

Oracle® Enterprise Manager Ops Center

Provisioning Oracle Solaris 10 Operating Systems

12c Release 3 (12.3.0.0.0)

E60024-01

June 2015

This document provides an end-to-end example for how to use Oracle Enterprise Manager Ops Center to create and apply an OS Provisioning deployment plan to install an Oracle Solaris 10 operating system on a configured SPARC system.

Introduction

Oracle Enterprise Manager Ops Center streamlines the process of installing an Oracle Solaris 10 operating system (OS) on configured or unconfigured hardware.

Oracle Enterprise Manager Ops Center uses an OS image that is stored in a software update library to provision the target servers. The library is located either in a directory on the Enterprise Controller or on a Network Attached Storage (NAS) appliance that the Enterprise Controller can access.

As shown in [Figure 1](#), when you use Ops Center to provision, you create two profiles to define the provisioning parameters and a plan to apply your configuration selection to target systems. Several different deployment plans are available for OS provisioning. Some are complex or multi-step plans where OS provisioning is part of a larger process, such as installing and configuring a server. The Provision OS deployment plan just provisions the operating system.

Figure 1 OS Provisioning Flow

As shown in [Figure 1](#), the following is an overview of the OS provisioning process:

1. **Create an OS Provisioning profile:** Defines the OS provisioning parameters, including the platform-specific OS image and software package, file system layout, user accounts, naming services, and other installation requirements.
2. **Create an OS Configuration profile:** Defines the configuration parameters, including the platform, how the OS is managed (with or without an agent), MPxIO and networking options.
3. **Create an OS Provisioning Deployment Plan:** Defines the profiles to use for the provisioning job. To successfully create the plan, the OS Provisioning and OS Configuration profiles must be the same sub-type. For example, Solaris SPARC.
4. **Apply the OS Provisioning Deployment Plan to selected targets:** Defines the targets to provision, defines the boot interface resource assignments, network

resource assignments, and server pool assignment (if applicable), and schedule when to begin the provisioning job.

You can reuse the OS Provisioning and OS Configuration profiles and the deployment plan to provision other systems or groups of systems.

Note: To provision operating systems on logical domains, you must use the OS Provisioning and OS Configuration profiles that have Logical Domains as a subtype. The profiles described in this document provision an operating system on configured systems.

See *Planning for Operating System Provisioning in the Oracle Enterprise Manager Ops Center Operate Reference* for things to consider before provisioning.

When you install the Oracle Enterprise Manager Ops Center software, you have the option to create a Linux, Oracle Solaris 8-10 Software Update Library. The library contains the OS images needed for provisioning, upgrading, and updating (patching) an Oracle Solaris 10 operating system.

Profiles and plans simplify and standardize the procedures between different operating systems and platforms. The profiles take care of many of the configuration requirements for you and the plan defines the systems to provision.

Beginning with Oracle Enterprise Manager Ops Center Release 2 (12.2.0.0.0), you must use two profiles to define your OS provisioning job:

1. **OS Provisioning profile:** Defines the image, provisioning, and installation requirements.
2. **OS Configuration profile:** Defines the OS and network configuration for a specific image.

You can reuse any of the profiles and plans to quickly provision other systems when new hardware is acquired or provision existing hardware. You can install the OS on a bare metal system or on a configured system. This example shows how to create and use an OS Provisioning profile, OS Configuration profile, and Provision OS plan in Oracle Enterprise Manager Ops Center to install an Oracle Solaris 10 operating system on a configured SPARC server.

This document provides a brief overview of the components used in provisioning a configured system with Oracle Solaris 10 and an end-to-end example. The example does not use the Solaris JumpStart Enterprise Toolkit (JET). If you do use JET, the Enterprise Controller and Proxy Controller must be installed on Oracle Solaris.

See [Related Articles and Resources](#) for links to related information and articles, including links to more information on JET.

What You Will Need

You will need the following to provision an Oracle Solaris 10 operating system:

- An Oracle Solaris 10 OS image, imported into the Initial EC software library.
- A Proxy Controller located on the same subnet as the target hosts with DHCP services configured for SPARC system.
- A discovered service processor that is the target for the provisioning job.

- The roles and permissions to complete the tasks. You need the following Oracle Enterprise Manager Ops Center roles:
 - **Update Admin** or **Plan/Profile Admin** to create an OS Provisioning profile, OS Configuration profile, and Provision OS deployment plan.
 - **Update Admin** to apply the plan.

Provisioning an Oracle Solaris 10 Operating System

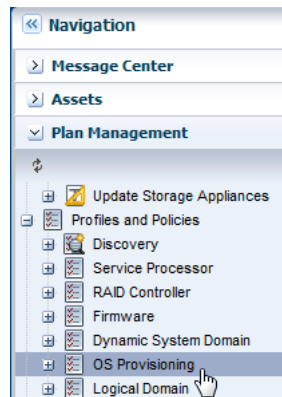

You can create OS profiles for provisioning Solaris OS on SPARC and x86 systems. Complete the following actions to provision Oracle Solaris 10 operating system.

- [Create an OS Provisioning Profile for Oracle Solaris 10 Operating System](#)
- [Create an OS Configuration Profile for an Oracle Solaris 10 Operating System](#)
- [Create a Provision OS Deployment Plan for Oracle Solaris 10 Operating System](#)
- [Apply the Provision OS Deployment Plan](#)

Create an OS Provisioning Profile for Oracle Solaris 10 Operating System

Complete the following steps to create an OS Provisioning profile:

1. Expand **Plan Management** in the Navigation pane.
2. Select **OS Provisioning** under the **Profiles and Policies** section.

3. Click **Create Profile** in the Actions pane.

4. Define the following profile parameters in the **Create Profile-OS Provisioning** wizard, then click **Next**.
 - Name: The name of the profile.
 - Description: A description of the profile.
 - Subtype: Select Solaris SPARC.
 - Target Type: The target type is automatically defined to SPARC type.

Identify Profile

*** Name:** S10_Update 10 SPARC OSP

Description: Solaris 10 Update 10 SPARC, entire distribution including OEM support

*** Subtype:** Subtype

- Oracle VM Server for SPARC
- Logical Domain
- Oracle Linux
- Oracle VM Server for x86
- Red Hat Linux
- SUSE Linux
- JET Template
- Solaris SPARC**
- Solaris x86

Target Type: Target Type

- OSP SPARC**

5. Select an **OS Image**, **OS Image Version**, and **Software Group**. This example does not include custom scripts. Click **Next**.

Specify OSP Parameters

Select an OS image from the list of images available.
Select the software group that this OS profile installs.

*** OS Image:** _SUNWCAT_Solaris_10_Sparc_U10_Official_Dv

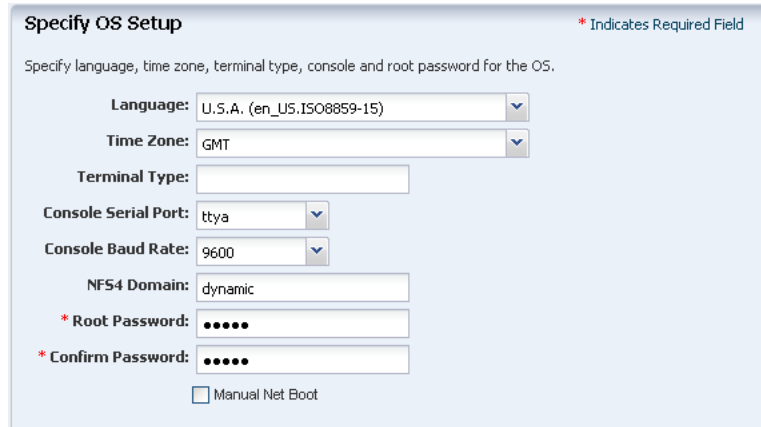

*** Software Group:** Entire Distribution plus OEM support

- Entire Distribution
- Developer System Support
- End User System Support
- Core System Support
- Reduced Networking Core System Support

Include Custom Scripts

6. Specify the following OS setup parameters:
- Language: Select a language for the OS.
 - Time Zone: Specify the time zone for the OS.
 - Terminal Type: Enter a terminal type, if other than the default type listed.
 - Console Serial Port: A default port appears in the wizard. If incorrect, select the correct console serial port device for your environment. This port enables you to monitor the installation using a serial connection.
 - Console Baud Rate: A default serial port device baud rate is provided. If incorrect, select the correct baud rate for your device.

- NFS4 Domain: Enter the NFS4 domain name that the target system will use. The dynamic value for NFSv4 domain name enables the NFSv4 domain to be derived dynamically, at run time, based on the naming service configuration. You can also provide valid domain name to hard code the value for NFSv4 domain.
- Password: Enter the root password for the root user on systems provisioned using this profile. Re-enter the password for confirmation. The password used in this example is admin.

Specify OS Setup * Indicates Required Field

Specify language, time zone, terminal type, console and root password for the OS.

Language: U.S.A. (en_US.ISO8859-15) [v]

Time Zone: GMT [v]

Terminal Type: []

Console Serial Port: ttya [v]

Console Baud Rate: 9600 [v]

NFS4 Domain: dynamic

* Root Password: []

* Confirm Password: []

Manual Net Boot

7. Click **Next** to skip specifying the Installation Parameters. To learn more about using the JumpStart Enterprise Toolkit (JET), see the JumpStart Enterprise Toolkit appendix in the *Oracle Enterprise Manager Ops Center Operate Reference*.
8. Review and edit the default file system layout, then click **Next**.

This example uses the default layout. To specify changes, click the size field for the file system and redefine the size. To add another file system, click the **Add** icon and complete the fields.

Specify File System Layout

Specify the file systems that need to be created.

File Systems (2)

[+][x]

File System Type	Mount Point	Device	Size (MB)
swap	swap	rootdisk.s1	4096
ufs	/	rootdisk.s0	Remaining unused space

9. Select **None**, then click **Next** to skip using a naming service.

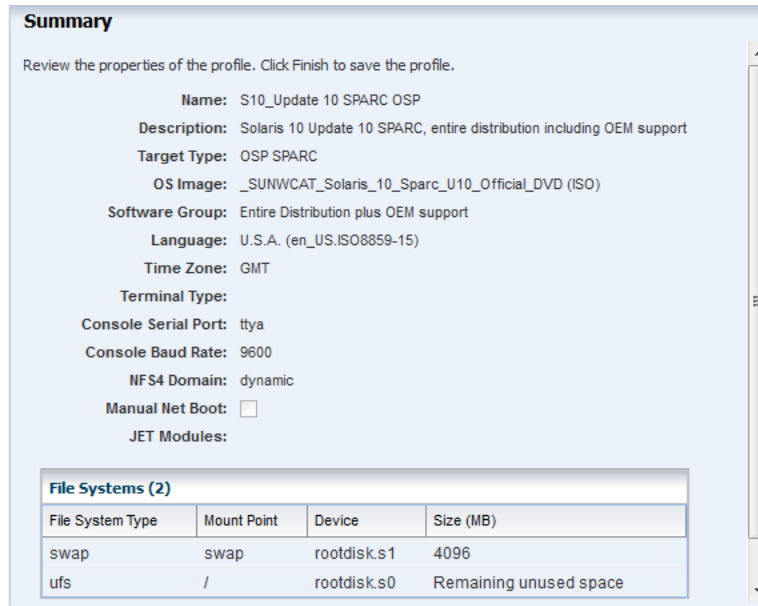

Specify Naming Services * Indicates Required Field

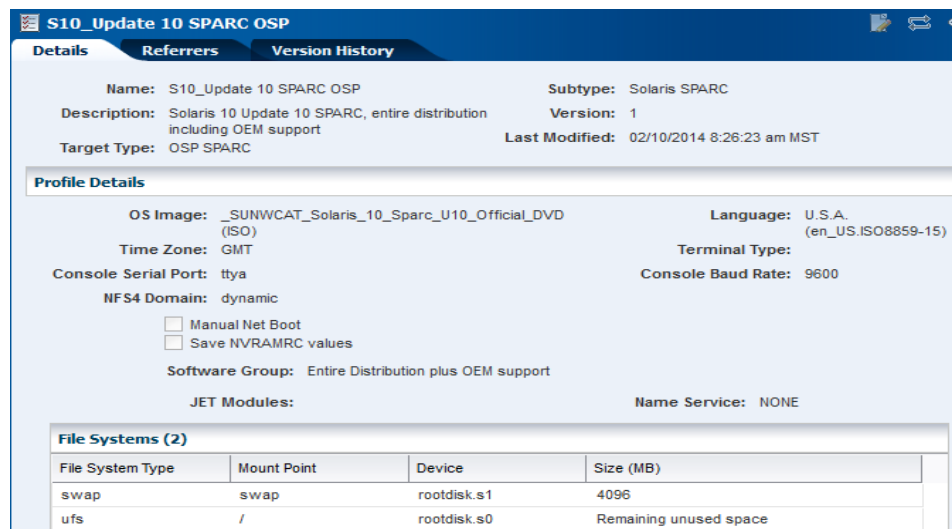

Specify the name service, the domain name, and the corresponding name server.
If the name service is specified, the hostname would be automatically derived from it.
Otherwise, the hostname will be generated by substituting the '.' in the target's IP address with '.'.

Name Service: NONE DNS NIS NIS+ LDAP

10. Review the parameters selected for Oracle Solaris 10 operating system provisioning, then click **Finish** to save the profile.

The profile appears in the center pane and in the **Profiles and Policies** section of **Plan Management** in the left Navigation pane.

Create an OS Configuration Profile for an Oracle Solaris 10 Operating System

The OS Configuration profile defines how the OS is managed (with or without an agent) and the networking options. The configuration profile is platform-specific.

The OS Configuration profile lets you define the network interface that you want to use on the operating system. The first interface you define in this wizard is the boot interface and also the primary interface. You can add more than one network interface. When you apply the plan to a target, you can select which network interface is the primary interface and define the IP address.

Note: Before you begin, contact your network administrator for the list of available networks and interfaces.

The wizard lets you choose from a list of 32 possible interfaces. Your network administrator can tell you which of the possible interfaces are available.

Complete the following steps to create a profile for configuring an Oracle Solaris 10 operating system:

1. Expand **Plan Management** in the Navigation pane, scroll down to **Profiles and Policies**.
2. Select **OS Configuration** in the **Profiles and Policies** tree. A list of existing OS configuration profiles appears.
3. Click **Create Profile** in the Actions pane.
4. Define the following profile parameters, then click **Next**.
 - Name: The name of the profile.
 - Description: A description for the profile.
 - Subtype: Select **Solaris**.
 - Target Type: Select **SPARC**.

Identify Profile * Indicates Required Field

* **Name:** Oracle Solaris 10 Configuring Profile

Description: Oracle Solaris 10 Configuring Profile

* **Subtype:** Subtype
Oracle VM Server for SPARC
Oracle Linux
Oracle VM Server for x86
Red Hat Linux
SUSE Linux
Solaris
JET Template

Target Type: Target Type
OSP SPARC
OSP x86

5. Select **Automatically Manage with Oracle Enterprise Manager Ops Center** and **Deploy the Agent Controller**. These options provide the most robust management and monitoring capabilities. Select **Enable Multiplexed I/O (MPxIO)** to enable SAN storage connectivity. When you enable MPxIO on the global zone, you are able to associate a SAN storage device to the global zone and use the storage for zones. Click **Next**.

OS Management

Automatically Manage with Oracle Enterprise Manager Ops Center

Deploy Agent Controller

Periodically probe the asset. SSH credentials are required, choose from an existing set or create a new set.

SSH:

Enable Multiplexed I/O (MPxIO)

6. Select **None** for the Networking Services, then click **Next**.

Specify Networking

Specify if the OS would need to use IPMP groups or IEEE 802.3ad Link Aggregations.

Use Link Aggregation

Use IPMP

None

7. Select a network interface that you want to use in the configuring process, then click **Next**. This example uses net_0 for the network interface, which is also the default boot interface. The address allocation method is static IP address allocation. You define the IP address when you apply the deployment plan to the target.

Note: By default, the primary interface is the boot interface. You can change the primary interface to a different interface when you deploy the plan.

Specify Network Interfaces

Specify all network interfaces that you want to use on the OS.

Network Interfaces (1)		
Controller	Interface	Address Allocation Method
default	net_0	Use Static IP

8. Review the Summary of the parameters selected for configuring Oracle Solaris 10 operating system. Click **Finish** to create the configuration profile.

Summary

Review the properties of the profile. Click Finish to save the profile.

Name: S10 SPARC OS Configuration
Description: Oracle Solaris 10 SPARC
Target Type: OSP SPARC

Automatically Manage with Oracle Enterprise Manager
 Ops Center:
 Deploy Agent Controller:
 Enable Multiplexed I/O (MPxIO):

Network Interfaces (1)

Controller	Interface	Address Allocation Method
default	net_0	Use Static IP

The profile appears in the center pane and in the **Profiles and Policies** section of **Plan Management** in the left Navigation pane.

S10 SPARC OS Configuration

Details **Referrers** **Version History**

Name: S10 SPARC OS Configuration **Subtype:** Solaris
Description: Oracle Solaris 10 SPARC **Version:** 1
Target Type: OSP SPARC **Last Modified:** 02/10/2014 9:03:51 am MST

Profile Details

Automatically Manage with Oracle Enterprise Manager Ops Center Deploy Agent Controller
 Enable Multiplexed I/O (MPxIO)

Network Interfaces (1)

Controller	Interface	Address Allocation Method
default	net_0	Use Static IP

Create a Provision OS Deployment Plan for Oracle Solaris 10 Operating System

When you create the plan, both the OS Provisioning profile and the OS Configuration profile must have the same platform subtype, either SPARC or x86. This example uses the Solaris SPARC subtype for both profiles.

Perform the following steps to create a deployment plan for provisioning Oracle Solaris 10 operating system:

1. Expand **Plan Management** in the Navigation pane, then select **Provision OS** in the Deployment Plans section.
2. Click **Create Plan from Template** from the Actions pane.
3. Enter the following parameters, then click **Save** to create a deployment plan.
 - Name: The name of the deployment plan.
 - Description: A description of the deployment plan.

- Failure Policy: Complete as much as possible.
- Deployment Plan Steps: For each step, click the **Associated Profile/Deployment Plan** field to display a list of available profiles. Select the OS Provisioning profile and OS Configuration profile that you created earlier.

Create a Deployment Plan ?

* Plan Name: S10 U10 SPARC

Description: Use this plan to provision Oracle Solaris 10, update 10, full distribution, including OEM. SPARC

Failure Policy: Stop at failure Complete as much as possible

Target Type: Servers

Template Name: Provision OS

Deployment Plan Steps

Step	Profile/Plan Type	Associated Profile/Deployment Plan
Provision OS (Required step)	OS Provisioning Profile	S10_Update 10 SPARC OSP v1 (Solaris SPARC)
Configure OS (Required step)	OS Configuration Profile	S10 SPARC OS Configuration v1 (Solaris)

Expand **Plan Management**, then expand **Provision OS**. Select the deployment plan to view its details in the center pane.

S10 U10 SPARC

Details Results Referrers Version History Jobs

Plan Name: S10 U10 SPARC Created: 02/10/2014 9:29:58 am MST

Version: 1 Last Modified: 02/10/2014 9:29:58 am MST

Description: Use this plan to provision Oracle Solaris 10, update 10, full distribution, including OEM. SPARC Template: Provision OS v3

Target Type: OSP SPARC Referrers: 0

Failure Policy: Stop at failure

Deployment Plan Steps

Step	Associated Profile/Deployment Plan	Number of Results	Assigned
Provision OS	S10_Update 10 SPARC OSP v1	0	0
Configure OS	S10 SPARC OS Configuration v1	1	-

Apply the Provision OS Deployment Plan

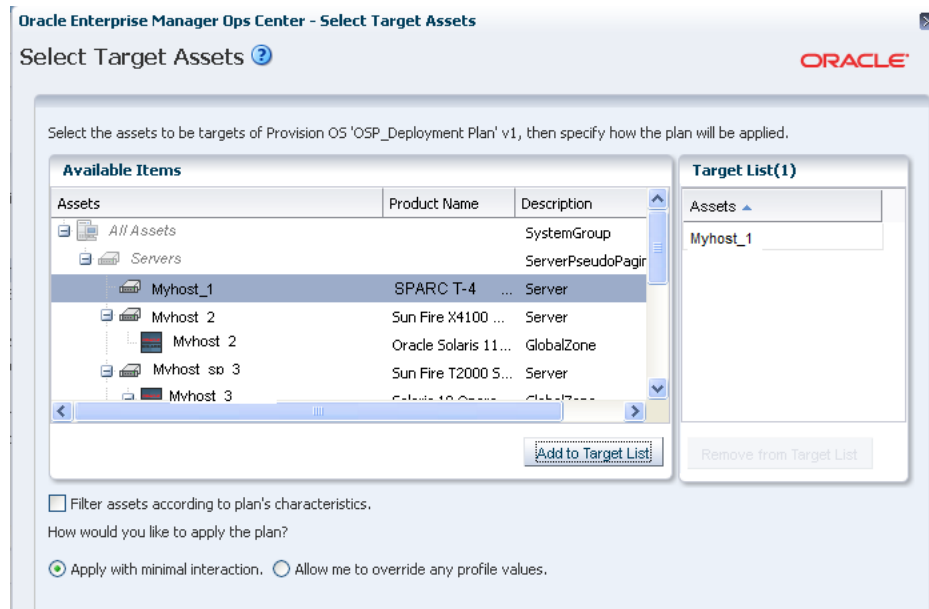

Perform the following steps to apply the deployment plan and provision a system:

1. Expand **Plan Management**, then expand **Deployment Plans** and select the plan. The plan details appear in the center pane.
2. Click **Apply Deployment Plan** in the Actions pane.

3. Expand Servers in the target selector. Select the target assets and click **Add to Target List**. The default setting filters the assets according to the plan's characteristics. You can only select eligible systems to add to the Target List. Select

Apply minimal interaction to limit or eliminate the need for you to provide input during the provisioning job. Click **Next** to open the deployment plan.

4. On the Introduction page for the deployment plan, the check box is selected to skip steps that are not included in the plan. Click **Next**.
5. Click **Next** to skip the OS Provision introduction page.
6. On the Boot Interface Resource Assignments page, verify that the Network and Interface are what you want to use. Complete the last octet of the IP address, or enter a different IP address. Optionally, you can provide a host name. Click **Next**.
7. Review the Provision OS Summary page, then click **Next**.
8. Click **Next** to skip the Configure OS introduction page.
9. Review the network resource assignment. You can edit the fields, if needed. Click **Next**.

Note: Verify with your administrator that the network interface, such as net_30, is available. The list is possible interfaces, the available interfaces is not known.

10. Select **Do not assign to a Server Pool**. The new server will execute in standalone mode. You can add the server to a pool at a later time. Click **Next**.
11. Review the Configure OS Summary page, then click **Next**.
12. Select **Now** to schedule the job for now. Click **Apply** to apply the deployment plan.

The provisioning job takes time to complete. You can view the progress and status of the provisioning job from the Jobs pane.

When the job is completed, go to **Assets** and expand **Servers** to see your operating system. Click the operating system in the Navigation pane to display the details in the center pane.

What's Next?

You can use the OS Provisioning and OS Configuration profiles to consistently and quickly provision and update your Oracle Solaris 10 operating system. You can use the profiles and plans to define which components must be installed and the level of automation during the installation. You can identify dependencies, download update packages or updates from the appropriate vendor sites, maintain consistent component configuration of your systems to the latest security updates.

Depending on the plan, you can either use the OS Provisioning and OS Configuration profiles or the Provision OS deployment plan as steps in the following plans:

- **Install Server:** This multi-step plan contains steps that use profiles to deploy a server. With this plan you can provision the OS, update the BIOS, update the OS, install software, execute preinstall and postinstall scripts, add operational profiles, add monitoring profiles, and create guests.
- **Configure and Install Dynamic System Domain:** This multi-step plan contains steps that use a profile to create a Dynamic System Domain and the Install Server plan to install and update the OS.
- **Configure M-Series Hardware, Create and Install Domain:** This complex plan contains steps that use profiles to configure a service processor, update firmware, and create a Dynamic System Domain. You can add a step to use the Install Server plan to install and update the OS on an M-series system.
- **Configure Server Hardware and Install OS:** This complex plan contains steps that use profiles to configure the service processor, configure the RAID Controller, and update firmware. You can add a step to use the Install Server plan to install and update the OS.

When you create a multi-step or complex plan from the template, you often have the choice to add or skip steps. You can choose to skip steps, such as updating the BIOS.

Once provisioned, you can associate a storage library with the global zone, deploy zones on the operating system, or monitor and manage the system. Go to http://docs.oracle.com/cd/E40871_01/nav/operatehowto.htm for information about how to use Oracle Enterprise Manager Ops Center to help you operate your environment.
