Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDAPartyAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDAPartyAdapter	fetchPartyName	This method will fetch legal name of party from flx_pi_names_b.This will call PartyNameApplicationService to get legal name of the party. @param sessionContext @param partyID @return	The method validates if there is memo on the account by account.hasMemo(); If account.hasMemo() return true then call {@link MemoService#fetchAllActiveAccountMemos}
IDDAPartyAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDAPartyAdapter	fetchPartyName	This method will fetch legal name of party from flx_pi_names_b.This will call PartyNameApplicationService to get legal name of the party. @param sessionContext @param partyID @return	
IDDAPartyAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDAPartyAdapter	fetchPartyName	This method will fetch legal name of party from flx_pi_names_b.This will call PartyNameApplicationService to get legal name of the party. @param sessionContext @param partyID @return	This method fetches the address linkages for all the parties associated with the account. In the Inquiry DTO the partyId and docTypeId fields would not contain any value. Steps to be performed are 1) Create an instance of AccountAddressLinkageInquiryResponse. 2) Fetch the transaction status using fetchTransactionStatus(). 3) Create TransactionContext by passing SessionContext and INQUIRE (as MaintenanceType) as an arguments. 4) Based on the account type , check the validity of the account and get its status by calling the appropriate ApplicationService through the adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDInquiryApplicationService with the accountId as input. If the account type is TD , call fetchAccountDetails() method exposed by the TermDepositAccountApplicationService with the accountId as input. 5) Call validateAccount() method with accountId and status as the input. If the account status is closed or dormant , " Closed/Dormant Account " error message would be displayed. 6)

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>Create an instance of the Domain Service (AccountAddressLinkageService). 7) Call the fetchAccountAddressLinkage() method of the AccountAddressLinkageService with accountId as the input. 8) Receive the AccountAddressLinkage entity in response. 9) Based on this response, call different Application Services to fetch other relevant details through the adapter. a) For each party in the AccountAddressLinkage, call the fetchPartyDetails() of PartyApplicationService with partyId as the input to get party details. b) For each party in the AccountAddressLinkage, i) For all the postal address preference set in the linkage call the fetchPartyAddress() of PartyAddressApplicationService to with partyId and postalAddressType to get party postal address. c) For each party in the Account Address Linkage, call the fetchPartyAccountRelationship() of PartyAccountRelationshipApplicationService with accountId and partyId as input to get the relationship. d) For each docTypeId in the linkage, call the fetchDocumentType() of DocumentTypeApplicationService with docTypeId as the input to get the description of the document. 10) Fill the AccountAddressLinkageInquiryResponse with all the relevant details. 11) Convert the AccountAddressLinkageInquiryResponse entity to DTO using the Assembler. 12) Return the AccountAddressLinkageInquiryResponseDTO. @param accountAddressLinkageInquiryDTO The partyId field would be null @param sessionContext</p>

IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchBrokerForFacilities	This method fetches the brokers for an array of facility Id provided @param appContext @param facilityId @param agentArrangementType @return @throws FatalException	This method will call the fetchBrokerForFacilities service of the Agent Arrangement Linkage Application service to query and return the broker Details for the array of facilities Id provided
IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchTermDepositAccountDetails	This method fetches the TD account details for an array of accountIds @param sessionContext @param accountIds @return @throws FatalException	This method is used for pagination purpose. It fetches the fixed number of arrangement records from DB based on the callcount. so if fixed page size is say 50, and call count is 1 , then it fetches records from 0-50. if call count is 2 then it fetches records from 51-100 and so on. It then calls respective modules to get other related data from them. in case of singleCustomerPortfolioTransfer when partyId is given, the respective modules is called directly to fetch the accountIds based on partyID and then from agentArrangementLinkage DB the corresponding commission Receipt Details are fetched.
IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchDepositDetails	This method fetches the deposit details for td account for a given account Id @param sessionContext @param accountId @return @throws FatalException	This method is used to fetch the CASA account Details based on the accountIds. In this method the accountIds(arrangementIds) are passed which is used to fetch the CASA Account Details.

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchTermDepositSearchDetails	This method is called from ui to search and fetch all the accounts and their details which fall under the given search criteria @param sessionContext @param searchDTO @return @throws FatalException	This method is used to fetch the Details which the uses has queried for a particular module. First the queries submissinIds and details are fetched from TD module and then agentArrangementLinkage DB is queried to get commission Receiptent Id and Name @param sessionContext @return @throws FatalException
IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchSubmissionDetails	This method is used to query and fetch submission details for an array of submission Ids @param sessionContext @param submissionId @return @throws FatalException	This method is used for pagination purpose. It fetches the fixed number of arrangement records from DB based on the callcount. so if fixed page size is say 50, and call count is 1 , then it fetches records from 0-50. if call count is 2 then it fetches records from 51-100 and so on. It then calls respective modules to get other related data from them. in case of singleCustomerPortfolioTransfer when partyId is given, the respective modules is called directly to fetch the accountIds based on partyID and then from agentArrangementLinkage DB the corresponding commission Receiptent Details are fetched.
IAgentArrangementLinkageAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\agent\IAgentArrangementLinkageAdapter	fetchSubmissionSearchDetails	This method is used to search the submission records based on the search DTO provided @param sessionContext @param searchDTO @return @throws FatalException	This method is used to fetch the Details which the uses has queried for a particular module. IDDASimulationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDASimulationAdapter	fetchFutureDatedClosureDetails		This method is used for fetching the account details in case of future dated account closure simulation  This will take the account id and the expected closure date in the input  It will call the simulation service for generating the simulated response
IDDASimulationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDASimulationAdapter	fetchFutureDatedClosureDetails		This will return the simulated state for the given simulation id.  The state of the account has been persisted in the database during the simulation  The exact state at that time would be returned to the caller
IDDASimulationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDASimulationAdapter	updateRecordToBeDisplayedFlag		This method is exposed to updated the waived amount during the account closure  @param sessionContext @param simulationId @param ddaClosureRequestDTO @throws FatalException
IInterestTDApplicationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\interest\IInterestTDApplicationAdapter	fetchLienAmountOnInterest	Responsible for fetching the lien amount on a TD account	This method will fetch the compounded interest amount available for adjustment. @param interestPlanItem @return
IInterestTDApplicationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\interest\IInterestTDApplicationAdapter	fetchLienAmountOnInterest	Responsible for fetching the lien amount on a TD account	This method will fetch the compounded interest amount available for adjustment. @param interestPlanItem @return
IOriginationEnumerationManagerAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationEnumerationManagerAdapter	fetchOpenEnumerationDetails		

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOrigination Enumeration ManagerAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationEnumerationManagerAdapter	fetchOpenEnumerationDetails		This method provides the implementation for validating the annotation {@link Enum}. This class invokes <i>Enumeration Manager</i> via <i>adapter</i>. It then validates the response returned by the Enumeration Manager against the field to which the annotation is attached, if there is a miss-match then respective error code (as configured in {@link Enum} annotation) is thrown.
IOrigination Enumeration ManagerAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationEnumerationManagerAdapter	fetchOpenEnumerationDetails		
IBundleParty Adapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\bundle\IBundlePartyAdapter	isPartyInHardship	<p>This method will determine if the input party is in hardship. </p> @fcb.param MI, String, partyId, Indicates the party which is to be verified for hardship. @return @throws FatalException

IAccountPartyAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountPartyAdapter	fetchPartyAddress	This method will return the postal address of the party depending upon the address type chosen. @param sessionContext @param partyId @param addressType @return PostalAddress	This method fetches the address linkages for a particular party associated with the account. In the Inquiry DTO the docTypeId field would not contain any value. Steps to be performed are 1) Create an instance of AccountAddressLinkageInquiry Response. 2) Fetch the transaction status using fetchTransactionStatus(). 3) Create Transaction Context by passing SessionContext and INQUIRE (as MaintenanceType) as an arguments. 4) Based on the account type , check the validity of the account and get its status by calling the appropriate Application Service through the adapter. If the account is not valid , "Invalid Account Number" error message is displayed. If the account type is CASA , call fetchBasicDetails() method exposed by the DDAInquiryApplicationService with the accountId as input. If the account type is TD , call fetchAccountDetails() method exposed by the TermDepositAccountApplicationService with the accountId as input. 5) Call validateAccount() method with accountId and status as the inputs. If the account status is closed or dormant , " Closed/Dormant Account " error message would be displayed. 6) Check for the validity of the party and its account relationship by calling fetchPartyAccountRelationship() method exposed by the PartyAccountRelationshipApplicationService with accountId and partyId as the input. If the party is not valid, "Invalid Party" error message is displayed. If the party does not have any relationship with the account, "No Relationship with the Account" error message is displayed. 7) Create an instance of the Domain Service (AccountAddressLinkageService). 8) Call the fetchPartyAddressLinkage() method of the AccountAddressLinkageService with accountId and

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>partyId as the input. 9) Receive the AccountAddressLinkage entity in response. 10) Based on this response, call different Application Services to fetch other relevant details through the adapter. a) Call the fetchPartyDetails() of PartyApplicationService with partyId as the input to get party details. b) For all the postal address preference set in the linkage call the fetchPartyAddress() of PartyAddressApplicationService to with partyId and postalAddressType to get party postal address. c) Call the fetchPartyAccountRelationship() of PartyAccountRelationshipApplicationService with accountId and partyId as input to get the relationship. d) For each docTypeId in the linkage, call the fetchDocumentType() of DocumentTypeApplicationService with docTypeId as the input to get the description of the document. 10) Fill the AccountAddressLinkageInquiryResponse with all the relevant details. 11) Convert the AccountAddressLinkageInquiryResponse entity to DTO using the Assembler. 12) Return the AccountAddressLinkageInquiryResponseDTO. @param accountAddressLinkageInquiryDTO @param sessionContext</p>

This method is specifically used to log the details required for Dashboard Notification while updating CRR Code. The basic purpose is to identify the following scenarios:-</p> <ul style="list-style-type: none"> <li>CRR Code update: NORMAL -&gt; NORMAL</li> <li>CRR Code Update: SUSPENDED -&gt; SUSPENDED</li> </ul> <p>When CRR Code is updated (assuming the Asset Classification Status is unchanged as SUSPENDED), Dashboard notification need to be sent. This scenario is referred to treat a Loan Account as a Non Performing Asset.</p> <p><b>NOTE:-</b> This method is exclusively referred by <a href="#">LoanArrearManagementApplication#updateAccountCRRCode(ApplicationContext, String, String)</a> to know the present Asset Classification Status of Loan Account.</p> <p>@param accountId @return</p>	<p>This method is called to set the account's new CRR Code. This method should be called when during classification batch the CRR code for an account is being changed but the accrual status is unchanged.</p> <p><b>NOTE:-</b> Notification Details will be logged Only when ACCRUAL Status is SUSPENDED and CRR Code is being updated.</p> <p>@param applicationContext @param accountId @param crrCode</p>

IExportImportAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\ops\IExportImportAdapter	generateID	This method returns the unique configpackageId for a BusinessEntity	This represents the fetchAndExport method of the entity. This method exports the inquiry response of the entity to the configurable location  This method makes an inquiry for the entity for the given key and then calls the adapter for further processing. It calls the audit method for logging into database and export method to export the   result to file in case of FileDataStore.     @fcb.param com.ofss.fc.app.context.SessionContext,sessionContext , , This parameter captures the basic information about the user of the system.  @fcb.param domainObjectDto @return entityInquiryResponse @throws FatalException
IExportImportAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\ops\IExportImportAdapter	generateID	This method returns the unique configpackageId for a BusinessEntity	This represents the fetchAndExportList method for the taskCode.This method takes list of DTO as input And fetches the response. For each DTO it calls the fetch method of the application service to get the response. The response is stored in a list. This list is exported to DB/File using export method.    @fcb.param com.ofss.fc.app.context.SessionContext,sessionContext , , This parameter captures the basic information about the user of the system.  @fcb.param List<EntityDTO> entityDTOList @return BaseResponse @throws FatalException
