter (JIP) value is to be added to the IAM

**JIPDIGITS**—The Jurisdictional Information Parameter value

**CCP**—Copy Charge Parameters

**SERVPORT**—Service Portability

**WQREDRCT**—Wireless queries directed to default GTT

**WSMS10DIG**—SCCP GTA length indicator for 10 or 11 digits

**rtrv-log****Display Records from the Log**

Use this command to retrieve records from the active or standby Alarm and UIM logs generated by the Maintenance system. This command selects these records based on a span of time or a specific log file index.

**Keyword:** rtrv-log

**Related Commands:**

**Command Class:** System Maintenance

## Parameters

**:dir=** (optional)

Direction in which to obtain entries from within the log (forward or backward) for displaying. See the Dependencies and Notes sections for usage information.

**Range:**       **fwd, bkwd**

**fwd**—Display entries from nearer the beginning of the log toward entries at the end of the log

**bkwd**—Display entries from nearer the end of the log toward entries at the beginning of the log

**Default:**     **fwd**

**:edate=** (optional)

End date. Report only log entries that were created on or *before* the specified date (when **dir=fwd**), or only log entries that were created on or *after* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:**       **000101-991231**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**     Report log entries regardless of their creation date

**:enum=** (optional)

Ending Message Reference Number (MRN) for which to display entries. The ending Alarm or UIM number if specifying a range.

**Range:**       **1-1499**

**1-999**—Alarms (UAMs)

**1000-1499**—UIMs

**Default:**     If **enum** is not specified and:

If **snum** is specified, the default **enum** value is the same as the specified **snum** value.

If **snum** is not specified and **type** is **alarm** or not specified, **enum= 999**.

If **snum** is not specified and **type** is **all** or **uim**, **enum= 1499**.

**:etime=** (optional)

End time. Report only log entries that were created on or *before* the specified time (when **dir=fwd**), or only log entries that were created on or *after* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:**       **000000-235959**

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:**     Report log entries regardless of their creation time

**:mode=** (optional)

Log display mode; display all information or just summary information from each log entry.

**NOTE:** If the entry is only one line, the same information (one line) is displayed in brief and full mode for that entry.

**Range:**       **brief, full**

**brief**—Display only the first “Summary” line of the log entry

**full**—Display all information available in the log entry

**Default:**     **full**

**:next=** (optional)

Number of additional records to display using the same direction (**dir**) and filtering criteria of **outgrp**, **type**, **slog**, and **mode** that were used for the previous successful **rtrv-log** command at the same terminal. This parameter cannot be specified with any other parameters in the command. See the Dependencies and Notes sections for usage information.

**Range:** 1-65500

**:num=** (optional)

Number of records that can be displayed before the report is stopped.

**Range:** 1-65500

**Default:** 15

**:outgrp=** (optional)

Output Group to sort or filter the Alarms (UAMs) and/or UIMs on. This parameter cannot be specified when the **snum** parameter is specified.

**Range:** **all**, **appserv**, **appss**, **card**, **clk**, **db**, **dbg**, **gtt**, **gws**, **link**, **meas**, **mon**, **mps**, **pu**, **sa**, **seas**, **slan**, **sys**, **traf**

**all** — Retrieve information for all Output Groups

**appserv** — Application Server

**appss** — Application Subsystem

**card** — Card

**clk** — Clock

**db** — Database

**dbg** — Debug

**gtt** — GTT Maintenance

**gws** — GWS Maintenance

**link** — Link Maintenance

**meas** — Measurements Maintenance

**mon** — Monitoring (Sentinel or IMF) Maintenance

**mps** — MPS Maintenance

**pu** — Program Update

**sa** — System Administration

**seas** — SEAS (Sentinel or IMF)

**slan** — SLAN Maintenance

**sys** — System Maintenance

**traf** — Traffic

**Default:** If the **next** parameter is not specified, the default is **all**.

If the **next** parameter is specified, the output is the same as the immediately previous successful **rtrv-log** command that was entered at the same terminal (and no **rtrv-log** command was entered at another terminal).

**:sdate=** (optional)

Start date. Report only log entries that were created on or *after* the specified date (when **dir=fwd**), or only log entries that were created on or *before* the specified date (when **dir=bkwd**). See the Notes section for usage information.

**Range:** 000101-991231

(in the form *yymmdd*, where *yy* is year, *mm* is month, and *dd* is day)

**Default:** Report log entries regardless of their creation date

**:slog=** (optional)

Source of log. Which OAM's Maintenance log to access: active or standby.

**Range:** **act**, **stb**

**act** — Active OAM

**stb** — Standby OAM

**Default:** act

**:snum=** (optional)

A single Alarm or UIM Message Reference Number (MRN), or the starting Alarm or UIM MRN if specifying a range. This parameter cannot be specified when the **outgrp** parameter is specified.

**Range:** 1-1499

1-999—Alarms (UAMs)

1000-1499—UIMs

**Default:** All entries for the specified **type** are displayed.

If **type** is **all**, **alarm**, or not specified, **snum=1**.

If **type** is **uim**, **snum=1000**.

**:stime=** (optional)

Start time. Report only log entries that were created on or *after* the specified time (when **dir=fwd**), or only log entries that were created on or *before* the specified time (when **dir=bkwd**). See the Notes section for usage information.

**Range:** 000000-235959

hhmmss—hh=hours (00-23), mm=minutes (00-59), ss=seconds (00-59)

**Default:** Report log entries regardless of their creation time

**:type=** (optional)

Type of Maintenance log to access for the report: alarms (UAMs), UIMs, or both logs (**all**).

**Range:** all, alarm, uim

**Default:** alarm

### Example

```
rtrv-log:sdate=960715:stime=220000:num=50
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106
```

```
rtrv-log:sdate=960715:stime=220000:num=50:snum=106:enum=350
```

```
rtrv-log:sdate=960715:stime=220000:num=50:outgrp=slan:type=all
```

```
rtrv-log:next=100
```

### Dependencies

No other **rtrv-log** command can already be in progress on the same OAM.

The initialization of the ELOG and UIM logs must be complete in the system before the **rtrv-log** command can be entered.

If both the **sdate** and **edate** parameters are specified,

- In the forward direction, the **sdate** value must be less than or equal to the **edate** value.
- In the backward direction, the **sdate** value must be greater than or equal to the **edate** value.

The month component of the **sdate** and **edate** parameters must be in the range 1–12.

The day component of the **sdate** and **edate** parameters must be in the range 1–31 and must accurately reflect the number of days in the month and year indicated (see Notes section).

The seconds component of the **stime** and **etime** parameters must be in the range 00–59.

The minutes component of the **stime** and **etime** parameters must be in the range 00–59.

If the **sdate** parameter value is equal to the **edate** parameter value,

- In the forward direction, the **stime** value must be less than or equal to the **etime** value.
- In the backward direction, the **stime** value must be greater than or equal to the **etime** value.

The **sdate** parameter value plus the **stime** parameter value must be less than the current time and date combination.

If **dir=bkwd** is specified with a date and time range, **sdate/stime** must be greater than **edate/etime**.

When the **enum** parameter is specified, the **snum** parameter must be specified with a value less than or equal to the specified **enum** value.

The specified **enum** parameter value and the specified **snum** value must be within the same range: **1-999** for Alarms (UAMs) and **1000-1499** for UIMs.

The **type** parameter and the **snum/enum** parameters cannot be specified together in the command.

The **rtrv-log:next=** command must be entered on the same terminal where the previous successful **rtrv-log** command was entered in the system. No other parameters can be entered with the **next** parameter in the command.

The **rtrv-log:next=** command cannot be entered following a **rtrv-log** command that contained the **type=all** parameter. A **rtrv-log** command without the **type=all** parameter must be entered before the **rtrv-log::next=** command can be entered.

Because entries can be overwritten between the entry of a **rtrv-log** command without the **next** parameter and the entry of a **rtrv-log:next=** command, the **rtrv-log:next:** command might not execute successfully. Another **rtrv-log** command without the **next** parameter must be entered before the **rtrv-log:next:** command can be entered again,

The values specified for the **edate** with the **stime** parameter combination is not valid.

The values specified for the **edate** with **stime** and **etime** parameter combination is not valid.

When an **enum** parameter is specified, it requires an **snum** as its mated parameter.

No other parameters can be entered with the **next** parameter in the command.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

To accommodate the year 2000 and beyond, the two-digit year portion of dates is interpreted to be in the indicated century as follows:

years 95–99 = 1995 through 1999  
years 00–94 = 2000 through 2094

This means that date 000101 (Jan. 1, 2000) is greater than 991231 (Dec. 31, 1999).

The day portion of any **sdate/edate** value entered must be in agreement with the month and year. The system issues error message E2252 if the day is found to be not valid (for example, 960631 is not a valid date). The system software and date/time hardware properly handle leap years and leap centuries. The year 2000 is a leap year.

When no date or time parameters are specified, the log display depends on the specified or default values of two other parameters: **num** and **dir**. The **num** parameter determines the maximum number of entries to display, and the **dir** parameter determines whether entries are displayed from the oldest end (**dir=fwd** or not specified) or the newest end (**dir=bkwd**).

When **sdate** is specified and **edate** is not specified in the forward direction, **edate** is defaulted to be the end of the log.

When **edate** is specified and **sdate** is not specified in the forward direction, **sdate** is defaulted to be the beginning of the log.

When **sdate** is specified and **edate** is not specified in the backward direction, **edate** is defaulted to be the beginning of the log.

When **edate** is specified and **sdate** is not specified in the backward direction, **sdate** is defaulted to be the end of the log.

When **stime** is specified and **etime** is not specified in the forward direction, **etime** is defaulted to 235959.

When **etime** is specified and **stime** is not specified in the forward direction, **stime** is defaulted to 000000.

When **stime** is specified and **etime** is not specified in the backward direction, **etime** is defaulted to 000000.

When **etime** is specified and **stime** is not specified in the backward direction, **stime** is defaulted to 235959.

When **stime** or **etime** is specified but neither the **sdate** or **edate** parameters are specified, **sdate** and **edate** are each defaulted to the value **today**.

The **num** parameter is used to control the maximum number of entries to be displayed by one command.

The **dir** parameter is used to control whether preceding (older) or following (newer) records are displayed. In either output format, records are displayed in time order regardless of the retrieval control of the **dir** parameter.

Because logging does not stop while records are displaying, old records that were displayed can be overwritten before they are accessed again.

After the date or time is changed in the system, output records can show anomalies in the date-time stamp. An example of this occurs when the time is changed back—in this case records may show that an earlier time follows a later time in the log.

When no Output Group (**outgrp**) is specified, no sorting based on Output Groups and no additional Alarm/UIM breakdown into Output Group categories is done for the report. The log entries will be shown only in the forward or reverse chronological ordering of the logs.

When a unique Output Group (**outgrp**) is specified, the report is separated into Alarm and UIM categories, and the entries for the specified Output Group are shown in each category.

When **outgrp=all** is specified, the report is separated into Alarm and UIM categories, and the available entries in each category are listed by Output Group.

The **next** parameter is used to display a specified number of additional log records after the previous **rtrv-log** entry at the terminal. New records that are logged after the previous **rtrv-log** command was entered will not be displayed when the **rtrv-log:next=** command is entered. The **next** parameter is valid only under the following conditions:

- The **rtrv-log:next=** command is entered at the same terminal from which the previous **rtrv-log** command was entered. The previous **rtrv-log** command must not include the **type=all** parameter.
- No other terminal has issued a **rtrv-log** command after the **rtrv-log** command entered at the terminal from which the **rtrv-log:next=** command is entered.
- The **next** parameter is the only parameter specified in the **rtrv-log** command.
- There are still logs present that match the conditions (except **time/date/num**) specified in the previous **rtrv-log** command.

When either a single **snum** or range of **snum/enum** is specified, only those Alarms or UIMs within the specified range are displayed.

When **snum** is specified and **enum** is not specified, the **enum** value defaults to the specified **snum** value.

When **enum** is specified, an **snum** value must be specified that is less than or equal to the specified **enum** value.

If an **snum** is specified within the range **1-999**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1-999**.

If an **snum** is specified within the range **1000-1499**, its corresponding **enum** must be greater than or equal to the **snum** and also within the range of **1000-1499**.

When **enum** is not specified and the specified **snum** Alarm or UIM does not exist (is not currently used in the system), a scroll area message indicates that the **snum** value is out of range.

If **snum** and **enum** are specified and one or both specified Alarms and/or UIMs do not exist (are not currently used in the system), the report lists all existing Alarms and/or UIMs that exist within the specified range.

## Output

In the following example, the sequence numbers that are replaced by the dashes (- - -) represent the UIMs that were discarded due to the UIM thresholding feature.

**rtrv-log:type=uim:sdate=960715:stime=220000:num=50**

**rtrv-loopset****Retrieve Loop Set Command**

Use this command to retrieve loopset data from the database.

**Keyword:** rtrv-loopset

**Related Commands:** chg-loopset, dlt-loopset, ent-loopset

**Command Class:** Database Administration

**Parameters**

**:disp=** (optional)

Display method. This parameter specifies the manner in which the retrieved data is displayed.

**Range:** detail, list

**detail**— Provides detailed information for a loopset entry.

**list**— Provides a list of loopset entries.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

**Default:** detail

**:force=** (optional)

The **force=yes** parameter must be specified if the value of the **num** parameter is greater than 50.

**Range:** yes

**:mode=** (optional)

Mode of operation. This parameter retrieves loopset entries that have been assigned the specified mode.

**Range:** notify, discard

**notify**— Generates a UIM without discarding the message.

**discard**— Generates a UIM and discards the message.

**:name=** (optional)

Loopset name. This parameter retrieves a specified loopset.

The **name=none** parameter cannot be specified.

**Range:** ayyyyyyy

1 alphabetic and up to 7 alphanumeric characters.

**:num=** (optional)

Number. This parameter specifies the number of entries to be retrieved.

If the value of the **num** parameter is greater than 50, then the **force=yes** parameter must be specified.

**Range:** 1-1000

**Default:** 50

### Example

This example provides detailed information for the first 50 valid loopset entries in the loopset table.

**rtrv-loopset**

This example provides detailed information for the loopset entry rtp1.

**rtrv-loopset:name=rtp1**

This example provides detailed information for the first 100 valid loopset entries in the loopset table.

**rtrv-loopset:num=100:force=yes**

This example provides a list of the first 100 valid loopset entries in the loopset table.

**rtrv-loopset:force=yes:num=100:disp=list**

This example provides detailed information for the first 100 valid loopset entries set to discard mode in the loopset table.

**rtrv-loopset:force=yes:num=100:mode=discard**

This example provides a list of the first 100 valid loopset entries set to notify mode in the loopset table.

**rtrv-loopset:force=yes:num=100:mode=notify:disp=list**

### Dependencies

If the value of the **num** parameter is greater than 50, then the **force=yes** parameter must be specified.

The value of the **name** parameter must already exist in the database.

The SCCP Loop Detection feature must be enabled before this command can be entered.

The GTT feature must be turned on before this command can be entered.

The **name=none** parameter cannot be specified.

If the **name** parameter is specified, then the **disp=list** parameter cannot be specified.

**Output**

The following example displays the loopset entry details for loopset **rtp1**.

**rtrv-loopset:name=rtp1**

```
rlghncxa03w 07-02-10 08:52:38 EST EAGLE Rel 35.6.0

## rtrv-ls

## Retrieve Linkset

Use this command to show the linkset information.

**Keyword:** **rtrv-ls**

**Related Commands:** **chg-ls**, **chg-lsopts**, **dlt-ls**, **ent-ls**, **rept-stat-ls**

**Command Class:** Database Administration

### Parameters

**:apc=** (optional)

ANSI point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The prefix subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—p-*

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001-005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006-255**.

The point code **000-000-000** is not a valid point code.

**:apc/apca/apci/apcn/apcn24=** (optional)

Adjacent point code.

**:apci=** (optional)

ITU international point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix—s-, p-, ps-*

*zone—0-7*

*area—000-255*

*id—0-7*

The point code **0-000-0** is not a valid point code.

**:apcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible

point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:apcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The prefix indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:cggtnod=** (optional)

Calling party GT modification indicator. This parameter displays the linksets that have the specified value of the calling party GT modification indicator.

**Range:** **yes, no**

**:itutfr=** (optional)

ITU TFR (Transfer Restricted) procedure indicator. This parameter displays the linksets that have the specified value of the **itutfr** parameter.

This parameter is valid for ITU national linksets only.

**Range:** **on, off**

**Default:** Display all link sets

**:lsn=** (optional)

Linkset name

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all link sets

**:lst=** (optional)

Linkset type. This parameter specifies whether to display proxy links.

This parameter can be specified only when the Proxy Point Code feature is enabled.

**Range:** **prx**

**prx**— Display proxy links.

**:mtprse=** (optional)

ANSI or ITU MTP Restart equipped. This parameter specifies whether the node adjacent to the linkset is equipped with MTP Restart.

**Range:** **yes, no**

**yes**— equipped

**no**— not equipped

**Default:** Display all link sets

**:ppc=** (optional)

ANSI proxy point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

The proxy point code must be a full point code.

**Synonym:** **ppca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:ppc/ppca/ppci/ppcn/ppcn24=** (optional)

Proxy Point Code.

The proxy point code must be a full point code.

**:ppci=** (optional)

ITU international proxy point code with subfields *zone-area-id*. The prefix subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:ppcn=** (optional)

ITU national proxy point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (*members*) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The prefix subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:ppcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000–255**

*ssa*—**000–255**

*sp*—**000–255**

**:randsls=** (optional)

Random SLS (signaling link selection). This parameter is used to display linksets that have the specified value of the **randsls** parameter.

**Range:** **off, class0, all**

**off** — Displays all linksets where random SLS is disabled.

**class0** — Displays linksets where random SLS generation for Class0 SCCP traffic is enabled.

**all** — Displays ITU linksets where random SLS generation for Class0 and Class1 SCCP traffic is enabled. Displays ANSI linksets where random SLS generation for Class0 and ISUP traffic is enabled.

**Default:** **off**

**:slsocbit=** (optional)

Other CIC (Circuit Identification Code) Bit. This parameter displays all the linksets that have the **slsocbit** parameter set to a value from 5 to 16.

**Range:** **\***

**\*** — Specifies all possible values ( **5-16** )

**Default:** Display all link sets

**:slsrsb=** (optional)

Rotated SLS (Signaling Link Selection) Bit. This parameter displays the linksets with the specified rotated bit.

**Range:** **1-4**

**Default:** Display all link sets

**:spc=** (optional)

ANSI secondary point code with subfields *network indicator-network cluster-network cluster member* (*ni-nc-ncm*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001–005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006–255**.

The point code **000-000-000** is not a valid point code.

**:spc/spca/spci/spcn/spcn24=** (optional)

Secondary point code.

**:spci=** (optional)

ITU international secondary point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—0-7

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:spcn=** (optional)

ITU national secondary point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npfmt** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:spcn24=** (optional)

24-bit ITU national secondary point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*).

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

## Example

Display the attributes of all link sets:

**rtrv-ls**

Retrieve link set ls1:

**rtrv-ls:lsn=ls1**

Retrieve all link sets with the *mtprse* parameter set to yes:

**rtrv-ls:mtprse=yes**

Retrieve all link sets that use the *slsocbit* parameter with a value from 5 to 16:

**rtrv-ls:slsocbit=\***

Display a specified ITU linkset to view the settings for the *slsrsb* or *slsocbit* parameters:

**rtrv-ls:lsn=lsitu**

Retrieve all ITU national linksets that have the *itutfr* parameter set to on:

**rtrv-ls:itutfr=on**

Retrieve the specified ITU national linkset and display its setting for the *itutfr* parameter:

**rtrv-ls:lsn=lsitun**

Retrieve all ITU linksets where random SLS generation is enabled for Class0 SCCP traffic.

**rtrv-ls:randsls=class0**

Display all proxy linksets.

**rtrv-ls:lst=prx**

Display all linksets using a specified proxy point code.

**rtrv-ls:ppc=11-11-11**

Display all linksets using a specified secondary point code.

**rtrv-ls:spc=2-2-2**

Display all linksets using a specified adjacent point code.

**rtrv-ls:apc=1-1-2**

Retrieves all linksets where calling party global title modification is requested:

**rtrv-ls:cggmod=yes**

### Dependencies

The specified linkset must be in the database.

All optional parameters, except for the combination of the **slsobit** and **slrsb** parameters, can only be used individually. Any combination of 2 or more of the optional parameters, other than the specified exception, is invalid.

If the **apcn** parameter is specified as the Adjacent Point Code, then the format of the **apcn** parameter must match the format dictated by the **chg-stpopts:npcfmti** parameter.

The SLSOCB feature must be enabled before the **slsobit** parameter can be specified.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before the **apc** and **spc** parameters can be specified.

At least one linkset must be associated with the value of the **apc** parameter.

The Proxy Point Code feature must be enabled before the **lst=prx** parameter can be specified.

The Proxy Point Code feature must be enabled before the **ppc** parameter can be specified.

The value specified for the **ppc** parameter must be a full point code.

The value specified for the **ppc** parameter must already exist in the Destination table, and the **prx=yes** parameter must have been specified.

The value specified for the **apc** parameter must be a full point code.

The value specified for the **spc** parameter must be a full point code.

The AMGTT feature or the AMGTT CgPA Upgrade feature must be turned on before the **cggmod** parameter can be specified.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

The CLLI, TFATCABMLQ, MTPRSE, and ASL8 fields are displayed only when a specific linkset is specified. The SLSOCBIT and SLSRSB fields are displayed only when a specific linkset is specified, and the linkset must be an ITU linkset.

If the **tfatcabmlq** parameter database value is **0** for a linkset, then the value displayed is one-half (rounded-up) of the number of links assigned to the given linkset (or **1** if there are 2 or fewer links in the linkset).

If the **tfatcabmlq** parameter database value is **0**, then the TFA/TCA broadcast minimum link quantity is calculated by the EAGLE 5 ISS to be a minimum of **1** for linksets containing 2 or fewer links, or half (rounded-up) of the number of links configured in the linkset for linksets containing more than 2 links. The calculated value is displayed in the **rtrv-ls** command output.

If the **tfatcabmlq** parameter value is set to a specific value greater than **0**, then the EAGLE 5 ISS does not calculate a TFA/TCA broadcast minimum link quantity. The provisioned value is displayed in the **rtrv-ls** command output.

The EAGLE 5 ISS **ent-ls** command allows 10-character linkset names, but entering a linkset name through SEAS is still restricted to 8 characters. In SEAS, a specific linkset with a name greater than 8 characters (entered using the EAGLE 5 ISS command) cannot be retrieved by name. If an asterisk is used for the linkset name in the SEAS **vfy-ls** command, all linksets will be shown; however, the linkset names that are more than 8 characters will have only the first 8 characters shown. Therefore it may appear that there are duplicate linkset names in SEAS **vfy-ls** output, but all linkset names are actually unique.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

The value specified for the **ppc** parameter must be a full point code. Cluster point codes and private point codes are not supported.

The ICNIMAP and OGNIMAP fields are displayed only if the linkset name is specified in the command, the ITU Spare Point Code feature is enabled, and an ITUN or ITUI point code is associated with the linkset.

## Output

The **randsls** parameter is displayed only for ITU linksets.

The Multiple Linksets to Single Adjacent PC (MLS) feature must be turned on before information can be retrieved for an adjacent point code or a secondary point code.

The Proxy Point Code feature must be enabled before information can be retrieved by proxy point code or proxy linkset.

In Release 37.5.0, if information is requested for a linkset, then the secondary point code field is displayed in the output. If the MLS feature is not enabled, or if the linkset was not created with a secondary point code, the field contains dashes.

In Release 38.0, headings for unequipped cards are not displayed.

The following example shows all linksets where random SLS generation is enabled for Class0 and Class1 SCCP traffic:

### rtrv-ls:randsls=all

```
tekelecstp 06-09-05 15:11:49 EST EAGLE 36.0.0

Link set table is (7 of 1024) 1% full.

;

In the following example for a specified linkset:

- The TFATCABMLQ and MTPRSE fields are displayed only when a specific link set is specified. In this example, link set **XZ172261**'s TFACABMLQ and MTPRSE attribute values are "---" because these attributes are not supported for link sets terminating in the X.25 domain. The FE-PC of this link set has no CLLI; therefore the CLLI is shown as "-----".
- The SLSOCBIT and SLSRSB fields are not displayed for ANSI link sets.

#### rtrv-ls:lsn=xz172261

```

**Legend**

- LSN**—The name of the linkset. When CHINA appears after the LSN heading, each linkset that is listed under the heading was defined with the **apctype=itunchina** parameter specified.
- APC/APCI/APCN/APCN24**—The adjacent DPC of the linkset.
- SPC/SPCI/SPCN/SPCN24**—The secondary PC of the linkset.
- SCRN**—The screen set assigned to the linkset.
- L3TSET**—The level 3 timer set value assigned to the linkset.
- SLTSET**—The SLTM record associated with the linkset.
- BEI**—The broadcast exception indicator. This field indicates whether TFP (transfer prohibited) messages are allowed to be broadcast on the linkset.
- LST**—The type of links in the linkset (access links, bridge links, etc.).
- LNKS**—The number of links in the linkset.
- GWSA**—Shows whether gateway screening is used on the specified linkset.

**GWSM**—Shows whether the display of messages generated for each screened message is turned on or off.

**GWSD**—Shows whether the gateway screening message discard function is turned on or off.

**SLSCI**—Shows whether the 5-to-8-bit SLS conversion feature is to be used to select links for outgoing messages directed to the given linkset.

**NIS**—Shows whether the Network Indicator Spare option is on or off for the specified linkset.

**CLLI**—The far end Common Language Location Identifier (CLLI).

**TFATCABMLQ**—Displays the minimum number of links in the given linkset (or in the combined linkset in which it resides) that must be available to user-part messages traffic in order for the STP to consider the first-choice ordered routes using that linkset as allowed rather than restricted.

**MTPRSE**—Shows whether the adjacent node is equipped with MTP restart.

**ASL8**—Shows whether the adjacent node is sending MSUs with 8-bit SLSs.

**MULTGC**—Shows whether multiple group codes are allowed.

**IPGWAPC**—Shows whether the adjacent point code is an IP Gateway adjacent point code.

**MATELSN**—The name of the mate IP Gateway linkset.

**IPTPS**—Provisioned or default TPS for the specific IPGWx linkset. This value is a user-defined or default portion of the total enabled system IP Signaling TPS.

**LSUSEALM**—The percent of the linkset TPS (**iptps**) at which an alarm is generated to indicate that the actual linkset TPS is approaching the configured **iptps** value for the linkset.

**SLKUSEALM**—The percent of the link "fair share" TPS at which an alarm is generated to indicate that the actual link TPS is approaching the link's "fair share" of its linkset's configured TPS (**iptps**). The "fair share" of the linkset TPS for a link is the configured linkset TPS divided by the number of in-service links in the linkset.

**LOC**—The location of the card containing the signaling links that make up the linkset.

**PORT**—The port on the card containing the signaling link.

**SLSOCBIT**—The setting of the Other CIC (Circuit Identification Code) Bit.

**SLRSRB**—The setting of the Rotated SLS (Signaling Link Selection) Bit.

**GMSCRN**—Shows whether the GSM MAP screening indicator is turned on or off.

**ITUTFR**—Shows whether the ITU TFR procedure indicator is turned on or off.

**L2TSET**—The level 2 timer set value associated with the signaling link.

**SLC**—The signaling link code of the signaling link.

**TYPE**—The type of card.

**BPS**—The transmission rate for the link in bits per second.

**L1MODE**—The mode of operation used to select the link clocking source at layer 1.

**TSET**—An indicator of whether the transmitter signal element timing is on or off.

**E1PORT**—The E1 port with the E1 interface that services the link.

**E1LOC**—The card location of the E1 card with the E1 interface that services the link.

**T1PORT**—The T1 port with the T1 interface that services the link.

**T1LOC**—The card location of the T1 card with the T1 interface that services the link.

**TS**—The timeslot assigned to the link that is serviced by the E1 or T1 interface.

**E1ATMCRC4**—The indicator of whether CRC4 multi-frame structure is enabled or disabled.

**E1ATMSI**—Value of two Spare International bits of NFAS data.

**E1ATMSN**—Value of five Spare National bits of NFAS data.

**RANDSLS**—The setting of linkset for Random SLS generation.

**ADAPTER**—Shows whether the linkset is IPSP M2PA or IPSP M3UA linkset.

**RCONTEXT**—The routing context id of IPSP M3UA linkset.

**ASNOTIF**—Shows whether AS notifications will be generated for IPSP M3UA linkset.

**ANAME**—The association name configured for signaling link of IPSP linkset.

**SLKTPS**—The provisioned TPS for concerned signaling link of the specified IPSP linkset.

**CGGTMOD**—Shows whether calling party global title modification indicator is yes or no for the linkset.

**PPC/PPCI/PPCN/PPCN24**—The proxy point code of the linkset.

**NUMSLKALW**—Threshold value for IPSP M3UA linkset used to transition to Allowed state from Restricted or Prohibited state.

**NUMSLKRSTR**—Threshold value for IPSP M3UA linkset used to transition to Restricted state from Allowed state.

**NUMSLKPROH**—Threshold value for IPSP M3UA linkset used to transition to Prohibited state from Restricted or Allowed state.

**ICNIMAP**—Incoming NI Map.

**OGNIMAP**—Outgoing NI Map.

## rtrv-m2pa-tset

## Retrieve M2PA Timer Set

Use this command to retrieve either one M2PA timer set or all M2PA timer sets.

**Keyword:** rtrv-m2pa-tset

**Related Commands:** chg-m2pa-tset

**Command Class:** Database Administration

### Parameters

**:tset=** (optional)  
The name of the M2PA timer set to be retrieved.  
**Range:** 1-20

**:ver=** (optional)  
The M2PA version supported by the association.  
**Range:** d6, rfc

### Example

```
rtrv-m2pa-tset
rtrv-m2pa-tset:tset=1
```

### Dependencies

None

### Notes

If a timer set is not specified in the command, all timer sets are retrieved.

## Output

**rtrv-m2pa-tset:tset=1:ver=d6**

**rtrv-map****Retrieve Mate Applications**

Use this command to show the mated application relationship information maintained by the system. This information is used to support the routing of SCCP management SSP/SSA messages.

**Keyword:** **rtrv-map**

**Related Commands:** **chg-map, dlt-map, ent-map**

**Command Class:** Database Administration

**Parameters**

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mapset=** (optional)

The MAP set ID.

**Range:** **1-36000 dflt**

**dflt**—Default MAP set

**Default:** **dflt** - The default value of the **mapset** parameter is **dflt** only when the Flexible GTT Load Sharing feature is not enabled.

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** **pca**

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, **ni = 000** is not valid.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is not valid if **ni = 001–005**.

When **chg-sid:pctype=ansi** is specified, **nc = 000** is valid if **ni = 006–255**.

The point code **000-000-000** is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Point code.

**:pci=** (optional)

ITU international point code in the form of *zone-area-id*.

**Range:** **s-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, 0-16383, aa-zz**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-**

*nnnnn*—**0-16383**

*gc*—**aa-zz**

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code in the form of *main signaling area-sub signaling area-signaling point*.

**Range:** **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ssn=** (optional)

Subsystem number

**Range:** **2-255**

**Default:** All subsystem numbers and their mates are shown for the given point code.

### Example

**rtrv-map:pc=10-10-10:ssn=10**

**rtrv-map:pcn=12345:ssn=5**

**rtrv-map:pcn=12345:ssn=5**

**rtrv-map:pcn24=12-12-12**

**rtrv-map**

**rtrv-map:mapset=dflt**

**rtrv-map:pc=1-1-3**

**rtrv-map:pc=1-1-3:ssn=10**

**rtrv-map:pc=1-1-1:ssn=10:mapset=362**

**rtrv-map:pc=1-1-2:ssn=10:mapset=dflt**

**rtrv-map:mapset=2**

**rtrv-map:pc=1-1-3:mapset=12**

### Dependencies

The value of the **pc/pca/pci/pcn/pcn24** parameter must already exist in the MAP entity set. All subsystem numbers for the specified PC and mate are displayed.

The remote PC must be specified as a full PC.

Asterisk entries are not allowed.

If an SSN is specified, the PC/SSN pair must exist in the MAP table. The PC/SSN entry and its mate are shown.

The DPC of the primary subsystem must be a full PC.

If the SSN is specified, then the remote PC must be specified.

The Flexible GTT Load Sharing feature must be enabled before the **mapset** parameter can be specified.

The specified MAP set must exist in the database.

If the PC and MAP set are specified, and the SSN is not specified, then at least one entry for that PC/MAP set must exist in the MAP table.

If the PC, SSN, and MAP set are specified, then they must already be provisioned in the MAP table.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See the **canc-cmd** command for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**).

When the Flexible GTT Load Sharing feature is enabled, MAP Load Sharing sets are supported. Each set is identified by a MAPSET field.

When the Flexible GTT Load Sharing feature is not enabled, the MAP set is not displayed and the display remains unchanged.

## Output

All subsystem numbers for the specified point code and its mates are shown.

If no parameters are entered, all defined remote point codes (up to 1024) are shown.

**rtrv-map**

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
MAP TABLE IS 1 % FULL (1 of 3000)

PCA          SSN   RC  MPCA          MSSN  MATERC  SRM   MRC   GRP NAME
001-001-001      5   10
```

;

For the PCN, the **chg-stpopts** command **npcfmti** parameter is set to a one-part format.

**rtrv-map**

```
rlghncxa03w 04-01-07 11:43:04 EST EAGLE 31.3.0
MAP TABLE IS 1 % FULL (1 of 3000)

### Legend

**PC/PCA/PCI/PCN/PCN24**—This field identifies the point code of the SCP where the primary application resides.

**MATE PC/PCA/PCI/PCN/PCN24**—This field identifies the point code of the SCP where the mate application resides.

**SSN**—This field identifies the applications subsystem number.

**RC**—This field identifies the relative cost of the point code/subsystem.

**MUL** —Multiplicity mode (Solitary, Loadsharing, Dominant, Combined) See the "Notes" section in the **chg-map** command description for an explanation of multiplicity modes.

**MPC** —This field identifies the multiplicity mode when the Flexible GTT Loadsharing feature or the Weighted GTT Loadsharing feature are on. The field can show SOL (Solitary), SHR (Load sharing), COM (Combined Load Sharing and Dominant), or DOM (Dominant). See the **ent-map** command "Notes" section for a definition of the multiplicity modes.

**SRM**—This field specifies whether subsystem routing messages are transmitted.

**MRC**—This field specifies whether message routing under congestion is on (YES) or off (NO).

**GRP NAME**—This field identifies the name of a group of point codes (the broadcast list group name) that should be notified of the subsystem status.

**SSO**—Subsystem Status Option. Indicates the subsystem status (ON=prohibited or OFF=allowed) for PC/SSN MAP entries.

**WT**—This field specifies the weight assigned to the PC.

**%WT**—This field specifies the relative percentage, according to weight, of an in-service PC within an RC group.

**THR**—This field specifies the service threshold. If the relative percentage, according to weight, of in-service PCs within an RC group falls below the in-service threshold, that RC group is considered out-of-service and traffic is routed to the next lowest RC group.

**MAPSET ID**—This field specifies the MAP set.

## rtrv-meas-sched

## Retrieve Measurements Schedule

Use this command to retrieve the list of measurement reports currently scheduled to be dumped to the UI, and the collection settings for EOAM based measurements.

**NOTE: This command provides no information on Measurements Platform (MCP) scheduled FTP reports or on the status of MCP measurements (see rtrv-measopts).**

**NOTE: Refer to the *Maintenance Manual* for specific details on measurement reports.**

**Keyword:** rtrv-meas-sched

**Related Commands:** chg-meas, rept-meas, rtrv-measopts

**Command Class:** Link Maintenance

### Parameters

This command has no parameters.

### Example

```
rtrv-meas-sched
```

### Dependencies

None

### Notes

None

## Output

Output with measurement collection on.

### rtrv-meas-sched

```
rlghncxa03w 04-02-27 07:19:51 EST  EAGLE 31.3.0
COLLECT      = on
GTWYLSFLTR   = both
-----
SYSTOT-STP   = on
SYSTOT-TT    = off
SYSTOT-STPLAN = off
COMP-LNKSET  = on
COMP-LINK    = on
GTWY-STP     = on
GTWY-LNKSET  = on
MTCD-STP     = on
MTCD-LINK    = on
MTCD-STPLAN  = on
MTCD-LNKSET  = on
;
```

Output with measurement collection off. The parentheses () indicate that a setting is not in effect because collection is turned off.

### rtrv-meas-sched

```
rlghncxa03w 04-02-27 07:19:51 EST  EAGLE 31.3.0
COLLECT      = off
GTWYLSFLTR   = (both)
-----
SYSTOT-STP   = (off)
SYSTOT-TT    = (off)
SYSTOT-STPLAN = (off)
COMP-LNKSET  = (off)
COMP-LINK    = (off)
GTWY-STP     = (off)
GTWY-LNKSET  = (off)
MTCD-STP     = (on)
MTCD-LINK    = (on)
MTCD-STPLAN  = (on)
MTCD-LNKSET  = (on)
;
```

## Legend

**COLLECT**—Shows whether measurement collection is on or off.

**GTWYLSFLTR**—Shows the setting that filters the linksets included in the GTWY report. The settings are as follows:

**both**—Only gateway linksets are included in the report to the terminal and SEAS.

**stp**—Only gateway linksets are included in the report to the terminal. All defined linksets are included in the report to SEAS.

**seas**—All defined linksets are included in the report to the terminal. Only gateway linksets are included in the report to SEAS.

**none**—All defined linksets are included in the report to the terminal and SEAS.

**SYSTOT-STP**—System total–STP measurement collection is on or off.

**SYSTOT-TT**—System total–translation type measurement collection is on or off.

**SYSTOT-STPLAN**—System total–STP LAN measurement collection is on or off.

**COMP-LNKSET**—Component-linkset measurement collection is on or off.

**COMP-LINK**—Component-link measurement collection is on or off.

**GTWY-STP**—Gateway administration-STP measurement report is on or off.

**GTWY-LNKSET**—Gateway administration-LNKSET measurement report is on or off.

**MTCD-STP**—Maintenance daily-STP measurement collection is on or off.

**MTCD-LINK**—Maintenance daily-link measurement collection is on or off.

**MTCD-STPLAN**—Maintenance daily-STP LAN measurement collection is on or off.

**MTCD-LNKSET**—Maintenance daily-LNKSET measurement report is on or off.

## rtrv-measopts

## Retrieve Measurement Options

Use this command for the following functions:

- Show the enabled/disabled status of all FTP scheduled measurements reports
- Verify that the Measurements Platform has been enabled (PLATFORMENABLE setting)
- Verify that the 15 Minute Measurements collection option has been turned on (COLLECT15MIN setting)
- Verify that the CLI-based report file name option is turned on or off (CLLIBASEDNAME setting)

**Keyword:** rtrv-measopts

**Related Commands:** chg-measopts, chg-mtc-measopts, rtrv-mtc-measopts

**Command Class:** Link Maintenance

### Parameters

This command has no parameters.

### Example

**rtrv-measopts**

### Dependencies

The Measurements Platform feature must be on before this command can be entered.

This command cannot be entered while in upgrade mode.

### Notes

None

**Output****rtrv-measopts**

**Legend**

**PLATFORMENABLE**—Indicator that measurements collection is enabled or disabled when the Measurements Platform feature is turned on. See the **chg-measopts** command.

**COLLECT15MIN**—Indicator that 15 Minute Measurements collection is enabled or disabled when the 15 Minute Measurements feature is turned on. See the **chg-measopts** command **collect15min** parameter.

**CLLIBASEDNAME**—Indicator that the CLI-based file name option is turned on or off.

**SYSTOTSTP**—System Total measurements report for the entire STP.

**SYSTOTTT**—System Total report for Translation Type measurements.

**SYSTOTSTPLAN**—System Total report STP LAN measurements.

**COMPLINK**—Component measurements report for links.

**COMPLNKSET**—Component measurements report for link sets.

**COMPSCTPASOC**—Component measurements report for SCTP associations.

**COMPSCTPCARD**—Component measurements report for SCTP cards.

**COMPUA**—Component measurements report for M3UA and SUA application server/association pairs.

**GTWYORIGNI**—Gateway Administration measurements report per originating network (large network uniquely identified by NI only).

**GTWYORIGNINC**—Gateway Administration measurements report per originating network (small network identified by NI-NC).

**GTWYLSORIGNI**—Gateway Administration measurements report per link set and originating network.

**GTWYLSDESTNI**—Gateway Administration measurements report per link set and destination network.

**GTWYLSONISMT**—Gateway Administration measurements report per link set, per originating network, per ISUP message type.

**MTCHEIR**—Maintenance Hourly (marginal) measurements report for Equipment Identity Register

**MTCHNP**—Maintenance Hourly (marginal) measurements report for INP or G-Port.

**MTCHLNP**—Maintenance Hourly (marginal) measurements report for LNP.

**MTCHMAP**—Maintenance Hourly (marginal) measurements report for GSM Map Screening.

**MTCDEIR**—Maintenance Daily measurements report for Equipment Identity Register

**MTCDSTP**—Maintenance Daily measurements report for STP.

**MTCDLNK**—Maintenance Daily measurements report for links.

**MTCDLNKSET**—Maintenance Daily measurements report for linksets.

**MTCDSCTPASOC**—Maintenance Daily measurements report for SCTP associations.

**MTCDSCTPCARD**—Maintenance Daily measurements report for SCTP cards.

**MTCDUA**—Maintenance Daily measurements report for M3UA and SUA application server/association pairs.

**MTCDSTPLAN**—Maintenance Daily measurements report for STPLAN.

**MTCDLNP**—Maintenance Daily measurements report for LNP.

**MTCDNP**—Maintenance Daily measurements report for INP or G-Port.

**MTCDMAP**—Maintenance Daily measurements report for GSM Map Screening.

**NMLINK**—Network Management measurements report for links.

**NMLNKSET**—Network Management measurements report for link sets.

**NMSTP**—Network Management measurements report for the entire STP.

**AVLINK**—Hourly Availability report for links.

**AVLSTPLAN**—Hourly Availability report for STP LAN.

**AVLDLINK**—Daily Availability report for links.

**rtrv-mrn****Retrieve Mated Relay Node**

Use this command to display the Mated Relay Node application relationship information maintained by the EAGLE 5 ISS. This information is used to support the routing of SCCP management SSP/SSA messages.

If the Intermediate GTT Load-Sharing Feature and the Flexible GTT Load-Sharing feature are enabled, use this command to retrieve MRN set information.

**Keyword:** rtrv-mrn

**Related Commands:** chg-mrn, dlt-mrn, ent-mrn

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:mrnset=** (optional)

The MRN set ID.

**Range:** 1-3000 dflt

dflt—Default MRN set

**:pc=** (optional)

ANSI point code in the form of *network indicator-network cluster-network cluster member (ni-nc-ncm)*.

**Synonym:** pca

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001–005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006–255.

The point code 000-000-000 is not a valid point code.

**:pc/pca/pci/pcn/pcn24=** (optional)

Post-GTT-translated point code.

**:pci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code (*prefix-zone-area-id*).

**Range:** s-, 0-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:pcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** s-, 0-16383, aa-zz

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-

*nnnnn*—0-16383

*gc*—aa-zz

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14

**:pcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*.

**Range:** 000-255

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*msa*—000-255

*ssa*—000-255

*sp*—000-255

### Example

```
rtrv-mrn
```

```
rtrv-mrn:pc=1-1-2
```

```
rtrv-mrn:pci=s-2-2-1
```

```
rtrv-mrn:pcn=s-1-1-1-123-aa
```

```
rtrv-mrn:mrnset=dflt
```

```
rtrv-mrn:pc=1-1-3:mrnset=dflt
```

```
rtrv-mrn:pc=1-1-3:mrnset=111
```

### Dependencies

A point code that is specified in the command must already exist in the MRN table.

The **mrnset** parameter can only be specified when the Flexible GTT Load-Sharing feature is enabled.

If the Flexible GTT Load Sharing feature is ON, then the PC and MRN set must be specified together.

The specified MRN set must already exist in the MRN table.

If the Flexible GTT Load Sharing feature is enabled, then the specified PC must already exist in the specified MRN set.

The Intermediate Global Title Translation Load Sharing (IGTTLS) feature must be turned on before this command can be entered.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (s-).

;
```

In the following example, the MRN table limit is 3000 entries; 768 entries are used as Mated Relay Nodes and 12 entries are used for SCCP-SERV reroute.

The MRN table capacity value is adjusted to subtract any point code values allocated to support the SCCP Service Reroute service. For this example, only a few of the 768 entries are reported to conserve space.

**rtrv-npp-srs****Retrieve a NPP Service Rule Set**

Use this command to display a Numbering Plan Processor (NPP) Service Rule Set entry.

**Keyword:** **rtrv-npp-srs**

**Related Commands:** **chg-npp-serv, chg-npp-srs, dlt-npp-srs, ent-npp-srs**

**Command Class:** Database Administration

**Parameters**

**:asn=** (optional)

Action set name. This parameter displays the rules associated with the specified action set.

**Range:** *aaaaaaaa*

1 alphabetic character followed by up to 9 alphanumeric characters

**:fdl=** (optional)

Filter digit length. This parameter displays rules that contain the specified number of digits on the incoming digit string that is filtered by the NPP.

**Range:** **1-32 \***

\*—multiple lengths of digit strings can be filtered

**:fnai=** (optional)

Filter nature of address indicator. This parameter displays the rules with the specified FNAI.

**Range:** **intl, natl, nai1, nai2, nai3, unkn**

**:fpfx=** (optional)

Filter prefix. This parameter displays the rules associated with the specified prefix that is used to filter incoming digit strings.

**Range:** **1-16 digits, \***

1 - 16 hexadecimal digits or a wildcard (\*); valid digits are **0-9, a-f, A-F**.

**:srvn=** (optional)

Service name. This parameter displays the rules associated with the specified service.

**Range:** **nppt, idprcdpn, idprcgpn, tif, tif2, tif3**

**nppt**— NPP Test Service Rule Set

**idprcdpn**— IDPRCDPN Service Rule Set

**idprcgpn**— IDPRCGPN Service Rule Set

**tif**— TIF Service Rule Set

**tif2**— TIF2 Service Rule Set

**tif3**— TIF3 Service Rule Set

**Dependencies**

None

**Output**

Display all NPP Service Rule Set table entries for a given service.

**rtrv-npp-srs**

**rtrv-oap-config****Retrieve OAP Configuration**

Use this command to display the OAP configuration information in the EAGLE 5 ISS database configured with the **chg-oap-config** command.

**Keyword:** rtrv-oap-config

**Related Commands:** chg-oap-config

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-oap-config**

## Dependencies

The SEAS feature must be on (**seas=on** in the **rtrv-feat** command output) before this command can be entered.

## Notes

None

## Output

In the following example, the SEAS feature is on.

### rtrv-oap-config

```
rlghncxa03w 03-03-07 00:57:31 EST EAGLE 31.3.0
OAP CONFIGURATION REPORT
DATA                OAP A                OAP B

IP Address           128.132.064.015          128.132.064.016
IP Netmask           255.255.255.000          255.255.255.000
Default Router       128.132.064.001          128.132.064.001
Config               dual                    dual
SEAC CLLI            SEASNJPYRRC                SEASNJPYRRC
X25 Packet Size      7                        7
X25 Mode             DTE                        DTE
;
```

### Legend

**HOSTNAME**—Host name of OAP A or OAP B.

**IP ADDRESS**—IP address of OAP A or OAP B.

**IP NETMASK**—The netmask for OAP A or OAP B.

**DEFAULT ROUTER**—The IP address of the default router assigned to OAP A or OAP B.

**CONFIG**—The number of OAPs configured (single or dual).

**SEAC CLLI**—The common language location identifier (CLLI) of the SEAC to which the OAP connects.

**X25 PACKET SIZE**—The X.25 package size for the link to the SEAC (7 or 8).

**X25 MODE**—The mode of the X.25 link to the SEAC (DTE or DTC).

## rtrv-obit

## Retrieve Obituary Report

Use this command to show the obituaries that were most recently logged in the system. The report shows the obituaries from either the active or standby OAM, and the report indicates which card and processor generated the obituary.

An obituary is a set of data that describes the status of the system just before a processor restarted due to a fault in hardware or software. The data includes a register and stack dump of the processor, card location, reporting module number, software code location, and class of the fault detected.

**Keyword:** **rtrv-obit**

**Related Commands:** **act-alm-trns**, **dact-alm-trns**, **rept-stat-clk**, **rept-stat-trbl**, **rls-alm**, **rtrv-trbl**

**Command Class:** System Maintenance

## Parameters

**:loc=** (mandatory)

The address of the card that is running the OAM from which the obituary information is to be retrieved.

**Range:** 1113, 1115

**:mode=** (optional)

Display mode

**Range:** c, m

**c**—Continuous mode; shows obituaries already logged and new obituaries as they occur.

**m**—Manual mode; shows obituaries on demand only, when this command is entered.

**Default:** c

**:num=** (optional)

This parameter indicates how many obituaries to display.

**Range:** 1-150

**Default:** 150

## Example

```
rtrv-obit:loc=1115:num=2
```

## Dependencies

The obituary log on the specified OAM must contain at least one obituary; otherwise, the command is rejected.

If the **mode** parameter is specified without the **num** parameter, the entire log is displayed.

Only one **rtrv-obit** or **rtrv-trbl** command at a time can be in progress throughout the entire system.

The card location specified by the **loc** parameter must be either **1113** or **1115**.

If the **loc** parameter specifies the card that is running the standby OAM, that card must be available.

The **num** parameter value must be between **1** and **150**.

## Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command when the command is entered for the active OAM. See **canc-cmd** for more information.

In most situations, obituary reports are generated automatically when a card is reset. Automatic report generation can be turned off by selecting the **mode=m** parameter for manual mode.

The obituary from a 186 processor displays the register dump and a 16-word stack dump.

The obituary from a 486 processor is different from 186 because the register set is larger. Also, only 12 words of the stack are dumped for the 486.

The obituary from an IXP-based processor card (which include HIPR and HC MIM cards) contains significantly more information than an obituary from an x86-based processor card. The data in an IXP obituary will be spread over multiple system buffers, where each buffer is logged and printed as an independent obituary. Sequence numbers are displayed in the output so that it is clear which buffers comprise a given obituary. There is an overall sequence number, and a sequence number within each class (such as IXP register set or user data) of information.

## Output

The following example shows output for two obituaries from an x86-based card.

**rtrv-obit:loc=1115:num=2**

**rtrv-ppsopts****Retrieve Prepaid SMS Options**

Use this command to display Prepaid Short Message Service options from the PPSOPTS table.

**Keyword:** rtrv-ppsopts

**Related Commands:** chg-ppsopts

**Command Class:** Database Administration

**Parameters**

**:ppt=** (optional)

Prepaid portability type. This parameter specifies an IN platform.

**Range:** 1-32

**Example**

**rtrv-ppsopts**

**rtrv-ppsopts:ppt=2**

**Dependencies**

The Prepaid SMS Intercept Ph1 feature must be turned on before this command can be entered.

**Output**

Set ID values are displayed only if the Flexible GTT Load Sharing (FGTTLS) feature is enabled.  
The following example displays Prepaid SMS options for a specific Prepaid Type.

**rtrv-ppspts:ppt=1**

```
tekelecstp 08-08-29 15:07:01 EST  EAGLE 39.2.0

**Legend**

- **PPT**—Prepaid Portability Type
- **PCI**—An ITU international point code for an IN platform
- **PCN**—An ITU national point code for an IN platform

- **RI**—A routing indicator for an IN platform
- **SETID**—Specifies the MAP Set ID or MRN Set ID based on the RI value
- **GTA**—Entity addresses for up to 32 IN platforms. An unprovisioned GTA has a value of **none**.

## rtrv-prefix

## Retrieve Prefix

Use this command to retrieve provisioned prefix information for all supported features or for a specified feature.

**Keyword:** rtrv-prefix

**Related Commands:** `chg-prefix`, `dlt-prefix`, `rtrv-ctrl-feat`

**Command Class:** Database Administration

## Parameters

**:feature=** (optional)

**Feature Name.** This parameter specifies the name of an enabled controlled feature that is supported by this command. The parameter value must match the feature name as it is displayed in the **rtv-ctrl-feat** command output.

**Range:**       azzzzzzzzzzzzzzzzzzzzzzzzzzzzzzz

1 alphabetic character and up to 24 optional alphanumeric characters and spaces, enclosed in double quotation marks.

The parameter value is not case-sensitive; upper case or lower case or both can be entered.

Part or all of the feature name can be entered. If part of the feature name is specified, the entry must start with the first letter of the name, and must contain enough of the name to uniquely identify the feature. For example, there are two feature names that begin with “GSM MAP.” Enough additional characters to identify which GSM MAP feature is being entered (at least “GSM MAP SR” to identify the “GSM MAP SRI Redirect” feature). This command supports the following controlled features:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

### Example

Retrieve provisioned prefix information for all supported features.

**rtrv-prefix**

Retrieve prefix information for the GSM MAP SRI Redirect feature.

```
rtrv-prefix:feature="GSM MAP SRI Redirect"
```

## Dependencies

The specified feature name must be the name of an enabled controlled feature as it is displayed in the **rtrv-ctrl-feat** command output. The following controlled features are supported by this command:

- GSM MAP SRI Redirect
- ISUP NP for EPAP

**Notes**

None

**Output**

For all features, retrieve the provisioned prefix information. There is additional information displayed in the function column for prefix numbers 6 and 7 of the “ISUP NP with EPAP” feature.

**rtrv-prefix**

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 34.1.0
```

| Feature              | NUM | Prefix | Function               |
|----------------------|-----|--------|------------------------|
| -----                |     |        |                        |
| GSM MAP SRI Redirect | 1   | 1a1a   |                        |
| GSM MAP SRI Redirect | 2   | ffff   |                        |
| GSM MAP SRI Redirect | 3   | 1234   |                        |
| ISUP NP with EPAP    | 1   | 3b4c   |                        |
| ISUP NP with EPAP    | 6   | 886    | Insertion Country Code |
| ISUP NP with EPAP    | 7   | 0      | Deletion Condition     |

```
FEATPFX table is (6 of 256) 2% full
```

;

For the “GSM MAP SRI Redirect” feature, retrieve the provisioned prefix information. The table capacity for the total number of entries in use is reported, not just the number of entries displayed. There is no additional information displayed in the Function column for this feature.

**rtrv-prefix:feature="GSM MAP SRI Redirect"**

```
rlghncxa03w 04-09-20 09:04:14 EST EAGLE 31.11.0
```

| Feature              | NUM | Prefix | Function |
|----------------------|-----|--------|----------|
| -----                |     |        |          |

```

;

**rtrv-pstn-pres****Retrieve PSTN Presentation Parameters**

Use this command to display PSTN Presentation parameters supported by the IP<sup>7</sup> Secure Gateway. This command provides a summary of the available values for the PSTNCAT and PSTNID parameters used in SS7 routing key commands and ISUP Normalization Administration commands.

**NOTE: This command is obsolete.**

**Keyword:** rtrv-pstn-pres

**Related Commands:** chg-appl-rtkey, chg-isupvar-attrib,, dlt-pstn-pres, ent-pstn-pres, rtrv-appl-rtkey

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

```
rtrv-pstn-pres
```

**Dependencies**

The ISUP Normalization controlled feature must be enabled.

**Notes**

All the *Tekelec-defined* and *user-defined* PSTNs will be displayed.

An asterisk (\*) will be displayed next to the PSTN Category for the following reasons:

- The ETSIV3 Variant before it has its controlled feature enabled
- Variants that are no longer useable. These are Variants that are disabled because their temporary feature key expired. The user should either get a permanent feature key for the Variant or use the **dlt-pstn-pres** command to remove the Variant.

**Output****rtrv-pstn-pres**

```
rlghncxa03w 03-03-07 12:05:33 EST EAGLE 31.3.0
```

**SI**—Service indicator value that designates which user part is assigned to the IPC.

**SSN**—SCCP subsystem number.

Point code subtype prefixes—

- s-** Spare point code
- p-** Private point code
- ps-** Private and spare point code

**rtrv-rte****Retrieve Route**

This command is used to display the parameter information for the route entries in the database.

Asterisks can be specified to select and display only point codes that have the same point code subfields. See the "Notes" section for this command for details.

**Keyword:** **rtrv-rte**

**Related Commands:** **dlt-rte, ent-rte, rept-stat-dstn**

**Command Class:** Database Administration

## Parameters

**NOTE:** See "Point Code Formats and Conversion" for a detailed description of point code formats, rules for specification, and examples.

**:cli=** (optional)

Common Language Location Identifier. This parameter specifies the Common Language Location Identifier assigned to the link.

**Range:**       ayyyyyyyyyy  
1 alphabetic character followed by 10 alphanumeric characters

**Default:**     No value given

**:dpc=** (optional)

ANSI destination point code with subfields network indicator-network cluster-network cluster member (*ni-nc-ncm*). The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:**       p-, 000-255, \*, \*\*, \*\*\*  
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = 000 is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is not valid if *ni* = 001-005.

When **chg-sid:pctype=ansi** is specified, *nc* = 000 is valid if *ni* = 006-255.

When **chg-sid:pctype=ansi** is specified, *ni*-\*- is valid if *ni* = 006-255.

The point code 000-000-000 is not a valid point code.

**:dpc/dpca/dpci/dpcn/dpcn24=** (optional)

Destination point code.

**:dpci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:**       s-, p-, ps-, 0-255  
Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—s-, p-, ps-

*zone*—0-7

*area*—000-255

*id*—0-7

The point code 0-000-0 is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified when the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:**       s-, p-, ps-, 0-16383, aa-zz, \*

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s**, **p**, **ps**

*nnnnn*—**0-16383**, \*

*gc*—**aa-zz**, \*

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or **\*-\*-\*-\*** when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p**, **000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:lsn=** (optional)

Linkset name

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. If selected, this parameter causes the command to display only the point codes that have no subtype prefix, or display only the point codes that have the specified subtype prefix.

**Range:** **none**, **s**, **p**, **ps**

**none**— Display all point codes that do not have subtype prefixes

**s**— Display only spare point codes

**p**— Display only private point codes

**ps**— Display only private and spare point codes

**:pctype=** (optional)

Point code domain. This parameter causes the command to display only the point codes of the specified domain type.

**Range:** **ansi**, **itui**, **itun**, **itun24**

### Example

**rtrv-rte**

**rtrv-rte:dpc=240-012-004:lsn=ls000001**

**rtrv-rte:clli=dp1:lsn=ls000001**

**rtrv-rte:dpc=140-012-008**

**rtrv-rte:clli=dp1rtrv-rte**

**rtrv-rte:dpcn=3-15-15-15-fr**

**rtrv-rte:lsn=e1m3itun**

```

rtrv-rte:dpcn24=10-100-14
rtrv-rte:pcst=s
rtrv-rte:pcst=none
rtrv-rte:pctype=ansi
rtrv-rte:pctype=itun24:pcst=none
rtrv-rte:dpc=1-1-**
rtrv-rte:dpc=1-1-***
rtrv-rte:dpc=1-**-*
rtrv-rte:dpc=1-***-*
rtrv-rte:dpc=1-***-*:lsn=ab64
rtrv-rte:dpc=1-***-*:lsn=xx64
rtrv-rte:dpcn=1000-*
rtrv-rte:dpcn=1000-*:lsn=dpcn64
rtrv-rte:dpcn=p-*aa
rtrv-rte:dpcn=s-9000-*

```

### Dependencies

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must exist in the Destination Point Code table.

If the **dpc** and **lsn** parameters are specified, the linkset name must be defined as a route.

If the **dpcn** parameter is specified, its format must match the format that was assigned with the **chg-stpopts** command **npcfmti** parameter.

If the **pctype** parameter has a value of **ansi** or **itun24**, then the **pcst** parameter cannot have a value of **s** or **ps**.

The **pctype** and **pcst** parameters cannot be specified in the same command with the destination point code, alias point code, secondary point code, **clli**, **msar=only**, and **ncai** parameters. If the **rset** parameter is specified, then the **rsn**, **dpc**, **clli**, **pctype**, and **pcst** parameters cannot be specified.

The NRT feature must be turned on before the **dcp/dpca/dpci/dpcn/dpcn24** parameter can be specified.

When using network routing, if the destination point code has a value of \* in the NC field, the NCM field must also be \* (for example, **dpc=21-\*-\***).

The value of the **dcp/dpca/dpci/dpcn/dpcn24** parameter must be a valid point code.

If the **clli** parameter is specified, then the value must exist in the Route table.

All link sets currently assigned to a route set must still be equipped.

All link sets must be defined in the route set.

The Route table is corrupt or cannot be found.

### Notes

This command can be canceled using the **F9** function key or the **canc-cmd** command. See **canc-cmd** for more information.

In this command, only ITU-international and ITU national point codes support the spare point code subtype prefix (**s-**) and the private and spare point code subtype prefix (**ps-**). All of the point code types support the private (internal) point code subtype prefix (**p-**).

#### *Asterisks in ANSI Point Codes*

Two asterisks in the *ncm* subfield of a cluster point code produces a summary report that shows all point code destinations residing in the given cluster (for example, **20-2-\*\***). This does not include the specified cluster point code (for example, **20-2-\***).

Three asterisks in the *ncm* subfield of a cluster point code (for example, **20-2-\*\*\***) produces a summary report that shows all point code destinations residing in the given network cluster. The specified cluster point code is also displayed if it exists.

If the linkset name is specified (**lsn** parameter) and the **dpc/dpca** parameter *ncm* subfield is specified with asterisks, all route entries are displayed that have the specified linkset and that match the specified **dpc/dpca** parameter subfield values.

#### ***Asterisks in ITU-N Duplicate Point Codes and Flexible Format Point Codes***

When the ITU Duplicate Point Code (ITUDUPPC) feature is on,

- An asterisk (\*) can be specified for the group code of an ITU-N duplicate point code to display all ITU-N point codes that have the specified node value (for example, **10101-\***).
- An asterisk (\*) can be specified for the node of an ITU-N duplicate point code to display all ITU-N point codes that have the specified group code value (for example, **\*-ab**).

When the ITUDUPPC feature is on and the STP flexible point code option (**npcfnti**) is used to change the ITU-N point format to four members (*m1-m2-m3-m4-gc*),

- An asterisk (\*) can be specified for the group code of an ITU-N flexible point code to display all ITU-N point codes that have the specified point code value (for example, **15-15-15-3-\***).
- An asterisk (\*) can be specified for every member of the ITU-N flexible point code to display all ITU-N flexible point codes that have the same group code (for example, **\*-\*-\*-\*-ab** is valid; **\*-15-\*-\*-\*-ab** is not valid).

## Output

In the **rtrv-rte** command output examples, the point code prefixes **s-**, **p-**, and **ps-** indicate that the point code is a spare point code, a private point code, or a private and spare point, respectively.

**rtrv-rte**

**Legend**

**DPC, DPCA, DPCI, DPCN, DPCN24**—The destination point code to be reached through this route.

**ALIAS, ALIASA, ALIASI, ALIASN/N24**—The alias associated with the route.

**CLLI**—The CLLI associated with the route.

**LSN**—The name of the linkset assigned to this route.

**RC**—The relative cost (priority) assigned to the route.

**APC, APCA, APCI, APCN, APCN24**—The point code of the STP or SSP that is directly adjacent to the linkset. The point code may or may not be the same as the destination point code assigned to this route.

**rtrv-rtx****Retrieve Exception Route**

Use this command to retrieve one or more exception route entries. Because all parameters are optional, the retrieve examines the entire Route table to find all entries that match the specified parameters. Entries with CIC-ECIC range values that fall in the range specified by the **cic** and **ecic** parameters are displayed.

**Keyword:** rtrv-rtx

**Related Commands:** dlt-rtx, ent-rtx

**Command Class:** Database Administration

**Parameters**

**:cic=** (optional)

Starting Circuit Identification Code. This parameter is used alone or together with the **ecic** parameter as exception routing criteria for the specified exception route.

**Range:** 0-16383

**:class=** (optional)

Exception routing class. This parameter causes all exception route sets provisioned for the specified class to be displayed.

**Range:** opc, ilsn, cic, si

**:dpc=** (optional)

ANSI destination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Synonym:** **dpca**

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values \*, \*\*, and \*\*\* are not valid for the *ni* subfield.

If \*\* or \*\*\* is specified for the *nc* subfield, either \*, \*\*, or \*\*\* must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-\* is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:dpci=** (optional)

Destination Point Code. ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—**000-255**

*id*—**0-7**

The point code **0-000-0** is not a valid point code.

**:dpcn=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmti** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—**s-, p-, ps-**

*nnnnn*—**0-16383, \***

*gc*—**aa-zz, \***

*m1-m2-m3-m4*—**0-14** for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:dpcn24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point (msa-ssa-sp)*. The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

*msa*—**000-255**

*ssa*—**000-255**

*sp*—**000-255**

**:ecic=** (optional)

Ending Circuit Identification Code. This parameter, together with the **cic** parameter, defines the CIC range that is used as exception routing criteria for the specified exception route.

**Range:** **0-16383**

**:ilsn=** (optional)

Incoming Link Set Name. This parameter contains the name of the originating linkset. The parameter value is used as part of the exception routing criteria for the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:lsn=** (optional)

Link Set Name. The linkset associated with the specified exception route.

**Range:** *ayyyyyyyyy*

1 alphabetic character followed by up to 9 alphanumeric characters.

**:opc=** (optional)

ANSI origination point code with subfields *network indicator-network cluster-network cluster member (ni-nc-ncm)*. The *prefix* subfield indicates a private point code (*prefix-ni-nc-ncm*).

**Range:** **p-, 000-255, \*, \*\*, \*\*\***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**p-**

The asterisk values **\***, **\*\***, and **\*\*\*** are not valid for the *ni* subfield.

If **\*\*** or **\*\*\*** is specified for the *nc* subfield, either **\***, **\*\***, or **\*\*\*** must be specified for the *ncm* subfield.

When **chg-sid:pctype=ansi** is specified, *ni* = **000** is not valid.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is not valid if *ni* = **001-005**.

When **chg-sid:pctype=ansi** is specified, *nc* = **000** is valid if *ni* = **006-255**.

When **chg-sid:pctype=ansi** is specified, *ni*-\*-**\*** is valid if *ni* = **006-255**.

The point code **000-000-000** is not a valid point code.

**:opci=** (optional)

ITU international point code with subfields *zone-area-id*. The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-zone-area-id*).

**Range:** **s-, p-, ps-, 0-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—**s-, p-, ps-**

*zone*—**0-7**

*area*—000-255

*id*—0-7

The point code **0-000-0** is not a valid point code.

**:opc=** (optional)

ITU national point code in the format of a 5-digit number (*nnnnn*); or 2, 3, or 4 numbers (members) separated by dashes (*m1-m2-m3-m4*) as defined by the **chg-stpopts:npcfmt** flexible point code option. A group code must be specified with the ITUDUPPC feature is turned on (*nnnnn-gc*, *m1-m2-m3-m4-gc*). The *prefix* subfield indicates a spare point code, private point code, or private and spare point code (*prefix-nnnnn*, *prefix-nnnnn-gc*, *prefix-m1-m2-m3-m4*, *prefix-m1-m2-m3-m4-gc*).

**Range:** **s-, p-, ps-, 0-16383, aa-zz, \***

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

An asterisk (\*) can be specified for the node (*nnnnn* or every member of a flexible point code) or for the group code (*gc*) only when group codes are present in the point codes.

An asterisk (\*) can be specified either for the node or for the group code, but not both.

*prefix*—s-, p-, ps-

*nnnnn*—0-16383, \*

*gc*—aa-zz, \*

*m1-m2-m3-m4*—0-14 for each member; values must sum to 14; or \*-\*-\*-\* when the point code includes a group code.

**:opc24=** (optional)

24-bit ITU national point code with subfields *main signaling area-sub signaling area-signaling point* (*msa-ssa-sp*). The *prefix* subfield indicates a private point code (*prefix-msa-ssa-sp*).

**Range:** **p-, 000-255**

Specify a valid value for each subfield of the point code, and separate the subfields with a dash (-).

*prefix*—p-

*msa*—000-255

*ssa*—000-255

*sp*—000-255

**:si=** (optional)

Service Indicator. This parameter is used as part of the exception routing criteria for the specified exception route.

**Range:** **3-15**

### Example

**rtrv-rtx:dpca=1-1-1**

**rtrv-rtx:opca=6-\*-\***

**rtrv-rtx:ilsn=lset4**

**rtrv-rtx:si=5**

**rtrv-rtx:cic=0:ecic=16383**

### Dependencies

Only one of the **opc**, **ilsn**, **cic**, **si**, or **class** parameters can be specified.

If the **ecic** parameter is specified, the **cic** parameter must also be specified.

The **ecic** parameter value cannot be less than the **cic** parameter value.

The Origin-Based MTP Routing feature must be enabled and turned on before this command can be entered.

The linkset name, as defined by the **ilsn** or **lsn** parameter, must exist.

The value specified for the destination point code must be a full point code and not a cluster or network point code.

### Notes

\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*).

\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** parameters to retrieve all point codes residing in (members of) a given network (*ni*).

\*\*\* can be used in the network cluster member (*ncm*) subfield of **dpc/dpca/opc/opca** to retrieve all point codes residing in (members of) a given network cluster (*ni-nc*), and the network cluster address (if any).

\*\*\* can be used in the network cluster (*nc*) subfield of **dpc/dpca** and **opc/opca** to retrieve all point codes residing in (members of) a given network (*ni*), and the network address (if any).

\* is allowed only for retrieves (for example, **rtrv-rtx:dpcn=-aa** or **rtrv-rtx:opc=-xy**) on ITU-N DPCs and ITU-N OPCs if the ITUDUPPC feature is on. \*\* and \*\*\* is not allowed for ITU-N DPCs and OPCs (for example, **dpcn=-\*-xy** is rejected). The node and group code cannot both be \* (**dpcn=-\*-\*** is rejected).

**Output**

Retrieve all provisioned exception routes.

**rtrv-rtx**

**rtrv-sccp-serv****Retrieve SCCP Service**

Use this command to display the SCCP Service application relationship information maintained by the EAGLE 5 ISS.

**Keyword:** **rtrv-sccp-serv**

**Related Commands:** **chg-sccp-serv**, **dlt-sccp-serv**

**Command Class:** Basic

**Parameters**

**:serv=** (optional)

Name of the service to be retrieved.

**Range:** **gflex**, **gport**, **mnp**

**gflex** — G-Flex (GSM Flexible Numbering)

**gport** — G-Port (GSM Mobile Number Portability)

**mnp** — Mobile Number Portability

**Dependencies**

- The A-Port or IGM feature must be enabled before the **serv=mnp** parameter can be specified.
- The G-Flex feature must be enabled before the **serv=gflex** parameter can be specified.
- The G-Port feature must be enabled before the **serv=gport** parameter can be specified.

**Notes**

Point codes are grouped by service in the output.

## Output

The number of entries that is reported in use for the SCCPSRV table includes an entry for each point code network type. This entry is not displayed with the point code entries in the output. For example, if 3 ANSI point codes are used, the reported number of ANSI entries is 4.

The following example displays output when no supporting features are turned on, and the SCCP Service table is empty.

### **rtrv-sccp-serv**

```
tekelecstp 06-10-30 09:26:14 EST  EAGLE 36.0.0
No Entries Found.
```

;

The following example displays output when the G-Port feature is turned on, and the SCCP Service table is empty.

### rtrv-sccpopts

### Retrieve SCCP Options

Use this command to display the current value of one or more of the SCCP option indicators maintained in the STP options table.

**Keyword:** rtrv-sccpopts

**Related Commands:** chg-sccpopts

**Command Class:** Database Administration

**Parameters**

This command has no parameters.

**Example**

**rtrv-sccpopts**

**Dependencies****Notes**

None.

**Output**

The following example displays output when the Origin-based MTP Routing feature is enabled and turned on.

**rtrv-sccpopts**

```
tekelecstp 06-03-16 14:07:11 EST EAGLE 35.0.0
```

```
SCCP OPTIONS
```

```
-----
CLASS1SEQ          off
MOBRSCCPOPC        MTP
```

```
;
```

The following example displays output that results when the Transaction-based GTT Loadsharing feature is enabled.

**rtrv-sccpopts**

```
tekelecstp 06-09-11 15:18:41 EST EAGLE 36.0.0
```

```
SCCP OPTIONS
```

```

**rtrv-scr-aftp****Retrieve Allowed Affected Point Code**

Use this command to show the allowed affected point code (AFTPC) screening references in the AFTPC entity set.

**Keyword:** rtrv-scr-aftpc

**Related Commands:** chg-scr-aftpc, dlt-scr-aftpc, ent-scr-aftpc

**Command Class:** Database Administration

## Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** ayyyyy, none

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all AFTPC screening references.

**Range:** yes, no

**Default:** no

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** 0-7, \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** 000-255 \*

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*

**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*

**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from **00000–16383**.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:**       **00000-16383 \***

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:**       **stop**

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:**     Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process.

**Range:**       *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:**       **none, s**

**Default:**     **none**

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **000-255 \***

**:sr=** (optional)

The AFTPC screening reference name

**Range:**       *ayyy*

1 alphabetic character followed by up to 3 alphanumeric characters

**Default:**     Display all

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**       **0-255 \***

**:ssn=** (optional)

Subsystem number. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:**       **1-255**

**Default:**     Display all.

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:**       **0-7, \***

**Example**

```

rtrv-scr-aftpc
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010&&014:ssn=012
rtrv-scr-aftpc:sr=iec
rtrv-scr-aftpc:all=yes
rtrv-scr-aftpc:sr=iec:ni=240:nc=001:ncm=010:ssn=012:actname=copy
rtrv-scr-aftpc:sr=aft1
rtrv-scr-aftpc:sr=aft1:zone=1:area=2:id=3:nsfi=stop:ssn=1:pcst=s

```

**Dependencies**

If the **nsfi** parameter is specified, the parameter value must be **stop**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If **nc=\*** is specified, **ncm=\*** must be specified. If **ni=\*** is specified, **nc=\*** and **nc=\*** must be specified. If **zone=\*** is specified, **area=\*** and **id=\*** must be specified. If **area=\*** is specified, **id=\*** must be specified. If **msa=\*** is specified, **ssa=\*** and **sp=\*** must be specified. If **ssa=\*** is specified, **sp=\*** must be specified.

The character **c** is not a valid value for the **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, and **npc** parameters.

The **nsr** parameter cannot be specified if the **actname** parameter is specified.

The **nsr** parameter cannot be specified if the **nsfi=stop** parameter is specified.

The value of the **actname** parameter must be defined in the gateway screening stop action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

If specified, the **sr** parameter value must exist in the AFTPC screen entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (s-) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **ni**, **nc**, **ncm**, **zone**, **area**, **id**, **msa**, **ssa**, **sp**, **npc**, **nsfi**, and **nsr** parameters must already exist in the AFTPC entity for the screening reference.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or s-) must exist in the database.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

The Gateway Screening Stop Action table must be accessible.

**Notes**

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is defined by separating the values that define the range by two ampersands (&&); for example, **ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

If no parameters are specified, a list of allowed AFTPC references is produced indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every allowed AFTPC screening table is displayed.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

The spare point code subtype prefix **s-** is supported only for ITU international and ITU national point codes. The **pcst** parameter indicates whether the specified point code has no subtype prefix or has the spare point code prefix.

**Output****rtrv-scr-aftpc**

**Legend**

For a summary report:

**REF**—This indicates whether a screen is referenced by another screen. If NO, the screen is not used. If you need a more detailed output, use the **rtrv-scr-blkdpc:all=yes** command, or specify the specific screening reference.

**RULES**—The number of screening rules in that screening table.

For a detailed report:

**SCREEN = ALLOWED AFTPC**—This is the screen type.

**SR**—This is used to identify the various screen sets being used. It can be up to four characters in length.

**NI-NC-NCM**—The point code referenced within the screen. For international point codes, these columns are ZONE - AREA - ID. For 24-bit ITU national point codes, these columns are MSA - SSA - SP. For national point codes, these columns become the single column NPC.

**SSN**—The subsystem number associated with the point code identified by *ni-nc-ncm*.

**NSFI**—The next screening category to be used.

**NSR/ACT**—The name of the next screening reference (NSR—up to four characters) or action to be taken (ACT—up to six characters), if the message passes this screen.

## rtrv-scr-blkdpc

## Retrieve Blocked DPC

Use this command to show the blocked destination point code (BLKDPC) screening references in the BLKDPC entity set.

**Keyword:** **rtrv-scr-blkdpc**

**Related Commands:** **chg-scr-blkdpc**, **dlt-scr-blkdpc**, **ent-scr-blkdpc**

**Command Class:** Database Administration

### Parameters

**:actname=** (optional)

The name of the gateway screening stop action set. Stop actions must be administered using the **actname** parameter in conjunction with the gateway screening stop action table (see **chg-gws-actset** and **rtrv-gws-actset**).

**Range:** *ayyyyy*, **none**

1 alphabetic character followed by up to 5 alphanumeric characters.

**none**—Display only those gateway screening rules that do not have a gateway screening stop action set assigned to them

**:all=** (optional)

Displays all blocked DPC screening references.

**Range:** **yes**, **no**

**Default:** **no**

**:area=** (optional)

The ITU international area. The area is specified in the point code. The format of the point code is *zone-area-id*. An asterisk (\*) indicates the full range of values from **000–255**.

**Range:** **000-255** \*, C

**:id=** (optional)

The ITU international ID. The parameter specifies the ID in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0–7**.

**Range:** **0-7**, \*

**:msa=** (optional)

The 24-bit ITU national main signaling area. The main signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:** **000-255** \*, C

**:nc=** (optional)

The network cluster identifier value. This parameter restricts display to those entries containing this specific cluster of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** **0-255** \*, C

**Default:** Display all

**:ncm=** (optional)

The network cluster member identifier value. This parameter restricts display to those entries containing this specific cluster member of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from **0–255**.

**Range:** 0-255 \*  
**Default:** Display all

**:ni=** (optional)

The network identifier value. This parameter restricts display to those entries containing this specific network of the point code represented by *ni-nc-ncm*. A single value or a range of values can be specified. An asterisk (\*) indicates the full range of values from 0–255.

**Range:** 0-255 \*, C  
**Default:** Display all

**:npc=** (optional)

The ITU national point code. An asterisk (\*) indicates the full range of values from 00000–16383.

**NOTE: Gateway screening allows the ITU national point code to be displayed and entered in the database only as a single number. If you are using multiple-part ITU national point codes, see "Converting ITU National Point Code Formats" in Appendix A.**

**Range:** 00000-16383 \*, C

**:nsfi=** (optional)

This parameter specifies the next screening category that is used in the gateway screening process, or it indicates that the gateway screening process should stop.

**Range:** cgpa, destfld, fail, isup, stop

**cgpa**—Allowed calling party address is the next screening category.

**destfld**—Allowed destination field (DESTFLD) is the next screening category.

**fail**—The received message should be discarded.

**isup**—ISUP message type (ISUP) is the next screening category.

**stop**—The gateway screening process ends and the message proceeds through normal routing.

**Default:** Display all

**:nsr=** (optional)

The next screening reference parameter indicates which screening reference in the specified screening category (**nsfi**) is to be used in the screening process. This parameter is mandatory if **nsfi** is other than **stop** or **fail**. The **nsr** parameter cannot be entered if **nsfi** is **stop** or **fail**, or the **copy=yes** parameter is specified.

**Range:** ayy  
 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all

**:pcst=** (optional)

Point code subtype. This parameter indicates whether the specified ITU international or ITU national point code has no subtype prefix or has the spare point code prefix (s-).

**Range:** none, s

**Default:** none

**:sp=** (optional)

The 24-bit ITU national signaling point. This parameter specifies the signaling point (sp) in the point code represented by *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from 000-255.

**Range:** 000-255 \*, C

**:sr=** (optional)

The BLKDPC screening reference name

**Range:** ayy  
 1 alphabetic character followed by up to 3 alphanumeric characters

**Default:** Display all.

**:ssa=** (optional)

The 24-bit ITU national sub signaling area. The sub signaling area is specified in the point code. The format of the point code is *msa-ssa-sp*. An asterisk (\*) indicates the full range of values from **000-255**.

**Range:**      **0-255 \*, C**

**:zone=** (optional)

The ITU international zone. The parameter specifies the zone in the point code represented by format *zone-area-id*. An asterisk (\*) indicates the full range of values from **0-7**.

**Range:**      **0-7, \*, C**

### Example

```
rtrv-scr-blkdpc
```

```
rtrv-scr-
```

```
blkdpc:sr=iec:ni=240:nc=001:ncm=010&&018:nsfi=stop:actname=rdct
```

```
rtrv-scr-blkdpc:sr=iec
```

```
rtrv-scr-blkdpc:all=yes
```

```
rtrv-scr-blkdpc:sr=bdp1:npc=128:nsfi=fail:pcst=s
```

### Dependencies

A complete point code must be specified, and must be one and only one of the four point code parameter combinations: **ni-nc-ncm**; **zone-area-id**; **msa-ssa-sp**; or **npc**, except in the special case of entering **c** for "continue."

If the **ni=c** parameter is specified, then the **nc** and the **ncm** parameters must have a value of **c** or must not be specified. If the **ni=c** parameter is specified, and the **nc** and the **ncm** parameters are not specified, then the **nc** and **ncm** parameters default to a value of **c**.

If the **zone=c** parameter is specified, then the **area** and the **id** parameters must have a value of **c** or must not be specified. If the **zone=c** parameter is specified, and the **area** and the **id** parameters are not specified, then the **area** and **id** parameters default to a value of **c**.

If the **msa=c** parameter is specified, then the **ssa** and the **sp** parameters must have a value of **c** or must not be specified. If the **msa=c** parameter is specified, and the **ssa** and the **sp** parameters are not specified, then the **ssa** and **sp** parameters default to a value of **c**.

ANSI point code value **000-000-000** and ITU-International point code value **0-000-0** are not allowed.

If the **area=\*** parameter is specified, then the **id=\*** parameter must be specified.

If the value of the **nsfi** parameter is **stop** or **fail**, then the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, the **nsr** parameter cannot be specified.

If the **actname** parameter is specified, then the **nsfi=stop** parameter must be specified.

If the **actname** parameter is specified with the **sr** parameter, the specified value for the **actname** parameter must be assigned to that screening reference name.

The value of the **actname** parameter must already be defined in the Gateway Screening Stop Action table with the **chg-gws-actset** command. These values are shown in the ACT NAME field of the **rtrv-gws-actset** command output.

If the **ni** parameter is specified as an asterisk (**ni=\***) or as a range, the **nc** and **ncm** parameters must be specified as an asterisk or as the full range **000-255**.

If the **nc** parameter is specified as a single value or a range, a single value must be specified for the **ni** parameter.

If the **nc** parameter is specified as a range, the **ncm** parameter must be specified as an asterisk or as the full range **000-255**.

If the **ncm** parameter is specified as a single value, or a range other than the full range of **000–255**, the **ni** and the **nc** parameters must be specified with a single value.

The value of the **sr** parameter must already exist in the BLKDPC entity set.

The Spare Point Code Support feature must be enabled before the **pcst** parameter can be specified.

The spare point code subtype prefix (**s-**) is not supported for ANSI point codes (parameters **ni**, **nc**, **ncm**) or for 24-bit ITU national point codes (parameters **msa**, **ssa**, **sp**). The **pcst** parameter cannot be specified for ANSI and ITU-N24 point codes.

Any specified **id** or **sp** parameter must already exist in the database.

If the **pcst** parameter is specified, point codes with the specified subtype prefix (no prefix or **s-**) must exist in the database.

Any specified **nc** parameter must already exist in the database

Any specified **ncm** parameter must already exist in the database

Any specified **zone** or **msa** parameter must already exist in the database.

Any specified **ni** parameter must already exist in the database

Any specified **nsr** parameter must already exist in the database

Any specified **nsfi** parameter must already exist in the database

Any specified **npc** parameter must already exist in the database

Any specified **area** or **ssa** parameter must already exist in the database.

Any specified **pcst** parameter must already exist in the database

The Gateway Screening Stop Action table must be accessible.

If the **zone=\*** parameter is specified, then the **area=\*** and the **id=\*** parameters must be specified.

If the **msa=\*** parameter is specified, then the **ssa=\*** and the **sp=\*** parameters must be specified.

If the **ssa=\*** parameter is specified, then the **sp=\*** parameter must be specified.

## Notes

If no parameters are specified, a list of blocked DPC screening references is displayed indicating whether they are referenced or not.

If only the **all=yes** parameter is specified, detailed information for every rule in every blocked DPC screening table is output.

If the **all** parameter is specified and other parameters are also specified, the **all** parameter is ignored.

An asterisk as a parameter value in this command displays only entries that have an asterisk as the same parameter value in the entry.

A range of values is specified by separating the values that define the range by two ampersands (**&&**); for example, **:ni=025&&100** specifies all network indicators for ANSI point codes from **25** to **100**.

The character **c** is used in the blocked DPC screens to allow the screening process to continue for messages with point codes that do not match any point codes in the blocked DPC screens. When screening for a blocked DPC and the point code being screened does not match any of the point codes in the blocked DPC screens, the message is not rejected and the screening process continues. There must be an entry in the blocked DPC screens to allow the screening process to continue. This entry consists of a screening reference, point code, **nsfi**, and **nsr**. The point code has the value **c-c-c**.

If the character **c** is specified for any subfield of a three-subfield point code, all three subfields must have the value **c**. No other values can be used. For example, a point code **c-c-255** is not allowed. The

point code must be **c-c-c**. The asterisk (\*) value cannot be used with the character **c** (for example, a point code **c-c-\*** is not allowed).

In all cases, if **c** for "continue" is entered for the first subfield in the point code, the other subfields default to **c** in the database.
