IPricingAccountAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\pricing\IPricingAccountAdapter	getRepricingConfiguration	The concrete method implementation will be provided by each servicing module. There they can write their own rule and decide if the account is to be reprice/refreshed. In what manner it is to be re priced. Pricing will read the return form dto and re-price the account as instructed by the servicing module. @param arrangementNumber @param emptyForm @param repriceDate @return {@link RepriceFormDTO} @throws FatalException	This method performs the task of filling the repriceFormDTO so as to indicate to Pricing as to in what manner the account is to rePriced/refreshed. Depending on the return form dto, Pricing will rePrice/refresh the account accordingly. This method first checks whether the RateChange is eligible or not by calling the isRateChangeEligible() method. If it is eligible, it logs the corresponding RateChange action in an actions table, from which, the action would be picked up during the Batch for processing. If it is not eligible, then the RejectedEntry details are logged in a <RejectedEntry> table for internal audit purposes. Based on the eligibility of the Ratechange action & the rules from the <RepriceRulesTable>, the repriceFormDTO will be filled & returned. @param accountId @param repriceDate @param emptyForm @return RepriceFormDTO

ITDProductAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\td\ITDProductAdapter	getMaxDepositAmount	This method return product maximum payin amount. @param productId The product for which maximum payin amount needs to be fetched @param currencyCode The currency allowed for the given product @return BigDecimal maximum payin amount	This method is the Starting Point for Maturity Processing. It is Invoked from {@link DepositMaturityActionExecutor#executeAction}. At a Broad level the method performs the following actions <ol> <li>Fetch the Necessary Details, such as Instructions Maintained at Product which are required in the Decision Making Process</li> <li>Invoke {@link DepositMaturityService#processDepositMaturity}. This method returns a {@link MaturityResponse} object. The Response object contains the following Information <ol> <li>The {@link RenewalResponse} containing any amount which has to be renewed</li> <li>The {@link MaturityPayoutResponse} contains Principal, Interest Amount which is to be paid out and the {@link PayoutInstruction}</li> <li>The Deposit which is being Matured</li> </ol> </li> <li>The method reads the RenewalResponse. <p> If Not null then it invokes {@link DepositRenewalService#autoRenewDeposit}. If New Deposit received from DepositRenewalService is not Null then {@link DepositMaturityService#processPostMaturityRenewal} is invoked. This service will remove any existing Blocks or Liens from Matured Deposit and Carry forward the Lien or Block whichever is applicable to the New Deposit and accordingly update the Deposit Balances </p> <p> If Deposit Returned from Renewal is null then {@link DepositMaturityService#matureDeposit} is invoked, which will update the Deposit Balances and mark the Deposit as Matured </p> </li> <li>If PayoutResponse object is present then the method determines the type of Payout. <p> If Principal Payout Instruction is Maintained then {@link

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>#doPrincipalPayout} is invoked. &lt;/p&gt; &lt;p&gt; If PrincipalInterest Payout Instruction is Maintained then {@link #doPrincipalInterestPayout} is invoked &lt;/p&gt; In both the cases above if Payout fails then {@link DepositService#matureDeposit} is Invoked&lt;/li&gt; &lt;/ol&gt; Finally after the method exits, all the Deposit Balances and Deposit Status would have been marked as per the conditions present. Control will go back to the Maturity Action Executor. It will check if All the Deposit Balances have been zeroised in which case it will close the Deposit @param sessionContext @param deposit @throws FatalException</p>
ITDProductAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\td\ITDProductAdapter	getMaxDepositAmount	This method return product maximum payin amount. @param productId The product for which maximum payin amount needs to be fetched @param currencyCode The currency allowed for the given product @return BigDecimal maximum payin amount	This method ensures that the principalBalance is in range of amount defines at product level

IAuthorizationAssertionAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\sms\IAuthorizationAssertionAdapter	assertRequiredAuthorizations		This method delegates the calls to the appropriate methods during security access check process. First of all, if the service is blacked out for the period in which the user is accessing it, then he  will not be allowed to perform the transaction.    Access policies are maintained on OID server corresponding to roles.  Based on the policies, the user  has access on a particular service or not is validated.    If the service under execution is eligible for OAAM validations, call is made to OAAM.  OAAM validates the policies and rules set for the service and returns the action to be taken.  Action can be Allow, Block, Challenge1FA, Challenge1FADelay, Challenge2FA, Challenge2FADelay.    Next assertRequiredAuthorizations is used to test for business conditions that can be either rejected,  ignored or overridden. If status is marked as overridden, system fetches the configured workflow and   distributes workitems accordingly.    @param serviceId @param context @param serviceInputs @param parameterNames @throws FatalException

IDSLAccount Adapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dsl\IDSLAccountAdapter	fetchCurrentStatementPeriod	<p>Statement inquiry and statement request have the facility of fetching items that are in the current statement period or prior statement period. Current period is the duration between the latest endDate of a system initiated statement request that has been generated and the current process date. Prior period is the same period as the last system initiated statement request that was generated. &lt;/br&gt;Consider the following example.</p> <p>&lt;/br&gt;AccountId: TestAccount001          &lt;/br&gt;Opening date: 22nd-feb-2008          &lt;/br&gt;Statements generated: &lt;table border='1'&gt; &lt;tr&gt; &lt;th&gt;Statement no.&lt;/th&gt; &lt;th&gt;Statement period start&lt;/th&gt; &lt;th&gt;Statement period end&lt;/th&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;1&lt;/td&gt; &lt;td&gt;22-feb-2008&lt;/td&gt; &lt;td&gt;29-feb-2008&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;2&lt;/td&gt; &lt;td&gt;1-april-2008&lt;/td&gt; &lt;td&gt;30-april-2008&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;td&gt;...&lt;/td&gt; &lt;/tr&gt; &lt;tr&gt; &lt;td&gt;1&lt;/td&gt; &lt;td&gt;22-feb-2008&lt;/td&gt; &lt;td&gt;29-feb-2008&lt;/td&gt; &lt;/tr&gt; &lt;/table&gt; Suppose the current process date is 24th may 2008.&lt;/br&gt;&lt;/br&gt;Then the current period: 1-may-2008 to 24th-may-2008 &lt;/br&gt;Prior statement period is: 1-april-2008 to 30-april-2008 &lt;/br&gt;&lt;/br&gt;In case there are no</p>	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
			<p>statements generated till 24th may 2008, then &lt;/br&gt;Current statement period: 22nd-feb-2008(opening date) to 24th may 2008 &lt;/br&gt;Prior statement period:22nd-feb-2008(opening date) to 24th may 2008&lt;p&gt;This method will fetch the current statement period for the given account id and account type. The current statement period can be derived as follows: &lt;ol&gt; &lt;li&gt;start date: It is the day after the latest endDate of all the statement request that have been generated for the particular account which are system initiated. If there has been no such statement requests in the account, the value considered will be from the account opening date. start date value can not be after the current process date. &lt;li&gt;end date: Its the current process date. &lt;/ol&gt;</p> <p>@param sessionContext MI,SessionContext,sessionContext, , This parameter captures the basic information about the user of the system. The information is used by the system for authentication purposes. @param accountId MI,String, It is the account id of the account for which statement period is to be fetched. @param accountType MI,{@link com.ofss.fc.enumeration.account.AccountType}, It denotes the type of</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDAProducerAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAProducerAdapter	deriveSingleStatementEntryFlag	This method derives the single statement entry flag @param accountId @return	<p>&lt;p&gt; This function will be used when a customer wishes to deposit cash and cheques simultaneously in a single transaction. &lt;/p&gt; &lt;p&gt; Bank can decide whether to display the transaction as a single entry in Account Statement as well as Statement inquiry screen in OBP. Also Bank can decide whether to charge a single fee for multi fund deposit transaction or charge separate fees for each cheque deposit and cash deposit in a Multi fund deposit transaction. Please note cheque deposit transaction is a non-fee event in product space however in consulting space it is a fee event. &lt;/p&gt; &lt;p&gt; TODO: Based on offer level parameter, the fee is charged. The parameter may indicate single fee for the entire transaction If Multi Fund transaction is not restricted for the offer, system will enable the accordion <input type="checkbox"/> Multi Fund Deposit Parameters <input type="checkbox"/>. This accordion will have following 2 check boxes &lt;/p&gt; &lt;p&gt; 1. Charge Single Fee for a Multi Fund Transaction &lt;/p&gt; &lt;p&gt; 2. Display Single Transaction in Bank Statement &lt;/p&gt; &lt;p&gt; &lt;u&gt;Charge Single Fee for a Multi Fund Transaction&lt;/u&gt; &lt;/p&gt; &lt;p&gt; If <input type="checkbox"/> Charge Single fee for a Multi Fund Deposit <input type="checkbox"/> checkbox is checked, system will charge single fee for Multi fund transaction. System will fetch fee for the event Multi Fund Deposit transaction. This fee can be negotiated if defined in price definition. &lt;/p&gt; &lt;p&gt; If this checkbox is not checked, system will charge fee for each cheque deposit and cash deposit in Multi fund transaction. System will fetch fee associated with events Cash deposit and Cheque Deposit. Please note in this case Fee associated with cheque deposit and cash deposit cannot be negotiated even though it may be defined as a Negotiable fee. &lt;/p&gt; &lt;p&gt; &lt;u&gt;Display Single Transaction in Bank Statement&lt;/u&gt; &lt;/p&gt; &lt;p&gt; If <input type="checkbox"/> Display Single</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>Transaction in Bank Statement <input checked="" type="checkbox"/> checkbox is ticked, system will display the transaction as a single entry in Account Statement as well as Statement inquiry screen in OBP. Please note this cumulative single entry will not include fee amount / amounts. Fee entry / entries will be displayed separately in the statement /Statement inquiry screen. &lt;/p&gt; &lt;p&gt; If this check box is not checked, system will display separate entries for each cheque deposit and cash deposit in statement and statement inquiry screen for Multi fund deposit transaction. &lt;/p&gt; The approach taken for the processing is. &lt;p&gt; The payments screen will get the details of transaction to be performed. The details include &lt;/p&gt; &lt;ul&gt; &lt;li&gt;Cheque of the banks other than own bank.&lt;/li&gt; &lt;li&gt;Cheque of the own bank.&lt;/li&gt; &lt;li&gt;Cheque where amount is less than threshold (Direct credit to DDA.)&lt;/li&gt; &lt;li&gt;Manager Cheques of same bank&lt;/li&gt; &lt;li&gt;Manager Cheques of different banks&lt;/li&gt; &lt;/ul&gt; Now there are 2 approaches possible to cater given requirements. &lt;p&gt; 1.No change in any service and payments can call in loop as per existing flows.CASA can accept the statement flags for controlling statement behaviour. &lt;/p&gt; But after each credit &lt;ul&gt; &lt;li&gt;If there are holds on CASA they will get knocked off in the processing.Which will log the statement entries which will cause the problem in running balance.&lt;/li&gt; &lt;li&gt;CASA will raise the accounting after each processing which needs to be stopped as payment needs amount tag info to add their details.&lt;/li&gt; &lt;/ul&gt; So this approach is not taken for the processing. &lt;/p&gt; Now other approach is Payments will identify the different types of cases possible on CASA and fills them in separate arrays. There are 3 arrays possible &lt;ul&gt; &lt;li&gt;ClearingTransactionDTO:=The array of</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>ClearingTransactionDTO {@link ClearingTransactionDTO} indicates the unclear transaction going to happen on CASA account.</p> <ul style="list-style-type: none"> <li>CashTransactionDTO:= The array of CashTransactionDTO {@link CashTransactionDTO} indicates the cash transaction going to happen of CASA account.</li> <li>FundDepositDTO := The array of FundDepositDTO {@link FundDepositDTO} indicates the credit which are going to happen on CASA account</li> </ul> <p>Now for each DTO DDA will call respective services for performing credits</p> <ul style="list-style-type: none"> <li>{@link DemandDepositCashTransactionService#depositCashApplication(CashTransactionDTO, Boolean)}</li> <li>{@link ChequeClearingApplicationService#updateBalanceOnChequeDepositInternal(ClearingTransactionDTO, Boolean)}</li> <li>{@link DDATransactionApplicationService#creditAccountApplication(AccountTransactionDetailsDTO, boolean)}</li> </ul> <p>Each method while calling credits set {@link FinancialEventType} as RegularWithoutHold.The RegularWithoutHold will not include Earmarks in the processing.For the unclear related transactions it will not perform reapportion on account.So Earmarks will not be apportioned.</p> <p>This method logic works as follows</p> <ul style="list-style-type: none"> <li>It validates the mandatory parameters passed by the caller by using method {@code validateMandatoryParameters }</li> <li>Then the call is given to derive the singleStatement entry flag from the product by using the {@code IDDAProductAdapter}</li> <li>Now the obtained value of flag is passed to respective cash ,credit and unclear credits for further processing along with</li> </ul>
