IConsumerCreditInsuranceCASAAdapter	com.ofss.fc.app.adapter.internal.interface.jar@/com/ofss/fc/app/adapter/ins/IConsumerCreditInsuranceCASAAadapter	applyPremiumToOD	<p>This method is invoked by Insurance when there is a change in premium to be applied on the OD, where as already an Insurance Policy is linked to the OD Account. The Change in premium could be as a result of an Amendment that happens in CCI Servicing. It can also happen as part of batch where the new premium for a subsequent review period needs to be applied to the OD, so that the same can be collected from the customer. The Important Parameters required by OD for this Update would be 1) Amount of the Premium : This will be the Actual premium to be Debited/Credited to the OD Account 2) Whether the Amount has to be Debited/Credited to the OD. 3) Date : This would be the posting Date when passed from Insurance. CASA might want to handle this with an effective Date on their side. Review Period From/To Date may not be of relevance to OD per se for the transactions....However the DTO will contain some additional attributes like the Plan details and the From/To Date ,Policy ID (concatenated String of the policy Id(s) if there are multiple policies) which if required can be used for the Account Statement. @param applicationContext @param premiumForCollectionDTO @return</p>	com.ofss.fc.module.ins.jar@/com/ofss/fc/app/ins/service/cci/CCIBatchReviewApplication

This involves discarding all existing price offerings, re-evaluating the price policy charts at all levels and merging them to create new price offerings. Campaign variances, if any, are re-fetched and re-applied to the new price offerings. Account-level variances are discarded with the earlier price-offerings, and are NOT reinstated with the new price offerings. @param sessionContext @param termDepositFactsDTO @param repriceDate</p>	com.ofss.fc.module.td.jar@/com/ofss/fc/domain/td/service/deposit/DepositService
