This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate failsafe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

This software or hardware and documentation may provide access to or information on content, products and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services.

# Preface

Oracle Banking Platform Extensibility - Adapter Usage Details guide is an extension of the Oracle Banking Platform Extensibility guide. It contains information about the detailed list of adapters which can be used for extending and customizing the product.

This preface contains these topics:

- [Audience](#)
- [Documentation Accessibility](#)
- [Related Documents](#)
- [Conventions](#)

## Audience

This guide is intended for the users of Oracle Banking Platform.

## Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

### Access to Oracle Support

Oracle customers have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

## Related Documents

For more information, see the following documentation:

- For information related to customization and extension of Oracle Banking refer the Oracle Banking Extensibility Guide

## Conventions

The following text conventions are used in this document:

---

Convention	Meaning
<b>boldface</b>	Boldface type indicates graphical user interface elements associated with an action, or terms defined in text or the glossary.
<i>italic</i>	Italic type indicates book titles, emphasis, or placeholder variables for

---

---

which you supply particular values.

monospace

Monospace type indicates commands within a paragraph, URLs, code in examples, text that appears on the screen, or text that you enter.

---

## Adapter Usage Details

This chapter provides information on the list of adapters which can be used for extending and customizing the product.

**Table 1-1 Adapter Usage Details**

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table <b>FLX_DA_ACCT_EVENT_B</b> which will have one to one relationship with behaviour<b>FLX_DA_ACCT_BEHAVIOUR_B</b> and one to many relationship with details <b>FLX_DA_ACCT_EVENT_DTLS_B</b>.   @param accountingRequest {@link ClassificationAccountingEvent} object containing details of accounting event	This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table <b>FLX_DA_ACCT_EVENT_B</b> which will have one to one relationship with behaviour<b>FLX_DA_ACCT_BEHAVIOUR_B</b> and one to many relationship with details <b>FLX_DA_ACCT_EVENT_DTLS_B</b>.   @param accountingRequest {@link ClassificationAccountingEvent} Object containing details of accounting event for asset classification @see com.ofss.fc.app.adapter.td.ITDAccountingAdapter#raiseAccountingEvent(com.ofss.fc.app.ac.dto.accounting.AssetClassificationAccountingEventDTO)

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	<p>This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table</p> <p>&lt;b&gt;FLX_DA_ACCT_EVENT_B&lt;/b&gt; which will have one to one relationship with behaviour&lt;b&gt;FLX_DA_ACCT_BEHAVIOUR_B&lt;/b&gt; and one to many relationship with details &lt;b&gt;FLX_DA_ACCT_EVENT_DTLS_B&lt;/b&gt;.</p> <p>@param accountingRequest {@link ClassificationAccountingEvent} object containing details of accounting event</p>	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	<p>This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table</p> <p>&lt;b&gt;FLX_DA_ACCT_EVENT_B&lt;/b&gt; which will have one to one relationship with behaviour&lt;b&gt;FLX_DA_ACCT_BEHAVIOUR_B&lt;/b&gt; and one to many relationship with details &lt;b&gt;FLX_DA_ACCT_EVENT_DTLS_B&lt;/b&gt;.</p> <p>@param accountingRequest {@link ClassificationAccountingEvent} object containing details of accounting event</p>	<p>@param sessionContext @param applicationContext @param loanAccount @param amountTagDetailsDTOs @param eventSequenceNumber</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	<p>This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table</p> <p>&lt;b&gt;FLX_DA_ACCT_EVENT_B&lt;/b&gt; which will have one to one relationship with behaviour&lt;b&gt;FLX_DA_ACCT_BEHAVIOUR_B&lt;/b&gt; and one to many relationship with details &lt;b&gt;FLX_DA_ACCT_EVENT_DTLS_B&lt;/b&gt;.</p> <p>@param accountingRequest {@link ClassificationAccountingEvent} object containing details of accounting event</p>	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	@param accountingEventDTO	This represents the raiseAccountingEvent method which raises the accounting event occurred. After getting the required details for processing of accounting entries from different modules of application, this method will persist the input values of accounting event into event table <b>FLX_DA_ACCT_EVENT_B</b> which will have one to one relationship with behaviour<b>FLX_DA_ACCT_BEHAVIOUR_B</b> and one to many relationship with details <b>FLX_DA_ACCT_EVENT_DTLS_B</b>. @param accountingRequest {@link ClassificationAccountingEvent} Object containing details of accounting event for asset classification @see com.ofss.fc.app.adapter.td.ITDAccountingAdapter#raiseAccountingEvent(com.ofss.fc.app.ac.dto.accounting.AssetClassificationAccountingEventDTO)
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	@param accountingEventDTO	
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	@param accountingEventDTO	@param sessionContext @param applicationContext @param loanAccount @param amountTagDetailsDTOs @param eventSequenceNumber
IAssetClassificationAccountingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ac\IAssetClassificationAccountingAdapter	raiseAccountingEvent	@param accountingEventDTO	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	createWorkflowTrackerSummarizedEntity	This method will create the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO @throws FatalException	
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	createWorkflowTrackerSummarizedEntity	This method will create the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO @throws FatalException	This method is called to save the a Draft Record of PartyMerge Request.  This is required for Audit purpose also during the Transaction the Party Merged state can be retrieved using this draft record. <ul> <li>Validation is performed on Input. If PartyMergeDTO or any of the merging partyIds is null, Exception is thrown. <li>The method can be called from two perspectives. <ul> <li>The Draft already exists but it needs to get updated (a valid mergeId is given). <ul> <li>PartyMergeState entity is directly loaded from the Party Merge state table <li>If no such record exists in the DB against given mergeId, a partyMergeState is created which and persisted into the DB. If the record Exists, it gets updated with the new data and values which comes as input to the method. </ul> <li>A new Draft needs to be created.(No mergeId given) <ul> <li>Victim party status id set to <i>MERGE_INITIATED</i> which gets persisted. <li>Then required Party details record for survivor and victim for merge is collected. <li>With these data Party Merge State entity is created and persisted into DB. </ul> </ul>
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	createWorkflowTrackerSummarizedEntity	This method will create the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO @throws FatalException	This method will create the workflow tracker summarized entity. @param mergeId @param partyMergeDTO @param partyMergeStatus

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	updateWorkflowTrackerSummarizedEntity	This method will update the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO	
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	updateWorkflowTrackerSummarizedEntity	This method will update the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO	This method is used for initiating merge. The Merge process follows sequential steps as below: <ul><li>First validation of Input Parameter (PartyMergeDTO) is done. <li>If PartyDTO (IndividualDTO for Party type Individual, TrustDTO for Trust, OrganizationDTO for Legal Entities) in the PartyMergeDTO is null, then it by default gets set to corresponding value of survivor's. <li>In case mergeId is null, that means SaveAsDraft has not been called before for this particular party merge, so saveAsDraft is called. <li>After all the data are available for the merge to proceed, Validation of Party Merge Business Policy is done. Any error occurred during this validation gets recorded in partyMergeResponse. <li>Now, based on the purpose for which the method has been called, the behavior is as below: <li>Initiate Party Merge (Actual Party Merge) <ul><li>Validation is performed for party data, i.e. comparison is done for data that comes to the method in form of Input and what actually exists in the DB. <li>If any Difference found while doing comparison, the method gets informed about data change and the Merge Process stops at this point. <li>If no difference found, PartyMergeAudit object is created which stores the currently existing data about the survivor Party.( before party merge takes place) <li>Now, Party Merge is performed. The data corresponding to both survivor and victim gets merged and set to survivor. <li>In case error occurs while performing the above merge, the errors gets

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>added to the response . &lt;li&gt;Then, Merge of party accounts and party relationships are done and errors, if any recorded, get added to response &lt;li&gt;Now, Merge takes place in other modules corresponding to the parties and errors, if any, get added to the Response. &lt;li&gt;After all the merging events have been performed, and no error in the response: &lt;ul&gt; &lt;li&gt;An Entity PartyMergeHistory gets persisted into the DB, indicating the parties have successfully been merged. &lt;li&gt;Party Merge status in PartyMergeState is updated to COMPLETED. &lt;li&gt;The Entity Status of Victim party is set to CLOSED., indicating victim party no longer exists. &lt;li&gt;The party merge status of Victim party is set to MERGED, indicating the party has been merged to some other party. &lt;li&gt;post merge PartyMergeAudit is formed, which contains survivor party related data after party merge has successfully taken place. &lt;li&gt;This PartyMergeAudit Entity gets persisted into the DB &lt;li&gt;The results of the PartyMerge event gets persisted into the DB. &lt;/ul&gt; &lt;li&gt;otherwise, the Errors in response get persisted in the Party Merge State Table. &lt;/ul&gt; &lt;li&gt;Validate Party Merge (Virtual simulation of Party Merge) &lt;ul&gt; &lt;li&gt;Merge takes place in other modules corresponding to the parties. If any error, gets set to the Response. &lt;/ul&gt; &lt;/ul&gt; &lt;/ul&gt; @param sessionContext @param partyMergeDTO @param isActualMerge @return @throws FCRException @throws ClassNotFoundException @throws IOException</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	updateWorkflowTrackerSummarizedEntity	This method will update the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO	This method is used for canceling a merge request. when a partyMergeRequest is raised, and if due to some reason it couldn't succeed then the related parties should get rolled back to their original states: <ul style="list-style-type: none"> <li>Victim Party Status should get marked back to <b>ACTIVE</b> from previous status</li> <li><b>MERGE_INITIATED</b>. Party Merge Status for PartyMergeState should get marked to <b>CANCELLED</b> from previous status</li> <li><b>INITIATED</b></li> </ul>
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	updateWorkflowTrackerSummarizedEntity	This method will update the Workflow Tracker Summarized Entity. @param workflowTrackerSummarizedEntity DTO	This method will update the status in the workflow tracker summarized entity. @param mergeId @param partyMergeStatus
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	onboardPartyThroughProcess	This method will call the create customer process to onboard a new party. This method will be used when a record for a party existing in other systems such as OCH needs to be created within OBP. @param sessionContext @param partyDataDTO @return @throws FatalException	This service will onboard a OCH only party and create a record within OBP system. @param sessionContext @param String, externalPartyId, Indicates the Id used for inquiring details of the party that is to be onboarded from OCH. @param PartyType, partyType, Indicates the party type for the party being onboarded. @return PartyOnBoardingResponse @throws FatalException
IPartyWorkflowAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\party\IPartyWorkflowAdapter	onboardPartyThroughProcess	This method will call the create customer process to onboard a new party. This method will be used when a record for a party existing in other systems such as OCH needs to be created within OBP. @param sessionContext @param partyDataDTO @return @throws FatalException	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDSLPCAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dsl\IDSLPCAdapter	inquireChequeStatus	This service fetches the cheque status details @param sessionContext @param chequeStatusInquiryDTO	
IDSLPCAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dsl\IDSLPCAdapter	issue	Issue () method of BankDraftApplicationService for issuing the bank draft .  It accepts 3 parameters-----   <ul> <li>BankDraftDTO - BankDraftDTO has all the information related to bankDraft (Settlement mode, Amount, serial-number, etc.).  <li>SessionContext - Standard header information for the application.   <li>MessageType </ul>This method will return the bank draft response for successful issuance of bank draft.   It will have the BankDraft serial no for further reference and tracking.   If an instrument is liquidated over the counter, then the serial number is used to track the instrument uniquely.   The serial number comprises of branch code followed by issue date followed by running serial number. @see com.ofss.fc.app.pc.bankdraft.service .IBankDraftApplicationService#issue(com.ofss.fc.app.context.SessionContext, com.ofss.fc.app.pc.bankdraft.dto.BankDraftDTO, java.lang.Object)	

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDSLPCAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dsl\IDSLPCAdapter	resolvePayableAtInstitution	This service represents the resolution of payable at institution @param sessionContext @return @throws FatalException	
IDSLPCAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dsl\IDSLPCAdapter	resolvePayableAtInstitution	This service represents the resolution of payable at institution @param sessionContext @return @throws FatalException	
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		The method is used to create CCI policy for each applicant inside product group. The CCI policy will be created   only if CCI is applicable at the product group level. This will call the Consumer Credit Insurance Interface   which will in-turn make a call to the corresponding CCI provider to actually create the CCI policy.  @fcb.param MI SessionContext, sessionContext Session Context which contains information   such as user id, branch, branch code, channel etc. @fcb.param MI LendingProductGroupLinkageDTO productGroupLinkageDTO, This stores information   regarding the product group such as requested amount, requested tenor, ConsumerCreditInsuranceDetailDTO, etc 
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		The method is used to create CCI policy for each applicant inside product group. The CCI policy will be created   only if CCI is applicable at the product group level. This will call the Consumer Credit Insurance Interface   which will in-turn make a call to the corresponding CCI provider to actually create the CCI policy.  @fcb.param MI SessionContext, sessionContext Session Context which contains information   such as user id, branch, branch code, channel etc. @fcb.param MI LendingProductGroupLinkageDTO productGroupLinkageDTO, This stores information   regarding the product group such as requested amount, requested tenor, ConsumerCreditInsuranceDetailDTO, etc 
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		This method is used to create CCI policy linkages for applicant applied for Consumer Credit Insurance in specific product group. @param sessionContext, It contains contain related to User, Bank Code , Branch etc. @param productGroupLinkageDTO, Represents details to specific product group. @return CCIDetailsResponse @throws FatalException

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicy		This method will initiate CCI Policy Creation at Application Level. This will be directly called from SOA Process.     It will internally call CCI Policy Creation at PG Level similar to one from Human task at PG level initiation. Based on final policy status by combining policy status of all PGs in Application further process takes place.     @param sessionContext @param applicationId
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicyWithQuote		
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicyWithQuote		
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	createCCIPolicyWithQuote		This method is used to create CCI policy linkages for applicant applied for Consumer Credit Insurance in specific product group. @param sessionContext, It contains contain related to User, Bank Code , Branch etc. @param productGroupLinkageDTO, Represents details to specific product group. @return CCIDetailsResponse @throws FatalException
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This adapter call is used to fetch CCI premium amount quote.

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This adapter call is used to fetch CCI premium amount quote.
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		@param sessionContext @param prodGrpLinkage @param accountOpeningDetailsDTO @return @throws FatalException
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		The method is called when the user wants to know if CCI is applicable for any product group in an application. This method will be called through BPEL process to check whether human task should be created for Consumer Credit Insurance or not. Inquiry of CCI policies for each applicant will be done and if Policy is rejected for all the applicants, then it will return NOT APPLICABLE. @param SessionContext, sessionContext Session Context which contains information such as user id, branch, branch code, channel etc. @param String applicationId, Indicates the application Id @return CCIApplicableResponse @throws FatalException

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		The method is called on submit of Consumer Credit Insurance Task. There are basically three scenarios that may happen on submission of CCI task. @param SessionContext, sessionContext Session Context which contains information such as user id, branch, branch code, channel etc. @param String applicationId, Indicates the application Id @return TransactionStatus @throws FatalException @exception OverridablePolicyViolationException FC_OR_CCI_0002:  This exception will be throws even if one product group inside an Application has CCI policy status as OR_CCI_POLICY_NOT_PROCESSED{@link OriginationErrorConstants.OR_CCI_POLICY_NOT_PROCESSED} .
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This method is used to fetch all policy details related to Consumer Credit Insurance for each applicant in given product group. This method will be called from Human Task on click of view details. @param sessionContext, It contains contain related to User, Bank Code , Branch etc. @param lendingProductGroupLinkageDTO, Represents details to specific product group. @return CCIPolicyDetailsResponse @throws FatalException
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This method will be called from UI to fetch Basic CCI Details for Applicant to be shown in CCI Human task as grid. @param sessionContext, contains user information. @param applicationId, denotes the application ID @param productGroupSerialNumber, denotes product group serial number @throws FatalException @{@link Exception BusinessException OR_INV_INPUT: This exception will be thrown if applicationID is null.}

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This will be called from back to Structure solution to cancel just the latest insurance policy request sent. @param sessionContext, contains user information. @param applicationId, denotes the application ID @param productGroupSerialNumber, denotes product group serial number @param ignoreCCIRejection, this flag denotes whether cci policy rejected flag should be updated to true or not. this flag will come true for Stage "Back to structure solution" @throws FatalException @link Exception BusinessException OR_INV_INPUT: This exception will be thrown if applicationID is null.}
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchCCIPolicyDetails		This will fetch all CCI details available under given application. @param sessionContext, contains user information. @param applicationId, denotes the application ID @throws FatalException @link Exception BusinessException OR_INV_INPUT: This exception will be thrown if applicationID is null.}
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	generateId		This adapter call is used to fetch CCI premium amount quote.
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	generateId		This adapter call is used to fetch CCI premium amount quote.

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	generateId		This method is used to create CCI policy linkages for applicant applied for Consumer Credit Insurance in specific product group. @param sessionContext, It contains contain related to User, Bank Code , Branch etc. @param productGroupLinkageDTO, Represents details to specific product group. @return CCIDetailsResponse @throws FatalException
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	generateId		This method is called from create lending application to persist the CCI quote details. At Funds table in application form, we generate an insurance id, fetch the CCI quote and persist the quote-facility linkage in insurance. The insurance Id is stored in CCIDetailDTO. On submit, if insurance id is present, we delete the existing quote-facility linkage and add quote-facility and quote-party linkages. If insurance id is not present, we generate the insurance id and create insurance-facility and insurance-party linkage. There would be no CCI quote data in this case. @param sessionContext @param productGroupLinkageDTO @return @throws FatalException
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchInsurancePolicyBasicDetails		This adapter call is used to fetch basic insurance details for given policy code.
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchInsurancePolicyBasicDetails		This adapter call is used to fetch CCI premium amount quote.

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchInsurancePolicyBasicDetails		This method will create InsuranceDTO from CCIDetailDTO @param cciDetail @param lendingPG @return
IOriginationInsuranceAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\origination\IOriginationInsuranceAdapter	fetchInsurancePolicyBasicDetails		This method would perform the following operations  <ul> <li>Derive the product group linkages via submission-helper</li> <li>Extract the lending product group linkages</li> <li>Update the CCI details by invoking the fetchInsurancePolicyBasicDetails() via Insurance adapter</li> <li>Update the CCI Details Dto in the applicant product group ref instance</li> </ul> @param sessionContext, Session context, needed to invoke the Insurance adapter @param submissionInputDTO, Submission Input Dto which is to be refreshed with the latest CCI details DTO @throws FatalException

ILoanProductAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\loan\ILoanProductAdapter	fetchDelinquencyDayRanges	This method is responsible for fetching Delinquency Day ranges defined at PMU SetUp. @param productId @return	<p>This method is exclusively defined to show overdue payments for the provided Loan Account ID for Loan Serve.  <ul> <b>Information provided about Overdue Payments</b> <li>Delinquency Day Range: Day Range Start - Day Range End</li> <li>No. of Days for Overdue (i.e. Delinquency Counters)</li> </ul> </p> @param sessionContext @param accountId @return @throws FatalException
ILoanProductAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\loan\ILoanProductAdapter	fetchDelinquencyDayRanges	This method is responsible for fetching Delinquency Day ranges defined at PMU SetUp. @param productId @return	<pre>This method is responsible for initiating the process of "Loan Delinquency Details Update". NOTE Capture a Due Date for Reference only once. This Due Date need to be compared with every single arrears which qualifies above criteria. This will help in identifying Arrears raised on same Date. For them, Delinquency Counter won't be decremented / incremented. A HashMap will be maintained with (Arrears Subsequence Number / Arrears Due Date) as Key / Value pair. Approach:- 1) Get the list of Unpaid Arrears for the Loan Account. 2) Get the list of Delinquency Day Ranges from Product 3) Get list of Delinquency Counter Details for the respective Loan Account. 4) Get the "Next Delinquency Day Range" from Product. 5) Identify whether Delinquency Day ranges are INCLUSIVE / EXCLUSIVE. 6) Filter Arrears which are due for Bucket Movement by applying following criteria. CASE I :: EXCLUSIVE Day Range ----- IF ( LoanArrear -> dueDate + LonaDelinquencyDetails -> delinquencyDayRange) EQUALS (actionDate+1) THEN Arrear is due for Bucket Movement. CASE II :: INCLUSIVE Day Range ----- IF ( LoanArrear -> dueDate + LonaDelinquencyDetails -> delinquencyDayRange) EQUALS (actionDate) THEN

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>Arrear is due for Bucket Movement. 7) Maintain two types of Mappings :- A) removedArrearsMap This map will have distinct entries of Removed Arrears for a Due Date It will help in decrementing the Counter only once when multiple arrears with same due date are removed from a bucket. B) addedArrearsMap This map will have distinct entries of Added Arrears for a Due Date It will help in incrementing the Counter only once when multiple arrears with same due date are added to next bucket. 8) Bucket Movement Process :- ----- For every Unpaid Arrear which is due for Bucket Movement IF listOfFilteredUnpaidArrears is not empty THEN REMOVE ARREAR FROM PRESENT BUCKET IF (removedArrearsMap) HashMap is empty THEN - Add the entry for the current arrear (arrearRefNo, dueDate) in HashMap. -Identify the Bucket (which holds the arrears reference number of the current arrears) from the list (i.e. CHECK IF LoanDelinquencyDetails -&gt; arrearReferenceNumbers CONTAINS( LoanArrear -&gt; ArreayKey -&gt; subSequenceNumber)) -Remove Arrears Sequence Number from LoanDelinquencyDetails -Decrement Delinquency Counter by 1 -IF Delinquency Counter IS 0 THENDelete the Bucket Details ELSE Update delinquency details in the list. ELSE IF (removedArrearsMap) HashMap is not empty, and has an entry of an Arrear for a Due Date THEN - Identify the Bucket (which holds the arrears reference number of the current arrears) from the list (i.e. CHECK IF LoanDelinquencyDetails -&gt; arrearReferenceNumbers CONTAINS( LoanArrear -&gt; ArreayKey -&gt; subSequenceNumber)) -Remove Arrears Sequence Number from LoanDelinquencyDetails ELSE IF</p>

ILoanInterestAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\loan\ILoanInterestAdapter	unRegisterInterestPlan		This method is used to unregister Interest plan during account closure @param applicationContext @param accountId
ILoanInterestAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\loan\ILoanInterestAdapter	inquireInterest		This method will called by the consumers of the interest module to process the partial pay off request.  There is an attribute defined at the product level which defines whether the pending interest needs to be charged during Partial Payoff.  This attribute is termed as applyInterestTillDate. This attribute will decide the whether the pending interest will be charged as a part of Partial Payoff processing or it will be charged in the next charging cycle.   If the applyInterestTillDate flag is set as false in the input , then pending interest won't be charged hence zero money response would be sent to the caller.  The below steps are applicable if the applyInterestTillDate flag is set as true This method would perform the interest charging as of the partial pay off date provided in the input.   Here the transaction reference number is taken as input from the loan module, which is generated during the partial pay off.   The same transaction reference number would be used to raise the interest related accounting entries.   So when there is reversal for the partial pay off, the same transaction reference number could be used to reverse the interest accounting entries.   The reversal of the accounting entries would be triggered by the loan module. Doing so the same transaction reference number would be used to reverse all the accounting entries. It will reverse both loan and interest module accounting entries.   The current state of the interest plan item would be preserved, so that during

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>the reversal the interest plan item could be brought to its original state as of pre-partial pay off.&lt;br&gt; &lt;br&gt; Algorithm : &lt;ol&gt; &lt;li&gt;Initialize {@link PartialPayOffResponse} partialPayOffResponse; &lt;li&gt;If the {@link PartialPayOffRequest#applyInterestTillDate}== false then&lt;br&gt; {@link PartialPayOffResponse#totalUnchargedInterest} = 0; &lt;li&gt;return the response to the caller. &lt;li&gt;Else &lt;ol&gt; &lt;li&gt;For given arrangement number, {@link InterestClass},{@link InterestDivision}, fetch {@link InterestPlanItem} which is latest with respect to partial pay off date. &lt;li&gt;Fetch the {@link ConstituentStatisticsForComputation} for the given arrangement number, {@link InterestClass},{@link InterestDivision} ,{@link InterestConstituentType#REGULAR} with respect to partial pay off date using &lt;br&gt; {@link ConstituentStatisticsForComputationRepository#load(Class, ConstituentStatisticsForComputationKey)} &lt;li&gt;Call the {@link InterestStateService#persistInterestState(String, InterestPlanItem, Date, isInterestActionStateRequired, ConstituentStatisticsForComputation)} &lt;li&gt;Prepare {@link InterestCapitalizationRequest} interestCapitalizationRequest = {@link InterestProcessingHelper#prepareInterestCapitalizationRequest(payOffdate, payOffdate, InterestPlanItem, isBackdating, transactionReferenceNumber)} &lt;li&gt;Call {@link InterestCapitalizationService#doInterestCapitalization(interestCapitalizationRequest)} &lt;li&gt;Money accruedAmount = {@link InterestCapitalizationResponse#getPostTaxInterestAmount()} &lt;li&gt;Set {@link</p>

ISettlementDemandDepositAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\settlement\ISettlementDemandDepositAdapter	fetchAccountNoUsingCounterParty		This method is called to validate the Hiso related validation.
ISettlementDemandDepositAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\settlement\ISettlementDemandDepositAdapter	fetchAccountNoUsingCounterParty		This method will process the settlement request for given execution context. It will call the appropriate module API based on the direction using the amount @param context Indicates the session context to be used for execution. This will also carry the predefined transaction reference number and the original reference number for reversal @param details The settlement mode details to be used @param direction Indicates the direction of fund flow from Customer perspective @param transactionType Indicates whether the current invocation should result in reversal. In such case, the context should carry the original reference number @param amount The amount to be settled

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
ISettlementDemandDepositAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\settlement\ISettlementDemandDepositAdapter	fetchAccountNoUsingCounterParty		This method should be called at time of submission of a component preference or settlement preference to the repository. This will do basic validation on the inputs. The response will also indicate when settlement engine should initiate any execution on its own so that the funds can be made available on time. For e.g., for a Loans PDC for arrears repayments, the settlement route will be cheque. When the clearing settlement mode is invoked, and the value date is sent to clearing API, then the API will return the proposed activation date, and the value date. This proposed activation date will be the initiation date. Although the caller module will keep track of the Arrears Appropriation Event as of value date, the settlement engine will Independently keep track of the initiation date. The module adapter will have to determine the facts required by e-Pricing to determine mode usage charges. E.g., for payments, the network related charges can be calculated only if the network id as a fact is known @param context @param amount @param details @param direction @param transactionType @throws FatalException
ISettlementDemandDepositAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\settlement\ISettlementDemandDepositAdapter	fetchAccountNoUsingCounterParty		This method is used to perform account related checks.

IDDLCMAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDLCMAdapter	createBorrowingEntity		<p>This is a common method used to update funds to a demand deposit account during a backdated transaction. The service is used to update funds both during a credit and a debit transaction. When a backdated transaction occurs, the funds have to be updated from the value date of the transaction upto the current process date. This is required in order to recompute the interest for the account. The demand deposit account contains a EffectiveBalance Pair of the current and future balances. The past balances of the account are available in the BalanceHistoryItem. Hence, when a backdated transaction takes place, the records of the BalanceHistoryItem will be updated starting from the value date of the transaction. Finally, the current balance of the account will be updated. The method works as follows:</p> <ul style="list-style-type: none"> <li>Loads the demand deposit account by calling {@link DemandDepositAccountRepository#load} using accountTransaction.accountId.</li> <li>Validate the status of the account by calling the service {@link DemandDepositAccount#validateStatus} to verify whether funds can be credited to the account or not.</li> <li>Retrieve the OD limit start date and AUF start date from demand deposit account (DemandDepositAccount#getBalances#getBalanceLimits#getOverdraftLimit/#getAufLimit#startDate).</li> <li>Call the service {@link DemandDepositAccount#resetEffectiveBackDate} with the transaction value date to update the value of the attribute effectiveBackDate at the account level.</li> <li>transactionAmounts = {@link TransactionAmounts#prepareTransactionAmounts()}.</li> <li>Load the details of the balance history item from the value date of the transaction by calling the</li> </ul>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>service {@link BalanceHistoryItemRepository#loadHistoryForBackdatedPeriod} with the value date as the value date of the transaction.</p> <ul style="list-style-type: none"> <li>Open a loop for the list of records returned by the above service.</li> <li>If the effective date of the Balance history Item record &lt; value date of the transaction, it means there is no row present in BalanceHistoryItem as of the value date. A row needs to be created in the BalanceHistoryItem with the effective date as the value date of the transaction. Prepare a balance history Item record with the effective date as the value date of the transaction, and the rest of the details same as the loop record and use for the below processing.</li> <li>When creating new balance history item, use the OD start date and AUF start date retrieved above</li> <li>If the value of the input.transactionType = Credit, call the service {@link BalanceHistoryItem#credit} to update the credit amount in the balance history. ElseIf the value of input.transactionType = Debit, call the service {@link BalanceHistoryItem#debit} to update the debit amount in the balance history. Pass the transaction value date as the effective date of the loop record.</li> <li>Call the service {@link BalanceHistoryItemRepository#saveOrUpdate} with the details of the transaction response returned by the service above.</li> <li>Reset the value date to the posting date in the attribute TransactionDates. If the value of the input.transactionType = Credit, call the service {@link DemandDepositAccount#credit} ElseIf the value of the input.transactionType = Debit, call the service {@link DemandDepositAccount#debit}</li> <li>Update the instance of the DemandDepositAccount by calling the update() method of the repository {@link</li> </ul>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>DemandDepositAccountRepository#update}&lt;/li&gt;  &lt;li&gt;Construct and log the financial statement item  &lt;li&gt;Invoke  StatementItemService.addDDFinancialStatementItem()  . 				information in it using {@link TaxComputationResponse} object obtained in Step 6.</li> <li>Return {@link TaxProcessingResult} object to caller.</li> </ol> @param taxProcessingRequest Arrangement number for which Tax processing is being done. return {@link TaxComputationResult} object containing details of tax computed along with pre and post tax Interest amounts.
ITaxationCoreAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\taxation\ITaxationCoreAdapter	computeAndReturnTax	This will be used to compute the tax for an arrangement number.  This will be called by the interest module.  @param taxComputationRequest @return @throws FatalException	
ITaxationCoreAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\taxation\ITaxationCoreAdapter	computeAndReturnTax	This will be used to compute the tax for an arrangement number.  This will be called by the interest module.  @param taxComputationRequest @return @throws FatalException	This method is called to retrieve the tax computed for an arrangement   which in case of CASA is an account number and in case of TD it is combination of account number#deposit number.  This method will follow following steps to compute   The interest module will trigger a call to the TDS module for Tax computation whenever needed.  The Tax deduction can be done at different stages of interest processing like accrual, compounding and capitalization.  1. Load tax Parameters 2. If the LCY is different from the ACY, TDS module converts the interest amount from the ACY to LCY.  3. TDS module checks if Tax waiver is applicable for this account/deposit.  4.If Yes, TDS module checks if any of the following conditions are met, a) If the 'Exempt entire amount' flag is checked. b) If interest amount [in LCY] is less than equal to the threshold amount specified for the waiver or   5. If yes, TDS module intimates Interest module that Tax is not applicable for the account/deposit.   6.If no, TDS

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>module checks if any Tax exemption criterion has been maintained for the <math>\cap_{\gamma}^{\text{J}}</math> customer type <math>\cap_{\gamma}^{\text{J}}</math> and <math>\cap_{\gamma}^{\text{J}}</math> customer class <math>\cap_{\gamma}^{\text{J}}</math> of the customer holding this account/deposit.&lt;br&gt; 7.TDS module evaluates the Tax exemption based on the interest amount (in LCY), customer type, customer class and age of the customer to whom this account/deposit belongs. (In case of joint accounts, the TDS module will evaluate all the Tax exemption criteria individually for each joint account/deposit holder and the least of all exemption amounts will be used for Tax processing).&lt;br&gt; 8.If the interest amount (in LCY) is less than the exemption amount then the TDS module intimates the interest module that the account/deposit is Tax exempt.&lt;br&gt; 9.If the interest amount (in LCY) exceeds the exemption limit, the TDS module will make a call to the Pricing module (Fees) for Tax amount computation. TDS module will send the interest amount (in LCY), Account holder details (Like customer type, customer class, age; these details are used as facts for evaluating PPC<math>\cap_{\gamma}^{\text{J}}</math>s).&lt;br&gt; 10.The Pricing module will do the following on receiving the Tax computation request &lt;br&gt; &lt;li&gt;1. Evaluate the PPC<math>\cap_{\gamma}^{\text{J}}</math>s based on the customer facts passed and resolve the Base Price Definition (PD) chart/s. (The PPC<math>\cap_{\gamma}^{\text{J}}</math>s may be maintained for the product under which the account/deposit is opened or may be defined at the bank level. PPC<math>\cap_{\gamma}^{\text{J}}</math>s defined at the bank level will be applicable for all the products in the bank). &lt;li&gt;2. Retrieve the TCY code from the base PD . &lt;li&gt;3. If the TCY is different from LCY, It converts the interest amount from LCY to TCY. &lt;li&gt;4. Compute the base tax amount using the tax rate maintained in the Base PD/s. &lt;li&gt;5. Check by if there is any additional PD/s defined in the Base PD/<math>\cap_{\gamma}^{\text{J}}</math>s. &lt;li&gt;6. If Yes,</p>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>check if any additional tax/es are applicable to this account/deposit by checking if the interest amount exceeds the exemption limit (in TCY) defined in the Additional Pd/∩∟s. &lt;li&gt;7. If yes, compute the Additional Tax/es using the Tax rate maintained in the Additional PD∩∟s. &lt;li&gt;8. Calculate the ∩∟ Total Tax amount∩∟ a. If Additional Tax/es are applicable the total Tax amount = Base Tax/es + Additional Tax/es. b. If Additional Tax/es are not applicable the total Tax amount = Bases Tax/es. &lt;li&gt;9. Pricing module checks if any more Base PD∩∟s are applicable to this account/deposit If yes it repaeats steps 2 through 9, else proceeds to step 10. &lt;li&gt;10. Pricing module will compute the Sum of all ∩∟ Total Tax amounts∩∟ as calculated in step 8 during each iteration and returns it to the TDS module along with the ∩∟ Tax type∩∟ breakup details (for inquiry purposes).&lt;li&gt;&lt;br&gt; 11.On receiving the TDS amount the TDS module will A. Apply rounding rules defined for Tax B. Log event for accounting entries for TDS in TCY. For a detailed description of the accounting entries refer section 10.1.1.2. (For a detailed explanation on the recovery of this Tax amount refer section ∩∟ Tax Recovery∩∟). C. Convert tax amount from TCY to ACY if needed. D. Return the Tax amount in ACY to the Interest module &lt;br&gt; @param SessionContext @param TaxComputationRequestDTO</p>

IOriginationPreApprovedLimitAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\origination\IOriginationPreApprovedLimitAdapter	retrievePreApprovedEligibility	This method retrieves pre-approved eligibility for a set of applicants and a particular lending or credit card product group. It invokes an external system. The logic for processing pre-approved eligibility varies across external systems. @param applicantDataDTOs @param submissionId @param productGroupLinkageDTO @return PreApprovedLimitDTO	This method invokes the external system to re-assess the pre-approved eligibility of an existing submission's lending or credit card product group that was pre-approved. It is an attempt to re-hold the pre-approved limit in an existing submission's product group that becomes released during edit submission. The rationale is to not lose the pre-approved limit of an existing submission's product group during edit submission via removing the product group or changing details of the product group. This aids cancel edit during edit submission to return to the initial submission's original states. @param sessionContext @param initialSubmissionProductGroupLinkageDTO @param initialSubmissionProductGroupApplicantDataDTOs

IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDALoanAdapter	creditFunds	Method to credit funds in loan account. @param accountId @param amountToCredit @param populateAccountingEventAmountDebit	This method is used to transfer funds from one demand deposit account (provider account) to another demand deposit account (beneficiary account).   A funds transfer is always initiated from the provider account.  A funds transfer results in the following:  Dr Provider Account Cr Beneficiary Account The amount to be transferred can be expressed either in terms of the provider account currency or the beneficiary account currency.  <ol> <li>Amount expressed in provider account currency: In this case, the amount to be transferred to the beneficiary account is derived, in case it is not sent by the caller. <li> Amount expressed in beneficiary account currency: In this case, the amount to be transferred from the provider account is derived, in case it is not sent by the caller. </li> </ol> This method works as follows:  <ol> <li>Construct AccountTransaction object for provider account. accountAmount = providerAmount. transactionAmount = beneficiaryAmount. Change transaction description to include beneficiary account number. Call this.debitFunds().</li> <li>Construct AccountTransaction object for beneficiary account. accountAmount = beneficiaryAmount. transactionAmount = providerAmount. Change transaction description to include provider account number. Call this.creditFunds().</li> </ol> @param fundTransferTransaction @return

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDALoanAdapter	creditFunds	Method to credit funds in loan account. @param accountId @param amountToCredit @param populateAccountingEventAmountDebit	This method is used to credit funds to a demand deposit account identified by accountTransaction.accountId.  The method differs from the current service creditFunds only with respect to the financial statement item. It will not log a financial statement item, since by default the statement item is logged on cheque deposit date. This method works as follows: <ol> <li>Loads the demand deposit account by calling {@link DemandDepositAccountRepository#load} using accountTransaction.accountId.</li> <li>transactionAmounts = {@link TransactionAmounts#prepareTransactionAmounts()}</li> <li>Call {@link DemandDepositAccount#credit()}.</li> <li>Update the instance of DemandDepositAccount by calling the update() method of the repository {@link DemandDepositAccountRepository#update}</li></ol> @param accountTransaction
IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\dda\IDDALoanAdapter	creditFunds	Method to credit funds in loan account. @param accountId @param amountToCredit @param populateAccountingEventAmountDebit	This method is used to credit funds on credit interest settlement. This function specially created because we do not want to call {@link #creditFunds} method as it does not take value date < process date. But this case is possible in case of settlement.   Consider following situation -  Credit Settlement date: 31-Jan-2011,  31-Jan, 1-Feb, 2-Feb-2011 falls on holiday. So this settlement will be processed in the BOD of 3-Feb-2011.  In this case Transaction.PostingDate = 3-Feb-2011  Transaction.valueDate=1-Feb-2011   So in this case valuedate < processDate. , {@link #creditFunds} method does not allow this case.  This method is created to overcome this condition. As we do not want to consider this transaction as backdated transaction. This method will perform following activity-   1)

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<p>TransactionDates settlementTransactionDates = new TransactionDates()  transactionDates.postingDate =  input.accountTransaction.TransactionDates.postingDate  transactionDates.valueDate =  input.accountTransaction.TransactionDates.ValueDate  transactionDates..transactionDate =  input.accountTransaction.TransactionDates.transactionDate.  2) TransactionDates  creditTransactionDates = new TransactionDates()  transactionDates.postingDate =  input.accountTransaction.TransactionDates.postingDate  transactionDates.valueDate =  input.accountTransaction.TransactionDates.postingDate  transactionDates..transactionDate  =input.accountTransaction.TransactionDates.transactionDate.  3) AccountTransaction.transactionDates = creditTransactionDates.. As creditFunds gives error on backdates we change the date  4) load DemandDepositAccount-  5) Call demandDepositAccount.creditFunds method to credit the funds.  6) AccountTransaction.transactionDates = settlementTransactionDates.  7) prepareDDFinancialStatementItem(AccountTransaction)-- In statement we want value date as settlement date + 1. @param accountTransaction</p>
IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDALoanAdapter	creditFunds	Method to credit funds in loan account. @param accountId @param amountToCredit @param populateAccountingEventAmountDebit	Intimate Loan on earmark recovery. The method must call Loan's credit service. @param earmark @param populateAccountingEventAmountDebit @param amountToCredit

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDALoanAdapter	intimateOnOffsetBalanceChange	The method will be called to intimate the loan account which has been marked as beneficiary for a CASA offset account on balance change in the offset account. @param accountId	This method will be used to levy period fees on the account on the fees charging date as intimated by e-pricing. This service will levy the fees on the main account or the alternate account if one has been maintained for fees posting.   It is assumed that when the service is called, the periodic fees to be charged on the input.chargingDate has already been computed and stored in e-pricing. Hence, it calls the service to retrieve the computed price and subsequently levies the fees on the account.   <pre> It works as follows : <ul><li> Call the service {@link IDDA PricingAdapter#getComputedPeriodicFees} to get the calculated periodic fees. </li><li> Call the service {@FeesManagementService#levyPeriodicFees} with the periodic fee details returned by the above service to levy the fees on the account. </ul></pre> @param applicationContext @param accountId @param chargingDate

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IDDALoanAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\dda\IDDALoanAdapter	intimateOnOffsetBalanceChange	The method will be called to intimate the loan account which has been marked as beneficiary for a CASA offset account on balance change in the offset account. @param accountId	Refer the class level documentation for this. <ul> <li>This method will first call the method {@link IDemandDepositAccount#checkAndMoveBalances}  <li>While updating the current book balances it needs to check whether the Future Book Balances for the same date are moved into the current book balances.  <li>The offset clear and unclear balance would be sent to interest for computation <li>If Future Book Balances for the next date also exist at that time, the current book balances will be updated with those Future Book Balances if the effective dates of both the balances are same.  <li>After updating the current book balances, balances history will be maintained, thus an instance of the balance w.r.t the effective date. <li>If the account is not OD,the interest computation process is invoked to calculate interest on the current balances.  <li>For OD accounts, this process will be done in the proportionate OD shell. Refer {@link IntimateInterestActionExecutor}</li>.<li>This method need not to bother about the interest computation parameters, it will simply call {@link InterestFacade#invokeInterestComputation()}.<li>While computing interest, interest will always be computed on current balances.  <li>Refresh the balance statistics by calling account.statistics.refreshForBalances In BalanceChangeActionExecutor, we will set the crossover field of BalanceInformationDTO either to true or false, depending upon the different amounts(TOD,OD,Overline,AUF). This method works as follows :   <pre> Load DemandDepositAccount = {@link DemandDepositAccountRepository#load()} Call {@link IDemandDepositAccount#checkAndMoveBalances()}</pre>

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
				<pre> Balancechangeactionexecutor will use BalanceInformationDTO and will set the different types of Amount. New attribute isCredit is added in DemandDepositBalances, so that we can set the crossover field to true in case of crossover. if ((demandDepositAccount.getUtilizedAUFLimit(tranD ate).isPositive()    demandDepositAccount.getUtilizedOverdraftAmount (tranDate).isPositive()    demandDepositAccount.getOverlineAmount(tranDate ).isPositive()    demandDepositAccount.getTODAmount(tranDate).is Positive()) &amp;&amp;&amp; demandDepositAccount.getIsCredit()) { balanceInformationDTO.setIsCrossOver(true); demandDepositAccount.setIsCredit(false); } else if (demandDepositAccount.getUtilizedAUFLimit(tranDa te).isZero() &amp;&amp;&amp; demandDepositAccount.getUtilizedOverdraftAmount (tranDate).isZero() &amp;&amp;&amp; demandDepositAccount.getOverlineAmount(tranDate ).isZero() &amp;&amp;&amp; demandDepositAccount.getTODAmount(tranDate).is Zero() &amp;&amp;&amp; !demandDepositAccount.getIsCredit()) { balanceInformationDTO.setIsCrossOver(true); demandDepositAccount.setIsCredit(true); } Prepare BalanceHistoryItem by calling parameterised constructor of BalanceHistoryItem() Call {@link BalanceHistoryItemRepository#saveOrUpdate()} Call {@link InterestFacade#invokeInterestComputation()} Call {@link DemandDepositAccount#AccountStatistics#refreshFor Balances} &lt;/pre&gt; </pre>

IAccessPolicyAssertionAdapter	com.ofss.fc.app.adapter.internal.interface.jar@com\ofss\fc\app\adapter\sms\IAccessPolicyAssertionAdapter	assertFraudPolicies	This method invokes the OAAM policies for user. @param serviceInputValues, This parameter captures the method arguments.  The method parameters and arguments are stored in key-value pair the HashMap. @return Object @throws fatalException , persistenceException, nestedException	This method delegates the calls to the appropriate methods during security access check process.  First of all, if the service is blacked out for the period in which the user is accessing it, then he  will not be allowed to perform the transaction.    Access policies are maintained on OID server corresponding to roles.  Based on the policies, the user  has access on a particular service or not is validated.    If the service under execution is eligible for OAAM validations, call is made to OAAM.  OAAM validates the policies and rules set for the service and returns the action to be taken.  Action can be Allow, Block, Challenge1FA, Challenge1FADelay, Challenge2FA, Challenge2FADelay.    Next assertRequiredAuthorizations is used to test for business conditions that can be either rejected,  ignored or overridden. If status is marked as overridden, system fetches the configured workflow and   distributes workitems accordingly.    @param serviceId @param context @param serviceInputs @param parameterNames @throws FatalException

IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	deleteActivityEventLog		This method gets called when the user chooses to come back to Structure solution stage from any of the below stages for any lending application   <ul> <li>Mortgage Insurance</li> <li>Create Offer</li> <li>Lending Account Opening</li> <li>Lending Settlement</li> </ul> Method resets the below data, if present   1. Cancel the LMI policy  2. Delete the auto refinance data  3. Delete offer data  Method also performs the state transition @param SessionContext,sessionContext, ,Session Context which must contain the session context information such as user id, branch, branch code, channel etc. @param String, applicationId, , Indicates the application id of the application to reset. @return {@link com.ofss.fc.service.response.TransactionStatus} An instance of the transaction status which contains the required information about the status of execution indicating if the invocation succeeded or failed. @exception   {@link OriginationErrorConstants#SS_REVERT_NOT_VALID } : FC_OR_SS_0020  This error occurs when:  Structure solution is reverted when account has already been opened for one or more product groups.
IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	deleteActivityEventLog		Internal method used for deleting data for given inputs by making repository call. @param sessionContext @param activityId @param partyAcctType @param applicationId @author VirendraO
IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	populateMultiEntityAttributes	Populate Multi Entity Attributes of ActivityLog @param activityLog @return @throws FatalException	Populate Multi Entity Attributes of ActivityLog @param activityLog @return @throws FatalException

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	populateMultiEntityAttributes	Populate Multi Entity Attributes of ActivityLog @param activityLog @return @throws FatalException	This method is used to register an activity along with the data relevant for the activity  being registered. Additionally, the methods queries for events which are registered with  the activity being performed and generates them for processing. The processing of events  generated as part of the activity registration happens only after the activity completes  successfully. The processing of events generated happens asynchronously in separate thread  and has it own processing lifecycle. @fcb.param MI,SessionContext,sessionContext, , Session Context which must contain the session context   information such as user id, branch, branch code, channel etc. @fcb.param MI,String,activityId, , Represents the activity that has occurred for which the   log data is being registered and configured events will be generated. Example of such activity  could be execution of a business service like cheque deposit, loan installment payment etc.  @fcb.param MI,ActivityLog,activityLog, , Data associated with the activity performed. This data is   stored in the database for future retrieval and processing of events associated with the activity  registered. @return response An instance of the transaction status which contains the required information  about the status of execution indicating if the invocation succeeded or failed. @throws FatalException @see com.ofss.fc.app.ep.service.event.EventHandler

Adapter Name	Adapter Path	Adapter Method	Interface Method Javadoc	Implementation Method Javadoc
IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	populateMultiEntityAttributes	Populate Multi Entity Attributes of ActivityLog @param activityLog @return @throws FatalException	This method is a helper method used for registering activity in bulk and generate the events configured against the activity. This method simply delegates the call to <code>registerActivityAndGenerateConfiguredEvents(SessionContext, String, ActivityLog)</code> in a loop. In this case, every single activity log is registered against the activity in a separate transaction scope and committed separately. @deprecated
IEventProcessingAdapter	com.ofss.fc.app.adapter.internal.interface.jar@\com\ofss\fc\app\adapter\ep\IEventProcessingAdapter	populateMultiEntityAttributes	Populate Multi Entity Attributes of ActivityLog @param activityLog @return @throws FatalException	This method is used to register an activity along with the data relevant for the activity being registered. Additionally, the methods queries for events which are registered with the activity being performed and generates them for processing. The processing of events generated as part of the activity registration happens only after the activity completes successfully. The processing of events generated happens asynchronously in separate thread and has its own processing lifecycle. This method facilitates future dated event action processing. @fcb.param MI,SessionContext,sessionContext, , Session Context which must contain the session context information such as user id, branch, branch code, channel etc. @fcb.param MI,ActivityEventKeyDTO,activityEvent, , Represents the activity that has occurred. The log data registered would be for the activity and the events that is sent along with the will be generated with a specific processing date passed as a separate parameter. Example of Example such activity could be execution of a business service like cheque deposit, loan installment payment etc. @fcb.param MI,Date,eventProcessingDate, , Date on which the event should be picked up for event
