JD Edwards World
Equipment/Plant Maintenance Guide
Release A9.4
E58766-01

April 2015
Describes equipment maintenance tasks, including entering and searching for equipment information, tracking equipment movement and status, assigning equipment to multiple locations and reporting.
## Preface

**Audience**

**Documentation Accessibility**

**Related Information**

**Conventions**

## 1 Overview to Equipment/Plant Maintenance

1.1 Equipment/Plant Maintenance Features ........................................ 1-1
1.1.1 Equipment Information and Search ........................................ 1-1
1.1.2 Equipment Location Tracking ............................................. 1-3
1.1.3 Detailed Equipment Cost Accounting .................................. 1-3
1.1.4 Reporting ............................................................................. 1-3
1.2 Equipment/Plant Maintenance Process Flow .......................... 1-4
1.3 Equipment/Plant Maintenance Tables ................................. 1-5
1.3.1 Primary Tables and Descriptions ...................................... 1-6
1.3.2 Secondary Tables and Descriptions .................................... 1-6
1.4 System Integration ................................................................ 1-8

## Part I Equipment Information

## 2 Overview to Equipment Identification

2.1 Objectives ............................................................................... 2-1
2.2 About Equipment Identification ........................................... 2-1
2.2.1 How Does the System Use Equipment Identification? .......... 2-2
2.2.2 Types of Equipment Identification Information ................ 2-2
2.2.3 Category Codes and Equipment Identification ................. 2-3
2.2.4 Equipment Identification Numbers ................................... 2-3
2.2.5 Parent and Component Relationships .............................. 2-3

## 3 Create an Equipment Master

3.1 Creating an Equipment Master .............................................. 3-1
3.1.1 What You Should Know About ........................................ 3-1
3.1.2 What You Should Know About ........................................ 3-7
3.1.3 Processing Options .......................................................... 3-7
4 Enter Additional Detailed Information

4.1 Entering Additional Detailed Information ................................................................. 4-1
4.2 Working with Supplemental Information ..................................................................... 4-1
4.2.1 Before You Begin ...................................................................................................... 4-2
4.2.2 Entering Supplemental Information ........................................................................ 4-2
4.2.3 What You Should Know About .............................................................................. 4-4
4.2.4 Reviewing Supplemental Information by Data Type .............................................. 4-4
4.2.5 To review supplemental information by data type ................................................ 4-4
4.2.6 Reviewing Supplemental Information by Equipment .......................................... 4-5
4.2.7 To review supplemental information by equipment ............................................... 4-5
4.3 Entering Specification Information ............................................................................ 4-6
4.3.1 Before You Begin ...................................................................................................... 4-7

4.4 Entering Permit and License Information ................................................................... 4-8
4.4.1 To enter permit and license information .................................................................. 4-8
4.4.2 Processing Options ................................................................................................. 4-9

5 Search for Equipment Information

5.1 Searching for Equipment Information ........................................................................ 5-1
5.1.1 Before You Begin ..................................................................................................... 5-2
5.1.2 What You Should Know About ................................................................................ 5-2
5.1.3 Searching for Equipment by Field ........................................................................... 5-3
5.1.4 What You Should Know About ................................................................................ 5-4
5.1.5 Searching for Equipment by Query ......................................................................... 5-4
5.1.6 What You Should Know About ................................................................................ 5-5
5.1.7 Processing Options ................................................................................................. 5-5

6 Work with Message Logs

6.1 Working with Message Logs ....................................................................................... 6-1
6.2 Entering an Equipment Message ................................................................................ 6-1
6.2.1 What You Should Know About ................................................................................ 6-2
6.2.2 Processing Options .................................................................................................. 6-2
6.3 Reviewing Equipment Messages .................................................................................. 6-3

7 Review Parent and Component Information

7.1 Reviewing Parent and Component Information .......................................................... 7-1
7.2 Reviewing Parent and Component History .................................................................. 7-1
7.2.1 Processing Options .................................................................................................. 7-2
7.2.2 Reviewing Current Equipment Components ......................................................... 7-2
7.2.3 What You Should Know About ................................................................................ 7-3
7.2.4 Processing Options .................................................................................................. 7-4

8 Equipment Information Tracking

8.1 Objectives .................................................................................................................... 8-1
8.2 About Equipment Information Tracking ..................................................................... 8-1
Part II  Preventive Maintenance Cycle

14  Overview to Preventive Maintenance Cycle

14.1  Objectives  14-1
14.2  About the Preventive Maintenance Cycle  14-1
14.2.1  Before You Begin  14-1
14.3  Terms and Concepts  14-2
14.3.1  Creating PM Schedules for Each Piece of Equipment  14-2
14.3.2  Scheduling PMs  14-3
14.3.3  Completing PMs  14-3
14.3.4  Preventive Maintenance Cycle  14-3
14.3.5  Preventive Maintenance Process Flow  14-4

15  Create a PM Schedule

15.1  Creating a PM Schedule  15-1
15.2  Creating an Item PM Schedule  15-2
15.2.1  Before You Begin  15-2
15.2.2  What You Should Know About  15-6
15.3  Linking Service Types  15-8
15.4  Creating a Maintenance Loop  15-11
15.4.1  Before You Begin  15-12
15.4.2  What You Should Know About  15-13
15.5  Creating a Model PM Schedule  15-13
15.5.1  What You Should Know About  15-15
15.6  Creating a Model Work Order  15-15
15.6.1  What You Should Know About  15-16
15.6.2  Processing Options  15-16

16  Work with Meter Readings

16.1  Working with Meter Readings  16-1
16.2  Entering Meter Readings  16-1
16.2.1  Before You Begin  16-2
16.2.2  What You Should Know About  16-4
16.2.3  Processing Options  16-6
16.3  Working with Meter Estimates  16-6
16.3.1  Setting Up Meter Estimates  16-6
16.3.2  What You Should Know About  16-8
16.3.3  Processing Options  16-8
16.3.4  Updating Meter Readings Based on Estimates  16-8
16.3.5  What You Should Know About  16-8
16.3.6  Processing Options  16-8
16.4  Reviewing Meter Readings  16-8
16.4.1  What You Should Know About  16-9
17 Update PM Schedule Information

17.1 Updating PM Schedule Information ................................................................. 17-1
17.1.1 What You Should Know About ................................................................. 17-2
17.1.2 Processing Options ...................................................................................... 17-2

18 Change the Status of PMs to Complete

18.1 Changing the Status of PMs to Complete ......................................................... 18-1
18.1.1 What You Should Know About ................................................................. 18-4
18.1.2 Processing Options ...................................................................................... 18-5

Part III Work Order Life Cycle

19 Overview to Work Order Life Cycle

19.1 Objectives ...................................................................................................... 19-1
19.2 About the Work Order Life Cycle ................................................................. 19-1
19.2.1 Features of the Work Order Life Cycle .................................................. 19-2
19.3 Work Order Process Flow ............................................................................ 19-4

20 Create Corrective Work Orders

20.1 Creating Corrective Work Orders .................................................................. 20-1
20.1.1 Before You Begin ..................................................................................... 20-2
20.1.2 What You Should Know About ............................................................... 20-2
20.2 Entering Basic Work Order Information ..................................................... 20-3
20.2.1 What You Should Know About ............................................................... 20-5
20.2.2 Processing Options .................................................................................. 20-5
20.3 Assigning Estimated Costs to a Work Order ............................................... 20-5
20.3.1 What You Should Know About ............................................................... 20-7
20.4 Assigning Category Codes to a Work Order ............................................... 20-7
20.4.1 What You Should Know About ............................................................... 20-7
20.4.2 What You Should Know About ............................................................... 20-9
20.5 Adding Text to a Work Order ....................................................................... 20-9
20.5.1 What You Should Know About ............................................................... 20-12
20.6 Working with Work Order Supplemental Information ................................ 20-12
20.6.1 Entering Supplemental Information to a Work Order ......................... 20-12
20.6.2 Reviewing Supplemental Data by Type ................................................. 20-15
20.6.3 Reviewing Supplemental Data by Work Order ...................................... 20-16
20.7 Assigning Parts to a Work Order ................................................................. 20-17
20.7.1 Before You Begin .................................................................................... 20-17
20.7.2 Assigning Parts from a Standard Parts List .......................................... 20-18
20.7.3 Before You Begin .................................................................................... 20-18
20.7.4 What You Should Know About ............................................................... 20-21
20.7.5 Working with Selected Parts from Inventory ....................................... 20-21
20.7.6 Before You Begin .................................................................................... 20-21
20.7.7 What You Should Know About ............................................................... 20-24
20.7.8 What You Should Know About ............................................................... 20-24
20.7.9 What You Should Know About .................................................................................... 20-25
20.7.10 Assigning Parts without an Inventory Master ........................................................ 20-26
20.8 Assigning Labor Routing to a Work Order........................................................................ 20-27
20.8.1 Before You Begin........................................................................................................... 20-27
20.8.2 What You Should Know About .................................................................................... 20-30
20.9 Copying a Work Order ..................................................................................................... 20-33
20.10 Creating a Work Order for Unscheduled Maintenance ........................................... 20-35
20.10.1 Before You Begin........................................................................................................... 20-35
20.10.2 What You Should Know About .................................................................................... 20-36

21 Set Up a Project
21.1 Setting Up a Project ........................................................................................................... 21-1
21.1.1 What You Should Know About .................................................................................... 21-3
21.1.2 Processing Options ....................................................................................................... 21-4

22 Review and Approve Work Orders
22.1 Reviewing and Approving Work Orders ........................................................................ 22-1
22.2 Approving a Work Order ................................................................................................... 22-2
22.2.1 Before You Begin.............................................................................................................. 22-2
22.2.2 What You Should Know About ..................................................................................... 22-3
22.2.3 Processing Options ......................................................................................................... 22-3
22.3 Reviewing the Approval History of a Work Order ............................................................ 22-3
22.3.1 What You Should Know About ..................................................................................... 22-5

23 Work with Work Orders
23.1 Working with Work Orders ............................................................................................... 23-1
23.2 Locating Work Orders ...................................................................................................... 23-1
23.2.1 Locating Work Orders Using Backlog Management ................................................... 23-4
23.2.2 What You Should Know About ..................................................................................... 23-6
23.2.3 Processing Options ......................................................................................................... 23-6
23.2.4 Locating Work Orders Using Equipment Backlog ....................................................... 23-6
23.2.5 Processing Options ......................................................................................................... 23-8
23.3 Revising Work Orders ...................................................................................................... 23-8
23.3.1 Updating the Life Cycle Information of a Work Order .................................................. 23-8
23.3.2 What You Should Know About ..................................................................................... 23-10
23.3.3 Revising the Detail Information of a Work Order .......................................................... 23-10
23.3.4 What You Should Know About ..................................................................................... 23-11
23.4 Printing Work Orders ....................................................................................................... 23-12
23.4.1 Printing Work Orders Using Backlog Management ..................................................... 23-12
23.4.2 Before You Begin............................................................................................................. 23-12
23.4.3 What You Should Know About ..................................................................................... 23-13
23.4.4 Printing a Batch of Work Orders .................................................................................... 23-13
23.4.5 Processing Options ......................................................................................................... 23-13

24 Swap a Component
24.1 Swapping a Component ................................................................................................. 24-1
Part IV  Maintenance Planning

28  Overview to Maintenance Planning

28.1  Objectives ................................................................. 28-1
28.2  About Maintenance Planning .................................... 28-1
28.2.1  PM Projections ....................................................... 28-2
28.2.2  Parts Plans .............................................................. 28-3
28.2.3  Labor Plans .............................................................. 28-3

29  Work with PM Projections

29.1  Working with PM Projections ...................................... 29-1
29.2  Running the PM Projection Batch Update ................. 29-1
29.2.1  Before You Begin .................................................... 29-2
29.2.2  Processing Options ............................................... 29-2
29.3  Reviewing PM Projections ........................................... 29-2
29.3.1  What You Should Know About ............................... 29-4

30  Generate a Parts Plan

30.1  Generating a Parts Plan ................................................ 30-1
30.1.1  Before You Begin ..................................................... 30-2
30.1.2  What You Should Know About ............................... 30-2

31  Review the Parts Plan

31.1  Reviewing the Parts Plan ............................................ 31-1
31.1.1  Before You Begin ..................................................... 31-1
31.2  Reviewing Parts by Planning Family ......................... 31-1
31.2.1  Processing Options ............................................... 31-4
31.3  Working with Parts Detail Messages ......................... 31-4
31.3.1  What You Should Know About ............................... 31-7
31.3.2  Processing Options ............................................... 31-9
31.4  Reviewing Parts Availability by Time ....................... 31-9
31.4.1  What You Should Know About ............................... 31-10
31.4.2  Processing Options ............................................... 31-11
31.5  Reviewing Part Supply and Demand ......................... 31-11
31.5.1  What You Should Know About ............................... 31-12
31.5.2  Processing Options ............................................... 31-13
31.6  Reviewing Component Part Information .................... 31-13
31.6.1  Reviewing Parent Information for Component Parts ... 31-14
31.6.2  Reviewing Where Used Information by Equipment or Work Order ... 31-15
31.6.3  Processing Options ............................................... 31-16
31.7  Reviewing and Revising Part Cross-References .......... 31-16
32 Generate a Labor Plan
32.1 Generating a Labor Plan ........................................................................................................ 32-1
32.1.1 Before You Begin............................................................................................................ 32-1
32.1.2 What You Should Know About.................................................................................... 32-2

33 Work with the Labor Plan
33.1 Working with the Labor Plan................................................................................................ 33-1
33.1.1 Before You Begin............................................................................................................ 33-1
33.2 Reviewing Labor Messages ................................................................................................ 33-2
33.2.1 What You Should Know About.................................................................................... 33-6
33.3 Reviewing Capacity Load.................................................................................................... 33-6
33.3.1 Reviewing Capacity Load by Work Center ................................................................. 33-7
33.3.2 Processing Options......................................................................................................... 33-8
33.3.3 Reviewing a Bar Graph of Capacity Load................................................................. 33-8
33.3.4 What You Should Know About................................................................................... 33-9
33.3.5 Processing Options......................................................................................................... 33-9
33.3.6 Reviewing Capacity Load by Period Summary ......................................................... 33-9
33.3.7 Processing Options......................................................................................................... 33-11
33.4 Revising Labor Resources.................................................................................................... 33-11
33.4.1 Revising Work Order Dates ......................................................................................... 33-12
33.4.2 Processing Options......................................................................................................... 33-13
33.4.3 Revising Resource Units for a Work Center ............................................................... 33-13
33.4.4 What You Should Know About.................................................................................... 33-15
33.4.5 Processing Options......................................................................................................... 33-15

Part V Setup

34 Overview to System Setup
34.1 Objectives .............................................................................................................................. 34-1
34.2 About System Setup ............................................................................................................. 34-1

35 Set Up Equipment
35.1 Setting Up Equipment.......................................................................................................... 35-1
35.2 Setting Up Equipment Data.................................................................................................. 35-1
35.2.1 Setting Up Equipment Constants .................................................................................. 35-1
35.2.2 What You Should Know About....................................................................................... 35-7
35.2.3 Setting Up Equipment/Plant AAIs................................................................................ 35-8
35.2.4 What You Should Know About....................................................................................... 35-12
35.2.5 Processing Options........................................................................................................... 35-12
35.2.6 Setting Up Equipment Next Numbers .......................................................................... 35-12
35.2.7 What You Should Know About....................................................................................... 35-14
35.2.8 Setting Up Depreciation Account Rules ........................................................................ 35-14
35.2.9 What You Should Know About....................................................................................... 35-16
35.2.10 Setting Up Ledger Depreciation Rules ......................................................................... 35-17
35.2.11 What You Should Know About..................................................................................... 35-22

B  Import Mass Data into Equipment Plant Maintenance

Index
Welcome to the JD Edwards World Equipment/Plant Maintenance Guide.

Audience
This document is intended for implementers and end users of JD Edwards World Equipment/Plant Maintenance system.

Documentation Accessibility
For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc.

Access to Oracle Support
Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info or visit http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs if you are hearing impaired.

Related Information
For additional information about JD Edwards World applications, features, content, and training, visit the JD Edwards World pages on the JD Edwards Resource Library located at: http://learnjde.com

You can use the maintenance features of the Equipment/Plant Management system to manage all aspects of equipment and machinery maintenance in your organization, such as:

- Planning
- Scheduling resources
- Purchasing parts and materials
- Tracking the status of preventive and corrective tasks

This chapter contains these topics:

- Section 1.1, "Equipment/Plant Maintenance Features"
- Section 1.2, "Equipment/Plant Maintenance Process Flow"
- Section 1.3, "Equipment/Plant Maintenance Tables"
- Section 1.4, "System Integration"

1.1 Equipment/Plant Maintenance Features

The maintenance features of the JD Edwards World Equipment/Plant Management system are designed to meet equipment maintenance needs in a variety of ways. For example, you can use the system to:

- Enter and search for equipment information.
- Track equipment movement and status, and assign equipment to multiple locations.
- Track the maintenance history of each piece of equipment and target potential problem machines to minimize equipment downtime.
- Coordinate maintenance activities based on preventive and corrective maintenance schedules.
- Coordinate maintenance activities with materials and labor resources.
- Maintain detailed cost accounting records for equipment.
- Produce reports on a wide range of equipment-related topics.

1.1.1 Equipment Information and Search

You can use Equipment/Plant Maintenance to locate, organize, and track the availability and repair status of equipment using the following types of information:
<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
</table>
| Parent and component relationships | A parent is an item or piece of equipment that consists of other parts or components. It can also be a child or component of another piece of equipment.  

A parent does not have to represent an actual piece of equipment. You can set up virtual or logical pieces of equipment and establish child relationships with the logical equipment. For example, a manufacturing line could be a parent and the associated manufacturing machinery would be children or components of the manufacturing line.  

Use parent and component relationships to group individual components in the system. You can track the history of a piece of equipment’s immediate parent or any of its components. The system accommodates up to 25 levels of components. This is useful if you use complex or interchangeable equipment assemblies.                                                                                                                |
| Equipment numbers   | You can identify equipment by any or all of the following:  

- Unit number  
- Item number  
- Serial number  

You can define unlimited types of supplemental data, which you can then assign to any piece of equipment. For example, you might want to track oil consumption, oil analysis, and so on. |
| Supplemental data   | You can define unlimited types of supplemental data, which you can then assign to any piece of equipment. For example, you might want to track oil consumption, oil analysis, and so on.  

You can define up to 23 category codes to classify equipment for reporting and data selection purposes. For example, you can perform online searches for equipment based on category codes that represent major accounting class, major equipment class, manufacturer, model year, and so on. |
| Location            | You can search for and track equipment based on its historical, current, or planned location. This is helpful if you need to review equipment that is used at a particular job site or reroute equipment between job sites. |
| Category codes      | You can define up to 23 category codes to classify equipment for reporting and data selection purposes. For example, you can perform online searches for equipment based on category codes that represent major accounting class, major equipment class, manufacturer, model year, and so on. |
| Other user defined codes | You can assign three additional user defined codes:  

- Finance methods  
- Equipment status codes  
- Equipment message types  

For example, you can set up equipment status codes to apply to each piece of equipment, such as:  

- Down  
- Standby  
- Working  
- Available  

You can record and track license and permit information for each piece of equipment. This is helpful if you dispatch equipment to job sites located in different licensing authorities. |
1.1.2 Equipment Location Tracking

You can locate and report on the availability and working status of equipment. You can also:

- Revise location tracking information.
- Transfer one or more pieces of equipment.
- Consolidate equipment from multiple locations.

1.1.3 Detailed Equipment Cost Accounting

Equipment/Plant Maintenance provides you with the following cost accounting features:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Custom chart of accounts</td>
<td>You define the chart of accounts for your equipment cost and revenue to meet your unique needs, such as matching a parent company’s accounting structure. At any time, you can view these accounts at a summarized or detailed level.</td>
</tr>
<tr>
<td>Unit cost analysis</td>
<td>You can analyze costs according to the operating hours or miles logged for equipment in payroll, and equipment time entry records or meter reading entries.</td>

1.1.4 Reporting

Equipment/Plant Maintenance provides you with several powerful reporting tools, which offer you a comprehensive view of your equipment needs and processes. These reporting tools include:
The following graphic illustrates the flow of the primary events and processes within Equipment/Plant Maintenance:

<table>
<thead>
<tr>
<th>Tool</th>
<th>Description</th>
</tr>
</thead>
</table>
| Standard reports | You can tailor predefined DREAM Writer reports to fit your company’s needs and simplify the fulfillment of various IRS reporting requirements. Equipment/Plant Maintenance includes reports, such as:  
  ■ Maintenance Log  
  ■ Maintenance Schedule  
  ■ Location Tracking  
  ■ Work Order Status  
  ■ Work Order Cost Summary  
  ■ Work Order Cost Detail  
  ■ Equipment Cost Analysis |
| STAR        | You can design your own equipment reports with STAR. STAR guides you through the setup of custom reports that specifically access the system’s equipment and fixed asset files.                                    |
| World Writer | For reporting needs not addressed by standard reports or STAR, you can use JD Edwards World Writer to design and build custom reports, providing unlimited user defined access to your database.                  |

Create Equipment Master

Create Preventive Maintenance Schedule

Generate Preventive Maintenance Work Order

Add Corrective Maintenance Work Order

Work with Parts Inventory → Perform Maintenance Planning → Work with Labor Resources

Perform Maintenance → Close Work Order → Review Work Order History

1.3 Equipment/Plant Maintenance Tables

The following information describes the primary and secondary tables within the Equipment/Plant Maintenance system.
### 1.3.1 Primary Tables and Descriptions

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Master (F1201)</td>
<td>Stores basic information about each piece of equipment, such as:</td>
</tr>
<tr>
<td></td>
<td>■ Equipment number</td>
</tr>
<tr>
<td></td>
<td>■ Description</td>
</tr>
<tr>
<td></td>
<td>■ Account coding</td>
</tr>
<tr>
<td></td>
<td>■ Category codes</td>
</tr>
<tr>
<td>Item Balances (F1202)</td>
<td>Stores the account balance amount or unit for each equipment account.</td>
</tr>
<tr>
<td>Location Tracking (F1204)</td>
<td>Stores location information for an equipment item, including:</td>
</tr>
<tr>
<td></td>
<td>■ Equipment number</td>
</tr>
<tr>
<td></td>
<td>■ Location</td>
</tr>
<tr>
<td></td>
<td>■ Start effective date</td>
</tr>
<tr>
<td></td>
<td>■ Ending date</td>
</tr>
<tr>
<td></td>
<td>■ Equipment status</td>
</tr>
<tr>
<td></td>
<td>■ Transfer number</td>
</tr>
<tr>
<td></td>
<td>■ Location code, which indicates the type of location, such as planned, current, or history</td>
</tr>
<tr>
<td>Maintenance Schedule (F1207)</td>
<td>Stores information about each occurrence for a type of service, such as:</td>
</tr>
<tr>
<td></td>
<td>■ When the service is to be performed</td>
</tr>
<tr>
<td></td>
<td>■ When the service was last completed</td>
</tr>
<tr>
<td></td>
<td>■ Current status</td>
</tr>
<tr>
<td></td>
<td>■ References to any associated work order</td>
</tr>
<tr>
<td>Work Order Master (F4801)</td>
<td>Stores static information about each work order, such as:</td>
</tr>
<tr>
<td></td>
<td>■ Description of work</td>
</tr>
<tr>
<td></td>
<td>■ Budgeted amount and hours</td>
</tr>
<tr>
<td></td>
<td>■ Equipment worked on</td>
</tr>
<tr>
<td></td>
<td>■ Charging information</td>
</tr>
<tr>
<td>Account Ledger (F0911)</td>
<td>Stores General Ledger journal entry audit trails for both the Item Balances table (F1202) and the Account Balances table (F0902).</td>
</tr>
</tbody>
</table>

### 1.3.2 Secondary Tables and Descriptions

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplemental Data (F12090, F12092, and F12093)</td>
<td>Stores additional information about equipment in either columnar or narrative format.</td>
</tr>
<tr>
<td>Supplemental Data Cross Reference (F1392)</td>
<td>Stores valid supplemental data types for classes of equipment that are defined by category codes.</td>
</tr>
<tr>
<td>Specification Data Table (F1216)</td>
<td>Stores static equipment information, such as power requirements, size, capacity, and other nameplate information.</td>
</tr>
<tr>
<td>Item Messages Log (F1205)</td>
<td>Stores messages regarding equipment maintenance.</td>
</tr>
<tr>
<td>Table</td>
<td>Description</td>
</tr>
<tr>
<td>---------------------------------------------------</td>
<td>-----------------------------------------------------------------------------</td>
</tr>
<tr>
<td>License Master (F1206)</td>
<td>Stores license and permit information for equipment.</td>
</tr>
<tr>
<td>Model Maintenance Schedule (F12071)</td>
<td>Stores model maintenance schedules.</td>
</tr>
<tr>
<td>Location History Text (F1210)</td>
<td>Contains text for location history records.</td>
</tr>
<tr>
<td>Parent History (F1212)</td>
<td>Contains the history of parents for a component.</td>
</tr>
<tr>
<td>Specification Cross Reference Table (F1215)</td>
<td>Stores the valid values for each field in the Specification Data Table by class of equipment.</td>
</tr>
<tr>
<td>Meter Reading Estimates (F1306)</td>
<td>Maintains estimated meter readings.</td>
</tr>
<tr>
<td>Status History (F1307)</td>
<td>Maintains a history of status changes to equipment and work orders.</td>
</tr>
<tr>
<td>Maintenance Loops (F1308)</td>
<td>Stores equipment maintenance information by associated equipment and service type.</td>
</tr>
<tr>
<td>Equipment Category Code Mapping (F1391)</td>
<td>Maintains the rules by which the system automatically assigns equipment and business unit category codes when you create master records for new equipment or create work orders for equipment.</td>
</tr>
<tr>
<td>Maintenance Rules (F1393)</td>
<td>Defines when preventive maintenance will be scheduled and provides default values to work orders.</td>
</tr>
<tr>
<td>PM Projections (F13411)</td>
<td>Maintains information about projected PMs by service type for each piece of equipment.</td>
</tr>
<tr>
<td>Work Order Record Types (F48002)</td>
<td>Stores text associated with work orders.</td>
</tr>
<tr>
<td>Work Order Parts (F3111)</td>
<td>Maintains information about parts related to specific work orders.</td>
</tr>
<tr>
<td>Work Order Routing (F3112)</td>
<td>Maintains information about the labor steps related to specific work orders.</td>
</tr>
<tr>
<td>Work Order Instructions (F4802)</td>
<td>Stores description text and the various record types that are defined in the user defined codes, such as Description of Request and Final Disposition.</td>
</tr>
<tr>
<td>Work Order Status Action (F4826)</td>
<td>Maintains information about the order of allowed statuses through which a work order must pass.</td>
</tr>
<tr>
<td>Work Order Approval Routing (F4827)</td>
<td>Maintains information about work order approvers.</td>
</tr>
<tr>
<td>Work Order Approval (F4828)</td>
<td>Stores audit information for work order approvals.</td>
</tr>
<tr>
<td>Bill of Material Master (F3002)</td>
<td>Stores information about the parts needed to perform a specific type of maintenance.</td>
</tr>
<tr>
<td>Routing Master (F3003)</td>
<td>Stores detailed instructions by labor step for a specific type of maintenance.</td>
</tr>
<tr>
<td>Forecast (F3460)</td>
<td>Stores the forecast data that the Material Requirements Planning (MRP) program uses for calculations.</td>
</tr>
<tr>
<td>Default Accounting Constants (F12002)</td>
<td>Maintains default account information by company and asset cost account.</td>
</tr>
<tr>
<td>Default Depreciation Constants (F12003)</td>
<td>Maintains default information by company and asset cost account of all depreciation books and values.</td>
</tr>
<tr>
<td>User Defined Codes (F0005)</td>
<td>Contains all user defined system values.</td>
</tr>
<tr>
<td>Address Book Master (F0101)</td>
<td>Contains tax assessor and equipment user address information.</td>
</tr>
</tbody>
</table>
1.4 System Integration

From Equipment/Plant Management, you can link to other JD Edwards World systems that your organization uses. For example, use the General Accounting system to record maintenance charges against work orders. Use the Work Order Processing system to track and monitor schedules by work order. Other systems that you can link to include:

- Job Cost
- Inventory Management
- Procurement
- Shop Floor Control
- Accounts Payable

Because JD Edwards World systems are integrated, you need to enter the vital information about a piece of equipment only one time. When you create equipment masters and supplemental information for a piece of equipment, the system stores the information in the Equipment Master table (F1201). Each JD Edwards World system that you use can then access the information.

System integration also helps ensure that equipment information is consistent throughout your organization. This saves considerable time and money, especially when you need to update or revise equipment information.

This guide describes features and functions that depend on the installation of the complete Equipment/Plant Management system. This system includes the following systems:

- 05 - Time Accounting (Stand alone Payroll module)
- 30 - Product Data Management
- 31 - Shop Floor Control
- 33 - Resource and Capacity Planning
- 34 - Material Planning
- 40 - Inventory Base and Order Processing
- 41 - Inventory Management
- 43 - Procurement

Your company might not have purchased all of these systems. Check with your system administrator to verify which systems have been purchased and installed.

The following diagram illustrates the system integration among the Equipment/Plant Management system and other JD Edwards World systems. The accompanying table briefly describes how you use each system within the context of Equipment/Plant Management.
The following table briefly describes how other JD Edwards World systems are used within the context of Equipment/Plant Management:

<table>
<thead>
<tr>
<th>System</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Book</td>
<td>Every JD Edwards World system works with the Address Book system to retrieve up-to-date employee, supplier, and other applicable name and address information.</td>
</tr>
<tr>
<td>General Accounting</td>
<td>When you enter equipment transactions (including billing transactions), you must process them through the general ledger. You enter all statistical values, such as miles, gallons, and so on, into the general ledger. When you charge a job for equipment use, the system searches the Account Master for the appropriate rate and account to bill.</td>
</tr>
<tr>
<td>Accounts Payable</td>
<td>You can enter equipment charges through the Accounts Payable system. When you process equipment parts orders through the Procurement system, the system automatically enters the equipment number from the purchase order to the accounts payable voucher.</td>
</tr>
</tbody>
</table>
You use World Writer to create user defined reports, such as additional location tracking and parent and component history reports.

When you charge a job for equipment use, the system searches the Job Cost Master for billing rate default values. When you track equipment location, the job defined in the Job Cost system is often the tracking location.

You can use Payroll and Time Accounting to:
- Enter equipment time for billing purposes.
- Charge for labor associated with operating or repairing equipment.
- Charge labor to a work order and a specific labor routing step.

The Fixed Assets system shares many tables with Equipment/Plant Maintenance, such as the:
- Item Master table (F1201) - Stores equipment master information
- Item Balances table (F1202) - Stores equipment account balance information

Equipment/Plant Maintenance also uses automatic accounting instructions from the Fixed Assets system.

You can access JD Edwards World Spreadsheet Tool for Asset Reporting (STAR) through the Fixed Assets system. Use this report writer to create custom reports of equipment balances and units.

Use the Work Orders system to track, schedule, and report on preventive and corrective equipment maintenance activities. You can attach parts lists and detailed instructions (routings) to the work order to assist in planning labor and parts requirements.

Use the Inventory Management system to:
- Track and take inventory of repair parts
- Attach parts lists to work orders

You can create purchase orders directly from the work order parts list and from other maintenance planning functions within Equipment/Plant Maintenance. A purchase order includes the equipment number, which the system automatically enters in related forms and tables, such as:
- Accounts payable entry
- General ledger
- Equipment ledger
You can use several programs within JD Edwards World manufacturing systems to plan maintenance parts and labor needs. Use these programs to:

- Set up the Master Planning Schedule to indicate that machines scheduled for maintenance are not available for use during that time.
- Project labor and parts needed for maintenance.
- Generate messages to indicate that parts need to be purchased and resources allocated to perform the needed maintenance.

Overview to Equipment Identification

This chapter contains the following topics:

- Section 2.1, "Objectives"
- Section 2.2, "About Equipment Identification"

2.1 Objectives

- To create equipment master information
- To create supplemental equipment information
- To locate equipment information
- To access other programs from an equipment identification program
- To review parent and component relationships and history online

2.2 About Equipment Identification

You must identify every piece of your equipment in the system before you can use Equipment/Plant Maintenance. After you create the necessary equipment identification information, you can:

- Account for equipment in quantities
- Search for equipment status, location, and activity online
- Track historical, current, and planned physical locations for a piece of equipment
- Keep detailed maintenance and project logs
- View assembly components individually or in groups

Identifying equipment consists of the following tasks:

- Creating an equipment master
- Entering additional detailed information
- Searching for equipment information
- Working with message logs
- Reviewing parent and component information
2.2.1 How Does the System Use Equipment Identification?

Equipment identification is the foundation of several JD Edwards World systems, in addition to Equipment/Plant Maintenance. When you identify equipment, consider the following issues:

- Type of information required
- Category codes and equipment identification
- Equipment identification numbers
- Parent and component relationships

2.2.2 Types of Equipment Identification Information

Equipment identification consists of four types of information:

- Equipment master
- Supplemental data
- Specification data
- Message logs

You must create an equipment master for every piece of equipment to use the system’s management features, such as scheduling equipment for preventive maintenance and tracking maintenance costs. You can also include supplemental data and message logs to further define equipment in the system.

Equipment Master

The equipment master is a repository of the standard information related to a specific piece of equipment. You must create an equipment master for every piece of equipment to manage equipment inventory, costs, warranties, billing, preventive maintenance, and so on.

In Equipment/Plant Maintenance, you use the equipment master to:

- Set up equipment for maintenance processing
- Set up parent/component relationships and track components as both equipment and inventory
- Link parts inventory to specific equipment

For example, you can set up preventive maintenance (PM) schedules for a large ventilation fan. You can identify a motor from inventory as one of the components of a fan. You can set up PMs for the motor as well, and attach parts lists to both the motor and the fan.

Supplemental Data

You can use supplemental data to record information that is important to your organization but is not included on the equipment master. Supplemental data is entirely user defined. You can use columnar and text formats to enter supplemental data. You can also establish security for supplemental data by user identification.

Specification Data

You can use specification data to record and track static information not included on the equipment master. For example, you might record nameplate data.
Message Logs
In addition to supplemental data, you can indicate the status and condition of a piece of equipment using the free-form remark capability of message logs. You can associate message logs with equipment to record operator notes or maintenance problems for equipment. You can also attach tickler dates to maintenance due messages so that they will appear at specified dates or intervals based on units, such as miles or hours. Depending on the type of information that you want to maintain, you can use equipment messages to meet any of your information needs. Use equipment messages to:

- Note special procedures for scheduled or preventive maintenance tasks
- Report on actual maintenance
- Log problems or complaints about a specific piece of equipment

2.2.3 Category Codes and Equipment Identification
Set up category codes to further classify equipment for tracking, reporting, and data selection throughout the system. You can define up to 23 category codes to meet your organization’s information needs. Use these category codes in the equipment master to describe equipment and group similar types of equipment.

If you use Equipment/Plant Maintenance with the JD Edwards World Fixed Assets system, the two systems access the same category code tables. The system displays the first 5 or first 10 category codes on the Equipment Search screen. Typically, Equipment/Plant Maintenance users access this screen more frequently than Fixed Asset users. In addition, Equipment/Plant Maintenance users frequently use the first 10 category codes as selection criteria for several tasks, such as selecting equipment for updating meter readings, selecting equipment for updating PM schedules, and so on. You should reserve as many of the first 10 category codes in the equipment master as you need for equipment maintenance purposes.

2.2.4 Equipment Identification Numbers
You can use up to three numbers to identify equipment throughout your system:

- Item number
- Unit number
- Serial number

Every equipment master in your system must include an item number. You can also enter unit and serial numbers. You must define which of these numbers is used as the primary number for identifying equipment in your system. Any identification number that you assign to a piece of equipment on the equipment master must be unique throughout your entire system.

2.2.5 Parent and Component Relationships
You can set up parent and component relationships to group individual pieces of equipment. For example, when you create master information, you can identify a building as a parent item. One of its components might be an air conditioner. The component of one item can also be the parent of another. For example, the air conditioner might be the parent of a number of components, including a motor, filters, and a compressor. Those components, in turn, might be the parents of still other components, and so on.
You can establish up to 25 hierarchical levels of parent and component relationships. The system assigns each component a number according to its level in the hierarchy. This is particularly useful to track and report on complex equipment assemblies.

The following graphic illustrates a typical relationship between parent and component equipment:

Figure 2–1  Relationship Between Parent and Component Equipment

Building
- Parent of Air Conditioner

Air Conditioner
- Component of Building
  - Parent of Filters, Compressor, and Fan

Filter
- Component of Air Conditioner

Compressor
- Component of Air Conditioner

Fan
- Component of Air Conditioner
  - Parent of Motor

Motor
- Component of Fan
This chapter contains this topic:

- Section 3.1, "Creating an Equipment Master"

3.1 Creating an Equipment Master

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Equipment Master

You must create an equipment master for every piece of equipment that you plan to manage throughout the system. When you create an equipment master, you establish basic information about the equipment, such as:

- Equipment number
- Description
- Account coding
- Category codes

Equipment master information is stored in the Item Master table (F1201). The system accesses this table every time you request any type of transaction for a piece of equipment.

3.1.1 What You Should Know About

<table>

<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment identification numbers</td>
<td>You can use up to three numbers to identify equipment throughout your system.</td>
</tr>
</tbody>
</table>
Creating an Equipment Master

To create an equipment master
On Equipment Master

**Figure 3–1  Master Information screen**

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing a unit or serial number</td>
<td>You can change the unit or serial number, but you must run the P12804 program to update the PM Schedule File F1207 and the Work Order File, F4801. You should run this program periodically to ensure that no changes have been made to the Equipment Master Unit, or that the serial numbers have not been updated to the PM and Work Order file.</td>
</tr>
<tr>
<td>Category codes</td>
<td>If you use Equipment/Plant Maintenance with the JD Edwards World Fixed Assets system, the two systems access the same category code tables. Depending on how you set up system, the system displays the first 5 or 10 of 23 category codes on the Equipment Search screen.</td>
</tr>
</tbody>
</table>

Typically, Equipment/Plant Maintenance users access the Equipment Search screen more frequently than Fixed Asset users. In addition, Equipment/Plant Maintenance users frequently use the first 10 category codes as selection criteria for several tasks, such as selecting equipment for updating meter readings, selecting equipment for updating PM schedules, and so on. You should reserve as many of the first 10 category codes in the equipment master as you need for equipment maintenance purposes.

1. Complete the following fields:
   - Description 01
   - Company
   - Responsible Business Unit
   - Asset Cost Business Unit/Object/Subsidiary
   - Date Acquired
2. Complete the following optional fields:
   - Unit Number
   - Serial Number
   - Parent Number
   - Equipment Status
   - Original Quantity
   - Location/Start Date

Depending on how you set processing options, you might be required to enter location and start date information. If you do not enter a location and start date when you create the equipment master and later need to establish this information, you must use Location Tracking.

3. Complete the following optional maintenance fields:
   - Inventory Item Number
   - Work Center

4. To add the record, place an 'A' in the action code field and key in the pertinent information.

5. Choose the Item Description Translation Window function.

6. On Item Description Translation, complete the following fields to add or revise the non-domestic descriptions for the piece of equipment:
   - Language
   - Description

7. To return to Equipment Master, choose Exit Program.

8. On Equipment Master, choose Category Codes.

Figure 3–2  Item Master - Category Codes screen
9. On Item Master - Category Codes, complete any of the category code fields to assign category codes to the piece of equipment.

Depending on how you set processing options, you might be required to enter category code information when you create a new equipment master. In addition, you might not be allowed to enter or change certain values on Item Master - Category Codes. Some fields might contain default values. In addition, Category Code 10 (Rate Group) is reserved for equipment billing.

10. To enter depreciation and tax information, complete the following optional fields:

- State
- Tax Entity
- Tax Rate/Area
- New or Used
- Investment Tax Credit

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Desc. 01       | A user defined name or remark.  
  *Form-specific information*  
The system displays the first line of the user defined description on all screens and reports. You can use any part of the description line when you locate an asset using the query search on the Search and Location screen. |
| Unit Number    | An alternate identification code that a company assigns to assets. This is commonly the number stenciled on the equipment. You can enter alphanumeric unit numbers up to 12-characters long. You are not required to use a unit number to identify equipment. Every equipment unit number must be unique. |
| Serial Number  | A 25-character alphanumeric number that you can use as an alternate asset identification number. You might use this number to track assets by the manufacturer’s serial number. You are not required to use a serial number to identify an asset. Every serial number you enter must be unique. |
| Parent Number  | A parent number groups related components together. Each item of property and piece of equipment can be associated with a parent item, if desired. For example, a mobile telephone can be associated with a specific automobile (the parent), a printer can be associated with a computer (the parent), or a flat bed can be associated with a specific truck chassis (the parent).  
  *Note:* If this is a data entry field, the default value is the item number. For example, if the item number is 123, the system assigns 123 to the parent number.  
  *Form-specific information*  
  If you leave this field blank, the system automatically assigns it the same number as the master item number. For example, if the master item number is 123, the system will assign it number 123.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Company                       | A code that identifies a specific organization, fund, entity, and so on. This code must already exist in the Company Constants table (F0010). It must identify a reporting entity that has a complete balance sheet. At this level, you can have intercompany transactions.  
  **Note:** You can use company 00000 for default values, such as dates and automatic accounting instructions (AAIs). You cannot use it for transaction entries.  
  **Form-specific information**  
  The system uses the company number from the parent master record as a default value for this field when you set up parent/component relationships. |
| Responsible BU                | An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant.  
  You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department.  
  Security for this field can prevent you from locating business units for which you have no authority.  
  **Note:** The system uses this value for Journal Entries if you do not enter a value in the AAI table.  
  **Form-specific information**  
  If you want the asset or accumulated depreciation business units to use the default value for the responsible business unit, the responsible business unit and company number must be in the same company. You set up the default business unit on the Fixed Assets Constants screen. |
| Asset Cost Account - Business Unit | The business unit to which the system charges original acquisition cost and any supplemental capital additions. The system uses a default value for this field based on the value you specify on the Master Information screen when you create a new asset master record. You can change this default value on Depreciation Information only if you have not entered any transactions for the account. |
| Inventory Item No             | A number that the system assigns to an item. It can be in short, long, or 3rd item number format.  
  **Form-specific information**  
  This is a number assigned in the Inventory Management system that identifies equipment repair parts, parts lists, and routings that relate to this asset or piece of equipment. For example, the number could identify a replacement part for which inventory is maintained. This number could also identify the parts list and routing used to maintain this piece of equipment. This number is informational only. The system verifies against the Inventory Master. |
Creating an Equipment Master

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Work Center       | A code that represents a high-level business unit. It can be used to reference a branch or plant that might have departments or jobs, which represent lower-level business units (data item MCU), subordinate to it. For example:  
  - Branch/Plant (MMCU)  
  - Dept A (MCU)  
  - Dept B (MCU)  
  - Job 123 (MCU)  
  Business unit security is based on the higher-level business unit.  
  **Form-specific information**  
  This is the manufacturing work center to which the system refers to calculate machine hours for a maintenance work order. When you create a work order for the equipment and attach routing instructions, the system includes this work center as a final routing instruction. The system totals the duration of the previous routing steps to determine machine hours for capacity planning. |
| Equipment Status  | A user defined code (12/ES) that identifies the equipment or disposal status of an asset, such as available, down, or disposed.  
  **Form-specific information**  
  The system updates the value in this field when you run the Asset Disposal program to dispose of the asset. |
| Original Qty      | The original number of units for an asset. If assets are purchased and accounted for in quantities (more than one), you can specify the original quantity purchased. For example, if you purchase 100 office chairs, you would set up one asset item with an original quantity of 100. Then, as you disposed of office chairs, you would adjust the current quantity to reflect the current balance. This allows you to track assets purchased in bulk quantity on one master record. |
| State             | A user defined code system 00, type S for the state or province. This is usually a postal service abbreviation. |
| Tax Entity        | The address number of the tax authority to which property taxes are paid.  
  **Field Explanation**  
  A code that identifies a tax or geographic area that has common tax rates and tax distribution. The tax rate/area must be defined to include the tax authorities (for example, state, county, city, rapid transit district, or province), and their rates. To be valid, a code must be set up in the Tax Rate/Area table (F4008).  
  Typically, U.S. sales and use taxes require multiple tax authorities per tax rate/area, whereas VAT requires only one simple rate.  
  The system uses this code to properly calculate the tax amount. |
### 3.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment status</td>
<td>You can change the status of a piece of equipment at any time. When you change equipment status, the system automatically records the current meter readings for the piece of equipment at the time of the status change and stores the information in the Status History table (F1307).</td>
</tr>
<tr>
<td>Revising inactive equipment masters</td>
<td>If you enter a 1 in the Subledger Inactive field and later need to revise the equipment master, you must first remove the value in the field. If the asset number is the same as the parent asset number, you must also remove the parent asset number before the system accepts changes to the record.</td>
</tr>
<tr>
<td>Updating property tax information</td>
<td>When you enter property tax information, the system stores the information in the Item Master table (F1201) for the piece of equipment. If you relocate equipment to areas with different taxing authorities, you can update the tax information directly from Item Master - Category Codes, or when you:</td>
</tr>
<tr>
<td></td>
<td>■ Enter location information using Transfer Processing</td>
</tr>
<tr>
<td></td>
<td>■ Revise location information using Location Revisions</td>
</tr>
<tr>
<td></td>
<td>When you enter property tax information using either Transfer Processing or Location Revisions, processing options enable you to interactively update the tax information in the Item Master table at the same time.</td>
</tr>
<tr>
<td></td>
<td>See Section 9.1, &quot;Tracking Equipment Location&quot;.</td>
</tr>
</tbody>
</table>

### 3.1.3 Processing Options

See Section 53.1, "Item Master Information (P1201)".
Enter Additional Detailed Information

This chapter contains these topics:

- Section 4.1, "Entering Additional Detailed Information"
- Section 4.2, "Working with Supplemental Information"
- Section 4.3, "Entering Specification Information"
- Section 4.4, "Entering Permit and License Information"

4.1 Entering Additional Detailed Information

You can enter information to further define your equipment in the system. The system stores this detailed equipment information in user defined databases. Use this detailed information to report and track information that is important to your organization, but is not included in the equipment master information.

4.2 Working with Supplemental Information

You can enter supplemental information for a piece of equipment that is not included in the equipment master. The information you enter can then be used to enhance your ability to track, review, and report on the equipment in your system. You can define and maintain any type of supplemental data you need. For example, you might set up supplemental data for motor graders. The data might include vibration readings, oil readings, condition reports, and so on.

Working with supplemental information consists of the following tasks:

- Entering supplemental information
- Reviewing supplemental information by data type
- Reviewing supplemental information by equipment

After you have entered supplemental data, you can review the information using the following formats:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>By data type</td>
<td>You can review a list of additional equipment information based on a particular supplemental data type. For example, assume that you have set up a supplemental data type for capacity. You can review a list of all equipment for which you have assigned the supplemental data type for capacity. You can use date selections to limit the amount of information that the system displays.</td>
</tr>
</tbody>
</table>
Working with Supplemental Information

4.2.1 Before You Begin

- Set up data types for supplemental information. See Section 35.3.1, "Defining Supplemental Data Types"

See Also:
- Section 35.3.9, "Setting Up Supplemental Data Security" for more information about supplemental data security

4.2.2 Entering Supplemental Information

Navigation
From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Supplemental Data

From Supplemental Data (G1318), choose Data Entry

Enter supplemental information to track, review, and report on additional information that is not contained in the equipment master.

When you enter supplemental data for a particular data type, the OP (Option) field for that data type is highlighted. You can set up supplemental data security to limit the number of users who are authorized to view data.

You can use any of the following formats to enter and display supplemental data:

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>By equipment</td>
<td>You can review a list of the additional information by supplemental data type that you assigned to individual pieces of equipment. For example, you can review information for all supplemental data types that you assigned to a particular motor grader. You can use date selections to limit the amount of information that the system displays.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Narrative (N)</td>
<td>Use this data type to access the Supplemental Text Entry screen. You can use this text format to enter unlimited information about equipment.</td>
</tr>
<tr>
<td>Columnar (C)</td>
<td>Use this data type to access the Supplemental Code Entry screen. When you set up supplemental data screens using this data type, you can define the columns into which you enter information. The system edits the values that you enter in the columns against the user defined code table you set up in Data Type Definition.</td>
</tr>
<tr>
<td>Columnar-Message (M)</td>
<td>Use this data type to access the Supplemental Code Entry screen. You can use this data type in the same way as the columnar type. The only difference is that the system edits the values you enter in the columns of this data type against the generic rates and messages table you set up in Data Type Definition.</td>
</tr>
</tbody>
</table>

To enter supplemental information
On Data Entry
1. To display a list of valid supplemental data types specific to a piece of equipment, complete the following field:
   - Item Number

2. Choose one or more types of information.
   - Capacity
   - Oil Readings
   - Transportation Notes
3. On User Defined Code Entry - Fixed Assets, complete the appropriate fields.

4. To enter text for a specific line of code, enter 1 (Text) in the Option field (C and M display formats only).

5. To review or change the standard message, for example, Standard Procedures, select Generic Message (M display mode only).

4.2.3 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entering additional text</td>
<td>You can use the Text option to enter additional information for equipment in text format, including supplemental data forms that you have defined as columnar.</td>
</tr>
<tr>
<td>Choosing Specification</td>
<td>If you choose Specification Sheets (SP) from Data Entry, the system displays the Specification Data Entry screen.</td>
</tr>
<tr>
<td>Sheets</td>
<td>See Section 4.1, &quot;Entering Additional Detailed Information&quot; for more information about using specification sheets.</td>
</tr>
</tbody>
</table>

4.2.4 Reviewing Supplemental Information by Data Type

Navigation
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Supplemental Data
From Supplemental Data (G1318), choose Inquiry by Data Type

You can review a list of additional equipment information based on a particular supplemental data type. For example, assume you have set up a supplemental data type for capacity. You can review a list of all equipment for which you have assigned the supplemental data type for capacity. You can use date selections to limit the amount of information that the system displays.

4.2.5 To review supplemental information by data type

On Inquiry by Data Type
1. Complete the following field:
   - Type Data

2. To limit the information that the system displays, complete the following optional fields:
   - Date From
   - Thru

4.2.6 Reviewing Supplemental Information by Equipment

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Supplemental Data

From Supplemental Data (G1318), choose Inquiry by Item

You can review a list of the additional information by supplemental data type that you assigned to individual pieces of equipment. For example, you can review information for all supplemental data types that you assigned to a particular motor grader. You can use date selections to limit the amount of information that the system displays.

4.2.7 To review supplemental information by equipment

On Inquiry by Item
1. Complete the following field:
   - Item Number

2. To limit the information that the system displays, complete the following optional fields:
   - Date From
   - Thru

### 4.3 Entering Specification Information

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Supplemental Data
From Supplemental Data (G1318), choose Specification Data Entry

You can use specification data to enter static information for each piece of equipment. For example, you might set up specification data to record and report on the information from the equipment’s nameplate and the manufacturer’s specification sheets.

<table>
<thead>
<tr>
<th>Data Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment nameplates</td>
<td>A nameplate is the metal plate or other label attached to a piece of equipment. The nameplate often includes information about the equipment, such as:</td>
</tr>
<tr>
<td></td>
<td>- Model number</td>
</tr>
<tr>
<td></td>
<td>- Power requirements</td>
</tr>
<tr>
<td></td>
<td>- Manufacture date</td>
</tr>
</tbody>
</table>
You can define the specification data that you want to keep, in which positions the data is entered, and the length of the data fields. You can also set up the specification database so that the system will edit the data against user defined code tables or a specific table.

4.3.1 Before You Begin

- Set up specification types for specification information. See Section 35.3, “Setting Up Supplemental Data”.

To enter specification information

On Specification Data Entry

Figure 4–5  Specification Data Entry screen

<table>
<thead>
<tr>
<th>Data Source</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specification sheets</td>
<td>Specification sheets come from the equipment manufacturer. Specification sheets include specific information about a piece of equipment, such as:</td>
</tr>
<tr>
<td></td>
<td>■ Operating and safety instructions</td>
</tr>
<tr>
<td></td>
<td>■ Power</td>
</tr>
<tr>
<td></td>
<td>■ Dimensions</td>
</tr>
</tbody>
</table>

1. Complete the following field:
   - Item Number

2. Complete all appropriate fields.
   - The fields that appear on this screen vary, depending on the data fields that you set up on Specification Cross Reference.

3. If more than 16 specification fields are defined for the equipment, complete the following field:
4.4 Entering Permit and License Information

Navigation
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Permit and License Tracking

Enter permit and license information to record permits, licenses, and certificates for equipment. You can also track renewal dates and multiple state licenses. For example, you can track certification information for equipment, such as bridge cranes, and license renewal information for equipment you transport to areas under different licensing authorities.

4.4.1 To enter permit and license information

On Permit & License Tracking

Figure 4–6 Permit and License Tracking screen

1. Complete the following fields:
   - Item Number
   - ST
   - License Number
   - Date
   - Agency Number
2. Complete the following optional field:
   - Fee
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Agency Number</td>
<td>Identifies the agency responsible for issuing this license. This is an address book number, which stores a telephone number and address information.</td>
</tr>
</tbody>
</table>

### 4.4.2 Processing Options

See Section 53.6, "Permit and License Tracking (P1206)".
5.1 Searching for Equipment Information

You can use Equipment Search to locate any piece of equipment. For example, if you need to transfer a piece of equipment, but you don’t know its identification number, you can locate the equipment by entering the equipment’s description on Equipment Search. You can also use the other equipment information that you know, such as equipment status or location, to search for all pieces of equipment that share the same characteristics.

Use Equipment Search to complete multiple tasks with a single piece of equipment. For example, after you locate a piece of equipment, you can access the Completed PM program directly from Equipment Search, without returning to the Equipment/Plant Maintenance menu.

Searching for equipment information consists of the following tasks:

- Searching for equipment by field
- Searching for equipment by query

Some of the tasks that you can perform from Equipment Search include:

- Updating equipment master information
- Reviewing location information
- Entering equipment messages
- Reviewing component relationships
- Accessing cost summary information
- Creating location tracking information
- Revising supplemental data
- Reviewing parent and component history information

The following graphic illustrates the criteria by which you can search for equipment, and many of the features that you can access directly from Equipment Search.
5.1.1 Before You Begin

- You must build a search word table to perform a query search. See Section 41.3, "Updating the Search Word Table".

5.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate formats</td>
<td>Use the function keys to toggle the information that displays on Equipment Search without having to access the detail portion of the screen.</td>
</tr>
<tr>
<td></td>
<td>For example, one format displays the equipment number, equipment description, and job number. To view the Remark field, you must choose Full Detail. The other format displays the equipment description and Remark field, but you must select Full Detail to view the equipment number.</td>
</tr>
</tbody>
</table>
5.1.3 Searching for Equipment by Field

Navigation
From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Equipment Search

When you search for equipment by field, you can locate groups of similar equipment or individual pieces of equipment. The more fields you complete on the search screen, the closer you narrow your search to a specific piece of equipment.

For example, if you need to see a list of all of your company’s backhoes, you can enter as much information as you know about the backhoes. The system searches the equipment information databases and displays all equipment that meets the criteria that you enter in the fields.

To search for equipment by field
On Equipment Search

Figure 5–2 Equipment Search screen

To search for equipment, complete any combination of the following fields:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query search mode</td>
<td>Use the function keys to toggle between field search and query search mode.</td>
</tr>
<tr>
<td>Parent and component relationships</td>
<td>Pieces of equipment that are components of parent equipment appear indented on Equipment Search. Depending on your search criteria, indented entries are not necessarily the components of preceding entries.</td>
</tr>
<tr>
<td>Multi-language searches</td>
<td>You must use the Lng (Language) field to search for equipment descriptions in multiple languages. The system searches for descriptions in your preferred language unless you indicate a different language in this field.</td>
</tr>
</tbody>
</table>
- Skip to Item Number
- Company
- Depr Cat Cd (Depreciation Category Code)
- Equip Status
- Description
- Responsible BU
- Location
- Inventory Number
- Category Codes 01 - 10

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equip Status</td>
<td>A user defined code (12/ES) that identifies the equipment or disposal status of an asset, such as available, down, or disposed.</td>
</tr>
<tr>
<td>Inventory Number</td>
<td>A number that the system assigns to an item. It can be in short, long, or 3rd item number format.</td>
</tr>
</tbody>
</table>

**Form-specific information**

This is a number assigned in the Inventory Management system that identifies equipment repair parts, parts lists, and routings that relate to this asset or piece of equipment. For example, the number could identify a replacement part for which inventory is maintained.

This number could also identify the parts list and routing used to maintain this piece of equipment.

**Note:** This number is informational only and is edited against the Inventory Master.

### 5.1.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Using category codes and equipment status                 | If you do not want the system to limit the search by category code or status, you must enter an asterisk (*) in the category code fields or the equipment status field.  
For example, if you enter an asterisk in the Category Code field for Major Equipment Class, the system searches for equipment from all major equipment classes that also meets the other search criteria that you specify. |
| Using an asterisk in a search field                        | When you enter an asterisk (*) in one of the category code fields or the Equipment Status field, the system locates all equipment with any value in those fields.                                                  |
| Searching for equipment by parts list                     | You can narrow your search to pieces of equipment that use the same parts list by entering the number of the parts list in the Inventory Number field.                                                          |

### 5.1.5 Searching for Equipment by Query

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Equipment Search

You can perform a query search using characters that represent only partial information. Use an asterisk (*) to perform a wildcard query. For example, if you enter CAT* as the query, the system searches the Asset Master and Supplemental database. The system retrieves all equipment that include a word that begins with CAT in the Description fields, or any of the category code fields, such as Category, Caterpillar, and so on.

To search for equipment by query

On Equipment Search

1. Complete the following field:
   - Description
     Enter characters that might exist in any of the following Equipment Master fields: Description, Category Code, AFE Number and Remark fields. You can also enter characters that might exist in any of the following Supplemental Data fields: User Defined Code, Narrative Text, and Remark.

2. Choose Query Search.
   You remain in Query Search mode until you toggle to regular search mode.

### 5.1.6 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Query searches using supplemental data</td>
<td>If you want to perform query searches based on information in the supplemental data database, you must indicate so when you define the supplemental data types.</td>
</tr>
</tbody>
</table>

See Section 35.3, "Setting Up Supplemental Data".

### 5.1.7 Processing Options

See Section 53.2, "Equipment Search Display Format (P1204)".
This chapter contains these topics:

- Section 6.1, "Working with Message Logs"
- Section 6.2, "Entering an Equipment Message"
- Section 6.3, "Reviewing Equipment Messages"

### 6.1 Working with Message Logs

You can use message logs to enter short text messages that pertain to a piece of equipment. You can also set up tickler dates or units on which you want to receive a reminder message for the equipment.

For example, you can indicate a unit meter reading, such as miles or hours, or a specific date when you want an equipment operator to receive a reminder message for the scheduled maintenance of a piece of equipment.

### 6.2 Entering an Equipment Message

#### Navigation

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Equipment Message Log

You can use message logs to enter short text messages that pertain to a piece of equipment. You can also set up tickler dates or units on which you want to receive a reminder message for the equipment.

You can only enter equipment messages from this screen. To display messages, use Equipment Search. To print messages, you must run the Maintenance Log.

You can classify messages by setting up message types, such as planned and actual maintenance, and problem reports. Use the information that you enter to:

- Track problems and complaints about specific equipment.
- Supplement scheduled or preventive maintenance.
- Report on actual maintenance.

To enter an equipment message

On Equipment Message Log
1. Complete the following fields:
   - Item Number
   - Message From

2. Type a text message in the following field:
   - Message

3. Complete the following optional fields:
   - Msg Type
   - Tickler M/H (Miles/Hours)
   - Tickler Dte

6.2.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using tickler miles or hours</td>
<td>If you use tickler miles or hours, you must run the global Update Message Log program as often as you update meter readings. See Section 41.2, &quot;Updating the Message Log&quot;.</td>
</tr>
</tbody>
</table>

6.2.2 Processing Options

See Section 53.3, "Item Message Entry - Actual (P1205)"

See Section 53.4, "Item Message Entry - Planned (P1205)"

See Section 53.5, "Item Message Entry - Problem (P1205)"
6.3 Reviewing Equipment Messages

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Equipment Search

You should periodically review messages to ensure that you have the most current information about a piece of equipment. If a message exists for a piece of equipment, the system highlights the Equipment Number and Description fields on the Equipment Search screen.

**To review equipment messages**
On Equipment Search

1. To locate a piece of equipment, complete any of the following fields:
   - Description
   - Company
   - Responsible Business Unit
   - Location
   - Skip to Equipment Number
   - Inventory Number
   - Equipment Status
   - Category Codes 01-10

*Figure 6–2  Review Message Log screen*

3. On Review Message Log, choose View Message for a line item. The View/Send Message screen displays.
Reviewing Equipment Messages

Figure 6–3  View/Send Message screen

See Also:

■ Section 5.1, "Searching for Equipment Information"
This chapter contains these topics:

- Section 7.1, "Reviewing Parent and Component Information"
- Section 7.2, "Reviewing Parent and Component History"

### 7.1 Reviewing Parent and Component Information

After you establish parent and component relationships in the equipment master, you can review all the components for a specific piece of equipment. Review parent and component relationships so you can:

- Report on equipment costs at the parent or component level.
- Track up to 25 levels of component relationships.

### 7.2 Reviewing Parent and Component History

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Parent History Information

Use Parent History Inquiry to review parent and component history. You can toggle between parent and component history to display all current or previous parents for a component or all current or previous components for a parent. Use date fields to limit your search to selected dates, or leave the date fields blank to review the entire history of a component or parent.

**To review parent and component history**

On Parent History Inquiry
1. Complete the following field:
   - Item Number

2. To alternately display component history, press F2 (Toggle).

### 7.2.1 Processing Options

See Section 53.8, "Parent History Information (P12212)"

### 7.2.2 Reviewing Current Equipment Components

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Equipment/Component Relations

You can use Equipment/Component Relations to display up to 25 levels of component information for a selected piece of equipment. This is particularly useful if you need to review component information for complex equipment assemblies, such as a production line. After you locate a component, you can display its immediate parent or display its components.

**To review current equipment components**

On Equipment/Component Relations
Review Parent and Component History

1. Complete the following field:
   - Item Number

2. To limit the level of components displayed, complete the following optional field:
   - Display Level

3. To access the component information that you need, choose the appropriate option.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display Level</td>
<td>A number that identifies the number of levels of components you want to view. For example, if you specify level 3, you can view the following:</td>
</tr>
<tr>
<td></td>
<td>Level 1 - The parent asset</td>
</tr>
<tr>
<td></td>
<td>Level 2 - Any children associated with the Level 1 parent</td>
</tr>
<tr>
<td></td>
<td>Level 3 - Any children associated with a Level 2 parent</td>
</tr>
<tr>
<td></td>
<td>You can view up to 25 levels of components.</td>
</tr>
</tbody>
</table>

7.2.3 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Displaying parent information</td>
<td>Choose Display Parent to display a component’s immediate parent.</td>
</tr>
<tr>
<td>Displaying the next component level</td>
<td>Choose Next Level to display all components of a specific piece of equipment. The component for which you select Next Level moves to the first display level, and its components display beneath it, according to the display level you choose.</td>
</tr>
<tr>
<td>Changing parent and component relationships</td>
<td>You can make changes to equipment parent and component relationships by changing the parent number for a piece of equipment on the equipment master.</td>
</tr>
<tr>
<td>Topic</td>
<td>Discussion</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>---------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Displaying by category code</td>
<td>When you search by category code, the system displays only the children that have the same category code as the parent if you search by category code</td>
</tr>
</tbody>
</table>

### 7.2.4 Processing Options

See Section 53.7, "Assembly Components and NBV (P12011)".
This chapter contains these topics:

- **Section 8.1, "Objectives"**
- **Section 8.2, "About Equipment Information Tracking"**

## 8.1 Objectives

- To enter and revise location transactions for equipment
- To track costs at the business or shop level
- To track costs at the equipment level

## 8.2 About Equipment Information Tracking

Use Equipment Information Tracking to control equipment movement and review equipment costs. For example, you can use various location programs to:

- Record equipment relocations from one job or business unit to another.
- Create location transactions for single pieces of equipment or groups of equipment.
- Relocate equipment with a quantity greater than one from a single location to multiple locations.
- Relocate equipment from multiple locations to a single location to consolidate multiple tracking records.
- Review historical, current and planned location tracking information
- Record equipment relocations out of sequence.
- Add text to equipment location transactions.

You can also record simple relocations for single pieces of equipment or more complex relocations for multiple pieces of equipment.

You can assign equipment to multiple current locations or relocate equipment from multiple current locations to one location. You can also record equipment relocations out of sequence. For example, you can use the system’s planning capability to record the relocation of equipment from a location where it does not currently reside.

When you enter relocation information for a parent piece of equipment, the system automatically transfers all components that are at the same location to the new location.
You can use cost tracking programs to:

- Review maintenance costs by shop or by piece of equipment.
- Review one subledger or all subledgers for a piece of equipment.
- Display detailed or summarized account balance information.
- Display equipment costs in currency amounts or in units and per unit costs.

Equipment information tracking consists of the following tasks:

- Tracking equipment location
- Reviewing maintenance costs

Permit and License tracking provides the ability to store and track permit, license and certificate information about equipment. Information is sorted first by state and next by license number. This allows you to include license dates in sort criteria. The ability to sort by license date makes it easier to quickly locate licenses, and minimizes the chance of overlooking pending renewal dates.
This chapter contains these topics:

- Section 9.1, "Tracking Equipment Location"
- Section 9.2, "Entering Location Information"
- Section 9.3, "Reviewing Location Information"
- Section 9.4, "Revising Location Information"

9.1 Tracking Equipment Location

You can record equipment location information to indicate where and when equipment is physically moved. You can update equipment location information for planned and current relocations, and keep a log of all historical relocations.

Use Equipment Location Tracking to record equipment movement. For example, you can:

- Record equipment relocations from one job or business unit to another.
- Create location transactions for single pieces of equipment or groups of equipment.
- Relocate equipment from multiple locations to a single location to consolidate multiple tracking records.
- Review historical, current and planned location tracking information.
- Record equipment relocations out of sequence.
- Associate text with equipment location transactions.

9.2 Entering Location Information

Navigation
From Equipment/Plant Management (G13), choose Equipment Location Tracking
From Equipment Location Tracking (G1314), choose Transfer Processing

You enter equipment location information into the system so you can track equipment locations as you physically transfer equipment from one job site or business unit to another. If you have multiple quantities of an equipment item, such as scaffolding, you can also:

- Relocate quantities of the same equipment item to more than one current location.
Relocate quantities of the same equipment item to a single location from more than one current location.

When you create equipment location information, you enter location information into the system. The system uses the location information that you enter to update the Location Tracking table (F1204). You can use the following methods to create equipment location transactions:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enter location information without inquiry</td>
<td>Use this method to enter location information without reviewing existing location information first. For example, you might want to use this method if you need to relocate several pieces of equipment and you do not want to review the current location information for each piece individually. When you use this method, you enter all the required location information from a blank screen.</td>
</tr>
<tr>
<td>Enter location information with inquiry</td>
<td>Use this method to review equipment location information before entering additional location information for a piece of equipment. This method is especially useful when you need to relocate several pieces of equipment from one location to another location.</td>
</tr>
</tbody>
</table>

Entering location information consists of the following tasks:

- Entering location information without inquiry
- Entering location information with inquiry

To enter location information without inquiry

On Transfer Processing

Figure 9–1  Transfer Processing screen

1. Complete the following fields:
   - To (Location)
2. Complete the following optional fields:
   - Item Number
   - Date
   - Time
   - From (Location)
   - Transfer Number
   - Equipment Status

3. To enter additional location information, choose Det (Details).

Figure 9–2  Transfer Processing screen

4. Complete the following optional fields:
   - Remark
   - Current Meter
   - Column
   - Row
   - State
   - Tax Entity
   - Tax Rate/Area

To enter location information with inquiry
On Transfer Processing

1. To review the location information for specific equipment, complete any of the following search fields:
   - Item Number
   - Location
2. To specify the type of location information that you want to review, complete the following field:
   - Location Code

3. To indicate the transfer of the equipment, complete the following fields:
   - To (Location)

4. To enter additional location information for the equipment, complete the following optional fields:
   - From (Location)
   - Transfer Number
   - Date
   - Time

5. Complete the following optional fields:
   - Begin Date
   - Begin Time
   - Location Code
   - Equipment Status
   - Quantity

6. To enter additional location information, choose Details.

7. Complete the following optional fields:
   - Current Meter Reading
   - Original Meter Reading
   - Column
   - Row
   - State
   - Tax Entity
   - Tax Rate/Area

8. Choose Transfer for each piece of equipment that you want to relocate.

9. To clear any information displaying, choose F6 (Clear). The system clears the Beginning Date and Time, Ending Date and Time, Remark, and related Equipment/Plant Management billing fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>To</td>
<td>The current physical location of an asset. This must be a valid business unit or job number in the Business Unit Master file (F0006).</td>
</tr>
</tbody>
</table>
### Field Explanation

#### Location Code (LC)
A code that indicates the type of location record. You can enter the following valid values:
- C – Current. Displays only the current location for an asset.
- H – Historical. Displays all previous locations for an asset.
- P – Planned or scheduled. Displays only the planned location dates for an asset. You enter planned locations for an asset in the Equipment/Plant Management system.
- * – Displays all locations (current, planned, and historical) that meet your search criteria.

The default value for this field is C.

**Note:** You cannot change historical (type H) location records. The system automatically updates location records to type H when you change the location and start date of an asset.

#### Transfer Number
A number that identifies a transfer record for an asset or group of assets. You can assign this number to new transfer records. If you leave this field blank when you perform a location transfer, the system assigns the transfer record a number from Next Numbers.

#### Time Stamp
The time that the asset is transferred to a new location.

*Form-specific information*

- If you leave the Transfer Time field and the Begin Time field blank, the system uses the beginning standard hours you set up for the job on Rental Rules.
- If you transfer an asset with location inquiry, the system automatically fills in the time in the Begin Time field from the asset's location tracking line. You can override this time. If you clear the time in this field, the system uses the time in the Transfer Time field. If you leave this field blank, the system uses the beginning standard time you set up on Rental Rules.

#### Begin Date
The date that an address, item, transaction, or table becomes active or the date from which you want transactions to display. The system uses this field depending on the program. For example, the date you enter in this field might indicate when a change of address becomes effective. Or, this date can represent a lease effective date, a price or cost effective date, a currency effective date, a tax rate effective date, and so on.

*Form-specific information*

- Enter the date to transfer an asset to a new location. If you transfer an asset with location inquiry, the system automatically fills in the date from the asset's location tracking line. You can override this date. If you clear the date in this field, the system uses the date in the Transfer Date field. If you leave the transfer date field blank as well, the system uses the system date.

**Note:** To transfer an asset to a new current location, the beginning date must be greater than the start date of the existing current location.

#### Current Meter
The current meter reading of the piece of equipment. This field is informational only.

#### State
A user defined code system 00, type S for the state or province. This is usually a postal service abbreviation.

#### Tax Entity
The address number of the tax authority to which property taxes are paid.
The system uses this code to properly calculate the tax amount.

### 9.2.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Location dates | When you specify the dates for location information, note the following guidelines:  
  ■ The system will not accept location information if the relocation date is after the equipment's disposal date.  
  ■ Any location information that you enter with a date after the system date must have a location code of P (Planned). |
| Multiple current locations | When the equipment has multiple current locations, the Location and Start Date fields in the equipment master are blank. The system message Multiple Current Locations appears in the location description line. |
| Updating fields in the Item Master table (F1201) | When you update the location information for a piece of equipment, the system automatically updates the following fields in the Item Master table:  
  ■ Equipment Status  
  ■ Location and Start Date (If the current transfer beginning date is greater than the existing location/start date, and you have only one current location)  
In addition, you can use processing options to update the following tax-related fields in the Item Master table:  
  ■ State  
  ■ Tax Entity  
  ■ Tax Rate/Area  
You can assign beginning location and start dates to equipment only when you create the equipment master or relocate the equipment. After you create the equipment master, you can make changes to the location and start date fields using the Transfer Processing program only. |
| Consolidating equipment to one location | The system automatically consolidates multiple current locations when you enter location information for multiple pieces of the same equipment with identical billing information. For example, if you enter location information with identical relocation dates, times, and billing information for equipment that is currently in multiple locations, the system will create one current location for the equipment. |
9.2.2 Processing Options

See Section 53.9, "Location Inquiry (P12215)"

9.3 Reviewing Location Information

Navigation
From Equipment/Plant Management (G13), choose Equipment Location Tracking

From Equipment Location Tracking (G1314), choose Location Inquiry

You can use Location Revisions to review and revise location tracking information for a piece of equipment. You can review current, planned, and historical location information for individual pieces of equipment, or review all information for a particular location. You can enter specific dates to limit the information that the system displays. You can also delete current and planned location information.

9.3.1 Before You Begin

- Verify that the equipment master includes a beginning location and start date. See Section 9.2, “Entering Location Information” for information about using Transfer Processing to update beginning location and start date fields on the equipment master.
To review location information
On Location Inquiry

Figure 9–3 Location Inquiry screen

1. To find location information, complete any of the following fields:
   - Equipment Number
   - Location
   - Transfer Number

2. To narrow your search, complete the following optional fields:
   - Date From
   - To Date
   - Location Code

3. To review additional information about a particular equipment location, choose
   Details (F4 key).
9.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate display formats</td>
<td>You can review equipment location information on Location Inquiry by equipment number or by location. Depending on the search criteria that you enter, the system displays the appropriate display format. You can toggle between formats to display location information by location or equipment number.</td>
</tr>
</tbody>
</table>
| Location messages   | If there is a text message associated with a particular location, the system highlights the Option field next to that location. Choose Text to review the message.  
See Section 9.4, "Revising Location Information" for more information about entering text messages. |

9.3.3 Processing Options

See Section 53.9, "Location Inquiry (P12215)"

9.4 Revising Location Information

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Location Tracking

From Equipment Location Tracking (G1314), choose Location Inquiry

You can make revisions to individual equipment locations. For example, you can revise the status of the equipment, meter reading information, or transfer number. You can also enter text messages for specific locations. For example, you might want to note specific instructions or explanations for a location.

When you enter a text message for an equipment location, the system highlights the Option field next to the equipment on Location Inquiry.
If your organization uses Location Billing to bill for equipment use, the location might include location billing information. You can use Location Revisions to make changes to location billing information if you have not yet billed for the equipment. After you bill for the use of a piece of equipment, you cannot change location billing information.

To revise location information
On Location Inquiry

1. To locate information about a specific equipment location, complete the following fields:
   - Equipment Number
   - Location
   - Transfer Number
   - Date From
   - To Date
   - Sequence
   - Location Code
2. For the location information that you want to change, choose Revise.
3. On Location Revisions, complete any of the following fields to revise the location information:
   - Ending Date
   - Ending Time
   - Transfer Number
   - Equipment Status
   - Remark
4. To revise location billing information, complete any of the following fields:
   - Transfer Action
   - Equipment Rate Code
   - Business Unit
   - Object
   - Subsidiary
   - Subledger
   - Subledger Type
   - Billing Amount

   You can revise the fields above only if you have not yet billed the equipment to the job.

5. To enter tracking text for the location, choose Text by typing a 1 in the option field to the left of the begin date.

   **Figure 9–6  Location Tracking Text screen**

6. On Location Tracking Text, enter a message.

Review Maintenance Costs

This chapter contains these topics:

- Section 10.1, "Reviewing Maintenance Costs"
- Section 10.2, "Reviewing Equipment Costs by Cost Account"
- Section 10.3, "Reviewing Equipment Costs by Repair Code"
- Section 10.4, "Reviewing Shop Costs by Cost Account"
- Section 10.5, "Reviewing Shop Costs by Repair Code"

10.1 Reviewing Maintenance Costs

To help manage costs within your maintenance organization, you can review inception-to-date, year-to-date, and month-to-date account balances for individual pieces of equipment. You can also:

- Review one subledger or all subledgers for a specific piece of equipment.
- Review detailed or summarized account balance information.
- Display equipment account balances in currency amounts or in units and per unit costs.
- Review maintenance costs by shop or job.
- Review maintenance costs by cost account or repair code.

You can review maintenance costs by cost account or repair code. When you review costs and expenses by cost account, the system displays all accounts in object account order. When you review costs by repair code, the system displays accounts in subsidiary account order, beginning with the account that you indicate.

<table>
<thead>
<tr>

10.4 Reviewing Shop Costs by Cost Account

Navigation
From Equipment/Plant Management (G13), choose Cost Inquiries and Reports
From Cost Inquiries and Reports (G1312), choose Shop Cost Inquiries by Cost Account

Each cost account (object account) represents a type of cost. When you review costs by cost accounts, you get a financial perspective of business costs. For example, you can set up individual cost accounts for labor, parts, materials, and so on. When you review shop costs by cost account, you see the total of each type of cost for a shop or business unit.

You can display all shop costs, and you can review cost account balances for costs, such as labor, parts, and material, for an entire shop. You can also compare actual amounts with budget amounts or amounts for any other two ledger types.

To review shop costs by cost account
On By Cost Account

Figure 10–4  By Cost Account screen

1. Complete the following field:
   - Account

2. To limit the information that displays, complete any of the following fields:
   - Level of Detail
   - Scaling Factor
   - Cum/Period (C/P)
   - Subledger/Type
3. To override the default values and specify different types of information to review, complete the following fields:
   ■ Date
   ■ LT (Ledger Type)

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scaling Factor</td>
<td>A code that controls how amounts are to be rounded, that is, whether amounts are expressed in 100s, 1000s, and so on. Valid codes are: blank – No scaling and do not round decimals (Default) (987,654,321.91) 0 – No scaling, but round decimals (987,654,322) 1 – Divide by 10 and round decimals (98,765,432) 2 – Divide by 100 and round decimals (9,876,543) 3 – Divide by 1000 and round decimals (987,654) 4 – Divide by 10,000 and round decimals (98,765) 5 – Divide by 100,000 and round decimals (9,877) 6 – Divide by 1,000,000 and round decimals (988)</td>
</tr>
<tr>
<td>Note: The number in parentheses shows how the number 987,654,321.91 is displayed using the scaling factor. Total fields show actual amounts that are divided and decimals rounded to the nearest whole number using the 5/4 rounding rule.</td>
<td></td>
</tr>
</tbody>
</table>

10.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate display formats</td>
<td>In addition to a two-column format that displays period and cumulative amounts for specific ledger types, you can specify a three-column or four-column format. The three-column format includes period or cumulative amounts for the ledger types that you specify, and a derivative of those amounts. The four-column format lists both cumulative and period amounts for each ledger type that you specify.</td>
</tr>
</tbody>
</table>

10.5 Reviewing Shop Costs by Repair Code

Navigation

From Equipment/Plant Management (G13), choose Cost Inquiries and Reports

From Cost Inquiries and Reports (G1312), choose By Repair Code

Review shop costs by repair code when you need to review costs for a particular repair code. Repair codes (subsidiaries) represent a subdivision of cost accounts. You can use repair codes to keep detailed records of the accounting activity for a cost account. For example, for a particular cost account, such as labor, you might need to compare electrical repair costs to costs associated with mechanical repairs.
You can display up to four user-defined columns of information related to the accounts for a single shop or business unit, or more than one business unit that you group as a project. You can review the following types of information:

- Actual amounts and unit quantities
- Budget amounts and unit quantities
- Actual values from the AA or AU ledger for the number of days prior to the date that you specify

**To review shop costs by repair code**

On By Repair Code

<tr>
<td>User defined columns and alternative formats</td>
<td>You can set up different formats for the By Repair Code screen that meet your specific business needs. You can also change the format of the screen interactively. As long as the search criteria that you enter in the header portion of the screen remains the same, the system searches only once on the related tables and ledgers. If you change one or more columns, or toggle to a new format, the system automatically recalculates the information to satisfy the different columns.</td>
</tr>
</tbody>
</table>

See Also:

- Section 35.4.1, "Defining Inquiry Columns" for more information about setting up the user-defined columns that you can use when reviewing shop costs.

10.5.2 Processing Options

See Section 55.6, "Job Status Inquiry (P512000)"
This chapter contains these topics:

- Section 11.1, "Objectives"
- Section 11.2, "About Processing G/L Journal Entries to Equipment"

### 11.1 Objectives

- To understand how costs and expenses are incorporated into Equipment/Plant Maintenance
- To revise G/L journal entries before they are posted to equipment
- To split G/L journal entries
- To post G/L journal entries to equipment

### 11.2 About Processing G/L Journal Entries to Equipment

You can enter equipment costs through any JD Edwards World system that creates journal entries for business transactions in the Account Ledger table (F0911). These systems include:

- Accounts Payable
- General Accounting
- Inventory

The system identifies the journal entries that affect equipment based on the fixed asset range of accounts that you set up in the automatic accounting instructions (AAIs). Accounts that fall within the FX range of the AAIs include:

- Maintenance expense accounts
- Operating expense accounts
- Statistical accounts
- Equipment revenue accounts

After the system creates journal entries for the equipment costs that you enter, you must post the entries first to the general ledger, and then to equipment. When you post to the general ledger, the system updates the Account Balances table (F0902). When you post to equipment, the system updates the Item Balances table (F1202). You can post journal entries to equipment, or you can set up your system to post the journal entries to equipment when you post the entries to the general ledger.
Before posting journal entries to equipment, the system verifies that each entry includes the following:

- A general ledger post code of P, which means the journal entry has been posted to the Account Balances table (F0902)
- An account that falls within the cost account range set up in the FX range of automatic accounting instructions (AAIs)
- A fixed asset post code of blank to indicate that the system can post the journal entry to the Item Balances table (F1202)
- A valid equipment number
- A hold code of blank

When you post journal entries to equipment, the system updates the Item Balances table and marks each transaction as posted.

The following graphic shows the type of journal entries that affect equipment costs, and how those entries are assigned to equipment.
Processing general ledger journal entries to equipment consists of the following tasks:

- Working with G/L journal entries
- Posting G/L journal entries to equipment
This chapter contains these topics:

- Section 12.1, "Working with G/L Journal Entries"
- Section 12.2, "Revising Unposted Journal Entries"
- Section 12.3, "Splitting Unposted Journal Entries"
- Section 12.4, "Printing the Journal Entries Report"

12.1 Working with G/L Journal Entries

You can revise equipment journal entries that have been posted to the general ledger but not to equipment. For example, you might want to review journal entries to ensure that all of the equipment information is included, such as equipment numbers. You also work with G/L journal entries to prevent any transactions that are within the fixed asset (FX) range of AAIs from posting to equipment. For example, you might want to prevent transactions that you record to make corrections to the general ledger from posting to equipment.

12.2 Revising Unposted Journal Entries

Navigation

From Fixed Assets (G12), choose Posting G/L to Fixed Assets

From Posting G/L to Fixed Assets (G1212), choose Revise Unposted Entries

Use Revise Unposted Entries to make specific changes to journal entries before they are posted to equipment. For example, you can:

- Revise or add an equipment number to a journal entry.
- Revise or add a description to further explain a journal entry.
- Create an equipment master for journal entries that include an asset cost account for a piece of equipment that is new to the system.
- Revise the hold or pass code on a journal entry to temporarily or permanently prevent it from posting to equipment.
- Post individual journal entries immediately (interactively) to equipment rather than in a batch job.
To revise unposted journal entries

On Revise Unposted Entries

1. To locate a journal entry, complete any of the following fields:
   - Company
   - Account Number
   - Business Unit
   - Object Account
   - Batch No/ Type
   - Document No/Type/Co
   - F/A Hold Code
   - Ledger type

2. To immediately post individual journal entries to equipment, choose Post.

3. To change or add a transaction description, complete the following field:
   - Explanation

---

**Note:** To ensure the integrity of your transaction records and audit trails, the system prevents changes to account information that has already been posted to the general ledger.
4. To change the hold code for a transaction, complete the following field:
   - Hold Code

5. To prevent a transaction from posting, complete the following field:
   - F/A Pass Code

6. To automatically create a new equipment master when you run Post G/L Entries to equipment, leave the following field blank:
   - Equipment Number

7. To create a new equipment master or review an existing equipment master, choose Master Information.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>F/A Hold Code</td>
<td>This hold code is used in conjunction with the F/A system. Only those records with a &quot;batch rear end&quot; value of blank, G/L post code of P and hold code value of blank will be selected in the Post Unposted F/A Entries program. If there are records that have been posted to G/L, but should not be posted to F/A, you can update this hold code to any character other than X or *. The X code is reserved for F/A Time Entry. The * code is reserved for selection of all hold codes in Revise Unposted Entries (P12102).</td>
</tr>
<tr>
<td>F/A Pass Code</td>
<td>Enter a value in this field to locate specific transactions. Transactions with an asterisk (*) in this field have already been posted to fixed assets. These transactions do not appear on Revise Unposted Entries. To view all fixed asset transactions, regardless of post code, enter @ in this field. The valid post codes for fixed asset transactions are as follows: blank – Unposted Transaction has not yet been posted to the Item Balances table (F1202) P – Pass Transaction does not fall within the FX range of accounts as set up in AAIs, and will not post to fixed assets. You can manually update this field to P through the Revise Unposted Entries program (P12102). Use P in this field when the account number is within the fixed asset range of accounts, but you do not want the transaction to post to fixed assets.</td>
</tr>
</tbody>
</table>
12.2.1 Processing Options

See Section 53.13, "Revise Unposted Entries (P12102)"

12.3 Splitting Unposted Journal Entries

Navigation
From Fixed Assets (G12), choose Posting G/L to Fixed Assets

From Posting G/L to Fixed Assets (G1212), choose Revise Unposted Entries

You can use Revise Unposted Entries to split a journal entry into two or more entries before you post to equipment. For example, you might split unposted journal entries when an accounts payable invoice for multiple pieces of equipment is distributed to one account, but you need to capitalize each piece separately.

For example, an invoice for computers can be distributed in the full amount to the G/L asset account for computers. However, you might want to capitalize each computer separately in equipment. You can split the original journal entry for computers into several pieces of equipment, such as central processing unit, printer, monitor, and keyboard.

After you split a journal entry, you can review the transactions on Revise Unposted Entries.

To split unposted journal entries
On Revise Unposted Entries

1. To locate a journal entry, complete any of the following fields:
   - Company Number
   - Account Number
   - Business Unit
- Object Account
- Batch No/Type
- Document No/Ty/Co
- F/A Hold Code
- Ledger Type

2. Enter C in the following field:
   - Action Code

3. Choose Split.

Figure 12–2  Split Journal Entry screen

4. On Split Journal Entry, complete the following fields:
   - Item Number
   - Amount
   - Units (if applicable)
   - Explanation - 2

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Explanation - 2</td>

12.4 Printing the Journal Entries Report

Navigation
From Fixed Assets (G12), choose Posting G/L to Fixed Assets
From Posting G/L to Fixed Assets (G1212), choose Print Journal Entries

You can print the Unposted Fixed Asset Transactions report to view a list of all transactions that have been posted to the general ledger but not to equipment. The FX range identifies the beginning and ending range of asset accounts that can post to equipment. The Unposted Fixed Asset Transactions report is a printed version of Revise Unposted Entries.

Figure 12–3  Unposted F/A Transactions report

12.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Viewing the results of an interactive post</td>
<td>Journal entries that you post interactively to the general ledger do not appear on the Unposted Fixed Asset Transactions report. You must view interactive post results online.</td>
</tr>
<tr>
<td>Report messages</td>
<td>When you post a journal entry that does not include an equipment number, the No Item Master Record message appears on the report.</td>
</tr>
<tr>
<td></td>
<td>You should create an equipment master for the equipment and attach the new equipment number to the journal entry.</td>
</tr>
</tbody>
</table>
12.4.2 Processing Options

See Section 53.14, "Unposted F/A Transactions (P12301)".
This chapter contains these topics:

- Section 13.1, "Posting G/L Journal Entries to Equipment"
- Section 13.2, "Posting a Batch of Journal Entries"
- Section 13.3, "Verifying the Post Process"

13.1 Posting G/L Journal Entries to Equipment

After you verify the information in the unposted equipment journal entries, you must post the entries to the Item Balances table (F1202). All journal entries that are within the fixed asset (FX) range of AAIs must be posted to the Item Balances table to update the Equipment/Plant Management system with current transaction records.

13.2 Posting a Batch of Journal Entries

**Navigation**

From Fixed Assets (G12), choose Posting G/L to Fixed Assets

From Posting G/L to Fixed Assets (G1212), choose Post G/L Entries to Assets

Before G/L journal entries can be posted to equipment, the system verifies that each entry includes:

- A G/L post code of P (posted to the Account Ledger table)
- An account that is within the FX range you set up in the AAIs
- A fixed asset post code of blank
- A valid equipment number or an account that is within the cost account (FA) range of the AAIs
- A hold code of blank

When you run the Post G/L Entries to Assets program, the system posts all equipment journal entries to the Item Balances table. The post program updates the Item Balances table and marks each transaction as posted.

13.2.1 Processing Options

See Section 53.15, "Post Unposted F/A Entries (P12800)"
13.3 Verifying the Post Process

After the post process is complete, the system generates a Post Unposted Fixed Asset Entries report. You can review this report to verify the results of the post. The report indicates all journal entries that were not posted and why. It also notes any automatic processes that might have occurred during the post.

Three messages can appear in the Message Area column on this report:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
</table>
| Item Master Record Created                      | This message indicates that the system created an equipment master and its corresponding balance record for a posted transaction. If you do not create these records for a piece of equipment before you run the post program, the system automatically creates them under the following circumstances:  
  - The equipment number is blank in the Account Ledger table (F0911).  
  - The object account is within the FA range of AAIs.  
  - You use the Post G/L Entries to Assets program to run the post.  
  The system creates equipment masters and balance records based on the values that you enter in Item Setup Default Coding. |
| Item Number Assigned                             | If you did not assign an equipment number to an unposted journal entry, this message indicates that the system has automatically assigned an equipment number based on the FA range in the AAIs. |
| Unable to Post-The record is not in the Item Master Table | This message indicates that you did not assign an equipment number to an unposted journal entry and the system was unable to assign a number automatically. |

You can also verify the results of the post to equipment online. To review posted equipment transactions and the effects of the post on other account information, access the following forms:

<table>
<thead>
<tr>
<th>Form</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Search and Location</td>
<td>Review new equipment and corresponding equipment masters that are generated by the post. This is useful if you split a general ledger transaction before running Post G/L Entries to Assets.</td>
</tr>
<tr>
<td>Cost Summary</td>
<td>Review how the new transactions affect cost accounts and balances.</td>
</tr>
</tbody>
</table>

Part II
Preventive Maintenance Cycle

This part contains these chapters:

- Chapter 14, "Overview to Preventive Maintenance Cycle"
- Chapter 15, "Create a PM Schedule"
- Chapter 16, "Work with Meter Readings"
- Chapter 17, "Update PM Schedule Information"
- Chapter 18, "Change the Status of PMs to Complete"
This chapter contains these topics:
- Section 14.1, "Objectives"
- Section 14.2, "About the Preventive Maintenance Cycle"
- Section 14.3, "Terms and Concepts"

14.1 Objectives
- To understand the process of events in a typical preventive maintenance cycle
- To set up preventive maintenance (PM) schedules for equipment
- To update PM schedules with current equipment information
- To track completed maintenance tasks

14.2 About the Preventive Maintenance Cycle

Use Equipment/Plant Maintenance to plan, monitor, and complete routine maintenance operations. When you use Equipment/Plant Maintenance, you can minimize equipment breakdowns and unscheduled repairs.

When you use Equipment/Plant Maintenance to manage your equipment maintenance needs, you define the type and frequency of each maintenance task for each piece of equipment in your organization. The preventive maintenance cycle refers to the sequence of events that make up a maintenance task, from its definition to its completion. Since most preventive maintenance tasks are commonly performed at scheduled intervals, parts of the preventive maintenance cycle repeat, based on those intervals.

The preventive maintenance cycle consists of the following tasks:
- Creating a PM schedule
- Working with meter readings
- Updating PM schedule information
- Changing the status of PMs to complete

14.2.1 Before You Begin
- Create equipment masters for all pieces of equipment that you want to maintain.
  See Section 3, "Create an Equipment Master"
You should be familiar with the following terms and concepts related to the preventive maintenance cycle:

<table>
<thead>
<tr>
<th>Term</th>
<th>Description</th>
</tr>
</thead>
</table>
| Service type                | You define service types to describe individual preventive maintenance tasks. You can define as many service types as you need. You can set up service types to apply to a particular piece of equipment or a class of equipment. Examples of service types include:  
  - 250-hour inspection  
  - Clutch adjustment  
  - Lubricate ventilation fan  
  - 10,000-hour engine rebuild |
| Preventive maintenance schedule | You create one preventive maintenance schedule for each piece of equipment for which you want to perform PMs. The PM schedule defines which service types should apply to a piece of equipment. The PM schedule also defines the service interval for each service type. A service interval refers to the frequency at which the service types will be performed.  
  For example, you could create a PM schedule for a piece of equipment that schedules a belt inspection every 5,000 hours, and a mandatory belt replacement every 20,000 hours. |
| PM                          | A PM refers to one or more service types that are scheduled to be performed for a piece of equipment. You typically specify that a PM be performed at a predefined point in time. The point in time can be based on days, date, or when a piece of equipment accumulates a predefined number of statistical units, such as hours, miles, and so on. You identify how many units have accumulated for each piece of equipment by periodically entering equipment meter readings. |
| PM status                   | When the system creates a record for a PM, it assigns an initial status of 01 (Maintenance Task Defined). You define other statuses to indicate the particular steps that a PM goes through before it is completed.  
  When you complete a PM, the system assigns it a status of 99 (Maintenance Complete). |

Although the level of complexity of the preventive maintenance cycle differs from company to company, a typical preventive maintenance cycle includes the following procedures:

- Creating PM schedules for each piece of equipment
- Scheduling PMs
- Completing PMs

### 14.3.1 Creating PM Schedules for Each Piece of Equipment

When you create a PM schedule, you include the service types that the equipment requires and the intervals at which the service types must be performed.
14.3.2 Scheduling PMs

You schedule maintenance by periodically updating PM schedule information. When you update PM schedule information, the system determines which service types are due to be performed, based on meter readings, dates, and other user defined criteria. If service types are due to be performed, the system updates the PM status. In addition, depending on how you set up your system, the system generates a PM work order.

14.3.3 Completing PMs

You indicate when maintenance has been performed by completing PMs and PM work orders. When you complete a PM, the system creates a historical record of it. For most service types other than warranty service types, the system then generates a new PM based on statistical information that you gather when you perform the maintenance. The system does not generate a new PM for warranty service types.

14.3.4 Preventive Maintenance Cycle

The following graphic shows the progression of events in a typical maintenance cycle.
14.3.5 Preventive Maintenance Process Flow

The following graphic shows the progression of a typical preventive maintenance process.

7. NO: Repeat steps 1-4
8. Attach Parts List
9. Attach Labor Routing Instructions
10. Determine Inventory Availability
11. Determine Labor Availability
12. Purchase Parts if Necessary
13. Schedule Work Order
14. Complete Work Order and PM
15. Perform Maintenance
This chapter contains these topics:

- Section 15.1, "Creating a PM Schedule"
- Section 15.2, "Creating an Item PM Schedule"
- Section 15.3, "Linking Service Types"
- Section 15.4, "Creating a Maintenance Loop"
- Section 15.5, "Creating a Model PM Schedule"
- Section 15.6, "Creating a Model Work Order"

### 15.1 Creating a PM Schedule

You create a PM schedule for each piece of equipment that you want to maintain. On each PM schedule, you indicate all of the service types you want to associate with the piece of equipment. You also specify the rules governing how and when the service types are performed. In addition, you can use PM schedules to signal warranty expirations, equipment messages, such as warnings and problem reports, and other planning events not necessarily associated with preventive maintenance tasks.

You can link related service types to a primary service type. When you link service types, the system determines if separate maintenance tasks can be performed concurrently based on rules that you set up.

You can set up maintenance loops by a specific PM service type. A maintenance loop links a particular routine maintenance task, such as a weekly inspection, to a group of equipment for which the maintenance task applies. For example, you can create a PM schedule to perform a weekly lubrication for one lathe on a production line, and set up a maintenance loop to inspect all other lathes on the line.

Create a model PM schedule to streamline maintenance scheduling for similar pieces of equipment. When you add a piece of equipment to your maintenance organization, the system uses values from the model PM schedule to create a PM schedule for the equipment. In addition, you can create model work orders with default values that the system uses when it generates new work orders for PMs.

You can schedule PMs to be performed based on:

- A specific date
- A specified interval of days since maintenance was last performed
- Statistical units based on employee usage, such as employee hours
- Statistical units based on meter readings, such as miles, fuel, cycles, and so on
15.2 Creating an Item PM Schedule

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose Item PM Schedule

You create a PM schedule for each piece of equipment that you want to maintain. On each PM schedule, you indicate all of the service types that you want to associate with the piece of equipment. You also specify the rules governing how and when the service types are performed. In addition, you can use PM schedules and service types to signal warranty service, equipment messages, such as warnings and problem reports, and other planning events not necessarily associated with preventive maintenance tasks.

15.2.1 Before You Begin

Set up the following user defined code tables:

- Service types
- Maintenance priority codes
- Maintenance procedure codes
- Equipment category codes 1 - 10, if you use model PMs

To create an item PM schedule
On Item PM Schedule
1. Complete the following fields:
   - Item Number
   - Skip To Service Type
2. For each service type that you enter, complete the following optional field:
   - Schedule Date
3. If you did not enter a schedule date, complete any of the following Service Interval fields for each service type:
   - Days
   - Miles
   - Fuel
   - Hours
4. Choose Dtls.
5. If you use model work orders, complete the following field:
   - Model Work Order

6. If the maintenance task for the piece of equipment has been performed but this is the first PM to be applied to the equipment, complete the following optional fields on the Last Completed line:
   - Miles
   - Fuel
   - Hours
   - Schedule Date

7. Complete the following optional fields:
   - Multiple WO
   - Frequency
   - Priority
   - Estimated Occur
   - Predictive Flag
   - Cat Code 1
   - Cat Code 2
   - Remark

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip To Service Type</td>
<td>A user defined code (system 12, type ST) that describes the preventive maintenance service to be performed. Examples of codes include CLUTCH for adjust clutch, OIL for change oil, 10H for 10 hour service, and so forth.</td>
</tr>
</tbody>
</table>
Creating an Item PM Schedule

Field | Explanation
--- | ---
Service Intervals Schedule Date | The date that you want to receive a reminder message about an asset.

*Form-specific information*

This is the future date on which the scheduled maintenance is due. You can enter a service interval based on the schedule date and service days.

Service Intervals Days | The number of days to elapse before you schedule maintenance.

*Form-specific information*

You can enter a service interval based on service days and schedule date.

Frequency | When used in conjunction with Schedule Date, this field indicates the frequency at which the system schedules maintenance. When maintenance is completed, the system automatically schedules the next maintenance according to the value that you enter in this field. Valid values are:

- blank – No frequency indicator
- 1 – Same date each month
- 2 – Last date each month
- 3 – Same date each quarter
- 4 – Same date each year
- 5 – Same day each week
- 6 – Semi-annually (same date at six month intervals)

Multiple WO | This code determines whether maintenance service types can be rescheduled and come due again before maintenance for the originally scheduled service type has been completed. Valid codes are:

- blank – One Cycle (default). Maintenance will not be rescheduled until the original maintenance task has been completed.
- 1 – Multiple Cycle with Multiple Work Orders. Once maintenance has come due, the maintenance task is automatically rescheduled so that it can come due again without completing the original maintenance. Multiple work orders can also accrue.
- 2 – Multiple Cycle. The same as 1 above but only one work order will accrue.
- 3 – Maintenance Loop. This is a system-generated code associated with maintenance loops. The Update PM Schedule program assigns this code to PM schedules generated through maintenance loops. These PM schedules are not repeated in the PM cycle. Maintenance tasks for the associated equipment indicated in the maintenance loop are performed under one work order.
- 4 – Warranty. This code indicates that the equipment is under warranty. The system provides a warning on the following screens: Work Order Entry, Work Order Inventory Issues, and Purchase Request (when called from the Work Order Parts List).

Priority | This field is used to indicate the relative priority that this maintenance has in relation to all other maintenance.
15.2.2 What You Should Know About

**Predictive Flag**
A user defined code that determines if service is due. This field can be updated based on information from a third party predictive maintenance system.

**Proj Start Date**
The Projected Start Date is controlled by processing option 7C in Update PM Schedule Status (P12807). The system will only project a start date for a PM or work order if this processing option is populated with a "1", and the Update PM Schedule Status (P12807) program has been run against a PM that has had at least one completion posted against it. You must also leave processing options 7A and 7B blank, as these options are to be used separately.

<table>

<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creating PM schedules for similar equipment</td>
<td>Use the PM Schedule Global Update program to create PM schedules based on service type and equipment category codes. This is especially useful if you have a large quantity of similar equipment for which you need to create PMs. See Chapter 15, &quot;Create a PM Schedule&quot; for more information about creating PMs using the PM Schedule Global Update program.</td>
</tr>
<tr>
<td>Equipment under warranty</td>
<td>You can indicate warranty tasks for a piece of equipment by entering a 4 in the Multiple Work Order field for each warranty service type. When a PM that includes warranty service types is completed, the system includes the warranty service in the PM history record, but does not reschedule the warranty service types in the new PM cycle.</td>
</tr>
<tr>
<td>Unscheduled service</td>
<td>When you have service types that are not associated with scheduled intervals or a schedule date, you can set up a service type without including a service interval. For example, you can set up a service type to wash the piece of equipment on an as-needed basis or repair the equipment at the point of failure. Use Backlog Management or Equipment Backlog to notify the system to create an unscheduled maintenance work order when you want to perform the maintenance task. When you set up a service type for unscheduled maintenance, you must include a model work order number. See Chapter 20, &quot;Create Corrective Work Orders&quot; for information about creating work orders for unscheduled maintenance.</td>
</tr>
<tr>
<td>Model work order procedures</td>
<td>If you enter both a model work order number with its own procedure and a procedure for a service type, the system displays a warning message. The message indicates that the work order might have its own procedure that could conflict with the procedure you entered.</td>
</tr>
<tr>
<td>Predictive maintenance</td>
<td>You can use a third party predictive maintenance system to update the Predictive Flag field. Any value in this field other than blank triggers the system to:</td>

<td></td>
<td>Create a PM work order for the service type</td>
</tr>
<tr>
<td>Topic</td>
<td>Discussion</td>
</tr>
<tr>
<td>-------------------------------</td>
<td>-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td><strong>Schedule date and service intervals</strong></td>
<td>You use the schedule date to force the PM to be due on a specific date. For example, if a plant shutdown will occur 12/31/17, you can enter this date in the Schedule Date field. The service interval is not used in conjunction with this field, and if you enter both the service interval and the schedule date, the system will give an error message. If you use the schedule date, the Frequency field can be utilized to reschedule the PM once the service is complete.</td>
</tr>
<tr>
<td><strong>Estimated occurrences</strong></td>
<td>You can enter the number of occurrences per year that a service type will likely be performed by completing the Estimated Occurrences field. The system uses this value, in combination with the last completed date, to project future PMs. You can also use processing options to automatically calculate the estimated occurrences, based on one of the following:</td>
</tr>
<tr>
<td></td>
<td>■ One year of PM history</td>
</tr>
<tr>
<td></td>
<td>■ Two years of PM history</td>
</tr>
<tr>
<td></td>
<td>■ Inception to date PM history</td>
</tr>
<tr>
<td><strong>Using a combination of hours (units) and days</strong></td>
<td>If you are using a combination of hours and days, the system will schedule the PM when the first interval becomes due. If a PM is setup as due 500 Hours or 45 Days, the system will schedule the PM for the interval that comes due first. If 45 Days have passed, the system will schedule the PM even if only 200 Hours of usage have occurred.</td>
</tr>
<tr>
<td><strong>Overriding a service interval</strong></td>
<td>You can specify that any service type be performed immediately by choosing the Create Work Order option for the service type. When you choose this option, the system indicates that the service type is 100% due, and generates a work order for the service type.</td>
</tr>
<tr>
<td></td>
<td>When you change the status of the work order to complete, you can specify the date that the system uses as a completion date for the PM. This is especially useful if you perform maintenance on a piece of equipment but postpone entering the information into the system until a later date.</td>
</tr>
<tr>
<td></td>
<td>When the system generates a work order, it also runs the Update PM Schedule Status program. You can use processing options to specify which version of Update PM Schedule Status that you want the system to use.</td>
</tr>
<tr>
<td></td>
<td>See Section 23.3.1, &quot;Updating the Life Cycle Information of a Work Order&quot; for more information about overriding the completion date of a PM.</td>
</tr>
<tr>

<td>See Chapter 43, &quot;Update PM Schedule Information&quot; for more information about the Update PM Schedule Status program.</td>
</tr>
<tr>
<td><strong>Work order activity rules</strong></td>
<td>The rules must be setup for WM type work orders, as the system is setup to always use document type 'WM' for PM system generated work orders.</td>
</tr>
</tbody>
</table>
Linking Service Types

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Calculating the PM-Projected Start Date</td>
<td>In many cases you may want the ability to project the start date of a PM Schedule and corrective work order. This is based on a piece of equipment’s service history and when the last time service was completed on the equipment. The system will calculate the projected start date using the following calculation: Current Meter Reading / 365 Days = AVG Per Day Service Interval Amount / AVG Per Day = Total Days Until Next Service Total Days Until Next Service + Last Completed Date = Projected Start Date To project a start date for an Assigned Work Order you must populate the model work order field with a valid model work order number in the Item PM Schedule. Run the Update PM Schedule Status program P12807, making sure that processing option 7C is populated with a “1”. Before You Begin: ■ Set up your Equipment Master (P1201) ■ Set up your Item PM Schedule (P1207) ■ Set up your Model Work Order (P48011)</td>
</tr>
</tbody>
</table>

| Updating the PM Schedule Status | The P12807 program updates the PM Schedule Status and is run after there has been a change in your meter readings. After making a net increase in your meter readings (P12120), you can now run the P12807 again. Make sure you have the correct Through Date selection in processing option 1 of Update PM Schedule Status (P12807). Enter a “1” in option 7C, and Data Select on your item number. **Note:** The P12807 will calculate the Service Intervals Miles, Fuel, and Hours using the formula listed above for the project start date. To calculate the Service Interval Days, the P12807 adds the amount of days entered in the field to the last completed date. |

### 15.3 Linking Service Types

**Navigation**

**From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance**

**From Equipment/Plant Maintenance (G1315), choose Item PM Schedule**

For each piece of equipment that you maintain, you can link several related service types to a primary service type. For example, for a particular piece of equipment, you might set up the following:

■ A primary service type for a 1000-hour inspection

■ A linked service type for a 500-hour inspection

When the primary service type is scheduled to be performed, the linked service types will be scheduled at the same time. This reduces equipment downtime and the possibility of performing unnecessary maintenance.

You use threshold percentages to specify when the system should include the maintenance tasks for linked service types when it schedules the primary service type. A threshold percentage is the percentage of a service interval that you define as the trigger for maintenance to be scheduled. For example, you might set up a service type
to be scheduled every 100 hours with a threshold percentage of 90 percent. When the equipment accumulates 90 hours, the system schedules the maintenance.

The system schedules the related maintenance to be performed with the primary maintenance if the equipment is within the threshold percentage you specify. If the system has already scheduled the PMs for the linked service types when the primary service type is due to be scheduled, the system might cancel the work orders or process them normally, depending on the current status of the PMs and the maintenance rules that you define for the primary service type.

You can specify whether the system creates a separate work order for each linked service type, or combines maintenance tasks for all linked service types into the work order for the primary service type. You can also specify how the system processes work orders that the system creates for linked service types that have been scheduled before the primary service type. For example, if the system has already created a work order for a linked service type when the primary service type becomes due, you can specify the status that the system assigns to the existing work orders, such as complete or canceled.

To link service types
On Item PM Schedule

**Figure 15–3  Item PM Schedule screen**

1. Complete the following field:
   - Item Number
2. Choose Assoc.
3. On Associated Service Types, complete the following for each associated service type on a separate line in the following field:

- Service Type
- Thresh (Threshold) %
- Thresh Day(s)
- SW (Separate Work Order)
- WO St

**Note:** Complete the Work Order Status field only if you entered either a 2, 3, or N in the SW field.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Thresh | A percentage measure that indicates how close a piece of equipment is to needing maintenance. This percentage is based on the greater of the actual date, miles, hours, or fuel consumption. A percentage of 090 indicates that the piece of equipment is 10% away from needing maintenance. A percentage greater than 100 indicates that maintenance is past due.  

**Note:** Miles, hours, and fuel are only examples of statistical units. You can define other statistical units appropriate to your organization within the Equipment/Plant Management automatic accounting instructions. |
Creating a Maintenance Loop

Create a PM Schedule

15.4 Creating a Maintenance Loop

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose Item PM Schedule

Create a maintenance loop when you need to perform identical routine maintenance
tasks, such as equipment inspections on multiple pieces of equipment.

When you use maintenance loops, you eliminate the need for separate work orders for
each piece of equipment that you inspect. For example, if you have 25 pumps of
similar style and configuration for which you perform a routine inspection every
week, you can:

- Set up a PM service type to perform a weekly inspection for one pump.
- Apply the other pumps to the PM for the first pump.

When the service type for the weekly inspection comes due, the system generates a
PM for each pump, but generates only one work order for the original pump. When
the system creates a work order for a maintenance loop PM, it stores the associated
equipment in the work order record type that you specify in equipment constants.

The system only recycles the original PM. It does not recycle the PMs for the
associated equipment.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Days</td>
<td>A daily measure of how close an equipment maintenance line item is to being eligible for being performed, taking into account the greater of the actual date, miles, hours, or fuel consumption.</td>
</tr>
<tr>

<tr>
<td>Note: You can enter Y for 1 or N for 2.</td>
<td></td>
</tr>
</tbody>
</table>

See Also:

- Section 37.3, "Setting Up Maintenance Rules"
You can create a maintenance loop using a virtual or logical piece of equipment, such as a production line or department. The logical equipment encompasses the equipment that you want to include in the loop. If you use a logical piece of equipment as the basis for a maintenance loop, you must create an equipment master for the logical piece of equipment.

15.4.1 Before You Begin

■ Complete the steps to create a PM service type for the maintenance loop. See Section 14.3.1, "Creating PM Schedules for Each Piece of Equipment".

To create a maintenance loop

On Item PM Schedule

1. Complete the following field:
   ■ Item Number

2. Choose Maintenance Loops (Option 7).

Figure 15–5 Maintenance Loops screen

3. On Maintenance Loops, complete the following field for each piece of equipment for which you want to perform the specified service type:
   ■ Item Number

| Equipment items and loops | A specific equipment master record can be set up to track loops. The PM Schedule will be entered for this virtual equipment item. All of the costs will be recorded against this equipment master record, but a detailed PM history will be recorded for each equipment item in the loop. |

15.5 Creating a Model PM Schedule

Navigation

From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance

From Equipment/Plant Maintenance (G1315), choose Item PM Schedule

Create a model PM schedule to store PM schedule information that you want to apply to multiple pieces of equipment with identical category codes. When you need to create PM schedules for equipment with identical category codes, you can use the model PM schedule to save data entry time.

The system stores model PM schedules in a separate table, which it accesses when you apply a particular model to a specific piece of equipment. After you apply a model PM schedule to a piece of equipment, you can modify the PM schedule to satisfy any unique maintenance requirements of that equipment.

Creating a model PM schedule consists of the following tasks:

- Setting up a model PM schedule
- Applying a model PM schedule to a piece of equipment

To set up a model PM schedule
On Item PM Schedule

1. Complete any combination of equipment category codes for which you want the model to apply.
Caution: Do not enter an Item number.

2. For each service type you want to include, complete the following field:
   - Service Type

3. For each service type you enter, complete the following optional field:
   - Schedule Date

4. If you did not enter a schedule date, complete any of the following optional service interval fields for each service type:
   - Days
   - Miles
   - Fuel
   - Hours

5. Choose Dtls.

6. If you use model work orders, complete the following field:
   - Model WO Number

7. Complete the following optional fields:
   - Multiple WO
   - Frequency
   - Priority
   - Estimated Occur
   - Predictive Flag
   - Cat Code 1
   - Cat Code 2
   - Remark

To apply a model PM schedule to a piece of equipment

On Item PM Schedule

1. Complete the following field:
   - Item Number

2. Enter I in the following field:
   - Action Code

3. Choose Model Maintenance Schedule.

   The system searches for a model PM schedule with category codes that match the equipment specified. When the system locates a model, it automatically enters service types and scheduling information on the Item PM Schedule based on values from the model.

<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revising information from a model PM schedule</td>
<td>You can revise any of the fields on Item PM Schedule that the system entered from a model PM schedule. However, you can only revise the value in the Multiple Work Order field when the status of the PM is 01.</td>
</tr>
</tbody>
</table>

15.6 Creating a Model Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose Item PM Schedule

You can create model work orders for any service type on a PM schedule. When you create a model work order, the system assigns it a unique number. Depending on how you set processing options on Update PM Schedule Status, the system automatically generates a new work order based on the model each time the service type comes due.

To create a model work order
On Item PM Schedule
1. Choose WO for each service type line that you want to create a model work order.

2. On Equipment Work Order Entry, complete the steps to create a work order. Write down the work order number.
3. To return to the Item PM Schedule, choose Exit.
4. On Item PM Schedule, choose Dtls.
5. Complete the following field for each service type:
15.6.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Assigning equipment numbers to model work orders</td>
<td>You do not need to enter an item number on the model work order. The system automatically assigns the item number from the PM schedule for which the work order applies.</td>
</tr>
<tr>
<td>Using an existing work order as a model</td>
<td>You can use any existing work order as a model work order.</td>
</tr>
</tbody>
</table>

- Chapter 20, "Create Corrective Work Orders" for more information about creating work orders
- Chapter 43, "Update PM Schedule Information" for more information about generating work orders based on models

15.6.2 Processing Options

See Section 54.1, "Item PM Schedule (P1207)"
This chapter contains these topics:

- Section 16.1, "Working with Meter Readings"
- Section 16.2, "Entering Meter Readings"
- Section 16.3, "Working with Meter Estimates"
- Section 16.4, "Reviewing Meter Readings"

16.1 Working with Meter Readings

Work with meter readings when you need to enter and update meter information about your equipment. You use meter readings to monitor equipment use and trigger maintenance tasks based on accumulated statistical units, such as miles. For example, you can specify that maintenance for a machine or piece of equipment be scheduled based on mileage, elapsed time (hours), fuel consumption, cycles, tonnage, and so on.

You can define as many accounts for statistical units as you need. However, you can use only three types of statistical units to trigger maintenance. You determine the statistical units you want to use.

In addition, you can set up meter estimates and update meters for equipment for which the usage is consistent and predictable, such as assembly line machinery that runs the same number of hours or produces the same number of parts in each production cycle.

You can also review the meter readings for any piece of equipment.

16.2 Entering Meter Readings

Navigation

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Meter Readings

You can enter meter readings in either of two ways:

- Enter meter readings for a piece of equipment
- Enter meter readings for multiple pieces of equipment

Enter and update meter readings for individual pieces of equipment when you need to record equipment usage on a piece-by-piece basis. In addition, you can update equipment records to indicate that a meter was replaced due to damage. You can also indicate when a meter rolls over. A meter rollover is the point at which a meter has reached its maximum value and reverts to a zero reading.
Enter and update meter readings for multiple pieces of equipment if you are:

- Updating meter readings for all equipment for which the usage is the same, such as for multiple pieces of production equipment that work the same number of hours on a given day
- Entering current meter readings for multiple pieces of identical new equipment

You use selection criteria to specify for which pieces of equipment the system updates meter information.

### 16.2.1 Before You Begin

- Verify that the following AAIs are set up:
  - AT00
  - FMA
  - FMB
  - FMC
  - FMD
  - FME

**See Also:**
- Section 35.2.3, "Setting Up Equipment/Plant AAIs"

**To enter meter readings for a piece of equipment**

*On Meter Readings*

**Figure 16–1  Meter Readings screen**

1. To locate a piece of equipment, complete any combination of the following fields:
   - Thru Date/Period
Entering Meter Readings

- Description
- Responsible BU
- Equipment Status
- Location
- Skip to Item Number
- Category Codes
- Company
- Inventory Number

**Note:** If you change any values in the fields above, choose the Enter action to refresh the display.

2. Complete only one of the following meter reading fields:
   - Current Meter Reading
   - Net Increase

3. Choose More Details.

![Figure 16–2 Meter Readings screen (Details area)](image)

4. Complete the following optional fields, if appropriate:
   - Original Reading
   - Reading at Change
   - New Reading
   - Rollover Amount
   - Subledger
5. To enter a meter reading for another statistical account, choose Display Alternate Panel Format.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Original Reading</td>
<td>The beginning reading of miles, hours, or fuel for a specific piece of equipment. Form-specific information To calculate the total lifetime hours for a piece of equipment, subtract the original reading from the current reading. For example, a piece of equipment with a current reading of 5,000 hours and an original reading of 2,000 hours has accrued 3,000 lifetime hours.</td>
</tr>
<tr>
<td>Reading at Change</td>
<td>For a change in meters, the reading on the old meter at the time it was removed.</td>
</tr>
<tr>
<td>New Reading</td>
<td>For a change in meters, the reading on the new meter at the time it was installed.</td>
</tr>
<tr>
<td>Rollover Amount</td>
<td>This is the amount the meter would show just before the point it rolls over to a value of zero. For example, a rollover amount of 1000 indicates that the meter rolls over every one thousand units.</td>
</tr>
</tbody>
</table>

16.2.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Meter rollover</td>
<td>You must complete the following fields in the fold area if you want the system to calculate the original reading when an equipment meter rolls over: ■ Rollover Amount ■ Current Reading</td>
</tr>
<tr>
<td>Meter replacements</td>
<td>You must complete the following fields if you replace the meter on a piece of equipment due to meter failure or damage: ■ Current Reading ■ Reading at Change ■ New Reading</td>
</tr>
<tr>
<td>Updating original readings</td>
<td>You enter a value in the Original Reading field only once. After a piece of equipment accumulates units, you should never have to change the original readings. When you enter meter information for a piece of used equipment, enter the actual meter reading shown on the face of the meter at the time you place the equipment in service. The system will update the original reading when the meter rolls over, or when you perform a meter replacement.</td>
</tr>
<tr>
<td>Calculating the lifetime meter reading</td>
<td>The system uses lifetime meter readings in general ledger transactions and when it updates the Item Balances table. To calculate the lifetime meter reading for a piece of equipment, subtract the original reading from the current reading. For example, the current reading is 5,000 hours and the original reading is 2,000 hours. The lifetime meter reading is 3,000 hours.</td>
</tr>
</tbody>
</table>
To enter meter readings for multiple pieces of equipment

On Meter Readings

1. To limit your equipment search, complete any of the following fields:
   - Thru Date/Period
   - Description
   - Location
   - Equipment Status
   - Skip to Item Number
   - Inventory Number
   - Category Codes
   - Company

2. Choose Global Update.

Figure 16–3  Global Master Update screen

3. On Global Meter Update, complete any of the following fields:
   - Fuel
   - Miles
   - Hours
   - Subledger

If you are entering a new reading, you can use either of these fields. You can either type over the current reading with the new reading, or use the net increase to enter the change since the last meter reading.

You can use the Meter Readings - Z File (P12120Z) processing program to call Meter Readings (P12120) as a batch process and use that data instead of data you enter manually; to create or update the Asset Balance file (F1202) and Account Ledger file (F0911).

See Appendix B, "Import Mass Data into Equipment Plant Maintenance" for more information.
4. To complete the process, choose Update.
   The system updates meter readings for all equipment that matches the selection
criteria you define.

16.2.3 Processing Options
See Section 54.2, "Odometer Reading Update (P12120)"

16.3 Working with Meter Estimates
You can use meter estimates to update meter readings for equipment whose usage is
consistent and predictable. For example, assume you have a production line with
multiple pieces of equipment. The production line runs 16 hours each day. You can set
up meter estimates for each piece of equipment that indicate 16 hours per day. You can
then update the meter readings each day, or set up your system to update the meter
readings automatically at the end of each day.

Working with meter estimates consists of the following tasks:
- Setting up meter estimates
- Updating meter readings based on estimates

16.3.1 Setting Up Meter Estimates

Navigation
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Meter Estimates

You must set up meter estimates to provide the system with information about the
equipment for which you want to use meter estimates.

To set up meter estimates
On Meter Estimates
1. To limit the equipment for which the meter estimates apply, complete any combination of the following fields:
   - Company
   - Description
   - Subledger
   - Subledger/Type
   - Business Unit
   - Location
   - Item Number
   - Category Codes

2. Complete the following field for each piece of equipment for which you want to apply an estimated meter reading:
   - Estimated Hour Meter

   The name of the meter for this field might be different, depending on how you set up processing options.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimated Hour Meter</td>
<td>Estimated Operating Meter Reading is the estimated units that can be applied to the operating miles/hours meter.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Updating meter estimates</td>
<td>You can choose Update Meter Estimates to update meter estimates directly from the Meter Estimate screen. When you choose Update Meter Estimates, the system runs version XJDE0001 of the Update Meter Estimates program.</td>
</tr>
</tbody>
</table>

16.3.3 Processing Options

See Section 54.3, "Meter Reading Estimates (P1306)"

16.3.4 Updating Meter Readings Based on Estimates

**Navigation**
- From Equipment/Plant Management (G13), choose Equipment Information
- From Equipment Information (G1311), choose Update Estimates

After you set up meter estimates for equipment, you update the meter readings at regular intervals. The system uses the estimates that you enter on Meter Estimates as the basis for updating meters.

When you choose Update Meter Estimates, the system displays a DREAM Writer versions list. The versions list contains DEMO versions that you can run, or copy and modify to suit your needs. When you run a version, the system displays Processing Options Revisions before submitting the job for processing.

16.3.5 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Automatically updating meter estimates</td>
<td>You can ensure that the system regularly updates the meter readings for equipment for which you have set up meter estimates by running Update Estimates as part of your unattended operations.</td>
</tr>

</tr>
</tbody>
</table>

See Also:
- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing a DREAM Writer version

16.3.6 Processing Options

See Section 54.4, "Update Meter Estimates (P13806)"

16.4 Reviewing Meter Readings

**Navigation**
- From Equipment/Plant Management (G13), choose Equipment Information
- From Equipment Information (G1311), choose Meter Inquiry
You can review the meter readings for any piece of equipment. You can also specify the time period for which you want to review meter readings.

**To review meter readings**

On Meter Inquiry

![Meter Inquiry screen](image)

1. Complete the following fields:
   - Item Number
   - Date From
2. Complete the following optional fields:
   - Thru
   - Subledger
   - Subledger Type

### 16.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revising meter readings</td>
<td>You can revise meter readings for any piece of equipment directly from Meter Inquiry. Choose Meter Reading Revisions. The system displays the Meter Reading Revisions screen.</td>
</tr>
</tbody>
</table>
17.1 Updating PM Schedule Information

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose Update PM Schedule Status

Update PM schedule information to change the status of PMs. For example, you can specify that the system update all PMs from status 01 (Maintenance Task Defined) to status 50 (Maintenance Due) for all pieces of equipment due for scheduled maintenance based on their service intervals. You can also change the status of a PM before the equipment reaches its scheduled maintenance interval to allow time for scheduling parts and labor resources. In addition, you can specify which PMs you need to update, as well as the date that the update becomes effective.

Update PM Schedule Status is a batch program. When you choose Update PM Schedule Status, the system displays Processing Options Revisions before submitting the job for processing. After you select the processing options you want to apply to the update, a message appears, notifying you that the batch was submitted for processing. When you run this program, the system automatically:

- Updates the current miles, hours, and fuel consumption readings
- Calculates the current maintenance interval, based on the last maintenance performed
- Changes the status for each PM service type, if necessary
- Generates PM work orders, if necessary
17.1.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generating work orders using Update PM Schedule Status</td>
<td>You can use a processing option to specify that the system generates PM work orders when it updates the PM schedule status. You must associate a model work order with a PM to use this feature. When the system generates a work order, it:</td>
</tr>
<tr>
<td></td>
<td>- Uses the service type description on the Item PM Schedule or the description from the model work order for the work order description, depending on how you set up the Maintenance Rules.</td>
</tr>
<tr>
<td></td>
<td>- Enters the parent number of the equipment in the Cross-Reference field on the work order. You can then search for the work order using the parent/component relationship. You can use a processing option to specify whether the system selects the equipment's immediate parent, its top level component, or the value from the model work order for the cross-reference value.</td>
</tr>
<tr>
<td></td>
<td>- Uses the priority from the PM service type if you have not defined the priority on the model work order.</td>
</tr>
<tr>
<td></td>
<td>You can specify that the system update the PM schedule status without generating work orders and rerun the program later, specifying the system to generate work orders without updating the PMs.</td>
</tr>
<tr>
<td>Accumulating multiple work orders</td>
<td>Depending on how you have set the multiple work order flag for a service type that is due to be performed, the system might create a new PM cycle, regardless of the status of the maintenance task. If you do not want the system to recycle the PM for the service type until previously scheduled maintenance has been completed, you must leave the Multiple Work Order field on the PM schedule blank. Other values allow the system to reschedule the maintenance task and accrue multiple work orders.</td>
</tr>
<tr>
<td></td>
<td>See Section 14.3.1, &quot;Creating PM Schedules for Each Piece of Equipment&quot; for more information about multiple work orders.</td>
</tr>
<tr>
<td>Updating PMs for equipment under warranty</td>
<td>When you change or update a warranty PM service type to complete, the system does not create a new PM cycle for that service type and piece of equipment.</td>
</tr>
<tr>
<td></td>
<td>See Section 14.3.1, &quot;Creating PM Schedules for Each Piece of Equipment&quot; for more information about creating PM service types for equipment under warranty.</td>
</tr>
</tbody>
</table>

17.1.2 Processing Options

See Section 54.5, "Set Maintenance Status for Scheduled Maintenance (P12807)".
Change the Status of PMs to Complete

This chapter contains this topic:
- Section 18.1, "Changing the Status of PMs to Complete"

18.1 Changing the Status of PMs to Complete

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose PM History and Completion

You must notify the system when you have completed or canceled a PM for a piece of equipment. You notify the system that you have completed or canceled the PM for selected equipment by changing the status of a PM to complete or canceled. When you change the status of a PM to complete or canceled, the system:
- Maintains a record of the PM with a status of 99 (Complete), or 98 (Canceled)
- Generates a new PM with a status of 01 and begins a new PM cycle (depending on the value of the multiple work order flag on the PM schedule)

The system does not begin a new PM cycle for warranty service types.

You can change the status of PMs by individual piece of equipment or globally by using search criteria to select PMs for a group of equipment.

You can use processing options to automatically update the status of a PM work order when you change the status of a PM. You can also use processing options to update the meter readings in the Item Balances table (F1202) and the Account Ledger table (F0911) in the G/L when you enter meter readings on PM History and Completion.

You can choose from two display formats on PM History and Completion. One format appears with the completion date and completed meter readings on the first detail line of a PM record. The other format appears with the percent due, planned date, and model work order number on the first detail line of the PM record. Regardless of the format that you choose, fields that do not appear on the first detail line are accessible in the full detail portion of the screen. You use processing options to specify the format that you want to initially appear. You can also view the alternate format interactively by choosing a function.

You can use processing options to specify whether you want the system to display actual meter readings or lifetime maintenance amounts on PM History and Completion. The actual meter reading is the number that appears on the actual meter located on a piece of equipment. The lifetime maintenance amount is the total lifetime usage of the equipment. In cases such as meter changes or meter rollovers, the lifetime
maintenance amount is not the amount shown on the meter. If you select actual meter reading for this processing option, you must enter the meter reading as it appears on the actual meter. The system calculates the lifetime maintenance amount from this amount.

Whether you choose to display actual meter readings or lifetime maintenance amounts, the system always uses lifetime maintenance amounts to calculate service intervals.

See Also:
- Chapter 16, "Work with Meter Readings" for more information about meter readings
- Section 14.3.1, "Creating PM Schedules for Each Piece of Equipment" for more information about warranty service types

To change the status of PMs to complete
On PM History and Completion (with processing options set to display completed meter readings on first detail line of the PM record)

Figure 18–1  PM History & Completion screen

1. To choose the PMs to complete, complete any combination of the following fields:
   - Service Type From/Thru
   - Status From/Thru
   - Completed Date From/Thru
   - Scheduled Date From/Thru
   - Work Order No.
   - Priority
   - PM Cat Code 1
■ PM Cat Code 2
■ Downtime From/Thru
■ % Due Range From/Thru
■ Location
■ Asset Number
■ Equipment Category Codes 1 - 10

Your system might be set up to display only the first five equipment category codes. See Section 35.2.1, "Setting Up Equipment Constants" for more information.

2. To change the status of the PM, complete the following fields:
   ■ Status
   ■ Completed Date

3. To update the statistical units in the Maintenance Schedule table (F1207), enter values in the following optional Completed Readings fields:
   ■ Miles
   ■ Fuel

4. Choose Full Detail.

5. Complete the following optional fields:
   ■ Hours
   ■ Assigned WO
   ■ Remark
Changing the Status of PMs to Complete

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>St</td>
<td>A user defined code (12/MS) that indicates the maintenance status of a piece of equipment, such as 50 for maintenance due or 60 for waiting for parts. <strong>Note:</strong> Status code 98 is reserved for canceled maintenance. Status code 99 is reserved for completed maintenance. Status code 01, the default, is reserved for initial maintenance setup. <strong>Form-specific information</strong>&lt;br&gt;If you enter a status of 99, the system requires you to enter a date in the Completed Date field.</td>
</tr>
<tr>
<td>Completed Date</td>
<td>This is the actual date that maintenance was completed. <strong>Form-specific information</strong>&lt;br&gt;When you enter a value in this field and leave the Maintenance Status field blank, the system automatically updates the PM status to 99 (Complete).</td>
</tr>
<tr>
<td>% Due</td>
<td>A percentage measure that indicates how close a piece of equipment is to requiring maintenance. This percentage is based on the greater of the actual date, miles, hours, or fuel consumption compared to the threshold date, miles, hours, or fuel consumption. A percentage of 090 means that the piece of equipment is 10% away from requiring maintenance. A percentage greater than 100 means that maintenance is past due. <strong>Form-specific information</strong>&lt;br&gt;You can enter numbers in the % Due Range From and Thru fields to limit your search to pieces of equipment that are within a certain percent of requiring maintenance.</td>
</tr>
<tr>
<td>Compl. Hours</td>
<td>Actual hours at completion of maintenance.</td>

Overview to Work Order Life Cycle

This chapter contains these topics:

- Section 19.1, "Objectives"
- Section 19.2, "About the Work Order Life Cycle"
- Section 19.3, "Work Order Process Flow"

19.1 Objectives

- To understand the events in the work order life cycle
- To create work orders for corrective maintenance
- To set up projects using multiple work orders

19.2 About the Work Order Life Cycle

Use work orders to manage the work flow of your maintenance tasks and projects. You can manage all aspects of a maintenance task or project, including the following:

- Creating work orders for preventive and corrective maintenance
- Purchasing parts and materials and committing inventory to a work order
- Scheduling multiple tasks and crafts, such as mechanical, electrical, and so on, to a work order
- Tracking the progress of a work order by status
- Tracking work order costs, such as materials, labor, and so on
- Recording unlimited detailed information about a work order
- Completing and closing a work order

The steps through which a work order must pass to accurately communicate the progress of the maintenance tasks it represents make up the life cycle of the work order. The work order life cycle applies to work orders for preventive maintenance and corrective maintenance.

The work order life cycle consists of the following tasks:

- Creating corrective work orders
- Setting up a project
- Reviewing and approving work orders
- Working with work orders
About the Work Order Life Cycle

- Swapping a component
- Purchasing parts for a work order
- Adding costs to work orders
- Reviewing work order information

19.2.1 Features of the Work Order Life Cycle

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Paperless processing</td>
<td>Save paper when you manage your maintenance tasks and projects using work orders. You enter work orders online and perform most of the subsequent processing without relying on printed documents.</td>
</tr>
<tr>
<td>Work order creation</td>
<td>You can create a single work order or a group of work orders quickly and easily, with minimal preplanning. You can set processing options and use parent work orders to direct the system to enter default values for a variety of work order information when you create work orders. When you use processing options and parent work orders, you save time and reduce the possibility of errors.</td>
</tr>
<tr>
<td>Work order approval</td>
<td>Establish approval controls for a work order based on a variety of criteria, including work order type, status, and the currency amount of the work order. For example, you can specify that all maintenance work orders must be approved before any work can begin. You can also specify who must approve the work orders and the threshold currency amount for which each person is responsible. You can also review the approval status of a work order.</td>
</tr>
</tbody>
</table>
| Work order activity rules| You can define work order activity rules that differ by work order type. You can use these rules to track a work order in its life cycle, review work orders that apply to certain procedures, and prepare reports based on a work order’s current status. You can also define the flow of statuses a work order must follow during its life cycle. In addition, you can define any of the following:  
  - Whether the work order is active or inactive at a particular status  
  - Whether to commit inventory at a particular status  
  - Whether to run the capacity update at a particular status  
  - Whether to change the status of the PM associated with a work order  
  - Whether to prevent changes to a work order |
| Work order location      | You can locate a work order using a variety of information. For example, you can limit your search for a work order by using any combination of the following information:  
  - The job or business unit  
  - The address book numbers of the originator, customer, manager, or supervisor  
  - The life-cycle status of a work order  
  - Any combination of the user defined category codes  
  - The type of work order  
  - The priority given to a work order  
  - Start and completion dates |
### Feature Description

<tr>
<td></td>
<td>■ Type and priority</td>
</tr>
<tr>
<td>Simple budgeting and</td>
<td>You can track the simple estimate and budget requirements of a work order. For example, you can use the Estimated Hours and Amounts fields on</td>
</tr>
<tr>
<td>estimate controls</td>
<td>the Cost by Work Order screen to enter budget information, and then update the information using Backlog Management. You can also track the information from Backlog Management and Cost Accounting screens. In addition, you can use a variety of reports to compare estimates with actual information.</td>
</tr>
<tr>
<td>Multiple control dates</td>
<td>You can track each work order according to control dates that you define, such as:</td>
</tr>
<tr>
<td></td>
<td>■ The transaction date (the date that a work order is entered into the system)</td>
</tr>
<tr>
<td></td>
<td>■ The start date</td>
</tr>
<tr>
<td></td>
<td>■ The planned completion date</td>
</tr>
<tr>
<td></td>
<td>■ The actual completion date</td>
</tr>
<tr>
<td>Levels of responsibility</td>
<td>You can assign several levels of responsibility to a work order, such as:</td>
</tr>
<tr>
<td></td>
<td>■ The job or business unit to which the work order is charged</td>
</tr>
<tr>
<td></td>
<td>■ The originator of the work order</td>
</tr>
<tr>
<td></td>
<td>■ The manager</td>
</tr>
<tr>
<td></td>
<td>■ The supervisor</td>
</tr>
<tr>
<td>Work order description</td>
<td>You can describe work orders briefly using two- or three-word descriptions, or you can provide much more detail. You can also enter different types of information in the record types you assign to a work order, such as:</td>

This chapter contains these topics:

- Section 20.1, "Creating Corrective Work Orders"
- Section 20.2, "Entering Basic Work Order Information"
- Section 20.3, "Assigning Estimated Costs to a Work Order"
- Section 20.4, "Assigning Category Codes to a Work Order"
- Section 20.5, "Adding Text to a Work Order"
- Section 20.6, "Working with Work Order Supplemental Information"
- Section 20.7, "Assigning Parts to a Work Order"
- Section 20.8, "Assigning Labor Routing to a Work Order"
- Section 20.9, "Copying a Work Order"
- Section 20.10, "Creating a Work Order for Unscheduled Maintenance"

20.1 Creating Corrective Work Orders

You create corrective work orders in Equipment/Plant Maintenance to formally request and schedule corrective maintenance and other unscheduled maintenance, such as emergency repairs. You also use corrective work orders to record and communicate all details pertaining to the maintenance task to others who are involved.

You must create a work order master for every work order that you want to track. The master consists of basic information that defines the work order, such as the work order number, description, and the business unit to which the work order is charged. You can also enter additional information to further identify the work order, such as category codes and user defined supplemental information.

The system stores work order master information in the Work Order Master table (F4801).

You can assign record types to work orders and then enter descriptive information into each record type to communicate important information about a task to others who are involved. For example, you might want to include special instructions, information about parts and tools needed to complete the task, and so on.

In addition, you can copy parts from a standard parts list or assign non-standard parts to a work order. You can also assign detailed labor routing instructions to a work order. For example, you can:

- Identify each work center needed to perform the maintenance tasks
- Specify the sequence in which the tasks are performed
- Indicate the estimated duration of each maintenance task

You can also create work orders by duplicating the information from existing work orders for those tasks that are similar to other tasks you perform.

### 20.1.1 Before You Begin
- Define your chart of accounts for the charge-to business unit information. See Creating Your Chart of Accounts in the *JD Edwards World General Accounting I Guide*.

### 20.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work order activity rules</td>
<td>Different work order activity rules might be in effect, based on the document type and work order type that you assign to a work order. For example, if the activity rules specify that the subledger is inactive at a particular status and you assign that status to the work order, you will not be able to apply future transactions to the work order. Review the work order activity rules prior to assigning a document type and work order type. See Chapter 38, &quot;Set Up Work Orders&quot;.</td>
</tr>
<tr>
<td>Work order approval routing</td>
<td>Different approval routings might be in effect, based on the document type, work order type, status, and approval type you assign to a work order. For example, you might create a work order for which you cannot assign a particular status until the work order is approved. Review the work order approval routing prior to creating a work order. See Chapter 38.5.5, &quot;Setting Up Work Order Approval Routes&quot;.</td>
</tr>
<tr>
<td>Assigning default values</td>
<td>You can use processing options to direct the system to automatically enter default values in the following fields on Work Order Entry: Type, Priority, Work Order Type (Document Type), Category Code fields 1 - 3. You can also retrieve numerous default values from a parent work order, if you specify one. For example, you can use values from a parent work order to enter the following fields: Work Order Type, Start Date, Planned Completion Date. In addition, you can use processing options to automatically complete all of the address book fields, such as Manager and Supervisor, if you defined them when setting up the system. See Chapter 38.2, &quot;Setting Up Default Managers and Supervisors&quot;.</td>
</tr>
</tbody>
</table>
20.2 Entering Basic Work Order Information

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Work Order Entry

Depending on the complexity of your maintenance organization, you can create work orders that include only the most basic information required by the system, such as the work order number, description, business unit, and branch. Or you can include equipment numbers, a variety of explanations, scheduling dates, and control codes. You can also enter budgeting information to help you track costs and resources.

To enter basic work order information

On Work Order Entry

**Figure 20–1  Work Order Entry screen**

1. Complete the following fields:
   - Description
   - Charge to BU
   - Branch

   The Branch field might already contain a default value.
2. Complete the following optional field:
   ■ Start Date
   You must enter a start date if you plan to attach routing instructions or a parts list.
3. To assign parts from a standard parts list, complete the following field:
   ■ Stnd Parts/Inst (Standard Parts or Instructions)
4. Complete the following optional address book fields:
   ■ Manager
   ■ Customer
   ■ Assigned to
5. Complete the following optional work order date fields:
   ■ Planned Comp (Completion Date)
   ■ Completed Date
   ■ Requested Date
6. To prevent the entry of transactions to the work order, complete the following field:
   ■ Subledger Inactive
7. To enter additional information for the work order, complete any of the remaining fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch</td>
<td>A code that represents a high-level business unit. It can be used to reference a branch or plant that might have departments or jobs, which represent lower-level business units (data item MCU), subordinate to it. For example:</td>
</tr>
<tr>
<td></td>
<td>■ Branch/Plant (MMCU)</td>
</tr>
<tr>
<td></td>
<td>■ Dept A (MCU)</td>
</tr>
<tr>
<td></td>
<td>■ Dept B (MCU)</td>
</tr>
<tr>
<td></td>
<td>■ Job 123 (MCU)</td>
</tr>
<tr>
<td></td>
<td>Business unit security is based on the higher-level business unit.</td>
</tr>
<tr>
<td>Start Date</td>
<td>This is a start date that you can enter, or an automatic start date which the planning system calculates using a backscheduling routine. The routine starts with the required date and offsets the total lead time to calculate the appropriate start date. Will default from system date or you can enter a date.</td>
</tr>
<tr>
<td>W.O. Date</td>
<td>The date the work order was entered into the system.</td>
</tr>
<tr>
<td>Requested</td>
<td>The date that an item is to arrive or that an action is to be complete.</td>
</tr>
</tbody>
</table>
20.2.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment under warranty</td>
<td>When you create a work order for a piece of equipment that is under warranty, a warning message appears to alert you that a warranty is in effect. You indicate that a piece of equipment is under warranty by creating PM service types for the warranty. See Chapter 14.3.1, &quot;Creating PM Schedules for Each Piece of Equipment&quot; for more information about creating PM service types for equipment under warranty.</td>
</tr>
<tr>
<td>Deleting a work order</td>
<td>You can delete any work order unless it has any of the following characteristics:</td>
</tr>
<tr>
<td></td>
<td>■ It is used as a parent work order.</td>
</tr>
<tr>
<td></td>
<td>■ It has any account ledger transactions associated with it.</td>
</tr>
<tr>
<td></td>
<td>■ It has a parts list or a routing attached.</td>
</tr>
<tr>
<td>Model work orders</td>
<td>A model work order is defined by the presence of an X in the first position of the second line of description for the user defined code for Work Order Type (system 00, type TY). You can specify that the system exclude model work orders from Backlog Management searches. See Chapter 15.6, &quot;Creating a Model Work Order&quot; for more information on using model work orders. See Chapter 36.1, &quot;Setting Up User Defined Codes&quot; for more information about work order types.</td>
</tr>
<tr>
<td>Parts lists and routings for model work orders</td>
<td>When you choose Parts List from a model work order, the system accesses the Standard Parts List screen. When you choose Routings, the system accesses the Standard Instructions screen.</td>
</tr>
<tr>
<td>Work Order entry and the charge to BU field</td>
<td>If an equipment number is entered on the work order and the Charge to BU is left blank, the system will default the Charge to BU from the Equipment Master Responsible BU field.</td>
</tr>
</tbody>
</table>

20.2.2 Processing Options

See Section 55.1, "Equipment Work Order Entry (P48011)"

20.3 Assigning Estimated Costs to a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry
Assigning Estimated Costs to a Work Order

After you create a work order, you can use Work Order Cost Summary to assign estimated costs to the work order. You can use estimated costs to provide responsible individuals with budgeting information regarding the work order. In addition, depending on how you set up work order approvals, the estimated costs that you assign to a work order determine its approval routing. You can assign the following information on Work Order Cost Summary:

- Estimated hours
- Duration (the total time that is required to complete the work order)
- Estimated labor cost
- Estimated material cost
- Estimated costs not related to labor or material, such as subcontractor costs

Depending on how you have set up equipment constants, you can also enter actual costs for the work order.

To assign estimated costs to work order
On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Work Order Cost Summary.

   Figure 20–2  Work Order Cost Summary screen

3. On Work Order Cost Summary, complete any of the following fields:
   - Estimated Hours
   - Estimated Duration
   - Estimated Labor Cost
   - Estimated Material Cost
   - Estimated Other Cost

   Depending on how you set up equipment constants, you might not be able to enter values in the actual cost fields.

4. To assign actual work order costs, complete any of the following fields:
   - Actual Labor Cost
Assigning Category Codes to a Work Order

- Actual Material Cost
- Actual Other Cost

Depending on how you set up equipment constants, you might not be able to enter values in the actual cost fields.

5. Complete the following optional fields:
   - Actual Hours
   - Actual Duration

6. To calculate the total estimated and actual costs and the difference between them, choose Update with Redisplay.

### 20.3.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parts lists and labor routing</td>
<td>If you use parts lists and routings, the system enters cost information</td>
</tr>
<tr>
<td>instructions</td>
<td>from the parts list and the routing to the estimated cost fields on Work</td>
</tr>
<tr>
<td></td>
<td>Order Cost Summary. You cannot update these values on Work Order Cost</td>
</tr>
<tr>
<td></td>
<td>Summary.</td>
</tr>
</tbody>
</table>

### 20.4 Assigning Category Codes to a Work Order

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Work Order Entry

You can assign up to twenty category codes to a work order. Use category codes to further identify and organize work orders that have similar characteristics. This is especially useful to analyze and report on work order information from a variety of perspectives, such as shop, division, type of work, and so on. You can also analyze work order costs according to category codes. JD Edwards World provides several predefined category codes. You can use these or customize your own category codes. You define all values for each category code.

You can also categorize a work order by originator, supervisor, and standard description. In addition, you can specify a search cross-reference that the system uses to search for work orders. For example, if you enter an equipment number on the work order, the system enters the parent equipment number in the Search Cross Reference field.

### 20.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category code 1</td>
<td>Category code 1 is a four-character category code that appears on all</td>
</tr>
<tr>
<td></td>
<td>work order reports and most screens that are associated with work orders.</td>
</tr>
<tr>
<td>Work order codes</td>
<td>The system includes up to 20 category codes that you can define.</td>
</tr>
</tbody>
</table>
Assigning Category Codes to a Work Order

To assign category codes to a work order

On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Category Codes.

3. On Work Order/Rate Category Codes, complete any of the category code fields that you want to apply to the work order.

4. Complete the following optional address book fields:
   - Originator
   - Supervisor

5. To assign a standard description from the Generic Rates and Messages table to the work order, complete the following optional field:
   - Standard Description

6. Complete the following additional optional fields:
   - Work Order Flash Message
   - Search Cross Reference
   - Authorization for Expenditure

Depending on how you set processing options for Work Order Entry, the Search Cross Reference field might contain a default value.
### What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Std. Desc           | A user defined code (system 48, type SN) that is assigned to a standard note, message, or general narrative explanation. You can use this code to add instructional information to a work order. You set up codes for this field on Standard Description.  
  *Form-specific information* |
|                     | For Equipment/Plant Maintenance users: You can use this code to assign narrative text for a standard procedure. The information appears on the Item PM schedule and the work order routing. |
| W.O. Flash Message  | A user defined code (system 00, type WM) that indicates a change in the status of a work order. The system indicates a changed work order with an asterisk (*) in the appropriate report or inquiry screen field. The flash message is highlighted in the Description field of the work order.  
  *Form-specific information* |
|                     | The flash message appears as a highlighted message on Backlog Management, replacing the work order description. |
| Search X-Ref        | An alphanumeric value used as a cross-reference or secondary reference number. Typically, this is the customer number, supplier number, or job number. |
| AFE                 | A number that provides additional information about an object, such as an asset or a work order. You can enter information in this field to track an item that is Authorized for Expenditure. |

### Adding Text to a Work Order

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders  

From Equipment Work Orders (G1316), choose Work Order Entry

You can add additional text to further describe details about a work order by using record types assigned to work orders. For example, you might want to include an extended description of the maintenance task in record type A, special instructions in record type B, parts and tools needed in record type C, and so on.

Depending on the type of information that you need to include, you can enter text in two formats. You define the format for each record type when you set up work orders. The formats are:

- Description only
Description with three columns
You can also copy descriptive information from another work order.

To add text to a work order
On Work Order Entry

Figure 20–4 Work Order Entry screen

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose the Record Types function.
3. On Record Type Review, choose Select and Review for each record type to add text.

Figure 20–6  W. O. Detail Entry screen (Full Description of Request)

4. On Work Order Detail Entry, enter the appropriate information for the current record type.

5. Repeat steps 3 and 4 for each record type you want to add to the work order.
20.5.1 What You Should Know About

### Topic | Discussion
--- | ---
Extended descriptions for work orders | The system stores the extended description of work orders in record type A. You can review this record type on the Work Order Entry screen.

See Also:
- Chapter 20.9, "Copying a Work Order"
- Chapter 38.4, "Setting Up Record Types"

20.6 Working with Work Order Supplemental Information

You can add additional user-defined information to a work order. Use supplemental information to assist in tracking and reporting on work orders. For example, you might set up a supplemental data type associated with safety procedures and enter specific safety procedures for each work order.

After you have entered supplemental data, you can review the information using the following formats:

### Format | Description
--- | ---
By data type | You can review a list of additional work order information based on a particular supplemental data type. For example, assume that you have set up a supplemental data type for budget estimates. You can review a list of all work orders for which you have assigned the supplemental data type for budget estimates.

By work order | You can review a list of the additional information by supplemental data type that you assigned to individual work orders.

Adding supplemental data to work orders consists of the following tasks:
- Entering supplemental information to a work order
- Reviewing supplemental data by type
- Reviewing supplemental data by work order

20.6.1 Entering Supplemental Information to a Work Order

**Navigation**

From Work Order/Service Billing Processing (G48), choose Work Order Processing

From Work Order Processing (G4811), choose Supplemental Data

From Work Order Supplemental Data (G4813), choose Data Entry

Enter supplemental information to a work order when you need to record information that is not included on the work order header or in work order record types. You can use supplemental information to assist in tracking and reporting on work orders.
After you enter supplemental information to a work order, you can review the information by selecting a data type and reviewing all work orders that contain that data, or by reviewing all of the supplemental data for a specific work order.

See Also:

- Section 20.6.2, "Reviewing Supplemental Data by Type"
- Section 20.6.3, "Reviewing Supplemental Data by Work Order"

To enter supplemental information to a work order

On Data Entry

Figure 20–7  Data Entry screen

1. Complete the following field:
   - Order Number
2. For each type of information that you want to enter, choose Select and Update.
Figure 20–8  Work Orders screen (Equipment Listing)

3. On Work Orders, complete any of the appropriate fields.
4. Choose Detail.

Figure 20–9  Work Orders screen, Equipment Listing (Detail area)

5. Complete the appropriate fields.
20.6.2 Reviewing Supplemental Data by Type

Navigation
From Work Order/Service Billing Processing (G48), choose Work Order Processing
From Work Order Processing (G4811), choose Supplemental Data
From Work Order Supplemental Data (G4813), choose Inquiry by Data Type

You can review a list of additional work order information based on a particular supplemental data type. For example, assume that you have set up a supplemental data type for budget estimates. You can review a list of all work orders for which you have assigned the supplemental data type for budget estimates.

To review supplemental data by type
On Inquiry by Data Type

Figure 20–10 Inquiry by Data type screen

1. Complete the following field:
   - Type Data
2. To view additional information, choose Detail.
20.6.3 Reviewing Supplemental Data by Work Order

Navigation
From Work Order/Service Billing Processing (G48), choose Work Order Processing
From Work Order Processing (G4811), choose Supplemental Data
From Work Order Supplemental Data (G4813), choose Inquiry by Order

You can review a list of the additional information by supplemental data type that you assigned to individual work orders. This is particularly useful if you need to see at a glance all of the supplemental information you entered for a specific work order.

When you enter a work order number on Inquiry by Order, basic work order information appears, in addition to its supplemental data. For example, you can review the following information about the work order:

- Type
- Priority
- Status
- Work order dates, such as the start date and the completed date

To review supplemental data by work order
On Inquiry by Order
Assigning Parts to a Work Order

You can assign parts to a work order to satisfy parts requirements for maintenance tasks. Depending on how you set up your system, you can indicate how and when the system commits inventory to satisfy a work order’s parts requirements. For example, you can direct the system to commit inventory to a work order only at a particular work order status.

You can assign parts from a standard parts list that you enter when you create the work order. In addition, you can assign inventory parts that do not appear on a standard parts list, such as when you are creating a work order for an unanticipated emergency repair. You can also assign parts for which you do not maintain an inventory master, such as special order parts for which you rarely have a need. All parts inventory information applicable to a work order appears on Work Order Parts List.

Assigning parts to a work order consists of the following tasks:

- Assigning parts from a standard parts list
- Working with selected parts from inventory
- Assigning parts without an inventory master

Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to use Work Order Parts List:
  - System 30: Product Data Management
  - System 31: Shop Floor Control
Assigning Parts to a Work Order

- System 40: Inventory Base and Order Processing
- System 41: Inventory Management
- System 43: Procurement

Review processing options for the Section 27.2, "Reviewing Work Order Parts Lists". See Section 38.7, "Setting Up Standard Parts Lists and Work Order Instructions"

Verify that standard parts lists have been set up. See Section 38.7.4, "Setting Up a Standard Parts List".

See Also:
- Appendix A, "Inventory Concepts and Setup" for more information about inventory terms and concepts
- Section 38.7.4, "Setting Up a Standard Parts List" for more information about how the system commits inventory

20.7.2 Assigning Parts from a Standard Parts List

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry

You can assign parts to a work order from a standard parts list. This is especially useful when you create work orders for routine maintenance tasks that require identical parts.

When you assign parts from a standard parts list to a work order, you can use a processing option to specify whether the system automatically chooses the add option for all of the parts from the standard parts list, or leaves the option field blank, allowing you to include only certain parts. This is especially useful if the standard parts list is lengthy and you only need to select a few parts.

20.7.3 Before You Begin

- Verify that the following fields on Work Order Entry have been completed:
  - Standard Parts or Instructions
  - Start Date

- Install the following systems in order to access Work Order Parts List:
  - System 30: Product Data Management
  - System 31: Shop Floor Control
  - System 40: Inventory Base and Order Processing
  - System 41: Inventory Management
  - System 43: Procurement

To assign parts from a standard parts list
On Work Order Entry
1. To locate a work order, complete the following field:
   - Work Order Number
2. Choose Parts List.

*Figure 20–13  Work Order Parts List screen*

3. On Work Order Parts List, choose Copy BOM.

*Figure 20–14  Work Order Parts List screen (showing Copy from BOM fields)*

4. Review the following fields:
   - Copy From Bill of Material
   - Copy From Plant
The system assigns default values to these fields based on values from the work order.

5. Accept the default values or revise them if needed.

The system completes the Work Order Parts List screen with values from the standard parts list.

**Figure 20–15 Work Order Parts List screen**

7. On Work Order Parts List, choose Add Part for BOM Copy for each part you want to include on the parts list for the work order.

Depending on how you set up processing options, this option might already have been preloaded for each part from the standard parts list. If so, you can clear the option for each part that you do not want to include on the Work Order Parts List.

8. To complete the process, choose the Update with Redisplay.

<table>

</tr>
</thead>
<tbody>
<tr>
<td>LT</td>
<td>A code that controls how the system processes lines on a transaction. It controls the systems with which the transaction interfaces (General Ledger, Job Cost, Accounts Payable, Accounts Receivable, and Inventory Management). It also specifies the conditions under which a line prints on reports and is included in calculations. Codes include: S – Stock item J – Job cost N – Non-stock item F – Freight T – Text information M – Miscellaneous charges and credits W – Work order</td>
</tr>
</tbody>
</table>

20.7.5 Working with Selected Parts from Inventory

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry

You can assign parts that do not appear on a standard parts list, such as when you are creating a work order for an unanticipated emergency repair. If you need a part that is not currently available at your location, you can search for other locations that stock the part and assign them to the work order parts list.

When a part is unavailable, you can specify a substitute part. In addition, you can add explanatory text to any part that you include on a work order parts list.

Working with selected parts from inventory includes:
- Assigning selected parts from inventory
- Adding non-stock parts to a parts list
- Revising the location for a part
- Choosing a substitute part
- Adding explanatory text to a part

20.7.6 Before You Begin

- Set up substitute parts through the Inventory Cross Reference program. See Setting Up Item Cross-References in the JD Edwards World Inventory Management Guide for more information about assigning inventory cross-references.
To assign selected parts from inventory
On Work Order Entry

Figure 20–16  Work Order Entry screen

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Parts Lst.

3. On Work Order Parts List, access the field help on the following field:
   - Part

Figure 20–17  Item Search screen

4. On Item Search, search for specific parts by entering descriptive text in the following field:
   - Search Text
5. Complete the following field next to each part that you want to add to the work order parts list:
   - Quantity

6. Choose Exit.
   The system returns to the Work Order Parts List with your selection.

7. On Work Order Parts List, choose More Details.

8. Complete the following optional field:
   - Vendor

**To add non-stock parts to a parts list**

On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Parts List.

3. On Work Order Parts List, complete the following fields:
   - Part Number
   - Description
   - Quantity
   - Line Type
20.7.7 What You Should Know About

<table>
<thead>
<tr>

<tbody>
<tr>
<td>Line types</td>
<td>Line types distinguish the various methods of recording stock and non-stock inventory.</td>
</tr>
<tr>
<td></td>
<td>See Appendix A, &quot;Inventory Concepts and Setup&quot; for more information about line types.</td>
</tr>
</tbody>
</table>

To revise the location for a part
On Work Order Entry
1. To locate a work order, complete the following field:
   - Work Order Number
2. Choose Parts List.
3. On Work Order Parts List, choose Location Search for each part you want to revise the location.

Figure 20–19  Location Search screen

4. On Location Search, choose Return Value for the alternate location. The system replaces the original location information with the new information.

20.7.8 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Multiple locations</td>
<td>You can specify multiple locations for a part. On Work Order Parts List, choose Multiple Location Parts Search. A window opens, showing all locations that stock the part. Select the locations that you want to add. The system adds the new locations to the parts list and updates the quantity on hand.</td>
</tr>
</tbody>
</table>

To choose a substitute part
On Work Order Entry
1. To locate a work order, complete the following field:
   - Work Order Number
2. Choose Parts List.

3. On Work Order Parts List, choose Item Substitutes for each part to substitute.

4. On Component Part Substitutions, complete the following field for each part substitute:
   - Quantity

20.7.9 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Substitute part availability</td>
<td>In order for a substitute part to appear on Component Part Substitution, the substitute part must have a quantity on hand in the inventory system.</td>
</tr>
<tr>
<td></td>
<td>See Appendix A, &quot;Inventory Concepts and Setup&quot; for more information about quantity on hand.</td>
</tr>
</tbody>
</table>

To add explanatory text to a part

On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Parts List.

3. On Work Order Parts List, choose Additional Part Text for each item to add text.
4. On Additional Part Information, enter the explanatory text.

When you enter explanatory text for a part, the system highlights the part on the work order parts list.

### 20.7.10 Assigning Parts without an Inventory Master

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Work Order Entry

You can assign parts for which you do not maintain an inventory master to a work order. This is especially useful to add parts for which you rarely have a need, such as special order parts, to a work order.

**To assign parts without an inventory master**

On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Parts List.

3. On Work Order Parts List, complete the following fields:
   - Part
   - Description
   - Quantity
   - LT (Line Type)

4. Complete the following optional field:
   - Unit of Measure

5. Choose More Details.

6. Complete the following optional fields:
20.8 Assigning Labor Routing to a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry

You can specify which work center is responsible for each maintenance task on a work order. You can specify the sequence of operations for each task, as well as the labor rates and the number of hours necessary to complete each task.

You can assign labor routing instructions to a work order using the following methods:

- Copy labor routing information from standard instructions
- Manually assign labor routing instructions

When you know in advance the labor requirements for a particular task, you can set up standard routing instructions for the task. You can copy from the instructions when you need to assign labor routings for similar tasks.

You can manually assign labor routing instructions for any maintenance task for which you have not set up standard routing instructions.

20.8.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to use Equipment Work Order Routings:
  - System 30: Product Data Management
  - System 31: Shop Floor Control
  - System 40: Inventory Base and Order Processing
  - System 41: Inventory Management
  - System 43: Procurement
- Review processing options for the Equipment Work Order Routings program. See Section 38.7.1, "Revising Processing Options for Parts Lists and Labor Routings"
- Verify that the following fields on Work Order Entry are complete:
  - Standard Parts or Instructions
  - Start Date

To copy labor routing information from standard instructions
On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number
2. Choose Routing Instructions.
Assigning Labor Routing to a Work Order

Figure 20–22 Equipment W. O. Routings screen

3. On Equipment Work Order Routings, choose Copy Routings.

Figure 20–23 Equipment W. O. Routings screen (showing Copy from Routings fields)

4. Review the following fields and revise them if needed:
   - Copy From Routings
   - Copy From Plant

5. Choose Copy Routings.
The system completes the Equipment Work Order Routings screen with values from the standard instructions.

Figure 20–24  Equipment Work Order Routings screen (showing completed fields)

6. On Standard Instructions, revise any information that does not apply to the current work order.

7. To complete the process, choose Update with Redisplay.

To manually assign labor routing instructions

On Work Order Entry

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Routing Instructions.

3. On Equipment Work Order Routings, complete the following fields for each labor routing that you want to establish:
   - Work Unit
   - Operation Sequence
   - Description
   - Total Hours

4. Complete the following optional fields:
   - Operation Status
   - Rate

5. Choose More Details.
6. Complete the following optional fields:
   - Start Date
   - Requested Date
   - Standard Procedures
   These fields might contain default values.

7. Complete the following optional fields:
   - Percent of Overlap
   - Crew Size

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Op St</td>
<td>A user defined code (31/OS) that identifies the current status of a work order or engineering change order as the operation steps in the routing are completed.</td>
</tr>
<tr>
<td>Rate</td>
<td>This is the rate used to estimate the labor cost of a routing step. The system derives this rate from frozen standard rates.</td>
</tr>
<tr>
<td>Std. Proc</td>
<td>A user defined code (system 48, type SN) that is assigned to a standard note, message, or general narrative explanation. You can use this code to add instructional information to a work order. You set up codes for this field on Standard Description.</td>
</tr>
</tbody>
</table>
Assigning Labor Routing to a Work Order

Create Corrective Work Orders

Work Unit
An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant.

You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department.

Security for this field can prevent you from locating business units for which you have no authority.

Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table.

Form-specific information
Use this field to identify the craft or resource (business unit) that will perform the maintenance task.

Op Seq
In routings, this number is used to sequence the fabrication or assembly steps in the manufacture of an item. You can track costs and charge time by operation.

In bills of material, this number designates the routing step in the fabrication or assembly process that requires a specified component part. You define the operation sequence after you create the routing for the item. The Shop Floor Control system uses this field in the backflush/preflush by operation process.

In engineering change orders, this number is used to sequence the assembly steps for the engineering change.

Skip To fields allow you to enter an operation sequence that you want to begin the display of information.

You can use decimals to add steps between existing steps. For example, use 12.5 to add a step between steps 12 and 13.

Form-specific information
You can use this field to sequence the maintenance tasks to perform in the maintenance of an item.

Requested
The date that an item is to arrive or that an action is to be complete.

Form-specific information
The system enters a default value based on the work order start date.

Start
This is a start date that you can enter, or an automatic start date which the planning system calculates using a backscheduling routine. The routine starts with the required date and offsets the total lead time to calculate the appropriate start date.

This system enters a default date from system date or you can enter a date.

Form-specific information
This is the date the system schedules the work order activity to begin. The system enters a default value based on the work order start date.
### 20.8.2 What You Should Know About

#### Field | Explanation
--- | ---
% of Overlap | The overlapping of successive operations. The actual overlap percentage entered for the operation sequence is the percent by which that operation overlaps the prior operation. For example, if you enter 80%, this indicates that work can begin on the overlapped operation when 20% of the prior operation is completed.

Overlapping has no effect on move and queue calculations.

The percent entered must be less than or equal to 100%.

**Note:** Enter percents as whole numbers: 5% as 5.00

Crew | The number of people who work in the specified work center or routing operation.

The system multiplies the Run Labor value in the Routing Master table (F3003) by crew size during costing to generate total labor dollars.

If the Prime Load Code is L or B, the system uses the total labor hours for backscheduling. If the Prime Load Code is C or M, the system uses the total machine hours for backscheduling without modification by crew size.

**Form-specific information**

If you leave this field blank, the system enters a value based on the Work Center Master table (F30006) for the work unit.

#### 20.9 Copying a Work Order

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Work Order Entry
When you have an existing work order with information that is applicable to other work orders, you can copy it using Copy Work Order. For example, you might need to perform maintenance on a machine that is similar to the maintenance you performed on another machine. Instead of creating a new work order, you can copy the work order for the previous maintenance. When you copy an existing work order, the system assigns a unique number to the new work order. Otherwise, the following information remains unchanged:

- All information from the Work Order Entry screen
- Parts instructions
- Labor routing instructions
- Record types

You can also use a parent work order as the basis for creating a work order. The system uses the information stored in the master for the parent work order to automatically enter the basic work order information, category codes, and record type information into the new work order. Use this method when you need to group work orders that share common information you use for reporting and cost accounting.

You can use the following methods to copy a work order:

- Copy a work order using an existing work order
- Create a work order based on a parent work order

**To copy a work order using an existing work order**

On Work Order Entry

1. Complete the following field to locate a work order:
   - Work Order Number
2. Choose Copy Work Order.

A new work order displays, identical to the one that you copied, but with a unique work order number. The system copies parts, routing instructions, and record types from the original work order to the new work order.

**To create a work order based on a parent work order**

On Work Order Entry

1. Complete the following fields:
   - Parent Work Order Number
   - Description
   - Branch
   - Equipment Number
2. Complete all of the fields that must contain unique information rather than the default information that the system provides from the parent work order.
3. Complete the following optional field:
   - Completed Date
4. To create the new work order, choose Update with Redisplay.

After you have created the new work order, assign estimated costs to the work order, if necessary. You can then assign any additional category codes and record type information to that added by the system from the parent work order.
Creating a Work Order for Unscheduled Maintenance

See Also:
- Chapter 20.3, "Assigning Estimated Costs to a Work Order"
- Chapter 20.4, "Assigning Category Codes to a Work Order"
- Chapter 20.5, "Adding Text to a Work Order"

20.10 Creating a Work Order for Unscheduled Maintenance

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Backlog Management

When you have set up maintenance tasks to come due on an as-needed basis rather than a scheduled interval, you can notify the system when you want to create a work order to perform the tasks. For example, you might want to wash a piece of equipment only when it is in the shop for other maintenance.

Note: When you create a work order for unscheduled maintenance, the system runs the XJDE001 version of the PM Update program. The default values for this version ensure that the system updates the maintenance status and PM schedule for only the equipment for which the unscheduled maintenance task applies. JD Edwards World recommends that you do not change the processing options for this version.

20.10.1 Before You Begin
- Set up a PM service type for each unscheduled maintenance task and verify that the service type has no schedule date or service interval. See Chapter 15.1, "Creating a PM Schedule" for more information about setting up service types.

To create a work order for unscheduled maintenance
On Backlog Management
Creating a Work Order for Unscheduled Maintenance

1. Complete the following field to locate a piece of equipment:
   - Equipment Number

2. Choose Unscheduled Maintenance.

   The Unscheduled Maintenance window appears, showing all unscheduled maintenance procedures that are set up for the equipment.

3. Choose Create Work Order.

   The system updates the PM schedule to indicate the maintenance as 100 percent due and generates the corresponding work order.
20.10.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accessing the Unscheduled Maintenance window</td>
<td>You can access the Unscheduled Maintenance window from Equipment Backlog or Backlog Management.</td>

21.1 Setting Up a Project

Navigation
From Work Order/Service Billing Processing (G48), choose Simple Project Management
From Simple Project Management (G4812), choose Project Setup

When you have a collection of maintenance tasks that are interrelated and subordinate to a larger task, such as a plant shutdown or the retooling of a manufacturing line, you can group the tasks into a project. Setting up a project is especially useful when you need to monitor the day-to-day details of a project within the context of the project as a whole.

Setting up a project is similar to creating work orders using parent information. However, by using Project Setup to create the work orders, you can create several work orders at the same time and group them into a hierarchy under an existing (parent) work order. The parent work order represents the project, and each work order assigned to the parent represents a task in the project.

The system automatically enters basic work order information, category codes, and record type information from the parent work order to each work order in the project. After you create the project hierarchy, you can enter specific information for each work order by accessing the Work Order Entry screen. You can use processing options to specify which Work Order Entry screen the system displays when you add additional work order information.

To set up a project
On Project Setup
1. To identify the project, complete the following fields:
   - Parent W.O. Number
   - Customer (optional)
   - Job or BU (optional)
2. To describe each step of the project, complete the following field:
   - Task
3. To further define each step of the project, complete the following optional fields:
   - Start (Date)
   - Complete (Date)
   - W.O. (Number)
   - Phas (Phase)
   - Hours
5. Complete the following optional fields:
   - Std. Desc. (Standard Description)
   - Manager

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent W.O. No</td>
<td>This is the parent work order number. You can use this number to:</td>
</tr>
<tr>
<td></td>
<td>1. Enter default values for newly added work orders, for example, Type, Priority, Status, or Manager.</td>
</tr>
<tr>
<td></td>
<td>2. Group work orders for project setup and reporting.</td>
</tr>
<tr>
<td>Hours</td>
<td>The estimated hours that are budgeted for this work order.</td>
</tr>
<tr>
<td>Manager</td>
<td>The address book number of a manager or planner.</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: A processing option for some screens allows you to enter a default value for this field based on values for Category Codes 1 (Phase), 2, and 3. Set up the default values on the Default Managers and Supervisors screen. After you set up the default values and the processing option, the information displays automatically on any work orders you create if the category code criterion is met. You can either accept or override the default value.</td>
</tr>
</tbody>
</table>

### 21.1.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Adding additional work order information</td>
<td>You can add additional information to each work order within the project. For example, you can add status comments or an extended description of the task. Choose Work Order Detail for each work order for which you want to add information.</td>
</tr>
</tbody>
</table>
21.1.2 Processing Options

See Section 55.2, "Default Values for Speed Project Setup (P48015)"
22.1 Reviewing and Approving Work Orders

You can review, approve, or reject a work order. When you approve a work order, the system sends an electronic mail message to the next person on the work order approval route. When you reject a work order, the system sends an electronic mail message to the person who requested the work order.

You can also hold a work order if you want to approve or reject the work order at a later time. The system does not send any messages when you hold a work order.

During the approval process, the system generates an audit record for approvals and rejections. If you reject a work order after approving it, the system creates a new audit record for the rejection and stores the approved record for historical purposes.

22.2 Approving a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Processing
From Work Order Processing (G1317), choose Work Order Approval

After you enter the information to create a work order, the system sends an electronic mail message to notify the person responsible for approving the work order that they have a work order to review. Use Work Order Approval to review and approve work orders.

When you access Work Order Approval, the system automatically enters your address book number in the Approver Number field and displays a description of the work orders for which you are responsible for approving. You can use processing options to limit the work orders that display according to:

- Order type (document type)
- Work order type
- Approval type
22.2.1 Before You Begin

- Verify that all work order approvers are included in the work order approval routing. See Section 38.5.5, “Setting Up Work Order Approval Routes”

To approve a work order
On Work Order Approval

Figure 22–1 Work Order Approval screen

1. Complete the following fields:
   - Type
   - Approval Type
   These fields might already contain default values.

2. To limit your search to specific work orders, complete the following optional fields:
   - Order Type
   - Approval Status
   - WO Date From/Thru
   - Date Revd. (Reviewed) From/Thru

3. Choose Approve, Reject, or Hold.

4. To complete the process, enter your password.

<table>
<thead>

Reviewing the Approval History of a Work Order

### 22.2.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reviewing details about specific work orders</td>
<td>You can access the work order master directly from the Work Order Approval screen when you need to review details about the work order. Choose Work Order Master from Work Order Approval.</td>
</tr>
<tr>
<td>Adding an explanation</td>
<td>You can enter a brief explanation regarding your approval decision. Choose Notes from Work Order Approval.</td>
</tr>
<tr>
<td>Passwords</td>
<td>Your password for this program is based on your user ID number.</td>
</tr>
<tr>
<td></td>
<td>See Section 38.5.7, &quot;Setting Up Work Order Approver Profiles&quot;.</td>
</tr>
<tr>
<td>Approving a work order from Message View/Entry</td>
<td>You can access Work Order Approval directly from Message View/Entry. When a work order requires your approval, the system sends an electronic mail message (JDE4805) that requests your approval. After you review the work order approval request, choose Requisition Approval. The system displays Approval Audit/Review, from which you can approve the work order.</td>
</tr>
</tbody>
</table>

### 22.2.3 Processing Options

See Section 55.3, "Work Order Approval (P4828)"

### 22.3 Reviewing the Approval History of a Work Order

**Navigation**

- From Equipment/Plant Management (G13), choose Equipment Work Orders
- From Equipment Work Orders (G1316), choose Work Order Processing
- From Work Order Processing (G1317), choose Approval Audit/Review

You can use Approval Audit/Review to review the approval history of a work order. When you enter the number of a work order, the system displays:

- A list of all the people that must approve the work order
- The date that the work order was approved or reviewed
- The status of the work order, such as approved or in process

You can also review any notes that an approver might have recorded when approving, rejecting, or holding a work order.

<table>

![Approval Audit/Review screen](image)

1. Complete the following field:
   - Order Number

2. To review any notes the approver might have recorded for the work order, choose Details.

**Figure 22–3  Approval Audit/Review screen (Details area)**

![Approval Audit/Review screen (Details area)](image)
3. To review additional information about the work order, choose Work Order Master.

22.3.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Locating a work order | If you don’t know the number of the work order that you want to review, you can search for it with Backlog Management. Access the field help for Work Order Number to display Backlog Management.  
See Section 23.2.1, "Locating Work Orders Using Backlog Management".                                                                 |
23 Work with Work Orders

This chapter contains these topics:

- Section 23.1, "Working with Work Orders"
- Section 23.2, "Locating Work Orders"
- Section 23.3, "Revising Work Orders"
- Section 23.4, "Printing Work Orders"

### 23.1 Working with Work Orders

After you have created work orders, you can perform a variety of tasks to manage the work orders as they move through the work order life cycle. For example, you can:

- Search for specific work orders or groups of work orders
- Revise information, such as start date, priority, status, and so on, as work orders move through the life cycle and demands on your maintenance organization change
- Print hard copies of work orders for use by maintenance personnel
- Change the status of a work order to complete to indicate that the maintenance tasks have been performed

### 23.2 Locating Work Orders

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Backlog Management

You can use a variety of search criteria to locate work orders in your maintenance organization. You can locate work orders using Backlog Management or Equipment Backlog. The method that you choose depends on the information that you know about the work orders you want to locate, as well as the tasks that you want to perform after you locate the work orders.

Locating work orders consists of the following tasks:

- Locating work orders using Backlog Management
- Locating work orders using Equipment Backlog

You can use Backlog Management or Equipment Backlog to complete multiple tasks with a single work order. For example, after you locate a work order using Backlog
Locating Work Orders

Management, you can access Work Order Parts List, a program that allows you to make revisions to the parts list without returning to the Equipment/Plant Maintenance menu.

You can access the following review and analysis screens directly from either Backlog Management or Equipment Backlog.

**Figure 23–1  Work Order Summary Window**

![Work Order Summary Window](image)

**Figure 23–2  Estimated and Actual Window**

![Estimated and Actual Window](image)
Figure 23–3  Equipment Backlog screen

The following graphic shows many of the screens and functions that you can access when you use Backlog Management or Equipment Backlog.
23.2.1 Locating Work Orders Using Backlog Management

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Backlog Management

Use Backlog Management to review work order information that is not specific to a piece of equipment or a category of equipment. When you use Backlog Management, you can use any combination of the information shared among work orders as search criteria to locate them. For example, you can locate all the work orders for a business unit that are assigned to a particular supervisor.

You can specify that the system locate work orders for a parent piece of equipment or the parent and all of its child components.

Information that you can use to locate work orders with Backlog Management includes:
- A job or business unit
Locating Work Orders

- A subsidiary or cost code
- Equipment for which the work orders apply
- The work center or craft to which work orders are assigned
- The estimated hours and duration of the work orders
- The person who originated the work orders
- The manager or supervisor of the work to be performed
- Any combination of the user defined information associated with the work orders, such as category codes and work order type
- Any of the dates associated with the work orders, such as start date and planned completion date

Some of the tasks that you can perform from Backlog Management include:

- Updating the start date and status of a work order
- Creating a work order for unscheduled maintenance
- Reviewing the work order activity rules
- Reviewing labor capacity messages
- Reviewing a summary of equipment failures and downtime
- Reviewing or revising work order text
- Reviewing a summary of estimated and actual work order costs
- Reviewing a summary of selected work orders that displays:
  - The number of work orders that meet your criteria
  - The estimated hours to complete all of the work orders
  - The estimated average number of hours needed to complete each work order
- Approving work orders
- Reviewing the approval history of a work order
- Reviewing parts and labor routing instructions
- Reviewing open purchase orders for work orders
- Issuing parts to a work order
- Printing work orders

**To locate work orders using Backlog Management**

On Backlog Management
To limit your search to specific work orders, complete any combination of fields in the header portion of the screen.

### 23.2.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Alternate display formats  | Display formats specify the detail information that the system displays on the first detail line for each work order. Depending on the display format that you choose, you can update different work order information directly from Backlog Management without accessing the detail portion of the screen. For example, different formats allow you to update information, such as:  
  - The person assigned to perform the work  
  - Start date  
  - Estimated hours  
  Choose the Display Alternate Panel Format function to toggle between formats. |

### 23.2.3 Processing Options

See Section 55.15, "Scheduling Workbench - Equipment Entry (P48201)"

### 23.2.4 Locating Work Orders Using Equipment Backlog

**Navigation**
- From Equipment/Plant Management (G13), choose Equipment Work Orders
- From Equipment Work Orders (G1316), choose Equipment Backlog
Use Equipment Backlog to review and analyze work order information for a particular piece of equipment or group of equipment. When you use Equipment Backlog, you can use any combination of information shared by equipment, such as equipment category codes, responsible business unit, location, and so on. For example, you might want to analyze all failures associated with your heavy equipment. You can locate all work orders associated with equipment class 30 (Heavy Equipment), or you can further narrow your search to only type 5 (Emergency) work orders for heavy equipment. The more information you enter, the more quickly you can narrow your search to specific work orders.

After you locate a work order or group of work orders, you can perform a variety of tasks. For example, you can:

- Review a summary of selected work orders that displays:
  - The number of work orders that meet your criteria
  - The estimated hours to complete all of the work orders
  - The estimated average number of hours needed to complete each work order
- Review a summary of equipment failures and downtime.
- Access a work order master.
- Review a summary of estimated and actual work order costs.
- Review purchase order information for parts and materials.
- Create a work order for unscheduled maintenance.

To locate work orders using Equipment Backlog

On Equipment Backlog

Figure 23–6  Equipment Backlog screen

To limit your search to work orders associated with specific pieces of equipment, complete any combination of fields in the header portion of the screen.
23.2.5 Processing Options

See Section 55.4, "Equipment Scheduling Workbench (P13220)"

23.3 Revising Work Orders

You can revise information about your work orders as they move through the life-cycle. For example, you can change the start date of the work order if you do not have the labor resources or parts to complete the maintenance task. You can revise a variety of other information, including:

- Life-cycle statuses
- Planned completion dates
- Percentage of work completed
- Work order priority

You can use Backlog Management to revise identical information shared by multiple work orders. You use search criteria to narrow your search to the specific work orders that you want to revise. This is especially convenient when you need to revise a single field, such as Status, for a group of similar work orders.

---

**Note:** If you already know the work order number, you can quickly revise work order information on Enter Work Orders.

Revising work orders consists of the following tasks:

- Updating the life cycle information of a work order
- Revising the detail information of a work order

23.3.1 Updating the Life Cycle Information of a Work Order

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Backlog Management

The life cycle of a work order includes the steps or statuses through which a work order must pass in order to accurately communicate the progress of the maintenance tasks it represents. For example, the life cycle of a work order can include statuses that indicate:

- Work order entered
- Work order pending review
- Waiting for parts
- Work in progress

When you have completed all of the tasks requested on a work order, you can change the work order's status to complete. Depending on how you set processing options for Work Order Entry, when you change the status of a work order to complete, the system provides a warning message that alerts you to any open purchase orders associated with the work order.

Whenever you change the status of a work order, the system automatically calculates the current meter readings for the piece of equipment associated with the work order.
and updates the status history table (F1307). This allows you to track the statistical units for a piece of equipment at every change in the work order's status.

**To update the life cycle information of a work order**

On Backlog Management

1. To limit your search to work orders associated with specific pieces of equipment, complete any combination of fields in the header portion of the screen.

2. Choose W.O. Entry.

3. On Work Order Entry, update the following field:
   - Status

4. Enter C in the following field:
   - Action Code

**Figure 23–7  Status Change Date and Time screen**

5. On Status Change Date and Time, complete the following optional fields to override any default values that the system provides:
   - Beginning Date
   - Beginning Time

6. Complete the following optional field:
   - Remark

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Status</td>
<td>A user defined code (system 00, type SS) that describes the status of a work order.</td>
</tr>
</tbody>
</table>
23.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Overriding the completion date on a completed PM</td>
<td>When you complete a work order associated with a PM, the system uses the completion date from the work order as the completion date for the PM. The system uses the system date as the default work order completion date. Occasionally, you might need to indicate a completion date that is prior to the system date. For example, assume that you complete maintenance on a piece of equipment but postpone entering the information into the system until a later date. You want your maintenance records to reflect the date that the work was actually completed. When you change the status of the work order to complete, you can override the system date on the Status Change Date and Time window. If the date that you enter overlaps the system date, a warning message appears, but does not prevent you from making the change.</td>
</tr>
<tr>
<td>Closing a work order</td>
<td>You can close a work order to prevent transactions from being entered against the work order. To close a work order, enter a value other than blank in the Subledger Inactive field on the work order master. See Section 42.2, &quot;Updating Work Order Cost&quot; for more information about the Update Work Order Cost program.</td>
</tr>
<tr>
<td>Automatically assigning a completed date</td>
<td>The Completed Date field is controlled by the Work Order Activity Rules. You can use the lock field is used to populate the Completed Date based on the status of the work order.</td>
</tr>
</tbody>
</table>

See Also:
- Section 42.3, "Updating Work Order Status Based on Purchase Order Receipt"

23.3.3 Revising the Detail Information of a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Backlog Management

You can revise the information in any of the fields on Backlog Management except the following:
- Work Order Number
- Description
- Equipment Number

If you use work order approvals, you might not be able to revise some life-cycle statuses, depending on how your system is set up.

To revise the detail information of a work order

On Backlog Management
1. Follow the steps to locate a work order or group of work orders.
2. Revise the following fields, if necessary:
   - Status
   - Start Date
   - Estimated Hours
   - Type
   - Priority

3. Choose Detail.

4. Revise the following fields, if needed:
   - Percent Complete
   - Flash Message
   - Status Comment

5. To revise any information not included on Backlog Management, choose Work Order Entry for each work order.

23.3.4 What You Should Know About

<table>

Printing Work Orders

You can print work orders when you need a hard copy of a work order or group of work orders. If you already know the work order number, you can quickly print the work order from the work order master. If you need to print multiple work orders, you can use data selection criteria to specify which work orders to print. You can also use Backlog Management to select a specific work order to print.

Printing work orders consists of the following tasks:

- Printing work orders using Backlog Management
- Printing a batch of work orders

23.4.1 Printing Work Orders Using Backlog Management

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Backlog Management

You can use Backlog Management to locate and print work orders for which you need a hard copy. Use search criteria to broaden or narrow your search for the work orders for which you need hard copies.

Processing options allow you to choose which version of the Equipment Work Order Print program the system uses to print work orders.

23.4.2 Before You Begin

- Set up Default Locations and Printer. See Section 38.8, "Defining Default Location and Printers" for more information.

To print multiple work orders, choose Print Work Orders. When you choose Print Work Orders, the system displays a versions list. The versions list includes a DEMO version that you can run or copy and revise for your business needs.

**To print work orders using Backlog Management**

On Backlog Management

1. Complete the steps for locating a work order or group of work orders.
2. For each work order that you want to print, choose Print Work Order.

---

**Topic** | **Discussion**
---|---
Over-capacity conditions | Depending on how you set up the work order activity rules, changing the following work order dates might create an over-capacity condition:
- Start date
- Request date
If the new dates create an over-capacity condition, the system displays a warning message.

See Section 33.4, "Revising Labor Resources" for more information about adjusting labor resources to accommodate over-capacity conditions.

See Section 38.5.2, "Setting Up Work Order Activity Rules" for more information about capacity warning messages.
23.4.3 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Printing work orders directly from the work order master</td>
<td>If you know the number of the work order that you want to print, you can print it directly from the work order master. Enter the number of the work order on Work Order Entry and choose Print.</td>
</tr>
<tr>
<td></td>
<td>You can use processing options to choose which version of the Equipment Work Order Print program the system uses to print work orders. See Section 20.1, &quot;Creating Corrective Work Orders&quot; for the processing options for Work Order Entry.</td>
</tr>
</tbody>
</table>

See Also:

- Section 23.2, "Locating Work Orders" for the processing options for Backlog Management

23.4.4 Printing a Batch of Work Orders

Navigation

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Print Work Orders

You can use Print Work Orders to print a batch of work orders. When you use Print Work Orders, you use data selections to specify which work orders to print. You then use processing options to specify the amount of work order information that you want the system to print. For example, you can specify whether the system prints:

- Parts lists and routing instructions on a separate page
- Dates associated with work order record types
- Equipment specification data
- A pick list report

You can also specify the record types that you want to print and whether to print work order supplemental data. In addition, you can update the status of the work orders at the same time that you print them.

See Also:

- JD Edwards World Technical Foundation Guide for information about running, copying, and changing a DREAM Writer version

23.4.5 Processing Options

See Section 55.5, "Equipment Work Order Print (P48425)".
24.1 Swapping a Component

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry

To simplify moving equipment components from parent to parent, you can swap an equipment component for another on a work order. When you swap a component, you can specify changes that you want to make to the parent/component relationships for each component. For example, you might need to install a new exhaust fan in Production Line 1 while you service the old exhaust fan. You can update the parent/component relationships to indicate that the new exhaust fan is now a child of Production Line 1.

When you swap components, you can update the status of each component affected by the swap. For example, you can indicate a status of Down for the exhaust fan that you removed from Production Line 1 and a status of Working for the new exhaust fan that you installed.

You can also revise the responsible business unit of the old component. In addition, you can revise the location information for either component. If you revise the location information for the new component, you can specify a location or use the location of the component's parent.

**To swap a component**
On Work Order Entry
Swapping a Component

1. To locate a work order, complete the following field:
   - W.O. Number

2. Update the following field:
   - Status

3. Enter C in the following field:
   - Action Code

4. On Status Change Date and Time, complete the following fields:
   - Changeout Code
   - Equipment Status (optional)

5. Press Enter to return to the Work Order Entry screen. The Component changeout fields display.
6. For the old component, complete the following optional fields:
   - BU Code
   - BU
   - Change Loc (Location)
   - Location
   - Create WO

7. Complete the following field:
   - New Component

8. For the new component, complete the following optional fields:
   - Children Code
   - BU Code
   - Eq (Equipment Status)
   - Update Children
   - Change Loc (Location)
   - Location

9. Choose Update.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changeout Code</td>
<td>This code is used to determine whether an Equipment Component Changeout was done on the work order. Valid Codes are:</td>
</tr>
<tr>
<td></td>
<td>0 – Component Changeout was not done.</td>
</tr>
<tr>
<td></td>
<td>1 – Component Changeout was done.</td>
</tr>
</tbody>
</table>
## 24.1.1 What You Should Know About

### Relocating a new component

To relocate a new component to the same location as its parent, enter a value of Y in the Change Location field and leave the Location field blank.

## 24.1.2 Processing Options

See Section 55.1, "Equipment Work Order Entry (P48011)"
See Also:

- Section 20.2, "Entering Basic Work Order Information" for the processing options for this program
This chapter contains this topic:

- Section 25.1, "Purchasing Parts for a Work Order"

25.1 Purchasing Parts for a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Entry

You can purchase parts for a work order by creating purchase orders directly from the work order parts list. This is particularly useful if a maintenance task requires parts that you do not usually stock, such as unusually costly parts or parts that have long order lead times.

When you create purchase orders directly from the work order parts list, you can use processing options to specify the initial status of the purchase order, as well as the approval route for the purchase order. After the system creates the purchase order, the purchase order number and document type appear in the detail portion of the work order parts list.

25.1.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to use Work Order Parts List:
  - · System 30 - Product Data Management
  - · System 31 - Shop Floor Control
  - · System 40 - Inventory Base and Order Processing
  - · System 41 - Inventory Management
  - · System 43 - Procurement

- Verify that the FP AAI is set up. See Section 35.2.3, "Setting Up Equipment/Plant AAI" for more information.

- Verify that processing options for Work Order Parts List Revisions have been set to allow you to create purchase orders. See Section 38.7.1, "Revising Processing Options for Parts Lists and Labor Routings" for more information.
To purchase parts for a work order

On Work Order Entry

**Figure 25–1  Work Order Entry screen**

1. To locate a work order, complete the following field:
   - Work Order Number

2. Choose Parts List.

**Figure 25–2  Work Order Parts List screen**

3. On Work Order Parts List, choose More Details.
4. Complete the following fields:
   - UM
   - Vendor

   This field might already contain a value. You can accept this value or revise it.

5. For each part that you want to order, choose Create Purchase Order.

6. On Suppliers Selected for Order, choose Create Order.

   The purchase order number appears on the screen. If you decide not to order the part at this time, you must choose Cancel before you return to Work Order Parts List.

7. Press Enter to return to Work Order Parts List.
25.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Purchasing parts on a recurring basis | When you need to purchase parts for which you have a recurring need, such as purchasing parts for PM work orders, you can create purchase orders for parts using Purchase Management or generate purchase orders using the parts planning features in Equipment/Plant Maintenance.  
See Entering Purchase Order Header Information and Entering Purchase Order Detail Information in the *JD Edwards World Procurement Guide* for more information about creating purchase orders. |
| Equipment under warranty              | When you create a purchase order for a piece of equipment for which you have defined a warranty service type, the system displays a warning message to alert you that a warranty is in effect.  
See Section 14.3.1, "Creating PM Schedules for Each Piece of Equipment" for more information about creating PM service types for equipment under warranty. |
| Viewing supplier catalogs             | If you have set up supplier catalogs, you can view the catalogs directly from Work Order Parts List. You must first identify a supplier in the vendor field in the detail portion of the screen.  
To view catalogs for the supplier, place the cursor in the Part field and choose the Supplier Item Selection function. This is especially useful if you want to review costs associated with non-stock parts.  
See Entering Supplier Prices in the *JD Edwards World Procurement Guide* for more information about setting up supplier catalogs. |

25.1.3 Processing Options

See Section 55.1, "Equipment Work Order Entry (P48011)".
This chapter contains these topics:

- Section 26.1, "Adding Costs to Work Orders"
- Section 26.2, "Issuing Parts to a Work Order"
- Section 26.3, "Entering Employee Time on a Work Order"

### 26.1 Adding Costs to Work Orders

You add costs to a work order whenever you issue parts and materials to a work order or enter employee time on a work order. You can use any JD Edwards World system that creates transactions (journal entries) with a subledger type of W in the Account Ledger table (F0911) to add costs to a work order. Each transaction contains the work order number.

### 26.2 Issuing Parts to a Work Order

When the maintenance tasks associated with a work order require parts, you add the cost of the parts to the work order by issuing parts to the work order. Depending on the parts requirements of the maintenance tasks and how you have applied parts to a work order, you can choose from the following methods to issue parts to a work order:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issuing parts included on parts lists</td>
<td>Use this method if you have set up parts lists for your work orders. When you issue parts included on the work order parts list, the system reflects a reduction in available inventory for the parts by reducing the commitment for the parts. See Section A.1.3, &quot;Commitments&quot; in Appendix A for more information about inventory commitments.</td>
</tr>
<tr>
<td>Issuing miscellaneous parts to a work order</td>
<td>Use this method if you need to assign different account numbers to parts issues than the account from the work order parts list. You can also use this method if you want to add parts costs directly to a piece of equipment without using a work order.</td>
</tr>
</tbody>
</table>

Issuing parts to a work order consists of the following tasks:

- Issuing parts included on the work order parts list
- Issuing miscellaneous parts to a work order
- Posting inventory issues to the G/L
26.2.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to issue parts to a work order:
  - System 30 - Product Data Management
  - System 31 - Shop Floor Control
  - System 40 - Inventory Base and Order Processing
  - System 41 - Inventory Management

- Set up the 4122 and 4124 automatic accounting instructions in the Inventory Management system. See Understanding Automatic Accounting Instructions for the Inventory Management System in the *JD Edwards World Inventory Management Guide*.

- Set up branch/plant constants in the Inventory Management system to specify how you want the system to display parts transactions in the G/L. You can specify either part numbers or part descriptions, but not both. See Defining Branch/Plant Constants in the *JD Edwards World Inventory Management Guide*.

**See Also:**
- Appendix A, "Inventory Concepts and Setup" for more information about inventory setup requirements specific to Equipment/Plant Maintenance

26.2.2 Issuing Parts Included on the Work Order Parts List

**Navigation**

- From Equipment/Plant Management (G13), choose Equipment Work Orders
- From Equipment Work Orders (G1316), choose Work Order Processing
- From Work Order Processing (G1317), choose Work Order Inventory Issues

You issue parts included on the work order parts list when you need to add costs to a work order for parts that you included on the parts list. This method is especially useful when you want to issue all parts from the parts list to the work order at the same time. You can specify the debit account to which any or all of the parts are charged if it differs from the charge to business unit specified on the work order.

You can also use Work Order Inventory Issues to issue parts to a work order that are not included on the work order parts list. When you issue parts that are not included on the work order parts list, the system updates the parts list to include the additional parts. You can use processing options to restrict the parts issued to a work order to only parts that are included on the parts list.

You can use processing options to direct the system to automatically preload all part detail lines with the Process Issue option. This is particularly useful if you rarely choose not to issue parts from the parts list to the work order. Other processing options allow you to update the work order status based on whether all or only some of the parts have been issued to the work order. This is especially useful for lengthy parts lists for which the availability of some of the parts might be delayed.

**To issue parts included on the work order parts list**

On Work Order Inventory Issues
1. To locate a work order, complete the following field:
   - Order Number
   
The system updates the screen with default values for all inventory items and quantities from the work order parts list.

2. Complete the following optional fields:
   - Issue Material For
   - Issued To
   - Issue Quantity
   - Account Number

3. Choose More Details.
4. Complete the following optional fields:
   - Br/Pl Branch or Plant
   - Location
   - Lot
   - Account Number
   - Phase

5. For each part to issue to the work order, choose Process Issue.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Issue Material for</td>
<td>The number of parent items you want to process. The system calculates lower-level values in quantity per the number of parent items requested. For example, if 3 components are needed for a parent item, and the requested quantity is 10, the system plans for 30 components.</td>
</tr>
</tbody>
</table>
| Issued To            | A number that identifies an entry in the Address Book system. Use this number to identify employees, applicants, participants, customers, suppliers, tenants, and any other Address Book members.  

**Form-specific information**

The system enters a default value based on the second address book number (AN8) entered on the work order header. |
| Location             | A code that identifies inventory locations in a branch/plant. You define the format of the location identifier by branch/plant. |
| Lot                  | A number that identifies a lot or a serial number. A lot is a group of items with similar characteristics. |
Issuing Parts to a Work Order

26.2.3 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Account Number</td>
<td>A field that identifies an account in the general ledger. You can use one of the following formats for account numbers:</td>
</tr>
<tr>
<td></td>
<td>- Standard account number (business unit.object.subsidiary or flexible format)</td>
</tr>
<tr>
<td></td>
<td>- Third G/L number (maximum of 25 digits)</td>
</tr>
<tr>
<td></td>
<td>- 8-digit short account ID number</td>
</tr>
<tr>
<td></td>
<td>- Speed code</td>
</tr>
<tr>
<td></td>
<td>The first character of the account indicates the format of the account number. You define the account format in the General Accounting Constants program.</td>
</tr>
<tr>
<td>Form-specific information</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Identifies the debit account to which the parts are charged. The account that you enter in this field overrides the charge to business unit on the work order. If you leave this field blank, the system charges the parts based on the charge to business unit on the work order and the object account from the Inventory system AAs.</td>
</tr>
<tr>
<td></td>
<td>This field appears in the header and detail portions of the screen. If you enter an account in the header portion of the screen and leave the account fields blank in the detail portion of the screen, the header account applies to all detail lines. If you enter an account in the detail portion for a particular item, it overrides the account specified in the header portion.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reversing an inventory issue transaction</td>
<td>You can reverse an inventory issue transaction by typing the quantity of the item that you want to reverse as a negative number in the Issues field.</td>
</tr>
<tr>
<td>Closing out parts no longer required for maintenance task</td>
<td>You can close out parts no longer required for a maintenance task by choosing Close Out Line for each item that you no longer need. You must also remove the value from the Issues field for the items that you do not want to process. When you close out an item, the system indicates closed in the Issues field for that item.</td>
</tr>
<tr>
<td>Equipment under warranty</td>
<td>When you issue parts to a work order for a piece of equipment for which you have defined a warranty, the system provides a soft warning indicating the warranty status.</td>
</tr>
<tr>
<td>Issuing non-stock parts</td>
<td>You can issue non-stock parts to a work order if you have defined them on the work order parts list. When you use Work Order Inventory Issues to issue non-stock parts, the system updates the work order parts list, but does not create any accounting transactions. See Appendix A, &quot;Inventory Concepts and Setup&quot; for more information about stock and non-stock parts.</td>
</tr>
<tr>
<td>Import/Export Functionality for Work Order Inventory Issues (P31111)</td>
<td>You can use the Import/Export functionality to allow Import and export Equipment Work Order Inventory issues. Use the Function Key to create a template to export P31111 to a file or upload data from an outside file to P31111.</td>
</tr>
</tbody>
</table>
26.2.4 Processing Options

See Section 55.7, "Work Order Inventory Issues (P31111)"

26.2.5 Issuing Miscellaneous Parts to a Work Order

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Processing
From Work Order Processing (G1317), choose Inventory Issues

Use Inventory Issues to issue miscellaneous parts to a work order when you need to assign different account numbers to charge parts issues than the account from the work order parts list. You can also use this method if you want to add parts costs directly to a piece of equipment without using a work order.

Note: If you use Inventory Issues to issue parts from inventory that are already included in the parts list for the work order, the system does not relieve the inventory commitment. If you need the system to relieve the inventory commitment, use Work Order Inventory Issues.

26.2.6 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to access Inventory Issues:
  - System 40 - Inventory Base and Order Processing
  - System 41 - Inventory Management

- You must set the processing option for Screen Control to display equipment-based issues or equipment and subledger-based issues to enter an equipment number and a work order number on Inventory Issues.

See Also:
- Section 26.2.2, "Issuing Parts Included on the Work Order Parts List" for more information about using Work Order Inventory Issues

To issue miscellaneous parts to a work order
On Inventory Issues
1. Complete the following fields:
   - Branch/Plant
   - Account Number
   - Subledger
   - Equipment Number
   - Explanation

2. For each part, complete the following fields:
   - Number
   - Quantity
   - Location
   - Lot

3. For each part, complete the following optional field:
   - Unit of Measure

4. Complete the following optional fields:
   - Transaction Date
   - Type
   - Phase

5. Choose Additional Information.

Figure 26–3  Inventory Issues screen
6. Complete the following optional fields:
   - Branch or Plant
   - Extended Cost

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Branch/Plant</td>
<td>An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant. You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department. Security for this field can prevent you from locating business units for which you have no authority. Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table. Form-specific information The Branch/Plant field in the fold area lets you indicate from which branch to issue if an item has more than one branch location.</td>
</tr>
<tr>
<td>Reason Code</td>
<td>This text identifies the reason that a transaction occurred. Form-specific information A specific explanation for a particular issue. If you leave this field blank, the system automatically supplies this explanation from the descriptions that are associated with the document type that you specified.</td>
</tr>
</tbody>
</table>
### Field Explanation

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Quantity</td>
<td>The available quantity can be on-hand balance minus commitments, reservations, and backorders. This is user defined in branch/plant constants.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>This is the quantity of an inventory item to be issued.</td>
</tr>
<tr>
<td>Location</td>
<td>A code that identifies inventory locations in a branch/plant.</td>
</tr>
<tr>
<td></td>
<td>You define the format of the location identifier by branch/plant.</td>
</tr>
<tr>
<td>Lot</td>
<td>A number that identifies a lot or a serial number. A lot is a group of items with similar characteristics.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>You can set the processing options to have the system use the lot specified in the primary location as the default.</td>
</tr>
<tr>
<td>Trans. Date</td>
<td>The date the work order was entered into the system.</td>
</tr>
<tr>
<td>Phase</td>
<td>A user defined code (00/W1) that indicates the current stage or phase of development for a work order. You can assign a work order to only one phase code at a time.</td>
</tr>
<tr>
<td></td>
<td><em>Note:</em> Certain forms contain a processing option that allows you to enter a default value for this field. If you enter a default value on a screen for which you have set this processing option, the system displays the value in the appropriate fields on any work orders that you create. The system also displays the value on the Project Setup screen. You can either accept or override the default value.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>You can charge inventory costs to a particular phase of a project.</td>
</tr>
<tr>
<td>Extended</td>
<td>For accounts receivable and accounts payable, this is the invoice (gross) amount. For sales orders and purchase orders, this is the unit cost times the number of units.</td>
</tr>
</tbody>
</table>
26.2.7 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using work order speed entry</td>
<td>You can use work order speed entry to save time and reduce the possibility of data entry error. To use speed entry, complete the Account Number field by entering a backslash () followed by the work order number, a period (.), and the number of the object account.</td>
</tr>
<tr>
<td></td>
<td>For example, to enter information for work order number 3981 and object account number 8486, enter \3981.8486.</td>
</tr>
<tr>
<td></td>
<td>When you use speed entry, the system enters values in the following fields:</td>
</tr>
<tr>
<td></td>
<td>■ Business Unit. The system uses the Charge to Business Unit from the work order.</td>
</tr>
<tr>
<td></td>
<td>■ Account Number. The system enters the object account number based on the object account that you entered. The system enters the subsidiary account number based on the repair code from the work order.</td>
</tr>
<tr>
<td></td>
<td>■ Subledger. The system enters the work order number.</td>
</tr>
<tr>
<td></td>
<td>■ Type. The system enters W for the work order subledger type.</td>
</tr>
</tbody>
</table>

26.2.8 Processing Options

See Section 55.8, "Equipment and Subledger Inventory Issues (P4112)"

See Section 55.9, "Simple Inventory Issues (P4112)"

See Section 55.10, "Work Order (Subledger) Inventory Issues (P4112)"

26.2.9 Posting Inventory Issues to the G/L

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Processing
From Work Order Processing (G1317), choose Post Inventory to G/L

When you issue parts to a work order, the system creates unposted G/L transaction records in the Account Ledger table (F0911). Each transaction contains the work order number and the equipment number. You must post these transactions to the G/L. You use Post Inventory to G/L to post transactions to the G/L. When you post transactions to the G/L, the system updates the Account Balances table (F0902).

After you post inventory transactions to the G/L, you must post them to equipment in order to update the Item Balances table (F1202). Processing options in the G/L post program enable you to post transactions to equipment at the same time you post to the G/L.

When you choose Post Inventory to G/L, the system displays Processing Options Revisions. After you choose the appropriate processing options, the system displays a message that the batch was submitted to post.
Entering Employee Time on a Work Order

26.2.10 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Reviewing inventory issues prior to posting | You can review inventory issues before you post them to the G/L. Choose G/L Journal Review from the Work Order Processing menu. Complete any of the following fields to display a specific batch:  
  - User ID  
  - Batch Number  
  - Batch Date From  
  - Batch Date Thru  
You can also display all posted batches by entering an asterisk (*) in the Batch Status field. |

26.2.11 Processing Options

See Section 55.16, "General Ledger Post (P09870)"

See Also:
- *JD Edwards World Technical Foundation Guide* for more information about copying, changing, and running DREAM Writer versions

26.3 Entering Employee Time on a Work Order

You can enter employee time on a work order to account for labor costs associated with the work order. You can use the following methods to enter employee time:

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entering time by employee</td>
<td>Use Time Entry by Employee to charge hours and costs for an individual employee to a work order, a piece of equipment, or an individual routing step. For example, you might use this method to enter employee time for an employee who has worked on multiple jobs during the pay period.</td>
</tr>
<tr>
<td>Entering time by shop or business unit</td>
<td>Use Time Entry by Shop or Business Unit to charge hours and costs for multiple employees to a work order, a piece of equipment, or an individual routing step.</td>
</tr>
</tbody>
</table>

When you use the Time Accounting system, you can enter labor time for individual routing steps. When you use the Payroll system, the system calculates payroll liabilities, such as payroll taxes and employee benefits.

You can enter employee time for a work order using the following methods:

- Enter work order time by employee
- Enter work order time by shop or business unit

26.3.1 Before You Begin

- Verify that you have purchased and installed at least one of the following systems. You must have installed at least one of these systems to be able to enter employee time on a work order:
  - System 05 - Time Accounting and HRM Base
26.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Choosing speed entry or standard entry     | You can use either speed entry or standard entry to enter time on a work order. When you use speed entry, the system automatically enters the following information:  
  ■ The object account number from the Accounting Rules table  
  ■ The subledger and subledger type  
  ■ The business unit and subsidiary (Repair Code) from the work order  

  In addition, depending on the method that you use, you can use processing options to direct the system to enter the equipment number from the work order on the time entry screen.  

  If you need to enter an account other than the one on the work order, you can use standard entry. When you use standard entry, you can enter any account in your chart of accounts, but you must manually enter the business unit, object account, subsidiary (Repair Code), subledger, and subledger type.  

| Speed entry                                | You can use speed entry to save data entry time and reduce the chance for errors. To use speed entry, complete the Account Number field or the Cost Code field by typing a backslash (\), followed by the work order number, and then a period (.). For example, to enter an account number and related information for work order #2314, type \2314. To create the account number, the system will then use the Charge to BU and Repair Code field in the Work Order Header. The system also references the Payroll Constants and Debit-Labor/Billing/Equipment tables related to the Object Account screen. |

26.3.3 Entering Work Order Time by Employee

Navigation
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Work Order Processing
From Work Order Processing (G1317), choose TE by Employee

Alternately, you can choose Time Entry from the Payroll Master Menu or the Canadian Payroll Master Menu.

Enter work order time by employee when you need to:
  ■ Transfer employee information for an individual employee from a work order to payroll
- Charge employee hours and costs to a work order, a piece of equipment, or an individual routing step

**To enter work order time by employee**

On TE by Employee

*Figure 26–5 TE by Employee screen*

1. Complete the following fields:
   - Employee
   - Date
   - Batch Number
   - Pay Type
   - Hours

   **Note:** You may add your own batch number or have the system automatically assign the batch number by selecting 1 in Processing Option #4.

2. Complete the following field:
   - Account Number

3. If you are not using speed entry, complete the following fields:
   - Subledger
   - Subledger type

4. Complete the following optional fields:
   - Billing Rate
Entering Employee Time on a Work Order

- Routing (Time Accounting only)

**Note:** You can set the processing options to allow you to select which employee rate will be used, such as Employee Occupational Rate or the Union Rate.

5. Choose More Detail.

*Figure 26–6  TE by Employee screen (Detail area)*

6. If you are not using speed entry, complete the following field:

- Eqwo (Equipment Worked On)

To generate a timecard journal

**Navigation**
From Time Accounting System (G05), choose Time Card Post/History Update
From Time card Post and History Update (G0513), choose Generate Timecard Journals
On Generate Timecard Journals
1. Create a version of P062901.

2. In Processing Options, enter the correct G/L date for Journal Entries and set the other processing options to your preference.

3. In Data Selection, make sure you enter the batch number created from Time Entry.

4. Run the Program.

5. Select Journal Batch Review.

6. Review the new Batch number.

7. Approve the batch.

**To post the timecard journal**

On Post Journals to G/L
1. Enter the Batch number
2. Choose Enter.

After running the program, you will have G/L entries for employee time entry on a work order, which you can review for the proper accounts, credit and debit entries. You will also have a batch record, which you can review in the Batch Header Revisions program P0011.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Bill/Rt | A rate used for the billing of labor services. This rate is often referred to as the billing or recharge rate. The extended amount based on this rate will be charged to the primary distribution account on the timecard with an offset being made to an account derived from the Accounting Rules table. This rate will not affect the employee’s payroll. To allow billing rates in time entry, you must set the employee’s record type as either 2 or 3 on the Basic Employee Entry screen.  
A rate entered on any of the following screens overrides the rate in the Employee Primary Job table:  
- Pay Rate Information  
- Employee Labor Distribution  
- Occupational Pay Rates  
- Time Entry by Employee  
- Time Entry by Job or Business Unit  
- Daily Timecard Entry  
- Time Entry by Employee with Equipment  
- Time Entry by Shop Floor Control |
Account Number

A field that identifies an account in the general ledger. You can use one of the following formats for account numbers:

- Standard account number (business unit.object.subsidiary or flexible format)
- Third G/L number (maximum of 25 digits)
- 8-digit short account ID number
- Speed code

The first character of the account indicates the format of the account number. You define the account format in the General Accounting Constants program.

Form-specific information

You can use speed codes to reduce data entry when you enter work order information. When you enter a speed code, the system automatically enters account information that is stored elsewhere in the system. To enter a speed code, enter a back slash (\), the work order number, and a period (.). For example, work order 145648 is entered as \145648. in the Account Number field.

When you add the timecard information, the system:

- Replaces the speed coding information with account number information
- Uses the Charge to Business Unit number from the work order
- Uses the Object Account number from the Automatic Accounting Instructions for Debit/Labor/Billing/Equipment for Journal Type LD
- Enters the work order number in the Subledger field in the detail area
- Enters W as the subledger type

Routing

In routings, this number is used to sequence the fabrication or assembly steps in the manufacture of an item. You can track costs and charge time by operation.

In bills of material, this number designates the routing step in the fabrication or assembly process that requires a specified component part. You define the operation sequence after you create the routing for the item. The Shop Floor Control system uses this field in the backflush/preflush by operation process.

In engineering change orders, this number is used to sequence the assembly steps for the engineering change.

Skip To fields allow you to enter an operation sequence that you want to begin the display of information.

You can use decimals to add steps between existing steps. For example, use 12.5 to add a step between steps 12 and 13.
26.3.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Speed entry with the Payroll system</td>
<td>When you use speed entry on the Time Entry by Employee program, or the Time Entry by Employee with Equipment program, the system does not enter the equipment number from the work order. However, when you post the time entry transaction, the system enters the equipment number from the work order on the transaction record.</td>
</tr>
</tbody>
</table>

26.3.5 Processing Options

See Section 55.11, "Time Entry by Individual (P051121)".

26.3.6 Entering Work Order Time by Shop or Business Unit

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Work Order Processing

From Work Order Processing (G1317), choose TE by Shop or Business Unit

You can enter employee time on a work order to account for labor costs associated with the work order. You can enter time by job or business unit when you need to:

- Transfer shared information for multiple employees from a work order to payroll
- Charge hours and costs for multiple employees to a work order or multiple accounts

**To enter work order time by shop or business unit**

On TE by Shop or Business Unit

*Figure 26–9  TE by Shop or Business Unit screen*
1. Complete the following fields:
   - Batch Number
   - Date Worked
   - Job Worked
   - Employee
   - Hours
   - Cost Code
   - Pay Type

2. If you are not using speed entry, complete the following fields:
   - Subledger
   - Subledger Type

3. Complete the following optional field:
   - Routing Step (Time Accounting only)

4. To display equipment fields, choose Values List.

5. If you are not using speed entry, complete the following field:
   - Eqwo (Equipment Worked On)
26.3.7 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using the Payroll system</td>
<td>The procedures for entering time to a work order through Payroll are similar to those for Time Accounting. However, when you use the Payroll system, you cannot enter a routing step.</td>
</tr>
<tr>
<td>Speed entry with the Payroll system</td>
<td>When you use speed entry with the Time Entry by Job or Business Unit program, you can use processing options to direct the system to enter the equipment number from the work order.</td>
</tr>
</tbody>
</table>

26.3.8 Processing Options

See Section 55.12, "Time Entry by Job (Business Unit) (P051161)".
This chapter contains these topics:

- Section 27.1, "Reviewing Work Order Information"
- Section 27.2, "Reviewing Work Order Parts Lists"
- Section 27.3, "Reviewing Work Order Transactions"
- Section 27.4, "Reviewing Work Order Costs by Category Code"
- Section 27.5, "Reviewing Project Costs"
- Section 27.6, "Reviewing Estimated and Actual Work Order Amounts"

27.1 Reviewing Work Order Information

You can review work order information to help increase productivity and control costs. You can review a variety of information related to your work orders without having to create reports. For example, you might need to review all work orders that are over budget, or review all current costs that are associated with a project to determine future budgeting requirements.

27.1.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Locating additional work order information</td>
<td>You can use Backlog Management or Equipment Backlog to locate and review work orders that match criteria that you specify.</td>
</tr>
<tr>
<td></td>
<td>See Section 23.2, &quot;Locating Work Orders&quot;.</td>
</tr>
</tbody>
</table>

27.2 Reviewing Work Order Parts Lists

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Parts List Inquiry

Review work order parts lists to view the most current information about the parts requirements of your work orders. Use Parts List Inquiry to review information for individual work orders or a selection of related work orders. You can review the following:

- Parts requirements based on work order status
- Parts requirements based on a specified period of time
- Parts with a negative availability

**To review work order parts lists**

On Parts List Inquiry

**Figure 27–1  Parts List Inquiry screen**

1. Complete the following field to locate the parts list for a specific work order:
   - Order Number
   
   You can search for parts information based on a single work order number or on a combination of the fields in step 2 for multiple work orders, but not on both.

2. Complete any combination of the following fields to search for parts associated with multiple work orders:
   - Status Range From
   - Status Range Thru
   - Start Date Range From
   - Start Date Range Thru
   - Category Codes
   - Item Number
   - Address Number
   - Business Unit

3. Complete the following fields:
   - Required
   - Available
Reviewing Work Order Transactions

<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>This address book number corresponds to the address book number entered in the AN8 field on the work order header.</td>
</tr>
<tr>
<td>Required</td>
<td>This field indicates whether to display all parts or only those parts with a requirement.</td>
</tr>
<tr>
<td>Avail</td>
<td>This field indicates whether to display all parts or only those parts with a negative availability.</td>
</tr>
</tbody>
</table>

27.2.2 Processing Options

See Section 55.13, "Parts List Inquiry (P1321)"

27.3 Reviewing Work Order Transactions

Navigation

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Cost by Work Order

Review work order transactions to track specific costs at the individual work order level. Use Cost by Work Order to review all posted and unposted general ledger transactions associated with a work order.

You can use date selections to limit the number of transactions that appear. You can also specify a ledger type to review actual amounts or budget amounts.

27.3.1 Before You Begin

- Verify that Summary Document Types (user defined code 48/DC) are set up. See Chapter 36, "Set Up User Defined Codes".

To review work order transactions

On Cost by Work Order
Reviewing Work Order Transactions

**Figure 27–2  Cost by Work Order screen**

1. Complete the following field:
   - W.O. Number

2. Complete the following fields to limit the range and type of G/L transactions displayed:
   - From Date/Period
   - Thru Date/Period
   - Ledger Type

3. Choose the More Details function to review the following information:
   - Document Type
   - Document Number
   - Account Number
   - Batch Number/Date
   - User ID
   - Item (Part Number)
   - Description

<table>
<thead>
<tr>
<th>Field</th>

</table>

27.4 Reviewing Work Order Costs by Category Code

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Backlog Management

You can review work order costs that are summarized based on work order category codes. This is especially useful to review the number of work orders and the associated costs, based on the category of work order and the characteristics of the work performed. For example, assume that you designate a work order category code to represent equipment failures, with each code assigned to represent a different type of failure, such as inadequate lubrication, operator error, and so on. When you review work order costs by that category code, a summary of work order costs appears that also includes the number of work orders for each type of failure that you define.

**To review work order costs by category code**

On Backlog Management

2. Complete the following field:
   - Category Code
Reviewing Project Costs

### 27.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Category Code</td>
<td>Identifies the table that contains user defined codes for work order failure. The system uses the table you specify to summarize work order failure codes based on work order selection from the Backlog Management screen (P48201). Form-specific information Identifies the work order category code for which you want to review work order costs.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment Backlog</td>
<td>You can access Category Code Analysis from Equipment Backlog. Choose Category Code Analysis Window.</td>
</tr>
<tr>
<td>Selection criteria</td>
<td>Costs for all work orders on Category Code Analysis appear, regardless of any selection criteria on Backlog Management or Equipment Backlog,</td>
</tr>
</tbody>
</table>

### 27.5 Reviewing Project Costs

**Navigation**

*From Equipment/Plant Management (G13), choose Equipment Work Orders*

*From Equipment Work Orders (G1316), choose Cost by Parent Work Order*

You can review all costs associated with a project. When you set up a project, you establish a hierarchy of work orders based on a parent work order. Use Cost by Parent Work Order to review the total project amount and hours at the parent work order level, with individual work orders summarized as follows:

- Estimated amount or hours
- Actual amount or hours
- Variance between estimated and actual

You review costs by amounts or hours. After you review a summary of costs for the parent work order, you can review detailed costs for each work order in the project.

**To review project costs**

On Cost by Parent Work Order
Reviewing Estimated and Actual Work Order Amounts

1. Complete the following field:
   - Order Number
     Information for all child work orders appears.

2. To toggle between display formats, choose Hours/Amount.

27.5.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reviewing individual work</td>
<td>Choose Work Order Cost Detail to review costs for each work order in the project.</td>
</tr>
<tr>
<td>orders</td>
<td>See Section 27.3, &quot;Reviewing Work Order Transactions&quot;.</td>
</tr>
</tbody>
</table>

27.6 Reviewing Estimated and Actual Work Order Amounts

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Estimate to Actual Variance

Use Estimate to Actual Variance to review and analyze labor costs for each operation sequence charged to a work order. In addition, you can review:

- Total labor amounts or hours charged to a work order.
- Individual parts amounts charged to a work order.
- Total parts amounts charged to a work order.
- All miscellaneous costs charged to a work order, such as an accounts payable voucher for an outside service.
A comparison of actual amounts with estimated amounts. You can review quantities or currency amounts.

To review estimated and actual work order amounts
On Estimate to Actual Variance

Figure 27–6 Estimate to Actual Variance screen

1. Complete the following field:
   - Order Number
2. To toggle between display formats, choose Toggle Quantity/Amount.

27.6.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Estimated amounts for parts and routings</td>
<td>If the work order that you review does not include a parts list or labor routing instructions, the system uses the estimated amounts from Work Order Cost Summary.</td>
</tr>
</tbody>
</table>
| Actual amounts for routings       | To review actual amounts for a specific routing, you must enter the operation sequence when you enter time against a work order through Time Accounting.  
                                  | If you do not use routings and equipment constants are set up to allow you to enter actual amounts on the Work Order Cost Summary window, those amounts appear. If equipment constants do not allow entry of actual amounts, labor amounts appear, based on payroll transactions from the following tables: |
                                  | - Payroll Transaction History Table (F0618)                                                                                             |
                                  | - Employee Transaction Detail Table (F06118)                                                                                           |
Reviewing Estimated and Actual Work Order Amounts

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Actual amounts for parts and materials     | To review actual amounts for parts and materials, you must set up inventory document types (user defined code 48/ID). If you do not use parts lists and equipment constants are set up to allow you to enter actual amounts on the Work Order Cost Summary window, those amounts appear. If equipment constants do not allow entry of actual amounts, amounts for parts and materials appear, based on inventory transactions from the Item Ledger table (F4111). 
See Chapter 36, "Set Up User Defined Codes". |
| Actual amounts for miscellaneous costs     | If equipment constants are set up to allow you to enter actual amounts on the Work Order Cost Summary window, those amounts appear. If equipment constants do not allow entry of actual amounts, miscellaneous amounts from general ledger transactions appear. |
| Reviewing shop costs by repair code        | You can access Shop Cost by Repair Code from Estimate to Actual Variance by choosing Job Status. The Job Status Inquiry screen appears. This screen is identical to the Shop Costs by Repair Code screen. The system enters the job number (business unit) and subledger (work order number) from the Estimate to Actual Variance screen. 
See Section 10.5, "Reviewing Shop Costs by Repair Code" for more information. |

27.6.2 Processing Options

See Section 55.14, "Budget to Actual Variance (P48218)".
This part contains these chapters:

- Chapter 28, "Overview to Maintenance Planning"
- Chapter 29, "Work with PM Projections"
- Chapter 30, "Generate a Parts Plan"
- Chapter 31, "Review the Parts Plan"
- Chapter 32, "Generate a Labor Plan"
- Chapter 33, "Work with the Labor Plan"
This chapter contains these topics:
- Section 28.1, "Objectives"
- Section 28.2, "About Maintenance Planning"

28.1 Objectives
- To understand the maintenance planning process
- To run and review PM projections
- To generate parts and labor plans
- To review and respond to system-generated planning messages

28.2 About Maintenance Planning

Use the maintenance planning features of the Equipment/Plant Management system to accurately forecast parts and labor resources needed to complete your maintenance tasks. Use maintenance planning to minimize equipment downtime by ensuring that the necessary parts, materials, and maintenance personnel are available when a piece of equipment requires maintenance.

When you use maintenance planning, you define a range of maintenance work orders for which the system projects parts requirements and labor requirements. Additionally, you can integrate this information with forecasted (planned) work orders that the system generates when you run a PM projection.

After the system generates a PM projection, you can:
- Review information from the PM projection
- Generate a parts plan
- Respond to system recommendations for purchasing parts and materials
- Generate a labor plan
- Revise a labor plan to accommodate available resources

The following graphic shows the elements that the system uses to generate parts and labor plans:
This section describes features and functions that depend on the installation of the complete Equipment/Plant Management system. To be able to use Maintenance Planning, you must have purchased and installed the following systems:

- 30 - Product Data Management
- 31 - Shop Floor Control
- 33 - Resource and Capacity Planning
- 34 - Material Planning
- 40 - Inventory Base and Order Processing
- 41 - Inventory Management
- 43 - Procurement

Check with your system administrator to verify which systems you have purchased and installed.

Maintenance planning consists of the following tasks:

- Working with PM projections
- Generating a parts plan
- Reviewing the parts plan
- Generating a labor plan
- Working with the labor plan

### 28.2.1 PM Projections

When you run the PM projection, you can use the information that the system generates to help plan your maintenance activities. You specify the time period for which you want the system to forecast when equipment requires maintenance. The PM projection includes the following information:
- All equipment that requires maintenance
- The dates when the equipment will require maintenance
- The parts and materials required for the maintenance
- The estimated amount of time required to perform the maintenance

PM Projections uses information from the equipment masters and the equipments' preventive maintenance schedules to update the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM Projections (F13411)</td>
<td>This table stores the following information:</td>
</tr>
<tr>
<td></td>
<td>■ Equipment numbers</td>
</tr>
<tr>
<td></td>
<td>■ Service types associated with the equipment</td>
</tr>
<tr>
<td></td>
<td>■ Projected start dates for each service type</td>
</tr>
<tr>
<td></td>
<td>■ Estimated hours for each service type</td>
</tr>
<tr>
<td></td>
<td>■ Estimated parts and labor costs</td>
</tr>
<tr>
<td></td>
<td>■ Forecast type</td>
</tr>
<tr>
<td>Forecast (F3460)</td>
<td>This table stores the following information:</td>
</tr>
<tr>
<td></td>
<td>■ Standard parts list and routing instructions from the model work order</td>
</tr>
<tr>
<td></td>
<td>■ Branch where parts are stocked</td>
</tr>
<tr>
<td></td>
<td>■ Requested date for maintenance</td>
</tr>
<tr>
<td></td>
<td>■ Forecast type</td>
</tr>
<tr>
<td></td>
<td>■ Document type</td>
</tr>
</tbody>
</table>

### 28.2.2 Parts Plans

Use the parts plan to review the availability of required parts. When you generate a parts plan, the system generates messages which you should review to identify various parts planning needs. For example, you review parts messages to determine the quantity needed for a particular part at a future date. You can also direct the system to create purchase orders for parts currently not on hand, but needed in the future.

### 28.2.3 Labor Plans

Use the labor plan to review the demands that maintenance tasks place on your labor resources. When you generate a labor plan, the system generates messages that alert you to over-capacity or under-capacity conditions. You can adjust your labor resources accordingly or reschedule selected maintenance tasks to alleviate the over- or under-capacity conditions.
This chapter contains these topics:
- Section 29.1, "Working with PM Projections"
- Section 29.2, "Running the PM Projection Batch Update"
- Section 29.3, "Reviewing PM Projections"

29.1 Working with PM Projections

You can use PM Projections to collect and review detailed information about future maintenance tasks. For example, depending on the time period that you specify, you can review:
- All future maintenance for a piece of equipment or a class of equipment
- All future maintenance tasks by service type
- All future maintenance tasks at a specific location

29.2 Running the PM Projection Batch Update

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose PM Projection Batch Update

Run the PM Projection Batch Update program to forecast parts and labor requirements for future PMs. When you run this program, you specify the dates for which you want the projection to apply.

The system uses information from a joined table based on the Equipment Master table (F1201) and the Maintenance Schedule table (F1207; specifically, the estimated occurrences value and the last completed date for each service type) to determine when a piece of equipment will be due for maintenance. The system also uses parts and labor resource information from the model work order to determine future parts and labor requirements.

When you run the PM Projection Batch Update, the system updates the following tables:

<table>
<thead>
<tr>
<th>Table</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PM Projections (F13411)</td>
<td>The system uses information from this table to calculate values for the PM Projection Inquiry and the PM Projection Report.</td>
</tr>
</tbody>
</table>
29.2.1 Before You Begin
- Create model work orders for PM schedules. See Section 15.6, "Creating a Model Work Order"

See Also:
- JD Edwards World Technical Foundation Guide for more information about running, copying, and changing DREAM Writer versions

29.2.2 Processing Options
See Section 56.1, "PM Projections (P13411)"

29.3 Reviewing PM Projections

**Navigation**
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose PM Projection Inquiry

You can use PM Projection Inquiry to review detailed information about future PMs. For example, you can review:
- Projected dates for PMs
- Projected service types for specific pieces of equipment
- Estimated hours for each service type

You can use any of the following types of information to limit the PM information that the system displays:
- Schedule dates
- Service types
- Equipment location
- Equipment number

---

**Table** | **Description**
--- | ---
Forecast table (F3460) | The system uses values from this table to calculate parts and labor requirements for projected PMs.

---

**Note:** You must have purchased and installed Requirements Planning (system 34) and Capacity Requirements Planning (system 33) to use parts and labor planning functions. In addition, you must associate model work orders with PM schedules to supply the system with the necessary data to determine parts and labor requirements.

When you select PM Projection Batch Update, the system displays a versions list. The versions list includes DEMO versions that you can run or copy and modify to suit your needs. When you run a version, the system displays Processing Option Revisions before submitting the job for processing.

After you select the appropriate processing options, the system displays a message that the job was submitted to batch.
To review PM projections

On PM Projection Inquiry

Figure 29–1  PM Projection Inquiry screen

1. Complete the following field:
   - Forecast Type

2. To limit your search to specific PM projection information, complete any of the following fields:
   - Service Type From and Thru
   - Service Date From and Thru
   - Location
   - Item Number
   - Category Codes
### 29.3.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Reviewing and revising projected PMs | You can review and revise information about projected PMs. From the MPS Daily Operations menu (G3412), choose Enter/Change Detail Forecast. From this screen you can:  
  ■ Manually revise forecast information for an existing projection  
  ■ Add or delete a parts forecast  
  ■ Enter descriptive text for the forecast  
  You can access forecasts that you want to revise by item number, branch plant, forecast type, or any combination of these elements. If your forecast is extensive, you can specify a beginning request date to limit the amount of information that the system displays.  
  *Form-specific information*  
  When you revise information on Enter/Change Detail Forecast, the changes you make only affect the Forecast table (F3460). They do not affect the PM Projections table (F13411).  
  See Revising Detail Forecasts in the *JD Edwards World Manufacturing and Distribution Planning Guide* for more information. |
This chapter contains this topic:

- Section 30.1, "Generating a Parts Plan"

### 30.1 Generating a Parts Plan

**Navigation**

*From Equipment/Plant Management (G13), choose Maintenance Planning*

*From Maintenance Planning (G1322), choose Material Planning*

*From Material Planning (G1323), choose Plan Generation*

You can generate a parts plan to assist you in planning parts and materials requirements for work orders. When you generate a parts plan, the system compares the parts inventory you have on hand with the parts needed for work orders. The system determines parts requirements for actual work orders, such as work orders generated for corrective maintenance, and forecasted (planned) work orders.

Based on this comparison, the system determines the availability of the parts needed for work orders. The system also generates messages that you can review to ensure that the right parts are available when they are needed. The messages include the following recommendations:

- Which parts and materials you should order
- When you should place orders for parts
- What quantity you should order
- Whether you should cancel, defer, expedite, or increase existing orders

You use processing options to define a planning horizon for the parts plan. A planning horizon refers to the period for which a plan applies and how the period is ordered for display purposes. For example, you can generate a parts plan with a six-month planning horizon ordered as follows:

- Days - 14
- Weeks - 7
- Months - 4

You can include up to 52 periods in a planning horizon.

When you review part availability by time, the system uses the planning horizon as the basis for the parts projection information it displays.
Generating a Parts Plan

When you run Plan Generation, the system displays Processing Option Revisions before submitting the job for processing.

After you select the appropriate processing options, the system displays a message that the job was submitted to batch.

### 30.1.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to generate a parts plan:
  - System 30 - Product Data Management
  - System 31 - Shop Floor Control
  - System 34 - Material Planning
  - System 40 - Inventory Base and Order Processing
  - System 41 - Inventory Management
  - System 43 - Procurement

- Verify that the workday calendar has been set up for the time period for which you want to generate the parts plan. If your parts planning requires order lead time, you must account for backward and forward scheduling to accommodate the lead time. See Section 39.2.3, "Setting Up the Workday Calendar".

### 30.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Deleting previous planning messages | Every time you generate a parts plan, the system deletes all previous messages regarding parts availability. The system also deletes all detail messages for the parts you specify, except:  
  - Messages you direct the system to hold  
  - Messages you enter manually  
  See Section 31.3, "Working with Parts Detail Messages" for more information about holding messages or entering messages manually. |
| Inventory item balance records | In order for the system to include an inventory part when the system calculates part availability, the inventory part must have an item balance record.  
  See Appendix A, "Inventory Concepts and Setup" for more information about inventory records. |
| Inventory commitments         | Work order commitments are determined by the work order activity rules. The Commit field is used to determine if inventory is committed at a specific status. Inventory is automatically committed when the status is changed on the work order to a commit status. Hard and soft commitments are determined by the hard/soft commitment flag in the manufacturing constants. |
| Ensuring accurate planning information | To ensure accurate information when you generate a parts plan, other system users should not access programs that use inventory or planning tables. |
See Also:

- Generating a Material Requirements Plan in the *JD Edwards World Manufacturing and Distribution Planning Guide* for more information about defining a plan generation

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing DREAM Writer versions
This chapter contains these topics:

- Section 31.1, "Reviewing the Parts Plan"
- Section 31.2, "Reviewing Parts by Planning Family"
- Section 31.3, "Working with Parts Detail Messages"
- Section 31.4, "Reviewing Parts Availability by Time"
- Section 31.5, "Reviewing Part Supply and Demand"
- Section 31.6, "Reviewing Component Part Information"
- Section 31.7, "Reviewing and Revising Part Cross-References"

31.1 Reviewing the Parts Plan

When the system generates a parts plan, it updates several screens and generates a variety of messages. You can review these screens and messages to plan the parts requirements for your maintenance tasks. The screens and messages include information on planning family, inventory parts details and availability, supply and demand, component parts, and cross-reference information.

31.1.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to review parts plans:
  - · System 30 - Product Data Management
  - · System 31 - Shop Floor Control
  - · System 34 - Material Planning
  - · System 40 - Inventory Base and Order Processing
  - · System 41 - Inventory Management
  - · System 43 - Procurement

31.2 Reviewing Parts by Planning Family

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Material Planning
From Material Planning (G1323), choose Review Planning Family

You can review information about parts according to the person or planning family responsible for the parts. For example, you can review parts information by:

- Planner
- Buyer
- Supplier
- Master planning family

When you choose the person or planning family for which you want to review parts information, all parts associated with the person or planning family that have outstanding messages appear. You can specify the type of messages that you want to appear.

To review parts by planning family

On Review Planning Family

**Figure 31–1  Review Planning Family screen**

1. Complete the following field:
   - Branch/Plant
     This field might already contain a default value.

2. To limit your search to a particular planning family, complete any of the following fields:
   - Planner Number
   - Buyer Number
   - Supplier Number
   - Master Planning Family
3. To limit the amount of information that appears, complete any combination of the following fields:

- Thru Date
- Planning Code
- Message Type
- Stocking Type
- All Items

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Buyer Number</td>
<td>The address number of the person responsible for setting up and maintaining the correct stocking levels for the item.</td>
</tr>
<tr>
<td>Supplier Number</td>
<td>The address book number of the preferred provider of this item. You can enter the number for the supplier or have the system enter it each time that you receive the item from a supplier. You specify whether the system enters the supplier using processing options for Enter Receipts.</td>
</tr>
<tr>
<td>Master Planning Family</td>
<td>A code (table 41/P4) that represents an item property type or classification, such as commodity type, planning family, or so forth. The system uses this code to sort and process like items. This field is one of six classification categories available primarily for purchasing purposes.</td>
</tr>
<tr>
<td>Planning Code</td>
<td>A code that indicates how Master Production Schedule (MPS), Material Requirements Planning (MRP), or Distribution Requirements Planning (DRP) processes this item. Valid codes are: 0 – Not Planned by MPS, MRP, or DRP 1 – Planned by MPS or DRP 2 – Planned by MRP 3 – Planned by MRP with additional independent forecast 4 – Planned by MPS, Parent in Planning Bill 5 – Planned by MPS, Component in Planning Bill These codes are hard-coded. Form-specific information Equipment/Plant Management users must enter a 2 for Maintenance Planning.</td>
</tr>

31.2.1 Processing Options

See Section 56.2, "Review Planning Family (P3401)"

31.3 Working with Parts Detail Messages

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Material Planning
From Material Planning (G1323), choose Item Detail Messages
When you generate a parts plan, the system produces messages that identify when planning conflicts exist. For example, depending on how you set up your system, if a part’s usage exceeds availability, the system produces an order message. You can process the messages according to the system’s recommendations, delete them, hold them, or clear them. You can also create your own messages to serve as reminders about particular parts.

The types of messages that the system produces are determined by user defined codes (34/MT). Standard message types include warning messages and planned purchase order messages. Other messages include:

- Expedite an order
- Defer an order
- Increase an order
- Decrease an order

After you review a message, you can do one of the following:

<table>
<thead>
<tr>
<th>Action</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Process the message</td>
<td>Use this command to resolve the planning conflict. When you direct the system to process an order message, it carries out actions to resolve the planning conflict. For example, when you direct the system to process a planned purchase order message, it automatically creates a purchase requisition.</td>
</tr>
<tr>
<td>Hold the message</td>
<td>Use this command to resolve the planning conflict at a later time. When you direct the system to hold a message, the system keeps the message active, but does not resolve the planning conflict. After you resolve the planning conflict for which the message applies and you want to clear or delete the message, you must do so manually.</td>
</tr>
<tr>
<td>Delete the message</td>
<td>Use this command to delete obsolete messages.</td>
</tr>
<tr>
<td>Clear the message</td>
<td>Use this command to prevent the message from appearing. You can retrieve a cleared message by completing the Cleared field.</td>
</tr>
</tbody>
</table>

Working with parts detail messages consists of the following tasks:

- To review parts detail messages
- To create a purchase request for a part

**To review parts detail messages**

On Item Detail Messages
1. Complete the following fields:
   - Item Number (Part Number)
   - Branch/Plant
   The Branch/Plant field might already contain a default value.

2. Complete the following field:
   - Supply/Demand
   This field might contain a default value.

3. To review both cleared and outstanding messages, complete the following optional field:
   - Cleared (Y)

4. Choose Process, Hold, Delete, or Clear for each message.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supply/Demand</td>
<td>This field allows you to view messages from the viewpoint of either the supply or demand branch. Changing this field from S to D also changes the Supply Plant field immediately below the Action Code field to Demand Plant.</td>
</tr>
<tr>
<td></td>
<td>S – Supply branch/plant</td>
</tr>
<tr>
<td></td>
<td>D – Demand branch/plant</td>
</tr>
</tbody>
</table>
31.3.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Planning family</td>
<td>You can view messages by planning family or individuals within a planning family. You use planning families to group individuals responsible for parts. For example, you can review messages pertaining to:</td>
</tr>
<tr>
<td></td>
<td>• Parts for which the maintenance planning family is responsible</td>
</tr>
<tr>
<td></td>
<td>• Parts for which only the buyer is responsible</td>
</tr>
<tr>
<td>Inventory parts details</td>
<td>Review parts detail messages when you want to review detailed ordering information about a particular part. The messages include recommendations about when you should order the part. In addition, you can review:</td>
</tr>
<tr>
<td></td>
<td>• Inventory locations where the part is needed</td>
</tr>
<tr>
<td></td>
<td>• Required dates</td>
</tr>
<tr>
<td></td>
<td>• Part suppliers</td>
</tr>
<tr>
<td></td>
<td>After you review the messages, you can take appropriate action on the messages.</td>
</tr>
<tr>
<td>Inventory parts availability by time</td>
<td>You can review the activity affecting an inventory part’s availability over a time period that you specify. You can review the activity in daily, weekly, or monthly increments. Activity that affects availability includes:</td>
</tr>
<tr>
<td></td>
<td>• Beginning available amounts</td>
</tr>
<tr>
<td></td>
<td>• Supplies created by purchase orders</td>
</tr>
<tr>
<td></td>
<td>• Demands created by maintenance work orders</td>
</tr>
<tr>
<td>Supply and demand</td>
<td>Review detailed supply and demand information for a particular part. For example, you can review detailed information about a work order that creates a demand for a part or a purchase order that creates a supply for a part.</td>
</tr>
<tr>
<td>Component parts</td>
<td>You can review component part information when you want to review all of the standard parts lists (or bills of material) for which a component part is used.</td>
</tr>
<tr>
<td>Part cross-reference</td>
<td>You can review part cross-reference information when you want to determine which parts can be used as substitutions or replacements for parts that are not available. You can also review substitute suppliers.</td>
</tr>
<tr>
<td>Adding or changing messages</td>
<td>You can add or change any message on Item Detail Messages. You can also direct the system to perform actions on messages that you add or change. See Setting Up Message Types in the JD Edwards World Manufacturing and Distribution Planning Guide for more information about adding or changing messages.</td>
</tr>
<tr>
<td>Preventing messages from being</td>
<td>To prevent the system from deleting a system-generated message when you run a new parts plan, you must choose Hold for that message. The system does not delete messages that you specify as held or any messages that you enter manually.</td>
</tr>
</tbody>
</table>

To create a purchase request for a part

On Item Detail Messages
Follow the steps to review parts detail messages in the section above.

2. Choose Process Message for each part for which you want to create a purchase request.

3. Choose Enter.

   The message type associated with the part must be a message type for which the system will create a purchase request. For example, if the message that displays for a part is a manual reminder message, the system will not create a purchase request.

4. Choose Exit.

5. On Suppliers Selected For Order, choose Create Order.

6. To complete the process, choose Exit.
See Also:

- Processing Purchase Order Messages for MRP in the *JD Edwards World Manufacturing and Distribution Planning Guide* for more information about message types that the system will create a purchase request

31.3.2 Processing Options

See Section 56.4, "Message Detail (P3411)"

31.4 Reviewing Parts Availability by Time

**Navigation**

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Material Planning

From Material Planning (G1323), choose Item Availability by Time

Use Item Availability by Time when you need to see a projection of inventory activity for a particular maintenance part. The following information displays:

- Projected activity for the part in daily, weekly, or monthly increments, depending on how you set up your planning horizon

- Abbreviations for the activities that affect a part's availability, such as scheduled receipts, demand requirements, and so on

The system derives information for Item Availability by Time from your most recent parts plan generation. You can run a single part plan regeneration to ensure that you have the most recent inventory information for the part.

**To review parts availability by time**

On Item Availability by Time
1. Complete the following fields:

- Item Number (Part Number)
- Branch/Plant

The Branch/Plant field might already contain a default value.

2. Complete the following optional field:

- Start From Date

### 31.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Row descriptions</td>
<td>When you review parts information on Item Availability by Time, abbreviated row descriptions appear. Choose Display MPS Key Window to view complete descriptions of the rows. The system provides information about part availability that suggests two scenarios. Row descriptions ending in U (unadjusted), such as BAU, show part availability with the assumption that any outstanding action messages will not be implemented by the responsible planner. Row descriptions that do not end in U, such as BA, show part availability with the assumption that action messages will be implemented.</td>
</tr>
<tr>
<td>Suppressing rows without data</td>
<td>You can review only rows that contain data by choosing Suppress Blank Line Toggle. When you choose this function, the system hides all rows that do not contain data.</td>
</tr>
<tr>
<td>Updating planning information</td>
<td>You can ensure that the system provides the most current planning information by running a single part plan regeneration. Choose Run Single Item MPS to run a single part plan regeneration.</td>
</tr>
</tbody>
</table>
31.4.2 Processing Options

See Section 56.5, "Time Series (P3413)"

31.5 Reviewing Part Supply and Demand

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Material Planning
From Material Planning (G1323), choose Supply/Demand Inquiry

You can review the individual supply and demand for a particular maintenance part by date. You can also review the documents that affect the supply and demand for a part and take appropriate action.

For example, on a particular date, the system might indicate a demand for a part, but no supply. You can review the work order that is creating the demand for the part and create a purchase order to satisfy the demand.

You determine which type of documents the system includes when it calculates supply and demand for a part by setting up supply and demand inclusion rules.

To review part supply and demand
On Supply/Demand Inquiry

Figure 31–6 Supply/Demand Inquiry screen

1. Complete the following fields:
31.5.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reviewing a work order</td>
<td>You can review the work order master for the work order that is creating a demand for a part. Choose Work Order Header to view the work order master.</td>
</tr>
<tr>
<td></td>
<td>You can also review the work order parts list to which the individual part is attached. Choose Work Order Details to view the work order parts list.</td>
</tr>
<tr>
<td></td>
<td>When you review work orders or parts lists from Supply/Demand Inquiry, the manufacturing version of the screens displays, which might limit the information that you can review or revise.</td>
</tr>
<tr>
<td>Reviewing the purchase order for a part</td>
<td>You can review the purchase order for a part for which the system indicates a supply. Choose Purchase Order Inquiry to review the purchase order.</td>
</tr>
<tr>
<td>Creating a purchase order for a part</td>
<td>You can create a purchase order for parts for which a demand exists but for which no supply exists. Choose Purchase Order Entry to create a purchase order.</td>
</tr>
</tbody>
</table>
31.5.2 Processing Options

See Section 38.9, "Setting Up Supply and Demand Inclusion Rules"

31.6 Reviewing Component Part Information

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Material Planning
From Material Planning (G1323), choose Where Used Inquiry

You can review a wide variety of information for all parent assemblies or kits for which a maintenance part is a component. This is particularly useful if you need to locate an alternate source for a component part.

You can also review a list of the work orders that include a particular component on the work order parts list or the pieces of equipment that use a particular part. This is useful if, for example, you have critical information about a part such as recall information, and you need to quickly determine where you have installed the part.

Reviewing component part information consists of the following tasks:

- Reviewing parent information for component parts
- Reviewing where used information by equipment or work order
31.6.1 Reviewing Parent Information for Component Parts

When you review parent information for component parts, the system displays each bill of material that includes the component part. The current parent information for a component part appears, but you can indicate that the system show historical or future parent information. You can also:

- Review effective dates of each bill of material
- Determine if the component is required or optional for the bill of material
- Review the inventory master information for each parent part

To review parent information for component parts

On Where Used Inquiry

1. Complete the following fields:
   - Component Branch
   - Component Number

2. To limit the information that appears, complete the following optional fields:
   - Mode
   - As of (Date)

3. To review additional information from the standard parts list, choose More Details.
31.6.2 Reviewing Where Used Information by Equipment or Work Order

You can review a list of the work orders that include a particular component on the work order parts list or the pieces of equipment that use a particular component. This is useful if, for example, you have critical information about a part such as recall information, and you need to quickly determine where you have installed the part.

To review where used information by equipment or work order

On Where Used Inquiry

1. Complete the following fields:
   - Component Branch
   - Component Number
2. To limit the amount of information that appears, complete the following optional fields:
   ■ Mode
   ■ As Of (Date)
3. To review the equipment or work orders that use the component part, choose Where Used Detail.
4. To review parent information for a component by equipment or work order, choose Where Used Detail.

**Figure 31–10 Where Used Detail screen**

5. On Where Used Detail, choose Toggle Equipment/Work Order to review information either by equipment or by work order.

### 31.6.3 Processing Options

See Section 56.7, "Where Used Inquiry (P30201)"

### 31.7 Reviewing and Revising Part Cross-References

**Navigation**

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Material Planning

From Material Planning (G1323), choose Item Cross-Reference

You can use part cross-references to track your maintenance parts in a variety of ways. When you set up part cross-references, you assign cross-reference types to each part. For example, you can assign cross-reference types for:

■ Replacements for discontinued parts
You can make changes to cross-reference information as new information becomes available. This is particularly useful when you need to access the most current information about a part. You can add or revise the following cross-reference information for a part:

- Cross-reference type code
- Address number
- Cross-reference part number
- Cross-reference description

To review and revise part cross-references

On Item Cross-Reference

1. Complete the following field:
   - Item Number (Part Number)
2. Complete the following optional fields:
   - Date Valid
   - Cross-Reference Type Code
   - Address Number
   - Cross-Reference Number
3. To review effective dates and additional cross-reference description, choose More Details.

5. On Item X-Reference Revisions, revise any of the appropriate fields.
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>X-Ref Type Code</td>
<td>A code (UDC table 41\DT) that identifies the type of cross-reference you have set up for this customer. The system contains examples for:</td>
</tr>
<tr>
<td></td>
<td>■ Substitutes</td>
</tr>
<tr>
<td></td>
<td>■ Replacements</td>
</tr>
<tr>
<td></td>
<td>■ Bar Codes</td>
</tr>
<tr>
<td></td>
<td>■ Customer Numbers</td>
</tr>
<tr>
<td></td>
<td>■ Supplier Numbers</td>
</tr>
<tr>
<td>X-Ref Number</td>
<td>The cross-reference item number that the system assigns to an item number. A cross-reference number allows you to use a supplier’s item number if it is different from your own item number when you are processing or printing an order.</td>
</tr>
</tbody>
</table>
This chapter contains this topic:

- Section 32.1, "Generating a Labor Plan"

## 32.1 Generating a Labor Plan

### Navigation

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Labor Planning

From Labor Planning (G1324), choose Labor Plan Generation

You can generate a labor plan to assist you in planning labor resources for your maintenance tasks. When you generate a labor plan, the system compares available labor resources with the labor resources required by forecasted (planned) work orders and actual (firm) work orders. Based on this comparison, the system generates messages that alert you to over-capacity and under-capacity conditions.

<table>
<thead>
<tr>
<th>Condition</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Over-capacity</td>
<td>When the system identifies an over-capacity condition, fewer labor resources are available than needed. You must adjust your resources or reschedule the sequence of maintenance tasks to correct an over-capacity condition.</td>
</tr>
<tr>
<td>Under-capacity</td>
<td>When the system identifies an under-capacity condition, it indicates that your labor resources are not being utilized to their full potential. You should adjust your resources or reschedule the sequence of maintenance tasks in order to better utilize your labor resources.</td>
</tr>
</tbody>
</table>

Ideally, you adjust your resources and schedule your maintenance tasks to achieve a 100-percent capacity throughout your maintenance organization.

When you run the Labor Plan Generation program, the system displays Processing Option Revisions before submitting the job for processing.

After you select the appropriate processing options, the system displays a message that the job was submitted to batch.

### 32.1.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to generate a labor plan:
You must generate a parts plan before you generate a labor plan. See Section 30.1, "Generating a Parts Plan".

### 32.1.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Deleting previous planning messages | Every time you generate a labor plan, the system deletes all previous capacity messages, except:  
  - Messages that you direct the system to hold  
  - Messages that you enter manually  
  See Section 33.2, "Reviewing Labor Messages" for more information about holding messages or entering messages manually. |
| Setting up critical work centers | A critical work center is a work center that you want the system to include as a demand for labor resources when the system processes a labor plan. When you are selecting data for Labor Plan Generation, JD Edwards World recommends that you set critical work centers not equal to 4.  
  See "Setting Up Work Centers" for more information about setting up critical work centers. |

**See Also:**

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing DREAM Writer versions
Work with the Labor Plan

This chapter contains these topics:

- Section 33.1, "Working with the Labor Plan"
- Section 33.2, "Reviewing Labor Messages"
- Section 33.3, "Reviewing Capacity Load"
- Section 33.4, "Revising Labor Resources"

33.1 Working with the Labor Plan

When the system generates a labor plan, it updates several forms and generates a variety of messages. You can review these forms and messages to plan the resource units needed to complete your maintenance tasks. The forms and messages include the following information:

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Labor messages</td>
<td>You can quickly identify over-capacity and under-capacity conditions by reviewing labor messages. You can review messages for an individual work center or for a dispatch group. A dispatch group is a group of related work centers that report to one business unit. Dispatch groups enable you to organize work centers according to common functions, similar operations, or steps in routing.</td>
</tr>
<tr>
<td>Capacity load</td>
<td>You can use capacity load to analyze the difference between the required labor resources (load) and the available labor resources (capacity) for any time period that you specify. You can review load versus capacity for a dispatch group or for individual work centers within the dispatch group. You can review detailed information by date, or you can view a bar graph that summarizes over-capacity and under-capacity conditions by date.</td>
</tr>
<tr>
<td>Period summary</td>
<td>You can review detailed information about the work orders scheduled to be completed within a period that you specify. You can also review a summary of the total capacity load for all work orders within a period.</td>
</tr>
</tbody>
</table>

33.1.1 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to review and revise labor plans:
  - System 30 - Product Data Management
### 33.2 Reviewing Labor Messages

**Navigation**

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Labor Planning

From Labor Planning (G1324), choose Review Dispatch Group

Labor messages identify any labor resource conflicts. For example, you might have scheduled too many maintenance tasks for a work center without enough technicians to perform the work.

You can review the following types of labor messages:

<table>
<thead>
<tr>
<th>Message</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Messages by dispatch group</td>
<td>Use Review Dispatch Group to quickly identify work centers that are over or under capacity. You can review messages for all work centers in a dispatch group or for a specific work center.</td>
</tr>
<tr>
<td>Capacity messages by work center</td>
<td>Use Capacity Messages to review detailed capacity requirements for each work center. You specify the time period for which you want to review capacity requirements. The system provides information that you can use to balance loads across machines or work centers. You can also use the information to plan for additional labor resources to relieve work centers that are over capacity.</td>
</tr>
</tbody>
</table>

Reviewing labor messages consists of the following tasks:

- To review messages by dispatch group
- To review capacity messages by work center

**To review messages by dispatch group**

On Review Dispatch Group
1. Complete one of the following fields:
   - Dispatch Group
   - Craft/Labor

2. To limit your search to a specific type of work center or message, complete any of the following optional fields:
   - Critical Work Center
   - Message Type
   - All WC’s (Work Centers) (Y/N)

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dispatch Group</td>
<td>A super category code to group work centers within an overall business unit. For example, you can group like machines operating out of several work centers that report to one business unit under a dispatch group.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>You can enter a dispatch group to view all messages for all work centers in the group. To view messages, if any, generated for a specific work center, leave this field blank and enter the work center code in the Work Center field.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------</td>
<td>---------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Craft/Labor</td>
<td>An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant. You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department. Security for this field can prevent you from locating business units for which you have no authority. Note: The system uses this value for Journal Entries if you do not enter a value in the AAI table. Form-specific information Enter a work center code in this field to see detail messages only for that work center. To view detail messages for all work centers in a dispatch group, leave this field blank and enter a code in the Dispatch Group field.</td>
</tr>
<tr>
<td>Critical W/C</td>
<td>A code that identifies the work center as critical or not critical when the system calculates capacity. Valid values are: N – Not a critical work center 1 – A critical work center in calculating resource requirement planning only 2 – A critical work center in calculating capacity requirements planning only 3 – A critical work center in calculating resource requirements planning and capacity requirements planning 4 – Not a capacity work center (will not be generated in capacity planning) Note: The system displays Type 3 work centers whenever type 1 or type 2 is selected in this field. Form-specific information The field is display only and shows the specific work centers for which messages are generated. If you entered a code in the Craft/Labor field in the header area of the screen, the work centers listed in this field will be the same as the craft/labor field.</td>
</tr>
</tbody>
</table>
To review capacity messages by work center

On Review Dispatch Group

1. Complete the steps to review messages by dispatch group.

2. Choose Message for each work center for which you want to review capacity messages.
3. On Capacity Messages, complete the following field to limit the type of messages that display:
   - Cleared

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cleared (Y)</td>
<td>A code to indicate which messages should be displayed.</td>
</tr>
<tr>
<td></td>
<td>A Y code will display all messages, including those that have been cleared or processed, but not those already deleted.</td>
</tr>
<tr>
<td></td>
<td>Any value other than Y will display current messages only.</td>
</tr>
</tbody>
</table>

### 33.2.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Working with capacity messages</td>
<td>When you run the Labor Plan Generation program, the system deletes all messages except manual entries and held messages. Choose one of the following:</td>
</tr>
<tr>
<td></td>
<td>Hold – Prevents the system from deleting a message</td>
</tr>
<tr>
<td></td>
<td>Clear – Clears a message from the screen without deleting it</td>
</tr>
<tr>
<td></td>
<td>Delete – Deletes a message</td>
</tr>
</tbody>
</table>

### 33.3 Reviewing Capacity Load

You can use capacity load information to help you allocate your labor resources as optimally as possible. You can compare the load created by your maintenance tasks with the labor resources available to perform the maintenance tasks.

Reviewing capacity load consists of the following tasks:

- Reviewing capacity load by work center
Reviewing Capacity Load

- Reviewing a bar graph of capacity load
- Reviewing capacity load by period summary

When you review detailed capacity load information by work center, you specify a work center and the unit of measure, such as hours, by which you track your maintenance tasks.

You can review capacity load information for a work center in a graphic format. This is particularly useful when you need a quick visual representation of over-capacity and under-capacity conditions by time period.

You can review all of the maintenance tasks that make up the capacity load on a work center. You can also specify the planning period you want to review. In addition, you can:

- Identify the percentage of the total load for the work center that each maintenance task accounts for
- Identify the resource units, such as hours, required for each maintenance task

33.3.1 Reviewing Capacity Load by Work Center

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Labor Planning
From Labor Planning (G1324), choose Capacity Load

When you review detailed capacity load information by work center, you specify a work center and the unit of measure, such as hours, by which you track your maintenance tasks. Depending on how you set up your system, the system provides some or all of the following information by period.

- Released load - The load created from actual (firm) work orders.
- Planned load - The load created from forecasted (planned) work orders.
- Total load - The released load plus the planned load.
- Gross capacity - The units available from the work center.
- Rated capacity - The available units factored by efficiency and utilization. Efficiency is a user defined value that indicates how efficiently a work center operates. Utilization is a ratio of the actual time that a work center charges for maintenance activities to the planned time.
- Percent of capacity used - The total load divided by the rated capacity.
- Available capacity - The rated capacity minus the total load.
- Accumulated available capacity - A running total of available capacity.

To review capacity load by work center
On Capacity Load
1. Complete the following field:
   - Craft/Labor
2. Complete the following optional field:
   - Start Date
3. To move the calendar dates forward or backward to the period to review, choose Right or Left.

See Also:
- Section 39.4.5, "Setting Up Resource Planning Codes" for more information about defining the information that appears on Capacity Load

### 33.3.2 Processing Options

See Section 56.8, "Load (P3313)"

### 33.3.3 Reviewing a Bar Graph of Capacity Load

**Navigation**
- From Equipment/Plant Management (G13), choose Maintenance Planning
- From Maintenance Planning (G1322), choose Labor Planning
- From Labor Planning (G1324), choose Capacity Load Bar Graph

You can use Capacity Load Bar Graph to review capacity load information for a work center in a graphic format. This is particularly useful when you need a quick visual representation of over-capacity and under-capacity conditions by time period.
To review a bar graph of capacity load

On Capacity Load Bar Graph

**Figure 33–4 Capacity Load Bar Graph screen**

![Capacity Load Bar Graph screen]

1. Complete the following fields:
   - Craft/Labor
   - Unit of Measure
     The Unit of Measure field might already contain a default value
2. Complete the following optional field:
   - Start Date

### 33.3.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Color and monochrome monitors</td>
<td>If you are using a color monitor, the system uses contrasting colors to distinguish over-capacity conditions and under-capacity conditions. If you are using a monochrome monitor, over-capacity conditions appear in normal shading and under-capacity conditions appear in bold shading.</td>
</tr>
</tbody>
</table>

### 33.3.5 Processing Options

See Section 56.9, "Load Bar Graph (P3313B)".

### 33.3.6 Reviewing Capacity Load by Period Summary

**Navigation**

From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Labor Planning

From Labor Planning (G1324), choose Period Summary

Use Period Summary to review all of the maintenance tasks that make up the capacity load on a work center. You can also specify the planning period that you want to review. In addition, you can:

- Identify the percentage of the total load for the work center that each maintenance task accounts for
- Identify the resource units, such as hours, required for each maintenance task

To review capacity load by period summary

On Period Summary

Figure 33–5  Period Summary screen

1. Complete the following field:
   - Craft/Labor

2. To limit the number of records that appear, complete the following fields:
   - Period From
   - Period To

3. To review work order number and type, choose More Details.
33.3.7 Processing Options
See Section 56.10, "Period Summary (P3312)"

33.4 Revising Labor Resources

After you have identified which work centers have over-capacity and under-capacity conditions, you should revise labor resources to correct the conditions and balance the workload. When you correct over-capacity and under-capacity conditions, you help maximize the efficiency of your maintenance organization and save costs.

You can use the following methods to revise labor resources:

- Change the date to perform the maintenance task
- Revise the labor resources allocated to a work center

For example, you have several work orders scheduled on a day that is 40 percent over capacity. You note that the following work day is 35 percent under capacity. You can balance your capacity load by rescheduling a portion of the work orders for the following day. You can also reschedule individual operation sequences (routing steps) on a work order.

You can also make short-term revisions to the work center that is responsible for the maintenance tasks. For example, you can:

- Indicate additional resources for a particular work day
- Add work days to a work week
- Revise the efficiency of the work center

Revising labor resources consists of the following tasks:

- Revising work order dates
- Revising resource units for a work center
33.4.1 Revising Work Order Dates

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Labor Planning
From Labor Planning (G1324), choose Capacity Load

You can revise work order dates to correct over-capacity and under-capacity conditions. You can also reschedule individual operation sequences (routing steps) on a work order.

To revise work order dates
On Capacity Load

Figure 33–7  Capacity Load screen

1. Complete the following field:
   - Craft/Labor
2. Choose Production Status.
3. On Production Status, complete the following field for each operation sequence on a work order that you want to reschedule:
   - Start Date

4. Complete the following optional field for each operation sequence on a work order that you want to reschedule:
   - Requested Date

### 33.4.2 Processing Options

See Section 56.11, "Production Status (P31226)"

### 33.4.3 Revising Resource Units for a Work Center

#### Navigation

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Labor Planning

From Labor Planning (G1324), choose Craft Resource Units

You can revise resource units for a work center to correct over-capacity and under-capacity conditions. Use Craft Resource Units to make short-term revisions to the work center responsible for the maintenance tasks. For example, you can:

- Indicate additional resources for a particular work day
- Add work days to a work week
- Revise the efficiency of the work center

**To revise resource units for a work center**

On Craft Resource Units
1. Complete the following fields:
   - Craft/Labor
   - Calendar Month/Year
   - Branch
   The Branch field might already contain a default value.

2. Verify that the following field is blank:
   - Shift
   Shift codes are not applicable in Equipment/Plant Maintenance.

3. Complete the following field for each calendar day for which you want to revise resource units:
   - Resource Unit
   Each resource unit field corresponds to a calendar day.

4. To revise work center efficiency, complete the following field:
   - Efficiency

### Field | Explanation
--- | ---
Efficiency | A user defined value that indicates how efficiently a work center operates. This value usually refers to people efficiency. When you enter a value in this field, and the Modify Cost by Work Center Efficiency field in the Job Shop Manufacturing Constants table (F3009) is set to Y, the system creates a new cost component (B4) from the cost calculated from the direct labor cost (B1). The system also uses this value to calculate rated capacity.

Enter percents as whole numbers, for example, enter 80% as 80.00.
33.4.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Revising work days on the workday calendar</td>
<td>You can add or subtract work days to the workday calendar. For example, you might want to add a Saturday to the work week to compensate for an over-capacity condition. Choose Work Day Calendar to access the workday calendar. Enter a new type of day for each day you want to revise. See Section 39.2.3, “Setting Up the Workday Calendar.”</td>
</tr>
<tr>
<td>Adding long-term resources</td>
<td>When you need to make permanent or long-term resource revisions to a work center, use Resource Revisions. See &quot;Setting Up Work Centers&quot; for more information about adding resources to a work center.</td>
</tr>
</tbody>
</table>

33.4.5 Processing Options

See Section 56.12, "Work Center Resource Units (P3007)".
This part contains these chapters:

- Chapter 34, "Overview to System Setup"
- Chapter 35, "Set Up Equipment"
- Chapter 36, "Set Up User Defined Codes"
- Chapter 37, "Set Up PM Schedule Information"
- Chapter 38, "Set Up Work Orders"
- Chapter 39, "Set Up Maintenance Planning"
34 Overview to System Setup

This chapter contains these topics:

- Section 34.1, "Objectives"
- Section 34.2, "About System Setup"

34.1 Objectives

- To set up the information necessary to use the maintenance features within the Equipment/Plant Management system

34.2 About System Setup

Before you can use any of the maintenance features in Equipment/Plant Management, you must define certain information to customize the system for your specific business needs. This information consists of:

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Equipment information</td>
<td>You can set up equipment information to establish system basics, such as:</td>
</tr>
<tr>
<td></td>
<td>- Equipment and Fixed Asset constants</td>
</tr>
<tr>
<td></td>
<td>- Next Numbers</td>
</tr>
<tr>
<td></td>
<td>- Automatic accounting instructions (AAIs) that define the link between Equipment/Plant Maintenance and General Accounting systems</td>
</tr>
<tr>
<td>User defined codes</td>
<td>Set up user defined codes to enter information to customize your system to your specific business needs. You can customize a wide variety of information using user defined codes.</td>
</tr>
<tr>
<td>PM information</td>
<td>You can set up PM information to:</td>
</tr>
<tr>
<td></td>
<td>- Define standard maintenance procedures</td>
</tr>
<tr>
<td></td>
<td>- Create maintenance schedules</td>
</tr>
<tr>
<td></td>
<td>- Define rules that govern when maintenance is performed</td>
</tr>
</tbody>
</table>
About System Setup

System setup consists of the following tasks:

- Setting up equipment
- Setting up user defined codes
- Setting up PM schedule information
- Setting up work orders
- Setting up maintenance planning

Work order information
You set up work order information to provide the system with the information needed to process work orders according to your business needs. For example, you must:

- Identify the managers and supervisors who are responsible for maintenance tasks
- Determine the types of work order data that you want to track
- Determine the steps through which a work order must pass

Maintenance planning information
You set up maintenance planning information to:

- Determine basic planning constants for each branch, such as the type of inventory commitment, the length of the work day, and so on
- Set up the work day calendar
- Determine the rules by which the system indicates a need for parts and labor resources

<table>

This chapter contains these topics:

- Section 35.1, "Setting Up Equipment"
- Section 35.2, "Setting Up Equipment Data"
- Section 35.3, "Setting Up Supplemental Data"
- Section 35.4, "Setting Up Shop Cost Inquiry"

35.1 Setting Up Equipment

Before you can use Equipment/Plant Maintenance, you must establish certain information about your equipment, including equipment data, supplemental data, and shop cost inquiries.

35.2 Setting Up Equipment Data

You set up equipment data to establish basic information about your equipment. The system accesses the equipment data you set up when it executes various programs within Equipment/Plant Maintenance.

Setting up equipment data consists of the following tasks:

- Setting up equipment constants
- Setting up equipment/plant AAIs
- Setting up equipment next numbers
- Setting up depreciation account rules
- Setting up ledger depreciation rules
- Mapping equipment category codes

35.2.1 Setting Up Equipment Constants

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Equipment Constants

You set up equipment constants to control how your business uses Equipment/Plant Maintenance features. For example, when you define a default business unit for depreciation expense in equipment constants, the system automatically transfers this
information to Depreciation Information whenever you add a new piece of equipment to the system. You can also specify the business unit that appears as a default value for the asset accounts when you create equipment master information for a new piece of equipment.

You set up equipment constants only one time for Equipment/Plant Maintenance. Typically, you should not change the system constants. However, if you need to change them for any reason, you should understand the consequences. For example, if you change the default business unit for asset accounts, the change affects only the equipment that you add to the system after the change, and not the equipment that exists in the system prior to the change.

For some equipment constants, you must perform an additional process to update the system with your latest change. For example, if you change the symbol for the item number on the Equipment Constants screen, you must also run the Refresh Item Number program in Fixed Assets Global Updates to ensure that other programs that use symbols to identify the item number reflect the change.

---

**Note:** Equipment/Plant Maintenance shares system constants with the Fixed Asset system. You should work with the system administrator for Fixed Assets to ensure that the constants are set up to meet the needs of Fixed Assets and Equipment/Plant Maintenance.

---

**To set up equipment constants**

On Equipment Constants

*Figure 35–1  Equipment Constants screen*

![Equipment Constants screen](image)

1. To define supply and demand inclusion rules for material planning, complete the following field:
   - Inclusion Version

2. To define the work order record type for maintenance loops, complete the following field:
3. To specify whether entry of actual work order costs is allowed on Work Order Cost Summary, complete the following fields:
   - Actual Work Order Labor Cost
   - Actual Work Order Material Cost
   - Actual Work Order Other Cost

**Figure 35–2  P & E Constants Revisions screen**

6. On P & E Constants Revisions, complete the following fields to establish default values for business units:
   - Default Asset Cost Business Unit
   - Default Depreciation Expense Business Unit
   - Default Accumulated Depreciation Business Unit
   - Default Revenue-Billing Business Unit

7. To specify how the system calculates depreciation, complete the following field:
   - Calculate Depreciation Utilizing Rules

8. To specify whether the system allows changes to depreciation accounts after entries have been posted, complete the following fields:
   - Lock Accumulated Depreciation Account
   - Lock Depreciation Expense Account

9. To specify the number of category codes that appear on applicable entry screens, complete the following field:
10. To specify how the system identifies equipment numbers, complete the following fields:
   - Symbol to Identify Item Number
   - Symbol to Identify Unit Number
   - Symbol to Identify Serial Number

11. To specify which equipment category code the system uses to assign supplemental data types, complete the following field:
   - Supplemental Category Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Inclusion Version      | A user defined code (system 40/type RV) that identifies an inclusion rule that you want the system to use for this branch/plant. The Manufacturing and Advanced Warehouse Management systems use inclusion rules as follows:  
  - For Manufacturing - Allows multiple versions of resource rules for running MPS, MRP, or DRP.  
  - For Advanced Warehouse Management - Allows multiple versions of inclusion rules for running put away and picking. The system processes only those order lines that match the inclusion rule for a specified branch/plant.  
  
  **Form-specific information**  
  This code determines whether the system submits capacity planning interactively when you create a work order or when you change the status of a work order. The value you enter defines which version of the supply/demand inclusion rules the system uses to update the capacity plan.  
  If you leave this field blank, the system does not update the capacity plan when you create a work order or change the status of a work order. |
| Record Type            | The detail specification record type. Record types are user defined. You can set them up on the Detail Specification Types screen and use them to describe certain types of work order or engineering change order information.  
  
  **Form-specific information**  
  This is the work order record type that stores the associated equipment you define for maintenance routes. For example, if you enter record type E on this screen, when you set up a maintenance route, the system includes all equipment contained in record type E on the work order. |
| Actual WO Labor Cost   | This code determines whether you can manually enter actual labor costs for a work order on the Work Order Cost Summary window. Valid values are:  
  - 0 – The system calculates actual labor costs from Payroll.  
  - 1 – Actual labor costs are manually entered and are not calculated by the system. |
### Field | Explanation
--- | ---
Actual WO Material Cost | This code determines whether you can manually enter actual material costs for a work order on the Work Order Cost Summary window. Valid values are:
0 – The system calculates actual material costs from Inventory Issues.
1 – Actual material costs are manually entered and are not calculated by the system.

Actual WO Other Cost | This code determines whether you can manually enter actual other costs for a work order on the Work Order Cost Summary window. Other costs are miscellaneous costs that are not associated with labor or materials, such as subcontracting costs. Valid values are:
0 – The system calculates actual other costs from general ledger transactions.
1 – Actual other costs are manually entered and are not calculated by the system.

Default Asset Cst BU | This code determines where the business unit for the asset cost account comes from when you add a new asset. When you add a new asset, the system uses the business unit that this value represents on Depreciation Information. Valid codes are:
Y – Responsible Business Unit. The system uses the business unit from the responsible business unit on the Master Information screen.
N – Company. The system uses the business unit from the company number on the Master Information screen.
Typically the business unit and company share the same number. For example, business unit 50 usually contains general accounts for company 50.

Default Depr Exp BU | This code determines where the business unit for the depreciation expense comes from when you add a new asset. When you add an asset, the system uses the business unit that this value represents on Depreciation Information. Valid codes are:
Y – Responsible business unit. The system uses the business unit from the responsible business unit on the Master Information screen.
N – Default. The system uses the business unit from the Item Setup Default Coding screen.

Default Accum Dep BU | This code determines where the business unit for accumulated depreciation comes from when you add a new asset. When you add an asset, the system uses the business unit that this value represents on Depreciation Information. Valid codes are:
Y – Responsible business unit. The system uses the business unit from the responsible business unit on the Master Information screen.
N – Default. The system uses the business unit from the Item Setup Default Coding screen.

</tbody>
</table>
35.2.2 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Symbol to Identify Serial Number | You can assign one of three different numbers to an asset. These numbers are:  
- Item Number - Eight-digit, computer assigned number  
- Serial Number - Twenty-five-digit model or serial number  
- Unit Number - Twelve-digit, alphanumeric, user-defined number  
  When you enter an asset number, you may use a prefix or symbol to designate the number you enter. If you use this number most often, you should leave the symbol blank so that you just need to enter the number. If it is not the number you use most often, you should define a symbol, such as ‘ or *, that you will type before you enter the number so that the system knows which number you are representing.  
  **Note:** You can leave only one asset number blank. The other two must have a symbol so that all three numbers are unique. Be sure that this symbol is not significant for any other purposes of entry, for example, a period or comma. |
| Supplemental Cat. Cd         | Enter the number of the equipment category code that controls which supplemental data types the system displays on the Equipment Management supplemental data screens.  
  When you set up supplemental data, you use Data Type Cross Reference to specify which types of data appear on supplemental data screens. For example, on Equipment Constants, you can specify equipment category code 2 (Major Equipment Class) as the supplemental data category code. Then, on Data Type Cross Reference, you can specify which data types are appropriate for each class of equipment you set up under Major Equipment Class, such as specification sheets and transportation notes for heavy equipment. |

### 35.2.2 What You Should Know About

#### Equipment data

You should set up the following types of equipment data:

- Equipment constants
- Automatic accounting instructions (AAIs)
- Next numbers
- Depreciation account rules
- Ledger depreciation rules
- Category code default values

#### Supplemental data

You should complete the following setup procedures for supplemental data:

- Set up supplemental data types
- Set up specification data types
- Assign supplemental data types to classes of equipment
- Set up security to limit user access to supplemental data
Setting Up Equipment/Plant AAIs

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Automatic Accounting Instructions

Many JD Edwards World programs need information about your account structure and specific account values to process business transactions properly. You define your account structure and specific account values by using automatic accounting instructions (AAIs). The system stores the AAI values that you define for your company in the Automatic Accounting Instructions table (F0012). Whenever a program performs an accounting function, it accesses the Automatic Accounting Instructions table.

Equipment/Plant AAIs define the rules by which Equipment/Plant Maintenance and the General Accounting system interact. When you define AAIs, you establish how the system processes transactions for various programs. For example, AAIs set the rules by which general ledger transactions can post to Equipment/Plant Maintenance.

You set up AAIs by company, based on account numbers, and in some cases, ranges of account numbers. The system includes predefined ranges. You must specify the business unit and object account for the AAIs as necessary. Additionally, you must specify subsidiary accounts for certain AAIs.

The system uses single AAI values to find individual accounts and AAI ranges to find account ranges. When you set up AAI ranges, you must observe the following guidelines:

- You can set up a maximum of 49 account ranges for a single company.
- The maximum number of account ranges that you can set up for all your companies combined is 200.
- Do not skip AAI ranges. For example, do not set up FX range 01 - 02 and FX05 - 06, leaving FX03 - 04 blank for later use. If the system searches the AAIs for an account and finds a gap in a range, the search is stopped.
- You must set up your AAI ranges in numerical order. However, you are not required to set up your object accounts in numerical order.

AAIs for Equipment/Plant Maintenance include the following categories:

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shop cost inquiry</td>
<td>You should set up the format of the shop cost inquiry screen to meet your business needs. You can define the following:</td>
</tr>
<tr>
<td></td>
<td>- Inquiry columns</td>
</tr>
<tr>
<td></td>
<td>- Inquiry formats</td>
</tr>
<tr>
<td></td>
<td>- Inquiry paths</td>
</tr>
</tbody>
</table>

35.2.3 Setting Up Equipment/Plant AAIs
### FX Range

The system uses the FX range in the AAI's to determine which journal entries in the general ledger can post to equipment. You must specify all equipment accounts within the FX range of accounts. For example:

- **FX01 - FX02.** Beginning and ending range for asset cost accounts
- **FX03 - FX04.** Beginning and ending range for accumulated depreciation accounts
- **FX05 - FX06.** Beginning and ending range for depreciation expense accounts

When you set up the FX range of AAIs, you must apply the following rules:

- Define up to 49 FX ranges, starting with FX01 - FX02 and ending with FX97 - FX98.
- Ending ranges must be even numbers, such as FX02 and FX98.
- FX ranges can be company specific, or you can use the default company 00000 to set up the FX range for all your companies at the same time. If you set up a company-specific FX range for one company, you must set up the FX ranges for all companies. In addition, you must begin the FX range for each company with FX01.

### See Also:

- Working with AAIs in the *JD Edwards World General Accounting I Guide* for more information about adding or changing AAIs.

The guidelines that follow pertain only to AAIs relevant to Equipment/Plant Maintenance.

### Equipment AAIs

<table>
<thead>
<tr>

<tr>
<td>FMD:</td>
<td>Identifies the statistical account for the original meter reading that corresponds to the FMB statistical account</td>
</tr>
<tr>
<td>FME:</td>
<td>Identifies the statistical account for the original meter reading that corresponds to the AT00 statistical account</td>
</tr>
</tbody>
</table>

### Work order AAIs

You must set up the FP AAI. This AAI identifies the account that the system charges when you create a purchase order for parts on the work order parts list.
- Specify an object account for each FX range.
- Subsidiary accounts are optional. To include all subsidiaries in the FX range, include .99999999 in the ending range. For example, if you use subsidiary accounts, you might have a range of accounts that includes accounts 3000 - 4000.99999999. If you add other subsidiaries to your chart of accounts at a later time, you do not have to change your AAIs.

**FC Range**
The system uses the FC range in the AAIs to determine which accounts are reserved for asset cost accounts.

When you set up the FC range of AAIs, you must apply the following rules:
- Define up to 49 FC ranges.
- Define account ranges for all asset cost accounts.
- Set up FC account ranges for company 00000 only. The FC range is not company specific.

**AT Range**
The system uses the AT range of AAIs to determine which general ledger accounts are included in the summary lines on the Cost Summary screen. Use AT01 - AT99 to specify these interim total accounts and wording that appear for each total on Cost Summary. Use AT00 to define the account in which to store statistical information for hours. The AT range of AAIs is optional.

For example, you might specify that your balance sheet accounts are in account range 1000 - 3999 and your income and expense accounts are in the 4000 - 8999 range. You could set up your AT range as follows:
- AT01. Object account 4000. This interim total sums all object accounts below 4000, or accounts 0 - 3999. The system does not include object account 4000.
- AT02. Object account 9000. This interim total sums all object accounts between 4000 - 8999. The system does not include object account 9000.

When you set up the AT range of AAIs, you must apply the following rules:
- Define interim totals between AT01 - AT99.
- Use AT00 to define the account number that stores statistical information for hours.
- Do not specify an interim total for the Cost Summary grand total. The system automatically creates a grand total on Cost Summary.

**FMA, FMB, and AT00 AAIs**
The system uses these AAIs to determine the statistical accounts to use when equipment accumulates units, such as miles, hours, and fuel. The system uses statistical units to track equipment use. Programs that use these AAIs include:
- Meter Readings
- Item PM Schedule
- Update PM Schedule
- PM History and Completion
- Equipment Cost Analysis
When you set up FMA, FMB, and AT00 AAIs, you can set them up to be company-specific. In addition, you must apply the following rules:

- Include a business unit and object account for each AAI
- Do not include a subsidiary account

If you perform preventive maintenance based on equipment use measured by billed hours, you can use the same accounts for these AAIs as you use for billing accounts. AAIs applicable to equipment billing include:

- FTC
- FTC1 - FTC0
- FTxx

**See Also:**

- Setting Up Automatic Accounting Instructions in the *JD Edwards World Equipment Billing Guide*

**FMC, FMD, and FME AAIs**

The system uses these AAIs to define the statistical account that records the original meter reading determined by the Meter Readings program. Each of these AAIs corresponds to a statistical account as follows:

- FMC corresponds to the FMA account
- FMD corresponds to the FMB account
- FME corresponds to the AT00 account

When you set up FMC, FMD, and FME AAIs, you can set them up to be company-specific. Additionally, you must apply the following rules:

- Include a business unit and object account for each AAI
- Do not include a subsidiary account

**FP AAI**

The system uses the FP AAI to determine which account to charge when you create a purchase order from the work order parts list. You can set up the FP AAI to be company-specific. Additionally, you must apply the following rules:

- Include an object account for each AAI.
- Optionally include a business unit or subsidiary account. If you do not include a business unit or subsidiary account, the system uses the Charge to Business Unit and Repair Code from the work order for which you are purchasing parts.

Additionally, you must verify that line types have been set up in the system.

**See Also:**

- Appendix A, "Inventory Concepts and Setup" for more information about setting up line types

**Example: AAI Screen**

The Automatic Accounting Instructions screen shows an index, or list, of the AAIs used in the JD Edwards World systems. Select Automatic Accounting Instructions from the Equipment/Plant Management setup menu (G1341) to view the AAIs for Equipment/Plant Maintenance.
You can use the roll keys or the page up and page down keys to move through the screens and view all the AAs. Or, you can skip to a specific AAI by entering its sequence number in the Skip to Sequence Number field.

You can access other AAI entry screens to make either single or multiple AAI revisions. Use Single AAI Revisions to revise any AAI for a particular company. Use Multiple AAI Revisions to revise or add more than one AAI for a company or specific AAs for multiple companies.

### 35.2.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entering an item number</td>
<td>The item number identifies the AAI and does not refer to an equipment item number.</td>
</tr>
<tr>
<td>Entering a description</td>
<td>You can change the description for the AAI account use to fit your needs. This field is for your information only and does not affect how individual programs use the AAI.</td>
</tr>
</tbody>
</table>

### 35.2.5 Processing Options

See Section 57.1, "AAIs - Fixed Assets (P00121)"

### 35.2.6 Setting Up Equipment Next Numbers

**Navigation**

From Equipment/Plant Management (G13), enter 29

From Equipment/Plant Management Setup (G1341), choose Next Numbers

When you set up equipment next numbers, you enable the system to automatically assign unique numbers for certain items. For example, when you create an equipment master for a new piece of equipment, the system assigns a unique item number to the equipment. You must set up next numbers for the following items:

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
</table>
| Item number           | The system generates an item number to uniquely identify each piece of equipment. Depending on how you set up equipment constants, you can use the item number as the primary equipment number.  
                          | See Section 35.2.1, "Setting Up Equipment Constants" for more information about equipment numbers.                                               |
| Document number       | The system assigns unique document numbers to identify documents that it creates when you run various Fixed Assets programs, including:   
                          | - Compute Depreciation  
                          | - Single/Mass Asset Transfer  
                          | - Single/Mass Asset Disposal  
                          | - Enter Beginning Balances  
                          | - Asset Splits |

35-12  JD Edwards World Equipment/Plant Maintenance Guide,
Setting Up Equipment Data

To set up equipment next numbers
On Next Numbers

Figure 35–3 Next Numbers screen

<table>
<thead>
<tr>
<th>Item</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Text key number</td>
<td>The system generates a text key number to uniquely identify each location and to associate location tracking text to the location. The system assigns every location a text number, whether you enter text for the location.</td>
</tr>
<tr>
<td>Transfer number</td>
<td>The system generates a transfer number to group location transfers. The transfer number can include multiple location information lines for multiple pieces of equipment. For example, when you enter location tracking information for several pieces of equipment on one screen, the system generates a transfer number to group each line of information as one transfer order.</td>
</tr>
</tbody>
</table>

The system stores these next numbers in the Fixed Assets system (system 12). The system generates next numbers from the Next Numbers table (F0002).

**Caution:** JD Edwards World strongly recommends that you do not use blank as a next number value.

1. To locate next numbers for a particular system, complete the following field:
   - System Code
2. Complete the following fields for each number that you need to set up:
   - Next Number
   - Check Digit
35.2.7 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Next Number</td>
<td>The next number which will automatically be assigned by the system. Next numbers can be used for many types of documents including voucher numbers, invoice numbers, journal entry numbers, employee numbers, address numbers, and so on. Next numbers can be reviewed from the Operations Control Menu. You must adhere to the next numbers that have been pre-established unless custom programming has been provided.</td>
</tr>
<tr>
<td>Check Digit</td>
<td>A number that prevents the Next Numbers program (P0002) from assigning transposed numbers. If you use check digits, the system automatically adds a number to the end of each number that it assigns through Next Numbers.</td>
</tr>
</tbody>
</table>

35.2.8 Setting Up Depreciation Account Rules

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Depreciation Account Rules

Before you create equipment masters, you must set up depreciation account rules. Depreciation account rules define links between asset cost accounts and depreciation accounts. Depreciation account rules simplify the creation of equipment masters by defining how the system classifies equipment. In addition, the system posts depreciation amounts to the accounts that you specify in the depreciation account rules.

You can set up date-sensitive depreciation account rules. For example, if depreciation for a particular class of assets, such as heavy equipment, must be posted to different accounts after January 1, you can set up a rule with an effective date of January 1. As of January 1, the system posts depreciation for heavy equipment to the accounts that you specify in the date-specific rule.

The values that you set up on Company Depreciation Account Rules are also used by the Fixed Assets system. JD Edwards World recommends that you coordinate with your accounting department when you set up or change depreciation account rules.

You must set up depreciation account rules for every combination of company and asset cost account. Ensure that you set up depreciation account rules for any new cost.
accounts or companies that you add to your system at a later time. If you make any changes to depreciation account rules, you should verify that the values are correct before you create new equipment masters.

To set up depreciation account rules

On Company Depreciation Account Rules

Figure 35–4 Depreciation Account Rules screen

1. Complete the following fields:
   - Company Number
   - Asset Cost Object

2. Complete the following optional fields:
   - Asset Cost Subsidiary
   - Effective From Date
   - Major Accounting Class
   - Major Equipment Class

3. To specify an accumulated depreciation account, complete the following fields:
   - Accumulated Depreciation Business Unit
   - Accumulated Depreciation Object
   - Accumulated Depreciation Subsidiary

4. To specify a depreciation expense account, complete the following fields:
   - Depreciation Expense Business Unit
   - Depreciation Expense Object
   - Depreciation Expense Subsidiary

5. To specify a default account for revenue credit, complete the following fields:
- Revenue Default Credit Business Unit
- Revenue Default Credit Object
- Revenue Default Credit Subsidiary

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Company Number         | A code that identifies a specific organization, fund, entity, and so on. This code must already exist in the Company Constants table (F0010). It must identify a reporting entity that has a complete balance sheet. At this level, you can have intercompany transactions.  
**Note:** You can use company 00000 for default values, such as dates and automatic accounting instructions (AAIs). You cannot use it for transaction entries. |
| Asset Cost Object      | The general ledger account (object number) used to record a fixed asset’s acquisition cost. Within each company, you define default coding instructions for asset cost accounts. Then, based on these default codes, when you set up a new asset, the system automatically assigns the following:  
- Major and subclass codes  
- G/L accounts for depreciation and revenue  
- Depreciation books |
| Major Accounting Class | A user defined code (12/C1) that determines the accounting class category code. You use this accounting category code to classify assets into groups or families, for example, 100 for land, 200 for vehicles, and 300 for general office equipment.  
JD Edwards World recommends that you set up major class codes that correspond to the major general ledger object accounts in order to facilitate the reconciliation to the general ledger.  
**Note:** If you do not want to use the major accounting class code, you must set up a value for blank in the user defined code table. |
| Major Equipment Class  | A user defined code (12/C2) that is used to classify assets into groups or families. You use the equipment category code as a subclass to further define the accounting class, for example, 310 for copy equipment, 320 for projectors, and 330 for typewriters within the accounting class for general office equipment.  
**Note:** If you do not want to use the major equipment class, you must set up a value for blank in the user defined code table. |

### 35.2.9 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Depreciation calculation</td>
<td>Depreciation calculation is based on the rule in effect at the end of the year. If a rule is added or changed during the year, you must run the asset transfer program to bring existing balances into alignment with the new rule.</td>
</tr>
<tr>
<td>Revising depreciation account values</td>
<td>Any revisions that you make to the depreciation account values for an asset cost account or company affect only the new equipment that you add to the system after making the changes. The revisions do not affect existing equipment.</td>
</tr>
</tbody>
</table>
35.2.10 Setting Up Ledger Depreciation Rules

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Ledger Depreciation Rules

Before you can create equipment masters, you must set up ledger depreciation rules. When you set up ledger depreciation rules, you define the depreciation methods that the system uses to calculate depreciation for specific ledger types. As a minimum, you must set up a depreciation rule for the AA (Actual Amounts) ledger type for each company and asset cost account combination that you have in the system. You can set up as many ledger depreciation rules as you need, based on any combination of the following:

- Company
- Accounting category
- Depreciation category
- Asset cost account
- Effective From

The values that you set up on Company Ledger Depreciation Rules are also used by the Fixed Assets system. JD Edwards World recommends that you coordinate with your accounting department when you set up or change ledger depreciation rules.

See Also:
- Understanding Depreciation Methods and Setting Up User Defined Depreciation in the JD Edwards World Fixed Assets Guide for more information about valid field combinations that you can apply to ledger depreciation rules

To set up ledger depreciation rules
On Company Ledger Depreciation Rules
1. For each ledger depreciation rule that you want to set up, complete at least one of the following fields:
   - Company
   - Accounting Category
   - Depreciation Category
   - Asset Cost Object
2. Complete any of the following optional fields:
   - Asset Cost Subsidiary
   - Asset Cost Subledger
   - Subledger Type
   - Effective From Date
3. For each ledger depreciation rule that you want to set up, complete a valid combination of the following fields:
   - Ledger Type
   - Depreciation Method
   - Life Periods
   - Investment Term Apportionment Code (TA)
   - Compute Direction
   - Method Percent
   - Production Units Schedule
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Company       | A code that identifies a specific organization, fund, entity, and so on. This code must already exist in the Company Constants table (F0010). It must identify a reporting entity that has a complete balance sheet. At this level, you can have intercompany transactions.  
Note: You can use company 00000 for default values, such as dates and automatic accounting instructions (AAIs). You cannot use it for transaction entries. |
| Accounting Category | A user defined code (12/C1) that determines the accounting class category code. You use this accounting category code to classify assets into groups or families, for example, 100 for land, 200 for vehicles, and 300 for general office equipment.  
JD Edwards World recommends that you set up major class codes that correspond to the major general ledger object accounts in order to facilitate the reconciliation to the general ledger.  
Note: If you do not want to use the major accounting class code, you must set up a value for blank in the user defined code table. |
| Depreciation Category | The depreciation category an asset belongs to. The value is derived from the User Defined Code specified as the "Depreciation Category Code", DPCC, in the Fixed Assets constants. Generally, a depreciation category will be used to group assets with identical depreciation characteristics for depreciation calculation and reporting purposes. |
| LT            | A user defined code (system 09/type LT) that specifies the type of ledger, such as AA (Actual Amount), BA (Budget Amount), or AU (Actual Units). You can set up multiple, concurrent accounting ledgers within the general ledger to establish an audit trail for all transactions. |
The user defined code (system 12, type DM) that indicates the method of depreciation for the specified book. In addition to any user defined depreciation methods you set up for your company, the following standard depreciation methods are available in the Fixed Assets system:

00 – No depreciation method used  
01 – Straight Line Depreciation  
02 – Sum of the Year’s Digits  
03 – 125% Declining Balance to Cross-Over  
04 – 150% Declining Balance to Cross-Over  
05 – Double Declining Balance to Cross-Over  
06 – Fixed % on Declining Balance  
07 – ACRS Standard Depreciation  
08 – ACRS Optional Depreciation  
09 – Units of Production Depreciation  
10 – MACRS Luxury Cars - Domestic  
11 – Fixed % Luxury Cars - Foreign  
12 – MACRS Standard Depreciation  
13 – ACRS Alternative Depreciation  
14 – ACRS Alternate Real Property  
15 – Fixed % of Cost  
16 – Fixed % on Declining Balance to Cross-Over  
17 – AMT Luxury Auto  
18 – ACE Luxury Auto  

**Note:** Any additional depreciation methods you create for your organization must have an alpha code.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Me</td>
<td>The user defined code (system 12, type DM) that indicates the method of depreciation for the specified book. In addition to any user defined depreciation methods you set up for your company, the following standard depreciation methods are available in the Fixed Assets system: 00 – No depreciation method used 01 – Straight Line Depreciation 02 – Sum of the Year’s Digits 03 – 125% Declining Balance to Cross-Over 04 – 150% Declining Balance to Cross-Over 05 – Double Declining Balance to Cross-Over 06 – Fixed % on Declining Balance 07 – ACRS Standard Depreciation 08 – ACRS Optional Depreciation 09 – Units of Production Depreciation 10 – MACRS Luxury Cars - Domestic 11 – Fixed % Luxury Cars - Foreign 12 – MACRS Standard Depreciation 13 – ACRS Alternative Depreciation 14 – ACRS Alternate Real Property 15 – Fixed % of Cost 16 – Fixed % on Declining Balance to Cross-Over 17 – AMT Luxury Auto 18 – ACE Luxury Auto</td>
</tr>
<tr>
<td>Life Per</td>
<td>The life of an asset in months or periods. The system uses months or periods only to express the life of an asset. For example, if your company uses a 12-month calendar, then a five-year ACRS asset has a 60-month life. If your company uses a 13-month calendar, then a five-year ACRS asset has a 65-month life, and so on. You must specify a life month value for all user defined depreciation methods, and for all standard depreciation methods, except the standard methods 00, 06, 09, 11, and 15.</td>
</tr>
</tbody>
</table>
A code for additional depreciation information. This code is used for Investment Tax Credit (ITC) and averaging conventions. The system validates the code you enter in this field against user defined code table 12/AC. Valid codes are:

0 – No ITC Taken
1 – Three Year Method (3 1/3%)
2 – Five Year Method (6 2/3%)
3 – Seven Year Method (10%)
4 – ACRS Method with Basis Reduction (10% ITC)
5 – ACRS Method without Basis Reduction (2% ITC or No ITC)

A – Actual Date of Depreciation Start Period
M – Mid-Month Convention
Q – Mid-Quarter Convention
Y – Mid-Year Convention
P – Middle of Period
F – First-half/Second-half
W – Whole Year
N – First Day of Next Period
R – First Day of Next Year
S – Actual Start Date for Primary Rule/First Day of Period for Secondary Rule

Note: Numeric codes apply to standard depreciation methods only.

To determine the date for F (First-half/Second-half), use the following guidelines:

- If the asset was placed in service in the first half of the year then the adjusted depreciation start date is the first day of the year.
- If the asset was placed in service in the second half of the year then the adjusted depreciation start date is the first day of the succeeding year.
- The first half of the year expires at the close of the last day of the calendar month which is closest to the middle of the tax year.
- The second half of the year begins the day after the expiration of the first half of the tax year.
35.2.11 What You Should Know About

</tbody>
</table>

35.2.12 Mapping Equipment Category Codes

**Navigation**

From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Category Code Mapping

If you set up category codes for your business unit that would also be helpful for tracking and reporting on your equipment, you can set up default values to map, or tie specific business unit category codes to specific equipment category codes. You can also map specific equipment category codes to specific work order category codes.

When you set up an equipment master for a new piece of equipment, the system automatically enters the category codes that you specified from the responsible business unit on Equipment Master. Similarly, when you set up work orders for equipment, the system automatically enters the category codes that you specified from the equipment master on the work order.

To map equipment category codes
On Category Code Mapping

*Figure 35–6  Category Code Mapping screen*

1. To indicate how you want to map the category codes, complete the following field:
   - Mapping Type
2. Complete the following fields:
   - Map to Category Code
   - Map From Category Code

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mapping Type</td>
<td>Enter a 1 in this field to map Business Unit Category Codes to Equipment Category Codes. Enter a 2 in this field to map Equipment Category Codes to Work Order Category Codes.</td>
</tr>
</tbody>
</table>
35.2.13 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Changing the responsible business unit</td>
<td>The system uses the responsible business unit from the equipment master to determine from which business unit to assign codes. If you change the responsible business unit for a piece of equipment, the system reassigns equipment category codes based on the new business unit.</td>
</tr>
<tr>
<td>Mapping default category codes with different values</td>
<td>The default values you set up on Category Code Mapping appear on Equipment Master only if the values are valid for the business unit and the equipment. For example, if you want to map the value for category code 05 from the business unit master to category code 08 on the equipment master, the values for both category code tables must match. The same applies when you map equipment category codes to work order category codes.</td>
</tr>
<tr>
<td>Mapping category codes with different character lengths</td>
<td>Several category codes throughout the system exceed three characters in length. The system truncates any codes longer than three characters that you map onto the equipment master or the work order master into a 3-character category code field.</td>
</tr>
</tbody>
</table>

35.3 Setting Up Supplemental Data

You can use supplemental data to further define the equipment in your system. The system stores detailed equipment information as supplemental data. After you set up supplemental data, you can use it to report on and track details about equipment which are important to your company, but are not included on the equipment master. You can define as many types of supplemental data as you need. You can also control which users have access to specific types of supplemental data.

You define and maintain supplemental data by equipment class. For example, you might set up supplemental data for an equipment class that includes motor graders. The data might include fuel capacities, oil readings, and so on. You can also set up a specific supplemental data type (SP) for specification sheets. Use specification sheets to track nameplate data and other static information.

You can use the following formats to record supplemental data:
Setting Up Supplemental Data

Set Up Equipment

35-25

The system stores the supplemental data types you set up in the Supplemental Data Types table (F12090).

Setting up supplemental data consists of the following tasks:

- Defining supplemental data types
- Defining specification data types
- Assigning supplemental data types to equipment
- Setting up supplemental data security

## 35.3.1 Defining Supplemental Data Types

**Navigation**
From Equipment/Plant Management (G13), enter 29

From Equipment/Plant Management Setup (G1341), choose Supplemental Data

From Supplemental Data Setup (G1344), choose Data Type Definition

You must define the data types for the supplemental data that you want to maintain for your system. You can define as many types of supplemental data as you need. You can also specify that certain information stored in supplemental data be included as word search data when you perform query searches from Equipment Search.

To define supplemental data types

On Data Type Definition

<table>
<thead>
<tr>
<th>Format</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Narrative (N)</td>
<td>Use this data type to access the Supplemental Text Entry screen. You can use this text format to enter unlimited text information about equipment.</td>
</tr>
<tr>
<td>Columnar (C)</td>
<td>Use this data type to access Supplemental Code Entry. When you set up supplemental data screens using this data type, you can define the columns into which you enter information. The system edits the values that you enter in the columns against the user defined code table that you set up in Data Type Definition.</td>
</tr>
<tr>
<td>Columnar-Message (M)</td>
<td>Use this data type to access Supplemental Code Entry. You can use this data type in the same way as the columnar type. The only difference is that the system edits the values you enter in the columns of this data type against the Generic Rates and Messages table that you set up in Generic Rates and Message Records. Standard Procedures is an example of Generic Rates and Messages. Standard Procedures is used in Preventive Maintenance and Work Orders.</td>
</tr>
</tbody>
</table>
Figure 35–7  Data Type Definition screen

1. Complete the following fields:
   - Type Data
   - Description
   - Display Mode

2. Complete the following optional fields:
   - Code Title
   - Amount Title
   - System Code (SY)
   - System Code (RT)
   - Word Search

3. Choose More Details.
4. Complete the following optional fields:
   - Remark 1 Title
   - Remark 2 Title

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>

<tbody>
<tr>
<td>Ty Dt</td>
<td>A user defined code (system 12, type RT) used to group data. This code is alphanumeric and is typically an abbreviation, such as PT for lease payment terms, TX for lease taxation terms, and so on.</td>
</tr>
</tbody>
</table>
| D M  | The format of a data type. This code determines the display mode for supplemental data. Valid codes are:
   - C – Code format, which displays the screen for entering code-specific information. These codes are associated with User Defined Codes table (F0005).
   - N – Narrative format, which displays the screen for entering narrative text.
   - P – Program exit, which allows you to exit to the program you specified in the Pgm ID field.
   - M – Message format, which displays the screen for entering code-specific information. However, the system can edit the code values you enter against values in the Generic Rates and Messages table (F00191). This code is not used by the Human Resources or Financials systems.   
     
     Form-specific information
     
     Display Mode P is not used by the Equipment/Plant Management or Fixed Assets systems. |
### Setting Up Supplemental Data

This field determines whether you want to include the data stored under a particular supplemental data type in a word search of the supplemental database. The fields included in the word search are User Defined Code, Remark, Remark 2, and Narrative Text. To rebuild the data into the word search file, you must run the Build Search File for Fixed Assets program (P12BDWRD). This allows you to use the query search function on the Asset Search and Location screen (P1204) for the data in Supplemental Data. Valid codes are:

- Y – Include in word search
- N – Do not include in word search

You can enter 1 for yes or 2 for no.

<table>
<thead>
<tr>

If you enter a value that is not in the table, the system displays error message. The Edit On function is available for data types with user defined codes, but it is not required. If you do not enter values in the Edit on RT and Edit on SY fields, the Type Data field is free form and no cursor-sensitive help is available. Note: The Edit On function is not available for data types with narrative text.</td>
</tr>
</tbody>
</table>
35.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
</table>
| Defining user defined codes as valid values for a data type | Use the following guidelines to define user defined codes as valid values for a data type:  
  - The user defined code table must be set up before you can set up the data type.  
  - To assign a user defined code table to a data type, specify the install system and code type in the Edit on SY and Edit on RT fields.  
  - If your supplemental data type does not relate to an existing user defined code or generic message code, you can set up a new user defined code table.  
  
  JD Edwards World recommends that you define the new tables for install systems 55 - 59. System 55 - 59 are reserved for client use. User defined code tables that you create for these systems will not be modified during any reinstall processes.  
  See the JD Edwards World Technical Foundation Guide or more information about user defined codes. |
| Defining specification sheets as a supplemental data type | If you want to use specification sheets, you must define Specification Sheets as a type of supplemental data. Enter SP as the data type.  
  See also Section 35.3.3, "Defining Specification Data Types" |

See Also:

- Section 5.1.5, "Searching for Equipment by Query" for more information about performing query searches.

35.3.3 Defining Specification Data Types

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Supplemental Data
From Supplemental Data Setup (G1344), choose Specification Cross Reference

Use specification data to define which types of static data, such as nameplate information, you want to record for a particular equipment class. For each equipment class, you can create up to 99 pages of data with as many as 16 data fields per page. You can set up the sequence in which the data appears and specify the names for the various data fields.

35.3.4 Before You Begin

- Define Specification Sheets as a supplemental data type. See Section 35.3.1, "Defining Supplemental Data Types".

To define specification data types
On Specification Cross Reference
1. Complete the following fields:
   - Category Code

2. Complete the following fields for each type of specification data that you want to define:
   - Sequence Number
   - Description
   - Field Number
   - Field Type
   - Item Size
   - Display Decimals (optional)
   - Right or Left (optional)
   - Required Field (optional)

3. To edit specification data against a user defined code, complete the following fields:
   - System Code
   - User Defined Code

4. To edit specification data against information in a specific table, complete the following field:
   - File Name

5. If an equipment class requires more than 16 specification data types, complete the following field to create a new page:
   - Page Number
### Field | Explanation
--- | ---
**Sequence Number** | A number that is used to sequence specification data. For any item of specification data, enter the number in the order you want it to appear on the Specification Data Entry screen (V1216).

**Field Number** | This number defines which field in the Specification Data table you are setting up. For this field number, you can define a description, the sequence in which it will display, and any editing rules that you want to apply to the data.

**Field Type** | Enter the type of data that the user will enter in the field on the Specification Data Entry screen. Valid values are:

- A – Alpha Numeric
- N – Numeric
- D – Date
- T - Time

**Item Size** | The field size of the data item.

*Note:* All amount fields should be entered as 15 bytes, 0 decimals, and the data item type should be P (packed).

*Form-specific information*

Enter the size of the data item. The lowest value you can enter is 1 character and the highest value is 99,999 characters.

**File Name** | The number of a specific table. For example, the General Ledger Master table name is F0901. See the Standards Manual on the programmers' menu for naming conventions.

Within the Cross Reference Search facility, this represents names of all types of objects (that is, programs, tables, field names, data dictionary names, and so on). One special reserved name for displaying overall total RPG statistical information is "XRPGTOT" in combination with type ="P" and to display type="#".

*Form-specific information*

Enter the number of the table you want the system to edit specification data values against. You can choose any table within any JD Edwards World system to edit against. However, the following tables have special features within the Equipment/Plant Management system:

- Work Order Master (F4801)
- Equipment Master by Item Number (F1201LA)
- Equipment Master by Unit Number (F1201LB)
- Short Address Book Number (F0101LA)
- Purchase Order Master (F4301)
- Inventory Master by Short Part Number (F4101LA)
- Inventory Master by Long Part Number (F4101LB)

If you specify one of these tables, the cursor-sensitive help screens for that field display a search screen or window for the table specified. In addition, the description of the data contained in the table appears as the description of the field on Specification Data Entry (V1216).
Setting Up Supplemental Data

35.3.5 What You Should Know About

Assigning Supplemental Data Types to Equipment

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Supplemental Data
From Supplemental Data Setup (G1344), choose Data Type Cross Reference

You can define which types of supplemental data appear for a specific class of equipment. For example, you might want to track separate supplemental data types for electrical equipment and diesel-powered equipment. You can specify that supplemental data types for electrical equipment, such as voltage, amperage, and so on, do not appear for equipment for which the data is not applicable.

If you choose not to assign supplemental data types, all supplemental data types that you define will appear for all classes of equipment. You specify the category code that you want to use to define the equipment class on Equipment Constants.

35.3.7 Before You Begin

- Define the supplemental category code on Equipment Constants. See Section 35.2.1, “Setting Up Equipment Constants”.

To assign supplemental data types to equipment
On Data Type Cross Reference

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disp Dec</td>
<td>Use this parameter to designate the number of decimals in the currency, amount, or quantity fields the system displays. For example, U.S. Dollars would be 2 decimals, Japanese Yen would be no decimals, and Cameroon Francs would be 3 decimals.</td>
</tr>
<tr>
<td></td>
<td><em>Form-specific information</em></td>
</tr>
<tr>
<td></td>
<td>For numeric specification data, if you do not enter a value in this field, the system uses a default value of 0.</td>
</tr>
<tr>
<td>Req Y/N</td>
<td>A code that specifies whether a value is required. The default is N for Not Required. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>Y or 1 - This value is required to be valid.</td>
</tr>
<tr>
<td></td>
<td>N or 0 - This value is not required.</td>
</tr>
</tbody>
</table>
1. Complete the following field:
   - Category Code Value
   
   The value that you enter must be a value from the user defined code table you defined in equipment constants for supplemental data. For example, if you defined equipment category code 2 as your supplemental category code in equipment constants, you can enter any value from equipment category code 2 in this field.

2. Assign all data types that you want to associate with the type or class of equipment.

### 35.3.8 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Alternate display format</td>
<td>You can review all of the category codes for which a specific data type is valid by entering the data type in the Type Data field and leaving the Category Code Value field blank. All of the category codes appear for which that data type is valid.</td>
</tr>
</tbody>
</table>

### 35.3.9 Setting Up Supplemental Data Security

**Navigation**

- From Equipment/Plant Management (G13), enter 29
- From Equipment/Plant Management Setup (G1341), choose Supplemental Data
- From Supplemental Data Setup (G1344), choose Supplemental Data Security

You can set up supplemental data security to prevent or permit access to some or all supplemental data types according to the user ID. For example, you can allow a user to access all data types except the data type for lease payment terms (PT) or prevent a
user from gaining access to any supplemental data. Supplemental data security allows you to maintain sensitive information about equipment.

All users have access to supplemental data types until you set up security.

Setting up supplemental data security consists of the following tasks:

- Preventing access to a data type
- Permitting access to a data type

**Figure 35–11  Supplemental Data Security screen**

To prevent access to a data type

On Supplemental Data Security

1. Complete the following fields:
   - User ID
   - Type of Data
2. Type N in the following field:
   - Allow

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Allow | A code that indicates whether a user is allowed access to the function key or selection. Valid codes are: Y – Yes, allow access
|       | N – No, prevent access
|       | blank – Yes, allow access (default). |

To permit access to a data type

On Supplemental Data Security

1. Complete the following fields:
Setting Up Shop Cost Inquiry

You use Shop Cost Inquiry to review maintenance costs for an individual shop by repair code. Before you can use Shop Cost Inquiry, you must define the information that you want to review, and the sequence in which you want to view it. You define the information that you want to review by defining and naming inquiry columns, such as budget amount, actual amount, and so on. You must also provide the system with a formula for calculating the amount or quantity that corresponds to an inquiry column. You can define as many columns as you need.

After you define the columns, you can combine them into different inquiry formats. You use inquiry formats to group specific columns of information into a meaningful display. You can set up different inquiry formats for Shop Cost Inquiry that meet your specific business needs. You can include up to four columns of information in an inquiry format. You can then name the inquiry format and provide a description of the information that the columns represent, such as Maintenance - Budget to Actual Comparison, where Maintenance is the name of the inquiry format, and Budget to Actual Comparison is the description.

After you set up inquiry formats, you can set up the sequence in which the formats appear. You use inquiry paths to set up this sequence. When you access Shop Cost Inquiry, you can toggle between the different inquiry formats according to the sequence you set up.

Setting up Shop Cost Inquiry consists of the following tasks:

- Defining inquiry columns
- Defining inquiry formats
- Defining inquiry paths

35.4.1 Defining Inquiry Columns

Navigation
From Job Cost (G51), enter 29
From Job Cost System Setup (G5141), choose Define Inquiry Columns

You must define the columns for Shop Cost Inquiry. When you define a column, you can include the following information.
Setting Up Shop Cost Inquiry

- Heading: The description of the information that the column represents
- Formula: The calculation that the system uses to determine the amounts or units that appear for the column
- Display format: Information about how the amounts or units appear, such as decimal position, whether to include commas, and so on
- Glossary item: Information from the data dictionary appears when the user accesses field help for the inquiry column

Inquiry column information is stored in the Inquiry Columns table (F5192).

**To define inquiry columns**

On Define Inquiry Columns

*Figure 35–12  Define Inquiry Columns screen*

1. Complete the following fields:
   - Column Name
   - Formula
2. Complete the following optional fields:
   - Description
   - Column Heading 1
   - Column Heading 2
   - Decimal Positions
   - Edit Code
   - Multiplier
   - Glossary Item
<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Column Name</td>
<td>Identifies a column set up for the Job Status Inquiry screen. It is an alphanumeric code.</td>
</tr>
</tbody>
</table>
| Formula              | A calculation that the system uses to input an amount or quantity in this column. You can use a single predefined value or multiple predefined values in conjunction with mathematical operators to enter a formula. Valid mathematical operators are:  
  + – Add  
  - – Subtract  
  * – Multiply  
  / – Divide  
  ( ) – Left and right parentheses for nesting  
  For example, you can enter the following formula to have the system calculate on-time percentages:  
  \( \frac{20}{20+21+22} \)  
  The formula above equals on-time percentages because:  
  ■ 20 is the value for on-time amounts  
  ■ 21 is the value for early amounts  
  ■ 22 is the value for late amounts |
| Column Heading 1     | The first line in the heading that describes the column. The system automatically centers this line for the column.                             |
| Decimal Positions    | The number of characters that display to the right of the decimal point. For example, if you enter 2, the amount or quantity in this column would have two characters to the right of the decimal point, such as 7.00. |
| Edit Code            | Determines how data is printed or displayed. Depending on the code, you can change the appearance of the fields as follows (standard IBM edit codes):  
  ■ Show commas - 1, 2, A, B, J, K, N, or O  
  ■ Show decimal point - 1, 2, 3, 4, A, B, C, D, J, K, L, M, N, O, P, Q  
  ■ Show sign for negative - A, B, C, D (“CR”) or J through Q (“-”)  
  ■ Suppress leading zeros - 1 through 4, A through D, J through Q, Y and Z  
  Refer to user defined codes (system 98/ type EC) for all valid codes, including additional JD Edwards World edit codes. |
| Multiplier           | The factor by which the amounts or unit quantities in a column are multiplied. The result of the calculation in the Formula field is multiplied by this factor before it is displayed on the Job Status Inquiry screen.  
  For example, if you want to scale down extremely large numbers to thousands, type .001 in this field. If you want percentages to be displayed as whole numbers, type 100. |
| Glossary Item        | The item in the Data Dictionary file (F9201) that describes the information a column represents on the Job Status Inquiry screen. The related glossary description is displayed when the cursor is in the column and you press F1 (cursor sensitive help). |

35.4.3 Defining Inquiry Formats

**Navigation**

From Job Cost (G51), enter 29

From Job Cost System Setup(G5141), choose Define Inquiry Formats

After you define the columns for Shop Cost Inquiry, you can group them into formats. A format can include up to four columns, which appear on Shop Cost Inquiry in the same order that you define them in the format. You are not required to assign a column to each of the four column fields. The system stores format definitions in the Inquiry Formats table (F5193).

35.4.4 Before You Begin

- Define inquiry columns. See Section 35.4.1, "Defining Inquiry Columns"

**To define inquiry formats**

On Define Inquiry Formats
Complete the following fields for each format:

- Format Name
- Description
- Column 1
- Column 2
- Column 3
- Column 4

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Format Name</td>
<td>Identifies a format, which is a sequence of up to four columns for the Job Status Inquiry screen. It is an alphanumeric code.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>The Skip to Format Name field in the upper part of the screen lets you specify the format you want displayed at the top of the list.</td>
</tr>
</tbody>
</table>

### 35.4.5 Processing Options

See Section 57.2, "Define Formats - Job Status Inquiry (P5193)"

### 35.4.6 Defining Inquiry Paths

**Navigation**

From Job Cost (G51), enter 29

From Job Cost System Setup(G5141), choose Define Inquiry Paths

After you define the inquiry formats for Shop Cost Inquiry, you can group them into paths. A path is a sequence of inquiry formats. When you access Shop Cost Inquiry,
you can toggle between the different formats in the sequence that you have defined. The system stores path definitions in the Inquiry Paths table (F5194).

Defining inquiry paths consists of the following tasks:

- Defining an inquiry path
- Arranging formats into a new sequence

35.4.7 Before You Begin

- Define inquiry formats. See Section 35.4.3, "Defining Inquiry Formats"

Figure 35–14 Define Inquiry Formats screen

To define an inquiry path
On Define Inquiry Paths
1. Complete the following fields:
   - Path Name
   - Description
2. Complete the following fields for each format in the path:
   - Format Name
   - Sequence Number

To arrange formats into a new sequence
On Define Inquiry Paths
1. Complete the following field:
   - Path Name
2. Complete the following field for each format according to the new sequence:
   - Sequence Number
### 35.4.8 Processing Options

See Section 57.3, "Define Paths - Job Status Inquiry (P51941)".

<table>
<thead>
<tr>
<th>Field</th>

<tbody>
<tr>
<td>Path Name</td>
<td>Identifies a path, which is a sequence of formats for the Job Status Inquiry screen. It is an alphanumeric code.</td>
</tr>
</tbody>
</table>
This chapter contains this topic:

- Section 36.1, "Setting Up User Defined Codes"

### 36.1 Setting Up User Defined Codes

**Navigation**

From Equipment/Plant Management (G13), enter 29

From Equipment/Plant Management Setup (G1341), choose User Defined Codes

Many fields throughout Equipment/Plant Maintenance accept only user defined codes. You can customize fields in your system by setting up user defined codes to meet the needs of your business environment.

User defined codes are stored in tables related to a specific system and code type. For example, 12/EM represents system 12 (Fixed Assets) and user defined code list EM (Equipment Message types). User defined code tables determine which codes are valid for the individual fields in your system. If you enter a code that is not valid for a field, the system displays an error message. For example, you can only enter codes in the major accounting class code field on Master Information that exist in the user defined code table for system 12 and code type C1 (Major Accounting Class).

You can access all user defined code tables through a single user defined code screen. After you select a user defined code screen from a menu, change the system code field and the user defined code type field to access another user defined code table. The system stores user defined codes in the User Defined Codes table (F0005).

---

**Caution:** User defined codes are central to JD Edwards World systems. You must be thoroughly familiar with user defined codes before you change them.

---

The following user defined codes are primary to Equipment/Plant Maintenance.

#### 36.1.1 Major Accounting Class (12/C1)

Use these codes to group equipment into categories, such as office equipment, furniture, heavy equipment, plant equipment, and so on.

JD Edwards World recommends that you set up a one-to-one relationship with major accounting class and the asset cost account.
36.1.2 Major Equipment Class (12/C2)

Use these codes to further categorize equipment into subclasses. For example, set up codes to divide office equipment into groups such as copiers, computers, printers, and so on.

36.1.3 Additional Class (12/C3-C0, 12/F1-F0, 12/21-23)

Use these codes to further group equipment into meaningful classifications based on your needs. JD Edwards World provides many predefined values. You can use the predefined values or modify them to your business needs. For instance, category code 3 (12/C3) is set up as Manufacturer, category code 4 (12/C4) is Model Year, and so on.

If you use Equipment Billing, you must use category code 10 to define billing rate groups.

36.1.4 Equipment Status (12/ES)

Use these codes to identify the operational status of equipment, such as whether it is available, working, down, or disposed.

Equipment status codes might also be used by the Fixed Assets system to track types of disposals.

36.1.5 Equipment Message Type (12/EM)

Use these codes to define and group different types of messages, such as planned maintenance, problem reporting, lease terms, and so on.

36.1.6 Finance Methods (12/FM)

Use these codes to specify how a piece of equipment was acquired, such as leased or purchased outright. Finance method information is stored in the Item Master table (F1201).

36.1.7 Ledger Types for Equipment Journal Entries (12/LT)

Use these codes to define the ledger types for various sets of books. The default ledger type for equipment transactions is AA (Actual Amounts). Any ledgers that you define in user defined code table 12/LT are in addition to the AA ledger. You are not required to specify any ledgers in this table.

Use special handling codes to indicate how you want the system to process data for these additional ledgers. Valid codes for this table’s special handling codes are as follows:

- 1: Disconnect cost from the AA ledger
- 2: Post to equipment but not to the general ledger
- 9: Never post ledger to equipment
- blank: Create journal entries for this ledger

**Note:** You must also define all additional ledger types on General Accounting Ledger Types (system 09, type LT).
36.1.8 Preventive Maintenance Service Type Codes (12/ST)

Use these codes to identify the different types of maintenance tasks that you assign to the PM schedules for each piece of equipment.

36.1.9 Preventive Maintenance Status Codes (12/MS)

Use these codes to identify the status of a maintenance task at a specific time. For example, you might set up a code to indicate that a maintenance task is waiting for parts and another code to indicate that the work is in progress.

Equipment/Plant Maintenance includes the following predefined status code values, which have special meaning to the system:

- 01: Maintenance schedule defined
- 98: Maintenance canceled
- 99: Maintenance complete

You can create any other status codes that you need.

36.1.10 Preventive Maintenance Category Code 01 (13/P1)

Use these codes to categorize PM schedules. For example, set up codes to divide PM schedules into groups, such as critical PMs and non-critical PMs.

36.1.11 Preventive Maintenance Category Code 02 (13/P2)

Use this code to further group PM schedules into categories.

36.1.12 Predictive Flag Codes (13/PF)

Use these codes in conjunction with third party predictive maintenance systems to indicate that maintenance is due for a piece of equipment. You can use predictive maintenance systems to update PM schedules based on the analysis of equipment operating parameters such as temperature and vibration readings, chemical analysis of lubricants, and so on.

36.1.13 Type Codes (00/TY)

Use these codes to group work orders by type. The system displays this classification code field on Enter Work Orders and Backlog Management.

The Work Order Processing system includes predefined type code values. If these type codes do not meet your needs, you can modify them or you can create new ones.

36.1.14 Work Order Priority Codes (00/PR)

Use these codes to group work orders by priority. The system displays this classification code field on Enter Work Orders and Backlog Management.

The Work Order Processing system includes predefined priority code values. If these priority codes do not meet your needs, you can modify them or you can create new ones.
36.1.15 Work Order Status Codes (00/SS)

Use these codes to group work orders by current condition. You can update the status code for a work order as work progresses. The system displays this classification code field on Enter Work Orders and on Backlog Management.

The Work Order Processing system includes predefined status code values. If these codes do not meet your needs, you can modify them or you can create new ones.

36.1.16 Work Order Category Code 01 (00/W1)

Category code 01 is a four-character user defined code that appears on all work order forms and reports. You can use category code 01 for the work order phase or matter codes. Use phase or matter codes to:

- Group families of work orders into phases or subcategories for project management and cost account purposes
- Group families of work orders on invoices by special matter or explanation code

If you do not want to use category code 01 for phase and matter codes, you can modify the predefined codes or create new ones.

36.1.17 Additional Work Order Category Codes (00/W2 - W0 and 00/X1 - X0)

Use category codes 02 - 20 to customize and further define your work orders. Category codes 02 - 20 have no predefined values. The system displays the first ten category codes on Backlog Management. You can set up these codes to help you limit your search for work orders on Backlog Management.

For example, you can set up category code 2 as a work order failure code to indicate reasons for equipment failure. You could then set up codes to indicate equipment failure due to:

- Operator error
- Design flaw
- Lubrication or cooling problem

36.1.18 Work Order Databases (00/WD)

Use to group supplemental data types for work orders. You can define as many supplemental data types for a specific work order database as you need.

See Also:

- Section 38.6, "Setting Up Work Order Supplemental Data"

36.1.19 Work Order Document Types (00/DT)

Use these codes to differentiate between different types of work order transactions in the general ledger. For example, you can create document types for preventive maintenance work orders, corrective maintenance work orders, and so on.

36.1.20 Record Type Codes (00/RT)

Use record type codes to divide and organize the descriptive information that you enter and track for your work orders. For example, you might set up record types to include the following types of information:
■ Tool and equipment instructions
■ Safety provisions
■ Equipment down time

See Also:
■ Section 20.5, "Adding Text to a Work Order"

36.1.21 Forecast Type (34/DF)

Use forecast types to distinguish different material planning forecasts. For example, you might set up different forecast types for maintenance parts forecasts and manufacturing materials forecasts.

You can use the same forecast type for PM projections and parts plans.

36.1.22 Summary Document Types (48/DC)

Use these codes to define the document types that the system displays on Cost by Work Order. For example, you can set up codes for the following document types:
■ Inventory issues
■ Work order inventory issues
■ Accounts payable entries
■ Time entries

36.1.23 Approval Type (48/AP)

Use these codes to define the approval types that you assign to work order approval routings.

36.1.24 Inventory document type (48/ID)

Use these codes to define the inventory document types that the system displays on the work order Estimate to Actual Variance screen. For example, you can set up codes for the following types of inventory issues:
■ Inventory issues
■ Work order inventory issues

36.1.25 Bill Type (40/TB)

Use these codes to define the types of parts lists that you can assign to a work order, such as preventive maintenance parts lists, corrective maintenance parts lists, and so on.

36.1.26 Routing Type (40/TR)

Use these codes to define the types of labor routing instructions you can assign to a work order, such as preventive maintenance instructions, corrective maintenance instructions, and so on.
36.1.27 Example: User Defined Codes Screen

The following is an example of a user defined codes screen. When you access a user defined code, the screen looks like this, with these exceptions:

- The title is the name of the user defined code.
- The Character Code field accepts 1, 2, 3, or 10 characters, depending on the code.
- Some user defined codes contain a field for a second line of description.

Figure 36–1  Major Equipment Class screen

To set up a user defined code

On any user defined codes screen

1. To locate the user defined code table that you want to set up or revise, complete the following fields:
   - System Code
   - User Defined Codes

2. To revise the user defined code table, complete the following fields:
   - Character Code
   - Description
### 36.1.28 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Integrating with the Fixed Assets system</td>
<td>Equipment/Plant Maintenance uses the category codes from the Fixed Assets system. Depending on how you set up your constants, the system displays only the first five or ten codes on some forms, such as Equipment Search. JD Edwards World recommends that you assign specific equipment needs to as many of the first 10 category codes as you need. This will help you perform online searches for equipment. You can then use the remaining codes for fixed asset reporting needs.</td>
</tr>
<tr>
<td>Defining blank as a valid value</td>
<td>If you have set up a user defined code for which you do not require a value to be entered, you must define blank as a valid value. To do so, leave the Character Code field blank, but enter at least one character in the description field. JD Edwards World recommends that you type a period in the last position in the field.</td>
</tr>
</tbody>
</table>

**See Also:**
- *JD Edwards World Technical Foundation Guide* for more information about setting up user defined codes
This chapter contains these topics:

- Section 37.1, "Setting Up PM Schedule Information"
- Section 37.2, "Setting Up Standard Procedures"
- Section 37.3, "Setting Up Maintenance Rules"

### 37.1 Setting Up PM Schedule Information

Preventive maintenance (PM) schedules are the foundation of your preventive maintenance program. PM schedules determine the types of service and the frequency of each service type for each piece of equipment that you maintain.

Before you can use the preventive maintenance features of Equipment/Plant Maintenance, you must provide the system with standard procedures and maintenance rules.

You can assign standard procedures to various maintenance tasks when you set up a PM schedule for a piece of equipment. The system uses standard procedures in the same way as user defined codes, with the exception that you can attach virtually unlimited text to a standard procedure.

Maintenance rules determine when the system schedules preventive maintenance tasks. In addition, maintenance rules can:

- Determine the status of scheduled tasks.
- Assign default values for the assigned work order.
- Assign default values for the business unit to be charged for the maintenance task.
- Determine when maintenance is due based on threshold percentages.

### 37.1.1 Before You Begin

- Set up standard procedures and maintenance rules.
- Verify that the following user defined codes have been set up:
  - Service types (12/ST)
  - Maintenance status (12/MS)
  - Work order type (00/TY)
  - Work order priority (00/PR)
  - Work order status (00/SS)
See Also:
- Section 36.1, "Setting Up User Defined Codes"

37.2 Setting Up Standard Procedures

**Navigation**

From Equipment/Plant Management (G13), enter 29

From Equipment/Plant Management Setup (G1341), choose Preventive Maintenance

From Maintenance Setup (G1345), choose Standard Procedures

You can define standard procedures (standard instructions) that apply to your PM schedules and work orders. You can then add unlimited text to describe the procedures. For example, assume that you have set up a service type for a 500-hour equipment inspection. You can define a standard procedure for a 500-hour equipment inspection and add text that describes the steps required for the inspection.

You can also copy text from other standard procedures. For example, you can copy text from a 250-hour inspection that also applies to the procedures for a 500-hour inspection.

After you set up standard procedures, you can attach them to the following programs:
- Work Order Entry
- Item PM Schedule
- Equipment Work Order Routings

Setting up standard procedures consists of the following tasks:
- To define standard procedures
- To add text to a procedure
- To copy text from other procedures

**To define standard procedures**

On Standard Procedures
Complete the following fields to define each procedure:

- Code
- Description

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Code</td>
<td>This column contains a list of valid codes for a specific user defined code list. The number of characters that a code can contain appears in the column title.</td>
</tr>
</tbody>
</table>

**To add text to a procedure**

On Standard Procedures

1. Choose General Message for each procedure for which you want to add text.
2. On General Message, enter text for each standard procedure.

**To copy text from other procedures**

On Standard Procedures

1. Choose the General Message option for each procedure for which you want to add text.

2. On General Message, choose Message Search.

**Figure 37–3 General Message Search screen**

3. On General Message Search, complete the following fields to narrow your search to a particular message:
   - System
   - Type (Optional)
   - Code (Optional)
4. Choose Enter.
5. To import the text into the procedure, choose Select.

<table>
<thead>
<tr>

<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>System Code</td>
<td>A user defined code (98/SY) that identifies a JD Edwards World system.</td>
</tr>
<tr>
<td>Record Type</td>
<td>Identifies the table that contains user defined codes. The table is also referred to as a code type.</td>
</tr>
</tbody>
</table>

37.3 Setting Up Maintenance Rules

Navigation
From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Preventive Maintenance
From Maintenance Setup (G1345), choose Maintenance Rules Table

To use the preventive maintenance features in Equipment/Plant Maintenance, you must set up maintenance rules. Maintenance rules determine the maintenance status that the system assigns to a PM for a service type when the service type is due to be performed.

For example, assume you have defined a service type for equipment lubrication, with a 100-hour maintenance interval. Also assume that you have defined maintenance rules for that service type that direct the system to assign a maintenance status of 50 (Maintenance Due) whenever 100 hours have elapsed. After 100 hours have elapsed and you update the PM schedule status, the system automatically assigns a maintenance status of 50 to the PM for equipment lubrication.

In addition to assigning a maintenance status to PMs, you use maintenance rules to:
- Define the threshold percentage when maintenance is due.
- Determine the assigned work order status, type, and priority, if you use model work orders.
- Specify whether the system assigns the Charge to Business Unit on the assigned work order based on the Charge to Business Unit on the model work order or the responsible business unit from the equipment master.
- Specify the status of associated service types that might already be scheduled and combine work orders for associated service types on to the work order for the primary service type.
- Specify the approval type for assigned work orders.
- Specify whether the description that appears on assigned work orders is based on the service type description or the description on the model work order.

37.3.1 How Does the System Apply Maintenance Rules?

When the system searches for rules to apply to a maintenance task, it uses the following sequence:
1. Search for and apply a rule for which both an equipment number and a service type have been assigned.
1. Search for and apply a rule for which an equipment number has been assigned, but no service type.

2. Search for and apply a rule for which a service type has been assigned, but no equipment number.

3. Apply a global default rule for which no equipment number or service type has been assigned.

To set up maintenance rules

On Maintenance Rules Table

**Figure 37–4  Maintenance Rules Table screen**

1. Complete the following fields:
   - Item Number
   - Service Type
   - Thr (Threshold) %
   - Maint. Status

2. Complete the following Assigned W.O. fields:
   - WO St (Status)
   - PR (WO Priority)
   - W.O. Type
   - Bus. Unit
   - WD (WO Description Flag)
   - App (Approval) Typ

3. Complete the following fields:
   - Assoc. (Associated) Status From
Setting Up Maintenance Rules

### Assoc. Status To

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Threshold Percent | A percentage measure that indicates how close a piece of equipment is to needing maintenance. This percentage is based on the greater of the actual date, miles, hours, or fuel consumption. A percentage of 090 indicates that the piece of equipment is 10% away from needing maintenance. A percentage greater than 100 indicates that maintenance is past due.  
**Note:** Miles, hours, and fuel are only examples of statistical units. You can define other statistical units appropriate to your organization within the Equipment/Plant Management automatic accounting instructions. |
| Maint Status  | A user defined code (12/MS) that indicates the maintenance status of a piece of equipment, such as 50 for maintenance due or 60 for waiting for parts.  
**Note:** Status code 98 is reserved for canceled maintenance. Status code 99 is reserved for completed maintenance. Status code 01, the default, is reserved for initial maintenance setup. |
| WO St         | A user defined code (system 00, type SS) that describes the status of a work order.                                                        |
| Priority      | A user defined code (system 00, type PR) that indicates the relative priority of a work order or engineering change order in relation to other orders.  
A processing option for some forms lets you enter a default value for this field. The value then displays automatically in the appropriate fields on any work order you create on those forms and on the Project Setup screen. You can either accept or override the default value. |
| W.O. Type     | A user defined code (00/TY) that indicates the type classification of a work order or engineering change order. You can use work order type as a selection criteria for work order approvals. |
| Bus Unit      | A code that determines which Business Unit will be used as the Charge to Business Unit on Assigned Work Orders that are created when items are scheduled for maintenance.  
Values are:  
1 – Use the Charge to Business Unit from the Model Work Order on the Assigned Work Orders.  
2 – Use the Responsible Business Unit from the Item Master (F1201) as the Charge to Business Unit on the Assigned Work Orders. |
| W D           | A code that determines which Description will be used as the Description on Assigned Work Orders that are created when items are scheduled for maintenance. Values are:  
1 – Use the Description from the Model Work Order on the Assigned Work Orders.  
2 – Use the Description from the Service Type on the Assigned Work Orders. |
Setting Up Maintenance Rules

37.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum setup requirements</td>
<td>You must set up a global default maintenance rule with a blank equipment number and a blank service type.</td>

- Section 38.8, "Defining Default Location and Printers"
- Section 38.9, "Setting Up Supply and Demand Inclusion Rules"

38.1 Setting Up Work Orders

Before you can use the work order features in Equipment/Plant Maintenance, you must provide the system with information necessary to customize work orders for your business needs. For example, you can set up different managers and supervisors for work orders, based on work order category codes. When you assign category codes to a new work order, the system automatically assigns the correct managers and supervisors.

In addition to setting up managers and supervisors, you must set up the following:

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work order next numbers</td>
<td>You set up the beginning number for work orders. The system assigns a unique number for each work order generated.</td>
</tr>
<tr>
<td>Record type information</td>
<td>You use record types to organize and track detailed information about a work order, such as its full description, final disposition, and so on. You can then track the information according to the record type to which you assigned the information.</td>
</tr>
<tr>
<td>Work order life-cycle information</td>
<td>You can set up rules that specify what statuses (steps) a work order must go through, such as work order entered, work order approved, and so on. You can also specify who can approve work orders. In addition, you can specify a currency amount, over which an approver must approve the work order.</td>
</tr>
</tbody>
</table>
Due to system integration, you must access other JD Edwards World systems to complete certain setup tasks. The guidelines for completing these tasks are discussed as needed in this chapter.

### 38.2 Setting Up Default Managers and Supervisors

#### Navigation

**From Equipment/Plant Management Setup (G1341), choose Work Order Setup**

**From Work Order/Service Billing Setup (G4841), choose Default Managers and Supervisor**

When you create a work order, you can specify that the system automatically enter the address book information for managers and supervisors based on any combination of the first three work order category codes. The system automatically enters address book values in the following fields on Work Order Entry and Backlog Management:

- ANPA (Supervisor)
- ANSA (Manager)

You can set up as many versions of default managers and supervisors as you need. For example, you can assign a specific manager and supervisor to every work order with a failure code (category code 02) of F1 - Improper start-up or operation. You can assign another manager and supervisor to every work order with a failure code of F2 - Improper installation or repair.

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work order supplemental data</td>
<td>You use work order supplemental data to track work order information that is not included on the work order master or record types. You can specify what data you want to track and how the data appears.</td>
</tr>
<tr>
<td>Standard parts lists and work order instructions</td>
<td>You can set up standard parts lists for work orders. You use a standard parts list when the maintenance task for which the work order applies is routine and repetitive, and for which you have advance knowledge of the parts requirements. You can set up standard work order instructions for a work order. Work order instructions specify the sequence of operations required to complete a work order, as well as the work centers responsible for each operation. You use standard work order instructions when the maintenance task for which the work order applies is routine and repetitive, and for which you have advance knowledge of the labor requirements. To use standard work order instructions, you must set up work center information and information about the sequence of operations.</td>
</tr>
<tr>
<td>Default user locations and printers</td>
<td>Many of the forms within the Work Order system require you to specify a location, such as a branch or plant, to which you are assigned. You can set up default locations for each person in your organization that uses the Work Order system. You can also assign a default print queue to each person. When a person prints a work order, the system uses the default print queue that you set up, unless the person specifies otherwise.</td>
</tr>
<tr>
<td>Supply and demand inclusion rules</td>
<td>You must set up rules that govern which document types and document statuses create a supply or demand for parts.</td>
</tr>
</tbody>
</table>
To set up default managers and supervisors
On Default Managers and Supervisor

Figure 38–1   Default Managers & Supervisor screen

Complete any of the following fields:

- Phase (Category Code 1)
- Category Code 02
- Category Code 03
- Supervisor
- Manager

You must complete at least one category code field and one address book field for each version of default managers and supervisors that you set up.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Phase</td>
<td>A user defined code (00/W1) that indicates the current stage or phase of development for a work order. You can assign a work order to only one phase code at a time.</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Certain forms contain a processing option that allows you to enter a default value for this field. If you enter a default value on a screen for which you have set this processing option, the system displays the value in the appropriate fields on any work orders that you create. The system also displays the value on the Project Setup screen. You can either accept or override the default value.</td>
</tr>
</tbody>
</table>
38.3 Setting Up Work Order Next Numbers

**Navigation**

**From Equipment/Plant Management Setup (G1341), choose Next Numbers**

When you set up work order next numbers, you enable the system to automatically assign unique numbers for each work order generated by you or the system.

The system stores next numbers for work orders in the Work Orders/Service Billing system (system 48). The system generates next numbers from the Next Numbers table (F0002).

---

**Caution:** JD Edwards World strongly recommends that you do not use blank as a next number value.

---

**To set up work order next numbers**

On Next Numbers
1. To locate next numbers for a particular system, complete the following field:
   - System Code

2. Complete the following fields for each number that you need to set up:
   - Next Number
   - Check Digit

### 38.4 Setting Up Record Types

**Navigation**

From Equipment/Plant Management Setup (G1341), choose Work Order Setup

From Work Order/Service Billing Setup (G4841), choose Detail Spec. Over Titles

You use record types to organize the detail information that you track for work orders. For example, you can organize information, such as original task description, tools required, safety provisions, and so on.

For each record type that you use, you can specify how the information appears. You can also control the display format for these record types. For each record type that you set up, you can specify a format that is text only or a format that includes text and three columns. If you use the format for text and three columns, you must specify at least one of the column headings that you want to appear. The text-only format does not include headings. If you specify even one column heading for the record type, the record type changes to the format that includes text and three columns.

You can review record types, formats, and column headings by choosing Record Types from Work Order Entry.
38.4.1 Before You Begin

- Define work order record types. See Chapter 36, “Set Up User Defined Codes” for more information about defining work order record types.

To set up record types
On Detail Spec. Over Titles

Figure 38-3  Detail Spec. Over Titles screen

1. Complete the following field:
   - Record Type

2. To define column headings, complete the following fields:
   - Sub-Title 1
   - Sub-Title 2
   - Sub-Title 3

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Record Type</td>
<td>The detail specification record type. Record types are user defined. You can set them up on the Detail Specification Types screen and use them to describe certain types of work order or engineering change order information.</td>
</tr>
<tr>
<td>Sub-Title 1</td>
<td>A subtitle, description, remark, name, or address. The text you type in this field appears as a column head on the Work Order Detail Entry screen for the record type indicated.</td>
</tr>
</tbody>
</table>
38.4.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Required record types</td>
<td>You must set up the following record types for Equipment/Plant Maintenance:</td>
</tr>
<tr>
<td></td>
<td>■ Maintenance Loops</td>
</tr>
<tr>
<td></td>
<td>■ Associated PMs</td>
</tr>
<tr>
<td></td>
<td>The record type that you set up for maintenance loops should coincide with the record type that you set up in equipment constants.</td>
</tr>
<tr>
<td></td>
<td>See Section 15.4, &quot;Creating a Maintenance Loop&quot; for more information about maintenance loops.</td>
</tr>
<tr>
<td></td>
<td>The record type you set up for associated PMs must be assigned to record type Z. This record type stores all associated service types to be performed on a work order.</td>
</tr>
<tr>
<td></td>
<td>See Section 15.3, &quot;Linking Service Types&quot; for more information about associated PMs.</td>
</tr>
<tr>
<td>Changing the format for a</td>
<td>When you change the format of a record type, the system updates the format of that record type for all work orders.</td>
</tr>
<tr>
<td>record type</td>
<td></td>
</tr>
</tbody>
</table>

38.5 Setting Up the Work Order Life Cycle

You can set up rules that specify what statuses (steps) a work order must go through, such as work order entered, work order approved, and so on. You can also specify who can approve work orders. In addition, you can specify a currency amount, over which an approver must approve the work order.

Setting up the work order life cycle consists of the following tasks:

■ Setting up work order activity rules
■ Setting up work order approval routes
■ Setting up work order approver profiles

38.5.1 Before You Begin

■ Set up work order status codes. See Chapter 36, "Set Up User Defined Codes" for more information about setting up work order status codes.

38.5.2 Setting Up Work Order Activity Rules

Navigation
From Equipment/Plant Management Setup (G1341), choose Work Order Setup
From Work Order/Service Billing Setup (G4841), choose Work Order Activity Rules

You can set up work order activity rules that differ by work order document type and work order type. Document types are user defined codes that you use to specify how a document is processed by the general ledger. For example, you might define separate document types for PM work orders and corrective work orders. A work order type is a user defined code that you can use to classify work orders, such as maintenance work orders, model work orders, and so on. Use work order activity rules to:

■ Define the sequence of work order statuses at any point in the work order life cycle.
- Specify whether the work order is active or inactive at a particular status.
- Commit inventory at a particular status.
- Change the PM status when the work order changes status.
- Determine whether to update the capacity plan at a particular status.
- Determine whether a work order can be changed at a particular status.

### 38.5.3 To set up work order activity rules

On Work Order Activity Rules

**Figure 38–4  Work Order Activity Rules screen**

1. To locate a classification of work orders, complete the following fields:
   - Order Type
   - Type
2. To define the activity rules for that classification of work orders, complete the following fields:
   - Work Order Status
   - Next Status (optional)
   - Other Allowed Statuses (optional)

   You must define a status code as a work order status in the work order activity rules table before you can use it as a next status or another allowed status.
3. Choose More Details.
4. Complete the following optional fields:

- Subledger Inactive
- Commit Inventory
- Maintenance Status
- Capacity
- Lock

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Type</td>
<td>A user defined code (00/DT) that identifies the type of document. This code also indicates the origin of the transaction. JD Edwards World has reserved document type codes for vouchers, invoices, receipts, and time sheets, which create automatic offset entries during the post program. (These entries are not self-balancing when you originally enter them.) The following document types are defined by JD Edwards World and should not be changed: P – Accounts Payable documents R – Accounts Receivable documents T – Payroll documents I – Inventory documents O – Purchase Order Processing documents J – General Accounting/Joint Interest Billing documents S – Sales Order Processing documents Form-specific information Enter the work order document type for which these rules apply.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>---------------------</td>
<td>-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------</td>
</tr>
<tr>
<td>Type</td>
<td>A user defined code (00/TY) that indicates the type classification of a work order or engineering change order. You can use work order type as a selection criteria for work order approvals.</td>
</tr>
<tr>
<td>Skip to Work Order Status</td>
<td>A user defined code (system 00, type SS) that describes the status of a work order.</td>
</tr>
<tr>
<td>Next Status</td>
<td>The next status for a work order, according to the work order activity rules, as the work order flows through the chain of approval. You must define a status code as a work order status in the Work Order Activity Rules table before you can use it as a next status.</td>
</tr>
<tr>
<td>Sbl Inact</td>
<td>A code that indicates whether a specific subledger is active or inactive. Any value other than blank indicates that a subledger is inactive. Examples are jobs that are closed, employees that have been terminated, or assets that have been disposed. If a subledger becomes active again, set this field back to blank. If you want to use subledger information in the tables for reports but want to prevent transactions from posting to the master record, enter a value other than blank in this field.</td>
</tr>
<tr>
<td>Commit</td>
<td>A code that determines whether inventory is committed when the status of a work order changes. Values are: 1 – Inventory is not committed. 2 – Inventory is committed.</td>
</tr>
<tr>
<td>Maint. Status</td>
<td>A user defined code (12/MS) that indicates the maintenance status of a piece of equipment, such as 50 for maintenance due or 60 for waiting for parts. Note: Status code 98 is reserved for canceled maintenance. Status code 99 is reserved for completed maintenance. Status code 01, the default, is reserved for initial maintenance setup.</td>
</tr>
<tr>
<td>Capacity</td>
<td>The capacity flag determines whether the system runs the capacity plan generation when a work order changes status. Values are: blank – Do not run the capacity plan generation. 1 – Run the capacity plan generation. 2 – Run the capacity plan generation and provide a warning message when labor resources are over capacity. The warning message appears on the work order header and on Backlog Management when you inquire on the work order.</td>
</tr>
</tbody>
</table>
Setting Up the Work Order Life Cycle

### 38.5.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Deleting status codes</td>
<td>You should not delete a status code from the activity rules table that another set of activity rules uses as a next status or another allowed status.</td>
</tr>
</tbody>
</table>

### 38.5.5 Setting Up Work Order Approval Routes

**Navigation**
- From Equipment/Plant Management Setup (G1341), choose Work Order Setup
- From Work Order/Service Billing Setup (G4841), choose Work Order Approval Routing

You can create a variety of approval routes for all the individuals who need to receive notification that a work order requires their approval.

Use the address book number of the individual responsible for the approval of a work order to include them in an approval route. You can also establish specific approval routes based on:

- The type of work order document, such as actual work orders, planning work orders, and so on
- The classification of the work order, such as maintenance work orders, model work orders, and so on
- The status of a work order in the work order life cycle, such as waiting for parts, completed, and so on
- The amount of a work order

**To set up work order approval routes**

On Work Order Approval Routing

---

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Lock</td>
<td>A code that determines whether a work order can be changed at a particular status. The lock applies to records in both the Work Order Master table (F4801) and the Work Order Instruction table (F4802). Values are: blank – Do not lock the work order. 1 – Lock the work order. 2 – Lock the work order with a completion date. 3 – Do not lock the work order with a completion date. 4 – Lock the work order with a parts list and routing. 5 – Lock the work order with a completion date, parts list, and routing. 6 – Lock the document type and the work order type.</td>
</tr>
</tbody>
</table>
1. Complete the following fields:
   - Order Type
   - Type
   - Approval Type
   - Status
   - Seq (Sequence)
   - Address Number
   - Reject Status

2. Complete the following optional field:
   - Amount

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval Type</td>
<td>A user defined code (system 48, type AP) indicating the type of work order approval path that a work order follows. You can use processing options to specify a default approval type based on the type of work order.</td>
</tr>
<tr>
<td>Seq</td>
<td>A number that the system uses to sequence information. Package-specific information. You can set up alternate approvers at any sequence. If you set up more than one approver at a sequence, only one of the approvers at that sequence needs to approve the work order.</td>
</tr>
</tbody>
</table>
38.5.6 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Address Number</td>
<td>A number that identifies an entry in the Address Book system. Use this number to identify employees, applicants, participants, customers, suppliers, tenants, and any other Address Book members. Form-specific information Enter the address number of the person who can approve the work order.</td>
</tr>
<tr>
<td>Reject Status</td>
<td>The reject status is the status that the work order will default to if an approver rejects a work order.</td>
</tr>
<tr>
<td>Amount</td>
<td>A number that identifies the actual amount. Type debits with no sign or a plus sign (+). Type credits with a minus sign (-) either before or after the amount. You can use decimals, dollar signs, and commas. The system ignores non-significant symbols. Form-specific information The estimated amount on the work order over which the approver needs to approve the work order.</td>
</tr>
</tbody>
</table>

38.5.7 Setting Up Work Order Approver Profiles

Navigation
From Security Officer (G94), choose User Information

You must set up profiles for all of your designated work order approvers. The system uses the approver’s address book number to send electronic mail messages associated with work approvals and to define the work order approval route.

When an approver enters a password to complete the approval process on Work Order Approval, the system validates the password against the approver’s user ID number. The system uses the user ID number to verify that the address book number is valid for the approver.

To set up work order approver profiles
On User Information
1. Locate a user by completing the following field:
   - **User ID**

2. Complete the following field:
   - **Employee Address Number (PPAT)**

### 38.6 Setting Up Work Order Supplemental Data

#### Navigation

- From **Equipment/Plant Management Setup** (G1341), choose **Work Order Setup**
- From **Work Order/Service Billing Setup** (G4841), choose **Define Your Own Data Types**

Use supplemental data to further define the work orders in your system. You can use supplemental data to report on and track work order details that are important to your company, but are not included in the work order master or record types. You can define as many types of supplemental data as you need.

You define and maintain supplemental data by work order database. Work order databases are user defined. For example, you might set up supplemental data for a database specific to maintenance work orders. The data types might include safety procedures, responsible personnel, and so on.

#### 38.6.1 Before You Begin

- Set up the user defined codes table for the valid work order databases with which you want to associate supplemental data. See Chapter 36, “Set Up User Defined Codes”.

---

**Figure 38–7  User Information screen**

![Figure 38–7  User Information screen](image)
38.6.2 To set up work order supplemental data

On Define Your Own Data Types

Figure 38–8 Define Your Own Data Types screen

1. To specify a work order database, complete the following field:
   - Work Order Data Base

2. To define a data type, complete the following fields:
   - Type Data
   - Description
   - Code or Order (CO)

3. Complete the following optional fields:
   - Code Title
   - Quantity Title
   - Amount Title
   - System Code (Cod)
   - User Defined Code (RT)

4. Choose More Details.
Figure 38–9  Define Your Own Data Types screen (Details area)

5. Complete the following optional fields:

- Date Title
- Remark Title
- Days Title
- Order Title
- Type Title

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Work Order Data Base</td>
<td>The code that represents what Work Order Data Base to use.</td>
</tr>
<tr>
<td>Ty Dt</td>
<td>User defined code (00/WT) that indicates the type of data being entered within the supplemental database. The code is often an abbreviation for the data it represents, for example, EC might represent Engineering Change.</td>
</tr>
<tr>
<td>C/O O</td>
<td>A code that determines the display mode for Supplemental Data. Valid codes are:</td>
</tr>
<tr>
<td></td>
<td>C – Automatically takes you to the Data Entry program where you can enter code-specific information. The code values you enter can be edited against values in the User Defined Codes file (F0005).</td>
</tr>
<tr>
<td></td>
<td>O – Automatically takes you to the Related Order Entry program, bypassing code-specific information. If you use an O, narrative text will not be tied to specific codes.</td>
</tr>
<tr>
<td>Code Title</td>
<td>The heading for a column on Supplemental Data Entry that relates to user defined codes. Enter the user defined codes for the supplemental data type in this column. For example, if the supplemental data type relates to the educational degrees of employees (BA, MBA, PHD, and so on), the heading could be Degree.</td>
</tr>
</tbody>
</table>
### Field Explanation

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Qty Title</td>
<td>This code is used for the column heading of a User Defined Quantity to be tracked within the supplemental data. For example, if you want to keep track of Quantity to be Scrapped, a logical column heading would be Scrapped.</td>
</tr>
<tr>
<td>Amt Title</td>
<td>The heading for a column on Supplemental Data Entry that relates to an amount. This column contains statistical or measurable information. For example, if the data type relates to bid submittals, the heading could be Bid Amounts.</td>
</tr>
<tr>
<td>Code</td>
<td>A user defined code (98/SY) that identifies a JD Edwards World system.</td>
</tr>
<tr>
<td>RT</td>
<td>Identifies the table that contains user defined codes. The table is also referred to as a code type.</td>
</tr>
<tr>
<td>Date Title</td>
<td>The title of a supplemental data column heading for the Date field (EFT). For example, a possible column heading for the date field linked to the education data type might be Graduation.</td>
</tr>
<tr>
<td>Remark Title</td>
<td>The heading for a column on Supplemental Data Entry that relates to user defined codes. This heading describes the first Remark field on the data entry screen. It contains additional information and remarks. For example, if the data type relates to bid submittals, the heading could be Subcontractor.</td>
</tr>
<tr>
<td>Days Title</td>
<td>The title of a row heading you can use to describe the Date field (EFTE). For example, if you set up a record type for professional licenses, a possible row title for the date field might be Expires.</td>
</tr>
<tr>
<td>Order Title</td>
<td>The row heading that is used to describe the order field.</td>
</tr>
<tr>
<td>Type Title</td>
<td>The row heading that is used to describe the type field.</td>
</tr>
</tbody>
</table>

### 38.6.3 What You Should Know About

#### Defining user defined codes as valid values for a data type

You can set up your system to edit the values that you enter on supplemental data forms against the valid values you set up in user defined code tables. Use the following guidelines to define user defined codes as valid values for a data type:

- The user defined code table must be set up before you can set up the data type.
- To assign a user defined code table to a data type, specify the install system and code type in the Edit on Code and Edit on RT fields.
- If your supplemental data type does not relate to an existing user defined code, you can set up a new user defined code table. JD Edwards World recommends that you define the new tables for install systems 55 through 59. These systems are reserved for client use. User defined code tables that you create for these systems will not be modified during any reinstall processes.

See the *JD Edwards World Technical Foundation Guide* for more information about user defined codes.
38.6.4 Processing Options

See Section 57.4, "Work Order Data Base (P48090)"

38.7 Setting Up Standard Parts Lists and Work Order Instructions

You can set up standard parts lists and standard work order instructions for work orders. You use a standard parts list when the maintenance task for which the work order applies is routine and repetitive, and for which you have advance knowledge of the parts requirements.

Work order instructions specify the sequence of operations required to complete a work order, as well as the work centers responsible for each operation. You use standard work order instructions when the maintenance task for which the work order applies is routine and repetitive, and for which you have advance knowledge of the labor requirements. To use standard work order instructions, you must set up work center information and information about the sequence of operations.

You can set up as many standard parts lists and standard work order instructions as you need. In addition, you can use a standard parts list or a version of standard work order instructions on as many work orders as you need. Typically, you assign standard parts lists and standard work order instructions to model work orders, but you can also use information from standard parts lists and standard work order instructions to create parts lists and routing instructions that you can attach to corrective work orders.

The following graphic shows how the system uses information from a standard parts list and standard work order instructions to generate a parts list and labor routing instructions for a work order that is assigned to a specific maintenance task.
Setting Up Standard Parts Lists and Work Order Instructions

Figure 38–10  Generating a Parts List and Labor Routing Instructions for a Work Order Assigned to a Specific Maintenance Task

- A - You can use standard parts lists and standard work order instructions for as many model work orders as you need.
- B - Parts information for the assigned work order comes from the model work order. The system copies the standard parts list that is attached to the assigned work order.
- C - Routing instructions for the assigned work order come from the model work order. The system copies the standard work order instructions to the routing instructions that are attached to the assigned work order.

Setting up standard parts lists and standard work order instructions consists of the following tasks:

- Revising processing options for parts lists and labor routings
- Setting up a standard parts list
- Setting up standard work order instructions
38.7.1 Revising Processing Options for Parts Lists and Labor Routings

From the DREAM Writer menu (G81), choose Versions List.

The system provides a variety of processing options when you assign parts lists and labor routings to a work order. You can specify when the system should create purchase orders for parts, whether to signal the user when a labor resource is over capacity, and so on. You can review the processing options for these programs and change them if necessary before you assign parts or labor routings to a work order.

**Note:** You can only access these processing options by following the procedures given below.

To revise processing options for parts lists and labor routings

On Versions List

---

1. Complete the following field to access a list of DREAM Writer versions:
   - **Form**
     
     Enter P1311 (Work Order Parts List Revisions) to view processing options for parts lists. Enter P1312 (Equipment Work Order Routings) to view processing options for labor routings.

2. Review the processing options and change them as necessary.
38.7.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Processing option security</td>
<td>You might not have authority to change processing options associated with parts and routings.</td>
</tr>
<tr>
<td></td>
<td>See the <em>JD Edwards World Technical Foundation Guide</em> for your system security officer for more information about security issues.</td>
</tr>
</tbody>
</table>

38.7.3 Processing Options

See Section 57.5, "Work Order Parts List Revisions (P1311)"

See Section 57.6, "Equipment WO Routings (P1312)"

See Also:

- *JD Edwards World Technical Foundation Guide* for more information about copying, changing, and running DREAM Writer versions

38.7.4 Setting Up a Standard Parts List

Navigation

From Equipment/Plant Management Setup (G1341), choose Planning

From Planning Setup (G1346), choose Standard Parts List

You can create standard parts lists that you can attach to work orders. This is especially useful when you have routine maintenance tasks that require identical parts.

For example, for a particular piece of equipment, you overhaul the hydraulic assembly every 250 hours. Because the overhaul procedure requires the same repair kit, you would set up a standard parts list that includes all of the parts necessary to overhaul the hydraulic assembly.

38.7.5 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to set up a standard parts list.
  - System 40: Inventory Base and Order Processing
  - System 41: Inventory Management

- Verify that inventory masters have been created for all parent items (part assemblies) and component items you want to include on a standard parts list. See Entering Item Master Information in the *JD Edwards World Inventory Management Guide* for more information about creating inventory master records.

To set up a standard parts list

On Standard Parts List
1. Complete the following fields:
   - Branch/Plant
   - Parent Part
   - Component Part
   - Quantity Per

2. Complete any of the following optional fields:
   - Fixed or Variable
   - Bill Type
   - Item Revision Level
   - Batch Quantity
   - Unit Of Measure
   - Issue Type

3. Choose More Details.
4. Complete any of the following fields:

- Effective From
- Effective Through
- Line Type
- Operation Sequence

Note: The following fields have no application within Equipment/Plant Maintenance: Feature Planned Percent, Feature Cost Percent, Grade From and Thru, Potency From and Thru

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Parent Part</td>
<td>A number that the system assigns to an item. It can be in short, long, or 3rd item number format.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>Header: The Parent field contains the item number of the parent item.</td>
</tr>
<tr>
<td></td>
<td>Detail: The Component Item field contains the item number of the component item.</td>
</tr>
<tr>
<td>Quantity Per</td>
<td>The number of units to which the system applies the transaction.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>A number that indicates how many components you use to manufacture the parent item. A quantity of zero is valid. The default value is 1.</td>
</tr>
<tr>
<td>Field</td>
<td>Explanation</td>
</tr>
<tr>
<td>----------</td>
<td>-------------</td>
</tr>
<tr>
<td>F V</td>
<td>Indicates if the quantity per assembly for an item on the bill of material varies according to the quantity of the parent item produced or is fixed regardless of the parent quantity. This value also determines if the component quantity is a percent of the parent quantity. Valid values are: F – Fixed Quantity, V – Variable Quantity (Default), % – Quantities are expressed as a percentage and must total 100%. For fixed quantity components, the Work Order and MRP systems do not extend the component's quantity per assembly value by the order quantity. For Process Manufacturing, the system stores percent components. Therefore, the system treats zero batch sizes like variable quantity components, and treats batch sizes greater than zero like fixed quantity components.</td>
</tr>
<tr>
<td>Bill Type</td>
<td>User defined code system 40, type TB, which designates the type of bill of material. You can define different types of bills of material for different uses. For example, you can differentiate between bills of material for maintenance and manufacturing. The system enters bill type M in the work order header when you create a work order, unless you specify another bill type. The system reads the bill type code on the work order header to know which bill of material to use to create the work order parts list. MRP uses the bill type code to identify the bill of material to use when it attaches MRP messages. Batch bills of material must be type M for shop floor control, product costing, and MRP processing. <strong>Form-specific information</strong> Type M is not required, but MRP uses it to explode component requirements for work orders without parts lists. Enter an asterisk (*) to display all bill types. This value defaults from the processing options for Enter/Change Bill (P3002).</td>
</tr>
<tr>
<td>Part Rev. Level</td>
<td>Indicates the revision level of a bill of material. It is usually used in conjunction with an engineering change notice or order (ECN or ECO). The revision level of the bill of material should match the revision level of its associated routing (data item RREV), although the system does not check this. This value is defined and maintained by the user.</td>
</tr>
<tr>
<td>Batch Quantity</td>
<td>This is the quantity of parts needed for the maintenance task.</td>
</tr>
</tbody>
</table>
### Setting Up Standard Parts Lists and Work Order Instructions

#### Field | Explanation
--- | ---
I | A code that defines how the system issues each component in the bill of material from stock. In shop floor control, it indicates how the system issues a part to a work order. Valid codes are:
   - I – Manual issue (default)
   - F – Floor stock (no issue)
   - B – Backflush (when part is reported as complete)
   - P – Preflush (when parts list is generated)
   - U – Super backflush (at pay-point operation)
   - S – Sub-contract item (send to supplier)
   - Blank – Shippable end item
   You can issue a component in more than one way within a specific branch/plant by using a different code on the bill of material and work order parts list. The bill of material code overrides the branch/plant value.

Effective From | A date that indicates one of the following:
--- | ---
   - When a component part goes into effect on a bill of material
   - When a routing step goes into effect as a sequence on the routing for an item
   - When a rate schedule is in effect
   The default is the current system date. You can enter future effective dates so that the system plans for upcoming changes. Items that are no longer effective in the future can still be recorded and recognized in Product Costing, Shop Floor Control, and Capacity Requirements Planning. The Material Requirements Planning system determines valid components by effectivity dates, not by the bill of material revision level. Some forms display data based on the effectivity dates you enter.

Effective Thru | A date that indicates one of the following:
--- | ---
   - When a component part is no longer in effect on a bill of material
   - When a routing step is no longer in effect as a sequence on the routing for an item
   - When a rate schedule is no longer active
   The default is December 31 of the default year defined in the Data Dictionary for Century Change Year. You can enter future effective dates so that the system plans for upcoming changes. Items that are no longer effective in the future can still be recorded and recognized in Product Costing, Shop Floor Control, and Capacity Requirements Planning.
   The Material Requirements Planning system determines valid components by effectivity dates, not by the bill of material revision level. Some forms display data based on the effectivity dates you enter.
Setting Up Standard Parts Lists and Work Order Instructions

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| Line Type              | A code that controls how the system processes lines on a transaction. It controls the systems with which the transaction interfaces (General Ledger, Job Cost, Accounts Payable, Accounts Receivable, and Inventory Management). It also specifies the conditions under which a line prints on reports and is included in calculations. Codes include:  
S – Stock item  
J – Job cost  
N – Non-stock item  
F – Freight  
T – Text information  
M – Miscellaneous charges and credits  
W – Work order  
Form-specific information  
The Branch/Plant table (F4102) supplies the default for this field.  
You can use line type T to display a text line on this screen in the sequence you define. The text does not display on review forms. |
| Operation Sequence Number | In routings, this number is used to sequence the fabrication or assembly steps in the manufacture of an item. You can track costs and charge time by operation.  
In bills of material, this number designates the routing step in the fabrication or assembly process that requires a specified component part. You define the operation sequence after you create the routing for the item. The Shop Floor Control system uses this field in the backflush/preflush by operation process.  
In engineering change orders, this number is used to sequence the assembly steps for the engineering change.  
Skip To fields allow you to enter an operation sequence that you want to begin the display of information.  
You can use decimals to add steps between existing steps. For example, use 12.5 to add a step between steps 12 and 13.  
Form-specific information  
JD Edwards World recommends that you do not use an operation number more than once within the same work center. |

38.7.6 Processing Options
See Section 57.5, "Work Order Parts List Revisions (P1311)"

38.7.7 Setting Up Standard Work Order Instructions

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Standard WO Instructions
You can create standard work order instructions that establish labor routing steps for work orders. For example, assume that you have created a standard parts list for routine hydraulic maintenance. The hydraulic maintenance has multiple steps that
must be performed in a specific sequence, such as machine lockout, disconnect motor, and so on. In addition, some of the steps must be performed by different work centers (crafts), such as electrical, mechanical, and so on. For this task, you would create standard work order instructions that specify the work centers and sequence of operations necessary to install the parts. You can then attach the instructions to each actual (firm) work order created for hydraulic maintenance.

38.7.8 Before You Begin

- Verify that you have purchased and installed the following systems. You must have installed these systems to be able to set up standard work order instructions.
  - System 40: Inventory Base and Order Processing
  - System 41: Inventory Management
- Verify that inventory masters have been created for all parent numbers specified in Standard Instructions. See Entering Item Master Information in the JD Edwards World Inventory Management Guide for more information about creating inventory master records.
- Verify that work centers have been set up as business units. See Section 39.4.1, “Setting Up Resource Units” for more information about setting up work centers as business units.

To set up standard work order instructions

On Standard WO Instructions

Figure 38–14 Standard WO Instructions screen

1. Complete the following fields:
   - Branch/Plant
   - Item Rev
   - Work Center (Resource)
Setting Up Standard Parts Lists and Work Order Instructions

- Oper Seq No (Operation Sequence Number)
- Description
- Run Hours - Labor

2. Complete the following optional fields:
   - Item Revision
   - Routing Type
   - Line/Cell
   - As of Date
   - Machine Hours

3. Choose Full Details.

**Figure 38–15 Standard WO Instructions screen**

4. Complete the following field:
   - Time Basis
     This field might already contain a default value.

5. Complete any of the following optional fields:
   - Eff (Effective) From
   - Eff Thru
   - Type (Operation)
   - % Overlap
   - Queue Hours
   - Equip No (for reference only)
   - Move Hours

<tr>
<td></td>
<td><strong>Form-specific information</strong></td>
</tr>
<tr>
<td></td>
<td>For Equipment users, this is the craft/resource responsible for completing the maintenance activity.</td>
</tr>
<tr>
<td>Labor Run Hours</td>
<td>This is the standard hours of labor expected in the normal production of this item.</td>
</tr>
<tr>
<td></td>
<td>The run labor hours in the Routing Master table (F3003) are the total hours it takes the specified crew size to complete the operation. The hours are multiplied by the crew size during shop floor release and product costing.</td>
</tr>
<tr>
<td></td>
<td><strong>Form-specific information</strong></td>
</tr>
<tr>
<td></td>
<td>For Equipment/Plant, this is the estimated number of hours needed to complete a maintenance activity.</td>
</tr>
<tr>
<td>Item Rev</td>
<td>Indicates the revision level of a routing. It is usually used in conjunction with an engineering change notice or order (ECN or ECO). The revision level of the routing should match the revision level of its associated bill of material (data item BREV), although the system does not check this.</td>
</tr>
<tr>
<td></td>
<td>This value is user defined and not maintained by the system.</td>
</tr>
<tr>
<td>Routing Type</td>
<td>User defined code (system 40, type TR) that designates the type of routing. You can define different types of routing instructions for different uses. For example, you can differentiate between equipment maintenance routings and manufacturing routings.</td>
</tr>
<tr>
<td></td>
<td>You define the routing type on the work order header. The specific type of routing defined will then be used in the work order routing.</td>
</tr>
<tr>
<td>Line/Cell</td>
<td>Defines a production line or cell. Detailed work center operations can be defined inside the line or cell. For rate based manufacturing to use this value for reporting, this value must match the line cell in the header.</td>
</tr>
</tbody>
</table>
Defining Default Location and Printers

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>As of Date</td>
<td>This field is used for effectivity checking. Enter a specific date to display documents (orders, bills of material, routings, as applicable) that are effective on or after that date. The current system date is the default, but you can enter any future or past date.</td>
</tr>
<tr>
<td>Mach Run Hours</td>
<td>This is the standard machine hours expected to be incurred in the normal production of this item.</td>
</tr>
<tr>
<td>Time Basis</td>
<td>A user defined code (system 30, type TB) that identifies the time basis or rate to be used for labor hours entered for any routing step. You can set rates per unit, per 10, per 1000, and so on. For example, if the time basis code is 10, then the labor hours represents the number of hours to complete the routing step for 10 units. For Equipment/Plant Maintenance, the value you enter in this field is normally U (Unit). The system uses the values in the Description-2 field on the User Defined Codes screen for costing calculations. The Description field is a description of what the code represents, but is not used in calculations.</td>
</tr>
</tbody>
</table>

38.7.9 What You Should Know About Entering machine hours

Entering machine hours has several consequences that you should be aware of. If you are not using manufacturing systems, do not enter machine hours. If you are using manufacturing systems, the machine you specify must be set up as a work center.

If you enter a value in the Machine Hours field, the system indicates a demand for those machine hours based on the time commitment of the work order. You should plan on taking the machine out of service for the entire time necessary to complete the work order. If you enter machine hours, you can optionally complete the Percent of Overlap field to indicate any operations that can overlap previous operations.

For planning purposes, the system determines the total duration of the work order based on values you enter for machine hours and percent overlap.

38.7.10 Processing Options

See Section 57.7, "Routing Master Revisions (P3003)"

38.8 Defining Default Location and Printers

Navigation
From Inventory System Setup (G4141), choose Default Location and Printers

Many of the forms within the Work Order Processing system require that you specify a location, such as a branch or plant, to which you are assigned. You can set up default locations for each person in your organization that uses the Work Order Processing system. A default location is the branch/plant that is assigned to your user ID or terminal ID. If you do not set up a default location for your user ID or terminal ID, you must enter a location manually.
You can also assign a default print queue to each person who uses the Work Order Processing system. When you print a work order, the system uses the default print queue that you set up, unless you specify otherwise. If you do not assign a default print queue, the system uses either the print queue assigned in the particular version for which the Work Order Print program applies or the print queue assigned to your user profile.

To define default location and printers
On Default Location and Printers

Figure 38–16  Default Location & Printers screen

1. Complete the following fields:
   - User ID
   - Branch or Plant
2. Choose Print Queues.

4. Complete the following field:
   - Print Queue

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Print Queue</td>
<td>The waiting area a job goes to after it has processed. Output Queues are sometimes attached to printers. If an OUTQ is not specified, it defaults from the user’s job description.</td>
</tr>
<tr>
<td></td>
<td>Form-specific information</td>
</tr>
<tr>
<td></td>
<td>The name of the print queue that you want the system to use for the adjacent document.</td>
</tr>
</tbody>
</table>

### 38.8.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Approval routing</td>
<td>The approval routing code on this screen refers to purchase orders only. See Section 38.5.5, “Setting Up Work Order Approval Routes” for more information about approval routing for work orders.</td>
</tr>
</tbody>
</table>

### 38.9 Setting Up Supply and Demand Inclusion Rules

**Navigation**

From Equipment/Plant Management Setup (G1341), choose Planning

From Planning Setup (G1346), choose Supply/Demand Inclusion Rules

To balance your parts inventory with the demand for parts created by maintenance work orders, you must set up supply/demand inclusion rules. You use supply and demand inclusion rules to specify the documents that create a supply for parts, such as purchase requests, and the documents that create a demand for parts, such as PM work orders, corrective work orders, and so on. In addition, you specify the statuses at which the various documents create supplies or demands.

The following programs use supply and demand inclusion rules:
In Equipment/Plant Maintenance, the following document types create a supply for parts:

- Purchase requests
- Purchase orders
- Blanket purchase orders

In Equipment/Plant Maintenance, the following document types create a demand for parts:

- System-generated maintenance work orders, such as PM work orders
- Corrective maintenance work orders

After you set up supply and demand inclusion rules, you can use the information that the system provides to balance the supply and demand for parts. For example, if demand is greater than supply at a given point, you can expedite purchase orders or postpone work orders.

When you review a version of the supply and demand inclusion rules, all document types and related statuses that are available appear. You choose the document types and document statuses that you want to include in the version.

### 38.9.1 Before You Begin

- Set processing options to include work order document types WO, WM, and any other work order document types that you have defined. See Chapter 36, "Set Up User Defined Codes" for more information about defining work order document types.

### 38.9.2 To set up supply and demand inclusion rules

On Supply/Demand Inclusion Rules
1. Complete the following field:
   - Inclusion Code

2. Choose Select Line for each document type and status for the inclusion rules to apply.
   When you apply inclusion rules to work order documents, line types do not appear. Line types are not applicable to the Work Order system.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Inclusion Code</td>
<td>A user defined code (system 40/type RV) that identifies an inclusion rule that you want the system to use for this branch/plant. The Manufacturing and Advanced Warehouse Management systems use inclusion rules as follows:</td>
</tr>
<tr>
<td></td>
<td>■ For Manufacturing - Allows multiple versions of resource rules for running MPS, MRP, or DRP.</td>
</tr>
<tr>
<td></td>
<td>■ For Advanced Warehouse Management - Allows multiple versions of inclusion rules for running put away and picking. The system processes only those order lines that match the inclusion rule for a specified branch/plant.</td>
</tr>
</tbody>
</table>
38.9.3 Processing Options

See Section 56.3, "Supply/Demand Inclusion Rules (P34004)".

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Skip to Order Type</td>
<td>A user defined code (00/DT) that identifies the type of document. This code also indicates the origin of the transaction. JD Edwards World has reserved document type codes for vouchers, invoices, receipts, and time sheets, which create automatic offset entries during the post program. (These entries are not self-balancing when you originally enter them.) The following document types are defined by JD Edwards World and should not be changed: P – Accounts Payable documents R – Accounts Receivable documents T – Payroll documents I – Inventory documents O – Purchase Order Processing documents J – General Accounting/Joint Interest Billing documents S – Sales Order Processing documents Form-specific information If you are using the Skip to Order Type field, you can enter an order type code and press Enter to display only rules about that order type. To see the whole set of order types included in the resource rules, leave this field blank and use the Roll keys.</td>
</tr>
</tbody>
</table>
This chapter contains these topics:

- Section 39.1, "Setting Up Maintenance Planning"
- Section 39.2, "Setting Up General Planning"
- Section 39.3, "Setting Up Parts Planning"
- Section 39.4, "Setting Up Resource Planning"

### 39.1 Setting Up Maintenance Planning

Before you can use maintenance planning features in Equipment/Plant Maintenance, you need to set up information that the system uses to process material plans and labor plans. This consists of:

<table>
<thead>
<tr>
<th>Information</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>General planning information</td>
<td>You set up general planning information for each branch or plant. General planning information determines how the system commits inventory to the branch or plant, which work days to include when you generate a material or capacity plan, how the system processes changes to standard parts lists, and so on.</td>
</tr>
<tr>
<td>Parts planning information</td>
<td>You set up parts planning information to determine how the system calculates the availability of parts. You also define the types of messages that appear when you generate a material plan. You can also set up different versions of the supply and demand inclusion rules, depending on the type of material plan that you want to generate.</td>
</tr>
<tr>
<td>Resource planning information</td>
<td>You set up resource planning information to determine how the system calculates the availability of labor resources, such as the number of employees at a work center, and the types of messages that appear when you generate a labor capacity plan. You can also set up different versions of the supply and demand inclusion rules, depending on the type of labor plan that you want to generate.</td>
</tr>
</tbody>
</table>

### 39.2 Setting Up General Planning

Before the system can generate material and labor plans and create planning messages, you must define general planning information for each branch or plant in your organization.

Setting up general planning consists of the following tasks:
- Setting up planning constants
- Setting up the workday calendar

### 39.2.1 Setting Up Planning Constants

**Navigation**

From Equipment/Plant Management Setup (G1341), choose Planning

From Planning Setup (G1346), choose General Planning Constants

You must define material and resource planning values for each branch or plant. For example, you can specify rules that govern how the system commits and routes inventory. You can also specify that the system log changes you make to standard parts lists if you need to track the changes. You can also define the number of hours per day that each branch or plant operates. The system uses this information to determine the maximum workload for each work center in a branch or plant.

**To set up planning constants**

On General Planning Constants

**Figure 39–1 General Planning Constants screen**

![General Planning Constants screen](image)

1. Complete the following fields:
   - Branch
   - Hard/Soft Commit

2. To specify the work hours per day, complete the following field:
   - Hours

   Equipment/Plant users complete only one field under the Hours column to specify work hours per day. The remaining five fields must remain blank. After you set up the planning constants for a branch, the system calculates a value for work hours per day, based on the value you enter in the Hours field.
3. Verify that the Shift Code fields are blank
   Shift codes are not applicable to Equipment/Plant Maintenance.

4. Complete the following optional fields:
   - Log Bill of Material Changes
   - On-Line BOM Validation (Y/N)

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| **Hours**                    | The number of work hours that the manufacturing plant operates per day.  
   Form-specific information   | For repetitive manufacturing, identify the number of work hours per shift for the specified branch. The Resource Generation program uses the corresponding shift hours to calculate the available resource units for each shift, and the total for the day.  
   Since the shift hours may apply to different days of the week, the system uses the total of the first three hours to define the work hours per day value. |
| **Hard/Soft Commit**         | Determines how the Shop Floor Control system commits inventory. Valid codes are:  
   1. The system performs a hard commitment at the creation of the parts list. The hard commitment remains in effect until inventory is relieved.  
   2. The system performs a soft commitment at the creation of the parts list. Changed to a hard commitment during the pick list print process for the work order. The hard commitment remains in effect until inventory is relieved.  
   3. The system performs a soft commitment at creation of the parts list. The soft commitment remains in effect until inventory is relieved.  
   For World: When the hard/soft commit option is set to 2 or 3, any line item in the parts list may be hard committed prior to printing or relieving the inventory.  
   Note: When you set the Commitment Method field in the Branch/Plant Constants screen to 2 or 3, you must use 1 or 2 for this field because a hard commitment must be performed. |
| **Log Bill of Material Changes** | This field determines whether changes to the bill of material are recorded in the Bill of Material Change table (F3011). Valid values are:  
   Y = Yes, log changes.  
   N = No, do not log changes.  
   Blank will assume an N.  
   When you log bill of material changes, the system saves the old bill of material and the new changed bill of material. |
39.2.2 What You Should Know About

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
</table>
| On-Line BOM Validation (Y/N) | Determines whether the system performs an online component/parent validation and low-level code assignment when you revise a bill of material. Valid values are:
Y – Yes, validate items online.
N – No, do not validate items online.

**Note:** JD Edwards World recommends that you validate items online (enter Y) unless your bills of material are extremely large.

Important: If you enter N, you must validate the items in batch. Run the Print Integrity Analysis program (P30601) after bill of material updates and before you run the Frozen Cost Update program (P30835) or perform a DRP/MPS/MRP generation (P3482).

39.2.3 Setting Up the Workday Calendar

**Navigation**
From Equipment/Plant Management Setup (G1341), choose Planning

From Planning Setup (G1346), choose Work Day Calendar

You must set up workday calendars for each maintenance branch or plant. You use the calendar to specify which days are workdays, holidays, and so on. You need to set up a workday calendar for every month for which you want to generate parts and labor plans. The system uses workday calendar information to plan and schedule labor resources, based on the workdays you specify. You should set up calendars six months to a year at a time.

When you initially set up a workday calendar, the system automatically specifies all weekdays as workdays and all Saturdays and Sundays as non-work days. You can accept these values or change the days to suit your business needs.

**To set up the workday calendar**
On Work Day Calendar
1. Complete the following field:
   - Branch

2. Complete the following fields for the time period that you want to set up for the workday calendar:
   - Calendar Year
   - Calendar Month

3. Verify that the following fields are blank:
   - Shift
   - Calendar Name

4. For each day you want to set up, enter a valid day type on the entry calendar.

   JD Edwards World provides several predefined day type codes (00/DT). With the exception of Workday (W), which is hard coded, you can use these, revise them, or add new ones. For more information about user defined codes, see the *JD Edwards World Technical Foundation Guide*.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Day - Type</td>
<td>A user defined code (00/TD) that indicates the type of day, that is, how work should be scheduled. Examples are: W – Work Day, E – Weekend, H – Holiday, M – Maternity Leave, L – Leave of Absence. With the exception of W, which is hard coded, you can use and revise these and add new codes.</td>
</tr>
</tbody>
</table>
39.2.4 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Shift codes and calendar</td>
<td>Shift codes and calendar names are not applicable to</td>
</tr>
<tr>
<td>names</td>
<td>Equipment/Plant Maintenance.</td>
</tr>
</tbody>
</table>

39.3 Setting Up Parts Planning

Before you can generate and review a parts plan, you must set up information that the system uses to process the plan. For example, you must set up a table of user defined quantity types that the system uses to calculate and display the supply and demand of parts. You must also specify the action messages that you want to appear when the system detects a conflict between the availability and the demand for a part.

In addition, you can set up different versions of the supply and demand inclusion rules to accommodate different types of parts plans that you want to generate. For example, you can generate a long-range parts plan and a short-range parts plan. You use supply and demand inclusion rules to specify the document types that you want the system to include when it processes each plan.

Setting up parts planning consists of the following tasks:

- Setting up parts planning codes
- Setting up supply and demand inclusion rules for parts plans

39.3.1 Setting Up Parts Planning Codes

Before you can use the parts planning features in Equipment/Plant Maintenance, you must set up the following user defined codes:

- Quantity types
- MRP calculation display
- MRP action messages

The system uses these codes to calculate and display the availability of parts. The system also uses these codes to determine which action messages appear when it detects a conflict between the availability and the demand for a part.

See Also:

- Section 36.1, "Setting Up User Defined Codes" for additional guidelines on setting up user defined codes

Quantity Types

Navigation

From Equipment/Plant Management (G13), enter 29
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Quantity Types

Quantity types are user defined codes (system 34, type QT) that represent the availability of parts. JD Edwards World provides several predefined codes, including the following:

- + Beginning available (unadjusted)
Setting Up Parts Planning

- + Beginning available
- + Purchase orders
- - Lot Expired
- - Firm work orders
- = Ending available (unadjusted)

The system uses codes that have unadjusted values to calculate part availability with the assumption that any outstanding action messages will not be implemented by the responsible planner. The system uses all other codes to calculate the availability of parts with the assumption that the planner will implement planning messages.

Caution: The table for quantity types is shared with the Manufacturing system. Under no circumstances should you delete this table. Values within this table have special meaning to the system, but you can change the description fields. JD Edwards World recommends that you leave this table unaltered.

See Also:
- JD Edwards World Technical Foundation Guide for more information about maintaining user defined code tables

MRP Calculation Display

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose MRP Calculation Display

You must set up the MRP Calculation Display table (system 34, type MM) with the quantity type codes you want the system to consider when it calculates the availability of a part. You can revise the codes in this table to meet your specific calculation or display purposes.

For example, you can set up a table to specify that the system:
- Use the beginning available quantity for a part
- Add quantities from existing purchasing orders
- Subtract quantities from maintenance work orders
- Provide the ending available amount
39.3.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Specifying a default MRP calculation display table</td>
<td>You can use processing options to specify which version of the MRP calculation display table the system uses. The maintenance material planning version of the MRP calculation display table appears unless you specify otherwise.</td>
</tr>
</tbody>
</table>

MRP Action Messages

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose MPS/MRP Action Messages

You must define the action messages that you want to appear when the system notifies you of parts planning conflicts. For example, depending on the severity of a parts shortage, you can direct the system to provide messages to place an order for a part, expedite an existing order, increase the quantity of an existing order, and so on.

The system stores MRP action message codes in user defined codes (system 34, type MT). You can change the description of the codes to meet your business needs.

39.3.3 Setting Up Supply and Demand Inclusion Rules for Parts Plans

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Supply/Demand Inclusion Rules
You typically use the same version of supply and demand inclusion rules that you set up for work orders. However, you can set up other versions of the supply and demand inclusion rules to accommodate your parts planning needs. You use supply and demand inclusion rules to specify the documents that create a supply for parts, such as purchase requests, and the documents that create a demand for parts, such as work orders. In addition, you specify the statuses at which the various documents create supplies or demands.

When you generate a parts plan, the system considers only the documents you specify in the inclusion rules when it calculates parts availability. For example, you can set up a version of the supply and demand inclusion rules that includes all purchase orders, regardless of status, but only PM work orders up to and including a status of MC (work order in planning.)

Using this example, the system calculates supply according to parts for which any purchase orders exist. The system calculates demand according to the parts requirements of PM work orders whose statuses are within the range you specified. The system does not take into consideration parts requirements for work orders whose status you have not specified in the inclusion rules.

See Also:
- Section 38.9, "Setting Up Supply and Demand Inclusion Rules"

### 39.4 Setting Up Resource Planning

Before you can generate and review a labor plan, you must set up information that the system uses to process the plan. For example, you must set up the work centers that are responsible for maintenance and specify the number of employees in each maintenance work center. You must also set up additional user defined codes, such as the codes that the system uses to calculate the availability of labor resources.

In addition, you can set up different versions of the supply and demand inclusion rules to accommodate different types of labor plans that you want to generate. For example, you can generate a long-range labor plan and a short-range labor plan. You use supply and demand inclusion rules to specify the document types that you want the system to include when it processes each plan.

Setting up resource planning consists of the following tasks:
- Setting up resource units
- Setting up resource planning codes
- Setting up supply and demand inclusion rules for labor plans

### 39.4.1 Setting Up Resource Units

You must set up resource units to enable the system to calculate labor demands and labor costs for maintenance tasks. The system calculates resource units by multiplying the work hours per day by the number of employees in a work center. In Equipment/Plant Maintenance, a work center usually represents the employees who perform maintenance work, although it can also represent a department or a machine. You must set up your work centers before the system can calculate resource units and labor costs.

In addition, you must establish standard labor rates. The system uses standard labor rates to calculate rate information on work order labor routings and on the work order Estimate to Actual Variance program.
Setting up resource units consists of the following tasks:

- Setting up work centers
- Running the Resource Units Refresh program
- Setting up standard labor rates

### 39.4.2 Before You Begin

- Set up workday calendars for each branch or plant. See Section 39.2.3, “Setting Up the Workday Calendar”

### Setting Up Work Centers

**Navigation**

From Equipment/Plant Management Setup (G1341), choose Planning

From Planning Setup (G1346), choose Resource Revisions

You must provide the system with the following types of information about each of your maintenance work centers:

- Basic information, such as work center names, crew sizes, job processing time, and so on
- Grouping information, so that you can combine similar work centers for planning and reporting
- Labor rate information

**To set up work centers**

On Resource Revisions

*Figure 39-4 Resource Revisions screen*

1. Complete the following fields:
1. Branch/Plant
2. Work Center (a Business Unit)
3. Dispatch Group (a Business Unit)
4. Number of Employees

2. Verify that the following fields are blank:
   a. Work Center Type
   b. Calendar

3. Complete the following optional fields:
   a. Prime Load Code
   b. Critical Work Center
   c. Efficiency

4. Choose Work Center Rates.

*Figure 39–5  Work Center Rate Revisions screen*

5. On Work Center Rate Revisions, complete the following field:
   a. Direct Labor-Simulated
### Field | Explanation
--- | ---
Work Center | An alphanumeric field that identifies a separate entity within a business for which you want to track costs. For example, a business unit might be a warehouse location, job, project, work center, or branch/plant.

You can assign a business unit to a voucher, invoice, fixed asset, and so on, for purposes of responsibility reporting. For example, the system provides reports of open accounts payable and accounts receivable by business units to track equipment by responsible department.

Security for this field can prevent you from locating business units for which you have no authority.

**Note:** The system uses this value for Journal Entries if you do not enter a value in the AAI table.

Dispatch Group | A super category code to group work centers within an overall business unit. For example, you can group like machines operating out of several work centers that report to one business unit under a dispatch group.

Branch/Plant | A code that represents a high-level business unit. It can be used to reference a branch or plant that might have departments or jobs, which represent lower-level business units (data item MCU), subordinate to it. For example:

- Branch/Plant (MMCU)
- Dept A (MCU)
- Dept B (MCU)
- Job 123 (MCU)

Business unit security is based on the higher-level business unit.

Number of Employees | This represents the normal number of employees in this work center. When you run the Work Center Resource Units Refresh program, the system multiplies this number by the Number of Work Hours Per Day from the Manufacturing Constants table (F3009) to generate the total gross labor hours available in the work center each day.

Prime Load Code | This value determines if a work center is machine or labor intensive. These codes are also used in Resource Requirements Planning and Capacity Requirements Planning calculations to develop load profiles.

Valid codes are:

- L – Run labor hours only
- M – Machine hours only
- B – Run labor plus setup labor hours
- C – Machine plus setup hours
- O – Other (will not generate resource units)
Setting Up Resource Planning

Running the Resource Units Refresh Program

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Resource Units Refresh

After you set up work centers on Resource Revisions and whenever you revise work center information, you must run the Resource Units Refresh program to calculate available resource units. You specify a time period and a branch or plant for which you want the system to calculate resource units. The system uses the Prime Load Code field on Resource Revisions to determine how to calculate the resource units that a work center is capable of generating over a particular period of time. To calculate resource units for maintenance work centers, you typically use a prime load code of L for labor hours.

If you use a prime load code of L, the system calculates resource units using the following information:

- Number of employees from Resource Revisions
- Work hours per day from General Planning Constants

When you run the Resource Units Refresh program, a versions list appears. The versions list contains DEMO versions that you can run, or copy and modify to suit

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critical Work Center</td>
<td>A code that identifies the work center as critical or not critical when the system calculates capacity. Valid values are:</td>
</tr>
<tr>
<td></td>
<td>N – Not a critical work center</td>
</tr>
<tr>
<td></td>
<td>1 – A critical work center in calculating resource requirement planning only</td>
</tr>
<tr>
<td></td>
<td>2 – A critical work center in calculating capacity requirements planning only</td>
</tr>
<tr>
<td></td>
<td>3 – A critical work center in calculating resource requirements planning and capacity requirements planning</td>
</tr>
<tr>
<td></td>
<td>4 – Not a capacity work center (will not be generated in capacity planning)</td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> The system displays Type 3 work centers whenever type 1 or type 2 is selected in this field.</td>
</tr>
<tr>
<td>Efficiency</td>
<td>A user defined value that indicates how efficiently a work center operates. This value usually refers to people efficiency. When you enter a value in this field, and the Modify Cost by Work Center Efficiency field in the Job Shop Manufacturing Constants table (F3009) is set to Y, the system creates a new cost component (B4) from the cost calculated from the direct labor cost (B1). The system also uses this value to calculate rated capacity.</td>
</tr>
<tr>
<td></td>
<td>Example: If the constant is set to Y, the value of this field is 80%, and the direct labor cost is 10, the system creates a B4 cost component for 2 in the Item Cost Component Add-Ons table (F30026).</td>
</tr>
<tr>
<td></td>
<td>Enter percents as whole numbers, for example, enter 80% as 80.00.</td>
</tr>
<tr>
<td>Direct Labor Simulated</td>
<td>This rate, in cost per hour, is the rate used to calculate the current labor cost as of the last simulation and update.</td>
</tr>
</tbody>
</table>

Efficiency
A user defined value that indicates how efficiently a work center operates. This value usually refers to people efficiency. When you enter a value in this field, and the Modify Cost by Work Center Efficiency field in the Job Shop Manufacturing Constants table (F3009) is set to Y, the system creates a new cost component (B4) from the cost calculated from the direct labor cost (B1). The system also uses this value to calculate rated capacity.

Example: If the constant is set to Y, the value of this field is 80%, and the direct labor cost is 10, the system creates a B4 cost component for 2 in the Item Cost Component Add-Ons table (F30026).

Enter percents as whole numbers, for example, enter 80% as 80.00.
your needs. When you run a version, the system displays Processing Options Revisions before submitting the job for processing.

See Also:

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing a DREAM Writer version

### 39.4.3 Processing Options

See Section 56.13, "Work Center Resource Units Refresh (P3007G)"

**Setting Up Standard Labor Rates**

**Navigation**
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Standard Cost Update

When you set up work centers, you enter a value for simulated labor rates on Work Center Rates Revisions. You must run the Standard Cost Update program to create the frozen direct labor rate. The system uses the frozen direct labor rate to calculate the estimated labor routing costs to work orders.

When you run Standard Cost Update, the system submits the job directly to batch.

See Also:

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing a DREAM Writer version

### 39.4.4 Processing Options

See Section 57.8, "Item Cost Update (P30835)"

### 39.4.5 Setting Up Resource Planning Codes

Before you can use the labor planning features in Equipment/Plant Maintenance, you must set up the following user defined codes:

- CRP display
- Message types

The system uses these codes to calculate and display labor availability when you generate a labor plan. The system also uses these codes to determine which action messages appear when it detects a conflict between the availability of labor resources and demand for labor resources.

See Also:

- Chapter 36, "Set Up User Defined Codes" for additional guidelines on setting up user defined codes

**CRP Display**

You must set up the CRP Display table (system 33, type MM) with the codes that you want to appear on Capacity Load. The system provides several predefined codes, such as:

- 10 - Released Load
■ 40 - Load Versus Capacity
■ 80 - Available Capacity
■ 90 - Accumulated Available Capacity

You can use these codes or modify them to meet your specific calculation or display purposes.

Message Types
You use message type codes (system 33, type MM) to define the action messages that you want to appear when the system notifies you of load and capacity conflicts. For example, you can define messages that indicate an over-capacity condition, an under-capacity condition, and so on.

39.4.6 Setting Up Supply and Demand Inclusion Rules for Labor Plans

Navigation
From Equipment/Plant Management Setup (G1341), choose Planning
From Planning Setup (G1346), choose Supply/Demand Inclusion Rules

You typically use the same version of supply and demand inclusion rules that you set up for work orders. However, you can set up other versions of the supply and demand inclusion rules to accommodate your labor planning needs. You use supply and demand inclusion rules to specify what type of work orders and range of work order statuses you want the system to include when it calculates available labor resources.

For example, you can set up a version of the supply and demand inclusion rules that includes only PM work orders up to and including a status of MC (work order in planning).

See Also:
■ Section 38.9, "Setting Up Supply and Demand Inclusion Rules"
This part contains these chapters:

- Chapter 40, "Equipment/Plant Maintenance Global Updates"
- Chapter 41, "Update Equipment Information"
- Chapter 42, "Update Work Order Information"
- Chapter 43, "Update PM Schedule Information"
- Chapter 44, "Update Accounts and Ledgers"
- Chapter 45, "Data Purge and Archival"
- Chapter 46, "Purge Work Orders"
- Chapter 47, "Purge Selected Equipment Information"
- Chapter 48, "Equipment/Plant Maintenance Reports"
- Chapter 49, "Print Equipment Reports"
- Chapter 50, "Print Cost Reports"
- Chapter 51, "Print Work Order Reports"
- Chapter 52, "Print Maintenance Planning Reports"
This chapter contains these topics:

- **Section 40.1, "Objectives"**
- **Section 40.2, "About Equipment/Plant Maintenance Global Updates"**

### 40.1 Objectives

- To make system-wide updates to:
  - Equipment information
  - Work order information
  - PM schedule information
  - Accounts and ledgers

- To identify the purpose for each global update program
- To determine when to use each global update program

### 40.2 About Equipment/Plant Maintenance Global Updates

Use global update programs to make system-wide changes that affect a variety of information within Equipment/Plant Maintenance. For example, you can:

- Update tickler dates in the message log
- Update the search word table when you add new equipment
- Create PM schedules for groups of similar equipment
- Make additions or changes to groups of related PM schedules, such as:
  - Schedule dates
  - Service intervals
  - Priorities
- Update maintenance and work order tables when you revise equipment numbers on the equipment master
- Recalculate work order costs to reflect actual time spent on each maintenance task
- Update all work orders and equipment masters when you revise parts lists
- Update all affected G/L transactions when you revise work order phase codes or equipment numbers
Update equipment tables when you revise numbers in your chart of accounts
- Restore account balance information if your account balance data is corrupted
- Update the Account Ledger table (F0911) when you change the symbol that you use to identify equipment numbers

Equipment/Plant Maintenance global updates consist of the following tasks:
- Updating equipment information
- Updating work order information
- Updating PM schedule information
- Updating accounts and ledgers
This chapter contains these topics:

- Section 41.1, "Updating Equipment Information"
- Section 41.2, "Updating the Message Log"
- Section 41.3, "Updating the Search Word Table"

41.1 Updating Equipment Information

You can update certain equipment information globally to reduce the amount of processing time it takes to maintain current equipment information in your system and throughout your organization.

41.2 Updating the Message Log

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Update Message Log

Run the Update Message Log program to keep tickler dates and units current in the message log. For example, if you set up a reminder message to appear at 3,000 miles for a piece of equipment, you use this update to ensure that the message appears when the equipment reaches the 3,000-mile mark.

The Update Message Log program compares tickler dates with the system date and tickler units (for example, miles or hours) to the current unit reading that you record for the corresponding piece of equipment. The program updates all the units that have reached or exceeded the tickler amounts that you post in the AT00 automatic accounting instruction. When the update is complete, the corresponding equipment number on Equipment Search is highlighted to indicate that a message exists for the equipment.

**Note:** You should run this program only if you use the Tickler Miles/Hours field in the message log.

When you select Update Message Log, the system submits the job directly to batch. You should update the message log frequently to keep message tickler units current. JD Edwards World recommends running Update Message Log as part of your unattended operations.
### 41.3 Updating the Search Word Table

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Build Search Word Table

You must build a search word table before you can perform a query search for equipment. For example, you might perform a query search if you need to locate the equipment master for a piece of equipment, but you do not know the equipment number. The search word table consists of possible words that you might use on a search screen to access equipment information that you need.

The Build Search Word File program scans your equipment information and creates a table of all the words found in the following places:

- Item Master table (F1201):
  - Equipment description fields
  - Any remark fields
  - Model number
  - Authorization for expenditure (AFE) number
  - All category code fields

- Supplemental Data tables (F12090, F12092, and F12093):
  - User defined codes
  - Remark fields
  - Narrative text

When you select Build Search Word File, the system submits the job directly to batch. You should run this update to maintain and refresh the Search Word table as you add, change, and delete equipment in your system. JD Edwards World recommends running this program as part of your unattended operations.

#### 41.3.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Using uppercase and lowercase descriptions for equipment</td>
<td>The Build Search Word File program is not case sensitive. The system locates and retrieves words in the description fields for equipment regardless of whether they are upper- or lowercase.</td>
</tr>
</tbody>
</table>

---

See Also:
- Section 6.1, "Working with Message Logs" for more information about using tickler dates and units
- *JD Edwards World Technical Foundation Guide* for more information about running unattended operations (SLEEPER)
See Also:

- Section 5.1, "Searching for Equipment Information" for more information about performing a query search to locate equipment
- *JD Edwards World Technical Foundation Guide* for more information about running unattended operations (SLEEPER)
This chapter contains these topics:

- Section 42.1, "Updating Work Order Information"
- Section 42.2, "Updating Work Order Cost"
- Section 42.3, "Updating Work Order Status Based on Purchase Order Receipt"
- Section 42.4, "Updating the Standard Parts List"
- Section 42.5, "Updating the Phase or Equipment Number in the G/L"

### 42.1 Updating Work Order Information

You can update certain work order information globally to reduce the amount of processing time it takes to maintain current information throughout your organization.

### 42.2 Updating Work Order Cost

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Update Work Order Cost

Run the Update Work Order Cost program to replace the actual hours in the Work Order Routing table (F3112) with the total hours for each operation sequence from the Payroll Transaction History table. The program also reads the Account Ledger table for material and subcontract amounts. The program then updates the following information in the Work Order Master table:

- Actual labor costs
- Actual material costs
- Actual hours
- Actual amount
- Actual other costs
- Actual duration (downtime hours)
42.3 Updating Work Order Status Based on Purchase Order Receipt

Navigation
From Equipment/Plant Management (G13), enter 27
From Advanced Operations (G1331), choose Update Work Order Status/PO Receipt

You can update the status of work orders based on whether parts ordered from associated purchase orders have been received. This is especially useful to schedule work orders based on the arrival of ordered parts. You can specify the status that the system updates work orders based on both partial and full receipt of the items on the associated purchase order. You can also specify the recipient of an e-mail message informing of the change in work order status.

When you choose Update Work Order Status/PO Receipt, a versions list appears. The versions list contains a DEMO version that you can run, or copy and modify to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the job for processing.

42.3.1 Processing Options
See Section 58.1, "Update Work Order Status based on Purchase Order Receipt (P48810)".

42.4 Updating the Standard Parts List

When you change a work order parts list, you can update the Bill of Materials Master table (F3002) to ensure that all future work orders that use the same standard parts list reflect the change.

When you add a part to a work order parts list, the Update Standard Parts List program adds the part to the standard parts list. When you change the quantity of a part on the work order parts list, the program updates the quantity on the standard parts list.

42.4.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Updating parts quantities</td>
<td>The Update the Standard Parts List program compares the transaction quantity on the work order part to the quantity indicated on the standard parts list when it updates the standard parts list.</td>
</tr>
<tr>
<td>Updating the equipment</td>
<td>You can use the Update the Standard Parts List program to update the equipment parts list. The update program works the same way as for the standard parts list, except that it updates the standard parts list from the Equipment Master table (F1201) instead of the Work Order Master table (F4801).</td>
</tr>
</tbody>
</table>

42.4.2 Processing Options
See Section 58.2, "Standard Parts List Update (P13802)"
42.5 Updating the Phase or Equipment Number in the G/L

Navigation
From Equipment/Plant Management (G13), enter 27
From Advanced Operations (G1331), choose Update Phase/Equipment Number in the G/L

If you post work order transactions to the general ledger and then change the equipment number or the phase code on the work order, you should run this update to ensure that the Account Ledger table (F0911) reflects the most current work order information. You can use this program to reflect changes to the phase code or equipment number for multiple work orders. You can also use this program to enter a value in the phase field on many general ledger transactions.

When you choose Update Phase/Equipment Number in the General Ledger, the system submits the job directly to batch processing.

42.5.1 Before You Begin
- Back up the Work Order Master table (F4801)
- Verify that no one accesses the Work Order Master table while you run this procedure
This chapter contains these topics:

- Section 43.1, "Updating PM Schedule Information"
- Section 43.2, "Updating PM Schedules"
- Section 43.3, "Updating Equipment Numbers"

### 43.1 Updating PM Schedule Information

You can update PM schedule information to:

- Create PM schedules for similar equipment
- Make global changes to PM service types
- Reflect changes you make to equipment numbers throughout your maintenance operation

### 43.2 Updating PM Schedules

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Global PM Schedule Update

You can globally add, change, or delete PM schedules. You specify the service type that you want to change and enter information about the equipment for which you want the changes to apply.

You can also make global revisions to a group of PM service types. You narrow the equipment for which you want the revisions to apply by using any combination of the first ten equipment category codes. For example, for any service type, you can:

- Change the service interval
- Revise the schedule date
- Revise the maintenance priority
- Revise the procedure number
- Assign a different model work order number
- Revise the value in the Occurrences field
- Revise the frequency indicator
Updating PM Schedules

- Revise the multiple work order code

You can also globally create PM schedules for multiple pieces of equipment that you place in service whose maintenance requirements are similar.

The Global PM Schedule Update program immediately updates the Maintenance Schedule table (F1207) depending on the information that you change. Consider the following guidelines when you update PM schedule information:

- If you enter a schedule date, the system removes all other meter service intervals.
- If you enter a meter service interval, the system removes the schedule date.
- If you enter a schedule date and a frequency indicator, the system removes any existing service days.
- If you enter a schedule date and service days, the system removes the existing frequency indicator.

To update PM schedules
On Global PM Schedule Update

**Figure 43–1 Global PM Schedule Update screen**

1. To locate the service type and equipment that you want to update, complete the following fields:
   - Service Type
   - Category Codes 01 - 10
2. To change the service type, complete any of the following fields:
   - Service Days
   - Service Miles
   - Service Fuel
   - Service Hours
43.2.1 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reviewing equipment that is affected by the update</td>
<td>Choose Completed PM to review the equipment that is affected by the changes you specify on Global PM Schedule Update. Note: Make this selection after the system displays the update message but before you enter your response.</td>
</tr>
<tr>
<td>Creating PM schedules for multiple pieces of equipment</td>
<td>You can create PM schedules for multiple pieces of equipment by using Global PM Schedule Update. This is particularly useful when you set up your system initially or when you add multiple pieces of identical equipment to your operation. You create a PM schedule globally by assigning a service type to equipment that matches specific selection criteria. You use the first ten equipment category codes to select the equipment for which the PM schedule applies. Caution: When you create PM schedules globally, the system updates the PM schedules for all equipment that matches the equipment category codes that you specify. If you are uncertain whether creating PM schedules globally will affect equipment for which you have previously created PM schedules, and you do not want the new PM information to apply, you should not use Global PM Schedule Update. Instead, create individual PM schedules using Item PM Schedule. See Section 14.3.1, &quot;Creating PM Schedules for Each Piece of Equipment&quot; for more information.</td>
</tr>
</tbody>
</table>

43.3 Updating Equipment Numbers

Navigation
From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Update Unit/Serial Number from F1201

If you change the unit number or serial number for a piece of equipment, the system updates only the equipment master in the Item Master table (F1201). The system does not automatically update other tables that store equipment numbers.

If you change a unit or serial number in the Item Master table, you must run the Update Unit/Serial Number from F1201 program to update the numbers in the following tables:

- Maintenance Schedule (F1207)
- Meter Reading Estimates (F1306)
- Maintenance Rules (F1393)
- Work Order Master (F4801)

The following graphic shows the process by which the system updates equipment numbers based on the Item Master table:

![Diagram of updating equipment numbers based on Item Master Table]

When you update equipment numbers, the system submits the job directly to batch.

### 43.3.1 Before You Begin

- Back up any of the tables that you plan to update.
- Verify that no one accesses these equipment tables while you run this program. The program is unable to update records that are locked by other system applications. Any equipment information that a user accesses elsewhere in the system will not be affected by the update.
44.1 Updating Accounts and Ledgers

You need to update the accounts and ledgers in your system if you change your chart of accounts, frequently add new pieces of equipment, and so on, for your organization.

44.2 Updating Company and Account Numbers

Navigation
From Equipment/Plant Management (G13), enter 27
From Advanced Operations (G1331), choose Fixed Assets Global Updates
From Advanced Operations (G1231), choose Update Company #, BU/Obj/Sub - F1202

You must update company numbers and account numbers in the Item Balances table (F1202) when the company numbers and account numbers in the Item Balances table do not match those in the Account Master table (F0901). Company and account numbers in the Item Balances table might not match those in the Account Master table if you change an existing account number or company for an account within the fixed asset (FX) range.

Run the Update Company Number, Business Unit/Object/Subsidiary program any time that you change an existing account in your chart of accounts. For example, run this program when you:

- Change the object or subsidiary of an existing account
- Assign existing accounts to a different business unit
- Assign an existing business unit to a different company
The Update Company Number, Business Unit/Object/Subsidiary program updates information from the Account Master table based on the system-assigned, short account ID number. The program does not update accounts in the Item Master table (F1201).

When you update company and account numbers, the system submits the job directly to batch.

44.2.1 Before You Begin

- Verify that no one accesses the general accounting or fixed asset tables. The program is unable to update accounts that are locked by other system applications. Any account that a user accesses elsewhere in the system will not be updated.

44.3 Running the Repost Ledger Program

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Fixed Assets Global Updates

From Advanced Operations (G1231), choose Repost Ledger

You can repost damaged account balances in the Item Balances table (F1202) to restore system integrity. You should run the repost only if you have no other means of restoring account information. For example, run the repost if account balance information is damaged as a result of hardware failure.

The Repost Ledger program reposts only the transactions that include all of the following:

- A valid period number.
- A code that indicates a post to both the general ledger and equipment.
- A valid equipment number that exists in the Item Master table (F1201).
- A transaction ledger type set up in Item Setup Default Coding, if one doesn’t already exist in the Item Balances table.
- A transaction account number in the Account Master table (F0901). The account number must be within the FX range of accounts in the automatic accounting instructions.
- Period postings for individual equipment. The transaction must not be a balance forward record and cannot be summarized by period and account.

**Note:** You do not have to run this program when you add an account number. You run this program only when you make changes to existing account numbers.

**Caution:** The Repost Ledger program clears all summarized account balances to zero. Do not use this program if your system includes item balance records without general ledger transactions, as in the case of summarized depreciation computations or beginning balances created without an audit trail.
When you select Repost Ledger, a caution message appears. Proceed with the post. A versions list appears. The versions list contains DEMO versions that you can run, or copy and modify to suit your needs. When you run a version, Processing Options Revisions appear before the system submits the job for processing.

44.3.1 Before You Begin

- Verify that the following procedures are complete:
  - All transactions are posted first to the general ledger and then to equipment.
  - All depreciation and transfer transactions are posted first to equipment and then to the general ledger.
- Verify that no one accesses the general accounting or fixed asset tables. The program is unable to update accounts that are locked by other system applications. Any accounts that a user accesses elsewhere in the system will not be updated.

See Also:

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, and changing a DREAM Writer version

44.3.2 Processing Options

See *Section 58.3, "Item Balance Repost (P12910)"

44.4 Updating the Equipment Item Number in the Account Ledger

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Fixed Assets Global Updates

From Advanced Operations (G1231), choose Refresh Item Number in F0911

If you change the symbol you use to identify the item number for equipment, you must run the Refresh Item Number in F0911 program. Run this update to ensure that all posted account ledger transactions contain the current item number format.

The item number and the symbol used to identify it are stored in the Account Ledger table.

When you run Refresh Item Number in F0911, the job is submitted directly to batch.

44.4.1 Before You Begin

- Verify that no one accesses the general accounting or fixed asset tables. The program is unable to update accounts that are locked by other system applications. Any accounts that a user accesses elsewhere in the system will not be updated.
This chapter contains these topics:
- Section 45.1, "Objectives"
- Section 45.2, "About Data Purge and Archival"

45.1 Objectives
- To remove historical or obsolete information from Equipment/Plant Maintenance tables

45.2 About Data Purge and Archival
You can increase your system's processing speed and create more storage space for current data by deleting selected information from your system that is old or inaccurate. When you use the purge programs in Equipment/Plant Maintenance, you can purge entire tables or specific data within tables. You can also archive the information you purge.

Purging and archiving data consists of the following tasks:
- Purging work orders
- Purging selected equipment information
This chapter contains this topic:

- Section 46.1, "Purging Work Orders"

## 46.1 Purging Work Orders

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1331), choose Work Order Purge

From Advanced Shop Floor Control (G3131), choose Purge Orders

You can purge work orders from your system to free space and to make your system operate more efficiently.

When you run the Purge Orders program, you use data selection to specify which work orders to purge from the Work Order Master table (F4801). In addition, the system purges related information from the following tables for the work orders that you select:

- Work Order Instructions (F4802)
- Work Order Parts List (F3111)
- Work Order Routing Instructions (F3112)
- Work Order Time Transactions (F31122) that are not used by Equipment/Plant Maintenance
- Work Order Approvals (F4828)

You can use processing options to save purged work order information in a special purge library.

When you choose Purge Orders, a versions list appears. The versions list includes DEMO versions that you can run or copy and modify to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the job for processing.

**See Also:**

- *JD Edwards World Technical Foundation Guide* for more information about running, copying, or changing a DREAM Writer version
46.1.1 Processing Options

See Section 58.4, "Work Order Purge (P4801P)"
This chapter contains this topic:

- Section 47.1, "Purging Selected Equipment Information"

47.1 Purging Selected Equipment Information

Navigation
From Equipment/Plant Management (G13), enter 27
From Advanced Operations (G1331), choose Fixed Assets Global Updates
From Advanced Operations (G1231), choose Purge Selected Asset Files

You can delete out-of-date or obsolete equipment information from your system. When you use the Purge Selected Asset Files program, you can purge entire data tables or specific data within the tables. You can also archive the records that you purge.

Use DREAM Writer versions to delete only those records that you specify in Processing Option Revisions. Company number and item number are mandatory data selections for this procedure.

Run the purge program to perform one or both of the following:

- Purge a piece of equipment that you disposed of in a prior year
- Purge the Item Balances table (F1202) for a prior year

When you run this program, all information that the system purges is transferred to a separate purge table. The purge table name is the same as the original table name with a P at the end. For example, the purge table for F1201 is F1201P.

If a purge table does not currently exist in your system, the program creates purge tables in the same library in which the corresponding tables exist. If the purge table already exists in your system, this program adds purged records to the existing table.

JD Edwards World strongly recommends that you back up any of the following tables you plan to purge:

- Item Master (F1201)
- Item Balances (F1202)
- Location Tracking (F1204)
- Item Messages (F1205)
- License Master (F1206)
After you run the purge program, you can save the purge tables on a diskette or tape to archive the information. You can then delete the purge tables from your system. You do not have to archive your purged equipment information. If you do not want to save the information in a purge table, delete it from the system without saving it on a diskette or tape.

Note: Ensure that no one accesses the general accounting or equipment tables while you run this procedure. The program is unable to purge information in tables that are locked by other system applications. Any information in tables that a user accesses elsewhere in the system will not be purged.

When you select Purge Selected Asset Files, a versions list appears. The versions list includes DEMO versions that you can run or copy and modify to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the job for processing.

After the purge is complete, the program prints a report that includes the equipment number, description, responsible business unit, and disposal date (if applicable) of the purged equipment. The report also shows which tables included records that were purged and a summary showing how many records were purged from each table.

47.1.1 Before You Begin

- Run the Asset Account Balance Close program
- Back up any tables that you plan to purge

47.1.2 Processing Options

See Section 58.5, "Purge Item Master and Item Balance Files (P12912)".
This chapter contains these topics:

- Section 48.1, "Objectives"
- Section 48.2, "About Equipment/Plant Maintenance Reports"

48.1 Objectives

- To identify the reports that are available in the Equipment/Plant Maintenance system
- To use reports for controlling and reporting on Equipment/Plant Maintenance

48.2 About Equipment/Plant Maintenance Reports

Equipment/Plant Maintenance provides a variety of reports to help you review and manage information about your equipment and its maintenance.

You can print cost reports to review financial information about your equipment. Cost reports can provide the following information:

- Equipment account balances, such as acquisition costs, revenue amounts, expense amounts, and so on
- Variances between revenue and expenses for a piece of equipment
- All equipment transactions

Equipment/Plant Maintenance includes two reporting tools that you can use to customize reporting information:

- Report Writer (STAR - Spreadsheet Tool for Asset Reporting)
- World Writer

Use Report Writer to generate custom reports from information stored in the Item Master table (F1201) and the Item Balances table (F1202).

Use World Writer reports to access information from all the tables on your system. You can create World Writer reports from any record or table in your database. JD Edwards World provides several predefined reports based on specific tables.

You can print work order reports to review information about maintenance work orders. Work order reports can provide the following information:

- Work order status
- Detailed or summarized work order costs
About Equipment/Plant Maintenance Reports

- Project information, including Gantt charts and project status summary
- Variances between projected and actual work order costs
- All work orders associated with a particular piece of equipment
- Work order parts and labor routing information by piece of equipment

You can print maintenance planning reports to review information about your planning processes. Maintenance planning reports provide information about projected PMs, projected parts requirements, and projected labor resource requirements.

You can print PM reports to review PM information, such as:
- Status of service types for a piece of equipment
- Maintenance messages
- The frequency of occurrence for selected service types

Printing Equipment/Plant Maintenance reports consists of the following tasks:
- Printing equipment reports
- Printing cost reports
- Printing work order reports
- Printing maintenance planning reports
- Printing PM reports

See Also:
- *JD Edwards World Technical Foundation Guide* for more information about running a DREAM Writer program
This chapter contains these topics:

- Section 49.1, "Printing Equipment Reports"
- Section 49.2, "Printing the Supplemental Data by Item Report"
- Section 49.3, "Printing the Supplemental Data by Type Report"
- Section 49.4, "Printing the Specification Data Report"
- Section 49.5, "Printing the Location Tracking Report"

49.1 Printing Equipment Reports

Print an equipment report to review and manage information, such as supplemental data, specification data, location history, and so on.

49.2 Printing the Supplemental Data by Item Report

Navigation

From Equipment/Plant Management (G13), choose Equipment Information

From Equipment Information (G1311), choose Supplemental Data

From Supplemental Data (G1318), choose Report by Item

You can print the Supplemental Data by Item report to review a list of additional information by supplemental data type that you assigned to individual pieces of equipment. For example, you can print a report that shows all supplemental data types assigned to a particular motor grader. This report draws its information from the following tables:

- Fixed Assets Supplemental Data Codes Types (F12092)
- Fixed Assets Supplemental Data Text (F12093)
- Item Master (F1201)
- General Message Detail (F00192)
49.3 Printing the Supplemental Data by Type Report

Navigation
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Supplemental Data
From Supplemental Data (G1318), choose Report by Data Type

You can print the Supplemental Data by Type report to review a list of additional equipment information based on a particular supplemental data type. For example, you set up a supplemental data type for vibration readings. You can print a report that displays vibration readings for all pieces of equipment for which you have assigned the supplemental data type for vibration readings. This report draws its information from the following tables:

- Fixed Assets Supplemental Data Codes Types (F12092)
- Fixed Assets Supplemental Data Text (F12093)
- Item Master (F1201)
- General Message Detail (F00192)
49.3.1 Processing Options
See Section 58.8, "All Item Numbers by Data Type - Alpha/Item Number (P12440)".

49.4 Printing the Specification Data Report

Navigation
From Equipment/Plant Management (G13), choose Equipment Information
From Equipment Information (G1311), choose Supplemental Data
From Supplemental Data (G1318), choose Specification Data Report

You can print the Specification Data report to review the static data, such as nameplate information and specification sheet data that you record for individual pieces of equipment. This report draws its information from the following tables:
- Specification Data (F1216)
- Specification Cross Reference (F1215)

You can use processing options to print a template of the report that includes the equipment number and descriptions of the data fields, as well as space to record the data. You can then fill in the data for the equipment.
49.4.1 Processing Options

See Section 58.7, "Specification Data Report (P12416)"

49.5 Printing the Location Tracking Report

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Location Tracking

From Equipment Location Tracking (G1314), choose Location Tracking Report

Print the Location Tracking report to review equipment movement and relocations. Depending on the version that you run, the report shows information by item number or by location.

The Location Tracking report is a printed version of the information that appears on Transfer Processing. The system prints the current, historical, and planned (future) locations for each piece of equipment. You can also use this report to print location tracking text.
49.5.1 Processing Options

See Section 58.9, "Location Tracking Report (P12460)"
This chapter contains these topics:

- Section 50.1, "Printing Cost Reports"
- Section 50.2, "Printing the Equipment Cost Analysis Report"
- Section 50.3, "Printing the Equipment Variance Report"
- Section 50.4, "Printing the Transaction Ledger Report"
- Section 50.5, "Working with Report Writer"
- Section 50.6, "Printing World Writer Reports"

50.1 Printing Cost Reports

Print cost reports to review and analyze equipment costs and transactions, such as equipment account balances, variances between costs and revenues, and so on.

Printing cost reports consists of the following tasks:

- Printing the Equipment Cost Analysis report
- Printing the Equipment Variance report
- Printing the Transaction Ledger report
- Working with Report Writer
- Working with World Writer reports

50.2 Printing the Equipment Cost Analysis Report

Navigation
From Equipment/Plant Management (G13), choose Cost Inquiries and Reports
From Cost Inquiries and Reports (G1312), choose Equipment Cost Analysis

You can print the Equipment Cost Analysis report to review account balances for specific pieces of equipment. The report shows acquisition costs, depreciation amounts, revenue and expense amounts, and so on, for the equipment that you specify. You can analyze these amounts in month-to-date, year-to-date, or inception-to-date increments.

You can use processing options to show the equipment usage amounts in units, such as miles or hours. You can review the total units a piece of equipment has
accumulated, as well as the per unit cost. The system derives per unit costs by dividing account balances by total accumulated units.

You can choose from three versions of this report:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Detail</td>
<td>Shows account balances for each business unit and object account.</td>
</tr>
<tr>
<td>Summary</td>
<td>Shows interim total amounts only, such as:</td>
</tr>
<tr>
<td></td>
<td>• Net book value</td>
</tr>
<tr>
<td></td>
<td>• Revenue earned</td>
</tr>
<tr>
<td></td>
<td>• Ownership costs</td>
</tr>
<tr>
<td></td>
<td>• Operating costs</td>
</tr>
<tr>
<td></td>
<td>• Maintenance costs</td>
</tr>
<tr>
<td></td>
<td>• Usage amounts</td>
</tr>
<tr>
<td>Object</td>
<td>Shows the summarization of identical object accounts that belong to different business units.</td>
</tr>
</tbody>
</table>

You can use processing options to determine the ledger type that you want to review. You can also omit items with zero account balances. Using data selections, you can print this report for selected companies, business units, category codes, and so on.

50.2.1 Equipment Cost Analysis Report - Detail

50.2.2 Processing Options

See Section 58.10, "Equipment Cost Analysis (P12424)"

50.3 Printing the Equipment Variance Report

**Navigation**

*From* Equipment/Plant Management (G13), choose Cost Inquiries and Reports

*From* Cost Inquiries and Reports (G1312), choose Equipment Variance Report

Print the Equipment Variance report to review the total revenues and expenses generated by a piece of equipment, as well as the variance between revenue and expenses.

You can view usage hours and other unit costs for each item that you print. A grand total of revenue, expense, and usage amounts for all items prints at the end of the report.

You can use processing options to define the range of accounts that you want the system to use for calculating amounts. You must define an account range for the Standard Amount column, which represents revenue totals, and for the Actual Amount column, which represents expense totals. You must also specify the accounts from which unit amounts are drawn for the Actual Hours column.

The Estimated Rate, Actual Rate, and Rate Variance columns represent unit costs. The system calculates these unit costs by dividing revenue and expense amounts by actual hours.
Use processing options to specify a date range and indicate whether you want the report to print inception-to-date amounts. If you indicate inception-to-date amounts, the system adds prior year balances to the amounts that are within the date range you specify.

You can print two versions of the Equipment Variance report:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Variance by job</td>
<td>Prints amounts for equipment items that you have assigned to a particular location</td>
</tr>
<tr>
<td>Variance by item</td>
<td>Prints information about the pieces of equipment that you specify</td>
</tr>
</tbody>
</table>

**50.3.1 Equipment Variance Report - By Job**

**50.3.2 Processing Options**

See Section 58.11, "Equipment Variance Report - by Item (P13400)"

See Section 58.12, "Equipment Variance Report - by Job (P13400)"

**50.4 Printing the Transaction Ledger Report**

**Navigation**

From Equipment/Plant Management (G13), choose Cost Inquiries and Reports

From Cost Inquiries and Reports (G1312), choose Transaction Ledger

You can print the Transaction Ledger report to review all the transactions for a piece of equipment. The report prints the transactions by company and in the order that they occurred. You can view the item number, the affected account, a brief explanation, the G/L date, a dollar and unit amount, and so on, for each transaction. The report shows currency and unit totals for each company.

This section contains the following:

- Section 50.5, "Working with Report Writer"
- Section 50.6, "Printing World Writer Reports"

The transactions that print on the Transaction Ledger report come from the Account Ledger table (F0911), which stores journal entry audit trails. Unless you specify otherwise, the report includes all equipment transactions that have accumulated in the Account Ledger since the ledger was last summarized.

You can run two versions of this report:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Posted</td>
<td>Prints equipment transactions that are posted to equipment and the general ledger.</td>
</tr>
<tr>
<td>Unposted</td>
<td>Prints equipment transactions that are not posted to equipment. The transactions are not necessarily posted to the general ledger.</td>
</tr>
</tbody>
</table>
50.4.1 Transaction Ledger Report

Figure 50–1  Fixed Asset Ledger - Posted report

50.4.2 Processing Options

See Section 58.13, "Fixed Asset Ledger - Posted (P12420)"

50.5 Working with Report Writer

Navigation
From Equipment/Plant Management (G13), choose Cost Inquiries and Reports

From Cost Inquiries and Reports (G1312), choose Report Writer

You can use Report Writer to maintain and print various versions of the Spreadsheet Tool for Asset Reporting (STAR). Report Writer performs functions similar to the standard DREAM Writer Version Selection, but you can define your report columns to suit your needs. Report Writer reports on information the system stores in the Item Master table (F1201) and the Item Balances table (F1202).

See Also:
- JD Edwards World STAR Guide for information about running, copying, and changing STAR versions

50.6 Printing World Writer Reports

You can use World Writer reports to access information from all the tables on your system. You can create World Writer reports from any record or table in your database. JD Edwards World provides several predefined reports based on specific tables. In Equipment/Plant Maintenance, these tables are as follows:

- License Master (F1206)
- Location Tracking (F1204)
- Status History (F1307)
- Maintenance Schedule (F1207)

You can access several predefined World Writer reports by choosing the following navigation paths:

- From the Equipment Information menu (G1311), choose World Writer Reports.

The following reports are available:
From the Equipment Location Tracking menu (G1314), choose Location World Writer Reports. The following reports are available:

- Equipment Location History Report
- Equipment Location Detail with Remarks Report
- Equipment Location Detail with Audit Trail Report

From the Equipment/Plant Maintenance menu (G1315), choose World Writer. The following reports are available:

- Percent Complete Report - Item
- Percent Complete Report - Unit
- Work Order Status History Report

### 50.6.1 Sample - License Renewal Report

*Figure 50–2  License Renewal Report*

See Also:

- *JD Edwards World World Writer Guide* for additional information about creating, running, and changing World Writer reports
This chapter contains these topics:

- Section 51.1, "Printing Work Order Reports"
- Section 51.2, "Printing Standard Work Order Reports"
- Section 51.3, "Printing Project Management Reports"
- Section 51.4, "Printing the Equipment History Report"
- Section 51.5, "Printing the Budget to Actual Report"
- Section 51.6, "Printing the Work Order Completion Report"
- Section 51.7, "Printing the Labor Utilization Report"
- Section 51.8, "Printing the Parts Forecast Report"
- Section 51.9, "Printing the Equipment Parts List Report"

51.1 Printing Work Order Reports

Equipment/Plant Maintenance provides you with a variety of reports to help you review and manage information about work orders. Work order reports can provide the following:

- Standard work order information, such as work order status and work order costs
- Project management information, such as the costs associated with each phase
- Work order information for specific pieces of equipment, such as work orders associated with a particular equipment malfunction and total work orders completed for a piece of equipment
- Budget information, such as a comparison of estimated and actual work order costs
- Labor resource information, such as labor hours committed to a particular piece of equipment
- Parts information, such as parts requirements and parts availability for outstanding work orders

51.2 Printing Standard Work Order Reports

You can print standard work order reports to track the progress of work orders by status for a particular date. You can also review the costs associated with selected work
orders. In addition, you can print detailed reports about supplemental data for your work orders.

Printing standard work order reports consists of the following steps:

- Printing the Work Order Status report
- Printing the Work Order Cost Summary report
- Printing the Work Order Cost Detail report
- Printing the Work Order Supplemental Data by Order Report
- Printing the Work Order Supplemental Data by Type Report

51.2.1 Printing the Work Order Status Report

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Print Work Order Status Summary

Print the Work Order Status report to review the detailed information that you associate with work orders. You can use the report to track and compare the progress of selected work orders. The report includes:

- The number of hours planned for each work order
- The number of actual hours charged as of the date you specify on the report
- The difference between hours planned and hours charged to date

You can use processing options to determine whether the equipment unit number, item number, or serial number prints on the report.

51.2.2 Work Order Status Report

51.2.3 Processing Options

See Section 58.14, "Work Order Summary Status - by Business Unit (P48496)"

See Section 58.15, "Work Order Summary Status - by Phase Code (P48496)"

51.2.4 Printing the Work Order Cost Summary Report

**Navigation**

From Equipment/Plant Management (G13), choose Equipment Work Orders

From Equipment Work Orders (G1316), choose Print Work Order Cost Summary

Print the Work Order Cost Summary report to review cost information about work orders. The report includes:

- The estimated hours and costs for each work order
- The actual hours and costs for each work order
- The difference between estimated and actual hours and costs for each work order

You can use processing options to specify a date range for the report.
51.2.5 Work Order Cost Summary Report

51.2.6 Processing Options
See Section 58.16, "Work Order Cost Summary (P48497)"

51.2.7 Printing the Work Order Cost Detail Report

**Navigation**
From Equipment/Plant Management (G13), choose Equipment Work Orders
From Equipment Work Orders (G1316), choose Print Work Order Cost Detail

Print the Work Order Cost Detail report to review detailed information on the costs you charge to work orders. You use a processing option to specify the date range for the report. The report includes:
- Actual hours and amounts charged to each work order
- The G/L date for each transaction
- An explanation of each transaction
- Total hours and amounts by phase code

51.2.8 Processing Options
See Section 58.18, "Work Order Cost Detail (P48498)"

---

Print Work Order Reports 51-3
51.2.9 Printing the Work Order Supplemental Data by Order Report

Navigation
From Work Order/Service Billing Processing (G48), choose Work Order Processing
From Work Order Processing (G4811), choose Supplemental Data
From Work Order Supplemental Data (G4813), choose Data by Order

Print the Work Order Supplemental Data by Order report to review a list of the additional information by data type that you assigned to individual work orders. The report contains a summary of the information stored in the following tables:

- Work Order Supplemental Data Types (F48090)
- Work Order Supplemental Data Base User Defined Fields (F48092)
- Work Order Master (F4801)

Figure 51–2 Work Order Profile Report

51.2.10 Printing the Work Order Supplemental Data by Type Report

Navigation
From Work Order/Service Billing Processing (G48), choose Work Order Processing
From Work Order Processing (G4811), choose Supplemental Data
From Work Order Supplemental Data (G4813), choose Data by Data Type

Print the Work Order Supplemental Data by Type report to review a list of additional work order information based on a particular supplemental data type. For example, assume that you have set up a supplemental data type for budget estimates. You can review a list of all work orders for which you have assigned the supplemental data type for budget estimates. The report contains a summary of the information stored in the following tables:

- Work Order Master (F4801)
- Work Order Supplemental Data Types (F48090)
- Work Order Supplemental Data Base User Defined Fields (F48092)
51.2.11 Work Order Cost Detail Report

Figure 51–3  Work Order Cost Detail report, part 1

Figure 51–4  Work Order Cost Detail report, part 2

51.3 Printing Project Management Reports

You can print project management reports to review and manage information about projects. You can review information about the specific tasks associated with a project, resource requirements, and so on.

Printing project management reports consists of the following tasks:

- Printing a Gantt Chart
- Printing the Task Details report
- Printing the Project Punch List report
- Printing the Project Status Summary Report

51.3.1 Printing a Gantt Chart

Navigation
From Work Order/Service Billing Processing (G48), choose Simple Project Management
From Simple Project Management (G4812), choose Gantt Chart
A Gantt Chart is a graph that shows time on the horizontal axis and tasks on the vertical axis. The chart gives you a graphical representation of start and end points of any series of tasks that make up a project.

When you use a Gantt Chart, you can:

- Review tasks quickly
- Determine which tasks precede others
- Determine if any tasks overlap
- Review under-utilized time between tasks

Use processing options to enter a date for the chart and to select the spreadsheet format that you want to use.

51.3.2 Gantt Chart

51.3.3 Processing Options

See Section 58.19, "Print Work Order Gantt Chart (P48440)"

51.3.4 Printing the Task Details Report

**Navigation**

From Work Order/Service Billing Processing (G48), choose Simple Project Management

From Simple Project Management (G4812), choose Task Details

Print the Task Details report to review a listing of the work orders included in a project. In addition to listing the work orders that make up a project, for each work order, the report includes:

- A description of the task
- Estimated number of hours
- Standard message
- Category code 01 (phase)
- An extended description of the task from record type A
- Any standard procedures

*Figure 51–5  Detailed Task Description report*
51.3.5 Printing the Project Punch List

**Navigation**

From Work Order/Service Billing Processing (G48), choose Simple Project Management

From Simple Project Management (G4812), choose Punch List

Print the Project Punch List to review a summary of the work requested and completed for each work order in a project.

The left side of the report includes the following information about the work that you request when you create a work order:

- Planned completion date
- Work order number and brief description
- Full description (everything associated with record type A for the work order)
- Any standard procedures

The right side of the report includes the following information about the work that is complete or in progress for each work order:

- Current status and status comment
- Manager

51.3.6 Project Punch List

51.3.7 Printing the Project Status Summary Report

**Navigation**

From Work Order/Service Billing Processing (G48), choose Simple Project Management

From Simple Project Management (G4812), choose Status Summary

Print the Project Status Summary report to review detailed and summary status of the projects assigned to a particular manager. The report lists:

- All work orders assigned to a particular manager
- Number of hours planned for each work order
- Actual hours charged as of the date of the report
- Either the number of hours remaining or the number of hours charged over the original estimate

After listing detailed information for each work order assigned to a particular manager, the report lists a summary of activity for that manager that includes:

- Status
- Type
- Phase (Category Code 01)
- Category Codes 02 through 10
- Priority
51.4 Printing the Equipment History Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Equipment History report to review the following information for equipment and equipment components:

- Work orders associated with each piece of equipment
- Problems and possible causes
- Actions that were taken to solve the problem

The report includes completed work orders. You can use processing options to specify a date range to control which work orders that you want to include in the report. You can also specify the work order category codes that you are using to define the problem. In addition, you can specify that the report print the actions that were taken to resolve the problem.

**Note:** You can only access this report by using the following procedure:

Enter P13420 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

51.4.1 Processing Options

See Section 58.20, "Equipment History Report (P13420)"

51.5 Printing the Budget to Actual Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Budget to Actual report to review work order information for specific pieces of equipment. The report is based on information from the Item Master table (F1201). The system totals amounts by equipment number. For each work order, the report includes:

- Estimated hours and amount
- Actual hours and amount
- Variance between estimated and actual hours and amounts

**Note:** You can only access this report by using the following procedure. Enter P13418 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

51.5.1 Before You Begin

- Run the Update Work Hours program to ensure current actual information

51.5.2 Processing Options

See Section 58.21, “Budget to Actual Report (P13418)"

51.6 Printing the Work Order Completion Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Work Order Completion report to review a list of work orders by individual pieces of equipment. You can use processing options to specify a date range to limit the work orders that you want to include in the report. The report includes the following information:

- The number of work orders created for a piece of equipment
- The number of work orders completed for a piece of equipment
- The number of work orders pending with parts requirements
- The percent of complete work orders
- The percent of pending work orders

Note: You can only access this report by using the following procedure: Enter P13430 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

Figure 51–8 Work Order Execution Report
51.6.1 Processing Options

See Section 58.22, "Work Order Execution Report (P13430)"

51.7 Printing the Labor Utilization Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Labor Utilization report to review a list of work orders created for a piece of equipment and the hours associated with each labor routing step, such as Electrical, Mechanical, and so on. The report also shows the total hours associated with each work order. You can use processing options to specify a date range to limit the work orders that you want to include in the report.

Note: You can only access this report by using the following procedure: Enter P13440 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

51.7.1 Processing Options

See Section 58.23, "Labor Utilization Report (P13440)"

51.8 Printing the Parts Forecast Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Parts Forecast report to review a list of parts and work orders by branch. You can use processing options to specify a date range to control which work orders that you want to include in the report. The report includes the following information:

- Equipment number on the work order
- Planned complete date
- Parts required
- Availability of the parts

**Note:** You can only access this report by using the following procedure. Enter P13450 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

51.8.1 Processing Options

See Section 58.24, "Parts Forecast Report (P13450)"

51.9 Printing the Equipment Parts List Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Equipment Parts List report to review parts information associated with individual pieces of equipment. You can review the location of the parts and the availability of the parts. In addition, you can use processing options to select which branch or location the system searches for parts information.

51.9.2 Processing Options

See Section 58.25, "Equipment Parts List Report (P13410)".
This chapter contains these topics:

- Section 52.1, "Printing Maintenance Planning Reports"
- Section 52.2, "Printing the PM Projections Report"
- Section 52.3, "Printing the Maintenance Schedule Report"
- Section 52.4, "Printing the MRP Schedule and Message Detail Report"
- Section 52.5, "Printing Labor Planning Reports"
- Section 52.6, "Printing the Maintenance Log Report"
- Section 52.7, "Printing the Frequency of Occurrence Report"
- Section 52.8, "Printing World Writer Reports"

52.1 Printing Maintenance Planning Reports

You can print maintenance planning reports to review and manage information about future parts and labor resource requirements.

52.2 Printing the PM Projections Report

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose PM Projections Report

Print the PM Projections report to review information about forecasted PMs. This report draws its information from the PM Projections table (F13411).

The PM forecast includes four periods. You can use processing options to define the periods as weeks, months, or quarters. You can also define the beginning period date, the forecast type, and whether to print a parts list report. The PM Projections Parts List prints all of the parts associated with the projected PMs in a summarized report.
52.2.1 Processing Options

See Section 58.36, "PM Projection Print - Weekly (P13412)"

See Section 58.34, "PM Projection Print - Monthly (P13412)"

See Section 58.35, "PM Projection Print - Quarterly (P13412)"

52.3 Printing the Maintenance Schedule Report

Navigation

From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance

From Equipment/Plant Maintenance (G1315), choose Maintenance Schedule

Print the Maintenance Schedule report to review the status of preventive maintenance for equipment.

The Maintenance Schedule report shows the service types that you assign for each piece of equipment on the preventive maintenance schedule. Depending on the maintenance status of each service type, the system determines whether it is scheduled, in process, or complete.

You can run three versions of the report:

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Completed maintenance</td>
<td>Prints service types that have a maintenance status of 98 (canceled) or 99.</td>
</tr>
<tr>
<td></td>
<td>The completion date prints, as well as the total miles, fuel, hours, or</td>
</tr>
<tr>
<td></td>
<td>other user defined statistical units for the equipment. The address book</td>
</tr>
<tr>
<td></td>
<td>number of the employee completing the service also prints.</td>
</tr>
</tbody>
</table>
Printing the MRP Schedule and Message Detail Report

<table>
<thead>
<tr>
<th>Version</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Scheduled maintenance</td>
<td>Prints service types that have a maintenance status of less than 98. If you schedule the service for a specific date, the date prints. If you schedule the service at intervals, the number of days prints. If you schedule the service, for example, according to miles, fuel, hours, or other user defined statistical units, the appropriate numbers print.</td>
</tr>
<tr>
<td>Mechanic’s worksheet</td>
<td>Prints service types that have a user defined maintenance status, for example, between 50 and 70. If you schedule service according to miles, fuel, hours, or other user defined statistical units, the current readings for the item print. The % Due column on the report shows how close the service is to being due or whether it is overdue. The address number of the employee assigned to the task also prints.</td>
</tr>
</tbody>
</table>

You can change maintenance statuses to suit your needs in user defined codes (system 12, type MS).

See Also:

- Chapter 36, "Set Up User Defined Codes"

52.3.1 Processing Options

See Section 58.26, "Completed Maintenance Records (P12407)"

See Section 58.28, "Scheduled Maintenance Records (P12407)"

See Section 58.27, "Mechanic’s Worksheet (P12407)"

52.4 Printing the MRP Schedule and Message Detail Report

Navigation

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Material Planning

From Material Planning (G1323), choose Print Schedule and Messages

Print the Material Requirements Planning (MRP) Schedule and Message Detail report to review a projection of inventory availability for individual maintenance items. You can also use this report to print any outstanding planning messages.

Your latest material plan generation supplies the information for the MRP Schedule and Message Detail report. The report is a printed version of the information you can access online using Item Availability by Time and Detail Messages.

You use processing options to select the items that print on the report and to determine whether to print the time series, planning messages, or both. You also define the row types that print for each time series. Row types determine the quantity type information, such as Beginning Available, Ending Available, and so on. In addition, you define the columns that print for each time series. Columns determine the time periods that you want to review. The report also provides detailed information for each item, such as quantity on hand, buyer numbers, and planner numbers.
52.4.1 MRP Schedule & Message Detail Report

Figure 52–2  MRP Schedule & Message Detail report

52.4.2 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Start dates</td>
<td>The start date must be within the planning horizon that you defined when you ran the Parts Plan Generation for which this report applies. You can indicate a start date for the report that is different from that of the original plan generation. However, you should ensure that past due time periods for the report is set to zero.</td>
</tr>
<tr>
<td>Past due amounts</td>
<td>The number of time periods (columns) that you specify to print on the report includes the number of weeks that you specify for past due amounts.</td>
</tr>
</tbody>
</table>

52.4.3 Processing Options

See Section 58.33, "Schedule & Message Detail (P3450)"

52.5 Printing Labor Planning Reports

Print Labor Planning reports to review and manage detailed information about future labor resource requirements.

Printing labor planning reports consists of the following tasks:

- Printing the Load and Detail Messages report
- Printing the Period Summary report
52.5.1 Printing the Load and Detail Messages Report

Navigation
From Equipment/Plant Management (G13), choose Maintenance Planning
From Maintenance Planning (G1322), choose Labor Planning
From Labor Planning (G1324), choose Print Load and Detail Messages

Print the Load and Detail Messages report to review time series information for a work center, outstanding action messages for a work center, or both. You can print the information for all work centers or for selected work centers.

Use processing options to control the following information on the report:

- **Time period**
- **Unit of measure for load information**
- **The type of planning**
- **Capacity requirements, capacity messages, or both**
- **The user defined code for row descriptions**

You can run three versions of the Load and Detail Messages report. However, the Equipment/Plant Management system uses the Capacity Requirements Planning version.

You use processing options to select the type of planning information that prints on the report.

52.5.2 Capacity Requirements Report

![Capacity Requirements report](image)

*Figure 52–3  Capacity Requirements report*
52.5.3 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Load types</td>
<td>A load type describes the type of labor demand placed on a work center. The system calculates the five load types as follows:</td>
</tr>
<tr>
<td></td>
<td>■ Rated Profile - the total resource units from the Work Center Revisions screen.</td>
</tr>
<tr>
<td></td>
<td>■ Loaded Profile - the load that is forecast from the planned and released work orders.</td>
</tr>
<tr>
<td></td>
<td>■ Percent Resource Used - the Loaded Profile divided by the Rated Profile.</td>
</tr>
<tr>
<td></td>
<td>■ Resource Available - the Loaded Profile subtracted from the Rated Profile.</td>
</tr>
<tr>
<td></td>
<td>■ Cumulative Resource Available - a running total of the resource available. If a work center runs over capacity, this could be a negative number.</td>
</tr>
<tr>
<td>Units of measure</td>
<td>If you enter a unit of measure in the processing options, it must be the same unit of measure in the Account Master table for the work center.</td>
</tr>
</tbody>
</table>

52.5.4 Processing Options

See Section 58.38, "Planning (P3350)"

52.5.5 Printing the Period Summary Report

**Navigation**

From Equipment/Plant Management (G13), choose Maintenance Planning

From Maintenance Planning (G1322), choose Labor Planning

From Labor Planning (G1324), choose Print Period Summary

Print the Period Summary report to review information for Capacity Requirements Planning (CRP).

The report includes all items scheduled at the work centers during the time period you specify. In addition, it lists the number of resource units required to complete each work order and the percent above or below the total load on the work center.

In addition to specifying the time period, you can use processing options to control the following information on the report:

■ Unit of measure for load information

■ Type of planning

You can specify the type of planning by selecting the appropriate report version. Equipment/Plant Maintenance uses the CRP version.
52.5.6 Period Summary Report

Figure 52–4 Period Summary report

52.5.7 What You Should Know About

<table>
<thead>
<tr>
<th>Topic</th>
<th>Discussion</th>
</tr>
</thead>
<tbody>
<tr>
<td>Period from and to dates</td>
<td>The system uses the Period From and the Period To dates that you enter as follows:</td>
</tr>
<tr>
<td></td>
<td>■ If you enter dates in both fields, the system prints the summary within that period.</td>
</tr>
<tr>
<td></td>
<td>■ If you enter a date in the Period To field only, the system prints the summary beginning with the current period. If you do not select a Period From date, the system prints the past due orders before the current date.</td>
</tr>
<tr>
<td></td>
<td>■ If you enter a date in the Period From field only, the system prints all items from that date onward.</td>
</tr>
<tr>
<td></td>
<td>■ If more than one order for an item has been scheduled at the work center for the same period, the system prints the item number once for each order on the report.</td>
</tr>
</tbody>
</table>

52.5.8 Processing Options

See Section 58.17, "Period Summary (P3352)"

52.6 Printing the Maintenance Log Report

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose Maintenance Log
You can print the Maintenance Log report to review equipment messages based on message type. Message types are user defined (system 12, type EM) and might include:

- Problem messages
- Planned maintenance messages
- Actual maintenance messages

You can print four versions of this report:

- Reported Problems
- Planned Maintenance
- Actual Maintenance
- Problems versus Maintenance

The Maintenance Log report prints messages in the following sequence:

- Equipment number
- Date
- Time

The report includes cleared messages only if you use data selections to specify that you want those messages to appear. The report also includes messages with a tickler date (the date that the messages go into effect).

### 52.6.1 Item Log Report

#### Figure 52–5 Item Log - Reported Problems report

See also:

- Chapter 6, "Work with Message Logs" for information about entering equipment messages

### 52.6.2 Processing Options

See Section 58.29, "Item Log - Actual Maintenance (P12450)"

See Section 58.30, "Item Log - Planned Maintenance (P12450)"

See Section 58.31, "Item Log - Problems vs Maintenance (P12450)"

See Section 58.32, "Item Log - Reported Problems (P12450)"
52.7 Printing the Frequency of Occurrence Report

From the DREAM Writer menu (G81), choose Versions List.

Print the Frequency of Occurrences report to review the overall frequency of selected service types. This information is particularly useful when you need to review maintenance patterns by specific type of repair.

The report shows the service types you specify, the estimated and actual frequency of each service type, and the percentage of each service type for which maintenance has been fulfilled.

You can use processing options to specify a completed date range and limit the number of service types that the report includes.

---

**Note:** You can only access this report by using the following procedure: Enter P13419 in the Form field on Versions List. A versions list appears that contains a DEMO version of the report. You can run the DEMO version or copy and modify it to suit your needs. When you run a version, Processing Options Revisions appears before the system submits the report for processing.

---

52.7.1 Frequency of Occurrence Report

*Figure 52–6 Frequency of Occurrence report*

See Also:
- *JD Edwards World Technical Foundation Guide* for information about running, copying, and changing DREAM Writer versions

52.7.2 Processing Options

See Section 58.37, "Frequency of Occurrence (P13419)"
52.8 Printing World Writer Reports

Navigation
From Equipment/Plant Management (G13), choose Equipment/Plant Maintenance
From Equipment/Plant Maintenance (G1315), choose World Writer

You can use World Writer reports to access information from all the tables on your system. You can create World Writer reports from any record or table in your database. JD Edwards World provides several predefined reports based on specific tables. The World Writer reports that are specific to PMs include:

- Percent Complete by Item
- Percent Complete by Unit
- Work Order Status History

Use these World Writer reports to review information about your PMs that is not available through other PM reports. You can change the fields and data selection on any of these reports.

World Writer uses the following tables from which to generate these reports:

- Status History (F1307)
- Maintenance Schedule (F1207)

52.8.1 Sample - Percent Complete by Item Report

Figure 52–7 Percent Complete Report

<td></td>
</tr>
<tr>
<td>2. Identify how to print amount fields on Post Journal: '1' = to Millions (w/ commas) '2' = to Billions (w/o commas) Blank (Default) = No Journal Printed.</td>
<td></td>
</tr>
<tr>
<td>3. Identify which account number to print on report: '1' = Account Number '2' = Short Account ID '3' = Unstructured Account '4' = (Default) Number Entered During Input</td>
<td></td>
</tr>
<tr>
<td><strong>FIXED ASSETS:</strong></td>
<td></td>
</tr>
<tr>
<td>4. Enter a '1' to post F/A entries to Fixed Assets. Note: DREAM Writer version ZJDE0001 of Post G/L Entries to Assets (P12800) is executed when this option is selected. All transactions selected from that DREAM Writer will be posted rather than just the current entries being posted to G/L.</td>
<td></td>
</tr>
<tr>
<td>5. Enter a 'Y' if you wish to explode parent item time down to the assembly component level. Component billing rates will be used. (This applies to batch type 'T' only.)</td>
<td></td>
</tr>
<tr>
<td><strong>CASH BASIS ACCOUNTING:</strong></td>
<td></td>
</tr>
<tr>
<td>6. Enter a '1' to create and post Cash Basis accounting entries. (Applies to batch type G, K, M, W, &amp; R only.)</td>
<td></td>
</tr>
<tr>
<td>7. Enter units ledger type for Cash Basis Accounting entries. (Default of blank will use &quot;ZU&quot; ledger type.)</td>
<td></td>
</tr>
<tr>
<td><strong>ACCOUNTING FOR 52 PERIODS:</strong></td>
<td></td>
</tr>
</tbody>
</table>
8. Enter a ‘1’ for 52 Period Post.

**Note:** DREAM Writer data selection is used for 52 period posting ONLY. It is NOT used for the standard post to the F0902. Additionally, 52 period date patterns must be set up.

**TAX FILE UPDATE:**

9. Identify when to update the Tax Work file (F0018):

‘1’ = V.A.T. or Use Tax only

‘2’ = for All Tax Amounts

‘3’ = for All Tax Explanation Codes

Blank (Default) = No Update to File

**Note:** When using Vertex Taxes the Vertex Tax Register file will be updated instead of the Tax Work file for methods ‘1’, ‘2’, and ‘3’.

10. Adjust VAT Account for Cash Receipt Adjustments and Write Offs. Tax explanation must be a ‘V’.

‘1’ = update VAT amount only

‘2’ = update VAT amount, extended price and taxable amount

11. Adjust VAT Account for Discount Taken. The Tax Rules file must be set to Calculate Tax on Gross Amount, including Discount and Calculate Discount on Gross Amount, including Tax. Tax explanation must be a ‘V’.

‘1’ = update VAT amount only

‘2’ = update VAT amount, extended price and taxable amount

**PROPERTY MANAGEMENT:**

12. Enter DREAM Writer version of Property Management G/L Transaction Creation to be executed.

Default is version ZJDE0001. (This applies to batch types ‘2’ and ‘/’.)

**UPDATE OPTION:**

13. Enter ‘1’ to update short ID number, company, fiscal year/period number, century, and fiscal quarter in unposted transaction records selected for posting. (May be required for custom input programs.)

**REPORT FORMAT:**

14. Enter a ‘1’ to print the Posting Journal in a 198 character format.

The default of blank will print the format with 132 characters.

**DETAILED CURRENCY RESTATEMENT:**

15. Enter a ‘1’ to create currency restatement entries. This creates records in the XA, YA, and/or ZA ledgers depending on the version you are running.
### Processing Option
16. Enter the version of the Detailed Currency Restatement (P11411) to execute.  
Default of blank will execute ZJDE0001.

### RECONCILIATION FILE PROCESSING:
17. Enter a '1' to update the Cross-Environment Reconciliation file. Blank will not update the reconciliation file.  
**Note:** The Cross-Environment Reconciliation file can also be updated through the stand-alone Cross-Environment File Creation program.

### REVERSING JOURNAL ENTRIES:
18. When normal number of periods = 12 or 13 and posting a reversing entry into period 12 or 13, enter a '1' to create reversing journal entries to the first period of the following year. This is to avoid posting reversing entries to an adjusting period.  
**Example:** Normal number of periods = 12. Period 12 ends 12/30/xx and period 13 ends 12/31/xx. Journal Entry date of 12/30/xx will post reversing entry to period 01 of next year if processing option is set to '1'.

### BATCH TYPE SELECTION:
**Note:** This option should NOT be changed by User.
This chapter contains these topics:

- Section 56.1, "PM Projections (P13411)"
- Section 56.2, "Review Planning Family (P3401)"
- Section 56.3, "Supply/Demand Inclusion Rules (P34004)"
- Section 56.4, "Message Detail (P3411)"
- Section 56.5, "Time Series (P3413)"
- Section 56.6, "Supply & Demand (P4021)"
- Section 56.7, "Where Used Inquiry (P30201)"
- Section 56.8, "Load (P3313)"
- Section 56.9, "Load Bar Graph (P3313B)"
- Section 56.10, "Period Summary (P3312)"
- Section 56.11, "Production Status (P31226)"
- Section 56.12, "Work Center Resource Units (P3007)"
- Section 56.13, "Work Center Resource Units Refresh (P3007G)"

### 56.1 PM Projections (P13411)

9. Purchase Order Entry (P4311)
10. Purchase Order Inquiry (P430301)
11. Sales Order Entry (P4211)
12. Sales Order Inquiry (P42045)
13. Scheduling Workbench (P31225)
14. MPS/MRP/DRP Pegging Inq. (P3412)
15. MPS/MRP/DRP Time Series (P3413)
16. MPS/MRP/DRP Message Detail(P3411)
OPTIONAL RECORDS:

17. Enter a '1' to include Planned Orders from MPS/MRP/DRP generations.
   If left blank, Planned Orders will not be displayed.

18. Enter the Forecast Type to include
   Forecast Type
   Forecast Type
   Forecast Type
   Forecast Type
   Forecast Type

19. Enter the number of days (+/-) from today’s date that you wish to begin including Forecast records.
   A blank will use today’s date to begin including Forecast records.

20. Enter a '1' to omit 'Bulk' Stocking Type records from screen.
    If left blank, 'Bulk' items will be included.

21. Enter the rate based Schedule Type to use.
    If left blank, no rate based schedules will be displayed.

22. Enter a '1' to include Past Due Rates as a supply.

POTENCY:

23. Enter ‘1’ to convert Quantities to Standard Potency.

LOT EXPIRATION:

24A. Enter ‘1’ to reduce Quantity available due to lot expiration.
    Note: This option will not work with ATP. If you use this option, option 5 must be set to blank or 2.

24B. Enter optional date to be used for expiration calculation when processing option 24A=’1’.
    If left blank, Lot Expiration Date will be used.
    1=Sell By Date
    2=Best Before Date
    3=User Defined Date1
    4=User Defined Date2
    5=User Defined Date3
    6=User Defined Date4
    7=User Defined Date5
    8=Commitment Date Method from Item/Branch Master.

LOT HOLD CODES:

25. Enter the lot hold codes (up to 5) to be considered on hand, or enter an '*' to consider all held lots as on hand.
    If left blank, held lots will not be considered on hand.

WORK ORDER ENTRY:
### WHERE USED INQUIRY (P30201)

#### BILL AVAILABILITY:

27. Enter the version of Bill Availability (P30205) to be called.

If left blank, version ZJDE0001 will be used.

#### OVER DUE SUPPLY CONTROL:

28. Enter a ‘1’ to leave past due supply out of available calculations (past due orders will be displayed but will not be included in quantity available or ATP).

#### FORECAST DISPLAY OPTIONS:

29. Enter a ‘1’ to override the planning fence rule and just use actual customer demand for the available calculation.

**Note:** forecast will still appear on the screen per processing option above.

When left blank, the available calculation will be based on the planning fence and rule established in the item’s branch plant manufacturing data.

### 56.7 WHERE USED INQUIRY (P30201)

#### DEFAULT VALUES:

1. Enter one of the following:
   - 1 = Single-Level
   - 2 = Multi-Level
   - 3 = Indented
   - 4 = All processes where a co- or by-product is produced
   - 5 = Part/Ingredient Availability If left blank, the Single-Level mode will be displayed.

2. Bill Type (Optional)

#### DREAM WRITER VERSIONS:

Enter the version for each program. If left blank, ‘ZJDE0001’ will be used.

**NOTE:** Option 6 is only valid if System 13 (Equipment) is available.

</tbody>
</table>
6. Enter one of the following:
   1 = Write Detailed G/L transactions (by Item)
   2 = Write Summarized G/L transactions (by Account).
   If left blank, no G/L transactions will be written.

7. Enter the General Ledger Date.
   If left blank, the system date will be used.

REPORT FORMAT:

8. Enter one of the following:
   1 = Print all items
   2 = Print changed items
   If left blank, all items will be printed.

WIP RE-VALUATION:

9. Enter a '1' to adjust WIP according to new costs.

10. Enter the document type.
    If left blank, 'IB' will be used.

11. Enter one of the following:
    1 = Write Detailed G/L transactions (by document)
    2 = Write Summarized G/L transactions (by Account).
    If left blank, no G/L transactions will be written.

12. Enter a '1' to move the Production Document Number into the Sub-Ledger field.
    This cannot be set to 1 if processing option 6 or 11 is set to 2.

DEFAULT DISPLAY DECIMALS:

13. Enter the number of decimals to use for display (0-4)
    in the Item Cost Rollup Report(P30835).
    If left blank, 4 decimals will be used.

### 58.5 Purge Item Master and Item Balance Files (P12912)

<table>
<thead>
<tr>
<th>Processing Option</th>
<th>Processing Options Requiring Further Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PURGE SELECTION OPTIONS:</td>
<td></td>
</tr>
</tbody>
</table>
1. Enter a '1' next to the following files you want to purge:
   F1201 - Item Master File
   F1202 - Item Balances File
   F1301 - Equipment Rental Rate File
   F1204 - Location History File
   F1205 - Item Message File
   F1206 - License Master File
   F1207 - Maintenance Schedule File
   F1212 - Parent History File
   F1307 - Status History File
   F1308 - Maintenance Loops File
   F13907 - Associated Service Types
   Note: If the F1201 File is selected for purge, all related files will also be purged.

2. Enter one of the following:
   '1' = purge records for assets if the disposal date is less than the current fiscal year. Use this option when purging F1301, F1204, F1205, F1206, F1207, and F1307 only:
   '2' = purge prior year Item Balance records for selected assets.
   '3' = do both 1 and 2 above.

3. If purging prior year Item Balance (F1202) records, enter the number of years to retain. (The default and minimum is one year or current year balances.)
   Note: Be sure the Fixed Asset Annual Close has been run PRIOR to purging last year's Item Balance Records.

4. Enter one of the following to print on the purge report:
   '1' = Item Number
   '2' = Unit Number
   '3' = Serial/Tag Number

58.6 Fixed Assets Supplemental Data (P12400)
### 58.7 Specification Data Report (P12416)

### Processing Option

1. Choose which report format to print:
   - '1' = Completed Maintenance (usually, statuses of '99').
   - '2' = Scheduled Maintenance (usually, statuses less than '99').
   - '3' = Mechanic's Worksheet (usually, status range of '50' to '70').

**Note:** DREAM Writer Data Selection determines which statuses are actually included on the report.

2. Enter a '1' to print the procedure number's standard text.
   Leave blank (default) to print no standard text.

3. Choose which asset number to print:
   - '1' = Item number (default).
   - '2' = Unit number.
   - '3' = Serial number.

4. Enter a '1' to print the assets by Location, page breaking by Location.
   **Note:** If selecting this option, Location should be high in the DREAM Writer data sequence list (for example Company, Location, Item Number; or Location, Item Number; and so forth).

---

| b. Capacity Messages | |

| 5. Enter the number of periods. |
| 6. Enter the UDC table to use for row descriptions. |
This appendix contains these topics:

- Section A.1, "About Inventory Concepts"
- Section A.2, "About the Inventory Item Master"
- Section A.3, "About Inventory Setup"

This appendix contains important information that you need if you use the Inventory Management system to manage parts inventories.

### A.1 About Inventory Concepts

You can plan for future parts needs by reviewing information that the system provides about parts and part quantities. For example, you can monitor quantity information about how many parts are on demand, available in supply, and available to be promised. To use quantity information to determine your current and future inventory needs, you need to understand the following concepts.

#### A.1.1 Stocking Types

In most inventory environments, such as a manufacturing environment, non-stock parts are rare. But, within the maintenance organization, the demand for parts is often not predictable, and it is impractical to stock every part for which there might be a future demand. Generally, maintenance planners consider inventory as a way to handle emergency replacement parts and to act as a temporary holding area for stock and non-stock parts.

Within the maintenance organization, it is necessary to identify three different stocking types:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stock parts</td>
<td>The most vital parts for which you know there is a predictable demand, such as parts required for routine scheduled maintenance tasks. Typically, you want to keep a physical inventory of these parts.</td>
</tr>
<tr>
<td>Pseudo non-stock parts</td>
<td>Parts for which you do not need to keep a physical on-hand quantity, such as parts required for future maintenance tasks or parts that are easily and quickly acquired. Typically you don’t want to keep a physical inventory of such parts. However, you want to maintain inventory records to assist in planning and to simplify purchasing. You can set up pseudo non-stock parts with an inventory master record and indicate an on-hand quantity of zero.</td>
</tr>
</tbody>
</table>
A.1.2 On-Hand Quantity vs. Available Quantity

On-hand quantity refers to the number of parts that are physically in stock in the primary unit of measure. On-hand quantity of parts can be affected by:

- Variances recorded following a physical inventory
- Daily removals, additions, or transfers of parts
- Shipment confirmations or updated sales information
- Locations with lots on hold, such as parts requiring inspection or placed in quarantine

Available quantity refers to the number of parts that you can use based on user defined calculations. You determine how the system calculates part availability by defining the factors that subtract from, or add to, the available quantity of a part. This calculation can include quantities that do not immediately affect on-hand amounts.

For example, you can set up the availability calculation to subtract any quantities that are committed to work orders and add any quantities that are on purchase orders or in transit.

A.1.3 Commitments

When you set up general planning constants, you can specify whether the system uses hard or soft commitment to commit parts to a work order.

When you specify hard commitment, the system:

- Indicates an actual reduction in inventory at the point that the maintenance task creates a demand for the part
- Specifies a location from which to remove parts

When you specify soft commitment, the system:

- Does not indicate an actual reduction in inventory at the point that the maintenance task creates a demand for the part
- Does not specify a location from which to remove the part

The following graphic illustrates how the Inventory Management system commits inventory:

<table>
<thead>
<tr>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Non-stock parts</td>
<td>Parts for which you rarely have a need and for which you do not need an inventory master.</td>
</tr>
</tbody>
</table>
A.1.4 Supply and Demand Quantities

The system uses supply and demand inclusion rules to calculate the supply and demand quantities for an inventory part. Unlike a manufacturing environment where work orders create a supply of parts or materials, work orders in a maintenance environment create a demand for parts.

Starting with the requested date on the work order parts list, the system calculates the demand quantity from the following sources:

- Work order requirements and parts lists - The quantity required minus the quantity issued
- Safety stock - Any quantity reserved as protection against fluctuations in demand and supply

Starting with the requested date on purchase orders, the system calculates the supply quantity from the following sources:

- On-hand inventory - The quantity on hand minus hard commitments and quantities on work orders
- Purchase orders - The quantity entered on purchase orders

A.2 About the Inventory Item Master

To ensure that maintenance planning features function properly, several fields on Inventory Item Master and Item Branch Information require special attention. You can access both screens within the Inventory Management system.

Navigation

From Inventory Management (G41), choose 2

From Inventory Management (G4111), choose Item Master Information
A.2.1 Entering Item Master Information

**Figure A–2  Item Master Information screen**

You must complete the following fields for each maintenance part for which you want to create a master record.

---

**Note:** The values you enter in these fields will be default values in the same fields on the Item Branch Information screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Stocking Type</td>
<td>A user defined code that indicates how a part is normally stocked.</td>
</tr>
<tr>
<td></td>
<td>The stocking type that you enter for maintenance parts must have an M or a P as the second description line.</td>
</tr>
<tr>
<td></td>
<td>- M: Parent part number. The system uses this stocking type when it processes inventory parts for planning.</td>
</tr>
<tr>
<td></td>
<td>- P: Individual parts or components of a parent part.</td>
</tr>
<tr>
<td></td>
<td>For example, assume you are creating master information for a hydraulic PM kit and each part within the kit. The parts include a motor and a filter. Enter a stocking type that includes M as the second line of description for the PM kit. Enter a stocking type that includes P as the second line of description for the motor and the filter. Do not enter a stocking type with a second description line of K (kit). Kit is used to process sales order items.</td>
</tr>
</tbody>
</table>
To use parts planning functions in Equipment/Plant Maintenance, you must enter a value in at least one of the following fields for each part:

- Planner Number
- Buyer Number
- Master Planning Family

The Planner Number and Buyer Number fields are located on the Item Master screen, as well as the Item Branch Information screen. The Master Planning Family field is located on the Classification Codes screen and is discussed later in this appendix.

### Field Explanation

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Planner Number</td>
<td>The address number of the material planner for a part. You must enter a planner number to be able to run parts inquiries and searches by planner.</td>
</tr>
<tr>
<td>Buyer Number</td>
<td>The address number of the person responsible for setting up and maintaining the correct stocking levels for inventory parts. You must enter a buyer number to be able to run parts inquiries and searches by buyer.</td>
</tr>
</tbody>
</table>
A.2.2 Entering Item Branch Information

You must enter a value in the Supplier field on the Item Branch Information screen for each part. You can access this screen directly from the Item Master screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supplier</td>
<td>The address number of the preferred provider of this item at this branch or plant.</td>
</tr>
<tr>
<td></td>
<td>JD Edwards World recommends that you enter a supplier for each branch or plant.</td>
</tr>
</tbody>
</table>
A.2.3 Entering Manufacturing Values

From the Item Master screen in the Inventory Management system, you can access the Manufacturing Values Entry screen (F10). You must complete the following fields on this screen to specify the rules by which the system plans for, orders, and issues parts.

Note: When you enter values in these fields, they automatically become default values in the same fields on the Plant Manufacturing Data screen.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Order Policy Code</td>
<td>A code that designates the rules for reordering in the Requirements Planning system. JD Edwards World recommends that you enter a 1 in this field.</td>
</tr>
<tr>
<td>Issue Type Code</td>
<td>A code that defines how each item in the bill of material is issued from stock. With the exception of floor stock items, such as small hardware, fasteners, and so on, JD Edwards World recommends that you enter an I in this field to indicate a manual issue for maintenance parts.</td>
</tr>
<tr>
<td>Planning Code</td>
<td>A code that indicates how the system processes this item. JD Edwards World recommends that you enter a 2 in this field.</td>
</tr>
</tbody>
</table>
A.2.4 Entering Plant Manufacturing Data

You can access the Plant Manufacturing Data screen directly from the Item Branch Information screen in the Inventory Management system. You must enter a value in the Time Basis field for each part to ensure that the system calculates the time required for routing steps based on hours per operation.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Time Basis</td>
<td>A code that identifies the time basis or rate to use for setup, machine, or labor hours entered for any routing step. JD Edwards World recommends that Equipment/Plant Maintenance users enter a U in this field.</td>
</tr>
</tbody>
</table>
A.2.5 Entering Classification Codes

To aid in parts planning and inquiry functions, you can assign each part to a master planning family. If you did not enter a planner number or a buyer number on either the Item Master screen or the Item Branch Information screen, you must enter a value for the master planning family. The Master Planning Family field is located on the Classification Codes screen. You can access this screen from either the Item Master screen or the Item Branch Information screen in the Inventory Management system.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Master Planning Family</td>
<td>A code under which you can organize logically related parts. For example, you can organize parts by type, location, machine, and so on.</td>
</tr>
</tbody>
</table>

A.3 About Inventory Setup

The following Inventory Management setup tasks have special implications for Equipment/Plant Maintenance users:

- Setting up Branch or Plant constants
- Setting up stocking type codes (user defined code, system 41, type I)

In addition to these tasks, setting up line types in the Purchase Management system has special implications for Equipment/Plant Maintenance users.
A.3.1 Setting Up Branch/Plant Constants

When you set up constants for each branch or plant, you should enter values in the following fields to ensure that inventory transactions create journal entries in the general ledger. In addition, you can specify a description for inventory transactions.

<table>
<thead>
<tr>
<th>Field</th>
<th>Explanation</th>
</tr>
</thead>
<tbody>
<tr>
<td>Interface G/L (Y/N)</td>
<td>Enter a Y to ensure that inventory transactions processed through this branch or plant create general ledger entries.</td>
</tr>
<tr>
<td>General Ledger Explanation</td>
<td>Depending on your reporting needs, you can specify the description that appears on the second line of the general ledger journal entry for inventory transactions: Enter a 1 for the item master description (part name) Enter a 2 for the primary item number (part number)</td>
</tr>
<tr>
<td>Update Units to G/L</td>
<td>Depending on your reporting needs, you can specify that the system enters both amounts and units for inventory transactions on the Account Ledger table (F0911).</td>
</tr>
</tbody>
</table>

A.3.2 Setting Up Stocking Type Codes

When setting up stocking type codes (system 41, type I) for maintenance parts, you must enter a P (Purchased) in the second description line. Do not enter a K (Kit). This code is reserved for sales order processing.
A.3.3 Setting Up Line Types

Line types control how parts transactions interface with the General Ledger and the Inventory Management system. Specifically, the line type that you assign to a part is a code that:

- Controls which of the following four systems that the transaction interfaces with:
  - General Ledger
  - Inventory Management
  - Accounts Receivable
  - Accounts Payable
- Specifies the conditions for which a line is printed on reports
- Specifies the conditions for which a line is included in calculations

You set up line types in the Procurement system. Depending on your planning and reporting needs, you might need to set up an additional line type to differentiate pseudo non-stock part transactions from genuine non-stock part transactions.

**Caution:** You should be thoroughly familiar with order line types before you add or modify them. Extreme damage to your system can occur if you do not set up order line types with precision and logic.

**See Also:**
- Setting Up Order Line Types in the *JD Edwards World Procurement Guide*

The following fields on Order Line Types have special significance for Equipment/Plant Maintenance users.
### Field | Explanation
--- | ---
**Interface with G/L (Y/N)** | A code that indicates whether the system reflects the monetary or unit value of any activity containing this order line type in the general ledger.  
JD Edwards World recommends that Equipment/Plant Maintenance users enter a Y in this field.

**Interface with Inventory** | A code that identifies the type of interface to the Inventory Management system. Valid codes are:

- **Y** – The system reflects the monetary or unit value of any activity containing this line type in inventory. The system edits the item you enter to ensure that it is a valid item.
- **A** – The system recognizes the number entered as a G/L account number. This code is used in purchasing only.
- **B** – The system edits the item and the G/L account when using format 4 in purchase order entry. The system retrieves price data from the inventory tables, but the system does not update the quantity on the purchase order. This code is valid only when the Interface with G/L code is set to Y (yes). Budget checking is fully functional with this interface type.
- **D** – The item in this line is an inventory item that will not affect availability or quantities.
- **N** – The item is not an inventory item.
Import Mass Data into Equipment Plant Maintenance

Two Equipment Plant Maintenance interactive programs can run in batch mode and accept data from a Z file, allowing you to process mass amounts of data from an outside source easily and efficiently using existing programs to validate the data.

You can process any number of records to add, change, or delete. You also have the advantage of:

- Data selection to limit the records you want to process.
- Processing options that allow you to choose the version of the interactive program to process the records.
- Error report printing.

See:
- Overview to Import/Export in the *JD Edwards World Technical Tools Guide* for information about importing data into the system.

The following table includes the Equipment Plant Maintenance Z file processing programs.

<table>
<thead>
<tr>

**Navigation**

From Equipment/Plant Management (G13), enter 27

From Advanced Operations (G1313), choose an option

**Technical Considerations**

The Location Transfer - Z File program (P12115Z) updates the Location Tracking (F1204), Location History (F1210), and Asset Master (F1201) files.

The Meter Readings - Z File program (P12120Z) updates the Asset Balance (F1202) and Account Ledger (F0911) files.
Processing Options
See the appropriate set of Z file processing options:

- Section 53.16, "Location Tracking Z File (P12115Z)"
- Section 54.7, "Meter Reading Z File (P12120Z)"

Data Selection
Do not change the existing data selection. The Processed Y/N field is set to NE Y. This prevents the program from processing records more than once.

You can add additional selections to limit the data.

Data Sequence
Do not change the data sequence.
