

Oracle® Communications Session Border Controller

Administrative Security Essentials Guide
Release S-CZ7.3.0

August 2017

Notices

Copyright ©2015, 2013, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be error-free. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

About this Guide

This guide explains support for a Administrative Security License (Admin Security), which provides a suite of applications and tools providing enhanced, more secure system access, monitoring, and management. All functionality described in this guide requires an active Admin Security and/or an Admin Security ACP license. Users of Oracle Communications Session Border Controller without an Admin Security license can safely ignore this guide.

Specific topics covered in this guide include

- Access
- Audit Log
- License Issues

Audience

This guide is written for network administrators and architects, and provides information about the Oracle Communications Session Border Controller implementation. Supporting and related material is available in the ACLI Configuration Guide. Please refer to that document as needed.

Related Documentation

The following table describes related documentation for the Oracle Communications Session Border Controller.

Document Name	Document Description
Acme Packet 4500 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 4500.
Acme Packet 3820 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 3820.
Acme Packet 4600 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 4600.
Acme Packet 6100 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 6100.
Acme Packet 6300 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 6300.
Release Notes	Contains information about the current documentation set release, including new features and management changes.
ACLI Configuration Guide	Contains information about the administration and software configuration of the Service Provider Oracle Communications Session Border Controller.
ACLI Reference Guide	Contains explanations of how to use the ACLI, as an alphabetical listings and descriptions of all ACLI commands and configuration parameters.
Maintenance and Troubleshooting Guide	Contains information about Oracle Communications Session Border Controller logs, performance announcements, system management, inventory management, upgrades, working with configurations, and managing backups and archives.

About this Guide

Document Name	Document Description
MIB Reference Guide	Contains information about Management Information Base (MIBs), Oracle Communication's enterprise MIBs, general trap information, including specific details about standard traps and enterprise traps, Simple Network Management Protocol (SNMP) GET query information (including standard and enterprise SNMP GET query names, object identifier names and numbers, and descriptions), examples of scalar and table objects.
Accounting Guide	Contains information about the Oracle Communications Session Border Controller's accounting support, including details about RADIUS and Diameter accounting.
HDR Resource Guide	Contains information about the Oracle Communications Session Border Controller's Historical Data Recording (HDR) feature. This guide includes HDR configuration and system-wide statistical information.
Administrative Security Essentials	Contains information about the Oracle Communications Session Border Controller's support for its Administrative Security license.
Security Guide	Contains information about security considerations and best practices from a network and application security perspective for the Oracle Communications Session Border Controller family of products.
Installation and Platform Preparation Guide	Contains information about upgrading system images and any pre-boot system provisioning.
Call Traffic Monitoring Guide	Contains information about traffic monitoring and packet traces as collected on the system. This guide also includes WebGUI configuration used for the SIP Monitor and Trace application.

Revision History

The following table describes updates to this guide.

Date	Description
October 2015	Initial Release
November 2015	Updates and standardizes Administrative Security and Administrative Security ACP topics.
August 2017	Removes deprecated Internet Key Exchange (IKEv2) chapter.

Access

Administrative Security

This section describes implications of installing and deleting the Admin Security license and the Admin Security ACP license on an Oracle Communications Session Border Controller (SBC).

These licenses enable the various security enhancements described in this document. In the absence of an Admin Security or Admin Security ACP license, these enhancements are not available.

As with any other license, an **activate-config** command must be executed after license installation for all changes to take effect. Certain ACLI aspects, such as login and password change prompts, change immediately after license installation.

These two licenses relate as follows:

1. Both licenses can exist together or separately on an SBC.
2. Removal of either or both licenses does not make available the protected areas of the system. This ensures that a system cannot be compromised by simply removing the Admin Security license(s).

Note: The Admin Security or the Admin Security ACP feature sets are not intended for all customer use. Consult your Oracle representative to understand the ramifications of enabling these features.

Note: Once the Admin Security or the Admin Security with ACP entitlement is provisioned, it can not be removed from the system in the field; your chassis must be returned to Oracle for replacement.

Admin Security Features for either license:

- telnet access is denied
- FTP access is denied
- history log access is denied
- shell access is denied
- additional password policy features are enabled

Additional Security features available with the Admin Security license:

- EMS (Element Management System) access is blocked
- ACP (Acme Control Protocol) is blocked

Additional Security features available with the Admin Security ACP license

Access

- EMS (Element Management System) access is open
- ACP is open

The below table reflects feature availability under each license scenario.

Case	Admin Security Features	Shell Access	Telnet, FTP, and SSH Keys	History Log File in code/history	Password-policy	EMS access and ACP Ports
Only Admin Security license is present	enabled	denied	denied	denied	enabled	blocked
Only Admin Security license was deleted	disabled	denied	denied	denied	disabled	open
Only Admin Security ACP license is present	enabled	denied	denied	denied	enabled; password-security-strength is available	open
Only Admin Security ACP license was deleted	disabled	denied	denied	denied	disabled	open
Both are present	enabled	denied	denied	denied	enabled; password-security-strength is available	open
Both were present and only Admin-Security license was deleted	enabled	denied	denied	denied	enabled; password-security-strength is available	open
Both were present and only Admin-Security ACP license was deleted	enabled	denied	denied	denied	enabled; password-security-strength is not available	blocked
Both were present then both were deleted	disabled	denied	denied	denied	disabled	open

Login Banner

Upon successful user authentication/authorization, the Oracle SBC displays the login banner.

Login Banner

- Last login: displays the date and time that the current user (admin in this case) last successfully logged-in
- System last accessed: displays the date and time and user name of the last user who successfully logged-in
- Unsuccessful login attempts: displays the date and time of the last five unsuccessful login attempts by the current user (admin in this case)
- Confirm reading: requires user acknowledgement of the display banner.

A positive response (y) successfully completes login, and starts audit-log activity for this user session. A negative response (n) generates an audit-log entry and logs the user out of the SBC.

The login banner also provides notification or impending password or SSH public key expiration as described in Password Policy Configuration.

Login Policy

The Login Policy controls concurrent system access to a specified number of users, sets the maximum number of unsuccessful login attempts, specifies the response to login failure, and specifies the login mode (single-factor or two-factor).

The single instance **login-config** configuration element defines login policy.

1. From admin mode, use the following command path to access the login-config configuration element:

```
ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# admin-security
ORACLE(admin-security)# login-config
ORACLE(login-config)#
```

login-config configuration element properties are shown below with their default values

concurrent-session-limit	2
max-login-attempts	3

```
login-attempt-interval      4
lockout-interval            60
send-alarm                  enabled
login-auth-mode             single-factor
enable-login-banner         enabled
```

2. **concurrent-session-limit**—specifies the maximum number of simultaneous connections allowed per user name

Allowable values are integers within the range 1 through 10, with a default of 2 (simultaneous connections).

Retain the default value, or specify a new connection limit.

```
ORACLE(login-config)# concurrent-session limit 4
ORACLE(login-config)#
```

3. **max-login-attempts**—specifies the number of consecutive unsuccessful login attempts that trigger disconnection of a console, SSH, or SFTP session.

Allowable values are integers within the range 2 through 100, with a default of 3 (sessions).

Retain the default value, or specify a new threshold value.

```
ORACLE(login-config)# max-login-attempts 5
ORACLE(login-config)#
```

4. **login-attempt-interval**—specifies an idle interval in seconds imposed after an unsuccessful login attempt.

Allowable values are integers within the range 4 through 60, with a default value of 4 seconds.

Retain the default value, or specify a new login interval.

```
ORACLE(login-config)# login-attempt-interval 6
ORACLE(login-config)#
```

5. **lockout-interval**—specifies the number of seconds that logins are not allowed after the **max-login-attempts** threshold has been reached

Allowable values are integers within the range 30 through 300, with a default value of 60 seconds.

Retain the default value, or specify a new lockout interval.

```
ORACLE(login-config)# lockout-interval 30
ORACLE(login-config)#
```

6. **send-alarm**—enables the generation and transmission of alarms in the event of an interface lockout

Allowable values are **enabled** (the default) or **disabled**.

Retain the default value, or select **disabled** to squelch alarm generation.

```
ORACLE(login-config)# send-alarm disabled
ORACLE(login-config)#
```

7. **login-auth-mode**—specifies the local login authentication mode

Allowable values are **single-factor** (the default) or **two-factor**.

single-factor authentication requires the service requester to present a single authentication credential, a password.

two-factor authentication requires the service requester to present two authentication credentials, a password and a passcode.

Retain the default value, or specify two-factor authentication.

```
ORACLE(login-config)# login-auth-mode two-factor
ORACLE(login-config)#
```

8. **enable-login-banner**—enables or disables display of the login banner

Allowable values are **enable** (the default) or **disable**.

Retain the default value, or disable login banner display.

```
ORACLE(login-config) # enable-login-banner disable
ORACLE(login-config) #
```

A sample login policy configuration appears below:

```
ORACLE(login-config) # concurrent-session limit 4
ORACLE(login-config) # max-login-attempts 5
ORACLE(login-config) # login-attempt-interval 6
ORACLE(login-config) # lockout-interval 30
ORACLE(login-config) # done
ORACLE(login-config) # exit
ORACLE(admin-security) #
```

Defines a login-config configuration element that allows four simultaneous connections per user name. An idle interval of 6 seconds is imposed after an unsuccessful login attempt. Five consecutive unsuccessful login attempts trigger a 30-second lockout of the interface over which the unsuccessful logins were received. By default, single-factor authentication, alarm generation, and login banner display are enable.

Password Policy

Both the Admin Security and Admin Security ACP licenses support the creation of a password policy that enhances the authentication process by imposing requirements for:

- password length
- password strength
- password history and re-use
- password expiration and grace period

The Admin Security license restricts access to the ACP ports and mandates the following password length/strength requirements.

- user password must contain at least 9 characters
- admin password must contain at least 15 characters

The Admin Security and Admin Security ACP licenses both work to increase the security of the Oracle Communications Session Border Controller (SBC). If a device already has an Admin Security license installed, you can add an Admin Security ACP license later in certain high-security environments. Both licenses may co-exist on a single device, or either license may be on the device alone. An Admin Security ACP license performs the same functions as an Admin Security license, but also allows access to the ACP ports blocked by an Admin Security license.

- passwords must contain at least 2 lower case alphabetic characters
- passwords must contain at least 2 upper case alphabetic characters
- passwords must contain at least 2 numeric characters
- passwords must contain at least 2 special characters
- passwords must differ from the prior password by at least 4 characters
- passwords cannot contain, repeat, or reverse the user name
- passwords cannot contain three consecutive identical characters

The Admin Security ACP license imposes the same password length/strength requirements as above except for the minimum length requirement, and also maintains or reopens access to the ACP ports.

With the enabling of the password-strength command as part of the Admin Security ACP license, you also impose these requirements:

- passwords cannot contain two or more characters from the user ID
- passwords cannot contain a sequence of three or more characters from any password contained in the password history cache
- passwords cannot contain a sequence of two or more characters more than once

- passwords cannot contain either sequential numbers or characters, or repeated characters more than once.

In the absence of the Admin Security APC license, retain the default value (**disabled**). With the Admin Security APC license installed, use **enabled** to add the new password requirements as listed above; use **disabled** to retain only the password requirements defined by the Admin Security license.

Some specific password policy properties, specifically those regarding password lifetime and expiration procedures, are also applicable to SSH public keys used to authenticate client users.

Configuring Password Policy Properties

The single instance **password-policy** configuration element defines the password policy.

- From superuser mode, use the following command path to access password-policy configuration mode.

```
ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# password-policy
ORACLE(password-policy)#
```

The **password-policy** configuration element properties (with the introduction of the Admin Security or Admin Security ACP license) are shown below with their default values.

min-secure-pwd-length	8
expiry-interval	90
expiry-notify-period	30
grace-period	30
grace-logins	3
password-history-count	3
password-change-interval	24
password-policy-strength	disabled

- The **min-secure-pwd-length** command is ignored when the Admin Security ACP license is installed and the **password-policy-strength** configuration element is set to **enabled**.
- Use the **expiry-interval** command to specify the password lifetime in days. Password lifetime tracking begins when a password is changed.

Allowable values are integers within the range 1 through 65535, with a default value of 90 (days).

```
ORACLE(password-policy)# expiry-interval 60
ORACLE(password-policy)#
```

- Use the **password-change-interval** command to specify the minimum password lifetime (the minimum time that must elapse between password changes.)

Allowable values are integers within the range 1 through 24, with a default value of 24 (hours).

```
ORACLE(password-policy)# password-change-interval 18
ORACLE(password-policy)#
```

- Use the **expiry-notify-period** to specify the number of days prior to expiration that users begin to receive password expiration notifications.

Allowable values are integers within the range 1 through 90, with a default value of 30 (days).

During the notification period, users are reminded of impending password expiration at both Session Director login and logout.

```
ORACLE(password-policy)# expiry-notify-period 10
ORACLE(password-policy)#
```

- Use the **grace-period** command in conjunction with the **grace-logins** command, to police user access after password expiration.

After password expiration, users are granted some number of logins (specified by the **grace-logins** command) for some number of days (specified by the **grace-period** command). Once the number of logins has been exceeded, or once the grace period has expired, the user is forced to change his or her password.

Allowable values for **grace-period** are integers within the range 1 through 90, with a default value of 30 (days).

Allowable values for **grace-logins** are integers within the range 1 through 10, with a default value of 3 (logins).

```
ORACLE (password-policy) # grace-period 1
ORACLE (password-policy) # grace-logins 1
ORACLE (password-policy) #
```

7. Use the **password-history-count** command to specify the number of previously used passwords retained in encrypted format in the password history cache.

Allowable values are integers within the range 1 through 10, with a default value of 3 (retained passwords).

By default, a user's three most recently expired passwords are retained in the password history. As the user's current password is changed, that password is added to the history, replacing the oldest password entry.

New, proposed passwords are evaluated against the contents of the password cache, to prevent password re-use, and guard against minimal password changes.

```
ORACLE (password-policy) # password-history-count 10
ORACLE (password-policy) #
```

8. (Optional) Use the **password-policy-strength** command to enable the enhanced password strength requirements.

In the absence of the Admin Security ACP license, this command can be safely ignored.

password-policy-strength may be enabled when the Admin Security ACP license is enabled. This license includes all the password security features contained in the Admin Security license and also adds password strength requirements beyond those imposed by the Admin Security license. Specific new requirements are as follows:

- passwords cannot contain two or more characters from the user ID
For example, given a user ID of administrator, the password thispasswordistragic is not allowed because istra is a substring of administrator
- passwords cannot contain a sequence of three or more characters from any password contained in the password history cache
- passwords cannot contain a sequence of two or more characters more than once
For example, ...w29W29... is legal; ...w29W29&&29... is not.
- passwords cannot contain either sequential numbers or characters, or repeated characters more than once
For example, '66666', 'aaaa', 'abcd', 'fedc', '1234', '7654'.
For example, 666, aaa abcd, fedc, 1234, and 7654 all render a password illegal.

In the absence of the Admin Security ACP license, retain the default value (**disabled**). With the Admin Security ACP license installed, use **enabled** to add the new password requirements as listed above; use **disabled** to retain only the password requirements defined by the Admin Security license.

```
ORACLE (password-policy) # password-policy-strength enabled
ORACLE (password-policy) #
```

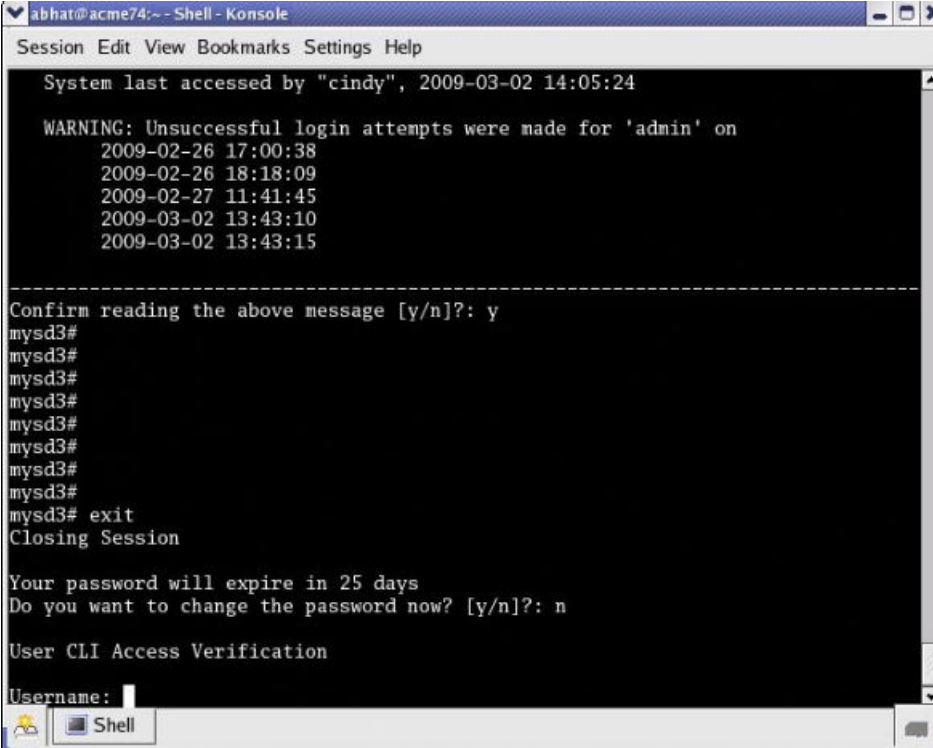

9. Use **done**, **exit** and **verify-config** to complete password policy.

RADIUS Passwords

With RADIUS enabled, passwords are stored and controlled on the remote RADIUS server or servers. Consequently, none of the length/strength, re-use, history, or expiration requirements mandated by the password policy are applicable to RADIUS passwords.

Changing a Password

As shown in the following figures, the **password-policy** configuration element provides prior notice of impending password expiration via the login banner display, and with additional notices when ending a login session.

Have to change

Grace Login Reminder/Forced Password Change

Changing Password Process

To change your password in response to (1) an impending expiration notice displayed within the login banner or at system logout, (2) a grace login notice, or (3) an expiration notice:

1. If responding to an impending expiration notice, or a grace login notice, type y at the Do you want to change the password ... prompt.

2. Provide a new, valid password in response to the Enter New Password: prompt.
3. Re-enter the password in response to the Confirm New Password: prompt.
4. If performing a login, enter y to acknowledge reading the login banner to complete login with the new password.

The user account can change the password only in response to one of the three notifications described above.

Similarly, the admin account can change the password in response to the same notifications. Additionally, these accounts can change passwords using the ACLI as described in the following sections.

Changing the user Password

Change the user password from the # (admin) prompt.

1. Enter **secret login** at the prompt and provide the current password when challenged.

```
ORACLE# secret login
Enter current password :
```

2. Type the new password in response to the Enter new password : prompt.

```
ORACLE# secret login
Enter current password :
Enter new password :
```

3. Confirm the password in response to the Enter password again : prompt.

```
ORACLE# secret login
Enter current password :
Enter new password :
Enter password again :
ORACLE#
```

Changing the admin Password

Change the admin password from the # (admin) prompt.

1. Enter **secret enable** at the prompt and provide the current password when challenged.

```
ORACLE# secret enable
Enter current password :
```

2. Type the new password in response to the Enter new password : prompt.

```
ORACLE# secret enable
Enter current password :
Enter new password :
```

3. Confirm the password in response to the Enter password again : prompt.

```
ORACLE# secret enable
Enter current password :
Enter new password :
Enter password again :
ORACLE#
```

Changing a Passcode

A passcode is a secondary credential passed to the authentication process when |two-factor authentication is enabled. Passcodes are subject to length/strength requirements imposed by the password policy, but are not bound by other policy mandates regarding history, re-use, and expiration.

The admin account can change passcodes using the ACLI as described below.

Change the user passcode from the # (admin) prompt.

1. Enter secret login passcode at the prompt.

```
ORACLE# secret login passcode
Enter Current Passcode :
```

2. Type the current passcode in response to the Enter Current Passcode : prompt.

```
ORACLE# secret login passcode
Enter Current Passcode :
Enter New Passcode :
```

3. Type the new passcode in response to the Enter New Passcode : prompt.

```
ORACLE# secret login password
Enter Current Passcode :
Enter New Passcode :
Confirm New Passcode :
```

4. Confirm the new passcode in response to the Confirm New Passcode : prompt.

```
ORACLE# secret login password
Enter Current Passcode :
Enter New Passcode :
Confirm New Passcode :
% Success
ORACLE#
```

Changing the admin Passcode

Change the admin passcode from the # (admin) prompt.

1. Enter secret enable passcode at the prompt.

```
ORACLE# secret enable passcode
Enter Current Passcode :
```

2. Type the current passcode in response to the Enter Current Passcode : prompt.

```
ORACLE# secret enable passcode
Enter Current Passcode :
Enter New Passcode :
```

3. Type the new passcode in response to the Enter New Passcode : prompt.

```
ORACLE# secret enable password
Enter Current Passcode :
Enter New Passcode :
Confirm New Passcode :
```

4. Confirm the new passcode in response to the Confirm New Passcode : prompt.

```
ORACLE# secret enable password
Enter Current Passcode :
Enter New Passcode :
Confirm New Passcode :
% Success
ORACLE#
```

Authentication and Authorization

Authentication is the process of confirming the alleged identity of a service requester; while several authentication methods are in use, authentication is most often performed by simple password verification.

Authorization, a process performed after authentication, determines the access or privilege level accorded an authenticated requester. Authorization answers two questions. Does this requester have access to a specific system resource (for example, a file or a configuration object)? If so, what kind of access (for example, create, destroy, or modify)? While there are several authorization methods, authorization is usually accomplished by assigning an authenticated requester to one of a number of pre-defined authorization classes. Conceptually, each class lists available objects, along with an associated object-access type (often expressed as read-only, write-only, or read-write).

Local Authentication and Authorization

This section describes authentication and authorization of users that is performed locally by the Oracle SBC that is equipped with an active Admin Security license.

The license provides two pre-defined user names

- user
- admin

Each of the two user names is associated with an eponymous authorization class which defines the access/privilege level for that user.

user (authorization class)

- provides read-only access to non-security configurations
- provides read access to visible files
- login to user mode
- cannot switch to admin mode

admin (authorization class)

- provides read-write access to all configuration
- provides read/write access to a sub-set of file system elements
- login to admin mode
- cannot switch to user mode

Console Login

With an active Admin Security license, local login to the Oracle SBC is restricted to the two previously described usernames (user and admin) via the console/serial connection. The following table summarizes default authentication and authorization for local logins.

Table 1: Local Login Authentication & Authorization

User Name	Logins into/prompt	Authentication	Authorization
user	user mode >	authenticated locally by SBC via password	authorized locally by SBC assigned to user class inherits access/privilege defined by that class
admin	admin mode #	authenticated locally by SBC via password	authorized locally by SBC assigned to admin class inherits access/privilege defined by that class

Serial Port Control

With an active Admin Security license, users have the ability to enable or disable access to the serial (console) port. In the absence of this license, access to the serial is generally available. The ACLI command **console-io** functions as a switch that you set to **enabled** to allow serial port access and to **disabled** to keep the serial port from being used.

If you remove the administrative management license after disabling the serial port, the SBC reverts to its default behavior by providing serial port access.

To turn off access to the serial port:

At the system prompt, type **console-io** followed by a Space. Then type disabled and press Enter.

```
ORACLE# console-io disabled
```

If you want to re-enable the serial port, use the same command with the **enabled** argument.

Initial Login

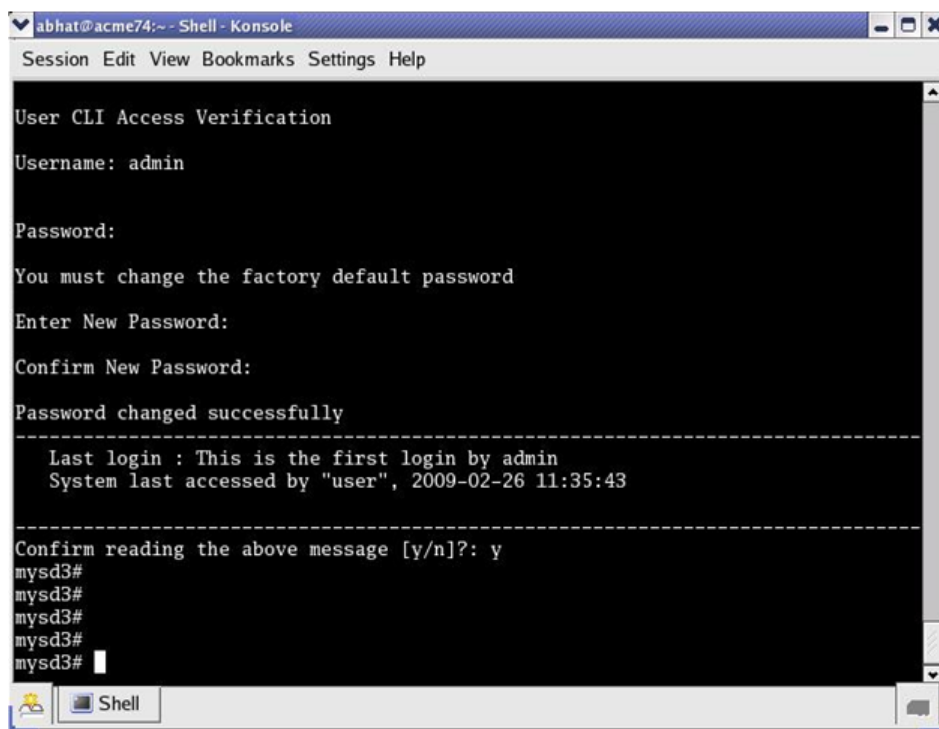

Upon initial login user and admin are required to change the respective password. Initial login is completed only after password change and acknowledgment of the login banner.

The following figure shows the initial login screen for the admin role (the user role views a nearly identical screen).

To complete initial login:

1. Enter one of the recognized user name (user or admin) in response to the **Username:** prompt.
2. Enter the factory default password in response to the **Password:** prompt.

The factory default user password is acme; the factory default admin password is packet.

Initial admin Login (Console Access)

3. Enter a new password in response to the Enter New Password: prompt.

Passwords must meet the following length/strength requirements.

- user password must contain at least 9 characters
 - admin password must contain at least 15 characters
 - passwords must contain at least 2 lower case alphabetic characters
 - passwords must contain at least 2 upper case alphabetic characters
 - passwords must contain at least 2 numeric characters
 - passwords must contain at least 2 special characters
 - passwords must differ from the prior password by at least 4 characters
 - passwords cannot contain, repeat, or reverse the user name
 - passwords cannot contain three consecutive identical characters
4. Re-enter the new password in response to the Confirm New Password: prompt.
 5. Enter y to acknowledge reading the login banner to complete initial login.

Remote SSH Login with Password

With an active Admin Security license, remote access, via the management interface (also referred to as wancom0), is available using SSH Version 2; telnet access is not allowed under the Admin Security license.

The following figure shows remote SSH access for both user and admin)

The figure consists of two overlapping screenshots of a Shell console window titled 'abhat@acme74:~ - Shell - Konsole <2>'. The top screenshot shows an SSH login for 'user' at 172.30.61.102. It displays the password prompt, two-factor authentication mode, a passcode prompt, and login details: 'Last login : 2009-02-26 11:35:19' and 'System last accessed by "admin", 2009-02-26 17:59:04'. A warning message indicates unsuccessful login attempts for 'user' on 2009-02-26 at 18:04:48 and 18:10:31. The user confirms reading the message and the prompt 'mysd3>' appears. The bottom screenshot shows an SSH login for 'admin' at 172.30.61.102. It follows a similar pattern but with login details for 'li-admin' (last login 2009-02-26 17:59:03, last accessed 2009-02-26 18:16:38) and a warning for 'admin' login attempts on 2009-02-26 at 16:39:12, 16:39:27, 17:00:29, 17:00:38, and 18:18:09. The user confirms reading the message, enters 'li-admin', receives an error message 'Error: you should login to the system with User Name "li-admin"', and then enters 'exit' to close the session, resulting in a 'Logged out.' message.

Remote SSH Login

The following table summarizes default authentication and authorization for remote SSH logins.

Table 2: Remote Login (SSH/Password) Authentication & Authorization

User Name	Logins into/prompt	Authentication	Authorization
-----------	--------------------	----------------	---------------

user	user mode >	authenticated locally by SBC via password	authorized locally by SBC assigned to user class inherits access/privilege defined by that class
admin	admin mode #	authenticated locally by SBC via password	authorized locally by SBC assigned to admin class inherits access/privilege defined by that class

Remote SSH Login with Public Key

The previous section described password-based SSH authentication. Alternatively, with an active Admin Security license, you can authenticate using SSH public keys.

Prior to using SSH-public-key-based authentication you must import a copy of the public key of each user who will authenticate using this method. The public key identifies the user as a trusted entity when the Oracle SBC performs authentication.

During the SSH login, the user presents its public key to the SBC, which validates the offered public key against the previously obtained trusted copy of the key to identify and authenticate the user.

Importing a public key requires access to the device on which the public key was generated, or on which it is currently stored with its associated private key. Access is generally attained with a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

1. Use a terminal emulation program to access the system from which the public key will be obtained.
2. Copy the base64 encoded public key making sure to include the Begin and End markers as specified by RFC 4716, *The Secure Shell (SSH) Public Key File Format*.
3. Use the **ssh-pub-key** command to import the public key to the SBC.

For importing a public key which will be used to authorize a user, this command takes the format:

```
ssh-pub-key import authorized-key <name> <authorizationClass>
```

- where name is an alias or handle assigned to the imported public key, often the user's name.
- where authorizationClass designates the authorization class assigned to this user, and takes the value user (the default) or admin.

To import a public key for Dwight who will be authorized for user privileges, use the following command

```
ORACLE# ssh-pub-key import authorized-key Dwight
ORACLE#
```

To import a public key for Matilda who will be authorized for admin privileges, use the following command

```
ORACLE# ssh-pub-key import authorized-key Matilda admin
ORACLE#
```

IMPORTANT:

Please paste ssh public key in the format defined in RFC 4716.
Terminate the key with ";" to exit.....

4. Paste the public key with the bracketing Begin and End markers at the cursor point.
5. Enter a semi-colon (;) to signal the end of the imported host key.
6. Follow directions to save and activate the configuration.

The entire import sequence is shown below.

```
ORACLE# ssh-pub-key import authorized-key Matilda admin
```

IMPORTANT:

Please paste ssh public key in the format defined in RFC 4716.
Terminate the key with ";" to exit.....

```

---- BEGIN SSH2 PUBLIC KEY ----

```

7. If necessary, repeat the above procedure to import additional user-specific public keys.

Note: Imported SSH public keys are subject to the same expiration policies and procedures as passwords. An SSH public key's lifetime is the same as a password, and it is subject to the same notifications and grace intervals. If an SSH public key expires, the admin user must import a new SSH public key for the user. To ensure continuity of access, the admin should import a new SSH public key prior to the key expiration.

The following figure shows the successful SSH-public-key based authentication of Matilda, who has logged in with admin privileges, and Dwight who has logged in with user privileges.

The screenshot shows a terminal window titled 'abhat@acme74:~ - Shell - Konsole <2>'. It displays two SSH sessions. The first session is for 'Matilda@172.30.61.102', showing a successful login with admin privileges. The second session is for 'Dwight@172.30.61.102', showing a successful login with user privileges. The terminal output includes the last login time and the system last accessed by the user.

```

abhat@acme74:~ - Shell - Konsole <2>

```

Note in the figure above that the login banner refers to the admin and user login by the aliases used when the trusted copies of their SSH public keys were imported. In all respects, however, Dwight is a user instance, and Matilda is a admin instance.

The following table summarizes default authentication and authorization for remote SSH logins.

Table 3: Remote Login (SSH/Public Key) Authentication & Authorization

User Name	Logins into/prompt	Authentication	Authorization
not relevant	user mode > or admin mode #	authenticated locally by SBC via SSH public key	authorized locally by SBC authorization determined by authorizationClass command argument (user or admin) inherits access/privilege defined by the specified class

RADIUS Authentication and Authorization

As an alternative to the local authentication/authorization described in previous sections, users may prefer to use a RADIUS server or server group for authentication and authorization.

For information on configuring between RADIUS servers and the SBC refer to RADIUS Authentication in the 3000 and 4000 ACLI Configuration Guide .

A RADIUS users file (shown below), stored on the RADIUS server, provides the basis for server authentication and authorization decisions.

```

cindy Auth-Type := Local, User-Password == "arens"
      Service-Type = Login-User,
      Acme-User-Class = admin,
      Acme-User-Privilege = sftpForAll

gregg Auth-Type := Local, User-Password == "kearnan"
      Service-Type = Login-User,
      Acme-User-Class = user,
      Acme-User-Privilege = sftpForAll

abhat Auth-Type := Local, User-Password == "bhat"
      Service-Type = Login-User,
      Acme-User-Class = SystemAdmin,
      Acme-User-Privilege = sftpForAll

juna Auth-Type := Local, User-Password == "naga"
      Service-Type = Login-User,
      Acme-User-Class = SystemAdmin,
      Acme-User-Privilege = sftpForAll

user1 Auth-Type := Local, User-Password == "user1"
      Service-Type = Login-User,
      Acme-User-Class = admin,
      Acme-User-Privilege = sftpForAll

user2 Auth-Type := Local, User-Password == "user2"
  
```

RADIUS Users File

Upon receiving a login request, the SBC sends a RADIUS Access Request message to the RADIUS server. The request message contains, among other things, the username:password requesting access to SBC

resources. Upon receiving the request, the RADIUS server checks its user file for the username:password pair. If it finds a congruent match, the requestor is authenticated.

Successful authentication generates a Access Accept message to the SBC; the message also contains the contents of two Oracle Vendor Specific Attributes (VSAs). Acme-User-Class specifies the configuration privileges accorded the authenticated user. Acme-User-Privilege specifies the log file access accorded to the authenticated user. Together these two VSAs provide the authorization function. Consequently, the RADIUS server functions as an authentication and authorization decision point, while the SBC functions as an enforcement point.

RADIUS Authorization Classes

The RADIUS authorization classes, as specified by the Acme-User-Class VSA, do not coincide directly with those used to authorize the two pre-defined local usernames (user and admin). The RADIUS authorization classes are as follows:

user (RADIUS Acme-User-Class = user)

- provides read-only for all system configuration (including cryptographic keys and certificates)
- The login prompt for this user is ORACLE>

SystemAdmin (RADIUS Acme-User-Class = SystemAdmin)

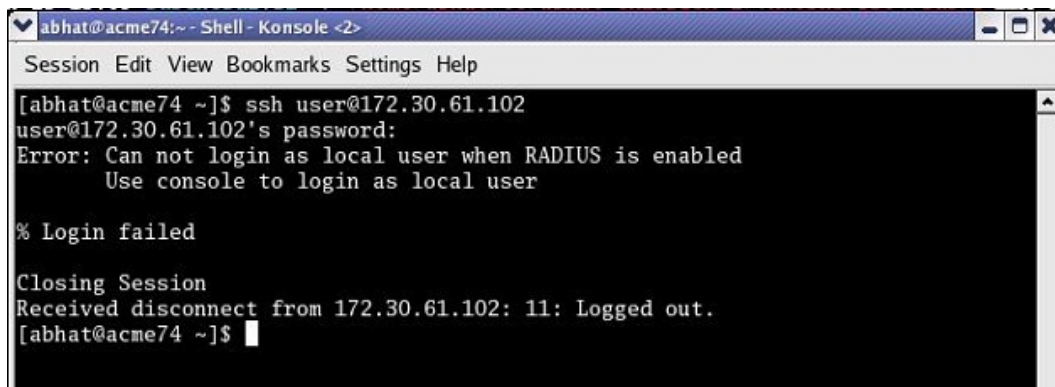

- provides read-write access for system configuration (not including cryptographic keys and certificates)
- The login prompt for this user is ORACLE\$

Admin (RADIUS Acme-User-Class = admin)

- provides read-write access for all system configuration (including cryptographic keys and certificates).
- The login prompt for this user is ORACLE#

RADIUS and SSH

When logging in via SSH and authenticating with RADIUS, username/password authentication for the two pre-defined user names (user, admin) is disabled. Attempts to login via SSH are rejected as shown in the following figure.

```
abhat@acme74:~ - Shell - Konsole <2>
Session Edit View Bookmarks Settings Help
[abhat@acme74 ~]$ ssh user@172.30.61.102
user@172.30.61.102's password:
Error: Can not login as local user when RADIUS is enabled
      Use console to login as local user

% Login failed

Closing Session
Received disconnect from 172.30.61.102: 11: Logged out.
[abhat@acme74 ~]$
```

Local User Login with SSH (RADIUS Enabled)

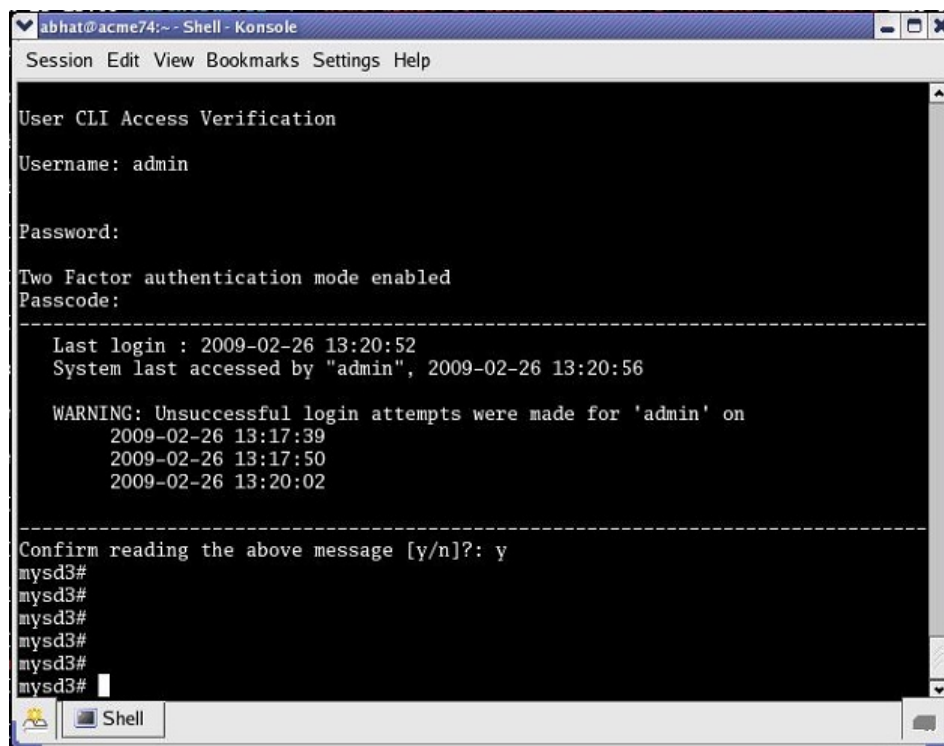

If you want to enable user and admin access via SSH with RADIUS configured, you must explicitly define users on the RADIUS server with appropriate Acme-User-Class.

RADIUS and Password Policies

With RADIUS enabled, passwords are stored and controlled on the remote RADIUS server or servers. Consequently, none of the length/strength, re-use, history, or expiration requirements mandated by the local password policy are applicable to RADIUS passwords. Most RADIUS servers, however, do enforce password policies of their own.

Two-Factor Authentication

Two-factor authentication, which adds an additional level of security, is available in support of local and SSH password authentication..

Two-Level Authentication

When enabled, two-factor authentication requires the authentication of a second passcode following the successful authentication of the initial password. Passcodes are subject to the length/strength requirements specified by the password policy; however they are not subject to other policy elements such as history or lifetime.

Two-factor authentication is not supported by RADIUS servers.

SSH and SFTP

With an active Admin Security license, the Secure Shell (SSH) and related Secure Shell File Transfer (SFTP) protocols provide for the secure transfer of audit files and for the secure transfer of management traffic across the wancom0 interface.

SSH Operations

SSH Version 2.0, the only version supported on the Oracle SBC, is defined by a series of five RFCs.

- RFC 4250, *The Secure Shell (SSH) Protocol Assigned Numbers*
- RFC 4251, *The Secure Shell (SSH) Protocol Architecture*
- RFC 4252, *The Secure Shell (SSH) Authentication Protocol*
- RFC 4253, *The Secure Shell (SSH) Transport Layer Protocol*
- RFC 4254, *The Secure Shell (SSH) Connection Protocol*

RFCs 4252 and 4253 are most relevant to SBC operations.

The transport layer protocol (RFC 4253) provides algorithm negotiation and key exchange. The key exchange includes server authentication and results in a cryptographically secured connection that

provides integrity, confidentiality and optional compression. Forward security is provided through a Diffie-Hellman key agreement. This key agreement results in a shared session key. The rest of the session is encrypted using a symmetric cipher, currently 128-bit AES, Blowfish, 3DES, CAST128, Arcfour, 192-bit AES, or 256-bit AES. The client selects the encryption algorithm to use from those offered by the server. Additionally, session integrity is provided through a crypto-graphic message authentication code (hmac-md5, hmac-sha1, umac-64 or hmac-ripemd160).

The authentication protocol (RFC 4252) uses this secure connection provided and supported by the transport layer. It provides several mechanisms for user authentication. Two modes are supported by the SBC: traditional password authentication and public-key authentication.

Configuring SSH Properties

The single instance **ssh-config** configuration element specifies SSH re-keying thresholds.

1. From admin mode, use the following command path to access the ssh configuration element:

```
ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# admin-security
ORACLE(admin-security)# ssh-config
ORACLE(ssh-config)#
```

ssh configuration element properties are shown below with their default values

```
rekey-interval      60
rekey-byte-count    31
```

2. **rekey-interval**—specifies the maximum allowed interval, in minutes, between SSH key negotiations

Allowable values are integers within the range 60 through 600, with a default of 60 (minutes). Shorter lifetimes provide more secure connections.

Works in conjunction with **rekey-byte-count**, which sets a packet-based threshold, to trigger an SSH renegotiation. If either trigger is activated, an SSH renegotiation is begun.

Retain the default value, or specify a new value.

```
ORACLE(ssh-config)# rekey-interval 20
ORACLE(ssh-config)
```

3. **rekey-byte-count**—specifies the maximum allowed send and receive packet count, in powers of 2, between SSH key negotiations

Allowable values are integers within the range 20 (1,048,576 packets) through 31 (2,147,483,648 packets), with a default of 31 (2^{31}). Smaller packet counts provide more secure connections.

Works in conjunction with **rekey-interval**, which sets a time-based threshold, to trigger an SSH renegotiation. If either trigger is activated, an SSH renegotiation is begun.

Retain the default value, or specify a new value.

```
ORACLE(ssh-config)# rekey-packet-count 24
ORACLE(ssh-config)
```

A sample SSH configuration appears below:

```
ORACLE(ssh-config)# rekey-interval 20
ORACLE(ssh-config)# done
ORACLE(ssh-config)# exit
ORACLE(admin-security)#
```

Specifies a key renegotiation every 20 minutes, or at the reception/transmission of 2,147,483,648 packets, whichever comes first.

Managing SSH Keys

Use the following procedure to import an SSH host key.

Importing a host key requires access to the SFTP server or servers which receive audit log transfers. Access is generally most easily accomplished with a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

1. Use a terminal emulation program to access the SSH file system on a configured SFTP server.
2. Copy the server's base64 encoded public file making sure to include the Begin and End markers as specified by RFC 4716, *The Secure Shell (SSH) Public Key File Format*.

For OpenSSH implementations host files are generally found at `/etc/ssh/ssh_host_dsa_key.pub`, or `etc/ssh/ssh_host_rsa.pub`. Other SSH implementations can differ.

3. From admin mode use the **ssh-pub-key** command to import the host key to the SBC.

For importing a host key, this command takes the format:

```
ssh-pub-key import known-host <name>
```

where name is an alias or handle assigned to the imported host key, generally the server name or a description of the server function.

```
ORACLE# ssh-pub-key import known-host fedallah
```

IMPORTANT:

Please paste ssh public key in the format defined in rfc4716.
Terminate the key with ";" to exit.....

4. Paste the public key with the bracketing Begin and End markers at the cursor point.
5. Enter a semi-colon (;) to signal the end of the imported host key.
6. Follow directions to save and activate the configuration.

The entire import sequence is shown below.

```
ORACLE# ssh-pub-key import known-host fedallah
```

IMPORTANT:

Please paste ssh public key in the format defined in rfc4716.
Terminate the key with ";" to exit.....

Importing SSH Keys

Use the following procedure to import an SSH public key.

Prior to using SSH-public-key-based authentication you must import a copy the public key of each user who will authenticate using this method. The public key identifies the user as a trusted entity when the Oracle SBC performs authentication.

During the SSH login, the user presents its public key to the SBC. Upon receiving the offered public key, the SBC validates it against the previously obtained trusted copy of the key to identify and authenticate the user.

Importing a public key requires access to the device on which the public key was generated, or on which it is currently stored with its associated private key. Access is generally attained with a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

1. Use a terminal emulation program to access the system from which the public key will be obtained.
2. Copy the base64 encoded public key making sure to include the Begin and End markers as specified by RFC 4716, *The Secure Shell (SSH) Public Key File Format*.
3. From admin mode use the **ssh-pub-key** command to import the public key to the SBC.

For importing a public key which will be used to authorize a user, this command takes the format:

```
ssh-pub-key import authorized-key <name> <authorizationClass>
```

- where name is an alias or handle assigned to the imported public key, often the user's name.
- where authorizationClass optionally designates the authorization class assigned to this user, and takes the value user (the default) or admin.

To import a public key for Matilda who will be authorized for admin privileges, use the following command

```
ORACLE# ssh-pub-key import authorized-key Matilda admin
```

IMPORTANT:

```
Please paste ssh public key in the format defined in rfc4716.
Terminate the key with ";" to exit.....
```

4. Paste the public key with the bracketing Begin and End markers at the cursor point.
5. Enter a semi-colon (;) to signal the end of the imported host key.
6. Follow directions to save and activate the configuration.

The entire import sequence is shown below.

```
ORACLE# ssh-pub-key import authorized-key Matilda admin
```

IMPORTANT:

```
Please paste ssh public key in the format defined in rfc4716.
Terminate the key with ";" to exit.....
```

```
---- BEGIN SSH2 PUBLIC KEY ----
```

```

Generating an SSH Key Pair

Use the following procedure to generate an SSH key pair.

The initial step in generating an SSH key pair is to configure a public key record which will serve as a container for the generated key pair.

1. Navigate to the **public-key** configuration element.

```

ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# public-key
ORACLE(public-key)#

```

2. Use the **name** command to provide the object name, and the **show** command to verify object creation.

```

ORACLE(public-key)# name tashtego
ORACLE(public-key)# show public-key
name                tashtego
type                rsa
size                1024
last-modified-by
last-modified-date

ORACLE(public-key)#

```

creates a public key record named tashtego.

3. Use the **done** command to complete object creation.

```

ORACLE(public-key)# done
public-key
name                tashtego
type                rsa
size                1024
last-modified-by    admin@console
last-modified-date  2009-03-06 11:18:00
ORACLE(public-key)#

```

4. Make a note of the **last-modified-date** time value.
5. Move back to admin mode, and save and activate the configuration.

```

ORACLE(public-key)# exit
ORACLE(security)# exit

```

```

ORACLE(configure)# exit
ORACLE#
ORACLE# save-config
...
...
...
ORACLE# activate-config
...
...
...
ORACLE#

```

6. Now use the **ssh-pub-key generate** command, in conjunction with the name of the public key record created in Step 3, to generate an SSH key pair.

For importing an SSH key pair, this command takes the format:

```
ssh-pub-key generate <name>
```

where name is an alias or handle assigned to the generated key pair, generally the client name or a description of the client function.

```

ORACLE# ssh-pub-key generate tashtego
Please wait...
public-key 'tashtego' (RFC 4716/SECSH format):
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "1024-bit rsa"

---- END SSH2 PUBLIC KEY ----
SSH public-key pair generated successfully....
WARNING: Configuration changed, run "save-config" command to save
        it and run "activate-config" to activate the changes
ORACLE#

```

7. Copy the base64-encoded public key. Copy only the actual public key — do not copy the bracketing Begin and End markers nor any comments. Shortly you will paste the public key to one or more SFTP servers.
8. Save and activate the configuration.

```

ORACLE# save-config
...
...
...
ORACLE# activate-config
...
...
...

```

9. Return to the public-key configuration object, and select the target public key record instance.

```

ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# public-key
ORACLE(public-key)# sel
<name>:
1: acme01
2: acme02
3: tashtego

selection: 3
ORACLE(public-key)# show
public-key
      name          tashtego
      type          rsa

```

```

size 1024
last-modified-by admin@console
last-modified-date 2009-03-06 11:24:32
ORACLE(public-key) #

```

10. Verify that the record has been updated to reflect key generation by examining the value of the last-modified-date field.

Copying Public Key to SFTP Server

Use the following procedure to copy a client public key to an SFTP server.

Copying the client public key to an SFTP server requires server access generally using a terminal emulation program such as PuTTY, SecureCRT, or TeraTerm.

1. Use a terminal emulation program to access the SSH file system on a configured SFTP server.
2. Copy the client key to the SFTP server.

On OpenSSH implementations, public keys are usually stored in the `~/.ssh/authorized_keys` file. Each line this file (1) is empty, (2) starts with a pound (#) character (indicating a comment), or (3) contains a single public key.

Refer to the `sshd` man pages for additional information regarding file format.

Use a text editor such as `vi` or `emacs` to open the file and paste the public key to the tail of the `authorized_keys` file.

For SSH implementations other than OpenSSH, consult the system administrator for file structure details.

Use the following procedure to view an imported SSH key.

You can use the `show security ssh-pub-key` command to display information about SSH keys imported to the SBC with the `ssh-pub-key` command; you cannot display information about keys generated by the `ssh-pub-key` command.

```

SFTP Operations

SFTP is an interactive file transfer program, similar to FTP, which performs all operations over an encrypted SSH connection. It may also use many features of SSH, such as public key authentication and compression. SFTP connects and logs into the specified host, then enters an interactive command mode.

Once in interactive mode, SFTP understands a set of commands similar to those of FTP. Commands are case insensitive and pathnames may be enclosed in quotes if they contain spaces.

Command	Description
bye	Quit sftp.
cd pathChange	remote directory to path.

Access

Command	Description
lcd pathChange	local directory to path.
chgrp grp path	Change group of file path to group. group must be a numeric GID.
chmod mode path	Change permissions of file path to mode.
chown own path	Change owner of file path to own. own must be a numeric UID.
dir (or ls)	List the files in the current directory
exit	Quit sftp.
get [flags] remote-path [local-path]	Retrieve the remote-path and store it on the local machine. If the local path name is not specified, it is given the same name it has on the remote machine. If the -P flag is specified, then the file's full permission and access time are copied too.
help	Display help text.
lcd	Change the directory on the local computer
lls	See a list of the files in the current directolls [ls-options [path]]Display local directory listing of either path or current directory if path is not specified.
lmkdir path	Create local directory specified by path.
ln oldpath newpath	Create a symbolic link from oldpath to newpath.
lpwd	Print local working directory.
ls [path]	Display remote directory listing of either path or current directory if path is not specified.
lumask umask	Set local umask to umask.
mkdir path	Create remote directory specified by path.
put [flags] local-path [local-path]	Upload local-path and store it on the remote machine. If the remote path name is not specified, it is given the same name it has on the local machine. If the -P flag is specified, then the file's full permission and access time are copied too.
pwd	Display remote working directory.
quit	Quit sftp.
rename oldpath newpath	Rename remote file from oldpath to newpath.
rmdir path	Remove remote directory specified by path.
rm path	Delete remote file specified by path.
symlink oldpath newpath	Create a symbolic link from oldpath to newpath.
! command	Execute command in local shell.
!	Escape to local shell.
?	Synonym for help.

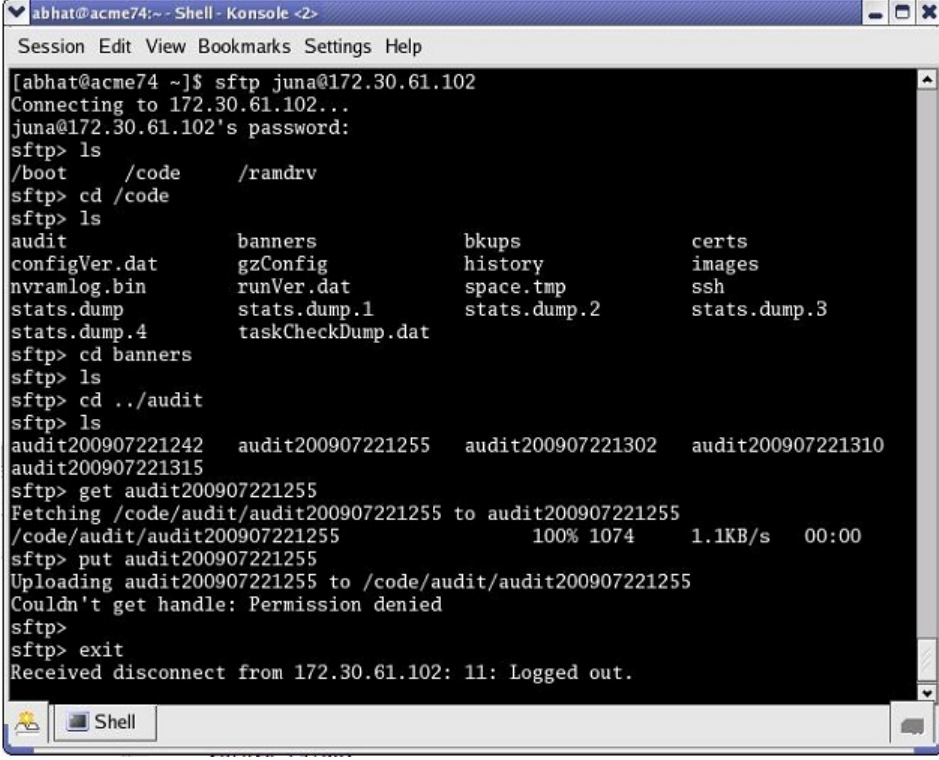

Note: Command availability is subject to Oracle authorization/privilege classes.

Some SFTP commands are available to only certain users; some commands are available to no users.

The following figure which shows two sample SFTP sessions illustrates some facets of SFTP authentication and authorization.

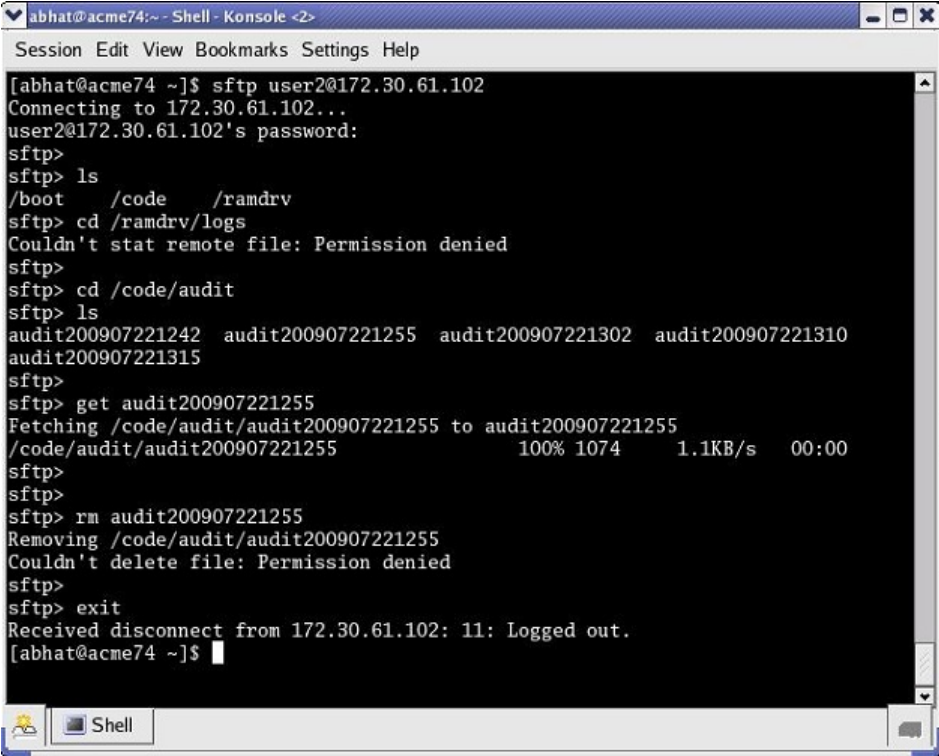

juna presents an SSH public key as an authentication credential, and after successful authentication/authorization, is granted admin privileges. **user** presents a password as an authentication credential, and after successful authentication/authorization, is granted user privileges.

```

```

SFTP Authentication/Authorization

Access

Note juna's inability to access the put command (which moves a file from the local system to the SBC), and user's inability to access a sub-directory under /opt, or to delete an audit log.

The following table summarizes SFTP authentication and authorization.

Table 4: SFTP Authentication & Authorization

User Name	Logins into/prompt	Authentication	Authorization
user	not relevant	authenticated locally by SBC via password	authorized locally by SBC assigned to user class inherits access/privilege defined by that class
admin	not relevant	authenticated locally by SBC via password	authorized locally by SBC assigned to admin class inherits access/privilege defined by that class
or			
not relevant	not relevant	authenticated locally by SBC via SSH public key	authorized locally by SBC authorization determined by authorizationClass command argument (user or admin) inherits access/privilege defined by the specified class

RADIUS file access privileges are specified by the Acme-User-Privilege VSA, which can take the following values.

- sftpForAudit—allows audit log access
- sftpForAccounting—allows system logs to be accessed
- sftpForHDR—allows HDR (Historical Data Records) to be accessed
- sftpForAll—allows all logs to be accessed

Audit Log

Overview

The audit log records creation, modification, and deletion of all user-accessible configuration elements, access to critical security data such as public keys. For each logged event it provides associated user-id, date, time, event type, and success/failure data for each event. As a result, the log supports after the fact investigation of loss or impropriety, and appropriate management response. Only admin-level users have audit log access. These users can retrieve, read, copy, and upload the audit log. The original log cannot be deleted or edited by any operator action.

The audit log is transferred to a previously configured SFTP server or servers when one of three specified conditions is satisfied.

1. A configurable amount of time has elapsed since the last transfer.
2. The size of the audit log (measured in Megabytes) has reached a configured threshold.
3. The size of the audit log has reached a configured percentage of the allocated storage space.

Transfer is targeted to a designated directory of each SFTP target server. The audit log file is stored on the target SFTP server or servers with a filename that takes the format:

audit<timestamp>

where <timestamp> is a 12-digit string that takes the format YYYYMMDDHHMM.

audit200903051630

names an audit log file transferred to an SFTP server on March 5, 2009 at 4:30 PM.

Audit Log Format

Audit log events are comma-separated-values (CSV) lists that have the following format:

```
{TimeStamp,user-  
id@address:port,Category,EventType,Result,Resource,Details,...}  
  
{2009-0305 15:19:27,sftp-  
elvis@192.2.0.10:22,security,login,success,authentication,..}
```

TimeStamp specifies the time that the event was written to the log

Category takes the values: security | configuration | system

Audit Log

EventType takes the values: create | modify | delete | login | logout | data-access | save-config | reboot | acquire-config

Result takes the values: successful | unsuccessful

Resource identifies the configuration element accessed by the user

Details (which is displayed only in verbose mode) provides fine-grained configuration details

- If EventType = create, details is "New = element added"
- If EventType = modify, details is "Previous = oldValue New = newValue"
- If EventType = delete, details is "Element = deleted element"
- If EventType = data-access, details is "Element = accessed element"

The following chart summarizes actions that generate audit log events.

Login	every login attempt 2009-03-05 17:31:14,sftp-elvis@192.2.0.10:22,security,login,success,authentication,,.
Logout	every logout attempt 2009-03-05 18:44:03,sftp-elvis@192.2.0.10:22,security,logout,success,authentication,,.
save-config	Every save-config CLI command 2009-03-05 15:45:29,acliConsole-admin@console,configuration,save-config,success,CfgVersion=111,,.
activate-config	Every activate-config CLI command 2009-03-05 15:45:36,acliConsole-admin@console,configuration,activate-config,success,RunVersion=111,,.
DataAccess	a) attempt to retrieve data using SFTP b) attempt to export using ssh-pub-key export c) attempt to display security info using show security d) attempt to kill a session using kill 2009-03-05 15:25:59,sftp-elvis@192.2.0.10:22,security,data-access,success,code/auditaudit200903051518,,.
Create	a) any action that creates a configuration property b) any action that creates a file 2009-03-05 15:45:01,acliConsole-admin@console,configuration,create,success,public-key,Element=<?xml version='1.0' standalone='yes'?><sshPubKeyRecord name='dummy' comment='' keyType='2' encrType='1' keySize='1024' pubKey='' privKey=''

	<pre> fingerPrint='' fingerPrintRaw='' lastModifiedBy='acmin@console' lastModifiedDate='2009-03-05 15:45:01' </sshPubKeyRecord </pre>
Modify	<p>a) any action that modifies a configuration property</p> <pre> 2009-03-05 15:48:01,accliConsole- admin@console,configuration,modify, success,public-key, Previous= <?xml version='1.0' standalone='yes'?> <sshPubKeyRecord name='dummy' comment='' keyType='2' encrType='1' keySize='1024' pubKey='' privKey='' fingerPrint='' fingerPrintRaw='' lastModifiedBy='acmin@console' lastModifiedDate='2009-03-05 15:45:01' </sshPubKeyRecord New= <?xml version='1.0' standalone='yes'?> <sshPubKeyRecord name='dummy' comment='' keyType='2' encrType='2' keySize='1024' pubKey='' privKey='' fingerPrint='' fingerPrintRaw='' lastModifiedBy='acmin@console' lastModifiedDate='2009-03-05 15:48:01' </sshPubKeyRecord </pre>
Delete	<p>a) any action that deletes a configuration property</p> <p>b) any action that deletes a file</p> <pre> 2009-03-05 15:51:39,accliConsole- admin@console,configuration,delete, success,public-key, Element= <?xml version='1.0' standalone='yes'?> <sshPubKeyRecord name='dummy' comment='' keyType='2' encrType='2' keySize='1024' pubKey='' privKey='' fingerPrint='' fingerPrintRaw='' lastModifiedBy='acmin@console' </pre>

```
lastModifiedDate='2009-03-05 15:51:39>  
</sshPubKeyRecord
```

Viewing the Audit Log

The audit log can be displayed only after transfer to an SFTP server, either by (1) automatic transfer triggered by a timer, or space-based threshold as previously described; or by (2) manual SFTP transfer accomplished by the admin user.

Audit Log Samples

The follow screen captures provide samples of specific audit log entries.

The screenshot shows a terminal window titled 'abhat@acme74:~ - Shell - Konsole <2>'. The terminal displays a list of audit log entries. Three callouts point to specific entries:

- Login info**: Points to the entry '2009-07-22 12:48:13, sftp-user2@172.30.0.74:34344, security, login, success, authentication, ...'.
- Banner acknowledge**: Points to the entry '2009-07-22 12:54:06, console-admin@console, security, data access, success, banner, ...'.
- Login fail info**: Points to the entry '2009-07-22 13:01:01, ssh-user2@172.30.0.74:34362, security, login, failure, authentication, ...'.

The terminal output includes the following entries (truncated for brevity):

```
2009-07-22 12:43:59, sftp-juna@172.30.0.74:34343, security, login, success, authentication, ...  
2009-07-22 12:44:45, sftp-juna@172.30.0.74:34343, security, data access, failure, /code/audit/co  
nfigVer.dat, ...

Create Element Reporting

Modify Element/Activate Reporting

Configuring the Audit Log

The single instance **audit-logging** configuration element enables, sizes, and locates the audit log within the local file structure. It also specifies the conditions that trigger transfer of the log to one or more SFTP servers.

1. From admin mode, use the following command path to access the audit-logging configuration element:

```
ORACLE# configure terminal
ORACLE(configure)# security
```

```
ORACLE(security)# admin-security
ORACLE(admin-security)# audit-logging
```

audit-logging configuration element properties are shown below with their default values

```
admin-state          disabled
detail-level         brief
file-transfer-time    720
max-storage-space     32
percentage-full       75
max-file-size         5
storage-path          /code/audit
```

2. admin-state—enables or disables the audit log

Use `enabled` to enable the audit log. Retain the default value (`disabled`) to disable the log.

```
ORACLE(audit-logging)# admin-state enable
ORACLE(audit-logging)#
```

3. detail-level—specifies the level of detail associated with audit log entries

Retain the default value (`brief`) to write succinct log entries; use `verbose` to generate more detailed entries.

```
ORACLE(audit-logging)# detail-level verbose
ORACLE(audit-logging)#
```

4. file-transfer-time—specifies the maximum interval (in hours) between audit-log transfers to a previously-configured SFTP server or servers

Allowable values are integers within the range 0 through 65535.

The value 0 disables time-based-transfer of the audit log. Consequently, upload to an SFTP server is triggered only by exceeding the percentage-based or absolute-size-based thresholds established by the **percentage-full** and **max-file-size** properties, or by manual SFTP file transfer performed by a properly privileged admin-level user.

Retain the default value (720 hours/30 days), or provide an alternate value to trigger time-based-transfer. With time-based-transfer enabled, automatic upload of the audit file to an SFTP server or servers is triggered when the interval decrements to 0. At that time the audit log is transferred, an alarm alerting the recipient to the transfer is generated, and the timer re-sets to its configured value. Assuming the file transfer succeeds, the audit log is deleted. If the file transfer fails, the audit log is retained until it exceeds the value specified by **max-storage-space**.

 **Note:** The file-transfer-time interval is reset to its configured value with any audit log transfer regardless of cause.

```
ORACLE(audit-logging)# file-transfer-time 1
ORACLE(audit-logging)#
```

5. max-storage-space—specifies the maximum disk space (measured in Megabytes) available for audit log storage

Allowable values are integers within the range 1 through 32.

Allocate space for the audit log by retaining the default value, or by selecting a new value from within the allowable range.

```
ORACLE(audit-logging)# max-storage-space 8
ORACLE(audit-logging)#
```

6. percentage-full—specifies a file size threshold (expressed as a percentage of max-storage-space) that triggers audit file transfer to a previously-configured SFTP server or servers

Allowable values are integers within the range 0 through 99.

The value 0 disables percentage-based-transfer of the audit log. Consequently, upload to an SFTP server is triggered only by exceeding the time-based and absolute-size-based thresholds established by the

file-transfer-time and **max-file-size** properties, or by manual SFTP file transfer performed by a properly privileged admin-level user.

Retain the default value (75 percent), or provide an alternate value to trigger percentage-based-transfer. With percentage-based-transfer enabled, automatic upload of the audit file to an SFTP server or servers is triggered when audit log size exceeds the value **max-storage-space** x (**percentage-full**/100). At that time the audit log is transferred, and an alarm alerting the recipient to the transfer is generated.

Assuming the file transfer succeeds, the audit log is deleted. If the file transfer fails, the audit log is retained until it exceeds the value specified by **max-storage-space**.

```
ORACLE(audit-logging) # percentage-full 0
ORACLE(audit-logging) #
```

7. **max-file-size**—specifies a file size threshold (expressed as an absolute file size measured in Megabytes) that triggers audit file transfer to a previously-configured SFTP server or servers

Allowable values are integers within the range 0 through 10.

The value 0 disables absolute-size-based-transfer of the audit log. Consequently, upload to an SFTP server is triggered only by exceeding the time-based and percentage-based thresholds established by the **file-transfer-time** and **percentage-full** properties, or by manual SFTP file transfer performed by a properly privileged admin-level user.

Retain the default value (5 Megabytes), or provide an alternate value to trigger absolute-size-based-transfer. With absolute-size-based-transfer enabled, automatic upload of the audit file to an SFTP server or servers is triggered when audit log size exceeds the value **max-file-size**. At that time the audit log is transferred and an alarm alerting the recipient to the transfer is generated. Assuming the file transfer succeeds, the audit log is deleted. If the file transfer fails, the audit log is retained until it exceeds the value specified by **max-storage-space**.

```
ORACLE(audit-logging) # max-file-size 0
ORACLE(audit-logging) #
```

8. **storage-path**—specifies the directory that houses the audit log

Retain the default value (/code/audit), or identify another local directory.

```
ORACLE(audit-logging) # storage-path code/mgmt
ORACLE(audit-logging) #
```

A sample audit log configuration appears below:

```
ORACLE(admin-security) # admin-state enabled
ORACLE(admin-security) # file-transfer-time 1
ORACLE(admin-security) # percentage-full 0
ORACLE(audit-logging) # max-file-size 0
```

This configuration allocates 32MB (the default value) for audit logging, which is enabled in brief mode. Audit log transfer to a configured SFTP server or servers occurs on an hourly schedule; other transfer triggers are disabled.

Configuring SFTP Audit Log Transfer

Prior to using SFTP-enabled file transfer you must import a copy of each SFTP server's host key to the SBC. The host key identifies the server as a trusted entity when the SBC is operating as an SSH or SFTP client.

The SSH protocol requires the server to present its host key to a client during the SSH handshake. The client validates the offered key against the previously obtained trusted copy of the key to identify and authenticate the server.

You must also generate an SSH public and private key pair for the SBC in support of its operations as an SSH client. Just as the host key authenticates the SSH server to the SSH client, the generated public key authenticates the SSL client to the SSH server. After generating the SSH key pair, you copy the public key

to each configured SFTP server. During the authentication process, the server validates the offered client key against this trusted copy to identify and authenticate the client.

To provide needed keys:

1. Use the procedure described in Importing a Host Key to import the host key of each SFTP server.
2. Use the procedure described in Generating an SSH Key Pair to generate an SSH public and private key.
3. Use the procedure described in Copying a Client Key to an SSH or SFTP Server to copy the public key to the SFTP server.

Configuring SFTP Servers

The multi-instance **push-receiver** configuration element identifies remote SFTP servers that receive audit log transfers.

1. From audit-logging mode, use the **push-receiver** command to access the configuration element:

```
ORACLE(audit-logging) # push-receiver
ORACLE(push-receiver) #
```

push-receiver configuration element properties are shown below with their default values

```
server          none
port            22
remote-path     "" (empty string)
filename-prefix "" (empty string)
username        "" (empty string)
auth-type       password
password        "" (empty string)
public-key      "" (empty string)
```

2. **server**—in conjunction with port, specifies an SFTP server IP address:port pair

Provide the IP address of an SFTP server that receives transferred audit logs. For example,

```
ORACLE(push-receiver) # server 192.0.2.100
ORACLE(push-receiver) #
```

3. **port**—in conjunction with server, specifies an SFTP server IP address:port pair

Provide the port number monitored by server for incoming audit log transfers. This parameter defaults to port 22, the well-known Secure Shell (SSH) port. Retain the default value, or identify the monitored port with an integer within the range from 1 through 65535.

```
ORACLE(push-receiver) # port 2222
ORACLE(push-receiver) #
```

4. **remote-path**—specifies the absolute file path to the remote directory that stores transferred audit log file

Provide the file path to the remote directory. For example,

```
ORACLE(push-receiver) # remote-path /home/acme/auditLogs
ORACLE(push-receiver) #
```

5. **filename-prefix**—specifies an optional prefix that can be appended to the audit log file name when transferred to an SFTP server

Provides an optional prefix which is appended to the audit log filename. For example,

```
ORACLE(push-receiver) # filename-prefix auvik
ORACLE(push-receiver) #
```

6. **auth-type**—specifies the authentication type required by this remote SFTP server

Two authentication types are supported — simple password, or public keys.

Refer to SSH Configuration for more information on SSH authentication.

Enter either **password** (the default) or **publickey**. For example,

```
ORACLE(push-receiver) # auth-type publickey
ORACLE(push-receiver) #
```

7. **username**—specifies the username used to authenticate to this SFTP server

Provide the username used to authenticate/login to this server. For example,

```
ORACLE(push-receiver) # username acme1
ORACLE(push-receiver) #
```

8. **password**—required when **auth-type** is **password**, and otherwise ignored, specifies the password used in conjunction with **username** to authenticate the SSH client to this SFTP server

Provide the username used to authenticate/login to this server. For example,

```
ORACLE(push-receiver) # password =yetAnotherPW!
ORACLE(push-receiver) #
```

9. **public-key**—required when **auth-type** is **publickey**, and otherwise ignored, identifies the certificate used in conjunction with **username** to authenticate the SSH client to this SFTP server

Identify the certificate used to authenticate/login to this server. For example,

```
ORACLE(push-receiver) # publickey certSFTP-1
ORACLE(push-receiver) #
```

A sample SFTP server configuration appears below:

```
ORACLE(push-receiver) # 192.0.2.100
ORACLE(push-receiver) # remote-path /home/acme
ORACLE(push-receiver) # filename-prefix auvik
ORACLE(push-receiver) # username acme
ORACLE(push-receiver) # auth-type public-key
ORACLE(push-receiver) # public-key acme01
ORACLE(push-receiver) # 192.0.2.125
ORACLE(push-receiver) # remote-path /security/auditLogs
ORACLE(push-receiver) # filename-prefix auvik
ORACLE(push-receiver) # username acme
ORACLE(push-receiver) # auth-type password
ORACLE(push-receiver) # password *****
```

This configuration identifies two SFTP servers as audit log recipients.

The first server (192.0.2.100) requires SSH public key authentication. acme01 aliases the certificate presented to the server by the Oracle Oracle Communications Session Border Controller (SBC) in its SFTP client role.

The second server (192.0.2.125) requires SSH password authentication.

Audit Log Alarms and Traps

Three audit log alarms and traps are provided to report significant or anomalous audit log activity.

The ALARM_AUDIT_LOG_FULL trap/alarm is generated in response to (1) the expiration of the file-transfer-time interval, (2) the crossing of the percentage-full threshold, or (3) the crossing of the max-file-size threshold. This trap/alarm is cleared when storage space becomes available, generally upon successful transfer of the audit log to a remote SFTP server or servers.

The ALARM_ADMIN_AUDIT_PUSH_FAIL trap/alarm is generated in response to failure to transfer the audit log to a designated SFTP server. This trap/alarm is cleared when a subsequent transfer to the same recipient succeeds.

The ALARM_AUDIT_WRITE_FAILED trap/alarm is generated in response to failure to record an auditable event in the audit log. This trap/alarm is cleared when a subsequent write succeeds.
