This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS. Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

Documentation Accessibility

For information about Oracle's commitment to accessibility, visit the Oracle Accessibility Program website at <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=docacc>.

Access to Oracle Support

Oracle customers that have purchased support have access to electronic support through My Oracle Support. For information, visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=info> or visit <http://www.oracle.com/pls/topic/lookup?ctx=acc&id=trs> if you are hearing impaired.

Using This Documentation

- **Overview** – Provides command descriptions, syntax, and examples for the Oracle Fabric OS 1.0.2 on the Oracle Infiniband Switch IS2-46 and the Oracle Fabric Interconnect F2-12.
- **Audience** – Technicians, system administrators, and authorized service providers.
- **Required knowledge** – Advanced experience troubleshooting and maintaining hardware.

Product Documentation Library

Documentation and resources for this product and related products are available at http://docs.oracle.com/cd/E64522_01.

Feedback

Provide feedback about this documentation at <http://www.oracle.com/goto/docfeedback>.

Using CLI Commands

These topics describe how to use the CLI commands in Oracle Fabric OS to manage the Oracle InfiniBand Switch IS2-46 (the leaf switch), the Oracle EDR InfiniBand Fabric, and the Oracle Fabric Interconnect F2-12 switch (the virtualization switch) For detailed information about concepts and procedures, refer to the [Oracle Fabric OS 1.0.2 Administration Guide](#).

The Oracle Fabric OS includes commands to configure the following elements:

- Virtual Resources – These resources, such as [vNICs](#) and [vHBAs](#), provide virtual I/O for your systems. VHBAs and modules are supported only on the virtualization switch.
- File System – A file storage system.
- Hardware – Servers, I/O cards, and system logs.
- Scripting Engine – Ability to run scripts within the Oracle Fabric OS for each I/O card. The engine also enables you to define new commands. Script support in the Oracle Fabric OS includes a full text editor for writing and revising your scripts. Refer to [“Creating Scripts” in Oracle Fabric OS 1.0.2 Administration Guide](#).

- [“Command Overview” on page 13](#)
- [“Help” on page 14](#)
- [“Keyboard Shortcuts” on page 15](#)
- [“Command History” on page 15](#)
- [“Other Commands” on page 15](#)
- [“Oracle Fabric Manager Login” on page 19](#)
- [“Oracle Fabric OS Login” on page 19](#)

Command Overview

The Oracle Fabric OS includes a powerful command-completion feature that informs you of possible commands, subcommands, and options at each point on the command line. The following kinds of command completion are available:

- To complete an unambiguous entry, press the Tab key.

- If your entry is unambiguous, the Oracle Fabric OS completes the command or subcommand that you have begun typing. For example:

```
[OFOS] add server-[Tab]
```

To see valid completions at any point, type ? on the command line.

Note - The Oracle Fabric OS prompt is `admin@hostname[OFOS]`, where your *hostname* is inserted. The prompt is not customizable. In the remaining topics, the prompt is simply shown as `[OFOS]`.

Typing a question mark causes the Oracle Fabric OS to print a list of valid completions, and some short help text for each item, for what is currently on the command line. For example, if you enter the following, the output below shows what is displayed.

```
[OFOS] ad?
```

The Oracle Fabric OS responds with the following output:

```
command::Possible completions:
  add      usercli::add
```

Help

In addition to command completion, the Oracle Fabric OS includes online help topics at various levels. To access these topics, type `help command`. The Oracle Fabric OS displays the detailed help topic for that item, if a topic is available.

Certain higher-level concepts also have help topics within the Oracle Fabric OS. Type `help TopicName` to see these help items.

For example, to view the help topic about adding a [vNIC](#):

```
[OFOS] help add vnic
```

```
Add a new virtual Network Interface Card (vNIC) to the system. You must provide a hierarchical name for the vNIC at the time that it is added. A 'hierarchical' name includes the name of the vNIC, plus the name of the server profile to which A second (optional) parameter of the 'add' command specifies the termination for the vNIC. A vNIC can be terminated on an I/O port. For example, when you type:
add vnic vNIC_name.server_profile_name slot/port,
the vNIC is assigned. The two names are separated by the dot '.' character. For example:
add vnic vNIC_name.server_profile_name.
```

Keyboard Shortcuts

While entering a command, you can move around in the command-line text and edit it. The following list shows the control key strokes that are available:

- Left and right arrow keys: Move the cursor to either the left or to the right on the command line.
- Up and down arrow keys: Scroll up and down in the command history.
- Ctrl-L: Retype the line.
- Ctrl-U: Erase the line.
- Ctrl-C: Quit the command.
- Ctrl-R: Search the command history.
- Ctrl-E: Move to the end of the command.
- Ctrl-A: Move to the beginning of the command.

Command History

The Oracle Fabric OS maintains a history of the commands that you have entered over multiple sessions. Use the up and down arrows to scroll through the command history and find a specific command. When you find the desired command, press the carriage return on the keyboard to execute that command.

You can also search the command history for a sequence of characters using Ctrl-R. As you type characters after Ctrl-R, the Oracle Fabric OS searches backwards through the command history for commands containing those characters. To select a command found this way, press Return. Alternatively, use Ctrl-R again to continue the search.

Other Commands

- [“Output Redirection” on page 16](#)
- [“Wildcards” on page 16](#)
- [“Pipes” on page 17](#)
- [“Filters” on page 17](#)
- [“Naming Conventions” on page 18](#)

Output Redirection

Redirect the output from any command may be redirected to a file by placing a > sign, followed by a filename at the end of the command. For example, typing the following runs the command and place the output in a file called `allvnics` in the current directory:

```
[OFOS] show vnics > allvnics
```

Another way to redirect the command output is to execute the command inside backtick characters and then place the result in a variable. For example, typing the following displays the variable `vnics`, which contains a vector of lines containing the output from the `show -list vnics` command:

```
[OFOS] var vnics = 'show -list vnics'
```

Wildcards

Use wildcards to control the display of output. Wildcards can be used in most of the Oracle Fabric OS show commands to select a set of objects. The only wildcard character supported is the asterisk (*) which causes zero or more of any character to be displayed in the show command. Wildcards can also represent entire names.

Strings you create with wildcards are case sensitive, ensure you enter the wildcard item correctly. For example, vNICs named `vn1c1` and `vn1c2` are not displayed if you issue `show vn1c V*`. If you type `show vn1c v*` with a lowercase `v`, the vNICs are displayed.

Note - Not all show commands support the use of wildcards. For example, LAGs and VLANs do not support them for selecting the LAG name or VLAN number.

Typing the following displays a list of all vNICs with `v` as the first letter:

```
[OFOS] show vn1c v*
```

The wildcard character represents zero or more characters in a name string starting with `v`.

Typing the following results in a list of all vNICs on all server profiles that contain the string `test` in their names:

```
[OFOS] show vn1c *.*test*
```

The first wildcard represents an entire name, and the second and third represent individual characters.

Pipes

Use pipes to control the display of output in the Oracle Fabric OS. Pipes in the Oracle Fabric OS are like standard UNIX pipes, and they use the same syntax. Typing the following displays all vNICs in the down state:

```
[OFOS] show vnic * | grep down
```

The Oracle Fabric OS pipes work with any command, but is most effective when coupled with the `grep` command. Pipes are not limited to only one set of pipes; many stages in the pipeline are supported.

Filters

The Oracle Fabric OS supports command filters, which are boolean expressions that operate on columns of object output. You can use filters to specify objects that will be displayed in the output of the following `show` commands:

- `show vnic`
- `show vhba`
- `show server-profile`
- `show physical-server`

To specify a filter for these commands, append a “where” clause containing operands and operators. Examples are provided later in this topic.

Filters determine specific output (the table columns) that will be displayed when you issue one of the listed commands. The value of a table column in a `show` command can be compared to a constant using one of the operators in the following table.

| Operator | Means |
|----------|--------------------------|
|) | Close expression |
| = | Equal to |
| <> | Not equal to |
| < | Less than |
| <= | Less than or equal to |
| > | Greater than |
| >= | Greater than or equal to |
| like | Regular expression match |

Expressions can be combined using “and”, “or”, and “xor”. Expressions can also be enclosed in parentheses.

Type the following to display all vNICs terminated on interface 1/1:

```
[OFOS] show vnic * where if = 1/1
```

Type the following to display vNICs with a name that starts with `priv` and are on the `prod` server profile, filtering those with an `if-state` column (interface state) that is not up:

```
[OFOS] show vnic priv*.prod where if-state <> up
```

Type the following to display all server-profiles that are connected to an external switch and are up:

```
[OFOS] show server-profile * where connection like "extsw" and state = up
```

Type the following to display all server profiles that have a vNIC or vHBA on them:

```
[OFOS] show server-profile * where vnics > 0
```

Naming Conventions

Follow these naming guidelines for object names in the Oracle Virtual Networking information model. Following is a partial list of characters to avoid when naming server profiles and vNICs and vHBAs:

- The `$` is used by the for textual replacement of expressions.
- The `/` (slash), the `^` (caret), and the `%` (percent sign) cause errors and prevent the named item from being displayed.
- The `:` (colon) causes a permissions error.

Internal blank spaces are accepted when they are enclosed in quotation marks. For example, a server profile named “web apps” is valid, but `web apps` is not.

Follow these guidelines to name objects for the Oracle Fabric OS:

- Characters accepted in the names of vNICs and vHBAs include alphanumeric and underscore (`_`). Avoid using other characters.
- Characters accepted in the other objects (for example, server profiles) include alphanumeric, dash (`-`), and underscores (`_`). Avoid using other characters.

The names you can set on virtual I/O resources can contain a restricted character set. Names of vNICs and vHBAs can contain the following:

- The letters A-Z and a-z

- The numerals 0-9
- The underscore character (_)

All other virtual I/O resources, such as server profiles, can contain:

- The letters A-Z and a-z
- The numerals 0-9
- The underscore character (_)
- A dash (-)

The names of virtual resources are restricted to the following lengths:

- A vNIC – Between 2 and 10 characters
- A vHBA – Between 2 and 15 characters
- Server profiles – Between 1 and 31 characters

Oracle Fabric OS Login

You can log in to the Oracle Fabric OS using the console or SSH. Telnet is not supported. Up to 20 concurrent Oracle Fabric OS sessions can be established on the chassis (limited by the number of instances available in the address object). For more information, refer to [“Choosing a Login Method” in Oracle Fabric OS 1.0.2 Administration Guide](#).

Oracle Fabric Manager Login

You can log in to the Oracle Fabric Manager GUI using a browser and your own account or the default account. Refer to [“Log In to Oracle Fabric Manager” in Oracle Fabric Manager 5.0.2 Installation Guide](#).

Generally, you will log in to the Oracle Fabric Manager CLI using a secure shell and your own account or the default account. Refer to [“Log in to the CLI” in Oracle Fabric Manager 5.0.0 Command Reference](#).

Configuring Oracle Fabric OS

These topics describe commands that configure and display the Oracle Fabric OS CLI.

| Command | Link |
|--------------------|---|
| set cli | “set cli” on page 21 |
| show cli | “show cli” on page 23 |
| cli record-script | “cli record-script” on page 25 |
| cli stop-recording | “cli stop-recording” on page 25 |

set cli

The `set cli` command configures different attributes of the CLI.

Syntax

```
set cli autocommit {off|on} [-noconfirm]
set cli block-entry {off|on}
set cli color {off|on}
set cli cols number
set cli confirm {off|on}
set cli echo {off|on}
set cli idle-timeout minutes
set cli mode {expert|user|xml}
set cli paging {off|on}
set cli progress-bar {off|on}
set cli prompt {custom value|normal}
set cli rows number
set cli space-completion {off|on}
set cli wrap {off|on}
```

where:

- *minutes* is the number of minutes an idle-timeout will last.

- *number* is the number of columns or rows on the screen.
- *value* is the CLI prompt.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------------|--|
| autocommit | Controls whether the CLI automatically commits after each change: <ul style="list-style-type: none"> ■ <i>on</i> – The default is <i>on</i>. When a CLI command is complete, the system automatically commits the changes to the configuration database. ■ <i>off</i> – When set to <i>off</i>, any changes must be manually written to the database using the <i>commit</i> command. Choosing <i>off</i> lets you make a set of changes and then commit the changes as a group. |
| block-entry | Controls whether the CLI prompts for the entry of scripting blocks, such as “foreach”. |
| color | Controls whether the CLI displays colors for command output in a session. Only output is displayed in color. Command prompts and command text is monochrome. By default, colors are displayed, but setting <i>color</i> to <i>off</i> returns the screen to monochrome display. |
| cols | Sets the number of columns on the terminal screen. The default is the screen size for your monitor. Setting row size might not be available through a TTY/console port. |
| confirm | Sets the CLI confirmation mode. If the mode is set to <i>on</i> , the CLI confirms dangerous commands. |
| echo | Displays all CLI communication. Choosing <i>on</i> echoes all commands to the terminal screen. The default is <i>off</i> . |
| history | Sets the number of saved history commands to display. The buffer limit size is 512 commands per user. The log is persistent across CLI login sessions. |
| idle-timeout | After a specified number of idle minutes, the CLI session times out. Configure a value of 0 to configure an infinite CLI timeout (no timeout). The default is 30 minutes. |
| mode | Controls the CLI mode. The default is <i>user</i> . |
| paging | Sets the CLI paging mode. When set to <i>on</i> , the display output stops when the screen is full. When paging mode is <i>off</i> , the output does not stop at the end of the page. |
| progress-bar | Determines if a progress bar is displayed on the screen for commands that are expected to take a long time to execute. |
| prompt | Controls the current CLI prompt mode. The custom keyword sets the prompt to be an arbitrary CLI expression. The normal keyword sets the prompt to be the full name of the current object, such as <code>admin@nsn150-162[OFOS]</code> . <ul style="list-style-type: none"> ■ <i>custom</i> – Sets the prompt to an arbitrary CLI expression. ■ <i>normal</i> – Sets the prompt to the full name of the current object. |
| rows | Sets the number of rows on the terminal screen. The default is the screen size for your monitor. Setting row size might not be available through a TTY/console port. |
| space-completion | Controls whether the CLI completes commands when the spacebar is pressed. The default is <i>on</i> . |
| wrap | Controls whether the CLI wraps text at the end of line. The default is <i>on</i> . |

Options

| Option | Description |
|------------|--|
| -noconfirm | Turns off the confirmation when configuring or displaying the CLI. |

Example: Controlling Echo on the Command Line

This example shows how to turn echo on and off on the command line.

```
[OFOS] set cli echo on
[OFOS] add server-profile foo
add server-profile foo
add server virtual "foo"
    // if a template was specified, apply it now
top
top
commit noconfirm
[OFOS] set cli echo off
set cli echo off
```

show cli

The `show cli` command displays information about the attributes of the CLI.

Syntax

```
show cli autocommit
show cli block-entry
show cli color
show cli cols
show cli command name
show cli commands name
show cli confirm
show cli echo
show cli history number
show cli idle-timeout
show cli keys
show cli loaded-commands
show cli mode
show cli paging
```

```

show cli progress-bar
show cli prompt
show cli rows
show cli space-completion
show cli user
show cli wrap

```

where:

- *name* is the name of the CLI command.
- *number* is the number of saved history commands to display.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|--------------|--|
| autocommit | <ul style="list-style-type: none"> ■ on – The default is on. When a CLI command is complete, the system automatically commits the changes to the configuration database. ■ off – When set to off, any changes must be manually written to the database using the <code>commit</code> command. Choosing <code>off</code> lets you make a set of changes and then commit the changes as a group. |
| block-entry | Controls whether the CLI prompts for the entry of scripting blocks, such as “for each”. |
| color | Controls whether the CLI displays colors for command output in a session. Only output is displayed in color. Command prompts and command text is monochrome. By default, colors are displayed, but setting <code>color off</code> returns the screen to monochrome display. |
| cols | Sets the number of columns on the terminal screen. The default is the screen size for your monitor. Setting row size might not be available through a TTY/console port. |
| command | Reflects the name of the commands to display. |
| rows | Sets the number of rows on the terminal screen. The default is the screen size for your monitor. Setting row size might not be available through a TTY/console port. |
| confirm | Sets the CLI confirmation mode. If the mode is set to <code>on</code> , the CLI confirms dangerous commands. |
| echo | Displays all CLI communication. Choosing <code>on</code> echoes all commands to the terminal screen. The default is <code>off</code> . |
| history | Sets the number of saved history commands to display. The buffer limit size is 512 commands per user. The log is persistent across CLI login sessions. |
| idle-timeout | After a specified number of idle minutes, the CLI session times out. Configure a value of <code>0</code> to configure an infinite CLI timeout (no timeout). |
| mode | Controls the CLI mode. The default is <code>user</code> . |
| paging | Sets the CLI paging mode. When set to <code>on</code> , the display output stops when the screen is full. When paging mode is <code>off</code> , the output does not stop at the end of the page. |
| progress-bar | Determines if a progress bar is displayed on the screen for commands that are expected to take a long time to execute. |
| prompt | Controls the current CLI prompt mode. The custom keyword sets the prompt to be an arbitrary CLI expression. The normal keyword sets the prompt to be the full name of the current object, such as <code>admin@nsn150-162[0F05]</code> . |

| Subcommand | Description |
|-------------------------------|---|
| | <ul style="list-style-type: none">■ <code>custom</code> – Sets the prompt to an arbitrary CLI expression.■ <code>normal</code> – Sets the prompt to the full name of the current object. |
| <code>space-completion</code> | Controls whether the CLI completes commands when the spacebar is pressed. The default is on. |
| <code>wrap</code> | Controls whether the CLI wraps text at the end of line. The default is on. |

cli record-script

The `cli record-script` command starts the command-line recording tool to capture commands in a management session in the exact sequence that the commands were issued. The commands are saved to a script that you name.

Syntax

```
cli record-script name  
cli stop-recording
```

where *name* is the name of the recording script that you create.

cli stop-recording

The `cli stop-recording` command stops the command-line recording tool that captures commands in a management session in the exact sequence that the commands were issued.

Syntax

```
cli stop-recording
```

Understanding Hardware Commands

These topics describe how to use the CLI to view hardware status, and configure I/O cards and ports:

- I/O cards – Adds, removes, and displays available I/O line card information.
- I/O ports – Displays state and configuration information on an I/O port.
- FC cards – Controls the operational state of an FC card.
- FC ports – Configures the attributes of an FC port.
- Gateway ports – Configures gateway port information. A gateway port is a general term that includes both IB ports and Ethernet gateway ports.
- Configurable ports – Allows you to configure up to two additional ports. These ports can be IB ports or 40 Gb Ethernet ports.

Note - FC storage is supported for the Oracle Fabric Interconnect F2-12 [virtualization switch](#), but not for the [leaf switch](#).

| Command | Link |
|-----------------------|---|
| help | “help” on page 28 |
| fc-card | “fc-card” on page 29 |
| set fc-port | “fc-port” on page 31 |
| show fc-port | |
| set gw-port | “gw-port” on page 38 |
| show gw-port | |
| iocard | “iocard” on page 33 |
| show ioport | “ioport” on page 37 |
| set multiconfig-port | “multiconfig-port” on page 39 |
| show multiconfig-port | |
| show config | “show config” on page 40 |
| show hardware | “show hardware” on page 42 |
| show physical-server | “show physical-server” on page 43 |
| show system info | “show system info” on page 45 |

help

The `help` command displays the detailed help topic for that command, if help is available.

Syntax

For example, to view the help topic about adding a [vNIC](#):

```
help command | class
```

where:

- *command* is the command for which you need assistance.
- *class* is the category of commands.

Description

This hardware command provides help information for supported commands. Typically, the same information is provided using the `-h` option.

Type `help` to get more information on topics like these:

- Getting-started – Information about getting started with the system.
- Scripts – Information about the use of scripts.
- Concepts – High-level concepts describing the Oracle Fabric OS.
- VLANs – Virtual LAN features.

Example: Viewing Help

This example shows how to view the help topic for adding a vNIC:

```
[OFOS] help add vnic
```

```
Add a new virtual Network Interface Card (vNIC) to the system. You must provide a hierarchical name for the vNIC at the time that it is added. A 'hierarchical' name includes the name of the vNIC, plus the name of the server profile to which A second (optional) parameter of the 'add' command specifies the termination forth vNIC. A vNIC can be terminated on an I/O port. For example:  
'add vnic <vNIC_name>.<server_profile_name> slot/port'. The vNIC is assigned. The two names are separated by the dot '.' character. For example:
```

```
'add vnic <vNIC_name>.<server_profile_name>'
```

fc-card

The `fc-card` command controls and displays the operational state of the FC card. Commands that affect card state also affect the FC ports on the cards, and in turn, the vHBAs that are supported on the port. You can use FC storage, vHBAs, and I/O modules on a [virtualization switch](#), but not on a [leaf switch](#). For more information about the FC module that works with the virtualization switch, refer to the [Oracle Fabric Interconnect F2-12 Product Page](#).

Syntax

```
remove fc-card {*|slot}
set fc-card {*|slot} [-descr=text]
show fc-card {*|slot} alarms
show fc-card {*|slot} dmesg
show fc-card {*|slot} errors
show fc-card {*|slot} ioport port-number wildcard
show fc-card {*|slot} ioports
show fc-card {*|slot} stats
show fc-card {*|slot} utilization
show fc-card {*|slot} vhas
show fc-card {*|slot} warnings
```

where:

- *slot* specifies the physical slot where the command will be applied. An asterisk (*) specifies all available FC cards.
- *port-number* specifies a particular FC port for which information will be displayed.
- *wildcard* specifies selected wildcard characters (for example, *) to facilitate executing a command for one or more FC cards.

These hardware commands have subcommands that determine their functionality. This table describes the *subcommands* and provides their syntax.

| Subcommand | Description |
|------------|--|
| alarms | Displays alarms for the specified card. |
| dmesg | Displays base OS messages. |
| errors | Displays error alarms for the FC card. |
| ioport | Displays information for the port on the FC card. |
| ioports | Displays information for all ports on the FC card. |

| Subcommand | Description |
|-------------|--|
| stats | Shows FC card statistics. |
| utilization | Displays FC card utilization. |
| vhbas | Displays a list of vHBAs connected to the FC card. |
| warnings | Displays warning alarms for the FC card. |

Options

| Option | Description |
|---------|--|
| -descr | Applies a text description to the FC card. Quotes are required around multiple words containing spaces in between. |
| -detail | Displays detailed information for the card. Optional. |

Example: Configure an FC Card

This example shows how to add a description to an FC card in slot 11 and then view the card's information for port 1.

```
[OFOS] set fc-card 11 -descr=SalesWest
[OFOS] show fc-card 11 ioport 1
-----
name                11/1
type                sanFc16GbPort
state              up/down
descr              SalesWest
wwnn                50:01:39:71:00:56:70:65
wwpn                50:01:39:70:00:56:70:65
rate                auto/16Gbps
frame-size          2048/2048
exec-throttle       65535
int-delay           1000
fc-link-down-timeout 30
login-retry         8
login-timeout       4
fc-target-port-down-timeout 30
topo                F
loop-delay          5
tape-support        true
sfp-type            16G
vhbas_2Mb_mtu_size  0
vhbas               0
-----
1 record displayed
```

fc-port

The `fc-port` command configures and displays the attributes of the FC port. FC storage is supported for the [virtualization switch](#), but not for the [leaf switch](#).

```
set fc-port {*|slot/port} [-descr=text]
set fc-port {*|slot/port} [-fc-link-down-timeout={number|default}]
set fc-port {*|slot/port} [-fc-target-port-down-timeout={number|default}]
set fc-port {*|slot/port} [-topology={f-port|l-port|n-port}]
show fc-port {*|slot/port} [-detail]
show fc-port {*|slot} alarms [-detail]
show fc-port {*|slot} stats [-detail]
show fc-port {*|slot} vhbases [-detail]
show fc-ports {*|slot/port} [-detail]
```

Syntax

where `slot/port` specifies the physical slot and port coordinate to be configured. An asterisk (*) specifies all available FC cards. You can configure FC ports on a [virtualization switch](#), but not on a [leaf switch](#).

These hardware commands have subcommands that determine their functionality. This table describes the *subcommands* and provides their syntax.

| Subcommand | Description |
|------------|--|
| alarms | Displays alarms for the specified port. |
| stats | Shows FC port statistics. |
| vhbas | Displays a list of vHBAs connected to the FC port. |

Options

| Option | Description |
|-----------------------|--|
| -descr | Applies a text description to the FC port. Quotes are required around multiple words containing spaces in between. |
| -detail | An optional modifier that displays detailed information (if available) for the FC port. |
| -fc-link-down-timeout | When a fibre link goes down, the FC port waits for the specified number of seconds before declaring the fibre link down. This parameter value in seconds determines the duration for which a link can experience a loss of signal, or be non-operational before the firmware declares the link is down and sends a link down event. This parameter guards against link |

| Option | Description |
|------------------------------|---|
| | flapping and excessive reporting of link state changes when there is a constant change in the state of the link. Specify the number of seconds between 0 and 60, or do not specify any value to use the default time-out of 30 seconds. |
| -fc-target-port-down-timeout | When an FC port goes down on a target, the fabric waits for the specified number of seconds before declaring the port down. This parameter is a counter that determines the maximum number of seconds a port can remain offline. If the specified number of seconds is exceeded, the port is timed out and declared down. Specify the time-out value as the number of seconds between 0 and 60, or do not specify any value to use the default retry limit. The default limit is 30 seconds. |
| -topology | Specifies the type of storage connection to use: <ul style="list-style-type: none"> ■ f-port – Specifies a point-to-point connection to the storage device through an FC switch. This type of connection supports NPIV. This is the default configuration for an FC module. ■ l-port – Specifies a loop connection to the storage device without using an FC switch. This type of connection does not support NPIV. A port configured this way can only support a single vHBA. ■ n-port – Specifies a point-to-point connection to the storage device without using an FC switch. This type of connection supports NPIV. |

Example: Set the Link Down Timeout

This example shows how to set the FC port wait time to 45 seconds. The port will wait this length of time before declaring that the fibre link is down. The default timeout is 30 seconds.

Note - Modified settings do not become effective until you reset the I/O card. To adopt new settings, the card must be brought down, rebooted, and reinitialized using the `set iocard` command. For more information, see [“iocard” on page 33](#).

```
[OFOS] show ioport

1 record displayed

Typically, you should use the default values for FC port parameters, and change them only if absolutely necessary.

iocard

The `iocard` command adds, resets, removes, and displays available I/O line card information in the system. The [virtualization switch](#) supports up to 12 I/O cards, while the [leaf switch](#) supports only one I/O card. You can configure vHBAs on a [virtualization switch](#), but not on a [leaf switch](#).

Note - The leaf switch and the virtualization switch are always in the embedded slot. Use the `add iocard` and `remove iocard` commands only on I/O modules that are in slots 0-11. Do not use these commands on switches that are in the embedded slot.

Syntax

```

add iocard {slot|wildcard} card-type [-noconfirm]
remove iocard {*/slot}
remove iocard {*/slot} vhbases [-noconfirm]
remove iocard {*/slot} vnics [-noconfirm]
set iocard {*/slot} clear-stats [-descr=text] [-fabric-mtu=mtu] [-type=card-type]

```

```

set iocard {slot} reset [-descr=text] [-fabric-mtu=mtu] [-type=card-type]
show iocard
show iocard *
show iocard {slot|wildcard}
show iocard {slot|wildcard} alarms
show iocard {slot|wildcard} cpu [-detail]
show iocard {slot|wildcard} dmsg [-detail]
show iocard {slot|wildcard} errors
show iocard {slot|wildcard} ioport {port} [-detail]
show iocard {slot|wildcard} ioports [-detail]
show iocard {slot|wildcard} stats [-detail]
show iocard {slot|wildcard} vnics [-detail]
show iocard {slot|wildcard} warnings

```

where:

- *card-type* is the type of I/O card you are adding or configuring. For example, gwEthernet4Port10GbCard.
- *slot* is the physical slot number.
- *port* is the physical port number.

Note - The [leaf switch](#) and the [virtualization switch](#) are always in the embedded slot.

This hardware command has subcommands that determine its functionality. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|-------------|--|
| alarms | Displays alarms for the I/O card. |
| clear-stats | Clears the statistics of the I/O card. |
| cpu | Displays CPU information. |
| dmsg | Displays base OS messages for the I/O card. |
| errors | Displays I/O card errors. |
| ioport | Displays information for a specific ioport for the I/O card. |
| ioports | Displays information for all ioports for the I/O card. |
| reset | Resets an I/O card. This subcommand removes the card's power, restores the power after a few seconds, and then rediscovers the card's settings. |
| | The set iocard reset command resets only I/O modules that are located in slots 0-11. This command does not reset switches that are in the embedded slot. |
| stats | Displays statistics for the I/O card. |
| type | Specifies the type of card. |
| vhbas | Removes vHBAs connected to the I/O card. |
| vnics | Displays or removes vNICs connected to the I/O card. |
| warnings | Displays warning alarms for a specific I/O card. |

These commands are supported on I/O cards only. The front panel, SCP, and IB fabric board are not affected.

Options

| Option | Description |
|-------------|--|
| -descr | Applies a text description to the I/O card. Use quotes if there are multiple words containing spaces in the description. |
| -detail | An optional modifier that displays detailed information (if available) for the I/O card. |
| -fabric-mtu | Displays the MTU of the card's fabric. |
| -noconfirm | The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |
| -type | The type of I/O card. For example, gwEthernet4Port10GbCard. |

Reset an I/O Card

This example shows how to reset I/O card 2 and view the results.

```
[OFOS] set iocard 2 reset
Resetting IO cards will adversely affect any virtual IO resource connected to them and
thus cut I/O to the physical servers. Are you sure you want to reset the IO card in
slot 2 (y/n)? y
[OFOS] show iocard
slot      state      descr      type      v-resources
-----
1          up/down   gwEthernet4Port10GbCard  0
2          up/up     gwEthernet4Port10GbCard  0
3          up/up     gwEthernet4Port40GbCard  0
4          up/up     gwEthernet4Port10GbCard  0

5 records displayed
```

Example: Remove an I/O Card

This example shows how to display all I/O cards and remove the card in slot 3.

```
[OFOS] show iocard ?
Possible completions:
 2          sanFc2Port16GbCard in slot 2
```

```
3          gwEthernet4Port10GbCard in slot 3
4          gwEthernet4Port40GbCard in slot 4
embedded  nsmCard in slot 5
7          sanFc2Port16GbCard in slot 7
8          ibLr4Port100GbCard in slot 8
9          ibSfm4Port100GbCard in slot 9
10         ibS1m8Port100GbCard in slot 10
[OFOS] remove iocard 3
This may disrupt traffic on all physical server that happen to be using the IO card.
Remove iocard in slot 3 (y/n)? y
```

Example: Remove a VHBA on an I/O Card

This example shows how to remove all vHBAs connected to the I/O card in slot 2.

```
[OFOS] remove iocard 2 vbas
Remove all vbas from iocard in slot 2 (y/n)? y
```

Example: Display I/O Card Information

This example shows how to view information for I/O card 2.

```
[OFOS] show iocard 2
-----
slot      2
state     up/up
descr
type      gwEthernet4Port40GbCard
vnic      0
qos       default

enables   --s--
-----
1 record displayed
```

The field v-resources indicates the number of Oracle Fabric OS virtual resources (vNICs and vHBAs) that are associated with this card. vNICs can be bound only to network Ethernet cards.

Example: Display a Port on an I/O Card

This example displays port information for I/O card 3.

```
[OFOS] show iocard 3 ioport
```

| name | type | state | descr | mode | lag | access-vlan | guid |
|------|--------------------|-------|-------|-------|-----|-------------|----------------|
| 3/1 | gwEthernet10GbPort | up/up | | trunk | | 1 | 10e08b50870102 |
| 3/2 | gwEthernet10GbPort | up/up | | trunk | | 1 | 10e08b50870102 |
| 3/3 | gwEthernet10GbPort | up/up | | trunk | | 1 | 10e08b50870102 |
| 3/4 | gwEthernet10GbPort | up/up | | trunk | | 1 | 10e08b50870102 |

4 records displayed

The field `v-resources` indicates the number of Oracle Fabric OS virtual resources (vNICs and vHBAs,) that are associated with this card. vNICs can be bound only to network Ethernet cards.

ioport

The `ioport` command displays state and configuration information on an I/O port.

Syntax

```
set ioport slot/port clear-stats [-descr=text]
show ioport
show ioport *
show ioport slot/port [-detail]
show ioport slot/port alarms [-detail]
show ioport slot/port stats [-detail]
show ioport slot/port vhas [-detail]
show ioport slot/port vnics [-detail]
show ioport slot/*
```

where:

- `*` is a wildcard.
- `slot /port` are the physical slot and port numbers.

This hardware command has subcommands that determine its functionality. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|-------------|--|
| alarms | Displays alarms for the port. |
| clear-stats | Clears the statistics for the port. |
| stats | Displays statistics for the port. |
| vhas | Displays vHBAs connected to this port. |
| vnics | Displays vNICs connected to this port. |

Options

| Option | Description |
|---------|---|
| -detail | Displays detailed information for the port. Optional. |
| -descr | Applies a text description to the port. Quotes are required around multiple words containing spaces in between. |

Example: Display I/O Ports

This example shows how to view I/O port information, with and without the `-detail` option.

```
[OF05] show ioport

gw-port

The `gw-port` configures and displays the gateway port. A gateway port can be either an IB port or an Ethernet gateway port.

Syntax

```
set gw-port slot/port down
set gw-port slot/port up
show gw-port
```

where *slot/port* are the physical slot and port numbers.

These hardware commands have subcommands that determine their functionality. This table describes the *subcommands* and provides their syntax.

| Subcommand | Description |
|------------|-----------------------------|
| down | Deactivates a gateway port. |
| up | Activates a gateway port. |

Example: Display Gateway Port Information

This example shows how to display information about the gateway port.

```
[OFOS] show gw-port
```

| name | type | state | descr | mode | lag | access-vlan |
|------------|--------------------|------------------|-------|-------|-----|-------------|
| 2/1 | gwEthernet40GbPort | up/up | | trunk | | 1 |

11 records displayed

multiconfig-port

The `multiconfig-port` command allows you to configure up to two additional ports. These ports can be IB ports or 40 GbE Ethernet ports.

Syntax

```
set multiconfig-port slot/port [-port-type={gwEthernet10GbPort|gwEthernet40GbPort|ibPort}]
show multiconfig-port slot/* [-detail]
```

where *slot/port* are the physical slot/ port numbers.

Options

| Option | Description |
|------------|--|
| -detail | Displays detailed information for the port. Optional. |
| -port-type | Specifies the type of port: <ul style="list-style-type: none"> ■ gwEthernet10GbPort – 10 GbE port ■ gwEthernet40GbPort – 40 GbE port ■ ibPort – InfiniBand port |

Example: Configure an Additional Ethernet Port

This example shows how to add an 4-port 40 GbE card, and then change the port type to 10GbE.

```
[OFOS] add iocard 7 gwEthernet4Port40GbCard
[OFOS] show iocard 7 ioport
name type state descr mode lag access-vlan guid
-----
7/1 gwEthernet40GbPort up/indeterminate trunk 1 0
7/2 gwEthernet40GbPort up/indeterminate trunk 1 0
7/3 gwEthernet40GbPort up/indeterminate trunk 1 0
7/4 gwEthernet40GbPort up/indeterminate trunk 1 0
[OFOS] set multiconfig-port 7/1 -port-type=gwEthernet10GbPort
[OFOS] show iocard 7 ioport
name type state descr mode lag access-vlan guid
-----
7/1 gwEthernet10GbPort up/indeterminate trunk 1 0
7/2 gwEthernet10GbPort up/indeterminate trunk 1 0
7/3 gwEthernet10GbPort up/indeterminate trunk 1 0
7/4 gwEthernet10GbPort up/indeterminate trunk 1 0
```

show config

The `show config` command displays a scrolling output that includes fabric type and speed information.

Syntax

```
show config [-sortby=value]
```

Options

| Option | Description |
|---------|--|
| -sortby | Specifies the column used to sort the configuration information. |

Description

An XML version of the configuration file (`config.xml`) is located in the `/config` directory.

The `config.xml` file is large and not easy to parse on the fabric. Use `file copy` to copy the `config.xml` file to a remote location and view the file with an XML reader.

Example: Display the Configuration

This example shows how to display configuration information.

```
[OFOS] show config
# NM3 Chassis System Configuration
# Model: Oracle Fabric Interconnect F2-12
# Serial: To be filled by O.E.M.
#
# Date: Wed Oct 5 16:20:13 PST 2016
# User: admin

```

show hardware

The `show hardware` command displays comprehensive hardware information and environmental statistics for the fabric.

Syntax

```
show hardware [-sortby=value]
```

Additional commands, `show config` and `show system info`, show the hardware status of the fabric.

Options

| Option | Description |
|---------|--|
| -sortby | Specifies the column used to sort the configuration information. |

Example: Display Hardware Status

This example shows how to display comprehensive output of important hardware information.

```
[OFOS] show hardware
# NM3 Chassis Hardware Status
# Model: Oracle Fabric Interconnect F2-12
# Serial: To be filled by O.E.M.
# Base MAC: 00:13:97:5D:A0:00
# Base WWN: 00:00:00:00:00:00:00:00
# Base VGUID: 00:13:97:02:F5:DA:00:00
# Locator LED: off
#
# Date: Wed Oct 5 01:10:37 PDT 2016
# User: admin
```

show physical-server

The show physical-server command displays the list of IB-connected servers.

Syntax

```
show physical-server name * hca
show physical-server name * where {descr|guid|name|os|port|server-profile|
version} operator value
```

where:

- *name* is the name of the server or the GUID.
- *operator* is an operator. For example, like, =, or <.
- *value* is the string value of the operator.

This hardware command has subcommands that determine its functionality. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|------------|---|
| descr | Displays the description of the physical server. |
| hca | Displays the GUID of the physical server. |
| guid | Displays HCA firmware and the option ROM version. |

| Subcommand | Description |
|----------------|---|
| name | Displays the name of the vNIC. |
| os | Displays the OS of the physical server. |
| port | Displays the server port. |
| server-profile | Displays the server profile that is connected to the physical server. |
| version | Displays version information for the physical server. |
| where | Displays a filter to view information. |

Description

The Oracle Virtual Networking host drivers communicate with Oracle Fabric's OS [OpenSM](#) by default. When an IB connected host server boots up, the installed Oracle Virtual Networking host driver advertises the server's host name to the fabric.

Example: List of IB-Connected Servers

This example shows how to view the list of IB physical servers.

```
[OFOS] show physical-server
admin@ovn86-114[OFOS] show physical-server

show system info

The `show system info` command displays a quick summary of the fabric's essential information.

Syntax

```
show system info
```

Example: Show Hardware Status

This example shows how to view hardware system information.

```
[OFOS] show system info

Configuring IB

These topics describe how to use the CLI to configure and enable an IB port on the chassis. You can also use the CLI to display IB information and [SM](#) group information. However, you must use the Oracle Fabric Manager GUI to create and configure SM groups and partitions. For instructions, refer to [“Create an SM Group” in Oracle Fabric Manager 5.0.2 Administration Guide](#) and [“Create a Partition” in Oracle Fabric Manager 5.0.2 Administration Guide](#).

The [IB](#) connects processor nodes and I/O nodes to a system area network. For information about the number of IB ports on a [leaf switch](#) and a [virtualization switch](#), refer to [“Understanding the Hardware” in Oracle Fabric OS 1.0.2 Administration Guide](#). Each external IB port connects to an external [HCA](#) installed on a remote host server.

Note - For login instructions for the Oracle Fabric Manager GUI, refer to [“Log In to Oracle Fabric Manager \(GUI\)” in Oracle Fabric OS 1.0.2 Administration Guide](#).

| Command | Link |
|-----------------------------------|--|
| <code>set infiniband-port</code> | “infiniband-port” on page 47 |
| <code>show infiniband-port</code> | |
| <code>show ib partition</code> | “show ib” on page 49 |
| <code>show ib path-stats</code> | |
| <code>show ib sm</code> | |
| <code>show ib sm-group</code> | |
| <code>show ib sm-keyset</code> | |

infiniband-port

The `infiniband-port` command sets and displays configuration information for an IB port.

Syntax

```
set infiniband-port slot/port up [-noconfirm]
set infiniband-port slot/port down [-noconfirm]
show infiniband-port slot/* stats [-detail]
```

where *slot/port* are the physical slot and port numbers.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------|--------------------------------------|
| down | Deactivates the IB port. |
| stats | Displays statistics for the IB port. |
| up | Activates the IB port. |

Options

| Option | Description |
|------------|---|
| -detail | Displays detailed information for the IB port. Optional. |
| -noconfirm | Switches off confirmation prompts. The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |

Example: Activate an IB Port

This example shows how to activate an IB port.

```
[OFOS] set infiniband-port 10/1 up -noconfirm
name      state      mode-state      guid
10/1      up/up      switching      10e00001289c31
```

Example: Display IB Port Configuration

This example shows how to display statistics for IB ports.

```
[OFOS] show infiniband-port 10/* stats
```

show ib

The `show ib` command displays configuration information for IB **SM** groups. This action assumes you have used the Oracle Fabric Manager GUI to create and configure an SM group. Refer to “[Create an SM Group](#)” in *Oracle Fabric Manager 5.0.2 Administration Guide*.

Syntax

```
show ib partition name {ports|groups} [-detail]
show ib path-stats {from-port-guid} {to-port-guid}
show ib sm
show ib sm-group name {group-member|ports|groups}
show ib sm-keyset
```

where *name* is the name of the SM group.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------|---|
| partition | Displays IB subnet partition information by groups or ports. The default is partition. |
| path-stats | Displays IB statistics. You can view statistics from one physical server or GUID to another. |
| sm | Displays IB SM configuration information. |
| sm-group | Displays IB SM details by group, group member, or port. |
| sm-keyset | Displays key set configuration details for an IB SM: <ul style="list-style-type: none"> ■ SM key – Controls messages for OpenSM. ■ Trusted MKey – Controls messages about programming switches. All switches are given this MKey. ■ Untrusted Mkey – Controls other messages. |

Options

| Option | Description |
|---------|---|
| -detail | Displays detailed information for the IB partition. Optional. |

Example: Show IB Partition Information

This example shows how to display IB partition information. Use the Oracle Fabric Manager GUI to create and configure an IB partition.

```
[OFOS] show ib partition
name      pkey    type    oper-pkey  isIPoIB  useGRH  adminPartition
LLL       777     subnet  8777      true     false   false
```

Example: Show IB SM Configuration

This example shows how to display SM configuration information. Use the Oracle Fabric Manager GUI to create and configure an SM group.

```
[OFOS] show ib sm
subnet-name           MT25218
subnet-id             0x2c9020023f4c1
subnet-prefix-id     0
chassis-id           0x2c9020023f4c1
state                up/master
priority             14
handover-enabled     true
log-level            4
subnet_lid_range_start 0
subnet_lid_range_end  bfff
router_lid_range_start 0
router_lid_range_end  bfff
routing-engine       ftree
```

Example: Show IB SM Key Set Configuration

This example shows how to display SM key set information. Use the Oracle Fabric Manager GUI to create and configure an SM key set.

```
[OFOS] show ib sm-keyset
sm-key  trusted-key  untrusted-key  isActive
333     3331234      333abcd        true
777     7771234      777abcd        false
```

Example: Show IB Partition Configuration for SM Groups

This example shows how to display IB partition information for an SM group. Use the Oracle Fabric Manager GUI to create and configure SM groups and IB partitions.

```
[OFOS] show ib partition JJJ groups
type      membership  oper-pkey
all       full        8777
self     full        8777
```

Example: Show IB Path Stats

This example shows how to display IB path statistics.

```
[OFOS] show ib path-stats ?
Possible completions:
10e08508ac0005  Port Guid of host nsn178-42
10e085095a0005  Port Guid of host nsn178-76
10e08b53a80005  Port Guid of host leaf_01
10e09a86500005  Port Guid of host hca-10e09a86500004
2c9030057b4de   Port Guid of host nsn178-32
```

Configuring Public Networks, PVIs and Server Profiles

These topics describe how to use the CLI to configure public networks, [PVIs](#), and server profiles:

- Public network – Enables access to other networks or an external Ethernet network.
- PVI – Provides 100-Gb Ethernet connections within the fabric.
- Server profile – Assigns connections and I/O configuration properties to a physical server. When you assign a server profile, the host server assumes all of the server profile's I/O characteristics. Server profiles must follow the guidelines listed in [“Naming Conventions” on page 18](#).

A default gateway enables IP communication with hosts on different IP subnets. A default gateway enables centralized IP address administration from the fabric. A default gateway is configured as part of the system OS installation, so you do not need to add or configure a default gateway. You can use the Oracle Fabric Manager GUI to create default gateways and server profiles. Refer to [“Managing Default Gateways” in Oracle Fabric Manager 5.0.2 Administration Guide](#) and [“Using I/O Profiles” in Oracle Fabric Manager 5.0.2 Administration Guide](#). For login instructions, refer to [“Log In to Oracle Fabric Manager \(GUI\)” in Oracle Fabric OS 1.0.2 Administration Guide](#).

| Command | Link |
|-----------------------|---|
| add public-network | “public-network” on page 54 |
| remove public-network | |
| set public-network | |
| show public-network | |
| add pvi | “pvi” on page 55 |
| show pvi | |
| add server-profile | “server-profile” on page 56 |
| remove server-profile | |
| set server-profile | |
| show server-profile | |

public-network

The `public-network` command creates, configures, displays, and removes a public network.

Syntax

```
add public-network name ID uplink slot/port|slot.port [-group-name=value] [-type=value]
[-mtu=value] [-pkey=value] [-trunk-mode={true|false}]
remove public-network name
set public-network name [-pkey=value] [-mtu=value] [-new-name=value]
set public-network name add allowed-vlans vlan [start1-end1,start2-end2]
set public-network name remove allowed-vlans vlan [start1-end1,start2-end2]
show public-network
```

where:

- *ID* is the ID of the public network.
- *name* is name of the public network.
- *slot/port* is the physical slot and port number. For example: 2/1.
- *vlan* is the name of the allowed-vlan to add or remove.

This hardware command has subcommands. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|----------------------|---|
| add allowed-vlans | Specifies the VLANs that can pass over any trunk VNICs on a public network. You can add starting and ending VLAN IDs. |
| remove allowed-vlans | Deletes any VLANs on the public network. |

Options

| Option | Description |
|-------------|--|
| -group-name | Defines a group name for the public networks. |
| -mtu | Sets the maximum size of packet transmitted without fragmentation for the public network. Specify an MTU number between 1500 and 4070. By default, 1500-byte packets are used. |
| -new-name | Defines a new name for the public network. |
| -pkey | A partition key (hex). Select from the list of established PVI partition pkeys. |
| -trunk-mode | When set to <code>true</code> , the <code>-trunk-mode</code> option assigns a VLAN range on the public network. When set to <code>false</code> , a VLAN range is not assigned. |

Example: Create a Public Network

This example shows how to create a public network named LLL.

```
[OFOS] add public-network LLL 333 2/4
```

Example: Display Public Network Configuration

This example shows how to display the configuration information for a public network.

```
[OFOS] show public-network
name group-name id pkey state type trunkMode mtu oper-mtu mode description uplink allowed-vlans
-----
KKK default 777 7fff up/up subnet true 1500 1500 UD 2.1 1-11
LLL default 333 7fff p/up subnet true 1500 1500 UD 2/4 none
```

pvi

The `pvi` command creates and removes a [PVI](#). Use the `set public-network` command to configure a PVI.

Syntax

```
add pvi name ID [-type={subnet|global}] [-mtu=value] [-pkey=value] [-trunk-mode={true|false}]
set pvi name [-pkey=value] [-mtu=value] [-new-name=value]
show pvi
```

where:

- *ID* is the PVI ID.
- *name* is the name of the PVI you are creating.

Options

| Option | Description |
|--------|--|
| -mtu | Sets the maximum size of packet transmitted without fragmentation. Specify an MTU number between 1500 and 10218. By default, 4070-byte packets are used. |

| Option | Description |
|-------------|---|
| -pkey | A partition key (hex). Select from the list of established pkeys. |
| -new-name | Defines a new name for the PVI. |
| -type | Defines the kind of traffic on the PVI: <ul style="list-style-type: none"> ■ global describes traffic between subnets. ■ subnet describes traffic with the subnet only. |
| -trunk-mode | When set to true, the -trunk-mode option assigns a VLAN range . When set to false, a VLAN range is not assigned. |

Example: Create a PVI

This example shows how to create a subnet PVI called MMM with an ID of 321 and a pkey of 222.

```
[OFOS] add pvi MMM 321 -type=subnet
set pvi MMM -pkey=222
show pvi
```

| name | id | pkey | state | type | mtu | oper-mtu | mode | description |
|------|-----|------|-------|--------|------|----------|------|-------------|
| MMM | 321 | 222 | up/up | subnet | 4070 | 4070 | UD | RC |
| JJJ | 444 | 7fff | up/up | global | 9000 | 1500 | | RC |

server-profile

The server-profile command creates a server profile for a server and assigns it to the physical server. The profile contains properties for the server. This command also displays or removes a server profile.

Syntax

```
add server-profile name physical-server
add server-profile {*|name} connection physical-server [-descr=text]
set server-profile {*|name} connect physical-server
set server-profile {*|name} disconnect
set server-profile {*|name} down
set server-profile name iscsi-boot [vnic-name|none] targetIP [mount {direct /dev/node|
LABEL=label|lvm group-name volume-name}]
set server-profile {*|name} reset
set server-profile {*|name} up
set server-profile {*|name} [-default-gateway=name|none]
set server-profile {*|name} [-descr==text]
```

```

set server-profile {*|name}
remove server-profile name
remove server-profile name [vhas] [vnics] [-noconfirm]
show server-profile name
show server-profile name [alarms][connection][iscsi-boot][throughput][vhas][vnics]
[where]

```

This hardware command has subcommands that determine its functionality. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|------------|---|
| alarms | Displays the alarms. |
| connection | Adds, sets, and displays the attributes of the physical connection to the server. |
| connect | Connects the server profile to the specified server. |
| disconnect | Disconnects the server profile from the physical server. |
| down | Deactivates the server profile. |
| iscsi-boot | Configures the iSCSI boot options for the server profile. |
| reset | Resets the busy state. |
| throughput | Displays throughput statistics. |
| up | Activates the server profile. |
| vhas | Displays the list of vHBAs. |
| vnics | Displays the list of vNICs. |
| where | Filters settings on the server profile. |

where:

- *name* is the name of the server profile. Use a name that is unique to the fabric. A server profile name must be between 1 and 32 characters. Restrict characters in the name to alphanumeric, the dash (-), and the underscore (_).
- *physical-server* is the name of a server connected to the fabric.
- *targetIP* is the IP address of the target vNIC.
- *vnics-name* is the name of an existing vNIC.

Options

| Option | Description |
|------------------|---|
| -default gateway | The name of a default gateway that is already configured. |
| -descr | An optional description of the server profile. This description is for your own use. If the description includes spaces, enclose the entire description in quotation marks. |

| Option | Description |
|------------|--|
| -noconfirm | The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |

Example: Create a Server Profile

This example shows how to add a server profile named mytest.

```
[OFOS] add server-profile mytest ?  
Possible completions:  
  alexander@iowa:ServerPort8  Connection to host alexander (up)  
  ceasar@iowa:ServerPort24    Connection to host caesar (up)  
[OFOS] add server-profile mytest alexander@iowa:ServerPort8
```

All the physical servers connected to the fabric are displayed. The two servers listed (alexander and caesar) were automatically discovered by the fabric.

Configuring vNICs

This topic describes how to use the CLI to add and configure vNICs. An Oracle vNIC virtualizes NIC connectivity. A vNIC appears to the Oracle Fabric OS as a physical NIC and enables a server to have an Ethernet network attachment without having a physical NIC present. Instead of the client server using a NIC, an IB HCA is used and then virtualizes the NIC for Ethernet connectivity.

Server profiles must follow the guidelines listed in [“Naming Conventions” on page 18](#).

You can also use the Oracle Fabric Manager GUI to add and configure vNICs. Refer to [“Managing vNICs on a Physical Server” in Oracle Fabric Manager 5.0.2 Administration Guide](#).

Note - For login instructions, refer to [“Log In to Oracle Fabric Manager \(GUI\)” in Oracle Fabric OS 1.0.2 Administration Guide](#).

| Command | Link |
|-------------|-----------------------------------|
| add vnic | “vnic” on page 59 |
| remove vnic | |
| set vnic | |
| show vnic | |

vnic

The vnic command adds, configures, and displays vNIC connectivity.

Syntax

```
add vnic vnic-name.server-profile {slot/port|none} [-noconfirm]
add vnic vnic-name.server-profile if-name [-boot-capable={true|false}]
```

```

add vnic vnic-name.server-profile [-addr-type={default|static|dhcp}] [-ip-addr=addr/mask]
  [-ipaddr-host-managed=n.n.n.n]
set vnic vnic-name.server-profile [-addr-type={default|static|dhcp}] [-ip-addr=addr/mask]
  [-ipaddr-host-managed=n.n.n.n]
set vnic vnic-name.server-profile clear
set vnic vnic-name.server-profile down
set vnic vnic-name.server-profile clear vnic-stats
set vnic vnic-name.server-profile up
set vnic vnic-name.server-profile down
set vnic vnic-name.server-profile [-boot-capable={true|false}]
set vnic vnic-name.server-profile if-name
remove vnic {*|vnic-name} [-noconfirm]
remove vnics [-noconfirm]
show vnic [*] vnic-name [-detail]
show vnic [*] vnic-name alarms
show vnic [*] vnic-name errors
show vnic [*] vnic-name l2entries
show vnic vnic-name.server-name vnic-stats
show vnic vnic-name vnic-stats
show vnic [*] vnic-name vlans
show vnic [*] vnic-name warnings
show vnic [*] vnic-name where
show vnic vnic-name|* [-detail]
show vnic vnic-name wildcard throughput

```

where:

- *if-name* is the interface name (public network or [PVI](#)).
- *port* is the port termination for a vNIC.
- *public-network-name*|*** specifies the name of the public network you are creating.
- *vnic-name*|*** specifies the name of a vNIC or all vNICs if you are using the wildcard.
- *server-profile* is the name of the server profile.

This hardware command has subcommands. This table describes the *subcommands* and provides their syntax.

| Subcommand | Description |
|------------|---|
| alarms | Displays alarms |
| clear | Removes items, such as vnic-stats. |
| down | Deactivates a vNIC, or deactivates specific settings (such as -boot-capable or -netmask.) |
| errors | Displays error alarms. |
| l2entries | Displays the L2 table entries. |
| throughput | Displays throughput statistics. |
| up | Activates a vNIC. |

| Subcommand | Description |
|------------|---------------------------------|
| v lans | Displays a list of VLANs. |
| vnic-stats | Displays statistics for a vNIC. |
| warnings | Displays warnings. |
| where | Filters information. |

Description

The fabric automatically assigns MAC addresses to vNICs from a pool of internal-sequential addresses.

Options

| Option | Description |
|----------------------|---|
| -addr-type | Specifies the type of address: <ul style="list-style-type: none"> ■ default – The default is DHCP. ■ static – A static address that is assigned by the director. ■ dhcp – A DHCP-assigned address. |
| -boot-capable | Determines if the vNIC is capable of booting. |
| -descr | Provides a text description of the vNIC. Use quotes if there are spaces in the description. |
| -detail | Displays detailed information. Optional. |
| -ip-addr | Configures the IP address (address/mask) for the vNIC. This address is propagated to the physical server and appears as the address of an interface. |
| -ipaddr-host-managed | Configures an IP address (address/mask) that is managed by the host. |
| -netmask | Configures a netmask for the vNIC. |
| -noconfirm | The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |

Example: Create a vNIC and Assign it to a Server Profile

This example shows how to create a vNIC called vNIC1, and assign it to server profile vserver1, and assign it to a public network named AAA.

```
[0F05] add vnic vNIC1.vserver1 ?
Possible completions:
```

```

AAA Public Network (ID: 777)
  none No interface
[OFOS] add vnic VNIC1.vserver1 AAA

```

Example: Configure a Server Profile With a vNIC

This example shows how to create a server profile called `myserver`, and then configure a vNIC for it called `myvnic.myserver` that is connected to a public network named `AAA`.

```

[OFOS] add server-profile myserver alexander@iowa:ServerPort8
[OFOS] add vnic myvnic.myserver AAA
[OFOS] set vnic myvnic.myserver -addr-type=static -ip-addr=10.1.1.1/32 -boot-
capable=true
[OFOS] show vnic myvnic.myserver
-----
name          myvnic.myserver
state         up/up
mac-addr      00:13:97:01:80:08

Configuring a VHBA

An Oracle vHBA virtualizes HBA connectivity. It appears to the OS as a physical HBA. Instead of the host server using an HBA, an IB HCA is used. You can use vHBAs on a [virtualization switch](#), but not on a [leaf switch](#).

This topic describes how to add and configure a vHBA.

| Command | Link |
|-------------|-----------------------------------|
| add vhma | “vhba” on page 65 |
| remove vhma | |
| set vhma | |
| show vhma | |

vhba

The `vhba` command creates a vHBA and attaches it to an existing server profile. The command can also customize a vHBA, remove a vHBA, and display additional information about the vHBA. For instructions on creating a server profile, see [“server-profile” on page 56](#).

Syntax

```
add vhma vhba.server-profile slot/port none [-local-id=ID] [-mtu=mtu-size] [-wn-id=wn-suffix]  
remove vhma {vhba.server-profile|wildcard} [-noconfirm]  
set vhma {vhba.server-profile|wildcard} clear stats [-descr=text]  
    [-fabric-link-down-timeout=value|default] [-if={slot/port|none}]  
set vhma {vhba.server-profile|wildcard} down [-descr=text] [-fabric-link-down-timeout=  
    {number|default}] [-if={slot/port|none}]  
set vhma {vhba.server-profile|wildcard} full-scan [-descr=text]  
    [-fabric-link-down-timeout=value|default] [-if={slot/port|none}]
```

```

set vhba {vhba.server-profile|wildcard} prescan [-descr=text]
    [-fabric-link-down-timeout={value|default}] [-if={slot/port|none}]
set vhba {vhba.server-profile|wildcard} remove-prescan [-descr=text]
    [-fabric-link-down-timeout={value|default}] [-if={slot/port|none}]
set vhba {vhba.server-profile|wildcard} rescan [-descr=text]
    [-fabric-link-down-timeout={value|default}] [-if={slot/port|none}]
set vhba {vhba.server-profile|wildcard} up [-descr=text]
    [-fabric-link-down-timeout={value|default}] [-if={slot/port|none}]
show vhba {vhba.server-profile|wildcard} alarms [-detail]
show vhba {vhba.server-profile|wildcard} errors [-detail]
show vhba {vhba.server-profile|wildcard} stats [-detail]
show vhba {vhba.server-profile|wildcard} target [-detail]
show vhba {vhba.server-profile|wildcard} targets [-detail]
show vhba {vhba.server-profile|wildcard} throughput [-detail]
show vhba {vhba.server-profile|wildcard} warnings [-detail]
show vhba {vhba.server-profile|wildcard} where [cmds-per-lun|descr|fabric-state|
    flags|if|if-state|local-id|luns-per-target|mtu|name|state|wwnn|wwpn]
    expression operator [-detail]

```

where:

- *expression* is evaluated to produce a value.
- *operator* matches strings following a specific pattern. For a list of operators, see [“Filters” on page 17](#).
- *server-profile* is the name of a server profile that you already created.
- *slot /port* are the physical slot and port numbers.
- *vhba* is the name of the vHBA. It must be unique in the Oracle server profile to which it is assigned.
- *wildcard* allows you to specify selected wildcard characters (for example, *) to facilitate executing a command.

This hardware command has subcommands that determine its functionality. This table describes the *subcommands* and provides their syntax.

| Subcommand | Description |
|------------|--|
| alarms | Displays vHBA alarms. |
| clear | Clears items from the vHBA and leaves it in the state it was in when you issued the <code>clear</code> command. The vHBA can be explicitly named, or you can use a wildcard character (for example, *) to clear all vHBAs. |
| down | Deactivates the vHBA and causes the disks on the server to become inoperable. The vHBA can be explicitly named, or you can use a wildcard character (for example, *) to turn down all vHBAs. |
| errors | Displays vHBA errors. |
| full-scan | Scans for devices using the port login. |
| none | Specifies no interface when adding a vHBA. |
| prescan | Configures prescan state for an unbound vHBA. |

| Subcommand | Description |
|----------------|--|
| remove-prescan | Removes a prior configured prescan state, which is required in order to re-issue a new prescan state. After you perform a prescan, the configuration resides on the I/O card. |
| rescan | Configures rescan state for a bound vHBA. When running rescan, if any vHBAs are in down state, the rescan process completes and then displays the vHBAs in a down state. |
| stats | Displays vHBA statistics. |
| target | Displays the storage target attached to the vHBA. |
| targets | Displays the storage targets attached to the vHBA. |
| throughput | Displays throughput speed for the vHBA. |
| up | Brings the vHBA online. The vHBA can be explicitly named, or you can use a wildcard character (for example, *) to bring all vHBAs online. |
| warnings | Displays vHBA warnings. |
| where | Displays filter criteria, expressions, and operators: <ul style="list-style-type: none"> ■ <code>cmds-per-lun</code> – Displays the number of commands allowed per LUN. ■ <code>descr</code> – Displays the text describing the vHBA. ■ <code>fabric-state</code> – Describes the state of the fabric, which can be up, down, indeterminate, initialized, or uninitialized. ■ <code>flags</code> – Indicates if LUNs are enabled for a vHBA. ■ <code>if</code> – Displays the termination port. ■ <code>if-state</code> – Displays the interface state. ■ <code>local-id</code> – Displays the ID used by the ESX server to map its HBA to this vHBA. ■ <code>luns-per-target</code> – Displays the number of LUNs allowed per target. ■ <code>mtu</code> – Displays the MTU of the vHBA. ■ <code>name</code> – Displays the name of the vHBA. ■ <code>state</code> – Displays the admin or oper state of the vHBA. ■ <code>wwn</code> – Displays the World Wide Node Name ■ <code>wwpn</code> – Displays the World Wide Port Name. <p>For a list of operators, see “Filters” on page 17.</p> |

Description

An IB connection exists between the [fabric interconnect](#) and host servers supporting the Oracle Virtual Networking vHBA host software stack. Up to 24 IB ports are supported. A 2-port FC I/O card connects to an FC switch fabric. All the host server vHBAs multiplex through the FC ports on the I/O card. A storage array is attached to the switch fabric. Initiators are host servers that request I/O processing and actively seek out and interact with target devices. Targets are passive storage devices (arrays, JBODs, RAIDs, and so on) that respond to requests sent by initiators. The Oracle Fabric Interconnect itself is an I/O initiator that provides a conduit for host-server initiators to send commands to the fabric.

The vHBA host software defines how the FC protocol will be transported (in or out) over IB. Without this software and the details of the transport, the vHBA will not function and the payload cannot be sent over IB.

Options

| Option | Description |
|---------------------------|---|
| -descr | Applies a text description to the vHBA. Quotes are required around multiple words containing spaces in between. Optional. |
| -detail | Displays detailed information (if available) for the vHBA. Optional. |
| -fabric-link-down-timeout | Sets a value in milliseconds for the IB fabric to be down before the vHBA is put in operational state down. Set a value between 0 and 255. The default is 0, which can be set through the number zero (0) or through the keyword default. The new value becomes effective after you reboot the FC card. |
| -if | Sets a termination slot and port for the vHBA. This option can be used to terminate the vHBA on a different FC port if needed. |
| -local-id | The identifier used by ESX Server to map its HBA to this vHBA. Enter 1 to 32. Each ID must be unique per ESX Server. |
| -mtu | Size of the MTU : <ul style="list-style-type: none"> ■ 2048 – 2 MByte ■ 256 – 256 Kbyte ■ 512 – 512 KByte ■ 1024 – 1 Mbyte ■ default – 256 Kbyte |
| -noconfirm | Allows you to remove vHBAs without displaying a confirmation prompt. This option assumes yes to the prompt asking for confirmation, and if used, no warning messages will be displayed and the vHBA will be immediately deleted. |
| -wwn-id | Specifies a particular WWN. This option allows you to enter the WWN suffix, which is the last 12 bits of the WWN address. The WWN suffix is a 12-bit hexadecimal number from 100 to FFF. |

Description

When you bring a vHBA online, it attempts to discover all the attached targets that are available to it. You can also have the vHBA relearn attached targets without bringing the vHBA down, and then up. See [“Target Prescan and Rescan”](#) in *Oracle Fabric OS 1.0.2 Administration Guide*.

Example: Create a Basic vHBA

This example shows how to create a server profile named `crawford` and bind it to a physical server connection. The example also shows how to find an FC card and an FC slot and port, and create and bind a vHBA to the server profile. The last command verifies that the vHBA was created.

```
[OFOS] add server-profile crawford ceasar@iowa:ServerPort24
[OFOS] show iocard
```

| slot | state | descr | type | v-resources |
|----------|-------|-------|---------------------|-------------|
| 3 | up/up | | sanFc2Port16GbCard | 0 |
| 4 | up/up | | sanFc2Port16GbCard | 2 |
| embedded | up/up | | spineIb4Gw2PortCard | 0 |

```
3 records displayed
[OFOS] show ioport
```

```
1 record displayed
```

Tip - The state is up when the FC port is connected to a reachable FC switch. If the state is `resourceUnavailable`, there is no FC connection, the server profile is not bound to a physical host resource, or the host cannot communicate.

Example: Discover Targets for a VHBA and Bind the Server Profile

This example shows how to discover and display targets attached to a vHBA. The last command shows how to bind the targets to the host server profile.

```
[OFOS] set vhba vhb1.crawford prescan
[OFOS] show vhba vhb1.crawford targets
vhba          wwnn          wwpn          lun-ids
-----
vhb1.crawford 2F:9F:00:06:2B:10:C3:BA 2F:9F:00:06:2B:10:C3:BA 3,2,1,0

Configuring LAGs

This topic describes how to use the CLI to add and configure a [LAG](#). A LAG is a group of physical Ethernet ports. You can combine multiple individual physical Ethernet ports into one logical port group. The ports combined into a LAG operate in parallel to increase bandwidth and [HA](#). The LAG must also be configured on the peer Ethernet device. For more details, refer to [“Working with a LAG” in Oracle Fabric OS 1.0.2 Administration Guide](#).

You can also use the Oracle Fabric Manager GUI to create and configure a LAG. Refer to [“Managing LAGs” in Oracle Fabric Manager 5.0.2 Administration Guide](#).

| Command | Link |
|------------|----------------------------------|
| add lag | “lag” on page 73 |
| remove lag | |
| set lag | |
| show lag | |

lag

The `lag` commands adds, configures, displays, and removes a LAG.

Syntax

```
add lag name port port-number
remove lag {*|*.*|name}
set lag {*|*.*|name} [-descr=text]
show lag {*|*.*|name}
```

where:

- `*.*` are wildcards that enable the command to be applied to all LAGs on the fabric.

- *name* is a LAG name (which consists of slot and LAG ID separated by a dot) that enables the command to be applied to a specific LAG.
- *port-number* is the port that will be added.

This hardware command has one subcommand. This table describes the subcommand and provides the syntax.

| Subcommand | Description |
|------------|---|
| port | Specifies an Ethernet port to add to a LAG. |

Options

| Option | Description |
|--------|--|
| -descr | Specifies an alphanumeric character string that describes the LAG. Optional. |

Example: Configure a Static LAG

This example shows how to configure a static LAG and specify the first port that you want in the LAG.

```
[OFOS] add lag 0.4 port 3,4,7,8
[OFOS] show lag
name      state  mac-addr          descr  mode  access-vlan  ports
-----
0.4      up    00:13:97:5D:A0:01  access  1      4
```

Managing Users and Roles

These topics describe how to use the CLI to configure an admin user's role and display users, and also view a list of admin users who are logged in. You *must* use the Oracle Fabric Manager GUI to add admin users. Refer to [“Assign a Role to a User” in Oracle Fabric Manager 5.0.2 Administration Guide](#).

Oracle's internal **IMS** service authenticates admin users and grants them suitable privileges according to assigned user roles to access the fabric and the switch. The IMS service is the Oracle Fabric OS local system, which is always present. For more information, refer to [“Implementing User Authorization” in Oracle Fabric OS 1.0.2 Administration Guide](#).

| Command | Link |
|------------|---|
| show login | “show login” on page 75 |
| set user | “user” on page 76 |
| show user | |

show login

The `show login` command shows which admin users are logged in, and provides details about the active CLI sessions.

Syntax

```
show login session-ID
```

where *session-id* is the ID number of the session.

Example: Display Login Details

This example shows which admin users are logged in to Oracle Fabric OS.

```
[OFOS] show login
-----
session          1
time             2011-08-20 21:28:20
name             admin
descr
roles            administrator
interface        cli
type             local
logged-in-from   172.16.48.190
-----
1 record displayed
```

```
show users
name    role          descr
-----
admin   administrators
```

user

The `set user` command sets attributes for an admin user. The `show user` command displays a specific admin user, and the `show users` command displays all admin users. Refer to [“Users and Roles” in Oracle Fabric OS 1.0.2 Administration Guide](#) for details about each type of role in Oracle Fabric OS. Use the Oracle Fabric Manager GUI to add admin users for the Oracle Fabric OS.

Syntax

```
set user name [-role=role-name] [-password]
show user name
show users
```

where *name* is the name of the admin user.

Options

| Option | Description |
|-----------|---|
| -descr | Specifies an alphanumeric character string that further describes the user. Optional. |
| -password | Specifies a password for the admin user. |
| -role | Specifies a role for the admin user: |

| Option | Description |
|--------|--|
| | <ul style="list-style-type: none">■ administrators■ network■ operators■ server■ storage |
| | <p>For more information about each role, refer to “Users and Roles” in <i>Oracle Fabric OS 1.0.2 Administration Guide</i>.</p> |

Monitoring Oracle Fabric OS

These topics describe how to use the CLI to monitor the chassis, hardware, and software:

- Alarms – View current alarms that are reported by the fabric.
- [SNMP](#) – Monitor hardware and the chassis. Oracle Fabric OS 1.0.2 supports SNMP v3.
- Diagnostics – Track and display performance statistics and error counters.

Note - You can also use the Oracle Fabric Manager GUI to monitor hardware and software. Refer to [“Working With Live Monitoring” in Oracle Fabric Manager 5.0.2 Administration Guide](#).

| Command | Link |
|-------------------------------|---|
| show alarms | “show alarms” on page 80 |
| show xyz stats | “show xyz stats” on page 80 |
| show system | “show system” on page 82 |
| show system copyright | |
| show system date | |
| show system demsg | |
| show system errors | |
| show system info | |
| show system interfaces | |
| show system log | |
| show system loglevel | |
| show system ntp-server | |
| show system password-strength | |
| show system processes | |
| show system root-ssh-login | |
| show system server-connection | |

| Command | Link |
|---------------------------|-----------------------------------|
| show system status | |
| show system syslog | |
| show system syslog-server | |
| show system user | |
| show system version | |
| show system warnings | |
| add snmp | "snmp" on page 85 |
| set snmp | |
| show snmp | |

show alarms

The `show alarms` command displays all alarms in the system database. Alarms can have a severity of info, warning, minor, major, or critical.

Syntax

```
show alarms
```

Example: Display Alarms

This example shows how to view all alarms.

```
[OFOS] show alarms
time                type      name      severity  cause      descr
-----
2016-03-26 22:09:54.439  server   vserver1  warning   termination  Unspecified no physical compute
resource provisioned.
016-03-26 00:11:54.439  equipment controller critical  failed      IB link is down.
```

show xyz stats

The `show xyz stats` command displays system real-time statistics.

Syntax

```
set vhma vhma-name clear stats
set vnic vnic-name clear vnic-stats
show vhma vhma-name stats
show vnic vnic-name vnic-stats
```

where:

- *vnic-name* is the name of the vNIC for which you want to gather or display statistics.
- *vhba-name* is the name of the vHBA or which you want to gather or display statistics.

You can use vHBAs on a [virtualization switch](#), but not on a [leaf switch](#). For more information on vHBAs, see [“Configuring a VHBA” on page 65](#). For more information on vNICs, see [“Configuring vNICs” on page 59](#).

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------------|-----------------------------------|
| clear vnic-stats | Clears statistics for the vNIC. |
| clear stats | Clears statistics for the vHBA. |
| vnic-stats | Displays statistics for the vNIC. |
| stats | Displays statistics for the vHBA. |

Example: Display vNIC Stats

This example shows how to display the statistics for a vNIC named `vn0.sp2`.

```
[OFOS] show vnic vn0.sp2 vnic-stats
```

```
-----
name                vn0.sp7
vlan-id-or-none     0
rcv-pkt             43544
rcv-bytes           4267274
trans-pkt           43507
trans-bytes         4265073
invalid-ip-checksum 0
invalid-l4-checksum 0
mtu-err             0
ipchecksum-pkt      0
tcp-checksum-pkt    0
udp-checksum-pkt    0
tcpseg-pkt          0
```

```
green-pkt          43519
yellow-pkt         0
red-pkt            0
-----
1 record displayed
```

show system

The `show system` command displays the system attributes: OS version, fabric IP address, installed Oracle Fabric OS version, memory information, hard disk status, and so on.

Syntax

```
show system
show system date
show system dmesg
show system errors
show system info
show system interfaces
show system log [debug|syslog]
show system loglevel
show system ntp-server
show system password-strength
show system processes
show system root-ssh-login
show system server-connection
show system status
show system syslog
show system syslog-server
show system user
show system version [-all]
show system warnings
```

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------|---|
| date | Displays the current system local date and time. |
| dmesg | Displays base OS messages. |
| errors | Displays syslog errors. |
| info | Displays system information, such as the fabric management IP address, hostname, and default gateway. |
| interfaces | Displays all the network interfaces in the system. |

| Subcommand | Description |
|-------------------|---|
| log | <p>Displays the logs. The <code>show system log</code> and <code>show system log debug</code> commands are interactive, and do not return to a command prompt after they have been issued.</p> <p>You must enter input to manipulate the command output (for example, pause or resume output), or exit the log file and return to the command prompt. If you do not provide any input, the <code>show system log</code> and <code>show system log debug</code> output is displayed indefinitely.</p> <p>Use one of the qualifiers to return to the command prompt:</p> <ul style="list-style-type: none"> ■ h – View a list of qualifiers ■ q – Quit ■ f – Enter filter ■ p – Pause or resume ■ - to skip backward through the file ■ + to skip forward through the file ■ / (forward slash) – Search backwards through the log for a string ■ Enter key – Marks a position on the screen <p>If there are no log entries, the message <i>Log file /log/user-debug.log is empty</i> appears, but you are still required to provide input to return to the Oracle Fabric OS command prompt.</p> |
| loglevel | <p>Displays the syslog level of each service:</p> <ul style="list-style-type: none"> ■ 0 XG_LOG_EMERG ■ 1 XG_LOG_ALERT ■ 2 XG_LOG_CRIT ■ 3 XG_LOG_ERR ■ 4 XG_LOG_WARNING ■ 5 XG_LOG_NOTICE ■ 6 XG_LOG_INFO ■ 7 XG_LOG_DEBUG |
| ntp-server | Displays the configured NTP server. |
| password-strength | Displays criteria for setting password strength. |
| processes | Displays process information. |
| root-ssh-login | Shows permission for the root user to log in with ssh. |
| server-connection | Displays server connection information. |
| status | Displays the current status of the system. |
| syslog | Displays entries. |
| syslog-server | Displays the syslog server. |
| user | Displays internal information about the current user. |
| version | Displays version information for the system, including the minimum driver version required to keep the Oracle Fabric OS and driver software synchronized. |
| warnings | Displays syslog warnings. |

Options

| Option | Description |
|--------|--|
| -all | Displays the version information for all images in the system. |

Example: Display System Details

This example shows how to display information for the system.

```
[OFOS] show system
```

```
Booted on: Wed Oct 12 00:21:02 PST 2016
uptime: 7 minutes, 14 seconds
```

```
RECENT UPGRADES, DOWNGRADES AND PATCHES
```

```
Tue Oct 4 16:21:35 PDT 2016: Upgraded to nm3-branch-OFOS-1.0.0-47175.xpf
Tue Oct 4 23:39:07 GMT 2016: Upgraded to nm3-branch-OFOS-1.0.0-47175.xpf
Thu Oct 6 17:09:20 GMT 2016: Upgraded to nm3-branch-OFOS-1.0.0-47156.xpf

snmp

The `snmp` command creates, monitors, and displays the operational status of the fabric. Use [SNMP](#) to configure trap destinations that will receive events. The commands below add an SNMP trap destination IP address and then add an authenticated user.

Oracle Fabric OS supports SNMP v3. For instructions on setting up SNMP, refer to [“Configure SNMP” in Oracle Fabric OS 1.0.2 Administration Guide](#).

Syntax

```
add snmp trap-dest IP-address [:port] [-community=community-name] [-version=version]
    v3-user username [-auth-protocol=auth-protocol] [-priv-protocol=priv-protocol]
add snmp v3-user username [-auth-protocol=auth-protocol] [-priv-protocol=priv-protocol]
remove snmp trap-dest IP-address[:port] [-noconfirm]
remove snmp v3-user username [-noconfirm]
set snmp v3-user username [-auth-password=auth-password] [-auth-protocol=auth-protocol]
    [-priv-password=priv-password] [-priv-protocol=priv-protocol]
set snmp trap-dest v3-user [-auth-password=auth-password] [-auth-protocol=auth-protocol]
    [-priv-password=priv-password] [-priv-protocol=priv-protocol]
set snmp [-descr=text [-sys-contact=sys-contact] [-sys-location=sys-location]
    [-sys-name=sys-name]
show snmp v3-users
```

where:

- *IP-address* is the IP address of the system that will receive SNMP traps.
- *port* specifies the physical port coordinate.
- *username* is the name of the SNMP user.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|------------|--|
| trap-dest | Adds or removes SNMP information about where to forward the traps. Type the IP address of the system that will receive SNMP traps. |
| v3-user | If you are entering a description with internal blank spaces (for example Oracle Systems) you must enclose the string in double quotes. Sets and removes SNMP version 3 user information. Use the <code>-community</code> and the <code>-version</code> options to add SNMP version 3 user information. |

Options

| Option | Descriptions |
|----------------|---|
| -auth-password | Sets the authorization password for the SNMP v3-user. |
| -auth-protocol | Sets the authorization protocol for the SNMP v3-user: <ul style="list-style-type: none">■ MD5■ SHA■ default (none)■ none |
| -community | Sets the SNMP community for the v3-user. |
| -descr | Sets the SNMP description. Optional. |
| -noconfirm | Switches off confirmation prompts. The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |
| -priv-password | Sets the privacy password for the SNMP v3-user. |
| -priv-protocol | Sets the privacy protocol for the SNMP v3-user: <ul style="list-style-type: none">■ AES128■ DES■ default (none)■ none |
| -sys-contact | Sets the SNMP system contact information. |
| -sys-location | Sets the SNMP system location. |
| -sys-name | Sets the SNMP system name. |
| -version | Sets the SNMP version number. |

Using System Commands

These topics describe how to use the CLI to set jumbo frames, retrieve log files, and get detailed system information.

| Command | Link |
|---------------------------------|--|
| get log-files | “get log-files” on page 88 |
| remove system | “remove system” on page 90 |
| set system address | “set system” on page 91 |
| set system default-gateway | |
| set system description | |
| set system domain | |
| set system domain-search | |
| set system hostname | |
| set system ipconfig | |
| set system jumbo-packet | |
| set system loglevel | |
| set system management-interface | |
| set system nameserver | |
| set system netmask | |
| set system password-strength | |
| set system root-password | |
| set system timezone | |
| show software | “show” on page 94 |
| show tech-support | |
| system access-core-files | “system” on page 95 |
| system broadcast | |

| Command | Link |
|-----------------------|------|
| system cancel | |
| system clear | |
| system export | |
| system import | |
| system install | |
| system logout | |
| system restart-ilom | |
| system restart-ofos | |
| system shutdown | |
| system upgrade | |
| system upgrade-io | |
| system upgrade-saturn | |
| system verify | |

get log-files

The `get log-files` command gathers log, archive, and core files and places them in a file to send to Oracle Customer Support. For example, `xsigo-logs.tar.gz`. The `.gz` file extension is automatically added.

Syntax

```
get log-files output file [-all] [-cores] [-noarchives] [-nologs] [-silent]
```

where *output file* is a compressed file containing information for Oracle Customer Support.

Options

| Option | Description |
|--------|---|
| -all | Gathers all log and archive files (but not core files) and puts them in the <code>xsigo-logs.tar.gz</code> file. If you want to include core files, use the <code>-cores</code> option. |

| Option | Description |
|-------------|---|
| -cores | Gathers all core files (but not log or archive files) and puts them in the <code>xsigo-logs.tar.gz</code> file. |
| -noarchives | Gathers all log and core files (but not archived log files) and puts them in the <code>xsigo-logs.tar.gz</code> file. |
| -nologs | Gathers all core and archive files (but not current log files) and puts them in the <code>xsigo-logs.tar.gz</code> file. |
| -silent | Gathers all log, archive, and core files and puts them in the <code>xsigo-logs.tar.gz</code> file without displaying any onscreen progress. |

Example: Gather All Log Files

This example gathers all available files, logs, and cores, as well as the output of the `show tech-support` command, and places it into a gzipped tar file to send to Oracle Customer Support.

```

*** output file is xsigo-logs.tar.gz (49.12M)
You can use the 'file copy' command to transfer it off the Oracle system
```

remove system

The `remove system` command removes name servers and syslog servers from the Oracle Fabric OS.

```
remove system nameserver nameserver-name [-noconfirm]
remove system syslog-server syslog-name [-noconfirm]
```

where:

- *nameserver-name* is the IP address of the DNS name server.
- *syslog-name* is the host name or IP address of the syslog server.

Options

| Option | Description |
|------------|---|
| -noconfirm | Switches off confirmation prompts. The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. Optional. |

set system

The `set system` commands perform a variety of tasks: enforcing password strength, enabling jumbo packets to increase throughput, setting a default gateway, searching domains, and so on.

Syntax

```
set system address system-addr [-noconfirm]
set system default-gateway gateway-IP [-noconfirm]
set system description value [-noconfirm]
set system domain domain [-noconfirm]
set system domain-search domains [-noconfirm]
set system hostname host-name [-noconfirm]
set system ipconfig {default|dhcp|static} [-noconfirm]
set system jumbo-packet {true|false} [-noconfirm]
set system loglevel service-name
set system management-interface [-address=IP]
set system management-interface [-default-gateway=gateway-IP] [-noconfirm]
set system management-interface [-hostname=value] [-noconfirm]
set system management-interface [-ipconfig={default|dhcp|static}] [-noconfirm]
set system management-interface [-netmask=network-IP]
set system management-interface nameserver [-noconfirm]
set system management-interface netmask mask [-noconfirm]
set system nameservers nameserver-address [-order=search-value]
set system netmask mask [-noconfirm]
set system password-strength [-min-length=min-length-value] [-min-lower-case
    =min-lower-case-value] [-min-number=min-number-value]
    [-min-special=min-special-value] [-min-upper-case=min-upper-case-value]
set system root-password [-noconfirm]
set system timezone [-noconfirm]
```

where:

- *domain* is the name of the domain you are configuring.

- *domains* is a list of domain names, separated by spaces and enclosed by quotes.
- *gateway-IP* is the IP address of the default gateway.
- *host-name* is the hostname (for example, Central).
- *mask* is the system netmask (for example 192.168.189.0).
- *nameserver-addr* is the IP address of the nameserver (for example, 192.168.3.56).
- *service-name* is the name of the service for which you want to generate logs.
- *system-addr* is the IP address of your system (for example, 192.168.1.3).
- *value* is text describing the system.

This command has subcommands. This table describes the subcommands and provides the syntax.

| Subcommand | Description |
|----------------------|---|
| address | Specifies an IP address for the fabric interconnect . To use the fabric interconnect's management interface remotely, you must configure an IP address and prefix length for the interface. You configure these parameters when you first run the installation wizard at the console port. If you have changes to your management network, you might need to change the IP address for the fabric interconnect. |
| default-gateway | Specifies the IP address of the default gateway. |
| description | Specifies a description for the system. |
| domain | Specifies the name of the domain (for example, sales.example.com). |
| domain-search | Lists the domain names, separated by a space and enclosed by quotes. |
| hostname | Specifies the hostname (for example, central or pubstest). |
| ipconfig | Specifies a static or DHCP IP address: <ul style="list-style-type: none"> ■ default – The default is a static address. ■ dhcp – A DHCP-assigned address. ■ static – A static address. |
| jumbo-packet | Determines the throughput for Oracle FCAs: <ul style="list-style-type: none"> ■ default – Enables support for jumbo packets. ■ true – Enables support for jumbo packets. ■ false – Disables support for jumbo packets. <p>Up to 10,000 jumbo frames are supported for an Ethernet gateway.</p> |
| loglevel | Determines the level of error logging for each service. |
| management-interface | Specifies the IP address and other related parameters for the network interfaces for the switch. |
| nameservers | Lists the name servers (comma-separated IP addresses) to access when the system connects to another server over the network. Three nameservers are allowed per chassis. |
| netmask | Specifies the network IP mask (for example, 255.255.255.0). |
| password-strength | Enforces password strength. |
| root-password | Changes the root password. The default root password is root. |
| timezone | Specifies the time zone to use for the fabric interconnect. |

Options

| Option | Description |
|------------------|--|
| -address | Specifies the IP address or netmask of the management interface. For example, 192.168.3.56/24. |
| -default gateway | Specifies the IP address of the default gateway. |
| -hostname | Specifies the host name. |
| -ipconfig | Specifies a static or DHCP IP address: <ul style="list-style-type: none"> ■ default – The default is a static address. ■ dhcp – A DHCP-assigned address. ■ static – A static address. |
| -min-length | Specifies a number from 0 to 20 that sets the minimum number of characters in the password. |
| -min-lower-case | Specifies a number from 0 to 20 that sets the minimum number of lower case letters in the password. |
| -min-number | Specifies a number from 0 to 20 that sets the minimum number of numbers in the password. |
| -min-special | Specifies a number from 0 to 20 that sets the minimum number of special characters in the password. |
| -min-upper-case | Specifies a number from 0 to 20 that sets the minimum number of upper case letters in the password. |
| -netmask | Specifies the IP netmask. For example, 255.255.255.0. |
| -noconfirm | Switches off confirmation prompts. The process completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |
| -order | Specifies which of the three allowed nameservers to access first. |

Example: Set Jumbo Frames

This examples shows how to configure jumbo frames on the virtualization switch, which can increase the throughput for Oracle FCAs.

```
[OFOS] set system jumbo-packet true
show system info
-----
hostname          ovn81-123
descr
domain            us.example.com
address           10.134.178.65
netmask           10.255.255.0
model-num         Oracle Fabric Interconnect F2-12
serial-num        To be filled by O.E.M.
ipconfig          static
```

show

```
default-gateway    10.128.9.86.1
mtu                1500
support-jumbo-packet true
timezone          GMT
nameservers
console-speed     115200
-----
```

1 record displayed

There is no progress indicator or completion message. When the command prompt returns, the command has completed.

Example: Change the Management Address of the Fabric Interconnect

This example show how to change the IP address to 192.168.3.56 and the host name to SalesCentral for the management interface.

```
[OFOS] set system management-interface -address 192.168.3.56
[OFOS] set system management-interface -hostname SalesCentral
[OFOS] show system info
-----
```

```
hostname          SalesCentral
descr
domain
address           192.168.3.56
netmask           192.255.255.0
model-num         Oracle Fabric Interconnect F2-12
serial-num        unknown
ipconfig          static
default-gateway   10.129.86.1
mtu               1500
support-jumbo-packet true
timezone          US_Pacific
nameservers
console-speed     115200
-----
```

1 record displayed

show

The `show software` command displays a variety of software information. The `show tech-support` command sends the contents to a file. You must use the redirection switch (`>`) to redirect the output to the file.

Syntax

```
show software -sortby=value
show tech-support > output file
```

where *output file* is a compressed file containing information for Oracle Customer Support.

- *output file* is a compressed file containing information for Oracle Customer Support.
- *value* is the column used to sort the information.

Options

| Option | Description |
|---------|---|
| -sortby | Displays the column used to sort the information. |

Example: Redirect show tech-support

Use the redirection switch (>) to send the current show tech-support command content to an output file to send to Oracle Customer Support.

```
[OFOS] show tech-support > test112011
```

There is no progress indicator or completion message. When the command prompt returns, the command has completed.

system

The system command provides system commands to perform system maintenance, backups, logouts, and shutdowns.

Syntax

```
system access-core-files
system broadcast message
system cancel {restart|shutdown}
```

```
system clear {config|garbage|logs}
system export filename
system import filename
system install ssh-key key
system logout session message
system restart-ofos [-noconfirm]
system restart-ilom [-noconfirm]
system shutdown message [-delay=sec] [-force] [-noconfirm] [-now]
system verify
```

where:

- *filename* is the name of the file to back up or restore.
- *key* is the SSH key that you are installing.
- *message* is a text message.
- *session* is the session ID of the user that will be logged out.

This command has subcommands. This table describes the subcommands and provides their syntax.

| Subcommand | Description |
|-------------------|---|
| access-core-files | Sets the system core files as readable. |
| broadcast | Sends a message to all CLI users who are logged in. |
| cancel | Cancels one of these pending operations: <ul style="list-style-type: none">■ restart■ shutdown |
| clear | Optional. Performs one of the following actions: <ul style="list-style-type: none">■ config – Clears your configuration by completely wiping it out and starting over. This command resets all values in the fabric's configuration database to the factory defaults. When you use the <code>system clear config</code> command, you are prompted for confirmation before the configuration is cleared. When prompted, type <code>confirm</code> to clear the configuration. Any answer other than <code>confirm</code> aborts the <code>system clear config</code> command.■ garbage – Removes failed processes, such as failed image installations.■ logs – Removes existing error and warning logs. |
| export | Before you upgrade the software through a chassis upgrade, export your system configuration to an XML file. The <code>system export</code> command is also used to back up the configuration of an I/O module. For more information about modules, refer to “Managing a Module” in Oracle Fabric OS 1.0.2 Administration Guide . |
| import | Loads a configuration file into the system. If you import a configuration, the system migrates the old configuration to the new. The file is imported in XML format. If your running configuration gets lost during a chassis software upgrade, you can import the old one. For more information on upgrading the virtualization switch , refer to “Upgrading the Switch Firmware (Oracle Fabric OS)” in Oracle EDR InfiniBand Switch and Virtualized I/O Systems Administration Guide . |

| Subcommand | Description |
|-----------------|--|
| | For more information on upgrading the leaf switch , refer to “ Upgrading the Switch Firmware (nm3tool) ” in <i>Oracle EDR InfiniBand Switch and Virtualized I/O Systems Administration Guide</i> . |
| install ssh-key | Installs SSH software on the system. |
| logout | Forces a user to logout (administrator only). |
| restart-ilom | Restarts Oracle ILOM on the hardware. For more information, refer to “ Controlling the Switch (Oracle ILOM CLI) ” in <i>Oracle EDR InfiniBand Switch and Virtualized I/O Systems Administration Guide</i> . |
| restart-ofos | Restarts Oracle Fabric OS and the base OS on the hardware. For more information, refer to “ Controlling the Switch (Oracle ILOM Web) ” in <i>Oracle EDR InfiniBand Switch and Virtualized I/O Systems Administration Guide</i> . |
| shutdown | Stops all processes and shuts off power to all components in the chassis. All power is deactivated. |
| verify | Verifies the integrity of the installation. |

Options

| Option | Description |
|------------|--|
| -delay | Defines the number of seconds before the shutdown begins. |
| -force | Performs the shutdown immediately, prompting for confirmation. |
| -noconfirm | Switches off confirmation prompts. The shutdown completes without prompting you for confirmation. The argument automatically answers yes to any prompts. |
| -now | Performs the shutdown immediately. |

Example: Clear All Configuration

This example shows how to clear all configuration information from the system and restart. If you are running [OpenSM](#), disable the IB subnet manager first and then run the `system clear config` command. After you shut down the IB subnet manager, its status changes to standby mode.

```
[OFOS] set ib sm down
Disabling IB Subnet Manager will disrupt traffic on the network. Are you sure (y/n)?
[OFOS] system clear config
This is a destructive operation. Your configuration will be cleared and the system will
be restarted.
Please type 'confirm' to clear the configuration and restart the system.
[OFOS] confirm
```

Example: Save and Restore System Configuration

This example shows how to export a saved configuration and restore the system.

```
[OFOS] system export myconfig.xml  
[OFOS] system import myconfig.xml
```

Glossary

A

AES128 Advanced Encryption Standard (AES). A symmetric-key algorithm specification used to encrypt data. AES supersedes DES.

D

DES Data Encryption Standard. An algorithm specification used to encrypt data.

DHCP Dynamic Host Configuration Protocol. The IP address is assigned by an external DHCP server.

F

F2-12 Oracle Fabric Interconnect F2-12 chassis.

fabric interconnect Short name for an IB switch that provides gateway services and additional functionality.

H

HA High Availability.

I

IB InfiniBand. A high bandwidth messaging technology used for very high performance computing.

IMS Identity Management System.

K

key set Key sets are used for enhanced security. For examples, see [“show ib” on page 49](#).

L

LAG Link Aggregation Group.

leaf switch Oracle InfiniBand Switch IS2-46.

M

MD5 MD5 message-digest algorithm used to verify data integrity.

O

OpenSM The default Subnet Manager running on the Oracle Fabric Interconnect.

S

switch Oracle InfiniBand Switch IS2-46.

P

PVI Private Virtual Interconnect used for cloud computing.

S

SCP System Control Processor.

SM Subnet Manager. SM groups manage and monitor an IB subnet.

SNMP Simple Network Management Protocol. A protocol for collecting and organizing information about managed devices on an IP network.

V

| | |
|------------------------------|---|
| vHBA | Virtual Host Bus Adapter. Connects a computer, which acts as the host system, to other network and storage devices. |
| virtualization switch | Oracle Fabric Interconnect F2-12 Switch. This virtualization switch supports several I/O modules that provide FC and Ethernet connectivity. |
| VLAN | Virtual local area network. A private, independent, logical network that is created within a physical network. A VLAN behaves like an ordinary LAN, but connected devices don't have to be physically connected to the same network segment. |
| vNIC | Virtual Network Interface Card. An Ethernet interface that is provided without a physical NIC. |
| HCA | Host Channel Adapter. An InfiniBand network interface card used in an InfiniBand network. An HCA provides high-speed connectivity and virtual interfaces, based on the InfiniBand interface. An HCA can have 1 or 2 ports. |
| I/O | Input/Output. In computer architecture, the combination of the CPU and main memory (i.e., memory that the CPU can read and write to directly, with individual instructions) is considered the heart of a computer. Any movement of information to or from that complex, for example to or from a disk drive, is considered I/O. |
| I/O module | A user-replaceable physical interface component for the virtualization switch . I/O modules are supported only on this switch. |
| I/O Port | A single port on an Ethernet module, a Host Bus Adapter module, or one of the 38 InfiniBand server ports. |
| MTU | Maximum Transmission Unit. An MTU is the largest physical packet size (in bytes) that a network can transmit. MTU values are only applicable to Ethernet ports, and the MTU of the I/O port must match the MTU of the neighboring switch. |
| PVI | Private Virtual Interconnect. Connects the switch to the fabric and manages those Ethernet connections. |
| SHA | Secure Hash Algorithm. |
