IDDAInterest Adapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDAInterestAdapter	doBackDateInterestProcessing	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. @param applicationContext @param backDatedInterestProcessingRequestDTO	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. For example, DD module performs backdated cash deposit transaction.  Due to this the base balance for interest computation would change for all subsequent interest computations happened after value date of backdated transaction. Hence interest needs to be recomputed for all subsequent balance changes which happened after value date of backdated transaction.  Also if backdated transaction has crossed current Accrual/Compounding/Capitalization/Settlement cycles then all these interest phases needs to be reprocessed and Interest adjustment entries needs to be passed for differential interest amount.  This method works as follows: <li>Convert the input DTO

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>to balance record entity by invoking  {@BalanceRecordDTO.convertDTOToEntity() }&lt;/li&gt;  &lt;li&gt;Create instance of BalanceChangeAnalyser using the input.applicationContext&lt;/li&gt; &lt;li&gt;Create the factContext with factMap, DDAAccount.AccountId as parameter. Retrieve the account Id from the input backDatedInterestProcessingRequestDTO&lt;/li&gt;  &lt;li&gt;Construct BackDatedInterestProcessingRequest with the values fetched or retrieved above&lt;/li&gt;  &lt;li&gt;Invoke the service {@link BackDatedInterestProcessingService#doBackDatedInterestProcessing} to preform back dated interest processing.&lt;/li&gt; &lt;li&gt;Validate backDatedInterestProcessingResponse. If the status code is not success, throw Business Exception.&lt;/li&gt;  &lt;li&gt;Get InterestPlanItemProcessingResult from BackDatedInterestProcessingResponse returned by the above service&lt;/li&gt; &lt;li&gt;Retrieve the InterestPlanItemKey and BackDatedInterestSettlementResponse from the result and populate InterestPlanItemKeyDTO,List&lt;BackDatedInterestSettlementResponseDTO&gt; map. &lt;li&gt; &lt;li&gt; Return back Dated Interest Settlement Response Map&lt;/li&gt;  @param applicationContext @param backDatedInterestProcessingRequestDTO</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDAInterestAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDAInterestAdapter	doBackdatedInterestProcessing	This service is used for recomputation of interest and posting of adjustment entries for an account if backdated transaction occurs on an account. @param applicationContext @param backDatedInterestProcessingRequestDTO	This method performs actual backdated processing for interest computation. It is created so as to facilitate internal recursive calls to this method.  When a backdated transaction takes place on an account, interest has to be recomputed for the account.  In case, the transaction value date is beyond the settlement date, then adjustment entries have to be passed for the settlement date and recomputation has to be done with the updated balances.   In order to facilitate recomputation, the caller module (CASA in this case) , prepares a set of balance records along with the interest rates from the value date of the transaction upto the posting date.   This set of records is sent to the interest module to enable it to perform computations. Along with the balance records, an instance of the BalancechangeAnalyser is also sent. This class, which implements the interface IBalanceChangeAnalyser, consists of a service to settle the adjustment amount and prepare the balance records with the updated balances of the account.  In effect, the interest service {@link IDDAInterestAdapter#doBackdatedInterestProcessing} recomputes the interest from the value date, settles the adjustment amount and recomputes interest again beyond the settlement date. It is a recursive process and continues till the current processing date.   As part of the alternate account maintenance, if an alternate account is maintained for InterestPosting of the input.account, then the adjustment entry has to be posted to the alternate account.   This will result in a backdated transaction of the alternate account, and hence recomputation of interest of the alternate account has to be triggered. It might so happen that the entry results in a beyond cap transaction for the alternate account. Hence, the whole process of

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>recomputation explained above has to be performed for the alternate account as well. &lt;br&gt; Therefore, this method has been designed in a fashion to support recursive calls for interest recomputation. &lt;br&gt;The method works as follows: &lt;li&gt;Call the method <a href="#">{@link BackdatedProcessingHelper#populateBalanceRecords}</a> to populate the balance records as required by the interest service.&lt;/li&gt; &lt;li&gt;Prepare the <a href="#">BackdatedInterestProcessingRequestDTO</a> with the balanceRecords returned by the service above, account id and requested date. The instance of the class <a href="#">{@link DDABalanceChangeAnalyser}</a>, which is required by the back dated interest processing request is later set in the adapter impl class.&lt;/li&gt; &lt;li&gt;Call the service <a href="#">{@link IDDAInterestAdapter#doBackdatedInterestProcessing}</a> with the request created in the step above to recalculate and process the backdated interest.&lt;/li&gt; &lt;li&gt;Validate the response returned by the interest service. Open a loop for the <a href="#">BackDatedInterestSettlementResponseDTO</a> response. &lt;ol&gt; &lt;li&gt;If the(<a href="#">InterestClass = Credit</a>, <a href="#">AlternateAccount#AccountTypeForCreditPosting = DemandDeposit</a> and <a href="#">AlternateAccount#AccountIdForCreditPosting</a> &lt;&gt; null) OR (ElsIf the <a href="#">interestClass = Debit</a>, <a href="#">AlternateAccount#AccountTypeForDebitPosting = DemandDeposit</a> and <a href="#">AlternateAccount#AccountIdForDebitPosting</a> &lt;&gt; null), then &lt;li&gt;Open a loop for the <a href="#">BackDatedInterestSettlementResponseDTO</a> &lt;li&gt;If the value of <a href="#">(BackDatedInterestSettlementResponse#oldPostTaxInterestAmount</a> &lt;&gt; <a href="#">BackDatedInterestSettlementResponse#newPostTaxInt</a></p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>erestAmount), it means that an adjustment entry has been passed for the settlement date. Since the adjustment entry has hit the alternate account, backdated interest computation for the alternate account also needs to be triggered. &lt;li&gt;Call the service {<a href="#">@link</a> BackdatedTransactionExecutor#performBackdatedInterestProcessing} with the effectiveDate as the BackDatedInterestSettlementResponse#dueDate and the accountId as the AccountIdForCreditPosting OR AccountIdForDebitPosting as the case may be.&lt;/li&gt;&lt;li&gt;Exit loop for BackdatedSettlementResponseDTO. The records in the BackdatedSettlementResponse will be in ascending order of dueDate. So, the interest needs to be recomputed from the earliest date on which an adjustment has been made. And hence, the call to the service is required only once.&lt;/li&gt;&lt;/li&gt;&lt;/ol&gt;&lt;/li&gt; @param applicationContext @param effectiveDate @param accountId</p>

In case the account is a nominated account to any of the facility , the attribute isAccountLinked of {@link FacilityFeeInquiryResponse} will be set to true indicating the nomination. The module based on this attribute can provide the user with the option of proceeding with the transaction or not. In case the account being closed is linked to a non revolving facility, the system needs to check whether the fees needs to be collected during the transaction. This is because loan accounts might get closed and hence the fees might go into deferred state during the auto closure of non revolving facility (based on system parameter). To ensure that the pro rate fees are collected this activity is done. In case of back dated closure also the fees upto the current date needs to be collected and charged/deferred based on the usecase. Once this is done the facility will be marked for closure to ensure that no fees gets collected for the facility again during its closure or upto its closure. @param accountId, The account which is being closed. @param closureDate , The date on which the account is being closed. It can current or back date. @param acctCurrency, The currency of the account. @since 2.3 @throws FatalException

ICustomerTermDepositsAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\ICustomerTermDepositsAdapter	getOfferId		This service validates the incoming party to account relationship channel facility flags against the account. Further if any affiliates are linked to the account, the same channel flags are further compared to the allowed access channels on relationship.     For cases where flag areToBeDefaulted is set to true, no validation is to be performed. The default values of the flags are stamped against the party account relationship.     For TRU and LEG party types, areToBeDefaulted is default set to true. No validation should be performed as channel facilities are not applicable for these.    New /Delink existing parties from stand alone party to account relationship screen is not allowed for Lending Accounts i.e. Loan or OD. @param partyToAccountRelationshipArray

IChannelDSL Adapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\channel\IChannelDSLAdapter	executeEmailTransaction	The following method executes the execute() of ETextCommand, which executes the email transaction. @param sessionContext @param businessContextDTO @param conversationText @return ContextResponse @throws FatalException	This method returns the instance of channel adapter. @return ChannelDSLAdapter class instance

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
ChannelDSLAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\channel\ChannelDSLAdapter	executeEmailTransaction	The following method executes the execute() of ETextCommand, which executes the email transaction. @param sessionContext @param businessContextDTO @param conversationText @return ContextResponse @throws FatalException	This method prepares the {@link BusinessContextDTO} to be used in calling the ChannelDSLAdapter. It then executes the email transaction through the adapter call and sets the response. @param sessionContext the session context to be used. @param channelContext the channel context to be used for transaction. @param transactionType @param emailTransactionContext contains all the information required to execute the email transaction. @return contextResponse contains information to be used to prepare the final response, which is sent to the user later. @throws BusinessException @throws FatalException
IPricingValidatorAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\pricing\IPricingValidatorAdapter	validateBusinessPolicy	This method will take pricingDomainObjectDTO as an input parameter. It will contain all the validations to be applied to the this particular Adapter class. It will check for all the validations that are kept and if the Validation fails it will add the validation error to a list of validation errors. once all the validations are checked it will then throw a validation exception passing the list of validation errors. This will be caught as a RuntimeException.	This method takes domain , domainCategory and pricingDomainObjectDTO as input parameters . It creates a unique instance of pricing adapter factory. It then calls the getPricingValidatorAdapter method of the pricing adapter factory passing domain , domain category and domain object as arguments. Pricing adapter factory will then return an instance of a particular pricing validator adapter based on the arguments passed . Then this method will call the validatebusinesspolicy method of that particular pricing validator adapter by passing the pricing domain object DTO as the argument. @param domain @param domainCategory @param pricingDomainObjectDTO

IAccountDDAAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\account\IAccountDDAAdapter	fetchAccount	<p>@param accountId @param accountType @return @throws FatalException</p>	<p>Customers may want to see the transactions that have occurred in their demand deposit account. For this they will have to submit a statement request. Every statement request that a customer makes is tracked as {@link DDStatementRequest} for casa accounts. The customer may also want to reorder the same statement request as before. To enable this facility, this method will fetch all the statement request that have been generated in the given period by system. From this, customer can then reorder any one , multiple or all of the requests present for his particular account. The method will not fetch statement request which are just reorders. &lt;/br&gt; Consider the following example: &lt;p&gt; Suppose there is a statement request for the period 'x' to 'y' with statement id 'z'. Now if the customer reorders this request, there will be one more statement request generated with 'z' as the reorder id. Lets say the new statement request id is 'newZ'. This statement id will not be fetched by this service. The same is true even if the reorder is bulk. @fcb.param MI,SessionContext,sessionContext, , This parameter captures the basic information about the user of the system. The information is used by the system for authentication purposes. @fcb.param MI,String,accountId , ,This parameter denotes the casa accountId for which the statement requests are to be fetched. @fcb.param MI,Period, period, ,This denotes the date range for which the statement requests are to be fetched. &lt;/br&gt;It contains: &lt;ol&gt; &lt;li&gt;beginDate: MI;{@link Date}. IAccountDDAAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\account\IAccountDDAAdapter	fetchAccount	<p>@param accountId @param accountType @return @throws FatalException</p>	<p>Customers may want to see the transactions that have occurred in their term deposit account. For this they will have to submit a statement request. Every statement request that a customer makes is tracked as {@link TDStatementRequest} for term deposit accounts. The customer may also want to reorder the same statement request as before. To enable this facility, this method will fetch all the statement request that have been generated in the given period by system. From this, customer can then reorder any one, multiple or all of the requests present for his particular account. The method will not fetch statement request which are just reorders. &lt;/br&gt; Consider the following example: &lt;p&gt; Suppose there is a statement request for the period 'x' to 'y' with statement id 'z'. Now if the customer reorders this request, there will be one more statement request generated with 'z' as the reorder id. Lets say the new statement request id is 'newZ'. This statement id will not be fetched by this service. The same is true even if the reorder is bulk. @fcb.param MI,SessionContext,sessionContext, , This parameter captures the basic information about the user of the system. The information is used by the system for authentication purposes. @fcb.param MI,String,accountId, , This parameter denotes the casa accountId for which the statement requests are to be fetched. @fcb.param MI,Period ,period , , This denotes the date range for which the statement requests are to be fetched. &lt;/br&gt;It contains: &lt;ol&gt; &lt;li&gt;beginDate: MI;{@link Date}. It denotes the start date from which the statement requests are to be fetched. It must not be after the endDate.&lt;/li&gt; &lt;li&gt;endDate: MI;{@link Date}. It denotes the end date to which the statement requests are to be fetched. It must not be before the</p>

IAccountDDAAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\account\IAccountDDAAdapter	validateAccountForOverrides	This method checks the account for following over-ridable conditions:- - If the customer is blacklisted. - If the memo is attached to the account. - If the customer has a memo. @param accountId	<p>The method will maintain &amp;quot;Predefined Account Operating Instructions&amp;quot; for Financial,Non Financial Transactions and Inquiry Transactions. For Financial transaction this will provide the user only relevant signature images based on the amount of the transaction as part of signature verification process in case the channel used in transaction is Branch,in case the channel is Internet or Mobile Banking the parties needed to authorize the transactions based on the amount of the transactions is provided to SMS module. The predefined account operating instructions for financial transactions will be amount based and maintained at the account level. Amount Slabs will be defined and a corresponding 'Mode of Operation' will be assigned to the Amount Slab. The number of signatures required per slab will also be maintained. The user can choose specific Party IDs who can sign/authorize for the particular amount slab. The predefined account operating instructions for non-financial transactions will be maintained at the account level. The predefined account operating instructions for inquiry transactions will be maintained at the account level. In case the channel for operating instruction has not been set,then it is defaulted to Branch. The various modes of operation available are: Any 'n'. Here 'n' will be the number of customer signatures required. Singly. Jointly. Signatory Set. User can maintain any number of amount slabs and assign the mode of operation to the amount slabs respectively Each of the amount slabs requires the user to maintain Party IDs depending upon the mode of operation selected. Following are the steps to be</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>followed in this method:-&lt;br /&gt; &lt;br /&gt; Check for Mandatory attributes by passing Operating Instruction DTO as argument to validateBeforeProcess&lt;br /&gt; IF type == &amp;quot;GROUP&amp;quot; THEN &lt;br /&gt; Call validateAccount() and pass GroupId, Type and AccountType as input arguments. &lt;br /&gt; ELSE &lt;br /&gt; Call validateAccount() and pass AccountId, Type and AccountType as input arguments. &lt;br /&gt; &lt;br /&gt; Create an object of Assembler &lt;br /&gt; Pass the OperatingInstructionDTO as an argument to toDomainObject() of Assembler and convert it to domain object. &lt;br /&gt; This would return the OperatingInstruction&lt;br /&gt; &lt;br /&gt; Create an object of OperatingInstructionService domain service. &lt;br /&gt; Call the addInstructionForAccount method of Domain Service and pass the OperatingInstruction to it as an argument. &lt;br /&gt; Call the {<a href="#">@link AccountActivityEventLogger#logActivityForOnline</a>} to log alerts to be sent to the customer. &lt;/p&gt; @param sessionContext @param operatingInstructionDTO</p>

IOrigination DocumentationAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationDocumentationAdapter	updateDocument	This service is called to update the document at the Documents module. DocumentDTO is passed as an input . @param sessionContext @param documentDTO @return DocumentContentResponse @throws FatalException	This service will create a Submission from the input details .   The service will be called from the BPEL process. The following activities will be carried out in sequence.    a) The service creates all new applicants for this submission by iterating through the list of ApplicantData.    b) This service will create applications based on the Product details submitted by the user.  The logic of creating multiple applications is as follows:    1) All deposit product groups applied will be put into separate applications.  2) All lending product groups newly applied will be split into separate applications based on the borrowing entity (group of parties identified by borrowing entity identifier). Different product groups applied by the same borrowing entity will be grouped under the same application.This is applicable for amended facilities as well.  3) All lending product groups that are applied as a result of amending existing facilities will be put into separate applications.     c) Simulation details are saved using the corresponding simulation application services based on the product group.   For e.g  Demand Deposit Product Simulation will be saved using the DemandDepositSimulationApplication Service.   Term Deposit Product Simulation will be saved using the TermDepositSimulationApplication Service.   Overdraft Product Simulation will be saved using the DemandDepositSimulationApplication Service.     d) The submission status is marked as SUBMISSION_SUBMITTED.    e) While creating a submission, the history records for submission are checked. If a record already exists, the number of history records for that submission identifier are set. This is required as an input to credit

IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	fetchNoOfAccountsForParty		This method validates that for the party passed and each chosen offer, the number of accounts to be applied plus existing accounts does not exceed the predefined maximum number of accounts per customer for a particular offer.  A query is used to check the total number of accounts that are already opened for the applicant for a given offer whereby the relationship of the applicant to the account is either SOW, JAF or JAO.  Also, accounts that are marked as 'CLOSED' are ignored in the count.   Finally, a check for the total count is checked against the max limit set for each offer in PMU and if it exceeds, an error is thrown and the user is not allowed to setup the account.   Originally, the validation was performed at product level instead of offer level. Additionally, the validation was performed for DDA, OD, TD, LOANS instead of DD and TD. @param sessionContext @param partyId @param productCode @param currencyCode @param accountSerialNumber @param productGroupLinkageType @throws FatalException

IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	getParty		<p>This service will create a Submission from the input details .&lt;br/&gt; &lt;br/&gt;The service will be called from the BPEL process. The following activities will be carried out in sequence.&lt;br/&gt; &lt;br/&gt; a) The service creates all new applicants for this submission by iterating through the list of ApplicantData.&lt;br/&gt; &lt;br/&gt; b) This service will create applications based on the Product details submitted by the user.&lt;br&gt; The logic of creating multiple applications is as follows:&lt;br&gt; &lt;br&gt; 1) All deposit product groups applied will be put into separate applications.&lt;br&gt; 2) All lending product groups newly applied will be split into separate applications based on the borrowing entity (group of parties identified by borrowing entity identifier). Different product groups applied by the same borrowing entity will be grouped under the same application.This is applicable for amended facilities as well.&lt;br&gt; 3) All lending product groups that are applied as a result of amending existing facilities will be put into separate applications. &lt;br&gt; &lt;br&gt; c) Simulation details are saved using the corresponding simulation application services based on the product group. &lt;br&gt; For e.g.&lt;br&gt; Demand Deposit Product Simulation will be saved using the DemandDepositSimulationApplication Service. &lt;br/&gt; Term Deposit Product Simulation will be saved using the TermDepositSimulationApplication Service. &lt;br/&gt; Overdraft Product Simulation will be saved using the DemandDepositSimulationApplication Service. &lt;br/&gt; &lt;br&gt; d) The submission status is marked as SUBMISSION_SUBMITTED.&lt;br&gt; &lt;br&gt; e) While creating a submission, the history records for submission are checked. If a record already exists, the number of history records for that submission identifier are set. This is required as an input to credit</p>

IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	getParty		<p>This service will create a simulation or save an existing simulation for overdraft products being setup for an application. Each overdraft product group is attached to a facility maintained in LCM system. In case of overdraft product groups, the user can setup multiple simulations for different offers selected. Each offer corresponds to a single simulation and contains the account configuration and additional details. The primary applicant will provide various preference details such as cheque book preference, deposit book preference, etc for the account. Preferences are also captured for each applicant of the account for statement, debit card details, etc. Overdraft facility can also be opted for existing demand deposit accounts in which case the user does not have to provide the configuration details since the account is already active. An existing demand deposit account can be attached only if the following conditions are fulfilled: &lt;br&gt; &lt;br&gt; Parties applying for Overdraft facility on existing CASA accounts must be owners of the account either as Sole Owners or as Joint Owners. &lt;br&gt; &lt;b&gt;For e.g.&lt;/b&gt; : If party A and party B apply for OD, then all CASA owned by Party A and Party B where each of them is Sole Owner and all CASA owned by both parties in joint are applicable for OD facility. If Party A and Party C hold a CASA, the same will not be applicable since Party C is not in the applicant list. &lt;br&gt; Existing CASA account selected for Overdraft, must not be linked to any other Overdraft facility. &lt;br&gt; &lt;br&gt; The system will internally create a linkage for this simulation to be fetched for future retrieval. The applicant(s) can continue making changes to this simulation until the account is opened. @fcb.param MI,SessionContext,sessionContext, ,Session Context</p>

IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	getParty		This method is to validate the party information for an ApplicantDTO object. For a new applicant who is an EXISTING_PARTY, we need to validate the party_id. And, if the other information is not input, we need to populate them. @param sessionContext @param applicantDTO @throws FatalException
IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	getParty		This method is to validate the party information for an ApplicantDTO object. For a new applicant who is an EXISTING_PARTY, we need to validate the party_id. And, if the other information is not input, we need to populate them. This method input ApplicantDataDTO @param sessionContext @param applicantDataDTO @throws FatalException
IOrigination ApplicantAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationApplicantAdapter	getParty		This service will update the account holder preferences provided by the secondary applicant for all the accounts setup as a part of the submission and also update the Applicant Status.   a) Prior to account opening, account configuration details are saved in Draft. Information stored in Draft is used for account opening process. For secondary applicants not available at the time of account opening, account holder preferences can be captured post account opening. These preferences are further updated in the draft that is stored for the account configuration.  b) It will update the applicant status as data entry complete.  c) If all the applicants have provided their preferences, then the application status is marked as APPLICATION_PROCESSED and the submission status is marked as SUBMISSION_COMPLETED.  @fcb.param MI,SessionContext,sessionContext, ,Session Context which must contain the session context information such as user id, branch, branch code, channel etc. @fcb.param MI, SecondaryApplicantInputDTO, secondaryApplicantInputDTO, , This DTO contains

In case of joint applications where one or more applicant(s) are not present, each applicant provides preferences such as statement and address for delivery. The new joint applicant is also added in the party account relationship.  If the account is opened with a single applicant, the single party is initially added as a Sole Owner on the account. When a joint applicant provides preferences for such account , the existing primary party relationship is changed to Joint and First and the new joint applicant is added as Joint and Other.  For accounts opened with 2 or more applicants, the existing party relationships remain unchanged as Joint And First and Joint And Other. The new joint applicant is added with a relationship of Joint And Other.  Finally, all joint applicant party level statement preferences and addresses are updated. @fcb.param MI, SessionContext,sessionContext, , Session Context which must contain the session context information such as user id, branch, branch code, channel etc.

IOriginationDDAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationDDAdapter	amendODAccount		
IOriginationDDAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationDDAdapter	updateDDAccountHolderPreferences		This service is used to update the Account Holder preferences for an already existing demand deposit account.  In case of joint applications where one or more applicant(s) are not present, each applicant provides preferences such as statement and address for delivery. The new joint applicant is also added in the party account relationship.  If the account is opened with a single applicant, the single party is initially added as a Sole Owner on the account. When a joint applicant provides preferences for such account , the existing primary party relationship is changed to Joint and First and the new joint applicant is added as Joint and Other.  For accounts opened with 2 or more applicants, the existing party relationships remain unchanged as Joint And First and Joint And Other. The new joint applicant is added with a relationship of Joint And Other.  Finally, all joint applicant party level statement preferences and addresses are updated. @fcb.param MI, SessionContext,sessionContext, , Session Context which must contain the session context information such as user id, branch, branch code, channel etc. @fcb.param MI, String accountId, Indicates the identifier for the account for which account holder

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>preferences are being updated. @fcb.param MI,DDAccountHolderPreferenceDTO,preferenceDTO, , This class contains information about preferences captured for the applicant of the demand deposit account. It has information about the external banking facilities such as internet banking, phone banking and mobile banking, demand deposit statement delivery preferences and debit card preferences such as color , type, etc. @fcb.param MI, Boolean, isUpdateAccountRelationShipRequired, , Indicates if account relation ship is to be updated. @return {@link com.ofss.fc.service.response.TransactionStatus} An instance of the transaction status which contains the required information about the status of execution indicating if the invocation succeeded or failed. @throws FatalException</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDenormalizedEntityAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\metadata\IDenormalizedEntityAdapter	fetchDataValue		This method takes the service inputs and extracts the data required for authorization by an asserter and returns the same as an array of name value pairs. The data is extracted either from the service inputs or a fixed set of entities that are configured and provided for out-of-the box for participating in the authorization process. The data that comes in as input for the service can be configured as directly available or indirectly available. Directly available input is one which would be a non-data object input and can be used directly in the authorization process. For example, transaction currency or transaction amount is taken as direct input in debit or credit services. An indirect input is a data element or attribute which can be obtained from a data object which come into the service as a direct input and hence needs to be extracted by recursing the object graph at runtime. An example of this would be the transaction branch input which is an attribute in the session context. In case where the data is taken from the domain entity, the key field data required to load an domain entity instance from the datastore is expected to be a direct or indirect input to the service call. @param inputs @return @throws FatalException
