# **Oracle® Communications Session Border Controller**

Maintenance and Troubleshooting Guide Release S-CZ7.3.0

May 2017

#### **Notices**

Copyright ©2015, 2004, Oracle and/or its affiliates. All rights reserved.

This software and related documentation are provided under a license agreement containing restrictions on use and disclosure and are protected by intellectual property laws. Except as expressly permitted in your license agreement or allowed by law, you may not use, copy, reproduce, translate, broadcast, modify, license, transmit, distribute, exhibit, perform, publish, or display any part, in any form, or by any means. Reverse engineering, disassembly, or decompilation of this software, unless required by law for interoperability, is prohibited.

The information contained herein is subject to change without notice and is not warranted to be errorfree. If you find any errors, please report them to us in writing.

If this is software or related documentation that is delivered to the U.S. Government or anyone licensing it on behalf of the U.S. Government, then the following notice is applicable:

U.S. GOVERNMENT END USERS: Oracle programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, delivered to U.S. Government end users are "commercial computer software" pursuant to the applicable Federal Acquisition Regulation and agency-specific supplemental regulations. As such, use, duplication, disclosure, modification, and adaptation of the programs, including any operating system, integrated software, any programs installed on the hardware, and/or documentation, shall be subject to license terms and license restrictions applicable to the programs. No other rights are granted to the U.S. Government.

This software or hardware is developed for general use in a variety of information management applications. It is not developed or intended for use in any inherently dangerous applications, including applications that may create a risk of personal injury. If you use this software or hardware in dangerous applications, then you shall be responsible to take all appropriate fail-safe, backup, redundancy, and other measures to ensure its safe use. Oracle Corporation and its affiliates disclaim any liability for any damages caused by use of this software or hardware in dangerous applications.

Oracle and Java are registered trademarks of Oracle and/or its affiliates. Other names may be trademarks of their respective owners.

Intel and Intel Xeon are trademarks or registered trademarks of Intel Corporation. All SPARC trademarks are used under license and are trademarks or registered trademarks of SPARC International, Inc. AMD, Opteron, the AMD logo, and the AMD Opteron logo are trademarks or registered trademarks of Advanced Micro Devices. UNIX is a registered trademark of The Open Group.

This software or hardware and documentation may provide access to or information about content, products, and services from third parties. Oracle Corporation and its affiliates are not responsible for and expressly disclaim all warranties of any kind with respect to third-party content, products, and services unless otherwise set forth in an applicable agreement between you and Oracle. Oracle Corporation and its affiliates will not be responsible for any loss, costs, or damages incurred due to your access to or use of third-party content, products, or services, except as set forth in an applicable agreement between you and Oracle.

# **About this Guide**

The Oracle Communications Session Border Controller Maintenance and Troubleshooting Guide provides the information you need for understanding and troubleshooting the operation of the Oracle Communications Session Border Controller.

**Note:** The Upgrades chapter that has appeared in previous documentation releases has been moved to the Oracle Communications Session Border Controller Installation Guide.

#### **Related Documentation**

The following table lists the members that comprise the documentation set for this release:

Document Name	Document Description
Acme Packet 4500 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 4500.
Acme Packet 3820 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 3820.
Acme Packet 4600 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 4600.
Acme Packet 6100 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 6100.
Acme Packet 6300 Hardware Installation Guide	Contains information about the components and installation of the Acme Packet 6300.
Release Notes	Contains information about the current documentation set release, including new features and management changes.
ACLI Configuration Guide	Contains information about the administration and software configuration of the Service Provider Oracle Communications Session Border Controller.
ACLI Reference Guide	Contains explanations of how to use the ACLI, as an alphabetical listings and descriptions of all ACLI commands and configuration parameters.
Maintenance and Troubleshooting Guide	Contains information about Oracle Communications Session Border Controller logs, performance announcements, system management, inventory management, upgrades, working with configurations, and managing backups and archives.
MIB Reference Guide	Contains information about Management Information Base (MIBs), Oracle Communication's enterprise MIBs, general trap information, including specific details about standard traps and enterprise traps, Simple Network Management Protocol (SNMP) GET query information (including standard and enterprise SNMP GET query names, object identifier names and numbers, and descriptions), examples of scalar and table objects.
Accounting Guide	Contains information about the Oracle Communications Session Border Controller's accounting support, including details about RADIUS and Diameter accounting.

### **About this Guide**

Document Name	Document Description
HDR Resource Guide	Contains information about the Oracle Communications Session Border Controller's Historical Data Recording (HDR) feature. This guide includes HDR configuration and system-wide statistical information.
Administrative Security Essentials	Contains information about the Oracle Communications Session Border Controller's support for its Administrative Security license.
Security Guide	Contains information about security considerations and best practices from a network and application security perspective for the Oracle Communications Session Border Controller family of products.
Installation and Platform Preparation Guide	Contains information about upgrading system images and any pre-boot system provisioning.
Call Traffic Monitoring Guide	Contains information about traffic monitoring and packet traces as collected on the system. This guide also includes WebGUI configuration used for the SIP Monitor and Trace application.

# **Revision History**

Date	Description
October 2015	Initial Release
March 2016	Remove password-secure-mode
April 2016	Removes the topic- Manually setting timezone
June 2016	Removes timezone-config
January 2017	<ul><li>Read only for SNMP community access mode .</li><li>AP, Net-Net, 4250 and MGCP updates</li></ul>
April 2017	Removes references to deprecated commands check-stack, stack sipd, and stack h323d.
May 2017	Clarifies the show platform's cpu-load parameter

# Logs

# Introduction

This chapter describes the logs available with the Oracle Communications Session Border Controller and explains how to access and view them. It also explains the relationship between logs and system events.

### **About Logs**

Logs are a critical component of system management and security. You can use the information in logs to assist real-time debugging and management, and to track potential security breaches or other nonstandard activities on the system. The Oracle Communications Session Border Controller supports the following three types of logs:

- acmelog (syslog): contains both generic messages (not task oriented) as well as system log messages
- process logs: contain process flow from tasks
- transaction logs: contain raw messages about protocol transactions sent and received by the Oracle Communications Session Border Controller.

The Oracle Communications Session Border Controller supports SYSLOG, a protocol that lets the Oracle Communications Session Border Controller log significant system information to a remote server.

#### Logging Events

The Oracle Communications Session Border Controller can log events that occur on different system components, such as those associated with a protocol transaction. If logging is enabled on the system, monitored events are evaluated against the logging level set for the component that sent the event. Events that meet the logging level are written to a log file.

SNMP traps are sent when an Oracle Communications Session Border Controller generates a system log (acmelog) message and the following conditions are present:

- SNMP is enabled.
  - Set the system configuration's SNMP functionality to enabled. Using the ACLI, set the **snmp-enabled** field for **system-config** to enabled.
- Sending system log (acmelog) notifications to an NMS using SNMP is enabled.
  - Set the system configuration's log functionality to enabled. Using the ACLI, set the **enable-snmp-syslog-notify** field for **system-config** to enabled.

 Severity level that identifies at which severity level syslog notifications are sent is configured. For example:

Set the system configuration's log functionality to one of the possible severity levels. Using the ACLI, set the **snmp-syslog-level** field for **system-config** to enabled.

See the *ACLI Configuration Guide* for details about configuring the Oracle Communications Session Border Controller and the *ACLI Reference Guide* for details about using the ACLI.

# **Event Categories**

This section describes the events and the different event categories the Oracle Communications Session Border Controller can generate.

### **About Events**

Events are the circumstances that generate one or more of the following:

- alarm
- entry in a log file
- SNMP trap

The following table lists the three categories used to define these events.

<b>Event Category</b>	Description	
Informational	Represents non-critical conditions. For example, a configuration element has changed.	
Warning	Indicates pending failures or unexpected events. For example, you typed the wro password at the console three consecutive times.	
Error	Indicates that a serious condition has occurred. For example, an internal temperature reading exceeds the recommendation.	

These broad categories generally consist of the facility that generated them, along with an indication of the severity of the message. This information helps filter the more important and time-sensitive notifications from the informative messages.

# Types of Events

The Oracle Communications Session Border Controller can generate the following types of events.

- process log events
- system log events
- protocol trace elements

### **Process Log Events**

Events are logged to the process log flow from tasks and are specific to a single process running on the Oracle Communications Session Border Controller. By default they are placed into individual files associated with each process with the following name format:

log.<taskname>

**Note:** Process logs serve as a debugging tool. When set to debug level, the quantity of events generated can become overwhelming for the Oracle Communications Session Border Controller. It should only be used by Oracle personnel, or with their assistance. It is not recommended for use on production systems.

When you configure the system, you set the default system-wide process log level and each task logs according to this setting. You can override this log level for specific tasks when configuring other elements. For example, when you configure the media manager you can set the ALGD and MBCD log levels to different severity levels.

### **System Log Events**

System log events are a subset of the collection of all process log events. Every software process writes messages to a file called acmelog, if the severity of the event meets or exceeds the configured log level threshold. There is one system log for the whole Oracle Communications Session Border Controller (filename: acmelog).

System log events are also referred to as acmelog events and are analogous to a traditional syslog event. The acmelog file is typically viewed as an aggregation of notable alarms and errors from all software processes.

The Oracle Communications Session Border Controller supports logging using SYSLOG, which is an industry-standard protocol that lets a device send event notification messages across IP networks to event message collectors - also known as syslog servers. Messages are usually sent using UDP port 514.

The Oracle Communications Session Border Controller can send information to a remote SYSLOG server. You configure the server and globally set the severity level at which the Oracle Communications Session Border Controller logs events when you configure the system.

#### **Protocol Trace Events**

Protocol trace events are the events associated with a protocol transaction. They are enabled on a perprocess basis using the notify command, resulting in transactional events being placed into transaction logs, such as sipmsg.log.

These events are helpful for troubleshooting sessions, but they are also the highest volume events the Oracle Communications Session Border Controller produces and can only be enabled for short times.

### **Event Granularity**

You can set the reporting level for events placed into the logs by using the following methods:

- Setting the system-wide severity level (at or above which events are logged) by configuring the system's process log level. This setting is persistent across boots.
  - You set the system-wide severity level by configuring the log severity level threshold when performing the system configuration.
- Configuring individual parameters for different elements that control specific process logs. For
  example, you can configure the mbcd log level for the media manager. These settings are persistent
  across boots.
  - For example, to configure the process log level for monitoring all H.323 activity on the Oracle Communications Session Border Controller, you configure the log level to INFO when configuring H. 323 signaling.
- Using ACLI log-level command to dynamically specify the log level for a specific task (or all tasks using the keyword all). You can specify finer granularity by including specific subtypes within the process. These settings are not persistent across boots.
- Using the ACLI or Acme Control Protocol (ACP) notify command. For example, notify mbcd debug.
   Such settings are not persistent across boots.

#### **Event Severity**

There are eight severity levels ranging from lowest severity, Debug, to the highest, Emergency.

syslog Numerical Code	syslog Severity	Oracle Log Enumeration
0	Emergency (system is unusable)	EMERGENCY (0)
1	Alert (action must be taken immediately)	CRITICAL (1)
2	Critical (critical conditions)	MAJOR (2)
3	Error (error conditions)	MINOR (3)
4	Warning (warning conditions)	WARNING (4)
5	Notice (normal but significant condition)	NOTICE (5)
6	Informational (informational messages)	INFO (6)
7	Debug (debug level messages)	TRACE (7)
		DEBUG (8)
		DETAIL (9)

### SNMP Traps

The Oracle Communications Session Border Controller supports several standard SNMP traps (cold start, link up/down) and proprietary traps used to notify SNMP managers of specific events:

- apSysMgmtGroupTrap used for different events. The trap must be parsed by a management tool to extract the specific event details.
- specific uniquely identified traps used for specific Oracle Communications Session Border Controller events. These traps correspond exactly to the events that show up in acmelog.

The unique traps are only generated if the following ACLI parameter is enabled:

```
System-config->enable-snmp-monitor-traps
```

• apSysLogGeneratedTrap – used as a catch-all for system log (syslog) events.

See the MIB Reference Guide for more details about traps.

#### Alarms

The most serious events noted by the Oracle Communications Session Border Controller are categorized as alarms. They appear in the alarm table, which is displayed in the ACLI using the command **display-alarms**. The ACLI also supports clearing alarms displayed in that table. Alarms are not sent off-box explicitly, however, at least one of the following mechanisms is usually triggered when an alarm occurs:

- A dry contact port on the back of the chassis that may be used to control a remote alarm panel.
- An SNMP trap may be generated
- A syslog event may be generated

See the MIB Reference Guide for details about alarms.

#### **Process Log Events**

Process log events can be sent to a log server by configuring the system to include the destination server's IP address and port number. For example, using the ACLI you configure the following system parameters:

- process-log-server
- process-log-port

The process log port can be any port from 1025 to 65535. It is most commonly configured as port 2500.

The Oracle Communications Session Border Controller stops logging events to RAM memory and instead sends them to the configured remote server over UDP. Because of the added overhead of sending log

messages using UDP datagrams versus writing to the RAM drive, message content decreases – even at the same configured log levels.

### **System Log Events**

System log events can be sent to one or more syslog servers using the traditional UNIX syslog mechanism as described in RFC 3164. Users can configure one or more syslog servers to which the Oracle Communications Session Border Controller will send generated syslog events by setting the following syslog parameters in the system configuration:

- address
- port
- facility

If the port is left empty, the default value is UDP port 514 (the well-known syslog port).

#### **Traps**

Traps are defined to be sent to a SNMP Manager using the following configuration parameters:

```
System-config->trap-receiver->ip-address
System-config->trap-receiver->filter-level
System-config->trap-receiver->community-name
```

#### Alarms

Alarms can be sent off the box using the dry contact port in the rear of the chassis.

# **Working with Logs**

This section explains how to work with logs.

# **Writing to Logs**

You need to configure the Oracle Communications Session Border Controller to indicate you want messages written to logs.

The log files are written until they become 1 MB in size. The file is then closed and renamed with a .1 appended to the original file name. For example, <code>sipmsg.log</code> becomes <code>sipmsg.log.log.1</code>. New logs continued to be written to the original file, <code>sipmsg.log</code>, until once again they reach the 1 MB limit. Again the file is closed and renamed with a .1 appended to the original file name. The existing file with .1 appended is renamed to .2, for example sipmsg.log.2. This continues until you have 13 1 MB files associated with the log. When this limit is reached, the oldest file (the one with .12 appended to the name) is discarded.

#### **Manually Rotating Logs**

You can manually rotate (close) the log file by using the following command:

```
notify * rotate-logs
```

The \* can be any of the following Oracle Communications Session Border Controller tasks:

- all
- sipd
- sysmand
- berpd
- lemd
- mbcd
- h323d
- algd

radd

You can manually rotate the log files when you are trying to isolate a specific problem. Working with Oracle Technical Support, you could close all current log files (or just for a specific task) and then run a test of your problem. You can then easily identify the log files to review.

### **Working with Logs Example**

For example, to troubleshoot issues you suspect are media-related using the ACLI, you can look at the logs for the middlebox control daemon (MBCD).

1. Instruct the Oracle Communications Session Border Controller to write all media management transactions to mbcd.log by entering the following command:

```
notify mbcd log
```

- 2. Make some test calls.
- 3. Set message writing to the log off by entering the following command:

```
notify mbcd nolog
```

4. SFTP the log off the Oracle Communications Session Border Controller to view it.

Note: Oracle recommends only setting the log level to DEBUG on non-production systems.

# **Displaying List of Log Files**

You can display the list of log files by using the **display-logfiles** ACLI command. Every task writes to its own process log (log.taskname) and protocol trace logs (transaction logs) are enabled or disabled creating a task.log file. The log files are stored in the /opt/logs directory on the Oracle Communications Session Border Controller.

#### For example:

ORACLE# dis	-	_	-					
Listing Dir		cory	/opt/logs:					
drwxrwxrwx	1	0	0		Jul		18:02	./
drwxrwxrwx	1	0	0	~ = =	Jul	-	09:50	/

-rwxrwxrwx	1	0	0	195	Jul	2	15:59	log.acliTelnet3
-rwxrwxrwx	1	0	0	195	Jul	2	15:59	log.acliTelnet4
-rwxrwxrwx	1	0	0	1000005	Jul	4	18:01	acmelog.1

# Viewing Logs

You can send the log off the Oracle Communications Session Border Controller through wancom0 or retrieve it using SFTP in order to view it.

**Note:** The view-log command currently listed in the ACLI is not supported.

### Viewing a Specific Logfile

You can view a specific logfile saved on the Oracle Communications Session Border Controller using the **show logfile <filename>** command. For example:

```
ORACLE# show logfile appweb.log
Jun 6 17:45:10.666 appWeb: 2: Server Root "/www"
Jun 6 17:45:10.666 appWeb: 2: DocRoot (Main Server): "/www/war"
Jun 6 17:45:10.667 appWeb: 2: Activating module (Builtin) dirHandler
Jun 6 17:45:10.667 appWeb: 2: Add handler "dirHandler" for ""
Jun 6 17:45:10.667 appWeb: 2: Set connector "netConnector"
Jun 6 17:45:10.667 appWeb: 2: Activating module (Builtin) authFilter
```

# **Dynamically Changing Log Level**

You can dynamically change the log level by using the ACLI's **log-level** command, in the Superuser mode. The **log-level** command sets the log level for a specific task. The following table lists the three subcommands within the **log-level** command.

log-level subcommands	Description
task_name	Displays the log level according to the task/process name. (You do not have to enter @ <system_name>.) To view all tasks, enter all.  To list available task/process names, enter the show processes command.</system_name>
log_level	Identifies the log level, either by name or by number.
log_type_list	Lets you list log types by number or by name in parentheses (()).

To change the log level:

- **1.** Access the ACLI in Superuser mode.
- **2.** Type **log-level** followed by a Space and one of the log-level subcommands. You can change the log level for the following:
  - system-wide

```
log-level system <log level>
For example:
```

log-level system DEBUG

• log level at which a specific task/process sends to the acmelog file

```
log level <task name> <log level>
```

For example:

```
log-level sipd debug
```

3. Press Enter.

### Requesting Log Level Data

You are able to view the current log level of processes/tasks that are running on the Oracle Communications Session Border Controller. You can do this through both the ACLI and ACP:

- ACLI—The loglevel subcommand has been added to the ACLI show command
- ACP—A new ACP method called GET\_LOG\_LEVEL has been added

### **ACLI show loglevel Command**

The ACLI **show loglevel** command allows you to request log level data from the ACLI console. It takes one mandatory and two optional parameters. The mandatory parameter specifies the name of the Oracle Communications Session Border Controller task for which you are requesting information; one of the optional parameters specifies the type of log level for which you want information and the other allows you to select whether you want to view a verbose display of the task.

You can enter all as the value for either of these parameters to view information for all system tasks or all log levels. If you do not enter a parameter, the system returns an error message and provides a list of valid parameters. You can also wildcard these parameters by entering an asterisk (\*), but entering partial wildcards does not work.

To view log level information for a single system task:

• Type **show loglevel**, a Space, and then the name of the system task for which you want to see log level information. Then press Enter.

```
ORACLE# show loglevel sipd
Log Levels for process sipd:
loglevel=DEBUG
```

To view log level information for a single system task with a specific log level:

• Type **show loglevel**, a Space, the name of the system task for which you want to see log level information, and the name of the log. Then press Enter.

To view verbose log level information for a single system task:

• Type **show loglevel**, a Space, the name of the system task for which you want to see log level information, and **verbose**. Then press Enter.

```
ORACLE# show loglevel sipd verbose
Log Levels for process sipd:
GENERAL=DEBUG
EMERGENCY=DEBUG
CRITICAL=DEBUG
MAJOR=DEBUG
MINOR=DEBUG
WARNING=DEBUG
PROC=DEBUG
IPC=DEBUG
SERVICE=DEBUG
EVENT=DEBUG
MESSAGE=DEBUG
```

```
TEST=DEBUG
TRIP=DEBUG
SIP=DEBUG
MBCP=DEBUG
FLOW=DEBUG
MEDIA=DEBUG
SESSION=DEBUG
TRANS=DEBUG
TIMER=DEBUG
ALG=DEBUG
NPSOFT=DEBUG
ARP=DEBUG
SNMP=DEBUG
ANDD=DEBUG
XNTP=DEBUG
REDUNDANCY=DEBUG
SIPNAT=DEBUG
H323=DEBUG
ERROR=DEBUG
CONFIG=DEBUG
DNS=DEBUG
H248=DEBUG
BAND=DEBUG
ALI=DEBUG
SS8GI=DEBUG
COPS=DEBUG
ATCP=DEBUG
ATCPAPP=DEBUG
CLF=DEBUG
```

### **ACP**

The new ACP command GET\_LOG\_LEVEL provides log level information. This ACP request requires authentication, and it must be sent to port 3000.

Because ACP message length is limited, obtaining log level information for multiple system tasks is a multi-step procedure. For a known, single task, the procedure does not require as many steps.

To obtain log level information, an ACP message with the GET\_LOG\_LEVEL method is sent, and its message body contains information about the log levels being requested. This message body takes the following format: process:type.

An asterisk (\*) can be used instead of the process name or log type to wildcard that value. If the process name is replaced with a \*, then the first message response is a list of processes; this allows the querying management software to query the level of each process directly.

#### Wildcarding Task Name and Log Type

When you want to wildcard the process name and log type, the ACP requests looks like this:

```
GET_LOG_LEVEL sysmand@acmesystem ACME/1.0
Object-ID:0
Trans-ID: 0
From: user@10.0.0.1
To: sd@10.0.0.2
Content-Type: text/plain
CSeq: 3 GET_LOG_LEVEL
Authorization: Digest
    username="user",
    realm="intern1",
    nonce=6eccad8d8a4d7473d3725bc54bdf4a59,
    uri="sysmand@acmesystem",
    response=5a700cf8c15a0902cb8e75a02cc99f33,
    algorithm="md5-sess",
```

```
cnonce=4c11d5,
  qop="auth",
  nc=00000002
Content-Length: 3
*:*
```

The response would return the actual list of tasks running on the system. Depending on what tasks are running, it would look like this:

```
ACME/1.0 200 Everything is OK
Trans-ID: 0
From: user@10.0.0.1
To: sd@10.0.0.2
CSeq: 3 GET LOG LEVEL
Content-Type: text/xml
Content-Length: 253
<ProcessList>
   cprocess name='sysmand'/>
    cprocess name='acliSSH0'/>
   cprocess name='brokerd'/>
   cprocess name='tCliWorker'/>
    cprocess name='lemd'/>
    cprocess name='atcpd'/>
    cprocess name='atcpApp'/>
    cprocess name='mbcd'/>
    cprocess name='lid'/>
    cprocess name='radd'/>
    cprocess name='pusher'/>
    cprocess name='ebmd'/>
    cprocess name='sipd'/>
    cprocess name='snmpd'/>
    cprocess name='acliSSH1'/>
    cprocess name='acliSSH2'/>
    cprocess name='acliSSH3'/>
    cprocess name='acliSSH4'/>
    cprocess name='acliConsole'/>
    cprocess name='acliTelnet0'/>
    cprocess name='acliTelnet1'/>
    cprocess name='acliTelnet2'/>
    cprocess name='acliTelnet3'/>
    cprocess name='acliTelnet4'/>
</ProcessList>
```

#### Specific Task with Wildcard Log Level

The NMS can use the list from the above example to query each task using additional GET\_LOG\_LEVEL messages by specifying the name of the tasks and the levels.

The message would look like this:

```
GET_LOG_LEVEL sysmand@acmesystem ACME/1.0
Object-ID: 0
Trans-ID: 0
From: user@10.0.0.1
To: sd@10.0.0.2
Content-Type: text/plain
CSeq: 3 GET_LOG_LEVEL
Authorization: Digest
    username="user",
    realm="intern1",
    nonce=5dd735490c78a0146ca06d50f47c0a50,
    uri="sysmand@acmesystem",
    response=129b882a3ee110db86565932819d017b,
    algorithm="md5-sess",
    cnonce=859dcc,
```

```
qop="auth",
nc=00000002
Content-Length: 9
sysmand:*
```

To which the response would look like this:

```
ACME/1.0 200 Everything is OK
Object-ID: 0
Trans-ID: 0
From: user@10.0.0.1
To: sd@10.0.0.2
CSeq: 3 GET_LOG_LEVEL
Content-Type: text/xml
Content-Length: 544
<sysmand
        GENERAL=DEBUG
        EMERGENCY=DEBUG
        CRITICAL=DEBUG
        MAJOR=DEBUG
        MINOR=DEBUG
        WARNING=DEBUG
        PROC=DEBUG
        IPC=DEBUG
        SERVICE=DEBUG
        EVENT=DEBUG
        MESSAGE=DEBUG
        TEST=DEBUG
        TRIP=DEBUG
        SIP=DEBUG
        MBCP=DEBUG
        FLOW=DEBUG
        MEDIA=DEBUG
        SESSION=DEBUG
        TRANS=DEBUG
        TIMER=DEBUG
        ALG=DEBUG
        NPSOFT=DEBUG
        ARP=DEBUG
        SNMP=DEBUG
        ANDD=DEBUG
        XNTP=DEBUG
        REDUNDANCY=DEBUG
        SIPNAT=DEBUG
        H323=DEBUG
        ERROR=DEBUG
        CONFIG=DEBUG
        DNS=DEBUG
        H248=DEBUG
        BAND=DEBUG
        ALI=DEBUG
        SS8GI=DEBUG
        COPS=DEBUG
        ATCP=DEBUG
        ATCPAPP=DEBUG
        CLF=DEBUG
```

#### **Specific Task and Log Level Type**

To request a specific type of log level for a specific process, specify the process name and type specified in the body of the request:

```
GET_LOG_LEVEL sysmand@acmesystem ACME/1.0
Object-ID: 0
```

```
Trans-ID: 0
From: user@10.0.0.1
To: sd@10.0.0.2
Content-Type: text/plain
CSeq: 3 GET LOG LEVEL
Authorization: Digest
    username="user",
    realm="intern1",
    nonce=d11774ac886bf2293217b1ed894444e3,
    uri="sysmand@acmesystem",
     response=b2eb7cae77e544685ce2883b90189e78,
     algorithm="md5-sess",
     cnonce=e0ad7,
     qop="auth",
     nc=00000002
Content-Length: 14
sysmand: CONFIG
```

#### The response to this request would look like this:

# Log files for offline analysis and defect reporting

Current releases of the Oracle Communications Session Border Controller collect by default a large amount of information which is saved in various system logs and available after a system crash. This information is useful when debugging and submitting defects to Oracle.

#### Table 1: Application crash log files

List of Application crash log files, including a description and the output location of the crash log file when an HDD/SDD is present in the system or not.

file name	description	Output path on HDD/SSD	Output path with flash drive only (no HDD/ SSD)
crashlogs.gz	compressed subset of /opt/logs/*	/opt/logs	/code/crash
dump.dpwd-datapath	Trace files for datapath watchdog initiated crash	/opt/crash	/code/crash
<pre>trace.<timestamp>. <task-name></task-name></timestamp></pre>	Crashing thread stack trace (text)	/opt/crash/code/ crash	/code/crash
minidump. <timestam p="">.<task-name>.gz</task-name></timestam>	Multi thread stack trace (binary)	/opt/crash/code/ crash	/code/crash

file name	description	Output path on HDD/SSD	Output path with flash drive only (no HDD/ SSD)
<pre>core.<timestamp>.&lt; task- name&gt;.<pre>process ID&gt;</pre></timestamp></pre>	Full process core dump	/opt/crash	not saved

### Table 2: Kernel crash log files

List of Kernel crash log files, including a description and the output path of the crash log file when an HDD/SDD is present in the system or not.

file name	description	Output path on HDD/SSD	Output path with flash drive only (no HDD/ SSD)
vmcore. <datestamp> .dmesg</datestamp>	Copy of console logs from crashed kernel	/opt/crash	/code/crash
<pre>vmcore.<datestamp> .dump.*</datestamp></pre>	Copy of the crashed kernel system memory	/opt/crash	not saved

### Table 3: Operating System Log files

List of operating system log files, including a description and the output path of the crash log file when an HDD/SDD is present in the system or not.

file name	description	Output path on HDD/SSD	Output path with flash drive only (no HDD/ SSD)
kernel_lgob.log	Copied from /opt/ logs/kernel.log at reboot	/opt/crash	/code/crash
dmesg_lgob.log	Copied from /opt/ logs/dmesg.log at reboot	/opt/crash	/code/crash

For systems without SSDs or HDDs installed, persistent files are written to flash in /code/crash. For systems with formatted SSDs or HDDs, the core and dump files are written to /opt/crash on HDD. Regardless of whether an HDD/SSD is present, check both flash and HDD locations on all platforms for all available files.

lgob files are overwritten at each reboot and crashlogs are overwritten at each crash. This data must be collected immediately after system recovers from an outage. Because trace and core files are deleted automatically at reboot to free disk space, they should be moved off-box at the earliest opportunity.

For systems with HDDs/SSDs, some minidump and trace files will be saved to /code/crash and some will be saved to /opt/crash. Please check both locations.

In the event of an uncontrolled reboot (i.e. hardware reset, power cycle, watchdog trigger) the lgobs corresponding to the crash timestamp will be missing, so absence of this file on /code/crash is an indication of an uncontrolled reboot event.

**Note:** Large core files (core, vmcore dumps) may be split into multiple files (.aa, .ab etc), and on some platforms these files are also compressed. Be advised to look for .gz versions of the core files.

# Log Files

This section contains information about the log files and what each contains. The log files are stored in the /opt/logs directory on the Oracle Communications Session Border Controller.

# log.sysmand

This log contains information about the system manager task. This task is currently responsible for writing the system log (acmelog), dispatching commands to other application tasks, and starting the application-level code.

### log.bootstrap

This log records information about the boot process as the system becomes operational.

# log.berpd

This log contains process logs for the berpd task or the redundancy health task. This file is primarily used for storing health messages and events and for determining whether a switchover is required.

# log.brokerd

This log contains information about platform-level tasks. For example, when the ARP manager wants to log information in a place other than the console, it sends a message to log-brokerd. This is also true of the various host tasks related to communicating with the network processors and/or the CAM.

This log also contains messages from the IP fragmenter, which currently takes part in the SIP NAT process. brokerd forwards these messages through sysmand to the acmelog (the overall system log). Thus, log-brokerd contains a subset of the logs that acmelog contains.

# log.lemd

This log refers to the local element manager (or local database server) processes. Information in log.lemd pertains to remote retrievals of and writing of configuration data.

# log.algd

This log contains information pertaining to DNSALG processing. It occasionally contains information about the SIP NAT function.

# log.mbcd

This log contains information pertaining to the application flow manager, such as the creation, updating, and removal of media NAT entries.

# miboco.log

Tasks use MIBOCO protocol processing to communicate with the mbcd task. This log can be used to determine whether the mbcd has returned any error messages or other type of messages. It is possible that sipmsg.log and algd.log contain MIBOCO messages. However, the miboco.log is used infrequently because log.sipd and log.algd also report return codes from the mbcd.

# log.radd

This log is used for the accounting daemon for RADIUS. It serves as a RADIUS client to the outside world. However, it also serves as a place to concentrate RADIUS records from various signaling protocol tasks running on the SBC. Its logs reflect the latter function.

### log.h323d

This log contains information pertaining to H.323 tasks.

### log.sipd

This log contains information pertaining to the SIP processing task. The log contains information about how the system's SIP proxy is processing messages.

# sipmsg.log

This protocol trace log contains information about SIP messages that have been received, NAT'd, and sent by the SIP proxy. MIBOCO messages sent and received by the sipd process are also contained in this log.

### log.acli

This log contains information pertaining to ACLI processing.

# log.acliConsole

This log contains information about ACLI console functions.

# log.acliTelnet0-4

This log contains information about ACLI Telnet sessions if your system access method is Telnet. You can have one log for each instance.

### log.SSH0-4

This log contains information about SSH processes. You can have one log for each instance.

# log.tCliWorker

This log contains information about tCliWoker processes.

# log.atcpApp

This log contains information about the asychronous Transport Control Protocol (TCP).

# log.atcpd

This log contains information about the asychronous TCP daemon.

# log.audit

This log contains information about any audits performed on the system.

# log.auditpusher

This log contains information about the audits that were pushed on the system.

# log.authd

This log contains information about authentication used on the system.

# log.certd

This log contains information about certificate records used on the system.

### log.qos

This log contains information about quality of service (qos) for call sessions.

### log.lid

This log contains information about the lawful intercept daemon.

### log.iked

This log contains information about the secure Internet Key Exchange (IKE) daemon.

### log.bcm

This log contains information about the Business Call Management (BCM) logger used with the system to process call detail records (CDR).

### log.Irtd

This log contains information about the local routing table (LRT) daemon.

### log.ebmd

This log contains information about Common Open Policy Service (COPS) and Call Admission Contol (CAC) on the system. It is information about the External Bandwidth Manager (Radius/Diameter).

### syslog

The term syslog refers to the protocol used for the network logging of system and network events. syslog facilitates the transmission of event notification messages across networks. Given that, the syslog protocol can be used to allow remote log access.

The syslog message functionality lets you configure more than one syslog server, and set the facility marker value used in the messages sent to that syslog server independently. All syslog messages are sent to all configured syslog servers.

**Note:** Oracle recommends configuring no more than eight syslog servers. As the number of configured syslog servers to which the system sends logs increases, the system performance might decrease.

Configured syslog servers are keyed (identified uniquely) by IPv4 or IPv6 address and port combinations. The Oracle Communications Session Border Controller is able to send logs to multiple syslog servers on the same host.

# **Process Logs**

Each individual process running on the system has its own process log and a server where the system sends those logs.

# **HA Switchover Log**

The switchover log provides historical information about the role of a High Availability (HA) Oracle Communications Session Border Controller in an HA Oracle Communications Session Border Controller pair. This log lists the last 20 switchovers on an HA SBC. The switchover log is not persistent across reboot(s). The switchover log message appears in the information provided by the show health command, and it also appears immediately on the terminal screen when a switchover takes place.

#### Log Message Graphical Display on the SBC

The switchover log message displayed on the High Availability (HA) SBC that has moved from the Standby to the BecomingActive state (has assumed the active role) indicates the date and time that the

switchover took place. It also indicates from which peer the active role was assumed and why. The peer displaying this message took the active role because a health score fell below a set threshold, because a timeout occurred, or because it was forced by a system administrator via the ACLI.

Refer to the following example of a switchover log for an HA SBC whose health score fell below a configured threshold.

```
ORACLE# Mar 28 16:36:38.226: Standby to BecomingActive, active peer ORACLE2 has unacceptable health (50) ORACLE#
```

Refer to the following example of a switchover log for an HA SBC that has timed out.

```
ORACLE# Mar 29 13:42:12.124: Standby to BecomingActive, active peer ORACLE2 has timed out ORACLE# ^{\prime\prime}
```

The peer relinquishing the active role (becoming the standby system in the HA SBC pair) also displays the date and time that the switchover took place. The peer also indicates that it has moved from the Active to the RelinquishingActive state.

Refer to the following example of a switchover log for an HA SBC that is relinquishing its active role.

```
ORACLE2# Mar 28 16:38:08.321: Active to RelinquishingActive ORACLE2#
```

# **Disabling Miboco Logging**

If your Oracle Communications Session Border Controller configuration is especially large—such that you deem it necessary to preserve as many system resources as possible during activation—you might want to disable Miboco logging. Miboco is a body of control messages allowing certain internal Oracle Communications Session Border Controller process to communicate with one another, and these message constitute part of the call trace logging. By turning Miboco call trace logging off, you provide additional safeguard around system resource and possibly prevent the adverse consequences that might arise from overuse.

# **Disabling Miboco Call Trace Logging**

To disable Miboco call trace logging:

options—Follow your entry with this value:

• +disable-miboco-logging

```
ORACLE(sip-config) # options +disable-miboco-logging
```

You can enable Miboco logging again by removing the option:

```
ORACLE(sip-config) # options -disable-miboco-logging
```

# **Fault Management**

# **Overview**

This chapter explains how to access Oracle Communications Session Border Controller fault management statistics to locate faults, determine the cause, and make corrections. Fault management involves the following:

- Continuous monitoring of statistics
- · Viewing alarms that warn of system problems

# **Accessing Fault Management Data**

You can access fault management information using the following ACLI commands:

- · show commands to view statistics
- display-alarms command to view alarms

You can access all show commands at the user level.

# **About Traps**

This section defines the standard and proprietary traps supported by the system. A trap is initiated by tasks (such as the notify task) to report that an event has happened on the system. SNMP traps enable an SNMP agent to notify the NMS of significant events by way of an unsolicited SNMP message.

The system uses SNMPv2c. These notification definitions are used to send standard traps and Oracle's own enterprise traps.

Traps are sent according to the criteria established in the following:

- IETF RFC 1907 Management Information Base for Version 2 of the Simple Network Management Protocol
- IETF RFC 2233 The Interfaces Group MIB using SMIv2
- Or the appropriate enterprise MIB (for example the Acme Packet syslog MIB or the Acme Packet System Management MIB).

For additional information about the traps and MIBS supported by the system, see the *Oracle Communications Session Border Controller MIB Reference Guide*.

# **Standard Traps**

The following table identifies the standard traps that the system supports.

Trap Name	Description
linkUp	The SNMPv2 agent detects that the ifOperStatus object of an interface has transferred from the down state to the up state. The ifOperStatus value indicates the other state.
linkDown	The SNMPv2 agent detects that the ifOperStatus object of an interface has transferred from the up state to the down state. The ifOperStatus value indicates the other state.
coldStart	The SNMPv2 agent is reinitializing itself and its configuration may have been altered.  This trap is not associated with a system alarm.
authenticationFailure	The SNMPv2 agent received a protocol message that was not properly authenticated. If the snmp-enabled and enable-snmp-auth-traps fields in the ACLI's system-config element are set to enabled a snmpEnableAuthenTraps object is generated.  This trap is not associated with a system alarm.

# **Enterprise Traps**

The following table identifies the proprietary traps that the system supports.

Trap Name	Description
apSyslogMessageGenerated	Generated by a syslog event. For example, this trap is generated if a switchover alarm occurs (for High Availability (HA) system peers only), or if an HA system peer times out or goes out-of-service. You enable or disable the sending of syslog messages by using the ACLI.
apSysMgmtGroupTrap	Generated when a significant threshold for a system resource use or health score is exceeded. For example, if Network Address Translation (NAT) table usage, Address Resolution Protocol (ARP) table usage, memory usage, or Central Processing Unit (CPU) usage reaches 90% or greater of its capacity, the apSysMgmtGroupTrap is generated. If the health score (for HA peers only) falls below 60, the apSysMgmtGroupTrap is generated.
apLicenseApproachingCapacityNotification	Generated when the total number of active sessions on the system (across all protocols) is within 98 - 100% of the licensed capacity.
apLicenseNotApproachingCapacityN otification	Generated when the total number of active sessions on the system (across all protocols) has gone to or below 90% of its licensed capacity (but no sooner than 15 seconds after the original alarm was triggered).
apEnvMonI2CFailNotification	Generated when the Inter-IC bus (I2C) state changes from normal (1) to not functioning (7).
apEnvMonStatusChangeNotification	Generated when any entry of any environment monitor table changes in the state of a device being monitored. To receive this

Trap Name	Description
	trap, you need to set the system config's enable- env- monitor- table value to enabled.
apSwCfgActivateNotification	Generated when an activate-config command is issued and the configuration has been changed at running time.
apSysMgmtPowerTrap	Generated if a power supply is powered down, powered up, inserted/present or removed/not present.
apSysMgmtTempTrap	Generated if the temperature falls below the monitoring level.
apSysMgmtFanTrap	Generated if a fan unit speed falls below the monitoring level.
apSysMgmtTaskSuspendTrap	Generated if a critical task running on the system enters a suspended state.
apSysMgmtRedundancyTrap	Generated if a state change occurs on either the primary or secondary system in a redundant (HA) pair.
apSysMgmtMediaPortsTrap	Generated if port allocation fails at a percentage higher or equal to the system's default threshold rate. Trap is generated when there are at least 5 failures within a 30 second window and a failure rate of 5% or more.
apSysMgmtMediaBandwidthTrap	Generated if bandwidth allocation fails at a percentage higher or equal to the system's default threshold rate. Trap is generated when there are at least 5 failures within a 30 second window and a failure rate of 5% or more.
apSysMgmtMediaOutofMemory	Generated if the media process cannot allocate memory.
apSysMgmtMediaUnknownRealm	Generated if the media process cannot find an associated realm for the media flow.
apSysMgmtRadiusDownTrap	Generated if all or some configured RADIUS accounting servers have timed out from a RADIUS server.
apSysMgmtGatewayUnreachableTrap	Generated if the gateway specified becomes unreachable by the system.
apSysMgmtH323InitFailTrap	Generated if the H.323 stack has failed to initialize properly and has been terminated.
apSysMgmtHardwareErrorTrap	Provides a text string indicating the type of hardware error that has occurred. If the message text exceeds 255 bytes, the message is truncated to 255 bytes.
apSysMgmtDOSTrap	Generated when the IP address and the realm ID is denied of service.
apSysMgmtCfgSaveFailTrap	Generated if an error occurs while the system is trying to save the configuration to memory.
apSysMgmtSystemStateTrap	Generated when the Oracle Communications Session Border Controller is instructed to change the system-state or the transition from becoming offline to online occurs. This trap contains one field called APSysMgmtSystemState, and that field has three values:
	<ul><li>online(0)</li><li>becoming-offline(1)</li></ul>

#### **Fault Management**

Trap Name	Description	
	• offline(2)	
apSysMgmtAuthenticationFailedTrap	Generated when an attempt to login to the Oracle Communications Session Border Controller through Telnet or by using the console fails for any reason. The trap sent to all configured trap receivers includes the following information:  • administration and access level (SSH, user, enable) • connection type (Telnet or console)	

# **Transcoding Capacity Traps**

The Oracle Communications Session Border Controller sends the apSysMgmtGroupTrap as transcoding capacity nears its limit. This trap is sent and cleared for three conditions:

- Total DSP usage exceeds 95%
- Total AMR sessions exceed 95% of licensed capacity
- Total AMR-WB sessions exceed 95% of licensed capacity
- Total EVRC sessions exceed 95% of licensed capacity
- Total EVRCB sessions exceed 95% of licensed capacity

The apSysMgmtGroupTrap contains the condition observed (apSysMgmtTrapType) and the corresponding value reached (apSysMgmtTrapValue).

When the resource usage retreats below a defined threshold, the Oracle Communications Session Border Controller sends an apSysMgmtGroupClearTrap.

```
apSysMgmtGroupClearTrap NOTIFICATION-TYPE
  OBJECTS { apSysMgmtTrapType }
  STATUS current
  DESCRIPTION
    " The trap will generated if value of the monitoring object
    returns to within a certain threshold. This signifies that
    an alarm caused by that monitoring object has been cleared. "
    ::= { apSystemManagementNotifications 2 }
```

The following table summarizes trigger and clear conditions for transcoding capacity alerts as sent in the the apSysMgmtGroupTrap:

Monitored Transcoding Resource	SNMP Object & OID in apSysMgmtTrapType	Trap Sent	Clear Trap Sent
Total DSP Usage	apSysXCodeCapacity 1.3.6.1.4.1.9148.3.2.1.1.34	95%	80%
AMR License Capacity Usage	apSysXCodeAMRCapacity 1.3.6.1.4.1.9148.3.2.1.1.35	95%	80%
AMR-WB License Capacity Usage	apSysXCodeAMRWBCapa city	95%	80%

Monitored Transcoding Resource	SNMP Object & OID in apSysMgmtTrapType	Trap Sent	Clear Trap Sent
	1.3.6.1.4.1.9148.3.2.1.1.36		
EVRC License Capacity Usage	apSysXCodeEVRCCapacit y 1.3.6.1.4.1.9148.3.2.1.1.39	95%	80%
EVRCB License Capacity Usage	apSysXCodeEVRCBCapaci ty 1.3.6.1.4.1.9148.3.2.1.1.40	95%	80%

The following SNMP Objects are inserted into the apSysMgmtTrapType when sending and clearing a transcoding capacity trap. You mayt query them individually with an SNMP GET.

- apSysXCodeCapacity (1.3.6.1.4.1.9148.3.2.1.1.34)
- apSysXCodeAMRCapacity (1.3.6.1.4.1.9148.3.2.1.1.35)
- apSysXCodeAMRWBCapacity (1.3.6.1.4.1.9148.3.2.1.1.36)
- apSysXCodeEVRCCapacity (1.3.6.1.4.1.9148.3.2.1.1.39)
- apSysXCodeEVRCBCapacity(1.3.6.1.4.1.9148.3.2.1.1.40)

### **About Alarms**

This section describes system-level alarms. Alarms play a significant role in determining overall health of the system. For additional information, see the *Oracle Communications Session Border Controller MIB Reference Guide*.

#### **Overview**

An alarm is triggered when a condition or event happens within either the system's hardware or software. This alarm contains an alarm code, a severity level, a textual description of the event, the time the event occurred, and for high severity alarms, trap information.

The system's alarm handler processes alarms by locating the alarm ID for a particular alarm condition and then looking up that condition in an alarm table. The alarm table contains all of the actions required for following up on an alarm.

# **Types of Alarms**

The system can generate the following types of alarms:

- Hardware alarms: generated when a problem with the chassis occurs.
- System alarms: accounts for system resource and redundancy issues. For example, CPU utilization is over threshold, memory utilization is high, the health score is under threshold, or a task is suspended. They also include low-level system calls (for example, there is not enough memory available).
- Network alarms: can occur when the software is unable to communicate with the hardware.
- Application alarms: account for application issues (for example, problems that involve protocols). These
  protocols include:
  - SIP
  - RADIUS

Application alarms also include security breaches, session failures, and problems related to accounting.

#### **About the Alarm Process**

An alarm is triggered when a condition or event happens within either the hardware or software. This alarm contains the following elements:

- **Alarm ID**: a unique 32-bit integer that contains a 16-bit category name or number and a 16-bit unique identifier for the error or failure within that category.
- **Severity**: how severe the condition or failure is to the system.
- **Character string**: a textual description of the event or condition.
- **Trap information**: is not contained within every alarm, but is only sent for events of greater severity. See the *Oracle Communications Session Border Controller MIB Reference Guide* for more information.

#### About Alarms and the Health Score

The Oracle Communications Session Border Controller health score is used to determine the active/standby roles of the Oracle Communications Session Border Controllers participating in a High Availibility pair architecture. The healthiest Oracle Communications Session Border Controller peer (peer with the highest health score) is the active Oracle Communications Session Border Controller peer. The Oracle Communications Session Border Controller peer with the lower health score is the standby Oracle Communications Session Border Controller peer.

The health score is based on a 100-point scoring system. When all system components are functioning properly, the health score of the system is 100.

Alarms play a significant role in determining the health score of an HA Oracle Communications Session Border Controller. Some alarm conditions have a corresponding health value, which is subtracted from the health score of the system when that alarm occurs. When that alarm is cleared or removed, the corresponding health value is added back to the system's health score.

If a key system task (for example, a process or daemon) fails, the health score of that HA Oracle Communications Session Border Controller might be decremented by 75 points, depending on how the system configuration was configured. These situations, however, do not have a corresponding system

When an alarm condition is cleared or removed, this action has a positive impact on the health score of a system.

# **Displaying and Clearing Alarms**

You display and clear alarms using the following ACLI commands:

- display-alarms
- clear-alarm

The clear-alarm command is only available in Superuser mode. You must have that level of privilege to clear alarms.

#### **Displaying Alarms**

To display system alarms:

Enter the display-alarms command.

A list of the current alarms for the system will be displayed. For example:

```
ORACLE# display-alarms
3 alarms to show
     Task Severity
ID
                               First Occurred
                                                      Last Occurred
262147 35615744
                               2005-02-10 13:59:05
                                                      2005-02-10 13:59:05
Count Description
       ingress realm 'test client realm' not found
131075 36786224
                                                      2005-02-10 13:59:05
                       3
                               2005-02-10 13:59:05
Count Description
```

```
1 Slot 0 Port 0 DOWN
131101 36786224 3 2005-02-10 13:59:10 2005-02-10 13:59:10
Count Description
1 health score is under threshold 50%
done
ORACLE#
```

#### **Clearing Alarms**

If an alarm situation is corrected, the corresponding alarm is cleared in the system's alarm table and health is restored. You can also issue an ACLI command to clear a specific alarm:

To clear a specific system alarm:

**1.** Ensure you are in Superuser Mode by entering the **show privilege** command. at the topmost ACLI level. For example:

```
ORACLE# show privilege
console user - privilege level 1
```

- privilege level 0 refers Level 0:User Mode
- privilege level 1 refers to Level 1: Superuser Mode.
- 2. Enter display-alarms to list the current alarms. Note the alarm ID (ID column) and task ID (Task column) of the alarm you want to clear. You will need this reference information in order to clear the alarm.
- 3. Enter clear-alarm followed by a Space, the alarm ID, another Space, and the task ID of the task that generated the alarm.
- 4. Press Enter.

With regard to redundant architectures, if you clear an alarm using the **clear-alarm** command without actually fixing the true cause of the alarm, it might have an adverse effect on the health score of the system and might, in turn, prevent future failover functionality.

### **About the Alarm Display on the Chassis**

The alarm display appears in a two-line front panel display mode. During an alarm condition, the alarm display replaces the standard display on the chassis.

The first line of the graphic display shows the number of hardware-related alarms, if any. The second line of the graphic display shows the number of link-related alarms, if any. For example:

```
1 HW ALARM
2 LINK ALARMS
```

If the graphic display window indicates an alarm condition, the system administrator must determine the nature of the condition by using the **display-alarms** ACLI command. Executing this command allows system administrators to view specific details about the alarm.

When an alarm condition is cleared, the standard display replaces the alarm display.

# **Alarm Severity Levels**

Five levels of alarm severity have been established for the system. These levels have been designated so that the system can take action that is appropriate to the situation.

Alarm Severity	Description
Emergency	Requires immediate attention. If you do not attend to this condition immediately, there will be physical, permanent, and irreparable damage to your system.
Critical	Requires attention as soon as it is noted. If you do not attend to this condition immediately, there may be physical, permanent, and irreparable damage to your system.

Alarm Severity	Description
Major	Functionality has been seriously compromised. As a result, this situation might cause loss of functionality, hanging applications, and dropped packets. If you do not attend to this situation, your system will suffer no physical harm, but it will cease to function.
Minor	Functionality has been impaired to a certain degree. As a result, you might experience compromised functionality. There will be no physical harm to your system. However, you should attend to this type of alarm as soon as possible in order to keep your system operating properly.
Warning	Some irregularities in performance. This condition describes situations that are noteworthy, however, you should attend to this condition in order to keep your system operating properly. For example, this type of alarm might indicate the system is running low on bandwidth and you may need to contact Oracle to arrange for an upgrade.

## **System Response to Alarms**

The system is capable of taking any of a range of actions when an alarm event occurs. It can present the alarms in the VED graphic display window on the front panel of the chassis, use the acmelog (syslog) to log the events off the system, create an SNMP trap with an event notification, or use three dry contacts for external alarming.

Within the system, a database holds all information related to what actions to take given an event of a specific category and severity. This section sets out and defines these actions.

## Writing to syslog (acmelog)

The term syslog refers to the protocol used for the network logging of system and network events. Because syslog facilitates the transmission of event notification messages across networks, the **syslog** protocol can be used to allow remote log access.

## **Sending SNMP Traps**

An SNMP trap is essentially an event notification that can be initiated by tasks (such as the notify task), by log messages, or by alarm reporting. When an event occurs, the Oracle Communications Session Border Controller sends a trap to the management station.

Although there is no direct correlation between system alarms and the generation of SNMP traps, there is a correlation between system alarms and the MIBs that support SNMP traps. For a list of the SNMP-related alarms and their associated traps, refer to the *Oracle Communications Session Border ControllerMIB Reference Guide*.

### **About Dry Contacts**

The system supports three relays at the back of the Oracle Communications Session Border Controller chassis used for transmission of alarms called dry contacts. A dry contact is triggered for the following levels of severity:

- Critical
- Major
- Minor

Most often, the dry contact action is registered in the physical location of the chassis. For example, there may be an LED signal on a communications cabinet.

### **Displaying Alarms to the Chassis**

The system can display a message concerning the alarm condition on the chassis itself. If this action is taken, a brief message appears in the VED graphic display window on the front panel of the chassis.

# **Hardware and Environmental Faults**

This section describes the hardware and environmental faults. It includes information about fan speed, voltage, temperature, and power supply for the system.

**Note:** If you suspect you have a hardware fault, contact Oracle Support for assistance with running the diagnostics image loaded on the Oracle Communications Session Border Controller.

## **Hardware Temperature Alarm**

The following table describes the hardware temperature alarm.

Alarm Name	Alar m ID	Alarm Severity	Cause(s)	Example Log Message	Actions	Health Score Impact
TEMPERATURE HIGH	655 38	Acme Packet 4500 CPU CRITICAL :>105°C MAJOR: >100°C MINOR: >95°C Acme Packet 3820 MB CRITICAL :>75°C MAJOR: >65°C MINOR: >55°C	Fans are obstructed or stopped. The room is abnormally hot.	Temperatur e: XX.XXC (where XX.XX is the temperature in degrees)	apSyslogMessageGenera ted trap generated apEnvMonStatusChange Notification apSysMgmtTempTrap critical, major, minor dry contact	CRITIC AL: -100 MAJOR: -50 MINOR : -25
SD5_TEMPERATUR E_HIGH_PHY0  If this alarm occurs, th	o cycł	CRITICAL :>100°C MAJOR:> 95°C MINOR:> 90°C	Fans are obstructed or stopped. The room is abnormally hot.	Temperatur e: XX.XXC (where XX.XX is the temperature in degrees)	Temperature X is at Y degrees C over minor/major/critical threshold of Z (Where X is sensor name, Y is temperature and Z is threshold)	

## **Fan Speed Alarm**

The following table describes the fan speed alarm.

Alarm Name	Alarm	Alarm Severity	Cause(s)	Example Log	Actions	Health
	ID	-		Message		Score
						Impact

## **Environmental Sensor Alarm**

The following table describes the environmental sensor alarm.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions	Health Score Impact
ENVIRONME NTAL SENSOR FAILURE	65539	CRITICAL	The environmental sensor component cannot detect fan speed and temperature.	Hardware monitor failure! Unable to monitor fan speed and temperature!	apSyslogMessage Generated trap generated critical, major, minor dry contact syslog power cycle the standby Oracle Communications Session Border Controller peer using the power supply on/off switches located on the rear panel of the chassis force a manual switchover by executing the	CRITICA L: -10

		ACLI notify berpd force command	
		power cycle the active Oracle Communications Session Border Controller peer	

## **Media Link Alarms**

Media link alarms include the following:

Major

If the Oracle Communications Session Border Controller's media link goes from being up to being down, it is considered a major alarm. This alarms applies to both slots 1 and 2 on the Oracle Communications Session Border Controller. A message appears on the front panel of the Oracle Communications Session Border Controller's chassis, similar to the following:

MAJOR ALARM Gig Port 1 DOWN

• Minor

If the Oracle Communications Session Border Controller's media link goes from being down to being up, it is considered a minor alarm. This alarm applies to both slots 1 and 2 on the Oracle Communications Session Border Controller.

## **Power Supply Alarms**

The following table describes the power supply alarms

Alarm	Alarm ID	Alarm Severity	Cause(s)	Log Message	Actions	
PLD POWER A FAILURE	65540	MINOR (-10)	Power supply A has failed.	Back Power Supply A has failed!	apSyslogMessageGenerat ed trap generated minor dry contact syslog	
PLD POWER A UP	65541	MINOR	Power supply A is now present and functioning.	Back Power Supply A is present!	apSyslogMessageGenerat ed trap generated minor dry contact syslog	
generated. If ar	If the system boots up with one power supply, the health score will be 100, and no alarm will be generated. If another power supply is then added to that same system, this same alarm will be generated, but the health score will not be decremented.					
PLD POWER B FAILURE	65542	MINOR (-10)	Power supply B has failed.	Back Power Supply B has failed!	apSyslogMessageGenerat ed trap generated minor dry contact syslog	

Alarm	Alarm ID	Alarm Severity	Cause(s)	Log Message	Actions
PLD POWER B UP	65543	MINOR	Power supply B is now present and functioning.	Back Power Supply B is present!	apSyslogMessageGenerat ed trap generated minor dry contact syslog

# **Voltage Alarms**

The following table describes the voltage alarms, which are only available for Oracle Communications Session Border Controller 2:

Alarm	Alarm ID	Alarm Severity	Cause(s)	Log Message	Actions
PLD VOLTAGE ALARM 2P5V	65544	MINOR EMERGENCY		Voltage 2.5V CPU has minor alarm Voltage 2.5V CPU has emergency alarm, the system should shutdown	apSyslogMessageGene rated trap generated dry contact syslog
PLD VOLTAGE ALARM 3P3V	65545	MINOR EMERGENCY		Voltage 3.3V has minor alarm  Voltage 3.3V has emergency alarm, the system should shutdown	apSyslogMessageGene rated trap generated dry contact syslog
PLD VOLTAGE ALARM 5V	65546	MINOR EMERGENCY		Voltage 5V has minor alarm Voltage 5V has emergency alarm, the system should shutdown	apSyslogMessageGene rated trap generated dry contact syslog
PLD VOLTAGE ALARM CPU	65547	MINOR EMERGENCY		Voltage CPU has minor alarm  Voltage CPU has emergency alarm, the system should shutdown	apSyslogMessageGene rated trap generated dry contact syslog

## **Physical Interface Card Alarms**

The following table describes the physical interface card alarms.

Alarm	Alarm ID	Alarm Severity	Cause(s)	Log Message	Actions
PHY0 Removed	65550	MAJOR	Physical interface card 0 was removed.	PHY card 0 has been removed.	
PHY0 Inserted	65552	MAJOR	Physical interface card 0 was inserted.	None	
PHY1 Removed	65553	MAJOR	Physical interface card 1 was removed.	PHY card 1 has been removed.	
PHY1 Inserted	65554	MAJOR	Physical interface card 1 was inserted.	None	

# **Transcoding Alarms**

The transcoding feature employs several hardware and software alarms to alert the user when the system is not functioning properly or overload conditions are reached.

Name/ID	Severity/ Health Degredation	Cause(s)	Traps Generated
No DSPs Present with Transcoding Feature Card (DSP_NONE_PRESE NT)	Minor/0	A transcoding feature card is installed but no DSP modules are discovered.	apSysMgmtHardwareErrorTrap
DSP Boot Failure (DSP_BOOT_FAILUR E)	Critical/0	A DSP device fails to boot properly at system initialization. This alarm is not health affecting for a single DSP boot failure. DSPs that fail to boot will remain uninitialized and will be avoided for transcoding.	apSysMgmtHardwareErrorTrap
DSP Communications Timeout (DSP_COMMS_TIME OUT)	Critical/100	A DSP fails to respond after 2 seconds with 3 retry messages. This alarm is critical and is health affecting.	apSysMgmtHardwareErrorTrap
DSP Alerts (DSP_CORE_HALT)	Critical/100	A problem with the health of the DSP such as a halted DSP core. The software will attempt to reset the DSP and gather	apSysMgmtHardwareErrorTrap

Name/ID	Severity/ Health Degredation	Cause(s)	Traps Generated
		diagnostic information about the crash. This information will be saved in the /code directory to be retrieved by the user.	
DSP Temperature(DSP_TE MPERATURE_HIGH )	Clear 85°C Warning 86°C / 5 Minor 90°C / 25 Major 95°C/ 50 Critical 100°C/ 100	A DSP device exceeds the temperature threshold. If the temperature exceeds 90°C, a minor alarm will be set. If it exceeds 95°C, a major alarm will be set. If it exceeds 100°C, a critical alarm will be set. The alarm is cleared if the temperature falls below 85°C. The alarm is health affecting.	apSysMgmtHardwareErrorTrap
Transcoding Capacity Threshold Alarm (XCODE_UTIL_OVE R_THRESHOLD) / 131329	Clear 80% Warning 95%	A warning alarm will be raised when the transcoding capacity exceeds a high threshold of 95%. The alarm will be cleared after the capacity falls below a low threshold of 80%. This alarm warns the user that transcoding resources are nearly depleted. This alarm is not health affecting.	apSysMgmtGroupTrap
Licensed AMR Transcoding Capacity Threshold Alarm/ 131330	Clear 80% Warning 95%	A warning alarm is triggered if the AMR transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of 80%. This alarm is not health affecting.	apSysMgmtGroupTrap
Licensed AMR-WB Transcoding Capacity Threshold Alarm/ 131331	Clear 80% Warning 95%	A warning alarm is triggered if the AMR-WB transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of	apSysMgmtGroupTrap

Name/ID	Severity/ Health Degredation	Cause(s)	Traps Generated
		80%. This alarm is not health affecting.	
Licensed EVRC Transcoding Capacity Threshold Alarm/ 131332	Clear 80% Warning 95%	A warning alarm is triggered if the EVRC transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of 80%. This alarm is not health affecting.	apSysMgmtGroupTrap
Licensed EVRCB Transcoding Capacity Threshold Alarm/ 131333	Clear 80% Warning 95%	A warning alarm is triggered if the EVRCB transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of 80%. This alarm is not health affecting.	apSysMgmtGroupTrap
Licensed Opus Transcoding Capacity Threshold Alarm/ 131159	Clear 80% Warning 95%	A warning alarm is triggered if the Opus transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of 80%. This alarm is not health affecting.	apSysMgmtGroupTrap
Licensed SILK Transcoding Capacity Threshold Alarm/ 131159	Clear 80% Warning 95%	A warning alarm is triggered if the SILK transcoding capacity exceeds a high threshold of 95% of licensed session in use. The alarm clears after the capacity falls below a low threshold of 80%. This alarm is not health affecting.	apSysMgmtGroupTrap

# **Viewing PROM Information**

Display PROM statistics for the following Oracle Communications Session Border Controller components by using the **show prom-info** command.

For example:

```
ORACLE# show prom-info mainboard
Contents of Main Board IDPROM
       Assy, NetNet4500
       Part Number:
                                      002-0610-50
       Serial Number:
                                      091132009670
       FunctionalRev:
                                      5.06
       BoardRev:
                                     05.00
       PCB Family Type:
                                     Main Board
                                     NetNet 4500 Main Board
       Options:
       Manufacturer:
                                    Benchmark Electronics
       Week/Year:
                                     32/2011
                                    009670
       Sequence Number:
       Number of MAC Addresses:
                                     16
       Starting MAC Address:
                                    00 08 25 a2 56 20
```

The following example shows the host CPU PROM contents.

```
ORACLE# show prom-info cpu
Contents of CPU IDPROM
Part Number: MOD-0026-62
Manufacturer: RadiSys
```

## **Graphic Window Display**

The Environment display lets you scroll through information about the operational status of the hardware displayed in the Oracle Communications Session Border Controller chassis's graphic window. For example, you can view hardware- and link-related alarm information, highest monitored temperature reading, and fan speed.

The graphic display window presents the following Environment information in the order listed:

```
Alarm state
temperature
fan speed
```

- alarm state: HW ALARM: X (where X is the number of hardware alarms, excluding ENVIRONMENTAL SENSOR FAILURE) and LINK ALARM: X (where X is the number of link down alarms)
- temperature: format is XX.XX C, where XX.XX is the temperature in degrees
- fan speed: XXXX, where XXXX is the RPM of the failing fan on the fan module

#### For example:

```
HW ALARM: 1
LINK ALARM: 2
TEMPERATURE: 38.00 C
FAN SPEED: 5800
```

From this display, pressing Enter for the Return selection refreshes the information and returns you to the main Environment menu heading.

**Note:** Environmental sensor failure alarms are not displayed in the graphic display window on the front panel.

### **Fan Stopped Alarm**

The fan stopped alarm presents the following in the graphic display window:

X HW ALARM(S) (where X indicates the number of HW alarms that exist on the system)

### Temperature High Alarm

The temperature high alarm presents the following in the graphic display window:

X HW ALARM(S) (where X indicates the number of HW alarms that exist on the system)

# **System Fault Statistics**

This section contains information about system faults. System faults include problems related to CPU usage, memory usage, and license capacity. System faults also include the functionality of the Address Resolution Protocol (ARP) on the system.

## **System State**

You can use the following commands to view system uptime and state information:

- show uptime
- show system-state

## **Viewing System Uptime**

Display current date and time information and the length of time the system has been running in days, hours, minutes, and seconds by using the **show uptime** command. For example:

```
ORACLE# show uptime
FRI FEB 25 13:02:55 2005 - up 0 days, 3 hours, 42 minutes, 30 seconds
```

## **Viewing System State**

Display whether the Oracle Communications Session Border Controller is currently online or offline by using the show system-state command. For example:

```
ORACLE# show system-state
The current system state is online
```

## **System Resources**

You can use the following command to view the system resource statistics:

• show processes cpu

#### Viewing CPU Usage

Display CPU usage information, categorized on a per task/process basis, for your Oracle Communications Session Border Controller by using the **show processes cpu** command.

	-	ses cr						
Task Name	Task Id	Pri	Status	Total CPU	Avg	Now	Load	Processor
tCli		-2	RUNNING	0:00:00.910		2.37	4.74	1
tAsctpd	1770	-70	SLEEPING	0:01:46.440	0.03	0.47	0.95	1
kworker/1:1	423	20	RUNNING	0:28:22.590	0.40	0.47	0.95	1
kworker/u:1	2478	20	SLEEPING	0:00:01.430	0.00	0.00	0.00	0
kworker/u:2	2477	20	SLEEPING	0:00:02.450	0.00	0.00	0.00	1
kworker/u:0	2476	20	SLEEPING	0:00:06.150	0.00	0.00	0.00	0
telnetD	1805	-100	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliTnet5	1804	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliTnet4	1803	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliTnet3	1802	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliTnet2	1801	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliTnet1	1800	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tSSH	1798	-100	SLEEPING	0:00:04.590	0.00	0.00	0.00	0
tCliSSH4	1797	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliSSH3	1796	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliSSH2	1795	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliSSH1	1794	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tCliSSH0	1793	-2	SLEEPING	0:00:00.000	0.00	0.00	0.00	1
tLogCleaner	1792	-100	SLEEPING	0:00:00.100	0.00	0.00	0.00	0
tAlarm	1791	-76	SLEEPING	0:00:29.130	0.01	0.00	0.00	1

tifXCheck	1787 -1	00 SLEEPING	0:00:00.130	0.00	0.00	0.00	0	
tSnmpd	1786 -	52 SLEEPING	0:00:00.070	0.00	0.00	0.00	0	

The output of the **show processes** cpu command includes the following information:

- Task Name—Name of the system task or process
- Task Id—Identification number for the task or process
- Pri—Priority for the CPU usage
- Status—Status of the CPU usage
- Total CPU—Total CPU usage since last reboot in hours, minutes, and seconds
- Avg—Displays percentage of CPU usage since the system was last rebooted
- Now—CPU usage in the last second
- Load—The CPU load
- Processor—The processor number where this task runs

#### **CPU Utilization Alarm**

The following table lists the CPU utilization alarm.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
CPU UTILIZATION	131099	MINOR		CPU usage X% over threshold X%	apSysMgmtGroupTrap trap generated minor dry contact syslog

## **System Task Suspended Alarm**

The following table describes the system task suspended alarm information.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
SYSTEM TASK SUSPENDED	131108	CRITICAL	A system task (process) suspends or fails.	Task X suspended, which decremented health by 75! (where X is the task/process name)	apSyslogMessageGener ated trap generated major dry contact syslog reboot (if the system is configured to do so)

## **Memory Usage**

You can use the following commands to view memory statistics:

- show memory usage
- show buffers

#### **Viewing Memory Usage Statistics**

Display memory usage statistics by using the **show memory usage** command. For example:

ORACLE# show memory usage
Mem Total: 3698 MB
Mem App: 505 MB
Mem OS: 179 MB

### Viewing Memory Buffer Statistics

Display memory buffer statistics by using the **show buffers** command. The memory buffer statistics are divided into three sections:

- Number of specific buffer types
- Total number of buffers and number of times the system failed, waited, or had to empty a protocol to find space
- Cluster pool table

## For example:

```
ORACLE# show buffers
type number
              _____
FREE : 64000
TOTAL : 64000
number of mbufs: 32000
number of times failed to find space: 0
CLUSTER POOL TABLE
      clusters free usage minsize maxsize empty
size

      64
      32000
      32000

      10064
      32000
      32000

                                    1234051
                                                 0
                                                                          0
                                1234051 0
1234051 0
                                                              0
                                                                          0
```

## **Memory Utilization Alarm**

The following table describes the memory utilization alarm.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
MEMORY UTILIZATION	131100	MAJOR	Memory usage reached 90% or greater of its capacity.	Memory usage X% over threshold X%	apSysMgmtGroupTrap trap generated minor dry contact syslog

## **License Capacity**

If the total number of active sessions on the system (across all protocols) is within 98-100% of the system's licensed capacity, an alarm and trap will be generated. The severity of this application alarm is MAJOR, but is not HA health-affecting.

The total number of active sessions is checked at an interval of 5 seconds (just as the system temperature and fans speed are). Once an approaching capacity alarm is triggered, another one will not be triggered until after the current alarm is cleared. This alarm will be cleared (and the trap sent, apLicenseNotApproachingCapacityNotification) after the total number of active sessions has gone to or below 90% of capacity, but no sooner than 15 seconds after the original alarm was triggered.

The following table describes the license capacity alarm

Alarm Name	Alarm	Alarm	Cause(s)	Example Log	Actions
	ID	Severity		Message	

	LICENSE ALARM APPROACHING SESSION CAPACITY	327684	MAJOR	Total number of active sessions on the system (across all protocols) is within 98 to 100% of the system's licensed capacity.		apLicenseApproaching CapacityNotification	
--	---	--------	-------	--	--	--	--

## **Configuration Statistics**

You can use the following commands to display configuration information:

- show configuration
- show running-config
- realm-specifics <realm ID>
- show virtual-interfaces

## Specifying a Configuration Element

Both the **show configuration** and the **show running-config** commands let you include a configuration element name as an argument to view only instances for that configuration element. The list of valid configuration elements you can use as an argument include the following:

- account-config—Show account-config object
- h323-config—Show h323-config object
- h323-stack—Show all h323-stack objects
- iwf-stack—Show iwf-stack object
- host-route—Show all host-route objects
- local-policy—Show all local-policy objects
- media-profile—Show all media-profile objects
- · media-manager—Show media-manager object
- dns-config—Show all dns-config objects
- network-interface—Show all network-interface objects
- ntp-config—Show ntp-config object
- phys-interface—Show all phys-interface objects
- realm—Show all realm objects
- MediaPolicy—Show all MediaPolicy objects
- ClassPolicy—Show all ClassPolicy objects
- · redundancy-config—Show redundancy-config object
- ResponseMap—Show all ResponseMap objects
- session-agent—Show all session-agent objects
- · session-group—Show all session-group objects
- session-translation—Show all session-translation objects
- translation-rules—Show all translation-rules objects
- session-router—Show session-router object
- sip-config—Show all sip-config objects
- sip-feature—Show all sip-feature objects
- sip-interface—Show all sip-interface objects
- sip-nat—Show all sip-nat objects
- snmp-community—Show all snmp-community objects
- static-flow—Show all static-flow objects

- steering-pool—Show all steering-pool objectssystem-config—show system-config object
- TrapReceiver—Show all TrapReceiver objects
- call-recording-server—Show call-recording-server configurations
- capture-receiver—Show capture-receiver configurations
- rph-profile—Show rph-profile configurations
- rph-policy—Show rph-policy configurations
- password-policy—Show password-policy configuration
- enforcement-profile—Show enforcement-profile configurations
- realm-group—Show realm-group configurations
- inventory—Displays an inventory of all configured elements on the Oracle Communications Session Border Controller

## **Viewing Current Configuration**

Display information about the current configuration (used once the **activate-config** command is executed) by using the **show configuration** command. You can include the name of a configuration element with the **show configuration** command to display only instances for that configuration element.

For example:

```
ORACLE# show configuration media-manager
media-manager
         state
                                               enabled
                                               enabled
         latching
         flow-time-limit
                                               86400
                                         300
         initial-guard-timer
subsq-guard-timer
tcp-flow-time-limit
         tcp-flow-time-limit 86400
tcp-initial-guard-timer 300
tcp-subsq-guard-timer 300
         tcp-number-of-ports-per-flow 2
                                            disabled
         hnt-rtcp
                                             NOTICE
         mbcd-log-level
                                            10000000
100
         max-signaling-bandwidth max-untrusted-signaling
                                               30
         min-untrusted-signaling
         app-signaling-bandwidth
         tolerance-window
                                               30
         rtcp-rate-limit
         min-media-allocation 32000
min-trusted-allocation 1000
deny-allocation 1000
                                             disabled
         anonymous-sdp
                                              32000
         arp-msg-bandwidth
         last-modified-date
                                               2007-04-05 09:27:20
task done
```

### **Viewing Running Configuration**

Display the running configuration information currently in use on the system by using the **show running-config** command. You can include the name of a configuration element with the show configuration command to display only the instances for that configuration element.

For example:

```
mm-in-network
                               enabled
                               enabled
mm-same-ip
mm-in-system
                               disabled
bw-cac-non-mm
                               disabled
msm-release
                               disabled
gos-enable
                               disabled

```

## **Viewing Realm-Specific Configuration**

Display realm-specific configuration based on the input realm ID by using the **realm-specifics** <realm ID> command. The information displayed includes the following:

- · realm-config
- steering-pool
- · session-agent
- session-translation
- class-policy
- local-policy (if the source realm or destination realm are defined)

#### For example:

```
ORACLE# realm-specifics testrealm
realm-config
    identifier testrealm
    addr-prefix 0.0.0.0
    network-interfaces
```

```
mm-in-realm
                                     disabled
                                     enabled
       mm-in-network
       mm-same-ip
                                    enabled
       mm-in-system
                                    disabled
       bw-cac-non-mm
                                    disabled
       msm-release
                                    disabled
       gos-enable
                                    disabled
       max-bandwidth
       ext-policy-svr
                                    boffo.com
       max-latency
       max-jitter
                                     0
       max-packet-loss
                                     0
       observ-window-size
       parent-realm
       dns-realm
       media-policy
       in-translationid
       out-translationid
       in-manipulationid
       out-manipulationid
       class-profile
       average-rate-limit
       access-control-trust-level
                                     low
       invalid-signal-threshold
                                     Ω
       maximum-signal-threshold
                                     0
       maximum-signal-threshold 758 30
                                    758

### **Configuration Save Failed Alarm**

The following table lists the CFG ALARM SAVE FAILED alarm.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
CFG ALARM SAVE FAILED	393217	MAJOR	The save-config command execution failed on a standby Oracle Communications Session Border Controller peer operating as part of an HA pair.	failed on	apSyslogMessageGener ated trap generated syslog

		the target name (tn) configured in the boot	
		parameters)	
		^	

## **HA Functionality**

You can monitor HA Oracle Communications Session Border Controller functionality using the following ACLI commands:

- **show health** to view information about the HA architecture and associated HA Oracle Communications Session Border Controller peers.
- **show redundancy** to view information about the synchronization of media flows and signaling for the members of an HA Oracle Communications Session Border Controller pair.

You can also view state displays on the graphical window display of the chassis.

## **Viewing Health Information**

Display the following information for HA architectures by using the **show health** command:

**Note:** The spaces are intentionally used in the following examples because they appear on the screen.

- · Health score
- Whether the current HA Oracle Communications Session Border Controller is active, standby, or out of service
- Whether the media flow information is synchronized for all supported protocols: SIP and H.323 (true/false)
- If media flow information is not available, Media Synchronized disabled will be displayed in the show health output.
- Whether SIP signaling information is synchronized (true/false)
- If SIP signaling is not available, SIP Synchronized disabled will be displayed in the show health output.
- Whether configuration information is synchronized (true/false)
- If configuration checkpointing is not available, Config Synchronized disabled will be displayed in the show health output.
- The IPv4 or IPv6 address of the current HA Oracle Communications Session Border Controller's active peer (an HA Oracle Communications Session Border Controller that is currently active does not have an active Oracle Communications Session Border Controller peer and shows 0.0.0.0)
- The last message received from the HA Oracle Communications Session Border Controller peer
- A switchover log containing the last 20 switchover events (whether becoming active or relinquishing the active role)

The following example shows a currently active Oracle Communications Session Border Controller.

```
ORACLE# show health
        Media Synchronized
                                       enabled
        SIP Synchronized
                                       enabled
        Config Synchronized
                                       enabled
        Collect Synchronized
                                       enabled
        Radius CDR Synchronized
Rotated CDRs Synchronized
                                       enabled
                                       enabled
        Active Peer Address
                                       163.4.12.2
Redundancy Protocol Process (v2):
        State
                                         Active
        Health
                                         100
        Lowest Local Address
                                         11.0.0.1:9090
        1 peer(s) on 1 socket(s):
        systest3B: v2, Standby, health=100, max silence=1050
```

```
last received from 11.0.0.2 on wancom1:0
Switchover log:
Jul 11 14:18:21.442: Active to RelinquishingActive
Jul 11 14:24:00.872: Standby to BecomingActive, active peer
systest3B has timed out.
```

### Viewing Redundancy Information

Display the following information about HA architecture by using the **show redundancy** command:

- General HA statistics
- Statistics related to HA transactions that have been processed
- Timestamp showing when the current period began
- The numerical identifier for the last redundant transaction processed (each transaction is numbered)

In an HA architecture that is functioning properly, the number for the last redundant transaction processed on a standby Oracle Communications Session Border Controller peer should not be far behind (if not exactly the same as) the one shown for the active Oracle Communications Session Border Controller peer.

Several subcommands appear under the **show redundancy** command. Within this set of subcommands, system administrators can view information related to HA transactions, including specific transaction information.

The following example shows the subcommands available for the **show redundancy** command.

ORACLE# show redundancy ?	
collect	Collect Redundancy Statistics
config	Configuration Redundancy Statistics
link	Shows Link Redundancy Configuration
mbcd	MBC Redundancy Statistics
radius-cdr	Radius CDR Redundancy Statistics
rotated-cdr	Rotated Radius CDR Redundancy Statistics
sipd	SIP Redundancy Statistics

#### **HA Alarms**

There are currently five alarms directly associated with the HA feature. A system alarm is triggered when any of the following HA conditions occurs:

- When the health score falls below 60. This is a hard-coded threshold value. It is not configurable.
- By the Active-BecomingStandby peer upon switchover.
- By the **Standby-BecomingActive** peer upon switchover.
- When the HA Oracle Communications Session Border Controller peer times out.
- When the standby system is unable to synchronize with its active Oracle Communications Session Border Controller peer within the amount of time set for the becoming standby time field of the redundancy element.

When certain alarms associated with the HA feature are triggered, traps are sent via the appropriate MIB (for example, syslog or system management). Traps for switchover alarms indicate that a switchover has occurred and identify the state transition of the HA Oracle Communications Session Border Controller reporting the switchover. For example:

- Standby to BecomingActive
- BecomingStandby to BecomingActive
- Active to RelinquishingActive and so on

In the case of an alarm from the **Standby to BecomingActive** peer, the associated trap also indicates the reason for switchover (as far as high availability is concerned). These reasons might include reporting the degraded health of the HA Oracle Communications Session Border Controller peer or indicating that the HA Oracle Communications Session Border Controller peer has timed out or that a switchover was forced by command.

The following table provides a list, by name, of the Oracle Communications Session Border Controller's HA-related alarms, including their alarm IDs, severities, causes, associated log messages, and actions.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
HEALTH SCORE	131101	MAJOR	System's health score fell below 60.	Health score X is under threshold (where X is the health score)	apSysMgmtGroupTrap
NAT TABLE UTILIZATION	131102	MINOR	NAT table usage reached 90% or greater of its capacity.	NAT table usage X% over threshold X%	apSysMgmtGroupTrap
ARP TABLE UTILIZATION	131103	MINOR	ARP table usage reached 90% or greater of its capacity.	ARP table X% over threshold X %	apSysMgmtGroupTrap
REDUNDANT SWITCH-TO- ACTIVE	131104	CRITICAL	A state transition occurred from Standby/BecomingStand by to BecomingActive.	Switchover, <state state="" to="">, active peer <name ha="" of="" peer=""> has timed out or Switchover, <state state="" to="">, active peer <name ha="" of="" peer=""> has unacceptable health (x) (where x is the health score) or Switchover, <state state="" to="">, forced by command</state></name></state></name></state>	apSyslogMessageGener ated apSysMgmtRedundanc yTrap
REDUNDANT SWITCH-TO- STANDBY	131105	CRITICAL	A state transition occurred from Active/BecomingActive to BecomingStand by/RelinquishingActive.	Switchover, <state state="" to="">, peer <name ha="" of="" peer=""> is healthier (x) than us (x) (where x is the health score) or Switchover, <state state="" to="">, forced by command</state></name></state>	apSyslogMessageGener ated apSysMgmtRedundanc yTrap
REDUNDANT TIMEOUT	131106	MAJOR	A HA system peer was not heard from	Peer <name ha="" of="" peer=""> timed out in state x,</name>	apSyslogMessageGener ated

			within a time period.	my state is x (where x is the state (for example, BecomingStand by))	apSysMgmtRedundanc yTrap
Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
REDUNDANT OUT OF SERVICE	131107	CRITICAL	Unable to synchronize with Active HA system peer within BecomingStand by timeout.	Unable to synchronize with Active redundant peer within BecomingStand by timeout, going OutOfService	apSyslogMessageGener ated apSysMgmtRedundanc yTrap
CFG ALARM SAVE FAILED	393217	MAJOR	The save-config command execution failed on a standby Oracle Communications Session Border Controller peer operating as part of an HA pair.	save-config failed on targetName!/ code full, config sync stopped! or save-config failed on targetName!/ code full, config sync stopped! (where the targetName is the target name (tn) configured in the boot parameters)	apSyslogMessageGener ated trap generated syslog

#### **Base Display Level**

The base display level of the graphic display window on the front panel of the chassis shows the state of an HA Oracle Communications Session Border Controller. The base display appears when the Oracle Communications Session Border Controller first starts up and when the graphic display times out at any menu level.

System administrators can distinguish between an active SBC and a standby Oracle Communications Session Border Controller in an HA architecture by looking at the front of the chassis. The chassis operating as the standby Oracle Communications Session Border Controller in an HA architecture displays an (S) in the graphic display window to indicate its status as the standby system. The chassis operating as the active Oracle Communications Session Border Controller in an HA architecture does not display anything in parentheses in the graphic display window.

### **HA State Display Stats**

The chassis's graphic display window shows the current state of the HA Oracle Communications Session Border Controller using an abbreviation that follows the Oracle Communications Session Border Controller name. The states are defined in the following table.

State Abbreviation	Description
(I)	Initial (the Oracle Communications Session Border Controller is in this state when it is booting)
(O/S)	Out of service
(B/S)	Becoming standby
(S)	Standby
(nothing displayed after the Oracle Communications Session Border Controller name)	Active

Refer to the following sections for examples of the graphic display window output.

## **Initial State Displays**

The following example shows the output in the graphic display window of a Oracle Communications Session Border Controller in the initial state:

```
NET - NET
SESSION DIRECTOR (I)
```

## **Out Of Service State Displays**

The following examples show the output in the graphic display window of an out-of-service Oracle Communications Session Border Controller:

```
NET - NET
SESSION DIRECTOR (O/S)
```

## **Becoming Standby State Displays**

The following example shows the output in the graphic display window of a Oracle Communications Session Border Controller becoming standby:

```
NET - NET
SESSION DIRECTOR (B/S)
```

#### **Standby State Displays**

The following example shows the output in the graphic display window of a standby Oracle Communications Session Border Controller:

```
NET - NET
SESSION DIRECTOR (S)
```

#### **Active State Displays**

HA Oracle Communications Session Border Controllers in the active state use the default graphic display. The following example show the display of an active Oracle Communications Session Border Controller.

```
ACME PACKET
SESSION DIRECTOR
```

For further information about the Oracle Communications Session Border Controller chassis and graphic display window, refer to the Oracle Communications Session Border Controller Installation Guide.

# **ARP Functionality**

You can use the following command to view ARP functionality information:

- arp-check
- show arp

#### **Testing Address Resolution**

Test a specific address resolution by using the **arp-check** command; which causes a a test message to be sent. The test is successful when an OK is returned. Note that the command does not send an ARP request if the specified address is already in the ARP table or is in a different subnet.

To run this test, you must enter the following information after typing arp-check and a Space:

- media interface slot (either of two values: 1 is for the left, and 2 is for the right)
- VLAN identifier

**Note:** If there is no VLAN identifier to be entered, enter a value of 0.

• IPv4 address (in dotted notation).

#### For example:

```
ORACLE# arp-check 1 6 192.168.100.1

ARP: Sending ARP REQ port=0, vlan=6, source_ipa=192.168.200.10, target_ipa=192.168.100.1

ORACLE#
```

## **Viewing Current Address Mappings**

Display the current Internet-to-Ethernet address mappings in the ARP table by using the **show arp** command. The first section of this display shows the following information: destination, gateway, flags, reference count, use, and interface. The second section shows the interface, VLAN, IP address, MAC address, timestamp, and type.

The intf (interface) column in the ARP includes both slot and port information. If a value of 0/1 appears, 0 refers to the slot and 1 refers to the port. For example:

```
ORACLE# show arp
LINK LEVEL ARP TABLE
                            flags Refcnt Use Interface
destination gateway
_____
172.30.0.1 00:0f:23:4a:d8:80 405 1 0
                Total ARP Entries = 3
                _____
Intf VLAN IP-Address MAC time-stamp type 0/0 0 010.000.045.001 00:00:00:00:00 1108462861 invalid
Intf VLAN
Special Entries:
0/0 0 000.000.000 00:00:00:00:00 1108462861 gateway 0/0 0 010.000.045.000 00:00:00:00:00:00 1108462861 network
Gateway Status:
Intf VLAN IP-Address MAC time-stamp hb status 0/0 0 010.000.045.001 00:00:00:00:00 1108462861 unreachable
-- ARP table info --
Maximum number of entries : 512
Number of used entries : 3
Length of search key : 1 (x 64 bits)
First search entry address: 0x3cb0
length of data entry : 2 (x 64 bits)
First data entry address : 0x7960
Enable aging : 0
Enable policing : 0
```

#### **ARP Table Utilization Alarm**

The following table describes the ARP table utilization alarm.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
		•		Ŭ	

ARP TABLE UTILIZATION			over threshold	apSysMgmtGroupTrap trap generated syslog	
-----------------------	--	--	----------------	--	--

## **Local Policy**

Use the following commands to view local policy statistics and information:

- show running-config local-policy
- show configuration local-policy

## **Viewing Running Configuration Local Policy**

Display information about the local policy in the running configuration information in use on the system by using the **show running-config local-policy** command. For example:

```
ORACLE# show running-config local-policy
local-policy
       from-address
                                      192.168.0.50
       to-address
                                      10.10.10.10
       source-realm
       activate-time
                                     N/A
       deactivate-time
                                    N/A
       state
                                    enabled
       policy-priority
                                    urgent
                                    2006-06-12 08:48:57
       last-modified-date
       policy-attribute
               next-hop
                                             172.168.0.10
               realm
               action
                                             none
               terminate-recursion
                                             enabled
               carrier
                                             0000
               start-time
               end-time
                                             2400
               days-of-week
                                             U-S
                                              0
               cost
               app-protocol
                                              enabled
               state
               media-profiles
task done
```

### **Viewing Current Configuration Local Policy**

Display information about the local policy in the current configuration that will be used once the **activate-config** command is executed by using the **show configuration** command. For example:

```
ORACLE# show configuration local-policy
ORACLE# show running-config local-policy
local-policy
       from-address
                                       192.168.0.50
       to-address
                                      10.10.10.10
       source-realm
                                      N/A
       activate-time
       deactivate-time
                                     N/A
                                      enabled
       policy-priority
                                      urgent
       last-modified-date
                                      2006-06-12 08:48:57
       policy-attribute
```

	-	
	next-hop	172.168.0.10
	realm	
	action	none
	terminate-recursion	enabled
	carrier	
	start-time	0000
	end-time	2400
	days-of-week	U-S
	<del>-</del>	
	cost	0
	app-protocol	
	state	enabled
	media-profiles	
	media-bioittes	
task done		

Session and Protocol Statistics

You can use the following commands to access protocol tracing statistics:

- notify
- monitor sessions

## **Viewing Runtime Protocol Tracing**

Display information about runtime protocol tracing for UDP/ TCP sockets by using the **notify** command. This command provides information for all protocol messages for ServiceSocket sockets to be written in a log file or sent out of the system to a UDP port.

This mechanism allows for tracing to be enabled for any socket, provided that the class has a logit method for displaying and formatting the protocol message. All ACP classes and SIP supports this. Tracing can be enabled for all processes, specific sockets, all sockets, or specific processes. Tracing for specific sockets is specified by the local IPv4 or IPv6 address and port on which the socket is connected.

```
notify all|port>]
notify all|port>all|<socket-address><file-name> [<out-udp-
port>]
notify all|process-name> notrace all|<socket-address>
```

The <socket-address> is the IPv4 or IPv6 address and the port on which the socket is connected. The <out-udp-port> is the UDP IPv4 or IPv6 address and port to which the log messages are sent. If the <out-udp-port> is not specified, the logs are written to the <filename>.

## **Viewing Real-Time SIP Session Statistics**

If you have Superuser access, you can display real-time SIP session statistics by using the **monitor sessions** command. For example:

ORACLE# monitor	sessions					
09:10:26-172						
SIP Status		Per	riod	Li	fetime -	
	Active	High	Total	Total	PerMax	High
Sessions	0	0	0	0	0	0
Subscriptions	0	0	0	0	0	0
Dialogs	0	0	0	0	0	0
CallID Map	0	0	0	0	0	0
Rejections	_	-	0	0	0	
ReINVITEs	_	-	0	0	0	
Media Sessions	0	0	0	0	0	0
Media Pending	0	0	0	0	0	0
Client Trans	0	0	0	0	0	0
Server Trans	0	0	0	0	0	0
Resp Contexts	0	0	0	0	0	0
Saved Contexts	0	0	0	0	0	0
Sockets	0	0	0	0	0	0
Req Dropped	-	-	0	0	0	
DNS Trans	0	0	0	0	0	0

DNS Sockets	0	0	0	0	0	0	
DNS Results	0	0	0	0	0	0	

Real-time statistics for the following categories appear on the screen:

- Dialogs
- Sessions
- CallID Map
- Rejections
- ReINVITES
- Media Sessions
- Media Pending
- Client Trans
- Server Trans
- Resp Contexts
- Sockets
- Reqs Dropped
- DNS Trans
- DNS Sockets
- DNS Results

By default, the statistics refresh every second. Press any numerical digit (0-9) to change the refresh rate. For example, while viewing the statistics, you can press <6> to cause the system statistics to refresh every 6 seconds.

Pressing <q> or <Q> allows you to exit the statistics display and returns you to the ACLI system prompt.

## **Media and Bandwidth Statistics**

You can use the following commands to display media and bandwidth statistics:

- show mbcd errors
- show mbcd realms
- · monitor media

### **Viewing MBCD Task Errors**

Display Middle Box Control Daemon (MBCD) task error statistics by using the **show mbcd errors** command. There are two categories of MBCD error statistics: Client and Server.

#### For example:

ORACLE# show mbcd error	rs		
16:19:18-139			
MBC Errors		Lifeti	me
	Recent	Total	PerMax
Client Errors	0	0	0
Client IPC Errors	0	0	0
Open Streams Failed	0	0	0
Drop Streams Failed	0	0	0
Exp Flow Events	0	0	0
Exp Flow Not Found	0	0	0
Transaction Timeouts	0	0	0
Server Errors	0	0	0
Server IPC Errors	0	0	0
Flow Add Failed	0	0	0
Flow Delete Failed	0	0	0
Flow Update Failed	0	0	0
Flow Latch Failed	0	0	0
Pending Flow Expired	0	0	0
ARP Wait Errors	0	0	0

Exp CAM Not Found	0	2	2	
Drop Unknown Exp Flow	0	0	0	
Drop/Exp Flow Missing	0	0	0	
Exp Notify Failed	0	0	0	
Unacknowledged Notify	0	0	0	
Invalid Realm	0	5	5	
No Ports Available	0	0	0	
Insufficient Bandwidth	0	0	0	
Stale Ports Reclaimed	0	0	0	
Stale Flows Replaced	0	0	0	
Pipe Alloc Errors	0	0	0	
Pipe Write Errors	0	0	0	

Client statistics count errors and events encountered by applications that use the MBCD to set up and tear down media sessions:

- Client Errors—Number of errors in the client application related to MBC transactions that are otherwise uncategorized
- Open Streams Failed—Number of errors related to sending Add or Modify requests to MBCD
- Drop Streams Failed—Number of errors related to sending Subtract requests to MBCD
- Exp Flow Events—Number of flow timer expiration notifications received from the MBCD by all applications
- Exp Flow Not Found—Number of flow timer expiration notifications received from the MBCD by all applications for which no media session or flow information was present in the application
- Transaction Timeouts—Number of MBC transaction timeouts
- Server statistics count errors and events encountered by MBCD
- Server Errors—Number of uncategorized errors in the MBC server
- Flow Add Failed—Number of errors encountered when attempting to add an entry to the NAT table
- Flow Delete Failed—Number of errors encountered when attempting to remove an entry from the NAT table
- Flow Update Failed—Number of errors encountered when attempting to update an entry in the NAT table upon receipt of the first packet for a media flow
- Flow Latch Failed—Number of errors when attempting to locate an entry in the NAT table upon receipt of the first packet for a media flow
- Pending Flow Expired—Number of flow timer expirations for pending flows that have not been added to the NAT table
- ARP Wait Errors—Number of errors and timeouts related to obtaining the Layer 2 addressing information necessary for sending media
- Exp CAM Not Found—This statistic shows the number that the NAT table entry for an expired flow could not find in the NAT table. This usually occurs due to a race condition between the removal of the NAT entry and the flow timer expiration notification being sent to MBCD from the NP
- Drop Unknown Exp Flow—Number of flows deleted by the MBCD because of a negative response from the application to a flow timer expiration notification
- Drop/Exp Flow Missing—Number of negative responses from the application to a flow timer expiration notification for which the designated flow could not be found in MBCD's tables. Also includes when a flow for a Subtract request to MBCD cannot be found
- Exp Notify Failed—Number of errors encountered when the MBCD attempted to send a flow timer expiration notification to the application.
- Unacknowledged Notify—Number of flow expiration notification messages sent from MBCD to the application for which MBCD did not receive a response in a timely manner.
- No Ports Available—Number of steering port allocation requests not be satisfied due to a lack of free steering ports in the realm
- Invalid Realm—Number of flow setup failures due to an unknown realm in the request from the application
- Insufficient Bandwidth—Number of flow setup failures due to insufficient bandwidth in the ingress or egress realm

### Viewing Steering Port and Bandwidth Usage

Display steering ports and bandwidth usage for home, public, and private realms by using the **show mbcd realms** command.

#### For example:

acmepacket# 18:26:39-162		cd real	ms					
	St	eering	Ports		Bai	ndwidth	Usage -	
Realm	Used	Free	No Ports	Flows	Ingrss	Egress	Total	Insuf BW
acme	0	0	0	0	0K	0K	0K	0
h323172	2	29999	0	0	0K	0K	0K	0
sip172	2	29999	0	0	0K	0K	0K	0
sip192	0	30001	0	0	0K	0 K	0K	0

Information in the following categories is displayed:

- Used—Number of steering ports used
- Free—Number of free steering ports
- No Ports—Number of times that a steering port could not be allocated
- Flows—Number of established media flows
- Ingrss—Amount of bandwidth being used for inbound flows
- Egress—Amount of bandwidth being used for outbound flows
- Total—Maximum bandwidth set for this realm
- Insuf BW—Number of times that a session was rejected due to insufficient bandwidth

## **Viewing Real-Time Media Monitoring Statistics**

If you have Superuser access, you can display real-time media monitoring statistics by using the **monitor media** command. For example:

acmepacket# moni	tor media					
MBCD Status		Pei	riod	Li	fetime -	
	Active	High	Total		PerMax	High
Client Sessions	143	182	1930	1218332	4225	683
Client Trans	0	18	5744	2500196	8439	625
Contexts	144	182	1930	834745	2783	2001
Flows	296	372		1669498	5566	3689
Flow-Port	286	362	3860	1669488	5566	3679
Flow-NAT	294	365	3788	1658668	5563	2051
Flow-RTCP	0	0	0	0	0	0
Flow-Hairpin	0	0	0	0	0	0
Flow-Released	0	0	0	0	0	0
MSM-Release	0	0	0	0	0	0
Rel-Port	0	0	0	0	0	0
Rel-Hairpin	0	0	0	0	0	0
NAT Entries	295	365	3791	1658671	5563	2051
Free Ports	7430	7518	7828	3346410	11604	8002
Used Ports	572	724	7724	3338980	11132	8000
Port Sorts	_	_	0	14796	4156	
MBC Trans	1141	1234	5748	2503147	8440	2974
MBC Ignored	_	_	0	0	0	
ARP Trans	0	0	0	8	8	1

Real-time statistics for the following categories appear on the screen:

- Client Sessions
- Client Trans
- Contexts
- Flows
- Flow-Port

- Flow-NAT
- Flow-RTCP
- Flow-Hairpin
- Flow-Release
- MSM-Release
- NAT Entries
- Free Ports
- Used Ports
- Port Sorts
- MBC Trans
- MBC Ignored
- ARP Trans

By default, the statistics refresh every second. Press any numerical digit (0-9) to change the refresh rate. For example, while viewing the statistics, you can press <6> to cause the system statistics to refresh every 6 seconds.

Pressing <q> or <Q> allows you to exit the statistics display and returns you to the ACLI system prompt.

#### **Media Alarms**

The following table describes the Media alarms:

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
MBCD ALARM OUT OF MEMORY	262145	CRITICAL: for flow MAJOR: for media (if server cannot allocate a new context)	No further memory can be allocated for MBCD.	Flow: Cannot create free port list for realm. Media Server: Failed to allocate new context.	apSyslogMessageGener ated(ap-slog.mib) apSysMgmtMediaOuto fMemory
MBCD ALARM UNKNOWN REALM	262147	MAJOR: if media server is adding a new flow	Media server is unable to find realm interface.	Realm type (ingress, egress, hairpin) X, not found	apSyslogMessageGener ated(ap-slog.mib) apSysMgmtUnknownR ealm
MBCD ALARM OUT OF BANDWIDTH	262149	CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50%	The realm is out of bandwidth.	Out of bandwidth	apSyslogMessageGener ated(ap-slog.mib) apSysMgmtMediaBand widthTrap
MBCD ALARM OUT OF PORTS	262150	CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50%	The realm is out of steering ports.	Out of steering ports	apSyslogMessageGener ated(ap-slog.mib) apSysMgmtMediaPorts Trap

## **System Problem Statistics**

## **Packet Tracing**

When you enable packet tracing (using the **packet-capture** configuration and related ACLI commands), the Oracle Communications Session Border Controller can mirror any communication between two endpoints, or between itself and a specific endpoint. To accomplish this, the Oracle Communications Session Border Controller replicates the packets sent and received, and can then send them to a trace server that you designate. Using the trace server, you can display the packets on software protocol analyzer. Currently, the Oracle Communications Session Border Controller supports:

- One configurable trace server (on which you have installed your software protocol analyzer)
- Sixteen concurrent endpoint traces

For more information about how to set up packet tracing, refer to the Oracle Communications Session Border Controller ACLI Configuration Guide.

You can see statistics for packet traces initiated on the Oracle Communications Session Border Controller by using the **show packet-trace** command. The display shows you a summary of the active packet traces on the Oracle Communications Session Border Controller. Displayed information includes: the IP address, local and remote port (which displays as 0 if no ports have been designated), slot, port, and VLAN.

ORACLE# <b>show p</b> a		Remote-Port	Slot	Port	VLAN
192.168.10.1 192.168.10.99	0 5060	0 5060	0	1 1	0
10.0.0.1	23	0	1	0	0

## **Capturing and Viewing Packets**

You can capture and view packets for debugging purposes by using the **packet-capture** command. For example, if you detect an issue with the system flows, you can capture certain packets so that you can resolve the problem. Using this command, you can examine the packets in question and then perform any debugging that might be necessary.

When you use packet-capture, you work with the following subcommands:

- packet-capture enable
- packet-capture show
- packet-capture detail

Use the **packet-capture enable** command to enable packet-capture before using it. Because enabling this function uses system resources that should otherwise be kept free, you should enable it only when you need it and then disable it when you finish debugging.

Use the **packet-capture show** command to view a summary of the most recently captured packets, including the following:

- ingress interface
- frame format
- type/length
- VLAN identifier
- source IPv4 or IPv6 address
- destination IPv4 or IPv6 address
- protocol
- source port
- destination port

For example:

Use the **packet-capture detail** command to view the details of a particular packet, including: the ingress interface, MAC source address, MAC destination address, VLAN identifier, and the length/type. For example:

## **System ACLs**

This section provide information about system ACL removal, and about viewing system ACL statistics and configurations.

#### **Notes on Deleting System ACLs**

If you delete a system ACL from your configuration, the Oracle Communications Session Border Controller checks whether or not there are any active FTP or Telnet client was granted access when the entry was being removed. If such a client were active during ACL removal, the Oracle Communications Session Border Controller would warn you about the condition and ask you to confirm the deletion. If you confirm the deletion, then the Oracle Communications Session Border Controller's session with the active client is suspended.

The following example shows you how the warning message and confirmation appear. For this example, and ACLI has been deleted, and the user is activating the configuration that reflects the change.

## **Viewing System ACL Configurations**

The **system-access-list** configuration has been added to the list of configurations you can display using the show configuration and show running-config ACLI commands. It will display each system ACL entry.

```
ORACLE# show running-config system-access-list
system-access-list
       dest-address
                                       165.31.24.2
                                       225.225.0.0
       netmask
                                       2007-04-30 13:00:02
       last-modified-date
system-access-list
                                       175.12.4.2
       dest-address
                                       225.225.225.0
       netmask
        last-modified-date
                                       2007-04-30 13:00:21
task done
```

#### **Viewing System ACL Statistics**

You can display statistics for system ACLs using the **show ip stats** ACLI command. Two new entries have been added to let you see the total number of ACL denials and the last ACL denial the Oracle Communications Session Border Controller made.

ORACLE# <b>show ip stats</b>	
total	3170
badsum	0
tooshort	0
toosmall	0
badhlen	0
badlen	0
infragments	0
fragdropped	0

              nogif
                                   0
                                   0
            badaddr
        acl-denials
                                1233
  last-srcip-denied 174.35.60.72
ORACLE#
```

## **Wancom Port Speed and Duplex Mode Display**

You can display the negotiated duplex mode and speed for all system control ports by using the ACLI **show wancom** command. This command allows you to diagnose network issues more efficiently.

When you use this command, the systems shows information for all three control ports with the numbers starting at 0. It will then tell you the negotiated duplex mode and speed, or that the link is down.

To display negotiated duplex mode and speed for control interfaces:

At the user prompt, type the ACLI **show wancom** command and press Enter.

```
ORACLE> show wancom
wancom [unit number 0]:
Duplex Mode: half
Speed: 100 Mbps
wancom [unit number 1]:
Link down
wancom [unit number 2]:
Link down
```

# Application Faults

This section contains information about application fault statistics. This category of alarm accounts for problems related to applications (protocols).

- H.323
- SIP
- RADIUS and Diameter

Application alarms do not display an alarm message in the graphic display window on the front panel of the chassis.

### **H.323 Statistics**

You can use the following command to display H.323 statistics:

• show h323d

There is also an alarm that occurs when stack initialization fails.

## **Viewing H.323 Statistics**

Display H.323 statistics by using the **show h323d** command.

For example:

```
acmepacket# show h323d
18:32:26-86
Session Stats -- Period -- ----- Lifetime -----
Active High Total Total PerMax High
```

Incoming Calls		5	5	1	18	6	5
Outgoing Calls		1	1	1	18	6	2
Connected Calls		1	1	1	8	2	1
Incoming Channels	S	2	2	2	17	4	2
Outgoing Channel:	S	2	2	2	17	4	2
Contexts		5	5	1	18	6	5
H323D Status	Current	Lifetime					
Queued Messages	1	1608					
TPKT Channels	5	404					
UDP Channels	0	0					
Stack	State	Type Mo	de	Register	red Gatekee	eper	
h323172	enable	ed H323 Ga	teway	No			

In the first display section, the following statistics are displayed for period and lifetime durations in addition to an active count.

- Incoming Calls—Number of incoming H.323 calls.
- Outgoing Calls—Number of outgoing H.323 calls.
- Connected Calls—Number of currently connected H.323 calls.
- Incoming Channels—Number of established incoming channels.
- Outgoing Channels—Number of established outgoing channels.
- Contexts—Number of established H.323 contexts.

In the second section, the following statistics are displayed for current and lifetime durations.

- Queued Messages—Number of messages queued.
- TPKT Channels—Number of TPKT channels open(ed).
- UDP Channels—Number of UDP channels open(ed).

#### **H.323 Stack Initialization Failure Alarm**

The following table provides information about the H.323 ALARM STACK INITIALIZATION FAILURE application alarm, which is triggered by the failure of an H.323 stack to initialize properly.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
H.323 ALARM STACK INITIALIZATION FAILURE	327682	CRITICAL	The H.323 stack has failed to initialize properly and is terminated.	[H.323   IWF] stack <stack- name&gt; has failed to initialize and is terminated</stack- 	apSyslogMessageGener ated trap generated critical dry contact syslog

#### **H.323 Monitoring Stack Alarm**

- Viewing the number of active calls—You can see the number of active calls using the **show h323 stack call** command at either the User or Superuser prompt. You can also access this information with an SNMP query.
- Viewing alarm information—Two ACLI commands allow you to view alarm information, but they provide different information:
  - **display-alarms**—This command shows alarm the most recently generated by an H.323 stack and the total number of stack monitoring alarms the Oracle Communications Session Border Controller has generated. Since alarms can fire simultaneously, the alarm you can see using this command will only be the most recent one.

```
Count Description

2 current calls are over critical threshold of 50 percent. Total no of h323 stack alarm generated are 2
```

• **show h323 stack stack-alarms**—This command refers to specific stacks by stack name, and provides shows the alarm severity and the current percentage of max-calls that triggered the alarm. The Oracle Communications Session Border Controller keeps track of how many alarms are raised by each stacks, and the severity of each of those alarms. When the alarm clears, the information relating to it is erased from the display.

ORACLE# show	h323 stack stack	-alarms	
Stack-Name	Alarm-Severity	%Max-Call	
external	minor	50	
internal	critical	50	

## **SIP Statistics**

You can use the following commands to view SIP statistics:

- show sipd errors
- show processes sipd
- show registration

### **Viewing SIP Errors**

Display SIP error statistics by using the **show sipd errors** command. For example:

ORACLE# show sipd err	ors		
11:34:13-194			
SIP Errors/Events		- Lifeti	me
	Recent	Total	PerMax
SDP Offer Errors	0	0	0
SDP Answer Errors	0	0	0
Drop Media Errors	0	0	0
Transaction Errors	0	0	0
Application Errors	0	0	0
Media Exp Events	0	0	0
Early Media Exps	0	0	0
Exp Media Drops	0	0	0
Expired Sessions	0	0	0
Multiple OK Drops	0	0	0
Multiple OK Terms	0	0	0
Media Failure Drops	0	0	0
Non-ACK 2xx Drops	0	0	0
Invalid Requests	0	0	0
Invalid Responses	0	0	0
Invalid Messages	0	0	0
CAC Session Drop	0	0	0
CAC BW Drop	0	0	0

### **Viewing SIP Processes**

Display statistics about SIP processes by using the **show processes sipd** command. For example:

ORACLE# <b>show p</b> 11:34:49-130 (		-	)			
Process Status	_			Li	fetime	
	Active	High	Total	Total	PerMax	High
Services	5	5	0	5	5	5
Messages	0	0	0	6	4	3
Transactions	0	0	0	0	0	0
Timed Objects	7	7	0	14	11	9
Total Buffers	5	5	0	5	5	5
Alloc Buffers	3	3	0	7	4	5
Memory Chunks	48	48	0	82	79	50

TOO Entries	2	2	14	58301	19	4	
~	2	2			-	4	
Operations			14	52997	12		
Messages Received			0	3	2		
Messages Sent			4	17681	30		
Partial Message			0	0	0		
Partial Msg Expired			0	0	0		
Partial Msg Dropped			0	0	0		
Timed Events			14	58291	12		
Alarms			0	0	0		
System Logs			4	17681	32		
Process Logs			4	17684	35		
Load Rate			0.0		0.0		
CPU Usage		0.0		8.133/52	9935		

## Viewing IP Session Replication for Recording (SRR) Information

The **show call-recording-server** command displays information regarding the IP call recording feature configured on the Oracle Communications Session Border Controller. Entering this command without the optional call recording server (CRS) ID displays all CRS endpoints configured on the Oracle Communications Session Border Controller along with their state.

You can specify a CRS whose information you want to view. When you specify an ID, the ACLI displays all session agents created for the CRS endpoint, its IP address, its state, and the last time a failover occurred. For example:

# **Viewing SIP Registration Cache Status**

Display SIP registration cache status by using the show registration command. The display shows statistics for the Period and Lifetime monitoring spans.

- Cached Entries—Number of registration entries for the address of record
- Local Entries—Number of entries for Contact messages sent to a real registrar.
- Forwards—Number of registration requests forwarded to the real registrar
- Refreshes—Number of registrations the Oracle Communications Session Border Controller answered without having to forward registrations to the real registrar
- Rejects—Number of unsuccessful registrations sent to real registrar
- Timeouts—Number of times a refresh from the HNT endpoint was not received before the timeout

### For example:

ORACLE# show regi	stration					
11:38:57-177						
SIP Registrations	5	Per	riod	Lii	fetime	
	Active	High	Total	Total	PerMax	High
User Entries	0	0	0	0	0	0
Local Contacts	0	0	0	0	0	0
Via Entries	0	0	0	0	0	0
AURI Entries	0	0	0	0	0	0
Free Map Ports	0	0	0	0	0	0
Used Map Ports	0	0	0	0	0	0
Forwards	_	-	0	0	0	
Refreshes	_	-	0	0	0	
Rejects	_	-	0	0	0	
Timeouts	_	-	0	0	0	
Fwd Postponed	_	-	0	0	0	
Fwd Rejected	_	-	0	0	0	
Refr Extension	0	0	0	0	0	0
Refresh Extended	_	-	0	0	0	
Surrogate Regs	0	0	0	0	0	0
Surrogate Sent	-	-	0	0	0	
Surrogate Reject	_	-	0	0	0	
Surrogate Timeout	<b>-</b>	-	0	0	0	

HNT Entries	0	0	0	0	0	0
Non-HNT Entries	0	0	0	0	0	0

#### SIP NSEP Statistics

To view statistics related to the NSEP feature, the ACLI **show** command has been expanded. It now allows you to see all of the statistics for NSEP support, to see them for a specific r-value (namespace and r-priority combination), or to see all of these. You can also reset the NSEP statistics counters.

When you use the ACLI **show nsep-stats** command without further arguments, the system shows you information for inbound sessions.

To display general NSEP statistics for inbound sessions:

Type show nsep-stats and press Enter.

ORACLE# \$	show nsep-stats			
			Lifetime	
		Current	Total	PerMax
Inbound S	Sessions	0	0	0

# **NSEP Statistics per R-Value Display**

You can see statistics for specific r-value by entering it with the **show nsep-stats** command. An r-value is a namespace and priority combination entered in the following format: namespace.priority. The display will also show the specified r-value for which it is displaying data.

To display general NSEP statistics for specific r-values:

• Type **show nsep-stats**, a Space, and then the r-value for which you want to display statistics. Then press Enter.

ORACLE# show nsep-stats RValue = ets.2	s ets.2					
		Pei	riod	Li	fetime	
	Active	High	Total	Total	PerMax	High
Incoming Sessions	0	0	0	0	0	0
Outgoing Sessions	0	0	0	0	0	0
InbSessions Rej	_	_	0	0	0	_
OutbSessions Rej	_	_	0	0	0	_

You can see the full set of statistics for NSEP inbound sessions and for all r-values by using the **show nsep-stats all** command. The display for r-values is divided into individual sections for each r-value shown.

To display general NSEP statistics for specific r-values:

• Type **show nsep-stats all** and press Enter.

ORACLE# show nsep-stats	s all					
Session Stats						
		Lifetime				
	Current	Tota	l PerMax			
Inbound Sessions	0		0 0			
Per RValue Stats						
		Per	iod	Li	fetime	
	Active	High	Total	Total	PerMax	High
RValue = ets.2						
Incoming Sessions	0	0	0	0	0	0
Outgoing Sessions	0	0	0	0	0	0
InbSessions Rej	_	_	0	0	0	_
OutbSessions Rej	_	_	0	0	0	_
RValue = ets.5						
Incoming Sessions	0	0	0	0	0	0
Outgoing Sessions	0	0	0	0	0	0
InbSessions Rej	-	_	0	0	0	_
OutbSessions Rej	-	_	0	0	0	_
OutbSessions Rej RValue = ets.5 Incoming Sessions Outgoing Sessions InbSessions Rej	0 0 - -	ŭ	0 0 0 0 0	0 0 0 0 0	0 0 0 0	0 0 -

### Viewing NSEP Burst Statistics for SIP Session Agents

The ACLI **show sipd** command supports an **sa-nsep-burst** argument that displays the NSEP burst rate for all SIP session agents.

ORACLE# show sipd	sa-nsep-burst	
Agent	Current Rate	Lifetime High
192.168.1.139	0	0
192.168.1.6	0	0
192.168.200.135	4	10

# **Resetting NSEP Statistics**

You can reset the statistics for incoming sessions, for an individual r-value, or for the entire set of NSEP data. You use the same command syntax as you do when showing the statistics, except that you start your entry with the **reset** command.

In the example below, the command resets the statistics counters for the specific r-value ets.2.

To reset the counters for a specific r-value:

• For the set of statistics you want to reset, type reset nsep-stats and then the group that you want to reset. The press Enter.

```
ORACLE# reset nsep-stats ets.2
```

To reset the counters for all NSEP statistics:

• For the set of statistics you want to reset, type reset nsep-stats and then press Enter.

```
ORACLE# reset nsep-stats
```

# **Viewing SIP Method Throttling Mechanism Statistics**

You can monitor the SIP method throttling mechanism statistics for either a specific SIP interface or a session agent.

To display SIP method throttling mechanism statistics for a SIP interface:

• Type **show sipd interface**, a Space, and then the SIP interface's name and the SIP method name for which you want statistics. Then press Enter.

ORACLE# show sipd into NOTIFY (15:53:42-57)	erface net1	NOTIFY				
		Server -			- Client -	
Message/Event	Recent	Total	PerMax	Recent	Total	PerMax
NOTIFY Requests	0	49	19	0	0	0
Retransmissions	0	0	0	0	0	0
100 Trying	0	49	19	0	0	0
180 Ringing	0	38	19	0	0	0
200 OK	0	38	19	0	0	0
503 Service Unavail	0	11	11	0	0	0
Response Retrans	0	9	5	0	0	0
Transaction Timeouts	-	_	_	0	0	0
Locally Throttled	_	_	_	0	0	0
Avg Latency=0.000 for Max Latency=0.000	0					
BurstRate Incoming=11	Outgoing=0	)				

To display SIP method throttling mechanism statistics for a session agent:

• Type show sipd agents, a Space, and then the session agent IP address and the SIP method name for which you want statistics. Then press Enter.

```
ORACLE# show sipd agents 198.167.1.60 NOTIFY

NOTIFY (15:53:34-49)

------- Server ------- Client -------

Message/Event Recent Total PerMax Recent Total PerMax
```

NOTIFY Requests	0	50	31	0	0	0
Retransmissions	0	3	3	0	0	0
200 OK	0	25	18	0	0	0
503 Service Unavail	0	25	24	0	0	0
Transaction Timeouts	_	_	_	0	0	0
Locally Throttled	_	_	_	0	24	24
Avg Latency=0.000 for	0					
Max Latency=0.000						
BurstRate Incoming=5	Outgoing	=0				

# Viewing SIP IP CAC Statistics

You can display CAC parameters for an IP address using the **show sipd ip-cac** command. For example:

```
ORACLE# show sipd ip-cac 192.168.200.191
CAC Parameters for IP <192.168.200.191>
Allowed Sessions=2
Active-sessions=0
Allowed Bandwidth=3000000
used-bandwidth=0
```

# **Viewing SIP PUBLISH Statistics**

You can display statistics related to incoming SIP PUBLISH messages using the show sipd publish command. For example:

summer# show sipd pub PUBLISH (10:26:43-199						
		- Server -			Client -	
Message/Event	Recent	Total	PerMax	Recent	Total	PerMax
PUBLISH Requests	1	1	1	0	0	0
Retransmissions	0	0	0	0	0	0
405 Not Allowed	1	1	1	0	0	0
Transaction Timeouts	_	_	_	0	0	0
Locally Throttled	_	_	_	0	0	0

# **RADIUS Statistics**

The ACLI **show radius** command, used with the three arguments described in this section, displays the status of any established RADIUS accounting connections and authentications. A working RADIUS connection displays READY, and a disabled connection displays DISABLED.

There is also an alarm that occurs when the RADIUS connection is down.

### Viewing RADIUS Statistics

The **show radius** command can take one of the three available arguments:

- authentication—Shows authentication statistics for primary and secondary RADIUS servers, including: server IP address and port; round trip time; information about failed and successful requests/ authentications; number of rejections; number of challenges; number of time-outs, number of retransmissions
- accounting—Shows the information described in the following table:

Section	Description
Client Display	General accounting setup (as established in the accounting configuration element), including:
	Information about the state of the RADIUS client

Section	Description
	Accounting strategy used (Hunt, Failover, RoundRobin, FastestRTT, or FewestPending)
	IP address and port on which the server is listening
	Maximum message delay in seconds
	Number of configured accounting servers
Waiting Queue	Amount of accounting (RADIUS) messages waiting to be sent. Waiting queue capacity is 4,096 messages.
<ip address:port=""></ip>	Information about each configured accounting server (established in the accounting servers configuration). The heading above each accounting server section is the IPv4 address and port combination of the accounting server described. This section also includes information about the accounting server's state (e.g., Connect_Attempt, INIT).

• all—Shows all of the information for both the authentication and accounting displays

The following is an example of the show radius authentication command output.

```
ORACLE# show radius authentication
Active Primary Authentication Servers:
  server ipAddr: 172.30.0.7
Active Secondary Authentication Servers:
  server ipAddr: 172.30.0.8

#### **RADIUS Connection Down Alarm**

The following table lists the alarm generated when the RADIUS accounting connection is down.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
RADIUS ACCOUNTING CONNECTION DOWN	327681	all enabled and configured Remote Authenticatio	The enabled connections to RADIUS servers have timed-out without a response from the RADIUS server.	CRITICAL: All enabled accounting connections have been lost! Check accounting status for more details.  MAJOR: One or more enabled accounting connections have been lost! Check accounting status for more details.	apSyslogMessageGener ated trap generated apSysMgmtRadiusDow nTrap trap generated syslog

# **Security Breach Statistics**

You can view statistics about denied ACL entries by using the following commands:

- acl-show
- show acl

# **Viewing List of Denied ACL Entries**

Display a list of denied ACL entries by using the **acl-show** command. If a IP address and realm ID is denied of service, its is added to the deny list. This command shows list of deny ACL entries. Information for each entry includes:

- Incoming port, slot, and VLAN tag
- Source IP, bit mask, port, and port mask
- Destination IP address and port
- Protocol
- ACL entry as static or dynamic
- ACL entry index

For example:

```
ORACLE# acl-show
deny entries:
intf:vlan source-ip/mask:port/mask dest-ip/mask:port/mask prot type index
Total number of deny entries = 0
Denied Entries not allocated due to ACL constraints: 0
task done
```

### **Viewing ACL List Entries**

Display entries in the deny, untrusted, and trusted lists using the **show acl** command.

- show acl denied
- show acl untrusted
- · show acl trusted
- show acl summary
- show acl all
- show acl ip

For example:

show acl denied displays summary data for denied endpoints.

```
ORACLE# show acl denied
Deny entries:
intf:vlan Source-IP/mask
                          port/mask dest-IP/mask port/mask prot type index
Total number of deny entries = 0
Denied Entries not allocated due to ACL constraints:
ORACLE# show acl trusted
-----
Apr 30 17:33:05.716
Static trusted entries:
intf:vlan src-ip/mask:port dest-ip/mask:port prot type index recv drop
0/3:3000 0.0.0.0 192.168.0.123 ICMP static 2 0 0/2:2000 0.0.0.0 172.16.0.123:5060 UDP static 4 0
                                                                       0
Total number of static trusted entries = 2
dynamic trusted entries:
intf:vlan source-ip/mask:port dest-ip/mask:port prot type index
0/3:3000 192.168.0.10:5060 192.168.0.123:5060 UDP dynamic
Total number of dynamic trusted entries = 1
```

**show acl summary** provides a summary of all available packet/drop counts for each entry type, to include drop/receive counters per interface.

```
ORACLE# show acl summary
Apr 30 17:26:42.737
                                Entries
                                                Packets
                                                                  Dropped
Total deny entries:
                                     9
Total media entries:
                                      0
                                                     n/a
                                                                      n/a
Total untrusted entries:
                                      1
                                                        0
                                                                        0
                                      2
Total static trusted entries:
                                                        0
                                                                        0
Total dynamic trusted entries:
                                                        0
                                                                        0
   by interface:
        0/2:
                                    n/a
                                                        0
                                                                        0
         0/3:
                                    n/a
                                                        0
                                                                        0
Total all trusted entries
```

**show acl all** displays summary data for denied endpoints, static trusted endpoints, and dynamic trusted endpoints.

```
ORACLE# show ad all
Deny entries:
intf:vlan src-IP/mask port/mask dest-IP/mask port/mask prot type index
Total number of deny entries = 0
Static trusted entries:
intf:vlan src-IP/mask:port dest-IP/mask:port prot type index recv drop
0/0:0 0.0.0.0 192,1680,80 ICMP static 65536 0 0 1/0:0 0.0.0.0 172.16.0.80 ICMP static 65537 0 0
Total number of static trusted entries = 2
dynamic trusted entries:

Total number of untrusted entries = 2
                                   0 (0 dropped)
Total deny entries:
Total media entries:
Total static trusted entries:
                                    2 (0 dropped)
Total dynamic trusted entries: 2 (0 dropped)
Total untrusted entries: 2 (0 dropped)
Total INTEC table entries:
Total INTFC table entries:
                                    0
Media Entries not allocated due to ACL constraints:
Trusted Entries not allocated due to ACL constraints:
untrusted Entries not allocated due to ACL constraints:
                                                                  0
Denied Entries not allocated due to ACL constraints:
                                                                  0
```

### Viewing ACL List Entries by IP Address

You can filter the output of **show acl all** based on IP address. For example:

```
ORACLE# show acl ip 192.168.69.65

deny entries:
intf:vlan src-ip/mask:port/mask dest-ip/mask:port/mask prot type index

Total number of deny entries = 0

trusted entries:
intf:vlan src-ip/mask:port/mask dest-ip/mask:port/mask prot type index recv
drop

Total number of trusted entries = 0

untrusted entries:
intf:vlan src-ip/mask:port/mask dest-ip/mask:port/mask prot type index
Total number of untrusted entries = 0
```

### Viewing ACL Entry Space in the CAM

Display how much space is used in the CAM for ACL entries, in a percentage and raw value breakdown of the use, by using the show acl info command. For example:

```
ORACLE# show acl info
Access Control List Statistics:

| # of entries | % utilization | Reserved Entry Count
```

-					
Denied		0	0.0%	32000	
Trusted		0	0.0%	8000	
Media		1	0.0%	64000	
Untrusted	ĺ	0	0.0%	2000	
Dynamic Trusted	ĺ	0	0.0%	250000	
INTFC	İ	1	-	_	
_					
Total CAM space u	sed =	2 of 1	26976 (100.00% free)		
Total HASH-table	space	used =	0 of 250050 (100.00% free)		
_					
Media Entries not	alloc	cated d	ue to ACL constraints:	0	
Trusted Entries n	ot all	ocated	due to ACL constraints:	0	
Untrusted Entries	not a	allocat	ed due to ACL constraints:	0	
Denied Entries no	t allo	cated	due to ACL constraints:	0	

# **Session Agent and Session Agent Group Faults**

This section explains how to view fault information about SIP and H.323 session agents and session agent groups.

# **SIP Agent Statistics**

You can use the following commands to view SIP agent statistics:

- show sipd agents
- show sipd agents <agent ID>

# **Viewing SIP Session Agent Statistics**

Display SIP session agent information by using the **show sipd agents** command. With this command, the Oracle Communications Session Border Controller ascertains whether a session agent is in service. When the session agent stops responding to SIP requests, it transitions to the out-of-service state. You can configure the Oracle Communications Session Border Controller to periodically ping the session agent if it has gone out-of-service, or if no requests have been sent to it.

The **show sipd agents** command shows information about the number of active sessions, the average rate of session invitations, and the number of times that the constraints established in the session-agent element have been exceeded for sessions inbound to and outbound from each session agent, as well as the average and maximum latency and the maximum burst rate related to each session agent.

#### For example:

### Inbound statistics:

- Active: number of active sessions sent to each session agent listed
- Rate: average rate of session invitations (per second) sent to each session agent listed
- ConEx: number of times the constraints have been exceeded

#### Outbound statistics:

- Active: number of active sessions sent from each session agent
- Rate: average rate of session invitations (per second) sent from each session agent listed
- ConEx: number of times the constraints have been exceeded

#### Latency statistics:

- Avg: average latency for packets traveling to and from each session agent listed
- · Max: maximum latency for packets traveling to and from each session agent listed
- Max Burst: total number of session invitations sent to or received from the session agent within the amount of time configured for the burst rate window of the session agent

The second column, which is not labeled, of the **show sipd agents** output shows the service state of each session agent identified in the first column. In the service state column, an **I** indicates that the particular session agent is in service and an **O** indicates that the particular session agent is out of service. An **S** indicates that the session agent is transitioning from the out-of-service state to the in-service state; it remains in this transitional state for a period of time that is equal to its configured in-service period, or 100 milliseconds (whichever is greater). A **D** indicates that the session agent is disabled.

# **Resetting Session Agent Statistics**

Reset a specific session agent's statistics by using the reset session-agent <hostname> command.

### For example:

```
ORACLE# reset session-agent agent2
Accepted
Reset SA failover timer
```

### **Viewing SIP Session Agent Activity**

Display a specific session agent's activity by using the show sipd <agent ID> command.

### For example:

acmepacket# show since 19:32:17-47	ipd agent	69.69.	69.22			
Session Agent 172.3	16.0.10(s	ip172)	[In Serv	rice]		
		Pe	riod	Li	.fetime -	
	Active	High	Total	Total	PerMax	High
Inbound Sessions	0	0	0	234666	92	168
Rate Exceeded	_	_	0	0	0	_
Num Exceeded	_	_	0	0	0	_
Reg Rate Exceeded	d -	_	0	0	0	_
Outbound Sessions	0	0	0	239762	126	200
Rate Exceeded	_	_	0	0	0	_
Num Exceeded	_	_	0	0	0	_
Reg Rate Exceeded	<b>–</b> b	_	0	0	0	_
Out of Service	-	-	0	0	0	_

Seizure	_	_	0	239762	126	_
Answer	-	-	0	234661	93	_
ASR Exceeded	_	-	0	0	0	_
Messages Received	-	-	0	1431343	1415	_
Latency=0.000; max=	=0.000					

# Inbound sessions:

- Rate Exceeded: number of times session or burst rate was exceeded for inbound sessions
- Num Exceeded: number of times time constraints were exceeded for inbound sessions

# Outbound sessions:

- Rate Exceeded: number of times session or burst rate was exceeded for outbound sessions
- Num Exceeded: number of times time constraints were exceeded for inbound sessions
- Burst: number of times burst rate was exceeded for this session agent
- Out of Service: number of times this session agent went out of service

### **Fault Management**

- Trans Timeout: number of transactions timed out for this session agent
- Requests Sent: number of requests sent via this session agent
- Requests Complete: number of requests that have been completed for this session agent
- Messages Received: number of messages received by this session agent

# **SIP Session Agent Group Statistics**

You can use the following commands to display SIP agent group statistics:

- show sipd groups
- show sipd groups -v
- show sipd groups <group name>

# **Viewing Session Agent Group Statistics**

Display session information for the session agent groups on the system by using the **show sipd groups** command. This information is compiled by totaling the session agent statistics for all of the session agents that make up a particular session agent group.

The Active column of the session agent group statistics output displays the first character of the session agent group state. The session agent group statistics can be in one of the following states.

- D—Disabled
- O—Out Of Service
- S—Standby
- I—In Service
- C—Constraints Exceeded
- N—No Response Timeout
- O—OOS Provisioned Response
- R—Reduction In Call Load

While the **show sipd groups** command accesses the subcommands that are described in this section, the main **show sipd groups** command (when executed with no arguments) displays a list of all session agent groups for the system.

For example:

```
ORACLE# show sipd groups

11:00:21-16

---- Inbound ---- Outbound ---- - Latency -

SAG Active Rate ConEx Active Rate ConEx Avg Max
recursion 0 0.0 0 1 0.1 0 0.005 0.005 2
```

If you carry out this command, but you do not specify the name of an existing session agent group, the system will inform you that the group statistics are not available.

#### Viewing List of SIP Session Agents in a Group

List the session agents that make up the session agent group, along with statistics for each by using the **show sipd groups -v** command. The -v (verbose) option must be included with this command to provide this level of detail.

For example:

Totals:								
	0	0 0	^	-1	0 0	0 0 005	0 005	0
recursion	U	0.0	0	Τ	0.8	0 0.005	0.005	2

# Viewing Statistics for a SIP Session Agent

Display statistics for a specific session agent group by using the **show sipd groups <group name>** command.

#### For example:

```
ORACLE# show sipd groups recursion

11:00:28-23

---- Inbound ---- Outbound ---- -- Latency --

SAG Active Rate ConEx Active Rate ConEx Avg Max
recursion 0 0.0 0 0.0 0.005 0.005 2
```

# **Session Agent and Session Router Constraint Statistics**

Oracle Communications Session Border Controller's support for session constraints is applicable not only to the system when configured for dialog-stateful or for session-stateful mode, but also when it operates in proxy (transaction or stateless) mode.

#### **Notes on Statistics**

When it runs in transaction mode, the Oracle Communications Session Border Controller counts INVITE transactions for calculating session agent statistics that are used to apply session agent constraints. The following describes how the Oracle Communications Session Border Controller performs its count:

- For calculating the max-burst-rate and the max-inbound-burst-rate, the Oracle Communications Session Border Controller counts the server transaction created when it receives an INVITE request.
- For calculating the max-outbound-burst-rate, the Oracle Communications Session Border Controller counts the client transaction when it sends an INVITE request to a session agent.
- The Oracle Communications Session Border Controller counts each INVITE transaction, except for indialog re-INVITE transactions. It detects in-dialog re-INVITE requests by checking the To tag.
- The Oracle Communications Session Border Controller does not count retransmitted INVITE requests, which it can detect.

## **Example 1 Statistics from Transaction Mode**

This section shows sample output from the ACLI **show sipd agents** command. The sections that do not apply to transaction mode appear in italics.

ORACLE# show sipd	agents acm	e5				
11:08:18-46

### Viewing H.323 Session Agent Group Statistics

Display statistics about the session agent group by using the **show h323d grouptstats** command. For example:

# FQDN-resolved Session Agent Statistics

A SIP session agent can be configured with an FQDN in the hostname parameter. When the response to the DNS query for that hostname yields one or more IP addresses, the Oracle Communications Session Border Controller maintains these IP targets as all able to perform the role of the session agent object. The Oracle Communications Session Border Controller can report aggregate statistics of all IP targets that correspond to the session agent object and individual statistics per IP address (including per-method statistics) of each member of the last that the FQDN query returns. These statistics are available at the command line, via SNMP GETs, and via HDR. In addition, the Oracle Communications Session Border Controller can send traps if an individual IP target goes in or out of service.

Use the following syntax to retrieve statistics for each IP target that is returned in an FQDN query for a session agent:

```
show sipd agents <session-agent-name>#<destination-ip-address>
```

You may find the list of IP address returned for an FQDN at the bottom of the **show sipd agents <agent name>** query. In the screen capture below, a session agent is configured with sa1.dg.com FQDN in the **hostname** parameter. A DNS query returns IP addresses 192.168.26.2 and 192.168.26.3. By executing the **show sipd agent sa1.dg.com** to verify the IP routes that are used for this session agent. Their service states will also be listed. The statistics presented are the aggregate of all traffic/activity for the Oracle Communications Session Border Controller's transactions with 192.168.26.3 and 192.168.26.2.

To retrieve an individual destinations statistics, use the **show sipd agents** command again and query on the session agent name, delimited with the pound character followed by the IP destination of note. The "Rate Exceeded", "Num Exceeded", "Reg Rate Exceeded" and "ASR Exceeded" counters are not be tracked and displayed for individual routes.

Out of Service	-	-	0	0	0	-	
Trans Timeout	0	0	0	0	0	0	
Requests Sent	_	_	1	10	1	-	
Requests Complete	-	_	1	10	1	-	
Seizure	-	-	0	0	0	-	
Answer	-	-	0	0	0	-	
Messages Received	-	_	1	10	1	-	
Latency=0.004; max=0.0	004						

To retrieve an individual destination's statistics per SIP method, use the previously explained command followed by a space and the method you wish to query.

# **FQDN-resolved Session Agent Statistics Configuration**

To configure FQDN-resolved Session Agent Statistics, you must add configuration to both the **sip-config** and **session-agent** configuration elements.

In the sip-config configuration element, set the sa-routes-stats parameter to enabled

```
ORACLE(configure) # exit
ORACLE# configure terminal
ORACLE(configure) # session-router
ORACLE(session-router) # sip-config
ORACLE(sip-config) # select
ORACLE(sip-config) # sa-routes-stats enabled
ORACLE(sip-config) # done
```

In the **session-agent** configuration element, set the **ping-interval** parameter to a value greater than 0, the **ping-method** to OPTIONS, and set the **ping-all-addresses** parameter to enabled.

```
ORACLE (configure terminal
ORACLE (configure) # session-router
ORACLE (session-router) # session-agent
ORACLE (session-agent) # sel
<hostname>:
1: hostname=sal.dg.com

selection: 1
ORACLE (session-agent) # ping-interval 120
ORACLE (session-agent) # ping-all-addresses enabled
ORACLE (session-agent) # ping-method=OPTIONS
ORACLE (session-agent) # done
```

# **FQDN-resolved Session Agent Statistics SNMP Retrieval**

When FQDN-resolved Session Agent Statistics are enabled, you can retrieve each IP target's session agent statistics via SNMP.

The apSipAgentTable returns a list of configured sessions agent with an index corresponding and configuration name. The mapping of index to configuration name is persistent across system reboot.

The index of the additional entries that correspond to the individual IP targets are identified by starting at 10000000. Because the IP targets that are retrieved from the DNS server may change on any DNS query, they are not persistent across a reboot. An snmpwalk query on asSIPAgentTable appears as:

```
SNMPv2-SMI::enterprises.9148.3.15.1.2.3.1.2.36 = STRING: "sal.dg.com"

SNMPv2-SMI::enterprises.9148.3.15.1.2.3.1.210000000 = STRING:

"sal.dg.com#192.168.26.2"

SNMPv2-SMI::enterprises.9148.3.15.1.2.3.1.210000001 = STRING:

"sal.dg.com#192.168.26.3"
```

The following snmpwalk query on asSipSessionAgentStatsTable appears as:

```
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.1.36 = INTEGER: 36
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.1.10000000 = INTEGER: 1000000
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.1.10000001 = INTEGER: 1000001
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.2.36 = STRING: "sal.dg.com"
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.2.10000000 = STRING:
"sal.dg.com#192.168.26.2"
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.2.10000001 = STRING:
"sal.dg.com#192.168.26.3"
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.3.36 = INTEGER: 1
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.3.10000000 = INTEGER: 1

SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.4.36 = Gauge32: 0
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.4.10000000 = Gauge32: 0
SNMPv2-SMI::enterprises.9148.3.2.1.2.2.1.4.100000001 = Gauge32: 0
```

# **FQDN-resolved Session Agent Statistics SNMP Traps**

The apSysMgmtSAStatusChangeTrap trap is generated when a session agent's individual IP target changes state.

# **FQDN-resolved Session Agent Statistics HDR Retrieval**

When FQDN-resolved Session Agent Statistics are enabled, each IP target's session agent statistics are written to HDR output.

For the sa1.dg.com example that retrieved 2 IP targets, the following 3 lines of HDR output are typical:

Note that the first entry is the aggregate of all individual targets.

# **Realm Faults**

This section explains how to access realm fault statistics.

# **Signaling**

Use the following command to display SIP realm statistics:

• show sipd realms

### Viewing SIP Realm Statistics

Display SIP realm statistics by using the **show sipd realms** command. For example:

```
ORACLE# show sipd realms
19:38:17-18
```

	I1	nbound	d	Out	bound	d	-Late	ncy-	Ma	ax -	
Realm	Active	Rate	ConEx	Active	Rate	ConEx	Avg	Max	Burst	In	Out
external	0	0.0	0	0	0.0	0	0.0	0.0	0	0	0
external-child	0	0.0	0	0	0.0	0	0.0	0.0	0	0	0
internal	0	0.0	0	0	0.0	0	0.0	0.0	0	0	0

### **Media Statistics**

You can use the following commands to display information about mbcd realms:

- show mbcd realms
- show mbcd realms <realm name>
- show flows

There are also alarms that occur when the following events happen:

- out of memory
- internal
- unknown realm
- realm change
- · out of bandwidth
- out of ports

# Viewing MBCD Steering Port and Bandwidth Usage for Realms

Display steering ports and bandwidth usage for home, public, and private realms by using the **show mbcd** realms command.

### For example:

acmepacket# 18:46:29-283		cd real	.ms					
	St	eering	Ports		Bar	ndwidth	Usage -	
Realm	Used	Free	No Ports	Flows	Ingrss	Egress	Total	Insuf BW
acme	0	0	0	0	0K	0K	0 K	0
h323172	0	30001	0	0	0K	0K	0 K	0
sip172	2	29999	0	0	0K	0K	0 K	0
sip192	2	29999	0	0	0K	0 K	0K	0

The information displayed includes the following:

- Used—Number of steering ports used
- Free—Number of free steering ports
- No Ports—Number of times that a steering port could not be allocated
- Flows—Number of established media flows
- Ingress—Amount of bandwidth being used for inbound flows
- Egress—Amount of bandwidth being used for outbound flows
- Total—Maximum bandwidth set for this realm
- Insuf BW—Number of times that a session was rejected due to insufficient bandwidth.

### Viewing MBCD Statistics for a Specific Realm

Display media statistics for a specific realm by using the **show mbcd realms <realm-name>** command. This information is given for period and lifetime durations.

- Ports Used—Number of ports used
- Free Ports—Number of free ports
- No Ports Avail—Number of times no steering ports were available
- Ingress Band—Amount of bandwidth used for inbound flows
- Egress Band—Amount of bandwidth used for outbound flows
- BW Allocations—Number of times that bandwidth was allocated

• Band Not Avail—Number of times a session was rejected due to insufficient bandwidth

# For example:

acmepacket# show 18:47:31-2881 Rea		-	72			
	1		riod	Li	fetime	
	Active	High	Total	Total	PerMax	High
Ports Used	2	2	18	18	18	2
Free Ports	29999	30001	30017	30017	30017	30001
No Ports Avail	_	_	0	0	0	_
Ingress Band	0K	0K	0	0	0	0K
Egress Band	0K	0K	0	0	0	0K
BW Allocations	0	0	0	0	0	0
Band Not Avail	_	_	0	0	0	_
Total Bandwidth=	0K					
Steering Ports: 3	100% Succe	SS				

# **Viewing MBCD Task Errors**

The **show mbcd errors** command displays MBCD task error statistics, starting with a time stamp that shows when the current period began.

# For example:

ORACLE# show mbcd error	s		
11:42:37-198			
MBC Errors/Events	_	Lifeti	me
	Recent	Total	PerMax
Client Errors	0	0	0
Client IPC Errors	0	0	0
Open Streams Failed	0	0	0
Drop Streams Failed	0	0	0
Exp Flow Events	0	0	0
Exp Flow Not Found	0	0	0
Transaction Timeouts	0	0	0
Server Errors	0	0	0
Server IPC Errors	0	0	0
Flow Add Failed	0	0	0
Flow Delete Failed	0	0	0
Flow Update Failed	0	0	0
Flow Latch Failed	0	0	0
Pending Flow Expired	0	0	0
ARP Wait Errors	0	0	0
Exp CAM Not Found	0	0	0
Drop Unknown Exp Flow	0	0	0
Drop/Exp Flow Missing	0	0	0
Exp Notify Failed	0	0	0
Unacknowledged Notify	0	0	0
Invalid Realm	0	0	0
No Ports Available	0	0	0
Insufficient Bandwidth	0	0	0
Stale Ports Reclaimed	0	0	0
Stale Flows Replaced	0	0	0
Telephone Events Gen	0	0	0
Pipe Alloc Errors	0	0	0
Pipe Write Errors	0	0	0

There are two categories of MBCD error statistics: Client and Server.

Client statistics count errors and events encountered by applications that use the MBCD to set up and tear down media sessions:

• Client Errors—Number of errors in the client application related to MBC transactions that are otherwise uncategorized

- No Session (Open)—Number of MBC transactions creating or updating a media session that could not be sent to MBCD because the media session state information could not be located
- No Session (Drop)—Number of MBC transactions deleting a media session that could not be sent to MBCD because the media session state information could not be located
- Exp Flow Events—Number of flow timer expiration notifications received from the MBCD by all applications
- Exp Flow Not Found—Number of flow timer expiration notifications received from the MBCD by all applications for which no media session or flow information was present in the application.
- Transaction Timeouts—Number of MBC transaction timeouts
- Server statistics count errors and events encountered by MBCD
- Server Errors—Number of uncategorized errors in the MBC server
- Flow Add Failed—Number of errors encountered when attempting to add an entry to the NAT table
- Flow Delete Failed—Number of errors encountered when attempting to remove an entry from the NAT table
- Flow Update Failed—Number of errors encountered when attempting to update an entry in the NAT table upon receipt of the first packet for a media flow
- Flow Latch Failed—Number of errors when attempting to locate an entry in the NAT table upon receipt of the first packet for a media flow
- Pending Flow Expired—Number of flow timer expirations for pending flows that have not been added to the NAT table
- ARP Wait Errors—Number of errors and timeouts related to obtaining the Layer 2 addressing information necessary for sending media
- Exp CAM Not Found—This statistic shows the number that the NAT table entry for an expired flow could not find in the NAT table. This usually occurs due to a race condition between the removal of the NAT entry and the flow timer expiration notification being sent to MBCD from the NP
- Drop Unknown Exp Flow—Number of flows deleted by the MBCD because of a negative response from the application to a flow timer expiration notification
- Unk Exp Flow Missing—Number of negative responses from the application to a flow timer expiration notification for which the designated flow could not be found in MBCD's tables
- Exp Notify Failed—Number of errors encountered when the MBCD attempted to send a flow timer expiration notification to the application
- Unacknowledged Notify—Number of flow expiration notification messages sent from MBCD to the application for which MBCD did not receive a response in a timely manner
- No Ports Available—Number of steering port allocation requests not be satisfied due to a lack of free steering ports in the realm
- Invalid Realm—Number of flow setup failures due to an unknown realm in the request from the application
- Insufficient Bandwidth—Number of flow setup failures due to insufficient bandwidth in the ingress or egress realm

# **Viewing Realm Configurations**

You can use the **show realm** command to display all realm-specific configurations. For example:

ORACLE# show rea 14:27:38-56SIP R		tics					
			Per	iod	Lifet	ime -	
Realm	Active	Rate	High	Total	Total Pe	rMax	High
realm1			_				_
Inbound	0	0.0	0	0	0	0	0
Outbound	0	0.0	0	0	0	0	0

# **Viewing Realm Configurations for a Specific Realm**

```
ORACLE# show realm realm1
realm stats for : Realm: realm1
```

14:29:22-40 Realm realm1 NO ACTIVITY

# **Viewing Monthly Minutes for a Specific Realm**

You can use the **show monthly minutes** <**realm-id>** command to display the monthly minutes for a specified realm. For example:

ORACLE# <b>show mon</b> 14:31:33-51	thly-minutes rea	lm1			
Realm	MinutesAllowed	MinutesLeft	Minutes	Exceed	Rejects
realm1	10	10	Recent 0	Total 0	PerMax 0

# **Media Alarms**

The following table lists information about the different media alarms.

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
MBCD ALARM OUT OF MEMORY	26214 5	CRITICAL: for flow  MAJOR: for media (if server cannot allocate a new context)	No further memory can be allocated for MBCD.	Flow: Cannot create free port list for realm.  Media Server: Failed to allocate new context.	apSyslogMessageGener ated apSysMgmtMediaOutof Memory trap generated
MBCD ALARM INTERNAL	26214 6	MINOR	An internal software error.	Internal Error. No agent for socket <ipport>.</ipport>	None
MBCD ALARM UNKNOWN REALM	26214 7	MAJOR: if media server is adding a new flow	Media server is unable to find realm interface.	Realm type (ingress, egress, hairpin) X, not found	apSyslogMessageGener ated apSysMgmtUnknownR ealm
MBCD ALARM OUT OF BANDWIDTH	26214 9	CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50%	The realm is out of bandwidth.	Out of bandwidth	apSyslogMessageGener ated apSysMgmtMediaBand widthTrap
MBCD ALARM OUT OF PORTS	26215 0	CRITICAL: failure rate = 100% MAJOR: failure rate > or = 50%	The realm is out of steering ports.	Out of steering ports	apSyslogMessageGener ated apSysMgmtMediaPorts Trap

# **Viewing Deny ACL List**

Display a list of deny ACLI entries by using the **acl-show** command at the topmost ACLI prompt. The following information is displayed:

- Incoming port, slot, and VLAN tag
- Source IP, bit mask, port, and port mask
- Destination IP address and port
- Protocol
- ACL entry as static and dynamic
- ACL entry index

## For example:

```
ORACLE# acl-show
deny entries:
intf:vlan source-ip/mask:port/mask dest-ip/mask:port/mask prot type index
Total number of deny entries = 0
Denied Entries not allocated due to ACL constraints: 0
task done
```

# **Network Faults**

This section explains how to access network fault information. Network alarms account for problems related to low-level network issues and might occur when the software is unable to communicate with the hardware.

### **NAT Statistics**

Use the following command to display NAT table information.

show nat

There is also an alarm that occurs when the NAT table usage reaches 90% or greater of its capacity.

### Viewing Information from the NAT Table

Display information from the NAT table by using the **show nat** command along with one of the following subcommands.

**Note:** Do not display the entire contents of the NAT table on your screen. The size of the table can interfere with call processing.

• **by-index**: specify the range of entries to display, up to a maximum of 5024 entries. For example, to see entries on lines 10 through 50 of the NAT table, enter the following:

```
show nat by-index 10 50
```

A Space separates the two numbers defining the range. If you do not specify a range, the system uses the default range of 1 through 200. The range you enter here corresponds to line numbers in the table, and not to the number of the entry itself.

• **by-addr**: specify the entries to display according to SA and DA values. For example, to view entries with an SA of 192.168.112.25 and a DA 101.102.103.104, enter the following:

```
show nat by-addr 192.168.112.25 101.102.103.104
```

The system matches these values to the NAT table entries and displays the pertinent information. If no addresses are entered, the system displays all of the table entries (all of the table entries will match).

- in-tabular: Display a specified range of entries in the NAT table display in table form, maximum of 5024 entries. The syntax is modeled on the show nat by-index command: show nat in-tabular <starting entry> <ending entry>
- info: Display general NAT table information. The output is used for quick viewing of a Oracle
  Communications Session Border Controller's overall NAT functions, including the maximum number
  of NAT table entries, the number of used NAT table entries, the length of the NAT table search key, the
  first searchable NAT table entry address, the length of the data entry, the first data entry address, and
  whether or not aging and policing are enabled in the NAT table.

• flow-info: Display NAT table entry debug information. The syntax is: show nat flow-info <all | by-addr | by-switchid>

### Viewing NAT information By Index

The following example shows the output of the **show nat by-index** command:

```
ORACLE# show nat by-index 1 2
Total number of entries in the Database = 395
NAT table search address 1, xsmAddr 62580 :
Flow type: Traditional weighted flow
SA_flow_key : 192.168.200.041

```

### **Viewing General NAT Table Information**

```
ORACLE# show nat info
-- NAT table info --
Maximum number of entries : 7768
Number of used entries : 10
Length of search key : 2 (x 64 bits)
First search entry address : 0x0
length of data entry : 4 (x 64 bits)
First data entry address : 0x0
Enable aging : 1
Enable policing : 0
```

#### Viewing Network Address Translation (NAT) Flow Information

To confirm that network interfaces are properly created, use the **show nat flow-info by-addr** command to view the NAT flow information table.

The following illustration is a sample NAT flow information table.

	0=0/0:33	192.168.225.1:10006	192.168.225.6:10000
ORACLE#			

#### **NAT Table Utilization Alarm**

The following table describes the NAT table utilization alarm:

Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
NAT TABLE UTILIZATION	131102	MINOR	NAT table usage reached 90% or greater of its capacity.	NAT table usage X% over threshold X%	apSysMgmtGroupTrap trap generated syslog

# **TCP and SCTP State Connection Counters**

The Oracle Communications Session Border Controller (SBC) can provide systemwide counts of Transmission Control Protocol (TCP) and Stream Control Transmission Protocol (SCTP) states by way of the **show ip tcp** and **show ip sctp** commands from the ACLI.

The **show ip tcp** command includes the following section of counters that correspond to counts of TCP states per active connections, including counts differentiated by inbound, outbound, listen and IMS-AKA connections.

```
Connections By State:
        0
                CLOSED
        0
               LISTEN
        0
               SYN SENT
        0
               SYN RCVD
        0
               ESTABLISHED
        0
               CLOSE WAIT
               FIN WAIT 1
        0
        0
               CLOSING
               LAST ACK
        0
        0
                FIN WAIT 2
                TIME WAIT
Inbound Socket Connection By State:
            CLOSED
          0
             LISTEN
          0
            SYN_SENT
SYN_RCVD
ESTABLISHED
          0
          0

        Maximum Number of Connections Supported = 220000
```

The **show ip sctp** command includes the following section of counters that correspond to counts of SCTP states per active connections.

The output of the state counters indicates the number of connections currently in each state. The statistics from the counters do not accumulate like many of the other statistics in the **show ip** command tree. Most states are ephemeral, and you may see many "0" counters for states other than LISTEN and ESTABLISHED.

# **ARP Statistics**

You can use the following command to view ARP statistics:

• show arp statistics

There is also an alarm that occurs when a gateway is unreachable.

# **Viewing Address Mappings**

Display the current Internet-to-Ethernet address mappings in the ARP table by using the **show arp** command. The first section of this display shows the following information: destination, gateway, flags, reference count, use, and interface. The second section shows the interface, VLAN, IP address, MAC address, timestamp, and type.

The intf (interface) column in the ARP includes both slot and port information. If a value of 0/1 appears, 0 refers to the slot and 1 refers to the port.

```
ORACLE# show arp

### **Gateway Unreachable Alarm**

The Oracle Communications Session Border Controller supports polling for and detection of front interface links to the default gateway when monitoring ARP connectivity. Based on configured gateway link parameter, the Oracle Communications Session Border Controller detects connectivity loss, generates an alarm when it loses ARP-connectivity to the front interface gateway, and decrements its health score accordingly.

The GATEWAY UNREACHABLE network-level alarm is generated in the following circumstances:

• If the ARP manager has not received any ARP messages from a front interface gateway (assigned when the network interface was configured) within the configured heartbeat time period, it will send out ARP requests and wait for a reply.

You can set this heartbeat time period when configuring the gateway heartbeat interval for the redundancy element or when configuring the gw heartbeat's heartbeat field for the network interface element.

• If no reply is received after retrying (re-sending) ARP requests for a configured number of times.

You can set this retry value when configuring the gateway heartbeat retry field for the redundancy element or the gw heartbeat's retry count field for the network interface element.

The GATEWAY UNREACHABLE alarm decrements the health score of the Oracle Communications Session Border Controller by the amount you set for either the gateway heartbeat health field of the redundancy element or the gw heartbeat's health score field for the network interface. The alarm is cleared once a front interface gateway ARP entry is valid again.

After the initial alarm is triggered, the Oracle Communications Session Border Controller continues to attempt to connect to the front interface gateway. It issues ARP requests (retries) every five seconds until front interface gateway ARP connectivity is achieved.

You can set the gateway link failure detection and polling parameters, and the health score decrement (reduction) value for the entire Oracle Communications Session Border Controller by configuring the redundancy element or for each individual network interface by configuring the gw heartbeat for the network interface.

The following table lists information about the GATEWAY UNREACHABLE alarm	The following	table lists information a	bout the GATEWAY	UNREACHABLE alarm
---	---------------	---------------------------	------------------	-------------------

Alarm Name	Alarm ID	Alarm Severi ty	Cause(s)	Example Log Message	Actions
GATEWAY UNREACHA BLE	dynami cID	MAJO R	The Oracle Communicati ons Session Border Controller lost ARP connectivity to the front interface gateway.	gateway X.X.X.X unreachable on slot Y port Z subport ZZ (where X.X.X.X is the IPv4 address of the front interface gateway, Y is the front interface slot number, Z is the front interface port number, and ZZ is the subport ID)	apSysMgmtGatewayUnreachab leTrap generated syslog

The value of this alarm changes based on a number of factors. The total alarm ID range falls between 196608 and 262143. The alarm ID is calculated based on a compilation of a hexadecimal number that represents the VLAN ID and the front interface slot/port numbers.

#### **View Network Interfaces Statistics**

Display statistics for network interfaces by using **show interfaces** command. The following is an example of the Version S-CZ7.1.2 output:

```
ORACLE# show interfaces
     Flags: (0x49) UP LOOPBACK TRAILERS ARP RUNNING
    Type: LOOPBACK INTERFACE
    inet is: 127.0.0.1 Vlan: 0
    Metric is 0:
    Maximum Transfer Unit size is 16436
     46001 octets received
     46001 octets sent
     364 packets received
     364 packets sent
     0 multicast packets received
     0 incoming packets discarded
     0 outgoing packets discarded
    0 incoming errors

    Auto Negotiation: enabled
    Internet address: 192.168.0.10
                                        Vlan: 0
    Broadcast Address: 192.168.0.255
    Netmask: 255.255.255.0
    Gateway: 192.168.0.1
    Maximum Transfer Unit size is 1500
    Ethernet address is 00:08:25:a2:56:23
    Virtual Ethernet address is 00:08:25:a2:56:23
    Metric is 0
     0 octets received
     4668396 octets sent
     0 packets received
    72942 packets sent
```

```
0 non-unicast packets received
0 unicast packets received
0 input discards
0 input unknown protocols
0 input errors
0 output errors
0 collisions; 0 dropped
```

You can also view key running statistics about the interfaces within a single screen by using the **show** interfaces [brief] command.

### For example:

IP	Gateway	Adm
Address	Address	Stat
127.0.0.1	-	up
172.30.46.20/16	172.30.0.1	up
192.168.0.10/24	192.168.0.1	up
	127.0.0.1	Address Address  127.0.0.1 - 172.30.46.20/16 172.30.0.1

# **Physical Interface Faults**

This section contains information about the statistics you can view for network and media interfaces, and alarms that occur for physical interface faults.

# **Viewing Network Interface Statistics**

Display information about the network interfaces by using the show interfaces command.

### For example:

```
ORACLE# show interfaces
    Flags: (0x49) UP LOOPBACK TRAILERS ARP RUNNING
    Type: LOOPBACK INTERFACE
    inet is: 127.0.0.1 Vlan: 0

    0 unicast packets received
    0 input discards
    0 input unknown protocols
    0 input errors
     0 output errors
    0 collisions; 0 dropped
```

# **Viewing Media Interface Statistics**

Display information about the system's media interfaces, if any, by using the show media command. You can also display information about loopback (internal) interfaces, which are logical interfaces used for internal communications.

You can use the following arguments to specify the information you want to view:

- classify—network processor statistics; requires slot and port arguments
- host-stats—host processor statistics, including number of packets received at a specific port and types
  of packets received; requires slot and port arguments
- frame-stats—frame counts and drops along the host path; does not require port and slot specification
- network—network interface details; does not require port and slot specification
- physical—physical interface information; does not require port and slot specification
- phy-stats—data/packets received on the front interface (media) ports; shows the physical level of front
  interface statistics according to slot and port numbers and is displayed according to received data/
  packets and transmitted data/packets; requires slot and port arguments

For the slot arguments, 1 corresponds to the left Phy slot and 2 corresponds to the right Phy slot on the front of the chassis. For the port argument, the values are 0, 1, 2, and, 3, with 0 corresponding to the leftmost port and 3 corresponding to the rightmost port.

For example:

The RECEIVE STATISTICS and TRANSMIT STATISTICS in the following examples have been abbreviated.

### Viewing Network Interface Statistics

The **show media network** command displays configured network interfaces according to IPv4 and IPv6 types.

```
ORACLE# show media network
nPApp Media max slots = 3
IPv4 Enabled Interfaces:
Slot/Port: Vlan IPAddress
                               Mask
                                              Gateway
                                                           Status
          0
 0/0:
                 192.168.0.10 255.255.255.0 192.168.0.1
                                                           enable
IPv6 Enabled Interfaces:
Slot/Port: Vlan IPAddress
                               Mask
                                              Gateway
                                                           Status
0/0:
```

# Viewing Physical Interface Statistics

# show media classify

The **show media classify** command displays counts of packets by type for a given interface. The command is entered as:

```
ORACLE# show media classify <slot> <port>
```

Global packet counters are displayed and classified according to direction and L2/L3. The interface identified by the supplied slot and port combination. The following screen capture is Version S-CZ7.1.2 executed on a Server Edition/VM platform.

```
ORACLE> show media classify 0 0

LINK DOWN ALARM FEPORT	131092	MAJOR	Fast Ethernet slot 2, port 0 goes down.	Slot 2 port 0 DOWN	linkDown trap generated minor dry contact syslog
LINK DOWN ALARM FEPORT	131093	MAJOR	Fast Ethernet slot 1, port 1 goes down.	Slot 1 port 1 DOWN	linkDown trap generated minor dry contact syslog
LINK DOWN ALARM FEPORT	131094	MAJOR	Fast Ethernet slot 2, port 1 goes down.	Slot 2 port 1 DOWN	linkDown trap generated minor dry contact syslog
LINK DOWN ALARM FEPORT	131095	MAJOR	Fast Ethernet slot 1, port 2 goes down.	Slot 1 port 2 DOWN	linkDown trap generated minor dry contact syslog
LINK DOWN ALARM FEPORT	131096	MAJOR	Fast Ethernet slot 2, port 2 goes down.	Slot 2 port 2 DOWN	linkDown trap generated minor dry contact syslog
Alarm Name	Alarm ID	Alarm Severity	Cause(s)	Example Log Message	Actions
LINK DOWN ALARM FEPORT	131097	MAJOR	Fast Ethernet slot 1, port 3 goes down.	Slot 1 port 3 DOWN	linkDown trap generated minor dry contact syslog
LINK DOWN ALARM FEPORT	131098	MAJOR	Fast Ethernet slot 2, port 3 goes down.	Slot 2 port 3 DOWN	linkDown trap generated minor dry contact syslog

## **Verifying an IP Address**

This section explains how to determine the existence of an IP address, and whether it is up and accepting requests.

You can use the ping command with the IPv4 address to send echo messages that indicate whether a given address is available. In addition the ping command returns the following information:

- time in milliseconds it took the ICMP packets to reach the destination and return
- statistics that indicate the number of packets transmitted, the number of packets received, and the
  percentage of packet loss.
- time in milliseconds for the minimum, average, and maximum RTTs. The default timeout is 64 milliseconds.

The following example shows the ping command used with IPv4 address 10.0.0.1:

```
ORACLE# ping 172.30.1.150
PING 172.30.1.150: 56 data bytes
64 bytes from 172.30.1.150: icmp_seq=0. time=1. ms
64 bytes from 172.30.1.150: icmp_seq=1. time=0. ms
64 bytes from 172.30.1.150: icmp_seq=2. time=0. ms
64 bytes from 172.30.1.150: icmp_seq=3. time=0. ms
64 bytes from 172.30.1.150: icmp_seq=3. time=0. ms
----172.30.1.150 PING Statistics----
4 packets transmitted, 4 packets received, 0% packet loss
round-trip (ms) min/avg/max = 0/0/1
```

## **Specifying a Source Address for ICMP Pings**

The Oracle Communications Session Border Controller's **ping** command can also be used to set the source IP address (a valid network interface) to use when sending ICMP pings. You must enter the IP address for the entity you want to ping first, followed by the source IP address.

To specify a source address for an ICMP ping:

At the main system prompt, type ping and a Space, the IP address of the entity you want to ping, the network interface, and then the source IP address you want to use, and then press Enter.

```
ORACLE # ping 124.7.58.6 core:0 172.30.56.6
```

### Traceroute Command

The system can trace the route of an IP packet to an Internet host by sending probe packets and listening to responses from gateways along the route. Use the traceroute command to see each host route and the round trip time of packets received from each host in a route for diagnostic purposes.

The traceroute command sends probe packets that start with a maximum time-to-live (TTL) value of one. The system listens for an Internet Control Message Protocol (ICMP) error message in response to the TTL expiry, and records the source that sent the ICMP error message. The system repeats this process and increments the TTL value by 1 for each hop in the route to the final destination.

The traceroute command returns the following information, which allows tracing the packet route to its destination.

- TTL value
- IP address of each host along the route
- Amount of time that it takes for each probe packet to travel to each host in the route

#### Notes:

• Unless otherwise specified, the system sends three probe packets to each host.

 The traceroute command is only available in software versions of the Oracle Communications Session Border Controller, for example, Server Edition (SE) and Virtual Machine Edition (VME). For more information on supported platforms, see "Platform Support."

For traceroute command syntax and arguments, see "Traceroute Command Specifications."

### **Examples**

The following example traces the route to IP address 172.30.0.167, identifying each host in the route and the amount of time that it takes for each of three probe packets to travel to each host. The first three probe packets reach the host at 172.44.0.1 in times ranging from less than one to a little over two milliseconds. The next three probe packets reach the route destination at IP address 172.30.0.167 all in less than one millisecond.

```
ORACLE# traceroute 172.30.0.167
traceroute to 172.30.0.167
1 172.44.0.1 (0.669003 ms) (2.140045 ms) (2.290964 ms)
2 172.30.0.167 (0.25602 ms) (0.219822 ms) (0.604868 ms)
```

The following example traces the route to IP address 172.30.0.167 but specifies the use of 4 probe packets instead of the default of 3.

```
ORACLE traceroute 172.30.0.167 probes 4 traceroute to 172.30.0.167 1 172.44.0.1 (0.549003 ms) (1.180045 ms) (2.920584 ms) (2.48541 ms) 2 172.30.0.167 (0.25802 ms) (0.220822 ms) (0.454868 ms) (0.387574)
```

The following example specifies that the traceroute command is issued to the IP address over the user-specified network interface private and VLAN 123.

```
ORACLE traceroute 10.1.2.6 intf-name:vlan private:123 traceroute to 10.1.2.6 1 10.1.2.6 (0.265121 ms) (0.599080 ms) (0.0184195 ms)
```

The following example specifies that the wait for a response timeout is 4 seconds. The default value is three seconds.

```
ORACLE traceroute 10.1.2.6 timeout 4 traceroute to 10.1.2.6 (0.199080 ms) (0.0284195 ms)
```

The following example specifies that the traceroute starts at a user-specified source IP address of 172.20.22.31 to a destination IP address of 10.25.2.10.

```
ORACLE traceroute 172.20.22.31 source-ip 10.25.2.10 traceroute to 172.20.22.31 172.20.22.31 (0.284121 ms) (0.499770 ms) (0.084595 ms)
```

## **Traceroute Command Specifications**

The traceroute command traces the route of an IP packet to an Internet host by sending probe packets with small maximum time-to-live (TTL) values and listening to responses from gateways along the path. This diagnostic command provides the route (path) and the round trip times of packets received from each host in a route.

The traceroute command works by sending probe packets starting with a maximum time-to-live (TTL) value of one, listening for an ICMP error message in response to the TTL expiry, and recording the source that sent it. This process is repeated by incrementing the TTL value by 1 each time until the final destination is reached. This information allows the path to be traced for the packet to reach its destination.

#### **Syntax**

```
traceroute <destination-address> <options>
```

#### **Arguments**

<destination-address> — Specifies the destination IP address for the route to be traced.

<intf-name:vla> — Specifies the network interface and VLAN to use.

<mas\_ttl> — Specifies the maximum number of hops before timeout.

- Default 30
- Values Min: 1 / Max: none

probes> — Specifies the number of probes to send.

<source-ip> — Specifies the source IP address from which to trace the route to the destination IP address.

<timeout> — Specifies the maximum time (in seconds) to wait for a response.

- Default 3
- Values Min: 1 / Max: none

#### Mode

Superuser

#### Release

First appearance: SCZ7.2.0

### **Example**

```
ORACLE# traceroute 172.30.0.167 probes 4 traceroute to 172.30.0.167  
1 172.44.0.1 (0.669003 ms) (2.140045 ms) (2.290964 ms) (2.40891 ms) 2 172.30.0.167 (0.25602 ms) (0.219822 ms) (0.604868 ms) (0.398874)
```

## **DNS Statistics**

You can monitor DNS statistics using the ACLI **show dns** command. The information displayed includes the following:

- Queries—The number of DNS queries initiated.
- Successful—The number of DNS queries completed successfully.
- NotFound—The number of DNS queries that did not result in DNS resolution.
- TimedOut—The number of DNS queries that timed out.

To get DNS statistics, use either the ACLI **show dns** or **show dns stats** command. Both return the same output. For example:

## **Viewing DNS Statistics for Specific Cache Entries**

To view DNS statistics for specific cache entries, use the **show dns cache-entry** command. You must include both the realm name and the entry ID as arguments to avoid receiving an error message. Your cache key entries must appear in one of the following formats:

- NAPTR records—NAPTR:abc.com
- SRV records—SRV:\_sip.\_tcp.abc.com
- A records—A:abc.com

A successful inquiry appears as follows:

```
ORACLE# show dns cache-entry core A:abc.sipp.com
Query-->
Q:A abc.sipp.com ttl=86329
Answers-->
172.16.0.191
```

## **Clearing ENUM and DNS Statistics**

To clear statistics for DNS, you can use additions to the ACLI **reset** command. Before you reset the counters, however, you might want to confirm the current statistics on the system are not zero. You can do so using the **show dns** command.

The **reset** command takes the DNS arguments to clear those sets of statistics. When you use the command, the system notifies you whether it has successfully cleared the statistics (even if the counter are zero) or if it has run into an error causing the command to fail.

You can **reset all** system statistics using the reset all command.

This section shows you how to clear DNS statistics. The sample below shows the error message that appears if the command fails.

To clear DNS statistics:

At the command line, type **reset dns** and then press Enter.

```
ORACLE# reset dns
SIP DNS statistics not available
```

## System Support Information for Troubleshooting

The **show support-info** command allows you to gather a set of information commonly requested by Oracle Support when troubleshooting customer issues.

The **show support-info** usage is as follows:

```
show support-info [standard | custom | media | signaling] {config}
```

- standard—Displays information for all commands the **show support-info** command encompasses.
- custom—Uses the /code/supportinfo.cmds file to determine what commands should be encompassed. If the file does not exist, then the system notifies you.
- media—Executes and writes out only the show media commands to the support-info.log file.
- signaling—Executes and writes all but the ACLI commands that display signaling data to the supportinfo.log file.

In all cases, the system displays the command's output on the screen and writes the output to the support-log.info file (stored in /opt/logs).

Each time the **show support-info** command is executed a new support-info.log file is created. The previous support-info.log file is renamed by appending a .1 to the end of the file name. All additional support-info.log files are renamed to their previous number, plus 1. The Oracle Communications Session Border Controller maintains up to 6 support-info files: support-info.log and support-info.log.1 through support-info.log.5.

For example, when executing the **show support-info** command, a new support-info.log file is created. The existing support-info.log file is renamed to support-info.log.1. The existing support-info.log.1 file is renamed to support-info.log.2, and so on. If a support-info.log.5 exists prior to executing the **show support-info** command, it is deleted from the system when rotating the files.

The **show support-info** command combines the output of several ACLI commands into a single command. These include:

### **Included Data**

This command combines the output of several other ACLI commands into a single command, which are listed in the table below.

Data Group	Included Data
General System Commands	show clock
	show version image
	show version boot
	show sipd spl
	show prom-info all
	display-alarms
	show process
	show arp
	show sessions
	show features
	show memory
	show buffers
	show health
	display-current
	display-run
	show user
	check-space-remaining code
	check-space-remaining ramdry
	check-space-remaining hard-disk
	show process cpu all
	show spl
Physical Interface Commands	show interfaces
	show media physical
	show media phy-stats
	show media host-stats
	show media classify
	show media network
	show media frame-stats
	show media tm-stats
	dump-etc-stats
SIP Commands	show registration

Data Group	Included Data
	show sipd all
	show sipd agent
H323 Commands	show h323
	show h323 h323stats
	show h323 agentstats
	show h323 stackCallstats
	show h323 stackPvtStats
	show h323 stackDisconnectInstate
	show h323 stacklist
Call Media Commands	show mbcd all
	show mbcd realms
	stack mbcd
Security Commands	show security certificates brief
	show security ssh-pub-key
	show security ssm-accelerator
	show security tls session-cache
Other Commands	ipt show all
	show acl info
	show acl summary
	show acl all (only in signaling)
	show ip connections (only in signaling)
	show dns stats
	show enum stats
	show routes

#### Using the ACLI show support-info command

To gather and ship information to Oracle Support using the **show support-info** command:

- 1. Select a meaningful filename for the file to which you will send data.
- 2. In either User or Superuser mode, type **show support-info** at the prompt. Include the name of the file you want to send the information to as follows:

ORACLE# show support-info 10102006

**3.** FTP the file to Oracle Support as follows:

Check the IP address of the system's management port (wancom0). (You might think of this as a management address since it is used in the management of your system.)

Create the connection to your system. In your terminal window, type **ftp** and the IPv4 address of your system's management port (wancom0), and then press Enter. Once a connection has been made, a confirmation note appears followed by the FTP prompt.

When prompted, enter your FTP username and FTP password information.

Invoke binary mode

ftp> binary

**Note:** Caution: Be sure to use binary transfer mode. If you do not, transfers will be corrupted.

From the FTP prompt, change the directory to /opt/logs.

ftp> cd /opt/logs

Go to the directory where you are putting the file. To do this, type **dir** at the FTP prompt.

ftp> dir

At the FTP prompt, enter the **get** command, a Space, the name of the file from the directory that you want to be transferred, and then press Enter.

ftp> get <filename>

Confirmation that the connection is opening and that the transfer is taking place appears.

After the file transfer is complete, type **bye** to end the FTP session.

ftp> bye

Once you have confirmed that Oracle Support has received the file, delete it from the /code in order to free up directory space.

#### support-info command

To Display information on the screen gathered from the show support-info command:

1. In either User or Superuser mode, type **show support-info** at the prompt. Include more if you want to view the information one page at a time.

ORACLE# show support-info more

- 2. At the prompt at the bottom of the window, select one of the following ways to view further information:
  - Enter a **q** to exit and return to the system prompt
  - Press the <enter> key to view the next page
  - Press the <space> bar to view the information through the end

#### System Configuration Listing

The show support info command can append the complete running config output (**show running-config**) to the end of the support output file by adding the config argument to the end of any show support-info command, except show support-info custom. For example:

ORACLE# show support-info standard config

#### **SLB Information**

The following show commands have been added so that more SLB-related debug information is available in the show support-info output.

- show sip tunnels is added to show support-info and show support-info signaling
- show sip ccp is added to show support-info and show support-info signaling
- show sip lb-endpoints is added to show support-info and show support-info signaling

The following changes have been made to avoid this situation on the Oracle Session Load Balancer image (LCX image):

• show ccd ccp is added show support-info

## **SIP Interface Constraints Monitoring**

The session constraints configuration allows you to set up a body of constraints that you can then apply them to a SIP interface. Using the constraints you have set up, the Oracle Communications Session Border Controller checks and limits traffic according to those settings for the SIP interface.

SIP interfaces have two states: "In Service" and "Constraints Exceeded." When any one of the constraints is exceeded, the status of the SIP interface changes to Constraints Exceeded and remains in that state until the time-to-resume period ends. The session constraint timers that apply to the SIP interface are the time-to-resume, burst window, and sustain window.

You can view information about constraints for a SIP interface by using the **show sipd interface** command. Using that command, you can show statistics for all SIP interfaces, or for one that you specify when you carry out the command.

### **All SIP Interfaces**

To display statistical information for all SIP interfaces:

Type **show sipd interface** at the command line and then press Enter. The results will resemble the following example.

```
ORACLE# show sipd interface

19:38:17-18

---- Inbound ---- --- Outbound ---- -Latency- --- Max ---

Realm Active Rate ConEx Active Rate ConEx Avg Max Burst In Out
external 0 0.0 0 0 0.0 0 0.0 0 0
```

## **Single SIP Interface**

To display statistical information for a single SIP interfaces:

Type **show sipd interface** at the command line, followed by the realm identifier for that interface, and then press Enter. The results will resemble the following example.

ORACLE# show sipd 19:46:10-37	interface	interna	1						
Sip Interface internal(internal) [In Service]									
Period Lifetime									
	Active	_	Total			High			
Inbound Sessions	0	0	0	0	0	0			
Rate Exceeded	_	_	0	0	0	_			
Num Exceeded	_	_	0	0	0	_			
Outbound Sessions	1	1	1	1	1	1			
Rate Exceeded	_	-	0	0	0	-			
Num Exceeded	_	_	0	0	0	-			
Out of Service	_	_	0	0	0	_			
Trans Timeout	0	0	0	0	0	0			
Requests Sent	_	_	1	1	1	_			
Requests Complete	_	-	1	1	1	_			
Messages Received	-	-	3	3	2	-			
Latency=0.013; max	=0.013								

## **Displaying and Clearing Registration Cache Entries**

The Oracle Communications Session Border Controller's registration cache management for all protocols offers detailed information (beyond basic registration cache displays) and flexible ways to work with SIP and H.323 registrations. You can query, clear and audit entries.

### Working with the SIP Registration Cache

There are two ways to view basic SIP registration cache statistics. The **show sipd endpoint-ip** command displays information regarding a specific endpoint, and the **show registration** command displays statistics for the SIP registration. These commands still remain.

There are additional commands let you view SIP registration cache information, and to clear and audit information from the cache.

### **Displaying the SIP Registration Cache**

You can view the SIP registration cache by using one of the following commands:

- show registration sipd by-ip <ipaddress>—Displays the Oracle Communications Session Border Controller's SIP process registration cache for a specified IP address. The IP address value can be a single IP address or a wildcarded IP address value that has an asterisk (\*) as its final character.
  - This command is only available if you configure the **reg-via-key** parameter in the SIP interface configuration prior to endpoint registration. The **reg-via-key** parameter keys all registered endpoints by IP address and username.
- show registration sipd by-realm <realm>—Display information for calls that have registered through a specified ingress realm. Enter the realm whose registration cache information you want to view. This value can be wildcarded.
- show registration sipd by-registrar <ipaddress>—Display information for calls that use a specific registrar. Enter the IP address of the registrar whose registration cache information you want to view. This value can be wildcarded.
- show registration sipd by-route <ipaddress>—Display information for calls by their Internet-routable IP address. This allows you to view the endpoints associated with public addresses. Enter the IP address whose registration cache information you want to view. This value can be wildcarded.
- **show registration sipd by-user <endpoint>**—Displays the Oracle Communications Session Border Controller's SIP process registration cache for a specified phone number or for a user name. That is, the **<endpoint>** portion of the command you enter depends on how the SIP endpoint is registered. For example, an endpoint might be registered as 7815551234@10.0.0.3 or as username@10.0.0.3. The value preceding the at-sign (@) is what you enter for the **<endpoint>**.

The phone number can be a single number (such as 7815551234) or a single number wildcarded by placing an asterisk (\*) (such as 7815551\*) at the end of the phone number. The user name can be a single name (such as user), or a single name wildcarded by using an asterisk at the end of the user name (such as us\*).

There are brief and detailed versions of this display. To see the detailed version, add the **detail** argument to the end of your entry.

The following is a sample of this command's output for the brief view:

```
ORACLE> show registration sipd by-user user*
                                                TUE JUL 11:29:50 UTC 2007
Registration Cache
                                      Nıım
User
                                Contacts Registered at
                                       1
                                           2007-07-26-11:29:50
sip:user@acme.com
                                      1
                                           2007-07-26-11:29:51
sip:username@acme.com
                                      1
sip:username2@acme.com
                                           2007-07-26-11:29:51
ORACLE>
```

You can add the **detail** argument to view this command's output with detailed information:

```
ORACLE> show registration sipd by-user user@acme.com detail

Registration Cache (Detailed View) TUE JUL 11:32:21 UTC 2007

User: sip:user@acme.com

Registered at: 2007-07-26-11:32:21 Surrogate User: false

Contact Information:
```

The following is a sample of the **show registration sipd by-realm** command's output:

```
ORACLE# show registration sipd by-realm access

Registration Cache WED JUN 25 2008 09:12:03
Realm User Registered at

access sip:16172345687@192.168.12.200

2008-06-25-09:00:32
access sip:3397654323@192.168.12.200

2008-06-25-09:00:40

Total: 2 entries
```

The following is a sample of the **show registration sipd by-registrar** command's output:

The following is a sample of the **show registration sipd by-route** command's output:

```
ORACLE# show registration sipd by-route 192.168.11.101
Registration Cache WED JUN 25 2008 09:06:04
Routable IP Address User Registered at

192.168.11.101 sip:3397654323@192.168.12.200
2008-06-25-09:00:40
Total: 1 entry
```

### **Clearing the SIP Registration Cache**

You can clear the SIP registration cache by using one of the following commands:

- clear-cache registration sipd all—Clears all SIP registrations in the cache.
- clear-cache registration sipd by-ip <ipaddress>—Clears the Oracle Communications Session Border Controller's SIP process registration cache of a particular IP address. The IP address value can be a single IP address or an IP address range in the form n.n.n.n/nn.
- clear-cache registration sipd by-user <endpoint>—Clears the Oracle Communications Session Border Controller's SIP process registration cache of a particular phone number. The phone number can be a single number (7815554400). You can also enter a user name for this value.

Note that you cannot wildcard values for commands to clear the SIP registration cache. When you use one of these commands, the system asks you to confirm clearing the applicable cache entries.

### **Auditing the SIP Registration Cache**

You can audit the SIP registration cache by using one of the following commands:

- request audit registration sipd by-ip <ipaddress>—Audits a specified IP address in the SIP registration cache.
- request audit registration sipd by-user <endpoint>—Audits a specific user by specifying the phone number in the SIP registration cache. You can also enter a user name for this value

Note that you cannot wildcard values for commands to audit the SIP registration cache. Expired entries are automatically cleared.

## Working with the H.323 Registration Cache

The ACLI displays the number of cached H.323 entries when you use the basic **show h323d registrations** command. Using this command with a registration key displays information about a single H.323 cached entry.

Additions to this command allow you to view detailed H.323 registration cache information based on a specific phone number or terminal identifier. You can also clear and audit the cache.

### Displaying the H.323 Registration Cache

You can view the H.323 registration cache by using the **show registration h323d by-alias <endpoint>** command. For the **<endpoint>** portion of the entry, use a phone number or terminal identifier. You can wildcard the **<endpoint>** value by using an asterisk (\*) as the final character in the terminal Alias string.

There are brief and detailed versions of this display. To see the detailed view, add the **detail** argument to the end of your entry.

The following is a sample of this command's output for the brief view:

```
ORACLE# show registration h323d by-alias 4278_endp

Registration Cache FRI AUG 20:22:00 2007

Endpoint Expiration Registered at

4278_endp 27 2007-08-03-19:58:34

ORACLE#
```

You can add the **detail** argument to view this command's output with detailed information:

```
ORACLE# show registration h323d by-alias 4224 endp detail
Registration Cache (Detailed View)
                                                  TUE JUL 14:51:59 007
Endpoint: 4224 endp, state: Registered
 Registered at: 2007-04-24-14:50:05
 Expiration: 204
 Gatekeeper: open-gk1
 Endpoint NAT Address: 192.168.200.56:1372
 SD Call Signaling Address: 150.150.150.10:2048
 SD RAS Address: 150.150.150.10:8200
 Terminal Alias(s):
   Alias: e164: 17815552222, Registered: true
 Call Signaling Address(s):
   Address: 192.168.200.56:1720
 RAS Address(s):
   Address: 192.168.200.56:1372
```

#### Clearing the H.323 Registration Cache

You can clear the H.323 registration cache by entering one of the following commands:

- clear-cache registration h323d all—Clears all H.323 registrations in the registration cache.
- **clear-cache registration h323d by-alias <endpoint>**—Clears H.323 registrations from the registration cache based on a phone number or terminal identifier.

Note that you cannot wildcard values for commands to clear the H.323 registration cache. When you use one of these commands, the system asks you to confirm clearing the appropriate cache entries.

### **Auditing the H.323 Registration Cache**

You can audit the H.323 registration cache by entering one of the following commands:

• request audit registration h323 <terminalAlias>—Audits the H.323 registration cache based on a phone number or terminal identifier.

## Session Management for SIP H.323 and IWF

Using the session management feature, you can display and manage SIP, H.323, and IWF sessions using a range of new ACLI commands. You can choose to view summary or detailed displays.

If you choose to terminate a session that is already in progress, the Oracle Communications Session Border Controller tears down the session and returns:

- SIP BYE with a reason header naming administrative preemption as a cause, and where the cause code is 3
- H.323 Disconnect with Q.850 disconnect cause code 8, preemption

Note that if your system is carrying a heavy traffic load, it could take a good amount of time to display or clear sessions. When you use these commands, a reminder will appear about the fact that it can take up to thirty seconds for the command to complete.

## **Displaying Sessions**

You can display SIP, H.323 and IWF sessions using the ACLI show command. sessions command. This command now takes the following additional arguments:

- all—Displays all SIP or H.323 sessions for the protocol you specify.
- **by-agent**—When entered with the name of a configured session agent, displays session information for the specified session agent: adding **iwf** to the very end of the command shows sessions for IWF; adding **detail** to the very end of the command expands the displayed information
- **by-ip**—When entered with the IP address of an endpoint, displays session information for the specific endpoint; adding **iwf** to the very end of the command shows sessions for IWF; adding **detail** to the very end of the command expands the displayed information
  - Entries for the IP address portion of this command must be enclosed in quotation marks ()
- **by-user**—When entered with the calling or called number, displays session information for the specified user; adding **iwf** to the very end of the command shows sessions for IWF; adding **detail** to the very end of the command expands the displayed information
- **by-callid**—Display H.323 sessions for the call ID specified; adding **iwf** to the end of the command shows sessions for the IWF; adding **detail** to the end of the command expands the displayed information

### **Example 1 Displaying All SIP Sessions**

The following is an example of a display showing all SIP sessions.

```

## **Clearing Sessions**

You can clear sessions from the Oracle Communications Session Border Controller with the **clear-sess** command. You can clear all sessions, or you can:

- Clear sessions for a specific session agent (by-agent)
- Clear sessions for a specific call by using the call identifier (by-callid)
- Clear sessions for a specific IP address (by-ip, where you enter the IP address in quotation marks ())
- Clear sessions for a specific user by using the called or calling number (by-user)

#### **Example 1 Clearing All SIP Sessions**

The following is an example of clearing all SIP sessions from the Oracle Communications Session Border Controller.

```
ORACLE# clear-sess sipd sessions all

Clearing Sessions 'all' expression ''

This may take up to 30 seconds

## **Datapath monitor alarm**

The datapath monitor alarm monitors the load on some of the major hardware components that packets traverse within the Oracle Communications Session Border Controller. These components collectively make up the datapath. The datapath overload alarm is non-health affecting, but when enabled, new SIP calls received by the Oracle Communications Session Border Controller are rejected. Existing calls remain unaffected.

The datapath monitor alarm identifies the physical interface over which the offending traffic was received.

### **Fault Management**

For the alarm to clear, ETC CPU and ETC Memory (network processor on 4500 only) loads must all fall below overload threshold.

Valid alarm IDs for the datapath monitor alarm are: 131200-131328

## Crash and Log File Maintenance

### package-crashfiles

Users may want to transfer the crash files to a separate device for analysis or storage. To facilitate this removal, use the **package-crashfiles** command to compress multiple crash files into a single file while preserving the timestamps. The syntax for the **package-crashfiles** command is:

```
package-crashfiles [name <file>.tar.gz] [newer-than <days>]
```

The package-crashfiles command takes two arguments:

• name—Specify the path and name of the saved file. Generally, the files should be saved to /opt. If the system's hard drive has been formatted with partitions, /mnt may be used instead. For example:

```
ORACLE# package-crashfiles name /opt/crash/recentcrashes.tar.gz

Tar/gzip file /opt/crash/recentcrashes.tar.gz to include 6 files of 1 MiB
(uncompressed)

Proceed? [y/n]?: y

Tar/gzip file created /opt/crash/recentcrashes.tar.gz with 6 files with
final size 169 kiB
ORACLE#
```

If the name argument is omitted, the Oracle Communications Session Border Controller saves the compressed crash files to a file named crash-<date>.tar.gz, where <date> is the current date.

```
ORACLE# package-crashfiles
Tar/gzip file /code/crash/crash-130529.tar.gz to include 6 files of 1 MiB (uncompressed)
Proceed? [y/n]?: y
Tar/gzip file created /code/crash/crash-130529.tar.gz with 6 files with final size 169 kiB
ORACLE#
```

• newer-than—Specify a time limit, in days, on the crash files to be compressed and saved. This option counts backwards, starting with the current day. Thus the option newer-than 5 would compress and save crash files for the past 5 days only.

```
ORACLE# package-crashfiles name /opt/crash/recentcrashes.tar.gz newer-than 5
Tar/gzip file /opt/crash/recentcrashes.tar.gz to include 6 files of 1 MiB
(uncompressed)
Proceed? [y/n]?: y
Tar/gzip file created /opt/crash/recentcrashes.tar.gz with 6 files with
final size 169 kiB
ORACLE#
```

If the newer-than argument is omitted, the Oracle Communications Session Border Controller compresses and saves all crash files.

To preserve system resources, users should remove the compressed file as soon as possible.

#### delete-crashfiles

The **delete-crashfiles** command deletes all closed crash-files located in the /opt/crash directory. You may specify the age of the crash-files to delete. The command is entered as

```
delete-crashfile all
or
delete-crashfile older-than <days>
```

### package-logfiles

Users may want to transfer the log files to a separate device for analysis or storage. To facilitate this removal, use the **package-logfiles** command to compress multiple log files into a single file while preserving the timestamps. The syntax for the **package-logfiles** command is:

```
package-logfiles [name <file>.tar.gz] [newer-than <days>]
```

The package-logfiles command takes two arguments:

• name—Specify the path and name of the saved file. Generally, the files should be saved to /opt. If the system's hard drive has been formatted with partitions, /mnt may be used instead. For example:

```
ORACLE# package-logfiles name /opt/logs/recentlogs.tar.gz
Tar/gzip file /opt/logs/recentlogs.tar.gz to include 61 files of 447 kiB
(uncompressed)
Proceed? [y/n]?: y
Tar/gzip file created /opt/logs/recentlogs.tar.gz with 61 files with final size 62 kiB
ORACLE#
```

If the name argument is omitted, the Oracle Communications Session Border Controller saves the compressed log files to a file named logs-<date>.tar.gz, where <date> is the current date.

```
ORACLE# package-logfiles
Tar/gzip file /opt/logs/logs-130528.tar.gz to include 61 files of 447 kiB (uncompressed)
Proceed? [y/n]?: y
Tar/gzip file created /opt/logs/logs-130528.tar.gz with 61 files with final size 62 kiB
ORACLE#
```

• newer-than—Specify a time limit, in days, on log files to be compressed and saved. This option counts backwards, starting with the current day. Thus the option newer-than 5 would compress and save log files for the past 5 days only.

```
ORACLE# package-logfiles name /opt/logs/5dlogs.tar.gz newer-than 5
Tar/gzip file /opt/logs/5dlogs.tar.gz to include 61 files of 271 kiB
(uncompressed)
Proceed? [y/n]?: y
Tar/gzip file created /opt/logs/5dlogs.tar.gz with 61 files with final size 45 kiB
ORACLE#
```

If the newer-than argument is omitted, the Oracle Communications Session Border Controller compresses and saves all log files.

To preserve system resources, users should remove the compressed file as soon as possible.

## delete-logfiles

The **delete-logfiles** command deletes all closed log-files located in the /opt/logs directory. Files currently being written to remain untouched. You may specify the age of the log-files to delete. The command is entered as

```
delete-logfile all
```

## **Fault Management**

or

delete-logfile older-than <days>

# **Performance Management**

## **Overview**

This chapter explains how to access and view statistics to help you monitor and manage Oracle Communications Session Border Controller performance. Gathering statistical information to help monitor system performance effectively helps you decide on the actions you need to take to correct or improve system behavior. For example, you can access statistics to monitor the calls per second capability of the Oracle Communications Session Border Controller and make decisions based on that information.

You can collect performance data to establish a baseline before making changes to the system. This helps determine what effect the change has on performance. You can use the baseline to compare future trends. You can collect performance data on a daily, weekly, and monthly basis for trend analysis. This allows you to pro-actively solve problems before they result in degraded performance.

## Viewing System Information

This section explains how to access system level performance statistics. All the commands defined in this section are accessible in User mode.

#### **ACLI Credit Information**

Display the credit information, including the version number, for the ACLI that you are running on your system by using the **show about** command. This command also displays current third party licenses applicable to the software image you are running.

## User Privilege Mode

Display the current level of privilege at which the user is operating on the system by using the **show privilege** command.

```
ORACLE> show privilege
console user - privilege level 0
ORACLE>
```

Privilege level 0 means the current user is in User mode and privilege level 1 means the current user is in Superuser mode.

## **System Uptime**

Display information about the length of time the system has been running in days, hours, minutes, and seconds (as well as the current date and time) by using the **show uptime** command.

```
ORACLE# show uptime
FRI SEP 06 12:57:23 2002 - up 0 days, 22 hours, 58 minutes, 57 seconds
ORACLE#
```

#### **Current Date and Time**

Display the current date and time for your system by using the **show clock** command.

```
ORACLE# show clock
11:51:41 est TUE APR 03 2007
```

### **Software Release Current Version**

Display the version information for the release, including: the version number, the date that the current copy of the OS was made, and other information by using the **show version** command.

```
ACMESYSTEM# show version
ACME PACKET 4500 Firmware SCX6.3.0 GA (WS Build 299)
Build Date=04/14/12
```

## **Viewing System Resource Information**

This section explains how to access system resource statistics.

## **System Memory**

Display the memory statistics for the system by using the show memory command. It displays the number of bytes, the number of blocks, the average block size in both free and allocated memory, and the maximum block size of free memory in table form. In addition, it displays the number of blocks currently allocated, the average allocated block size, and the maximum number of bytes allocated at any given time (peak use, for example).

ow memory			
bytes	blocks	avg block	max block

moved	0		
Failures	0		
rors	0		
	bytes 	bytes blocks	bytes blocks avg block  826292736 179 4616160 211642160 3398 62284 448 2 224  212286912 5105 41584  211643792 ors: paired 0 Modified 0 moved 0 Failures 0

#### **Listing Memory Subcommands**

You can access a list of available **show memory** subcommands.

```
ORACLE# show memory ?
application application memory usage statistics
layer 2 cache status
```

13	layer 3 cache status
usage	memory usage statistics

### **Application Object Allocation and Use**

Display information about application object allocations and usage by using subcommands associated with the **show memory application** command.

ORACLE# show memory application 14:06:47-153								
Memory Statistics		Per	riod	Li	fetime			
-	Active	High	Total	Total	PerMax	High		
Processes	27	27	0	29	28	27		
Messages	3	4	12	23768	298	27		
Services	133	133	0	142	139	134		
Sockets	120	120	0	129	126	121		
Buffers	338	338	0	350	325	338		
Transactions	0	0	0	22	11	11		
Timed Objects	16164	16164	0	16486	16218	16176		
TOQ Entries	25	25	1893	4178055	1334	37		
SIP Messages	0	0	0	0	0	0		
MBC Messages	0	0	0	0	0	0		
Pipe Messages	30	30	0	30	30	30		
Message Blocks	0	0	0	0	0	0		

The following table lists and defines the subcommands of the **show memory application** command.

show memory application	Description
Subcommand	
Processes	Process object statistics
Message	Message class and all derived classes statistics
Services	Service class and all derived classes statistics
Sockets	ServiceSocket class and all derived classes statistics
Buffers	Malloced buffers in various classes statistics
Transactions	All classes derived from the transactions template statistics
Timed Objects	TimedObject class and all derived classes statistics
TOQ Entries	Timed out queue (TOQEntry) class statistics
SIP Messages	Sip request (SipReq) and SIP response (SipResp) entry classes statistics
MBC Messages	MbcpMessage class statistics
Pipe Messages	Pipe message class statistics

# **Memory Buffer**

Display memory buffer statistics information by using the **show buffers** command.

```
ORACLE# show buffers

type number

```

The first column of the two column list shows the type of buffer, and the second column shows the number of buffers of that type. The first line of the list shows the number of buffers that are free; all subsequent lines show buffers of each type that are currently in use. Next you see four lines that describe the total number of buffers and how many times the system failed, waited, or had to empty a protocol to find space.

Following this information, the next section of the displayed information shows the cluster pool table. The size column lists the size of the clusters. The clusters column lists the total number of clusters of a certain size that have been allocated. The free column lists the number of available clusters of that size. The usage column lists the number of times that clusters have been allocated (and not the number of clusters currently in use).

### **Control and Maintenance Interfaces**

Display all information concerning the system's control and maintenance interfaces by using the **show** interfaces command.

```
ORACLE# show interfaces

     0 input errors
     0 output errors
     0 collisions; 0 dropped
f01 (media slot 1, port 0)
     Flags: Down
    Type: GIGABIT ETHERNET
    Admin State: enabled
    Auto Negotiation: enabled
     Internet address: 10.10.0.11
                                      Vlan: 0
    Broadcast Address: 10.10.255.255
    Netmask: 0xffff0000
    Gateway: 10.10.0.1
    Ethernet address is 00:08:25:01:07:6a
    Metric is 0
    Maximum Transfer Unit size is 1500
     0 octets received
     0 octets sent
     0 packets received
     0 packets sent
     0 non-unicast packets received
     0 non-unicast packets sent
     0 unicast packets received
     0 unicast packets sent
     0 input discards
     0 input unknown protocols
     0 input errors
     0 output errors
     O collisions; O dropped
```

The following information is listed for each interface:

- Internet address
- broadcast address
- netmask

#### **Performance Management**

- subnet mask
- Ethernet address
- · route metric
- maximum transfer unit
- number of octets sent and received
- number of packets sent and received
- number of input discards
- number of unknown protocols
- number of input and output errors
- number of collisions
- number of drops
- flags (such as loopback, broadcast, promiscuous, ARP, running, and debug)

This command also displays information for loopback (internal) interfaces, which are logical interfaces used for internal communications.

You can also view key running statistics about the interfaces within a single screen by using the **show** interfaces [brief] command.

#### For example:

```
ORACLE# show interfaces brief
                                           Gateway
Address

```

## **Platform information**

## show platform cpu

The **show platform cpu** command displays an overview of the system's CPU(s), including number of CPUs, speed in MHz, model, flags, and CPU workload. For example:

```
ORACLE# show platform cpu

CPU count: 8

CPU speed: 2301 MHz

CPU model: Intel(R) Core(TM) i7-3615QE CPU @ 2.30GHz

CPU flags: fpu vme de pse tsc msr pae mce cx8 apic sep mtrr pge mca cmov pat pse36 clflush dts acpi mmx fxsr sse sse2 ss ht tm pbe syscall nx rdtscp lm constant_tsc arch_perfmon pebs bts rep_good nopl xtopology nonstop_tsc aperfmperf pni pclmulqdq dtes64 monitor ds_cpl vmx smx est tm2 ssse3 cx16 xtpr pdcm sse4_1 sse4_2 x2apic popcnt aes xsave avx f16c rdrand lahf_lm ida arat epb xsaveopt pln pts dts tpr_shadow vnmi flexpriority ept vpid fsgsbase smep erms

CPU workload:

Capacity: 80000 bogoMIPS

App load: 4599 bogoMIPS
```

## show platform cpu-load

Depending on platform, the show **show platform cpu-load** command displays 1 or 2 sets of CPU status statistics.

On VM and COTS platforms, the command displays a timestamp and the percentage of CPU consumed on each core during the last 10 second window using calculations similar to the linux top command.

On Acme platforms, the command omits the timestamp, displays CPU load as above, and also displays the load average for all CPUs and IO over time using 5 statistics, including:

### **Performance Management**

- 1. CPU and IO utilization in the last 1 minute
- 2. CPU and IO utilization in the last 5 minutes
- 3. CPU and IO utilization in the last 10 minutes
- 4. Number of currently running processes and the total number of processes
- 5. Last process ID used

## **Viewing Active Processes**

This section explains how to display statistics for active processes by displaying the task information for the system. By using the **show processes** command, you can view the system tasks in a table.

The information in this table is useful not only for viewing the process running on the system, but also for obtaining task names and identification numbers (TIDs in this table) for carrying out **notify** and **stop-task** commands.

This table contains the following information: names of tasks, entries, task identification codes, priority of a task, status, program counter, error numbers, and protector domain identification.

ORACLE# si TaskName Proc		roces: PPID		Status	EIP	Up Time	RSS(kb)	vMEM(kb)	
uscc	2115	1557	20	SLEEPING	7fe09fa86974	0:16:37.660	1366524	5932844	0

brokerd cliWorker collect cpu current ebmd h323d lemd lid mbcd pusher radd sipd snmpd	brokerd process statistics CliWorker process statistics Collector process statistics display CPU Usage current process statistics embd process statistics h323d process statistics lemd process statistics lid process statistics mbcd process statistics pusher process statistics radd process statistics sipd process statistics sipd process statistics snmpd process statistics
snmpd sysmand total	snmpd process statistics sysmand process statistics total process statistics
LULAI	rorat brocess starractos

The following table lists and defines the subcommands and additional capabilities of the **show processes** command.

show processes Subcommand	Description
sysmand	Statistics for the sysmand process, which is related to the system startup tasks. sysmand starts and keeps track of many of the system tasks. All application tasks send their system log messages to the sysmand task and all notify requests go through sysmand.
lemd	Statistics for the local element management (lemd) process, which is responsible for maintaining and providing local and remote access to data (including configuration and policy data) stored in the system.
brokerd	Statistics for the brokerd process, which is a log concentrator and sequencer used for forwarding path and hardware monitor tasks.
mbcd	Statistics for the mbcd process, which is the process for the middlebox control daemon. It provides signalling applications with the ability to dynamically manage (crete, modify, delete, and receive flow event notifications) NAT entries (pinholes) for media flows via the MIBOCO protocol.
sipd	Statistics for sipd process statistic, which acts as a SIP server that receives and forwards them on the behalf of the requestor. sipd is responsible for processing SIP (RFC 3261) messages. It NATs the Layer 5 signaling content (for example, SIP message headers) and manages the associated media flows via tMBCD.
current	Current statistics for all processes.
total	Total statistics for all processes.
all	All statistics for all processes.
cpu	Percentage of CPU utilization by all processes.

# **Viewing Statistics for all Processes**

Display the statistics for all processes by using the **show processes all** command.

### ORACLE# show processes all

### **Checking Remaining Space**

Check the amount of storage space is available on the flash file system on the following devices by using the **check-space-remaining** command:

- /boot
- /code
- /crash
- /opt
- the data-disk, system-disks or a combination

For example:

```
ORACLE# check-space-remaining boot
boot: 20127744/29760512 bytes (67%) remaining
```

# **SMP-Aware Task Load Limiting**

The ability to manage CPU load is critical for highly available devices. SMP architectures require unique load limiting because a task's threads may be spread out over several cores. The Acme Packett 6300 employs a method of determining aggregate load in its SMP environment so that resources may be evenly spread across all CPUs and applications can decrease their load when necessary. In turn, traffic may be dropped or rejected depending on the application to reduce the CPU load to an acceptable value.

Load limiting can be performed on three fundamental processing areas of the Oracle Communications Session Border Controller:

- Transport Limiting When the system's CPU load rises above the transport limiting value, traffic received from endpoints is dropped. The Acme Packet 6300 scales back the load of the processes where network packets (TCP, SCTP, and UDP) are disassembled.
- SIP Limiting When the system's CPU load rises above the SIP limiting value, session-oriented SIP requests can be gracefully rejected or dropped. The Oracle Communications Session Border Controller

responds to SIP requests with 488 Too Busy Here. This helps the Acme Packet 6300 scale back the load that SIP applications consume.

Media Limiting — When the system's CPU load rises above the Media limiting value, the process that
creates end-to-end media interface connections begins to drop requests (changes to existing transport
sessions can still occur) thereby reducing CPU load. The Acme Packet 6300 replies to SIP requests that
initiate transport sessions with 503 Service Unavailable (this would typically be an INVITE with SDP).

### **Transport Limiting Configuration**

To set transport application load limiting:

1. In Superuser mode, type **configure terminal** and press Enter.

```
ORACLE# configure terminal
ORACLE(configure)#
```

2. Type system and press Enter.

```
ORACLE(configure) # system
ORACLE(system) #
```

3. Type system-config and press Enter.

```
ORACLE(system) # system-config
ORACLE(system-config) #
```

From this point, you can configure system-config configuration parameters. To view all system-config parameters, enter a ? at the system prompt.

**4. options**—Set the options parameter by typing **options**, a Space, the option name **transportload-limit=<value>** with a plus sign in front of it, and then press Enter.

```
ORACLE (media-manager) # options +transport-load-limit=80
```

Set this option's value to between 10 and 100 to set the CPU load point at which the transport application threads begin rejecting requests to disassemble packets. A value of 0 disables transport load limiting.

If you type the option without the plus sign, you will overwrite any previously configured options. In order to append the new options to the realm configuration's options list, you must prepend the new option with a plus sign as shown in the previous example.

5. Save and activate your configuration.

#### **SIP Application Limiting Configuration**

To set SIP Application load limiting:

1. In Superuser mode, type **configure terminal** and press Enter.

```
ORACLE# configure terminal
ORACLE(configure)#
```

2. Type session-router and press Enter to access the system-level configuration elements.

```
ORACLE(configure) # session-router
ORACLE(session-router) #
```

**3.** Type **sip-config** and press Enter. The system prompt changes.

```
ORACLE(session-router) # sip-config
ORACLE(sip-config) #
```

From this point, you can configure SIP configuration parameters. To view all sip-config parameters, enter a ? at the system prompt.

4. options—Set the options parameter by typing options, a Space, the option name load-limit=<value> with a plus sign in front of it, and then press Enter.

```
ORACLE (media-manager) # options +load-limit=80
```

Set the option's value to between 10 and 100 to set the CPU load point at which the SIP application threads begin rejecting requests. A value of 0 disables SIP task limiting.

If you type the option without the plus sign, you will overwrite any previously configured options. In order to append the new options to the realm configuration's options list, you must prepend the new option with a plus sign as shown in the previous example.

5. Save and activate your configuration.

### **Media Limiting Configuration**

To set Media load limiting:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal ORACLE(configure)#
```

2. Type media-manager and press Enter to access the media-level configuration elements.

```
ORACLE(configure) # media-manager
ORACLE(media-manager) #
```

**3.** Type **media-manager** and press Enter to begin configuring media over TCP.

```
ORACLE (media-manager) # media-manager
ORACLE (media-manager-config) #
```

From this point, you can configure media-manager-config configuration parameters. To view all media-manager-config parameters, enter a ? at the system prompt.

4. options — Set the options parameter by typing options, a Space, the option name media-load-limit=<value> with a plus sign in front of it, and then press Enter.

```
ORACLE (media-manager) # options +media-load-limit=80
```

Set the option's value to between 10 and 100 to set the CPU load point at which the media traffic setup begin rejecting requests. A value of 0 disables media task limiting.

If you type the option without the plus sign, you will overwrite any previously configured options. In order to append the new options to the realm configuration's options list, you must prepend the new option with a plus sign as shown in the previous example.

5. Save and activate your configuration.

# Viewing Redundancy Statistics

This section explains how to check the redundancy status for Acme Packet High Availability (HA) pairs by using the show redundancy command. Viewing the redundancy statistics provides the following information:

- General HA statistics
- Statistics related to HA transactions that have been processed
- Numerical identifier for the last redundant transaction processed (each transaction is numbered)

In an HA architecture that is functioning properly, the number for the last redundant transaction processed on a standby Oracle Communications Session Border Controller peer should not be far behind (if not exactly the same as) the one shown for the active Oracle Communications Session Border Controller peer.

The **show redundancy** command's output displays a time stamp showing when the current period began, the statistics and transactions for high availability and the numerical identifier for the last redundant transaction processed.

## **Accessing Redundancy Subcommands**

The following example shows the **show redundancy** subcommands. You can display the redundancy statistics for the Middlebox Control (MBC), SIP and for the configuration.

ORACLE# show redundancy ?	
collect	Collect Redundancy Statistics
config	Configuration Redundancy Statistics
link	Shows Link Redundancy Configuration
mbcd	MBC Redundancy Statistics
radius-cdr	Radius CDR Redundancy Statistics
rotated-cdr	Rotated Radius CDR Redundancy Statistics
sipd	SIP Redundancy Statistics

### **Configuration Checkpoint Example**

The following example shows the configuration checkpointing statistics you can display by using the **show redundancy config** subcommand.

config								
	Period	Li	fetime -					
ve Hig	h Total	Total	PerMax	High				
0	0 0	5	2	1				
_	- 0	0	0					
1	1 44	593	78	27				
0	0 0	0	0	0				
	Lifet:	ime						
Recent	Total							
44	593	78						
0	2	1						
44	593	78						
0	0	0						
0	0	0						
0	0	0						
0	0	0						
0	0	0						
0	0	0						
Last redundant transaction processed: 5								
	ve Hig 0 - 1 0 Recent 44 0 44 0 0 0	Period  ve High Total  0	Period Li  ve High Total Total  0 0 0 5  - 0 0 0  1 1 44 593  0 0 0 0 0  Lifetime  Recent Total PerMax  44 593 78  0 2 1  44 593 78  0 0 1  44 593 78  0 0 0  0 0  0 0  0 0  0 0  0 0  0 0	Period Lifetime  ve High Total Total PerMax  0 0 0 5 2  - 0 0 0 0  1 1 44 593 78  0 0 0 0 0  Lifetime  Recent Total PerMax  44 593 78  0 2 1  44 593 78  0 0 2 1  44 593 78  0 0 0 0  0 0 0  0 0 0  0 0 0	Period Lifetime  ve High Total Total PerMax High  0 0 0 5 2 1  0 0 0 0  1 1 44 593 78 27  0 0 0 0 0 0 0  Lifetime  Recent Total PerMax  44 593 78  0 2 1  44 593 78  0 0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0  0 0 0			

# **About High Availability Transactions**

The following table lists the redundancy statistics for the HA transactions for the Lifetime monitoring span. A standby Oracle Communications Session Border Controller always acts as the client side in a client-server relationship with an active Acme Packet SD peer and an active Oracle Communications Session Border Controller acts as the server. The standby Oracle Communications Session Border Controller peer always sends HA requests to its active Oracle Communications Session Border Controller peer, which always acts as receiver of HA transactions from the standby peer.

Statistic	Description
Queued entries	Number of transactions the active Oracle Communications Session Border Controller has not yet sent to its standby Oracle Communications Session Border Controller peer.
Red Records	Total number of HA transactions created. This set of statistics should be the same as those for Queued entries.

Statistic	Description
Records Dropped	Number of HA transaction records that were lost (i.e., dropped) because the standby Oracle Communications Session Border Controller fell behind in synchronization.
Server Trans	This statistic shows the number of HA transactions in which the Oracle Communications Session Border Controller acted as the server side in the client-server relationship. The active HA Oracle Communications Session Border Controller peer is the server.
Client Trans	This statistic shows the number of HA transactions in which the Oracle Communications Session Border Controller acted as the client side in the client-server relationship. The standby HA Oracle Communications Session Border Controller peer is the client.

## **Viewing Border Element Redundancy Protocol Information**

You can view Border Element Redundancy Protocol statistics by using the **show berpd** command.

The border element redundancy protocol responds to alarms, advertisements, and checkpointing. This protocol manages switchovers between active and standby Oracle Communications Session Border Controllers and checkpoints health, media flow, and signaling state information. Using the border element redundancy protocol, HA Oracle Communications Session Border Controller peers communicate through their configured interfaces with User Datagram Protocol (UDP) messages.

In HA operation, each HA Oracle Communications Session Border Controller peer in an HA Oracle Communications Session Border Controller pair uses the border element redundancy protocol to advertise its current state and health so that an active peer can be elected. Using the border element redundancy protocol, HA Oracle Communications Session Border Controller peers communicate with UDP (advertisement or checkpoint) messages which are sent out on one or more rear interfaces (destinations). These checkpoint messages are sent by both HA Oracle Communications Session Border Controller peers in the HA Oracle Communications Session Border Controller pair on a regular basis.

The border element redundancy protocol is sometimes referred to as BERP (e.g., the berpd task/process) by the internal system components

# **Viewing Redundancy Health**

In HA architectures, the **show health** command displays the following information:

Health score

The health score of a Oracle Communications Session Border Controller is used to determine the active/standby roles of the Oracle Communications Session Border Controllers participating in an HA pair architecture. The healthiest Oracle Communications Session Border Controller peer (the Oracle Communications Session Border Controller peer with the highest health score) is the active Oracle Communications Session Border Controller peer. The Oracle Communications Session Border Controller peer with the lower health score is the standby Oracle Communications Session Border Controller peer.

The health score is based on a 100-point scoring system. When all system components are functioning properly, the health score of the system is 100.

If the health score of an active Oracle Communications Session Border Controller peer drops below a configurable threshold, the standby Oracle Communications Session Border Controller peer takes control and initiates an automatic switchover (assumes the active role). The standby Oracle Communications Session Border Controller peer only takes over the active role if its own health score is greater than that of the active Oracle Communications Session Border Controller peer. In the case where an active Oracle Communications Session Border Controller's health score has reached an unsatisfactory level and therefore the standby Oracle Communications Session Border Controller has

taken over, the Oracle Communications Session Border Controller that was originally active assumes the role of the standby system.

- Whether the current HA Oracle Communications Session Border Controller is active, standby, or out of service
- The last 20 switchover events in the switchover log

### **HA States**

Refer to the following table for information about each potential HA state.

State	Description
Initial	HA Oracle Communications Session Border Controller is booting and looking for its configured peers.
BecomingActive	HA Oracle Communications Session Border Controller has negotiated to become the active system, but it is waiting for the length of time equal to its configured becoming-active-time to become fully active.
	It is important to note that packets cannot be processed in this state. An HA Oracle Communications Session Border Controller must be in the Active state before packet processing can occur.
Active	HA Oracle Communications Session Border Controller has waited for the length of time set in the becoming-active-time field and is healthy enough.
	This HA Oracle Communications Session Border Controller is handling all media flow and signaling processing.
RelinquishingActive	HA Oracle Communications Session Border Controller has been in the Active state, but has begun the switchover process to the Standby state. This state is very brief (i.e., the HA Oracle Communications Session Border Controller quickly transitions from the Active state through the RelinquishingActive state to the BecomingStandby state).
BecomingStandby	HA Oracle Communications Session Border Controller has negotiated to become the standby system, but is waiting to become synchronized and fully standby. It remains in this state for the length of time equal to its configured becoming-standby-time.
Standby	HA Oracle Communications Session Border Controller is fully synchronized with an active peer.
OutOfService	HA Oracle Communications Session Border Controller is not able to synchronize with its peer within the length of time set in the becoming-standby-time field. The HA Oracle Communications Session Border Controller can only transition to this state from the BecomingStandby state.
	An active Oracle Communications Session Border Controller will consider its HA Oracle Communications Session Border Controller peer to be in this state if the peer has timed out and not sent a checkpoint message to the active peer within a time period (equal to the percent-drift value multiplied by the advertisement-time value).

# **Command Examples**

Display information about redundancy health by using the **show health** command. (available in User Mode)

#### Active

The following example shows a currently active Oracle Communications Session Border Controller.

```
ORACLE# show health
        Media Synchronized
                                          enabled
        SIP Synchronized
                                         enabled
        Config Synchronized enabled
Collect Synchronized enabled
Radius CDR Synchronized enabled
Rotated CDRs Synchronized enabled
        Active Peer Address
                                          163.4.12.2
Redundancy Protocol Process (v2):
        State
                                            Active
        Health
                                            100
        Lowest Local Address
                                            11.0.0.1:9090
        1 peer(s) on 1 socket(s):
        systest3B: v2, Standby, health=100, max silence=1050
                   last received from 11.0.0.2 on wancom1:0
        Switchover log:
        Jul 11 14:18:21.442: Active to RelinquishingActive
        Jul 11 14:24:00.872: Standby to BecomingActive, active
                  systest3B has timed out. The following example that follows
peer
                 currently standby Oracle Communications Session Border
shows a
Controller.
```

### Standby

The following example shows a becoming standby Oracle Communications Session Border Controller.

```
ORACLE# show health
       Media Synchronized
                                      true
       SIP Synchronized
                                     disabled
       Config Synchronized
                                     true
       Active Peer Address
                                      0.0.0.0
Redundancy Protocol Process (v2):
       State
                                      Active
       Health
                                       100
       Lowest Local Address
                                      11.0.0.1:9090
       1 peer(s) on 1 socket(s):
       systest3B: v2, Standby, health=100, max silence=1050
                 last received from 11.0.0.2 on wancom1:0
       Switchover log:
       Jul 11 14:18:21.442: Active to RelinquishingActive
       Jul 11 14:24:00.872: Standby to BecomingActive, active peer systest3B
has timed out
ORACLE2#
```

The following table lists the health statistics along with a brief description.

Statistic	Description
Media Synchronized	Whether or not the media flow is synchronized for both supported protocols: SIP and H.323, (true/false). If media flow information is not available, the Media Synchronized displayed message is displayed in the show health output.
SIP Synchronized	Whether or not SIP signaling information is synchronized (true/false). If SIP signaling is not available, the SIP Synchronized disabled message is displayed in the show health output.
Config Synchronized	Whether or not configuration information is synchronized (true/false).
Active Peer Address	IPv4 address of the current HA Oracle Communications Session Border Controller's active peer (an HA Oracle Communications Session Border

### **Performance Management**

Statistic	Description
	Controller that is currently active does not have an active Oracle Communications Session Border Controller peer and will show 0.0.0.0)

# **Viewing Routing Statistics**

This section explains how to view the routing statistics.

## **Viewing Routing Table Entries**

Display entries in the routing table by using the **show routes** command. The routing table displays IP layer information about the destination, mask, TOS, gateway, flags, reference count, use, interface, and protocol information.

ORACLE# show route	es						
Destination/Pfx	Gateway	Flags	RefCnt	Use	Proto	Tos	I/f
0.0.0.0/0	172.30.0.1	2010003	0	0	1	0	wancom0
10.0.0.0/16	172.30.0.1	2010003	1	0	1	0	wancom0
10.0.200.164	172.30.0.1	2020007	1	13801	2	0	wancom0
127.0.0.1	127.0.0.1	2200005	82	36220	2	0	100
172.30.0.0/16	172.30.55.127	2000101	2	0	2	0	wancom0

## **Viewing Routing Stats**

Display statistics for the application layer routes shown in the routing table by using the **show route**-**stats** command.

```
ORACLE# show route-stats
routing:

0 bad routing redirect
3 dynamically created route
1 new gateway due to redirects
9 destinations found unreachable
2 use of a wildcard route

ORACLE#
```

# **Testing Routing Policies**

Use the **test policy** command to test application layer routes from the ACLI by specifying a from and to address. You can also specify a source realm, time of day, and carriers.

The **test-policy** command works similarly to the way a configuration element does. This command allows you to test and display local policy routes from the ACLI by specifying From and To addresses. After you have entered these addresses, use the **show** command to perform the actual lookup.

```
ORACLE# test-policy ?
                               sets list of permitted carriers
carriers
from-address
                              From address list
media-profiles
                              list of media profiles
show
                              shows local policy test results
source-realm
                              Source realm
time-of-day
                              enables/disables time of day
to-address
                              To address
exit
                              end test
```

The following table lists the test-policy specification formats.

Specification	Format
source-realm	A string that indicates the name set in the source-realm field of a configured local-policy element. If you enter a "*" in this specification, any configured source realms will be matched. An empty source-realm value indicates that only the global realm will be tested
time-of-day	A Boolean value that can be set to either enabled or disabled that indicates whether or not to use the time of day value set in the start-time and end-time fields set in configured local-policy elements
carriers	A list of comma-separated text strings enclosed in quotation marks of the names of permitted carriers set in the carriers fields set in configured local-policy elements.

### **Test Policy Subcommands**

The following table lists and describes the **test-policy** subcommands.

test-policy Subcommand	Description
from-address	Set the From address of the local policy you want to look up/test. From addresses should be entered as SIP-URLs (e.g., sip: 19785551212@netnetsystem.com).
to-address	Set the To address of the local policy you want to look up/test. To addresses should be entered as SIP-URLs (for example, sip: 19785551212@netnetsystem.com).
show	Performs the actual policy lookup and shows the next hop and the associated carrier information for all routes matching the From and To addresses entered.
exit	Exits the test-policy session.

# **Testing Address Translations**

Oracle Communications Session Border Controller number translation is used to change a Layer-5 endpoint name according to prescribed rules. Number translations can be performed on both the inbound and the outbound call legs independently, before and after routing occurs. Number translation is used for SIP, H.323, and SIP/H.323 interworking. configurations.

ORACLE# test-translation	
called-address	called address
calling-address	calling address
show	shows local translation test results
translation-id	Translation Id
exit	end test

# **Viewing QoS Based Routing Statistics**

You can view statistics about QoS based routing for realms, and see what realms are in service or whether a call load reduction has been applied. In the ACLI **show realms** display, the following values show you QoS based routing information:

- QoS Major Exceeded
- QoS Critical Exceeded
- QoS R-Factor Avg.

You can see these statistics in the following example of a **show realm** display:

ORACLE# show realm	. 0+-+'							
13:34:24-167 Realm	n Statis		D '	-1		T ! C !		
Realm	7 0+ 1					- Lifeti	_

# **Local Route Table Statistics and Management**

This section ACLI commands that have been added so that you can troubleshooting this feature, and view monitoring statistics and other information about it.

# **Setting the Log Level**

Log files for the local routing system task are log.lrtd and lrt.log. The lrt.log file contains the DNS request and response communication between the system's SIP and local routing tasks.

Using the new ACLI **notify lrtd** command, you can set the local routing task's log level to any of the following:

- log
- nolog
- debug
- nodebug

To set the log level for the local routing task:

In Superuser mode, type **notify 1rtd**, followed by the log level you want to set. Then press Enter.

ORACLE# notify 1rtd log

## **Updating the Local Cache**

When you want to update the cache file with new entries, delete old ones, or edit existing entries, you can refresh the local cache for a specific local routing policy.

To update the cache file for a local routing policy:

In Superuser mode, type **notify lrtd refresh**, followed by the name of the local routing policy you want updated.

```
ORACLE# notify 1rtd refresh lookup
```

## Testing a Lookup in the Local Cache

To test a lookup in the local cache:

In User or Superuser mode, enter the **show enum lookup lrt=** command. After the equal sign (=), type the name of the local routing configuration you want to test followed by a Space. Then type in the E.164 number you want to look up, and press Enter.

## Displaying a Route Entry in the Local Cache

To see a route entry in the local cache:

In User or Superuser mode, enter the **show lrt route-entry** command. Then type in the name of the local routing configuration, a Space, the key you want to use, and then press Enter.

```
ORACLE# show lrt route-entry lookup 123
UserName <123>
User Type= E164
NextHop= !^.*$!sip:123@192.168.1.191!
NextHop Type= regexp
```

# **Displaying Statistics for a Local Route Tables**

There are two ways to see statistics for local route tables:

- Collectively—Viewing all of the statistics for all of the local route tables at once (using the **show lrt stats** command)
- Individually—Viewing the statistics for a local route table that you specify (using the **show lrt stats** command with the name of a specific local routing configuration)

The Oracle Communications Session Border Controller shows you the following information:

- Queries—Number of queries from the application includes those that resulted in a cache hit, and those that caused an actual query to be sent
- Success—Number of successful results; includes cache hits and queries sent
- NotFound—Number of note found results; includes cache hits and queries sent
- Number of Valid Entries—Total number of valid entries in the cache
- Number of Invalid Entries—Total number of invalid entries in the cache
- Last Modified—Date and time the cache was last modified

## **Resetting ENUM Statistic Counters**

To clear statistics for ENUM, you can use the ACLI **reset** command. Before you reset the counters, however, you might want to confirm the current statistics on the system are not zero. You can do so using the show command—by typing, for example, **show enum stats**.

The **reset** command takes the ENUM arguments to clear those sets of statistics. When you use the command, the system notifies you whether it has successfully cleared the statistics (even if the counter are zero) or if it has run into an error causing the command to fail.

You can **reset all** system statistics using the reset all command.

The ENUM example confirms successful completion of the command.

To clear ENUM statistics:

At the command line, type **reset enum** and then press Enter.

```
ORACLE# reset enum
Successful reset of the ENUM Agent stats
```

# **Viewing SIP Protocol Performance Statistics**

This section contains the commands you use to access SIP protocol statistics. These statistics provide information about the SIP protocol performance.

## **Accessing SIP Statistics**

You can access SIP statistics for both client and server SIP transactions by using the **show sipd** command. You can then use additional subcommands to display more specific information, including specific types of SIP messages.

### **Example**

The following example show s the output of the **show sipd** command.

ORACLE# show sij	pd						
14:10:32-178							
SIP Status		Per	iod	Li	ifetime -		
	Active	High	Total	Total	PerMax	High	
Sessions	0	0	0	0	0	0	
Subscriptions	0	0		0	0	0	0
Dialogs	0	0	0	0	0	0	
CallID Map	0	0	0	0	0	0	
Rejections	_	_	0	0	0		
ReINVITEs	_	_	0	0	0		
Media Sessions	0	0	0	0	0	0	
Media Pending	0	0	0	0	0	0	
Client Trans	0	0	0	0	0	0	
Server Trans	0	0	0	0	0	0	
Resp Contexts	0	0	0	0	0	0	
Saved Contexts	0	0	0	0	0	0	
Sockets	0	0	0	0	0	0	
Req Dropped	_	_	0	0	0		
DNS Trans	0	0	0	0	0	0	
DNS Sockets	0	0	0	0	0	0	
DNS Results	0	0	0	0	0	0	
Session Rate = 0	0.0						
Load Rate = $0.0$							

The display organizes the SIP transaction statistics for the system into two categories: Client Trans(actions) and Server Trans(actions). The remainder of the display provides information regarding dialogs, sessions, sockets, and DNS transactions.

## **Viewing SIP Status Information**

The following example shows the output of the **show sipd status** command.

ORACLE# show sip	d status					
14:11:15-121 SIP Status		Per	iod	T.i	fetime	
	Active	High	Total		PerMax	High
Sessions	0	0	0	0	0	0
Subscriptions	0	0	0	0	0	0
Dialogs	0	0	0	0	0	0
CallID Map	0	0	0	0	0	0
Rejections	-	-	0	0	0	
ReINVITEs	-	-	0	0	0	
Media Sessions	0	0	0	0	0	0
Media Pending	0	0	0	0	0	0
Client Trans	0	0	0	0	0	0
Server Trans	0	0	0	0	0	0
Resp Contexts	0	0	0	0	0	0
Saved Contexts	0	0	0	0	0	0
Sockets	0	0	0	0	0	0
Req Dropped	_	_	0	0	0	
DNS Trans	0	0	0	0	0	0
DNS Sockets	0	0	0	0	0	0
DNS Results	0	0	0	0	0	0
Replaced Dialogs		-	Ţ	Ţ	1	
Session Rate = 0	. 0					
Load Rate = $0.0$						

The following table lists the SIP status statistics.

Statistic	Description
Dialogs	Number of SIP signaling connections between the Oracle Communications Session Border Controller and a SIP UA (for example, a call leg)
Sessions	Number of sessions established by an INVITE request. A session consists of all dialogs created by one INVITE transaction.
Sockets	Number of active SIP communication ports (the number of open UDP and TCP sockets)
DNS Transactions	Number of outstanding DNS requests

# **Viewing SIP Performance Statistics**

The following example shows the subcommands available for the **show sipd** command.

### show sipd all

Display information for many of the subcommands by using the **show sipd** command. The following information is returned:

- SIP status
- SIP media events
- SIP server transactions
- SIP client transactions
- SIP messages and events, including: INVITEs, REGISTERs, OPTIONS, CANCELs, BYEs, ACKs, INFOs, PRACKs (provisional ACKs), SUBSCRIBEs, NOTIFYs, REFERs, and UPDATEs

**Note:** Only statistics for those SIP messages and events that have traversed the system will be displayed.

The **show sipd** command, when issued with the appropriate message name, lets you view information about individual types of SIP messages including: INVITEs, REGISTERs, OPTIONS, CANCELs, BYEs, ACKs, INFOs, PRACKs (provisional ACKs), SUBSCRIBEs, NOTIFYs, REFERs, and UPDATEs.

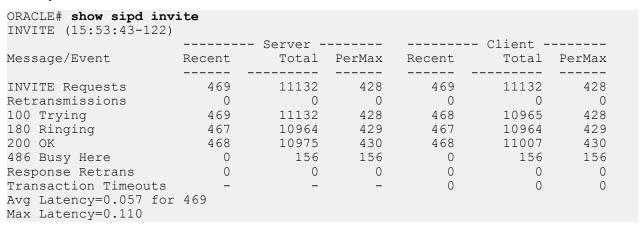

- show sipd invite
- show sipd ack

### **Performance Management**

- show sipd bye
- show sipd register
- · show sipd cancel
- · show sipd prack
- show sipd options
- show sipd info
- show sipd notify
- show sipd refer
- show sipd subscribe
- show sipd update
- show sipd other

For each type of SIP message, only those transactions for which there are statistics will be shown.

### **Example**

**Note:** If there is no data available for a certain SIP message, the system displays the fact that there is none and specifies the message about which you inquired.

#### **About the Information**

The information is divided in two sections: **Server** and **Client** and includes information for recent, total, and period maximum messages or events.

- **Recent**: number of specific SIP messages and/or events that occurred within the current time period—in one-second increments, and always is between 100 and 199 and never below 100, constituting a 100-200 second recent period. This is done in order to keep the statistics from zeroing out between transition periods
- **Total**: current number of SIP messages and/or events that occurred since the system was last rebooted.
- **PerMax**: maximum number of SIP messages and/or events that occurred during a single time period since the system was last rebooted.

This display also shows information regarding the average and maximum latency.

#### **Viewing Statistics for Other SIP Methods**

Display statistics for other SIP methods by using the **show sipd other** command.

# SIP Monitoring by Transaction Type

You can view statistics about SIP monitoring by transaction type.

### **SIP Server Transactions**

Display statistics SIP server transactions by using the **show sipd server** command.

ORACLE# show sipd serv 15:40:05-65	er				
SIP Server Trans	Pe	riod	Lifetime		
Active	High	Total	Total	PerMax	High
All States 0	346	2213	67975	3729	365
<initial> 0</initial>	1	2213	67975	3729	1
<trying> 0</trying>	48	1504	44773	2431	63
<proceeding> 0</proceeding>	9	709	23202	1310	9
<cancelled> 0</cancelled>	2	75	1370	182	4
<established> 0</established>	2	545	20201	971	3
<completed> 0</completed>	148	959	24572	1489	149
<confirmed> 0</confirmed>	157	716	23202	1309	161
<terminated> 0 ORACLE#</terminated>	1	545	20201	972	1

The following table lists the specifics along with a brief description.

Statistic	Description
All States	Total number of all server transactions.
Initial	State when the server transaction is created after a request is received.
Trying	Number of times the 100 Trying message has been sent, meaning that a request has been received and action is being taken.
Proceeding	Number of times a server transaction has been constructed for a request.
Cancelled	Number of INVITE transactions for which the system receives a CANCEL.
Established	Situation in which the server sends a 2xx response to an INVITE.
Completed	Number of times that the server has received a 300 to 699 status code and therefore entered the completed state.
Confirmed	Number of times that an ACK was received while the server was in the completed state and therefore transitioned to the confirmed state.
Terminated	Number of times that the server has received a 2xx response or has never received an ACK while in the completed state, and has therefore transitioned to the terminated state.

## **SIP Client Transactions**

Display statistics for SIP client transactions by using the **show sipd client** command.

ORACLE# show s 15:40:09-69	ipd client					
SIP Client Tra	ns	Pei	ciod	Lifetime		
	Active	High	Total	Total	PerMax	High
All States	0	382	2042	64973	3371	387
<initial></initial>	0	1	2042	64973	3371	2
<trying></trying>	0	128	1333	41771	2073	128
<calling></calling>	0	2	709	23202	1310	2
<proceeding></proceeding>	0	8	613	21570	1130	9
<cancelled></cancelled>	0	2	75	1370	182	4
<earlymedia></earlymedia>	0	0	0	0	0	0
<completed></completed>	0	146	959	24571	1489	167
<setmedia></setmedia>	0	2	545	20201	972	2
<established></established>	0	127	545	20201	971	127

The following table lists the statistics along with a brief description.

Statistic	Description
All States	Total number of all client transactions.
Initial	State before a request is sent out.
Trying	Number of times the trying state was entered due to the receipt of a request.
Calling	Number of times that the calling state was entered due to the receipt of an INVITE request.
Proceeding	Number of times that the proceeding state was entered due to the receipt of a provisional response while in the calling state.
Early Media	Number of times that the proceeding state was entered due to the receipt of a provisional response that contained SDP while in the calling state.
Completed	Number of times that the completed state was entered due to the receipt of a 300 to 699 status code when either in the calling or proceeding state.
SetMedia	Number of transactions in which the system is setting up NAT and steering ports (setting up the steering of the RTP flow).
Established	Number of situations in which the client receives a 2xx response to an INVITE, but can not forward it on because it requires NAT and steering port information.
Terminated	Number of times that the terminated state was entered due to the receipt of a 2xx message.

# **Viewing SIP Media Event Errors**

Display statistics for SIP media event errors by using the **show sipd errors** command.

ORACLE# show sipd erre	ors				
13:06:59-159					
SIP Errors/Events	SIP Errors/Events Lifetime				
	Recent	Total	PerMax		
SDP Offer Errors	0	0	0		
SDP Answer Errors	0	0	0		
Drop Media Errors	0	0	0		
Transaction Errors	0	0	0		
Application Errors	0	0	0		
Media Exp Events	0	0	0		
Early Media Exps	0	0	0		
Exp Media Drops	0	0	0		
Expired Sessions	0	0	0		
Multiple OK Drops	0	0	0		
Multiple OK Terms	0	0	0		
Media Failure Drops	0	0	0		
Non-ACK 2xx Drops	0	0	0		
Invalid Requests	0	0	0		
Invalid Responses	0	0	0		
Invalid Messages	0	0	0		
CAC Session Drop	0	0	0		
CAC BW Drop	0	0	0		
Replace Dialog Fails	0	0	0		

### The information displayed is divided into the following categories:

- **Recent**: number of errors that occurred within the number of seconds defined by the figure that appears directly after the time. In the example above, the Recent period of time is 60 seconds.
- **Total**: number of errors that occurred since the system was last rebooted.
- **PerMax**: period maximum number of errors that occurred since the system was last rebooted. This value identifies the highest individual Period Total value calculated over the lifetime of the monitoring.

These statistics record exceptional events encountered by the SIP application in processing SIP media sessions, dialogs, and sessions descriptions (SDP). Serious errors will be accompanied by a log message in <code>log.sipd</code> and <code>acmelog</code> (depending of the current <code>log level</code> setting) of the appropriate severity which will indicate the nature of the error.

Statistic	Description
SDP Offer Errors	Number of errors encountered in setting up the media session for a session description in a SIP request or response which is an SDP Offer in the Offer/Answer model defined in RFC 3264. This may be a failure to send the transaction to MBCD or an error response from MBCD. These errors may also be counted in one of the show mbcd errors.
SDP Answer Errors	Number of errors encountered in setting up the media session for a session description in a SIP request or response which is an SDP Answer in the Offer/Answer model (RFC 3264). This may be a failure to send the transaction to MBCD or an error response from MBCD. These errors may also be counted in the show mbcd errors.
Drop Media Errors	Number of errors encountered in tearing down the media for a dialog or session that is being terminated due to: a) non-successful response to an INVITE transaction; or b) a BYE transaction received from one of the participants in a dialog/session; or c) a BYE initiated by the Oracle Communications Session Border Controller due to a timeout notification from MBCD. This may be a failure to send the transaction to MBCD or an error response from MBCD. These errors may also be counted in the show mbcd errors.
Transaction Errors	Number of errors in continuing the processing of the SIP client transaction associated with setting up or tearing down of the media session.
Missing Dialog	Number of requests received by the SIP application for which a matching dialog count not be found. Usually, this event will also be counted as a 481 (Does Not Exist) server response for the method of the SIP request. This event will occur quite often particularly when both endpoints send a BYE request at approximately the same time.
Application Errors	Number of miscellaneous errors that occur in the SIP application that are otherwise uncategorized.
Media Exp Events	Number of flow timer expiration notifications received from MBCD. These may be fairly common particularly if endpoints stop sending media (or do not start sending media) without sending the appropriate signaling message (BYE) to terminate the dialog/session. These events may also be counted in the show mbcd errors.
Early Media Exps	Number of flow timer expiration notifications received for media sessions that have not been completely set up due to an incomplete or still pending INVITE transaction (e.g., 200 OK response to the INVITE has not been received yet). This can occur if an INVITE transaction takes longer than the initial-guard-timer or subsq-guard-timer fields defined in the media-manager-config element. This event does not result in the dialog/session being terminated if the INVITE is still pending. Note that this statistic is a subset of the Media Exp Events above.

# **Performance Management**

Statistic	Description
Exp Media Drops	Number of flow timer expiration notifications from MBCD which resulted in the SIP application terminating the dialog/session.
Multiple OK Drops	Number of dialogs that were terminated upon reception of a 200 OK response from multiple UASs for a given INVITE transaction which was forked by a downstream proxy. When multiple UASs accept an INVITE with a 200 OK responses, only the first one is passed on by the Oracle Communications Session Border Controller. If the subsequent 200 OK were processed and passed on the media session established by the first 200 OK would be disrupted. The Oracle Communications Session Border Controller will ACK the 200 OK response and then send a BYE request to terminate the dialog for the subsequent 200 OK response. The proscribed behavior for the proxy is to cancel outstanding branches of the fork when a 200 OK is received. However, there is a race condition where a subsequent 200 OK is generated by a UAS before the CANCEL reaches the UAS.
Multiple OK Terms	Number of dialogs that were terminated upon reception of a 200 OK response which conflicts with an existing established dialog on the Oracle Communications Session Border Controller. This is similar to the Multiple OK Drops statistic. The difference is that an upstream proxy forked the INVITE resulting in multiple INVITE transactions which have the same Call-ID and session description (SDP). The Oracle Communications Session Border Controller will accept only the first 200 OK received. If the subsequent 200 OK were processed, the media session established by the initial 200 OK would be disrupted. The Oracle Communications Session Border Controller will ACK the 200 OK response and then send a BYE request to terminate the dialog for the subsequent 200 OK response. The Oracle Communications Session Border Controller will send a 487 (Terminated) response upstream in order to complete the client transaction which conflicted with an established dialog. The prescribed behavior for the proxy is to cancel outstanding branches of the fork when a 200 OK is received. However, there is a race condition where a subsequent 200 OK is generated by a UAS before the CANCEL reaches the UAS.
Media Failure Drops	Number of dialogs that had to be terminated due to a failure in setting up the media session. This situation occurs when an SDP offer is sent downstream in a request, but the SDP answer in a response to that request encounters a failure. Rather than passing the successful response upstream to the User Agent Client (UAC), the Oracle Communications Session Border Controller terminates the session. For an INVITE transaction, the Oracle Communications Session Border Controller sends an ACK for the 200 OK response and then sends a BYE request. The Oracle Communications Session Border Controller then sends an error response to the UAC.
Expired Sessions	Number of sessions that were terminated due to the session timer expiring. When the media for a dialog/session does not traverse the Oracle Communications Session Border Controller, the SIP application sets a session timer (equal to the flow-time-limit defined in the media-manager-config). This to ensure that the session is properly cleaned up in the event that the endpoints do not send the appropriate signaling to terminate the session (e.g., BYE). Note that when the media session does traverse the Oracle Communications Session Border Controller, the flow timers are used by MBCD and the SIP application does not set a session timer.

## **Viewing SIP Session Agent Statistics**

Display SIP session agent information by using the **show sipd agents** command. With this command, the Oracle Communications Session Border Controller ascertains whether a session agent is in service. When the session agent stops responding to SIP requests, it transitions to the out-of-service state. You can configure the Oracle Communications Session Border Controller to periodically ping the session agent if it has gone out-of-service, or if no requests have been sent to it.

The **show sipd agents** command shows information about the number of active sessions, the average rate of session invitations, and the number of times that the constraints established in the session-agent element have been exceeded for sessions inbound to and outbound from each session agent, as well as the average and maximum latency and the maximum burst rate related to each session agent.

#### For example:

#### Inbound statistics:

- Active: number of active sessions sent to each session agent listed
- Rate: average rate of session invitations (per second) sent to each session agent listed
- ConEx: number of times the constraints have been exceeded

#### Outbound statistics:

- Active: number of active sessions sent from each session agent
- Rate: average rate of session invitations (per second) sent from each session agent listed
- ConEx: number of times the constraints have been exceeded

#### Latency statistics:

- Avg: average latency for packets traveling to and from each session agent listed
- Max: maximum latency for packets traveling to and from each session agent listed
- Max Burst: total number of session invitations sent to or received from the session agent within the amount of time configured for the burst rate window of the session agent

The second column, which is not labeled, of the **show sipd agents** output shows the service state of each session agent identified in the first column. In the service state column, an I indicates that the particular session agent is in service and an O indicates that the particular session agent is out of service. An S indicates that the session agent is in transition from the out-of-service state to the in-service state; it remains in this transitional state for a period of time that is equal to its configured in-service period, or 100 milliseconds (whichever is greater). A D indicates that the session agent is disabled.

#### Viewing SIP Session Agent Group Statistics

Display session information for the session agent groups on the system by using the **show sipd groups** command. This information is compiled by totaling the session agent statistics for all of the session agents that make up a particular session agent group. While the **show sipd groups** command accesses the subcommands that are described in this section, the main **show sipd groups** command (when executed with no arguments) displays a list of all session agent groups for the system.

If you carry out this command, but you do not specify the name of an existing session agent group, the system informs you that the group statistics are not available.

# **Viewing Session and Dialog States**

Display session and dialog states by using the **show sipd sessions** command. For example:

SIP Session Status		Per	riod	Lifetime		
	Active	High	Total	Total	PerMax	High
Sessions	0	0	0	0	0	0
Initial	0	0	0	0	0	0
Early	0	0	0	0	0	0
Established	0	0	0	0	0	0
Terminated	0	0	0	0	0	0
Dialogs	0	0	0	0	0	0
Early	0	0	0	0	0	0
Confirmed	0	0	0	0	0	0
Terminated	0	0	0	0	0	0

#### Sessions

- Initial—state of a new session for which an INVITE or SUBSCRIBE is being forwarded.
- Early—state the session enters when it receives the first provisional response (1xx other than 100).
- Established—state the session enters when it receives a success (2xx) response.
- Terminated—state the session enters when the session is ended by receiving or sending a BYE for an Established session or forwarding an error response for an Initial or Early session. The session remains in the Terminated state until all the resources for the session are freed.

### **Dialogs**

A dialog is created when a dialog establishing method (INVITE or SUBSCRIBE) receives a provisional (1xx other than 100) or success (2xx) response.

- Early—dialog is created by a provisional response.
- Confirmed—dialog is created by a success response; an Early dialog transitions to Confirmed when it receives a success response.
- Terminated—dialog enters this state when the session is ended by receiving/sending a BYE for an Established session, or by receiving/sending error response Early dialog. The dialog remains in the Terminated state until all the resources for the session are freed.

# **Viewing SIP Endpoint**

The **show sipd sip-endpoint-ip** command supports the look-up and display of registration information for a designated endpoint. This command uses the following syntax: show sipd endpoint-ip cphone number>. For the phone number value, you can enter as many components of the particular phone number about which you would like information—including information about adaptive HNT.

This command must be entered with the numerical value representing the endpoint to look up. The ACLI help menu prompts you for this information.

```
ORACLE# show sipd endpoint-ip ?
------ ACLI v1.0 -------
<phone number> enter phone number to look up endpoint
```

There is no support for wildcard matches or lists of users. The first entry that matches the phone number given as an argument will be returned. The following examples show a range of matching values.

```
ORACLE# show sipd endpoint-ip 1781

Reg[sip:17815551111@69.69.69.10]

RegEntry[sip:17815551111@69.69.69.10] ID=4 exp=28

UA-contact='sip:17815551111@69.69.69.69:5062;acme_nat=192.168.201.50:5060'

hnt-test-status='COMPLETED'
successful-test-time='40 secs'
```

## Viewing SIP Per User CAC Statistics

The commands in this section allow you to view information about SIP per user CAC.

#### **IP-Based CAC Information**

If you want to see information about the operation of SIP per user CAC for the IP address mode, you can use the new ACLI **show sipd ip-cac** command. You enter this command with the IP address for which you want to view data.

The Oracle Communications Session Border Controller will display the number of configured sessions allowed, number of active sessions, amount of configured bandwidth allowed, and the amount of bandwidth used.

To view information about SIP per user CAC using the IP address mode:

In either User or Superuser mode, type **show sipd ip-cac**, a Space, and the IP address for which you want to view data. Then press Enter.

```
ORACLE# show sipd ip-cac 192.168.200.191
CAC Parameters for IP <192.168.200.191>
Allowed Sessions=2
Active-sessions=0
Allowed Bandwidth=3000000
used-bandwidth=0
```

#### **AoR-Based CAC Information**

If you want to see information about the operation of SIP per user CAC for the AoR mode, you can use the **show sipd endpoint-ip** command. You enter this command with the AoR for which you want to view data.

In either User or Superuser mode, type **show sipd endpoint-ip**, a Space, and the AoR for which you want to view data. Then press Enter.

```
ORACLE# show sipd endpoint-ip 123
User <sip:123@192.168.200.191>
    Contact local-exp=47 exp=97
        UA-Contact: <sip:123@192.168.200.191:5061>
```

```
SD-Contact: <sip:123-rrbgdlubs3e66@192.168.1.190:5060>
Call-ID: 00078555-47260002-3dde9eea-259763e2@10.10.10.16'
Allowed Sessions=2
Active-sessions=0
Allowed Bandwidth=3000000
used-bandwidth=0
```

### **Number of Calls Dropped because of Per User CAC Limits**

The **show sipd errors** command allows you to view how many calls were dropped:

- Because the per user CAC session limit was exceeded
- Because the per user CAC bandwidth limit was exceeded

## Viewing Statistics for SIP Per User Subscribe Dialog Limit

You can display the number of subscription dialogs per SUBSCRIBE event type using the ACLI **show registration sipd subscriptions-by-user** command. You can display this information per event type, or you can show data for all event types by wildcarding the event type argument.

The following example shows you how to use this command with a wildcard.

```
ORACLE# show registration sipd subscriptions-by-user *

Registration Cache FRI NOV 21 2008 13:40:14

User: sip:7815550001@192.168.1.206

AOC: <sip:7815550001@192.168.1.206:5060;transport=udp>
Event-Type: dialog --> Subscriptions: 2
```

## **Message Rate Statistics**

The Oracle Communications Session Border Controller provides message rate statistics for SIP traffic. You must first enable extra method statistics generation in the sip config.

To enable full SIP message rate statistics:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal
```

2. Type session-router and press Enter.

```
ORACLE(configure) # session-router
ORACLE(session-router) #
```

3. Type sip-config and press Enter.

```
ORACLE(session-router) # sip-config
ORACLE(sip-config) #
```

- **4. extra-method-stats**—Set this parameter to enabled for the Oracle Communications Session Border Controller to collect and track SIP method statistics per second.
- 5. Save and activate your configuration.

Message rate statistics are listed per message type. This command is entered as:

```
ORACLE# show sipd rate [interface <interface-name> | agent agent-name]
```

### show sipd rate

The **show sipd rate** command displays request and response rates for messages (per method) on a system-wide basis. The rates are calculated based on the time in the current monitoring window (100+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show sipd rate
17:24:28-103
Method Name Msg Recv Msg Sent Req Recv Req Sent Resp Recv Resp Sent
```

	Rate	Rate	Rate	Rate	Rate	Rate
INVITE	0.0	0.0	0.0	0.0	0.0	0.0
ACK	0.0	0.0	0.0	0.0	0.0	0.0
BYE	0.0	0.0	0.0	0.0	0.0	0.0

## show sipd rate interface

The **show sipd rate interface** command displays request and response rates for messages (per method) for all configured sip-interfaces. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

ORACLE# show	gind rate	interface				
17:24:33-58	sipu lace	Incertace				
Sip Interfac	a core					
Method Name		Mea Sent	Req Recv	Per Sent	Resp Recv	Resp Sent

### show sipd rate agent

The **show sipd rate agent** command displays request and response rates for messages (per method) for all session agents. By adding a session agent name in the form show sipd rate agent <session-agent-name>, you can view statistics for the identified agent only. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

ORACLE# show sipd rate agent 192.168.202.100 17:26:47-42									
Session Agen	t 192.168.	202.100							
Method Name	Msg Recv	Msg Sent	Req Recv	Req Sent	Resp Recv	Resp Sent			
	Rate	Rate	Rate	Rate	Rate	Rate			
INVITE	0.0	0.0	0.0	0.0	0.0	0.0			
ACK	0.0	0.0	0.0	0.0	0.0	0.0			
BYE	0.0	0.0	0.0	0.0	0.0	0.0

### **SNMP Reporting of Message Rate Statistics pointer**

Message Rate Statistics are available via SNMP. See the MIB Reference Guide, SNMP Reporting of Message Rate Statistics section for detailed information.

## **Viewing IMS-AKA Statistics**

The ACLI **show sipd endpoint-ip** command is updated to show the IMS-AKA parameters corresponding to each endpoint. The display shows the algorithms used, the ports used, and the security parameter indexes (SPIs) used.

In addition, the **show sa stats** command now shows the security associations information for IMS-AKA.

ORACLE# show sa stats			
05:28:32-107			
SA Statistics		Lifetime	
	Recent	Total	PerMax
IKE Statistics			
ADD-SA Req Rcvd	0	0	0
ADD-SA Success Resp Sent	0	0	0
ADD-SA Fail Resp Sent	0	0	0

# STUN Server Statistics and Protocol Tracing

This section describes how you can monitor STUN server statistics and perform STUN protocol tracing.

### **STUN Server Statistics**

You can display statistics for the STUN server using the ACLI **show mbcd stun** command when the STUN server has been enabled. However, if the STUN server has not been enabled since the last system reboot, the command does not appear and no statistics will be displayed.

#### **Performance Management**

ORACLE# show mbcd 09:05:21-193 STUN Statistics	stun	Dog	~; ~ d	Li	fotimo	
SIUN SCACISCICS		rei	110u	PT	recime	
	Active	High	Total	Total	PerMax	High
Servers	1	1	0	2	1	1
Server Ports	4	4	0	8	4	4
Binding Requests	_	_	4	861	4	
Binding Responses	_	_	4	861	4	
Binding Errors	_	_	0	0	0	
Messages Dropped	-	-	0	0	0	

The table below defines display's categories.

STUN Server Display Category	Description
Servers	The number of STUN servers (the same as the number of realms configured with a STUN server).
Server Ports	Number of ports per STUN server; there will be four ports per STUN server.
Binding Requests	Number of STUN Binding Request messages received by all STUN servers.
Binding Responses	Number of STUN Binding Response messages sent by all STUN servers.
Binding Errors	Number of STUN Binding Error messages sent by all STUN servers.
Messages Dropped	Number of messages dropped by all STUN servers.

### **STUN Protocol Tracing**

You can enable STUN protocol tracing two ways: by configuration or on demand.

By configuration—The Oracle Communications Session Border Controller's STUN protocol trace file is
called stun.log, which is classified as a call trace. This means that when the system configuration's calltrace parameter is set to enabled, you will obtain STUN protocol information for the system. As with
other call protocol traces, tracing data is controlled by the log-filter in the system configuration.

On demand—Using the ACLI notify mbcd log or notify mbcd debug commands, you enable protocol tracing for STUN. Using notify mbcd debug sets the STUN log level to TRACE. You can turn off tracing using the notify mbcd nodebug returns the STUN log level back to its configured setting.

## **H.323 Protocol Performance**

This section describes the different statistics you can access for monitoring H.323 protocol performance.

# Viewing the H.323 Performance Statistics

Display the H.323 performance statistics by using the **show h323d** command. The main **show h323d** command executed without arguments indicates the date and time the current period began and displays session statistics, status statistics, and stack statistics for functioning H.323 processes.

For example:

acmepacket# <b>show h323d</b> 18:22:24-84						
Session Stats		Per	riod	L	ifetime	
	Active	High	Total	Total	PerMax	High
Incoming Calls	135	176	1001	77258	785	196
Outgoing Calls	135	176	1001	77258	785	196

Connected Calls		135	172	977	74390	727	196
Incoming Channel	251	319	1953	148780	1454	358	
Outgoing Channel	S	251	319	1953	148780	1454	358
Contexts		135	179	1001	77258	785	197
H323D Status	Current	Lifetime					
Queued Messages	238	16000					
TPKT Channels	542	4004					
UDP Channels	0	0					
Stack	State	4 L		Regist	ered Gatek	eeper	
external	enabl	ed H323 Ga	ateway	No			

internal enabled H323 Gateway No

The following table lists the session statistics along with a brief description.

Statistic	Description
Incoming Calls	Number of H.323 calls coming into the Oracle Communications Session Border Controller.
Outgoing Calls	Number of H.323 calls going out of the Oracle Communications Session Border Controller.
Connected Calls	Number of H.323 calls that are currently connected via the Oracle Communications Session Border Controller.
Incoming Channels	Number of incoming channels that have been established on the Oracle Communications Session Border Controller.
Outgoing Channels	Number of outgoing channels that have been established on the Oracle Communications Session Border Controller.
Contexts	Number of contexts (i.e., the number of calls traversing the Oracle Communications Session Border Controller) that have been established on the Oracle Communications Session Border Controller.

#### **About Status Statistics**

The following table lists the current H.323 process status statistics along with a brief description:

Statistic	Description
Queued Messages	Number of messages queued.
TPKT Channels	Number of Transport Packet (TPKT) channels open(ed).
UDP Channels	Number of User Datagram Protocol (UDP) channels open(ed).

**Note:** The show h323d status command shows the same information available when the show h323d command is executed without any arguments.

#### **About Stack Statistics**

The stack statistics provide a summary of information about the H.323 stacks configured on the Oracle Communications Session Border Controller via the h323 stack. This information includes the following facts about each stack: its name, whether or not it is enabled, its type, its mode (either Gateway or Gatekeeper), and whether or not it is registered with a Gatekeeper.

# **Viewing Current Configuration**

Display statistics for the H.323 configuration currently running on the Oracle Communications Session Border Controller by using the **show h323d** config command. Only information about the main configuration element is shown, not for any subelements.

```
ORACLE# show h323d config
h323-config
       state
                                       enabled
       log-level
                                       INFO
       response-tmo
       connect-tmo
                                       32
       rfc2833-payload
                                      101
       alternate-routing
                                       proxy
        codec-fallback
                                       disabled
       last-modified-date
                                      2006-07-07 07:49:57
```

## **Viewing Stack Information**

You can view statistics about the configured H.323 stacks.

### Viewing a List of Stacks

Display the list of H.323 stacks (for example, configured instances of the h323 stack) that are currently configured by using the show h323d stacklist command.

```
ORACLE# show h323d stacklist
H323-Stack List
name internal
name external
ORACLE#
```

### **Viewing Stack Details**

Display detailed information about the configured instances of H.323 stacks by using the **show h323d stackconfig** command.

```
ORACLE# show h323d stackconfig
h323-stack
       name
                                       tester
       state
                                       disabled
       isgateway
                                       enabled
       realm-id
                                      test

# **Viewing Session Agent Stats**

You can view statistics about the session agents.

#### Viewing a List of Session Agents

Display a list of session agents by using the **show h323d agentlist** command. For example:

```
ORACLE# show h323d agentlist
H323-Session Agent List
hostname 192.168.200.20
hostname 192.168.200.30
hostname 10.10.10.3
```

### **Viewing Session Agent Stats**

Display statistics about the session agent by using the **show h323d agentstats** command. For example:

The following table lists the statistics along with a brief description of each.

Statistic	Description
Inbound	
Active	Number of active sessions sent to each session agent listed in the Session Agent column of this command's output.
Rate	Average rate of session invitations (per second) sent to each session agent listed in the Session Agent column of this command's output.
ConEx	Number of times that the constraints established in the constraints fields of the session-agent element have been exceeded. The constraints fields of the session-agent element include the following: max-sessions, max-outbound-sessions, max-burst-rate, max-sustain-rate, burst-rate-window, and sustain-rate-window.
Outbound	
Active	Number of active sessions sent from each session agent listed in the Session Agent column of this command's output.
Rate	Average rate of session invitations (per second) sent from each session agent listed in the Session Agent column of this command's output.

Statistic	Description
ConEx	Number of times that the constraints established in the constraints fields of the session-agent element have been exceeded.
Latency	
Avg	Average latency for packets traveling to and from each session agent listed in the Session Agent column of this command's output.
Max	Maximum latency for packets traveling to and from each session agent listed in the Session Agent column of this command's output.
Max Burst	Total number of session invitations sent to or received from the session agent within the amount of time configured in the burst-rate-window field of the session-agent element.

## **Viewing Specific Session Agent Statistics**

Display the activity for the particular H.323 session agent specified in the <agent> argument by using the show h323d agents <agent> command.

ORACLE# <b>show h323d agentstats 172.16.0.13</b> 19:57:21-51										
	6 0 13(h	3231721	[In Serv	icel						
Session Agent 172.16.0.13(h323172) [In Service] Period Lifetime										
	Active			Total						
Inbound Sessions	0	0	0	0	0	0				
Rate Exceeded	_	_	0	0	0	_				
Num Exceeded	_	_	0	0	0	_				
Reg Rate Exceeded	_	_	0	0	0	_				
	199	245	196	23583	164	256				
Rate Exceeded	_		0	0	0					
Num Exceeded	_	_	0	0	0	_				
Reg Rate Exceeded	_	_	0	0	0	_				
Out of Service	_	_	0	0	0	_				
Trans Timeout	0	0	0	19	2	1				
Requests Sent	_	_	2092	234608	1569	_				
Requests Complete	_	_	196	23563	164	_				
Seizure	_	_	196	23583	164	_				
Answer	_	_	199	23563	164	-				
ASR Exceeded	_	_	0	0	0	-				
Messages Received	_	_	2267	258308	1675	-				
Latency=0.011; max=0.045										

The following table lists the statistics and a brief description.

Statistic	Description
Inbound Sessions	
Rate Exceeded	Number of times the session or burst rate was exceeded for inbound sessions.
Num Exceeded	Number of times the time constraints were exceeded for inbound sessions.
Outbound Sessions	
Rate Exceeded	Number of times the session or burst rate was exceeded for outbound sessions.

Statistic	Description
Num Exceeded	Number of times the time constraints were exceeded for outbound sessions.
Burst	Number of times the burst rate was exceeded for this session agent.
Out of Service	Number of times this session agent went out of service.
Trans Timeout	Number of transactions that timed out for this session agent.
Requests Sent	Number of messages sent via the session agent.
Requests Complete	Number of requests that have been completed for this session agent.
Messages Received	Number of messages received by this session agent.

### **Viewing Session Agent Configurations**

Display the configuration for all configured H.323 session agents by using the **show h323d agentconfig** command.

```
ORACLE(session-agent) # show h323d agentconfig
session-agent
       hostname
                                       testhostname.com
       ip-address
                                       192.168.200.13

### **Viewing Session Agent by Hostname**

The **show h323d agentconfig <hostname>** command displays detailed information about the configured session agent specified by its hostname in the <hostname> argument.

When displaying individual H.323 session agent configurations, remember that H.323 does not support DNS and therefore the **hostname** field values for H.323 session agents are IPv4 addresses.

```
ORACLE(session-agent) # show h323d agentconfig
session-agent
                                     testhostname.com
       hostname
                                    192.168.200.13
       ip-address

### **Viewing Session Agent Group Stats**

You can view statistics for session agent groups.

#### **Listing Session Agent Groups**

Display a list of the H.323 session agent groups by using the **show h323d grouplist** command.

```
ORACLE# show h323d grouplist
H323-Session Agent Group List
group-name sag1
ORACLE#
```

### **Viewing Session Agent Group Stats**

Display session information for the session agent groups by using the **show h323d groupstats** command. Session information is compiled by totalling the session agent statistics for all session agents that make up a particular session agent group.

While the **show h323d groupstats** command accesses the subcommands that are described in this section, the main **show h323d groupstats** command (when executed without arguments) displays a list of all session agent groups for the Oracle Communications Session Border Controller.

All of the categories for these statistics are the same as those used in the displays produced by the **show** h323d agent command.

```
ORACLE# show h323d groupstats

19:38:59-30
---- Inbound ---- --- Outbound ---- -Latency ---- Max ----

SAG Active Rate ConEx Active Rate ConEx Avg Max Burst In Out

H323Group 0 0.0 0 0.0 0.0 0.0 0.0 0
```

### **Viewing Session Agent Details**

You can list and show the statistics for the session agents that make up the session agent groups that are being reported. The -v (meaning verbose) executed with this command must be included to provide this level of detail.

```
ORACLE# show h323d groups -v
              SGTest
SAG:
19:38:59-30

SGTest
ORACLE#
```

### **Viewing Specific Session Group Statistics**

Display statistics for the designated session agent group by using the **show h323d groups <group** name> command with the name of a specific session agent group.

```
ORACLE# show h323d groups testgroup

16:35:18-18

---- Inbound ---- Outbound ---- -Latency- Max

SAG Active Rate ConEx Active Rate ConEx Avg Max Burst

testgroup 0 0.0 0 0.0 0.0 0.0 0.0 0

ORACLE#
```

If this command is carried out, but the name of an existing session agent group is not available, the system will display a messaging saying that the group statistics are not available.

```
ORACLE# show h323d groups test
group statistics not available
ORACLE#
```

#### **Viewing all Configurations**

Display the configuration for all configured H.323 session agent groups by using the **show h323d groupconfig** command.

```
acmepacket# show h323d groupconfig
session-group
                                        h323
        group-name
        description
                                        enabled
        state
                                        H323

        trunk-group
        last-modified-date
                                        2006-07-11 19:12:22
```

#### **Viewing Specific Session Agent Group Statistics**

Display detailed information about the configured session agent group specified by its group name by using the **show h323d agentconfig <group name>** command. The group name is configured in the group-name field of the session-agent-group element in the <group name> argument.

```
ORACLE# show h323d groupconfig h323
session-group
group-name h323
description
```

```
      state
      enabled

      app-protocol
      H323

      strategy
      Hunt

      dest
      172.16.0.13

      1.1.1.1

      trunk-group

      last-modified-date
      2006-07-11 19:12:22
```

## **Viewing Stats for Each Configured Stack**

Display information for each of the configured H.323 stacks by using the **show h323d h323stats** command.

		show h32	23d h323	stats					
н.225	:	Sent	585622	Recd	764844	maxCPU	0		
H245	:	Msg	976289	Ack	1171626	Rej	0	Rel	0
RAS	:	Req	0	Ack	0	Rej	0	maxCPU	0
STACK	:	h323192							
н.225	:	Sent	586040	Recd	585622	maxCPU	0		
H245	:	Msg	976087	Ack	1171626	Rej	0	Rel	0
RAS	:	Req	0	Ack	0	Rej	0	maxCPU	0

The display identifies the H.323 stack by its name and then provides the data described in the following table.

Statistic	Description
H.225	Number of H.225 messages sent and received by this H.323 stack
H245	Number of H.245 requests, acknowledgements, rejections, and releases sent and received by this H.323 stack
RAS	Number of RAS requests, acks, and rejects sent and received by this H. 323 stack

### **Viewing Statistics for Specific Stacks**

Display detailed statistics for the H.323 stack specified in the <stack name> argument by using the show h323d h323stats <stack name> command. This information is displayed according to the following categories: H.225, H.245, and RAS.

acmepacket# show h3 STACK: h323172 H.225 STATISTICS	323d h323sta	ats h323172				
MESSAGE TYPE	SENT	RECD

Release Complete	199906	191628				
Status	0	0				
Status Inquiry	0	0				
Notify	0	0				
Info	0	0				
H.245 STATISTICS (7	[otal)					
MESSAGE TYPE		MSG	ACK	REJ	REL	
Master Slave		200110	400218	0	0	
Terminal Capability	•	400218	400218	0	0	
OpenLogical Channel		0	0	0	0	
CloseLogical Channe	el	399812	399812	0	0	

The following table lists the statistics along with its type and a brief description.

Statistic	Туре	Description
H.225 STATISTICS		Statistics about the H.225.
	MESSAGE TYPE	Type of messages sent and received by this H.323 stack.
	SENT	For each type of message specified in the MESSAGE TYPE column, how many of the message types were sent by this H.323 stack.
	RECD	For each type of message specified in the MESSAGE TYPE column, this statistic shows how many of the message types were received by this H.323 stack.
H.245 STATISTICS To	tal	Statistics about the H.245
	MESSAGE TYPE	Type of H.245 messages sent and received by this H.323 stack.
	MSG	For each type of H.245 message specified in the MESSAGE TYPE column, this statistic shows how many message requests were sent and received by this H.323 stack.
	ACK	For each type of H.245 message specified in the MESSAGE TYPE column, this statistic shows how many acknowledgements were sent and received by this H.323 stack.
	REJ	For each type of H.245 message specified in the MESSAGE TYPE column, this statistic shows how many rejections were sent and received by this H.323 stack.
	REL	For each type of H.245 message specified in the MESSAGE TYPE column, this statistic shows how many releases were sent and received by this H.323 stack.
RAS STATISTICS FOI	R MESSAGES	There are two sections of RAS statistics: one for SENT (or issued) and one for RECD (or received.

Statistic	Туре	Description
	MESSAGE TYPE	Type of RAS messages sent and received by this H.323 stack.
	REQ	For each type of RAS message specified in the MESSAGE TYPE column, this statistic shows how many requests were issued/received by this H.323 stack.
	CON	For each type of RAS message specified in the MESSAGE TYPE column, this statistic shows how many confirmations were issued/received by this H.323 stack.
	REJ	For each type of RAS message specified in the MESSAGE TYPE column, this statistic shows how many rejections were issued/received by this H.323 stack.

### Viewing H.323 Registrations

Display the total number of H.323 endpoint registrations by using the **show h323d reg** command.

```
acmepacket# show h323d reg
Stack: external Number of registrations: 256
Total Number of Registrations: 256
```

# **Viewing DNS ALG Message Rate Statistics**

The Oracle Communications Session Border Controller provides message rate statistics for DNS ALG traffic. You must first enable extra method statistics generation in the dns config.

To enable full DNS ALG message rate statistics:

1. In Superuser mode, type **configure terminal** and press Enter.

```
ORACLE# configure terminal
```

**2.** Type **media-manager** and press Enter to access the media-manager path.

```
ORACLE(configure) # media-manager
```

3. Type dns-config and select an existing configuration element.

```
ACMESYSTEM(media-manager) # dns-config
ACMESYSTEM(dns-config) # select
<realm-id>:
1: realm01
selection: 1
```

- **4. extra-dnsalg-stats**—Set this parameter to enabled for the Oracle Communications Session Border Controller to collect message rate statistics for DNS ALG objects.
- **5.** Type **done** when finished.

DNS ALG Message rate statistics are maintained system-wide, per realm, and per DNS Server. This command is entered as:

```
ORACLE# show dnsalg rate [realm-id <realm-name> | server-ip-addr <server-ip-address>]
```

## show dnsalg rate

The **show dnsalg rate** command displays request and response rates for DNS messages on a system-wide basis. The rates are calculated based on the time in the current monitoring window (100+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show dnsalg rate
17:31:21-15
Realm-id Msg Recv
                    Msg Sent Req Recv
                                         Req Sent
                                                   Resp Recv
                                                               Resp Sent
                        Rate
                                   Rate
                                             Rate
                                                        Rate
                                                                    Rate
              Rate
ALL
               0.0
                         0.0
                                    0.0
                                              0.0
                                                         0.0
                                                                     0.0
```

### show dnsalg rate realm-id

The **show dnsalg rate realm-id** command displays request and response rates for DNS messages on a per-realm basis. If you add a realm-name to the query, that specific realm's data will be returned. Entered without a realm name, all configured realms will be displayed. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show dnsalg rate realm-id peer
17:31:31-26
Realm-id Msg Recv Msg Sent Reg Recv
                                         Req Sent Resp Recv
                                                              Resp Sent
              Rate
                        Rate
                                  Rate
                                             Rate
                                                        Rate
                                                                    Rate
               0.0
                         0.0
                                    0.0
                                              0.0
                                                         0.0
                                                                     0.0
peer
```

### show dnsalg rate server-ip-addr

The **show dnsalg rate server-ip-addr** command displays request and response rates for DNS messages on a per-DNS server basis. If you add a DNS Server IP address to the query, that specific server's data will be returned. Entered without a server IP address, all configured servers will be displayed. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show dnsalg rate server-ip-addr 172.16.10.5
17:32:19-44
DNS ALG Realm peer
Ip Address
                       Msg Recv Msg Sent Req Recv Req Sent Resp Recv
Resp Sent
                           Rate
                                      Rate
                                                Rate
                                                          Rate
Rate
           Rate
172.16.10.5
                            0.0
                                       0.0
                                                           0.0
                                                 0.0
0.0
           0.0
```

# **SNMP Reporting of Message Rate Statistics pointer**

Message Rate Statistics are available via SNMP. See the MIB Reference Guide, SNMP Reporting of Message Rate Statistics section for detailed information.

# **ENUM Server Message Rate Statistics**

The Oracle Communications Session Border Controller provides message rate statistics for ENUM traffic. You must first enable extra method statistics generation in the sip config.

To enableENUM message rate statistics:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal
```

2. Type session-router and press Enter.

```
ORACLE(configure) # session-router
ORACLE(session-router) #
```

3. Type sip-config and press Enter.

```
ORACLE(session-router)# sip-config
ORACLE(sip-config)#
```

- **4. extra-enum-stats**—Set this parameter to enabled for the Oracle Communications Session Border Controller to collect and track ENUM message statistics per second.
- 5. Save and activate your configuration.

ENUM Message rate statistics are maintained system-wide, per realm, and per ENUM Server. This command is entered as:

```
ORACLE# show enum rate [config-name <enum-server-name> | server-ip-addr <server-ip-address>]
```

#### show enum rate

The **show enum rate** command displays request and response rates for ENUM messages on a system-wide basis. The rates are calculated based on the time in the current monitoring window (100+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# # show enum rate
17:22:28-23
Config Name Msg Recv Msg Sent Req Recv Req Sent Resp Recv Resp Sent
Rate Rate Rate Rate Rate Rate Rate
ALL 0.0 0.0 0.0 0.0 0.0 0.0
```

### show enum rate config-name

The **show enum rate config-name** command displays request and response rates for ENUM messages per ENUM configuration. If you add a an enum-config-name to the query, that specific configuration's data will be returned. Entered without a name, all configured enum-configs will be displayed. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show enum rate config-name test1
17:22:53-48
Config Name Msg Recv Msg Sent Req Recv Req Sent Resp Recv Resp Sent
                                           Rate
                                                      Rate
                                                                Rate
               Rate
                    Rate
                                  Rate
                0.0
                        0.0
                                  0.0
                                            0.0
                                                      0.0
                                                                 0.0
test1
```

# show enum rate server-ip-addr

The **enum rate server-ip-addr** command displays request and response rates for individual enumservers. If you add an IP address to the query, that specific server's data will be returned. Entered without a server IP address, all configured servers will be displayed. If an IP address is present in more than one ENUM configuration then the message processing level is displayed separately for each configuration object. The rates are calculated based on the time in the current monitoring window (30+current period elapsed). The Message Received and the Messages sent columns are the sum of the corresponding Requests or responses. For example:

```
ORACLE# show enum rate server-ip-addr 192.168.201.5
17:24:00-55
ENUM Config Name enum
Ip Address Msg Recv Msg Sent Req Recv Req Sent Resp Recv Resp Sent
                Rate Rate Rate Rate
                                                   Rate
                                                              Rate
192.168.201.5
                  0.0
                          0.0
                                   0.0
                                            0.0
                                                      0.0
                                                               0.0
17:24:00-55
ENUM Config Name test1
Ip Address Msg Recv Msg Sent Req Recv Req Sent Resp Recv Resp Sent
                Rate Rate
                                   Rate
                                           Rate
                                                     Rate
                                                              Rate
192.168.201.5
                  0.0
                         0.0
                                    0.0
                                            0.0
                                                      0.0
                                                               0.0
```

### **SNMP Reporting of Message Rate Statistics pointer**

Message Rate Statistics are available via SNMP. See the MIB Reference Guide, SNMP Reporting of Message Rate Statistics section for detailed information.

# **Viewing External Policy Server Statistics**

### show ext-band-mgr

The **show ext-band-mgr** command includes cumulative statistics for all configured ext-policy-server server objects. The display includes the following counts for Period and Lifetimes:

- socket connections established
- total active Diameter connections
- · active Diameter server transaction
- active Diameter client transactions

Further the **show ext-band-mgr** command displays the event counts with respect to client transaction with recent and lifetime counts only:

- reserve requests sent
- update requests sent
- termination requests (STR) sent
- · times requests are transmitted
- · responses received to install flows
- · request errors occurred
- deny/reject responses received from the server
- client transactions expired
- total application errors occurred

ORACLE# show ext-band-mgr
10:50:28-196
EBM Status Period Lifetime
Active High Total Total PerMax High
Client Trans 0 0 0 0 0 0
Server Trans 0 0 0 0 0 0
Sockets 0 0 0 0 0 0
Connections 0 0 0 0 0
Lifetime
Recent Total PerMax
Reserve 0 0 0
Modify 0 0 0
Commit 0 0 0
Remove 0 0 0
EBM Requests 0 0 0
EBM Installs 0 0 0
EBM Req. Errors 0 0 0
EBM Rejects 0 0 0
EBM Expires 0 0 0
EBMD Errors 0 0 0

### show policy-server

The **show policy-server** command displays each external policy server's name and address, followed by the policy server's IP addresses that are resolved through DNS, its priority, state of the server, socket related errors and Diameter related failures.

The display also includes the following external bandwidth manager counts for recent and lifetime periods.

- Total socket connections established
- Total Diameter connections established

Client transactions counts include:

- reserve type requests sent
- update requests sent
- termination requests (STR) sent
- responses received that installs the flow
- deny/rejected responses received from the server
- client transaction timeouts occurred
- client side related errors that occurred

Server transactions counts include:

- requests received from the client
- duplicate requests received
- responses sent successfully
- errors occurred while sending the response
- requests dropped

Finally, the command displays aforementioned statistics for all configured ext policy server configuration elements. For example:

L92.168.9.101:3868	0	active		res Diame	ter-Fai	lures
192.168.101.48:3868	L	standby	!

### **CLF Statistics**

The **show ext-clf-srv** command is entered as follows:

```
show ext-clf-srv [<realm-name> | ext-policy-server <policy-server-name>]
```

The **show ext-clf-svr** command displays aggregate statistics for all CLF external policy servers active on the system. You can enter a realm-name to display only the given realm's statistics. For example:

ORACLE# show ext- 16:11:38-168	clf-svr							
EBM Status		Peri	od		Lif	etime		
	Active	High	Tota	1	Total	PerMax	High	
Client Trans	0	0	0		6	2	1	
Server Trans	0	0	0		0	0	0	
Sockets	1	1	0		1	1	1	
Connections	1	1	0		2	1	1	
		Li	fetim	ne				
	Recent	To	otal	$\operatorname{PerMax}$				
CLF Requests	0		4	1				
CLF Admits	0		0	0				
CLF Req. Errors	0		0	0				
CLF Rejects	0		4	1				
CLF Expires	0		0	0				
CLFD Errors	0		0	0				

Note the following application statistics:

- CLF Requests—This counter is incremented when new CLF request are sent.
- CLF Admits—This counter is incremented when the Oracle Communications Session Border Controller received RESP\_STATUS\_OK response from the external policy server (i.e. successful registration).
- CLF Req. Errors—This counter is incremented when the Oracle Communications Session Border Controller has protocol level based type of error returned back from the external policy server, i.e. a bad request.
- CLF rejects—This counter is incremented when the CLF returns a response code other than "RESP\_STATUS\_OK" or "RESP\_STATUS\_BAD"(i.e. Above mentioned CLF Req Errors)
- CLF Expires—This counter is incremented when the Oracle Communications Session Border Controller does not receive a response to a request it sent to the CLF.
- CLFD Errors—This counter is incremented when the encounters a general error in processing the received response from the external policy server (i.e. no socket for request, no agent for socket or no response in socket).

The **show ext-clf-svr ext-policy-server** command displays all ext-policy-servers Summarys. For example:

```
ORACLE# show ext-clf-svr ext-policy-server
15:41:22-1687
Ext Clf Server summary
Ext Clf Server
                       Recent
                                   Total
                                             PerMax
diameter check 1
                        0
                                     0
                                                 0
diameter_check_2
                          0
                                      0
                                                 0
diameter check 3
                          0
                                      0
                                                 0
```

The **show ext-clf-svr ext-policy-server** with a supplied ext-policy-server configuration object **name** displays specific statistics for the named external policy server. For example:

```
ORACLE# show ext-clf-svr ext-policy-server diameter_check_1
15:41:43-1707
Ext Clf Svr Errors
------ Lifetime ------
Recent Total PerMax
Errors 0 0 0
```

#### **HSS Statistics**

The show home-subscriber command displays detailed information about HSS transactions. For example:

ORACLE## show home	e-subscril	ber-se	rver					
17:54:58-186								
HQQ Qtatue		Pai	riod -		T.i	fatima -		
	Active	High	Tota	1 1	otal	PerMax	High	
Client Trans	0	0		0	12	4	1	
Server Trans	0	0		0	1	1	1	
Sockets	1	1		0	1	1	1	
Connections	1	1		0	1	1	1	
		]	Lifeti	me				
	Recent		[otal	PerMax				
LIR	0		0	0				
Sent Req Accepted	0		11	3				
Sent Req Rejected	0		0	0				
Sent Req Expired	0		0	0				
Sent Req Error	0		0	0				
Internal Errors	0		0	0				
Client Trans Server Trans Sockets Connections  LIR Sent Req Accepted Sent Req Rejected Sent Req Expired Sent Req Error	0	High 0 0 1 1	Tota Lifeti: Total 0	1 I 0 0 0 0 0 me	otal	fetime - PerMax 4 1 1		

Note the following statistics provided for Recent and Lifetime periods:

- LIR—Number of LIR requests sent
- Sent Req Accepted—Number of requests for which we got success response (2xxx)
- Sent Req Rejected—Number of permanent failures (5xxx)
- Sent Req Expired—Number of requests for which there was no response
- Sent Req Error—Number of protocol errors/bad requests (1xxx, 3xxx, 4xxx)

# **Viewing Accounting Data and Statistics**

This section explains how to view accounting data and statistics. See Admission Control and Quality of Service Reporting in the Oracle Communications Session Border Controller ACLI Configuration Guide for additional details about Quality of Service (QoS). See the Oracle Communications Session Border Controller RADIUS Guide for additional details about Remote Authentication Dial-in User Service (RADIUS).

## **QoS Reporting**

If you are using for the QoS functionality in collecting and calculating the jitter, latency, and loss statistics. QoS reporting provides you with real-time evaluation of network and route performance. It lets you contrast internal domain and external domain performance and facilitates SLA verification and traffic engineering.

QoS metrics are collected and reported on a per-session basis, per call-leg basis for completed calls. These metrics are reported through real-time RADIUS records along with call accounting data. These metrics are the result of the monitoring of the Real-Time Transport Protocol (RTP) and Real-Time Control Protocol (RTCP) traffic for each flow that has QoS enabled.

The following statistics:

- lost packets for RTP and RTCP that indicates the count of packets lost based on comparing the sequence numbers since the beginning of the call or the last context memory flow
- jitter count for RTP and RTCP that indicates the incremental number of packets that have been used to generate total and max jitter since the beginning of the call or the last context memory poll
- jitter total for RTP and RTCP indicates the incremental accumulated jitter (ms) over all the packets received since the beginning of the call or the last context memory poll
- jitter max for RTP and RTCP that indicates the maximum single jitter value (ms) from all the packets since the beginning of the call or the last context memory poll
- latency count for RTCP only indicates the number of RTCP frames over which latency statistics have been accumulated since the beginning of the call or the last context memory poll
- latency total for RTCP only indicates the incremental total of latency values reported since the beginning of the call or the last context memory poll
- latency max for RTCP only indicates the highest single latency value measured since the beginning of the call or the last context memory poll

From these flow context statistics the QoS daemon derives the following statistics that are kept in host memory while the call is active:

- lost packets indicates the total number of RTP and RTCP lost packets for the call
- jitter count indicates the number of RTP and RTCP packets that make up a call
- jitter total indicated the accumulated jitter over all the packets received during the call
- jitter average indicates the total accumulated jitter divided by the total jitter count for the call
- jitter max indicates the maximum single jitter value from all the packets during the call
- latency count for RTCP indicates the number of RTCP frames of which latency statistics have been accumulated during the call
- latency total for RTCP only indicates the incremental total of latency values reported
- latency max for RTCP only indicates the highest latency value reported during the call
- latency average for RTCP only indicates the RTCP latency total divided by the latency count

You can access QoS statistics that provide information about four areas of call performance.

# **Viewing Network Management Control Statistics**

You can use the new ACLI **show net-management-control** command to see the statistics that the Oracle Communications Session Border Controller collects. When you use the command, you specify the name of the network management control rule for which you want to display data or you can enter **all** to see the statistics for all control rules.

For each network management control rule, the Oracle Communications Session Border Controller gathers statistics for the number of:

- Incoming calls—Incoming calls that match the destination identifier
- Rejected calls—Calls that were rejected as a result of the control rule being applied
- Diverted calls—Incoming that were diverted as a result of the control rule being applied

The display you see when you execute this command shows statistics for the current period, lifetime, and maximum value in a period.

### **Displaying Network Management Control Statistics**

To display network management control statistics:

In either User or Superuser mode, type the **show net-management-control** command, a Space, and then the name of the control rule for which you want to see data. You can enter **all** if you want to see the data for all control rules. Then press Enter.

ORACLE# show net-management-control nmcpercent 14:45:15-63 Name: nmcpercent									
Type: gap-percent		Lifeti	ime						
	Current	Total	PerMax						
Incoming Calls	0	0	0						
Rejected Calls	0	0	0						
Diverted Calls	0	0	0						

### **Resetting Network Management Control Statistics**

To reset network management control statistics, you use the ACLI **reset net-management-control** command followed by the name of the control rule for which you want to reset statistics. This command resets the counters to zero (0).

To reset network management control statistics:

In Superuser mode, type the ACLI **reset net-management-control** command, a Space, and then the name of the control rule for which you want to see data. Then press Enter.

ORACLE# reset net-management-control nmcpercent

## **Monitoring Your System in Real-Time**

This section explains how to monitor your system in real-time by using the monitor media and monitor sessions commands.

- monitor media: real-time media statistics
- monitor sessions: real-time SIP statistics

**Note:** The ACLI statistics displays use standard VT100 escape sequences to format the display. Therefore, your terminal emulator or terminal itself must support VT100.

# **Displaying the Statistics**

The following information explains how to work with the statistics display.

### **Changing the Refresh Rate**

At any point, you can press any numerical digit (0-9) to change the number of seconds for the refresh rate (the rate at which the display is updated). By default, the statistics refresh every second. For example, while viewing the statistics, you can press 6 to cause the system statistics to refresh every 6 seconds. While viewing the statistics via the ACLI, you can press any key to automatically refresh the statistics upon key press.

### **Quitting the Display**

Pressing <q> or <Q> allows you to exit the statistics display and returns you to the ACLI system prompt (for example, ORACLE#). From that point, you can continue with any other task you choose.

# **Viewing Real-Time Media Statistics**

Display real-time media statistics for your running system by using the monitor media command.

acmepacket# moni 17:31:00-160	tor media					
MBCD Status		Pe	riod	Li	fetime -	
	Active	High	Total	Total	PerMax	High
Client Sessions	143	182	1930	1218332	4225	683
Client Trans	0	18	5744	2500196	8439	625
Contexts	144	182	1930	834745	2783	2001
Flows	296	372	3860	1669498	5566	3689
Flow-Port	286	362	3860	1669488	5566	3679
Flow-NAT	294	365	3788	1658668	5563	2051
Flow-RTCP	0	0	0	0	0	0
Flow-Hairpin	0	0	0	0	0	0
Flow-Released	0	0	0	0	0	0
MSM-Release	0	0	0	0	0	0
NAT Entries	295	365	3791	1658671	5563	2051
Free Ports	7430	7518	7828	3346410	11604	8002
Used Ports	572	724	7724	3338980	11132	8000
Port Sorts	-	_	0	14796	4156	
MBC Trans	1141	1234	5748	2503147	8440	2974
MBC Ignored	-	-	0	0	0	

ARP Trans 0 0 0 8 8 1

Real-time statistics for the following categories appear on the screen:

- Client Sessions
- Client Trans
- Contexts
- Flows
- Flow-Port
- Flow-NAT
- Flow-RTCP
- Flow-Hairpin
- Flow-Release
- MSM-Release
- NAT Entries
- Free Ports
- Used PortsPort Sorts
- MBC Trans
- MBC Ignored
- ARP Trans

By default, the statistics refresh every second. Press any numerical digit (0-9) to change the refresh rate. For example while viewing the statistics, you can press 6 to cause the system statistics to refresh every 6 seconds.

Pressing **q** or **Q** allows you to exit the statistics display and returns you to the ACLI system prompt.

# **Viewing Real-Time SIP Session Statistics**

If you have Superuser access, display real-time monitoring of your running system for sessions. This table displays information similar to that which is displayed for the **show sipd** command, except that the information in the **monitor sessions** table is real-time and updates automatically.

Subscriptions	0	0	0	0	0	0	
Dialogs	0	0	0	0	0	0	
CallID Map	0	0	0	0	0	0	
Rejections	-	_	0	0	0		
ReINVITEs	-	-	0	0	0

DNS Sockets	0	0	0	0	0	0	
DNS Results	0	0	0	0	0	0	
Session Rate = $0.0$							
Load Rate = 0.0							

Real-time statistics for the following categories appear on the screen:

- Dialogs
- Sessions
- CallID Map
- Rejections
- ReINVITES
- Media Sessions
- Media Pending
- Client Trans
- Server Trans
- Resp Contexts
- Sockets
- Reqs Dropped
- DNS Trans
- DNS Sockets
- DNS Results

By default, the statistics refresh every second. Press any numerical digit (0-9) to change the refresh rate. For example, while viewing the statistics, you can press 6 to cause the system statistics to refresh every 6 seconds.

Pressing q or Q allows you to exit the statistics display and returns you to the ACLI system prompt.

# Viewing TLS Information

You can use the commands described in this section to obtain information about TLS and its associated Acme Packet SSM hardware module.

# **Clearing the Entire TLS Session Cache**

To clear the entire TLS session cache:

Enter the ACLI clear-cache tls command.

ORACLE# clear-cache tls

### **Viewing TLS Session Cache State and Statistics**

To see whether TLS session caching is enabled on your system and how many entries there are in the cache:

Enter the ACLI show security tls session-cache command.

```
ORACLE# show security tls session-cache
TLS Session Caching enabled.
Current TLS Session Cache Entries: 3
ORACLE#
```

### **Viewing Certificates in PEM Form**

The ACLI **show certificates** command has been enhanced to provide a **pem** argument that you can use to retrieve the Privacy Enhanced Mail Security Certificate (PEM) portion of the certificate after it the Oracle Communications Session Border Controller has imported it.

You enter this command with the name of the certificate you want to see in PEM form.

To see a certificate in PEM form:

Enter the command **show security certificates pem** followed by a Space, the name of the certificate, and then press Enter.

```
ORACLE# show security certificates pem client1a
certificate-record:client1a

# **Viewing SSM Status**

For TLS support, you must have an Oracle SSM hardware module installed in the system chassis. Without this module, TLS functions will not work.

The Oracle Communications Session Border Controller tells you whether or not the SSM installed on bootup, but now you can check the module's status from the command line.

To view the status of the SSM installed in your Oracle Communications Session Border Controller chassis:

Enter the command **show security ssm-accelerator**, and press Enter. The system will tell you if an SSM is installed.

```
ORACLE# show security ssm-accelerator
SSM (Security Service Module) present.
ORACLE#
```

## **Viewing IPSec Statistics**

The following section explains the commands used to obtain IPSec statistics which can be helpful for debugging purposes.

### **Security Association Entries**

The ACLI **show security ipsec sad** command displays the security association database entries which are programmed into the security processor. In the case of manual keying, the entries should match that of the running configuration. Network-interface is entered as a network interface configuration element name, selectors are entered as the selector term, a <space>, and a search term for that selector. You can enter multiple selector in one command. The command's syntax follows:

Entering no selectors returns all entries for that network interface. Valid values for the selectors argument are as follows:

- direction—Direction (IN | OUT | BOTH), Default: BOTH
- dst-addr-prefix—Destination address prefix, Default: match any
- dst-port—Destination port, Default: match any
- ipsec-protocol—IPSec protocol (AH | ESP | ALL), Default: ALL
- spi—security-policy-index, Default: match any
- src-addr-prefix—Source address prefix, Default: match any
- src-port—Source port, Default: match any
- trans-proto—Transport protocol (UDP | TCP | ICMP | ALL), Default: ALL

### **Security Policy Entries**

The **show security ipsec spd** command shows the security policy database entries which are programmed into the security processor. Network-interface is entered as a network interface configuration element name. The command's syntax follows:

```
show security ipsec spd [network-interface]
```

#### IPSec Statistics

The ACLI **show** commands for IPSec statistics are used to display statistical values as reported directly from the IPSec hardware. There are two versions of this command:

- The **show security ipsec statistics sad** command queries a selected IPSec processor for statistics about the SAs configured on it, as located in the security association database (SAD).
- The show security ipsec statistics gmac command queries the GMAC side of the security processor for Ethernet statistics.

#### Viewing Statistics for a Specific SA

The **show security ipsec statistics sad** command shows statistical values for a particular SA entry on the IPSec security processor. You enter a network interface configuration name, selectors by the selector term, a Space, and a search term for that selector. You can enter multiple selector in one command. The command's syntax follows:

```
show security ipsec statistics [network-interface] sad <selectors>
```

Entering no selectors returns all entries for that network interface. Valid values for the selectors argument are as follows:

- direction—Direction (IN | OUT | BOTH), Default: BOTH
- dst-addr-prefix—Destination address prefix, Default: match any
- dst-port—Destination port, Default: match any

- ipsec-protocol—IPSec protocol (AH | ESP | ALL), Default: ALL
- spi—security-policy-index, Default: match any
- src-addr-prefix—Source address prefix, Default: match any
- src-port—Source port, Default: match any
- trans-proto—Transport protocol (UDP | TCP | ICMP | ALL), Default: ALL

### Viewing Statistic for Traffic to from the GMAC Interface and the Security Processor

The **show security ipsec statistics gmac** command displays statistics on traffic that moves between the GMAC interface and the security processor on a specified network interface. Network-interface is entered as a network interface configuration element name. You can display either errors, transmit statistics, receive statistics, or all statistics per HW accelerator / gmac interface. The command's syntax follows:

```
show security ipsec statistics [network-interface] gmac <enter | error | rx |
tx>
```

### **Viewing IPSec Interface Status**

The **show security ipsec status** command displays whether a particular interface on Oracle Communications Session Border Controller is IPSec enabled, and the hardware status of the security processor. Network-interface is entered as a network interface configuration element name. The **show security ipsec status** command usage is as follows:

```
show security ipsec status [network-interface]
```

## **Viewing SSH Security Information**

The following section explains the commands used to obtain SSH statistics which can be helpful for debugging purposes.

# **Viewing SSH Statistics**

The **show security ssh** command displays public key record information. You can include the brief argument to view a brief display which includes login name, fingerprint, and fingerprint raw, or you can view a detailed display which, along with the information displayed in the brief output, also includes comment, and public key.

#### Viewing a Brief SSH Statistics Output

The following is an example of a **show security ssh brief** command:

```
ORACLE# show security ssh-pub-key brief
login-name:
    SEtest
finger-print:
    31:b1:5d:16:ed:01:a7:97:52:e3:92:72:f2:ee:00:74
finger-print-raw:
    66:81:95:8b:05:1b:fc:cd:a4:f9:01:39:44:42:f1:87
```

#### Viewing a Detailed SSH Statistics Output

The following is an example of a **show security ssh detailed** command:

```
ORACLE# show security ssh-pub-key detail
login-name:
    SEtest
comment:
    "2048-bit RSA, converted from OpenSSH by test1@tac-linux.acmepacket.com"
finger-print:
    31:b1:5d:16:ed:01:a7:97:52:e3:92:72:f2:ee:00:74
finger-print-raw:
```

```

# Viewing ETC NIU Statistics

The following ACLI commands are NOT supported by the ETC NIU; they continue to be supported on the HiFN-based NIU.

- show sec srtp spd
- show security srtp status
- show security srtp statistics

The following ACLI commands have been modified when used in conjunction with the ETC NIU; these commands continue to operate as described in previous documentation releases when used in conjunction with the HiFN-based NIU.

show sa stats

The **srtp** option (**show sa stats srtp**) is not available for the ETC NIU; the option continues to be supported on the HiFN NIU.

show security srtp sad

Only the brief option (show security srtp sad intName brief) is supported for the ETC NIU; the sal-index and sad-index, which are HiFN-specific values, along the ssrc (session source) values are not available.

```
dst-addr-prefix
                                  : any
       dst-port
                                 : any
        trans-proto
                                 : ALL
Inbound:
       destination-address : 192.168.203.51
       destination-port

                                  : 80
                                  : 0
       mki
ORACLE#
```

The following ACLI commands have been augmented for use with the ETC HIU.

### show nat flow-info all

The **show nat flow-info all** ACLI command provides two new fields that identify the encryption/decryption protocol applied by the ETC NIU to inbound and outbound SRTP packets.

```
ORACLE# show nat flow-info all
SA_flow_key : 172.16.28.1
DA_flow_key : 172.16.28.2
                                                         SA prefix : 32
                                                         DA_prefix : 32

### show nat flow-info srtp by-addr

The **show nat flow-info srtp by-addr** ACLI command displays cryptographic details for a specific SRTP data flow, as identified by an IPv4 address specifying the data flow source.

Alternatively, you can use the **all** argument in place of a specific IP address to display cryptographic details for all SRTP data flows.

```
ORACLE# show nat flow-info srtp by-addr 172.16.28.1
Crypto Parameters 172.16.28.1:7000 -> 172.16.28.3:8000

### show mbcd statistics

The **show mbcd statistics** ACLI command displays additional counters enumerating the number of active SRTP/SRTCP flows, as well as the number of SRTP sessions.

The SRTP flow count indicates the number of flows that require either SRTP encryption or decryption on either side of the flow.

The SRTP session count indicates the number of concurrent SRTP/SRTCP sessions on the Oracle Communications Session Border Controller. An SRTP session is counted as a full SRTP plus SRTCP crypto context, including both an encryption and decryption context. Note that a collapsed flow containing SRTP and SRTCP will count as one SRTP Session, and two uncollapsed flows for SRTP and the corresponding SRTCP will also count as one SRTP session.

Note that a hairpin connection counts as two SRTP sessions, one for each SRTP/SRTCP pair on each call leg, and two SRTP collapsed flows.

ORACLE# show mbcd statistics 18:13:14-126

### show security srtp sessions

The **show security srtp sessions** ACLI command displays summary information for currently active SRTP sessions.

```
ORACLE# show security srtp sessions

16:31:52-199 Capacity=10000
SRTP Session Statistics -- Period -- ----- Lifetime -----
Active High Total Total PerMax High
SRTP Sessions 100 55 100 17264 100 75
ORACLE#
```

# **System Management**

# User Privilege Levels and Passwords Without Data Storage Security

## **User and Superuser Modes**

There are two modes available in the ACLI: User mode and Superuser mode. User mode provides only limited system access and allows no system configuration. It simply enables you to view configuration files, logs, and all show commands. Superuser mode provides more complete system access and it allows you to configure your Oracle Communications Session Border Controller.

When you log in to a Oracle Communications Session Border Controller you are initially in User mode. To indicate this, the system uses a ">" (close-angle-bracket) as the final character of the ACLI prompt. To enter Superuser mode, you type **enable** followed by Enter at the ACLI prompt. The system prompts you to enter the Superuser password. After you enter the correct password, the prompt changes to a # (pound sign) to indicate Superuser mode.

User Access Verification Password:
ORACLE> enable
Password:
ORACLE#

To exit to User mode from Superuser mode, type **exit** at the top-level ACLI prompt.

ORACLE# exit
ORACLE>

### **Setting Passwords**

Acme Packet recommends that you change the preset passwords for ACLI User and Superuser modes. You can change the passwords from Superuser mode only.

To set new ACLI passwords:

1. Use the **secret** command to change passwords.

Type **secret login** and press Enter to set the User password. The Oracle Communications Session Border Controller asks for a new password, which must be between six and eight characters with at least one non-alphabetic character. For example:

```
ORACLE# secret login
Enter new password :
```

If you do not enter a password in the required format, the following error message appears:

```
% Password must be 6-8 characters with at least one non-alpha
```

2. Type **secret enable** to set the Superuser password. Again, the Oracle Communications Session Border Controller asks for a new password that must be between six and eight characters with at least one non-alphabetic character. For example:

```
ORACLE# secret enable
Enter new password :
```

3. Use your new passwords when prompted for them.

#### SSH Remote Connections

For increased security, you can also connect to your system using SSH (secure shell). SSH requires that you have an SSH client. The system supports five concurrent SSH and/or SFTP sessions.

To initiate an SSH connection to the system without specifying users and SSH user passwords:

- 1. Open your SSH client (Windows, an open source client, etc.).
- 2. At the prompt in the SSH client, type the **ssh** command, a Space, the IPv4, IPv6 address or hostname of your system, and then press Enter. You will be prompted for a password. Enter the system's User mode password. After it is authenticated, an SSH session is initiated and you can continue with tasks in User mode or enable Superuser mode.

```
ssh sd.acme.com
Password:
ORACLE>
```

You can explicitly use the default username and password pair (user/packet) by specifying you are logging in with the user account.

```
ssh -l user sd.user acme.com
Password: <ACLI-user-password>
ORACLE>
```

#### **Create SSH User and Password**

To create an SSH user and password pair on your system:

In the ACLI at the Superuser prompt, use the **ssh-password** command and press Enter. Enter the name of the user you want to establish. Then enter a password for that user when prompted. Passwords are not displayed on the screen.

```
ORACLE# ssh-password
SSH username [saved]: MJones
Enter new password:
```

If you do not enter a password in the required format, the following error message appears:

```
% Password must be 6-8 characters with at least one non-alpha
Enter new password again:
```

Once you have entered a valid password, you must enter your password a second time for confirmation.

After your SSH username and password is set, you can SSH into your Oracle Communications Session Border Controller. Once you provide a valid username and password pair, you need to log in to the ACLI with the previously configured ACLI username and password.

You can SSH into the Oracle Communications Session Border Controller for the first time with the default username and superuser password.

```
ssh -1 user net-net-sd.company.com
```

## SSH RADIUS Authentication VSA Support

The Oracle Communications Session Border Controller supports the use of the Cisco Systems Inc.™ Cisco-AVPair vendor specific attribute (VSA). This attribute allows for successful administrator login to servers that do not support the Acme Packet authorization VSA. While using RADIUS-based authentication, the Oracle Communications Session Border Controller authorizes you to enter Superuser mode locally even when your RADIUS server does not return the ACME\_USER\_CLASS VSA or the Cisco-AVPair VSA.

For this VSA, the Vendor-ID is 1 and the Vendor-Type is 9. The list below shows the values this attribute can return, and the result of each:

- shell:priv-lvl=15—User automatically logged in as an administrator
- shell:priv-lvl=1—User logged in at the user level, and not allowed to become an administrator
- Any other value—User rejected

## SSHv2 Public Key Authentication

The Oracle Communications Session Border Controller supports viewing, importing, and deleting public keys used for authentication of SSHv2 sessions from administrative remote users.

#### Viewing SSH Public Key Data

This section explains how to use the ACLI **show security ssh-pub-key** commands that show you the following information in either brief or detailed displays:

- Login name
- Fingerprint
- Fingerprint raw
- Comment (detailed view only)
- Public key (detailed view only)

You use the login name information from these displays to import or delete SSHv2 public keys.

To view information for public keys in brief format:

1. In Superuser mode, type **show security ssh-pub-key brief**, and the log-in name for the public key you want to see. Then press Enter.

```
ORACLE# show security ssh-pub-key brief jdoe
```

Your display will resemble the following example:

```
login-name:
    jdoe
finger-print:
    c4:a0:eb:79:5b:19:01:f1:9c:50:b3:6a:6a:7c:63:d5
finger-print-raw:
    ac:27:58:14:a9:7e:83:fd:61:c0:5c:c8:ef:78:e0:9c
```

2. In Superuser mode, type **show security pub-key detail**, and the log-in name for the public key you want to see. Then press Enter.

```
ORACLE# show security ssh-pub-key detail msmith
login-name:
    msmith
comment:
    1024-bit rsa, created by me@example.com Mon Jan 15 08:31:24 2001
finger-print:
    61:f8:12:27:13:51:ef:c2:3e:b3:29:32:d7:3a:f2:fc

Exponent: 37 (0x25)
```

#### **Importing a Public Key Record**

This section shows you how to import a public key record. Note that the processes requires you to save and activate your configuration for changes to take effect.

To import an SSHv2 public key record:

 In Superuser mode, type the command ssh-public-key import, then a Space and the login-name (found in both brief and detail show security public-key commands) corresponding to the public key you want to import.

The Oracle Communications Session Border Controller confirms you have successfully imported the key, and then reminds you to save your configuration.

After you complete this procedure, you can confirm the public key has been imported by using either of the show security **ssh-pub-key** commands.

```
ORACLE# ssh-pub-key import jdoe
IMPORTANT:
       Please paste ssh public key in the format defined in rfc4617.
       Terminate the certificate with ";" to exit......
---- BEGIN SSH2 PUBLIC KEY ----
Comment: "2048-bit RSA, converted from OpenSSH by jdoe@acme54"
AAAAB3NzaC1yc2EAAAABIwAAAQEA7OBf08jJe7MSMgerjDTgZpbPblrX4n17LQJgPC7clL

hOr4J/Nlp+vpsvpdrolV6Ftz5eiVfgocxrDrjNcVtsAMyLBpDdL6e9XebQzGSS92TPuKP/
yqzLJ2G5NVFhxdw5i+FvdHz1vBdvB505y2QPj/iz1u3TA/307tyntB0b7beDyIrg64Azc8
G7E3AGiH49LnBtlQf/aw==
---- END SSH2 PUBLIC KEY ----
SSH public key imported successfully....
WARNING: Configuration changed, run "save-config" command to save it and
run activate-config to activate the changes.
```

**2.** Save and activate your configuration.

#### Deleting a Public Key Record

To delete an SSHv2 public key record:

 In Superuser mode, type the command ssh-public-key delete, then a Space and the login-name (found in both brief and detail show security public-key commands) corresponding to the public key you want to import.

The Oracle Communications Session Border Controller confirms you have successfully imported the key, and then reminds you to save your configuration.

After you complete this procedure, you can confirm the public key has been imported by using either of the show security **ssh-pub-key** commands.

```
ORACLE# ssh-pub-key delete jdoe
SSH public key deleted successfully....
WARNING: Configuration changed, run "save-config" command.
```

```
ORACLE# ssh-pub-key delete jdoe record (jdoe) does not exist
```

2. Save and activate your configuration.

## **Expanded Privileges**

Commands available to the User level user now include:

- All show commands
- All display commands
- All monitor commands

See the Oracle Communications Session Border Controller ACLI Reference Guide Command Summary Chapter for a list of privileges for each ACLI command.

### **User Sessions**

The Oracle Communications Session Border Controller provides a way to manually terminate an existing Telnet session on your system. Sessions are terminated by issuing the kill command to a specifically chosen session. You first identify the session you wish to kill and then issue the command.

1. At the User or Superuser prompt, type **show users** followed by <enter>. This will display the current sessions on the Oracle Communications Session Border Controller.

ORACLE# <b>show use</b> : Index task-id		IdNum	duration	type	state
0 0x0225c400 1 0x0225e260 2 0x0219c720 ORACLE#	10.0.200.40:4922	1	00:00:44 00:00:26 00:00:08	telnet	priv

The current session is noted by the asterisk to the right of the entry in the state column. In the above example, the current session has an IdNum of 2.

Identify the session you wish to kill by the IPv4 address listed in the remote-address column of the show users display.

2. Issue the **kill** command followed by the IdNum of the session you wish to kill. The IdNum is listed when you issue the **show users** command.

```
ORACLE# kill 2
Killing ssh session at Index 2
ORACLE# show users
Index task-id remote-address IdNum duration type state
---- 0 0x0225c400 0 00:03:42 console priv

ORACLE#
```

**Note:** You must be in Superuser mode o issue the kill command, but you only need to be in User mode to issue the show users command.

#### **Concurrent Sessions**

The Oracle Communications Session Border Controller allows a maximum number of 5 concurrent Telnet sessions and 5 concurrent SSH sessions. (4 concurrent Telnet sessions on Netra/7xxx hardware) The SSH allowance is shared between SSH and SFTP sessions.

# **Data Storage Security**

In Acme Packet Release C5.0, the Oracle Communications Session Border Controller supports more secure storage of the various passwords used for system functions and using certain system features. These include: administration, certificate private key information, and manual IPSec security association key information. In addition, the Oracle Communications Session Border Controller now stores passwords in a more secure manner when you enable password-secure mode.

**Note:** Before enabling the features described in this section, you should be certain that you want to upgrade to Acme Packet OS Release C5.0.

## **Considerations When Enabling Data Storage Security**

The features in this group make your system more secure, and in doing so they correspondingly make it difficult for an outsider to tamper both with sensitive information used for IPSec, TLS, and HDR and with your passwords in secure-password mode.

If you use these security measures, you should be careful to:

- Guard against losing your secure data password.
- Enable secure-password mode in Upgrade to Acme Packet Release C5.0 and when you are certain you
  will not need to fall back to an earlier software image.

Note that the password-secure mode feature does not default to enabled on your system. This is for backward compatibility, so you need to enable password-secure mode if you want to use it and you should exercise caution when you enable it.

# **About Oracle Communications Session Border Controller Password Features**

This section describes the multiple ways that password support has been expanded and improved to provide your system with a greater degree of security. It contains information about new password support for configurations, configuration migration, new password requirements and backwards compatibility.

#### Protected Configuration Password for TLS IPSec and HDR

You can now set a password for your configuration to guard sensitive information for TLS, IPSec, and HDR configurations.

Once you set the protected configuration password, the older configuration can become unusable unless you set the password back to the old value when creating the backup configuration. During the verification and activation of a configuration, the Oracle Communications Session Border Controller checks these values. If there is a conflict and the Oracle Communications Session Border Controller cannot access encrypted data using the password information you set, it displays a message notifying you of the fact.

Note that for HA nodes, the Oracle Communications Session Border Controller requires you to update the new password manually both on the active and on the standby systems.

#### Configuration Migration

If you want to move a configuration file from one Oracle Communications Session Border Controller to another, the Oracle Communications Session Border Controller checks passwords during the verification and activation processes. If there is a conflict and the Oracle Communications Session Border Controller cannot access encrypted data using the password information you set, it displays a message notifying you of the fact.

However, you can still reuse this configuration. Simply enter the correct protected configuration password information, and then verify and activate the configuration again.

#### **Password Requirements**

Since we are inclined to select passwords that are easy for us to remember, the Oracle Communications Session Border Controller has several requirements for passwords that make them more difficult to tamper with. The passwords you enter on the Oracle Communications Session Border Controller must be:

- Between 8 and 20 characters in length
- Comprised of both alphabetical and numeric characters, where your password must have at least one non-alphabetical character
- Comprised of both upper and lower case letters, where your password must have at least one upper case character and one lower case character
- Void of any of the passwords commonly used as default on the Oracle Communications Session Border Controller: default, password, acme, packet, user, admin

#### **Note on Backwards Compatibility**

Since the password requirements for previous releases of the Acme Packet OS clearly do not meet with the new criteria that have been defined for Acme Packet Release C5.0, the password-secure mode is disabled by default. Once you are certain that you want to run Acme Packet Release C5.0, you can enable the new password feature.

When you enable the password-secure mode, all old passwords become invalid. These old passwords are rendered useless in order to close any possible holes in security.

## **Password Reset and Recovery**

The enhancements to password protection on the Oracle Communications Session Border Controller have been intentionally implemented so that password recovery and reset are not accessible through the ACLI. Acme Packet strongly recommends that you treat this password information with care and take all precautions against losing it.

For both password secure mode and the protected configuration password, the process for recovery and reset involves loading a diagnostics image on your system. For information about loading and running diagnostics, contact Acme Packet Customer Support.

# **Password Policy**

When you use password secure mode on your Oracle Communications Session Border Controller, you can now configure the minimum acceptable length for a secure password if you have Superuser (administrative) privileges. The maximum password length is 64 characters.

In password secure mode, your password requires three out of four of the following:

- Upper case letters
- Lower case letters
- Numbers
- Punctuation marks

However, secure mode password cannot contain any of the following strings in any variations of case: default, password, acme, user, admin, packet.

Any change you make to the password length requirement does not go into effect until you configure a new password (and are in password secure mode). Pre-existing passwords can continue to be used until you go to change them.

# **Upgrade to ACP**

Another measure Acme Packet Release C5.0 takes to provide enhanced security is upgrading the version of the Acme Control Protocol (ACP) from version 1.0 to version 1.1. Version 1.0 uses normal digest authentication, but version 1.1 uses advanced digest authentication. Advanced digest authentication does not require that credentials be stored using reversible format; it uses a pre-calculated hash to construct the

digest value. In ACP version 1.1, there is an additional directive (user credentials hash algorithm) in the Authentication header so that the server (such as the Acme Packet EMS) can calculate the proper digest.

#### **SSH Password Considerations**

Your existing SSH password will still work after you upgrade to Acme Packet Release C5.0. However, because this password is no longer stored in the /code/ssh directory, a warning will appear every time the SSH server accesses the file for user authentication:

```
ORACLE# Cannot check the integrity of SSH password storage.
Should consider reset the SSH password.
```

As of Acme Packet Release C5.0, the hash of the password is saved. The file with the password also contains information that guards integrity to prevent tampering.

Resetting your password will prevent the warning messages and make your SSH sessions more secure. The procedure for setting your SSH password is the same as in prior releases.

#### **Password Administration**

This section shows you how to set a password policy.

#### **Setting a Protected Configuration Password Matching Configurations**

You set a protected configuration password using the ACLI **secret** command. As the system warning indicates when you start this process, changing the password makes backup and archived configurations unusable and requires you to change the password on the standby system in an HA node (if applicable).

When your saved and active configurations match, the process will proceed as in the sample below. However, when the saved and active configuration are out of sync, the Oracle Communications Session Border Controller requires you to correct the condition by activating the configuration (using the ACLI activate-config command).

To set a protected configuration password when configuration data is in synch:

1. In Superuser mode, type **secret config** at the system prompt and press Enter.

```
ORACLE# secret config
```

**2.** The Oracle Communications Session Border Controller issues a warning for the change you are about to make, and asks you to confirm whether or not you want to proceed. Type a **y** and press Enter to continue; type an n and press Enter to abort the process.

```
WARNING:
Proceed with caution!
Changing the configuration password will result in any previous backup/archive configuration unusable.
You also need to change the password on any stand-by
SDs when you have changed the password successfully

Are you sure [y/n]?: y
```

**3.** Then the system asks for the old configuration password.

```
Enter old password : [your entry will not echo]
```

If your entry does not match the old password, the system displays an error message: % Password mismatch - aborted.

If your entry matches, you will be asked for the new password.

**4.** Enter the new configuration password. Your entry must confirm to the Password Requirements for Acme Packet Release C5.0.

```
Enter new password : [your entry will not echo]
```

**5.** Confirm the new configuration password and press Enter. The Oracle Communications Session Border Controller first displays a message letting you know that it is changing the password, and then another message confirming the change. It also prompts you to save and activate your configuration.

```
Enter password again: [your entry will not echo]
Changing the configuration password...
Be patient. It might take a while...
Preparing backup...
Creating backup...
Done
Removing backup...
Done
Configuration password changed
ORACLE#
```

#### **Setting a Protected Configuration Password Mismatched Configurations**

When the saved and active configuration are out of sync, the Oracle Communications Session Border Controller requires you to correct the condition by activating the configuration (using the ACLI activate-config command). Once this is complete, you can carry out the process for setting a protected configuration password.

To set a protected configuration password when the saved and active configurations are different:

1. In Superuser mode, type **secret config** at the system prompt and press Enter.

```
ORACLE# secret config
```

**2.** The Oracle Communications Session Border Controller issues a warning for the change you are about to make, and asks you to confirm whether or not you want to proceed. Type a **y** and press Enter to continue; type an n and press Enter to abort the process.

```
WARNING:
Proceed with caution!
Changing the configuration password will result in any previous backup/archive configuration unusable.
You also need to change the password on any stand-by SDs when you have changed the password successfully

Are you sure [y/n]?: y
Currently active (137) and saved configurations (138) do not match!
To sync & activate, run 'activate-config' or 'reboot activate'.
ORACLE#
```

3. Use the activate-config command to synchronize the saved and active configurations.

```
*ORACLE# activate-config
Activate-Config received, processing.
waiting 120000 for request to finish
Request to 'ACTIVATE-CONFIG' has Finished,
Activate Complete
```

**4.** Continue with the process described in Setting a Protected Configuration Password: Matching Configuration.

#### Setting a Protected Configuration Password Committing Changes

This section describes the process of committing the changes you have made by saving and activating configurations when both the configuration data and password have been updated. Committing the changes means saving and activating your configuration.

To commit your protected configuration password changes:

**1.** Carry out the process described in Setting a Protected Configuration Password: Matching Configuration.

2. After you have finished and the system is done creating a backup, the system reminds you that you need to save and activate.

```
Preparing backup...

Creating backup...

Done

updating cert-record name: end

updating cert-record name: ca

updating security-association name: sal

Removing backup...

Done

WARNING:

Configuration changed, run 'save-config' and
'activate-config' commands to commit the changes.
```

**3.** Save your configuration using the save-config command.

```
ORACLE# save-config
Save-Config received, processing.
waiting 1200 for request to finish
Copy OK: 8516 bytes copied
Copy OK: 8517 bytes copied
Request to 'SAVE-CONFIG' has Finished,
Save complete
```

**4.** Activate your configuration using the activate-config command.

```
*ORACLE# activate-config
Activate-Config received, processing.
waiting 120000 for request to finish
Request to 'ACTIVATE-CONFIG' has Finished,
Activate Complete
```

#### Changing Protected Configuration Password on a Standby System in an HA Node

When changing the protected configuration password for an HA node, you carrying out the Setting a Protected Configuration Password: Matching Configuration process (or one of the related processes) on the active system, and then must manually change it on the standby. However, changing the protected configuration password on the standby is an abbreviated process.

To change the protected configuration password on a standby system in an HA node:

1. On the stand-by system, delete the configuration using the delete-config command.

```
ORACLE2# delete-config
```

2. On the active system, update the configuration password.

```
ORACLE1# secret config
```

Carry out all of the subsequent confirmations, paying close attention to the warnings.

**3.** On the stand-by system, update the configuration password. Ensure that the password you set on the stand-by matches the password you set on the active system

```
ORACLE2# secret config
```

Carry out all of the subsequent confirmations, paying close attention to the warnings.

4. On the stand-by system, acquire the configuration from the activate system using the acquire-config command.

```
ORACLE2# acquire-config
```

**5.** Reboot the stand-by system.

```
ORACLE2# reboot
```

#### **Confirming Synchronous Protected Configuration Password and Configuration**

To confirm that your protected configuration password and configuration are synchronized:

In Superuser mode, type **verify-config** at the system prompt and press Enter.

```
ORACLE2# verify-config
Checking configuration data...
OK: configuration password is in sync with the configuration data
```

#### **Configuration Migration**

This section provides with instructions for how to move your configuration file from one Oracle Communications Session Border Controller to another. Additional checking has been added to the verification and activation processes. To describe how to migrate a configuration, this section uses the designations Oracle Communications Session Border Controller1 and Oracle Communications Session Border Controller2, where:

- Oracle Communications Session Border Controller1 has the configuration you want to copy and move
- Oracle Communications Session Border Controller2 is the system to which you want to migrate the configuration from Oracle Communications Session Border Controller1

**Note:** For Acme Packet OS Release C5.0, the protected configuration password only applies if you are using TLS, IPSec, and/or HDR. The coverage (range of Oracle Communications Session Border Controller configurations) offered by the protected configuration password might expand in the future.

To migrate a configuration from Oracle Communications Session Border Controller1 (where the password configuration has been set) to Oracle Communications Session Border Controller2:

- 1. Ensure that the protected configuration password on Oracle Communications Session Border Controller1 and Oracle Communications Session Border Controller 2 are the same.
- 2. On Oracle Communications Session Border Controller1, back up a well-working configuration that you also want to use on Oracle Communications Session Border Controller2. Use the backup-config command. The ACLI tells you when the back up has been saved.

```
ORACLE1# backup-config copyConfig1
task done
```

- **3.** On Oracle Communications Session Border Controller2, update the protected configuration password if necessary.
- 4. On Oracle Communications Session Border Controller2, delete the configuration using the **delete-config** command.

```
ORACLE2# delete-config
```

5. On Oracle Communications Session Border Controller2, use the **restore-backup-config** command with the appropriate file name for the backup from Oracle Communications Session Border Controller1. Save the configuration once the backup is restored.

```
ORACLE2# restore-backup-config copyConfig1

Need to perform save-config and activate/reboot activate for changes to take effect...

task done

ORACLE2# save-config

Save-Config received, processing.

waiting 1200 for request to finish

Request to 'SAVE-CONFIG' has Finished,

Save complete

Currently active and saved configurations do not match!

To sync & activate, run 'activate-config' or 'reboot activate'.
```

**6.** Before activating the configuration, verify it.

```
ORACLE2# verify-config
...
```

#### System Management

```
Checking configuration password...
OK: configuration password is in sync with the configuration data
...
```

7. Activate the configuration on Oracle Communications Session Border Controller2.

```
ORACLE2# activate-config
Activate-Config received, processing.
waiting 120000 for request to finish
Request to 'ACTIVATE-CONFIG' has Finished,
Activate Complete
```

#### **Setting the Password Policy**

In the security ACLI path, you will find the **password-policy** configuration. It contains the **min-secure-pwd-len** parameter where you set the length requirement—between 8 and 64 characters—to use for passwords when password secure mode is enabled. For example, if you set this value to 15, then your password must be a minimum of 15 characters in length.

To set the minimum password length to use for password secure mode:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal
ORACLE(configure)#
```

2. Type **security** and press Enter.

```
ORACLE(configure)# security
ORACLE(security)#
```

3. Type password-policy and press Enter.

```
ORACLE(system-config) # password-policy
ORACLE(password-policy) #
```

- **4.** min-secure-pwd-len—Enter a value between 8 and 64 characters that defines the minimum password length to use when in password secure mode. This parameter defaults to 8.
- 5. Save and activate your configuration.

# **Admin Security APC License**

The Admin Security APC license works in conjunction with a previously installed Admin Security license to enhance password strength requirements in certain high security environments.

Enhanced password strength requirements depend on the presence of both the Admin Security license and the Admin Security ACP license.

In addition to enhancing password security, the Admin Security APC license addresses issues caused by the removal of a Admin Security license from an Acme Packet Session Director. In previous releases, removal of the Admin Security license left the Session Director in a less than optimal state.

# **License Requirements**

Support for enhanced password strength requires two licenses: the previously existing Admin Security license and the newly available Admin Security ACP license.

The following tables show previously-supported and newly-supported trusted endpoint populations for the NN38xx and NN4500 platforms.

# **Password Policy**

The existing Admin Security license supports the creation of a password policy that enhances the authentication process by imposing requirements for

password length

- password strength
- password history and re-use
- password expiration

Specifically, the Admin Security license mandates the following password length/strength requirements.

- user password must contain at least 9 characters
- admin password must contain at least 15 characters
- passwords must contain at least 2 lower case alphabetic characters
- passwords must contain at least 2 upper case alphabetic characters
- passwords must contain at least 2 numeric characters
- passwords must contain at least 2 special characters
- passwords must differ from the prior password by at least 4 characters
- passwords cannot contain, repeat, or reverse the user name
- passwords cannot contain three consecutive identical characters

## **Configuring Password Policy Properties**

The single instance password-policy configuration element defines the password policy.

1. From superuser mode, use the following command path to access password-policy configuration mode.

```
ORACLE# configure terminal
ORACLE(configure)# security
ORACLE(security)# password-policy
ORACLE(password-policy)#
```

The password-policy configuration element properties are shown below with their default values.

```
min-secure-pwd-length 8
expiry-interval 90
expiry-notify-period 30
grace-period 30
grace-logins 3
password-history-count 3
password-change-interval 24
password-policy-strength disabled
```

- 2. The min-secure-pwd-length command is ignored when the Admin Security license is installed.
- **3. Use the expiry-interval** command to specify the password lifetime in days. Password lifetime tracking begins when a password is changed.

Allowable values are integers within the range 1 through 65535, with a default value of 90 (days).

```
ORACLE(password-policy) # expiry-interval 60
ORACLE(password-policy) #
```

**4. Use the password-change-interval** command to specify the minimum password lifetime (the minimum time that must elapse between password changes.)

Allowable values are integers within the range 1 through 24, with a default value of 24 (hours).

```
ORACLE(password-policy) # password-change-interval 18
ORACLE(password-policy) #
```

**5. Use the expiry-notify-period** to specify the number of days prior to expiration that users begin to receive password expiration notifications.

Allowable values are integers within the range 1 through 90, with a default value of 30 (days).

During the notification period, users are reminded of impending password expiration at both Session Director login and logout.

```
ORACLE(password-policy)# expiry-notify-period 10
ORACLE(password-policy)#
```

6. Use the grace-period command in conjunction with the grace-logins command, to police user access after password expiration.

After password expiration, users are granted some number of logins (specified by the **grace-logins** command) for some number of days (specified by the **grace-period** command). Once the number of logins has been exceeded, or once the grace period has expired, the user is forced to change his or her password.

Allowable values for **grace-period** are integers within the range 1 through 90, with a default value of 30 (days).

Allowable values for **grace-logins** are integers within the range 1 through 10, with a default value of 3 (logins).

```
ORACLE(password-policy) # grace-period 1
ORACLE(password-policy) # grace-logins 1
ORACLE(password-policy) #
```

7. **Use the password-history-count** command to specify the number of previously used passwords retained in encrypted format in the password history cache.

Allowable values are integers within the range 1 through 10, with a default value of 3 (retained passwords).

By default, a user's three most recently expired passwords are retained in the password history. As the user's current password is changed, that password is added to the history, replacing the oldest password entry.

New, proposed passwords are evaluated against the contents of the password cache, to prevent password re-use, and guard against minimal password changes.

```
ORACLE(password-policy) # password-history-count 10
ORACLE(password-policy) #
```

**8. Use the password-policy-strength** command to enable the enhanced password strength requirements provided by the new Admin Security ACP license.

In the absence of the Admin Security ACP license, this command can be safely ignored.

**password-policy-strength adds** additional password strength requirements beyond those imposed by the Admin Security license. Specific new requirements are as follows.

- passwords cannot contain two or more characters from the user ID
  - For example, given a user ID of administrator, the password this password is tragic is not allowed because is tra is a substring of administrator.
- passwords cannot contain a sequence of three or more characters from any password contained in the password history cache
- passwords cannot contain a sequence of two or more characters more than once
  - For example, ...w29W29... is legal; ...w29W29&&29... is not.
- passwords cannot contain either sequential numbers or characters, or repeated characters more than once. (e.g '66666', 'aaaa', 'abcd', 'fedc', '1234', '7654' ...)

For example, 666, aaa abcd, fedc, 1234, and 7654 all render a password illegal.

In the absence of the Admin Security APC license, retain the default value (disabled). With the Admin Security APC license installed, used enabled to add the new password requirements as listed above; use disabled to retain the password requirements defined by the Admin Security license.

```
ORACLE(password-policy) # password-policy-strength enabled
ORACLE(password-policy) #
```

9. Use done, exit and verify-config to complete the password policy.

# **Licensing Issues**

The Admin Security license enables the various security enhancements described in the Admin Security Essentials guide (Acme Packet Document Number: 400-0132-00).

As with any other license, an activate-config command must be executed after license installation for all changes to take effect. Certain ACLI aspects, such as login and password change prompts, change immediately after installation of the Admin Security license.

Installation of the Admin Security license, disables access to the underlying operating system. As it is sometimes necessary to access the operating system to debug issues at customer sites, an Admin Sec-Shell license, that provides temporary operating system access, is available.

These two licenses relate as follows:

- 1. A Session Director with an Admin Security license also requires the Admin Sec-Shell license for operating system access.
- 2. A Session Director that has never had an Admin Security license install will have shell access enabled.
- 3. Removal of the Admin Security license does not re-enable operating system access (such access requires the Admin Sec-Shell license to be present). This ensures that a system cannot be compromised via the operating system by simple removing the Admin Security license.

A bit is permanently set in the NVRAM of a Session Director to denote that it currently has, or has previously had an Admin Security license. This bit will is checked even if the license is removed, to determine if the Session Director should enforce the added security features.

Should the Admin Security license be removed the following restrictions are imposed, resulting in a severely compromised Session Director:

- telnet access is not available
- FTP access is not available
- EMS (Element Management System) access is not available
- audit log deletion is not allowed
- ACP (Acme Control Protocol) is disabled
- operating system access is not allowed

When an Admin Security APC license is in place, however, removal of the Admin Security license produces near-normal Session Director operations.

- telnet access is available
- FTP access is available
- EMS access is available
- a static and inaccessible audit long remains
- ACP (Acme Control Protocol) is enabled
- · operating system access is allowed

# System Time

There are several reasons why your Oracle Communications Session Border Controller needs to keep an accurate reference to the system time. These include, but are not limited to, the need for accurate billing, logging, and the need to stay synchronized with other network equipment.

# **Setting Time**

To manually set the system-time on your Oracle Communications Session Border Controller:

In the ACLI at the superuser prompt, enter the **systime-set** command and press Enter. Enter the Date and Time in the exact format shown on the screen. Remember to use 24-hour time when entering the time. You will be given a chance to confirm your change. Type **Y** followed by <enter> to confirm.

```
ORACLE# systime-set
Date YYYY MM DD: 2005 01 26
Time HH MM: 16 05
WARNING: Changing the time can have an adverse
effect on session processing
Do you want to continue [y/n]?: y
Setting time to: WED JAN 26 16:05:00 2000
ORACLE#
```

## **Setting Timezone**

The timezone on the Acme Packet ESD must be set manually via the ACLI using one of two methods:

- using the **timezone-set** command at the root prompt. This commands starts a timezone wizard that allows you to answer prompts specifically related to timezone settings. You can set your timezone location and the wizard automatically sets the daylight savings time for the location you select.
- at the path system->timezone. This parameter allows you to create a timezone name and apply specific instructions for daylight savings time (DST) and specify the number of minutes from Coordinated Universal Time (UTC). If you initiated the timezone-set wizard previous to accessing this parameter, the settings for system->timezone are already populated. You can change them if required.

It is recommended you set the timezone after first boot of the system.

#### **About UTC Timezones**

Coordinated Universal Time (UTC) is used as the official world reference for time. Coordinated Universal Time replaced the use of Greenwich Mean Time (GMT) in 1972. Sometimes time zones are represented similar to UTC - 5h or GMT - 5h. In this example, the (-5h) refers to that time zone being five hours behind UTC or GMT and so forth for the other time zones. UTC +5h or GMT +5h would refer to that time zone being five hours ahead of UTC of GMT and so forth for the other time zones.

The usage of UTC and GMT is based upon a twenty four hour clock, similar to military time, and is based upon the 0° longitude meridian, referred to as the Greenwich meridian in Greenwich, England.

UTC is based on cesium-beam atomic clocks, with leap seconds added to match earth-motion time, where as Greenwich Mean Time is based upon the Earth's rotation and celestial measurements. UTC is also known as Zulu Time or Z time.

In areas of the United States that observe Daylight Saving Time, local residents move their clocks ahead one hour when Daylight Saving Time begins. As a result, their UTC or GMT offset would change from UTC -5h or GMT - 5h to UTC -4h or GMT - 4h. In places not observing Daylight Saving Time the local UTC or GMT offset will remain the same year round. Arizona, Puerto Rico, Hawaii, U.S. Virgin Islands and American Samoa do not observe Daylight Saving Time.

In the United States Daylight Saving Time begins at 2:00 a.m. local time on the second Sunday in March. On the first Sunday in November areas on Daylight Saving Time return to Standard Time at 2:00 a.m. The names in each time zone change along with Daylight Saving Time. Eastern Standard Time (EST) becomes Eastern Daylight Time (EDT), and so forth. A new federal law took effect in March 2007 which extends Daylight Saving Time by four weeks.

The United States uses nine standard time zones. From east to west they are Atlantic Standard Time (AST), Eastern Standard Time (EST), Central Standard Time (CST), Mountain Standard Time (MST), Pacific Standard Time (PST), Alaskan Standard Time (AKST), Hawaii-Aleutian Standard Time (HST), Samoa standard time (UTC-11) and Chamorro Standard Time (UTC+10). The following tables identify the standard time zone boundaries and the offsets.

Standard Timezone Boundaries Table

Coordinated Universal Time (UTC)	Greenwich Mean Time (GMT)
UTC/GMT +0	UTC/GMT +0

#### Timezone Offsets Table

United States GMT/UTC Offsets				
Time Zone in United States	Examples of places in the United States using these Time Zones	UTC Offset Standard Time	UTC Offset Daylight Saving Time	
Atlantic	Puerto Rico, US Virgin Islands	UTC - 4h	N/A	
Eastern	Connecticut, Delaware, Florida, Georgia, part of Indiana, part of Kentucky, Maine, Maryland, Massachusetts, Michigan, New Hampshire, New Jersey, New York, North Carolina, Ohio, Pennsylvania, Rhode Island, South Carolina, part of Tennessee, Vermont, Virginia and West Virginia	UTC - 5h	UTC - 4h	
Central	Alabama, Arkansas, Florida, Illinois, part of Indiana, Iowa, part of Kansas, part of Kentucky, Louisiana, part of Michigan, Minnesota, Mississippi, Missouri, Nebraska, North Dakota, Oklahoma, part of South Dakota, part of Tennessee, most of Texas, and Wisconsin	UTC - 5h		
Mountain	raizona , obiorado, partor dano, partor		UTC - 6h * n/a for Arizona	
Pacific	California, part of Idaho, Nevada, most of Oregon, Washington	UTC - 8h	UTC - 7h	
Alaska	Alaska and a portion of the Aleutian Islands that is east of 169 degrees 30 minutes west longitude observes the Alaska Time Zone.	UTC - 9h	UTC - 8h	
Hawaii - Aleutian	Hawaii and a portion of the Aleutian Islands that is west of 169 degrees 30 minutes west longitude observes the Hawaii-Aleutian Standard Time Zone. Although Hawaii does not observe daylight saving time the Aleutian Islands do observe daylight saving time.	UTC - 10h	UTC - 9h Hawaii does not observe daylight saving time	

#### **Using the Timezone-Set Wizard**

You can configure the timezone on the Acme Packet ESD by running a **timezone-set** wizard from the root location via the ACLI. Use the following procedure to configure the Acme Packet ESD timezone. If you need to exit the **timezone-set** command before completing it, use the key sequence **Ctrl-D**.

**Note:** The procedure described below may display different prompts depending on whether your system is running on VXWorks or LINUX.

To configure the timezone:

1. At the root prompt, enter timezone-set and press Enter.

ORACLE# timezone-set

The following displays.

\_\_\_\_\_

Calling tzselect. Use ^D to cancel without save
Please identify a location so that time zone rules can be set correctly.
Please select a continent or ocean.

1) Africa
2) Americas
3) Antarctica
4) Arctic Ocean
5) Asia
6) Atlantic Ocean
7) Australia
8) Europe
9) Indian Ocean
10) Pacific Ocean

```

The following displays.

\_\_\_\_\_\_

```
The following information has been given:
       United States
       Eastern Time
Therefore TZ='America/New York' will be used.
Local time is now: Wed Mar 13 11:18:52 EDT 2013.
Universal Time is now: Wed Mar 13 15:18:52 UTC 2013.
Is the above information OK?
1) Yes
2) No
#?
```

5. Enter 1 (Yes), and press Enter. Or enter 2 (No) to go back to Step 2 and enter the correct timezone information.

```
#? 1
```

The following displays.

\_\_\_\_\_\_

```
Timezone=America/New York
ORACLE#
```

\_\_\_\_\_

You have completed the timezone-set wizard.

#### **Configuring Timezone using POSIX Format**

If you want to configure the timezone using POSIX format, you can select the option none - I want to specify the time zone using the Posix TZ format in Step 2 of the timezone-set wizard. If you need to exit the timezone-set command before completing it, use the key sequence Ctrl-D.

To set the timezone using POSIX format:

1. At the root prompt, enter timezone-set and press Enter.

```
ORACLE# timezone-set
```

The following displays.

\_\_\_\_\_

```
Calling tzselect. Use ^D to cancel without save
Please identify a location so that time zone rules can be set correctly.
Please select a continent or ocean.
```

- 2) Americas
- 3) Antarctica
- 4) Arctic Ocean

```
5) Asia
6) Atlantic Ocean
7) Australia
8) Europe
9) Indian Ocean
10) Pacific Ocean
11) none - I want to specify the time zone using the Posix TZ format.
#?
```

\_\_\_\_\_

2. Enter 11, and press Enter.

#### #? 11

The following displays.

\_\_\_\_\_

```
Please enter the desired value of the TZ environment variable. For example, GST-10 is a zone named GST that is 10 hours ahead (east) of UTC.
```

\_\_\_\_\_

**3.** Enter **the UTC/GMT** value for your location. For valid UTC/GMT values, see the Timezone Offsets Table.

```
#? UTC-10
```

The following displays.

\_\_\_\_\_

```
The following information has been given:

TZ='UTC-10'

Therefore TZ='UTC-10' will be used.

Local time is now: Thu Apr 11 02:50:18 UTC 2013.

Universal Time is now: Wed Apr 10 16:50:18 UTC 2013.

Is the above information OK?

1) Yes

2) No
#?
```

-----

**4.** Enter **1 (Yes)**, and press Enter. Or enter **2** (No) to go back to Step 2 and enter the correct timezone information.

```
#? 1
```

The following displays. If you specified a value that does not relate to your Acme Packet ESD location, a warning displays.

\_\_\_\_\_

```
Timezone=UTC-10
WARNING: custom timezone will apply to application only.
ORACLE#
```

\_\_\_\_\_

You have completed the timezone-set wizard.

# **Displaying the System Timezone**

You can display the timezone configured for your Oracle Communications Session Border Controller using the ACLI **show** timezone command from the root prompt.

#### **System Management**

```
ORACLE# show timezone
America/New_York
ORACLE#
```

To show more specific information about timezone settings, such as daylight savings time, navigate to the timezone parameter at the path **system** > **timezone**, and initiate the **show** command. The following example shows the results from the show command.

```
ORACLE(timezone) # show
timezone
                 TimezoneA
        name
        minutes-from-utc
                              240
                                                  1
        dst-start-month
        dst-start-day
                                                  1
        dst-start-weekday
                                                  sunday
        dst-start-hour
                                                  1
        dst-start-rule
                                                  disabled
        dst-end-month
                                                  1
                                                  1
        dst-end-day
        dst-end-weekday
                                                  sunday
        dst-end-hour
                                                  1
        dst-end-rule
                                                  disabled
```

## NTP Synchronization

This section provides information about how to set and monitor NTP on your Oracle Communications Session Border Controller.

When an NTP server is unreachable or when NTP service goes down, the Oracle Communications Session Border Controller generates traps for those conditions. Likewise, the Oracle Communications Session Border Controller clears those traps when the conditions have been rectified. The Oracle Communications Session Border Controller considers a configured NTP server to be unreachable when its reach number (whether or not the NTP server could be reached at the last polling interval; successful completion augments the number) is 0. You can see this value for a server when you use the ACLI **show ntp server** command.

- The traps for when a server is unreachable and then again reachable are:
   apSysMgmtNTPServerUnreachableTrap and apSysMgmtNTPServerUnreachableClearTrap
- The traps for when NTP service goes down and then again returns are:
   apSysMgmtNTPServiceDownTrap and apSysMgmtNTPServiceDownClearTrap

#### Setting NTP Synchronization

When the Oracle Communications Session Border Controller requires time-critical processing, you can set NTP for time synchronization. Setting NTP synchronizes both the hardware and the software clocks with the reference time from an NTP server that you specify. NTP is most useful for synchronizing multiple devices located on one network, or across many networks, to a reference time standard.

To guard against NTP server failure, NTP is restarted periodically to support the dynamic recovery of an NTP server.

Note that **ntp-sync** works only by way of the management interface and only on wancom0. Do not configure **ntp-sync** by way of the media interface or any other port.

To set NTP synchronization:

In the ACLI's configure terminal section, type ntp-sync and then press Enter to access the NTP configuration.

```
ORACLE# configure terminal
ORACLE(configure)# ntp-sync
ORACLE(ntp-config)#
```

2. To add an NTP server, type **add-server**, the Space bar, the IPv4 or IPv6 address of the server and then press the Enter key.

For example, this entry adds the NTP server at the Massachusetts Institute of Technology in Cambridge, MA:

```
ORACLE(ntp-config) # add-server 18.26.4.105
```

**3.** To delete an NTP server, type **delete-server**, the Space bar, and the IPv4 or IPv6 address of the server you want to delete and then press the Enter key.

```
ORACLE (ntp-config) # del-server 18.26.4.105
```

#### Authenticated NTP

The Oracle Communications Session Border Controller can authenticate NTP server requests using MD5. The configured MD5 keys are encrypted and obscured in the ACLI. You configure an authenticated NTP server with its IP address, authentication key, and the key ID. Corresponding key and key IDs are provided by the NTP server administrator.

To configure an authenticated NTP server:

1. Access the ntp-config configuration element.

```
ORACLE# configure terminal
ORACLE(configure)# ntp-sync
ACMEPACKET(ntp-config)#
```

**2.** Type select.

```
ORACLE(ntp-config) # select
```

3. Access the auth-servers configuration element

```
ORACLE(ntp-config) # auth-servers
ORACLE(auth-servers) #
```

- 4. ip-address Enter the IPv4 or IPv6 address of the NTP server that supports authentication.
- 5. key-id Enter the key ID of the key you enter in the next step. This value's range is 1 999999999.
- **6.** key Enter the key used to secure the NTP requests. The key is a string 1 31 characters in length.
- 7. Type **done** to save your work.
- **8.** Type **exit** to return to the previous configuration level.
- **9.** Type **done** to save the parent configuration element.

#### **Monitoring NTP from the ACLI**

NTP server information that you can view with the new **show ntp server** command tell you about the quality of the time being used in terms of offset and delays measurements. You can also see the maximum error bounds.

When you use this command, information for all configured servers is displayed. Data appears in columns that are defined in the table below:

Display Column	Definition	
server	Lists the NTP servers configured on the Oracle Communications Session Border Controller by IP address. Entries are accompanied by characters:	
	Plus sign (+)—Symmetric active server	
	Dash (-)—Symmetric passive server	
	Equal sign (=)—Remote server being polled in client mode	
	Caret (^)—Server is broadcasting to this address	
	Tilde (~)—Remote peer is sending broadcast to *	

#### System Management

Display Column	Definition
	Asterisk (*)—The peer to which the server is synchronizing
st	Stratum level—Calculated from the number of computers in the NTP hierarchy to the time reference. The time reference has a fixed value of 0, and all subsequent computers in the hierarchy are n+1.
poll	Maximum interval between successive polling messages sent to the remote host, measured in seconds.
reach	Measurement of successful queries to this server; the value is an 8-bit shift register. A new server starts at 0, and its reach augments for every successful query by shifting one in from the right: 0, 1, 3, 7, 17, 37, 177, 377. A value of 377 means that there have been eight successful queries.
delay	Amount of time a reply packet takes to return to the server (in milliseconds) in response.
offset	Time difference (in milliseconds) between the client's clock and the server's.
disp	Difference between two offset samples; error-bound estimate for measuring service quality.

#### **View Statistics**

To view statistics for NTP servers:

At the command line, type **show ntp server** and press Enter.

ORACLE# <b>show</b> I	-					50 UTC 2007
server	st 	poll	reach	delay 	offset 	disp
*64.46.24.66	3	64	377	0.00018	0.000329	0.00255
=61.26.45.88	3	64	377	0.00017	0.002122	0.00342

You can the see the status of NTP on your system by using the **show ntp status** command. Depending on the status of NTP on your system, one of the following messages will appear:

- NTP not configured
- NTP Daemon synchronized to server at [the IP address of the specific server]
- NTP synchronization in process
- NTP down, all configured servers are unreachable

#### **View Status**

To view the status of NTP on your Oracle Communications Session Border Controller:

At the command line, type **show ntp status** and press Enter.

ORACLE# show ntp status

# **Automated Daylight Savings Time (DST) Updates**

In addition to configuring DST at the command prompt, the Oracle Communications Session Border Controller provides a mechanism to create static or rules-based time updates to reflect your location's seasonal Daylight Savings Time changes. This configuration offsets the Oracle Communications Session Border Controller's internal time, obtained via NTP or from ACLI configuration. When DST is configured as a configuration element, it is persistent across reboots.

When the DST start date/time is reached, 1 hour is added to the system clock. When the DST end date/time is reached, 1 hour is subtracted from the system clock.

#### **Baseline Configuration**

To complete automated DST configuration, you must give a name to the time zone that this system adheres to and the minutes from UTC (offset) from UTC, entered as +/-720.

#### Static DST Updates

You can configure the Oracle Communications Session Border Controller to enact and rescind DST offset on a predefined start and stop date. This is set with the following parameters:

dst start/end rule — This parameter is set to static when configuring static DST start and end times.

dst start/end month — The month when DST offset begins or ends, entered as 1-12.

dst start/end day — The day of the month when DST offset begins or ends, entered as 1-31.

dst start/end hour — The hour on the chosen day when DST offset starts or ends, entered as 0-23.

#### **Rules-based DST Updates**

You can configure the Oracle Communications Session Border Controller to enact and rescind DST offset based on rules that correspond to relative dates in a month. That is, start and stop dates can be the Nth (or last) day-name, in a calendar month, as opposed to a day-number of the month.

dst start/end rule — This parameter is set to ordinal number of the start/stop weekday when configuring rules-based DST start and end times. This parameter is entered as: first | second | third | fourth | last.

dst start/end month — The month when DST offset begins or ends, entered as 1-12.

dst start/end weekday — The named day when DST offset begins or ends, entered as: sunday | monday | tuesday | wednesday | thursday | friday | saturday.

dst start/end hour — The hour on the chosen day when DST offset starts or ends, entered as 0-23.

dst start/end day is not configured when entering rules based DST updates.

#### **DST Update Examples**

The current DST rule for North America is that daylight savings starts on the second Sunday in March at 2:00am and ends on the first Sunday in November at 2:00am. Thus the settings for the Eastern Time Zone would be as follows:

```
name
                       = EST
minutes-from-utc = 300
dst-start-month = 3
dst-start-day = 1
                         = 1
dst-start-day
dst-start-weekday = sunday
dst-start-hour = 2
dst-start-hour
dst-start-rule
                      = second
dst-end-month
dst-end-day
                       = 11
                      = 1
dst-end-weekday = dst-end-hour = 2
                      = sunday
                   = first
dst-end-rule
```

**Note:** The dst-start-day and dst-end-day values are ignored.

The European Union directive states that DST starts on the last Sunday in March at 1:00am UTC and ends on the last Sunday in October at 1:00am UTC. Therefore the timezone settings for the UK would be:

#### System Management

```
dst-start-rule = last
dst-end-month = 10
dst-end-day = 1
dst-end-weekday = sunday
dst-end-hour = 2
dst-end-rule = last
```

Note the dst-end-hour is 2 because this is the local time and 2am BST is 1am UTC.

# System Task Management

It is useful to directly control the tasks and processes that are running on your system. For example, you might need to terminate a hung task.

The Oracle Communications Session Border Controller also offers several debugging features such as: viewing stack traces and task control blocks, and configuring task-specific logs.

# **Setting Task Log Levels**

Logging tasks is essential for debugging problem configurations on your Oracle Communications Session Border Controller.

The log setting changes made via the ACLI's **log-level** commands are not persistent after a system reboot. Upon reboot, you need to change the log settings in the system-config element in order for them to be persistent. See the Oracle Communications Session Border Controller ACLI Reference Guide for the default log levels associated with each configuration element.

You can set log levels globally for all tasks or on a task-by-task basis.

To set log levels globally:

• In the ACLI at the Superuser prompt, enter the **log-level all** command, followed by the logging severity level the system should set all processes to. Refer to the following table for an explanation of logging levels, which can be entered in either numerical or English format.

```
ORACLE# log-level all 4
```

To set log levels for a specified task:

• In the ACLI at the superuser prompt, enter the **log-level** command followed by a specific task name and then the logging severity level to set this process to. Refer to the following table for an explanation of logging levels. Log levels can be entered in either numerical or English format.

```
ORACLE# log-level mbcd minor
```

The following table defines the syslog levels by severity and number against the log enumeration. For more information regarding the syslog severities, refer to IETF RFC 3164, "The BSD syslog Protocol."

syslog Level (numerical code)	syslog Severity Level (number) From RFC 3164	Code Description
Emergency (1)	Emergency (0)	The EMERGENCY syslog level signifies the utmost severity. These situations require immediate attention. If you do not attend to these types of conditions immediately, there will be physical, permanent, and irreparable damage to your system.
Critical (2)	Alert (1)	The CRITICAL syslog level signifies a serious condition within the system. These situations require attention as soon as they are noted. If you do not attend to these conditions immediately, there

syslog Level (numerical code)	syslog Severity Level (number) From RFC 3164	Code Description
		may be physical, permanent, and irreparable damage to your system.
Major (3)	Critical (2)	The MAJOR syslog level signifies that functionality has been seriously compromised. As a result, these situations may cause loss of functionality, hanging applications, and dropped packets. If you do not attend to these situations, your system will suffer no physical harm, but it will cease to function.
Minor (4)	Error (3)	The MINOR syslog level signifies that functionality has been impaired to a certain degree. As a result, you may experience compromised functionality. There will be no physical harm to your system. However, you should attend to these types of conditions as soon as possible in order to keep your system operating properly.
Warning (5)	Warning (4)	The WARNING syslog level signifies those conditions that signal that the system has noted some irregularities in performance. This condition is used to describe situations that are noteworthy. However, you should attend to these conditions in order to keep your system operating properly.
Notice (6)	Notice (5)	These log levels are used for Oracle support purposes.
Info (7)	Informational (6)	These log levels are used for Oracle support purposes.
Trace (8) Debug (9)	Debug (7)	These log levels are used for Oracle support purposes.

## Stopping a Task

The stop-task command shuts down a specified task. You can obtain the identification number of the task you wish to end by using the tcb command. Follow the procedure below to stop a task.

To stop a task:

In the ACLI at the superuser prompt, enter the **stop-task** command followed by the name or ID of the task you wish to terminate.

```
ORACLE# stop-task tRadd ORACLE#
```

# **Notifying Tasks**

The notify command sends a notification to a specific task. Notify commands have different applications and are used as a general method of telling tasks to perform a given action. Several notify applications are presented below. The generalized syntax for using the notify command is:

```
notify <task name> <action> [<arguments>...]
```

#### **Tracing Sockets**

The notify command is used for runtime protocol tracing for UDP/TCP sockets. This use of the command provides for all protocol messages for ServiceSocket sockets to be written in a log file or sent out of the system to a UDP port. This mechanism allows for tracing to be enabled for any socket, provided that the class has a logical method for displaying and formatting the protocol message. All ACP classes and SIP supports this. Tracing can be enabled for all processes, specific sockets, all sockets, or specific processes. Tracing for specific sockets is specified by the local IPv4 address and port on which the socket is connected.

```
notify all|process-name> trace all|<socket-address><file-name> [<outuberrormals]
notify all|<pre>process-name> notrace all|<socket-address>
```

The <socket-address> is the IPv4 or IPv6 address and the port on which the socket is connected. The <out-udp-port> is the UDP IPv4 or IPv6 address and port to which the log messages are sent. If the <out-udp-port> is not specified, the logs are written to the <filename>.

#### **Notify Subcommands**

The table below lists and defines the subcommands and additional capabilities that are included in the notify command.

notify Subcommand	Description	
BERPD		
notify berpd force	This command is used to perform a manual switchover between systems in HA architectures, regardless of the system on which the command is executed (active or standby). This command forces the active system into the Standby state and forces the standby system into the Active state.	
MBCD		
notify mbcd nolog	This command disables MIBOCO logging.	
notify mbcd log	This command enables MIBOCO logging in the miboco.log.	
notify mbcd debug	This command sets the log level for MBCD for debugging purposes. Unless a specific log type is specified, this command will use its defaults: FLOW and MEDIA.	
notify mbcd nodebug	This command disables setting the log level for MBCD. This command is used for debugging purposes.	
RADD		
notify radd reload	This command changes the configurations for RADIUS dynamically by reloading the configuration data in the account-config.	
SIPD		
notify sipd reload	This command allows you to reload SIPd and thereby update its running state with the latest configuration changes. This command cannot tear down any inprogress sessions, and it cannot tear down any listening sockets.	
	For example, if the previously configured SIP port is 5060 and you edit the configuration and change the port to 5061, both 5060 and 5061 will be listening ports. This command only adds the new listening port to the SIP functionality and does not overwrite the previous one. Calls in progress remain up.	
notify sipd nosiplog	This command disables logging SIP and MIBOCO messages, including SIP messages as seen from the system SIP proxy's perspective (i.e., all messages are seen coming from and going to home realm addresses) and MIBOCO messages exchanged with the MBCD to manage flows.	

notify Subcommand	Description
notify sipd siplog	This command enables the logging of SIP and MIBOCO messages in the sipmsg.log.
notify sipd report	This command writes all SIP process statistics to the log file.
notify sipd dump limit	This command writes CPU limit information to the log file.
notify sipd debug	This command sets the log level for the SIP protocol for some SIP activity. This command is used for debugging purposes. Unless a specific log type is specified, this command uses its defaults: SIP, SESSION, TRANS, SIPNAT, and MEDIA.
notify sipd nodebug	This command disables setting the log level for the SIP protocol for some SIP activity. This command is used for debugging purposes.

## Viewing Power Supply and RAMdrive Status

The **show power** command allows you to view Oracle Communications Session Border Controller power supply information including the state of the power supply and the installation position.

```
ORACLE# show power
Power Supply A (right): Present \ On
Power Supply B (left): Present \ Off or Fail
```

Displays RAMdrive usage, including the log cleaner threshold values and the size of the most recently saved configuration.

ORACLE# show ramdrv					
opt Directory	#Files	Bytes	Blocks	Percent	
collect	35	1400	35	0	
H323CfgFile	1	394	1	0	
spl	0	0	0	0	
logs	64	46646727	11430	8

./	2	2036	2	0	
Total	108	46652937	11474	8	
Free		490078208	_	91	
log-min-free=16: log-min-check=20 log-max-usage=20	68435450 (50%)				

# Rebooting the SBC

The **reboot** command is used to reboot the Oracle Communications Session Border Controller system. There are three modes you can use to reboot your Oracle Communications Session Border Controller. Different modes determine which configurations are used to boot your system.

#### reboot activate

The **reboot activate** command reboots the system with the last saved current configuration. This command is useful if changes have been made and saved to the system configuration but that configuration has not yet been activated and the system goes out of service.

In terms of making the current configuration into the running configuration, using this command is the same as using the **activate-config** command.

#### reboot fast

On VM/server-based platforms, the **fast** argument has been added to the reboot command. The **reboot fast** (VM only) command reboots the system using the last running configuration and does not reinvoke the bootloader.

#### reboot force

The **reboot force** command reboots the system using the last running configuration. This command does not require you confirm the reboot directive. The boot sequence begins immediately after issuing this command.

#### reboot force activate

The **reboot force activate** command reboots the system using the last saved current configuration. This command does not require you confirm the reboot directive. The boot sequence begins immediately after issuing this command.

Like the **reboot** activate command, **reboot** force activate allows you to activate the current configuration that has been saved but not previously activated. Reboot force activate is the same as issuing the activate-config command and then a **reboot** force.

reboot Subcommand	Description
reboot activate	This subcommand reboots the Oracle Communications Session Border Controller and activates the newly saved configuration.
reboot force	This subcommand reboots the Oracle Communications Session Border Controller and loads the last running configuration without confirmation.
reboot force activate	This subcommand reboots the Oracle Communications Session Border Controller and activates the newly saved configuration without confirmation.

# **Reboot Safeguards**

The ACLI's reboot command has safeguards to prevent it from being executed in one ACLI session when certain key processes are in progress in another ACLI session.

Attempting to reboot the Oracle Communications Session Border Controller while a key process is in progress in another ACLI session will result in a warning and notification message that appears on the console. The message informs you that another ACLI session is manipulating the system configuration if any of the following commands/processes are executed:

- · save-config
- backup-config
- restore-backup-config
- delete-backup-config
- delete-config

#### **Reboot Status File**

The **delete-status-file** command removes the taskcheckdump.dat and statsDump.dat files on the Oracle Communications Session Border Controller. These files contains information from Oracle Communications Session Border Controller system failures.

The system writes status information to the statsDump.dat file before the system reboots itself. Oracle uses the status file to gather information about why a system rebooted itself for debugging and/or technical service purposes. To carry out this command, type **delete-status-file** into the command line and press Enter.

## **Warning on Reboot**

The Oracle Communications Session Border Controller issues a warning when you attempt to reboot the system without having saved configuration changes. If you encounter this warning, you can simply save your configuration (using the ACLI **save-config** command), and then proceed with the reboot. If you want to reboot without saving changes, you can confirm to the reboot but any changes to the configuration (made since the last save) will be lost).

# **System Watchdog Timer**

The Oracle Communications Session Border Controller's watchdog timer ensures that the system will reset itself if it becomes unstable. If a set period of time elapses before the timer is reset by another process, the system will initiate a hardware reset. The watchdog timer expires after 31 seconds. This period is not configurable.

The watchdog process runs at a very high priority so that it is always active. As long as other essential processes are running, the watchdog timer will be reset before it expires. If an essential system process encounters a problem, forcing the system software to hang or enter into an unstable state, the watchdog timer will not be reset. As a consequence, the watchdog timer will expire, and the system will reboot.

# **Watchdog Timer Configuration**

The watchdog timer has the following five configuration features:

- **1.** The watchdog state is persistent across reboot.
- 2. The watchdog timer is disabled by default.
- 3. Changes to the watchdog timer state are activated in real time.
- 4. The watchdog timer state can only be changed from ACLI Superuser mode.
- 5. The watchdog timer state can be viewed from ACLI Superuser and User modes.

#### **ACLI Example**

The following template shows the usage of the watchdog command.

```
ORACLE# watchdog [enable | disable | fetch]
```

- enable—enables the watchdog timer
- disable—disables the watchdog timer
- fetch—prints the current state of the watchdog timer to the screen

To enable the watchdog timer on your Oracle Communications Session Border Controller:

1. Enter the Superuser mode in the ACLI.

ORACLE#

2. Type watchdog <space> enable and press Enter to enable the watchdog timer.

```
ORACLE# watchdog enable
Watchdog timer started
ORACLE#
```

3. Type watchdog <space> fetch and press Enter to confirm that the watchdog timer has been enabled.

```
ORACLE# watchdog fetch
Watchdog timer is enabled
ORACLE#
```

## **ARP Information**

The ACLI's ARP commands are used to associated IPv4 addresses (Layer 3) with Ethernet MAC addresses (Layer 2). You can view the ARP table, add or remove an entry, or test an entry.

## show arp

The **show arp** command is one of the many **show** commands available to you on the Oracle Communications Session Border Controller. It displays the Link Level ARP table, ARP entries, and ARP table statistics. An example output is shown below.

```
ORACLE# show arp
IP address
           HW type Flags HW address
                                          Mask Device
Total ARP Entries = 1
Intf VLAN IP-Address MAC
                                  time-stamp
                                                    type
                                                         active-
count

ORACLE#
```

# arp-add

The **arp-add** command allows you to add ARP entries into the ARP table. Since some network devices do not support ARP, static ARP entries sometimes need to be added to the ARP table manually. The syntax for using the **arp-add** command is:

```
arp-add <slot> <port> <vlan-id> <IP address> <MAC address>
```

If there is no VLAN tagging on this interface, set vlan-id to 0.

# arp-delete

The **arp-delete** command allows you to remove ARP entries from the ARP table. You only need to identify the IPv4 address, VLAN tag, and slot and port pair to be removed. The syntax for using the **arp-delete** command is:

```
arp-delete <slot> <port> <vlan-id> <IP address>
```

# arp-check

The arp-check command allows you to test a particular address resolution. When this command is carried out, a test message is sent. The test is successful when an OK is returned. If there is no VLAN identifier to be entered, then enter a value of 0. The syntax for using the **arp-check** command is:

```
arp-check <slot> <port> <vlan-id> <IP address>
```

## **SCTP Information**

## **Monitoring SCTP Operations**

The ACLI show ip sctp command provides basic SCTP information as shown below.

```
ORACLE# show ip sctp
SCTP Statistics
        0 input packets
                0 datagrams
                0 packets that had data
                0 input SACK chunks
                0 input DATA chunks
                0 duplicate DATA chunks
                0 input HB chunks
                0 HB-ACK chunks
                0 input ECNE chunks
                0 input AUTH chunks
                0 chunks missing AUTH
                0 invalid HMAC ids received
                O invalid secret ids received
                0 auth failed
                O fast path receives all one chunk
                O fast path multi-part data
        0 output packets

# **NAT Information**

The ACLI can display NAT table information and the NAT table itself in a variety of formats: by entry range, by table entry range in tabular form, by matching source and destination addresses. This information is used primarily for debugging purposes.

NAT information is displayed using the **show nat** command with the appropriate arguments.

#### show nat info

The **show nat info** command allows displays general NAT table information. The output is used for quick viewing of the system's overall NAT functions, including the maximum number of NAT table

entries, the number of used NAT table entries, the length of the NAT table search key, the first searchable NAT table entry address, the length of the data entry, the first data entry address, and whether or not aging and policing are enabled in the NAT table.

```
ORACLE# show nat info
-- NAT table info --
Maximum number of entries : 7768
Number of used entries : 0
Length of search key : 2 (x 64 bits)
First search entry address : 0x0
length of data entry : 4 (x 64 bits)
First data entry address : 0x0
Enable aging : 1
Enable policing : 0
ORACLE#
```

## show nat by-addr

The **show nat by-addr** command displays NAT table information that matches source and destination addresses. When using this command, you can specify the entries to display according to source address (SA) and/or destination address (DA) values.

The system matches these values to the NAT table entries and shows the pertinent information. If no addresses are entered, the system shows all of the table entries. NAT entries can be matched according to SA or DA or both.

show nat by-addr <source IPv4 address> <destination IPv4 address>

The table below explains the output of the **show nat by-addr** command.

Parameter	Description
SA_flow_key	Source IPv4 or !Pv6 address key used for matching in the look-up process.
DA_flow_key	Destination IPv4 or IPv6 address key used for matching in the look-up process.
SP_flow_key	UDP source port used for matching in the look-up process.
DP_flow_key	UDP destination port used for matching in the look-up process.
VLAN_flow_key	If this is a non-zero value, then there is an associated VLAN. If this value is zero, then there is no associated VLAN.
SA_prefix	These values determine how many bits in the key are considered in the look-up process for a match, where SA is the source IPv4 address, DA is the destination IPv4 address, SP is the UDP source port, and DP is the UDP source port.
DA_prefix	
SP_prefix	
DP_prefix	
Protocol_flow_key	This value stands for the protocol used, where the following values and protocols correspond:
	• 1 = ICMP
	• 6 = IP
	• 17 = UDP
Ingress_flow_key	This value uniquely identifies from where the packet came, and it is a combination of the Ingress Slot and Ingress Port values.
Ingress Slot	Together with the Ingress Port, this value makes up the Ingress_flow_key.
Ingress Port	Together with the Ingress Slot, this value makes up the Ingress_flow_key.

Parameter	Description		
XSA_data_entry	This is the translated (i.e., post-lookup) source IPv4 or IPv6 address value.		
XDA_data_entry	This is the translated (i.e., post-lookup) destination IPv4 or IPv6 address value.		
XSP_data_entry	This is the translated (i.e., post-lookup) source port value.		
XDP_data_entry	This is the translated (i.e., post-lookup) destination port value.		
Egress_data_entry	This value uniquely identifies the outbound interface for the packet, and it is a combination of the Egress Slot and Egress Port values. This is the functional equivalent to the Ingress_flow_key.		
Egress Slot	Together with the Egress Port, this value makes up the Egress_data_entry.		
Egress Port	Together with the Egress Slot, this value makes up the Egress_data_entry.		
flow_action	This value displays the defined flow_action (i.e., flag) bits. The flow action bit mask includes the following bit options:		
	• bit 1 - 1=MPLS strip		
	• bit 2 - 1=Diffserv clear		
	• bit 5 - 1=Latch source address		
	• bit 6 - 1=Collapse flow		
	• bit 7 - 1=Slow Path		
	• bit 8 - 1=QoS Requirement		
	• bit 9 - 1=RTCP, 0=RTP is bit 8 is set		
	• bit 10 - 1=packet capture if bit 8 is set		
	• bit 11 - 1=full packet capture, 0=header packet capture, if bit 9 is set		
	Bits 8 through 11 only apply to QOS.		
optional_data	This value is related to the flow_action value.		
	If the flow_action Slow Path bit (bit 7) is set, then the		
	optional_data value is the UDP destination port for delivery to the		
	host. The optional_data value may also contain DSCP markings.		
VLAN_data_entry	This value refers to the outbound VLAN look-up process. A non-zero value means that there is an associated VLAN, while a zero value means that there is no associated VLAN.		
host_table_index	This value refers to the virtual index for the host management of CAM processing.		
init_flow_guard	This timer is used to age the entries in the CAM.		
inact_flow_guard	This timer is used to age the entries in the CAM.		
max_flow_guard	This timer is used to age the entries in the CAM.		

In the above table, the following values are equivalent:

- SA = Source IPv4 or IPv6 Address
- DA = Destination IPv4 or IPv6 Address
- SP = UDP Source Port
- DP = UDP Destination Port

• X = Translated

Using a zero in the source address location of the command execution line is a wildcard value. This is used for displaying NAT information by destination address only.

## show nat by-index

The **show nat by-index** command displays a specified range of entries in the NAT table, with a maximum of 5024 entries. The syntax for using the show nat by-index command is:

```
show nat by-index <starting entry> <ending entry>
```

To view lines 10 through 50 of the NAT table, you would enter the following:

```
show nat by-index 10 50
```

If you do not specify a range, the system uses the default range of 1 through 200. The range you enter corresponds to line numbers in the table, and not to the number of the entry itself.

#### show nat in-tabular

The **show nat in-tabular** command displays a specified range of entries in the NAT table display in table form, with a maximum of 5024 entries. This tabular output allows for ease in viewing the sometimes lengthy NAT table information. The syntax is modeled on the show nat by-index command:

```
show nat in-tabular 10 50
```

In this abbreviated display, the fields that are shown for each NAT entry are:

- SA\_key—equivalent to SA\_flow\_key in other **show nat** commands. Displayed in hexadecimal format.
- DA\_key—equivalent to DA\_flow\_key in other show nat commands. Displayed in hexadecimal format.
- SP\_key—equivalent to SP\_flow\_key in other show nat commands. Displayed in hexadecimal format.
- DP\_key—equivalent to DP\_flow\_key in other show nat commands. Displayed in hexadecimal format.
- VLAN\_key—equivalent to VLAN\_data\_entry in other **show nat** commands.
- ING—equivalent to Ingress\_flow\_key in other **show nat** commands.
- PROTO—equivalent to Protocol\_flow\_key in other **show nat** commands.
- WEIGHT—Flow weight.

The display of the show nat in-tabular requires a 132-column display. Please adjust your terminal program appropriately.

## **SNMP Community and Trap Receiver Management**

You can view and reset the counters for SNMP community table and SNMP trap receivers using the ACLI commands described in this section.

## **SNMP Community Table**

The SNMP community table stores information about the SNMP servers that you configure. These configurations set the community name and define what kind of information that server can access.

#### show snmp-community-table

The **show snmp-community-table** command displays all of the configuration information for the SNMP community. It also shows the total responses in and total responses out. Type **show snmp-community-table** followed by pressing Enter in the ACLI to use this command. For example:

```
ORACLE# show snmp-community-table community-name : public
```

access-mode : READ-ONLY ip-addresses : 10.0.200.61

```
172.30.0.13
total requests in : 111
total responses out : 111
community-name : test
access-mode : READ-ONLY ip-addresses : 172.30.0.
                     : 172.30.0.13
10.0.200.61
total requests in : 21
total responses out : 21
community-name : test1
access-mode : READ-ONLY ip-addresses : 10.0.200.
                     : 10.0.200.61
total requests in : 101
total responses out : 101
community-name : testipv6
access-mode : READ-ONLY ip-addresses : [fe80::221:f6ff:fe69:224]:162
total requests in : 121
total responses out : 121
```

### reset snmp-community-table

You can specifically reset the counters on SNMP community table statistics by using the ACLI **reset snmp-community-table** command. This set of statistics also resets when you use the ACLI **reset all** command.

```
ORACLE# reset snmp-community-table
```

## Trap Receiver

The trap receiver is a network management system (NMS) to which the Oracle Communications Session Border Controller sends SNMP traps to report system events. The SNMP agent uses trap receiver information that you configure to send traps to NMSs.

When you use the ACLI **show trap-receiver** table command, the system displays all of the configuration information for the SNMP community and the total number of traps sent to it.

#### show trap-receiver

The **show trap-receiver** command displays all of the configuration information for the SNMP community and the total number of traps sent to it. For example:

```
ORACLE# show trap-receiver

community-name : public

filter-level : All

ip-address : 10.0.0.43

total traps out : 3

community-name : test

filter-level : All

ip-address : 10.0.200.61

total traps out : 3

community-name : testipv6

filter-level : All

ip-address : fe80::221:f6ff:fe69:224

total traps out : 103
```

#### reset trap-receiver

You can specifically reset the counters for trap receiver statistics by using the ACLI reset trap-receiver command. This set of statistics also resets when you use the ACLI reset all command.

```
ORACLE# reset trap-receiver
```

## Login Banner

You can customize the displayed text banner, visible at the start of each ACLI session on your Oracle Communications Session Border Controller. This feature lets you tailor the appearance of the ACLI's initial login screen to make it more company- or customer-specific. This file is stored in the /code/banners/directory, which the system will creates for you if it does not exist when you upload the file (called banner.txt).

## **ACLI Audit Trail**

You can configure your Oracle Communications Session Border Controller to send a history of all user-entered commands to a common audit log file. When you enable this feature, all commands entered from any ACLI session are written to the cli.audit.log file. You can also display the log file using the **show** logfile cli.audit.log command. In addition, the system records what configuration a user selects when using the **select** command. Prompted passwords are not saved, but the requests for changes to them are.

The cli.audit.log file is stored in the log directory, and it is lost when you reboot your system; this file is not available off-box. The ACLI audit trail is enabled by default, but you can turn it off by changing the system configuration's cli-audit-trail parameter to disabled.

## SBC Processing Language (SPL)

SPL provides a means for Acme Packet to craft solutions and features to unique problems and deploy them in a portable plugin-type software package. SPL plugins are uploaded to the Oracle Communications Session Border Controller, marked to be executed, and then perform a feature-like function as expected. SPL only works for SIP messaging. You may only run signed SPL files on your Oracle Communications Session Border Controller available directly from Acme Packet.

Upon boot, the Oracle Communications Session Border Controller compiles all scripts in the /code/spl directory that are configured in the spl config configuration element. If there is an error during parsing tile SPL files, it is written to the log.sipd and the script is not loaded. Scripts are loaded in the order in which they are configured in the spl plugins configuration element.

SPL Packages act identically to SPL plugins but contain multiple plugins in one file. When a package file is configured in the name parameter of the spl plugins configuration element, the Oracle Communications Session Border Controller will load all SPL plugins contained in that package. You may also configure the Oracle Communications Session Border Controller to execute a single plugin contained within the package with the syntax package-name:plugin-name. You may omit the .pkg extension when configuring the Oracle Communications Session Border Controller to load one plugin from a package.

## **Enabling SPL Plugins**

Enabling SPL plugins is a three step process.

- 1. Copy the SPL plugins to a Oracle Communications Session Border Controller.
- 2. Configure the Oracle Communications Session Border Controller to recognize and run the plugins.
- 3. Command the Oracle Communications Session Border Controller to execute the plugins.

## **Uploading SPL Plugins**

SPL plugins must be manually FTPed to the Oracle Communications Session Border Controller's / code/spl directory with use any CLI or GUI-based FTP or SFTP application. The Oracle Communications Session Border Controller's FTP server, if enabled may be reached from the system's wancom or eth0 management physical interface. For example:

```
C:\Desktop>ftp 172.30.46.10
Connected to 172.30.46.10.
220 ACMESYSTEM FTP server (VxWorks 6.4) ready.
User (172.30.46.10:(none)): user
331 Password required for user.
Password:
230 User user logged in.
ftp> cd /code/spl
250 CWD command successful.
ftp> put HelloWorld.spl
200 PORT command successful.
150 Opening ASCII mode data connection for '/code/spl/HelloWorld.spl'.
226 Transfer complete.
ftp: 317 bytes sent in 0.04Seconds 8.13Kbytes/sec.
ftp> bye
221 Goodbye.
```

## **Configuring SPL Plugins**

All SPL plugin files that you intend to run must be configured in the spl plugins configuration element. The Oracle Communications Session Border Controller executes the plugin files in the order in which they were configured.

To add an SPL Plugin or SPL Package to the configuration:

1. In Superuser mode, type **configure terminal** and press Enter.

```
ORACLE# configure terminal
```

2. Type **system** and press Enter to access the system-level configuration elements.

```
ORACLE(configure)# system
ORACLE(system)#
```

3. Type **spl-config** and press Enter.

```
ORACLE(system) # spl-config
ORACLE(spl-config) #
```

**4.** Type **plugins** and press Enter. The system prompt changes to let you know that you can begin configuring individual parameters.

```
ACMESYSTEM(spl-config) # plugins
ACMESYSTEM(spl-plugins) #
```

- **5. name**—Enter the name of a plugin file in the /code/spl directory that you wish the Oracle Communications Session Border Controller to execute.
  - You can enter the name of the SPL Package file in the name parameter.

```
ACMESYSTEM(spl-plugins) #name SPL PACKAGE.PKG
```

• You can enter a single SPL Plugin that exists in a package file as follows:

```
ACMESYSTEM(spl-plugins) #name SPL PACKAGE: MODIFY HEADER
```

**6.** Type **done** to save your work.

## **SPL Parameter Configuration**

SPL Plugins may create the **spl-options** parameter in either the session-agent, sip-interface, realm-config, or spl-config configuration elements. The **spl-options** parameter appears in the ACLI after an SPL plugin that creates the parameter is executed. The **spl-options** parameter will not necessarily appear in all four (or any) configuration elements. Where and when to configure the **spl-options** parameter is discussed in each plugin's specific documentation.

## **Executing SPL Files**

There are three ways to execute SPL files:

#### System Management

- 1. Perform a save-config and activate-config after exiting the configuration menu.
- **2.** Reboot the system (after a **save-config**)
- 3. Execute the reset spl command—all configured SPL files are refreshed by with the reset spl command. You can also refresh a specific file by typing reset spl <spl-file>.

Note: Acme Packet suggests that scripts are only refreshed during system downtime.

If an SPL file exists in the /code/spl directory, but is not configured in the **spl-files** parameter, it will be ignored when the Oracle Communications Session Border Controller loads all SPL plugins. You may still manually load an SPL file directly with the **reset** command. For example:

```
ORACLE#reset spl HelloWorld.spl
```

In this case, the operator must remember that HelloWorld.spl will no be loaded on the next reboot.

### Synchronizing SPL Files

When running in an HA configuration, both the active and the standby system must have the same version of the running SPL plugins installed. To facilitate configuring the standby system, the **synchronize spl** ACLI command has been developed. Executing this command without any arguments copies all files in the /code/spl directory from the active system to the to the standby Oracle Communications Session Border Controller overwriting any existing files with the same name.

By adding the specific filename as an argument to the **synchronize spl** command, the individual, specified scripts are copied between systems. For example:

```
ORACLE#synchronize spl HelloWorld.spl
```

The **synchronize spl** command can only be executed from the active system in a HA pair. There is no means to automatically synchronization SPL files during a save and activate of the SBC.

## **Maintenance and Troubleshooting**

#### show spl

Typing **show spl** displays the following items:

- The version of the SPL engine
- The filenames and version of the SPL plugins currently loaded on the Oracle Communications Session Border Controller
- The signature state of each plugin
- The system tasks that each loaded plugin interacts with, enclosed in brackets.

#### For example:

```
ORACLE# show spl
SPL Version: C1.0.0
[acliConsole] File: signed_valid_lower_version.spl version: 1 signature:
signed and valid
[acliConsole] File: signed_valid.spl version: 1 signature: signed and valid
[sipd] File: signed_valid_lower_version.spl version: 1 signature: signed and valid
[sipd] File: signed_valid.spl version: 1 signature: signed and valid
```

Adding the task to the end of the show spl command displays only the plugin information for the specified task. For example:

```
ORACLE# show spl sipd

SPL Version: C1.0.0

[sipd] File: signed_valid_lower_version.spl version: 1 signature: signed and valid

[sipd] File: signed_valid.spl version: 1 signature: signed and valid
```

#### **SPL Signature State**

Upon executing **show spl <task>** , the ACLI displays SPL file information including the signature which will be in one of three states:

- not signed
- 2. signed and valid
- 3. signed but invalid

### **Deleting SPL Plugin Files**

Deleting files from /code/spl must be performed via FTP; there is means to delete files from the ACLI.

### SPL Log Types

The SPL log messages can often be found in the respective task's log file when that task is set to DEBUG level.

## Old File Remover

You can enable your Oracle Communications Session Border Controller to clean up old files automatically by configuring the exact directories in which those files resides and the time at which they should be purged. To enable this capability, you use the **directory-cleanup** and **cleanup-time-of-day** settings in the system configuration.

For each directory you want cleaned, you identify the directory path as explicitly as possible (beacuse subdirectories are not cleaned) and the age of the files to remove from the directory. The configuration allows you to turn each file remover on and off, setting the admin-state parameter to enabled for on and disabled for off. You also set the time of day, in hours and minutes in local time, to identify when the system performs the clean-up.

## **Specifics and Caveats**

This section calls out special safeguards, limitations, and cautions to note before you enable file removal.

#### **Protected Directories**

As a preventive measure, the Oracle Communications Session Border Controller does not permit you to remove files from the following directories (and their subdirectories) that are vital to correct system functioning:

- /code—Contains essential system files.
- /boot—Contains essential system files.
- /opt/logs—Contains all logs, including: CLI audit logs, the support info to-file, the show config to-file. However, you can still use the log cleaner function configurable under the system configuration's options parameter.
- /opt/collect—Contains all HDR files.

If you try to configure any of these directories, the system will deem your entry invalid.

#### **Paritally Protected Directories**

The directories listed below cannot be cleaned themselves, though you can clean their subdirectories:

• The CDR file path—Configured in the accounting configuration's **file-path** parameter. If configured, cleaning this directory would interfere with proper operation of the FTP push capacbility you can establish as part of your accounting configuration; it would interfere with file rotation and deletion. The Oracle Communications Session Border Controller will return an warning when you verify your configuration if you mark this file path as one to clean. This warning informs you that the Oracle Communications Session Border Controller will not be cleaned.

• /opt—Apart from its subdirectories, this directory contains files that could be vital to proper system functioning. If you try to enter the main /opt directory, the system will deem your entry invalid.

## **Cleanup Daily Time**

This section shows you how to configure the Oracle Communications Session Border Controller to clean up old files daily at a specified time. This feature is RTC-supported, so you can use the ACLI saveconfig and activate-config commands to enable it.

To set the daily local time at which the Oracle Communications Session Border Controller will clean up files:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal
ORACLE(configure)#
```

2. Type system and press Enter.

```
ORACLE(configure) # system
ORACLE(system) #
```

3. Type system-config and press Enter.

```
ORACLE(system) # system-config
ORACLE(system-config) #
```

**4.** cleanup-time-of-day—Change this parameter from its default (00:00) to local time when you want the Oracle Communications Session Border Controller to begin the clean up process. You enter the time as HH:MM, where HH are the hours and MM are the minutes.

```
ORACLE(system-config) # time-of-day 03:30
```

### **Cleanup Directories**

To identify the directories the Oracle Communications Session Border Controller will clean up:

**1.** Type directory-cleanup and press Enter.

```
ORACLE(system-config)# directory-cleanup
ORACLE(directory-cleanup)#
```

- 2. directory-path—Enter the name of the directory path where you want the Oracle Communications Session Border Controller to perform file clean-up. Remember that subdirectories are not examined or cleaned. This parameter is required and is empty by default.
- 3. admin-state—To turn on daily clean-up for the directory path you just specified in the directory-path parameter, leave this set to its default: enabled. If you want to turn of clean-up for the specified directory, set this parameter to disabled.
- **4. age**—Enter the age of the files to be deleted in number of days. For example, if you want the Oracle Communications Session Border Controller to clean all files that are three days old, you set this parameter to **3**. Files older than this number of days will be purged. The default and maximum value is **30** (days), and the minimum value is **1** (day).
- 5. Save and activate your configuration.

This chapter explains how to access Oracle Communications Session Border Controller inventory management statistics to review the hardware components and licenses installed on the system, as well as active and stored configurations, and configuration information for specific elements or realms.

## **Accessing Inventory Management Data**

You can access inventory management statistics by using the ACLI show command with different subcommands. You can access all show commands at the User level, you do not need Superuser privileges.

## **Hardware Inventory**

This section describes the information you can view about the hardware components installed in the Oracle Communications Session Border Controller.

## Components

You can view hard-coded, programmable read-only memory (PROM) information about the following Oracle Communications Session Border Controller hardware components:

- mainboard (chassis)
- CPU
- PHY cards
- Management card
- Transcoding modules
- Motherboard
- Security modules
- Power supply information (Acme Packet 4600, 6100, 6300)

### show prom-info mainboard

Display the mainboard PROM information by using the **show prom-info** mainboard command. For example:

```
ORACLE# show prom-info mainboard
CContents of Main Board IDPROM
Assy, NetNet4500
```

```
Part Number:
                                          002-0610-50
        Serial Number:
                                          091132009670
        FunctionalRev:
                                          5.06
        BoardRev:
                                          05.00
        PCB Family Type:
                                         Main Board
                                         NetNet 4500 Main Board
        TD:
        Options:
        Manufacturer:
                                         Benchmark Electronics
        Week/Year:
                                          32/2011
        Sequence Number:
                                         009670
                                       16
00 08 25 a2 56 20
        Number of MAC Addresses:
Starting MAC Address:
25 01 07 60
```

#### show prom-info CPU

Display the host CPU PROM information by using the **show prom-info CPU** command. For example:

```
ORACLE# show prom-info CPU

Contents of CPU IDPROM
Part Number: MOD-0026-62
Manufacturer: RadiSys
```

### show prom-info PHY0

Display PROM information for the left physical interface card by using the **show prom-info** PHY0 command. For example:

```
ORACLE# show prom-info PHY0
Contents of PHY0 IDPROM
       Assy, 4 Port SFP
       Part Number:
                                       002-0611-58
       Serial Number:
                                       091138058055
       FunctionalRev:
                                       3.04
                                       03.00
       BoardRev:
       PCB Family Type:
                                       Quad port GigE SFP PHY
                                       4 Port GigE SFP
       Options:
                                       Benchmark Electronics
       Manufacturer:
       Week/Year:
                                       38/2011
                                      058055
       Sequence Number:
```

### show sfps

The **show sfps** command displays the EEPROM contents of the SFP modules in the system (Small Formfactor Pluggable (optical transceiver module)). This command is only applicable to the Acme Packet 4600, 6100, 6300.

```
ORACLE# show sfps
PHY0 SFP0 EEPROM
Identifier: Unknown or unspecified
Extended Identifier: 0x0
Connector: Unknown or unspecified
SONET Compliance Codes: 0x0
Gigabit Ethernet Compliance Codes: 0x0
Fibre Channel Link Length: 0x0
Fibre Channel Transmitter Technology: 0x0
Fibre Channel Transmission Media: 0x0
Fibre Channel Speed: 0x0
Encoding: Unspecified
Nominal Bit Rate (100MBits/sec): 0
Link Length Supported 9/125mm fiber (km): 0
Link Length Supported 9/125mm fiber (100m): 0
Link Length Supported 50/125mm fiber (10m): 0
Link Length Supported 62.5/125mm fiber (10m): 0
```

```
Link Length Supported copper (m): 0
Vendor Name: AVAGO
Vendor OUI: j
Vendor Part Number: AFBR-703SDZ
Vendor Rev Number: G2.3
PHY0 SFP1 EEPROM:
Identifier: Unknown or unspecified
Extended Identifier: 0x0
Connector: Unknown or unspecified
SONET Compliance Codes: 0x0
Gigabit Ethernet Compliance Codes: 0x0
Fibre Channel Link Length: 0x0
Fibre Channel Transmitter Technology: 0x0
Fibre Channel Transmission Media: 0x0
Fibre Channel Speed: 0x0
Encoding: Unspecified
Nominal Bit Rate (100MBits/sec): 0
Link Length Supported 9/125mm fiber (km): 0
Link Length Supported 9/125mm fiber (100m): 0
Link Length Supported 50/125mm fiber (10m): 0
Link Length Supported 62.5/125mm fiber (10m): 0
Link Length Supported copper (m): 0
Vendor Name: AVAGO
Vendor OUI: j
Vendor Part Number: AFBR-703SDZ
Vendor Rev Number: G2.3
```

## **Software Inventory**

This section explains how to access information about the system image used for booting.

## System image

You can display the name the system image currently booting on your system by using the following commands:

- show version
- bootparam (if you have Superuser privileges)

### **Image Filename Acme Packet 4500**

The output from both commands includes the image filename. If that filename starts with either of the following, the system is booting from flash memory:

- For the Acme Packet 4500, you can use **/boot**.
- /tffs1/ (referring to /code)

For example, /tffs1/sd200b1.gz.

If the filename starts with /tftpboot/, the system is booting from an external device. For example, /tftpboot/sd200b1.gz.

#### Location

The output from both commands also includes a code that signals the system from where to boot. The code also signals the system about which file to use in the booting process. This sequence always starts with 0x (these flags are hexadecimal). For example, 0x8.

### bootparam

Display information about the system image being booted on your system by using the **bootparam** command. After you issue the bootparam command, you need to press Enter to scroll down the list of boot configuration parameters.

In the following example, the system image is identified as sd201b37.gz and the location from where the system should boot is identified by the flag's value, 0x8.

#### For example:

```
ORACLE(configure) # bootparam
'.' = clear field; '-' = go to previous field; q = quit
boot device : wancom0
processor number : 0
host name : goose
file name : sd201b37.gz
inet on ethernet (e) : 172.30.55.127:ffff0000
inet on backplane (b) :
host inet (h) : 172.30.0.125
gateway inet (g) : 172.30.0.1
user (u) : vxftp
ftp password (pw) (blank = use rsh) : vxftp
flags (f) : 0x8
target name (tn) : ACMEPACKET
startup script (s) :
other (o) :
```

**Note:** These changed parameters will not go into effect until reboot. Also, be aware that some boot parameters may also be changed through PHY and Network Interface Configurations.

### **Version**

You can view operating system (OS) information, including the OS version number and the date that the current copy of the OS was made, by using the **show version** command. For example:

#### show version

```
ACMESYSTEM# show version
ACME PACKET 4500 Firmware SCX6.3.0 GA (WS Build 299)
Build Date=04/14/12
```

## **Configuration Information**

This section explains how to access information about the system current and running configurations. It also explains how to view configuration information for a specific element or for all elements associated with a specific realm.

#### Overview

You can display information about your system's configuration by using the following commands:

- **show running-config** displays the configuration currently active and running on the Oracle Communications Session Border Controller.
  - You can also use subcommands with show running-config to specify the element configuration you want to view. See the table in the following section for a list.
- show configuration displays the new configuration or configuration that you are modifying.
  - You can also use subcommands with show configuration to specify the element configuration you want to view. See the table in the following section for a list.
- display-running-cfg-version displays the running configuration's version number.

- **display-current-cfg-version** displays the current configuration's version number.
- realm-specifics <realm ID> displays realm-specific configuration based on the input realm ID.

### **Configuration Show Subcommands**

The following table lists the subcommands you can use to specify the configuration element whose configuration you want to view. You use these subcommands with the **show running-config** or **show configuration** commands.

Subcommand	Description
to-file	Send output from this command to a file located on the local flash system file system.
account-config	Account configuration
h323-config	H323 configuration
h323-stack	All h323 stacks
iwf-stack	SIP/H.323 IWF stack
host-route	All host routes
local-policy	All local policies
media-profile	All media profiles
media-manager	Media manager
dns-config	All DNS configurations
network-interface	All network interfaces
ntp-config	NTP configuration
phys-interface	All physical interfaces
realm	All realms
MediaPolicy	All media policies
ClassPolicy	All class policies
redundancy-config	Redundancy configuration
ResponseMap	All response maps
session-agent	All session agents
session-group	All session groups
session-translation	All session translations
translation-rules	All translation rules
session-router	Session router
sip-config	All SIP configurations
sip-feature	All SIP features
sip-interface	All SIP interfaces
sip-nat	All SIP NATs
snmp-community	All SNMP communities

Subcommand	Description
static-flow	All static flows
steering-pool	All steering pools
system-config	System configuration
TrapReceiver	All trap receivers
call-recording-server	All IP call recording servers
capture-receiver	All capture receivers
rph-profile	All RPH profiles
rph-policy	All RPHP policies
password-policy	Password policy
enforcement-profile	All enforcement profiles
realm-group	All realm groups
inventory	Displays an inventory of all configured elements

## **Running Configuration Commands**

You can display the entire running configuration or specify the element for which you want to view configuration information. The information in this section includes an example of one of the available show subcommands, media-manager.

### show running-config

Display the configuration currently running on the Oracle Communications Session Border Controller by using the **show running-config** command. A sample of the **show running-config** output is included at the end of this section.

### show running-configuration media-manager

Display configuration information for media manager only. For example:

```
ORACLE# show running-config media-manager
media-manager
       state
                                      enabled
       latching
                                     enabled
                                    86400
       flow-time-limit
                                    300
       initial-quard-timer
       subsq-quard-timer
                                     300
       tcp-flow-time-limit
                                    86400
       tcp-initial-guard-timer 300
tcp-subsq-guard-timer 300
       tcp-number-of-ports-per-flow 2
       hnt-rtcp
                                    disabled
       mbcd-log-level
                                    NOTICE
                                    10000000
       max-signaling-bandwidth
       max-untrusted-signaling
                                     100
       min-untrusted-signaling
                                     30
       app-signaling-bandwidth
       tolerance-window
                                     30
       rtcp-rate-limit
       min-media-allocation
                                     32000

### display-running-cfg-version

Display the saved version number of the configuration currently running on the Oracle Communications Session Border Controller by using the **display-running-cfg-version** command. For example:

```
ORACLE# display-running-cfg-version
Running configuration version is 3
```

The version number value is incremented by one for each new configuration version.

## **Configuration Commands**

You can display the entire new or modified configuration or you can specify the element for which you want to view configuration information. The information in this section includes an example of one of the available show subcommands, media-manager.

### show configuration

Display the new or modified configuration that will become the running configuration after you execute the save-config and activate-config commands. The output for this command is similar to the output for the show running-config command. A sample of the show running-config output is included at the end of this section.

### show configuration media-manager

Display configuration information for media manager only. For example:

```
ORACLE# show configuration media-manager
media-manager
       state
                                     enabled
       latching
                                     enabled
       flow-time-limit
                                     86400
       initial-quard-timer
                                    300
                                    300
       subsq-quard-timer
                                   86400
       tcp-flow-time-limit
       tcp-initial-guard-timer 300
tcp-subsq-guard-timer 300
       tcp-number-of-ports-per-flow 2
                             disabled
       hnt-rtcp
       algd-log-level
                                    NOTICE

```

#### display-current-cfg-version

Display the saved version number of the current configuration by using the **display-current-cfg-version** command. For example:

```
ORACLE# display-current-cfg-version
Current configuration version is 4
```

The version number value is incremented by one for each new configuration version.

## **Realm Specific**

You can display configuration information for elements associated with a specific realm.

### realm-specifics realm ID

Display realm-specific configuration based on the input realm ID by using the **realm-specifics** <realm ID> command. The information displayed includes the following:

- realm configuration
- steering pool
- session agent
- session translation
- class policy
- local policy (if the source realm or destination realm is defined)

#### For example:

```
ORACLE# realm-specifics testrealm
realm-config
       identifier
                                      testrealm
       addr-prefix
                                      0.0.0.0
       network-interfaces
       mm-in-realm
                                      disabled
                                     enabled
       mm-in-network
                                     enabled
       mm-same-ip
                                     disabled
       mm-in-system
                                     disabled
       msm-release
       gos-enable
                                     disabled
       max-bandwidth
                                      \cap
                                     boffo.com
       ext-policy-svr
       max-latency
                                      Ω
                                      Ω
       max-jitter
                                      0

## **Running Configuration Example**

The following example shows the output of the **show running-config** command. All configuration parameters are displayed on the screen. You see similar output when you execute the **show configuration** command

```
ORACLE# show running-config access-control
access-control
       realm-id
       source-address
                                       172.30.1.10
                                       170.30.1.10
       destination-address
       application-protocol
                                      SIP
        transport-protocol
                                       ALL
       access
                                       permit
       average-rate-limit
                                       30
        trust-level
                                       high
        invalid-signal-threshold
                                       15
                                       60
       maximum-signal-threshold
       untrusted-signal-threshold
                                       0
                                       10
       deny-period

## **Software License Inventory**

This section explains how to view license information for your system.

### **About Licenses**

The components of the Oracle Communications Session Border Controller software are licensed by Oracle for your use. In order to use these components and deploy their related services in your network, you must have a valid license for each of them.

The following software components, interfaces, and features are licensed. If you do not have a license for a given component, interfaces, or feature, its configuration parameters are not visible.

Licence	Description	
Session capacity	Determines the maximum number of sessions allowed by a system for all protocols combined: SIP, H.323, and SIP<—>H.323 IWF (interworking). Each flow that doubles back (or hairpins) through theOracle Communications Session Border Controller counts as two flows. Options for session capacity are: 250, 500, 1000, 2000, 4000, 8000, 16000, and 32000. When your system reaches a 100% of its capacity, an alarm is generated and a trap sent.	
SIP	Enables SIP signaling.	
H.323	Enables H.323 signaling.	
SIP<>H.323	Enables SIP<—>H.323 IWF signaling. In order to run IWF between these two protocols, you must also have valid SIP and H.323 licenses.	
QoS	Enables measurement for QoS (jitter, packet latency, and packet loss) on theOracle Communications Session Border Controller.	
ACP	Enables the Oracle Communications Session Border Controller to respond to ACP requests. Required for Oracle EMS use.	
Routing policies	Establishes routing policies on the Oracle Communications Session Border Controller.	
Load balancing	Establishes distribution of traffic across gateways, application servers, soft switches, and so on.	
Accounting	Establishes RADIUS servers to which the Oracle Communications Session Border Controller can make connections and send CDRs.	
НА	Enables two Oracle Communications Session Border Controllers to work as a pair so that, in case of failover, one system can take over for the other. The two systems paired as HA nodes checkpoint configuration, signaling state, and media.	
	Ensure that the same licensed capabilities are enabled on both SDs that act as HA peers.	
PAC	Enables the system to operate in a PAC configuration with other systems.	

# **Unlicensed Signaling Protocols**

If any of the signaling protocols are not licensed, the system behaves as if it was not configured for those protocols. When this happens, the system writes an error message to the corresponding process log file.

If you exceed the session capacity license, the system responds to signaling messages as if any other constraint has been exceeded. For example, for a SIP signaling message, the system responds with a 503 Service Unavailable, as if a SIP Session Agent Max. Sessions constraint has been exceeded.

If you do not have a license for the ACP feature, only LOGIN and license-related GET, SAVE, and DELETE requests will be accepted on the Oracle Communications Session Border Controller's system manager port. Any other requests to the system manager or LEM ports are rejected with a 603 Decline response.

## **Viewing License Information**

You can view a list of the features that are currently enabled on your system, which indicates their licenses are installed. You can also view detailed license information. The available license commands are the following:

- show features command at the main ACLI user prompt
- **show** command from the license menu (if you have Superuser privileges)

#### show features

Display features that are currently enabled because the licenses for those features are installed on the system by using the **show features** command. For example:

```
ORACLE# show features
Total session capacity: 32000
Enabled features: SIP, H323, IWF, QOS, ACP, Routing,
Load Balancing, Accounting, High Availability, PAC
```

#### license show

Display the list of features that are available by using the **show** command for the license. The **show** command displays the features that are available and, if applicable, the start or end time of the license's activation

To access the show command on the license menu:

1. In Superuser mode, type **configure terminal** and press Enter.

```
ORACLE# configure terminal
```

2. Type system and press Enter.

```
ORACLE(configure) # system
```

3. Type license and press Enter.

```
ORACLE(system) # license
ORACLE(license) #
```

4. Type **show** and press Enter.

### For example:

```
acmepacket(license) # show
License #1: 2000 sessions, SIP, ACP
no expiration
installed at 12:34:42 SEP 01 2004
License #2: H323
expired at 23:59:59 SEP 08 2004
installed at 12:35:43 SEP 01 2004
License #3: 250 sessions, IWF
expires at 23:59:59 SEP 29 2004
installed at 12:36:44 SEP 01 2004
License #4: QOS
starts at 00:00:00 SEP 29 2004
expires at 23:59:59 OCT 27 2004
installed at 12:37:45 SEP 01 2004
Total session capacity: 2250
host(license)#
```

The next example shows installed licenses that have no expiration date:

```
ORACLE(system) # license
ORACLE(license) # show
License #1: 32000 sessions, SIP, H323, IWF, QOS, ACP,
Routing, Load Balancing, Accounting, High Availability, PAC
no expiration
installed at 11:48:05 MAR 04 2005
Total session capacity: 32000
```

### show sessions

Display session capacity for your license and session use information by using the **show sessions** command. For example:

ORACLE# show features Total session capacity: 32000 Enabled features: SIP, H323, IWF, QOS, ACP, Routing, Load Balancing, Accounting, High Availability, PAC, LI							
ORACLE# show session							
15:13:33-165517 Cap	-						
Session Statistics		Per	riod	Li	fetime		
	Active	High	Total	Total	PerMax	High	
Total Sessions	0	0	0	0	0	0	
SIP Sessions	0	0	0	0	0	0	
H.323 Calls	0	0	0	0	0	0	
IWF Statistics Period Lifetime							
	Active	High	Total	Total	PerMax	High	
H.323-to-SIP Calls	0	0	0	0	0	0	
SIP-to-H.323 Calls ORACLE#	0	0	0	0	0	0	

# **Working with Configurations**

## **Configuration Overview**

The Oracle Communications Session Border Controller uses three configuration spaces: the current configuration, last-saved configuration, and the running configuration. The current configuration is a temporary workspace where changes to the configuration are initially stored before they go "live." Once you are satisfied with your edits, they are saved to the last-saved configuration space, as a backup configuration that is persistent across reboot. Finally, when you execute the <code>activate-config</code> command the system goes live using this configuration and makes a copy of the configuration. The copy is also stored on the file system and is called the running configuration, reflecting the running state of the Oracle Communications Session Border Controller.

The following table lists the three configuration spaces along with the creation command and location of configuration.

Configuration Name	ACLI Command to create	Location of Configuration
Current Configuration	done	/opt/data
Last-saved Configuration	save-config	/code/config
Running Configuration	activate-config	/opt/running

## **Configuration Process**

To make configuration changes, set a current configuration, create a last-saved configuration, and finally enact your changes by making a running configuration:

1. Set all the necessary parameters on the Oracle Communications Session Border Controller. Each time you complete configuring a full configuration element, type done to set that element and update the current configuration. When all configuration elements are set, back out of configuration tree to the topmost ACLI level at the superuser prompt. The following example sets an arbitrary configuration element and backs you out to the superuser prompt.

```
ORACLE (host-route) # dest-network 10.0.0.0
ORACLE (host-route) # netmask 255.255.0.0
ORACLE (host-route) # gateway 172.30.0.1
ORACLE (host-route) # done
host-routes

dest-network
netmask

10.0.0.0
255.255.0.0
```

```
gateway 172.30.0.1

ORACLE(host-route) # exit

ORACLE(system) # exit

ORACLE(configure) # exit
```

2. Save all configurations to the last-saved configuration by using the **save-config** command. This step is mandatory.

```
ORACLE# save-config
Save-Config received, processing.
waiting 1200 for request to finish
Request to 'SAVE-CONFIG' has Finished,
Save complete
Currently active and saved configurations do not match!
To sync & activate, run 'activate-config' or 'reboot activate'.
ORACLE#
```

3. Set the Oracle Communications Session Border Controller to enact the last-saved configuration into the running state by using the activate-config command. This will make the last-saved configuration the running configuration and write it to the local file system.

```
ORACLE# activate-config
Activate-Config received, processing.
waiting 120000 for request to finish
H323 Active Stack Cnt: 0
Request to 'ACTIVATE-CONFIG' has Finished,
Activate Complete
ORACLE#
```

## **Verifying & Regenerating Configurations**

The **verify-config** command checks the consistency of configuration elements that make up the current configuration and should be carried out prior to activating a configuration on the Oracle Communications Session Border Controller.

When the **verify-config** command is run, anything configured that is inconsistent produces either an error or a warning message. An error message lets the user know that there is something wrong in the configuration that will affect the way Oracle Communications Session Border Controller runs. A warning message lets the user know that there is something wrong in the configuration, but it will not affect the way the Oracle Communications Session Border Controller runs. The following is an example of the verifyconfig output:

```
ORACLE# verify-config

---
ERROR: realm-config [r172] is missing entry for network-interface
ERROR: sip-nat [nat172] is missing ext-address entry
ERROR: sip-nat [nat172] is missing ext-proxy-address entry
ERROR: sip-nat [nat172] is missing domain-suffix entry
WARNING: sip-nat [nat172] has ext-address [5.6.7.8] which is different from sip-interface [sip172] sip-port address [1.2.3.4]

---
Total:
4 errors
1 warning
```

Every time a user executes the **save-config** command, **verify-config** is automatically run. If any configuration problems are found, you receive a message pointing to the number of errors found during the saving, along with a recommendation to run the **verify-config** command to view the errors fully. The following is an example of the **save-config** verification output:

```
ORACLE# save-config
------
Results of config verification:
```

#### **Verifying Address Duplication**

The **verify-config** command, entered either directly or via the **save-config** command, checks for address duplication for a given network-interface within a configuration. Addresses are checked for duplication based on the following criteria:

- Every address entered is checked against the Primary and Secondary Utility addresses
- All UDP, TCP, and TFTP addresses are checked against other UDP, TCP, and TFTP addresses respectively within the same port range

The following tables display the entire list of addresses which are checked for duplication, the network-interface or realm which they are checked against, and the port range:

#### **Network-Interface**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
pri-utility-addr	Primary	itself	0	0
sec-utility-addr	Secondary	itself	0	0
ip-address	Unknown	itself	0	0
ftp-address	Unknown	itself	0	0
snmp-address	Unknown	itself	0	0
telnet-address	Unknown	itself	0	0
dns-ip-primary	Unknown	itself	0	0
dns-ip-backup1	Unknown	itself	0	0
dns-ip-backup2	Unknown	itself	0	0
hip-ip-address	Unknown	itself	0	0
icmp-address	Unknown	itself	0	0

#### Steering-Pool

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
ip-address	UDP	network-interface or realm-id	start-port	end-port

#### **SIP-Interface**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
sip-port address	transport-protocol (UDP or TCP)	realm-id	sip-port port	0
sip-port address	UDP if transport- protocol is UDP	realm-id	port-map-start	port-map-end

#### SIP-NAT

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
ext-proxy-address	Unknown	realm-id	0	0
home-proxy-address	Unknown	realm-id	0	0
home-address	Unknown	realm-id	0	0
ext-address	Unknown	realm-id	0	0

<sup>\*</sup> The home-address value must be unique across all network interfaces configured on the Oracle Communications Session Border Controller.

#### H323-Stack

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
local-ip	ТСР	realm-id	q031-port	0
local-ip	TCP	realm-id	q931-start-port	q931-start-port + q931- number-ports - 1
local-ip	TCP	realm-id	dynamic-start- port	dynamic-start- port + dynamic- number-port - 1
local-ip	UDP	realm-id	ras-port	0
gatekeeper	Unknown	realm-id	0	0
alternate-protocol	UDP	realm-id	it's port	0

<sup>\*</sup> If an h323-stack's q931-port (TCP) parameter is configured with a value of 1720, there is an address duplication exception. This configured port can exist within two port map ranges; the value of q931-start-port and its entire port range, and the value of dynamic-start-port and its entire port range.

#### **Local-Policy Local-Policy-Attributes**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
next-hop	Unknown	realm	0	0

# **Session-Agent**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
ip-address	UDP or TCP	realm-id	port	0
host-name (If different from ip-address)	UDP or TCP	realm-id	port	0
ip-address	UDP or TCP	egress-realm-id if no realm-id or different from it	port	0
host-name (If different from ip-address)	UDP or TCP	egress-realm-id if no realm-id or different from it	port	0

#### **Static-Flow**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
in-source/32	Unknown	in-realm-id	0	0
in-destination/32	UDP or TCP if ALG is TFTP or otherwise unknown	in-realm-id	start-port	end-port
out-source/32	UDP or TCP if ALG is TFTP or NAPT otherwise unknown	out-realm-id	start-port	end-port
out-destination/32	Unknown	out-realm-id	0	0

# **Capture-Receiver**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
address	Unknown	network-interface	0	0

# **Realm-Config**

Parameter Name	Address Type	Network Interface or Realm	Port Start	Port End
stun-server-ip	UDP	network-interfaces	stun-server-port	0
stun-server-ip	UDP	network-interfaces	stun-changed- port	0
stun-changed-ip	UDP	network-interfaces	stun-server-port	0
stun-changed-ip	UDP	network-interfaces	stun-changed- port	0

# **Verify-Config Errors and Warnings**

The following tables list every error and warning the **verify-config** command produces for each configuration element:

#### **Access-Control**

Error Text	Reason for Error
WARNING: access-control [id] has unsupported application-protocol [x]	Unsupported protocols [x]
ERROR: access-control [id] has reference to realm-id [xyz] which does not exist	Realm was not found in realm table

#### **Account-Config**

Error Text	Reason for Error
ERROR: account-config is enabled, but there are no account servers configured	State is enabled, file-output is disabled and there are not servers
WARNING: account-config is enabled, there are no account-servers configured, but ftp-push is disabled	State and file-output are enabled, there are not account servers and ftp-push is disabled
WARNING: account-config is enabled, account-servers are configured, file-output is disabled, but ftp-push is enabled	State and ftp-push are enabled, account servers are configured, file-output is disabled
ERROR : account-config is enabled, ftp-push is enabled, but there is no ftp-address entered or push-receiver configured	State and ftp-push are enabled, but there is no ftp-address or push-receiver configured
ERROR: account-config has reference to push-receiver [xyz] which can not get password	Password failed decryption
ERROR: account-config has reference to push-receiver [xyz] which does not have remote-path set	Push-receiver has no remote-path set
ERROR: account-config has reference to push-receiver [xyz] which does not have username set	Push-receiver has no username set
ERROR: account-config has reference to push-receiver [xyz] which does not have password set for protocol FTP	Push-receiver has no password set for FTP
WARNING: account-config has reference to push-receiver [xyz] with a public key set, but protocol is set to FTP	Push-receiver has set public key, but protocol is FTP
ERROR: account-config has reference to push-receiver [xyz] which does not have password or public key set for protocol SFTP	Push-receiver has no password or public key set for SFTP
ERROR: account-config has push-receiver [xyz] with reference to public-key [zyx] which does not exist	Public key was not found in public key table
ERROR: account-config has account-server [IP:Port] with empty secret	Account-server [IP:Port] has empty secret field

#### **Authentication**

Error Text	Reason for Error
ERROR: authentication has specified unsupported protocol [x] for type [y]	Unsupported protocols for given type
ERROR: authentication has no configured active radius servers for authentication type [x]	No configured active radius for given type

### **Call-Recording-Server**

Error Text	Reason for Error
ERROR: call-recording-server must have a name	Name is missing
ERROR: call-recording-server [id] must have a primary-signaling-addr or primary-media-addr	There has to be either primary signaling or media address
ERROR: call-recording-server [id] is missing primary-realm	Realm name is missing
ERROR: call-recording-server [id] has reference to the primary-realm [xyz] which does not exist	Primary-realm [xyz] was not found in realm-config table
ERROR: call-recording-server [id] has reference to the secondary-realm [xyz] which does not exist	Secondary-realm [xyz] was not found in realm-config table

# **Capture-Receiver**

Error Text	Reason for Error
	Network-interface was not found in network-interface table

#### **Certificate-Record**

Error Text	Reason for Error
ERROR: certificate-record [id] is not trusted and will not be loaded	Certificate record is not trusted
ERROR: certificate-record [id] cannot extract private key	Certificate record failed to extract the private key
ERROR: certificate-record [id] cannot convert PKCS7 string to structure	Failure to convert PKCS7 record to the structure

# **Class-Policy**

Error Text	Reason for Error
ERROR: class-policy [id] ] has reference to the media-policy [xyz] which does not exist	Media-policy [xyz] was not found in the media-policy table

# **DNS-Config**

Error Text	Reason for Error
ERROR: dns-config [id] is missing client-realm entry	Missing client realm

# **Working with Configurations**

Error Text	Reason for Error
ERROR: dns-config [id] has reference to client-realm [xyz] which does not exist	Realm was not found in the realm-config table
ERROR: dns-config [id] does not have any server-dns-attributes	Server-dns-attributes are missing
ERROR: dns-config [id] is missing server-realm entry	Realm entry is missing (source address is empty)
ERROR: dns-config [id] is missing server-realm entry for source-address [x]	Realm entry is missing (source address is not empty)
ERROR: dns-config [id] has reference to server-realm [xyz] which does not exist	Realm was not found in the realm-config table

### **ENUM-Config**

Error Text	Reason for Error
ERROR: enum-config [id] is missing realm-id entry	Missing realm
ERROR: enum-config [id] has reference to the realm-id [xyz] which does not exist	Realm [xyz] was not found in realm-config table
ERROR: enum-config [id] has no enum-servers	List of ENUM servers is empty

### **Ext-Policy-Server**

Error Text	Reason for Error
ERROR: ext-policy-server [id] is missing realm entry	Missing realm
ERROR: ext-policy-server [id] address is not valid	Invalid address entry
ERROR: ext-policy-server [id] has reference to protocol [xyz] which is not valid	Invalid protocol entry
ERROR: ext-policy-server [id] has reference to realm [xyz] which does not exist	Realm was not found in the realm-config table

#### H323-Stack

Error Text	Reason for Error
ERROR: h323-stack [id] has no realm-id	Missing realm entry
ERROR: h323-stack [id] has reference to the realm-id [xyz] which does not exist	Realm was not found in the realm-config table
WARNING: h323-stack [id] is missing local-ip address entry	Missing address entry
WARNING : h323-stack [id] has reference to media-profile [xyz] which does not exist	Media profile was not found in media profile table
ERROR: h323-stack [id] has reference to the assoc-stack [xyz] which does not exist	Stack name was not found in the h323-stack table

#### **Host-Route**

Error Text	Reason for Error
	gateway entry was not found in any network-interface object

# **IWF-Config**

E	Error Text	Reason for Error
	WARNING: iwf-config has reference to media-profile [xyz] which does not exist	media profile was not found in media profile table

### **Local-Policy**

Error Text	Reason for Error
ERROR: local-policy [id] has reference to source-realm [xyz] which does not exist	Source-realm [xyz] was not found in realm-config table
WARNING: local-policy [id] has no policy-attributes set	No policy-attributes set
ERROR: local-policy-attribute [id1] from local-policy [id2] has reference to realm [xyz] which does not exist	Realm [xyz] was not found in realm-config table
ERROR: local-policy-attribute [id1] from local-policy [id2] is missing next-hop entry	Next-hop is missing for given attribute
ERROR: local-policy-attribute [id1] from local-policy [id2] has reference to next-hop [xyz] which is invalid	Invalid value for the next-hop
ERROR: local-policy-attribute [id1] from local-policy [id2] has reference to next-hop [xyz] which does not exist	Value for the next-hop was not found (either from enum-config, or lrt-config, or session-group)
WARNING: local-policy-attribute [id] from local-policy [di] has reference to media-policy [xyz] which does not exist	Media-policy [xyz] was not found in media- policy table

### **Local-Routing-Config**

Error Text	Reason for Error
ERROR: local-routing-config [id] has reference to the file-	specified file is missing from /boot/
name [xyz] which does not exist	code/lrt folder

#### **Network-Interface**

Error Text	Reason for Error
ERROR: network-interface [id] has reference to phy- interface [xyz] which does not exist	Phy-interface [xyz] was not found in phy-interface table
ERROR: network-interface [id] is missing pri-utility-addr entry	If redundancy is enabled pri-utility-addr entry has to be entered
ERROR: network-interface [id] is missing sec-utility-addr entry	If redundancy is enabled sec-utility-addr entry has to be entered

# **Working with Configurations**

Error Text	Reason for Error
ERROR: network-interface [id] has reference to DNS address, but dns-domain is empty	Dns-domain is empty. Word "address" will be plural addresses if there are more DNS addresses entered
ERROR: network-interface [id] has reference to DNS address, but ip-address is empty	Ip-address is empty. Word "address" will be plural addresses if there are more DNS addresses entered

# **Phy-Interface**

Error Text	Reason for Error
ERROR: phy-interface [id] has invalid operation-type value $[x]$	Operation-type value is invalid
ERROR: phy-interface [id] of type [x] with port [y] and slot [z] has invalid name	If type is MAINTENANCE or CONTROL name has to start with either "eth" or wancom
ERROR: phy-interface [id] of type [x] has duplicated port [y] and slot [z] values with phy-interface [di]	Port and slot values are duplicated with another phy-interface

# **Public-Key**

Error Text	Reason for Error
ERROR: public-key [id] has no public/private key pair generated for public-key [x]	No public/private key generated
ERROR: public-key [id] cannot extract private key	Cannot extract private key

# **Realm-Config**

Error Text	Reason for Error
ERROR: realm-config [id] has reference to ext-policy-svr [xyz] which doe not exist	Missing external BW manager
ERROR: realm-config [id] is missing entry for network-interface	Missing Network Interface
ERROR: realm-config [id] has reference to network-interface [xyz] which does not exist	Network interface was not found in network-interface table
ERROR: realm-config [id] has reference to media-policy [xyz] which does not exist	Media-policy was not found in media- policy table
ERROR: realm-config [id] has reference to class-profile [xyz] which does not exist	Class-profile was not found in class-profile table
ERROR: realm-config [id] has reference to in-translationid [xyz] which does not exist	In-translationid was not found in session translation table
ERROR: realm-config [id] has reference to out-translationid [xyz] which does not exist	Out-translationid was not found in session translation table
ERROR: realm-config [id] has reference to inmanipulationid [xyz] which does not exist	In-manipulationid was not found in manipulation table

Error Text	Reason for Error
ERROR: realm-config [id] has reference to outmanipulationid [xyz] which does not exist	Out-manipulationid was not found in manipulation table
ERROR: realm-config [id] has reference to enforcement-profile [xyz] which does not exist	Enforcement-profile was not found in enforcement-profile table
ERROR: realm-config [id] has reference to call-recording-server-id [xyz] which does not exist	Call-recording-server-id was not found in call-recording-server-table
ERROR: realm-config [id] has reference to codec-policy [xyz] which does not exist	Codec-policy was not found in codec-policy table
ERROR: realm-config [id] has reference to constraint-name [xyz] which does not exist	Constraint-name was not found in session constraint table
ERROR: realm-config [id] has reference to qos-constraint [xyz] which does not exist	Qos-constraint was not found in qos constraint table
ERROR: realm-config [id] with parent-realm [xyz] are part of circular nested realms	Realm and its parent realm are part of the closed loop where they referring back to themselves
ERROR: realm-config [id] has reference to dns-realm [xyz] which does not exist	Dns-realm doesn't exist in the realm table
WARNING: realm-config [id] has reference to itself as a parent (parent-realm value ignored)	Realm name and parent name are the same
ERROR: realm-config [id] has reference to parent-realm [xyz] which does not exist	Parent realm doesn't exist in the realm table
ERROR: realm-config [id] has identical stun-server-port and stun-changed port [x]	Stun-server-ip is identical to stun-changed-ip, when stun is enabled
ERROR: realm-config [id] has identical stun-server-ip and stun-changed-ip $[x]$	Stun-server-port is identical to stun- changed-port, when stun is enabled

# Realm-Group

ERROR: realm-group [id] has reference to source-realm [xyz] which does not exist	Realm was not found in realm-config table
ERROR: realm-group [id] has reference to destination-realm [xyz] which does not exist	Realm was not found in realm-config table

# Redundancy

Error Text	Reason for Error
ERROR: redundancy-config peer [id] has Address [x] which does not match pri-utility-addr from network-interface [y]	If redundancy is enabled, peer IP addresses have to match Primary Utility addresses from specified network-interface (priutility-addr is missing here)
ERROR: redundancy-config peer [id] has Address [x] which does not match pri-utility-addr [z] from network-interface [y]	If redundancy is enabled, peer IP addresses have to match Primary Utility addresses from specified network-interface

# **Working with Configurations**

Error Text	Reason for Error
ERROR: redundancy-config peer [id] has Address [x] which does not match sec-utility-addr from network-interface [y]	If redundancy is enabled, peer IP addresses have to match Secondary Utility addresses from specified network-interface (secutility-addr is missing here)
ERROR: redundancy-config peer [id] has IP Address [x] which does not match sec-utility-addr [z] from network-interface [y]	If redundancy is enabled, peer IP addresses have to match Secondary Utility addresses from specified network-interface
ERROR: redundancy-config peer [id] has reference to network-interface [xyz] which does not exist	Network-interface [xyz] was not found in network-interface table
ERROR: redundancy-config peer [id] is missing destination object	Destination object is missing
ERROR: redundancy-config is missing Primary peer object	Primary peer object is missing
ERROR: redundancy-config is missing Secondary peer object	Secondary peer object is missing
ERROR: redundancy-config is missing both Primary and Secondary peer objects	Primary and Secondary peer objects are missing

# **Security-Association**

Error Text	Reason for Error
ERROR: security-association [id] is missing network-interface entry	Missing network-interface entry
ERROR: security-association [id] has reference to network-interface [xyz] which does not exist	Network-interface was not found in network-interface table
ERROR: security-association [id] has invalid local-ip-addr	Invalid local-ip-addr entry
ERROR: security-association [id] has invalid remote-ip-addr	Invalid remote-ip-addr entry
ERROR: security-association [id] has reference to network-interface [xyz] which is not valid IPSEC enabled media interface	Network-interface is not valid IPSEC media interface
ERROR: security-association [id] Unable to decrypt auth- key from configuration. This configuration may not have been saved using this systems configuration password	Failed to decrypt auth-key
ERROR: security-association [id] has auth-algo [hmac-md5] with an auth-key of invalid length, must be 32 hex characters long	Invalid length of the auth-key for auth-algo [hmac-md5]
ERROR: security-association [id] has auth-algo [hmacsha1] with an auth-key of invalid length, must be 40 hex characters long	Invalid length of the auth-key for auth-algo [hmac-sha1]
ERROR: security-association [id] Unable to decrypt encrkey from configuration. This configuration may not have been saved using this systems configuration password	Failed to decrypt encr-key
ERROR: security-association [id] has encr-algo [xyz] with and encr-key of invalid length, must be 64 bits (odd parity in hex)	Invalid encr-key length for given algorithm

Error Text	Reason for Error
ERROR: security-association [id] has encr-algo [xyz] with and encr-key of invalid length, must be 192 bits (odd parity in hex)	Invalid encr-key length for given algorithm
ERROR: security-association [id] has encr-algo [xyz] with and encr-key of invalid length, must be 128 bits (odd parity in hex)	Invalid encr-key length for given algorithm
ERROR: security-association [id] has encr-algo [xyz] with and encr-key of invalid length, must be 256 bits (odd parity in hex)	Invalid encr-key length for given algorithm
ERROR: security-association [id] has invalid aes-ctr-nonce (must be non-zero value) for encr-algo [xyz]	Has invalid aes-ctr-nonce for given algorithm
ERROR: security-association [id] has invalid tunnel-mode local-ip-addr (will be set to inner local-ip-address)	Invalid tunnel-mode local-ip-addr
ERROR: security-association [id] has invalid tunnel-mode remote-ip-addr (will be set to inner remote-ip-address)	Invalid tunnel-mode remote-ip-addr
ERROR: security-association [id] has invalid espudp localip-addr (must be non-zero)	Invalid espudp local-ip-addr
ERROR: security-association [id] has invalid espudp remote-ip-addr (must be non-zero)	Invalid espudp remote-ip-addr
ERROR: security-association [id] has invalid espudp local-port (must be non-zero)	Invalid espudp local-port
ERROR: security-association [id] has invalid espudp remote-port (must be non-zero)	Invalid espudp remote-port

# **Security-Policy**

Error Text	Reason for Error
ERROR: security-policy [id] has invalid local-ip-addrmatch	Empty local-ip-addr-match
ERROR: security-policy [id] has invalid local-ip-addrmatch [x]	Invalid local-ip-addr-match
ERROR: security-policy [id] has invalid remote-ip-addrmatch	Empty remote-ip-addr-match
ERROR: security-policy [id] has invalid remote-ip-addrmatch [x]	Invalid remote-ip-addr-match
ERROR: security-policy [id] is missing network-interface entry	Missing network-interface entry
ERROR: security-policy [id] priority [x] is identical to security-policy [id2]	Duplication of the priorities
ERROR: security-policy [id] has reference to network-interface [xyz] which does not exist	Network-interface was not found in network-interface table
ERROR: security-policy [id] has reference to network-interface [xyz] which is not valid IPSEC enabled media interface	Network-interface is not valid IPSEC media interface

### **Session-Agent**

Error Text	Reason for Error
ERROR: session-agent [id] has reference to realm-id [xyz] which does not exist	Realm was not found in realm table
ERROR: session-agent [id] has reference to egress-realm-id [xyz] which does not exist	Realm was not found in realm table
ERROR: session-agent [id] has reference to in-translationid [xyz] which does not exist	Translation id was not found in translation table
ERROR: session-agent [id] has reference to out- translationid [xyz] which does not exist	Translation id was not found in translation table
ERROR: session-agent [id] has reference to inmanipulationid [xyz] which does not exist	Manipulation id was not found in manipulation table
ERROR: session-agent [id] has reference to outmanipulationid [xyz] which does not exist	Manipulation id was not found in manipulation table
ERROR: session-agent [id] has reference to enforcement-profile [xyz] which does not exist	Enforcement-profile was not found in enforcement-profile table
ERROR: session-agent [id] has reference to code-policy [xyz] which does not exist	Codec-policy was not found in codec-policy table
ERROR: session-agent [id] has reference to response-map [xyz] which does not exist	Response-map was not found in response map table
ERROR: session-agent [id] has reference to local-responsemap [xyz] which does not exist	Response-map was not found in response map table

### **Session-Group**

Error Text	Reason for Error
	Session agent was not found in the session agent table

# **Session-Translation**

Error Text	Reason for Error
ERROR: session-translation [id] has reference to rules- called [xyz] which does not exist	Translation rule was not found in the translation rule table
ERROR: session-translations [id] has reference to rules- calling [xyz] which does not exist	Translation rule was not found in the translation rule table

### **SIP-Config**

Error Text	Reason for Error
ERROR: sip-config has reference to home-realm-id [xyz] which does not exist	Realm was not found in the realm-config table
ERROR: sip-config has reference to egress-realm-id [xyz] which does not exist	Realm was not found in the realm-config table
ERROR: sip-config has reference to enforcement-profile [xyz] which does not exist	Enforcement profile was not found in enforcement profile table

Error Text	Reason for Error
WARNING: sip-config is missing home-realm-id for SIP-NAT, defaults to [sip-internal-realm]	Missing home-realm-id, defaulted to sip- internal-realm
WARNING: sip-config home-realm-id [xyz] does not have a sip-interface	Sip-interface missing for the home realm
WARNING: sip-config has nat-mode set to [None], but there are configured sip-nat objects	Nat-mode needs to be set to either Public or Private if there are sip-nat objects in the configuration
ERROR: sip-config object is disabled	Sip-config is disabled, but there are configured sip-interface objects

#### **SIP-Interface**

Error Text	Reason for Error
ERROR: sip-interface [id] is missing realm-id entry	missing realm
ERROR: sip-interface [id] has reference to realm-id [xyz] which does not exist	realm was not found in realm-config table
ERROR: sip-interface [id] has reference to inmanipulationid [xyz] which does not exist	in-manipulationid was not found in manipulation table
ERROR: sip-interface [id] has reference to outmanipulationid [xyz] which does not exist	out-manipulationid was not found in manipulation table
ERROR: sip-interface [id] has reference to enforcement-profile [xyz] which does not exist	enforcement profile was not found in enforcement profile table
ERROR: sip-interface [id] has reference to response-map [xyz] which does not exist	response-map was not found in response- map table
ERROR: sip-interface [id] has reference to local-responsemap [xyz] which does not exist	local-response-map was not found in response-map table
ERROR: sip-interface [id] has reference to constraint-name [xyz] which does not exist	constraint-name was not found in session constraint table
ERROR: sip-interface [id] has no sip-ports	sip-ports are missing
ERROR: sip-interface [id] with sip-port [id2] has reference to tls-profile [xyz] which does not exist	tls-profile was not found in TLS profile table (only valid for protocols TLS or DTLS)
ERROR: sip-interface [id] with sip-port [id2] has reference to ims-aka-profile [xyz] which does not exist	ims-aka-profile was not found in Ims-Aka- Profile table (valid for protocols other than TLS or DTLS)
WARNING: sip-interface [id] has no sip-ports, using SIP-NAT external-address	no sip-ports so SIP-NAT external-address is used
WARNING: sip-interface [id] has no valid sip-ports, using SIP-NAT external-address	no valid sip-ports so SIP-NAT external- address is used

### **SIP-Manipulation**

Error Text	Reason for Error
ERROR: sip-manipulation [id] has no header-rules defined	Missing header rules

# **Working with Configurations**

Error Text	Reason for Error
ERROR: sip-manipulation [id] with header-rule [xyz] is missing new-value entry	Missing new-value entry (checked only for action type sip-manip)
ERROR: sip-manipulation [id] with header-rule [xyz] has reference to new-value [zxy] which does not exist	New-value entry missing from the sip- manipulation table
ERROR: sip-manipulation [id] with header-rule [xyz] has new-value that refers to itself from sip-manipulation [di]	Looping reference between two objects

### SIP-NAT

Error Text	Reason for Error
ERROR: sip-nat [id] is missing home-address entry	Missing home-address
ERROR: sip-nat [id] has invalid home-address [x] entry	Invalid home-address entry
ERROR: sip-nat [id] is missing ext-address entry	Missing ext-address
ERROR: sip-nat [id] has invalid ext-address [x] entry	Invalid ext-address entry
ERROR: sip-nat [id] is missing ext-proxy-address entry	Missing ext-proxy-address
ERROR: sip-nat [id] has invalid ext-proxy-address [x] entry	Invalid ext-proxy-address entry
ERROR: sip-nat [id] is missing user-nat-tag entry	Missing user-nat-tag
ERROR: sip-nat [id] is missing host-nat-tag entry	Missing host-nat-tag
ERROR: sip-nat [id] is missing domain-suffix entry	Missing domain-suffix
ERROR: sip-nat [id] is missing realm-id entry	Missing realm entry
ERROR: sip-nat [id] does not match sip-interface realm [xyz]	Sip-interface name was not found in realm table
ERROR: sip-nat [id] does not have a sip-interface	Sip-interface is missing
WARNING: sip-nat [id] has same user-nat-tag as sip-nat [di]	Duplicated user-nat-tag
WARNING: sip-nat [id] has same host-nat-tag as sip-nat [di]	Duplicated host-nat-tag
WARNING: sip-nat [id] has ext-address [x] which is different from sip-interface [di] sip-port address [y]	Sip-nat ext-address needs to be the same as sip-port address
ERROR: sip-nat [id] has same home-address [x] as sip-nat [di]	Duplicated home-address

### **Static-Flow**

Error Text	Reason for Error
ERROR: static-flow [id] is missing in-realm-id entry	Missing in-realm-id
ERROR: static-flow [id] has reference to in-realm-id [xyz] which does not exist	Realm was not found in the realm-config table
ERROR: static-flow [id] is missing out-realm-id entry	Missing out-realm-id
ERROR: static-flow [id] has reference to out-realm-id [xyz] which does not exist	Realm was not found in the realm-config table

Error Text	Reason for Error
ERROR: ext-policy-server [id] has illegal protocol value [xyz]	Invalid protocol entry

# **Steering-Pool**

Error Text	Reason for Error
ERROR: steering-pool [id] has invalid start-port [x]	Invalid start-port value (smaller than 1025)
ERROR: steering-pool [id] has start-port [x] greater than end-port [y]	Start-port value is greater than end-port value
ERROR: steering-pool [id] is missing realm entry	Missing realm entry
ERROR: steering-pool [id] has reference to realm [xyz] which does not exist	Realm [xyz] was not found in realm-config table
ERROR: steering-pool [id] has reference to network-interface [xyz] which does not exist	Network-interface [xyz] was not found in network-interface table

# **Surrogate-Agent**

Error Text	Reason for Error
ERROR: surrogate-agent [id] is missing realm entry	Missing realm entry
ERROR: surrogate-agent [id] has reference to realm [xyz] which does not exist	Realm was not found in the realm-config table
ERROR: surrogate-agent [id] is missing customer-next-hop entry	Missing customer-next-hop entry
ERROR: surrogate-agent [id] is missing register-contact-user entry	Missing register-contact-user entry
ERROR: surrogate-agent [id] is missing register-contact-host entry	Missing register-contact-host entry

# **System-Config**

Error Text	Reason for Error
ERROR: system-config has reference to default-gateway [xyz] which does not exist	gateway was not found in the network- interface table or boot parameters
ERROR: system-config collect has sample-interval [x] greater than push-interval	sample-interval greater than push-interval
ERROR: system-config collect has start-time [x] greater than end-time [y]	Start-time greater than end-time
ERROR: system-config collect has group [xyz] with sample-interval [x] greater than collection push-interval [y]	Group [xyz] has incorrect sample interval
ERROR: system-config collect has group [xyz] with start-time [x] greater than end-time [y]	Group [xyz] has incorrect sample interval
ERROR: system-config collect has no push-receivers defined	No push-receivers defined

#### **Working with Configurations**

Error Text	Reason for Error
ERROR: system-config collect has reference to push-receiver [xyz] which does not have user-name set	No user-name set
ERROR: system-config collect has reference to push-receiver [xyz] which does not have password set	No password set
ERROR: system-config collect has reference to push-receiver [xyz] which does not have address set	No address set
ERROR: system-config collect has reference to push- receiver [xyz] which does not have data-store set	No data-store set

#### **TLS-Profile**

Error Text	Reason for Error
ERROR: tls-profile [id] has reference to end-entity-certificate [xyz] which does not have any certificates	End-entity-certificate entry missing certificate or certificate-record is part of config, but record was not imported to the SD
ERROR: tls-profile [id] has end-entity-certificate [xyz] which has an end entry certificate, but the private key is invalid.	Bad private key for the cert-record
ERROR: tls-profile [id] has reference to end-entity-certificate [xyz] which does not exist	Certificate record was not found in cert-record table
ERROR: tls-profile [id] has an end-entity-certificate records without any end entity certificate	End certificate missing from all end-entity- certificate records or none of them where imported to the SD
ERROR: tls-profile [id] found an entry in the trusted-cacertificates with zero length	Found an empty trusted-ca-record in the list
ERROR: tls-profile [id] has reference to trusted-cacertificates [xyz] which does not have any certificates	Trusted-ca-records entry missing certificate
ERROR: tls-profile [id] has reference to trusted-cacertificates [xyz] with PKCS7 structure which does not have any certificates	Trusted-ca-records entry with PKCS7 structure missing certificate
ERROR: tls-profile [id] has reference to trusted-cacertificates [xyz] which does not exist	Certificate record was not found in cert- record table
ERROR: tls-profile [id] has no trusted-ca- certificates, but mutual-authentication is enabled	No trusted certificates, but enabled mutual- authentication

#### regenerate-config

The **regenerate-config** command rebuilds the configuration database information. This command is used to fix a corrupted system configuration when running Oracle Communications Session Border Controller software release 1.3.

At the superuser command prompt, enter the **regenerate-config** command.

```
ORACLE# regenerate-config
Finish updating all of the configs.
task done
ORACLE#
```

### **Viewing Configurations**

While configuration archives describe a full Oracle Communications Session Border Controller configuration, you can not display them on the screen for quick reference. To view configurations through a local connection, there are two options.

1. To display the current configuration on the screen, type **show configuration** at a command prompt. You can add a specific configuration element after the show configuration command to display only that element on the screen.

```
ORACLE> show configuration host-route
host-routes
dest-network 10.0.0.0
netmask 255.255.0.0
gateway 172.30.0.1
task done
ORACLE>
```

**2.** To display the running configuration on the screen, type **show running-configuration** at a command prompt.

### **Checking Configuration Versions**

The Oracle Communications Session Border Controller maintains a running count of the version of both the running configuration and current configuration. It can be helpful to know when the running and current configurations are out of sync.

While they can differ, the current configuration and the running configuration should generally be the same. After a configuration is modified, saved and activated, the current and running configuration versions should be the same.

To check the version of each configuration:

**1.** Type **display-current-cfg-version** at a command prompt to display the version number of the current configuration.

```
ORACLE> display-current-cfg-version
Current configuration version is 3
ORACLE>
```

2. Type **display-running-cfg-version** at a command prompt to display the version number of the running configuration.

```
ORACLE> display-running-cfg-version
Running configuration version is 3
ORACLE>
```

### **Deleting Configurations**

You can completely delete the data in the last-saved configuration with one command. This can be useful if you want to reconfigure your Oracle Communications Session Border Controller starting with a blank configuration. You must reboot your Oracle Communications Session Border Controller after issuing the **delete-config** command to complete this task.

To delete the running and current configuration:

1. Type **delete-config** at a superuser command prompt. You will be prompted to confirm that you want to complete this task.

2. Reboot the Oracle Communications Session Border Controller using the reboot command.

#### **Configuration Checkpointing**

In an HA configuration, configuration checkpointing copies all configuration activity and changes on one Oracle Communications Session Border Controllerto the other Oracle Communications Session Border Controller. Checkpointed transactions copy added, deleted, or modified configurations from the active system to the standby system. You only need to perform configuration tasks on the active Oracle Communications Session Border Controller because the standby SD will go through the checkpointing process and synchronize its configuration to the active Oracle Communications Session Border Controller to reflect activity and changes.

The **acquire-config** command is used to manually invoke configuration checkpointing between two Oracle Communications Session Border Controllers in an HA node.

#### To synchronize the systems in an HA node:

- 1. On either the active or standby Oracle Communications Session Border Controller, type **acquire-config** <IP address of other SD in HA pair>.
  - The IPv4 or IPv6 address for the Oracle Communications Session Border Controller from which to acquire the configuration.
  - For **acquire-config** to work, one rear interface on each SD must be named wancom1, and one rear interface on each SD must be named wancom2.

```
ORACLE# acquire-config 10.0.1.8
```

**2.** Following the procedure defined directly above, confirm that the HA node now has synchronized configurations.

```
ORACLE-1# display-current-cfg-version
Current configuration version is 30
ORACLE-1# display-running-cfg-version
Running configuration version is 30
ORACLE-2# display-current-cfg-version
Current configuration version is 30
ORACLE-2# display-running-cfg-version
Running configuration version is 30
```

# Realm-Specific Delete Command

The ACLI provides a way to delete a specific realm and the configurations (objects) associated with that realm. You use the **delete realm-specifics** command with the name of the realm you want to delete. Not only does the Oracle Communications Session Border Controller delete that realm, it also deletes the configurations where that realm is also used as a primary or foreign key—such as steering pools, session agents, and SIP interfaces. A complete list of configurations subject to deletion appears below.

The Oracle Communications Session Border Controller safeguards against unintentionally deleting configurations by showing you a complete list of the configurations it is about to delete, warns you that you are about to the delete the realm, and then asks you for confirmation. The list of candidates for deletion appears each with its key identifier so that you can more easily recognize it. You must type in a **y** for **yes** or **n** for **no** to move forward.

Despite these safeguards, you should use the **delete realm-specifics** command with the utmost care. Oracle recommends that only advanced users work with this command. In fact, the command appears in the configuration menu, to which only Superusers have access.

# **Deleted Configurations**

This section provides a list of the configuration that use the name of realm either as a primary or as a foreign key. These are the configuration that you can remove from your configuration when you delete a specific realm.

ACLI Configuration Name	ACLI Parameter Value	
access-control	realm-id	
call-recording-server	primary-realm	
	secondary-realm	
dns-config	client-realm	
enum-config	realm-id	
ext-policy-server	realm	
h323>h323-stack	realm-id	
lawful-intercept	(associated parameters; specified in Oracle LI support documentation)	
local-policy	source-realm	
realm-config	identifier	
session-agent	realm-id	
sip-features	realm	
sip-interface	realm-id	
sip-nat	realm-id	
static-flow	in-realm-id	
	out-realm-id	
steering-pool	realm-id	
surrogate-agent	realm-id	

There are configurations (objects) that use realms but do not reference them directly either as a primary or foreign key. The Oracle Communications Session Border Controller does not delete these configurations when you use the **delete realm-specifics** command:

- media-policy
- · class-policy
- translation-rules
- sip-manipulation

**Note:** This command cannot delete realms associated with network management control configurations.

#### **Deleted Parameter Values**

For other configurations that reference realms, only the parameters containing realm identifiers are cleared while the object as a whole remains. When you confirming you want to delete the realm and doing so will clear the parameters set out in this section, the Oracle Communications Session Border Controller informs you of the configuration object and the parameter within it that will be affected.

The following table shows you which parameters are cleared.

ACLI Configuration Name	ACLI Parameter Value(s)
dns-config	server-realm
local-policy	source-realm

ACLI Configuration Name	ACLI Parameter Value(s)
	next-hop
	realm
media-manager	home-realm-id
realm-config	parent-realm
	dns-realm
	ext-policy-svr
realm-group	source-realm
	destination-realm
session-agent	egress-realm
session-group	dest
sip-config	egress-realm-id
	home-realm-id

### **Deleted Parameter Configuration**

This section shows you how to use the **delete realm-specifics** command. Remember that you need to be in Superuser mode to use it.

To use the **delete realm-specifics** command, you need to know the identifier for the realm (and the other configurations associated with the realm) that you want to delete.

These instructions and examples do not include information for parameters that will be emptied for configurations that will otherwise be left intact. This information will appear in the following form: <a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a href="mailto:<a h

To delete a specific realm and its associated configurations:

1. In Superuser mode, type configure terminal and press Enter.

```
ORACLE# configure terminal
ORACLE(configure)#
```

**2.** Type delete realm-specifics, a Space, and the name of the realm you want deleted. The press Enter.

After you press Enter, the system displays a list of all configurations on which the deletion will have an impact. It also warns you that you are about to delete the realm.

```
ORACLE(configure) # delete realm-specifics peer_1
RealmConfig with key identifier=peer_1 will be deleted
SteeringPool with key ip-address=192.168.0.11 start-port=21000 realm-id=peer_1 w
ill be deleted
SessionAgent with key hostname=127.0.0.11 will be deleted
SipInterface with key realm-id=peer_1 will be deleted
SipNatConfig with key realm-id=peer_1 will be deleted
WARNING: you are about to delete the realm!
Delete the realm? [y/n]?:
```

3. At the end of the display, the system asks you to confirm (by typing a  $\mathbf{y}$ ) or abort (by typing an  $\mathbf{n}$ ) the deletion.

```
Delete the realm? [y/n]?: y
```

If you confirm the deletion, the system will list all of the configurations that have been removed.

```
RealmConfig with key identifier=peer_1 deleted
SteeringPool with key ip-address=192.168.0.11 start-port=21000 realm-
id=peer_1 d
deleted
SessionAgent with key hostname=127.0.0.11 deleted
SipInterface with key realm-id=peer_1 deleted
SipNatConfig with key realm-id=peer_1 deleted
ORACLE(configure)#
```

When you abort the deletion, the Oracle Communications Session Border Controller will return you to the ORACLE(configure)# system prompt.

# **System Prompt Indicator**

Using the **prompt-enabled** command, you can enable a system prompt indicator to show you when a configuration requires saving and activation.

The system informs you should a configuration has been changed and you have applied the **done** command, but have not saved and activated yet. When you issue the **done** command and return to Superuser mode, the ACLI prompt prefixes two asterisks (\*\*). When you have saved but not yet activated, the ACLI prompted prefixes one asterisk (\*). This command allows you to decide whether or not you want the system to give this prompt. To clarify:

- \*\*—Requires save and activate
- \*—Configuration saved, but requires activate

This feature is disabled by default.

# **Configuration File Format**

The functionality described in this section is of interest only to those users running a 6.3x software version which pre-dates S-C630F1 who want to downgrade to an earlier release. Other users can safely ignore this section

Configuration files, referred to as config files, are stored in XML format. Releases prior to C630F1 saved certain special characters in a non-standard XML format. From release C630F1 and forward, these characters are saved in formats compliant with current W3C XML standards. Character formats are shown below.

Character	Standard XML C63F1 (and after)	Non-Standard XML Pre C63F1
ASCII hard tab	&#xp;	value 0x9
ASCII line feed		value 0xA
ASCII carriage return		value0xD
Ampersand	&	&
Less then	<	<
Greater than	>	>
Double quote	&quote	и
Single quote	'	,

By default config files are now saved using standard XML coding. Consequently pre-C630F1 software images are unable to parse such config files, complicating the software downgrade process.

To address these complications, the **save-config** and **backup-config** ACLI commands has been enhanced to allow the saving of config files and backup configuration files in either standard XML or legacy, non-standard XML format.

### save-config ACLI Command

By default, config files are saved in standard XML format that is non-parsable by a pre-C63F1 software image.

```
ORACLE# save-config
checking configuration
Results of config verification:
2 configuration warnings
Run 'verify-config' for more details
Save-Config received, processing.
waiting for request to finish
Request to 'SAVE-CONFIG' has Finished,
Save complete
Currently active and saved configurations do not match!
To sync & activate, run 'activate-config' or 'reboot activate'.
ORACLE# verify-config
WARNING: security-policy [SP] local-ip-addr-match has 0.0.0.0. This is an
acceptable configuration if intended.
WARNING: security-policy [SP] remote-ip-addr-match has 0.0.0.0. This is an
acceptable configuration if intended.
______
Total:
2 warnings
ORACLE#
```

**save-config**, when used in conjunction with a newly supported argument, **standard**, also saves config files in standard XML format that is non-parsable by a pre-C63F1 software image.

```
ORACLE# save-config standard
checking configuration
Results of config verification:
2 configuration warnings
Run 'verify-config' for more details
Save-Config received, processing.
waiting for request to finish
Request to 'SAVE-CONFIG' has Finished,
Save complete
Currently active and saved configurations do not match!
To sync & activate, run 'activate-config' or 'reboot activate'.
ORACLE# verify-config
WARNING: security-policy [SP] local-ip-addr-match has 0.0.0.0. This is an
acceptable configuration if intended.
WARNING: security-policy [SP] remote-ip-addr-match has 0.0.0.0. This is an
acceptable configuration if intended.
Total:
2 warnings
ORACLE#
```

**save-config**, when used in conjunction with a newly supported argument, **non-standard**, saves config files in legacy XML format that is parsable by a pre-C63F1 software image.

```
ORACLE# save-config non-standard
checking configuration
Results of config verification:
2 configuration warnings
Run 'verify-config' for more details
Save-Config received, processing.
waiting for request to finish
Request to 'SAVE-CONFIG' has Finished,
Save complete
Currently active and saved configurations do not match!
To sync & activate, run 'activate-config' or 'reboot activate'.
ORACLE# verify-config
WARNING: security-policy [SP] local-ip-addr-match has 0.0.0.0. This is an

acceptable configuration if intended.
Total:
2 warnings
ORACLE#
```

### backup-config ACLI Command

By default, backup config files are saved in standard XML format that is non-parsable by a pre-C63F1 software image.

```
ORACLE# backup-config testBU
task done
ORACLE#
```

**backup-config <filename> standard** also saves backup config files in standard XML format that is non-parsable by a pre-C630F1 software image.

```
ORACLE# backup-config standardBU standard
task done
ORACLE#
```

**backup-config <filename> non-standard** saves backup config files in legacy XML format that is parsable by a pre-C63F1 software image.

```
ORACLE# backup-config nonStandardBU non-standard
task done
ORACLE#
```

**Note:** The standard and non-standard optional arguments are not supported by the backup-config <filename> saved command, which takes the last saved version of config (whatever the XML format), and saves a copy of that file as the backup.

# Moving a Configuration

This section outlines a process for moving an existing Oracle Communications Session Border Controller configuration to a new system. Process summary:

- 1. Create a backup configuration file on the source Oracle Communications Session Border Controller.
- **2.** Using SFTP, copy the source backup from the source to the destination Oracle Communications Session Border Controller .
- 3. Restore the newly-transferred backup on the target Oracle Communications Session Border Controller.

### **Backup Commands**

The Oracle Communications Session Border Controller software includes a set of commands for easily working with backup configurations. These commands are backup-config, display-backups, delete-backup-config, restore-backup-config.

To back up a configuration, use the **backup-config** command. You can confirm that your backup has been created with the **display-backups** command. When the **backup-config** command is executed, the system checks for sufficient resources to complete the operation. If resources are sufficient, the system creates the backup. If resources are insufficient, the task is not completed and the system displays the limiting resources and recommends completing the task at another time.

Backups are created as gzipped tar files in a .tar.gz format. They are stored in the /code/bkups directory on the Acme Packet 4000.

### Backing up the current configuration

To create a backup:

In superuser mode, use the **backup-config** command followed by a descriptive filename for the backup you are creating.

```
ORACLE#backup-config 02_Feb_2008
task done
ORACLE#
```

#### **Listing Backups**

You can view the backups available on your system using the **display-backups** command.

To list available backup configurations:

In Superuser mode, enter the **display-backups** command. A list of available backup files from the / code/bkups directory is displayed on the screen.

```
ORACLE# display-backups
test_config.tar.gz
test-config.tar.gz
runningcfgtest.tar.gz
runningtest_one.tar.gz
BACK_UP_CONFIG.tar.gz
02_Feb_2008.tar.gz
01_Feb_2008.tar.gz
ORACLE#
```

# Copy the Backup to the destination Oracle Communications Session Border Controller

Send the backup configuration file by way of SFTP from the source to destination Oracle Communications Session Border Controller.

To copy a backup configuration from the source to destination Oracle Communications Session Border Controller:

- 1. Use an SFTP client to connect to the SBC using the default username: user and password: acme. The management IP address is configured in the bootparams.
- 2. Change directory to where you want to upload a file.
  - cd /code/bkups for backup configurations
- 3. Type bin and press Enter to force the SFTP program into binary mode.
- **4.** Upload the file you want to transfer by typing the filename and pressing Enter.

```
C:\Documents and Settings>ftp 172.30.55.127
Connected to 172.30.55.127.
```

```
220 VxWorks (1.0) FTP server ready
User (172.30.55.127:(none)): user
331 Password required
Password:
230 User logged in
ftp> cd /code/bkups
250 Changed directory to "/code/bkups"
ftp> bin
200 Type set to I, binary mode
ftp> put 02_Feb_2008.tar.gz
200 Port set okay
150 Opening BINARY mode data connection
226 Transfer complete
ftp: 9587350 bytes sent in 51.64Seconds 185.65Kbytes/sec.
ftp>
```

#### **Restoring Backups**

To restore a backup configuration on the Oracle Communications Session Border Controller:

 In Superuser mode, enter the restore-backup-config command followed by the backup filename you want to restore to the current configuration. You must explicitly name the backup file you want to restore, including the file extension

```
ORACLE# restore-backup-config 02_Feb_2008.tar.gz
Need to perform save-config and activate/reboot activate for changes to take effect...
task done
ORACLE#
```

2. Correct the Virtual MAC address configuration established on the former device to be suitable for the new device.

Establish the base MAC needed for HA operation by, first, determining the base MAC by way of the ethernet address value of the show media physical command.

```
ORACLE#show media physical
s0p0 (media slot 0, port 0)
Flags: UP BROADCAST MULTICAST ARP RUNNING
Type: ETHERNET_CSMACD
Admin State: enabled
Auto Negotiation: enabled
...
Ethernet address is 00:08:25:01:08:44
```

Apply the formula for calculating virtual MAC addressing to the MAC addressing used for this system. This formula is described in the ACLI Configuration Guide.

Configure the physical interfaces with the computed virtual MAC addressing. Refer to the following command line sequence as an example of this procedure.

# **Working with Configurations**

slot 0 virtual-mac 00:08:25:01:08:48

**3.** Save the configuration.

ORACLE# save-config

**4.** Activate the configuration.

ORACLE# activate-config

# **Managing Backups and Archives**

#### Introduction

The Oracle Communications Session Border Controller can concatenate the full system configuration into a single backup file and also archive log files. You can perform a set of actions on backup files or archived log files, such as saving, backing up, listing, and deleting the files.

To save disk space, the Oracle Communications Session Border Controller has archiving features that use the standard tar and gzip utilities. Archiving lets you easily change, move, store, and back up the system's log files. After a log file has been archived, it can be transferred via FTP to a remote host. The Oracle Communications Session Border Controller has a set of file manipulation commands that you can apply only to archive files.

Using the **backup** command enables you to successfully save and restore an existing configuration. The major difference between backup and archive files is that backup commands are used for configurations and log archive commands are used with log files.

# **Backup Commands**

The Oracle Communications Session Border Controller includes a set of commands for easily working with backup configurations. These commands are backup-config, display-backups, delete-backup-config, restore-backup-config.

Oracle suggests that you back up properly functioning configurations on your system before making any new major configuration changes. The backup configurations are crucial to have when configuration changes do not function as anticipated and a rollback must be applied immediately.

To back up the system configuration, use the **backup-config** command. You can confirm your backup has been created with the **display-backups** command. When the **backup-config** command is executed, the system checks if sufficient resources exist to complete the operation. If resources are sufficient, the system creates the backup. If resources are insufficient, the task is not completed and the Oracle Communications Session Border Controller instead displays the limiting resources, recommending that the task be completed at another time.

Backups are created as gzipped files in a .gz format. They are stored in the /code/bkups directory on the Oracle Communications Session Border Controller.

### **Creating Backups**

To create a backup:

In the ACLI at the superuser prompt, enter the **backup-config <filename> [editing | running]** command. Enter **backup-config** followed by a descriptive filename for the backup you are creating. You can also enter an optional argument to specify whether you want to create a backup from the editing configuration cache or the running configuration cache.

```
ORACLE# backup-config 01_Feb_2005_Test running task done ORACLE#
```

### **Listing Backups**

To list available backup configurations:

In the ACLI at the superuser prompt, enter the **display-backups** command. A list of available backup files from the /code/bkups directory is displayed on the screen.

```
ORACLE# display-backups
test_config.gz
test-config.gz
runningcfgtest.gz
runningtest_one.gz
BACK_UP_CONFIG.gz
02_Feb_2005.gz
01_Feb_2005_Test.gz
ORACLE#
```

### **Restoring Backups**

To restore a backup configuration:

In the ACLI at the superuser prompt, enter the **restore-backup-config <filename>** [running | saved] command. Enter **restore-backup-config** followed by the backup filename you wish to restore to the current configuration. You must explicitly name the backup file you wish to restore, including the file extension. You can also enter an optional argument to specify whether you want to restore the last running configuration or the last saved configuration on the Oracle Communications Session Border Controller.

```
ORACLE# restore-backup-config backup_file.gz saved

Need to perform save-config and activate/reboot activate for changes to take effect...

task done

ORACLE#
```

You can restore files from either .tar.gz format or just .gz. All backup files are gzipped in the .gz format.

You must still save and activate the configuration or reboot the Oracle Communications Session Border Controller to apply the backup configuration.

# **Deleting Backups**

The **delete-backup-config** command deletes the backup configurations from the /code/bkups directory on your system.

In the ACLI at the superuser prompt, enter the **delete-backup-config** command, followed by the backup file you wish to delete.

```
ORACLE# delete-backup-config FEB_BACKUP.gz
task done
ORACLE#
```

### **Viewing Backup Configurations**

The **show backup-config** command displays a specified configuration file saved on the Oracle Communications Session Border Controller's standard backup file directory.

In the ACLI at the superuser prompt, enter the show backup-config command followed by the backup configuration filename you want to view.

```
ORACLE# show backup-config
```

The configuration of the backup file you specify is displayed on the screen. The contents of this output are in the same format as the **show configuration** command. For example:

```
ORACLE# show backup-config
Possible configuration files are:
0606_HMRSIPNAT_Overlay.gz
0606_HMRSIPPeering.gz
0605_SingleSIPNATH_in_access.gz
0605_SingleSIPNATHTN_ABBN.gz
0605_SNB_ABBN.gz
HMR_OAI_config.gz
0619_HMR_OAI.gz
```

### **Archive Commands**

### **Creating Archives**

You can create archives of log files. Creating log archives requires a unique procedure described below.

#### **File Locations**

The following table lists source and destination directories used with archive functions.

Configuration Type	Source Directory	Destination Directory
Log	/opt/logs	/opt/archives

#### Log File Archives

To create an archive that contains all log files on the Oracle Communications Session Border Controller:

Enter the archives shell by typing archives at the topmost ACLI level while in superuser mode.

```
ORACLE# archives
ORACLE(archives)#
```

2. Type create LOGS, followed by a name for the archive file. The Oracle Communications Session Border Controller will pause while it completes the task and alert you when the task has completed.

```
ORACLE(archives) # create LOGS All_Logs_27_Feb
task done
ORACLE(archives) #
```

# Listing Archives

To display a list of the archived log files:

1. Enter the archives shell by typing **archives** at the topmost ACLI level while in superuser mode.

```
ORACLE# archives
ORACLE(archives)#
```

**2.** Type **display LOGS** to view the available log files.

#### **Managing Backups and Archives**

```
ORACLE(archives) # display LOGS
testlogs1.tar
log.algdd.tar
bluff1.tar
log.mbcd.tar
log.lemd.tar
log.sipd.tar.gz
log.NOTTESTING.sipd.tar
sipd.log.tar.gz
ORACLE(archives) #
```

### **Deleting Archives**

To delete archived log files:

1. Enter the archives shell by typing archives at the topmost ACLI level while in superuser mode.

```
ORACLE# archives
ORACLE(archives)#
```

**2.** Type **delete LOGS**, followed by the filename of the log file to delete.

```
ORACLE(archives) # delete LOGS sipd.log.tar.gz
ORACLE(archives) #
```

### **Renaming Archives**

To rename archived log files:

1. Enter the archives shell by typing archives at the topmost ACLI level while in superuser mode.

```
ORACLE# archives
ORACLE(archives)#
```

**2.** Type **rename LOGS**, followed by the full filename of the old log file, and then the new filename without an extension.

```
ORACLE(archives) # display LOGS
log.sipd.tar.gz
ORACLE(archives) # rename LOGS log.sipd.tar.gz backup_log.sipd
ORACLE(archives) # display LOGS
backup_log.sipd.tar.gz
ORACLE(archives) #
```

The newly renamed file remains in the same directory.

# **Viewing Free Space**

The **check-space-remaining** command checks the free space in the boot directory, code (flash memory), and other devices. Type a ? at the command to see all valid values. This command displays the total number of bytes free and total number of bytes available on the specified device. Each volume is used in the following way:

- /boot—A flash memory partition used primarily for system boot images and the bootloader image.
- /code—A flash memory partition used to store archives and data that needs to be persistent across reboot.

In the ACLI at the superuser prompt, enter the **check-space-remaining** command followed by the device you want to check the space on. Valid devices are **boot**, **code**, **opt**. All examples of this command are shown below.

```
ORACLE# check-space-remaining boot
boot: 29759488/29760512 bytes (99%) remaining
```

# **File System Maintenance**

# **Local File System**

The file system consists of 2 essential volumes and 1 or more user-defined volumes.

The Acme Packet 6300 and 6100 maintain /boot and /code partitions that are each 2 GB. These volumes are located on the same internal 4GB flash drives. Once a storage device is installed in the system, the /opt and /opt/crash volumes are moved there.

- /opt is located on the first system partition and is always 8 GB. Although it can be used for many purposes, it is primarily intended for core dumps, log files, CDRs, and HDR data.
- /opt/crash is located on the second system partition. It appears as just /crash. It is the remainder of the storage device with an 8GB minimum. /opt/crash is used for crash files.

The Acme Packet 3820 and 4500 maintain /boot and /code partitions that are each 256 MB. These volumes are located on separate 256MB flash drives. Once a storage device is installed in the system, the /opt and /opt/crash volumes are moved there.

#### **Default Paths**

The **show platform paths** command displays the default paths for system files. For example:

```
ORACLE# show platform paths
Filesystem paths
------
boot : /boot/
code : /code/
base : /opt/
crash : /opt/crash
logs : /opt/logs/
tar config : /code/config/
gz config : /code/gzConfig/
backups : /code/bkups/
import : /code/imports/
temp : /opt/tmp/
collect : /opt/collect/
running ver : /code/configVer.dat
running data : /opt/running/
editing data : /opt/data/
```

#### **File System Maintenance**

SPL files : /code/spl/
SPL bytecode : /opt/spl/

### File System Management

The Oracle Communications Session Border Controller provides you with tools to manage the file system.

### **Identifying File System Volumes**

You can identify partitions on the file system with the **show space** command. In addition, free and used space are reported. This command is entered as follows:

show space < boot | code | system-disk | data-disk | hard-disk >

#### Where

- boot the /boot partition
- code the /code partition
- system-disk all system partitions, including /opt and /opt/crash
- data-disk all user partitions that mount under /mnt
- hard-disk all partitions

### Formatting the File System

The storage device format scheme is dependent on the drive's size. With a large storage device, you can accept the file system's default partition configuration, or you can create your own scheme. The formatting plan differs based on the internal storage device being less than or equal to 40 GB or greater than 40 GB.

#### Acme Packet 3820 and 4500 without Storage Device

Two internal 256 MB flash drives are preconfigured as volumes /boot and /code, per previous releases. An optional hard drive may be provisioned for mass storage of logs, crash files and CDR accounting records on the /opt volume. With no hard drive installed in an Acme Packet 3820 or 4500, the /opt volume will use a RAM based filesystem, thus there is no persistent storage for logs, crash files, or CDR logs.

#### 40GB or Less Format Plan

When formatting a 40 GB or smaller storage device, no data partitions are created. The default partitioning scheme is as follows:

Table 4: System Default Format Plan (40 GB max):

Location	Volume Name	Volume Size
system partition	/opt	8 GB
system partition	/opt/crash	32 GB

#### 40GB + Default Format Plan

When formatting a storage device larger than 40 GB, /mnt/sys and /mnt/app volumes are created in the data partition. Their relative sizes are based on the drive's size.

Table 5: System Format Plan (40 GB +):

Volume Number	Volume Name	Volume Size
system partition	/opt	8 GB
system partition	/opt/crash	2 x RAM size (not less than 8 GB)

Volume Number	Volume Name	Volume Size
data partition	/mnt/sys	20% remaining space
data partition	/mnt/app	80% remaining space

#### 40GB + Custom Format Plan

You can customize the format plan when a storage device larger than 40 GB is installed in your system. Before formatting the storage device, plan the number of volumes, volume names, and relative percentage of storage device disk space. A maximum of 4 volumes in the data partition are allowed.

Table 6: Custom System Format Plan (40 GB +):

Volume Number	Volume Name	Volume Size
systempartition	/opt	8 GB
system partition	/opt/crash	2 x RAM size (not less than 8 GB)
data partitions 1-4	/mnt/ <user-label></user-label>	user-defined percentage of remaining space

### **Formatting Procedure**

Formatting a hard drive should always be an offline activity. Prior to formatting the hard drive, back-up the configuration, delete the configuration, and reboot. Additionally, no external network connections should be active as the format procedure is executed.

The **format** command requires one of the following arguments:

- system-disk formats and creates the 2 system partitions: /opt and /opt/crash
- data-disk formats and creates 1 or more data partitions with the default (/mnt/sys and /mnt/app) or user-defined volumes
- hard-disk formats and creates both the system partition and data partition

After the drive(s) are formatted, the system mounts the newly created partitions.

**Note:** Ensure that no application traffic flows over the Oracle Communications Session Border Controller when you format the disk.

**Note:** The format command may only be executed if certain tasks like local CDR and HDR generation are not active. Remove any boot time configuration for these features and reboot the system before attempting to format the hard-disk.

The following example shows the format command process.

```
ORACLE# format hard-disk
WARNING: Please ensure device is not currently in use by any applications
before proceeding
Continue [y/n]?: y
The following system partitions will now be created:
1: /opt 8000000 bytes 2: /crash 16218284032 b
2: /crash
                   16218284032 bytes
Create the system partitions and filesystems as configured above [y/n]: y
WARNING: All system logs and data on the disk will be
permanently erased and unrecoverable.
Are you sure [y/n]?: y
The format process will take a few minutes. Once
the format process begins, it cannot be stopped.
Please do not power down or reboot the system until
the format process is complete.

# Mounting and Unmounting Filesystems

You may unmount and stop the file system with the unmount command. Unmounting a file system is required to resize user partitions or replace a storage device. Prior to issuing this command you must disable user-initiated tasks that access the target volume. An example of a task which writes to disk is local CDR creation. Task log files generation is automatically halted. The unmount command is entered as follows:

```
unmount <data-disk | system-disk | hard-disk>
```

Where each of the arguments corresponds to the format command.

- system-disk unmount 2 system partitions: /opt and /opt/crash
- data-disk unmount the 1 or more data partitions containing the default (/mnt/sys and /mnt/app) or user-defined volumes
- hard-disk unmounts both the system partition and data partition

#### For example:

```
ORACLE# unmount data-disk
WARNING: Please ensure device is not currently in use by any applications
before proceeding
Continue [y/n]?: y
/VOLUME1 unmounted
/VOLUME2 unmounted
/VOLUME3 unmounted
ORACLE# show space hard-disk
```

#### **File System Maintenance**

```
ORACLE# unmount system-disk
WARNING: Please ensure device is not currently in use by any applications
before proceeding
Continue [y/n]?: y
Suspending logging to hard disk
Stopping tLogCleaner task
Relocating logging onto RAM drive
Initializing /opt/ Cleaner
Starting tLogCleaner task
ORACLE#
```

You may mount and start the file system with the **mount** command. Mounting the file system is required to bring the storage device volumes back online after they have been unmounted. The **mount** command is entered as follows:

```
mount <data-disk | system-disk | hard-disk>
```

Where each of the arguments corresponds to those used in the format command.

- system-disk mount 2 system partitions: /opt and /opt/crash
- data-disk mount the 1 or more data partitions containing the default (/mnt/sys and /mnt/app) or user-defined volumes
- hard-disk mounts both the system partition and data partition

#### For example:

```
ORACLE# mount system-disk
Suspending logging to ramdrive
Stopping tLogCleaner task
Relocating logging onto hard disk
e2fsck 1.41.14 (22-Dec-2010)
opt: clean, 60/488640 files, 67799/1953125 blocks
Initializing /opt/ Cleaner
Starting tLogCleaner task
e2fsck 1.41.14 (22-Dec-2010)
crash: clean, 11/991232 files, 104681/3960320 blocks
ORACLE#
```
