Preface

Oracle Big Data Discovery is a set of end-to-end visual analytic capabilities that leverage the power of Hadoop to transform raw data into business insight in minutes, without the need to learn complex products or rely only on highly skilled resources.

About this guide

This guide describes how to download, deploy, verify, and validate the Enterprise Manager Plug-in for Big Data Discovery. The plug-in extends Oracle Enterprise Manager Cloud Control to add support for monitoring, diagnosing, and managing Oracle Big Data Discovery.

Audience

This guide is intended for administrators who are using Enterprise Manager Cloud Control to monitor and manage an Oracle Big Data Discovery environment.

Conventions

The following conventions are used in this document.

Typographic conventions

The following table describes the typographic conventions used in this document.

Typeface	Meaning
User Interface Elements	This formatting is used for graphical user interface elements such as pages, dialog boxes, buttons, and fields.
Code Sample	This formatting is used for sample code segments within a paragraph.
Variable	This formatting is used for variable values. For variables within a code sample, the formatting is Variable.
File Path	This formatting is used for file names and paths.

Symbol conventions

The following table describes symbol conventions used in this document.

Preface 5

Symbol	Description	Example	Meaning
>	The right angle bracket, or greater-than sign, indicates menu item selections in a graphic user interface.	File > New > Project	From the File menu, choose New, then from the New submenu, choose Project.

Path variable conventions

This table describes the path variable conventions used in this document.

Path variable	Meaning	
\$ORACLE_HOME	Indicates the absolute path to your Oracle Middleware home directory, where BDD and WebLogic Server are installed.	
\$BDD_HOME	Indicates the absolute path to your Oracle Big Data Discovery home directory, \$ORACLE_HOME/BDD- <version>.</version>	
\$DOMAIN_HOME	Indicates the absolute path to your WebLogic domain home directory. example, if your domain is named bdd- <version>_domain, then \$DOMAIN_HOME is \$ORACLE_HOME/user_projects/domains/bdd <version>_domain.</version></version>	
\$DGRAPH_HOME	Indicates the absolute path to your Dgraph home directory, \$BDD_HOME/dgraph.	

Contacting Oracle Customer Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. This includes important information regarding Oracle software, implementation questions, product and solution help, as well as overall news and updates from Oracle.

You can contact Oracle Customer Support through Oracle's Support portal, My Oracle Support at https://support.oracle.com.

This section covers the steps for installing, upgrading, or uninstalling the *Enterprise Manager Plug-in for Big Data Discovery*.

Adding Big Data Discovery targets

Verifying and Validating the Plug-in

Upgrading the Plug-in

Undeploying the Plug-in

Documentation Accessibility

Description

The Enterprise Manager Plug-in for Big Data Discovery extends Oracle Enterprise Manager Cloud Control to add support for monitoring, diagnosing, and managing Oracle Big Data Discovery and its components.

By deploying the plug-in within your Cloud Control environment, you gain the following management features:

- · Monitor the availability and performance of Big Data Discovery components.
- · Perform administrative operations such as starting and stopping Dgraph nodes.
- View logging information for each Big Data Discovery component including Dgraph request logs.
- Perform trend analysis on collected performance information.
- · Gain access to rich out-of-box reports.

When the plug-in is deployed, its version displays as **13.1.1.1.0** on the **View>Plug-ins >Only Deployed** filtered listing of deployed plug-ins.

Supported Versions

This plug-in supports the following versions of Oracle products:

- Enterprise Manager Cloud Control 13c Release 1 (or higher).
- Oracle Big Data Discovery 1.1.0 or higher.

Prerequisites

The following prerequisites must be met before you can deploy the plug-in:

- Oracle Big Data Discovery 1.1.0 or higher is installed.
- The following components of Oracle Enterprise Manager Cloud Control 13c Release 1 or higher are installed:
 - Oracle Management Service with Oracle Management Repository
 - Oracle Management Agent for Linux
- For remote Agent monitoring, a remote Agent must be properly configured. See *Configuring a Remote Management Agent on page 8*.
- Set user privileges for the Job System of Enterprise Manager. For the procedure, refer to "Setting Credentials for the Job System to Work with Enterprise Manager" in the *Database Installation Guide for Microsoft Windows* (E24186-04).

This guide is listed in the Installing and Upgrading section of the Oracle Database Documentation Library at: http://www.oracle.com/pls/db112/homepage.

Upgrading from Version 12.1.0.2.0

If you have Version 12.1.0.2.0 of the Enterprise Manager Plug-in for Big Data Discovery, you must first upgrade your Enterprise Manager Cloud Control to Version 13c Release 1 (or higher) before you can install Version 13c Release 1 of the plug-in.

After the upgrade, all BDD targets discovered in the EM 12c plugin should also exist in the new EM 13c plugin and be workable. So there is no need to deploy the new BDD plug-in and discover those BDD targets again.

Downloading the Plug-in

You can download plug-ins in online or offline mode. Online mode refers to an environment where you have Internet connectivity and can download the plug-in directly through Enterprise Manager from My Oracle Support. Offline mode refers to an environment where you do not have Internet connectivity, or where the plug-in is not available from My Oracle Support.

See the Managing Plug-ins chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for details on downloading the plug-in in either mode:

http://docs.oracle.com/cd/E63000_01/EMADM/plugin_mngr.htm#CJGBEAHJ

Configuring a Remote Management Agent

Enterprise Manager uses remote agents as a communication mechanism to monitor and manage host machines. You must install and configure a remote agent on any host machine running Big Data Discovery nodes. Enterprise Manager can then monitor the host, discover any Big Data Discovery targets running on the host, and manage the targets.

To configure a remote agent:

- Log in to Enterprise Manager Cloud Control.
- Select Setup>Add Target>Add Targets Manually.
- 3. Select Add Host Targets and click Add Host...
- On the Add Host Targets: Host and Platform page, click + Add and do the following:
 - (a) In Host field, specify the fully qualified name of the host where you want to install the remote agent.
 - (b) From the **Platform** list, select the appropriate platform.
 - For example, this is typically Linux x86-64.
 - (c) Specify as many target hosts as necessary.
 - (d) Click Next.
- 5. On the Add Host Targets: Installation Details page, do the following:
 - (a) In Installation Base Directory field, specify the path to install the remote agent into.
 - For example, the typical installation path is /localdisk/basedir.
 - (b) The **Instance Directory** name is populated by default based on the **Installation Base Directory** value. You should not have to change this value.
 - (c) In Named Credential field, click the + icon.
- 6. In the Create new Named Credential dialog, specify the following:
 - (a) In **UserName**, specify the user who has privileges to log into the host where you want to install the remote agent.
 - (b) In Password and Confirm Password, specify the corresponding password for the user.
 - (c) In Run Privilege, select Sudo.
 - (d) In Run as, specify root.
 - (e) Click OK.

The user you specify must have write privileges to create an installation directory on the host.

7. In the **Privileged Delegation Setting**, add -s to the list of command line arguments.

For example:

/usr/bin/sudo -S -u %RUNAS% %COMMAND%

8. At the top of the Add Host Targets: Installation Details page, click Next.

9. On the Add Host Targets: Review page, confirm the information and click Deploy Agent.

It may take a few moments to install the remote agent on the host. If you specified multiple target hosts in step 4, Enterprise Manager deploys an agent to each host.

10. Click Done.

Deploying the Plug-in

You can deploy the plug-in to an Oracle Management Service instance using the Enterprise Manager Cloud Control console, or using the EM Command Line Interface (EMCLI).

The console and the command line interface let you deploy one plug-in at a time or multiple plug-ins.

For instructions on deploying the plug-in, see the "Managing Plug-ins" chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide*:

http://docs.oracle.com/cd/E63000_01/EMADM/plugin_mngr.htm#CHDBGHFE

Adding Big Data Discovery targets

After deploying the plug-in, follow the steps below to manually discover Big Data Discovery targets and add the targets to Enterprise Manager for central monitoring and management. Also, as part of this procedure, you promote the targets after they have been discovered.

Remember that discovering Big Data Discovery targets identifies the components on their host machines. Promoting the targets adds them to Enterprise Manager for central monitoring and management.

To discover targets:

- Log in to Enterprise Manager Cloud Control.
- 2. Click Setup>Add Target>Add Targets Manually.
- 3. Select Add Targets Using Guided Process.
- From the Target Types list, choose Oracle Big Data Discovery and click Add Using Guided Process.
- On the Add Oracle Big Data Discovery Targets: Select Hosts page, click + Add to display a list of hosts.
- On the Search and Select: Host page, select one or more host names where Big Data Discovery is installed and click Select.
- 7. Specify a path to the installation for **Big Data Installation Home**.
 - For example, a typical default value is /localdisk/Oracle/Middleware/BDD1.1.1.
- 8. Set preferred credentials for a host:
 - (a) Select a host name from the table.
 - (b) Click Set Credential and Selected Host.
 - Note that the **Test Connection** button on the lets the system validate if the provided credentials are correct.
 - (c) Specify **UserName** and **Password** values to access a host.

- (d) Click OK.
- 9. Click Next.
- On the Add Oracle Big Data Discovery Targets: Select Targets page, choose a specific cluster from Cluster Name.
- 11. Select one or more targets within that cluster to promote.
- For any Studio targets on this page, specify the WebLogic username and password under WebLogic Authentication.
- 13. If a Studio target is installed with one-way or two-way SSL model, the Guided Process page automatically enables or disables the related SSL fields. Depending on how SSL is enabled for Studio, do one of the following so that Enterprise Manager can access the secured targets:
 - If Studio is configured in one-way SSL mode, provide the Trust Keystore file name and path, type and passphrase for Studio targets only in the SSL Trust Keystore Authentication field.
 - If Studio is configured in two-way SSL mode, provide the corresponding keystore file names and paths, types and passphrases for Studio targets in both the SSL Trust Keystore Authentication and the SLL Keystore Authentication fields.

These SSL fields have the same meaning as their WebLogic counterparts.

Note: Enabling SSL for Studio activates default demo keystores in Weblogic, which you should replace with your own certificates after deployment.

For additional information on the plug-in requirements for a securely deployed Studio, see the section on Enterprise Manager plug-in in the *Oracle Big Data Discovery Administrator's Guide*.

- 14. Click Next.
- 15. On the Add Oracle Big Data Discovery Targets: Review page, click Submit.

You can confirm that Enterprise Manager is managing the targets by selecting **Targets > All Targets** and expanding the **Target Type > Middleware** folder. You'll see the Target Name (the Big Data Discovery hosts) and the Target Type (the Big Data Discovery components).

Verifying and Validating the Plug-in

After waiting a few minutes for the plug-in to start collecting data, follow the steps below to verify and validate that Enterprise Manager is properly monitoring the plug-in target.

To verify and validate the plug-in:

- Click Targets, then All Targets.
- On the All Targets page, expand Target Type>Middleware and select an Oracle Big Data Discovery Cluster.

The target home page displays.

Upgrading the Plug-in

The Self Update feature allows you to expand Enterprise Manager's capabilities by updating Enterprise Manager components whenever new or updated features become available. Updated plug-ins are made available via the Enterprise Manager Store, an external site that is periodically checked by Enterprise Manager Cloud Control to obtain information about updates ready for download.

See the Updating Cloud Control chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for steps to update the plug-in:

http://docs.oracle.com/cd/E63000_01/EMADM/self_update.htm#CHDCGJBJ

Undeploying the Plug-in

See the Managing Plug-ins chapter in the *Oracle Enterprise Manager Cloud Control Administrator's Guide* for steps to undeploy the plug-in:

http://docs.oracle.com/cd/E63000_01/EMADM/plugin_mngr.htm#CHDFDJAB

Documentation Accessibility
