Glossary
Introducing Oracle Tuxedo Mainframe Adapter for TCP (IMS)

Oracle Tuxedo Mainframe Adapter products offer a set of communication gateways between Oracle Tuxedo systems and other online transaction processing environments, including IBM’s CICS and IMS. They allow applications to scale in size by providing interoperability between systems. The Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) product is a gateway connectivity feature that provides transparent communications between client and server transactions in an IMS system and a Oracle Tuxedo domain, a CICS system, or another IMS system. (A Oracle Tuxedo domain is a single computer [or network of computers] that shares a single Oracle Tuxedo configuration.)

The following information introduces the TMA TCP for IMS product:

- What You Need to Know
- Features/Benefits
- Oracle TMA TCP for IMS Architecture
- Oracle Tuxedo Mainframe Adapter for TCP Functionality
- Required System Components

What You Need to Know

This document is intended for system administrators who configure and administer the Tuxedo Mainframe Adapter for TCP system. In addition, programmers can find useful information for developing client programs and service routines that exchange data with the remote Tuxedo Mainframe Adapter for TCP gateways.
Programmers who work with Tuxedo Mainframe Adapter for TCP (IMS) should be familiar with the IMS applications development.

System administrators who work with Tuxedo Mainframe Adapter for TCP (IMS) should be familiar with the following concepts, tools, and procedures:

- IBM IMS Sockets
- Defining new resources to IMS
- IMS supplied procedure

**Features/Benefits**

The features and benefits provided by Oracle Tuxedo Mainframe Adapter for TCP (IMS) are:

- Ensured online integration of business operations through transparent client/server communications among heterogeneous systems
- Truly open distributed applications
- High throughput through TCP/IP for online request/response messaging
- Ease of integration; modular architecture for flexible on-schedule migration
- High performance open solution

**Oracle TMA TCP for IMS Architecture**

IMS Open Transaction Manager Access (OTMA) is a transaction-based, connectionless client/server protocol. By using OTMA, each client (z/OS application) can submit transactions to IMS or issue IMS commands and receive output from IMS application programs and from IMS itself.

An OTMA client is a z/OS application program that sends transactions to an IMS server and receives output. The application program must be a member of an XCF group and uses the OTMA protocol.

The TMA TCP for IMS product executes as an OTMA client running under z/OS. It uses the z/OS TCP/IP Sockets API to communicate with a TMA TCP Gateway on a remote Oracle Tuxedo system, and the IMS message queue (directly or indirectly through OTMA) to communicate with IMS transactions. This product supports connectivity with remote TMA TCP Gateways, TMA
TCP for CICS gateways, or other TMA TCP for IMS gateways. Figure 1-1 illustrates connection with a remote TMA TCP Gateway.

Figure 1-1  The Oracle TMA TCP for IMS Interoperability Solution

The configuration definition of the TMA TCP Gateway in the remote Oracle Tuxedo system maps Oracle Tuxedo local services to remote services provided by the IMS gateway. Each remote service corresponds to an IMS server transaction. Service requests issued by clients in the Oracle Tuxedo system are routed through the TMA TCP Gateway to the TMA TCP for IMS gateway for processing by the appropriate IMS server transaction.

Similarly, the configuration definition in the TMA TCP for IMS gateway maps local service names to remote services provided by the Oracle Tuxedo system. Service requests issued by IMS client transactions are routed to the TMA TCP Gateway for processing by the appropriate Oracle Tuxedo service.

In both cases, access to a remote service is transparent to the client requesting the service.

Oracle Tuxedo Mainframe Adapter for TCP Functionality

The following functionality is available in the TMA TCP product.
Domains-based Gateway Connectivity

The TMA TCP product has a domains-based architecture supporting bidirectional communications, request/response support, and support for an IMS OTMA interface.

Security

The TMA TCP product grants access to Tuxedo services based on a user name that the remote gateway supplies.

The TMA TCP for IMS product has an OTMA interface that supports enhanced security. This interface allows a requester from Tuxedo to pass a user ID through the OTMA server interface for authorization through a third party security package.

For more information about configuring security, refer to the “Monitoring Oracle TMA TCP for IMS” section.

Domain Name Server Support

The TMA TCP product supports domain name server (DNS) resolution of IP addresses. This support allows you to change the IP address at the domain name server to implement address changes without reconfiguring the TMA TCP gateway.

Dynamic Configuration

The TMA TCP product supports dynamic configuration updates of the TMA TCP configuration parameters. You can modify the configuration without shutting down and restarting the TMA TCP product.

Required System Components

The TMA TCP for IMS product requires the following components for transaction processing.

Oracle TMA Gateway Program

The TMA TCP for IMS product executes as an OTMA client running under z/OS. It uses the z/OS TCP/IP sockets API to communicate with remote Oracle Tuxedo Mainframe Adapter gateways and the IMS message queue (directly or indirectly through OTMA in the case of the OTMA client) to communicate with IMS application transactions.
IBM LE/370

IBM LE/370 provides a common runtime environment for a number of IBM high-level languages, including C/C++. The TMA TCP for IMS gateway is written in the C programming language and requires the LE/370 runtime environment.

IBM TCP/IP for z/OS

IBM TCP/IP for z/OS provides TCP/IP communications support for programs executing in a z/OS environment by means of a standard, UNIX-style socket API. The TMA TCP for IMS product uses TCP/IP to communicate with remote Oracle TMA gateways.

Note: This guide assumes you are using the IBM TCP/IP for z/OS product. If you are using another supported TCP/IP product, such as Interlink TCPaccess, consult the product documentation for equivalent components.

IMS Server Transactions

IMS server transactions are user-written programs that process service requests issued by a remote system. Server transactions are ordinary IMS transactions and can be written in any language supported by IMS. For supported languages, refer to the IBM IMS manuals.

IMS Client Transactions

IMS client transactions are user-written programs that issue requests for services offered by a remote system. Client transactions are ordinary IMS message processing program (MPP) transactions and can be written in any language supported by IMS.
Understanding How Oracle TMA TCP for IMS Works

The following information helps you understand how Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) works:

- Inbound Processing
- Outbound Processing
- How Oracle TMA TCP for IMS Is Initialized
- Processing IMS Server Requests
- Processing IMS Client Requests
- How Oracle TMA TCP for IMS Shuts Down

As shown in Figure 2-1, the TMA TCP for IMS gateway serves as the interface between IMS and remote Oracle Tuxedo Mainframe Adapter gateways via TCP/IP.
Inbound Processing

The gateway “listens” for incoming TCP/IP connection requests from remote gateways. When a request is received, an *inbound session* is established over which the remote gateway can present requests for service.

As shown in Figure 2-2, when a request is received from a remote system, it is relayed to IMS which schedules the appropriate server transaction to process the request. If a response is required, the server transaction places the response in the IMS message queue. If the TMA TCP gateway is running as an OTMA client, the response is queued to the transaction pipe and delivered to the client through the cross-system coupling facility (XCF). The response is returned to the remote system over the TCP/IP connection.
Outbound Processing

The TMA TCP for IMS product can also initiate TCP/IP connections with remote systems. These *outbound sessions* are used to send IMS client requests to remote systems for processing.

As shown in Figure 2-3, an IMS client transaction initiates a request by placing a properly formatted message into the IMS message queue. When running the gateway, two IMS user exits must be installed to route messages to the OTMA client. (For more information about request/response processing, refer to the “Programming Oracle TMA TCP for IMS” section, and for sample user exits, refer to the “Sample JCL and User Exits” section.) The gateway retrieves the request and forwards it to the appropriate remote system for processing. When the response (if required) is received from the remote system, it is returned to IMS for delivery to a transaction that processes the response.
How Oracle TMA TCP for IMS Is Initialized

The TMA TCP for IMS gateway is started by submitting the appropriate JCL (or as a started task) for an OTMA client. The following activities then occur.

1. The gateway (load module name, BEATCPI) opens a message log (normally allocated to a disk dataset) into which all messages issued during the course of execution are written.

2. If the message log cannot be opened, the gateway immediately terminates; any messages are written to a SYSOUT dataset by default.

3. The gateway obtains configuration information from a sequential dataset containing text statements. These statements define the operating environment for TMA TCP for IMS, including the definitions of local and remote gateways. If any configuration errors are detected during initialization, the gateway immediately terminates.

Processing IMS Server Requests

An IMS server request, also referred to as an inbound request (relative to IMS), is a request issued by a remote client for a service provided by an IMS server transaction.
1. When TMA TCP for IMS receives a request from a remote system, a request message is formatted and is inserted into the IMS message queue, destined for the specified IMS server transaction (the service name for the request corresponds to the transaction code of the IMS server transaction that handles the request).

2. IMS schedules the specified server transaction to process the request message.

3. The server transaction retrieves the request message from the IMS message queue and performs the indicated processing.

4. If a response is required, the server transaction formats a response message and inserts it into the IMS message queue, destined for the TMA TCP for IMS gateway.

5. The TMA TCP for IMS gateway retrieves the response message from IMS and returns it to the requesting remote system via the TCP/IP connection.

**Processing IMS Client Requests**

An IMS client request, also referred to as an outbound request (relative to IMS), is a request issued by an IMS application message processing program (MPP) for a service provided by a remote system.

**Two Phases of an IMS Client Request**

Because of the design philosophy of IMS, processing of an IMS client request occurs in two distinct “phases.”

1. A request phase wherein the request is issued during the execution of one transaction (T1).

2. A corresponding response phase wherein the response is processed during the execution of a second transaction (T2).

Transactions T1 and T2 may in fact be the same transaction ID (with appropriate logic to perform the required request or response processing, based on execution context). T1 and T2 must be two distinct transaction executions. This distinction is necessary because T1 can only initiate a request; it cannot “wait” on the response to that request because the architecture and design philosophy of IMS does not permit this.
How Oracle TMA TCP for IMS Processes an IMS Client Request

1. An IMS transaction issues a client request by inserting a properly formatted message into the IMS message queue specifying the TMA TCP for IMS OTMA client (through the use of the appropriate IMS user exit) as the destination.

   **Note:** For information about the IMS user exits, refer to the “Sample JCL and User Exits” section.

2. Once the request has been inserted into the Message Queue, the requester is effectively “decoupled” from the request; that is, processing of the request by TMA TCP for IMS proceeds asynchronously with respect to execution of the requesting transaction. The request includes the name (transaction code) of a response transaction that is scheduled by TMA TCP for IMS to process the response to the request.

3. The TMA TCP for IMS gateway retrieves the request from IMS and validates it for proper format. If any errors are detected, the specified response transaction is immediately scheduled with appropriate return codes.

4. The requested service name is located in the directory of services offered by remote systems to which TMA TCP for IMS has access. If the requested service cannot be found, or the required remote gateway is currently inaccessible, an error is recognized and the response transaction is immediately scheduled with appropriate return codes.

5. If a remote service provider is successfully identified for the request, an outbound session is established with the remote system (if one is not available) and the request is sent to the remote system for processing.

6. If a response is required, TMA TCP for IMS schedules the response transaction (with any response data) when the response is received.

7. Eventually, if no response is received from the remote system, the request **times out**, an error is recognized, and the response transaction is scheduled with appropriate return codes.

How Oracle TMA TCP for IMS Shuts Down

Once started, TMA TCP for IMS normally executes as a non-ending job, servicing inbound requests from remote systems and outbound requests originated by IMS client transactions.

Normal termination is initiated when a system operator issues the **SHUTDOWN** command. In response to a **SHUTDOWN** command, TMA TCP for IMS performs the following tasks.
1. Stops accepting new inbound TCP/IP connection requests.
2. Terminates active inbound sessions.
3. Terminates active outbound sessions.
4. Returns control to z/OS.

Note: Pending or in progress transactions are not allowed to complete prior to the system shutting down.
The TMA TCP product supports a security feature that allows a requester from Oracle Tuxedo services to pass a user ID requirement through the OTMA or CICS server interfaces for verification through a third-party security package.

**Note:** The security feature on Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) runs as an OTMA client only.

**Security Checking from Tuxedo to Mainframe**

Figure 3-1 depicts the process flow for security verifications from TMA TCP Gateway on UNIX to a mainframe.
1. Verify the user is valid on UNIX. For valid users, access is given; for invalid users, access is rejected.

2. Verify user name (reviewing the *tpusr* file), group (reviewing the *tpgrp* file), and ACL (reviewing the *tpacl* file). If all three pass, the transaction request processes. If any one of the three are rejected, the transaction request stops and a security violation occurs.

   **Note:** The user IDs in these files must match in the Tuxedo and the mainframe environments or a security violation occurs.

3. Accept the transaction request at the mainframe gateway based on the request coming from a trusted source. No password is passed.

4. Verify the user name associated with the transaction against the security system (such as RACF). If the user name is not valid, the request is rejected and a security violation occurs.

5. Complete the transaction request to the server.

### Security Checking from Mainframe to UNIX

Figure 3-2 depicts the process flow for security verifications from a mainframe to TMA TCP Gateway on UNIX.
1. Authorization checking is done by the mainframe security package prior to initiating the client.

2. Pass the transaction request from the client to the mainframe gateway.

3. Accept the transaction request at the UNIX gateway based on the request coming from a trusted source. No password is passed.

4. Decode the appkey to obtain the user and group numbers. Verify the user name against the security system. If the user name is valid and the user has the authority to run the transaction, the transaction request is accepted. If the user name is not valid, the request is rejected and a security violation occurs.

5. Complete the transaction request to the server if the user name is accepted.

**Setting Up Security for TMA TCP for IMS**

The TMA TCP for IMS product has an OTMA interface that supports enhanced security. This interface allows a requester from Oracle Tuxedo services to pass a user ID through the OTMA server interface for authorization through your security package.

**Securing Connections from IMS to IMS**

Complete the following tasks to enable the connection security feature.
1. Specify the **ACCOUNT** and **PASSWORD** parameters in the **GATEWAY** configuration statement for local or remote gateways.

2. Verify that the parameter values for **ACCOUNT** and **PASSWORD** in the **GATEWAY** statement for the **GATEWAY TYPE=LOCAL** match the **ACCOUNT** and **PASSWORD** values in the **GATEWAY TYPE=REMOTE** statement.

**Note:** The security for connection validation is obsolete.

### Securing Connections from IMS to CICS

Complete the following tasks to enable the connection security feature.

1. Specify the **ACCOUNT** and **PASSWORD** parameters in the **GATEWAY TYPE=LOCAL** configuration statement.

2. Verify that the parameter values for **ACCOUNT** and **PASSWORD** in the **GATEWAY TYPE=LOCAL** statement match the **ACCOUNT** and **PASSWORD** values in the User Account Connection screen.

**Note:** The security for connection validation is obsolete.

### Securing Services

Complete the following tasks to enable the service security feature.

1. Set up transaction security through the mainframe with the security administrator.

2. Specify **OTMASECURITY=Y** in the **SYSTEM** statement of your TMA TCP for IMS configuration file.

3. Set the security flag for each local service using the **SECURITY** parameter in **SERVICE TYPE=LOCAL** statement. For parameter information, refer to the “Defining Local Services” section.

4. Issue the **/SEC OTMA PROFILE** command in IMS to enable security checking on a service by service basis for the OTMA interface. Issue the **/SEC OTMA FULL** command in IMS to enable security checking on all services.

**WARNING:** If **SECURITY=N** in the **SERVICE TYPE=LOCAL** statement for any local service definition, issue **/SEC OTMA PROFILE**. A security failure results if you specify **SECURITY=N** and issue **/SEC OTMA FULL** command.
Configuring Oracle TMA TCP for IMS

Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) makes use of a configuration file that is read and processed at runtime to establish the processing environment. The configuration file is a simple, plain-text file that a systems programmer can edit easily to define and alter the configuration.

The configuration is defined in terms of the local (IMS) gateways, one or more remote gateways (for example, CICS), and one or more remote services offered by various remote gateways to which TMA TCP for IMS can have access. When using the OTMA client, you must configure local services as well.

To change the configuration file without shutting down the TMA TCP for IMS system, refer to “Dynamically Configuring TMA TCP for IMS” section.

The configuration file includes the following information:

- A `SYSTEM` statement that defines the system configuration parameters (refer to the “System Configuration Parameters” section)
- Statements that define one or more IMS host systems (OTMA only) with which TMA TCP for IMS establishes communications (refer to the “Defining the Local Host” section)
- Statements that define one or more local gateways (refer to the “Defining the Local Gateway” section)
- Statements that define one or more remote gateways with which TMA TCP for IMS can establish connections and exchange requests and responses (refer to the “Defining Remote Gateways” section)
• Statements that define one or more services offered by remote gateways that can be requested by IMS clients of TMA TCP for IMS (refer to the “Defining Remote Services” section)

• Statements that define one or more services offered by local IMS Hosts (OTMA only) that can be requested by remote clients of TMA TCP for IMS (refer to the “Defining Local Services” section)

• Security information when running as an OTMA client (refer to the “Dynamically Configuring TMA TCP for IMS” section)

### System Configuration Parameters

System configuration parameters are defined by the `SYSTEM` statement. Only one `SYSTEM` statement is allowed, and it should be the first statement in the configuration file. See Listing 2-1 for parameter syntax.

### Syntax of the SYSTEM Statement

The following listing contains the parameter syntax for the `SYSTEM` statement.

#### Listing 2-1  SYSTEM Statement Syntax

```
SYSTEM,
  SLEEPTIME=(sleep-min,sleep-max,sleep-delta),
  OTMACLIENT=TMA-clientname],
  OTMAGROUP=XCF-groupname]
[,OTMASECURITY={Yes|No}]
[,MSGLEVEL={msg-level|4}]
[,CLIENTSHUTDOWN={Yes|No}]
[,IDLETIMEOUT={nn|0}]
[,DRUEXIT=exit-name|DFSYDRU0]
[,SPARESOCKETS=nn|0]
```

### Description of SYSTEM Parameters

The `SYSTEM` statement uses the following parameters.
<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SLEEPTIME</td>
<td>sleep-min</td>
<td>Specifies the minimum amount of time (decimal, milliseconds) that TMA TCP for IMS delays before checking for work. Default value: 150</td>
</tr>
<tr>
<td></td>
<td>sleep-max</td>
<td>Specifies the maximum amount of time (decimal, milliseconds) that TMA TCP for IMS delays before checking for work. Default value: 500</td>
</tr>
</tbody>
</table>
sleep-delta

Specifies the incremental amount of time (decimal, milliseconds) that TMA TCP for IMS uses to graduate from the minimum sleep time to the maximum sleep time.

TMA TCP for IMS periodically “polls” for new work. The TMA TCP for IMS product uses a graduated polling interval that is set to the minimum sleep time whenever new work is found. The polling interval is then incrementally increased by the delta time until one of the following occurs:

• New work is found (in which case the polling interval is again reset to the minimum value)
• The maximum sleep time is reached (in which case the polling interval remains at the maximum value)

This value limits the amount of CPU time required to poll for work when traffic is heavier.

Avoid specifying values that cause the polling interval to be very small (or zero), or values smaller than 100 milliseconds. These values may result in polling too frequently. However, also avoid specifying values that cause the polling interval to be too large (greater than one second). These values may cause TMA TCP for IMS to be unresponsive. Varying the sleep time between 100 and 500 milliseconds in 5 millisecond increments is recommended.

Default value: 5

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OTMACLIENT</td>
<td>clientname</td>
<td>Specifies the XCF client name for TMA TCP OTMA. This parameter is 1-16 characters and referenced by DRU EXIT.</td>
</tr>
</tbody>
</table>
### System Configuration Parameters

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>OTMAGROUP</td>
<td>groupname</td>
<td>Specifies the XCF group name for IMS and TMA TCP. This parameter is 1-8 characters and the same as GRNAME parameter in the IMS system.</td>
</tr>
<tr>
<td>OTMASECURITY</td>
<td>Yes</td>
<td>Specifies whether to enable or disable security for user authorization. Specify Yes to enable security or No to disable security.</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td>Default value: No</td>
</tr>
<tr>
<td>MSGLEVEL</td>
<td>msg-level</td>
<td>Specifies the message detail level to be logged by TMA TCP for IMS. 0 - No messages are logged, 2 - Error Messages only, 3 - Informational Messages and Error Messages, 4 - Security Audit Messages. 4 - Security Audit Messages. 4 - Security Audit Messages.</td>
</tr>
<tr>
<td></td>
<td>4</td>
<td>The message level is cumulative. For example, if a message level of 4 is specified, all messages with a message level of 4 or less is logged (such as, security audit, informational, and error messages) and is also displayed on the z/OS console. Normally, a message level of 4 should be specified, which results in TMA TCP for IMS logging all security, informational and error messages. Default value: 5</td>
</tr>
<tr>
<td>CLIENTSHUTDOWN</td>
<td>Yes</td>
<td>Specifies whether a SHUTDOWN request can be made by a remote client request or as a response to a remote client request. For additional information for shutting down the system, refer to the “Monitoring Oracle TMA TCP for IMS” section. Default value: No</td>
</tr>
<tr>
<td></td>
<td>No</td>
<td></td>
</tr>
</tbody>
</table>
Defining the Local Host

IMS host systems that service IMS requests are defined with the `HOST TYPE=IMS` statement. This statement is only used when running TMA TCP for IMS as an OTMA client.

Syntax of the HOST Statement

The following listing contains the parameter syntax for the `HOST` statement.

**Listing 2-2  **HOST Statement Syntax

```
HOST,TYPE=IMS,
    IMSID=IMS-system-logical-identifier,
    OTMANAME=IMS-clientname,
    OTMAINPIPE=server-request-name,
    OTMAOUTPIPE=client-request-name
```

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IDLETIMEOUT</td>
<td>nn</td>
<td>0</td>
</tr>
<tr>
<td>DRUEXIT</td>
<td>exit-name</td>
<td>Specifies the name of the destination resolution User Exit routine in IMS that this client should use. The default is DFSYDRU0. For a sample of the DFSYDRU0 user exit, refer to the “Sample JCL and User Exits” section.</td>
</tr>
<tr>
<td>SPARESOCKETS</td>
<td>nn</td>
<td>Specifies the number of spare socket descriptors reserved for dynamic configuration changes, for example, adding a gateway, increasing the maximum number of sessions for a gateway. Default value: 0.</td>
</tr>
</tbody>
</table>
### Description of HOST Parameters

The `HOST` statement uses the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSID</td>
<td>IMS-system-logical-identifier</td>
<td>Specifies a symbolic name that uniquely identifies the IMS system definition. This parameter is not related to the IMSID parameter specified in the IMS syssgen or on IMS region JCL statements.</td>
</tr>
<tr>
<td>OTMANAME</td>
<td>IMS-clientname</td>
<td>Specifies the XCF client name for the IMS system. This parameter is 1-16 characters and the same as OTMANM parameter in the IMS system. When OTMANM is not specified, it is the same as IMS APPLID.</td>
</tr>
<tr>
<td>OTMAINPIPE</td>
<td>server-request-name</td>
<td>Specifies the transaction pipe name for the IMS server requests. This parameter is 1-4 characters.</td>
</tr>
<tr>
<td>OTMAOUTPIPE</td>
<td>client-request-name</td>
<td>Specifies the transaction pipe name for the IMS client requests. This parameter is 1-8 characters and referenced by DRU EXIT.</td>
</tr>
</tbody>
</table>
Defining the Local Gateway

The local (IMS) gateway defines the access points that remote gateways can use to connect to the IMS gateway.

The local gateway can be defined as having a single physical IP address and port number, or multiple physical IP addresses and/or port numbers. Furthermore, each physical port can be defined as accepting one or more concurrent inbound TCP/IP connections from remote gateways.

One or more GATEWAY TYPE=LOCAL statements must exist in the configuration file to define the local gateways. Each GATEWAY TYPE=LOCAL statement defines a specific IP address and port number through which TMA TCP for IMS accepts inbound connection requests from remote gateways. Inbound connections are used by a remote gateway to send client requests to the IMS gateway for processing by IMS server transactions. Each local gateway (as defined by a GATEWAY TYPE=LOCAL statement) must have a unique logical machine ID (a symbolic name used to identify a gateway).

Remote systems attempting to establish an inbound session with the local gateway can optionally be required to supply a valid account ID and/or password.

For sample configurations, refer to the “Example Configuration Files” section.

Syntax of the GATEWAY TYPE=LOCAL Statement

Listing 2-3 contains the parameter syntax for the local gateway.
Listing 2-3  Local Gateway Syntax

GATEWAY,TYPE=LOCAL,
    LMID=logical-machine-id,
    PORT=port-number,
    ACCOUNT={account-id|*},
    PASSWORD={password|*}
    [,HOSTADDR=(ip-address|hostname)]
    [,MAXMSGLEN={max-message-length|2048}]
    [,SESSIONS={({startup-sessions,max-sessions)|1}}]
    [,IDLETIMEOUT={nn|0}]
    [,MULTIPLEX={nn|1}]

Description of GATEWAY TYPE=LOCAL Parameters

The GATEWAY TYPE=LOCAL statement uses the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LMID</td>
<td>logical-machine-id</td>
<td>Specifies a symbolic name (1-16 characters) that uniquely identifies this gateway/port. Special characters are not supported.</td>
</tr>
<tr>
<td>PORT</td>
<td>port-number</td>
<td>Specifies the port number (decimal, 1-32,767) at which inbound connections from remote gateways are accepted. Choose a port number that is not in the range of well-known port numbers reserved for use by TCP/IP applications.</td>
</tr>
<tr>
<td>Parameter</td>
<td>Value</td>
<td>Description</td>
</tr>
<tr>
<td>-----------</td>
<td>------------------------</td>
<td>-------------</td>
</tr>
<tr>
<td>ACCOUNT</td>
<td>account-id</td>
<td>*</td>
</tr>
<tr>
<td>PASSWORD</td>
<td>password</td>
<td>*</td>
</tr>
</tbody>
</table>
| HOSTADDR  | ip-address|hostname | Is the IP address or hostname for this machine over which inbound connections from remote gateways are accepted at the specified port number. The IP address is specified using standard dotted-decimal notation (for example, 199.203.45.99). The hostname is specified as a 1-256 character string and must match the DNS entry.  

**Note:** If any special characters, such as "," are in the host address, quotes must be placed around the address name. Example: HOSTADDR="SIA-COT 5"  

Default value: If this parameter is not specified, then connections are accepted over any network interface.
Defining Remote Gateways

A remote gateway is another Oracle Tuxedo Mainframe Adapter gateway (TUX, CICS, or IMS) to which TMA TCP for IMS can be connected by one or more TCP/IP connections. A remote gateway definition defines the access points that TMA TCP for IMS uses to connect to the remote gateway.

The remote gateway is defined by its IP address and port number. The remote gateway may be defined as accepting one or more concurrent *outbound* TCP/IP connections initiated by the local gateway.
(IMS) gateway. Outbound connections are used by the IMS gateway to send IMS client requests to a remote gateway for processing by the requested service.

One or more `GATEWAY TYPE=REMOTE` statements are used in the configuration file to define remote gateways. Each `GATEWAY TYPE=REMOTE` statement defines the IP address and port number that TMA TCP for IMS uses to establish an outbound connection with a remote gateway. The `GATEWAY TYPE=REMOTE` statement also identifies a remote gateway by a unique logical machine ID.

The configuration file may contain multiple `GATEWAY TYPE=REMOTE` statements, each defining a different remote gateway. If no `GATEWAY TYPE=REMOTE` statements are present, then TMA TCP for IMS cannot establish outbound connections with remote gateways, and therefore cannot process IMS client requests.

The TMA TCP for IMS software can optionally be configured to supply a valid account ID and valid password when establishing an outbound session with a remote gateway.

For examples of the `GATEWAY TYPE=REMOTE` statement, refer to the “Example Configuration Files” section.

**Syntax of the GATEWAY TYPE=REMOTE Statement**

Listing 2-4 contains the parameter syntax for the `GATEWAY TYPE=REMOTE` statement.

```
GATEWAY,TYPE=(REMOTE,{TUX|IMS|CICS,tran-id|CICSCPT}),
    LMID=logical-machine-id,
    HOSTADDR=(ip-address|hostname),
    PORT=port-number,
    ACCOUNT={account-id,*},
    PASSWORD={password,*}
[,MAXMSGLEN=max-message-length|2048]
[,SESSIONS=(min-sessions),(max-sessions)]
[,MULTIPLEX={nn|0}]
[,IDLETIMEOUT={nn|0}]
```
### Description of GATEWAY TYPE=REMOTE Parameters

The GATEWAY TYPE=REMOTE statement uses the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>TYPE</td>
<td>(REMOTE,type)</td>
<td>Specifies the remote gateway type. You must specify one of the following. TUX - The remote gateway is an TMA TCP Gateway gateway. IMS - The remote gateway is an TMA TCP for IMS gateway. CICS, tran-id - The remote gateway is an TMA TCP for CICS gateway. tran-id specifies the 1-4 character name of the TMA TCP for CICS transaction that is to be scheduled by CICS to handle incoming TCP/IP TMA requests. Refer to the Oracle Tuxedo Mainframe Adapter for TCP CICS User Guide for more information. CICSCPT - The remote gateway is an TMA TCP for CICS gateway that uses the Interlink CPT product for TCP/IP access.</td>
</tr>
<tr>
<td>LMID</td>
<td>logical-machine-id</td>
<td>Specifies a symbolic name (1-16 characters) that uniquely identifies the remote gateway. The logical machine ID is used to associate a remote service with a particular remote gateway.</td>
</tr>
<tr>
<td>HOSTADDR</td>
<td>ip-address</td>
<td>hostname</td>
</tr>
</tbody>
</table>

**Note:** If any special characters, such as "," are in the host address, quotes must be placed around the address name. Example: HOSTADDR="SIA-COTS"
PORT port-number
Specifies the port number (decimal, 1-32,767) to be used to establish a connection with the remote gateway.

ACCOUNT account-id
Specifies the account ID (1-8 characters) to be used to establish a connection with the remote gateway. If an account ID is not used, ACCOUNT=* should be specified. The account ID for connection validation is obsolete.

PASSWORD password
Specifies the password (1-8 characters) to be used to establish a connection with the remote gateway. If a password is not used, PASSWORD=* should be specified. The password for connection validation is obsolete.

MAXMSGLEN max-message-length
Specifies the maximum TCP/IP message length (decimal, 1-32,767) that is sent over the connection.
Default value: 2048

SESSIONS min-sessions
Specifies the minimum number of outbound sessions (decimal, 0-32,767) that are to be automatically started with this gateway during initialization of TMA TCP for IMS. Additional sessions (up to the maximum number of sessions specified) are started on a demand basis.

Remember that by specifying a minimum number (greater than 0) of outbound sessions for a remote gateway, you can cause outbound session to be automatically established with that gateway during initialization. This process can be helpful in verifying outbound connectivity without having to make use of test transactions.
Default value: 0
Defining Remote Services

A remote service is a service offered by a remote gateway to which TMA TCP for IMS has access. IMS client transactions can make requests for services offered by remote gateways.

One or more SERVICE TYPE=REMOTE statements are used in the configuration file to define remote services. Each SERVICE TYPE=REMOTE statement defines the local service name (used by the IMS client transaction to request the service), the remote service name (used to invoke the service on the remote system), and the logical machine ID of a remote gateway that offers the service. There must be a corresponding GATEWAY TYPE=REMOTE statement in the configuration file for the specified logical machine ID.

The configuration file can contain multiple SERVICE TYPE=REMOTE statements for a given (local) service name, each pointing to a different logical machine ID (that is, remote gateway). In this case, TMA TCP for IMS distributes requests for the service among the available service providers, thus maximizing throughput during busy periods.

For examples of this statement, refer to the “Example Configuration Files” section.
Syntax of the SERVICE TYPE=REMOTE Statement

Listing 2-5 contains the parameter syntax for the SERVICE TYPE=REMOTE statement.

Listing 2-5  Remote Services Syntax

```
SERVICE TYPE=REMOTE,
    NAME=(local-service-name,remote-service-name),
    LMID=logical-machine-id
[,TIMEOUT=(timeout|30)]
```

Description of SERVICE TYPE=REMOTE Parameters

The SERVICE TYPE=REMOTE statement uses the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>local-service-name</td>
<td>Specifies the name (1-16 characters) by which the service is known on this machine. This is the name which must be used by an IMS client to request the service.</td>
</tr>
<tr>
<td></td>
<td>remote-service-name</td>
<td>Specifies the name (1-16 characters) by which the service is known on the remote machine. This name is the name used to invoke the service on the remote machine.</td>
</tr>
<tr>
<td>LMID</td>
<td>logical-machine-id</td>
<td>Specifies the logical machine ID (1-16 characters) of a remote gateway that offers this service. This name must match a logical machine ID (LMID) specified in a GATEWAY TYPE=REMOTE statement.</td>
</tr>
<tr>
<td>TIMEOUT</td>
<td>timeout</td>
<td>30</td>
</tr>
</tbody>
</table>
Defining Local Services

A service offered by a local IMS host is defined by a `SERVICE TYPE=LOCAL` statement. There can be multiple `SERVICE TYPE=LOCAL` statements and multiple statements defining the same service, provided each specifies a different local IMSID.

Syntax of the SERVICE TYPE=LOCAL Statement

Listing 2-6 contains the parameter syntax for the `SERVICE TYPE=LOCAL` statement.

**Note:** `SERVICE TYPE=LOCAL` statements are only used when running TMA TCP for IMS as an OTMA client.

Listing 2-6  Local Service Syntax

```
SERVICE,TYPE=LOCAL,
    NAME=(local-service-name,remote-service-name),
    IMSID=logical-IMS-id,
[,V21COMPAT={Yes|No}]
[,FASTPATH={Yes|No}]
[,SECURITY={Yes|No}]
[,RESPONSE=remote-service-name]
```

Description of SERVICES Parameters

The `LOCAL SERVICES` statement uses the following parameters.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>NAME</td>
<td>local-service-name</td>
<td>Specifies the name (1-16 characters) by which the service is known on this machine. This name is the name passed to IMS as the transaction name.</td>
</tr>
<tr>
<td></td>
<td>remote-service-name</td>
<td>Specifies the name (1-16 characters) by which the service is known on the remote machine. This name is the name passed by the remote client to invoke this service.</td>
</tr>
</tbody>
</table>
Dynamically Configuring TMA TCP for IMS

The TMA TCP for IMS product makes use of a configuration file that is read and processed at runtime to establish the processing environment. The configured parameters can be modified while the gateway is running. You can make the following changes to the TMA TCP for IMS gateway configuration dynamically by entering the commands on TCP Outstanding WTOR:

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Value</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>IMSID</td>
<td>logical-IMS-id</td>
<td>Specifies a symbolic name that uniquely identifies an IMS system definition. This name must match a logical IMS ID (IMSID) specified in a HOST, TYPE=IMS statement.</td>
</tr>
<tr>
<td>FASTPATH</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>SECURITY</td>
<td>Yes</td>
<td>No</td>
</tr>
<tr>
<td>RESPONSE</td>
<td>remote-service-name</td>
<td>Specifies the remote service name you want to send the response to as a request. Note: This parameter is only valid for local service requests with a NOREPLY response.</td>
</tr>
<tr>
<td>V21COMPAT</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
Modifying SYSTEM Parameters

You can modify the following SYSTEM parameters dynamically using the MOD SYSTEM command.

- SLEEPTIME
- MSGLEVEL
- CLIENTSHUTDOWN

The example in Listing 2-7 uses the MOD SYSTEM command.

Listing 2-7 MOD SYSTEM Command Example

MOD SYSTEM, SLEEPTIME=(150,500,5), MSGLEVEL=4, CLIENTSHUTDOWN=NO

For parameter descriptions and syntax, refer to the “Description of SYSTEM Parameters” section.

Writing the Configuration to a File

To write the current configuration to a file, use the CHKPT CONFIG command with a fully qualified file name. The example in Listing 2-8 saves the current configuration to a file named BEA.TMATCP.CONFIG1.
Processing a File

To process a file containing commands, use the `INFILE` command with a fully qualified file name. The example in Listing 2-9 processes the `BEA.TMATCP.TESTFILE1` file.

Listing 2-9  INFILE Command Example

```
INFILE BEA.TMATCP.TESTFILE1
```

Changing Gateway Configurations

You can dynamically change gateway configurations by adding a new gateway, modifying an existing gateway definition, starting a gateway, and stopping a gateway. For parameter descriptions and syntax, refer to the “Description of GATEWAY TYPE=LOCAL Parameters” and “Description of GATEWAY TYPE=REMOTE Parameters” sections.

Adding a Gateway

To add a gateway to the current configuration, use the `ADD GATEWAY` command. The following `GATEWAY` statement parameters are supported with this command.

- TYPE
- LMID
- PORT
- ACCOUNT
- PASSWORD
- HOSTADDR
- MAXMSGLEN
- SESSIONS
MULTIPLEX

The example in Listing 2-10 uses the \texttt{ADD GATEWAY} command.

\textbf{Listing 2-10  \texttt{ADD GATEWAY} Command Example}

\begin{verbatim}
ADD GATEWAY, TYPE=LOCAL,
    LMID=IMS1,
    PORT=4500,
    ACCOUNT=ACCT101,
    PASSWORD=PSWD101,
    HOSTADDR=128.0.0.1,
    MAXMSGLEN=2048,
    SESSIONS=5,
    MULTIPLEX=3
\end{verbatim}

\textbf{Starting a Gateway}

To start a gateway, use the \texttt{START GATEWAY} command with the \texttt{LMID} parameter. The example in 
Listing 2-11 starts the OS3901 gateway.

\textbf{Listing 2-11  \texttt{START GATEWAY} Command Example}

\begin{verbatim}
START GATEWAY, LMID=OS3901
\end{verbatim}

\textbf{Stopping a Gateway}

To stop a gateway, use the \texttt{STOP GATEWAY} command with the \texttt{LMID} parameter. Use the \texttt{IMMED=YES} parameter to stop the gateway immediately \textit{without} waiting for requests in progress to complete. Outstanding requests are sent an error message and all gateway connections are closed. Use the \texttt{IMMED=NO} to allow the gateway to complete transaction processing and then shutdown. While waiting, the gateway does not accept any new requests. \texttt{IMMED=NO} is the default. The example in Listing 2-12 stops the OS3901 gateway after transaction processing completes.
Modifying an Existing Gateway

To change an existing gateway, stop the gateway first. Then use the `MOD GATEWAY` command to change any supported parameter definitions. You must specify an existing LMID for the `MOD GATEWAY` command. The following `GATEWAY` statement parameters are supported with this command.

- LMID
- ACCOUNT
- PASSWORD
- MAXMSGLEN
- SESSIONS

The example in Listing 2-13 uses the `MOD GATEWAY` command.

```
Listing 2-13  MOD GATEWAY Command Example

MOD GATEWAY, LMID=SUN2, ACCOUNT=ACCT102, PASSWORD=PSWD102, MAXMSGLEN=2048
```

Changing IMS Host Configurations

You can dynamically change IMS host configurations by adding a new host, modifying an existing host definition, starting a host, and stopping a host. For parameter descriptions and syntax, refer to the “Description of GATEWAY TYPE=LOCAL Parameters” and “Description of GATEWAY TYPE=REMOTE Parameters” sections.

Adding a Host

To add a host to the current configuration, use the `ADD HOST` command. The following `HOST` statement parameters are supported with this command.

- TYPE
The example in Listing 2-14 uses the ADD HOST command.

Listing 2-14  ADD HOST Command Example

```
ADD HOST, TYPE=IMS,
   IMSID=IMS3,
   OTMANAME=IMS71SYS3,
   OTMAINPIPE=SYS3,
   OTMAOUTPIPE=SYS3OUT,
   NUMTPIPES=5
```

Starting a Host

To start a host, use the START HOST command with the IMSID parameter. The example in Listing 2-15 starts the IMS3 host.

Listing 2-15  START HOST Command Example

```
START HOST, IMSID=IMS3
```

Modifying an Existing Host

The following tasks explain how to change an existing host.

1. Stop the host first.

2. Then use the MOD HOST command to change any supported parameter definitions. You must specify an IMSID for the MOD HOST command.

The following HOST statement parameters are modifiable with this command.
The example in Listing 2-16 uses the MOD HOST command.

Listing 2-16  MOD HOST Command Example

MOD HOST, IMSID=IMS3, NUMTPIPES=6

Stopping a Host

To stop a host, use the STOP HOST command with the IMSID parameter with a value matching the IMSID specification on the HOST, TYPE=IMS statement. Refer to the “Defining the Local Gateway” section. Use the IMMED=YES parameter to stop the host immediately without waiting for requests in progress to complete. Outstanding requests are sent an error message. (For a description of error messages, refer to the “Error and Informational Messages” section.) Use the IMMED=NO to allow the host to complete processing outstanding requests and then shutdown. While waiting, the host does not accept any new requests. IMMED=NO is the default. The example in Listing 2-17 stops the IMS3 host after transaction processing completes.

Listing 2-17  STOP HOST Command Example

STOP HOST, IMSID=IMS3

Changing Remote Service Definitions

You can dynamically change remote service definitions by adding a new service, modifying an existing service definition, or starting and stopping services. Existing services must be stopped prior to modifying them. For parameter descriptions and syntax, refer to the “Description of SERVICE TYPE=REMOTE Parameters” section.
Adding a Remote Service

To add a remote service to the current configuration, use the `ADD SERVICE` command. The following `SERVICE` `TYPE=REMOTE` statement parameters are supported with this command. `TYPE`, `LMID`, and `NAME` are required parameters.

- `TYPE`
- `LMID`
- `NAME`
- `TIMEOUT`

The example in Listing 2-18 uses the `ADD SERVICE` command to add a remote service.

Listing 2-18  ADD SERVICE Command (RemoteService) Example

```
ADD SERVICE, TYPE=REMOTE,
   LMID=TUX1,
   NAME=(ECHO,ECHO),
   TIMEOUT=60
```

Stopping a Remote Service

To stop a remote service, use the `STOP SERVICE` command with the `LMID` and `NAME` parameters. In this case, the `NAME` parameter only specifies the `local name`, rather than the fully qualified (`local name, remote name`) syntax. Use the `IMMED=YES` parameter to stop the service immediately without waiting for requests in progress to complete. Outstanding requests are sent an error message. Use the `IMMED=NO` to allow the requests to complete processing. While waiting, the gateway does not accept any new requests. `IMMED=NO` is the default. The example in Listing 2-19 stops `ECHO` on the `TUX1` gateway.

Listing 2-19  STOP SERVICE Command (Remote Service) Example

```
STOP SERVICE,
   LMID=TUX1,
   NAME=ECHO
```
Modifying an Existing Remote Service

The following tasks explain how to change an existing remote service definition.

1. Stop the service first.

2. Then use the MOD SERVICE command to change the service information. Use the LMID and NAME parameters to specify the service you want to modify. The TIMEOUT parameter in the SERVICE TYPE=REMOTE statement is the only parameter that can be modified with this command and is required.

The example in Listing 2-20 uses the MOD SERVICE command. In this case, the NAME parameter only specifies the local name, rather than the fully qualified (local name, remote name) syntax.

Listing 2-20 MOD SERVICE Command (Remote Service) Example

```plaintext
MOD SERVICE,
    LMID=TUX1,
    NAME=ECHO,
    TIMEOUT=60
```

Starting a Remote Service

To start a service, use the START SERVICE command with the LMID and NAME parameters. In this case, the NAME parameter only specifies the local name rather than the fully qualified (local name, remote name) syntax. The example in Listing 2-21 starts the TUX1 service.

Listing 2-21 START SERVICE Command (Remote Service) Example

```plaintext
START SERVICE,
    LMID=TUX1,
    NAME=ECHO
```
Changing Local Service Definitions

You can dynamically change local service definitions by adding a new service, modifying an existing service definition, or starting and stopping services. Existing services must be stopped prior to modifying them. For parameter descriptions and syntax, refer to the “Defining Local Services” section.

Adding a Local Service

To add a local service to the current configuration, use the **ADD SERVICE** command. The **TYPE**, **IMSID**, and **NAME** are required parameters when adding a local service. The following **SERVICE TYPE=LOCAL** statement parameters are supported with this command.

- **TYPE**
- **IMSID**
- **NAME**
- **SECURITY**
- **FASTPATH**
- **V21COMPAT**

The example in **Listing 2-22** uses the **ADD SERVICE** command.

**Listing 2-22  ADD SERVICE Command (Local Service) Example**

```plaintext
ADD SERVICE, TYPE=LOCAL, 
    IMSID=IMS1, 
    NAME=(BEASVR01,ECHO), 
    SECURITY=YES, 
    FASTPATH=NO, 
    V21COMPAT=NO
```

Stopping a Local Service

To stop a local service, use the **STOP SERVICE** command with the **IMSID** and **NAME** parameters. In this case, the **NAME** parameter only specifies the **remote name**, rather than the fully qualified (**local name, remote name**) syntax. Use the **IMMED=YES** parameter to stop the service immediately **without** waiting for requests in progress to complete. Outstanding requests are sent
an error message. Use the `IMMED=NO` to allow the requests to complete processing. While waiting, the gateway does not accept any new requests. `IMMED=NO` is the default. The example in Listing 2-23 stops ECHO on the IMS1 host.

Listing 2-23  STOP SERVICE Command (Local Service) Example

```
STOP SERVICE, IMSID=IMS1, NAME=ECHO
```

Modifying an Existing Local Service

The following tasks explain how to change an existing local service definition.

1. Stop the service first.
2. Then use the `MOD SERVICE` command to change any supported parameters.

The following `SERVICE TYPE=LOCAL` statement parameters can be modified with this command.

- `SECURITY`
- `FASTPATH`
- `V21COMPAT`

The example in Listing 2-24 uses the `MOD SERVICE` command. In this case, the `NAME` parameter only specifies the remote name, rather than the fully qualified (local name, remote name) syntax.

Listing 2-24  MOD SERVICE Command (Local Service) Example

```
MOD SERVICE, IMSID=IMS1, NAME=ECHO, SECURITY=YES
```

Starting a Local Service

To start a local service, use the `START SERVICE` command with the `IMSID` and `NAME` parameters. In this case, the `NAME` parameter only specifies the remote name, rather than the fully qualified (local name, remote name) syntax. The example in Listing 2-25 starts the ECHO service for IMS1.
Listing 2-25  START SERVICE Command (Local Service) Example

START SERVICE, IMSID=IMS1, NAME=ECHO

Display Status Information

Use the STATUS command to display the status of the TMA TCP gateway. The command displays XCF status with all IMS hosts, the number of messages processed, the number of XCF messages received, message control block usage, and service counts. The following status codes for IMS hosts can result:

- ACTIVE
- ERROR
- RESTART
- BID SENT
- UNKNOWN

Listing 2-26  STATUS Command Response Example

BEA2128I  XCF Status with IMS Client IMS71CR1 = Active
BEA2128I  XCF Status with IMS Client IMS71CR2 = Active
BEA2184I  XCF Messages Received = 4
BEA2183I  Messages Processed = 0
BEA2185I  MCBs: Allocated = 771 Assigned = 0
BEA2186I  Services: Remote = 7 Local = 6
CHAPTER 5

Monitoring Oracle TMA TCP for IMS

The following topics explain operating and monitoring the Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) product:

- Testing Connectivity with Remote Systems
- Operating Oracle TMA TCP for IMS
- The Oracle TMA TCP for IMS Message Log
- The Server Response Log File

Testing Connectivity with Remote Systems

When you start TMA TCP for IMS for the first time, you should do so in a controlled environment, using a small, simple configuration that allows you to methodically test the system to verify your installation and the configuration.

An appropriate test configuration would include the IMS gateway (one port) and one remote gateway. The SOURCE distribution library includes several sample IMS client and server transactions that can be used to test connectivity with a remote Oracle Tuxedo Mainframe Adapter gateway.

By specifying a minimum number (greater than 0) of outbound sessions for a remote gateway, you can cause outbound sessions to be automatically established with that gateway during initialization. This can help verify outbound connectivity without having to make use of test transactions.
Execute test client and server transactions from both sides of the configuration to verify bidirectional connectivity. If errors are encountered, use the diagnostic messages issued by both sides of the configuration (that is, the IMS gateway and the remote Oracle Tuxedo gateway) to identify and correct the problem.

For a description of the TMA TCP for IMS error messages, refer to the “Error and Informational Messages” section.

**Monitoring and Troubleshooting OTMA**

The following commands are a few of the available IMS commands that may assist you in monitoring or troubleshooting problems with the OTMA connection. For definitions and command syntax for these IMS commands, refer to the *IMS/ESA Operator’s Reference* or the *Open Transaction Manager Access Guide*.

- /SEC OTMA *security-level*
  
  Specify **FULL** for *security-level* to check security on all messages.
  
  Specify **PROFILE** for *security-level* to check security only when requested.
  
  Specify **NONE** for *security-level* to disable security checking.

- /DIS OTMA
  
  Displays the OTMA status.

- /STO OTMA
  
  Stops OTMA messaging.

- /STA OTMA
  
  Enables OTMA messaging.

- /DIS TMEMBER *name* TPIPE ALL
  
  Displays the status of the client.

- /STO TMEMBER *name* TPIPE ALL
  
  Stops an individual client from accessing a service.

- /STA TMEMBER *name* TPIPE ALL
  
  Enables an individual client and allows access to a service.
Operating Oracle TMA TCP for IMS

The TMA TCP for IMS product is started by submitting JCL. For sample JCL, refer to the “Sample JCL and User Exits” section.

During operation, TMA TCP for IMS writes all messages to the message log dataset (DDNAME=MSGLOG). The message log is primarily useful for historical purposes after TMA TCP for IMS has ended. The message log remains open for output during execution and recent messages cannot be viewed (using ISPF Browse, for example) until the dataset is closed at termination.

However, informational and error messages are also written to the z/OS console, where they can be viewed in real time by a system operator. When MSGLEVEL=4 is specified in the configuration file (the normal mode), all messages written to the message log are also displayed on the z/OS console.

Initialization

During initialization, the following activities occur:

- The runtime datasets (configuration file, message log, and server response log) are opened
- The configuration file is read and processed to establish the configuration
- The TMA TCP for IMS product establishes a TCP/IP Listener for each defined local gateway (port)
- If requested, outbound sessions are established with remote gateways
- The TMA TCP for IMS product puts up an outstanding write-to-operator with reply (WTOR) on the z/OS console by means of which operator commands can be entered

If any errors are detected during initialization, TMA TCP for IMS issues the appropriate error messages and initialization fails. If initialization fails, correct the indicated errors and restart TMA TCP for IMS.

Normal Operation

If initialization is successful, normal operation begins, during which the following activities occur:

- Requests for new inbound sessions, initiated by remote systems, are accepted.
New outbound sessions are requested and established with remote systems as required.

The TMA TCP for IMS product monitors the TCP/IP network for requests and responses from remote systems.

Inbound requests are received from remote systems through the TCP/IP network and are relayed to the appropriate IMS server transactions.

IMS is polled for requests and responses from IMS client and server transactions.

Outbound requests issued by IMS client transactions are relayed to the appropriate remote systems through the TCP/IP network.

The TMA TCP for IMS product monitors requests-in-progress to ensure that a response (if required) is received within a specified period of time.

Operator commands (entered through a reply to the outstanding command \texttt{WTOR}) are processed.

**Operator Commands**

During normal operation, TMA TCP for IMS puts up an outstanding WTOR (message ID \texttt{BEA2113I}) that can be used to enter commands. A command is entered by simply replying to the outstanding WTOR in the format in Listing 5-1.

**Listing 5-1  Syntax for Replying to WTOR**

\begin{verbatim}
R \textit{nn, command}
\end{verbatim}

In Listing 5-1, \textit{nn} is the z/OS-assigned reply ID and \textit{command} is the text of the command.

**Issuing Session-related Messages**

During normal operation, only messages for session-related events are issued. These include requests to establish a TCP/IP connection, requests to establish a session between two gateways, session disconnect, and session termination. This minimizes the amount of console traffic that occurs under normal operating conditions. Messages associated with TCP/IP connections include the 4-digit TCP/IP socket ID (immediately following the message ID).
Termination

Normal operation continues until a `SHUTDOWN` command is received. Under normal circumstances, TMA TCP for IMS is terminated by entering an operator `SHUTDOWN` command (through the outstanding command WTOR).

When a `SHUTDOWN` command is received and accepted, the following activities occur:

1. The TMA TCP for IMS gateway stops accepting requests for new inbound connections (from remote systems).
2. Active inbound and outbound sessions are terminated without permitting in progress transactions to complete.
3. The Message Log and Server Response Log datasets are closed.
4. The TMA TCP for IMS gateway terminates and returns control to z/OS.

**SHUTDOWN Command**

The `SHUTDOWN` command allows an operator to initiate termination of TMA TCP for IMS, and is entered in the format in Listing 5-2.

Listing 5-2  Syntax for Termination Initiation

```
R nn, SHUTDOWN
```

**A Client-Initiated Shutdown**

The TMA TCP for IMS product can be configured to allow shutdown to be initiated by a remote client request or a response to a remote client request. This may be useful if it is necessary to shut down TMA TCP for IMS from a remote system, rather than by operator command from an z/OS console.

Shutdown is requested by embedding a modify command into the user request data of an IMS server request, or the user response data of an IMS server response in the following format.

Format the command as shown in Listing 5-3. If the `jobname` specified is incorrect, TMA TCP for IMS simply ignores the command and processes the request or response in the usual way.
**Note:** To use this feature, the configuration file must specify the `CLIENTSHUTDOWN=YES` option on the SYSTEM statement (the default is **NO**). Otherwise, TMA TCP for IMS ignores a remote client request to initiate shutdown processing.

**Listing 5-3  Syntax for Client-Initiated Shutdown**

```
F jobname TERM=type
```

`jobname` is the z/OS jobname assigned to TMA TCP for IMS.

`TERM=type` is the method for shutting down the system. The values for `type` are as follows.

**STOP** is a normal shutdown. If `TERM=STOP` is specified, TMA TCP for IMS initiates normal shutdown processing, as if an operator had entered the `SHUTDOWN` command from an z/OS console.

**DUMP** is an abend with a dump. If `TERM=DUMP` is specified, TMA TCP for IMS issues a U3166 abend. If a `SYSUDUMP DD` statement is included in the JCL, a standard z/OS dump is produced.

### The Oracle TMA TCP for IMS Message Log

The TMA TCP for IMS product uses a message log dataset to record all messages issued. Normally, the message log (`DDNAME=MSGLOG`) is allocated to a disk dataset, but it can be allocated to another destination (such as *sysout*) if desired.

The message log is primarily intended for historical use; that is, as a means to review TMA TCP for IMS activity after-the-fact. The message log remains open for output during the entire execution of TMA TCP for IMS. Consequently, messages cannot ordinarily be viewed interactively (for example, using ISPF Browse) due to the dataset disposition and/or buffering of messages by z/OS.

The `MSGLEVEL` parameter of the `SYSTEM` statement in the configuration file controls the type of messages written to the log. Specifying a `MSGLEVEL` of 4 causes all informational and error messages to be recorded. Specifying a `MSGLEVEL` of 2 records only error messages. A `MSGLEVEL`
of 0 (zero) suppresses all logging. Under normal circumstances, a `MSGLEVEL` of 4 should be specified.

You may elect to have messages appended to the existing log (thus preserving messages from previous executions of TMA TCP for IMS) by coding `DISP=MOD` in the `MSGLOG DD` statement in the JCL for TMA TCP for IMS. Alternatively, coding `DISP=OLD` or `DISP=SHR` causes the log to be overwritten, discarding any messages from a previous execution of TMA TCP for IMS.

## Message Format

Each message written to the message log has the general format as in **Listing 5-4**.

**Listing 5-4**  Message Log Format

```
mm-dd-yyyy hh:mm:ss msgid ssss text
```

where:

- `mm-dd-yyyy` is the month of the year (1-12) in which the message was logged.
- `dd` is the day of the month (1-31) on which the message was logged.
- `yyyy` is the year that the message was logged.
- `hh:mm:ss` is the hour of the day during which the message was logged.
- `mm` is the minute of the hour during which the message was logged.
- `ss` is the second of the minute during which the message was logged.
- `msgid` is the message ID, in the form `BEAnnnnt`, where `nnnn` is a unique message number and `t` is the message type.
- `ssss` is the socket number for the TCP/IP connection with which the message is associated. If the message is not associated with a TCP/IP connection, this field is blank.
- `text` is the text of the message.
For additional information on messages issued by the gateway, refer to the “Error and Informational Messages” section.

**z/OS Console Messages**

The TMA TCP for IMS product also logs messages to the z/OS console so that operators can monitor the operation of TMA TCP for IMS and respond to any conditions requiring their attention.

In general, TMA TCP for IMS logs the same messages to the console that are recorded in the message log (that is, informational and error messages). However, because TMA TCP for IMS issues few informational messages during normal operation, console traffic is minimized.

**The Server Response Log File**

When TMA TCP for IMS receives a client request from a remote system, the request is inserted into the IMS message queue for delivery to the specified IMS server transaction. The IMS server transaction processes the request and inserts the response (if required) into the IMS message queue for delivery to TMA TCP for IMS. When the response is received, it is returned to the requesting remote system.

Each IMS server request and the associated response contains a unique request/response ID, consisting of the date and time that TMA TCP for IMS was started, and a serial number. The TMA TCP for IMS gateway uses the request/response ID to correlate each response with a pending server request.

It is possible that TMA TCP for IMS may receive a response from an IMS server transaction for which no pending request exists. This can occur under any of the following conditions:

- The TMA TCP for IMS gateway was restarted after the request was sent to IMS but before the response was received. In this case, the response is usually received when TMA TCP for IMS is subsequently restarted.

- The TCP/IP connection with the remote gateway was lost after the request was sent to IMS but before the response was received.

- The request was sent to IMS, but timed out and was aborted before the response was received from IMS.

- The IMS server transaction returned a response to a request that did not require a response.

When a response cannot be correlated with a pending request (that is, a pending request with a matching request/response ID cannot be found), TMA TCP for IMS writes the response to a
server response log file (DDNAME=SVRLOG). The information in the server response log file can be useful as part of a manual recovery procedure. Message BEA2033E is also issued, indicating that a server response has been logged and specifying the reason (“Server Request not found” or “No response was expected”).

Server responses are logged as two separate records: the BEA server request/response header (containing the unique request/response ID), and the response data.

Note: The dataset attributes of the server response Log File are fixed by architecture. Refer to the Oracle Tuxedo Mainframe Adapter for TCP Installation Guide for additional information.
CHAPTER 6

Programming Oracle TMA TCP for IMS

Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) allows user-written IMS application transactions to service requests received from remote systems (server requests) and to initiate requests for services provided by remote systems (client requests).

The following topics are programming considerations:

- Programming Your Application
- Programming Interface
- Returning a Response
- IMS Client Requests
- Error Handling
- How Oracle TMA TCP Gateway Translates Data

Programming Your Application

IMS client and server transactions are ordinary IMS message processing programs (MPPs) and with the use of OTMA, server transactions can also be FastPath programs. These programs may be written in any programming language supported by IMS. Because COBOL is the traditional language used for this purpose, the examples in this document are written in COBOL. However, these examples may be translated easily to other supported programming languages such as C.
Programming Interface

The TMA TCP for IMS product and user-written IMS client and server transactions communicate by exchanging standard IMS messages (using the IMS message queue directly or through OTMA).

IMS Server Requests

An IMS server transaction is one that services requests originated by a remote system. The request message is inserted directly into the IMS message queue or indirectly through OTMA as a single segment. The IMS server transaction retrieves the request message from the IMS message queue and processes the request as required.

Message Format

When running the TMA TCP gateway as an OTMA client, the request or response message is in the standard IMS message format. The following message is a sample when using OTMA.

Listing 6-1  Sample Message using OTMA

```
01 BEA-SERVER-REQUEST-RESPONSE-MESSAGE.
05 BEA-SERVER-HEADER
   10 LL             PIC 9(4) COMP VALUE 0.
   10 ZZ             PIC 9(4) COMP VALUE 0.
   10 TRAN-CODE      PIC X(8) VALUE SPACES.
   REQUEST-DATA.
```

Field Descriptions

The request messages contain the following fields.
Header Files and Copybooks

The INCLUDE distribution library contains the following header files and copybooks for use by IMS server transactions.

<table>
<thead>
<tr>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEATCPI</td>
<td>C Header file</td>
</tr>
<tr>
<td>SERVER</td>
<td>COBOL copybook</td>
</tr>
</tbody>
</table>

Returning a Response

If a response is required, the server transaction formats a client response message.

OTMA Client Gateway

The request message presented to the server transaction contains the name of the transaction pipe (tpipe) in the LTERM field of the I/O PCB. If the security feature is in use, the USERID and GROUPID fields of I/O PCB also contain relevant data.

If a response is required, the response message is inserted into the IMS message queue and routed back to the gateway by OTMA. The response message is inserted either as a single segment, or as multiple segments. The TMA TCP for IMS gateway can handle either format.
IMS Client Requests

An IMS client transaction is one that issues a request for a service provided by a remote system. You must install the DFSYPRX0 and DFSYDRU0 IMS user exits prior to using an IMS client transaction with the OTMA client gateway. Refer to the IBM document, *Open Transaction Manager Access Guide* for additional information on these user exits. Basic samples of these exits are in the “Sample JCL and User Exits” section.

Message Format

An TMA TCP for IMS client request or response message consists of three contiguous “sections”:

- BEA-defined request/response header
- User-defined context data
- User-defined request or response data

An TMA TCP for IMS client request or response has the following message format.

Listing 6-2  Client Request/Response Message Format

```
01 BEA-CLIENT-REQUEST-RESPONSE-MESSAGE.
   05 BEA-CLIENT-HEADER.
      10 LL PIC 9(04) COMP VALUE 0.
      10 ZZ PIC 9(04) COMP VALUE 0.
      10 TRAN-CODE PIC X(08) VALUE SPACES.
      10 FILL-CHAR PIC X VALUE SPACES.
      10 BEA-RESERVED-1 PIC X(03) VALUE LOW-VALUES.

Field Descriptions

The client request or response messages contain the following fields.

<table>
<thead>
<tr>
<th>Field</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>LL</td>
<td>The length of the complete request or response message (including this field).</td>
</tr>
<tr>
<td>ZZ</td>
<td>Reserved for use by IMS; normally zero.</td>
</tr>
<tr>
<td>TRAN-CODE</td>
<td>For a request message, the transaction code of the TMA TCP for IMS gateway. For a response message, the transaction code of the IMS client response transaction.</td>
</tr>
<tr>
<td>FILL-CHAR</td>
<td>Message fill character (space).</td>
</tr>
<tr>
<td>BEA-RESERVED-1</td>
<td>Reserved for use by TMA TCP for IMS. For a request message, this field must be initialized to binary zero (low values).</td>
</tr>
<tr>
<td>HEADER-LENGTH</td>
<td>The length of the BEA request/response header.</td>
</tr>
<tr>
<td>CONTEXT-LENGTH</td>
<td>The length of user context data, if any. If there is no context data, the length is set to zero.</td>
</tr>
<tr>
<td>DATA-LENGTH</td>
<td>The length of user request or response data, if any. If there is no request or response data, the length is set to zero.</td>
</tr>
<tr>
<td>MAX-RESPONSE-LENGTH</td>
<td>For a request, the maximum length of user response data that can be accepted. If the response data exceeds this length, it is truncated as necessary and appropriate return codes are set.</td>
</tr>
<tr>
<td>REQUEST-TYPE</td>
<td>For a request, indicates whether or not a response is required. If no response is required, TMA TCP for IMS schedules the specified response transaction as soon as the request has been sent to the remote system. Otherwise, the response transaction is scheduled when the required response has been received from the remote system.</td>
</tr>
</tbody>
</table>
RESPONSE-FORMAT
For a request, specifies the type or response message format desired.

If the single segment option is specified (the default), TMA TCP for IMS inserts the complete response message into the IMS message queue as a single message segment.

If the multi-segment option is requested, the response message is inserted into the IMS message queue in three separate segments.
   1. response header
   2. user context data
   3. user response data

ERROR-CODE
This field is set in the response message to indicate that an error occurred. If this field is zero, the request successfully processed. Otherwise, the error code indicates the nature of the error that occurred.

Error codes are documented in the “Error and Reason Codes” section.

REASON-CODE
For certain kinds of errors, this field may be set to provide additional information about the error. If this field is zero, no additional information is available.

Reason Codes are documented in the “Error and Reason Codes” section.

SERVICE-NAME
Specifies the name of the service (as locally defined to TMA TCP for IMS) that processes the request. Note that the local service name may not be the same as the remote system name.

RESPONSE-TRAN
The name of the transaction (IMS transaction code) that is to be scheduled to process the response to a request. A response transaction must be specified for all requests, even if an application-level response is not required.

ORIGIN-TERMINAL
The name of the terminal (IMS LTERM) associated with this request. For example, if the request is issued by a transaction processing a terminal message, this name is the name of the associated terminal.
## Header Files and Copybooks

The `INCLUDE` distribution library contains the following header files and copybooks for use by IMS client transactions.

<table>
<thead>
<tr>
<th>Member Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>BEATCPI</td>
<td>C Header file</td>
</tr>
<tr>
<td>SERVER</td>
<td>COBOL copybook</td>
</tr>
</tbody>
</table>

## Error Handling

Every client request must designate a response transaction (even though the request itself may not require an application-level response). The TMA TCP for IMS product schedules the response...
transaction if an error is encountered that prevents processing of the request (for example, the request may be improperly formatted, or the specified service may be unavailable).

The response transaction should always check the error code to determine whether the request was successfully processed.

**Types of Errors**

The TMA TCP for IMS product recognizes a wide variety of error conditions that may prevent successful processing of a client request. These are briefly summarized in the following sections.

**Invalid Request Format**

The TMA TCP for IMS gateway validates a client request prior to sending it to a remote system for processing. Types of validation errors include invalid service name, invalid length values, etc.

**Remote System Not Available**

The TMA TCP for IMS gateway may be unable to process a request because the required remote system is either inaccessible or currently busy processing other requests.

**Request Timeout**

The TMA TCP for IMS gateway monitors each request sent to a remote system for processing. If a response is required and is not received within a prescribed period of time, the request *times out*.

**Remote System Errors**

The request may fail due to an error that occurs on the remote system. For example, the requested service may detect an application-level error, a security authorization failure, or the remote gateway may be unable to invoke the requested service.

**Other Errors**

Although unlikely, it is possible that TMA TCP for IMS may be unable to process a request due to an internal or system error, such as a temporary storage shortage.

**How Oracle TMA TCP Gateway Translates Data**

When a client program on the remote Oracle Tuxedo system sends data to (or receives data from) a service routine on a different model of computer, TMA TCP Gateway automatically translates data as required. Translation involves changing the representation of intrinsic data types by changing attributes such as the following:
- Word length
- Byte order

**Oracle Tuxedo Buffer Types**

The following table contains definitions for buffer types.

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>STRING</td>
<td>A buffer of character data that is terminated by the first null character in the buffer. Typically these character string buffers undergo translation when sent to a system that is dissimilar from the sending system.</td>
</tr>
<tr>
<td>CARRAY</td>
<td>A CARRAY is a buffer of raw data that contains no terminating character. The data in the array undergoes no conversion or translation; it is sent from one system to another without modification. (A CARRAY is an exemplary buffer type for a graphics file.)</td>
</tr>
<tr>
<td>VIEW</td>
<td>A VIEW buffer is a collection of field definitions that can be treated as a single entity. It is comparable to a record layout in COBOL or a structure in C.</td>
</tr>
<tr>
<td>FML</td>
<td>Fielded manipulation language (FML) buffers are variable length, dynamic, self-describing buffers. Each field in the buffer has its own descriptive header. In the Oracle Tuxedo product, FML buffers can be tied closely to VIEW buffers so that conversion from one to the other is direct.</td>
</tr>
</tbody>
</table>

**Data Translation Rules**

The TMA TCP Gateway adheres to the following data translation rules:

- CARRAY fields are passed untranslated as sequences of bytes.
- STRING and CHAR fields undergo ASCII to EBCDIC translation (if needed).
- SHORT and LONG fields are translated to S9(4) COMP and S9(9) COMP, respectively.
- FLOAT and DOUBLE fields are translated to COMP-1 and COMP-2, respectively.
Note: The Oracle Tuxedo product provides a field type named `dec_t` that supports decimal values within `VIEWs`. The TMA TCP for IMS gateway translates these fields into machine independent representations of packed decimals. For example, `dec_t(m,n)` becomes `S9(2*m-(n+1))V9(n) COMP-3`. Therefore, a decimal field with a size of 8,5 corresponds to `S9(10)V9(5) COMP-3`.

The following table summarizes the rules for translating between C and IBM 370 data types.

<table>
<thead>
<tr>
<th>Remote Data Type</th>
<th>Description</th>
<th>View Field Type/Length</th>
</tr>
</thead>
<tbody>
<tr>
<td>PIC X(n)</td>
<td>Alphanumeric characters</td>
<td>string / n</td>
</tr>
<tr>
<td>PIC X</td>
<td>Single alphanumeric character</td>
<td>char</td>
</tr>
<tr>
<td>PIC X(n)</td>
<td>Raw bytes</td>
<td>carray / n</td>
</tr>
<tr>
<td>PIC 9</td>
<td>Single numeric byte</td>
<td>carray / 1</td>
</tr>
<tr>
<td>PIC S9(4) COMP</td>
<td>32-bit integer</td>
<td>short</td>
</tr>
<tr>
<td>PIC S9(9) COMP</td>
<td>64-bit integer</td>
<td>long</td>
</tr>
<tr>
<td>COMP-1</td>
<td>Single-precision floating point</td>
<td>float</td>
</tr>
<tr>
<td>COMP-2</td>
<td>Double-precision floating point</td>
<td>double</td>
</tr>
<tr>
<td>PIC S9((m+(n+1))/2)V9(n) COMP-3</td>
<td>Packed decimal</td>
<td>dec_t / m,n</td>
</tr>
</tbody>
</table>

Strings and Numeric Data: A Closer Look

This section provides the following information:

- Suggestions that help you develop `VIEW` definitions for input and output buffers and records
- Explanations of how TMA TCP Gateway treats string data and numeric data
Including NULL Characters in String Length Calculations

When you create `VIEW` definitions for input and output buffers that are used by IMS applications, do not specify extra characters for terminating NULL characters that are used in string fields.

For example, when a remote IMS application program expects 10 characters in an input record, specify 10 for that field, not 10 plus 1 (for the terminating NULL character).

**Note:** Although TMA TCP Gateway does not require strings to be NULL-terminated, it respects NULL termination. Therefore, when TMA TCP Gateway detects a NULL (zero) character within a string, it does not process any subsequent characters. To pass full 8-bit data that contains embedded NULL values, use a `CARRAY` type field or buffer.

The character set translations performed by TMA TCP Gateway are fully localizable, in accordance with the `X/Open XPG Portability Guides`. ASCII and EBCDIC translations are loadable from message files. The TMA TCP Gateway product contains default behaviors that should meet the requirements of most English-language applications. However, you may find it necessary to customize tables. For complete instructions, see *Oracle Tuxedo Mainframe Adapter for TCP Gateway User Guide*.

Converting Numeric Data

You can convert numeric data easily into different data types, provided that you have enough range in the intermediate and destination types to handle the maximum value you need to represent.

For example, you can convert an FML field of double into a packed decimal field on the remote target system by specifying an appropriate `dec_t` type `VIEW` element.

In addition, you can convert numeric values into strings (and the reverse). For example, while FML buffers do not directly support the `dec_t` type, you can place decimal values in string fields and map these to `dec_t` fields within `VIEW` definitions.
System Services Descriptions

Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) uses the following system services:

- TCP/IP for z/OS
- LE/370
- z/OS

TCP/IP for z/OS

The TMA TCP for IMS product makes use of the following TCP/IP for z/OS services by issuing the appropriate API calls.

<table>
<thead>
<tr>
<th>TCP/IP for z/OS Service</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>accept</td>
<td>Accept a TCP/IP connection request</td>
</tr>
<tr>
<td>bind</td>
<td>Bind a socket to an IP address and port</td>
</tr>
<tr>
<td>close</td>
<td>Close a socket and free associated resources</td>
</tr>
<tr>
<td>connect</td>
<td>Initiate a TCP/IP connection with a specified IP address and port</td>
</tr>
<tr>

Error and Informational Messages

All messages issued by Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) have an IBM-standard 8-character message ID beginning with the characters, “BEA”. Messages have the following general format: BEAnnnnt ssss text.

<table>
<thead>
<tr>
<th>Message Part</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>nnnn</td>
<td>A unique message number in the range 2000 - 2500.</td>
</tr>

<td>E=Error</td>
</tr>
<tr>
<td></td>
<td>W=Warning</td>
</tr>
<tr>
<td>ssss</td>
<td>The socket number identifying the TCP/IP connection with which the message is associated. If the message is not associated with a specific TCP/IP connection, this field is blank.</td>
</tr>
<tr>
<td>text</td>
<td>The actual text of the message.</td>
</tr>
</tbody>
</table>

Logical Machine IDs

A logical machine ID (LMID) is a symbolic name used to identify a Oracle Tuxedo Mainframe Adapter gateway. LMIDs are defined in the Oracle TMA TCP for IMS configuration file, and appear in selected messages issued by Oracle TMA TCP for IMS.
When used in a message to identify a gateway, the logical machine ID displays as follows:

LMID (logical-machine-id, type)

*logical-machine-id*

is the logical machine ID (1-16 characters)

*type*

is the type of gateway: L is the local gateway; R is a remote gateway

**Note:** The logical machine IDs are defined in the configuration file for Oracle TMA TCP for IMS.

The terms *local* and *remote*, as used in this document, are relative to the Oracle TMA TCP for IMS gateway. *Local* refers to the IMS gateway; *remote* refers to another Oracle Tuxedo Mainframe Adapter gateway with which the IMS gateway is communicating.

The following are examples of LMIDs used in messages issued by Oracle TMA TCP for IMS:

- LMID(OS3901,L) is a local gateway named “OS3901”
- LMID(TUXC9A,R) is a remote gateway named “TUXC9A”

**Messages Returned to the Remote Gateway**

Oracle TMA TCP for IMS returns the following messages to a remote gateway in conjunction with positive and negative responses to requests presented by a remote gateway:

- BEA2030E
- BEA2034E
- BEA2038I
- BEA2039E
- BEA2042I
- BEA2045I
- BEA2047E
- BEA2049E
- BEA2078E
These messages may also be recorded in the message log and displayed on the z/OS console. For a complete description of each of these messages, refer to the “Messages Written to the Oracle TMA TCP for IMS Message Log” section that follows.

### Messages Written to the Oracle TMA TCP for IMS Message Log

<table>
<thead>
<tr>
<th>BEA2000I</th>
<th>Description</th>
<th>Response</th>
</tr>
</thead>
</table>
| **jobname** BEA TMA vv.rr TCP For IMS has ended - RC = rc | This message is issued during termination just before Oracle TMA TCP for IMS returns to z/OS. 

*jobname* is the z/OS job name assigned to Oracle TMA TCP for IMS.

*vv* is the product version number.

*rr* is the product release number.

*rc* is a return code indicating the reason for termination. The most common return code is 24, indicating that termination occurred in response to a SHUTDOWN request. | Oracle TMA TCP for IMS normally terminates in response to a SHUTDOWN request, in which case the return code is 24 and no special response is required. If Oracle TMA TCP for IMS terminates with a return code other than 24, termination is the result of an abnormal condition. In that case, there should be other messages that provide additional information about the reason for the termination. |

Description: This message is issued when Oracle TMA TCP for IMS has successfully completed initialization and is ready to begin normal processing.

jobname is the z/OS job name assigned to Oracle TMA TCP for IMS.

vv is the product version number.

rr is the product release number.

Response: None required.

BEA2003I  BEA TMA vv.rr TCP For IMS is terminating (RSN=rc)

Description: This message is issued when Oracle TMA TCP for IMS begins the termination process (for example, in response to an operator SHUTDOWN command).

vv is the product version number.

rr is the product release number.

rc is a reason code indicating the reason for termination.

Response: Oracle TMA TCP for IMS normally terminates in response to a SHUTDOWN request, in which case the return code is 24 and no special response is required.

If Oracle TMA TCP for IMS terminates with a return code other than 24, termination is the result of an abnormal condition. In that case, there should be other messages that provide additional information about the reason for the termination.

BEA2004E  Invalid IMS Client Request: description, Error(error-code), Reason(reason-code)

Description: An IMS client transaction has issued a request that is invalid.

description is a text description of the error detected.

error-code is the error code. For a description of error codes issued by Oracle TMA TCP for IMS, refer to the “Error and Reason Codes” section.

reason-code is the reason code. For a description of reason codes issued by Oracle TMA TCP for IMS, refer to the “Error and Reason Codes” section.
**Response:** Identify and correct the indicated problem.

**BEA2005E**  
**IMS Client Request for Service** *(service)* **failed: Requested service not defined**

**Description:** The requested service is not defined to Oracle TMA TCP for IMS.

*service* is the specified service name.

**Response:** The specified service is not defined in the Oracle TMA TCP for IMS configuration file. Ensure that the correct local service name is being specified, and that the service is properly defined in the configuration file with the specified local service name.

**BEA2006E**  
**IMS Client Request for Service** *(service)* **failed: All outbound sessions busy**

**Description:** All available outbound sessions with remote systems offering the service are currently in use (and no additional sessions can be started due to session limits).

*service* is the specified service name.

**Response:** Retry the request later. Increase the maximum number of outbound sessions defined for remote systems that offer the specified service.

**BEA2007E**  
**Client Request routing error: Service** *(service-name)* **, RC** *(rc)*

**Description:** An internal error occurred while attempting to select a remote system and outbound session to process an IMS client request.

*service-name* is the specified service name.

*rc* is the return code returned by the GetServiceInfo() function.

**Response:** Report the error to the systems programmer responsible for Oracle TMA TCP for IMS.

**BEA2008E**  
**Operator command unrecognized - rejected**

**Description:** An operator command has been entered that is syntactically invalid.

**Response:** Correct and re-enter the command.

<td>BEA2017E</td>
<td>Unable to allocate Session Control Block for Listener</td>
<td>None required.</td>
</tr>
</tbody>
</table>
Oracle TMA TCP for IMS was unable to allocate storage for an internal control block used to manage a Listener session.

This is an abnormal condition indicating a severe storage shortage or corruption of the storage allocation control blocks. It may be necessary to terminate Oracle TMA TCP for IMS (preferably with a dump) to identify and correct the problem.

A Listener was successfully started for a local gateway and is ready to accept inbound TCP/IP connection requests from remote systems.

ssss is the socket ID assigned to the Listener by TCP/IP.

lmid is the logical machine ID of the local gateway.

ip-address is the IP address at which TCP/IP connection requests are accepted. If an asterisk (*) appears, connection requests are accepted through any available network interface.

port-number is the port number on which TCP/IP connection requests are accepted.

None required.

A TCP/IP connection request was received from a remote system for a local gateway.

ssss is the socket ID assigned to the connection by TCP/IP.

lmid is the logical machine ID of the local gateway receiving the request.

ip-address is the IP address of the remote system making the request.

host-name is the network name of the remote system making the request. TCP/IP obtains this information from a domain name server or from a local /etc/hosts file. If the name of the remote host cannot be determined, "Unknown" is displayed.

</tbody>
</table>
Response: This error can be caused by any of the following:

1. The configurations of the local and/or remote gateways may be incorrect or inconsistent with respect to the maximum message length allowed. The maximum message length of the local gateway is specified by the MAXMSGLEN parameter on the GATEWAY TYPE=LOCAL statement.

2. The remote gateway may not be properly configured to connect to an IMS gateway. In particular, the remote gateway may be configured incorrectly to connect to a CICS gateway.

3. Some other TCP/IP application (i.e., not a Oracle Tuxedo Mainframe Adapter gateway) may be attempting to connect to the IP address and port number used by Oracle TMA TCP for IMS. Check the configuration and verify that Oracle TMA TCP for IMS is not using an IP address and port number which are also being used by another TCP/IP application.

</tr>
</tbody>
</table>
**BEA2027E**  
**ssss Message length (length) is not valid**

**Description:** The local gateway received a gateway message whose overall length is invalid (the total length is less than the length of the message header).

*ssss* is the socket ID assigned to the connection by TCP/IP.

*length* is the length of the gateway message received.

**Action:** The session is terminated.

**Response:** Contact your Oracle TMA TCP for IMS system programmer.

**BEA2028E**  
**ssss IMS Client Request timed out: LMID(lmid,R), Service(service)**

**Description:** An IMS client request was sent to a remote system for processing, but no response was received within a specified period of time.

*ssss* is the socket ID assigned to the connection by TCP/IP.

*lmid* is the logical machine ID of the remote gateway.

*service* is the remote name of the service requested (i.e., the name of the service as defined on the remote system).

**Action:** Oracle TMA TCP for IMS aborts the request and schedules the specified IMS response transaction with the appropriate return codes.

**Response:** The remote system may be experiencing problems, or may be extremely busy. An adjustment to the time out value may resolve this problem.

**BEA2029E**  
**ssss Allocation failed for buffer (size = buffer-size)**

**Description:** Oracle TMA TCP for IMS is unable to allocate a buffer of the specified size for a gateway message.

*ssss* is the socket ID assigned to the connection by TCP/IP (this field is blank if there is no associated connection).

*buffer-size* is the size of the requested buffer.

**Action:** The session is terminated.
**Response:** Assuming a reasonable buffer size, this is an abnormal condition indicating a severe storage shortage or corruption of the storage allocation control blocks. It may be necessary to terminate Oracle TMA TCP for IMS (preferably with a dump) to identify and correct the problem.

<table>
<thead>
<tr>
<th>BEA2030E</th>
<th><strong>ssss IMS Server Request failed - Invalid IMS transaction code:</strong> Service(service-name)</th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS received an abnormal return from IMS (PCB Status Code = "A1") while attempting to insert a server request message into the IMS message queue.  
  
  *ssss* is the socket ID assigned to the connection by TCP/IP.  
  
  *service-name* is the name of the requested service (i.e., the IMS transaction code for the server transaction). |
| **Action:** | The request fails. This message is also returned to the remote gateway as part of a negative response to the request. |
| **Response:** | The requested service name must be the (correct) IMS transaction code for the server transaction that processes the request. Check the remote configuration and verify that a valid IMS transaction name is specified as the remote service name. |

<table>
<thead>
<tr>
<th>BEA2031I</th>
<th><strong>ssss Shutdown requested by client transaction:</strong> Type(type)</th>
</tr>
</thead>
</table>
| **Description:** | A client transaction requested a shutdown of the IMS gateway. Note that this request can be made either by a remote (e.g., Oracle TUXEDO) client or an IMS server transaction if CLIENTSHUTDOWN is set to Yes.  
  
  *ssss* is the socket ID assigned to the connection by TCP/IP.  
  
  *type* is the type of shutdown requested: STOP - Normal shutdown DUMP - User 3166 abend with dump |
<p>| <strong>Action:</strong> | Oracle TMA TCP for IMS initiates shutdown processing. |
| <strong>Response:</strong> | Assuming that this is a valid request, no response is required. |</p>
<table>
<thead>
<tr>
<th>BEA2032E</th>
<th><strong>ssss IMS Server Request (size=</strong> size <strong>) exceeds maximum supported IMS message length (</strong> max-length <strong>)</strong></th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS received a server request which is too large to be formatted into a single IMS message segment for insertion into the IMS message queue.  

**ssss** is the socket ID assigned to the connection by TCP/IP.  
**size** is the length of the request message received.  
**max-length** is the maximum supported length of an IMS message segment. |
| **Action:** | The request fails. |
| **Response:** | Server requests are limited by the maximum supported IMS message segment length. |

<table>
<thead>
<tr>
<th>BEA2033E</th>
<th><strong>Logging IMS Server Response: mmddyyyy.hhmmss.nnnnnn (reason)</strong></th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS is unable to correlate a response message returned by an IMS server transaction with a pending, active request. Each server request and response message is identified by a timestamp consisting of the date and time that Oracle TMA TCP for IMS was started and a unique serial number:  

**mm** month (1-12)  
**dd** day (1-31)  
**yyyy** year  
**hh** hour (0-23)  
**mm** minute (0-59)  
**ss** second (0-59)  
**nnnnnn** serial number  
**reason** specifies the reason that the response is being logged. |
| **Action:** | The response message is logged in the server response log dataset. |
Response: If the reason is "Server Request not found", one of the following occurred:

1. Oracle TMA TCP for IMS was restarted after the server request was sent to IMS but before the response was received. This message may be issued following a restart of Oracle TMA TCP for IMS if server requests were in progress at the time Oracle TMA TCP for IMS was terminated.

2. The TCP/IP connection with the remote gateway was lost after the server request was sent to IMS but before the response was received.

3. A server request timed out and was aborted (either by the local or the remote gateway) before the response was received from IMS.

Response: If the reason is "No response was expected", it indicates that an IMS server transaction issued a response to a request for which a response was not required. Correct the IMS server transaction. One other possible cause for this error is that Oracle TMA TCP for IMS was unable to identify an IMS client request and processed it as if it were an IMS server response. This can happen if an IMS client transaction improperly initializes the Oracle Client request header by failing to initialize the BEA-RESERVED1 field (BEA_Reserved1 in the C header file) to binary zero (low values).

<table>
<thead>
<tr>
<th>BEA2034E</th>
<th><strong>ssss Invalid or unsupported request received by LMID(lmid,L): Opcode(opcode)</strong></th>
</tr>
</thead>
<tbody>
<tr>
<td>Description:</td>
<td>Oracle TMA TCP for IMS received a gateway message from a remote gateway containing an invalid or unsupported request type.</td>
</tr>
</tbody>
</table>

ssss is the socket ID assigned to the connection by TCP/IP.

lmid is theological machine ID of the local gateway receiving the request.

opcode is a numeric value identifying the request type.

| Action: | The session is terminated. This message is also sent to the remote gateway as part of a negative response to the request. |
### BEA2035E

**Unable to add service service-name, maximum service count reached.**

**Description:** The maximum number of dynamically added services has been reached.

**Action:** The ADD SERVICE operator command is rejected.

**Response:** The service cannot be added dynamically. The Oracle TMA TCP for IMS gateway must be stopped and restarted before additional services can be added dynamically.

### BEA2036I

**ssss CONNECT request received by LMID(lmid,L)**

**Description:** Oracle TMA TCP for IMS received a CONNECT request from a remote gateway. A CONNECT request is issued to establish an inbound session with the local gateway.

- **ssss** is the socket ID assigned to the connection by TCP/IP.
- **lmid** is the logical machine ID of the local gateway receiving the request.

**Response:** None required.

### BEA2037I

**ssss CONNECT request accepted by LMID(lmid,L)**

**Description:** Oracle TMA TCP for IMS accepted a CONNECT request from a remote gateway. An inbound session has been established.

- **ssss** is the socket ID assigned to the connection by TCP/IP.
- **lmid** is the logical machine ID of the local gateway receiving the request.

**Response:** None required.

### BEA2038I

**Reserved for future use by Oracle TMA TCP for IMS.**

### BEA2039E

Response: None required.

**BEA2046I**  
**ssss COMMAND received by LMID(lmid,L)**

**Description:** Oracle TMA TCP for IMS has received a command from a remote gateway.

*ssss* is the socket ID assigned to the connection by TCP/IP.

*lmid* is the logical machine ID of the local gateway receiving the request.

Response: The COMMAND request is not currently supported by Oracle TMA TCP for IMS and should not be sent by a remote gateway. (See ID: BEA2047E).

**BEA2047E**  
**ssss Command rejected by LMID(lmid,L): Remote commands are not supported**

**Description:** Oracle TMA TCP for IMS does not currently support commands sent by remote gateways.

*ssss* is the socket ID assigned to the connection by TCP/IP.

*lmid* is the logical machine ID of the local gateway.

**Action:** Oracle TMA TCP for IMS ignores the request. This message is also returned to the remote gateway as part of a negative response to the COMMAND request.

**Response:** The remote gateway should not be sending commands. Check the configuration and version of the remote gateway to determine why this is occurring.
### BEA2048I  Allocating Buffer (size=n)

**Description:** An internal storage buffer was allocated.

**Action:** None.

**Response:** None required. This message is used only when MSGLEVEL is set to DEBUG(10).

### BEA2049E  ssss Protocol error detected by LMID(lmid,L) on Inbound Session: Request(request), State(state)

**Description:** Oracle TMA TCP for IMS received a request from a remote gateway, but the session is currently in a state which is inconsistent with the request.

- **sss:** is the socket ID assigned to the connection by TCP/IP.
- **lmid:** is the logical machine ID of the local gateway receiving the request.
- **request:** is the type of request received: CONNECT, DISCONNECT, etc.
- **state:** is a numeric value corresponding to the current state of the session, as viewed by Oracle TMA TCP for IMS.

**Action:** Oracle TMA TCP for IMS takes no specific action. However, subsequent errors (including additional protocol errors) can occur, which likely leads to termination of the session. This message is also returned to the remote gateway as part of a negative response to the request.

**Response:** This error can occur if two gateways become "out of sync" on a session with respect to their respective states. If this error occurs frequently or persistently, notify the systems programmer responsible for Oracle TMA TCP for IMS.

### BEA2050I  IMS Host hostname has been added.

**Description:** The ADD HOST operator command has completed successfully.

**Action:** None.

**Response:** None required.
### BEA2051E

**ssss Invalid or unsupported response received from LMID(lmid,R): Opcode(opcode)**

**Description:** Oracle TMA TCP for IMS received a response message from a remote gateway on an outbound session that cannot be identified (that is, the Opcode in the Oracle Tuxedo Mainframe Adapter message header is not valid).

- **ssss** is the socket ID assigned to the connection by TCP/IP.
- **lmid** is the logical machine ID of the remote gateway.
- **opcode** is the numeric value of the Opcode in the Message Header.

**Action:** The session is terminated.

**Response:** If this error occurs, notify the systems programmer responsible for Oracle TMA TCP for IMS.

### BEA2052I

**ssss Issuing CONNECT request for LMID(lmid,R)**

**Description:** Oracle TMA TCP for IMS is requesting an outbound session with a remote gateway.

- **ssss** is the socket ID assigned to the connection by TCP/IP.
- **lmid** is the logical machine ID of the remote gateway.

**Response:** None required.

### BEA2053E

**ssss CONNECT request rejected by LMID(lmid,R): GWErro(gwerror), GWMsg(gwmsg)**

**Description:** Oracle TMA TCP for IMS received a negative response to a CONNECT request to establish an outbound session with a remote gateway.

- **ssss** is the socket ID assigned to the connection by TCP/IP.
- **lmid** is the logical machine ID of the remote gateway.
- **gwerror** is the gateway error code returned by the remote gateway.
- **gwmsg** is the gateway error message returned by the remote gateway.

**Action:** The CONNECT request fails and the TCP/IP connection with the remote gateway is terminated.

| **Description:** | Oracle TMA TCP for IMS is sending a command to a remote gateway.  

*ssss* is the socket ID assigned to the connection by TCP/IP.  

*lmid* is the logical machine ID of the remote gateway. |
| **Response:** | None required. |

<table>
<thead>
<tr>
<th>BEA2062E</th>
<th>ssss COMMAND rejected by LMID(lmid,R): GWError(gwerror), GWMsg(gwmsg)</th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS received a negative response to a command sent to a remote gateway.  

*ssss* is the socket ID assigned to the connection by TCP/IP.  

*lmid* is the logical machine ID of the remote gateway.  

gwerror is the gateway error code returned by the remote gateway.  

gwmsg is the gateway error message returned by the remote gateway. |
| **Action:** | The session is terminated. |
| **Response:** | Refer to the documentation for the remote gateway for information about the reason for the error. Also, consult the remote gateway's log file for additional information. |
### BEA2063E  
**sss Unable to allocate buffer for IMS Client Request (size=buffer-size)**

**Description:**
Oracle TMA TCP for IMS was unable to allocate storage for an internal buffer required to process an IMS client request.  
*sss* is the socket ID assigned to the connection by TCP/IP.  
*buffer-size* is the size of the required buffer.

**Response:**
This is an abnormal condition indicating a severe storage shortage or corruption of the storage allocation control blocks. It may be necessary to terminate Oracle TMA TCP for IMS (preferably with a dump) to identify and correct the problem.

### BEA2064E  
**sss IMS Client Request sent to LMID(lmid,R) failed: GWError(gwerror), GWMsg(gwmsg)**

**Description:**
Oracle TMA TCP for IMS received a negative response to an IMS client request sent to a remote gateway.  
*sss* is the socket ID assigned to the connection by TCP/IP.  
*lmid* is the logical machine ID of the remote gateway.  
*gwerror* is the gateway error code returned by the remote gateway.  
*gwmsg* is the gateway error message returned by the remote gateway.

**Action:**
The specified IMS client response transaction is scheduled with the appropriate return codes.

**Response:**
Refer to the documentation for the remote gateway for information about the reason for the error. Also, consult the remote gateway's log file for additional information.
<table>
<thead>
<tr>
<th>BEA2065E</th>
<th><strong>ssss State error on inout Session: LMID(lmid,type), Request(request), State(state)</strong></th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS attempted to execute an operation against a session which is not currently in a state consistent with the requested operation.  
`ssss` is the socket ID assigned to the connection by TCP/IP.  
Inout session type: inbound or outbound.  
`lmid` is the logical machine ID of the gateway.  
`type` is the gateway type: L (local) or R (remote).  
`request` is the request type: CONNECT, DISCONNECT, etc.  
`state` describes the current state of the session. |
| **Action:** | The session is terminated. |
| **Response:** | Refer this error to the systems programmer responsible for Oracle TMA TCP for IMS. |

<table>
<thead>
<tr>
<th>BEA2066E</th>
<th><strong>Unable to allocate Session Control Block for Outbound Session</strong></th>

| **Description:** | Oracle TMA TCP for IMS was notified that a TCP/IP connection with a remote system was closed by the session partner.  
`ssss` is the socket ID assigned to the connection by TCP/IP. |
<p>| <strong>Action:</strong> | The session is terminated. |
| <strong>Response:</strong> | None required. |</p>
<table>
<thead>
<tr>
<th>BEA2068I</th>
<th>ssss TCP/IP connection reset</th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS was notified that a connection with a remote system was reset. A reset occurs when the connection is hard-closed (i.e., closed without first issuing a TCP/IP shutdown request).

*ssss* is the socket ID assigned to the connection by TCP/IP. |
| **Action:** | The session is terminated. |
| **Response:** | None required. |

<table>
<thead>
<tr>
<th>BEA2069E</th>
<th>ssss Length error on socket read</th>
</tr>
</thead>
</table>
| **Description:** | TCP/IP reported an illogical length read from a connection; for example, the length reported was greater than the actual length requested.

*ssss* is the socket ID assigned to the connection by TCP/IP. |
| **Action:** | The session is terminated. |
| **Response:** | This error may indicate a problem with TCP/IP for z/OS. |

<table>
<thead>
<tr>
<th>BEA2070E</th>
<th>ssss Abnormal return from TCP/IP API request: fcn(<em>function</em>), rc(<em>rc</em>), errno(<em>errno</em>)</th>
</tr>
</thead>
</table>
| **Description:** | Oracle TMA TCP for IMS received an abnormal return from a TCP/IP socket operation.

*ssss* is the socket ID assigned to the connection by TCP/IP. *function* is the TCP/IP API function called: read, write, etc. *rc* is the TCP/IP return code (usually -1). *errno* is the TCP/IP errno value returned. |
| **Action:** | The session is terminated. |
| **Response:** | Consult the IBM TCP/IP for z/OS documentation for a description of possible errno values and their meanings. |
### BEA2071I  ssis Session termination in progress (RSN=reason)

**Description:** Oracle TMA TCP for IMS has initiated termination of a session with a remote gateway.

sssis the socket ID assigned to the connection by TCP/IP.

reason is a numeric value indicating the reason the session is being terminated. Some typical reason codes are: 12 A socket error occurred.

16 The connection was closed by the session partner.
20 An internal gateway request (such as CONNECT) timed out.
24 BEA TMA TCP for IMS is terminating in response to a SHUTDOWN request.
28 Session limit exceeded (a new session cannot be started).
60 A session protocol error occurred.

**Response:** This action typically occurs as the result of a session-related error condition (identified by the reason code), or in conjunction with a SHUTDOWN request. If a reason code other than one of those previously listed is given, the error should be reported to the systems programmer responsible for Oracle TMA TCP for IMS.

### BEA2072I  ssis TCP/IP connection closed

**Description:** As part of the session termination process, Oracle TMA TCP for IMS successfully closed the TCP/IP connection. ssisis the socket ID assigned to the connection by TCP/IP.

**Response:** None required.

### BEA2073I  ssis Session termination complete

**Description:** A session was successfully terminated by Oracle TMA TCP for IMS.

ssisis the socket ID assigned to the connection by TCP/IP.

**Response:** None required.

### BEA2074E  Error writing to Server Response Log File

**Description:** Oracle TMA TCP for IMS received an abnormal return attempting to write a record to the server response log file.
### Response:
Check the server response log file to ensure that it is allocated with the correct dataset attributes, allocated using the correct DDNAME, and is not full or experiencing I/O errors.

### BEA2075E  Open failed for server response log file: DDNAME(ddname)

**Description:**
Oracle TMA TCP for IMS is not able to open the Server Response Log File. 
*ddname* is the DDNAME used by Oracle TMA TCP for IMS to open the dataset.

**Action:**
Initialization fails and Oracle TMA TCP for IMS terminates.

**Response:**
Check the server response log file to ensure that it is allocated with the correct dataset attributes and is allocated using the correct DDNAME as shown.

### BEA2076E  ssss IMS Server Request received with previous request pending (timeout assumed)

**Description:**
Oracle TMA TCP for IMS received an IMS server request from a remote gateway, but a prior request is still pending (i.e., currently being serviced by IMS). 
*ssss* is the socket ID assigned to the connection by TCP/IP.

**Action:**
Oracle TMA TCP assumes that the remote gateway timed out while waiting for a response to the previous request. Therefore, the previous request (currently being serviced by IMS) is aborted (discarded) and Oracle TMA TCP for IMS begins processing the new request.

**Response:**
This error can occur when a remote gateway cancels a previously sent request (i.e., due to timeout) and immediately sends another request.

### BEA2077E  ssss Pending IMS Server Request for Service(service) aborted

**Description:**
Oracle TMA TCP for IMS aborted processing of the current server request. 
*ssss* is the socket ID assigned to the connection by TCP/IP. 
*service* is the name of the IMS server transaction scheduled to process the current request.
<table>
<thead>
<tr>
<th>Action</th>
<th>The current request is discarded and the session is ready to accept a new request.</th>
</tr>
</thead>
<tbody>
<tr>
<td>Response</td>
<td>None required.</td>
</tr>
</tbody>
</table>

### BEA2078E  ssxx IMS Server Request timed out: Service(service)

**Description:** An IMS server request requiring a response was being processed by IMS, but no response was received within a specified period of time.

- *ssxx* is the socket ID assigned to the connection by TCP/IP.
- *service* is the name of the IMS server transaction scheduled to process the request.

**Action:** The request is aborted. This message is also returned to the remote gateway as part of a negative response to the request.

**Response:** Check the IMS server transaction (service) that processes the request to make sure that it is not stopped or has an unusually high backlog.

### BEA2079E  Client Response failed: Sense Code=**sc** Reason=**reason**

**Description:** A response to a client request was rejected by OTMA.

- *sc* is the sense code.
- *reason* is a numeric value indicating the reason for the response failure.

**Action:** The response is logged.

**Response:** Consult the IMS Open Transaction Manager Access Guide to determine the cause of the error.

### BEA2080E  Malloc failed for parse work area

**Description:** Oracle TMA TCP for IMS was unable to allocate storage for an internal work area used to parse the configuration file.

**Action:** Initialization fails and Oracle TMA TCP for IMS terminates.

**Response:** Report this error to the systems programmer responsible for Oracle TMA TCP for IMS.

Check the file name and re-enter the command. Contact the system programmer responsible for Oracle TMA TCP for IMS to check for availability of DASD resources.

**BEA2132I**  
Configuration checkpoint complete

- **Description:** Normal response to a CHKPT CONFIG operator command.
- **Action:** None
- **Response:** None required.

The file name entered with the INFILE operator command could not be opened.

**BEA2133E**  
Error opening file *filename*

- **Description:** The INFILE command processing is aborted.
- **Response:** Check the file name and retry if it is correct. Resolve any contention issues with other processes needing exclusive access to the file.

The LMID for a gateway definition is not a unique name. No two gateways can share the same LMID.

**BEA2134E**  
Host LMID not Unique

- **Description:** If the error occurs during Oracle TMA TCP for IMS startup, initialization aborts. If the error occurs while dynamically adding a gateway, the gateway is not added.
- **Response:** Change the LMID to a unique name.

This is the normal response to an ADD GATEWAY operator command.

**BEA2135I**  
Gateway *lmid* has been added

- **Description:** *lmid* is the logical machine ID specified for the ADD GATEWAY command.
- **Action:** None
- **Response:** None required.

### BEA2152I  Message rejected by Lmid(Lmid, L) on Inbound Session - Gateway Stopped

**Description:** A new request was received by a gateway in a stopping condition.

- lmid is the logical machine ID specified for the MOD SERVICE command.

**Action:** A system error response is sent back to the requestor. TMA will then abend.

**Response:** Verify the OTMA system parameters, correct any errors, and retry. If the error persists, refer this error to the systems programmer responsible for Oracle TMA TCP for IMS.

### BEA2153I  Service service-name for Lmid lmid has been started

**Description:** This is the normal response for a START SERVICE operator command.

- service-name is the name of the requested service (i.e., the IMS transaction code for the server transaction).
- lmid is the logical machine ID specified for the gateway.

**Action:** None

**Response:** None required.

### BEA2154I  Service service-name for Lmid lmid is being stopped

**Description:** This is the initial response to a STOP SERVICE operator command.

- service-name is the name of the requested service (i.e., the IMS transaction code for the server transaction).
- lmid is the logical machine ID specified for the gateway.

**Action:** All outstanding requests are allowed to continue processing unless the IMMED=YES option was specified.

**Response:** None required.

### BEA2155I  Service service-name for Lmid lmid has been stopped
| **Description** | This is the normal response to a STOP SERVICE operator command.  
 service-name is the name of the requested service (i.e., the IMS transaction code for the server transaction).  
 lmid is the logical machine ID specified for the gateway. |
| **Action** | None |
| **Response** | None required. |

**BEA2156I**  
**Response received for previously timed out request**  
**Description**: A response was received for a request for which timeout processing had already initiated.  
**Action**: None  
**Response**: None required.

**BEA2157I**  
**Hostname maximum length (256) exceeded.**  
**Description**: The hostname string used in the HOSTADDR gateway parameter is too long.  
**Action**: If the error occurs during Oracle TMA TCP for IMS startup, initialization aborts. If the error occurs while dynamically adding a gateway, the gateway is not added.  
**Response**: Contact your network administrator to provide a new hostname less than 256 characters, or use the IP address in dotted decimal format.

**BEA2158I**  
**Maximum number of hostnames (256) exceeded.**  
**Description**: More than 256 gateways were defined in the configuration using the hostname option of the HOSTADDR parameter.  
**Action**: If the error occurs during Oracle TMA TCP for IMS startup, initialization aborts. If the error occurs while dynamically adding a gateway, the gateway is not added.  
**Response**: Refer this error to the systems programmer responsible for Oracle TMA TCP for IMS.

Example Configuration Files

This document illustrates several Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) configurations, from a simple, server-only configuration to a fully-functional, bidirectional configuration. Member CONFIGOT in the CONTROL distribution library contain a sample configuration file, which you can use as a starting point for developing a configuration file tailored to your environment.

Listing C-1 is a sample configuration for running TMA TCP for IMS. Every configuration file must contain one SYSTEM statement that is the first statement in the file. The SYSTEM statement contains the OTMA-specific parameters including the definition for security. In this example, FASTPATH is not enabled.

Listing C-1  Sample OTMA Configuration

```
#---------------------------------------------------------------------#
#                                                                  #
#       BEA TMA TCP FOR IMS CONFIGURATION FILE                      #

Sample JCL and User Exits

Use the following sample JCL and user exits to run the BEA Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) product:

- **JCL for Executing TMA TCP for IMS**
- **Sample User Exits Enabling IMS Clients to Communicate to Remote Services**
  - OTMA Prerouting User Exit (DFSYPRX0)
  - OTMA Destination Resolution User Exit (DFSYDRU0)

**JCL for Executing TMA TCP for IMS**

The JCL distribution library contains sample JCL for executing the TMA TCP for IMS product. You must modify the sample JCL to conform to the conventions and standards for your installation. Modifications include the following:

- Adding an appropriate job card
- Ensuring all concatenations of the JOBLIB/STEPLIB are APF-authorized, when using it for executing the TMA TCP for IMS
- Changing the names of IBM product datasets (IMS, TCP/IP for z/OS, and LE/370) to match those used by your installation
- Changing the names of TMA TCP for IMS datasets to match those used by your installation
- Changing the names of certain program modules (for example, the linkage editor), if necessary, to match those used by your installation

**Executing TMA TCP for IMS**

Listing D-1 is sample JCL for executing as an OTMA client. Use the following JCL only as a reference for modifying the standard OTMA JCL for use with the TMA TCP for IMS product.

**Listing D-1  Sample Run JCL**

```
//JOBNAME  JOB    ETC.
//***************************************************************
//*  BRING UP BEA TMA TCP FOR IMS/OTMA                      *
//***************************************************************
//STEP1    EXEC PGM=BEATCPI,REGION=0M,TIME=1440
//STEPLIB  DD   DSN=hlq1.hlq2,DISP=SHR
//* Place the name of the authorized library in the STEPLIB DD above
//SYSTCPD  DD   DISP=SHR,DSN=TCPIP.DATA
//MSGLOG   DD   DISP=SHR,DSN=BEATCPI.MSGLOG
//MSGCAT   DD   DISP=SHR,DSN=BEATCPI.MSGCAT
//SVRLOG   DD   DISP=SHR,DSN=BEATCPI.SVRLOG
//CONFIG   DD   DISP=SHR,DSN=hlq1.hlq2.JCL(CONFIG)
//* Place the name of the Config file in the CONFIG DD above
//SYSPRINT DD   SYSOUT=*  
//SYSUDUMP DD   SYSOUT=*  
```

**Sample User Exits Enabling IMS Clients to Communicate to Remote Services**

To enable IMS clients to communicate to remote services through OTMA, you must install both the `DFSYPRX0` and `DFSYDRU0` IBM user exits available in IMS. Customize the exits to recognize specific transactions as well as the Tuxedo Mainframe Adapter OTMA client name as defined in the configuration file. For more information about setting up the configuration file, refer to the “Configuring Oracle TMA TCP for IMS” section. Refer to the IBM document *Open Transaction Manager Access Guide* for additional information on the IBM user exits.
OTMA Prerouting User Exit (DFSYPRX0)

Listing D-2 is the sample IBM OTMA prerouting user exit which can be found in the dataset BEATCPI source. The IBM DFSYPRX0 user exit enables IMS to search for a destination for an application request. In the following sample, the lines in bold are modifications that you must make to the IBM DFSYPRX0 user exit.

Listing D-2  OTMA Pre-routing Sample User Exit (DFSYPRX0)

OTMA Destination Resolution User Exit (DFSYDRU0)

Listing D-4 is the sample IBM OTMA destination resolution user exit. The IBM DFSYDRU0 user exit enables IMS to determine whether the destination is an OTMA client, a non-OTMA LTERM, a different OTMA client, or an invalid destination. In the following sample, the lines in bold are modifications that you must make to the IBM DFSYDRU0 user exit.

Listing D-4  OTMA Destination Resolution User Exit (DFSYDRU0)

*
END
```
Sample IMS Client and Server Transactions

Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) client and server transactions are ordinary IMS MPP transactions, and when running the Oracle TMA TCP for IMS gateway as an OTMA client, FastPath transactions as well. Transactions can be written in any application programming language supported by IMS. Source code for the sample transactions in this document can be found in the Oracle TMA TCP for IMS source distribution library. The following sample transactions are provided in this document:

- IMS Server Transaction
- IMS Client Transactions

IMS Server Transaction

An IMS server transaction offers a specified service and processes client requests for that service. A server request takes place according to the following sequence of events.

1. A client transaction running on a remote system makes a request for a service offered by the IMS gateway. The remote gateway forwards the request to the IMS gateway, which formats and inserts a server request message indirectly through OTMA. The server request message is destined for the IMS server transaction that offers the service.

2. IMS schedules the specified server transaction, which retrieves the server request message from the IMS message queue and performs whatever processing is appropriate. If a response is required, the server transaction formats a server response message and inserts it into the IMS message queue destined for the Oracle TMA TCP for IMS server response transaction.
3. Oracle TMA TCP for IMS retrieves the server response message from the IMS message queue or the OTMA interface and returns the response to the remote system making the request.

**BEASVR01 - A Sample IMS Server Transaction**

Listing E-1 is a simple *echo transaction*; that is, it simply returns a response consisting of whatever request data it received.

**Listing E-1  Sample IMS Server Transaction**

Notes

1. The format of the Oracle TMA TCP for IMS server request/response message header is supplied by a COBOL copybook, `SERVER`. The equivalent C language header is provided by the `BEATCPI.H` header file. Both are available in the Oracle TMA TCP for IMS `INCLUDE` distribution library.

2. A `GU` (Get Unique) call is issued to retrieve the request message from the IMS message queue. A server request message is always formatted as a single message segment, so a `GN` (Get Next) call is not strictly required.

3. The `USER-DATA` (user-defined request data) is simply copied from the request message to the response message.

4. The `TRAN-CODE` in the response message is set to that of the Oracle TMA TCP for IMS (in this example, `BEAGW="BEATCPI"`; the name may be different in your installation).

5. An `ISRT` (Insert) call is issued to insert the message into the IMS message queue, returning the response to Oracle TMA TCP for IMS.

6. In cases where no response is required, the server transaction simply performs any processing required by the request and returns to IMS (without sending a response message to Oracle TMA TCP for IMS).

IMS Client Transactions

An IMS client transaction is one that issues a request for a specified remote service made available through Oracle TMA TCP for IMS. IMS client requests (unlike server requests) are processed in two distinct “phases”: a request phase, followed by a response phase. The request and response must be processed by two separate transaction executions (for example, T1 and T2).

Request Phase

A client request takes place according to the following scenario.

1. The request transaction, T1, issues a request for a service provided by a remote gateway by inserting a `client request message` into the IMS message queue. The client request message is destined for TMA TCP for IMS, and must specify the name (transaction code) of a response transaction (T2).

2. The TMA TCP for IMS gateway retrieves the client request message and forwards the request to a remote system which offers the requested service.
Response Phase

A client response takes place according to the following scenario.

1. When the response (if required) is received, a client response message is formatted and inserted directly into the IMS message queue. If running the OTMA client, the response is placed into the IMS message queue indirectly through the OTMA interface. The client response message is destined for the specified response transaction (T2).

2. The response transaction is scheduled by IMS and retrieves the client response message from the IMS message queue. The client response message contains sufficient information to enable the response transaction to correlate the response with the original request.

BEACRQ01 - A Sample IMS Client Request Transaction

The following sample IMS client request transaction makes a request for a service called TOUPPER, provided by a remote system. The TOUPPER service returns a response consisting of the request data translated to uppercase.

Notes

1. Although not used in the previous example, the format of the TMA TCP for IMS client request/response message header is supplied by a COBOL copybook, CLIENT. The equivalent C language header is provided by the BEATCPI.H header file. Both are available in the TMA TCP for IMS INCLUDE distribution library.

2. A GU (Get Unique) call is issued to retrieve the terminal input message from the IMS message queue.

3. The client request header is initialized as follows:
   - CRR-TRANCODE is set to the transaction code of the TMA TCP for IMS gateway (in this example, “BEATCPI”; the name may be different in your installation).
   - BEA-RESERVED-1 must be initialized to binary zero.
   - CRR-HEADER-LEN is set to the length of the client request header (96 bytes).
   - CRR-REQUEST-TYPE is set to 1, specifying that a response is required.
   - CRR-RESPONSE-FORMAT is set to 0, specifying that the response is to be returned as a single message segment.
   - CRR-ORIGIN-TERMINAL is set to the name of the requesting terminal (LTERM), obtained from the IOPCB.
   - CRR-SERVICE-NAME is set to the name of the service being requested (“TOUPPER”). This name must be the name of the service as locally defined to TMA TCP for IMS. This name may (or may not) be the same as the name of the service as defined on the remote system which offers the service.
   - CRR-RESPONSE-TRAN is set to the name of the designated response transaction (“BEACRP01”).
   - CRR-REQUEST-DATA-LEN is set to the length of user-defined request data being sent.
– CRR-MAX-RESPONSE-LEN is set to the maximum amount of response data that can be accommodated.
– BEA-RESERVED-2 must be initialized to binary zero.

4. Context data is optional and can be any data desired. Typically, context data is used by the response transaction to correlate the response with the original request.
– CRR-CONTEXT-DATA-LEN is set to the length of any user-defined context data included.

5. The length of the message segment (LL) is set to the overall length of the client request message (header + context data + request data).

6. A CHNG (Change) call is issued to set the destination to the transaction code of the TMA TCP for IMS gateway (in this example, “BEATCPI”; the name may be different in your installation).

7. An ISRT (Insert) call is issued to insert the client request message into the IMS message queue. Although the client request message is formatted as a single message segment in this example, the client request message may be formatted as multiple message segments, if desired.

8. A PURG call is issued to signal that the message is complete; for example, there are no additional message segments.

9. The requesting transaction does not wait on the response. Rather, the specified response transaction is scheduled by TMA TCP for IMS when processing of the request completes.

**BEACRP01 - A Sample IMS Client Response Transaction**

The following sample IMS client response transaction processes the response from a request for a service called **TOUPPER**, provided by a remote system. The **TOUPPER** service returns a response consisting of the request data translated to uppercase.

Notes

1. Although not used in the previous example, the format of the TMA TCP for IMS client request/response message header is supplied by a COBOL copybook, CLIENT. The equivalent C language header is provided by the BEATCPI.H header file. Both are available in the TMA TCP for IMS INCLUDE distribution library.

2. A GU (Get Unique) call is issued to retrieve the client response message from the IMS message queue.

3. CRR-RESPONSE-FORMAT indicates the response format: single segment or multiple-segment, as specified in the original request. If multi-segment response format is specified, the response message consists of three segments: response header, context data, and response data.

4. CRR-ERROR-CODE indicates whether or not an error occurred. If this field is zero, it indicates that the request was successfully processed. Otherwise, an error occurred and the error code identifies the type of error. The error code should always be checked before processing a response.

5. CRR-REASON-CODE may provide additional information when an error is indicated. A value of zero indicates that no additional information is available.

6. Context data, if present, is preserved from the original request message. Typically, the context data is used by the response transaction to correlate the response with the original request.

7. CRR-RESPONSE-DATA-LEN contains the length of any response data returned. However, if a truncation error occurred, this field contains the actual (pretruncated) length of the response data. The amount of response data returned is truncated to the length specified by CRR-MAX-RESPONSE-LEN.
8. A response indicating success or failure (based on the error and reason codes) is written to the original (requesting) terminal, using the LTERM preserved in CRR-ORIGIN-TERMINAL. Note that a modifiable, alternate PCB must be used for this purpose.

**BEACRR01 - A Sample IMS Client Request/Response Transaction**

If desired, the functionality of the IMS client request and response transactions can be combined into a single application transaction. However, logic must be added to perform the appropriate (request or response) processing based upon the dynamic execution context.

**Listing E-4 Sample IMS Request/Response Transaction**

The equivalent C language header is provided by the BEATCPI.H header file. Both are available in the TMA TCP for IMS INCLUDE distribution library.

2. The actual request processing is otherwise identical to that performed by BEACRQ01.

3. The actual response processing is otherwise identical to that performed by BEACRP01.
Error and Reason Codes

The Oracle Tuxedo Mainframe Adapter for TCP (IMS) (hereafter referenced as TMA TCP for IMS) client response message header contains error and reason codes used to return error information to an IMS client. When an error occurs while processing an IMS client request, the error code is set to a unique, nonzero value that indicates the type of error that occurred. Depending on the particular error, the reason code may also contain a value that provides additional information about the error.

<table>
<thead>
<tr>
<th>Error Code (Decimal Values)</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>0</td>
<td>Normal Return</td>
</tr>
<tr>
<td></td>
<td>The request completed successfully (no errors occurred).</td>
</tr>
<tr>
<td>4</td>
<td>Response Data Truncated</td>
</tr>
<tr>
<td></td>
<td>The user response data was truncated because it exceeded the maximum response length specified in the request. When this error occurs, the user response data is truncated to the maximum response length specified, but the actual length of the user response data (before truncation) is returned in the data length field.</td>
</tr>
<tr>
<td>8</td>
<td>Remote System Unavailable</td>
</tr>
<tr>
<td></td>
<td>The TMA TCP for IMS gateway cannot establish a session with the remote gateway required to service the request.</td>
</tr>
<tr>
<td>Error Code (Decimal Values)</td>
<td>Description</td>
</tr>
<tr>
<td>-----------------------------</td>
<td>--------------------------------------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| 12                          | **Remote System Busy**  
All existing sessions with the required remote gateway are busy and TMA TCP for IMS cannot establish a new session (due to session limits). |
| 16                          | **Request Timed Out**  
A required response was not received from the remote host within the specified time limit. This may indicate a connectivity problem or a problem with the remote system. |
| 20                          | **Service Not Defined**  
The requested service name is not defined to TMA TCP for IMS. This error can also occur if the requested service name is currently out of service. |
| 24                          | **Internal Error**  
An internal error occurred and TMA TCP for IMS could not allocate storage required to process the request. |
| 28                          | **Invalid Request**  
An error was detected while validating the request. When this error occurs, the reason code indicates the specific reason for the error.  
0=No additional information is available for this error.  
4=The request header length is not valid.  
8=The combined header length, context length, and data length exceed the length of the request message (LL).  
12=The specified request type is not valid.  
16=A response transaction is not specified (that is, the response transaction field is spaces or binary zero).  
20=The context length is not valid. The length of user context data cannot be greater than 32,767 bytes.  
24=The data length is not valid. The length of user request data cannot be greater than 32,767 bytes.  
28=The maximum response length is not valid. The maximum length of user response data cannot be greater than 32,767 bytes.  
32=A service name is not specified (that is, the service name field is spaces or binary zero).  
36=The requested service name is not defined to TMA TCP for IMS. |

</table>
Glossary

A

account ID
A 1-8 character name that is exchanged between Oracle Tuxedo Mainframe Adapter gateways as part of an authentication mechanism during CONNECT processing.

alternate PCB
Program Control Block that allows an IMS transaction to write output messages to a destination other than that from which input was received.

API
See application programming interface.

application programming interface (API)
A set of well-defined programming interfaces (entry points, calling parameters, and return values) by which one software program utilizes the services of another.

B
(No terms begin with the letter “B.”)

C

CHKP (Checkpoint)
An IMS API call that commits the changes a program has made to a database and establishes restart places within a program.

CHNG (Change)
An IMS API call that changes (sets) the destination associated with a program control block (PCB). Subsequent messages inserted into the IMS message queue using the PCB are directed to the specified destination.
CICS

See Customer Information Control System.

client

A software program that makes a request for a service in a client/server architecture.

client request

A request by an IMS client request transaction to Oracle TMA TCP for IMS for a service provided by remote system.

client request transaction

A user-written IMS application transaction that requests a service via Oracle TMA TCP for IMS that is offered by a remote system.

client response

The response to a previously issued IMS client request, processed by an IMS client response transaction.

client response transaction

A user-written IMS application transaction that processes the response to an IMS client request for a service offered by a remote system.

client/server model

A systems or application programming model in which servers provide architected services and clients request those services. Some components in the client/server model can function only as servers; others may function only as clients; still others can function both as clients and servers.

CLIENTSHUTDOWN

An option that can be specified in the Oracle TMA TCP for IMS configuration file that allows shutdown processing to be initiated by a remote client request, or as a response to a remote client request.

COBOL

A standard programming language widely used for business applications, especially on IBM mainframe systems.

configuration file

A text file used by Oracle TMA TCP for IMS to define the network configuration of Oracle Tuxedo Mainframe Adapter gateways and services.
Customer Information Control System (CICS)

An IBM transaction processing monitor that runs on IBM mainframe systems.

D

DASD

See direct access storage device.

direct access storage device (DASD)

Any storage device, such as a hard disk, that offers random access or direct access to the stored data.

DNS

See domain name server.

domain name server (DNS)

A program that runs on an Internet-connected computer system (called a DNS server) and provides an automatic translation between domain names and IP addresses.

dotted decimal notation

A convention for expressing IP addresses, consisting of a series of 4 decimal numbers (0-255), separated by periods. Example: 123.205.23.99.

E

(No terms begin with the letter “E.”)

F

(No terms begin with the letter “F.”)

G

gateway

A software program that allows dissimilar systems to communicate and exchange information. A gateway normally handles communication between systems and performs all necessary protocol translation such that the end applications communicate transparently.

gateway message

A Oracle Tuxedo Mainframe Adapter architected data structure used to exchange requests and responses over a TCP/IP link connecting two Oracle Tuxedo Mainframe Adapter gateways.
GN (Get Next)
   An IMS API call that retrieves the next segment of a multisegment message from the IMS message queue.

GU (Get Unique)
   An IMS API call that retrieves the first (or only segment) of a message from the IMS message queue.

H
(No terms begin with the letter “H.”)

I

IMS
   See Information Management System.

IMS message
   An IMS-architected data structure used to implement communications between components in an IMS system.

inbound session
   A logical communications path between Oracle TMA TCP for IMS and another (remote) Oracle Tuxedo Mainframe Adapter gateway. An inbound session is used by the remote gateway to send client requests to the local (IMS) gateway for processing.

Information Management System (IMS)
   An IBM high-performance, high-volume transaction processing monitor that runs on IBM mainframe systems.

input/output program control block
   An API control block used by an IMS transaction to retrieve its input and write output back to the input source (e.g., a terminal).

Interactive System Productivity Facility (ISPF)
   An IBM program product used by system and application programmers to manipulate data (edit, browse, copy, etc.) on an IBM mainframe system.
Internet protocol address (IP address)
A numeric value that uniquely identifies a node in a TCP/IP network. IP addresses are usually expressed in “dotted decimal notation”, a series of 4 decimal numbers (0-255), separated by periods. Example: 123.205.23.99.

I/O PCB
See input/output program control block.

ISPF
See Interactive System Productivity Facility.

IP address
See Internet protocol address.

ISRT (Insert)
An IMS API call used to insert a message segment into the IMS message queue.

J

JCL
See job control language.

job control language (JCL)
A language used to define and submit batch jobs on an IBM mainframe system.

K
(No terms begin with the letter “K.”)

L

Language Environment /370 (LE/370)
An IBM program product which provides common runtime support for a variety of high-level IBM mainframe programming languages, including COBOL, C/C++, and PL/I.

LE/370
See Language Environment / 370.

listener
A special TCP/IP socket that is dedicated to “listening” for incoming TCP/IP connection requests at a specific port number.
LMID

See logical machine ID.

local gateway

The Oracle TMA TCP for IMS gateway.

local service name

A 1-16 character name that identifies a service that can be requested by an IMS client transaction.

logical machine ID (LMID)

A symbolic name for a Oracle Tuxedo Mainframe Adapter gateway (corresponding to a specific IP address and port combination).

logical terminal (LTERM)

A terminal attached to an IMS system, used by end users to enter transactions and receive responses.

LTERM

See logical terminal.

M

message level

An attribute associated with messages issued by Oracle TMA TCP for IMS that classifies each message as informational, error-related, etc.

message log

A dataset (usually allocated on disk) to which Oracle TMA TCP for IMS logs all messages issued.

message processing program (MPP)

A user-written application program that processes transactions in an IMS system. MPPs typically confine their I/O operations to the IMS message queue (e.g., retrieving terminal input and writing terminal output) and a database.
message queue
The message storage and retrieval mechanism used by IMS components to exchange messages. For example, end-user input at a terminal causes a message to be placed into the message queue. A transaction processing program retrieves the message (containing the user input) from the message queue.

message segment
IMS messages are made up of “pieces” called message segments. A message can consist of a single segment, or multiple segments. A message segment is the basic unit of I/O when inserting messages into and retrieving messages from the IMS message queue.

MPP
See message processing program.

Multiple Virtual Storage
An IBM operating system used by IBM mainframe computers.

MVS
See Multiple Virtual Storage.

MVS Console
A terminal device used by the MVS operating system and other software components to display informational and error messages for the system operator. MVS consoles can also be used by the system operator to enter commands or to inquire on and modify system status.

N
(No terms begin with the letter “N.”)

O
online transaction processing
A form of data processing in which users at terminals or workstations send messages to application programs that update databases in real time.

OTMA
Open Transaction Manager Access is a transaction-based, connectionless client/server protocol.
outbound session

A logical communications path between Oracle TMA TCP for IMS and another (remote) Oracle Tuxedo Mainframe Adapter gateway. An outbound session is used by the local (IMS) gateway to send client requests to the remote gateway for processing.

P

password

A 1-8 character name that is exchanged between Oracle Tuxedo Mainframe Adapter gateways as part of an authentication mechanism during CONNECT processing.

PCB

See program control block.

port number

The entity on a TCP/IP host that identifies a logical communications channel and distinguishes one connection from another. A TCP/IP server application “listens” for incoming connection requests at a designated port. A TCP/IP client application initiates a connection with the server by specifying the host’s IP address and the server’s designated port number.

program control block (PCB)

An IMS API control block used in conjunction with application program I/O (e.g., inserting messages into and retrieving messages from the IMS message queue).

program specification block (PSB)

A control block that defines a transaction processing program to IMS.

protocol

The set of “rules” followed by two systems to communicate and exchange information.

PSB

See program specification block.

PURG (Purge)

An IMS API call that indicates that insertion of a message into the IMS message queue is complete (that is, there are no additional message segments).

Q

(No terms begin with the letter “Q.”)
**R**

**remote gateway**
A Oracle Tuxedo Mainframe Adapter gateway (TUX, CICS, or IMS) to which a local Oracle TMA TCP for IMS gateway is connected.

**remote service name**
A 1-16 character name that identifies a service offered by a remote system and which can be accessed through a remote gateway.

**request phase**
IMS client requests are processed in two “phases” – a request phase (in which transaction T1 issues an IMS client request), and a corresponding response phase (in which transaction T2 processes the response to the request).

**response phase**
IMS client requests are processed in two “phases” – a request phase (in which transaction T1 issues an IMS client request), and a corresponding response phase (in which transaction T2 processes the response to the request).

**S**

**server**
A software program that provides a service in a client/server architecture.

**server request**
A request (issued by a client located on a remote system) for a service provided by an IMS server transaction.

**server response**
The response to a request (issued by a client located on a remote system) for a service provided by an IMS server transaction.

**server response log**
A dataset to which Oracle TMA TCP for IMS logs all IMS server responses not correlated with a pending IMS server request.

**server transaction**
A user-written IMS application transaction that provides a service that can be requested by a remote client through Oracle Tuxedo Mainframe Adapter.
**shutdown**

The process of terminating (or “shutting down”) a Oracle Tuxedo Mainframe Adapter gateway.

**sleep time**

The amount of time that Oracle TMA TCP for IMS “waits” before polling the IMS message Queue for new work.

**socket**

The logical end point of a TCP/IP connection. An application accesses a TCP/IP connection through a socket.

**socket descriptor**

A TCP/IP-assigned number that uniquely identifies a socket and TCP/IP connection. An application must specify the socket descriptor in TCP/IP API calls to identify the socket/connection.

**socket ID**

See socket descriptor.

**socket number**

See socket descriptor.

**T**

**TCP/IP**

See *Transmission Control Protocol Internet Protocol*.

**timeout**

When a request is sent to a remote system or to an IMS server transaction and no response is received within a specified period of time, the request “times out” and an error is recognized.

**TRANCODE**

See transaction code.

**transaction code (TRANCODE)**

A name that uniquely identifies a transaction in an IMS environment.
Transmission Control Protocol Internet Protocol (TCP/IP)

An open communications protocol supported by most systems, including UNIX, personal computers, and IBM mainframes. TCP/IP can be used to exchange information between dissimilar computing platforms.

U

(No terms begin with the letter “U.”)

V

(No terms begin with the letter “V.”)

W

Write-To-Operator-with-Reply (WTOR)

A persistent message displayed on a z/OS console which solicits operator input. A system operator replies to the message by entering the associated reply ID and the text of the reply.

WTOR

See Write-To-Operator-with-Reply.

X

XCF

See cross-system coupling facility.

Y

(No terms begin with the letter “Y.”)

Z

(No terms begin with the letter “Z.”)
