# Using This Documentation

---

- **Overview** – Provides reference information about the interfaces and APIs of Oracle's Netra Modular System.
- **Audience** – Programmers and developers with experience coding and porting applications using APIs.
- **Required Knowledge** – Advanced experience programming and using interfaces.

## Product Documentation Library

Documentation and resources for this product and related products are available at <https://www.oracle.com/goto/netra-modular-system/docs>.

## Feedback

Provide feedback about this documentation at <http://www.oracle.com/goto/docfeedback>.

# Understanding the Interfaces and Software

---

These topics provide an overview of the software environment that forms the basis for managing and developing applications for the modular system.

- “[Understanding Interface Options](#)” on page 11
- “[Management Software](#)” on page 17

## Related Information

- “[Programming API Functions](#)” on page 19
- “[Programming OEM Controls](#)” on page 29

## Understanding Interface Options

The following interfaces are supported.

- “[CLI Overview](#)” on page 11
- “[SNMP Overview](#)” on page 13
- “[IPMI Overview](#)” on page 13
- “[Oracle ILOM Overview](#)” on page 14
- “[SAF HPI Overview](#)” on page 15
- “[OpenHPI Overview](#)” on page 16

## Related Information

- “[Management Software](#)” on page 17
- “[Programming API Functions](#)” on page 19
- “[Programming OEM Controls](#)” on page 29

## CLI Overview

The [CLI](#) provides a comprehensive set of textual commands that you can issue to the system through [Oracle ILOM](#).

The Oracle ILOM CLI is based on the Distributed Management Task Force specification, Server Management Command-Line Protocol Specification (DMTF CLP). The entire specification is available at: <http://www.dmtf.org/>.

The DMTF CLP provides a management user interface for servers regardless of server state, method of access, or installed operating system. The DMTF CLP architecture models a hierarchical namespace, which is a predefined tree that contains every managed object in the system.

In this model, commands operate on a namespace of targets, which you can modify by using options and properties. This namespace defines the targets for each command. The command syntax is as follows:

*action [options] [target] [properties]*

The *action* refers to the command purpose or action taking place. The standard actions are *set*, *show*, *create*, *delete*, *reset*, *start*, *stop*, *cd*, *version*, *exit*, and *help*. The *target* indicates the address or path of the target of the command.

From the CLI, you can access the /FMM namespace, which includes /FMM/FBN*n*.

In the /FMM namespace, you can manage and configure the FMM. In the /FMM namespaces, you can access and configure properties for managed components.

Namespace	CLI Management Target Description
/FMM	Use to monitor the <i>SP</i> on the FMM. The targets and properties in this target type are for configuring the <i>FMM</i> and viewing the configuration. The /FMM replaces the /CMM used in the Sun Blade 6000 Modular System.
/Frame	Use to provide inventory status, environmental conditions, and hardware management at the frame level. The /Frame address space replaces the /CH on the Sun Blade 6000 Modular System.
/Frame/FBN <i>n</i>	Use to access and configure /Frame FBN properties and options from the FMM CLI session.

For mapping management tasks to CLI targets on the FMM, refer to 3.2.x *Oracle ILOM User's Guide for System Monitoring and Diagnostics* at: [https://docs.oracle.com/cd/E37444\\_01/html/E37447/z40000091420195.html#scrolltoc](https://docs.oracle.com/cd/E37444_01/html/E37447/z40000091420195.html#scrolltoc)

For information about CLI commands, refer to the *Oracle ILOM Quick Reference for CLI Commands* at: [https://docs.oracle.com/cd/E37444\\_01/html/E37448/z4000068165586.html#scrolltoc](https://docs.oracle.com/cd/E37444_01/html/E37448/z4000068165586.html#scrolltoc)

## Related Information

- “[OpenHPI Overview](#)” on page 16

## SNMP Overview

[SNMP](#) is a standard protocol for monitoring networked components. The SNMP is part of an internet protocol suite, defined by the Internet Engineering Task Force (IETF).

SNMP is employed by management systems to monitor networked components for conditions that need system administrative action. SNMP is of a suite of standards for network management that includes an application layer protocol, a database schema, and data objects.

To be managed, a device must have an SNMP associated agent. The agent manages requests for data representing a component's state and generates an appropriate response. The agent controls the component's state. Additionally, the agent generates SNMP traps (unsolicited messages to network management stations) to signal significant events relating to the component.

For more information, refer to SNMP specifications (RFCs 3410-3417) at:

<https://www.ietf.org/>

- “[IPMI Overview](#)” on page 13
- “[Oracle ILOM Overview](#)” on page 14
- “[SAF HPI Overview](#)” on page 15
- “[OpenHPI Overview](#)” on page 16

## IPMI Overview

[RMCP](#) is a standard network interface to an [IPMI](#) controller through the LAN and is defined by the IPMI specification. Access to the IPMI subsystem is usually through RMCP.

For the supported features, the IPMI driver user interface is compatible with the Linux OpenIPMI driver user interface.

All of the IPMI features are supported except for:

- Power on Host (IPMITool)

- Power off Host (IPMITool)
- PowerCycle Host (IPMITool)
- Shutdown Host Gracefully (IPMITool)
- Receive a message, such as a shut down request, from other IPMI clients

An IPMI driver is required to communicate with the local IPMI controller or other IPMI clients. For instance, with the IPMI driver, you can:

- Program the node front panel LEDs.
- Program the watchdog timer in the IPMI controller.
- Receive a message, like a shutdown request, from other IPMI clients.

For more information, refer to the IPMI specification at:

<http://www.intel.com/content/www/us/en/servers/ipmi/ipmi-specifications.html>

- “[Oracle ILOM Overview](#)” on page 14
- “[SAF HPI Overview](#)” on page 15
- “[OpenHPI Overview](#)” on page 16

## Oracle ILOM Overview

Through [Oracle ILOM](#), you can manage systems and resources. Compute nodes in the modular system support all of the standard Oracle ILOM interfaces and features that are documented in the Oracle ILOM documentation. For the modular system, use the Oracle ILOM for managing the compute nodes, management nodes, [FSA](#), and [FMM](#).

---

**Note** - Compute nodes in the modular system do not have a serial console available, because this port is used to detect the node's presence in the modular system and to read configuration data. The only physical access to the SP is through the network (NET\_MGT) port through a switch in the [FMM](#).

---

A new target is available under the /SYS target for the FMM. You can get the error and presence status of the FMM with other properties, such as the IP address of the FMM. However, this target might not be visible in the default mode, which masks legacy targets. By default, the Oracle ILOM CLI interface shows the [SDM](#), which brings uniformity to the CLI on all systems.

For detailed information, refer to the Oracle ILOM documentation:

*Oracle ILOM User's Guide for System Monitoring and Diagnostics* [https://docs.oracle.com/cd/E37444\\_01/html/E37447/z4000091420195.html#scrolltoc](https://docs.oracle.com/cd/E37444_01/html/E37447/z4000091420195.html#scrolltoc)

*Oracle ILOM Quick Reference for CLI Commands* [https://docs.oracle.com/cd/E37444\\_01/html/E37448/z4000068165586.html#scrolltoc](https://docs.oracle.com/cd/E37444_01/html/E37448/z4000068165586.html#scrolltoc)

## Related Information

- “[CLI Overview](#)” on page 11
- “[SNMP Overview](#)” on page 13
- “[IPMI Overview](#)” on page 13
- “[SAF HPI Overview](#)” on page 15
- “[OpenHPI Overview](#)” on page 16

## SAF HPI Overview

The [SAF HPI](#) provides platform-independent C APIs to use as building blocks for monitoring and controlling highly-available systems. The [HPI](#) standards specify generic data structures, functions, and resources that you can program to interact with manageable components of the modular system.

Using the standard interfaces, you can develop applications and middleware to access and manage hardware components. The HPI allows portability of HPI code across many hardware platforms.

The SAF HPI is based upon the [IPMI](#) specification, which defines platform-independent capabilities and data formats. However, HPI is a generic interface specification, therefore, you can implement it on any platform with compatible platform management technology.

For more information about the HPI specification and usage examples, refer to <http://www.saforum.org>.

The SAF HPI model defines four concepts: sessions, domains, resources, and entities.

**Sessions** – Provide all access to an HPI implementation by [HPI user](#). An HPI session is opened on a single domain; one HPI user can have multiple sessions open at once, and there can be multiple sessions open on any given domain at once. Sessions also provide access to events created or forwarded by the domain accessed by the session. An HPI user accesses the system through sessions, where each session is opened on a domain. A session provides access to domain functions and to a set of resources that are accessible through the domain.

**Domains** – All HPI user functions are accessed through sessions, and each session is associated with a single domain. A domain provides access to zero or more resources and provides a set of associated services and capabilities. The latter are logically grouped into an abstraction

called a *domain controller*. The resources that are accessible through a domain are listed in the domain's Resource Presence Table (RPT). The contents of this table can change over time, and the domain's session management capability rejects any attempt to access a resource that is not currently listed in the domain's [RPT](#).

**Resources** – Provide management access to the entities within the system. Frequently, resources represent functions performed by a local control processor used for management of the entity's hardware. Each resource is responsible for presenting a set of management instruments and management capabilities to the HPI User. Resources can be dynamically added and removed in a system as hot-swappable system components.

**Entities** – Represent the physical components of the system. Each entity has a unique identifier, called an entity path, which is defined by the component's location in the physical containment hierarchy of the system.

### Related Information

- “[CLI Overview](#)” on page 11
- “[SNMP Overview](#)” on page 13
- “[IPMI Overview](#)” on page 13
- “[Oracle ILOM Overview](#)” on page 14
- “[OpenHPI Overview](#)” on page 16

## OpenHPI Overview

[OpenHPI](#) implements of the SAF HPI C application programming interface to provide platform management capabilities, such as:

- Configuration – The components in the system.
- Inventory – The vendor, model, version, and serial number of the components.
- Status – The temperature, voltage, fan speed, and state of the LEDs.
- Control – The ability to power on, power off, and reset the system, along with setting the WDT.

OpenHPI is an open source implementation of the SAF HPI. OpenHPI implements the APIs with a client library that interfaces with a daemon. The OpenHPI client library communicates with the OpenHPI daemon using a TCP-based OpenHPI-specific protocol. The daemon has a modular, configurable, plug-in architecture. Plug-ins are dynamically loaded, shared libraries, that interface with the systems that are being monitored and managed.

An OpenHPI plugin developed specifically for the Netra Modular System uses the [RMCP](#) to interface with the [FMM](#) and the Oracle ILOM interfaces of the nodes and switches in the system.

For a detailed description of the OpenHPI, with supported return codes, refer to the OpenHPI specification at: <http://www.openhpi.org/>.

### Related Information

- “[CLI Overview](#)” on page 11
- “[SNMP Overview](#)” on page 13
- “[IPMI Overview](#)” on page 13
- “[Oracle ILOM Overview](#)” on page 14
- “[SAF HPI Overview](#)” on page 15
- “[OpenHPI Overview](#)” on page 16

## Management Software

The modular system has two components that provide management access, the [FMM](#) and the [FSA](#). The FMM is the access point for [OOB](#) management. The FSA is the single-point of [IB](#) management.

For in-service systems management operations, all external access (such as element management systems) occurs through the FSA, with the FSA accessing the FMM.

Direct access to the FMM is limited to the service operations needed to bring the FSA in-service. The FSA is a [RMS](#) that hosts the system management software stack for frame-level management.

The system management software:

- Interfaces with the [FMM](#) and the networked components through [Oracle ILOM](#).
- Can run on a dedicated management node or a virtualized domain.
- Provides semantics-to-solution application and data center manager.
- Provides service management API to the upper-layer service manager.
- Provides hardware model sensors and messages via [JMX](#).
- Bases the equipment modeling part of the management devices on [CIM](#).

The equipment model and Java API documentation are delivered as part of modular system release package, in a `.tar` file. After you expand the `.tar` file, you can view the documentation with a web browser.

- “Inventory Data Repositories” on page 24
- “Watchdog Timers” on page 25
- “Hot-Swap” on page 26
- “Reset Management” on page 27
- “Power Management” on page 27

## Hot-Swap

Only the `saHpiHotSwapStateGet()` function is supported.

All resources except the `SYSTEM_CHASSIS` resource for rackmount servers follow the simple two-state hot-swap (`NOT_PRESENT` or `ACTIVE`). The `SYSTEM_CHASSIS` resource for a server can transition through the five-state HPI hot-swap model (`NOT_PRESENT`, `INACTIVE`, `INSERTION_PENDING`, `ACTIVE`, or `EXTRACTION_PENDING`).

When you insert a server into the modular system, the modular system attempts to create an `RMC` session with the Oracle ILOM of the server. Once the session is established, the plugin discovers the resources, sensors, controls, and inventories on the server.

After the discovery is complete, first `NOT_PRESENT` then `ACTIVE` hot-swap events are sent for each resource associated with the server, except for the `SYSTEM_CHASSIS` resource. The `SYSTEM_CHASSIS` resource follows the five-state HPI hot-swap model described in the HPI specification.

If a server is removed from the NMS, the `ACTIVE` to `NOT_PRESENT` hot-swap events are generated for each resource associated with the server. The `SYSTEM_CHASSIS` resource for the server follows the five-state HPI hot-swap model described in the HPI specification.

- “Inventory Data Repositories” on page 24
- “Watchdog Timers” on page 25
- “FUMI” on page 25
- “Reset Management” on page 27
- “Power Management” on page 27

## Reset Management

- `saHpiResourceResetStateGet()`  
Returns SAHPI\_RESET\_DEASSERT for SYSTEM\_BOARD resources.
- `saHpiResourceResetStateSet()`  
Supported for SYSTEM\_BOARD resources.  
SAHPI\_COLD\_RESET – Implemented with the IPMI chassis control power cycle command.  
SAHPI\_WARM\_RESET – Implemented with the IPMI chassis control warm reset command.

### Related Information

- “Power Management” on page 27

## Power Management

- `saHpiResourcePowerStateGet()`  
Supported for SYSTEM\_BOARD resources.
- `saHpiResourcePowerStateSet()`  
Supported for SYSTEM\_BOARD resources.  
SAHPI\_POWER\_CYCLE – Implemented with the IPMI chassis control power cycle command.  
SAHPI\_POWER\_ON – Implemented with the IPMI chassis control power up command.  
SAHPI\_POWER\_OFF – Use the IPMI chassis control soft shutdown command first. If the resource does not power off, then use the IPMI chassis control power down command.

# Glossary

---

## A

**ARP** Address Resolution Protocol.

## B

**bridge** A device that connects multiple network components or segments.

## C

**CIM** Common Information Model.

**CLI** Command line interface.

## F

**FBA** Frame backplane adaptor (attached to a node).

**FBN** See [FBS PCB](#).

**FBS** Frame backplane segment, which is attached to the modular system frame and provides the connector to the node [FBAs](#).

**FBS PCB** FBS printed circuit board (also known as FBN). See also [FBS](#).

**FMM** Frame monitoring module. Provides the backplane features for compute nodes, management nodes, networking, and storage devices in the system. The FMM controls the frame backplane nodes and provides a management switch for the management components installed in the system.

**FSA** Frame system agent.

## H

**HA** High availability.

**HPI** Hardware Platform Interface.

**HPI user** Any software that uses the HPI. Software includes an operating system, high-availability middleware, application software, and so on.

## I

**IaaS** Infrastructure as a Service. One of three service models of cloud computing with Platform as a Service (PaaS) and Software as a Service (SaaS).

**IB** Inbound.

**ICMP** Internet Control Message Protocol.

**ILOM** See [Oracle ILOM](#).

**IPMI** Intelligent Platform Management Interface.

## J

**JMX** Java Management Extension API.

## M

**modular system** Shortened name for Oracle's Netra Modular System.

## O

**OOB** Out-of-bound.

**OpenHPI** Open Hardware Platform Interface.

**Oracle ILOM** Oracle Integrated Lights Out Manager.

**P**

<b>ping</b>	An echo request message in ICMP.
<b>PSK</b>	Pre-shared key, used for authentication.
<b>PVI</b>	Private Virtual Interconnect.

**Q**

<b>QOS</b>	Quality of service.
------------	---------------------

**R**

<b>RDR</b>	Resource data records. RDRs are contained in the RDR repository of the <a href="#">resource</a> .
<b>resource</b>	Represents the management access to a component in the system. Provides management capabilities such as power control and event logging. Additional capabilities might be provided through management instruments associated with a resource. These management instruments include sensors, controls, and inventory records. When applicable, management instruments are described in <a href="#">RDRs</a> .
<b>RMCP</b>	Remote Management Control Protocol, a protocol for sending <a href="#">IPMI</a> messages over a LAN.
<b>RMS</b>	Rackmount server.
<b>RPT</b>	Resource Presence Table.

**S**

<b>SA</b>	Security association.
<b>SAF</b>	Service Availability Forum.
<b>SDM</b>	Simplified data model.
<b>SLB</b>	Server load balancing.
<b>SNMP</b>	Simple Network Management Protocol.
<b>SP</b>	Service processor.

## T

<b>TCP</b>	Transmission Control Protocol.
<b>tenant</b>	One of multiple tenants in a hosted cloud computing virtual network configuration. A hosting provider connects multiple tenant networks to their network and offers secure network isolation for each user.

## U

<b>UDP</b>	User Datagram Protocol.
------------	-------------------------

## V

<b>VCPU</b>	Virtual CPU.
<b>VIP</b>	Virtual IP address.
<b>VM</b>	Virtual machine.
<b>VNI</b>	Virtual Network Interface.
<b>VPN</b>	Virtual private network.
<b>VRID</b>	Virtual Router ID.
<b>VRRP</b>	Virtual Router Redundancy Protocol.
<b>vSwitch</b>	Virtual layer-2 switch in a virtualized network environment.

## W

<b>web tier</b>	A web that includes components that interact with end users at the outermost tier of application grid infrastructure, typically through HTTP requests and responses.
-----------------	--
