## Introduction

---

### Topics:

- [\*Overview.....7\*](#)
- [\*Scope and Audience.....7\*](#)
- [\*Manual Organization.....7\*](#)
- [\*Related Publications.....7\*](#)
- [\*My Oracle Support \(MOS\).....7\*](#)
- [\*Emergency Response.....8\*](#)
- [\*Locate Product Documentation on the Oracle Technology Network Site.....8\*](#)

This section contains an overview of the available information for the Integrated Diameter Intelligence Hub.

The contents include sections on the organization, scope, and audience of the documentation, as well as how to receive customer support assistance.

## Overview

This documentation provides information about the functions of the Alarm Forwarding application of the Integrated Diameter Intelligence Hub (IDIH).

**Note:** The Alarm Forwarding application is only available to users logging into IDIH as "idihadmin."

## Scope and Audience

This user's guide provides information about the Alarm Forwarding application. This guide provides definitions and instructions to help the user efficiently and effectively define conditions and destinations for forwarding Alarms.

## Manual Organization

*Introduction* contains general information about this document, how to contact *My Oracle Support (MOS)*, and *Locate Product Documentation on the Oracle Technology Network Site*.

*Introduction to Alarm Forwarding* provides an introduction to the Alarm Forwarding application.

*Working in Alarm Forwarding* contains information about procedures used while using the Alarm Forwarding application.

*SNMP Agent* contains information about the SNMP Agent of the Alarm Forwarding application.

## Related Publications

For information about additional publications that are related to this document, refer to the *Related Publications Reference* document, which is published as a separate document on the Oracle Technology Network (OTN) site. See *Locate Product Documentation on the Oracle Technology Network Site* for more information.

## My Oracle Support (MOS)

MOS (<https://support.oracle.com>) is your initial point of contact for all product support and training needs. A representative at Customer Access Support (CAS) can assist you with MOS registration.

Call the CAS main number at **1-800-223-1711** (toll-free in the US), or call the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. When calling, make the selections in the sequence shown below on the Support telephone menu:

1. Select **2** for New Service Request
2. Select **3** for Hardware, Networking and Solaris Operating System Support
3. Select **2** for Non-technical issue

You will be connected to a live agent who can assist you with MOS registration and provide Support Identifiers. Simply mention you are a Tekelec Customer new to MOS.

MOS is available 24 hours a day, 7 days a week, 365 days a year.

## Emergency Response

In the event of a critical service situation, emergency response is offered by the Customer Access Support (CAS) main number at **1-800-223-1711** (toll-free in the US), or by calling the Oracle Support hotline for your local country from the list at <http://www.oracle.com/us/support/contact/index.html>. The emergency response provides immediate coverage, automatic escalation, and other features to ensure that the critical situation is resolved as rapidly as possible.

A critical situation is defined as a problem with the installed equipment that severely affects service, traffic, or maintenance capabilities, and requires immediate corrective action. Critical situations affect service and/or system operation resulting in one or several of these situations:

- A total system failure that results in loss of all transaction processing capability
- Significant reduction in system capacity or traffic handling capability
- Loss of the system's ability to perform automatic system reconfiguration
- Inability to restart a processor or the system
- Corruption of system databases that requires service affecting corrective actions
- Loss of access for maintenance or recovery operations
- Loss of the system ability to provide any required critical or major trouble notification

Any other problem severely affecting service, capacity/traffic, billing, and maintenance capabilities may be defined as critical by prior discussion and agreement with Oracle.

## Locate Product Documentation on the Oracle Technology Network Site

Oracle customer documentation is available on the web at the Oracle Technology Network (OTN) site, <http://docs.oracle.com>. You do not have to register to access these documents. Viewing these files requires Adobe Acrobat Reader, which can be downloaded at [www.adobe.com](http://www.adobe.com).

1. Log into the Oracle Technology Network site at <http://docs.oracle.com>.
2. Under **Applications**, click the link for **Communications**.  
The **Oracle Communications Documentation** window opens with Tekelec shown near the top.
3. Click **Oracle Communications Documentation for Tekelec Products**.
4. Navigate to your Product and then the Release Number, and click the **View** link (the **Download** link will retrieve the entire documentation set).
5. To download a file to your location, right-click the PDF link and select **Save Target As**.

# Chapter 2

## Introduction to Alarm Forwarding

---

### Topics:

- [Overview.....10](#)
- [Alarm Forwarding Key Features.....11](#)
- [Alarm Forwarding Architecture.....11](#)

This chapter provides basic information about the Alarm Forwarding application.

## Overview

Alarm Forwarding enables the user to forward alarms to specified destinations. The user can create alarm forwarding rules using Filters.

This application handles several types of alarms, including those pertaining to

- Traffic supervision
- Quality of service
- System errors

## Setting User Preferences on IDIH Dashboard

Once inside IDIH, a user can set User Preferences. These include:

- Time specifications (date format, time zone, etc.)
- Enumeration values (numerals vs. text)

### Setting Time Format

Follow these steps to set the time format:

1. Click **User Preferences** on the Application board.  
The User Preferences screen is displayed.
2. Click the **Date/Time** tab.  
The Date/Time screen is displayed. The red asterisk denotes a required field.  
**Note:** Use the tips on the screen to help configure the time format.
3. Enter the format for these time-related displays.
  - **Date format**
  - **Time format**
  - **Date and time fields**
4. Select the formats for these time-related displays by using the drop-down arrow.
  - **Duration fields** - how the hours, minutes, seconds, and milliseconds of the Time format is displayed
  - **Time zone**  
**Note:** The local time zone must be chosen to get local time.
5. To reset the time-related displays to default settings, click **Reset**.
6. Click **Apply** to save settings.

### Setting Mapping Preferences

The user can set the Mapping settings using the User Preferences feature.

Follow these steps to set Mapping preferences.

1. Click **User Preferences** in the Application board.  
The User Preferences screen is displayed.
2. Click the **Mapping** tab.  
The Mapping screen is displayed.
3. Check **Translate ENUM values** to display text instead of numerals.  
Enumeration is used by TDRs to display text values instead of numeric. Rather than showing the numeral for Alarm Severity, the user interface will show the actual word, such as "Major" or "Critical."
4. Check **IP Address to Node Name** to translate an IP Address to a textual Node Name.
5. To reset the Mapping values to the default, click **Reset**.
6. Click **Apply** to save the changes.

## Alarm Forwarding Key Features

The key features of Alarm Forwarding include

- A Simple Network Management Protocol (SNMP) agent compliant with ITU x721, X733
- Acknowledge / Terminate capability from SNMP
- For an alarm event, only one email is sent to a selective list of email addresses. Alarm Forwarding allows a list of email addresses to be attached to a filter. It is possible to send a particular type of alarm to a list of email addresses and another type of alarm to a different list of email addresses. These multiple email address are set when Creating a Filter and Editing a Filter.

Each alarm is evaluated against each filter. The same alarm can pass different filter conditions and be sent to different destinations. If the same alarm passes different filters and is forwarded using SNMP in each of those filters, the alarm is sent only once since Alarm Forwarding detects this condition and SNMP has only one destination.

Also see [Alarm Forwarding MIB](#).

## Alarm Forwarding Architecture

Alarm Forwarding supports the forwarding of alarms to applications in an external system. It supports the following two protocols for alarm forwarding:

- Traps (SNMP)
- Mails (SMTP)

Alarm Forwarding supports the use of Filters. You can create, edit, and delete a Filter and a forwarding destination. A Filter List provides the following information for a Filter:

- Rec No - record number; a number given for indexing alarms in the Filter alarm list
- Rule - unique system-generated number that identifies the Filter
- Filter Name - name of the Filter
- Description - description of the Filter
- Destination Name - destination of the filtered alarm. It can be SNMP or SMTP or both.

You can set the forwarding criteria based on the Filters defined for the following fields:

- Ack State
- Alarm Cleared User
- Alarm ID
- Alarm Type
- Managed Object Class
- Managed Object ID
- Perceived Severity ID
- Probable Cause
- Specific Problem
- User Name

**Note:** Destination configuration is part of platform configuration. These steps (SMTP server, SNMP version, and target IP) are described in *IDIH Installation Document*.

# Chapter 3

## Working in Alarm Forwarding

---

### Topics:

- *Accessing Alarm Forwarding.....14*
- *Alarm Forwarding Toolbar.....14*
- *Using Alarm Forwarding.....14*
- *Alarm Forwarding Test Connection.....16*

This chapter provides information about procedures used when working in the Alarm Forwarding application.

## Accessing Alarm Forwarding

To open Alarm Forwarding, follow these steps:

1. Log in to IDIH .  
The IDIH Application board is displayed.
2. Click **Alarm Forwarding**.  
The Alarm Forwarding home page is displayed.

## Alarm Forwarding Toolbar

Figure 1: Alarm Forwarding Toolbar

Table 1: Alarm Forwarding Toolbar Icons

Button	Explanation
Select Columns	Allows the user to select which columns are displayed
Navigation Arrows	Moves back and forth among the records.
Filters	Number of records to display on a page
Set Size	Sets the number of records to display per page
Refresh	Resets display to include the most current data
Add Filter	Adds a Filter, defining the types of alarms to be forwarded and their destination
Modify Filter	Edits an existing filter's definition
Delete Filter	Deletes a selected filter
Test Connection	Sends a test message to the destination SNMP and/or SMTP

## Using Alarm Forwarding

This section explains how to set conditions and destinations for forwarding alarms.

## Creating a Filter

Filters define the types of alarms to be forwarded and their destination. Filters return True or False results depending upon whether the alarm should be forwarded or not. Each Filter that returns True is forwarded to its specified destination.

**Filter Creation Dialog**

**General**

Filter Name:  Description:

**Filter Configuration**

Field	Operator	Value

Operator: ☒ AND ☐ OR ☐ Use parenthesis

Expression:

**Figure 2:**

To create a Filter,

1. Click the **Add Filter** icon on the toolbar.  
The Create New Filter dialog is displayed.
2. Type in a **Filter Name** and **Description**.
3. Select Filter and click the **Add** icon.
4. Select a Field, Operator, and Value from the drop-down menus.
5. Enter an Expression.
6. Select **Next** to advance to the Destination display.
7. Select SNMP and/or SMTP.
8. Enter Email list (addresses) information.

**Note:** Email list is only used when SMTP is selected.

9. To advance to the Filter Creation Dialog Summary display, select **Next**.
10. If this information on the Summary display is correct, select finish create this filter. If there are errors in this summary information, select the previous to return to the display to correct the errors.

11. To add another filter, repeat from [Step 1](#).

## Editing a Filter

To edit an existing Filter:

1. Select a Filter from the Filter table.
2. Click the **Modify Filter** icon on the toolbar.  
The Filter Creation Dialog is displayed.
3. Modify the appropriate field(s) as needed.  
For specific information on fields and options, see [Creating a Filter](#).
4. Click **Next**.  
The Select Forwarding Destination dialog is displayed.
5. Update Destination information as necessary.  
**Note:** For SNMP, only one trap destination can be defined. For SMTP, multiple email destinations are permitted.
6. Click **Finish** to save the record changes.

## Alarm Forwarding Test Connection

The user can send a test message to the destination SNMP and/or SMTP using the **Connection Test Dialog** screen after clicking the **Test Connection** icon.

Figure 3: Connection Test Dialog

## Test Connection for SMTP

The configuring user should verify the SMTP address, SMTP availability thru firewalls, and SMTP access mode. Secured destinations require additional parameters be defined and are described in the Installation Document.

1. If the message was received in the targeted mail box, the test was successful. This procedure is complete.  
If the message is not in the targeted mail box, continue with this procedure.
2. Use the `Audit Viewer` application to verify if a mail sending error is logged.
3. Contact the [My Oracle Support \(MOS\)](#) to investigate and help determine the correct SMTP configuration.

## Test Connection for SNMP

The configuring user should verify the SNMP address and the SNMP availability thru firewalls. Secured destinations require additional parameters be defined and are described in the *IDIH Installation Document*.

1. Verify the test trap was received by the management system. If the test trap was received by the management system, the test was successful. This procedure is complete.  
If the test trap was not received by the management system, continue with this procedure.
2. Contact the [My Oracle Support \(MOS\)](#) to investigate and help determine the correct SNMP configuration.

# Chapter 4

## SNMP Agent

---

### Topics:

- [SNMP Overview.....19](#)
- [Alarm Forwarding MIB.....19](#)

This chapter provides information about how the SNMP Agent functions in the Alarm Forwarding application.

## SNMP Overview

The main features of the Simple Network Management Protocol (SNMP) agent of Alarm Forwarding are:

### Overview

- The Management Information Base (MIB) contains Managed Object types, Managed Objects, and opened alarms in specific tables.
- The MIB is loaded at SNMP agent startup with metadata and opened alarms already forwarded.

### Validation of Traps Sent

- Traps contain a sequence number (since agent startup) that permits Telecommunications Management Network (TMN) to check that none were lost.
- In case of a gap (lost trap) or if the number is lower, the process is restarted and TNM can re-synchronize its database by querying the opened alarms table.

### Acknowledgment or Termination from SNMP

A dedicated Access Module for HP TeMIP is available to integrate easily with the NSP Forwarding SNMP agent.

**Note:** SNMP trap forwarding requires the system administrator to configure the destination address, please refer to section "Configure SNMP Management Server" in the IDIH Installation Document.

## Alarm Forwarding MIB

Shown here is the Alarm Forwarding MIB , which is located on the NSP server at

```
/usr/TKLC/xIH/apps/forwarding/target/misc/NSP-FORWARDING-MIB
