Part III Setting Up and Using Infrastructure as a Service

4 Setting Up Cloud for IaaS
  4.1 Getting Started 4-1
  4.2 Cloud Infrastructure Privileges 4-2
  4.3 Registering the Oracle VM Manager 4-6
    4.3.1 Port Requirements for Oracle VM Manager Setup 4-9
    4.3.2 Updating the Oracle VM Manager URL 4-10
      4.3.2.1 Importing the Oracle VM Manager WebLogic Certificate 4-11
    4.3.3 Discovering and Promoting the Oracle VM Manager (Optional) 4-11
    4.3.4 Upgrading Oracle VM Manager 4-12
      4.3.4.1 Upgrading to the 3.3 Release 4-12
      4.3.4.2 Upgrading to the 3.4 Release 4-13
    4.3.5 Viewing the Monitoring Configuration (OVM Manager) 4-13
  4.4 Synchronizing the Oracle VM Manager Targets 4-15
    4.4.1 Automatically Synchronizing the Oracle VM Manager Targets 4-15
    4.4.2 Manually Synchronizing the Oracle VM Manager Targets 4-16
  4.5 Discovering a Virtual Server 4-16
  4.6 Rediscovering a Virtual Server 4-17
  4.7 Setting Up Networks 4-17
    4.7.1 Generating MAC Addresses 4-18
    4.7.2 Configuring a VLAN Group for Oracle VM Manager 3.2 or Earlier Versions 4-19
    4.7.3 Creating a VLAN Interface for Oracle VM Manager 3.3 4-20
      4.7.3.1 Viewing the VLAN Interfaces 4-21
      4.7.3.2 Editing a VLAN Interface 4-22
      4.7.3.3 Deleting a VLAN Interface 4-22
    4.7.4 Creating Networks 4-22
  4.8 Creating a Network Profile 4-25
  4.9 Registering Storage Servers 4-27
    4.9.1 Registering the File Server 4-28
    4.9.2 Registering the Storage Array 4-29

</tbody>
</table>
5.8.1.3 Creating a Policy Group (Start Up and Shut Down) 5-10
5.8.2 Example 2 5-11
  5.8.2.1 Creating a Policy to Scale Down a Tier Instance 5-11
  5.8.2.2 Creating a Policy to Scale Up a Tier Instance 5-11
  5.8.2.3 Creating a Policy Group (Scale Up and Scale Down) 5-12
5.9 Creating DRS and DPM Policies 5-12
  5.9.1 Creating Automated DRS and DPM Policies 5-13

6 Setting Up the IaaS Self Service Portal

6.1 Setting Up the Self Service Portal 6-1
6.2 Uploading Large Files on the Self Service Portal 6-6
  6.2.1 Setting the OMS Property Using emctl 6-6
  6.2.2 Modifying the web.xml Configuration File 6-6

7 Using the IaaS Self Service Portal

7.1 Using the Self Service Portal to Request Server Resources 7-1
7.2 Requesting Servers 7-2
7.3 Viewing Requests 7-5
7.4 Viewing Servers 7-5
  7.4.1 Zone Details Page 7-6
  7.4.2 Performing Assembly Operations 7-6
    7.4.2.1 Assembly Details Page 7-7
  7.4.3 Tier Operations 7-7
    7.4.3.1 Scaling Up a Tier Instance 7-8
    7.4.3.2 Scaling Down a Tier Instance 7-9
    7.4.3.3 Tier Details Page 7-9
  7.4.4 Performing Server Operations 7-9
    7.4.4.1 Modifying the Server Configuration 7-10
    7.4.4.2 Cloning the Server 7-10
    7.4.4.3 Server Details Page 7-10
7.5 Viewing Storage 7-11
7.6 Viewing Chargeback Details 7-12
7.7 Viewing Library 7-12
7.8 Viewing Policies 7-12
7.9 Viewing Preferences 7-13

8 Administering and Monitoring an IaaS Cloud

8.1 Viewing the Infrastructure Cloud Home Page 8-1
8.2 Viewing the OVM Manager Home Page 8-3
8.3 Viewing and Managing Members 8-4
8.4 Managing Zones 8-5
  8.4.1 Viewing the Zone Home Page 8-5
  8.4.2 Creating or Editing a Zone 8-6
  8.4.3 Deleting a Zone 8-7
  8.4.4 Deleting a Zone from Enterprise Manager 8-7
8.5 Virtual Server Pool Home Page 8-8
8.6 Managing Virtual Servers 8-8
  8.6.1 Virtual Server Home Page 8-9
  8.6.2 Editing a Virtual Server 8-10
  8.6.3 Upgrading a Virtual Server 8-10
  8.6.4 Starting and Stopping a Virtual Server 8-10
  8.6.5 Performing Maintenance on the Virtual Server 8-11
8.7 Managing Guest Virtual Machines 8-11
  8.7.1 Creating a Guest Virtual Machine 8-12
  8.7.2 Guest Virtual Machine Home Page 8-12
  8.7.3 Migrating a Guest Virtual Machine 8-13
  8.7.4 Starting and Shutting Down a Guest Virtual Machine 8-14
    8.7.4.1 Starting a Guest Virtual Machine 8-14
    8.7.4.2 Restarting a Guest Virtual Machine 8-14
    8.7.4.3 Stopping a Guest Virtual Machine 8-14
    8.7.4.4 Killing a Guest Virtual Machine 8-15
  8.7.5 Cloning a Guest Virtual Machine 8-15
  8.7.6 Editing a Guest Virtual Machine 8-17
  8.7.7 Saving a Guest Virtual Machine as a Template 8-18
  8.7.8 Deleting a Guest Virtual Machine 8-20
  8.7.9 Deleting a Guest Virtual Machine Only From Enterprise Manager 8-20
8.8 Deploying Guest Virtual Machines 8-20
  8.8.1 Getting Started 8-20
  8.8.2 Deployment Options 8-21
  8.8.3 Prerequisites 8-21
    8.8.3.1 Creating and Storing Virtualization Components in the Software Library 8-22
  8.8.4 Provisioning Guest Virtual Machines Using Oracle Virtual Assemblies (OVA) 8-29
  8.8.5 Provisioning a Guest Virtual Machine Using Oracle VM Templates 8-36
  8.8.6 Provisioning a Guest Virtual Machine Using an ISO Image 8-40
  8.8.7 Creating PXE Bootable Guest Virtual Machines 8-42
8.9 Viewing the Infrastructure Request Dashboard 8-44
  8.9.1 Request Details Page 8-45
  8.9.2 Viewing the Assembly / Tier Instance Page 8-45
8.10 New Features in Enterprise Manager VT Plugin 13.2.3 8-46
8.10.1 Exporting VM to Virtual Appliance 8-46
8.10.2 Increased Supported Limits 8-46
8.10.3 Inbound Migration Lock 8-47
8.10.4 Improving Assembly Deployment Code to Eliminate Extra Template Creation 8-47
8.10.5 Support for hot memory modify with PVHVM guest 8-47

Part IV Setting Up and Using Oracle Compute

9 Meeting the Prerequisites

9.1 Verifying or Installing the Virtual Infrastructure (VI) Plug-in 9-1
  9.1.1 Deploying the Enterprise Manager for Virtual Infrastructure Plug-in 9-1
9.2 Understanding Users in Oracle Public Cloud Machine 9-2
  9.2.1 Cloud Administrator Tasks 9-2
  9.2.2 Tenant Administrator Tasks 9-3
  9.2.3 Tenant User Tasks 9-3
9.3 Creating Users and Roles 9-3
9.4 Mapping Enterprise Manager User Roles to Oracle Compute User Roles 9-4

10 Using Oracle Compute

10.1 Registering the Oracle Compute Site 10-1
  10.1.1 Importing the Site Certificate 10-2
10.2 Using the Oracle Compute Self Service Portal 10-3
10.3 Creating a New Orchestration 10-4
10.4 Viewing the Orchestration Details 10-7
  10.4.1 Viewing the Oracle VM Instance Home Page 10-8
10.5 Viewing the Service Networks 10-9
10.6 Creating IPoIB Subnets for Tenant Networks 10-9
10.7 Creating Storage Volumes 10-10
10.8 Managing the Library 10-10
  10.8.1 Uploading a Template 10-11
  10.8.2 Deleting a Template or a Deployment Plan 10-12
10.9 Discovering an Orchestration 10-12

11 Oracle Compute REST APIs

11.1 Using the REST API Tool 11-1
11.2 Overview of REST Resources 11-1
11.3 Supported Use Cases 11-4
11.3.1 Orchestration Use Cases
   11.3.1.1 Creating an Orchestration
   11.3.1.2 Performing an Orchestration Action
11.3.2 Service Network Use Cases
   11.3.2.1 Create Service Network
   11.3.2.2 Update Service Network
   11.3.2.3 Delete Service Network
11.3.3 vEthernet Use Cases
   11.3.3.1 Create EoIB vEthernet
   11.3.3.2 Update EoIB vEthernet
   11.3.3.3 Delete EoIB vEthernet
11.3.4 Subnet Use Cases
   11.3.4.1 Create EoIB Subnet
   11.3.4.2 Create IPoIB Subnet
   11.3.4.3 Update Subnet
   11.3.4.4 Delete Subnet
11.3.5 IP Reservation Use Cases
11.3.6 Subnet Access Use Cases
11.3.7 Storage Volume Use Cases
11.3.8 Tenancy Use Cases
11.3.9 User Use Cases
11.3.10 Quota Use Cases
11.3.11 Template Use Cases
11.4 References

Part V  Direct Monitoring

12  Direct Monitoring of Xen Based Systems
   12.1 Direct Monitoring Overview
   12.2 Discovering the Hypervisor Target
      12.2.1 Deleting the Targets
      12.2.2 Setting the Credential Properties
   12.3 Viewing the Oracle Server Home Page
   12.4 Viewing the Oracle Virtual Platform Home Page
   12.5 Viewing the Oracle VM Instance Home Page

Part VI  Setting Up and Using Platform as a Service
## Setting Up the PaaS Infrastructure

13.1 About Service Families 13-1  
13.2 Common Setup Tasks 13-1  
13.2.1 Adding Hosts 13-2  
13.2.2 Creating the Resource Providers 13-2  
13.2.2.1 Creating a PaaS Infrastructure Zone 13-3  
13.2.2.2 Creating a PaaS Pool 13-6  
13.2.3 Configuring Request Settings 13-8  
13.2.4 Setting Up Quotas 13-9

## Enabling the DBaaS Cloud

14.1 Getting Started 14-1  
14.2 Setting Up Credentials for Provisioning 14-2  
14.3 Provisioning Database Software for Database as a Service 14-2  
14.4 Provision the Database for Schema as a Service 14-3  
14.5 Provision a Container Database for PDB as a Service 14-4  
14.6 Configuring the Oracle Listener 14-4

## Setting Up an MWaaS Cloud

15.1 About Middleware as a Service 15-1  
15.2 Getting Started with Middleware as a Service 15-1  
15.2.1 Creating Provisioning Profiles 15-2  
15.2.1.1 Creating a WebLogic Domain Provisioning Profile 15-2  
15.2.2 Provisioning a Middleware Home 15-3  
15.2.2.1 Provision from Oracle Middleware Home Gold Image Deployment Procedure 15-4

## Part VII Provisioning New Database Artifacts

16 Getting Started with Database as a Service

16.1 Supported DBaaS Use Cases 16-1  
16.2 Getting Started with DBaaS 16-2

17 Creating Databases Using Database Template

17.1 Creating Databases Using Database Template 17-1  
17.1.1 Creating Resource Providers 17-1  
17.1.1.1 Creating a Database Pool for Database as a Service 17-2
Part VIII  Cloning Databases

20  Supported Cloning Options

20.1  About Data Lifecycle Management  20-1
20.2  Supported Cloning Options  20-1

21  Creating Full Clones

21.1  Creating a Full Database Clone Using RMAN Backup from the Self Service Portal  21-1
  21.1.1  Creating Resource Providers  21-1
    21.1.1.1  Creating a Database Pool for Database as a Service  21-2
  21.1.2  Creating a Database Provisioning Profile  21-3
    21.1.2.1  Creating a Database Provisioning Profile Using RMAN Backup  21-3
    21.1.2.2  Creating a Database Provisioning Profile Using Existing RMAN Backup  21-6
  21.1.3  Configuring Request Settings  21-10
  21.1.4  Defining Quotas  21-10
  21.1.5  Create Service Template Using RMAN Backup Profile  21-10
  21.1.6  Configuring Chargeback  21-14
  21.1.7  Requesting a Database  21-14

21.2  Creating a Full Database Clone Using RMAN Duplicate from the Self Service Portal  21-14
  21.2.1  Creating a Service Template Using RMAN Duplicate  21-15

22  Creating Snap Clones

22.1  About Data Lifecycle Management  22-1
22.2  About Snap Clones  22-1
22.3  Registering and Managing Storage Servers  22-2
  22.3.1  Overview of Registering Storage Servers  22-2
  22.3.2  Before You Begin  22-2
  22.3.3  Prerequisites for Registering Storage Servers  22-3
    22.3.3.1  Configuring Storage Servers  22-3
    22.3.3.2  Customizing Storage Proxy Agents  22-20
  22.3.4  Registering Storage Servers  22-23
    22.3.4.1  Registering a NetApp or a Sun ZFS Storage Server  22-23
    22.3.4.2  Registering a Solaris File System (ZFS) Storage Server  22-27
    22.3.4.3  Registering an EMC Storage Server  22-28
22.5.3.4 Configuring Request Settings 22-91
22.5.3.5 Defining Quotas 22-91
22.5.3.6 Configuring Chargeback 22-91
22.5.3.7 Requesting a Database 22-91
22.5.3.8 Example: Creating Snap Clones from an In-Sync Test Master 22-91
22.5.4 Creating Snap Clones from a Storage Test Master 22-92
22.5.4.1 Getting Started 22-93
22.5.4.2 Registering Storage Servers 22-93
22.5.4.3 Creating Resource Providers 22-93
22.5.4.4 Configuring Request Settings 22-93
22.5.4.5 Defining Quotas 22-93
22.5.4.6 Configuring Chargeback 22-93
22.5.4.7 Requesting a Database 22-93
22.5.5 Creating a CloneDB Database 22-93
22.6 Creating a Database Provisioning Profile for Snap Clone 22-94
22.6.1 Creating a Database Provisioning Profile Using Snapshots 22-94
22.6.2 Creating a Database Provisioning Profile Using RMAN Database Image 22-96
22.7 Creating Service Templates for Snap Clone 22-100
22.7.1 Creating Service Template Using Snap Clone Profile 22-100
22.7.2 Creating a Service Template from a Storage Test Master 22-105
22.7.3 Creating a Service Template Using RMAN Image Profile 22-108
22.7.4 Creating a Service Template for EMC Snap Clone 22-111
22.8 Snap Clone Data Creation 22-114
22.8.1 Requesting a Database 22-114
22.8.1.1 Requesting a Schema 22-116
22.8.1.2 Requesting a Pluggable Database 22-117
22.8.2 Refreshing the Test Master Database 22-119
22.8.3 Refreshing the Test Master Snapshots 22-120
22.8.4 Snapshot Data Profile Refresh 22-121
22.8.4.1 Refreshing the Snap Shot Profile 22-121
22.8.4.2 Creating and Refreshing Snapshots of the Test Master 22-122
22.8.5 Refreshing a Database 22-122
22.9 Creating Test Master Pluggable Databases and Snapshot Clones 22-124
22.9.1 Creating a Test Master Pluggable Database 22-125
22.9.2 Creating an Exadata Test Master Pluggable Database 22-127
22.9.3 Creating a Snapshot Clone of an Exadata Test Master PDB 22-130
22.9.4 Creating an ACFS Test Master Pluggable Database 22-133
22.9.5 Creating a Snapshot Clone of an ACFS Test Master PDB 22-135
22.9.6 Enabling a Test Master Pluggable Database 22-138
### Part IX  Maintaining and Customizing Databases

#### 23 Using the DBaaS Self Service Portal

- 23.1 About the Database Cloud Self Service Portal  
  - 23-1
- 23.2 Provisioning of Database using Database Cloud Self Service Portal  
  - 23-3
- 23.3 Viewing the History of a Request  
  - 23-4
- 23.4 Database Service Home Page  
  - 23-4
- 23.5 Database Instance Home Page  
  - 23-5
- 23.6 Standby Database Home Page  
  - 23-6

#### 24 Maintaining the Database Pool

- 24.1 About Database Pool Maintenance  
  - 24-1
- 24.2 Creating a Database Gold Image  
  - 24-3
- 24.3 Subscribing to an Image  
  - 24-5
- 24.4 Deploying the Image  
  - 24-7
  - 24.4.1 Deploying the Oracle Home  
    - 24-7
  - 24.4.2 Activating the New Oracle Home  
    - 24-8
  - 24.4.3 Updating the Database  
    - 24-8
- 24.5 Performing Ongoing Image Updates  
  - 24-9
  - 24.5.1 Creating a New Version of the Image  
    - 24-9

#### 25 PBaaS Fleet Operations

- 25.1 Preparing and Subscribing to the Software Image (SSA Admin)  
  - 25-1
- 25.2 PDBaaS Pool Operations Performed by SSA Admin (Option 1)  
  - 25-2
- 25.3 PDBaaS Pool Operations Performed by SSA Admin (Option 2)  
  - 25-3
- 25.4 Update CDB (SSA Admin and SSA User Operations)  
  - 25-4
- 25.5 PDBaaS Pool Cleanup Operations - SSA Admin  
  - 25-4

#### 26 Customizing Database as a Service

- 26.1 Pre and Post Request Creation / Deletion Scripts  
  - 26-1
  - 26.1.1 Selecting the Post SQL Script  
    - 26-2
  - 26.1.2 Sample Scripts  
    - 26-3
  - 26.1.3 Input Parameters for Pre and Post Database Scripts  
    - 26-3
26.1.3.1 Input Parameters for DBaaS Pre and Post Request Creation Scripts
26.1.3.2 Input Parameters for DBaaS Pre and Post Request Deletion Scripts
26.1.3.3 Input Parameters for SchaaS Pre and Post Request Creation Scripts
26.1.3.4 Input Parameters for SchaaS Pre and Post Request Deletion Scripts
26.1.3.5 Input Parameters for PDBaaS Pre and Post Request Creation Scripts
26.1.3.6 Input Parameters for PDBaaS Pre and Post Request Deletion Scripts
26.1.3.7 Sample Input Files
26.1.3.8 Sample PDBaaS Post Scripts

Part X Setting Up Middleware as a Service

27 Setting Up the WebLogic Self Service Portal
27.1 Setting Up the WebLogic Self Service Portal
27.2 Creating a Middleware Pool
27.3 Creating a Load Balancer Configuration
   27.3.1 Custom Script Guidelines
      27.3.1.1 Sample Script (Oracle Cloud Application 12.1.0.8 or Earlier)
      27.3.1.2 Sample Script (Oracle Fusion Middleware 12.1.0.7 or Later)
   27.3.2 Adding the Third Party LBR Configuration to the Software Library
27.4 Configuring Request Settings
27.5 Setting Up Quotas
27.6 Creating a WebLogic Service Template
   27.6.1 Sample Postscript
      27.6.1.1 Sample Properties File
      27.6.1.2 Sample Script
      27.6.1.3 Sample Script Output
   27.6.2 Resource Management Script
      27.6.2.1 Create Operation
      27.6.2.2 Scaleup Operation
      27.6.2.3 Scaledown Operation
      27.6.2.4 Delete Operation
27.7 Configuring Chargeback
28 Setting Up the SOAaaS or the OSBaaS Self Service Portal

28.1 Getting Started with SOAaaS and OSBaaS

28.2 Setting Up DBaaS used to Clone a SOA Repository
   28.2.1 Creating a Database Service Template for SOA Profile
   28.2.2 Creating a Database Service Template for OSB Profile

28.3 Prerequisites for Creating a SOA or an OSB Provisioning Profile

28.4 Setting Up the SOA and OSB Cloud Self Service Portal
   28.4.1 Creating a SOAaaS and OSBaaS Pool
   28.4.2 Creating SOA and OSB Service Templates
   28.4.3 Sample Postscript
      28.4.3.1 Sample Properties File
      28.4.3.2 Sample Script
      28.4.3.3 Sample Script Output
   28.4.4 Resource Management Script
      28.4.4.1 Create Operation
      28.4.4.2 Scaleup Operation
      28.4.4.3 Delete Operation
   28.5 Creating a SOA Instance
      28.5.1 Prerequisites for Creating a SOA Instance
      28.5.2 Procedure for Creating a SOA Instance

29 Setting Up the JVMaaS Self Service Portal

29.1 Setting Up the Java Application Service Self Service Portal

29.2 Creating a Customized Middleware Profile

29.3 Uploading the Middleware Profile to Software Library

29.4 Creating a Service Template Based on Java Applications Profile

30 Using the MWaaS Self Service Portal

30.1 Using the MWaaS Self Service Portal
   30.1.1 Setting the Preferences
   30.1.2 Defining Dynamic Elasticity Policies for Middleware Services
      30.1.2.1 Creating a MWaaS Schedule Policy
      30.1.2.2 Defining a MWaaS Performance Policy
   30.2 Requesting a Middleware Service
      30.2.1 Requesting a WebLogic Service
      30.2.2 Requesting an Oracle Service Bus or SOA Infrastructure Service
   30.3 Middleware Service Home Page
      30.3.1 Deploying and Redeploying an Application
         30.3.1.1 Redeploying an Application
32.1.2.1 Configure Enterprise Manager Cloud Control 32-3
32.1.2.2 Obtain the Client Kit 32-3
32.1.2.3 Configure Enterprise Manager Ops Center 32-4

32.2 Configure Resources for vDC 32-4
  32.2.1 Add Client Kit Contents to Software Library for Oracle Solaris 11 32-4
  32.2.2 Preparing Network Resources for the vDC 32-5
    32.2.2.1 Identify a Fabric 32-5
    32.2.2.2 Create a Network Domain 32-6
    32.2.2.3 Configure Public Network 32-9
  32.2.3 Preparing Storage Resources 32-9
    32.2.4 Create a NAS Storage Library 32-9
      32.2.4.1 Identify the NAS Share 32-10
      32.2.4.2 Create a NAS Storage Library 32-10
    32.2.5 Create SAN Storage Libraries using Fibre Channel LUNs 32-12
      32.2.5.1 What You Will Need 32-12
      32.2.5.2 Configure the Storage Server 32-12
      32.2.5.3 Create a Static Block Storage SAN Library 32-12
    32.2.6 Create an OS Update Profile 32-15
  32.2.7 Deploy Control Domains 32-16
    32.2.7.1 Create an Provisioning Profile for Oracle VM Server for SPARC 32-16
    32.2.7.2 Create an OS Configuration Profile for Oracle VM Server for SPARC 32-19
    32.2.7.3 Apply the Deployment Plan 32-23
  32.2.8 Create the Server Pool 32-25

32.3 Set Up and Configure a Virtual Data Center 32-28
  32.3.1 Create the vDC 32-28
  32.3.2 Create the vDC account for PaaS 32-29
  32.3.3 Preparing the vServers
    32.3.3.1 Create a new vServer Type 32-31
    32.3.3.2 Create a vServer Template 32-32
    32.3.3.3 Create a Private vNet 32-32
  32.4 Validate the Integration and PaaS 32-34
    32.4.1 Create Volumes for vServer 32-34
    32.4.2 Create Test vServers 32-35
    32.4.3 Verify Shared Storage and Connectivity 32-36
    32.4.4 Diagnosing Problems 32-37

33 Getting Started with Dynamic Resource Provisioning
  33.1 About Dynamic Resource Provisioning 33-1
  33.2 Configuring the Solaris SPARC Adapter 33-2
    33.2.1 Adding the Stage Server 33-2
39 Setting Up Testing as a Service

39.1 Getting Started
39.2 Creating Test Administrators
39.3 Creating an Assembly Component
39.4 Creating a Deployment Plan

40 Using the Testing as a Service Portal

40.1 Prerequisites
40.2 Test Administrator Tasks
  40.2.1 Setting Up Application Types
  40.2.2 Setting Up Test Drivers
  40.2.3 Setting Up Oracle Load Testing Test Drivers
  40.2.4 Setting Up Oracle Functional Testing Test Drivers
  40.2.5 Setting Up Custom Test Driver Types
  40.2.6 Setting Up Quotas
  40.2.7 Setting Up Result File Systems
  40.2.8 Publishing Test Environments, Test Assets, and Test Drivers
  40.2.9 Setting Up Chargeback Service
40.3 Test Designer Tasks - Creating Test Assets and Test Environments
  40.3.1 Creating Test Assets - General Information
  40.3.2 Creating Test Asset - Oracle Load Testing
  40.3.3 Creating Test Asset - Oracle Functional Testing
  40.3.4 Creating Test Asset - Custom Test
  40.3.5 Creating Test Environments
40.4 Tester Tasks - Using the Testing Environment
  40.4.1 Verifying Available Test Assets and Environments
  40.4.2 Creating Tests
  40.4.3 Creating Tests - Oracle Load Testing Tests
  40.4.4 Creating Tests - Oracle Functional Testing Tests
  40.4.5 Creating Tests - Custom Tests
  40.4.6 Creating and Running Trials
  40.4.7 Creating and Running Oracle Load Testing Trial
  40.4.8 Creating and Running Oracle Functional Testing Trial
  40.4.9 Monitoring On-Going Trials
  40.4.10 Comparing Trial Results
  40.4.11 Sharing Tests
  40.4.12 Viewing Activity and Usage Information
### Part XV  Using Chargeback and Consolidation

**41  Chargeback Administration**

<table>

41.2.4.3 Creating High-Level Cost Centers in Chargeback 41-21
41.2.5 Adding Entities to Chargeback 41-22
41.2.5.1 Configuring Metric Collection for Enterprise Manager Database Services 41-23
41.2.5.2 Selecting Entities for Chargeback 41-24
41.2.5.3 Making Assignments 41-25
41.2.5.4 Reviewing Entity Setup 41-26
41.2.5.5 After Adding Entities to Chargeback 41-26
41.2.5.6 Defining Plan Assignment Rules 41-27
41.2.6 Assigning Cost Centers to Entities 41-28
41.2.7 Assigning Charge Plans to Entities 41-29
41.2.8 Running the Daily Data Collection Job 41-30
41.3 Self Service Applications and Zones within Chargeback 41-31
41.4 Accessing Chargeback Information 41-33
41.4.1 Following Usage and Charge Trends 41-33
41.4.2 Viewing an Entity’s Collected Metric Data and Other Entity Details 41-35
41.4.3 Generating and Distributing Chargeback Reports 41-37
41.4.4 Viewing Chargeback Information in the Self Service Portal 41-39
41.4.5 Sharing Chargeback Data with Other Applications 41-40

42 Enterprise Manager Consolidation

42.1 Overview of Consolidation 42-1
42.2 Host Consolidation Planner 42-2
42.2.1 Overview of Host Consolidation Planner 42-3
42.2.2 Creating a Host Consolidation Planner Project 42-4
42.2.2.1 Selecting the Host Consolidation Project Type 42-4
42.2.2.2 Specifying Host Source Candidates 42-4
42.2.2.3 Specifying Host Destination Candidates 42-5
42.2.2.4 Setting Data Collection Parameters 42-6
42.2.2.5 Choosing a Pre-configured Scenario 42-6
42.2.2.6 Reviewing and Saving the Host Consolidation Project 42-7
42.2.3 Creating a Host Consolidation Planner Scenario 42-8
42.2.3.1 Setting Up the Scenario 42-8
42.2.3.2 Defining Constraints for Host Consolidation 42-9
42.2.3.3 Planning the Destination for a Physical Server to Virtual Server Project 42-9
42.2.3.4 Planning the Destination for a Physical Server to Physical Server Project 42-10
42.2.3.5 Mapping Host Sources to Destinations 42-11
42.2.3.6 Reviewing and Saving the Host Consolidation Scenario 42-11
42.2.4 Other Host Consolidation Scenario Creation Options 42-12
42.2.5 Evaluating Host Consolidation Scenarios 42-12
42.3 Database Consolidation Workbench 42-14
42.3.1 Overview of Database Consolidation Workbench 42-14
42.3.2 Creating a Database Consolidation Workbench Project 42-15
42.3.2.1 Selecting the Database Consolidation Project Type 42-16
42.3.2.2 Specifying Database Source Candidates 42-16
42.3.2.3 Specifying Database Destination Candidates 42-16
42.3.2.4 Setting Data Collection Parameters 42-17
42.3.2.5 Choosing a Pre-configured Scenario 42-17
42.3.2.6 Reviewing and Saving the Database Consolidation Project 42-18
42.3.3 Creating a Database Consolidation Workbench Scenario 42-19
42.3.3.1 Setting Up the Scenario 42-19
42.3.3.2 Defining Constraints for Database Consolidation 42-20
42.3.3.3 Planning the Destination for a Database to Database Project 42-20
42.3.3.4 Planning the Destination for a Database to Server Project 42-22
42.3.3.5 Mapping Database Sources to Destinations 42-23
42.3.3.6 Reviewing and Saving the Database Consolidation Scenario 42-23
42.3.4 Other Database Consolidation Scenario Creation Options 42-23
42.3.5 Evaluating Database Consolidation Scenarios 42-24
42.3.6 About the Advisor Feature of Database Consolidation Workbench 42-27
42.3.7 About Compression Advisor 42-27
42.3.8 Estimating Compressed Storage Requirements 42-28
42.3.9 About Implementing a Database Consolidation Scenario 42-28
42.3.10 Implementing a Database Consolidation Scenario 42-29
42.3.11 Database Migration and Encrypted Tablespace 42-29
42.3.12 Assessing the Performance Impact of Database Migration on SQL Workload 42-30
42.4 Topics Common to Host and Database Consolidations 42-31
42.4.1 How Enterprise Manager Consolidation Analyzes a Consolidation Scenario 42-31
42.4.2 Viewing Consolidation Reports 42-32
42.4.2.1 Viewing Consolidation Project Reports 42-32
42.4.2.2 Viewing Consolidation Scenario Reports 42-33
42.4.3 Managing Data Collections 42-33
42.4.4 About Oracle Compute Cloud Shapes 42-33

Part XVI Using the Cloud APIs
## Introduction to Cloud APIs

43.1 Introduction 43-1
43.2 When to Use Cloud REST APIs 43-2
43.3 Change History 43-2
43.4 Common Behaviors 43-4
  43.4.1 Transport Protocol 43-4
  43.4.2 URI Space 43-4
  43.4.3 Media Types 43-4
  43.4.4 Request Headers 43-5
  43.4.5 Response Headers 43-5
  43.4.6 HTTP Status Codes 43-6
  43.4.7 Common Resource Attributes 43-7
    43.4.7.1 Resource State 43-7
  43.4.8 Collection 43-8
  43.4.9 Error Response Message 43-9

## Cloud Resource Models

44.1 Enterprise Manager Cloud Resource Model 10001 44-1
44.2 About Cloud Resources 44-2
44.3 Resource Data Models 44-3
  44.3.1 Cloud [application/oracle.com.cloud.common.Cloud+json] 44-3
  44.3.2 ServiceTemplate [application/oracle.com.cloud.common.ServiceTemplate+json] 44-4
  44.3.3 Zone [application/oracle.com.cloud.common.Zone+json] 44-5
  44.3.4 Service Family Type [application/oracle.com.cloud.common.ServiceFamilyType+json] 44-6
  44.3.5 Service Instance Type [application/oracle.com.cloud.common.ServiceInstanceType+json] 44-7
  44.3.6 Metric [application/oracle.com.cloud.common.Metric+json] 44-8
  44.3.7 Service Instance [application/oracle.com.cloud.common.ServiceInstance+json] 44-9
  44.3.8 Quota Usage [application/oracle.com.cloud.common.QuotaUsage+json] 44-10
  44.3.9 Service Template Finds [application/oracle.com.cloud.common.ServiceTemplateFinds+json] 44-11
44.4 Cloud REST API Examples 44-11
  44.4.1 Cloud Resource 44-12
  44.4.2 Service Family Type Resource 44-15
  44.4.3 Quota Resource 44-20
  44.4.4 Service Instance Type Resource 44-21
  44.4.5 Zone Resource 44-22
45 EM CLI Verbs for Database as a Service Administrator

45.1 PaaS Zone EM CLI Verbs 45-2
45.2 Software Pool EM CLI Verbs 45-5
45.3 Database Quota EM CLI Verbs 45-13
45.4 Database Request Settings EM CLI Verbs 45-16
45.5 Database Size EM CLI Verbs 45-17
45.6 Database Profile EM CLI Verbs 45-19
  45.6.1 About Database Provisioning Profile Types 45-19
    45.6.1.1 DBCA Template 45-20
    45.6.1.2 RMAN 45-20
    45.6.1.3 Snapclone 45-20
    45.6.1.4 Schema 45-20
  45.6.2 Creating Provisioning Profiles using EM CLI 45-21
  45.6.3 Sample EM CLI Property Files 45-21
    45.6.3.1 DBCA Template 45-22
    45.6.3.2 New RMAN Backup from the Source Database 45-24
    45.6.3.3 Existing RMAN Backup from the Source Database 45-27
    45.6.3.4 Existing RMAN Backup on the Stage Location 45-29
    45.6.3.5 Snapclone Database 45-31
    45.6.3.6 Schema Database 45-33
  45.6.4 Database Profile EM CLI Verbs 45-35
  45.6.5 Creating a Database Profile Using EM CLI Verbs 45-42
  45.6.6 Editing a Database Profile Using EM CLI Verbs 45-53
  45.6.7 Deleting a Database Profile Using EM CLI Verbs 45-55
  45.6.8 Viewing All the Database Profiles 45-57
  45.6.9 Refreshing a Database Profile Using EM CLI Verbs 45-58
45.7 Service Template EM CLI Verbs 45-59
45.8 Service Template Executable .json Files 45-61
  45.8.1 DBCA Based Service Template .json File 45-62
  45.8.2 Standby DBCA Based Service Template .json File 45-64
  45.8.3 RMAN Based Single Instance Database Service Template .json File 45-67
  45.8.4 RMAN Based Single Instance Database with Single Instance Standby Service Template .json File 45-71
  45.8.5 RMAN Based RAC One Node Database Service Template .json File 45-75
  45.8.6 RMAN Based RAC One Node Database with Standby Service Template .json File 45-78
45.8.7 RMAN Based RAC Database with Single Instance Standby Service Template .json File 45-81
45.8.8 RAC Database with Standby Using a DBCA Template Service Template .json File 45-84
45.8.9 DNFS Based Database Service Template .json File 45-88
45.8.10 Snap Clone Single Instance Database with Archiving Enabled Service Template .json File 45-91
45.8.11 Schema Based Service Template .json File 45-94
45.8.12 Pluggable Database Service Template .json File 45-96
45.8.13 RAC Pluggable Database Using an Empty Pluggable Database Service Template .json File 45-98
45.8.14 RAC Pluggable Database Using a Profile Pluggable Database Service Template .json File 45-102
45.8.15 Clone DB Based Service Template .json File 45-108
45.8.16 Full Clone Using an RMAN Duplicate Service Template .json File 45-109
45.8.17 Snapclone Database Using Live Clone Template on EMC Storage Service Template .json File 45-110
45.9 Creating a Database Clone Using EM CLI Verbs 45-111
45.10 Refreshing a Database Using EM CLI Verbs 45-123
45.11 Deleting a Database Using EM CLI Verbs 45-126
45.12 Deleting a Database Clone Using EM CLI Verbs 45-128
45.13 Database Fleet Maintenance EM CLI Verbs 45-130
45.14 Database Request Handling EM CLI Verbs 45-138
45.15 Cloning a Pluggable Database 45-139
45.15.1 Pluggable Database Full Clone Methods 45-141
45.15.2 Pluggable Database Snapshot Clone Types 45-142
45.16 Creating a Test Master Pluggable Database 45-144
45.17 Transferring Data Between Databases 45-147
45.18 Backing Up Datafiles and Metadata of a Pluggable Database 45-148
45.19 Importing Data from Export Dumps to a Database 45-149
45.20 Using the db_clone_management EM CLI Verb 45-151
45.21 Invoking a REST API Using EM CLI Verb 45-153

46 Database as a Service Administrator REST APIs

46.1 Summary of Database as a Service Administrator REST APIs 46-1
46.2 Creating a New DBaaS Cloud Setup Using REST APIs 46-3
46.3 Database as a Service Administrator Operations REST APIs 46-5
46.3.1 PaaS Zones and PaaS Zone REST APIs 46-5
46.3.1.1 PaaS Zones REST APIs 46-6
46.3.1.2 PaaS Zone REST APIs 46-6
46.3.1.3 PaaS Zones and PaaS Zone REST API Examples 46-7
46.3.2 Software Pools and Software Pool REST APIs 46-12
46.3.2.1 Software Pools
46.3.2.2 Software Pool
46.3.2.3 Software Pool REST API Examples
46.3.3 Database Request Settings REST APIs
46.3.3.1 Database Request Settings Resource Model
46.3.3.2 Dbaas Request Settings Resource
46.3.3.3 Supported Operations for Dbaas Request Settings
46.3.3.4 Dbaas Request Settings REST API Examples
46.3.4 Database Quota REST APIs
46.3.4.1 Database Quota Resource Model
46.3.4.2 Dbaas Quota Resource
46.3.4.3 Supported Operations for Dbaas Quota
46.3.4.4 Database Quota REST API Examples
46.3.5 Service Template REST APIs
46.3.5.1 Service Templates Resource
46.3.5.2 Service Template Resource
46.3.5.3 Service Templates and Service Template REST API Examples
47 Database as a Service SSA User REST APIs
47.1 Summary of Database as a Service SSA User REST APIs
47.2 Database as a Service
47.2.1 Database as a Service Resource Model
47.2.1.1 DB Zone
47.2.1.2 DB Platform Template
47.2.1.3 DB Platform Instance
47.2.2 Supported Operations for Database as a Service Resources
47.2.3 Database as a Service REST API Examples
47.2.3.1 Viewing Details of All the Cloud Resources
47.2.3.2 Filtering Output for Specific Resource Attributes
47.2.3.3 Viewing Details of the Service Family Type Resource
47.2.3.4 Viewing Details of the Service Instance Type Resource
47.2.3.5 Viewing Details of a Service Requests Resource
47.2.3.6 Viewing Details of the DB Zone
47.2.3.7 Viewing Details of the DB Platform Template Resource
47.2.3.8 Creating a Database Instance
47.2.3.9 Viewing the Database Creation Details
47.2.3.10 Updating a Database
47.2.3.11 Deleting a Database Instance
47.2.3.12 Lifecycle operations on a Database Instance
47.2.3.13 Lifecycle operations on a Snap clone Database Instance
47.3 Schema as a Service
47.3.1 Schema as a Service Resource Model
47.3.1.1 Schema Platform Template
47.3.1.2 Schema Platform Instance
47.3.2 Supported Operations for Schema as a Service Resources
47.3.3 Schema as a Service REST API Examples
47.3.3.1 Viewing Details of the Schema Platform Template Resource
47.3.3.2 Creating a Schema Service
47.3.3.3 Viewing Details of the Schema Service Creation
47.3.3.4 Deleting a Schema Service
47.3.3.5 Object Missing

47.4 Pluggable Database as a Service
47.4.1 Pluggable Database as a Service Resource Model
47.4.1.1 Pluggable DB Platform Template
47.4.1.2 Pluggable DB Platform Instance
47.4.2 Supported Operations for Pluggable Database Resources
47.4.3 Pluggable Database as a Service REST API Examples
47.4.3.1 Viewing Details of the Pluggable Db Platform Template Resource
47.4.3.2 Creating a Pluggable Database
47.4.3.3 Viewing Details of the Pluggable Database Creation
47.4.3.4 Deleting a Pluggable Database Instance
47.4.3.5 Lifecycle operations on a Pluggable Database Instance

48 DBaaS REST APIs and EM CLI Verbs Based Use Cases

48.1 Getting Started with DBaaS With REST APIs and EM CLI Verbs
48.2 Creating Databases Using Database Template With REST APIs and EM CLI Verbs
48.2.1 Creating Standby Databases With REST APIs and EM CLI Verbs
48.3 Creating Empty Schemas and Schemas Based on Profile With REST APIs and EM CLI Verbs
48.4 Creating Empty PDBs and PDBs Based on Profile With REST APIs and EM CLI Verbs
48.5 Migrating/Transferring Data from One Database to Another
48.6 Creating Databases Using Snap Clone With REST APIs and EM CLI Verbs
48.6.1 Creating a Snap Clone Using a Profile With REST APIs and EM CLI Verbs
48.6.2 Creating a Snap Clone Using Live Database With REST APIs and EM CLI Verbs
48.6.3 Continuous Sync
48.7 Creating Full Database Clones Using RMAN With REST APIs and EM CLI Verbs

49.10 VM Adapters for V2 49-112
49.10.1 VM Adapters Data Model 49-112
49.10.2 Supported Operations 49-112
49.10.3 VM Adapters REST API Examples for V2 49-112
49.10.3.1 Viewing Details of All the Registered VM Adapters 49-113
49.10.3.2 Viewing Details of a Specific Registered VM Adapter 49-113
49.10.3.3 Viewing Details of the Staging Servers 49-114
49.10.3.4 Creating a Staging Server 49-114

49.11 SSA Admin Resources for V1 49-115
  49.11.1 Viewing Details of the REST API Entry Point Resources 49-116

49.12 PaasZones for V1 49-117
  49.12.1 PaasZones REST API Examples 49-118
    49.12.1.1 Viewing PaaS Zones Metadata 49-118
    49.12.1.2 Listing PaaS Zones 49-119

49.13 PaasZone for V1 49-120
  49.13.1 PaaS Zone REST API Examples 49-121
    49.13.1.1 Creating a PaaS Zone 49-122
    49.13.1.2 Updating a PaaS Zone 49-123
    49.13.1.3 Deleting a PaaS Zone 49-124
    49.13.1.4 Viewing Details of the PaasZone 49-125
    49.13.1.5 Viewing the Expanded form of a PaasZone 49-126

49.14 SoftwarePools for V1 49-128
  49.14.1 Software Pools REST API Example 49-128
    49.14.1.1 Viewing Details of the Software Pools 49-129
    49.14.1.2 Filtering Output based on Search Query Parameters 49-130

49.15 SoftwarePool for V1 49-131
  49.15.1 SoftwarePool REST API Examples 49-132
    49.15.1.1 Creating a Software Pool 49-133
    49.15.1.2 Updating a Software Pool 49-134
    49.15.1.3 Deleting a Software Pool 49-135
    49.15.1.4 Viewing Details of the Software Pool 49-135
    49.15.1.5 Expands Query Parameter 49-137
  49.15.2 SoftwarePoolMetadata for V1 49-137
    49.15.2.1 Retrieving Software Pool Metadata REST API Example 49-138
  49.15.3 SoftwarePoolFilteredTargets for V1 49-140
    49.15.3.1 Retrieving Available Filtered Targets - REST API Example 49-141
  49.15.4 SoftwarePoolCapacity for V1 49-142
    49.15.4.1 Retrieving Software Pool Capacity 49-142

49.16 Composite Resource Attributes for V1 49-144
  49.16.1 ValueDescriptor for V1 49-144
  49.16.2 ValueEntity for V1 49-144
  49.16.3 EntityValueHolder for V1 49-144
  49.16.4 PoolEntityCapacity for V1 49-145
  49.16.5 ResourceTypeCapacity for V1 49-145

49.17 Service Template Management for V1 49-145
  49.17.1 Service Templates for V1 49-146
    49.17.1.1 Supported Methods on ServiceTemplates Resources 49-146
    49.17.1.2 ServiceTemplates REST API Example 49-146

   50.11.3 General Preferences for V1 50-77
50.12 Composite Resource Attributes for V1 50-78
   50.12.1 RequestEntity Data Model for V1 50-78
   50.12.2 InstanceExpireEntity Data Model for V1 50-79
   50.12.3 QuotaEntity Data Model for V1 50-79
50.13 Supported Methods for General Preferences (for V1) 50-80
   50.13.1 Viewing Details of the General Preferences for an SSA User 50-80
   50.13.2 Updating the General Preferences for an SSA User 50-81
## 50.14 Service Specific User Preferences for V1

- **50.14.1 Service Preferences for V1**
- **50.14.2 Supported Methods for My Preferences (for V1)**
- **50.14.3 ServicePreferenceMetadata Data Model for V1**
- **50.14.4 Composite Resource Attributes for V1**
  - **50.14.4.1 ValueEntity Data Model for V1**
  - **50.14.4.2 EntityValueHolder Data Model for V1**
  - **50.14.4.3 ValueDescriptor Data Model for V1**
- **50.14.5 Service Preferences REST API Examples for V1**
  - **50.14.5.1 Viewing Details of the Service Preferences Resource**
- **50.14.6 My Database Preferences REST API Examples for V1**
  - **50.14.6.1 Viewing Details of the DBaaS User Preferences Metadata**
  - **50.14.6.2 Updating DBaaS User Preferences**
  - **50.14.6.3 Setting a Blank DBaaS User Preference Setting**
  - **50.14.6.4 Viewing the DBaaS User Preferences**
- **50.14.7 My Middleware Preferences REST API Examples for V1**
  - **50.14.7.1 Viewing MWaaS User Preferences Metadata**
  - **50.14.7.2 Updating MWaaS User Preferences**
  - **50.14.7.3 Setting a Blank MWaaS User Preference Setting**
  - **50.14.7.4 Viewing MWaaS User Preference Settings**
- **50.14.8 My Tests Preferences for V1**
  - **50.14.8.1 Viewing TaaS User Preferences Metadata**
  - **50.14.8.2 Updating TaaS User Preferences**

## 51 WebLogic as a Service REST APIs

- **51.1 Summary of WebLogic as a Service REST APIs for V2**
- **51.2 Summary of WebLogic as a Service REST APIs for V1**
- **51.3 Resource Providers for V2 - PaaS Infrastructure Zone and Middleware Pool**
  - **51.3.1 Resource Providers - PaaS Infrastructure Zone and Middleware Pool REST API Examples**
    - **51.3.1.1 Viewing Details of All the Resource Providers**
    - **51.3.1.2 Creating a PaaS Infrastructure Zone**
    - **51.3.1.3 Creating a Middleware Pool**
    - **51.3.1.4 Updating a PaaS Infrastructure Zone**
    - **51.3.1.5 Updating a Middleware Pool**
    - **51.3.1.6 Deleting a Resource Provider (PaaS Infrastructure Zone or Middleware Pool)**
- **51.4 Quotas for V2**
  - **51.4.1 Quotas REST API Examples**
    - **51.4.1.1 Viewing Details of Quota Settings**
    - **51.4.1.2 Creating a Quota for a SSA User Role**
51.4.1.3  Updating a Quota for a SSA User Role  51-13  
51.4.1.4  Deleting a Quota for a SSA User Role  51-14
51.5  Service Templates for V2  51-14
  51.5.1  Service Templates REST API Examples  51-15
    51.5.1.1  Viewing Details of all Service Templates  51-15
    51.5.1.2  Viewing Details of a Specific Service Template  51-15
    51.5.1.3  Creating a Service Template  51-16
    51.5.1.4  Updating a Service Template  51-19
    51.5.1.5  Deleting a Service Template  51-22
51.6  Load Balancer Configurations for V2  51-22
  51.6.1  Load Balancer Configuration for V2  51-23
  51.6.2  Load Balancer Configurations REST API Examples  51-24
    51.6.2.1  Viewing all the Load Balancer Configurations  51-24
    51.6.2.2  Viewing Details of a Specific Load Balancer Configuration  51-24
    51.6.2.3  Creating a Load Balancer Configuration  51-26
    51.6.2.4  Updating a Load Balancer Configuration  51-28
    51.6.2.5  Deleting a Load Balancer Configuration  51-30
51.7  Service Instance Action for V2  51-31
51.8  User Operation REST API Examples for V2  51-31
  51.8.1  Viewing Details of all Service Templates  51-32
  51.8.2  Viewing Details of all Service Instances  51-33
  51.8.3  Viewing all Service Instances With UP Status  51-34
  51.8.4  Creating a Service Instance Request  51-34
  51.8.5  Viewing Details of all Possible Actions on a Specific Service Instance  51-36
  51.8.6  Scaling Up a Service Instance  51-37
  51.8.7  Scaling Down a Service Instance  51-38
  51.8.8  Stopping a Service Instance  51-39
  51.8.9  Starting a Service Instance  51-39
  51.8.10  Deleting a Service Instance  51-40
  51.8.11  Viewing Details of Java EE Applications Components from the Software Library  51-40
  51.8.12  Deploying an Application  51-41
  51.8.13  Redeploying an Application  51-41
  51.8.14  Un-deploying an Application  51-42
  51.8.15  Stopping an Application  51-43
  51.8.16  Starting an Application  51-43
  51.8.17  Viewing Details of all Applications Deployed in a Domain  51-44
  51.8.18  Viewing an Application URL  51-45
  51.8.19  Viewing Details of the Libraries Deployed in a Domain  51-45
  51.8.20  Viewing the WebLogic Console URL  51-47
  51.8.21  Viewing Details of All the Data Sources  51-47
51.8.22 Viewing Details of All Data Sources in the Profile 51-48
51.8.23 Creating a Data Source 51-49
51.8.24 Editing a Data Source 51-49
51.8.25 Deleting a Data Source 51-50
51.8.26 Testing a Data Source 51-51

51.9 WebLogic as a Service Resource Model for V1 51-51
51.9.1 Cloud 51-52
  51.9.1.1 Viewing Details of the Cloud Resource 51-53
51.9.2 JaaS Service Family Type 51-56
  51.9.2.1 Viewing Detail of the JaaS Service Family Type Resource 51-57
  51.9.2.2 Creating an Application Instance Component by Passing a
         POST Request on the Jaas Service Family Type Resource 51-58
51.9.3 Zone 51-60
  51.9.3.1 Viewing Details of the Zone Resource 51-60
51.9.4 JavaPlatformTemplate 51-61
  51.9.4.1 Viewing Details of the Java Platform Template Resource 51-62
  51.9.4.2 Creating a Java Platform Instance by Passing POST Request on
         a Java Platform Template 51-63
  51.9.4.3 Viewing Details of the Java Platform Request Resource 51-65
51.9.5 Java Platform Instance 51-67
  51.9.5.1 Viewing Details of the Java Platform Instance Resource 51-68
  51.9.5.2 Deleting a Service Instance by Passing a DELETE Request on a
         Java Platform Instance 51-70
  51.9.5.3 Viewing Status of the DELETE Request 51-71
  51.9.5.4 Creating an Application Instance Deployment By Passing a
         POST Request on Java Platform Instance 51-71
  51.9.5.5 Viewing Status of the Application Instance Deployment Creation
         Request 51-72
  51.9.5.6 Creating a Data Source by Passing a POST Request on the
         Java Platform Instance Resource 51-74
  51.9.5.7 Viewing Status of the Data Source Creation Request 51-75
  51.9.5.8 Scaling Up/Down the Service Instance 51-76
51.9.6 Application Instance Deployment 51-77
  51.9.6.1 Viewing Details of the Application Instance Deployment
         Resource 51-78
  51.9.6.2 Deleting an Application Instance Deployment 51-80
  51.9.6.3 Viewing Status of the Application Instance Deployment Deletion
         Request 51-80
  51.9.6.4 Starting, Stopping and Redeploying an Application Instance
         Deployment 51-81
51.9.7 DataSource 51-83
  51.9.7.1 Viewing Details of the Data Source Resource 51-84
  51.9.7.2 Deleting a Data Source 51-85
# SOAaaS and OSBaaS APIs

## 52.1 PaaS Infrastructure Zone and Middleware Pool
- **52.1.1** Viewing Details of All the Resource Providers 52-1
- **52.1.2** Creating a PaaS Infrastructure Zone for SOA/OSB Domains 52-2
- **52.1.3** Creating Middleware Pool for SOA/OSB 52-2
- **52.1.4** Updating a PaaS Infrastructure Zone 52-3
- **52.1.5** Updating a Middleware Pool 52-3
- **52.1.6** Deleting a Resource Provider (PaaS Infrastructure Zone or Middleware Pool) 52-4

## 52.2 Quotas
- **52.2.1** Viewing Details of Quota Settings 52-4
- **52.2.2** Creating a Quota for a SSA User Role 52-5
- **52.2.3** Updating a Quota for a SSA User Role 52-5
- **52.2.4** Deleting a Quota for a SSA User Role 52-6

## 52.3 Service Templates
- **52.3.1** Viewing Details of all Service Templates 52-6
- **52.3.2** Viewing Details of a Specific Service Template 52-7
- **52.3.3** Deleting a Service Template 52-7
- **52.3.4** Creating a Service Template
  - **52.3.4.1** Viewing Service Template Types 52-8
  - **52.3.4.2** Getting Service Template Metadata Details 52-8
  - **52.3.4.3** Getting the Resource Provider Characteristics 52-9
  - **52.3.4.4** Creating the Service Template Configuration 52-9
  - **52.3.4.5** Creating Service Templates Using these Responses 52-10

## 52.4 Load Balance Configuration
- **52.4.1** Viewing Details of all the Load Balancer Configuration Resource 52-16
- **52.4.2** Viewing Details of the specified Load Balancer Configuration 52-17
- **52.4.3** Creating the Load Balancer Configuration 52-17
- **52.4.4** Editing the Load Balancer Configuration 52-18
- **52.4.5** Deleting a Load Balancer Configuration 52-19

## 52.5 SSA User Operation API Examples
- **52.5.1** Viewing Details of all Service Templates 52-19
- **52.5.2** Viewing Details of all Service Instances 52-20
- **52.5.3** Viewing all Service Instances With UP Status 52-20
- **52.5.4** Viewing the Service Offering Metadata 52-21
- **52.5.5** Creating a Service Instance Request 52-21
- **52.5.6** Viewing all the Action IDs for the Service Instances 52-23
- **52.5.7** Stopping a Service Instance 52-23
- **52.5.8** Starting a Service Instance 52-24
- **52.5.9** Deleting a Service Instance 52-24
53

Rapid Start Cloud Setup

53.1 Introduction 53-1
53.2 Installing the Kit 53-1
  53.2.1 OMS Host 53-2
  53.2.2 Other Hosts 53-2
53.3 Contents of the Kit 53-2
53.4 Prerequisites 53-3
  53.4.1 Oracle Management Server 53-3
  53.4.2 EMCLI Setup 53-3
  53.4.3 Infrastructure Setup 53-3
    53.4.3.1 Pluggable Database as a Service 53-4
53.5 Artifacts Created by the Rapid Start Kit 53-4
53.6 Rapid Kit Modes 53-6
  53.6.1 Simple Mode (On Exadata Only) 53-6
  53.6.2 Advanced Mode (Exadata and Non Exadata) 53-6
53.7 Cloud Setup Inputs: Simple Mode 53-6
  53.7.1 Pluggable Database as a Service: Simple Mode 53-7
  53.7.2 Database as a Service: Simple Mode 53-7
  53.7.3 Input Customization: Simple Mode 53-7
53.8 Cloud Setup Inputs: Advanced Mode 53-8
  53.8.1 Creating Custom Users 53-9
  53.8.2 Pluggable Database as a Service: Advanced Mode 53-9
  53.8.3 Database as a Service: Advanced Mode 53-11
53.10 Rapid Start Kit Sample Run 53-16
53.9 Command Line Interface 53-18
  53.9.1 Usage 53-18
  53.9.2 Database as a Service (DBaaS) 53-19
  53.9.3 Pluggable Database as a Service (PDBaaS) 53-19
  53.9.4 Securing the Cloud Setup 53-20
    53.9.4.1 Expire Default Passwords 53-20
  53.9.5 Set New Passwords 53-20

54

Chargeback and Metering EMCLI Verbs

54.1 Performing UI Equivalent Chargeback Operations 54-1
  54.1.1 list_chargeback_entity_types 54-1
  54.1.2 list_chargeback_entities 54-2
  54.1.3 add_chargeback_entity 54-2
54.1.4 remove_chargeback_entity 54-3
54.1.5 list_charge_plans 54-3
54.1.6 assign_charge_plan 54-4
54.1.7 unassign_charge_plan 54-5
54.1.8 list_cost_centers 54-5
54.1.9 assign_cost_center 54-6
54.1.10 unassign_charge_plan 54-7
54.2 Using Custom Charge Items 54-7
54.2.1 list_charge_item_candidates 54-8
54.2.2 create_charge_item 54-8
54.2.3 delete_charge_item 54-10
54.3 Examples of Custom Charge Item Verb Use 54-10
54.3.1 Metric Extension (PGA) 54-10
54.3.2 Metric Extension (Application A Orders) 54-12
54.3.3 Configuration Extensions 54-16
54.4 Creating a Generic Entity Type 54-18
54.5 Retrieving Metering Data from Enterprise Manager 54-19
54.5.1 get_metering_data 54-20
54.5.2 Data Retrieval Output 54-21
54.5.3 get_metering_data Examples 54-22

55 Introduction to Blueprints

55.1 Introduction to Blueprints 55-1
55.2 Uses of the Blueprint 55-2
55.3 Enterprise Manager Cloud Concepts 55-2
55.4 Blueprint Concepts 55-3
55.5 Deploying a Blueprint 55-4
55.6 Blueprint Deployment Processing 55-4
55.7 Blueprint Examples 55-7
  55.7.1 Blueprint Structure and Basics 55-7
    55.7.1.1 Simple Blueprint 55-8
    55.7.1.2 Simple Resource: Database Service Instance 55-8
    55.7.1.3 Intrinsic Functions 55-9
    55.7.1.4 Simple Resource with Parameter 55-10
    55.7.1.5 Data Section (Named Literals) 55-10
  55.7.2 Putting It All Together – Multiple Interdependent Resources 55-11
    55.7.2.1 Macro Section 55-13
    55.7.2.2 Attributes of Created Resources (Dependencies) 55-13
  55.7.3 Visual Depiction of Blueprint Processing 55-14
Cloud Blueprints and Blueprint Reference

56.1 Installing the Blueprint Processor
  56.1.1 Linux (Oracle Linux)
    56.1.1.1 Installing Python
    56.1.1.2 Installing the Blueprint Processor from Zip File
    56.1.1.3 Testing the Installation
  56.1.2 Windows
    56.1.2.1 Installing Python
    56.1.2.2 Installing the Blueprint Processor from Zip File
    56.1.2.3 Testing the Installation

56.2 Optional Components for Graphical Summary Report

56.3 Running the Blueprint Processor

56.4 Blueprint Processing Phases
  56.4.1 Initialization
  56.4.2 Input Parameter Evaluation
  56.4.3 Resource Creation
  56.4.4 Outputs

56.5 Language Specifics

56.6 Overview of Blueprint Content
  56.6.1 Inputs Section
    56.6.1.1 Example 1
    56.6.1.2 Example 2
    56.6.1.3 Example 3
  56.6.2 Resources Section
  56.6.3 Outputs Section
  56.6.4 Data Section
  56.6.5 Macros Section
  56.6.6 Expressions
    56.6.6.1 Path Expressions
    56.6.6.2 Operator Summary
    56.6.6.3 Example: Viewing all values of Info
    56.6.6.4 Examples: Viewing Blueprint Values
    56.6.6.5 Examples: Browsing Your Cloud
    56.6.6.6 Eval or Blueprint Expressions
  56.6.7 Intrinsic Functions
    56.6.7.1 Evaluation Intrinsics
    56.6.7.2 Resource Access Intrinsics
    56.6.7.3 Lookup Intrinsics
56.6.7.4 Debugging Intrinsic
56.6.7.5 Other Intrinsic

56.7 Dealing with Errors
56.7.1 YAML Syntax Errors
56.7.2 Protocol Version Mismatch
56.7.3 Expression Evaluation Error
56.7.4 Cloud Resource Creation Error

56.8 Simulation Mode

56.9 Debugging with the Blueprint Processor
56.9.1 Printing Intermediate Results
56.9.2 Pause Points
56.9.3 Breakpoints
56.9.4 Debugger Commands
56.9.4.1 Path Command
56.9.4.2 Continue Command
56.9.4.3 Exit Command
56.9.4.4 Eval Command

56.10 Tips and Hints
56.10.1 Editing YAML - Notepad ++ Example
56.10.2 YAML Duplicate and Name / Value Pairs
56.10.3 Explicit Dependencies
56.10.4 Hint: Use `-T` Option
56.10.5 Help Forums

57 Infrastructure as a Service REST APIs

57.1 Summary of Infrastructure as a Service REST APIs
57.2 Infrastructure as a Service Resource Model
57.2.1 Changes for Infrastructure as a Service
57.2.2 IaaS Zone [application/oracle.com.cloud.iaas.Zone]
57.2.3 AssemblyInstance [application/oracle.com.cloud.common.AssemblyInstance+json]
57.2.4 Scalability Group [application/oracle.com.cloud.common.ScalabilityGroup+json]
57.2.5 VM [application/oracle.com.cloud.common.VM+json]
57.2.6 VNet [application/oracle.com.cloud.common.VNet+json]
57.2.7 NetworkInterface [application/oracle.com.cloud.common.NetworkInterface+json]
57.2.8 VMTemplate [application/oracle.com.cloud.common.VMTemplate+json]
57.2.9 AssemblyTemplate [application/oracle.com.cloud.common.AssemblyTemplate+json]
57.2.10  IaasServiceFamilyType [application/oracle.com.cloud.iaas.IaasServiceFamilyType+json] 57-12
57.2.11  Iaas Quota Definition [application/oracle.com.cloud.iaas.Quota+json] 57-13

57.3  Infrastructure as a Service REST API Examples 57-14

57.3.1  Creating a Service Instance 57-15
  57.3.1.1  Creating a VM 57-15
  57.3.1.2  Viewing Details of the VM Creation Status 57-18
  57.3.1.3  Creating an Assembly Instance 57-20

57.3.2  Updating a VM Service Instance 57-37
  57.3.2.1  Changing the VM Status 57-37
  57.3.2.2  Changing the VM Size 57-41
  57.3.2.3  Adding a VM Disk 57-42

57.3.3  Deleting a Service Instance 57-44

57.3.4  Listing Service Instances 57-45

57.3.5  Searching Service Templates 57-46

57.4  Support for Version 1000 57-49

58  Testing as a Service REST APIs

58.1  Summary of Testing as a Service REST APIs 58-2

58.2  Introduction to Testing as a Service REST API 58-4
  58.2.1  How to Use Testing as a Service REST API 58-4

58.3.23  Operation 58-34
58.3.24  TestType 58-36
58.3.25  Target 58-36
58.3.26  OltAgent 58-37

58.4  Testing as a Service REST API Examples 58-38
58.4.1  Viewing Details of all Applications 58-39
58.4.2  Querying an Application by Context ID 58-39
58.4.3  Viewing Details of All Test Assets 58-40
58.4.4  Querying a Test Asset by Context ID 58-40
58.4.5  Viewing Details of all Test Environments 58-41
58.4.6  Querying a Test Environment by Context ID 58-41
58.4.7  Viewing Details of all Test Drivers 58-42
58.4.8  Querying a Test Driver by Context ID 58-42
58.4.9  Querying Test Driver Type by Context ID 58-43
58.4.10  Viewing Details of all Test Environment Instances 58-43
58.4.11  Querying a Test Environment Instance by Context ID 58-44
58.4.12  Creating a Test Environment Instance 58-45
58.4.13  Executing an Operation on Test Environment / Driver Instance 58-46
58.4.14  Deleting a Stopped Test Environment Instance 58-47
58.4.15  Viewing Details of All Test Driver Instances 58-47
58.4.16  Querying a Test Driver Instance by Context ID 58-47
58.4.17  Creating a Test Driver Instance 58-48
58.4.18  Deleting a Stopped Test Driver Instance 58-49
58.4.19  Viewing Details of All Tests 58-49
58.4.20  Querying a Test by Context ID 58-50
58.4.21  Creating a Test 58-51
58.4.22  Updating a Test 58-52
58.4.23  Deleting a Test 58-53
58.4.24  Viewing Details of All Trials 58-53
58.4.25  Querying a Trial by Context ID 58-54
58.4.26  Creating a New Trial 58-54
58.4.27  Updating a Trial 58-55
58.4.28  Deleting a Trial 58-56
Preface

This book describes how to set up a Private Cloud, manage and deploy virtualization targets with Oracle Enterprise Manager. The preface covers the following:

• Audience
• Supported Plug-ins
• Documentation Accessibility
• Related Documents
• Conventions

Audience

This document is intended for administrators who want to setup and manage the cloud infrastructure. It is also intended for Cloud Administrators, Self Service Administrators and Self Service Users.

Supported Plug-ins

The features in this book pertain to the following plug-ins:

Note:

It is recommended that you check the My Oracle Support Note 1549855.1 for the latest patches.

Part I

Cloud Management Overview

This section provides an introduction to the Oracle Cloud offering and explains the various Cloud service models available.

It contains the following sections:

• Cloud Management - An Overview
Cloud Management - An Overview

This chapter introduces Cloud Management and provides an overview of the various service offerings and components available with the Oracle Cloud platform. It also describes the Consolidation Planner, which is useful in planning your Cloud requirements, as well as various life cycle management capabilities of Oracle Enterprise Manager including resource management, metering and chargeback support.

This chapter contains the following sections:

• Introduction to Cloud Management
• Managing the Cloud Management Lifecycle With Enterprise Manager
• Understanding the Oracle Cloud Service Models
• Accessing Oracle Cloud Features

1.1 Introduction to Cloud Management

Enterprises and Cloud service providers can use Oracle Enterprise Manager to build and operate their Cloud services. The functionality provided by Enterprise Manager spans the entire Cloud lifecycle and allows you to setup and manage any type of Cloud service.

Enterprises must support hundreds or even thousands of applications to meet growing business demands. This growth has driven up the cost of acquiring and managing servers and storage. Clouds enable customers to consolidate servers, storage, and database workloads onto a shared hardware and software infrastructure.

By providing on-demand access to servers and storage in a self-service, elastically scalable and metered manner, Enterprise Manager offers the following benefits.

• **Increasing Quality of Service**: IT organizations are not only trying to drive down costs, they are also looking at solutions that will simultaneously improve quality of service in terms of performance, availability and security. Cloud consumers inherently benefit from the high availability characteristics built into the Cloud.

  Organizations can also enforce a unified identity and security infrastructure as part of standardized provisioning. Thus, instead of bolting on security policies, these policies and compliance regulations are part of the provisioning process.

• **Enabling Faster Deployment**: Building the Cloud infrastructure using standard building block components (for example, servers, CPUs, storage, and network), configurations, and tools, enables a streamlined, automated, and simplified deployment process.

• **Providing Resource Elasticity**: The ability to grow and shrink the capacity of a given database, both in terms of storage size and compute power, allows applications the flexibility to meet the dynamic nature of business workloads.

• **Rapid Provisioning**: Databases in a Cloud can be rapidly provisioned, often by way of a self-service infrastructure, providing agility in application deployment.
1.2 Managing the Cloud Management Lifecycle With Enterprise Manager

Enterprise Manager allows you to manage the entire Cloud lifecycle which includes the following:

- Planning
- Setting Up the Cloud
- Building the Cloud
- Testing and Deploying a Service
- Monitoring and Managing the Cloud
- Metering, Charging, and Optimization

Figure 1-1  Cloud Lifecycle

1.2.1 Planning

Using Enterprise Manager, you can transform existing data centers into a Cloud environment. Before setting up a Cloud, you should map out your infrastructure.
requirements, such as the physical and virtual networks, storage arrays, applications and so on.

The Enterprise Manager Consolidation Planner is a powerful tool that helps administrators plan the Cloud architecture. It allows you to identify source and destination targets and applicable technical and functional constraints such as where the application can reside, and so on. You can generate consolidation advisories that may include plans to move from Physical to Virtual (P2V), Physical to Physical (P2P), or Physical to an Exadata solution. The Consolidation Planner can also be used to identify the database consolidation plan which is helpful when setting up Database-as-a-Service (DBaaS). See Enterprise Manager Consolidation for details.

1.2.2 Setting Up the Cloud

Enterprise Manager can be used to model Infrastructure-as-a-Service (IaaS), Database-as-a-Service (DBaaS), and Middleware-as-a-Service (MWaaS) clouds. It is important to select the appropriate Cloud Service Model (as discussed in Understanding the Oracle Cloud Service Models) that suits the needs of your users and organization. To facilitate Cloud setup, Enterprise Manager offers capabilities for both physical and virtual infrastructure.

For physical infrastructure, Enterprise Manager leverages its core automation framework of deployment procedures, job system, and the enterprise software library. It offers out of the box deployment procedures that can be used for provisioning the pre-requisite software for both databases and middleware. The same automation framework is also used to interact with third party storage systems for the purposes of data cloning and storage management. For virtual infrastructure, it offers bare metal provisioning of hypervisor and setting up server and storage pools. Once completed, you can group all of these into zones based on functional or QoS characteristics.

Enterprise Manager leverages the Virtualization Storage Connect technology, where the Cloud setup process is integrated with storage technologies like Netapp, Hitachi, Fujitsu. Administrators can define standardized service templates for databases and middleware platforms, and publish these as services. These services can represent single-tier templates or complex, multi-tier enterprise platforms.

Enterprise Manager uses components called assemblies created by the Oracle Virtual Assembly Builder (OVAB). Assemblies help package a multi-tier platform into a single metadata which can be deployed by the Enterprise Manager Cloud service. An assembly is essentially a complete multi-tier application stack - including database, application server and other middleware components - packaged as a single downloadable entity. When an assembly is deployed, the result is the creation of a set of related virtual machines representing every tier of the application stack.

Using OVAB, platform architects can model the entire platform topology graphically, define all dependencies, deployment constraints, and deliver the entire stack in the form of an assembly. This assembly can then be published to the centralized Software Library in Enterprise Manager, and be made available to developers as a Cloud service – an entire application development stack, that can be provisioned quickly. Administrators can create different types of services depending upon the business needs. For example, administrators may offer a database service based on different versions of the Oracle database, but only the ones approved for use within the business.

Enterprise Manager supports role-driven access control. Resource limits, or quotas, are assigned to roles to control access to services. This prevents unauthorized usage
1.2.3 Building the Cloud

Enterprise Manager allows entire applications or components to be packaged and published to the Cloud as a service. This expedites application development and provisioning processes within an organization.

Developers can publish utility components and applications in the form of assemblies and service templates for reuse within their groups. Similarly, allowing applications to be available as assemblies allows testing teams, business analysts or production teams to deploy pre-built applications in a few clicks.

1.2.4 Testing and Deploying a Service

After an application has been built, it needs to be tested. Enterprise Manager provides a testing portfolio that allows users to test both application changes and changes to the database. The testing solution provides the ability to capture a production load and replay in a test environment, so that the results are predictable. The testing solution also leverages the diagnostic capabilities built into the technology layers and provides prescriptions for remediation. Enterprise Manager provides a self-service application that lets end-users deploy a service. This self-service application can also be customized. End users can choose to provision application assemblies, along with databases and platforms, in an on-demand manner. For each request, users can specify the amount of underlying resources such as CPU, memory, and so on that they require for each component. Enterprise Manager automatically provisions the requested service and the appropriate resources. The self-service application also lets users define policies to scale out or scale back resources based on schedule or performance metrics. For example, a user could set a policy to elastically scale out a Web server if the processor load on existing Web servers exceeds a certain threshold value.

1.2.5 Monitoring and Managing the Cloud

Enterprise Manager offers a number of inherent monitoring and management features that collectively comprise a full Cloud management system.

For example, Enterprise Manager provides the ability to collate targets into groups for better manageability. The Administration Group feature allows administrators to define monitoring settings, compliance standards and cloud policies through templates and also organize each target in multiple hierarchies, such as Line of Business and Lifecycle status. This allows the monitoring framework to scale to thousands of servers, databases and middleware targets in the Cloud.

Enterprise Manager’s built-in Incident Management system allows you to monitor the Cloud for complex operational issues that may affect performance. You can review, suppress, escalate and remediate events that occur as needed, and even integrate incident escalation with existing support ticketing systems. See the Enterprise Manager Cloud Control Administrator’s Guide for details. Contractual Service Level Agreements (SLAs) can be defined to govern the contract between the application owner and the provider of the Cloud. Administrators as well as users can also define management policies that automatically adjust the service resources to ensure that SLAs are met.
The configuration management capabilities of Enterprise Manager are optimized for Cloud environments. For example, Enterprise Manager can monitor vast numbers of configurations continuously to discover changes, measure drifts, pin-point configuration errors, and offer insight into system topologies - all through a single console. Enterprise Manager Cloud management capabilities are also integrated with My Oracle Support. This integration delivers facilities such as Patch Advisories, Service Request Management, Knowledge Management right on-premise and in-context of the overall Cloud.

The IaaS, DBaaS, and MWaaS Home pages provided through the Enterprise Manager Cloud Control user interface allow Cloud administrators to get a summary view of the requests, the general state of the service such as zones, pools, servers, service instances, and databases.

1.2.6 Metering, Charging, and Optimization

The Metering and Chargeback features in Enterprise Manager enable enterprises to account for actual usage versus representative usage. Administrators can also extend the pricing models to account for fixed costs, configurations, administrative expenses, people costs, energy utilization or a combination of these. Cloud Management also entails an ongoing optimization of resources as well as processes to make sure that the service levels are persistent. Enterprise Manager provides administrators and application users with features that help rediscover assets, re-evaluate the performance, rebalance the Cloud, and fine-tune the provisioning process. Chargeback supports basic metrics like CPU, memory, and storage usage. It also offers pricing models based on application usage, database usage, and Middleware-level metrics.

1.3 Understanding the Oracle Cloud Service Models

This section describes the available Oracle Cloud service models available.

- Oracle Cloud Service Models
- Oracle Cloud Anatomy
- IaaS Components
- DBaaS and MWaaS Components
- TaaS Components

1.3.1 Oracle Cloud Service Models

Oracle’s Cloud service models can be divided into two primary categories: Infrastructure as a Service, which allows users to request the physical infrastructure required to run applications; and Platform as a Service, which provides the database and middleware components required by applications.

- **Infrastructure as a Service (IaaS) Service Model**: In the IaaS model, users request servers that are created as guest virtual machines, or Guest VMs.

  The IaaS model allows users to request Guest VMs using the Self Service Portal in Enterprise Manager. It also allows users to specify an assembly or a template that is to be deployed on the requested Guest VMs. Using pre-packaged assemblies consisting of the operating system, database software and middleware software, a platform can be deployed using this service.
Users can monitor the services provided using the Self Service Portal and perform limited management operations as permitted. They can also run chargeback reports to review resource usage and chargeback amounts calculated for the resources consumed.

IaaS cloud infrastructure can be built out of Oracle hardware and software components such as Oracle VM, Oracle Solaris, Oracle Enterprise Linux, and so on, or it may have 3rd party components.

- **Platform as a Service (PaaS) Service Model:** The PaaS model allows you to create platforms onto which consumers can deploy their own applications. A platform resource is typically comprised of a host, an operating system, an Oracle WebLogic Application server - all of which can be virtualized. It can also include an Oracle database or RAC cluster.

Models available with PaaS include:

- **Database as a Service (DBaaS) Service Model:** In this model, users can request database services (single instance or RAC) through the Self Service Portal. DBaaS is implemented through several options:
  
  - **Virtual Machine Based:** The database is deployed as a part of a virtual assembly or template, and several virtual machines share the same physical server. This offers the maximum level of isolation (at the operating system level).
  
  - **Shared Cluster:** The database is deployed on existing clusterware. Typically the grid infrastructure (Oracle Clusterware, ASM) and database software is pre-installed; the Cloud service essentially consists of the deployment of databases on top of that infrastructure.
  
  - **Shared Installation:** The database is deployed as a single instance database on an existing database installation.
  
  - **Pluggable Database as a Service:** A pluggable database is deployed. This model provides high consolidation, and minimal administrative and maintenance overhead.
  
  - **Snap Clone:** You can make a thin-clone using copy on write technology of the database. This model requires minimal space, provides instantaneous cloning, and is ideal for functional testing.
  
  - **Full Clone:** You can make a full copy of the database. This model is ideal for load testing with significant data updates.
  
  - **Shared Database (Schema as a Service):** The database service is a schema deployment on an existing database. It is assumed for purposes of metering and chargeback that each of the consumers of the database will use a different service while accessing the database. This service model is also referred to as Schema as a Service.

As in IaaS, users are allowed to perform a few administrative tasks such as start/stop, backup, and recovery of databases. Chargeback reports are also made available for Self Service users.

- **Middleware as a Service (MWaaS):** In this model, users submit requests for middleware domains to be created. Applications can then be deployed into these domains. MWaaS is implemented through the following option:
  
  - **Physical Provisioning Based:** The MWaaS platform is built using physical hosts and Fusion Middleware Provisioning.
Testing as a Service (TaaS): In this model, testing can be made faster and simpler though the Cloud Testing Self Service Portal. The applications being tested can be provisioned to the private cloud using assemblies or to an existing Enterprise Manager target. The TestDrivers need to be provisioned into the private cloud.

1.3.2 Oracle Cloud Anatomy

In the Oracle implementation, Clouds are composed of logical zones. Zones are composed of logical pools and pools are composed of targets on hosts.

The pools in an IaaS zone are collections of one or more Oracle VM servers and their associated storage resources. The pools in DBaaS zones are collections of one or more Oracle Database homes (used for database requests), or databases (used for schema requests) of the same platform and version (for example, Oracle Database 11.2.0.3 RAC on Oracle Linux 6 x86-64), or Oracle Middleware homes of the same platform and version (for example, Oracle Database 11.2.0.2 on Linux x86-64).

In either IaaS or PaaS, Self Service users will request resources at the zone level from a catalog of templates. Enterprise Manager will then determine which pool in the chosen zone can be used to satisfy the request. The needed Enterprise Manager jobs will be initiated on one or more hosts in the selected pool to create the entities required to fulfill the request.

In an IaaS Cloud, self-service users request that servers be created. These are actually guest virtual machines, or Guest VMs. A single IaaS request may result in one or more virtual machines being created complete with database(s), middleware software and deployed applications.

In the DBaaS view of a PaaS Cloud, a self-service user can request that new databases or schemas in existing databases be created. Databases can be single instance or RAC, depending upon the zones and catalog templates to which the user has access. Similarly, in the MWaaS view of the PaaS Cloud, self-service users request that middleware domains be created.

Figure Figure 1-2 shows the Cloud anatomy.
1.3.3 IaaS Components

The IaaS Cloud model consists of the following components:

- **Cloud**: A *Cloud* is a set of storage pools, server pools and zones under the programmatic control of a Cloud Controller and the administrative control of the Cloud Administrator. The Cloud Administrator works with the Cost Center Administrator who has paid for the cloud to determine a resource allocation and charge back policy that meets their needs.

- **Zone**: A Cloud can consist of one of more zones. A zone is a logical grouping of resources - for example, servers and storage entities - that facilitate self-service provisioning and administration. A typical zone may consist of hundreds to thousands of servers.

A zone can be an empty zone or consist of a set of server pools. The second case may be simple to set up and will not require shared storage; however no HA and live migration is permitted within this zone.
Zones are non-overlapping, which means that a resource can only belong to one zone. However, resources within a zone may be accessible from another zone. For example, it is possible for a virtual machine in Zone 1 to interact with a virtual machine in another zone.

- **Server Pool**: A server pool is a set of tightly coupled group of servers (typically up to 32 servers) that hosts a set of Guest VMs. The servers are assumed to be largely homogeneous in capabilities and in connectivity. High Availability and Live Migration is permitted within a server pool boundary. Each server pool needs to have access to a shared storage subsystem (which could just be an NFS mount point) to facilitate live migration. In addition, access to a clustered file system may be required to maintain the HA heartbeat file.

- **Storage Entity**: A storage entity is an individual file system or block store. Each storage entity is served by a storage pool. Some entities are free standing and will exist until they are deleted. Other storage entities that are associated with one or more Guest VMs are deleted when those VMs are retired.

- **Storage Pool**: A storage pool is an abstract storage system that hosts a set of storage entities. A storage pool is generally implemented using a set of storage devices such as disks, SSDs, and storage servers.

### 1.3.4 DBaaS and MWaaS Components

The DBaaS and MWaaS Cloud structures consist of the following:

- **PaaS Infrastructure Zone**: A PaaS infrastructure zone is a group of hosts. Each resource in a zone represents a location at which a service instance is to be deployed.

  Before you enable or setup DBaaS or MWaaS, you must create a PaaS Infrastructure Zone which allows you to define the placement policy constraints for a specified set of targets and the users to whom this zone will be available.

- **Software Pool**: A software pool is a set of homogeneous resources. You can create software pools for DBaaS and MWaaS. A Database Pool, which is created in DBaaS, is a collection of database homes, databases, or container databases depending on the type of cloud service model selected. You can create a Middleware Pool, used for MWaaS, which is a collection of hosts.

  A software pool has the following constraints:
  - A target can belong to only one software pool.
  - The name of the software pool and the version cannot be modified after it has been created.
  - All targets in a software pool must be homogeneous.
  - A service template can use multiple zones but only one software pool within each zone.

- **Database Provisioning Profile**: A database provisioning profile is an entity that captures source database information for provisioning. A profile can represent a complete database or a set of related schemas that form an application.

- **Middleware Provisioning Profile**: A middleware provisioning profile is used to standardize deployments and help reduce errors when deployment procedures are configured.
• **Service Template**: A *service template* is a standardized service definition that is offered to self service users to create databases, schemas, or middleware services.

### 1.3.5 TaaS Components

The TaaS solution is based on the IaaS platform. Before you set up TaaS, ensure that you have set up Enterprise Manager, and the IaaS components. To use TaaS with the Oracle Load Testing TestDriver, you must download this though the Enterprise Manager self-update.

### 1.4 Accessing Oracle Cloud Features

Access to the Oracle Cloud features is either through the standard Enterprise Manager console, or the Self Service Portal, which is also part of Enterprise Manager.

Access to the rest of the Enterprise Manager functionality is restricted. This allows enterprises to safely implement Clouds without worrying about exposing the entire infrastructure to the end users.

#### 1.4.1 Enterprise Manager Cloud Control Console

Administrators will use the Enterprise Manager Cloud Control console to set up, monitor, and manage Cloud services. Each service is managed using a page specific to that service. For example, IaaS, DBaaS, MWaaS, and TaaS all have their own pages that can be accessed directly from the Cloud Summary page or from the Enterprise Manager menu.

The Enterprise Manager Cloud Summary page is a single pane that contains the summary of all Cloud services. Enterprise Manager enables a layer of abstraction that hides the underlying complexities of the application from the end-user. This abstraction is delivered via a self-service interface, both in Graphical User Interface (GUI) and Application Programming User Interface (API).

#### 1.4.2 Self Service Portal

To directly manage the Cloud infrastructure, Enterprise Manager provides an out-of-the-box Self Service Portal that allows self-service users to access Cloud services (provisioning applications) without IT intervention. It provides several pre-packaged virtual assemblies and templates for on-demand provisioning, tracks usage of services and resources, and allows data to be used for Chargeback reports and capacity planning.

The Self Service Portal is the Home Page for the self service user. Users who have the necessary privileges can navigate between Services pages by clicking the appropriate radio button. How you use the Portal will vary depending on the type of service you are managing.
Part II
Setting Up and Enabling Cloud

This section provides an introduction to virtualization concepts and describes how to start managing virtualization targets in Enterprise Manager.

It contains the following sections:

- Setting Up the Cloud Management Infrastructure
- How to Enable Cloud
2

Setting Up the Cloud Management Infrastructure

This chapter describes the initial setup needed before you can begin using the Enterprise Manager Cloud Management solution. The chapter includes the following sections:

• Setting Up Self Update
• Deploying the Required Plug-ins
• Defining Roles and Assigning Users
• Configuring LDAP Authentication
• Configuring Privilege Delegation Settings
• Customizing the Self Service Login Page

Note:
From the Enterprise Manager 12.1.0.4 release, the Software Library is configured during the installation of Enterprise Manager. It need not to be separately configured.

2.1 Setting Up Self Update

The Self Update feature allows you to expand Enterprise Manager's capabilities by updating Enterprise Manager components whenever new and updated features become available between official releases. Oracle makes functional updates available between releases by publishing them to the Enterprise Manager Store, an external site that is periodically checked by Enterprise Manager to obtain information about available updates.

The updatable entities for the Oracle Cloud platform include:

• Cloud Plug-ins. See Deploying the Required Plug-ins
• Oracle VM Templates and Assemblies. See Using Self Update to Download Oracle VM Templates and Virtual Assemblies.
• Database Provisioning Profiles. See Creating a Container Database Provisioning Profile Using Database Template.
• Middleware Provisioning Profiles. See Creating Provisioning Profiles.

Before you can use the Self Update feature, you must satisfy these prerequisites:

• If you are applying an update in online mode, ensure that the My Oracle Support credentials have been set up using the SYSMAN user. This is required to enable entities to be downloaded from the My Oracle Support site.
The Software Library (also known as the local store) has been configured. Updates are downloaded to this local store before being deployed into Enterprise Manager.

Review the following sections for instructions on setting up Self Update:

- Setting Up Enterprise Manager Self Update Mode
- Assigning Self Update Privileges to Users
- Setting Up the EM CLI Utility (Optional)

### 2.1.1 Setting Up Enterprise Manager Self Update Mode

In order to set up or modify the Enterprise Manager Self Update feature, you must have Enterprise Manager Super Administrator privileges.

1. Log in to Enterprise Manager as an administrator with Super Administrator privileges.
2. From the Setup menu, select Extensibility, then select Self Update. The Self Update console appears with the default setup displayed.
3. From the General status area, click the Connection Mode status to set either offline or online mode. Enterprise Manager takes you to the Patching Setup page to specify online and offline settings.
4. Once the desired connection mode has been selected, return to the Self Update console.
   From here you can select entity types and schedule updates from the Enterprise Manager Update Store.

### 2.1.2 Assigning Self Update Privileges to Users

Enterprise Manager administrators must have the requisite privileges to use the Self Update feature. The Enterprise Manager Super Administrator must assign the following Self Update roles to these administrators:

- VIEW_SELF_UPDATE: The user can view the Self Update console and can monitor the status of download and apply jobs.
- MANAGE_SELF_UPDATE: The user can schedule download and apply jobs. User can also suppress/unsuppress updates. This privilege implicitly contains VIEW_SELF_UPDATE.
- EM_INFRASTRUCTURE_ADMIN: The user can perform all self update operations. This privilege implicitly contains MANAGE_SELF_UPDATE.

By default, the Super Administrator will be granted EM_INFRASTRUCTURE_ADMIN privilege.

To assign Self Update privileges to regular Enterprise Manager administrators:

1. From the Setup menu, select Security, then select Administrators.
2. Select an administrator and click Edit.
3. From the Roles page, assign the appropriate Self Update roles.
2.1.3 Setting Up the EM CLI Utility (Optional)

If you plan to apply software updates in offline mode, you will need to use the Enterprise Manager Command Line Utility, or EM CLI, to import entity archives for deployment to Enterprise Manager.

A page is provided in the Enterprise Manager Cloud Control console with instructions on setting up EMCLI. Access the page by appending `/console/emcli/download` to the URL used to access the Cloud Control console:

https://emcc_host:emcc_port/em

For example:

https://emcc_host:emcc_port/em/console/emcli/download

2.2 Deploying the Required Plug-ins

Much of the functionality available in Enterprise Manager Cloud Control is made available through plug-ins. As its name implies, a plug-in is a component or module that can be plugged into an existing Enterprise Manager installation to extend its management and monitoring capabilities.

The features that collectively comprise the Oracle Cloud Management solution are provided via several plug-ins which must be deployed to your Oracle Management Service (OMS). The plug-ins that must be deployed to enable each Cloud model are listed below.

You can deploy the plug-ins needed to enable Cloud in two ways:

- If you have not yet installed Enterprise Manager Cloud Control, or have not yet upgraded to the latest Enterprise Manager release, you can deploy the plug-ins as part of the installation or upgrade process. You will select the Advanced Install mode and in the Select Plug-ins screen, select the plug-ins that you wish to install.

- If you already have Enterprise Manager Cloud Control 12c installed, you must download the needed plug-ins to the Software Library. You can then deploy the plug-ins to your Oracle Management Service (OMS).

See the Enterprise Manager Cloud Control Administrator's Guide for instructions on downloading and deploying the plugins.
Note:

- The default plugins are:
  - Enterprise Manager for Oracle Database
  - Enterprise Manager for Oracle Fusion Middleware
  - Enterprise Manager for Oracle Cloud Framework
- The Enterprise Manager for Oracle Consolidation Planning and Chargeback plugin is an optional plugin for all service families and is required only if you are using the chargeback features.
- For a complete list of all cloud plug-ins along with the version numbers, see Supported Plug-ins. You must check for any plug-ins updates that are available and ensure that the latest version has been downloaded.

Plug-ins Required to Enable Infrastructure as a Service (IaaS)

- Enterprise Manager for Oracle Cloud (listed as Oracle Cloud Application in Self Update)
- Enterprise Manager for Oracle Virtualization (listed as Oracle Virtualization in Self Update)
- Enterprise Manager for Oracle Virtualization Infrastructure (listed as Oracle Virtual Infrastructure in Self Update)
- Enterprise Manager for Oracle Cloud Framework (listed as Oracle Cloud Framework in Self Update)
- Enterprise Manager for Oracle Consolidation Planning and Chargeback (listed as Oracle Consolidation Planning and Chargeback in Self Update)

Plug-ins Required to Enable Database as a Service (DBaaS)

- Enterprise Manager for Oracle Cloud (listed as Oracle Cloud Application in Self Update)
- Enterprise Manager for Oracle Virtualization (listed as Oracle Virtualization in Self Update)
- Enterprise Manager for Oracle Consolidation Planning and Chargeback (listed as Oracle Consolidation Planning and Chargeback in Self Update)
- Enterprise Manager for Oracle Database (listed as Oracle Database in Self Update)
- Enterprise Manager for Storage Management (listed as Oracle Storage Management Framework in Self Update)
- Enterprise Manager for Oracle Cloud Framework (listed as Oracle Cloud Framework in Self Update)
When you are upgrading to the latest plugin versions, you must upgrade them in the following sequence:

1. Enterprise Manager for Oracle Cloud Framework
2. Enterprise Manager for Oracle Database
3. Enterprise Manager for Oracle Fusion Middleware (Mandatory even if not performing any Fusion Middleware or Middleware as a Service operations).
4. Enterprise Manager for Oracle Virtualization
5. Enterprise Manager for Oracle Cloud (This plugin cannot be upgraded unless the Enterprise Manager for Oracle Fusion Middleware plugin has been upgraded).
6. Enterprise Manager for Storage Management

Plug-ins Required to Enable Middleware as a Service (MWaaS)

- Enterprise Manager for Oracle Consolidation Planning and Chargeback (listed as Oracle Consolidation Planning and Chargeback in Self Update)
- Enterprise Manager for Oracle Fusion Middleware (listed as Oracle Fusion Middleware in Self Update)
- Enterprise Manager for Oracle Cloud Framework (listed as Oracle Cloud Framework in Self Update)
- Enterprise Manager for Oracle Virtualization (listed as Oracle Virtualization in Self Update)

Note:

- The Enterprise Manager for Cloud and the Enterprise Manager for Oracle Virtualization plugins are not required if you are using Middleware as a Service for the first time. The features that are part of these plugins have now been bundled with the Enterprise Manager for Oracle Fusion Middleware 12.1.0.7 plugin onwards.
- If you have already deployed the Enterprise Manager for Cloud plugin (12.1.0.8 or earlier), you must upgrade the following plugins to use the new features in this release:
  - Enterprise Manager for Oracle Cloud to 12.1.0.10
  - Enterprise Manager for Oracle Cloud Framework to 12.1.0.3
  - Enterprise Manager for Oracle Virtualization to 12.1.0.8
  - Enterprise Manager for Oracle Fusion Middleware to 12.1.0.8

Plug-ins Required to Enable Testing as a Service (TaaS)
2.3 Defining Roles and Assigning Users

Roles are named groups of related system and object privileges. You can create roles and then assign them to users and to other roles. You can assign any of the existing roles to a new role and the associated privileges. Enterprise Manager contains four out-of-the-box roles for the Cloud Self Service Portal, namely:

- **EM_CLOUD_ADMINISTRATOR**: Users with this role can set up and manage the cloud infrastructure. This role is responsible for deploying the cloud infrastructure (servers, zones, storage, and networks) and infrastructure cloud operations for performance and configuration management. This user has the following privileges:
  - Access to all services and service families.
  - Privileges to manage any service or service family.
  - Privileges to view any target.

- **EM_SSA_ADMINISTRATOR**: Users with this role can define quotas and constraints for the self service users and grant them access privileges. Users with this role also have provisioning and patching designer privileges that allow them to create and save deployment procedures, create and view patch plans, and support the plug-in lifecycle on the Management Agent. These privileges are required for initial setup and on going maintenance of the infrastructure. This user has the following privileges:
  - Access to all services and service families.
  - Privileges to manage any service or service family.
  - Privileges to view any target.

Apart from this default role, you can create custom self service administrator roles with access to specific service families and specific services.

- **EM_SSA_ADMINISTRATOR_BASE**: Users with this role do not have access to any services or service family. This user has View Any Target privilege only.

- **EM_SSA_USER**: Users with this role, by default, can only access the Self Service Portal and all the service families. An administrator with the EM_SSA_ADMINISTRATOR role can provide additional privileges that allow users with the EM_SSA_USER role to access other features in Enterprise Manager.
• **EM_SSA_USER_BASE**: Users with this role can access the Self Service Portal but will not have access to any service family. Access to a specific service family (DBaaS, MWaaS, and so on) needs to be explicitly granted to the users with this role. This user has the following privileges:
  – Can submit service requests.
  – Can view PaaS Infrastructure Zone targets.

The table below lists the roles associated with each user.

<table>
<thead>
<tr>
<th>User Profile</th>
<th>EM_CLOUD_ADMINISTRATOR</th>
<th>EM_SSA_ADMINISTRATOR</th>
<th>EM_SSA_USER</th>
<th>EM_SSA_USER_BASE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum roles required to create a user</td>
<td>EM_CLOUD_ADMINISTRATOR</td>
<td>EM_SSA_ADMINISTRATOR</td>
<td>EM_SSA_USER</td>
<td>EM_SSA_USER_BASE</td>
</tr>
<tr>
<td>Roles to be removed when creating a user</td>
<td>NONE</td>
<td>NONE</td>
<td>PUBLIC</td>
<td>NONE</td>
</tr>
<tr>
<td>NONE</td>
<td>Additional roles may be added as required</td>
<td>NONE</td>
<td>NONE</td>
<td>NONE</td>
</tr>
</tbody>
</table>

The Oracle Cloud Self Service Portal is intended for end-users to be able to provision and manage their own cloud services. Since the functions performed by users with the EM_CLOUD_ADMINISTRATOR and EM_SSA_ADMINISTRATOR roles are consistent across Enterprise Manager, these out-of-box roles can be used as they are. All you need to create users with the EM_CLOUD_ADMINISTRATOR and EM_SSA_ADMINISTRATOR roles.

If you want to restrict access to certain service families and specific service types, you can create custom self service administrator roles based on the out-of-the-box EM_SSA_ADMINISTRATOR role.

But the EM_SSA_USER and EM_SSA_USER_BASE roles are used for quota assignment, and to limit access to PaaS Infrastructure zones, and service templates. In this case, the pre-defined role cannot be used as it is defined. You must create custom self service user roles based on the standard EM_SSA_ROLE and EM_SSA_USER_BASE roles as described in Creating Custom Roles for Self Service Application Administrators and Users. After creating a custom role, you must assign users to this role.

For example, in a DBaaS Cloud setup, you may want to create the following users:

• **CLOUD_ADMIN**: This user will have the EM_CLOUD_ADMINISTRATOR role and is responsible for network, system, storage, and administration activities.

• **SSA_ADMIN_DBAAAS**: This user will have the EM_SSA_ADMINISTRATOR role but will have access only to the Database Service Family. Users with this role will be responsible for all database administration activities. You can further restrict access by granting access to only a certain service type within the Database Service Family.

• **SSA_USER_DBAAAS**: In this case, the default EM_SSA_USER role must be customized and a custom role must be created. A user in this role is typically a junior database administrator, developer, or tester.

• **SSA_USER_BASE_DBAAAS**: In this case, you need to create a copy of the EM_SSA_USER_BASE role and grant access to the Database Service Family to this
You can then create the SSA_USER_BASE user who will have access the Database Cloud Self Service Portal.

For more details on Users and Roles, see the Enterprise Manager Cloud Control Security Guide.

2.3.1 Creating Custom Roles for Self Service Application Administrators and Users

This section describes the following:

- Creating a Custom Role Based on the EM_SSA_ADMINISTRATOR Role
- Creating a Custom Role Based on the EM_SSA_USER Role
- Creating a Custom Role Based on the EM_SSA_USER_BASE Role

2.3.1.1 Creating a Custom Role Based on the EM_SSA_ADMINISTRATOR Role

You can create a custom self service administrator role and grant access to the Database Service Family. You can grant privileges to users with this role to access all service types or specific service types and view or manage the services. To create a custom role, follow these steps:

1. Log in to Enterprise Manager as a Super Administrator user.
2. From the Setup menu, select Security, then select Roles.
3. Click Create in the Roles page to launch the Create Role wizard.
4. Provide a name and description (SSA_ADMIN_DBAAS) for the role and click Next.
5. From the list of Available Roles, select the EM_SSA_ADMINISTRATOR role and move it to the Selected Roles table. Click Next.
6. Accept the default target privileges and click Next.
7. In the Resource Privileges page, click the Edit icon for the Cloud Service Families. In the Resource Privileges page, click Add and select DBAAS and click Continue to return to the Manage Privileges page.

Nota:

If you want users with this role to view and manage all the DBaaS service types, click the Manage Resource Privilege Grants icon and select the following privileges:

- View Service Family
- Manage Service Family

8. Click Continue to return to the Resource Privileges page. Click the Edit icon for the Cloud Service Types. Click Add and select the database service type for which the privileges should be granted. You can select one of the following:

- DB
2.3.1.2 Creating a Custom Role Based on the EM_SSA_USER Role

Typically, you need to create new SSA User roles either for different functional groups like developers, testers, production DBAs, or for different customer teams like the Siebel DBA team, BRM DBA team, and operations team for hosting custom Java applications, and so on. To create a custom SSA user role who has access only to the Database Service Family and can submit requests, follow these steps:

1. Log in to Enterprise Manager as a Super Administrator user.
2. From the Setup menu, select Security, then select Roles.
3. Click Create in the Roles page to launch the Create Role wizard.
4. Provide a name and description (SSA_USER_DBAAS) for the role and click Next.
5. From the list of Available Roles, select the EM_SSA_USER role and move it to the Selected Roles table. Click Next.
6. Accept the default target privileges and click Next.
7. In the Resource Privileges page, remove access to the following resource types
   - Cloud Self Service Portal for JVM Diagnostics
   - Cloud Self Service Portal for Test
   - Infrastructure Self Service Portal
8. Click the Manage Privilege Grants for the Cloud Service Families resource type. In the Resource Type Privileges region, select the View Any Service Family checkbox.
9. Click Add in the Resource Privileges region and select the DBAAS service family and click Continue.
10. Skip the Create Role: Administrators step and click Next.
11. Review the changes and click Finish to create the custom SSA user (SSA_USER_DBAAS) role.

2.3.1.3 Creating a Custom Role Based on the EM_SSA_USER_BASE Role

You may want to restrict some self service users from using all service families and allow them to access only certain service types depending on their requirements. In this case, you can create a custom role based on the EM_SSA_USER_BASE role and grant them access to only certain service types.
To create a custom SSA user role, follow these steps:

1. Log in to Enterprise Manager as a Super Administrator user.
2. From the Setup menu, select Security, then select Roles.
3. Click Create in the Roles page to launch the Create Role wizard.
4. Provide a name and description (SSA_USER_BASE_DBAAS) for the role and click Next.
5. From the list of Available Roles, select the EM_SSA_USER_BASE role and move it to the Selected Roles table. Click Next.
6. Select the default target privileges and click Next.
7. In the Resource Privileges page, click the Manage Privilege Grants icon for the Cloud Requests resource type.
8. In the Resource Privileges page, deselect the Create Any Cloud Request checkbox and click Continue.
9. Click the Manage Privilege Grants icon next to the Cloud Service Families and Cloud Service Types resource types and select the service families and service types for which you need access.
10. Skip the Create Role: Administrators step and click Next.
11. Review the changes and click Finish to create the custom SSA user (SSA_USER_BASE_DBAAS) role. This user can only access the Database Cloud Self Service Portal.

2.3.2 Creating a User and Assigning Roles

To create a user called SSA_USER1 and grant the custom role created earlier (SSA_USER_DBAAS), follow these steps:

1. Log in to Enterprise Manager as a Super Administrator user.
2. From the Setup menu, select Security, then select Administrators.
3. Click Create in the Administrators page to launch the Create Administrator wizard.
4. Enter the name and password for the user (SSA_USER1) and create Next.
5. From the list of Available Roles, select the SSA_USER_DBAAS role and move it to the Selected Roles table. Remove the EM_USER and PUBLIC roles from the Selected Roles table. Click Next.
6. Accept the default target privileges and click Next.
7. Accept the default resource privileges and click Next.
8. Review all the changes and click Finish to create the SSA_USER1 user.

**Tip:**

To create multiple users with the same role, select the newly created user and click Create Like. This will create a new user that will have the same properties as the source. You can then update the name, description, and email address for the new user.
### 2.3.3 Granting Roles and Privileges for Managing Storage Servers for Snap Clone

To perform various storage server activities, you need to grant the following roles and privileges:

- **Granting General Privileges**
- **Granting Target Privileges**
- **Granting Roles**
- **Granting Privileges for Provisioning**

#### 2.3.3.1 Granting General Privileges

Table 2-1 displays the general privileges you need to set before you register a storage server.

**Table 2-1  General Privileges for Storage Server Registration and Management**

<table>
<thead>
<tr>
<th>Privilege</th>
<th>Description</th>
<th>Scope</th>
<th>Notion</th>
<th>Included Privilege</th>
</tr>
</thead>
<tbody>
<tr>
<td>VIEW_ANY_STORAGE</td>
<td>Ability to view any storage.</td>
<td>class</td>
<td>VIEW</td>
<td>nil</td>
</tr>
<tr>
<td>REGISTER_STORAGE</td>
<td>Ability to register storage.</td>
<td>class</td>
<td>CREATE</td>
<td>nil</td>
</tr>
<tr>
<td>VIEW_STORAGE</td>
<td>Ability to view storage details.</td>
<td>object</td>
<td>VIEW</td>
<td>nil</td>
</tr>
<tr>
<td>MANAGE_STORAGE</td>
<td>Ability to synchronize storage.</td>
<td>object</td>
<td>EDIT</td>
<td>VIEW_STORAGE, CREATE_JOB</td>
</tr>
<tr>
<td>MANAGE_ANY_STORAGE</td>
<td>Ability to manage any of the registered storage servers.</td>
<td>object</td>
<td>EDIT</td>
<td>VIEW_ANY_STORAGE, CREATE_JOB</td>
</tr>
<tr>
<td>FULL_STORAGE</td>
<td>Ability to modify or remove storage.</td>
<td>object</td>
<td>FULL</td>
<td>MANAGE_STORAGE</td>
</tr>
</tbody>
</table>

#### 2.3.3.2 Granting Target Privileges

Table 2-2 displays the target privilege you need to set, for enabling or disabling Snap Clone for a target.
Table 2-2  Target Privilege for Enabling or Disabling Snap Clone

<table>
<thead>
<tr>
<th>Target Privilege</th>
<th>Scope</th>
<th>Notion</th>
<th>Include In Privilege</th>
<th>Included Privilege</th>
<th>Applicable Target Type</th>
</tr>
</thead>
<tbody>
<tr>
<td>SNAP_CLONE_TARGET</td>
<td>object</td>
<td>Manage</td>
<td>FULL_TARGET</td>
<td>VIEW_TARGET</td>
<td>oracle_database</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
<td></td>
<td></td>
<td>rac_database</td>
</tr>
</tbody>
</table>

2.3.3.3 Granting Roles

Table 2-3 displays the roles you need to grant to be able to register a storage server and perform various activities on the registered storage server.

Table 2-3  Roles for Registering and Managing the Storage Server

<table>
<thead>
<tr>
<th>Role</th>
<th>Description</th>
<th>Security Class</th>
<th>Privilege</th>
<th>Granted To Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>EM_STORAGE_ADMINISTRATOR</td>
<td>Role has privileges to register storage hardware for Snap Clone.</td>
<td>STORAGE STORAGE TARGET TARGET NAMED_CREDENTIALS JOB SWLIB_ENTITY_MGMT</td>
<td>MANAGE_ANY_STORAGE REGISTER_STORAGE VIEW_ANY_TARGET PERFORM_OPERATION_ANYWHERE CREATE_CREDENTIAL CREATE_JOB SWLIB_CREATE_ANY_ENTITY SWLIB_VIEW_ANY_ENTITY</td>
<td>EM_ALL_ADMINISTRATOR</td>
</tr>
<tr>
<td>EM_STORAGE_OPERATOR</td>
<td>Role has privileges to manage storage hardware for Snap Clone.</td>
<td>STORAGE STORAGE TARGET TARGET JOB SWLIB_VIEW_ANY_ENTITY</td>
<td>MANAGE_ANY_STORAGE VIEW_ANY_TARGET PERFORM_OPERATION_ANYWHERE CREATE_JOB SWLIB_VIEW_ANY_ENTITY</td>
<td>EM_ALL_OPERATOR</td>
</tr>
</tbody>
</table>

2.3.3.4 Granting Privileges for Provisioning

You need the following privileges to be able to use the storage server for provisioning:

- **VIEW_STORAGE** on the storage server
- **GET_CREDENTIAL** on the storage server
- **GET_CREDENTIAL** on all the Management Agent credentials of the storage server
- **PERFORM_OPERATION** on the storage server Management Agent
2.4 Configuring LDAP Authentication

Oracle Enterprise Manager provides tools and procedures to help you ensure that you are managing your Oracle environment in a secure manner. Enterprise Manager's authentication framework consists of pluggable authentication schemes that let you use the type of authentication protocol best suited to your environment. The following authentication schemes are available:

- Oracle Access Manager (OAM) SSO
- Repository-Based Authentication
- SSO-Based Authentication
- Enterprise User Security Based Authentication
- Oracle Internet Directory (OID) Based Authentication
- Microsoft Active Directory Based Authentication

Enterprise User Security (EUS) provides automatic authentication to users and roles from the LDAP compliant directory server.

For more details on Enterprise User Security, see the Enterprise Manager Cloud Control Security Guide.

2.5 Configuring Privilege Delegation Settings

Privilege delegation allows a logged-in user to perform an activity with the privileges of another user. Sudo and PowerBroker are privilege delegation tools that allow a logged-in user to be assigned these privileges. These privilege delegation settings will be used for all provisioning and patching activities on these hosts.

For details on how to configure the privilege delegation settings, see the Enterprise Manager Cloud Control Security Guide.

2.6 Customizing the Self Service Login Page

You can configure Enterprise Manager and provide specific access to SSA users. To configure Enterprise Manager for SSA users, you must set some properties on the OMS and copy the required images to a specified directory. This section describes the following:

- Configuring the Self Service Login Page
- Switching Back to the Enterprise Manager Login Page
- Routing SSA Requests to a Specific OMS Pool
2.6.1 Configuring the Self Service Login Page

To launch a separate SSA login page for all SSA users, you must do the following:

- Set the following mandatory property on all OMSes:
  
  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.ssa_oms -value true
  
  If this property is not set to `true`, the standard Enterprise Manager login page is displayed.
  ```

- Set the following optional OMS properties.
  
  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.show_cloud_provider_brand -value true
  
  If this property is not set to `true`, the default Oracle Enterprise Manager 12c logo is displayed.

  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.show_cloud_tenant_brand -value true
  
  If this property is not set to `true`, the tenant logo is not displayed.

  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.cloud_provider_alt_text -value "Cloud Provider"
  
  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.cloud_tenant_alt_text -value "Cloud Tenant"
  
  These properties are optional and if not set, the default values for "Cloud Provider", and "Cloud Tenant" are displayed.

  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.show_disclaimer_text -value true
  
  If this property is not set to `true`, the default Oracle copyright message is displayed.

  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.disclaimer_text -value "Customer specified Disclaimer text"
  
  If this property is set to `true`, the specified disclaimer text is displayed instead of the default Oracle copyright message.

  -  ```
  $ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.show_em_branding_text -value true
  
  If this property is not set to `false`, the "Powered by Oracle Enterprise Manager" text will appear on the Self Service Login page.

- Copy the following images to the `$ORACLE_HOME/sysman/config/` directory.
  
  -  cloud_provider_small_brand.png
  
  -  cloud_tenant_small_brand.png
  
  If a single image is used, the maximum recommended size is 500 * 20 px. If 2 images are used, the maximum recommended size is 200 * 20 px per image. After login, these images are displayed instead of the Oracle logo, if the OMS
properties oracle.sysman.ssa.logon.show_cloud_provider_brand and oracle.sysman.ssa.logon.show_cloud_tenant_brand are set. If the OMS property oracle.sysman.ssa.logon.show_cloud_provider_brand is not set to true, along with the tenant logo, the default Oracle logo appears.

- cloud_provider_large_brand.png
- cloud_tenant_large_brand.png

If a single image is used, then the maximum recommended size is 525 * 60 px. If 2 images are used, the maximum recommended size is 250 * 50 px per image. These images are displayed on the login page, if the OMS properties oracle.sysman.ssa.logon.show_cloud_provider_brand and oracle.sysman.ssa.logon.show_cloud_tenant_brand are set.

2.6.2 Switching Back to the Enterprise Manager Login Page

To revert to the default Enterprise Manager login page, set the following property:

$ORACLE_HOME/bin/emctl set property -name oracle.sysman.ssa.logon.ssa_oms -value false

2.6.3 Routing SSA Requests to a Specific OMS Pool

Oracle Management Service (OMS) is one of the core components of Enterprise Manager Cloud Control that works with the Oracle Management Agents (Management Agents) and plug-ins to discover targets, monitor and manage them, and store the collected information in a repository for future reference and analysis.

When you install Enterprise Manager for the very first time, by default, one OMS is installed along with one Management Agent. This default configuration is suitable for small environments. In larger production environments with several SSA users, you may need to install additional OMS instances to reduce the load on a single OMS and improve the efficiency of the data flow. You can then configure the Server Load Balancer (SLB) to redirect all SSA requests to a specific OMS pool. The other OMS pools will then be available for administration usage. To learn more about setting up multiple OMS instances and the SLB, see Adding Additional Oracle Management Service section in the Enterprise Manager Cloud Control Basic Installation Guide.

To redirect SSA requests, you must specify the following SLB configuration:

https://<slb_host_name>:<slb_em_port>/em redirecting to oms for em
https://<slb_host_name>:<slb_ssa_port>/em redirecting to oms for ssa

The SSA and non-SSA OMS pools are differentiated based on the port number. All requests with a particular port number will be redirected to a specific OMS pool (SSA OMS pool) and all the other requests will be redirected to the other pool.
3

How to Enable Cloud

This chapter lists the tasks to be performed to enable your IaaS or PaaS Cloud. It contains the following sections:

- Enterprise Manager Cloud Deployment Models
- Enabling Infrastructure as a Service (IaaS)
- Enabling Platform as a Service (PaaS)
- Enabling Middleware as a Service (MWaaS)
- Enabling Testing as a Service (TaaS)

3.1 Enterprise Manager Cloud Deployment Models

Figure 3-1 shows the cloud deployment models supported by Enterprise Manager.

Figure 3-1  Cloud Deployment Models

The sections below list the tasks that need to be performed to set up and use the various cloud deployment models. Apart from these tasks, you must also ensure that the correct plugins have been deployed. For more details on the plugins required, see Supported Plug-ins.
3.2 Enabling Infrastructure as a Service (IaaS)

This section describes the tasks that need to be performed by users with the Super Administrator, EM_CLOUD_ADMINISTRATOR, EM_SSA_ADMINISTRATOR, and EM_SSA_USER roles to setup and use IaaS.

3.2.1 Infrastructure as a Service (IaaS): Super Administrator Tasks

This section lists the tasks that can be performed by the Super Administrator.

Table 3-1  Super Administrator User Tasks (IaaS)

<table>
<thead>
<tr>
<th>Cloud Service Model</th>
<th>Usecase</th>

3.2.4 Infrastructure as a Service (IaaS): Self Service User Tasks

This section lists the tasks that can be performed for IaaS by users with the following roles:

- **EM_SSA_USER**: Users with this role, by default, can only access the Self Service Portal and all the service families.

- **EM_SSA_USER_BASE**: Users with this role can access the Self Service Portal but will not have access to any service family. Access to a specific IaaS service family must be explicitly granted to the users with this role. See Creating a Custom Role Based on the EM_SSA_USER_BASE Role for details.

3.4 Enabling Middleware as a Service (MWaaS)

Note:
Before you enable Middleware as a Service, you must have performed the tasks listed in Enabling Platform as a Service (PaaS).

This section describes the tasks that need to be performed by users with the EM_CLOUD_ADMINISTRATOR, EM_SSA_ADMINISTRATOR, and EM_SSA_USER roles to setup and use MWaaS.

3.4.1 Middleware as a Service (MWaaS): Cloud Administrator Tasks

This section lists the tasks that need to be performed for MWaaS by users with the EM_CLOUD_ADMINISTRATOR role.

</table>

3.5 Enabling Testing as a Service (TaaS)

This section describes the tasks that need to be performed by users with the **EM_CLOUD_ADMINISTRATOR**, **EM_SSA_ADMINISTRATOR**, and **EM_SSA_USER** roles to setup and use TaaS.

3.5.1 Testing as a Service (TaaS): Cloud Administrator Tasks

This section lists the tasks that need to be performed for TaaS by users with the **EM_CLOUD_ADMINISTRATOR** role.
3.5.2 Testing as a Service (TaaS): Self Service Administrator Tasks

This section lists the tasks that need to be performed for TaaS by users with the EM_SSA_ADMINISTRATOR.

<table>
<thead>
<tr>
<th>Cloud Service Model</th>
<th>Usecase</th>

3.5.3 Testing as a Service (TaaS): Self Service User Tasks

This section lists the tasks that need to be performed for TaaS by users with either of the following roles:

- **EM_SSA_USER**: Users with this role, by default, can only access the Self Service Portal and all the service families.
- **EM_SSA_USER_BASE**: Users with this role can access the Self Service Portal but will not have access to any service family. Access to a the TaaS service family must to be explicitly granted to the users with this role. See Creating a Custom Role Based on the EM_SSA_USER_BASE Role for details.

Part III

Setting Up and Using Infrastructure as a Service

This section describes how to set up infrastructure as a service, manage virtualization targets, deploy guest virtual machines, set up, and use the self service application.

It contains the following chapters:

- Setting Up Cloud for IaaS
- Defining and Managing Cloud Policies
- Setting Up the IaaS Self Service Portal
- Using the IaaS Self Service Portal
- Administering and Monitoring an IaaS Cloud
4

Setting Up Cloud for IaaS

This chapter describes the server, storage and networking infrastructure that needs to be defined for providing Infrastructure as a Service (IaaS) cloud using the Oracle VM technology.

It contains the following sections:

- Getting Started
- Cloud Infrastructure Privileges
- Registering the Oracle VM Manager
- Synchronizing the Oracle VM Manager Targets
- Discovering a Virtual Server
- Rediscovering a Virtual Server
- Setting Up Networks
- Creating a Network Profile
- Registering Storage Servers
- Creating a Storage Repository
- Presenting the Storage Repository
- Using Self Update to Download Oracle VM Templates and Virtual Assemblies
- Importing Assemblies, Templates, and Virtual Disks into the Storage Repository
- Creating a Virtual Server Pool
- Creating a Zone
- Setting Up the Storage Quality of Service (QoS)
- Patching the Oracle VM Server
- Acknowledging OVM Events
- Managing the NTP Configuration
- Importing Virtual Machines
- Acknowledging the Repository Events

4.1 Getting Started

This section helps you get started with this chapter by providing an overview of the steps involved in setting up the virtualization infrastructure. Consider this section to be a documentation map to understand the sequence of actions you must perform to successfully set up virtualized systems.
1. Before you start monitoring and managing virtualization targets, you must register the Oracle VM Manager with Oracle Enterprise Manager. See Registering the Oracle VM Manager for details.

2. You can then discover one or more Oracle VM Server targets. See Discovering a Virtual Server for details.

3. Set up the storage infrastructure for the cloud. See Registering Storage Servers for details.

   If you are using Oracle VM Manager 3.3, you must configure the VLAN Interface. See Creating a VLAN Interface for Oracle VM Manager 3.3

6. Create a zone by grouping one or more server pools. See Creating a Zone for details.

Figure 4-1 shows the sequence of steps involved in setting up the virtualization infrastructure.

Figure 4-1 Setting Up the Cloud Infrastructure

4.2 Cloud Infrastructure Privileges

This section lists the actions that can be performed on various targets in the Infrastructure Cloud Home page when you:

• Right click on a target in the left panel.
• Select a target on the Members region on the parent target home page and then select the Action menu.
• Select the Target menu of the corresponding Target Home page.

4.3 Registering the Oracle VM Manager

The Oracle VM Manager provides the user interface that allows you to create and manage zones, virtual server pools, virtual servers, and guest virtual machines. Before you use the Oracle VM Manager to manage virtualization targets in Enterprise Manager, you must register an existing installation of the Oracle VM Manager.
Note:

- The Oracle VM Manager that you register with Enterprise Manager must be at least version 3.0.2 or higher.
- The Oracle VM Manager must be associated with only one Enterprise Manager installation.
- As a best practice, it is recommended that the Management Agent and the Oracle VM Manager are present on the same physical machine.
- If you are registering Oracle VM Manager 3.3 or later, you must ensure that the Enterprise Manager for Oracle Virtualization (Oracle Virtualization) plugin 13.1.1.0 or a later version has been deployed on the Oracle Management Service and the Management Agent.

Prerequisites

- If you are registering Oracle VM Manager 3.1.1 through 3.3, before you update the Oracle VM Manager URL, you must have configured tcps as described in Configure Secure TCP (TCPS) for Oracle VM Manager (Doc ID 1456338.1).
- You must have imported the Oracle VM Manager certificate to the Agent keystore by following these steps:
  
  - Login as a root user and export the OVM Manager certificate
    ```
    <JAVA_HOME>/bin/keytool -keystore <OVM_MANAGER_HOME>/ovmmCoreTcps.ks -exportcert -alias ovmm -file <file_loc_for_certificate>
    ```
  
  - Login as an EM Agent install user and import the OVM Manager certificate
    ```
    <AGENT_INSTANCE_HOME>/bin/emctl secure add_trust_cert_to_jks -trust_certs_loc <file_loc_for_certificate> -alias <alias_name>
    ```

    If the certificate is being imported for multiple Oracle VM Managers, you can specify multiple alias names.

- If you are registering Oracle VM Manager 3.3, in addition to importing the Oracle VM Manager certificate, you must export the Oracle VM Manager WebLogic certificate and import the certificate to the Agent Keystore. See Importing the Oracle VM Manager WebLogic Certificate for details.

To register the Oracle VM Manager, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. From the Infrastructure Cloud menu, select Register OVM Manager. The Add Oracle VM Manager page appears.
3. Enter the target name for the Oracle VM Manager instance to be registered.
4. Select the Management Agent to monitor and manage the Oracle VM Manager instance to be registered. It is recommended that the Management Agent (with Enterprise Manager for Oracle Virtualization plug-in (listed as Oracle Virtualization in Self Update) is present on the same machine where the Oracle VM Manager instance is running.
5. Enter the Oracle VM Manager URL. Refer to Note 1456338.1 (Configure Secure TCP (TCPS) for Oracle VM Manager) for details on configuring Oracle VM Manager for tcps access. The URL must be in one of the following formats:

- tcp://localhost:<port>. Example: tcp://localhost:54321 (If the Oracle VM Manager version is 3.1.1 or greater, you can specify only the tcps URL.)

6. Enter the Oracle VM Manager's Console URL. This is the URL to enable the VNC Console for the Guest VMs. For example, https://ovmmgr.example.com:7002/ovm/console

7. The URL must be in the following format:

https://<hostname>:<port>

Note:

If you are registering Oracle VM Manager 3.3, this URL is used to connect to the Oracle VM Manager.

8. By default, data from Oracle VM Manager is automatically synchronized with Enterprise Manager at fixed intervals of time. If you do not wish to enable this option, you must disable the Automatic Synchronization checkbox and manually synchronize the data. For more details on the automatic and manual synchronization options, see Synchronizing the Oracle VM Manager Targets for details.

9. Enter the administrator user name and password to connect to the Oracle VM Manager URL provided in Step C. If you want to use separate credentials for managing Oracle VM Manager, check the Use Administration Credentials check box. If these credentials are not specified, the monitoring credentials are used by default.

10. Click Submit to register the Oracle VM Manager. You can now use the Oracle VM Manager to monitor and manage the virtualization targets in Enterprise Manager.

Registering Oracle VM Manager 3.4.X

Prerequisites

You must export the Oracle VM Manager WebLogic certificate and import the certificate to the Agent Keystore. See Importing the Oracle VM Manager WebLogic Certificate for details.

To register Oracle VM Manager 3.4.x, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.

2. From the Infrastructure Cloud menu, select Register OVM Manager. The Add Oracle VM Manager page appears.

3. Enter the target name for the Oracle VM Manager instance to be registered.

4. Select the Management Agent to monitor and manage the Oracle VM Manager instance to be registered. It is recommended that the Management Agent (with Enterprise Manager for Oracle Virtualization plug-in (listed as Oracle Virtualization...
in Self Update) is present on the same machine where the Oracle VM Manager instance is running.

5. Enter the Oracle VM Manager URL.
   The URL must be in one of the following formats:
   - tcp://<hostname:<port> (As tcps specification is not required for Oracle VM Manager 3.4.x, enter a dummy URL such as tcp://here.)

   Enter the Oracle VM Manager’s Console URL. This is the URL to enable the VNC Console for the Guest VMs. For example, https://ovmmgr.example.com:7002/ovm/console
   The URL must be in the following format:
   https://<hostname>:<port>

6. By default, data from Oracle VM Manager is automatically synchronized with Enterprise Manager at fixed intervals of time. If you do not wish to enable this option, you must disable the Automatic Synchronization checkbox and manually synchronize the data. For more details on the automatic and manual synchronization options, see Synchronizing the Oracle VM Manager Targets for details.

7. Enter the administrator user name and password to connect to the Oracle VM Manager URL provided in Step C. If you want to use separate credentials for managing Oracle VM Manager, check the Use Administration Credentials check box. If these credentials are not specified, the monitoring credentials are used by default.

8. Click Submit to register the Oracle VM Manager. You can now use the Oracle VM Manager to monitor and manage the virtualization targets in Enterprise Manager.

### 4.3.1 Port Requirements for Oracle VM Manager Setup

The ports required for the Web browser connection to Oracle VM Manager are 7002 and 15901. TCP 7002 is used by the Oracle VM Servers to connect to Oracle VM Manager. Oracle VM Manager, in turn, connects to the Oracle VM Servers through port 8899 for Oracle VM Agent communication, and port 6900 and up for secure VNC tunneling to virtual machines (one port per VM). Ports 7900 and up are used to allow Oracle VM Manager to open secure serial console tunnels to virtual machines (one port per VM) on the Oracle VM Servers. The Oracle VM Command Line Interface connects to Oracle VM Manager on port 10000. TCP ports 54321 and 54322 must be enabled for remote API access to the Oracle VM Manager core. Follow the guidelines of in the diagram below:
4.3.2 Updating the Oracle VM Manager URL

If you had Oracle VM Manager 3.0.x registered with Enterprise Manager previously and had upgraded it to higher versions 3.1.x or 3.2.1, you must update the Oracle VM Manager URL.

If you are upgrading to version 3.3, you must also import the WebLogic certificate. See Importing the Oracle VM Manager WebLogic Certificate for details.

Prerequisites

- Before you update the Oracle VM Manager URL, you must have configured tcps as described in Note 1490283.1.
- You must have imported the Oracle VM Manager certificate to the Agent keystore by following these steps:
  - Login as a root user and export the OVM Manager certificate
    `<JAVA_HOME>/bin/keytool -keystore <OVM_MANAGER_HOME>/ovmCoreTcps.ks -exportcert -alias ovmm -file <file_loc_for_certificate>`
  - Login as an EM Agent user and import the OVM Manager certificate
    `<AGENT_INSTANCE_HOME>/bin/emctl secure add_trust_cert_to_jks -trust_certs_loc <file_loc_for_certificate> -alias <alias_name>`

To update the Oracle VM Manager URL, follow these steps:

1. Right click on the OVM Manager target that is to be upgraded and select Edit.
2. Enter a tcps based `tcps://hostname:port` URL in the Oracle VM Manager field.

It is recommended that you use the tcps based URL. But if the Management Agent is running on the same host on which Oracle VM Manager has been installed, you can use the tcp based URL `tcp://localhost:54321`
Note:
For Oracle VM Manager versions 3.4 and above, tcps is not used. But a dummy value such as tcps:// must be entered for the registration to be successful.

4.3.2.1 Importing the Oracle VM Manager WebLogic Certificate

Note:
This step is required for Oracle VM Manager versions 3.3 and 3.4

Oracle VM Manager version 3.3 or later contains an internal Certificate Authority (CA) that is used to perform certificate-based authentication and to sign the SSL certificate that is used for the web-based user interface. Certificates are generated automatically when Oracle VM Manager is installed.

To export the Oracle VM Manager WebLogic certificate, login as the root user and enter the following command:

```
#/u01/app/oracle/ovm-manager-3/ovm_upgrade/bin/ovmkeytool.sh exportca > <file_loc_for_certificate>
```

To import the Oracle VM Manager Weblogic certificate to the Agent Keystore, login as EM Agent user enter the following command:

```
<AGENT_INSTANCE_HOME>/bin/emctl secure add_trust_cert_to_jks -trust_certs_loc <file_loc_for_certificate> -alias <alias_name>
```

Note:
If you are using a pre-3.4 Oracle VM Manager version, you must delete the first line in the `<file_loc_for_certificate>`:

```
''libdir is /u01/app/oracle/ovm-manager-3/ovm_upgrade/bin/./../lib''before you can import the OVM Manager certificate.
```

4.3.3 Discovering and Promoting the Oracle VM Manager (Optional)

Automatic discovery is a process that detects hosts, Oracle VM Managers, and other targets so that they can be monitored and managed by Enterprise Manager. If you know the Oracle VM Manager instances in your environment, see Registering the Oracle VM Manager for details on registering them with Enterprise Manager.

Discovery and promotion of Oracle VM Manager should be attempted if you want to scan your networks to discover unknown Oracle VM Manager instances.

To discover an Oracle VM Manager, follow these steps:

1. Log in to Enterprise Manager as a user with the Super Administrator role.
2. From the **Setup** menu, select **Add Target**, then select **Configure Auto Discovery**.

3. In the Network Scan-based Auto Discovery table, click **Configure Network Scan Discovery** in the Host and Oracle VM Manager row. The Network Discovery page appears. Use this page to search, browse, and create OVM Manager discovery specifications.

4. Click **Create**. The Network Scan Discovery: Create page appears.

5. Enter the Name and Description for the Discovery Specification. Click **Add** in the Network Scans region to select the Agent that is to be used perform the IP scan. For each Agent, specify the IP ranges for the scan. The following formats are supported: host name, IP address, and IP range. Use space to separate values.

6. Use the **Job Details** tab on the Host Discovery Specification Create page to schedule the discovery IP scan, allowing you to start it immediately or at a later specified time. Use the Credentials section to enter preferred credentials for the host. You can choose from Preferred Credentials, Named Credentials, or New Credentials. The discovery IP Scan is run as root. It is required that you set privileged host credentials or named credentials that use Sudo.

7. You can use the Host Discovery page to check the status of discovery and view newly discovered OVM Managers.

8. After the target has been discovered, from the **Setup** menu, select **Add Target**, then select **Auto Discovery Results**. Enterprise Manager displays the Auto Discovery Results page where you can review discovered unmanaged targets and promote targets to be managed by Enterprise Manager for monitoring.

9. On the Network-scanned Targets tab, the target discovery results are displayed in the table at the bottom. Select the OVM Manager target and click **Promote**. The OVM Manager Registration page is displayed. See *Registering the Oracle VM Manager* for details.

### 4.3.4 Upgrading Oracle VM Manager

The instructions to upgrade earlier versions of Enterprise Manager and Oracle VM Manager are covered in the following sections:

**Topics**

- Upgrading to the 3.3 Release
- Upgrading the 3.4 Release

#### 4.3.4.1 Upgrading to the 3.3 Release

To upgrade from earlier versions of Enterprise Manager and Oracle VM Manager to Oracle VM Manager 3.3, follow these steps:

1. Upgrade Oracle Management Service to 12.1.0.4 and deploy the Oracle Virtualization plugin version 12.1.0.7 or higher.

2. Upgrade Management Agent to 12.1.0.4 and the deploy the Oracle Virtualization plugin 12.1.0.7 or higher.

3. Blackout the old Oracle VM Manager target.

4. Upgrade the Oracle VM Manager to 3.3.1. For more information, see the *Oracle VM Installation and Upgrade Guide for Release 3.3*. 
5. Upgrade the Oracle VM Server to 3.3.1. For more information, see the *Oracle VM Installation and Upgrade Guide for Release 3.3*.

6. Import the WebLogic certificate. See Importing the Oracle VM Manager WebLogic Certificate for details.

7. Change the blackout status of the Oracle VM Manager target.

8. Add or modify the target property if required. For example, Webservice URL using Edit Oracle VM Manager page.

### 4.3.4.2 Upgrading to the 3.4 Release

To upgrade from earlier versions of Enterprise Manager and Oracle VM Manager to Oracle VM Manager 3.4, follow these steps:

1. Upgrade the Oracle Management Service to 13.2.1.0 and deploy the Oracle Virtualization 13.2.1.0 plugin.

2. Upgrade Management Agent to 13.2.1.0 and the deploy the Oracle Virtualization 13.2.1.0 plugin.

3. Blackout the old Oracle VM Manager target.

4. Upgrade the Oracle VM Manager to version 3.4. For more information, see the *Oracle VM Installation and Upgrade Guide for Release 3.4*.

5. Upgrade the Oracle VM Server from 3.3.x to 3.4. For more information, see the *Oracle VM Installation and Upgrade Guide for Release 3.4*.

   **Note:** If you are upgrading the Oracle VM Server from the 3.2.10 version, follow the steps listed in the *Oracle VM Installation and Upgrade Guide for Release 3.4*.

6. Import the WebLogic certificate. See Importing the Oracle VM Manager WebLogic Certificate for details.

7. Change the blackout status of the Oracle VM Manager target.

8. Add or modify the target property if required. For example, Webservice URL using Edit Oracle VM Manager page.

### 4.3.5 Viewing the Monitoring Configuration (OVM Manager)

To customize or view the monitoring configuration details for the OVM Manager target, follow these steps:

1. From the Enterprise menu, select **Cloud**, then select **Infrastructure Home**.

2. Click on an OVM Manager target in the left panel.

3. From the VM Manager menu, select **Target Setup**, then select **Monitoring Configuration**. The Monitoring Configuration page for the OVM Manager target appears.
4. The following details are displayed:

- **LiveSyncEnabled**: Indicates if auto synchronization is enabled between Enterprise Manager and Oracle VM Manager. By default, this is true. If enabled, the data is synchronized every 1 minute.

- **Timeout Settings For Network Configuration of Deployment**: The total wait time allowed for network configuration during assembly deployment. The default is 60 minutes.

- **OVM Job Retry Count**: The number of attempts that can be made after which the OVM Job should be retired. The default number of attempts is 5.

- **OVM Job Retry Sleep Interval**: The interval between two subsequent OVM job retry attempts. The default interval is 5 seconds.

- **Timeout value for short running OVM Job (minutes)**: The time interval allowed for an OVM job to be completed.

- **OVM Manager Console URL**: The URL used to launch VNC consoles for VM.

  **Note:**
  
  For Oracle VM Manager 3.3, this URL is used to connect to the Oracle VM Manager.

- **OVM Manager URL**: The OVM Manager registration URL used for communication between Enterprise Manager and Oracle VM Manager.

- **Oracle VM Manager Password**: The password required to access Oracle VM Manager.

- **Oracle VM UUID**: The internal Oracle VM identifier.

- **Oracle VM Manager Username**: The username required to access Oracle VM Manager.

- **Timeout Settings for Product Configuration of Deployment**: The total wait time allowed for product configuration during assembly deployment. The default is 60 minutes.

- **Timeout Value for Checking if SSH Service is Running on a Deployed Virtual Machine**: The total wait time allowed to check if the SSH service is
running on a Guest VM. This parameter is used as prerequisite for deploying the Management Agent on the Guest VM.

- **SyncDataFetchTime**: The time at which the Oracle VM Manager was last synchronized.
- **SyncStatus**: The status of the Oracle VM Manager synchronization.
- **Deployed on Exalogic**: Indicates whether the Oracle VM Manager is inside an Exalogic rack.

5. After editing the entries, click **OK** to return to the previous page.

### 4.4 Synchronizing the Oracle VM Manager Targets

Enterprise Manager can monitor the OVM Manager and the various virtualization targets registered with the OVM Manager. The targets registered with the OVM Manager must also be monitored targets in Enterprise Manager. If some targets have been created directly in OVM Manager, you can synchronize them in two ways:

- **Automatically Synchronizing the Oracle VM Manager Targets**
- **Manually Synchronizing the Oracle VM Manager Targets**

#### 4.4.1 Automatically Synchronizing the Oracle VM Manager Targets

You can enable this option when Oracle VM Manager is registered or when you Edit Oracle VM Manager. If the **Automatic Synchronization** option is enabled, all changes made in Oracle VM Manager are automatically reflected in Enterprise Manager at fixed intervals. The default interval is 1 minute. To change the default interval, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Select an Oracle VM Manager target from the right panel to navigate to the Oracle VM Manager Home page.
3. From the **Target** menu, select **Monitoring**, then select **Metrics and Collection Settings**.
4. Click **Other Collected Items** and then click the **Collection Schedule** link for the OVM Manager Events Data metric.
5. Modify the frequency as required, click **Continue**, then click **OK**.

**Note:**

If you do not enable automatic synchronization at this time, you can enable it later by following these steps:

- Navigate to the OVM Manager homepage.
- From the **Target** menu, select **Target Setup**, then select **Edit OVM Manager**.
- Select the **Automatic Synchronization** check box and click **Submit**.
4.4.2 Manually Synchronizing the Oracle VM Manager Targets

When the Oracle VM Manager is registered, if the Automatic Synchronization option is enabled, for the targets created in Oracle VM Manager, corresponding targets are created in Enterprise Manager. If this option is not enabled, you can manually synchronize the targets by following these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target from the left panel and select Synchronize.
3. A confirmation message appears. Click Submit to submit a job to perform synchronization. The targets in Enterprise Manager and OVM Manager are synchronized.
   - Targets that are not present in OVM Manager will be removed.
   - For targets present only in OVM Manager, corresponding targets are created in Enterprise Manager.
   - Configuration collections are refreshed for all other targets.

4.5 Discovering a Virtual Server

A virtual server is a generic term used to describe a physical box which has virtualization software (hypervisor) running on it. A new virtual server can be provisioned by installing the OVM Hypervisor on a bare metal box. Before you add a virtual server to a server pool, it must be discovered.

To discover an Oracle VM Server, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Click on an OVM Manager target from the left panel to navigate to the OVM Manager Home page. From the VM Manager menu, select Discover Virtual Server.

   ![Figure 4-4 Discover Virtual Servers](image)

3. Specify the host name or the IP address of the virtual server. You can enter multiple host names or IP addresses on separate lines.
4. Enter the user name and password of the Oracle VM Agent running on the virtual server to be discovered.
5. Click **Submit** to discover the virtual server.

The newly discovered Oracle VM Server contains some basic information about itself, and about any immediate connectivity to a network storage, but it is considered to be in an unconfigured state. After the storage and networking has been configured, the Oracle VM virtual servers are ready to be used as the infrastructure for cloud.

### 4.6 Rediscovering a Virtual Server

To rediscover a virtual server, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on a Virtual Server target in the left panel and select **Rediscover Virtual Server**.
3. A confirmation message appears. Click **OK** to rediscover the virtual server and discover any new NICs and LUNs that have been added.

### 4.7 Setting Up Networks

This section discusses creation and use of Oracle VM Networks. You can define a name or an alias for each logical network. When you have created your networks, you connect the physical network ports on Oracle VM Servers to the logical networks. Before you define the logical networks in Enterprise Manager, you have to review your physical network configuration that you intend to use, such as VLAN and subnet usage. Setting up an Oracle VM network involves:

- **Generating MAC Addresses**
- **Creating and configuring VLAN Groups / Interfaces**
  - Configuring a VLAN Group for Oracle VM Manager 3.2 or Earlier Versions
  - Creating a VLAN Interface for Oracle VM Manager 3.3
- **Creating Networks**

**Figure 4-5   Setting Up Networks**
Note:
In Oracle VM Manager 3.3, VLAN Groups have been replaced with VLAN Interfaces. When you are configuring the VLAN Interface, you are prompted for the VLAN Segment IDs and the ports on which the interfaces are to be created.

4.7.1 Generating MAC Addresses

Virtual network interfaces (VNICs) are used to carry network traffic to virtual machines. You can generate MAC addresses that can be assigned to VNICs in a virtual machine. Specify a range of MAC addresses that need to be generated.

VLAN Group has been replaced with VLAN Interface and during Vlan interface configuration, it asjs VLAN Segment ID's and then Select Ports of Servers where the Interfaces to be created

Note:
MAC addresses must be unique across all Oracle VM Managers in the data center.

To create MAC Addresses, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target from the left panel and select Manage Network.
3. Click the Virtual Network Interface Card Manager tab.
4. Click Generate. In the Generate MAC Addresses pop-up window, you are prompted to specify an initial MAC address in 3 sets of 3 characters. This is a two-digit number for the Initial MAC Address. Click OK to return to the previous page. You can now use these VNICs while creating virtual machines.

Note:
If you are using 3.4 or later versions of Oracle VM Manager, enter the From and To range in the Dynamic MAC Address field and click Apply Range. This range will then be used to create MAC addresses as needed in future deployments.
4.7.2 Configuring a VLAN Group for Oracle VM Manager 3.2 or Earlier Versions

Note:
Configuring a VLAN Group is an optional feature. If VLANs exist in your physical network, you must follow the steps in this section to use them in the cloud.

VLAN (Virtual Area Network) is a mechanism to virtualize network interfaces across subnets and physical location so that they appear to be on a single confined LAN. This concept is used to isolate (and group) the network traffic across these distributed interface, which enables secure network traffic within such nodes.

You can create multiple virtual LAN (VLANs) on the same NIC port. Each VLAN is an independent logical network operating with other VLANs over the same physical connection. Configuring VLANs involves creating one or more VLAN Groups, each of which contain multiple VLANs segments.

Each VLAN is assigned a distinct VLAN identification. The VLAN ID is used by an attached VLAN switch to segregate traffic among the different VLANs operating on the same link. Once a VLAN is configured, it functions exactly like a separate physical connection. VLANs need to be configured in the physical switches before you use them. To create a VLAN group, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target from the left panel and select Manage Network.
3. Click the VLAN Groups tab and click Create.
4. Enter a name and description for the VLAN Group.
5. Enter one or more VLAN Segments. This is the VLAN ID that is enabled on the switch ports connecting the virtual server to the switch. The valid range is from 1 to 4094.
6. Click Add to select the ports to be added to the network. Select one or more virtual servers to be added to the network. If you add more than two ports of a virtual server, the first four ports will be bonded. Network bonding refers to the combination of network interfaces on one host for redundancy or increased throughput.

If your network supports jumbo frames, you must set the Maximum Transfer Unit size in the MTU field. Setting the MTU field, sets the maximum transmission rate, so that larger packets can be sent and received. You can set the MTU to a maximum of 1500 for Ethernet, 9000 for 1GbE, and 64,000 for 10GbE.
The ports that you have selected must have the VLAN Segment IDs enabled.

7. Click **OK** to create the VLAN Group.

### 4.7.3 Creating a VLAN Interface for Oracle VM Manager 3.3

Configuring a VLAN Interface is an optional feature. If VLANs exist in your physical network, you must follow the steps in this section to use them in the cloud.

VLAN (Virtual Area Network) is a mechanism to virtualize network interfaces across subnets and physical location so that they appear to be on a single confined LAN. This concept is used to isolate (and group) the network traffic across these distributed interface, which enables secure network traffic within such nodes. VLANs are divided into segments that are usually tagged with an ID.

To manage network traffic tagged for different VLAN IDs, a separate VLAN or virtual interface can be created for each VLAN ID. When creating different logical networks in Oracle VM Manager, these VLAN interfaces can be attached to different networks to specify the type of traffic that belongs to a particular VLAN ID.

If your network is configured to support VLANs, you should define interfaces for your different VLAN IDs on each of your servers, so that you are able to define Oracle VM networks that take advantage of VLAN separation.

You can create multiple virtual LAN (VLANs) on the same NIC port. Each VLAN is an independent logical network operating with other VLANs over the same physical connection. Configuring VLANs involves creating one or more VLAN Interfaces, each of which contain multiple VLANs IDs.

Each VLAN is assigned a distinct VLAN identification. The VLAN ID is used by an attached VLAN switch to segregate traffic among the different VLANs operating on the same link. Once a VLAN is configured, it functions exactly like a separate physical connection. VLANs need to be configured in the physical switches before you use them. To create a VLAN Interface, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on an OVM Manager target from the left panel and select **Manage Network**.
3. Click the **VLAN Interfaces** tab and click **Create**.
4. Enter one or more VLAN Segments separated by commas.

VLANs are divided into segments that are usually tagged with an ID. The ID is enabled on the switch ports connecting the virtual server to the switch. The valid range is from 2 to 4094.
5. Click **Add** to select the ports to be added to the network. In the Create VLAN Interfaces: Add Ports page, click the **Search** icon next to the Select Virtual Server(s) field. Select one or more virtual servers to be added to the network and click **Select**. The list of ports with the MTU size, MAC Address, and status is displayed. Select the ports to be added and click **Continue**. If you select more than one port of a virtual server, they will be bonded. Network bonding refers to the combination of network interfaces on one host for redundancy or increased throughput.

6. The selected ports are displayed. You can modify the following for each port:
   - **MTU**: If your network supports jumbo frames, you must set the Maximum Transfer Unit size in the MTU field. Setting the MTU field, sets the maximum transmission rate, so that larger packets can be sent and received. You can set the MTU to a maximum of 1500 for Ethernet, 9000 for 1GbE, and 64,000 for 10GbE.
   - **Address Type**: The network address assignment type can be Static, Dynamic, or None.
   - **IP Address**: The IP address for the port.
   - **Netmask**: The netmask for the port.
   - **Bonding Mode**: Network bonding refers to the combination of network interfaces on one host for redundancy and/or increased throughput. This can be:
     - **Active-Backup**: There is one NIC active while another NIC is asleep. If the active NIC goes down, another NIC becomes active.
     - **Load Balancing**: The network traffic is equally balanced over the NICs of the machine and failover is also supported to provide redundancy.
     - **Link Aggregation**: Aggregated NICs act as one NIC which results in a higher throughput, but also provides failover in the case that a NIC fails.

   **Note:**
   
   The ports that you have selected must have the VLAN Segment IDs enabled.

7. The VLAN Segments with the ports, MTU, Address Type, IP Address, and NetMask are listed in the VLAN Interfaces region. These parameters can be modified if necessary.

   Click the **Manage** icon to add or delete VLAN Segments and click **OK** and return to the Create VLAN Interfaces page. Click **OK** to create the VLAN Interfaces and return to the Network page.

### 4.7.3.1 Viewing the VLAN Interfaces

To view the VLAN Interfaces that have been added, click the VLAN Interfaces tab on the Network page. The VLAN Interfaces are listed with the following details:

- **Name**: The name of the VLAN Interface that is created.
- **Port**: The network port on which the VLAN Interface has been assigned.
• Segment: The VLAN ID assigned to the VLAN Interface.
• Server: The server where the VLAN Interface is located.
• Network: The network to which the VLAN Interface is attached.
• MTU: The MTU value for the VLAN Interface.
• Address Type: The network address assignment type. This can be Static, Dynamic, or None.
• IP Address: The IP address allocated to the VLAN Interface.
• Netmask: The netmask applied to the VLAN Interface.

4.7.3.2 Editing a VLAN Interface

To edit a VLAN Interface, follow these steps:

1. Select the VLAN Interface you wish to edit from the list of VLAN Interfaces and click Edit.
2. In the Edit VLAN Interface page, you can edit the MTU setting and the Address Type. If you select Static type, you can specify the IP Address and the Netmask.
3. Click OK to save the changes and return to the previous page.

4.7.3.3 Deleting a VLAN Interface

To delete a VLAN Interface, follow these steps:

1. Select the VLAN Interface you wish to delete from the list of VLAN Interfaces and click Delete.
2. The Delete Confirmation dialog box is displayed. Click OK to delete the VLAN Interface.

4.7.4 Creating Networks

A network is a grouping of Oracle VM virtual server physical NIC ports. This section describes the procedure to create a logical network.

Prerequisites

• If you choose to associate a network profile with the network, then the network profile must be created before the network is created. A network profile stores the network interface configuration (IP address, subnet mask, host name, DNS servers) that is allocated to network interfaces of newly provisioned virtual machines.

Follow these steps to create a logical network:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target from the left panel and select Manage Network.
3. Click the Create option in the Networks tab. You are prompted to configure the ports of the VLAN groups. Click Create VLAN Groups to configure VLAN Groups.
For Oracle VM Manager 3.3, click Create VLAN Interfaces to configure the VLAN interfaces. See Creating a VLAN Interface for Oracle VM Manager 3.3 for details.

If you want to create the networks without configuring the VLAN groups or interfaces, click Continue Network Creation. In the Create Network: General page, enter the name and description of the network.

**Figure 4-6  Create Network: General**

4. Specify if you are creating an inter-server or intra-server network. An inter-server network is routable through standard switches. An intra-server network is available within a single server without a route to an external physical network.

5. Specify the network role by checking one or more check boxes in the Network Roles section.

---

**Note:**

To deploy a Guest VM, you must have at least one logical network with the **Virtual Machine** role.

- **Server Management**: Manages the physical virtual servers in a server pool, for example, to update the Oracle VM Agent on the different virtual servers.
- **Live Migrate**: Carries live migrate traffic. You can migrate virtual machines from one virtual server to another in a server pool, without changing the status of the virtual machines.
- **Cluster Heartbeat**: Carries cluster heartbeat traffic.
- **Virtual Machine**: Used for the network traffic between the different virtual machines in a server pool. The virtual machine role can either be an Inter-Server (routable through standard switches), or an Intra-Server (without a route to an external physical network). The Virtual Machine role must be unique on the network, which means that this network cannot have other network roles. It is however possible, and very likely, to have multiple networks with the Virtual Machine role in one Oracle VM Manager.
- **Storage**: Used for all storage transport in a server pool. It is used by the virtual servers to connect to ethernet-based storage repositories.
6. Click **Next**. In the Configure Ports and VLAN Interfaces page, click **Add** and select a VLAN Interface from the list.

![Figure 4-7 Create Network: Configure Ports and VLAN Interfaces (OVM Manager 3.2)](image)

7. After adding the VLAN Segment, click **Add** the VLAN Interfaces and the ports. Select the ports to be added to network. If you select more than two ports, they will be bonded or aggregated into a single interface. By default, the Bonding Mode is Active Passive but you can change it by selecting one of the following:

- **Active Passive**: There is one active NIC. If this one goes down, another NIC becomes active.
- **Link Aggregation**: All NICs act as one NIC which results in a higher throughput.
- **Load Balanced**: The network traffic is equally balanced over the NICs of the machine.

If your network supports jumbo frames, you must set the Maximum Transfer Unit size in the MTU field. Setting the MTU field, sets the maximum transmission rate, so that larger packets can be sent and received. You can set the MTU to a maximum of 1500 for Ethernet, 9000 for 1GbE, and 64,000 for 10GbE.

**Note**: If you are using Oracle VM Manager 3.3, you will see the following page:
8. Click Next. The Network Profile and QoS page appears.

**Note:**
Defining the Network Profile and QoS is optional. A network profile stores the network interface configuration (IP address, subnet mask, host name, DNS servers) to be allocated to network interfaces of newly provisioned virtual machines.

Specify the following:

- **Network Type:** You can select Internet Routable, Non Internet Routable, or a predefined set of network types. For more details, see Setting Up the Network Type.

- **Network Profile:** A network profile defines a set of IP Addresses, their associated host names (optionally), and common networking attributes for them. See Creating a Network Profile for details.

9. Review the details entered so far and click Finish to create the network.

### 4.8 Creating a Network Profile

A network profile is used to automate assignment of IP addresses to guest virtual machines. A network profile is a list of IP address along with host names. It defines a set of IP addresses, their associated host-names, and common networking attributes for them.

To create a network profile, follow these steps:

1. From the Setup menu, select Provisioning and Patching, then select Network Profile.

2. Click Create on the Network Profile page.

3. Enter the following details in the Create Network Profile pop-up window:
Figure 4-9  Create Network Profile

- **Name**: Unique name that identifies the network profile name.
- **Domain Name**: Domain for which the profile is being defined. The domain name must not begin with a dot (\'\'.\'). For example, you must specify the domain name as `us.example.com` and not with a dot (\'\'.\') in the front like `.us.example.com`.
- **Netmask**: Network mask for the subnet IP. For example: 255.255.240.0
- **Gateway**: Gateway for the IP address list.
- **DNS Servers**: Name resolution servers.

4. You can add a list of IP addresses or specify a range. If you select:
   - **List**: Specify IP addresses with host name and MAC address (optional).
- **Range**: Specify a Hostname Pattern. The Start Value is appended to the host names generated. The First IP Address and the Last IP Address defines the range. For example, if the pattern is say `hostprod` and Start Value is 1, First IP Address is 10.1.1.1 and Last IP Address is 10.1.1.3, the host names will be `hostprod1`, `hostprod2`, and `hostprod3`.

5. Click **OK** to save the network profile.

### 4.9 Registering Storage Servers

You can create external storage elements like storage servers, file systems, and LUNs. An external storage element is created on dedicated storage hardware such as a server configured for NAS offering NFS shares. The server on which the storage element is present must be accessible by the Oracle VM Servers through a fibre channel or ethernet network. You can configure a virtual server pool with multiple such external storage devices.

**Figure 4-10  Creating Storage Servers and File Systems**

To set up a storage server, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on an OVM Manager target in the left panel and select **Manage Storage**. **Figure 4-11** appears.

**Figure 4-11  Storage Server**
3. A list of file servers, storage arrays, and local file servers that have been defined appears.

   - **Type**: Select the type of storage array that can be defined. A storage array is additional network provided storage that can be specifically used to store virtual disks for virtual machines. A server pool can be configured with multiple external storage devices. You can define 3 types of storage servers:
     - **iSCSI**: An iSCSI target configured or discovered on the Oracle VM Server.
     - **SAN**: A Fiber Channel SAN target configured/discovered on the Oracle VM Server.
     - **NFS**: An NFS or NAS file system mounted locally.

   Select File Server (NFS) or Storage Array (iSCSI or SAN).

4. You can register a File Server or a Storage Array by clicking the appropriate link.

5. Select a storage element and click **Discover** to start the discovery operation of the file systems available on the server. A confirmation message prompting you to refresh the file system appears. Click **OK** to refresh the file system and return to the Storage page.

6. Click on a **File Server**, **Storage Array**, or **Local File Server** link to drill down to the Details page.

7. Select a storage element and click **Validate**. A confirmation message prompting you to validate the storage server appears. Click **OK** to refresh the file system and return to the Storage page.

### 4.9.1 Registering the File Server

To register a file server, follow these steps:

1. Click the **File Server** link on the Storage page. The Register File Server: General page appears.

   ![Register File Server: General](image)

2. Enter the following details:
   - **Name**: Name by which the storage server is to be identified.
   - **Plugin Name**: The Oracle VM Manager communicates with the external storage through a set of plug-ins. Generic plug-ins offer a limited set of standard storage operations on virtually all storage hardware, such as
discovering and operating on existing storage resources. Vendor-specific plug-ins include a much larger set of operations (snapshot, clone, and so on).

- **Admin Host**: Host name of the Administration Server.
- **Admin Username and Password**: User name and password for the Administration Server.
- **Access Host**: Host name or IP address of the server offering external storage.
- **Uniform Exports**: Select this check box to indicate that the NFS exports are uniform. This ensures that all the VM Servers in the server pool will have access to the same exports on the NFS server. If this check box is not selected, the NFS exports can be accessed only by specific servers that are used to refresh the NFS file systems.

3. Click **Next**. The Register File Server: Admin and Refresh Servers page appears. Enter the following:

   - **Admin Servers**: VM Servers that have the required Storage Plugin installed and are responsible for information exchange with the Admin Host of the Storage Server are referred to as Admin Servers. Click Add to add one or more Admin Servers.

   - **Refresh Servers**: If you have not selected the Uniform Exports checkbox in the Register File Server: General page, click Add to specify the list of Refresh servers that will be used to refresh the NFS file systems.

4. Click **Finish** to add the file server. The new server appears in the table. At this point, the Storage Connect plugin has established a link to the storage location. No storage has been mounted yet.

5. Click **Discover** to start the discovery operation of the file systems available on the server. When the operation is complete, the available file systems appear in the File Systems tab in the Storage Details page.

### 4.9.2 Registering the Storage Array

To register a storage array, follow these steps:

1. Click the **Storage Array** link on the Storage page. The Register Storage Array: General page appears.

   ![Register Storage Array: General](image)

   **Figure 4-13** Register Storage Array: General

2. Enter the following details:
• **Name**: Name by which the storage server is to be identified.

• **Storage Type**: Select the type of storage array that can be defined. A storage array is additional network provided storage that can be specifically used to store virtual disks for virtual machines. You can define 2 types of storage arrays:
  
  – **Fibre Channel Storage Array**: A Fiber Channel SAN target configured or discovered on the Oracle VM Server.
  
  – **iSCSI Storage Array**: An iSCSI target configured or discovered on the Oracle VM Server.

• **Plugin Name**: The Oracle VM Manager communicates with the external storage through a set of plug-ins. Generic plug-ins offer a limited set of standard storage operations on virtually all storage hardware, such as discovering and operating on existing storage resources. Vendor-specific plug-ins include a much larger set of operations (snapshot, clone, and so on).

• **Plugin Private Data**: Any vendor-specific storage plug-in data that may be required. This is not available to generic storage.

**Note:**

When registering a vendor-specific storage array, be sure to double-check the information you entered in the plug-in private data field. Once the storage array is registered, this field can no longer be modified. If you need to update the plug-in private data, you must unregister and re-register the storage array.

• **Admin Host**: Host name of the Administration Server.

• **Admin Username and Password**: User name and password for the Administration Server.

3. Click **Next**. The Register Storage Array: Access Information page appears.

**Figure 4-14  Register Storage Array: Access Information**

4. Enter the following details:

  • **Access Host**: Host name or IP address of the server offering external storage.
  
  • **Access Port**: Port number used to access the storage.
  
  • **Access Username and Password**: User name and password for the Access Host.
  
  • **Use Chap (Applies to all Access Hosts)**: Select this check box to enable Chap authentication.
If you have selected the Storage Type as iSCSI Storage Array and Plugin Name as Oracle Generic SCSI Plugin (1.2.1 or above) in the Register Storage Array: General page, you can add multiple Access Hosts.

5. Click Next. The Register Storage Array: Admin Servers page appears. Click Add to add one or more Administration Servers on which the storage plug-in has been installed. The Administration Server is responsible for information exchange with the Administration Host of the storage server.

6. Click Finish to add the storage array. The new server appears in the table. At this point, the Storage Connect plugin has established a link to the storage location. No storage has been mounted yet.

7. Click Discover to start the discovery operation of the file systems available on the server. When the operation is complete, the available file systems appear in the General tab of the Storage Details page.

4.9.3 File Server Details

Click a File Server link to view the Details page. This page contains the following tabs:

- **General**: A list of Administration Servers is displayed. An Administration Server is a virtual server on which the storage plug-in has been installed. You can add an Administration Server or delete an existing one.

  In the Configuration region, the storage server details are displayed. Click Edit to modify details such as Name, Description, and the name of the Access Host which provides the external storage.

  In the Storage QOS Mapping region, map the storage type defined by the Cloud Administrator to the QOS defined by the Storage Server.

- **Refresh Servers**: For non-uniform NFS file system exports, you can specify the servers that need to be refreshed. Click Add. The Refresh Servers dialog box is displayed. Click Select Servers, choose one or more servers from the list and click Select. Click OK to refresh the servers.

- **File Systems**: A list of file systems is displayed. You can do the following:
  - Select a file system from the list and click Edit. You can modify the name and description of the file system.
  - Select a file system and click Delete. A confirmation message is displayed. Click OK to delete the file system.
  - Select one or more file systems and click Refresh. A confirmation message is displayed. Click OK to refresh the file system.

- **Access Groups**: Shows the mapping between Refresh Servers and File Systems (Exports). You can Create, Edit, or Delete an Access Group.

4.9.4 Storage Array Details

Click a Storage Array link to view the Details page. This page has four tabs:
• **General**: Provides general information on the storage array. A list of administration servers is displayed in the Administration region. An Administration Server is a virtual server on which the storage plug-in has been installed. You can add an Administration Server or delete an existing one.

In the Configuration region, the storage server details are displayed. Click Edit to modify the Name and Description.

• **Physical Disks**: Displays a list of all the physical disks on the storage array. Depending on the type of storage connector (You can Create, Clone, Edit, Resize (resize or extend the physical disk), Rescan (refreshes the physical disk), Delete, and Create File System (create OCFS2 file system on the physical disk).

  **Note:**
  The operation allowed depends on the type of storage connect plug-in that has been installed. For example, if the generic storage connect plug-in has been installed, you cannot perform a Create operation on the physical disks.

• **Access Group**: Shows the mapping between Storage Initiators and Physical Disks. You can Create, Edit, Present / Unpresent Access Group (Add or Delete physical disk), and Delete access group.

• **Volume Group**: Displays the volume group available for this storage server.

### 4.9.5 Local File Server Details

Click on a Local File Server link to view the Details page. This page contains the following tabs:

• **General**: The configuration details of the selected Local File Server including the Administration Host, Plug-in Name, and so on are displayed.

• **File Systems**: You can edit or refresh a file system in the list. Select a file system from the list and click **Edit**. You can modify the name and description of the file system.

To refresh, select a file system from the list and click **Refresh**. Select the name of the virtual server and click **OK** to refresh the file system.

### 4.10 Creating a Storage Repository

A storage repository is virtual disk space on top of physical storage hardware, made available to the Oracle VM Servers in a server pool or various server pools. It defines where Oracle VM resources may reside. Resources include virtual machines, templates for virtual machine creation, virtual machine assemblies, ISO images, shared virtual disks, and so on.

After you have created the storage server, you can assign these storage resources to the server pools in a zone by creating a storage repository.

To create a storage repository, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on an OVM Manager target in the left panel and select Manage Storage Repository.

![Figure 4-15 Storage Repository](image)

3. The list of storage repositories that have been defined appears. Click Create to create a storage repository.

4. In the pop-up window, enter the name of the storage repository.

5. Click the Search icon in the Disk field to select the Storage Server and File System on which the storage repository is to be created and click OK.

   If you select the NFS File System, you must select the location of the storage server and a virtual server. You can optionally specify the Share Path and a description. The storage repository has now been created and will be displayed in the Storage Repositories page.

### 4.10.1 Performing Administrative Operations on a Storage Repository

After the storage repository has been created, you can perform a number of management operations on it. The listing of storage repositories depends on the server pool selection. If you select server pools, you see all the storage repositories. If you select an individual server pool, only the storage repositories related to that server pool appear. You can perform the following operations:

- **Edit**: Select a repository and click Edit. You can modify the name and description or release the ownership of the repository. Click OK to save the changes.

  **Note:**

  If you are editing a storage repository that has been created on a physical disk, you can change the server pool with which the storage repository is associated. To change the server pool, in the Edit dialog box, click the Search icon next to the Server Pool field, select a different server pool and click OK.

- **Delete**: Select a repository and click Delete. All the contents of the selected repository along with its associations will be deleted.

- **Auto-Refresh**: Select this option to enable Auto-Refresh and periodically refresh and update the file system size of all storage repositories. In the dialog box that appears, select the Enable check box and specify the Interval at which the file system size is to be refreshed.
4.11 Presenting the Storage Repository

After you have created the storage repository, you can propagate it to one or more server pools. When the storage repository is prepared and created, it still must be made available for use by your virtual servers before it can be used. Typically you present the storage repository to all the virtual servers in the server pool.

To present a storage repository to server pool, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target from the left panel and select Manage Storage Repository.
3. In the Storage Repository page, click on a storage repository from the list. The list of server pools on which the storage repositories have been propagated appears.
4. Select one or more server pools from the list and click Present. In the Present Servers dialog box, click the Select Servers icon. The list of members appears in the Select Targets dialog box. Expand the Members in this dialog box and check the boxes for zones, pools, or individual virtual servers and click Select to return to the previous dialog box. Click Present to mount the member on the server.

4.12 Importing Assemblies, Templates, and Virtual Disks into the Storage Repository

A storage repository associated with an Oracle VM server stores binary components associated with an Oracle VM servers. The following software components can be stored in the storage repository:

- Oracle VM Templates
- Oracle Virtual Assemblies
- ISOs
- Virtual Disks
- VM Files
The Oracle Virtual Assemblies, Oracle VM Templates and ISO images need to be imported into the storage repository before guest virtual machines can be created using them. Follow these steps to import software components into the storage repository:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target in the left panel and select Manage Storage Repository.
3. Click on a Repository Name link. The Storage Repository Details page shows the list of server pools on which the selected storage repository has been propagated.
4. Click the Assemblies tab. An assembly can be imported as a single .ova file.

**Figure 4-17   Storage Repository - Assemblies**

- Click Import. You can import the assembly from the Software Library or from an external source. If you select:
  - **Software Library**: The list of assemblies present in the Software Library are displayed. Select the assemblies to be imported and click OK. After the assembly has been imported, a series of templates is created. This option unpacks the contents of the assembly, for example, configuration files, disk images, and so on.
  - **External**: Specify a external URL from which the assembly is to be imported and click OK. The URL you specify must be accessible from the OVS Host on which the repository is presented.
Note:

If the Enterprise Manager upload port is not present in the tinyproxy configuration file, the assembly or template cannot be imported. To resolve this issue, do the following:

* On the Enterprise Manager node, as Oracle user, enter the following command:
  
  $OMS_HOME/bin/emctl status oms -details

* From the output, capture the HTTPS upload port from the example below:
  
  HTTPS Upload Port : 4473

* On both active and passive PCA management nodes, run the following command:
  
  Edit /etc/tinyproxy/tinyproxy.conf

* Add a line as follows in the ConnectPort section:
  
  ConnectPort 4473

* Restart the tinyproxy service on both active and passive management nodes as follows:
  
  service tinyproxy restart

5. Click on the ISOs tab to import the ISO images. Virtual machines have no access to the physical DVD or CD-ROM drive. You can assign virtual drives to virtual machines by offering .iso files containing the image of a DVD or CD-ROM. These image files can be found in the ISOs tab of the storage repository.

   • Click Import. You can import the ISO image from the Software Library or from an external source. If you select:
      
      – Software Library: The list of ISO images present in the Software Library are displayed. Select the ISO images to be imported and click OK. Select the ISO image that has been imported and click Assign to assign this template to a server pool.
      
      – External: Specify a valid external URL from which the ISO image is to be imported and click OK. The URL you specify must be accessible from the OVS Host on which the repository is presented.

Note:

Creation Time is not displayed if you are using 3.4 or later versions of Oracle VM Manager.

6. Click the VM Templates tab. Templates contain the configuration of a single virtual machine. When you create a new virtual machine, you choose to either create it from scratch or from a template. In a storage repository, templates are typically imported as an archive (.tgz, .tar or other). The archive contains a .cfg file with the virtual machine configuration, and at least one .img file which is a virtual disk image.
• Click **Import**. You can import the VM Template from the Software Library or from an external source. If you select:
  
  – **Software Library**: The list of VM Templates present in the Software Library are displayed. Select the VM Template to be imported and click **OK**. After the template has been imported, select the template and click **Assign** to assign this template to a server pool.
  
  – **External**: Specify a valid external URL from which the VM template is to be imported and click **OK**. The URL you specify must be accessible from the OVS Host on which the repository is presented.

**Note:**

Creation Time is not displayed if you are using 3.4 or later versions of Oracle VM Manager.

7. Click on the **Virtual Disks** tab.

**Figure 4-19  Storage Repository - Virtual Disks**

• Click **Create** and size of virtual disk to be created.

• Indicate if this is a shared disk by checking the **Shared** check box.

• Click **Import**. You can import the virtual disk from the Software Library or an external source. If you select:

  – **Software Library**: The list of virtual disks present in the Software Library are displayed. Select the virtual disks to be imported and click **OK**. Select the virtual disk has been imported, click **Assign** to assign this template to a server pool.
-- **External**: Specify a valid external URL from which the virtual disk is to be imported and click **OK**. The URL you specify must be accessible from the OVS Host on which the repository is presented. If you reference the virtual disk using `http://` or `ftp://` protocols, you must include `user/pw` in the reference.

For example, you must specify the URL as `http://user:pw@host/virtualdisk_file_image_file` or `ftp://user:pw@host/virtual_disk_image_file`. If the virtual disk is accessible by way of NFS, you can also specify `file:///net/host/virtual_disk_image_file` if the OVS is enabled for NFS automount.

8. Click **Return** to return to the Storage Repository page.

<table>
<thead>
<tr>
<th>Note:</th>
</tr>
</thead>
<tbody>
<tr>
<td>Creation Time is not displayed if you are using 3.4 or later versions of Oracle VM Manager.</td>
</tr>
</tbody>
</table>

### 4.12.1 Creating a Repository Export (Optional)

You can configure the virtual server to enable third party applications to back up the contents of the storage repository.

**Prerequisites**

- The Repository Exports feature is available only for storage repositories based on physical disks and at least one server must have been presented to the repository.
- The virtual server must be configured to provide an NFS share to access the contents of the repository.
- The virtual server must be in a clustered server pool and have the OCFS2-based storage repository presented to it.

To create a repository export, follow these steps:

1. Click the **Repository Exports** tab in the Storage Repository Details page.
2. Click **Create**. The Create Repository Export window appears.
3. Enter a name of the host which is used to mount the contents of the storage repository to the Export Server.
4. Specify the options to restrict access to the repository. For Linux systems, the default is `rw,async,no_root_squash`.
5. Click **Add** in the Export Server(s) region. Select one or more virtual servers on which the storage repository is to be presented and click **Select**.
6. Click **OK** to submit the job and return to the Storage Repository Details page.

### 4.13 Using Self Update to Download Oracle VM Templates and Virtual Assemblies

You can download the preconfigured assemblies and templates from the Self Update Console by following these steps:
1. Log in to Enterprise Manager as a user with the EM_CLOUD_ADMINISTRATOR role.

2. From the Setup menu, select Extensibility and then select Self Update. The Self Update Console with the list of entity types that can be downloaded appears.

3. Select the Oracle VM Templates and Oracle Virtual Assemblies folder and click Open. The Oracle VM Templates and Oracle Virtual Assemblies Updates page appears.

4. Select an update and click Download. The Schedule Download dialog appears.

5. Specify if the update is to be downloaded immediately or at a later date.

6. Click Select. An Enterprise Manager job is created to download the update to the Software Library. Enterprise Manager starts downloading the archive from the Oracle Enterprise Manager store. Wait for the download to complete. (When in offline mode the system starts reading from the specified location.) When the download is complete, the status indicates that the update has been downloaded.

7. Click Apply. A job is submitted to apply the update. The downloaded plug-in is applied and appears on the Oracle VM Templates and Oracle Virtual Assemblies Updates page.

4.14 Creating a Virtual Server Pool

This section guides you through the ways of designing a server pool to meet your requirements.

Before creating a server pool, you need to consider how many physical servers will be contained in the server pool, and what functions each physical server will perform. The more virtual machines you will run in the server pool, the more resources these virtual machines will consume, therefore the more physical servers are needed to provide sufficient resources for the server pool. A server pool is scalable. If you find a server pool does not have sufficient resources, such as CPU and memory, to run the virtual machines and the applications inside, you can expand the server pool by adding more Oracle virtual servers.

A virtual server pool contains one or more virtual servers and guest virtual machines. A virtual server can belong to one and only one virtual server pool at a time. Guest virtual machines and resources are also associated with the server pools.

Prerequisites

- A non-clustered virtual server pool can contain a maximum of 64 Oracle VM servers and a clustered virtual server pool can contain a maximum of 32 Oracle VM servers.
- Virtual servers that can be deployed as the Master Server, the Utility Server, and/or the Guest Virtual Machine. At least one virtual server is required in a server pool.
- All virtual servers in a server pool should have CPUs in the same CPU family. If they are not in the same CPU family, some operations such as live migration may fail. Though the CPUs should be in the same CPU family, they may have differing configurations, such as different number of cores. Other hardware components on the host computer may also differ, such as the amount of RAM, the number and size of disk drives, and so on.
Although the host computers may have differing configurations, Oracle recommends that all virtual servers in a server pool are identical.

- A dedicated file system (either a NAS export, or a LUN) to use as the server pool file system is available.
- IP addresses for the virtual servers must be available. The IP address to be used as the Master Server’s virtual IP address must be an unused and available IP address.
- To create a virtual server pool, you must be logged in as an Administrator with Add Any Target privilege.
- To delete a virtual server pool, you must have Full privilege on the server pool and appropriate privileges on the virtual servers and guest virtual machines belonging to the virtual server pool.

To create a virtual server pool:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on an OVM Manager target in the left panel and select Create Virtual Server Pool.

Figure 4-20 Create Virtual Server Pool

3. Enter the server pool information:
   - **Virtual Server Pool Name:** The name of the server pool. A server pool name must consist of alphanumeric characters, and must not contain spaces or special characters, except the underscore (_) or hyphen (-) characters. The maximum length of a server pool name is 200 characters.
   - **Description:** A description of the server pool.
   - **Keymap:** Specify the keyboard type for the guest virtual machines created in this server pool.
• **VM Start Policy**: Select the policy to be used to start the virtual machines. You can choose:
  - **Start on Best Server**: The best server in the server pool is used to start the virtual machine.
  - **Start on Current Server**: The virtual machine will be started on the same server on which it was created.

• **Secure VM Migrate**: Specify whether encrypted migration of virtual machines is to be enabled. If this checkbox is selected, virtual machines are migrated using SSL to protect data during the migration process.

• **Activate Cluster**: Select this check box to enable high availability on the server pool.

• **Cluster Timeout**: If the Activate Cluster is enabled, you can set the cluster timeout period in seconds. The disk heartbeat and network heartbeat are derived from the cluster timeout value.

• **Type of Pool File System**: Select the pool file system to use for the server pool. The pool file system is used to hold the server pool, cluster data, and is also used for the cluster heartbeat.

  The type can either be Network File System or Physical Disk. If you are using a file server for the server pool, select Network File System. If you are using a physical disk on a storage array for the server pool, select the type as Physical Disk.

• **Location**: Click the Search icon to search for and select the pool file system. This must be accessible by all virtual servers in the server pool.

• **Virtual IP**: An IP address used to locate the Master Server in the server pool. If the Master Server changes to another Oracle VM Server, this IP address is then assigned to the new host.

4. Click Add in the Virtual Servers section. Select one or more virtual servers from the Search window and click OK.

   **Note:**

   Before you add a virtual server to the server pool, it must have been discovered. See Discovering a Virtual Server for details.

5. Click OK to create a virtual server pool.

4.14.1 Editing a Virtual Server Pool

You can edit the configuration information of a virtual server pool, including the description, key map, start policy, and so on. You can also change the master server, which controls the cluster, as well as whether the virtual machines are migrated securely. You cannot change the Virtual IP or the Pool File System used for the server pool. To edit a virtual server pool, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.

2. From the left panel, select the virtual server pool target that you want to edit.
3. From the VM Server Pool menu, select Target Setup, then select Edit VM Server Pool. The Edit Virtual Server Pool page appears.

4. You can also edit the following fields:
   - **Keymap**: The keyboard type for the guest virtual machines created in this server pool.
   - **VM Start Policy**: The policy to be used to start the virtual machines. You can choose to start on the current server or on the best server.
   - **Secure VM Migrate**: Indicates whether encrypted migration of virtual machines is to be enabled. If this checkbox is selected, virtual machines are migrated using SSL to protect data during the migration process.
   - **Master Server**: Indicates the server that is the master of the server pool. You can choose any server in the server pool to become a master. This feature is not available for Oracle VM Manager versions 3.4 and later.

   **Note:**
   The Master Server feature is not supported in Oracle VM Managers versions 3.4 and higher.

5. In the Virtual Servers region, you can add or remove virtual servers.

6. Click **Change Agent Password** to change the password for the Management Agent running on the Master Server. The modified password will applied to the Management Agents running on all virtual servers in the server pool.

   **Note:**
   Before you add a virtual server to the server pool, it must have been discovered. See Discovering a Virtual Server for details.

7. You can **Add**, **Edit**, or **Delete** Anti-Affinity Groups. Anti-affinity groups specify that a group of virtual machines cannot run on the same server. In the Add Anti-Affinity Group window, enter a name for the group and select one or more virtual machines that should be part of this group. The virtual machines that are part of this group cannot run on the same server.

8. Click **OK** to apply the changes to the virtual server pool.

### 4.15 Creating a Zone

A zone is used to group related cloud resources together. Cloud zones can be created based on location, software lifecycle status, for grouping resources according to a cost center or for metering and chargeback purposes. Typically, a zone can cover a department or possibly a small data center. The cloud environment can comprise of one or more zones. Each zone has a set of metrics that show the aggregate utilization of the zone.

**Prerequisites**
To create a zone, you must be logged in as an Administrator with Add Any Target privilege.

To remove a zone, you must have Operator / Full privilege on the zone.

Follow these steps to create a zone:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click the OVM Manager target for which the zone is to be created in the left panel and select Create Zone.

3. In the Create Zone page, specify the zone name and description.
4. Indicate if this zone will be used by the self service users by checking the Infrastructure Cloud Self Service Zone check box.
5. Click Add in the Virtual Server Pool section to add one or more virtual server pools. See Creating a Virtual Server Pool for details. You can add the virtual server pools for which you have the privileges and that are not part of any other zone.
6. Click OK. The virtual server pools and the storage arrays appears in the newly created zone on the Home page.

### 4.16 Setting Up the Storage Quality of Service (QoS)

Storage QoS refers to quality of service that is defined at the storage server level. Setting up the storage QoS involves defining various storage properties. Before deploying a guest virtual machine, you can define the storage QoS, map this QoS to a storage server, and specify this QoS while deploying a guest virtual machine.

This involves defining the machine size, network type, and the storage QoS. After you have set up the storage QoS, you can set up the storage servers, network repositories, and storage arrays. This storage QoS can then be used during deployment of guest virtual machines.

To define the storage QoS, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on the Infrastructure Cloud menu in the left panel and select Setup.
3. Click **Create** in the Storage Quality of Service page.

4. In the pop-up window, specify the name and description of the storage QoS and click **OK**. The newly added storage QOS appears on the Storage Quality of Service page.

5. Navigate to the OVM Manager Home page and select **Storage** from the **OVM Manager** menu.

6. Click the **Storage** link under File Servers. In the General tab, scroll down to the Storage QOS Mapping region.

7. Click **Edit**. The Storage QOS Mapping window appears. Click **Add** and select that you had created earlier. The Storage QOS you have added appears in the Storage QOS Mapping table.

8. To see how this mapping is used when you deploy an assembly, navigate to the Home page of a Zone under the OVM Manager. From the **Zone** menu, select **Deploy**, then select **Assembly**.

9. In the Deployment Configuration page, click **Override** in the Disk section and select the Storage QOS you have created. This storage QOS will be used for deploying the assembly.

### 4.16.1 Setting Up the Network Type

You can define the QoS for network by defining some network types like routable, internet-facing, and so on. After the network QoS has been defined, you can map this to any network that is being created. You can then use this network type while deploying a guest virtual machine.

To define the network QoS, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.

2. Select **Setup** from the **Infrastructure Cloud** menu.

3. Click the **Network Types** link on the Infrastructure Cloud page.

4. Click **Create** in the Network Types page.

5. Enter a name and description of the network type and click **OK**.
4.16.2 Setting Up the Machine Sizes

You can define the machine size that will be available to the SSA users and during deployment. To define the machine size, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on the Infrastructure Cloud menu in the left panel and select Setup.
3. Click the Machine Sizes link on the Infrastructure Cloud page.
5. Enter the name (internal name of the machine size), description, number of VCPUs, amount of memory and local storage assigned to machines of this size. Click Save to add this machine size.

4.16.3 Configuring the Software Library User

While setting up the storage repository, you can import VM Templates, Assemblies, and other software components into the storage repository. To configure the software library user who has the privileges to perform these tasks, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on the Infrastructure Cloud menu and select Setup.
3. Click the Software Library User Configuration link on the Infrastructure Cloud page.
4. Enter the password for the Cloud Software Library user who is allowed to import components from the Software Library. This password must be specified when the user accesses the Software Library and download the required components.

4.16.4 Configuring the Software Library User with External Management Agent

If the Management Agent is running on a remote machine, when importing the virtualization components, you must ensure that:

- The Software Library user must have Execute command privileges on the remote host.
- If Named Credentials are required to access the Management Agent on the remote host, the Software Library user must have View privileges while creating the Reference File locations for the Agent Storage Type.

To set up View privileges, follow these steps:

1. From the Setup menu, select Security, then select Named Credentials.
2. Select the Named Credentials to be used while creating the Software Library Reference Location of Storage Type: Agent.
3. Click Add Grant. Select the CLOUD_SWLIB_USER and click Save.

To set up Execute privileges on the remote host, follow these steps:
1. From the **Setup** menu, select **Security**, then select **Administrators**.

2. Select the `CLOUD_SWLIB_USER` and click **Edit**.

3. Navigate to the Target Privileges step. In the Target Privileges section, click **Add** and select the host target on which the Management Agent is running. The host target is added to the table.

4. Select the host target added in the Step 3 and click the **Edit** icon in the Manage Privilege Grants column. Select **Execute Command** in addition to the already existing View option and click **Continue**.

5. Click **Save** to save this configuration.

### 4.16.5 Defining the Request Purging Policy

All deployment requests can be retained for a certain period and then purged. To specify the number of days for which the requests should be available, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.

2. Right click on the **Infrastructure Cloud** menu and select **Setup**.

3. Click the **Request Archiving Policy** link on the Infrastructure Cloud page.

4. Select the **Enable Archiving** check box, specify the Archiving Duration, and click **Apply**. The requests will be archived for the specified period and will then be purged.

### 4.17 Patching the Oracle VM Server

Oracle provides a publicly available YUM repository which includes repositories for Oracle VM. These repositories include the full releases of Oracle VM and mirror those releases on the Oracle VM DVDs/ISOs. The Oracle VM Server must be patched to ensure that the latest software updates and enhancements are applied. Patching the Oracle VM Server involves the following:

- Configuring the YUM Repository
- Upgrading the Virtual Server

#### 4.17.1 Configuring the YUM Repository

You can configure the YUM repository that is to be used to upgrade the virtual server. The configured YUM repository can be used for to upgrade all discovered virtual servers.

**Prerequisites**

- The YUM repository being configured must be present at a `http` location. You can configure an internal or public YUM repository.

To configure the YUM repository, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on an OVM Manager target in the left panel, then select **Manage YUM Repository**.

3. Enter the following details in the YUM Repository page:
   - **Name**: Name of the YUM repository.
   - **YUM Base URL**: HURL for the YUM repository.
   - **Enable GPG Key**: Select this check box if you want to enable the GPG key. The GPG key checks the validity of the YUM repository and packages downloaded from the repository.
   - **YUM GPG Key**: If the Enable GPG Key field has been checked, specify the YUM GPG Key here.

4. Click **OK**. The YUM repository will be configured for the Oracle VM Manager.

### 4.17.2 Upgrading the Virtual Server

After you have configured the YUM repository, you must upgrade the virtual server to ensure that it has the latest updates. The virtual server being upgraded must be in maintenance mode. To upgrade the virtual server, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on a VM Server in the left panel and select **Upgrade**.

   **Note:**
   The Upgrade button is disabled if the Oracle VM Manager version is 3.3.x and the Oracle Virtual Server version is less than 3.3.1.

3. A confirmation message appears. Click **OK** to proceed with the upgrade. After the virtual server has been upgraded, the virtual server will be restarted.

### 4.18 Acknowledging OVM Events

OVM events are generated for all operations performed on a server, server pool, storage, or network. The event can be Informational, Minor, or Critical. When a target is in an error state, a Critical event is generated. Targets with a Critical status cannot be used to perform any operations. The **EM_CLOUD_ADMINISTRATOR** can acknowledge such events as the associated targets cannot be used. To acknowledge an OVM event, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Click on a VM Server in the left panel to navigate to the VM Server Home page.
3. From the **VM Server** menu, select **OVM Events**. The list of unacknowledged events appears. Select an event from the list and click **Acknowledge** to acknowledge the event.
4.19 Managing the NTP Configuration

**Note:**

- This feature is available only with Oracle VM Manager 3.2.1 or later.
- The NTP Server to be added must already be configured to provide the NTP service.

Network Time Protocol (NTP) is a networking protocol that enables clock synchronization across all Oracle VM Servers managed by an Oracle VM Manager. By default, when an Oracle VM Server is discovered, it is configured to use the Oracle VM Manager host computer as the NTP time source. You can configure a custom list of NTP servers that will be used to synchronize the clock when an Oracle VM Server is discovered. To create a custom list of NTP servers, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**. The Infrastructure Cloud Home page appears.

   **Figure 4-24** NTP Configuration

2. Right click on an Oracle VM Manager target from the left panel and select **Manage NTP Configuration**.

3. To add an NTP server, click **Add**. In the Add NTP Server dialog box, enter the IP address or hostname of the NTP server in the IP Address/DNS Hostname field and click **OK**.

4. To edit an NTP server, select the server in the table and click **Edit**. In the Edit NTP Server dialog box, you are prompted for the name of the New NTP Server. Enter the IP address or hostname of the new NTP Server and click **OK**.

5. To delete an NTP server, select the server in the table and click **Delete**. A confirmation message is displayed. Click **OK** to delete the server or **Cancel** to cancel the operation.

6. To update the NTP server configuration on all Oracle VM Servers managed by the VM Manager, click **Update All Servers**. Any previous NTP configuration is overwritten.

   Alternatively, you can save the NTP server configuration that you have added by clicking **Save**. This option saves the configuration but does not update the Oracle VM Servers. You can push the configuration to the VM Servers at a later date.
After any changes have been made to the NTP server configuration, you must restart the VM Server for the changes to be effective.

**Note:**
If multiple NTP configurations have been defined, the order in which they have been defined will be used for clock synchronization.

### 4.20 Importing Virtual Machines

**Note:**
This feature is available only with Oracle VM Manager 3.2.1 or later.

You can import a virtual machine into Oracle VM Manager from an external location. The imported virtual machine is placed under the VM Zone, VM Server Pool, or the VM Server you have selected. The virtual machine must be located on an FTP or web server, either as separate files, or compressed into a single archive file (for example, a .tgz or .zip file).

To import a virtual machine, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**. The Infrastructure Cloud Home page appears.
2. Right click on a VM Zone, VM Server Pool, or a VM Server target from the left panel and select **Import Virtual Machine**. The Import Virtual Machine: Select Target and Source page appears.
3. The destination target on which the virtual machine is to be imported and the name of the target is displayed.
4. Enter the following details:
   - **Source**: Enter the URL of the archive (tgz or gzip) that is to be imported as a virtual machine. The URL can be in format HTTP, HTTPS, or FTP.
   - **Request Name**: Enter a name for the virtual machine import request.
5. Click **Next**. The Import Virtual Machine: Instance Details page appears.

**Figure 4-25 Import Virtual Machine: instance Details**
6. Enter the following details:

- **Enable High Availability**: If you want to enable high availability for this guest virtual machine, select this checkbox. This option allows the guest virtual machine to be automatically restarted on other virtual servers in the pool in case the virtual server hosting the guest virtual machine fails.

  
  
  Note:

  High availability must be enabled both on the virtual server pool and on the guest virtual machine. If it is not enabled on both, high availability is disabled.

- **Start VM After Creation**: Specify whether the guest virtual machine should be started automatically after it is created.

- **CPU Scheduling Priority**: Specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. Higher the priority, higher is the stake of the guest virtual machine in claiming CPU cycles.

- **CPU Scheduling Cap (%)**: Restricts the amount of physical CPU that a guest virtual machine can use. Use this to constrain guest virtual machine resource allocation.

- **Keymap**: The keyboard mapping that will be used by the guest virtual machine being cloned.

- **Tags**: Specify one or more tags for the virtual machine. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.

- **VM Size**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values). Select the VM Size which can be Small, Medium, Large, or Custom.

  
  
  Note:

  The Root Password, Network, and Storage configuration cannot be modified for an imported virtual machine.

7. Click **Next**. In the Import Virtual machine: Schedule page, specify the Start and End Date. The Start Date is the date on which the request is being submitted and the End Date is the date on which the virtual machine is retired. Click **Next**.

8. Review the details of the virtual machine being imported and click **Submit**. From the Enterprise menu, select Job, then select Activity to view the Job Activity page. This page shows the details of the submitted job. You can click on the Name link to view more details.
4.21 Acknowledging the Repository Events

When the file system on the storage repository gets corrupted, a critical event is raised on the storage repository. This page displays all the critical events for the storage repository. To acknowledge repository events, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home. The Infrastructure Cloud Home page appears. Select an OVM Manager target from the left panel.

2. From the VM Manager menu, select Administration, then select Storage Repository.

3. A list of storage repositories that have been defined is displayed. Click on a storage repository name and click the Repository Events tab.

4. A list of unacknowledged critical events is displayed. Select an event from list and click Acknowledge Events. The file system associated with the acknowledged event cannot be used.
5
Defining and Managing Cloud Policies

This chapter describes the process to define policies for different target types and perform specific actions on virtualization targets. It contains the following sections:

- About Cloud Policies
- Viewing Cloud Policies
- Viewing Policies for a Target
- Defining a Performance Policy
- Defining a Schedule-Based Policy
- Activating and Deactivating Policies
- Viewing Policy Groups
- Creating a Policy Group
- Creating DRS and DPM Policies

5.1 About Cloud Policies

Cloud management policies are rules that a EM_CLOUD_ADMINISTRATOR can define to take certain actions based on either performance metric thresholds or based on a schedule. You can create your own policies or use the ready-to-use policies. The ready-to-use policies provided by Oracle cannot be edited but you can do a create like cloning of the policy and then edit it as required.

Note:
A self service user (EM_SSA_USER) can also create cloud policies for the services for which he has been granted access..

There are two kinds of cloud management polices: Performance-based policies and Schedule-based policies. Performance policies are based on the performance metrics of a specific type of target. Schedule based policies are executed based on the schedule you have defined. You can group one or more policies together to form policy groups. You can:

- View and Monitor Cloud Policies
- Define a new policy which can be of the following types:
  - Performance Policy
  - Schedule Policy
- Activate or Deactivate a Policy
5.2 Viewing Cloud Policies

You can view all the cloud policies and policy groups from the Cloud Policy Home page. You can view details like the status of the policy, type of policy, action type, policy associations and the schedule for the policy.

1. Log in to Enterprise Manager as a user with the EM_CLOUD_ADMINISTRATOR role and from the Enterprise menu, select Cloud, then select Infrastructure Policies.

   **Note:**

   if you have logged into as a user with the EM_SSA_USER role, click the Policies tab in the Infrastructure Cloud Self Service Portal.

2. On the Policy Home page, you will see a list of a policies that you own and for which you have administration privileges.

3. Select a policy from the table. The policy details including the type of policy, performance (rule, action, action description), or schedule (schedule, action and action description), the status, date on which it was created, and the target type are displayed.

4. You can perform the following actions on this page:

   - **Create:** To create a new policy, from the Create menu, select either of the following:
     - Schedule Policy: See Defining a Schedule-Based Policy.
     - Performance Policy: See Defining a Performance Policy.

   - **Create Like:** Select a policy and click Create Like to make a copy of an existing policy.

   - **Edit:** Select a policy and click Edit to launch the Edit Policy wizard. You can modify the description of the policy and add metrics to the policy. You cannot
change the name of the policy, the type of policy, the target with which the policy is associated, and the actions that can be performed.

- **Activate or Deactivate a Policy**: See Activating and Deactivating Policies.

- **Create Policy Associations**: In the Associations region, you can view a list of targets that have been associated with a selected policy. A policy can be associated with one or more targets. Click Add. In the Search and Select: Targets window, choose a target and click Select to associate the target with the policy. After you have associated one or more targets with the policy, you can:
  - Click on a target to drill down to the Policies page for the target. See Viewing Policies for a Target.
  - Select a target and click View History to view the Policy Action History.
  - Select a policy and click Remove to delete the associations for the policy.

- **Note**:
  - Associations cannot be added for inactive policies.
  - The View History option is not available for users with the EM_SSA_USER role.

### 5.3 Viewing Policies for a Target

After you have associated a target with a policy, you can view all policies that can be associated with a target on the Policies page.

To view policies that can be associated with a selected target, follow these steps:

1. Navigate to the Cloud Policies page.
2. Select a policy from the list of active policies in the list. In the Associations region, click on a target link to drill down to the Policies page for the target.

**Figure 5-2  Policies - Target**
3. All policies that can be associated with the selected target are listed on this page. For each policy, the type of policy association that has been defined is displayed. This can be:
   - Standalone
   - Template Collection
   - Policy Group

   For each policy, the following details are displayed:
   - Name and description of the policy.
   - The type of policy which can be Schedule or Performance.
   - The policy association method. A policy can be associated with a standalone association, template collection, a policy group or a combination of the three.
   - The General section displays details like status of the policy, the number of associations, the date on which the policy was created, and the type of policy.
   - The Policy Action History region shows the history of associations for this target.

   **Note:**
   - The history of policy associations is displayed only for users with the EM_CLOUD_ADMINISTRATOR role.
   - The Policy Action History region is blank if the action has a Failed status.

4. For policies that are active, you can do the following:
   - Select a policy and click **Associate** to associate it with the target.
   - Select a policy that has already been associated and click **Disassociate** to delete the policy association.

## 5.4 Defining a Performance Policy

Performance policies are formed based on the performance metrics of a specific target type and its associated targets. You can create conditions and rules for the policy based on the metrics.

To define a performance policy, follow these steps:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. On the Policy Home page, you will see a list of policies that you own and for which you have administration privileges.
3. From the **Create** menu, select **Performance Policy**.
4. In the General Information page, enter the name and description of the policy. Select the Target Type with which the policy is to be associated.
5. Click **Next**. In the Rule page, select a metric from the right panel and click **Add to Definition**, or drag and drop metric from the Metrics column to the Definition column. Specify the condition, value, and number of occurrences. In the Match radio button, you can select

- **All**: All conditions must be met before the policy is executed on the target.
- **Any**: Any of the conditions must be met for the policy to be executed.

6. Click **Next**. Specify the action to be performed when the policy condition is met. The list of available actions can vary depending on the selected target type.

   If notifications are disabled, you will see the following message:

   **Notification action is currently disabled. Contact your system administrator to set up the email server information.**

7. Review the policy and click **Save** to define this policy and return to the Policy Home page.
5.5 Defining a Schedule-Based Policy

Schedules based on policies are based on a predefined schedule. To define a schedule-based policy, follow these steps:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. On the Policy Home page, you will see a list of the policies that you own and for which you have administration privileges. From the Create menu, select Schedule Policy.

![Create Schedule Policy](image)

3. In the Create Schedule Policy page, enter the name, description of the policy, and the Target Type with which the policy is to be associated.
4. Specify the Grace Period, frequency, and schedule for the policy.
5. When the policy conditions are met, the policy is executed as per the schedule on the selected target. The list of available actions can vary depending on the target type with which the policy is associated.
6. Click Save to define this policy.

![Note]

After you have defined the policy, you can associate one or more targets with the policy.

5.6 Activating and Deactivating Policies

Once a policy is defined, it becomes active and can be applied to one or more targets. You can deactivate an active policy by following these steps:
1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.

2. On the Policy Home page, you will see a list of policies that you own and have administration privileges.

3. Select a policy from the table and click Deactivate. The policy is deactivated and the status of the policy is marked as Inactive. You cannot associate this policy to any target until it is activated and its current associations will be suspended for further evaluations.

   Once a policy is deactivated, it is marked as Inactive. To activate an Inactive Policy, select the policy from the table and click Activate. In the confirmation window, click Activate again. The policy is now marked as Active.

5.7 Viewing Policy Groups

A policy group is a collection of policies that can be applied together and evaluated to generate a compliance score. To view the policy groups, follow these steps:

1. Log in to Enterprise Manager as a user with the EM_CLOUD_ADMINISTRATOR role and from the Enterprise menu, select Cloud, then select Infrastructure Policies.

   Note: if you have logged into as a user with the EM_SSA_USER role, click the Policies tab in the Infrastructure Cloud Self Service Portal.

2. The Cloud Policies page appears. Click on the Policy Groups tab.

Figure 5-7  Policy Groups

3. The list of policy groups that have already been defined are displayed. You can do the following:

   • Create a Policy Group: See Creating a Policy Group.

   • Create Like: Select a policy group and click Create Like to make a copy of an existing policy group.

   • Edit: Select a policy group and click Edit to launch the Edit Policy Group wizard. You can add or remove policies from the policy group. You cannot modify the name of the policy group.
• **Delete**: Select a policy group and click **Delete**. When a policy group is deleted, all associations defined for the policy group will also be deleted.

  
  **Note:**
  
  You can edit or delete policy groups that you have created or for which you have the privileges.

• **Create Policy Group Associations**: Click the **Associations** tab in the Policy Group region, to view a list of targets that have been associated with the selected policy group.

  A policy group can be associated with one or more targets. Click **Add**. In the Search and Select: Targets window, choose a target and click **Select** to associate the target with the policy group. After you have associated one or more targets with the policy group, you can:

  – Click on a target to drill down to the Policies page for the target. See **Viewing Policies for a Target**.
  – Select a target and click **View History** to view the Policy Group Action History.
  – Select a target and click **Remove** to delete the policy group association.

• **View Policies**: Click the **Policies Included** tab in the Policy Group region to view the list of policies included in the policy group.

  
  **Figure 5-8   Policy Group: Policies Included**

---

### 5.8 Creating a Policy Group

To define a policy group, follow these steps:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.

2. Click on the **Policy Groups** tab. On the Policy Groups page, you will see a list of a policy groups that have been defined.

3. Click **Create**. The Create Policy Group page appears.
4. Click **Add**. A list of policies that can be added to the policy group are displayed. Select one or more policies from the list and click **Select**.

5. The selected policies will be added to the policy group. Click **OK** to save this policy group.

6. Click **OK** to save this policy group.

5.8.1 Example 1

If you want to shut down a guest virtual machine every Friday at 6:00 pm and restart it every Monday at 9:00 pm, you can create policies as follows:

- First, create a schedule based policy where the guest virtual machine shuts down every Friday at 6:00 pm. See Creating a Policy for Shutting Down Guest Virtual Machine.
- Secondly, create another schedule based policy where the guest virtual machine is restarted every Monday at 6:00. See Creating a Policy for Starting Up Guest Virtual Machine.
- Combine these two policies into a Policy Group and associate these policies with one or more guest virtual machine targets. See Creating a Policy Group (Start Up and Shut Down).

5.8.1.1 Creating a Policy for Shutting Down Guest Virtual Machine

To shut down a guest virtual machine every Friday, you can set up the policy as follows:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. In the Cloud Policies page, select **Schedule Policy** from the **Create** menu. In the Create Schedule Policy page, enter the following details:
   - Enter a name and description for the policy.
   - Select the Target Type as **Oracle VM Guest**.
   - Select **Stop** in the Policy Action field.
   - In the Start field, specify the date and time from which this policy should be effective.
   - In the Repeat field, select **Specific Days of the Week** and select **Friday** in the Days of Week checkbox.
3. Click **OK** to save this policy and return to the Cloud Policies page.

**5.8.1.2 Creating a Policy for Starting Up Guest Virtual Machine**

To start a guest virtual machine every Monday, navigate to the Cloud Policy page and select the policy you just created. Perform the following steps:

1. Click **Create** Like to make a copy of the policy.

2. In the Cloud Policies page, select **Schedule Policy** from the **Create** menu. In the Create Schedule Policy page, enter the following details:
   - Enter a name and description for the policy.
   - Select the Target Type as **Oracle VM Guest**.
   - Select **Start** in the Policy Action field.
   - In the Start field, specify the date and time from which this policy should be effective.
   - In the Repeat field, select **Specific Days of the Week** and select **Monday** in the Days of Week checkbox.

3. Click **OK** to save this policy and return to the Cloud Policies page.

**5.8.1.3 Creating a Policy Group (Start Up and Shut Down)**

After defining the two policies for the guest virtual machine target type, you can combine these policies into a policy group and associate these policies to one or more targets. To create a policy group, follow these steps:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.

2. On the Cloud Policies page, click the **Policy Groups** tab.

3. Click **Create**. The Cloud Policy Group page appears.

4. Enter a name and description for the group.

5. Click **Add** and select the two schedule policies that you have created.

6. Click **OK** to return to the Cloud Policies page and click on the Policy Group that you have created.

7. The details of the policy group that you have created such as the name of the policy group, number of policies associated with this group, number of targets associated, and so on are displayed.

8. Click the **Policies Included** tab in the bottom region to view the policies associated with this policy group.

9. Click the **Associations** tab to view the list of guest virtual machines associated with this policy. Click **Add** to associate more guest virtual machines with this policy group.

10. When this policy group is active, the guest virtual machines associated with the policies are shut down and started up as per the schedule.
5.8.2 Example 2

Suppose you want to define a policy group for an Oracle Tier Instance target where the tier instance is scaled down to 1 every Friday and scaled up to 2 every Monday. You can create the following policies:

- First, create a Schedule Policy to scale down the tier instance to 1. See Creating a Policy to Scale Down a Tier Instance.
- Next, create another policy to scale up the tier instance to 2 every Monday. See Creating a Policy to Scale Up a Tier Instance.
- Combine these policies and create a Policy Group. See Creating a Policy Group (Scale Up and Scale Down).

5.8.2.1 Creating a Policy to Scale Down a Tier Instance

To scale down a tier instance every Friday, you can set up a performance policy as follows:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. In the Cloud Policies page, select Schedule Policy from the Create menu. The Create Schedule Policy page appears.
3. Enter a name and description for the policy and specify the following details:
   - **Target Type**: Select the Tier Instance target type.
   - **Policy Action**: Select the Scale Down policy action.
   - **Repeat**: In the Repeat field, select Specify Days of the Week.
   - **Days of the Week**: Select Friday here.
4. Click OK to save the policy.

5.8.2.2 Creating a Policy to Scale Up a Tier Instance

To scale down a tier instance every Friday, you can set up a performance policy as follows:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. In the Cloud Policies page, select Schedule Policy from the Create menu. The Create Schedule Policy page appears.
3. Enter a name and description for the policy and specify the following details:
   - **Target Type**: Select the Tier Instance target type.
   - **Policy Action**: Select the Scale Up policy action.
   - **Action Parameters**: Enter 2 for the Number of Nodes parameter.
   - **Repeat**: In the Repeat field, select Specify Days of the Week.
   - **Days of the Week**: Select Monday here.
4. Click OK to save the policy.
5.8.2.3 Creating a Policy Group (Scale Up and Scale Down)

After defining the two policies for the Oracle Tier Instance target type, you can combine these policies into a policy group and associate these policies to one or more targets. To create a policy group, follow these steps:

1. Depending on your user role, use the menu options to navigate to the Infrastructure Policies page.
2. On the Cloud Policies page, click the Policy Groups tab.
3. Click Create. The Cloud Policy Group page appears.
4. Enter a name and description for the group.
5. Click Add and select the two schedule policies that you have created.
6. Click OK to return to the Cloud Policies page and click on the Policy Group that you have created.

5.9 Creating DRS and DPM Policies

The Dynamic Resource Scheduling (DRS) and Distributed Power Management (DPM) policies are automated policies that improve quality of service and reduce power consumption by dynamically relocating running virtual machines within a server pool based on the load.

Dynamic Resource Scheduling (DRS) policies provide real-time monitoring of Oracle VM Server utilization to rebalance a server pool and provide consistent resources to the running virtual machines. DRS migrates VMs away from heavily loaded Oracle VM Servers to those servers with more resources available.

Distributed Power Management (DPM) policies optimize the server pool for minimum power consumption. DPM complements DRS by reducing the number of powered-on servers in the pool when there are periods of low resource utilization. It can automatically power-on capacity as needed when resource utilization ramps up.

To set up a DRS / DPM policy, follow these steps:

1. Log in as a user with the EM_CLOUD_ADMINISTRATOR role, and from the Enterprise menu, select Cloud, then select Infrastructure Home.
2. Right click on a VM Server Pool target in the left panel and select Manage DRS/DPM Policies. Click Configure. The Configure DRS/DPM General page appears.
3. Select the Policy Type. This can be:
   - Distributed Resource Scheduler: Select this policy type to optimize virtual machine resource utilization in a server pool.
   - Distributed Power Management: Select this policy type to increase the consolidation ratio to use fewer Oracle VM Servers during periods of relative low resource utilization.
4. Specify the Time Period (Minutes). This is the time period for the policy job to run. This sets the policy job to run every n minutes, for example, 10 sets the policy job to run every 10 minutes. You can enter a number between 1 and 60.
5. Click **Add** in the Virtual Servers region to add one or more virtual server targets for which the policy is to be enabled.

6. Specify the Constraints for the Virtual Server CPU as follows:
   - **Enable**: Set this field to enable or disable logging of CPU performance and utilization.
   - **Threshold**: The maximum amount of CPU percentage usage allowed before the policy must be enacted. You can enter between 0 and 99.

7. Click **Next**. The Configure DRS/DPM Network page appears.

8. Select the **Enable** checkbox to indicate whether the policy is to be enabled on the network, and select the threshold at which the policy is to be enacted for the network.

9. Click **Apply**.

**Note:**

Once the policy is created, it is enabled and applicable to all the virtual server pool targets that have been included in the policy. To disable the DRS/DPM policy, create a schedule based policy for the Oracle VM Server Pool target type and in the Policy Action field, select **Disable DRS/DPM** policies. See Defining a Schedule-Based Policy for more details on creating a schedule based policy. You can enable the policy by editing the Schedule Policy and select **Enable DRS** or **Enable DPM** as necessary.

### 5.9.1 Creating Automated DRS and DPM Policies

You can create automated DRS or DPM policies by following these steps:

1. Log in as a user with the `EM_CLOUD_ADMINISTRATOR` role and from the **Enterprise** menu, select **Cloud**, then select **Infrastructure Policies**.

2. From the **Create** menu, select **Schedule Policy**.

3. In the Create Schedule Policy page, enter a name and description for the policy.

4. Select Oracle VM Server Pool as the Target Type.

5. Select **Enable DRS** or **Enable DPM** Policy from the Policy Action field.

6. Specify the schedule and frequency for the policy and click **OK** to save the policy.

7. In the Cloud Policies page, select the policy you have created and click **Add** in the Associations region.

8. Select the Oracle VM Server Pool target with which the policy is to be associated and click **Select**.

9. The DRM or DPM policy is now automatically enabled for the selected target.
Setting Up the IaaS Self Service Portal

This chapter describes the process of setting up the Self Service Portal. It contains the following sections:

- Setting Up the Self Service Portal
- Uploading Large Files on the Self Service Portal

6.1 Setting Up the Self Service Portal

The Self Service Portal allows administrators to configure the cloud and perform various operations such as deciding the total amount of resources each user can reserve, quota for each user role, and so on. Users can log in to the Self Service Portal and identify the images they need, reserve resources (for example, compute power, storage, memory, and so on) and define policies specific to their system.

**Note:**

Click here to view a visual demonstration on how to enable the Self Service capability for the Cloud using Enterprise Manager Cloud Control 12c. You will see how to setup Self Service roles and users, allocating quota and privileges, publishing assemblies to the Self Service portal, and configuring metering and chargeback for the Cloud.

Before the Self Service Portal can be used, the user quota, roles for zone access, and software components must be defined.

**Prerequisites**

- Enterprise Manager Cloud Control is set up to manage the cloud environment.
- The Enterprise Manager administrator has the privileges to set up the self service application. This user must have the `EM_SSA_ADMINISTRATOR` role. See Defining Roles and Assigning Users for details.

Follow this process to set up and configure the Self Service Portal.

1. From the Setup menu, select **Cloud**, then select **Infrastructure**. Click **Machine Sizes** in the left panel. Small, Medium, and Large machine sizes are available out-of-the-box.

**Figure 6-1**  Self Service Portal Setup - Machine Sizes
• To view a demo on setting up the self service portal, click the video link next to the Page Refreshed section of the page. Click **Create** to add a machine size. You are prompted for the Name (internal name of the machine size), description, number of VCPUs, amount of memory and local storage to be assigned to machines of this size. Click **Create** to add this machine size.

• Select a machine size from the list and click **Edit**. You can configure the machine sizes by specifying the amount of memory, number of CPUs, and the local storage for each machine. While requesting a server, the SSA user can specify any of the machine sizes defined here.

2. Click **Request Settings** in the left panel to define request related policies. On this page, you can enter the following details:

   • **Future Reservation**: Indicate how far in advance you can make a request.

   • **Request Duration**: The maximum duration for which requests should be made.

   • **Network Restriction**: Allows you to restrict the physical networks for each **EM_SSA_USER** role. If this feature is enabled, you can navigate to the Roles page and assign networks for each **EM_SSA_USER** role.

   • **Configure EM Agent**: Select the **Enable EM Agent Configuration** check box to configure the Management Agent on the servers while the self service user's request is being processed.

   **Note:**

   If you have chosen to configure the Management Agent, you must ensure the following:

   – Write permissions to the directory specified in the **Installation Base Directory** field must be available.

   – Write permissions to the `/home/oracle/agent` directory specified during assembly or template deployment must be available.

   – Necessary software components must be configured.

• **Allow Partial Deployment**: Select this option to enable partial deployment. By default, when a deployment fails, the assembly instance, tier instance, and the Guest VMs that have been created are automatically deleted. But if partial deployment is enabled, this clean up activity is disabled.

• **Software Library Top Folder**: Select the top level folder in the Software Library in which user specific folders need to be created. This folder is used by the SSA users to store their assemblies, templates, and deployment plans.
3. Click **Roles** in the left panel to define the mappings between roles and other entities like zones, quota, and network profiles. The SSA administrator can control the quota that the SSA user can request which ensures that there is no over provisioning of cloud resources.

4. In the Roles page, click **Assign Quota to Role** to define quota at the role level. The quota assigned to a role is available to all users with that role. For example, if the Number of Servers for the **SSA_USER_ROLE1** is set to 5, all users with this role can have a maximum of 5 servers. The quota is the aggregate amount of resources that can be granted to each self service user belonging to a certain role. If the user has more than one role, his quota is calculated as the absolute maximum across the roles for each attribute value.

   - **Select Roles**: Click the torch icon to select a role for which the mapping is to be defined. The list of all the SSA roles appears.
   - **Select Zones**: Click the torch icon. All zones marked as Cloud Self Service Zones during zone creation are displayed here. Select a zone from the list and click **OK**.
   - **Number of Servers**: Maximum number of servers that can be reserved at any time. This number is across the zones. For example if the quota for a user is 5. Then, the total number of instances from all zones is 5. So the user can have 3 instances in zone 1 and 2 instances in zone 2, or all 5 instances in the same zone.
   - **Number of VCPUs**: Maximum number of VCPUs that can be allocated.
   - **Memory**: Maximum amount of memory that can be allocated.
   - **Local Disk**: Maximum amount of local storage that can be allocated.
   - **Additional Storage**: Maximum amount of additional storage that can be allocated.
- **Allow Archiving to Software Library**: Indicate whether the machine images can be archived in the Software Library after expiry. You can also select this option to save the machine image as a template when the guest virtual machine is stopped.

- **Select Networks**: This field is displayed only if Network Restriction has been enabled. Click the torch icon to select the physical networks that are to be assigned to all users in the role.

- **Select Network Profiles**: Select the network profile to assigned to the selected role. All deployments are done in a specific network defined by the network profile.

  **Note:**
  
  Network profiles that have been associated with networks in the selected zone are displayed. For more details on network profiles, see Creating a Network Profile

- **Override Global Request Settings**: Select this checkbox to override the request settings for the selected role. You can modify the Future Reservation, Request Duration, and configure the Management Agent.

  Select a role and click **Edit**. You can modify the role mappings in the **Assign Quotas, Zones & Network Profiles to Role** page.

5. Click **Software Components** in the left panel to select the set of templates or assemblies that are accessible to the SSA users. You can publish the assemblies and templates to the SSA Portal and provide SSA users with access to these software components.

![Figure 6-4 Self Service Portal Setup - Software Components](image)

6. You can do the following on this page:
   - **Add Components**: Click **Add Components**. The Publish Assemblies / Templates to Roles page appears.

      On this page, do the following:

      a. Click **Add**. Select the assembly or template from the list and click **Select**.

      b. Click **Add** in the Select Roles section. Select the role from the list and click **Select**.
c. Click **Publish** to publish these software components to the SSA Portal. These software components are now available to the SSA users and can be deployed.

**Note:**
You will see a list of assemblies or templates if they have been uploaded to the Software Library. See the *Enterprise Manager Cloud Control Administrator’s Guide* for details on uploading components to the Software Library.

- **Import:** You can import the published assembly to a selected set of zones. Select the assembly and click **Import**. In the Select Zones page, select one or more zones and click **Save** to import the assembly to the selected zones.

- **Configure:** Select a software component and click **Configure** to configure the Management Agent.

**Note:**
The Management Agent can be deployed only if the **Enable Agent Configuration** check box has been selected in the Request Settings page.

The Management Agent configuration details are displayed:

- **Installation Base Directory** (Mandatory): Specify the full path to the directory in which the Management Agent is to be installed. Ensure that the Installation Base Directory you specify in the response file is empty and has write permissions. This is a mandatory field.

- **Platform** (Mandatory): The platform for which you want to download the Management Agent software. This is a mandatory field.

- **Password** (Mandatory): Specify a password for registering the new Management Agents. By default, the communication between the Oracle Management Service and the Management Agent is secure and locked. Any new Management Agents that are registered must be authenticated. The password you specify here will be used to authenticate the new Management Agents.

- **Port** (Mandatory): Enter the port used for the Management Agent process. If no value is specified, then either 3872 or any free port between 1830 and 1849 will be used.

- **Additional Parameters:** You can add some options supported by agent installation. See the *Enterprise Manager Basic Installation Guide* for details.

- **SSH Timeout:** The timeout minutes for SSH.

- **Privilege Delegation Settings:** Run as root.

- **Tier Configuration:** Specify the product and network configuration time out values and the log file location.
Specify the details and click **OK** to configure the Management Agent.

- **Import Rules:** You can define rules to import published assemblies and templates to zones on a periodic basis based on a predefined schedule. Click **Create** in the Import Rules section. Enter a Rule Name, select a set of zones, a schedule for the import and click **Save**. The published assembly or template is imported to the selected server pools and zones on a regular basis.

7. Click **Chargeback** tab in the left panel. The Chargeback application allows the SSA Administrator to define a charge plan and assign the plan to a specific zone or target.

8. Setting up the Chargeback Plan involves:
   - **Defining Extended Charge Plans:** Click **Configure Charge Plan**. You can edit the Base Charge Plan or create an Extended Charge Plan to customize the charge plan for a specified target type.
   - **Assigning Charge Plans:** Click **Configure Targets**. You can assign charge plans to a set of targets.
   - **Setting Up the Cost Center:** Click **Configure Cost Center**. You can setup cost centers to aggregate costs among groups of users.

For more details on setting up the chargeback plan, see Chargeback Administration.

### 6.2 Uploading Large Files on the Self Service Portal

The **EM_SSA_USER** can upload software components to a library location. See Viewing Library for details. If the file to be uploaded is large, the **EM_SSA_USER** will see the following error message.

**Error:** The file is too large. Please add a smaller file.

To resolve this issue, you can use one of the following methods:

#### 6.2.1 Setting the OMS Property Using emctl

To set the Oracle Management Service property, follow these steps:

1. Set the `oracle.sysman.emSDK.ui.trinidad.uploadedfilemaxdiskspace` OMS property to a value (in bytes) greater than the size of the file that is to be uploaded. For example, to set the value of the property to 3 GB,

   ```
   $ORACLE_HOME/bin/emctl set property -name "oracle.sysman.emSDK.ui.trinidad.uploadedfilemaxdiskspace" -sysman_pwd sysman -value 3221225472
   ```

2. If the file to be uploaded is huge, the page may expire while the upload is still in progress (usually after 10 minutes). To avoid this, the `oracle.sysman.eml.maxInactiveTime` OMS property must be set to a value (in seconds) greater than the expected time for the upload to complete. If this property is set, you must restart the OMS to reflect the new property value.

#### 6.2.2 Modifying the web.xml Configuration File

To modify the `web.xml` configuration file, follow these steps:
1. Locate the `web.xml` configuration file by navigating to the following location in the Oracle Management Service Home

   

   `.oms/sysman/archives/emgc/deployments/EMGC_DOMAIN/emgc.ear/em.war/WEB-INF/web.xml`

   If this directory structure is not present, navigate to the following location in the Oracle Management Service Home

   

   `.oms/sysman/archives/emgc/deployments/GCDomain/emgc.ear/em.war/WEB-INF/web.xml`

2. Open the `web.xml` file and locate the following four lines. If these lines are not present in the `web.xml`, you must add them. Increase the size of the `<param_value>` parameter to a value larger than the size of the file to be uploaded.

   ```xml
   <context-param>
      <param-name>org.apache.myfaces.trinidad.UPLOAD_MAX_DISK_SPACE</param-name>
      <param-value>40960000</param-value>
   </context-param>

   <context-param>
      <param-name>org.apache.myfaces.trinidad.UPLOAD_MAX_FILE_SIZE</param-name>
      <param-value>40960000</param-value>
   </context-param>

   A smaller chunk size increases performance during large file upload. By default, the chunk size would be 2 GB. Setting this to a smaller chunk size such as 500MB will optimize browser memory usage. The parameter for setting the chunk size is `org.apache.myfaces.trinidad.UPLOAD_MAX_CHUNK_SIZE`.

   ```xml
   <context-param>
      <param-name>org.apache.myfaces.trinidad.UPLOAD_MAX_CHUNK_SIZE</param-name>
      <param-value>40960000</param-value>
   </context-param>
   ```

3. If the file to be uploaded is huge, the page may expire while the upload is still in progress (usually after 10 minutes). To avoid this, the OMS property `oracle.sysman.eml.maxInactiveTime` must be set to a value (in seconds) greater than the expected time for the upload to complete.

   For example, set
   ```bash
   $ORACLE_HOME/bin/emctl set property -name oracle.sysman.eml.maxInactiveTime -value 3600
   ```

4. Restart the Oracle Management Service to reflect the updated settings.

5. While the file upload is in progress, the uploaded chunks are written in a default location on the OMS. This default location is usually a subdirectory of where the application is deployed on the WebLogic Server. This location can be configured by setting the parameter `org.apache.myfaces.trinidad.UPLOAD_TEMP_DIR` in the `web.xml` file to a custom location. If there are multiple users uploading files concurrently on the OMS, you must ensure that this location has enough disk space to accommodate all of this data. It is recommended that this location is on a
different volume than the location on which the OMS is installed. This ensures that if the volume runs out of space, there is no impact on the OMS performance.
7

Using the IaaS Self Service Portal

This chapter provides instructions on using the Self Service Portal for IaaS. It contains the following sections:

- Using the Self Service Portal to Request Server Resources
- Requesting Servers
- Viewing Requests
- Viewing Servers
- Viewing Storage
- Viewing Chargeback Details
- Viewing Library
- Viewing Policies
- Viewing Preferences

Note:
Click here to view a visual demonstration on how to allow users to create new deployment requests through the Cloud Self Service Portal, manage requested deployments, track metering and chargeback information, and author and enforce Cloud policies using Enterprise Manager Cloud Control 12c.

7.1 Using the Self Service Portal to Request Server Resources

The Self Service Portal for IaaS provides a dashboard for business users and cloud consumers to request resources. It allows SSA users to request and manage resources, view the metering and usage of these resources, and define policies to manage the workload and deployment automatically. The SSA Portal allows users to:

- Create new deployment requests
- Manage requested deployments
- Track metering and chargeback information
- Author and enforce cloud policies.

To use the Self Service Portal, follow these steps:

1. Log in as a user with the EM_SSA_USER role. The All Cloud Services page appears. Click on the Infrastructure - Oracle VM Cloud Services link.
2. The Infrastructure - Oracle VM Cloud Services Home page appears. Click on the video link next to the Page Refreshed section to view a demo on using the self service portal. The following details are displayed:

- **Notifications**: Lists notifications related to machine expiry and new assemblies.
- **Your Usage**: Lists the total quota allowances available for server and storage requests and quota that has been used.
- **10 Last Requested Servers**: Lists the top 10 machines that you own in descending order of creation date. Click a Server Name to view the server details. See Server Details Page for more information.
- **10 Latest Requests**: This section lists the top 10 requests which are sorted as follows:
  - Descending order of the End Date.
  - Descending order of the Creation Date.
Click a Request Name to view the request details.

![Figure 7-1  Self Service Portal](image)

3. Click **Request Servers**. The New Server Request wizard appears. See Requesting Servers for details.

### 7.2 Requesting Servers

Follow this process if you need to request or reserve servers for a specific duration:

1. From the **Enterprise** menu, select **Cloud**, then select **Self Service Portal**.
2. On the Cloud Self Service Portal page, click **Request Servers** to create a new request for a virtual machine.
3. In the General page, enter a name for the request and select a zone in which the server is to be created.
4. Click the **Search** icon in the **Source** field. Select an assembly or template to be used for this request and enter the server name. For details on how to create an assembly component, see *Creating an Assembly Component*. For details on how to create a template component, see *Creating a Template Component*.

**Note:**

- The source file that you select must be in the `.ova` format (for assemblies), and `.tgz` format (for templates).
- You can see only the assemblies and templates for which you have access (granted by the user with the `EM_SSA_ADMINISTRATOR` role).

5. You can optionally select a Deployment Plan to pre-fill values in the deployment flow from an existing saved or imported deployment plan.

6. Click **Next**. Depending on your selection, the configuration properties defined for the assembly or template are displayed. Click on a tier that you wish to configure.

7. Click on the **Server Configuration** tab. The following regions can be configured:

   - **General**
     - Enable High Availability: If you want to enable high availability for this server, select this check box.
     - Root Password: The root password to access the server.
     - Keymap: Select a keyboard type for the server.
     - Tags: You can specify tags that can be used to identify the servers. You can use these tags to search for servers in the My Servers page.

   - **Network**: The network interfaces for the server. Click **Add** to add a network interface card. In the Add a Network Interface Card, specify the name of the NIC card and click **OK**.
To modify the QoS and Backend Network, click the **Configure Networks** in the top right hand corner of the page.

**Note:** If Network Restriction has been enabled by the self service administrator, the backend network cannot be edited.

On this page, you can configure the Network QoS and Backend Network to be associated with Assembly Network. All the NICs will be configured based on the Network QoS and Backend Network that have been assigned. Click **OK** to return to the previous page.

- **Server Size:** If the server size is large, medium, or small, you can modify the maximum memory and maximum number of CPUs that can be allocated to the server. If the server size is custom, you can specify the memory that can be allocated and the number of CPU cores to be assigned to the server.

- **Storage:** The storage disks assigned to the server. This can be system defined or custom.

8. Click on the **Product Configuration** tab. This tab shows the properties of the products in the tier. You can choose to view All Properties or Required Properties. For each property, the default value and the current value is displayed. Select a property to modify the value if applicable.

9. If a tier has more than one server, you can configure each server separately. Click the **Configure Individual Servers** link on the top right corner of the lower region. The Deployment Configuration: Configure Individual Servers page appears. You can modify the configuration of the individual server and click **Continue** to return to the New Server Request: Deployment Configuration page.

10. Specify the schedule for the request and click **Next**.

**Note:**

The schedule for the new server request is dependent on the schedule defined by the EM_SSA_ADMIN in the Self Service Portal Setup pages. See **Setting Up the Self Service Portal**

11. In the Review page, you can click **Finish** to submit the request or **Save as Deployment Plan**. If you select the **Save as Deployment Plan** option, the request will be saved as a Deployment Plan that can be used to record inputs that can be used to create new request.
7.3 Viewing Requests

The Requests tab lists all the requests made by the SSA user.

**Figure 7-3 Requests**

The name of the request, status, start and end date, type of request, number of servers, total CPU, and memory appears. Click a Name to drill down to the Request Details page which shows complete details about the request.

You can:

- **Edit a Request**: You can edit the following types of requests:
  - **Scheduled**: Select a request that is Scheduled and click **Edit** to modify the request configuration details. The Request Server wizard appears and you can modify the request server configuration as required. See Requesting Servers for details.
  - **Executed**: Select a request that has been executed successfully and click **Edit**. In the window that appears, specify a new End Date for the request and click **Edit** to edit the request.

- **Delete a Request**: Select a request that has been scheduled or executed to click **Delete** to delete the request.

7.4 Viewing Servers

Click the **Servers** tab to view a list of servers grouped according to the zone. On this page, the self service user can view the specific assembly and template deployments, the tiers, and the servers in each tier. You will see a list of servers that you have requested and can perform a search based on either the name of the server or the tag.

**Figure 7-4 My Servers**
You can drill down to the Assembly or Tier Instance Home page or click a server name to drill down to the Server Details page. From this page, you can perform the following actions:

- **Request Servers**: You can request or reserve servers for a specific duration. See [Requesting Servers](#) for details.
- **Assemblies**: You can start, stop, delete an assembly instance, and add tiers. Select an assembly instance from the list and from the **Actions** menu, select an appropriate option. See [Performing Assembly Operations](#).
- **Tiers**: You can start, stop, scale up, and scale down a tier instance. Select a tier instance from the list and from the **Actions** menu, select an appropriate option. See [Tier Operations](#).
- **Servers**: You can modify the configuration of the server, stop, start or restart a server, clone a server, save as template, suspend, resume, and launch a VNC Console. See [Server Operations](#).

### 7.4.1 Zone Details Page

The Zone Details page displays the details of all assemblies, tiers, and servers in the SSA Zone.

![Figure 7-5 Zone Details Page](image)

From this page, depending on the entity you select, the following options are available:

- **Requesting Servers**
- **Performing Assembly Operations**
- **Tier Operations**
- **Performing Server Operations**

You can click a tier instance, assembly instance, or a server link to drill down to the Details page.

### 7.4.2 Performing Assembly Operations

You can perform the following operations on an assembly instance:
• **Start**: Select an assembly instance and select **Start** from the *Actions* menu. A confirmation message is displayed. Click **Start** to submit the Start Assembly Instance job. You can start an assembly instance only if it has been stopped.

• **Stop**: Select an assembly instance and select **Stop** from the *Actions* menu. A confirmation message is displayed. Click **Stop** to submit the Stop Assembly Instance job. You can stop an assembly instance only if it has been started.

• **Delete**: Select an assembly instance and select **Delete** from the *Actions* menu. A confirmation message is displayed. Click **Delete** to submit the Delete Assembly Instance job.

• **Add Tier**: Select an assembly instance and select **Add Tier** from the *Actions* menu.

7.4.2.1 Assembly Details Page

This page displays the details of the SSA Assembly Instance.

**Figure 7-6  Assembly Details Page**

![Assembly Details Page](image)

It contains the following sections:

- **General**: This section displays the name of the assembly, the zone to which it belongs, the total number of servers or guest VMs deployed by the assembly, and the date on which the assembly was created.

- **Members**: A hierarchical view of the members in the assembly is displayed here. Click on a link to drill down to the member Home page.

- **Request**: This section lists all the requests corresponding to the assembly and its members. Click on a request link to drill down to the Request Details page.

You can perform operations such as **Start**, **Stop**, **Delete**, and **Add Tiers** on the assembly instance. Select the required option from the Assembly menu and click **OK** in the confirmation page to perform the selected operation.

7.4.3 Tier Operations

You can perform the following operations on an assembly tier instance:
- **Start**: Select a tier instance and select **Start** from the **Actions** menu. A confirmation message is displayed. Click **Start** to submit the Start Tier Instance job. You can start a tier instance only if it has been stopped.

- **Stop**: Select a tier instance and select **Stop** from the **Actions** menu. A confirmation message is displayed. Click **Stop** to submit the Stop Tier Instance job. You can stop a tier instance only if it has been started.

- **Scale Up**: You can scale up or add more servers to a tier instance. See **Scaling Up a Tier Instance**.

- **Scale Down**: You can scale down or stop servers that are part of a tier. See **Scaling Down a Tier Instance**.

### 7.4.3.1 Scaling Up a Tier Instance

A scalable tier allows creation of multiple servers and has a minimum and maximum limit. The scalability of the tier depends on how it is defined in the Assembly. See **Provisioning Guest Virtual Machines Using Oracle Virtual Assemblies (OVA)** for details. To scale up a tier instance, follow these steps:

1. Log in to Enterprise Manager as an user with the **EM_SSA_USER** role.
2. Click the **My Servers** tab, expand an assembly and click on a tier of the assembly.
3. In the Tier Instance Home page, click the **Scale Up** option from the Tier menu.
4. The Scale Up: General page appears. The name of the request, the assembly, zone, and number of instances appears. Click **Next** to continue.
5. In the Server Selection page, select the servers for the scale up operation. As a part of the Scale Up operation, either the existing shutdown servers of the tier are brought up and/or new servers are created to the Max Instance Number Limit if required.

If the Max Instance Number Limit of the tier is 4 and only 1 server has been created during the assembly deployment, the tier can be scaled up by 3 new servers. Click **Next** to continue.

6. If new servers are to be provisioned, you can modify their configuration in the Server Configuration page. The values are pre-filled with the values that specified during the deployment of the assembly. Modify the details if required and click **Next** to continue.

   **Note:**
   - If the tier is auto scalable, the Server Configuration page cannot be modified.
   - If Network Restriction has been enabled (see **Setting Up Networks**), the backend network cannot be modified.

7. Specify the schedule for this operation and click **Next**.
8. Review the details and click **Finish** to scale up the tier.
7.4.3.2 Scaling Down a Tier Instance

You can scale down the servers belonging to a tier. To scale down a tier, follow these steps:

1. Log in to Enterprise Manager as an user with the EM_SSA_USER role.
2. Click the My Servers tab, expand an assembly and click on a tier of the assembly.
3. In the Tier Instance Home page, click the Scale Down option from the Tier menu.
4. In the Scale Down page, select the servers to be included in the Scale Down operation and click OK. The selected servers will be stopped and scaled down.

7.4.3.3 Tier Details Page

This page displays the details of the SSA Tier Instance. It contains the following sections:

- **General**: This section displays the name of the tier, the zone to which it belongs, the total number of servers or guest VMs deployed, and the date on which the tier was created.
- **Members**: A hierarchical view of the members in the tier is displayed here. Click on a link to drill down to the member Home page.
- **Request**: This section lists all the requests corresponding to the tier and its members. Click on a request link to drill down to the Request Details page.

You can perform operations such as **Start**, **Stop**, **Scale Up**, and **Scale Down** on the tier instance. Select the required option from the Tier menu and click OK in the confirmation page to perform the selected operation.

7.4.4 Performing Server Operations

You can perform the following operations for a server:

- **Modify Configuration**: Select the server to be modified and select Modify Configuration from the Actions menu. Note that the server must be in a Stopped status if the configuration is to be modified.
- **Clone**: Select the server to be cloned and select Clone from the Actions menu.
- **Delete**: You can delete a server that is Down or Suspended. Select the server to be deleted and select Delete from the Actions menu. A confirmation message is displayed. Click Delete to submit the Delete Server Job.
- **Save as Template**: You can save a server that is Down or Suspended as a template for future use. Select the server and select Save as Template from the Actions menu. The Save as Template page appears. You can specify the following details:
  - Template Name: Enter a unique name for the template
  - Request Name: Enter a name for the Save as Template request.
  - Keymap: Select a keyboard type for the server.
  - Configuration: In this region, you can specify the default and maximum memory and number of CPUs.
Click OK to save as template.

- **Start**: Select a server that is Stopped and select Start from the Actions menu. A confirmation message is displayed. Click Start to submit the Start Server job to start the server.

- **Stop**: Select a server that is up and running and select Stop from the Actions menu. A confirmation message is displayed. Click Stop to submit the Stop Server job to stop the server.

- **Restart**: A server that is up and running can be restarted.

- **Suspend**: Select a server that is up and running and select Suspend from the Actions menu. A confirmation message is displayed. Click Suspend to submit the Suspend Server job.

- **Resume**: Select a server that is Suspended and select Resume from the Actions menu. A confirmation message is displayed. Click Resume to submit the Resume Server job to start the server.

- **Launch VNC Console**: Select this option from the Actions menu to launch a VNC Console. This option is available only if the server is up and running.

### 7.4.4.1 Modifying the Server Configuration

Select the server that is to be modified and select **Modify Configuration** from the Actions menu. The Modify Configuration page appears. You can modify the details such as Server Size, Keymap, Tags, Network, and Storage. Click OK to save the configuration.

Note:

If the server is up and running, you cannot modify the Maximum Memory, Maximum Number of CPUs, Network, and Storage. To modify these parameters, you must stop the server and then select the **Modify Configuration** option.

### 7.4.4.2 Cloning the Server

You can clone a server to create one or more servers. Select a server and select **Clone** from the Actions menu. The Clone Server Request: General page appears. Enter the name for the clone request. The name of the source server cloned and the zone in which the cloned server will appear is displayed. Click Next to continue to the Clone Server Request: Deployment Configuration page. In this page, you can specify the number of servers to be cloned and the resource configuration parameters. These parameters will be applicable to all the servers being cloned. Specify the schedule, review the details, and click Finish to submit the Clone Server operation.

### 7.4.4.3 Server Details Page

The Server Details page displays detailed information about the server. From this page, you can modify configuration, clone, stop, restart, suspend, resume, and launch VNC console.

This page contains the following sections:
Figure 7-7  Server Details Page

- **General**: Displays information like status of server, the associated zone, date from which it is available, and the expiry date.
- **Configuration**: Displays configuration details of the server such as number of CPUs, memory, storage, operating system, and other software installed on the server.
- **Availability**: Shows the availability status of the server over the last 24 hours.
- **Charts**: You can see the Availability chart that displays the status of the server for past 24 hours, and the CPU, Memory, and Storage Utilization charts.
- **Chargeback Details**: This section displays all the charge back break-up data for the server. The charge incurred will be calculated from the server requested date to the current date.

### 7.5 Viewing Storage

Click the **Storage** tab to view all the storage elements grouped by the Guest VMs with which they are associated. The Storage tab lists all the Servers owned by the EM_SSA_USER along with all the storage resources in tree format. The top level nodes represent the servers owned by the user and the sub nodes represent the storage disks that belong to the server. You can do the following:

- **Request Storage**: This action allows the user to add a shared or non-shared storage disk to a server. Select one or more servers and click **Request Storage**. Enter the Disk Name, Size, and Mode. Select the Shared Disk check box to add a shared disk. If you create a non-shared storage disk, it is available only for the server on which it is created. A shared storage disk can be assigned to other servers. If you select multiple servers, you can create only non-shared storage disks.
- **Assign Storage**: This action allows the user to assign shared storage disk to any other server owned by the EM_SSA_USER. Select a server and click **Assign**
**Storage.** The list of available shared storage disks are displayed. Select a disk from the list and click **OK** to assign the shared storage disk to the server.

- **Release Storage:** Select a server and click **Release Storage.** This action allows the user to release an existing shared or non-shared storage disks.

### 7.6 Viewing Chargeback Details

Click the **Chargeback** tab to view the chargeback details. The tab contains the following sections:

- **Charge Trend:** The Charge Trend shows the charges across a date range for various metrics. You can set a date range and click **Go** to recalculate charges.

- **Details:** This section shows charge details for the specified date range. You can reorder the data by selecting an option from the Detail Level drop-down menu. Click **Export** to export the details of the charge plan to a .csv file.

- **Charge Plans:** This section allows you to select a zone to see the charge plan in effect for the target type.

- **Oracle VM Guest (Default):** If you are using the Extended Charge Plan, the base plan for the Oracle Guest VM target type appears here.

### 7.7 Viewing Library

Click the **Library** tab to view the list of assemblies, templates, and deployment plans that you can access. You can choose to view:

- **Public:** The list published by the SSA Administrator for your role. The assemblies, templates and deployment plans on which you have view privileges. You will see the assemblies, templates, or deployment plans if the EM_SSA_ADMINISTRATOR has published them or if another EM_SSA_USER has made them shareable.

- **Private:** These include the assemblies, templates, and deployment plans that you own. Generally, an SSA user may not own assemblies but may own templates and deployment plans.

You can request servers from this page. See [Requesting Servers](#) for details.

You can upload software, share, delete, or stop sharing a software component that you own. Select a component from the list and click **Share.** Select one or more users with whom the entity is to be shared and click **Share.**

To unshare an entity, select a shared entity from the list and click **Stop Sharing.** The list of users with whom this component has been shared appears. Select one or users from the list and click **Stop Sharing.**

To upload software, click **Upload.** In the dialog box that appears, select the source file to be upload, enter a name and description, and specify the type (Assembly or Template) of component being uploaded. Click **Upload** to upload to software to My Library.

### 7.8 Viewing Policies

Click the **Policies** tab to view the list of policies that you have defined. You can create a new Performance or Schedule Based Policy or a Policy Group. For example, you
can define a policy to start an automatic scale up for a tier if the CPU Utilization is greater than 90 for 5 consecutive occurrences.

For more details on creating and using policies, see About Cloud Policies.

7.9 Viewing Preferences

You can customize the self service portal settings by modifying the preferences. From the user menu on the top right corner of the page, select Preferences, then select SSA Portal Settings. Before you request resources using SSA, you can set up your user profile by specifying the following details:

- **General Preferences**
  - **Email Address**: The default email address to be used to receive notifications.
  - **Locale**: The default locale for receiving cloud notifications.
  - **Request Notifications**: Select this checkbox to receive notifications of different statuses of the request.
  - **Request Status**: If you select the Request Notifications checkbox, select the status for each you wish to receive notifications from the drop down list.
  - **Days Before the First / Second Notification**: If you select the Instance Expiry Notifications checkbox, specify the number of days before the first and second notifications are sent.
  - **Quota Notification**: If you select this checkbox, notifications are sent when the quota reaches a specified threshold.
  - **Quota Threshold (%)**: If you have selected the Quota Notification checkbox, specify the quota threshold in this field.
  - **Self Service Portal**: Select the default Self Service Portal page that should appear when you log in to the Self Service Portal.
This chapter describes the monitoring and administrative tasks that you can perform on the zones, virtual server pools, virtual servers and guest virtual machines within an IaaS Cloud. It includes the following sections:

- Viewing the Infrastructure Cloud Home Page
- Viewing the OVM Manager Home Page
- Viewing and Managing Members
- Managing Zones
- Virtual Server Pool Home Page
- Managing Virtual Servers
- Managing Guest Virtual Machines
- Deploying Guest Virtual Machines
- Viewing the Infrastructure Request Dashboard

### 8.1 Viewing the Infrastructure Cloud Home Page

The Cloud target is available out of the box and represents the entire virtualization infrastructure monitored by Enterprise Manager Cloud Control. You can view and monitor the various targets in the data center from the Infrastructure Cloud Home page. To view the Infrastructure Cloud Home page, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home. The Infrastructure Cloud Home page shows the various targets such as zones, pools, and virtual servers, request status, policies, and so on. Click the video link to view a demo on setting up the cloud infrastructure.
The Infrastructure Cloud Home page shows the following details:

- **General**: Shows the number of OVM Managers, zones, and servers, and guest virtual machines in the cloud and the status of each target. Select a link to drill down to the Members page.
- **Target Flux**: Shows the number of targets (Guest VMs, Oracle VM Managers, Zones, server pools, virtual servers) created and deleted over the last 30 days.
- **Request Status**: Shows the status of various requests and reservations. Click the graph to drill down to the Requests page.
- **CPU & Memory**: Shows the CPU and memory utilization by the virtual servers in the data center.
- **Software Library**: Shows the number of assemblies and templates available in the software library and how many have been deployed.
- **Policy**: Shows the status of the various policies that have been defined for the cloud. It shows the number of corrective actions that were executed and whether they were successful. Click the graph to drill down to the Policy Home page.
- **Overview of Incidents and Problems**: Shows the various incidents and policy violations that have occurred in the last 24 hours.
- **Charge Trend**: Shows the charge back break-up data across the cloud. It lists the top 5 requests that have incurred the highest cost.
- **Inventory and Usage**: Shows the inventory summaries for virtual servers, guest virtual machines, and assembly instances. Select an option from the Show drop down list to view the details. You can view the summary information in the context of different dimensions. For example, for Oracle VM Servers, you can view the number of virtual servers under each Oracle VM Manager, zone, virtual server pool, and so on.
Click on the bar charts to drill down multiple levels of inventory details. Click **See Details** to drill down to the Inventory and Usage Details page which provides detailed information on the selected target and associated inventory charts.

Before you can start monitoring a virtualization target, you must register the OVM Manager target. See **Registering the Oracle VM Manager** for details.

### 8.2 Viewing the OVM Manager Home Page

The OVM Manager provides the interface to monitor zones, virtual servers, virtual server pools, and guest virtual machines. A zone is a set of virtual server pools. Each virtual server pool contains one or more virtual servers and guest virtual machines. A virtual server pool cannot belong to more than one zone. To view the OVM Manager Home page, follow these steps:

1. From the Enterprise menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Click on an OVM Manager target from the left panel. The OVM Manager Home page shows the following details:

![OVM Manager Home](image)

- **General**: Shows the number of zones, and servers, and guest virtual machines under the OVM Manager and the status of each target. Click on a link to drill down to the Members page.
- **Request Status**: Shows the status of all requests for this OVM Manager. Click on the graph to drill down to the All Requests page.
- **Job Activity**: Shows the list of jobs started within the last 7 days.
- **Policy**: Shows the status of all the policies that have been defined for the OVM Manager. It shows the number of corrective actions that were executed and whether they were successful.
8.3 Viewing and Managing Members

You can view and manage members for one or more virtualization targets on this page.

1. From the Enterprise menu select Cloud, then select Oracle VM Infrastructure Home.

2. Right click on the Infrastructure Cloud menu, select Members, then select Show All.

3. The list of OVM Managers, Zones, Virtual Server Pools, Virtual Servers, and Guest Virtual Machines that can be managed from the Infrastructure Cloud appear.
4. You can:
   a. Click on a target to drill down to its Home page.
   b. Select a target and click on an option from the Actions menu. The actions you can perform vary based on the target you have selected.

**Note:**
You can view and manage the members under a OVM Manager target, zone, virtual server pool, or virtual server. From the Infrastructure Cloud Home page, select the appropriate target (such as an OVM Manager, zone, virtual server pool, or virtual server) from the left panel. From the Infrastructure Cloud menu, select Members, then select Show All. The Members page for the selected target appears and you can perform various administrative activities on these targets.

8.4 Managing Zones

This section describes the following:

- Viewing the Zone Home Page
- Creating or Editing a Zone
- Deleting a Zone

8.4.1 Viewing the Zone Home Page

A zone is a logical grouping of resources like servers and storage entities. It is a logical entity used to organize the guest virtual machines exposed to the self service application user. Zones have metrics that show the aggregate utilization of the zone. To view the Zone Home page, follow these steps:

1. From the Enterprise menu select Cloud, then select Oracle VM Infrastructure Home. In the left panel, click on the zone to be viewed. The following details are displayed:
Figure 8-3  Zone Home

- **General**: Shows the number of virtual servers, virtual server pools, and guest virtual machines under this zone and the status of each target. Click on a link to drill down to the Members page.
- **Job Activity**: Shows the list of jobs started within the last 7 days.
- **Overview of Incidents and Problems**: Shows all the incidents and problems reported on the OVM Manager and member targets.
- **CPU and Memory Usage Trending**: Shows the average CPU and memory utilization over the last 30 days.
- **CPU and Memory**: Shows the CPU and memory utilization by the virtual servers and guest virtual machines in this zone.

8.4.2 Creating or Editing a Zone

A zone is a collection of virtual server pools which share storage. Follow these steps to create a zone:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Select the OVM Manager target for which the zone is to be created, and click **Create Zone** from the OVM Manager menu.
3. In the Create Zone page, specify the zone name and description.
4. Indicate if this zone will be used by the self service users by checking the **Infrastructure Cloud Self Service Zone** check box.
5. Click **Add** in the Virtual Server Pool section to add one or more virtual server pools. See **Creating a Virtual Server Pool** for details.
6. Click **Create Zone** and click **OK**. After the successful completion of this job, the virtual server pools appear in the newly created zone on the Virtualization Central Home page.
8.4.3 Deleting a Zone

To delete a zone, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Click on a zone target from the left panel to navigate to the Zone Home page. From the Zone menu, select Target Setup, then select Delete. A confirmation message appears.
3. Click OK to delete the zone. Any virtual server pools that are members of this zone will now be moved under the OVM Manager target.

Note:

If Chargeback has been enabled for the zone (or virtual server pools / guest virtual machines within the zone) being deleted, the metric data is automatically disabled when the target is deleted.

8.4.4 Deleting a Zone from Enterprise Manager

To delete a zone from Enterprise Manager, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Click on a zone target from the left panel to navigate to the Zone Home page. From the Zone menu, select Target Setup, then select Delete from Enterprise Manager. A confirmation message appears.
3. Click OK to delete the zone. The zone and the associated targets under this zone will be removed from Enterprise Manager. After synchronization, these targets will be added back to Enterprise Manager.

Note:

If Chargeback has been enabled for the zone (or virtual server pools / guest virtual machines within the zone) being deleted, the metric data is automatically disabled when the target is deleted.
8.5 Virtual Server Pool Home Page

A virtual server pool is logically an autonomous region that contains one, or more virtual servers. A virtual server pool may or may not belong to a zone. However, it can belong to only one zone at a time. The following details are displayed:

Figure 8-4  Virtual Server Pool Home

- **General**: Shows details of the virtual server pool such as the zone to which it belongs, the number of CPUs, memory and storage, and number of NICs.
- **Job Activity**: Shows the list of jobs started within the last 7 days.
- **Issues**: Shows all the incidents and problems reported on the virtual server pool and member targets.
- **CPU and Memory Usage Trends**: Shows the average CPU and memory utilization by the virtual servers in the zone over the last 30 days.
- **CPU and Memory Utilization**: These charts show the CPU and memory utilization by all the virtual servers in the server pool.

8.6 Managing Virtual Servers

This section describes the following:

- **Virtual Server Home Page**
- **Editing a Virtual Server**
- **Upgrading a Virtual Server**
- **Starting and Stopping a Virtual Server**
• Performing Maintenance on the Virtual Server

8.6.1 Virtual Server Home Page

A virtual server is a generic term used to describe a physical machine which has virtualization software (hypervisor) running on it. A virtual server can belong to one and only one virtual server pool at a time. Guest virtual machines and resources are also associated with the server pools.

Figure 8-5 Virtual Server Home

The following regions are displayed:

• **General:** Shows details of the virtual server such as the virtual server pool it belongs to, whether the server needs to be upgraded, if it is under maintenance, and so on.

• **Job Activity:** Shows the list of jobs started within the last 7 days.

• **Configuration:** The virtual server configuration such as number of enabled CPU cores and processors, memory, diskspace, OVS Agent Port, and so on.

• **Network and Disk Activity:** The network and disk activity of the virtual server.

**Note:**

If you are using Oracle VM Manager 3.2.4, the Disk Activity is not shown in the graph.

• **CPU and Memory Utilization:** The CPU and memory utilization of the virtual server.

• **Incident Summary:** This region shows a list of incidents and problems reported on all the Guest VMs and related targets.
8.6.2 Editing a Virtual Server

To edit a virtual server, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. In the left panel, select the virtual server that is to be edited. The Virtual Server Home page appears.
3. From the Virtual Server menu, select Target Setup, then select Edit VM Server. You can modify the description of the virtual server and the following fields:
   - **Configure IPMI**: Select the Enable Server IPMI checkbox to enable the Intelligent Platform Management Interface (IPMI). Selecting this option allows you to remotely power off a virtual server and send a wake on lan message to power on a virtual server without having to physically press the power button. If this checkbox is selected, you must enter the user name, password, and IP address of the IPMI.
   - **Server Role**: A server can be designated to perform utility or virtual machine functions by specifying the role which can be:
     - Utility Role: Servers with this role are used to perform non-virtual machine operations such as cloning, importing templates, creating repository, deleting assemblies and so on.
     - Virtual Machine Role: Servers with this role are used to run virtual machines. This role cannot be deselected if the virtual server already contains Guest VMs.
4. Click OK to confirm the changes.

8.6.3 Upgrading a Virtual Server

After the YUM Repository has been set up (see Configuring the YUM Repository), you must upgrade the virtual server to ensure that it has the latest updates. The virtual server must be in maintenance mode if it is to be upgraded.

To upgrade the virtual server, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on a VM Server from the left panel and select Upgrade.
3. After the virtual server has been upgraded, the virtual server will be restarted.

8.6.4 Starting and Stopping a Virtual Server

You can start a virtual server that is in a Stopped state. To start a virtual server, follow these steps:
1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.

2. Right click on a virtual server target in the left panel and select **Start**. A confirmation message appears.

3. Click **OK** to start the virtual server.

You can stop a virtual server that is **Up**. To stop a virtual server, follow these steps:

1. Login to Enterprise Manager Cloud Control.

2. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.

3. Right click on a virtual server target in the left panel and select **Stop**. A confirmation message appears.

4. Click **OK** to stop the virtual server.

### 8.6.5 Performing Maintenance on the Virtual Server

You can place a virtual server in maintenance mode to perform hardware and software maintenance. When a virtual server is placed in maintenance mode, any virtual machines running on the virtual server are automatically migrated to other virtual servers in the server pool, if they are available, otherwise they are stopped. The server pool roles being performed by the virtual server are also moved to other virtual servers in the server pool, if available. To place an Oracle VM Server into maintenance mode:

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.

2. Select a virtual server target from left panel.

3. Right click on a virtual server target from the left panel and select the **Start Maintenance**. The virtual server target is placed in blackout mode during maintenance.

When you have finished performing maintenance, click **Stop Maintenance** for it to rejoin the server pool.

### 8.7 Managing Guest Virtual Machines

This section describes the following:

- Creating a Guest Virtual Machine
- Guest Virtual Machine Home Page
- Migrating a Guest Virtual Machine
- Starting and Shutting Down a Guest Virtual Machine
- Cloning a Guest Virtual Machine
8.7.1 Creating a Guest Virtual Machine

A guest virtual machine runs on a virtual server. You can create a guest virtual machine by using one of the following methods:

- Assemblies
- Templates
- Installation Media (ISO or PXE)

For more details on creating a Guest VMs, see Deploying Guest Virtual Machines.

Before you create a guest virtual machine, you must have:

- Discovered a virtual server.
- Created a virtual server pool.
- Created the necessary components in the Software Library
- Deployed assemblies, templates, ISO images, or PXEs for creating virtual machines based on these.

8.7.2 Guest Virtual Machine Home Page

A guest virtual machine is the container running on top of a virtual server. Multiple guest virtual machines can run on a single virtual server.
The following regions are displayed:

- **General**: Shows details of the guest virtual machine such as the virtual server pool, and virtual server it belongs to, and a description.
- **Networks**: Displays the network configuration for the guest virtual machine.
- **CPU and Memory Utilization**: The CPU and memory utilization of the guest virtual machine.
- **Networks and Network Activity**: The networks in the guest virtual machine and the network throughput of the guest virtual machine.
- **Configuration**: The virtual server configuration such as number of virtual CPUs, CPU priority, allocated storage and memory, whether it is HA enabled, and the domain type.
- **Job Activity**: Shows the list of jobs started within the last 7 days.
- **Incidents Summary**: Shows the various alerts and policy violations that have occurred in the last 31 days.

From the Guest Virtual Machine Home page, you can do the following:

- Edit a Guest VM
- Migrate a Guest VM
- Clone a Guest VM
- Start and Stop
- Reboot, Restart, Suspend, and Resume

### 8.7.3 Migrating a Guest Virtual Machine

To migrate one or more guest virtual machines, do the following

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. From the **Infrastructure Cloud** menu, select **Members**, then select **Show All**.
3. Expand the list of targets displayed and select one or more guest virtual machines from the list. From the **Actions** menu, select **Guest VMs**, then select **Migrate**. The Migrate page appears. You can select the following:
   - Running Guest VMs
   - Stopped / Suspended Guest VMs.
4. Select one or more Guest VMs from these regions, and click **Submit**.

**Note:**

For running Guest VMs, the virtual server to which the guest virtual machine is to be migrated is auto selected by default. For stopped or suspended Guest VMs, the target server can be modified if required.
8.7.4 Starting and Shutting Down a Guest Virtual Machine

After a guest virtual machine has been created, you can start it or shut it down. When a guest virtual machine is running, you can pause or suspend it temporarily:

- Starting a Guest Virtual Machine
- Restarting a Guest Virtual Machine
- Stopping a Guest Virtual Machine

8.7.4.1 Starting a Guest Virtual Machine

When a Guest VM has not been used for a while, it may be shut down to release system resources. To use the Guest VM, you must start it:

**Prerequisites**

The guest virtual machine must be **Down**.

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Select the guest virtual machine target from the left panel.
3. Click Start from the guest virtual machine menu.

8.7.4.2 Restarting a Guest Virtual Machine

You may need to reboot or restart a virtual machine if operating system updates require you to restart the virtual machine, for example Microsoft Windows updates. To reboot a guest virtual machine:

**Prerequisites**

The guest virtual machine must be **Up**.

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on a guest virtual machine target from the left panel and click Restart.

8.7.4.3 Stopping a Guest Virtual Machine

You may need to stop a Guest VM that is not being used to release system resources.

**Prerequisites**

The guest virtual machine must be **Up**.

To stop a guest virtual machine:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on a guest virtual machine target from the left panel and click **Stop**.
8.7.4.4 Killing a Guest Virtual Machine

Killing a virtual machine is equivalent to performing a power off of a virtual machine, similar to unplugging the power cable from a physical machine. This is not the recommended method of shutting down a virtual machine, but may be used if the Stop command fails to shut down the virtual machine.

To kill a guest virtual machine:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on a guest virtual machine target from the left panel and click Kill.

8.7.5 Cloning a Guest Virtual Machine

Prerequisites

- At least one virtual machine must exist and be in a state appropriate for cloning to proceed.
- You can clone a guest virtual machine to create one or more new virtual machines in the same server pool.

Note:

If you are using the Enterprise Manager for Oracle Virtualization 12.1.0.3 (listed as Oracle Virtualization in Self Update) plug-in or above, you can clone running guest virtual machines if the virtual disks associated with them are thin cloneable.

To clone a guest virtual machine, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Select a guest virtual machine target from the left panel.
3. Click Clone from the guest virtual machine menu.
4. In the Select Target and Source page, specify the Request Name.
5. In the Deployment Configuration page, you can modify the following:
   - **Guest VM:**
     - **Number of Guest VMs:** The number of guest virtual machine instances being cloned.
     - **Guest VM Naming:** Indicates whether the guest virtual machine names are to be automatically generated or if the names will be uploaded from a file.
     - **Guest VM Name:** Enter a name of the guest virtual machine being cloned. The guest virtual machine name cannot contain any special characters.
   - **General:**
- **Enable High Availability / Start VM After Creation**: Select the Enable High Availability and Start VM After Creation checkboxes to restart the guest virtual machine automatically after any outage.

- **CPU Scheduling Priority**: Set the Priority of the virtual machine. You can select a high, medium, low, or custom priority for the virtual CPUs.

- **CPU Scheduling CAP**: This parameter defines the percentage to which the virtual CPUs can receive scheduled time. You can select a high, medium, low, or a custom percentage of scheduled time for the virtual CPUs.

- **Keymap**: The keyboard mapping that will be used by the guest virtual machine being cloned.

- **Tags**: Specify one or more comma separated tags. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.

### VM Size

- **VM Size**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values).

- **Memory**: Specify the memory allocated to guest virtual machine. For a running guest virtual machine, this can be increased up to the Max Memory.

- **CPU Cores**: Specify the number of virtual CPUs for the guest virtual machine. For a running guest virtual machine, this can be increased up to the Max virtual CPU.

### Disk Configuration

- **Disk Configuration**: You can configure the storage type to specify the location of the disks of the new cloned Guest VM. You can use the Default type as specified by the server pool or select Override. If you select Override, you must specify the Storage QoS and click the Search icon in the Storage field to specify the Storage Type. In the Storage Type window, specify the following:
  
  - **Clone Target Type**: This can be Repository or Storage Array.
  
  - **Clone Target**: If you select Repository, select the storage location where the disk is to be created. If you select Storage Array, specify the type, which can be SAN or ISCSI storage server.
  
  - **Clone Type**: This can be Sparse or Non-Sparse Copy. A sparse copy is a disk image file of a physical disk, taking up only the amount of space actually in use; not the full specified disk size. A non-sparse copy is a disk image file of a physical disk, taking up the space equivalent to the full specified disk size, including empty blocks.

- Apart from specifying the storage type, you can also add new disks for the Guest VM to be cloned. Click **Add New Disk** to create a new disk in repositories and connect it to the target Guest VM. Click **Attach Disk** to provide the existing disk in the repositories and connect it to the Guest VM.

6. Click **Next** to continue.

7. On the Schedule page, specify whether the guest virtual machine is to be cloned immediately or later. Click **Next**.
8. On the Review page, review the configuration details and click Submit to run the cloning procedure.

8.7.6 Editing a Guest Virtual Machine

Note:

• If you edit a guest virtual machine that is Up, you cannot modify the server size, storage and network fields. To edit these values, you must stop or halt the guest virtual machine.

• You can create a new disk for a guest virtual machine which is Down, if Oracle VM Manager 3.1.1 and Enterprise Manager for Oracle Virtualization 12.1.0.2 plug-in have been installed. In other cases, existing disks are attached to the guest virtual machines.

To modify the configuration of a guest virtual machine, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.

2. Select a guest virtual machine target from the left panel. From the Guest VM menu, select Target Setup, then select Edit VM Guest. The Guest VM Configuration page appears.

3. In the Hardware Configuration page, you can modify the following details:
   • General:
     – VM Size: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values).
     – Memory: Specify the memory allocated to guest virtual machine. For a running guest virtual machine, this can be increased upto the Max Memory.
     – CPU Cores: Specify the number of virtual CPUs for the guest virtual machine. For a running guest virtual machine, this can be increased upto the Max virtual CPU.
     – CPU Scheduling Priority: Set the Priority of the virtual machine. You can select a high, medium, low, or custom priority for the virtual CPUs.
     – CPU Scheduling CAP: This parameter defines the percentage to which the virtual CPUs can receive scheduled time. You can select a high, medium, low, or a custom percentage of scheduled time for the virtual CPUs.
   • Network: You can add delete virtual network interfaces. For more details, see Setting Up Networks.
   • Storage: Select the desired storage configuration of your virtual machine, such as virtual disks and ISO file.
4. Click the **Other Configuration** tab.

- **Attribute**: You can set the basic attributes of the guest virtual machine such as the description and the type of operating system to be used.

- **High Availability**: If the **High Availability** checkbox is selected, the guest virtual machine will automatically restart after any outage.

- **Boot Sequence**: Specify the boot sequence for the guest virtual machine. This is the boot order for the guest virtual machine and indicates if the guest virtual machine is forced to boot from disk, CDROM, or network.

- **Advanced**:
  - **Keymap Name**: The name of the keyboard mapping that will be used by the guest virtual machine.
  - **Mouse Type**: The mouse type to be used for the guest virtual machine. This can be Default, PS2 Mouse, USB Mouse, or USB Tablet.
  - **Domain Type**: The domain type of the virtual machine. This can be:
    - **Xen HVM**: Hardware virtualization, or fully virtualized. When you select this option you must supply an ISO file in a repository (in the Create Storage step of the wizard) from which to create the virtual machine.
    - **Xen HVM, PV Drivers**: Identical to Xen HVM, but with additional paravirtualized drivers for improved performance of the virtual machine. This Domain Type is used to run Microsoft Windows guest operating systems with an acceptable performance level.
    - **Xen PVM**: Enables you to select a location for the mounted ISO file from which to create the virtual machine. Before you create the virtual machine using the paravirtualized method, mount the ISO file on an NFS share, or HTTP or FTP server. You supply the location of the mounted ISO file in the Network Boot Path field in the Boot Options step of the wizard.
    - **OVM/SPARC**: This domain type should be selected if the server pool and hypervisors use Oracle VM Server for SPARC as the hypervisor instead of Oracle VM Server for x86.
    - **Unknown**: This hypervisor should be selected if the domain type is unknown.

- **VM Start Policy**: Select the policy to be used to start the virtual machines. You can choose:
  - **Start on Best Server**: The best server in the server pool is used to start the virtual machine.
  - **Start on Current Server**: The virtual machine will be started on the same server on which it was created.

- **Tags**: Specify one or more comma separated tags. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.

### 8.7.7 Saving a Guest Virtual Machine as a Template

You can save a guest virtual machine as a template and use the template for provisioning guest virtual machines.

To save a guest virtual machine as a template, follow these steps:
1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.

2. Select a Guest VM target from the left panel. From the Guest VM menu, select Target Setup, then select Save Guest VM as a Template. The Save Guest VM as Template: Select Target and Source page appears.

3. The name of the guest virtual machine target that is to be saved as template is displayed.

4. In the Target Repository field, select the repository on which the guest virtual machine template is to be stored.

5. Specify a name for the template and click Next.

6. In the Save Guest VM as Template: Deployment Configuration page, you can modify the following details:
   - General Configuration:
     - Memory and No. of CPU Cores: Specify the Memory and No of CPU Cores (virtual CPUs) for the virtual machine. The number of processors is expressed in number of physical CPU cores, and is limited to 32. The memory and the number of processors that you can select is limited to the properties of the Virtual Machine Server. If you do not select a Virtual Machine Server however, you can set your desired value. You can modify the Max Virtual CPUs and Max Memory fields without restarting the Guest VM.
     - CPU Scheduling Priority: Set the Priority of the virtual machine. You can select a high, medium, low, or custom priority for the virtual CPUs.
     - CPU Scheduling CAP: This parameter defines the percentage to which the virtual CPUs can receive scheduled time. You can select a high, medium, low, or a custom percentage of scheduled time for the virtual CPUs.
     - Storage: Select the desired storage configuration of your virtual machine, such as virtual disks and ISO file.
     - Tags: Specify one or more comma separated tags. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.
   - Disk: Specify the storage type. You can use the Default type as specified by the server pool or select Override. If you select Override, you must specify the Storage QoS and click the Search icon in the Storage field to specify the Storage Type. In the Storage Type window, specify the following:
     - Clone Target Type: This can be Repository or Storage Array.
     - Clone Target: If you select Repository, select the storage location where the disk is to be created. If you select Storage Array, specify the type, which can be SAN or ISCSI storage server.
     - Clone Type: This can be Sparse or Non-Sparse Copy. A sparse copy is a disk image file of a physical disk, taking up only the amount of space actually in use; not the full specified disk size. A non-sparse copy is a disk image file of a physical disk, taking up the space equivalent to the full specified disk size, including empty blocks.
8.7.8 Deleting a Guest Virtual Machine

To delete a guest virtual machine, follow these steps:

1. From the Enterprise menu, select Cloud, then select Infrastructure Home.
2. Click on a guest virtual machine target from the left panel to navigate to the Guest VM Home page. From the Guest VM menu, select Target Setup, then select Delete. A confirmation message appears.
3. Click OK to delete the guest virtual machine. The guest virtual machine must be down before it can be deleted. This option deletes the guest virtual machine permanently from Oracle VM Manager.

8.7.9 Deleting a Guest Virtual Machine Only From Enterprise Manager

To delete a guest virtual machine only from Enterprise Manager, follow these steps:

1. From the Enterprise menu, select Cloud, then select Infrastructure Home.
2. Click on a guest virtual machine target from the left panel to navigate to the Guest VM Home page. From the Guest VM menu, select Target Setup, then select Delete from Enterprise Manager. A confirmation message appears.
3. Click OK to delete the guest virtual machine from the Enterprise Manager repository. This option does not delete the guest virtual machine from the Oracle VM Manager. You can use the Synchronize operation to restore the target to the Enterprise Manager repository. See Synchronizing the Oracle VM Manager Targets.

To permanently delete the guest virtual machine from the Enterprise Manager repository and the Oracle VM Manager, see Deleting a Guest Virtual Machine.

8.8 Deploying Guest Virtual Machines

This section describes the various options that can be used to deploy guest virtual machines. It contains the following sections:

- Getting Started
- Deployment Options
- Prerequisites
- Provisioning Guest Virtual Machines Using Oracle Virtual Assemblies (OVA)
- Provisioning a Guest Virtual Machine Using Oracle VM Templates
- Provisioning a Guest Virtual Machine Using an ISO Image
- Creating PXE Bootable Guest Virtual Machines

8.8.1 Getting Started

This section helps you get started by providing an overview of the steps involved in provisioning virtualized systems. Consider this section to be a documentation map to understand the sequence of actions you must perform to successfully provision
virtualized systems. Click the reference links provided against the steps to reach the relevant sections that provide more information.

Table 8-1  Getting Started with Oracle VM Provisioning

8.8.2 Deployment Options

Enterprise Manager provides the following deployment options for provisioning guest virtual machines:

- **Virtual Machine Provisioning Using Assembly**: Creates new guest virtual machines using an assembly component.
- **Virtual Machine Provisioning Using Template**: Creates new guest virtual machines using a template component.
- **Virtual Machine Provisioning Using PXE**: Creates a new guest virtual machine using Preboot Execution Environment. The new guest virtual machines will be PXE-booted and they will get provisioned by way of networks.
- **Cloning a Virtual Machine**: Clones a guest virtual machine to one or more guest virtual machines.

8.8.3 Prerequisites

Before you run any deployment procedures, meet the infrastructure requirements described in this section.
• Mandatory Infrastructure Requirements as defined in the Enterprise Manager Lifecycle Management Administrator’s Guide.

• Optional Infrastructure Requirements as defined in the Enterprise Manager Lifecycle Management Administrator’s Guide.

• The assembly, template, or the ISO image to be deployed must be present as a Software Library component, or at an external HTTP or NFS location, or imported to the server pool shared location.

8.8.3.1 Creating and Storing Virtualization Components in the Software Library

This section describes the procedure to create the virtualization components in the Software Library. It includes the following:

• Creating an Assembly Component
• Creating a Template Component
• Creating an ISO Component
• Creating a Virtual Disk

8.8.3.1.1 Creating an Assembly Component

An assembly is a collection of virtual machine instances. When an assembly is deployed, a group of virtual machines or an assembly instance is created.

**Prerequisites**

• The Assembly Binary, a file with a .ova extension must be present on the Management Agent or on an external http/ftp/nfs location.

Follow this process to create a new assembly component:

1. From the Enterprise menu, select Provisioning and Patching, then select Software Library.

2. Select a folder on the Software Library page. From the Actions menu, select Create Entity, then select Virtualization. You can also right click on a folder and select the virtualization option from the context menu.

3. From the Create Entity: Virtualization pop-up window, choose Assembly from the Select Subtype drop down list.

4. In the Create Assembly: Describe page, enter the following details:
   • Name and description of the assembly.
   • In the Attachments section, click Add to attach any files relevant to the entity. Ensure that the file size is less than 2 MB.
   • In the Notes section, include information related to the entity like changes being made to the entity or modification history that you want to track and click Add.

5. Click Next to continue. In the Create Assembly: Upload Files page, select one or more files to be associated with the assembly. You can either:
   • Upload Files: You can upload files from a storage location in the Software Library. For Software Library to become usable, at least one upload file location must be configured. Select the Upload Files option. In the Specify
Destination section, click the **Browse** button in the Upload Location field. Two storage options are supported:

- **OMS Shared File System**: An OMS Shared File System location is required to be shared (or mounted) across all the Oracle Management Server (OMS) hosts. This option is ideal for UNIX systems.

  For single OMS environments, you can configure the Software Library either on the host where the OMS is running or in a shared location, so that it is accessible to all the OMS hosts. For multiple OMS environments, Oracle recommends that you configure the Software Library in a shared location so that the storage is accessible through NFS mount points to all Oracle Management Servers in the environment.

- **OMS Agent File System**: An OMS Agent File System location is a location that is accessible to one of the OMS host's Agent. This option is ideal for OMS installed on Windows hosts. By selecting this option for uploading files, you can avoid sharing a location between all participating OMS hosts.

Credentials must be set before using an OMS Shared File System or OMS Agent File System. For an OMS Shared File System, normal host credential must be set before configuring a storage location. However, for OMS Agent File System location configuration, a credential (preferred or named) has to be specified.

- **Refer Files**: Select this option if you want to use an external file location where the software library files are staged. Referenced File Locations support three storage options:
  
  - **HTTP**: An HTTP storage location represents a base URL which acts as the source of files that can be referenced. For example, the base URL `http://my.files.com/scripts` could be configured as an HTTP location for sourcing files such as `http://my.files.com/scripts/perl/installMyDB.pl` or `http://my.files.com/scripts/linux/stopMyDB.sh`.

  - **Agent**: A storage location is similar to the OMS Agent File System option, but can be any host monitored by an Management Agent. The Management Agent can be configured to serve the files located on that host. For example, the directory `/u01/binaries` on the Enterprise Manager Host `my.em.file.server` could be configured as an Agent location for sourcing files such as `/u01/binaries/rpms/myCustomDB.rpm` or `/u01/binaries/templates/myTemplate.tar.gz`.

  - **NFS**: An NFS storage location represents an exported file system directory on a server. The server need not be an Enterprise Manager host target. For example, the directory `/exported/scripts` is exported on server `my.file.server` could be configured as an NFS location for sourcing files such as `/exported/scripts/generic/installMyDB.pl` or `/exported/scripts/linux/stopMyDB.sh` once mounted on a target host file system.

These locations require a named credential to be associated which will be used to access the files from the base location on the host through the Management Agent.

- **Specify Source**: You can add additional file storage locations.

  To add a HTTP location that can be accessed through a HTTP URL, select HTTP from the Storage Type list and click **Add**. In the Add HTTP
Location dialog box, enter a unique name and a HTTP location for the storage that you want to reference, and click OK. A new entry for the storage location is created, with details like Name, Location, and Status.

- To add a Management Agent location that has read-only privileges set on it, select Agent from the Storage Type list and click Add.

6. Click Next. In the Assembly Details page, you will see a set of predefined deployment profiles. You will also see the structure of the assembly and all the appliances in the assembly. Click Next.

7. On the Review page, click Save to save the assembly component. Click Upload to upload the assembly component to the Software Library.

8.8.3.1.2 Creating a Template Component

Follow these steps to create a template component:

1. From the Enterprise menu, select Provisioning and Patching, then select Software Library.

2. Select a folder on the Software Library page. From the Actions menu, select Create Entity, then select Virtualization. You can also right click on a folder and select the virtualization option from the context menu.

3. Select the Subtype as Template.

4. In the Create Template: Describe page, enter the name and description of the template.

5. Select the Operating System Name, Type, and Virtualization Type. The Virtualization Type can be Para Virtualized, Hardware Virtualized or both. Select Para Virtualized if you want use machines that are not enabled for virtualization. Select Hardware Virtualized if you want to use machines that are enabled for virtualization.

   - **Para Virtualized**: A virtual machine with a kernel that is recompiled to be made aware of the virtual environment. Runs at near native speed, with memory, disk and network access optimized for maximum performance.

   - **Hardware Virtualized**: A virtual machine with an unmodified guest operating system. It is not recompiled for the virtual environment. There may be substantial performance penalties running as a hardware virtualized guest. Enables Microsoft Windows™ operating system to be run, as well as legacy operating systems. Hardware virtualization is only available on Intel VT or AMD SVM CPUs.

6. Click Next to continue. In the Create Template: Upload Files page, select one or more files to be associated with the assembly. You can:

   - **Upload Files**: You can upload files from a storage location in the Software Library. For the Software Library to become usable, at least one upload file location must be configured. Select the Upload Files option. In the Specify Destination section, click the Browse button in the Upload Location field. The following storage options are supported:

     - **OMS Shared File System**: An OMS Shared File System location is required to be shared (or mounted) across all the Oracle Management Service (OMS) hosts. This option is ideal for UNIX systems.

     For single OMS environments, you can configure the Software Library either on the host where the OMS is running or in a shared location, so
that it is accessible to all the OMS hosts. For multiple OMS environments, Oracle recommends that you configure the Software Library in a shared location so that the storage is accessible through NFS mount points to all Oracle Management Servers in the environment.

- **OMS Agent File System**: An OMS Agent File System location is a location that is accessible to one of the OMS host's Agent. This option is ideal for OMS installed on Windows hosts. By selecting this option for uploading files, you can avoid sharing a location between all participating OMS hosts.

Credentials must be set before using an OMS Shared File System or OMS Agent File System. For an OMS Shared File System, normal host credential must be set before configuring a storage location. However, for OMS Agent File System location configuration, a credential (preferred or named) has to be specified.

- **Refer Files**: Select this option if you want to use an external file location where the software library files are staged. Referenced File Locations support three storage options:
  - **HTTP**: An HTTP storage location represents a base URL which acts as the source of files that can be referenced. For example, the base URL `http://my.files.com/scripts` could be configured as an HTTP location for sourcing files such as `http://my.files.com/scripts/perl/installMyDB.pl` or `http://my.files.com/scripts/linux/stopMyDB.sh`.
  - **Agent**: A storage location is similar to the OMS Agent File System option, but can be any host monitored by the Management Agent. The Management Agent can be configured to serve the files located on that host. For example, the directory `/u01/binaries` on the Enterprise Manager Host `my.em.file.server` could be configured as an Agent location for sourcing files such as `/u01/binaries/rpms/myCustomDB.rpm` or `/u01/binaries/templates/myTemplate.tar.gz`.
  - **NFS**: An NFS storage location represents an exported file system directory on a server. The server need not be an Enterprise Manager host target. For example, the directory `/exported/scripts` is exported on server `my.file.server` could be configured as an NFS location for sourcing files such as `/exported/scripts/generic/installMyDB.pl` or `/exported/scripts/linux/stopMyDB.sh` once mounted on a target host file system.

These locations require a named credential to be associated which will be used to access the files from the base location on the host through the Management Agent.

- **Specify Source**: You can add additional file storage locations.
  - To add a HTTP location that can be accessed through a HTTP URL, select HTTP from the Storage Type list and click **Add**. In the Add HTTP Location dialog box, enter a unique name and a HTTP location for the storage that you want to reference, and click **OK**. A new entry for the storage location is created, with details like Name, Location, and Status.
  - To add the Management Agent location that has read-only privileges set on it, select Agent from the Storage Type list and click **Add** and enter the required information in the Add Agent Location dialog box.
7. Click **Next**. In the Review page, review the details of the template and click **Save**. Click **Upload** to upload the template component to the Software Library. The template component will now appear as an entity in the Software Library page.

---

8.8.3.1.3 Creating an ISO Component

Follow these steps to create an ISO component:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. Select a folder on the Software Library page. From the **Actions** menu, select **Create Entity**, then select **Virtualization**. You can also right click on a folder and select the virtualization option from the context menu.
3. Select the Subtype as **ISO**.
4. In the Create ISO: Describe page, enter the name and description of the deployment plan.
5. Click **Next** to continue. In the Create ISO: Upload Files page, select one or more files to be associated with the assembly. You can either:

   - **Upload Files**: You can upload files from a storage location in the Software Library. For Software Library to become usable, at least one upload file location must be configured. Select the **Upload Files** option. In the Specify Destination section, click the **Browse** button in the Upload Location field. The following storage options are supported:
     - **OMS Shared File System**: An OMS Shared File System location is required to be shared (or mounted) across all the Oracle Management Service (OMS) hosts. This option is ideal for UNIX systems.
       For single OMS environments, you can configure the Software Library either on the host where the OMS is running or in a shared location, so that it is accessible to all the OMS hosts. For multiple OMS environments, Oracle recommends that you configure the Software Library in a shared location so that the storage is accessible through NFS mount points to all Oracle Management Servers in the environment.
     - **OMS Agent File System**: An OMS Agent File System location is a location that is accessible to one of the OMS host's Agent. This option is ideal for OMS installed on Windows hosts. By selecting this option for uploading files, you can avoid sharing a location between all participating OMS hosts.
       Credentials must be set before using an OMS Shared File System or OMS Agent File System. For an OMS Shared File System, normal host credential must set before configuring a storage location. However, for OMS Agent File System location configuration, a credential (preferred or named) has to be specified.
   
   - **Refer Files**: Select this option if you want to use a external file location where the software library files are staged. Referenced File Locations support three storage options:
     - **HTTP**: An HTTP storage location represents a base URL which acts as the source of files that can be referenced. For example, the base URL http://my.files.com/scripts could be configured as an HTTP location for sourcing files such as http://my.files.com/scripts/perl/installMyDB.pl or http://my.files.com/scripts/linux/stopMyDB.sh.
Agent: A storage location is similar to the OMS Agent File System option, but can be any host monitored by the Management Agent. The Management Agent can be configured to serve the files located on that host. For example, the directory `/u01/binaries` on the Enterprise Manager Host my.em.file.server could be configured as an Agent location for sourcing files such as `/u01/binaries/rpms/myCustomDB.rpm` or `/u01/binaries/templates/myTemplate.tar.gz`.

NFS: An NFS storage location represents an exported file system directory on a server. The server need not be an Enterprise Manager host target. For example, the directory `/exported/scripts` is exported on server my.file.server could be configured as an NFS location for sourcing files such as `/exported/scripts/generic/installMyDB.pl` or `/exported/scripts/linux/stopMyDB.sh` once mounted on a target host file system.

These locations require a named credential to be associated which will be used to access the files from the base location on the host through the Management Agent.

- **Specify Source:** You can add additional file storage locations.
  - To add a HTTP location that can be accessed through a HTTP URL, select HTTP from the Storage Type list and click Add. In the Add HTTP Location dialog box, enter a unique name and a HTTP location for the storage that you want to reference, and click OK. A new entry for the storage location is created, with details like Name, Location, and Status.
  - To add an NFS shared location, select NFS from the Storage Type list and click Add. In the Add NFS Location dialog box, enter a unique name in the Name field for the storage. In NFS server field, provide a fully qualified domain name or the IP address of the hosted machine that has NFS services running on them. In the Location field, provide the shared location or directory path on the NFS server to define a storage location, then click OK. A new entry for the storage location is created in the table, with details like Name, Location, and Status.
  - To add a Management Agent location that has read-only privileges set on it, select Agent from the Storage Type list and click Add.

6. Click Next. In the Review page, review the details and click Save. Click Upload the ISO component to the Software Library. The ISO image will now appear as an entity in the Software Library page.

### 8.8.3.1.4 Creating a Virtual Disk

Follow these steps to create a virtual disk component:

1. From the Enterprise menu, select Provisioning and Patching, then select Software Library.
2. Select a folder on the Software Library page. From the Actions menu, select Create Entity, then select Virtualization. You can also right click on a folder and select the virtualization option from the context menu.
3. Select the Subtype as Virtual Disk.
4. In the Virtual Disk: Describe page, enter the name and description of the deployment plan.
5. Click **Next** to continue. In the Create Virtual Disk: Upload Files page, select one or more files to be associated with the assembly. You can either:

- **Upload Files**: You can upload files from a storage location in the Software Library. For Software Library to become usable, at least one upload file location must be configured. Select the Upload Files option. In the Specify Destination section, click the **Browse** button in the Upload Location field. The following storage options are supported:
  
  - **OMS Shared File System**: An OMS Shared File System location is required to be shared (or mounted) across all the Oracle Management Server (OMS) hosts. This option is ideal for UNIX systems.
    
    For single OMS environments, you can configure the Software Library either on the host where the OMS is running or in a shared location, so that it is accessible to all the OMS hosts. For multiple OMS environments, Oracle recommends that you configure the Software Library in a shared location so that the storage is accessible through NFS mount points to all Oracle Management Servers in the environment.

  - **OMS Agent File System**: An OMS Agent File System location is a location that is accessible to one of the OMS host's Agent. This option is ideal for OMS installed on Windows hosts. By selecting this option for uploading files, you can avoid sharing a location between all participating OMS hosts.

  Credentials must be set before using an OMS Shared File System or OMS Agent File System. For an OMS Shared File System, normal host credential must set before configuring a storage location. However, for OMS Agent File System location configuration, a credential (preferred or named) has to be specified.

- **Refer Files**: Select this option if you want to use an external file location where the software library files are staged. Referenced File Locations support three storage options:

  - **HTTP**: An HTTP storage location represents a base URL which acts as the source of files that can be referenced. For example, the base URL `http://my.files.com/scripts` could be configured as an HTTP location for sourcing files such as `http://my.files.com/scripts/perl/installMyDB.pl` or `http://my.files.com/scripts/linux/stopMyDB.sh`.

  - **Agent**: A storage location is similar to the OMS Agent File System option, but can be any host monitored by the Management Agent. The Agent can be configured to serve the files located on that host. For example, the directory `/u01/binaries` on the Enterprise Manager Host `my.em.file.server` could be configured as an Agent location for sourcing files such as `/u01/binaries/rpms/myCustomDB.rpm` or `/u01/binaries/templates/myTemplate.tar.gz`.

  - **NFS**: An NFS storage location represents an exported file system directory on a server. The server need not be an Enterprise Manager host target. For example, the directory `/exported/scripts` is exported on server `my.file.server` could be configured as an NFS location for sourcing files such as `/exported/scripts/generic/installMyDB.pl` or `/exported/scripts/linux/stopMyDB.sh` once mounted on a target host file system.
These locations require a named credential to be associated which will be used to access the files from the base location on the host through the Management Agent.

- **Specify Source**: You can add additional file storage locations.
  - To add a HTTP location that can be accessed through a HTTP URL, select HTTP from the Storage Type list and click **Add**. In the Add HTTP Location dialog box, enter a unique name and a HTTP location for the storage that you want to reference, and click **OK**. A new entry for the storage location is created, with details like Name, Location, and Status.
  - To add an Agent location that has read-only privileges set on it, select Agent from the Storage Type list and click **Add**.

6. Click **Next**. In the Review page, review the details of the virtual disk and click **Save**. Click **Upload** to upload the virtual disk component to the Software Library. The virtual disk component will now appear as an entity in the Software Library page.

### 8.8.4 Provisioning Guest Virtual Machines Using Oracle Virtual Assemblies (OVA)

An assembly is a packaging of a multi-tier application stack, which when deployed results in the creation of a set of related virtual machines representing every tier of the application stack. For example, a Siebel assembly can contain the Siebel mid-tier and a database. It can be deployed such that it creates 2 virtual machines for a 2-node Siebel mid-tier and 1 virtual machine running the database.

The deployment of the assembly is based on the policies/constraints defined in the assembly definition. The initial placement of virtual machines will be based on the storage, network and computational resources. Once an assembly is deployed, additional instances can be added (scale up) or removed (scale down) based on application demand. When an assembly is deployed, an assembly instance is created. An assembly instance is a collection of dependent virtual machines, which is created after an assembly is deployed. The composition of the assembly instance is dynamic in nature, as any subsequent scale-up or scale-down operations will change the membership. An assembly instance contains one or more tiers, each tier further comprising of virtual machines and or tiers.

Follow this process to deploy an assembly and create the virtual machines.

1. From the **Enterprise** menu, select **Cloud**, then select **Oracle VM Infrastructure Home**.
2. Right click on a Zone, VM Server Pool, or VM Server target and select **Deploy Assembly**.

---

**Oracle**

8-29
3. On the Assembly Deployment: Instance Details page, specify the following:

- **Target**: Select the server pool on which the guest virtual machines are to be deployed.

- **Source**: You can select either of the following options:
  - **Deployment Plan**: If you select the Use Deployment Plan check box, you can select a deployment plan (if available) with predefined configurations. The deployment plan will be used when the assembly is deployed. (Image is selected automatically when the deployment plan is selected)
  - **Image**: The assembly component to be used for this deployment. This can either be a component present in the Software Library, or at an external location. If it is stored in an external location, specify the NFS or HTTP location where the component is stored. For example, `http://myvm_server/assembly` or `file://myvm_server/assembly`.

- **Details**:
  - **Request Name**: This is the name of the assembly deployment request.
  - **Assembly Instance Name**: The name to be assigned to the assembly instance.
  - **Allow Partial Deployment**: Select this option to enable partial deployment. By default, when a deployment plan fails, all virtual machines that have been created are automatically deleted. But if partial deployment is enabled, virtual machines are not deleted even if the deployment has failed.

- **Assembly Content**: You can disable an assembly tier or a node from being deployed. By default, all nodes and tiers in the selected component are automatically deployed. To disable a node or tier from being deployed, unselect the **Deploy** checkbox in the table.
Note:

- A tier or a node can be disabled for deployment if the minimum number of instances for the node or tier is set to 0 in the ovf metadata file.
- If you choose to use a deployment plan where a tier or a node has been enabled for deployment, that node or tier cannot be disabled.

4. Click **Next**. In the Deploy Assembly: Network and Agent page, specify the physical public and private networks to be used for the assembly instance. A public network is used for external traffic. In a private network, the guest virtual machines can communicate only within a predefined network set up by the Cloud Administrator.

Assembly network refers to the logical network defined in the OVF metadata file and the network defined here is the actual physical network to which it is to be mapped. If you do not choose to associate the network explicitly, the mappings are automatically assigned.

**Figure 8-8  Assembly Deployment: Network and Agent**

5. Click on the **Browse** icon in the Network field. Specify if the network should be allocated by the system or selected manually.

6. If you want to install the Management Agent on an assembly tier (collection of Guest VMs) or selected guest virtual machines, check the **Enable EM Agent Push Configuration** check box. You can then select the tiers and / or the guest virtual machines on which the Management Agent is to be installed using the Agent Push approach in the Assembly Node Selection for the EM Agent Push Selection table.

   - **Node Name**: The name of the assembly tier on which the Management Agent is to be deployed.
   - **Installation Type**: The type of installation which can be Push Agent Installation, No Agent Installation, and RPM Installation.
• **Enable Agent Push**: This checkbox is enabled only if the Enable EM Agent Push Configuration checkbox has been selected. Select this checkbox to select the tiers on which the Management Agent is to be installed by way of the Agent Push approach.

    In a selected tier, you can also choose the guest virtual machines on which the Management Agent is to be installed.

    **Note:**

    • If you select Push Agent Installation, you can specify the guest virtual machines that need to be enabled or disabled in the Miscellaneous tab.

    • For tiers that have the Management Agent as a product (as part of the binary package), the **Enable Agent Push** checkbox is disabled and only RPM Installation is available. In this case, you can specify the Management Agent details in the Product Configuration tab of the selected tier.

7. After you have specified the options to configure the Management Agent, enter the following details:

    • **Installation Base Directory**: This is the parent directory on the remote host where the Oracle home of the Management Agent is created.

    • **Platform**: The operating system on which the Management Agent is to be installed.

    • **User**: The name of the Oracle Install user is displayed here.

    • **Port**: The port used by the Management Agent for communication.

    • **Password**: This field is mandatory for PS5 assemblies if the **Enable Agent Push Configuration** checkbox has been selected.

    • **Privilege Delegation Settings**: Run as root.

    • **SSH Service Timeout**: The timeout settings for SSH.

    • **Additional Parameters**: Specify additional parameters to be used during the installation of the Management Agent. This field is pre-populated with the entry `-ignoreDirPrereq -enablePty` to ignore the prerequisite checks during installation.

8. Click **Next** to go to the Deploy Assembly: Deployment Configuration page.
The following details are displayed:

- **Component**: The assembly component that is being deployed.
- **Guest VMs**: The default number of guest virtual machines as specified in the deployment profile appears. Specify the minimum and maximum number of guest virtual machines that are to be created.
- **Auto Scalable**: Select this check box to indicate that the tier instances can be auto scaled based on their policies.
- **VM Size**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values).
- **Deployment Option**: The deployment for this assembly instance.
- **Guest VM Name Prefix**: This string will be used as a prefix in the guest virtual machine name. When a guest virtual machine is created using the Enterprise Manager, guest virtual machine names will be prefixed by the virtual machine name prefix you provide here and a number.

9. Select the assembly component to view and customize the default configuration properties.

- **Product Configuration**: This tab shows the properties of the products in the assembly. You can choose to view All Properties or Required Properties. For each property, the default value and the current value is displayed. Select a property to modify the value if applicable.

- **Miscellaneous**: You can create one or more anti-affinity groups. An anti-affinity group is a group of virtual machines cannot run on the same server. Click Add and enter the Group Name and select the guest virtual machines that are to be part of the anti-affinity group.

10. Click a row in the table to select the tier you want to configure. There are 3 tabs that can be configured for each tier in the assembly: **Guest VM Configuration**, **Product Configuration**, and **Miscellaneous**.
11. Let us look at the first tab: **Guest VM Configuration**. This tab allows you to modify the resource configuration parameters for all guest virtual machine instances of the selected assembly tier. The following parameters can be configured:

- **Guest VM Configuration**:
  - **Enable High Availability**: If you want to enable high availability for this guest virtual machine, select this check box. If this option is enabled, the virtual server is shut down or restarted, the guest virtual machine is migrated to or restarted on another virtual server.

  **Note:** High availability must be enabled both on the virtual server pool and on the guest virtual machine. If it is not enabled on both, high availability is disabled.

  - **CPU Scheduling Priority**: Specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. The higher the priority, the higher the stake of the guest virtual machine in claiming CPU cycles.
  - **CPU Scheduling Cap (%)**: Restricts the amount of physical CPU that a guest virtual machine can use. Use this to constrain guest virtual machine resource allocation.
  - **Root Password**: Specify the operating system root password to log in to the guest virtual machine once it is up and running.
  - **Keymap**: The keyboard mapping that will be used by the guest virtual machine being cloned.
  - **Tags**: Specify one or more tags for the virtual machine. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.
  - **Memory (in MB)**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started.
  - **CPUs**: The number of CPU cores to assign to this guest virtual machine. This will show up as virtual CPU (VCPU) configuration parameter for the guest virtual machine.
  - **Disk**: Specify the storage type. You can use the **Default** type as specified by the server pool or select **Override**. If you select **Override**, you must specify the Storage QoS and click the **Search** icon in the Storage field to specify the Storage Type. In the Storage Type window, specify the following:
    - **Clone Target Type**: This can be Repository or Storage Array.
    - **Clone Target**: If you select Repository, select the storage location where the disk is to be created. If you select Storage Array, specify the type, which can be SAN or ISCSI storage server.
    - **Clone Type**: This can be Sparse or Non-Sparse Copy. A sparse copy is a disk image file of a physical disk, taking up only the amount of space.
actually in use; not the full specified disk size. A non-sparse copy is a disk image file of a physical disk, taking up the space equivalent to the full specified disk size, including empty blocks.

– **Disk**: Every guest virtual machine is created with at least one disk. You can specify additional disks and their sizes. These disks will be added to the guest virtual machine. After the guest virtual machine is created, log in to the guest virtual machine and reformat and mount the additional disks. Click **Add** to add a storage device (disk).

Specify the name of the hard disk, its size, and QoS Priority Class. You can enable the disk I/O priority by setting an appropriate QoS Priority Class. The priority class ranges from 0 to 7. The priority class 0 has the highest priority, and 7 the lowest. Select the Shared Disk check box to share this disk between multiple guest virtual machines. You can enable the disk I/O priority by setting an appropriate QoS Priority Class. The priority class ranges from 0 to 7. The priority class 0 has the highest priority, and 7 the lowest.

– **NIC**: Specify the network interfaces for this guest virtual machine. The minimum value is 1 and maximum is 8. Click **Add** to add a network interface and specify the following details:

  **Name**: Enter a name for the network resource.
  **Network**: Assembly Network / Backend network.
  **Network Type**: Specify if the network type is Internet Routable, Non Internet Routable, or a predefined set of IP addresses.
  **IP Assignment**: Select the protocol to be used to assign the IP address. This can be DHCP, Network Profile, or None.

The configuration parameters you specify here will be applied to all the guest virtual machine instances of the selected node. If you want to specify a different configuration for a guest virtual machine instance, click the Guest VM Instances option. In the Deployment Configuration: GuestVM Instance page, you can select a guest virtual machine instance from the View list and specify configuration parameters for that instance.

12. The next tab is Product Configuration. This tab shows the properties of the products in the tier. You can choose to view **All Properties** or **Required Properties**. For each property, the default value and the current value is displayed. Select a property to modify the value if applicable.

13. The next tab is the Miscellaneous tab.

- **Miscellaneous**: Specify the following details:
  - **Log File Location**: Specify the directory in which the log files are to be stored.
  - **Timeout Settings**: Specify the timeout settings for the Product Configuration and Network Configuration. The default value is 60 minutes and this value can be modified for each Oracle VM Manager target. The timeout value specifies how long Enterprise Manager should wait for either Product Configuration or Network Configuration to be completed before proceeding with the assembly deployment.

1. If a tier has more than one Guest VM Instance, you can configure each Guest VM Instance separately. Select the tier for each Guest VM Instance has to be separately configured. Click the **Guest VM Instances** link on the top right corner of the lower region. The Deployment Configuration: Configure Guest VM Instance
page appears. Click Edit VM Name to modify the name of the Guest VM Instance, specify a new name and click OK. You can modify the configuration of the Guest VM and click Continue to return to the Assembly Deployment: Deployment Configuration page.

2. Click Next. In the Assembly Deployment: Schedule page, specify the Start and End Date for the assembly deployment. The Start Date is the date on which the request is being submitted and the End Date is the date on which the assembly deployment instances are retired. Click Next.

3. Click Next. The Assembly Deployment: Review page appears. Review the details entered so far. You can save as a plan that can be used later. Click Save as Plan, specify a name, and description for the plan. Select the folder in which the deployment plan is to be saved and click OK. Note that the deployment plan is stored as a software library component but can be created only through this procedure or by a Cloud API that generates a default deployment plan for an assembly.

4. Click Submit to submit the job. From the Enterprise menu, select Job, then select Activity to view the Job Activity page. This page shows the details of the submitted job. You can click on the Name link to view more details.

To view details of the deployment request, from the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Request Dashboard. See Viewing the Infrastructure Request Dashboard for details.

**Note:**

To ensure that Enterprise Manager has been configured correctly to push a 12c Management Agent automatically on the guest virtual machines when the assembly deployed, you must change the agentpush entry in the `<OMS_ORACLE_HOME>/sysman/prov/agentpush/agentpush.properties` file as follows:

From: oracle.sysman.prov.agentpush.pdpShellOutEnabled=true

To: oracle.sysman.prov.agentpush.pdpShellOutEnabled=false

After this change has been made, you must restart the Oracle Management Service.

### 8.8.5 Provisioning a Guest Virtual Machine Using Oracle VM Templates

You can create one or more virtual machines by deploying a template. The deployment of the template is based on the constraints defined while the template was created. Typically, a template can contain an operating system, basic configuration (number of CPUs, memory, disk size), and preinstalled applications. The initial placement of virtual machines will be based on the storage, network and computational resources. Once a template is deployed, additional instances can be added (scale up) or removed (scale down) based on application demand.
Note:

Enterprise Manager supports deployment of legacy Oracle VM 2.2 style Templates. This templates are available in the .tgz file format. Guest virtual machines are created when these templates are deployed, but the you need to manually login to the VNC console of the newly created virtual machines to complete the network and product configuration. Also, unlike for Oracle Virtual Assemblies (.ova file format), Enterprise Manager does not automatically push the Management Agent for Oracle VM 2.2 Templates (.tgz file format).

Prerequisites

• Enterprise Manager Cloud Control is set up to manage the cloud environment.
• The template is available to the zone and you have sufficient privileges to deploy it. There are sufficient resources available in the zone for successful deployment.

Follow this process to deploy a template:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.

2. Right click on a virtual server pool target and select Deploy Template.

![Figure 8-10 Template Deployment - Select Target and Source](image)

3. On the Select Target and Source page, select the following:
   • Select the target machine on which the guest virtual machine is to be created.
   • In the Source section, you can select either of the following options:
     • **Deployment Plan**: If you select the Use Deployment Plan check box, you can select a deployment plan (if available) with predefined configurations. Selecting a plan at this stage allows you to prepopulate the interview with previously saved values of deployment and configuration parameters.
     • **Template**: The template component to be used for this deployment. This can either be a component present in the Software Library, or at an external location. If it is stored in an external location, specify the NFS or HTTP location.
where the component is stored. For example, http://myvm_server/template or file://myvm_server/template.

4. Click Next. The Template Deployment: Instance Details page appears.

Figure 8-11  Template Deployment - Instance Details

This page contains the following sections:

- **Guest VM**
  - **Guest VM**: Number of guest virtual machines to be deployed. Click **Configure Each Guest VM Instance** if you want to configure each guest virtual machine instance individually.
  - **Guest VM Naming**: You can choose either of the following options:
    - **Generate Guest VM Names Using Prefix**: This string will be used as a prefix in the guest virtual machine name. When a guest virtual machine is created using the Enterprise Manager, guest virtual machine names will be prefixed by the virtual machine name prefix you provide here and a number.
    - **Upload Guest VM Names from File**: If you select this option, you can Browse and upload a file with user defined guest virtual machine names. The guest virtual machine name cannot contain any special characters.

- **General Configuration**
  - **Enable High Availability**: If you want to enable high availability for this guest virtual machine, select this check box. If this option is enabled, the virtual server is shut down or restarted, the guest virtual machine is migrated to or restarted on another virtual server.
Note:
High availability must be enabled both on the virtual server pool and on the guest virtual machine. If it is not enabled on both, high availability is disabled.

- **Start VM After Creation**: Specify whether the guest virtual machine should be started automatically after it is created.

- **CPU Scheduling Priority**: Specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. Higher the priority, higher is the stake of the guest virtual machine in claiming CPU cycles.

- **CPU Scheduling Cap (%)**: Restricts the amount of physical CPU that a guest virtual machine can use. Use this to constrain guest virtual machine resource allocation.

- **Keymap**: The keyboard mapping that will be used by the guest virtual machine being cloned.

- **Tags**: Specify one or more tags for the virtual machine. These tags are used to logical group the virtual machines and can be used to search for one or more virtual machines that meet a certain criteria.

- **Memory (in MB)**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started.

- **CPU Cores**: The number of CPU cores to assign to this guest virtual machine. This will show up as virtual CPU (VCPU) configuration parameter for the guest virtual machine.

- **VM Size**: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values). Select the VM Size which can be Custom or Medium. If you select Custom, specify the Memory size and the number of CPUs.

- **NIC**: Specify the network interfaces for this guest virtual machine. The minimum value is 1 and maximum is 8. Click Add to add a network interface and specify the following details:
  - **Name**: Enter a name for the network resource.
  - **Network Type**: Specify if the network type is Internet Routable, Non Internet Routable, or a predefined set of IP addresses.
  - **IP Assignment**: Select the protocol to be used to assign the IP address.

- **Disk**: The list of available disks appears in the Disk section. Click Add to add an additional storage. In the Add Storage Device window, enter the name of the disk and its size. Indicate if it is a shared disk and specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. Higher the priority, higher is the stake of the guest virtual machine in claiming CPU cycles.
5. Click Next and Review the details entered so far.

6. Review the details entered so far. You can save as a plan that can be used later. Click Save as Plan, specify a name, and description for the plan. Select the folder in which the deployment plan is to be saved and click OK. If you do not wish to save the deployment procedure, click Submit to submit the job. From the Enterprise menu, select Job, then select Activity to view the Job Activity page. This page shows the details of the submitted job. You can click on the Name link to view more details.

To view details of the deployment request, from the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Request Dashboard. See Viewing the Infrastructure Request Dashboard for details.

8.8.6 Provisioning a Guest Virtual Machine Using an ISO Image

ISO images are imported into Enterprise Manager from installation media. You can create one or more virtual machines by deploying an ISO image.

**Prerequisites**

- Enterprise Manager Cloud Control is set up to manage the cloud environment.
- The ISO image is available to the zone and you have sufficient privileges to deploy the image. There are sufficient resources available in the zone for successful deployment.
- The Domain Type of the guest virtual machine being deployed must be set to HVM (hardware virtualized).

Follow this process to deploy an ISO image:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Home.
2. Right click on a virtual server pool target and select Deploy ISO.
3. On the Select Target and Source page, the server pool target on which the ISO image is to be deployed appears. In the Destination section, you can select either of the following:
   - Deployment Plan: If you select the Use Deployment Plan check box, you can select a deployment plan (if available) with predefined configurations. Selecting a plan at this stage allows you to pre-populate the interview with previously saved values of deployment and configuration parameters.
   - ISO: The ISO image to be used for this deployment. This can either be a component present in the Software Library, or at an external location. If it is stored in an external location, specify the NFS or HTTP location where the component is stored. For example, http://myvm_server/image or file:///myvm_server/image.
4. Enter the name of the request and click Next to continue. The ISO Deployment: Deployment Configuration page appears.
5. This page contains the following sections:
   - Guest VM
     - Guest VM: Number of guest virtual machines to be deployed. Click Configure Each Guest VM Instance if you want to configure each guest virtual machine instance individually.
Guest VM Naming: You can choose either of the following options:

Generate Guest VM Names Using Prefix: This string will be used as a prefix in the guest virtual machine name. When a guest virtual machine is created using the Enterprise Manager, guest virtual machine names will be prefixed by the virtual machine name prefix you provide here and a number.

Upload Guest VM Names from File: If you select this option, you can Browse and upload a file with user defined guest virtual machine names. The guest virtual machine name cannot contain any special characters.

General Configuration

Enable High Availability: If you want to enable high availability for this guest virtual machine, select this check box. If this option is enabled, the virtual server is shut down or restarted, the guest virtual machine is migrated to or restarted on another virtual server.

Note:
High availability must be enabled both on the virtual server pool and on the guest virtual machine. If it is not enabled on both, high availability is disabled.

Start VM After Creation: Specify whether the guest virtual machine should be started automatically after it is created.

CPU Scheduling Priority: Specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. Higher the priority, higher is the stake of the guest virtual machine in claiming CPU cycles.

CPU Scheduling Cap (%): Restricts the amount of physical CPU that a guest virtual machine can use. Use this to constrain guest virtual machine resource allocation.

VM Size: The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started. The size of the guest virtual machine (memory and CPU values). Select the VM Size which can be Custom or Medium. If you select Custom, specify the Memory size and the number of CPUs.

NIC: Specify the network interfaces for this guest virtual machine. The minimum value is 1 and maximum is 8. Click Add to add a network interface and specify the following details:

Name: Enter a name for the network resource.

Network Type: Specify if the network type is Internet Routable, Non Internet Routable, or a predefined set of IP addresses.

IP Assignment: Select the protocol to be used to assign the IP address.

Disk:
The list of available disks appears in the Disk section. Click Add to add an additional storage. In the Add Storage Device window, enter the name of the disk and its size. Indicate if it is a shared disk and specify the priority of a
guest virtual machine to access the physical CPUs, while competing with other
guest virtual machines on the same virtual server. Higher the priority, higher is
the stake of the guest virtual machine in claiming CPU cycles.

6. Click Next. In the Schedule page, specify when the ISO image is to be deployed
and click Next.

7. Review the details entered so far. You can save as a plan that can be used later.
Click Save as Plan, specify a name, and description for the plan. Select the folder
in which the deployment plan is to be saved and click OK. If you do not wish to
save the deployment procedure, click Submit to submit the plan and complete the
process.

8.8.7 Creating PXE Bootable Guest Virtual Machines

One of the key requirements of provisioning is the hardware server’s ability to boot
over the network instead of a diskette or CD-ROM. There are several ways computers
can boot over a network, and Preboot Execution Environment (PXE) is one of them.
PXE is an open industry standard supported by a number of hardware and software
vendors. A detailed document on PXE specification can be found at http://
www.pix.net/software/pxeboot/archive/pxespec.pdf.

You can create a network bootable (PXE boot) virtual machine that has the minimum
configuration information, then start the virtual machine through Preboot Execution
Environment (PXE) over a network later to install the guest operating system.

Prerequisites

• Enterprise Manager Cloud Control is set up to manage the cloud environment.
• There are sufficient resources available in the zone for successful deployment.

Follow this process to deploy an ISO image:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure
Home.

2. Select a Virtual Server Pool target. Select Deploy PXE from the Virtual Server
Pool menu.

3. On the Select Target and Source page, select the following:
   • Select the target machine on which the guest virtual machines are to be
     deployed.
   • Select the deployment plan to be used while creating PXE bootable guest
     virtual machines. The Deployment Plan contains pre-configured values and
     configuration parameters. This is an optional field.

4. Click Next. In the General Configuration page, enter the following details:
   • Name of the guest virtual machine to be deployed. If you are deploying more
     than one guest virtual machine, you can use a prefix or upload a file with user
deﬁned guest virtual machine names.
   • Number of guest virtual machines to be deployed. Click Configure Each
     Guest VM Instance if you want to conﬁgure each guest virtual machine
     instance individually.
   • Select the VM Size which can be Custom or Medium. If you select Custom,
specify the Memory size and the number of CPUs.
• Specify the priority of a guest virtual machine to access the physical CPUs, while competing with other guest virtual machines on the same virtual server. Higher the priority, higher is the stake of the guest virtual machine in claiming CPU cycles.

• Specify the cap to restrict the amount of physical CPU that a guest virtual machine can use.

• CPU Cores: The number of CPU cores to assign to this guest virtual machine. This will show up as virtual CPU (VCPU) configuration parameter for the guest virtual machine.

• Keymap: The keyboard mapping to be used for the guest virtual machine.

• Memory (in MB): The amount of memory to be allocated to the guest virtual machine. The virtual server should have sufficient memory to run the guest virtual machine. Otherwise, the guest virtual machine will be created, but will not be started.

• CPU Cores: The number of CPU cores to assign to this guest virtual machine. This will show up as virtual CPU (VCPU) configuration parameter for the guest virtual machine.

• In the NIC Configuration section, you can specify the number of virtual network interfaces for this guest virtual machine. The minimum value is 1 and the maximum value is 8. You can add one or more network interfaces or edit existing ones.

• Enterprise Manager Cloud Control provides a VNC console to the newly created guest virtual machine. This is the VNC password to access the VNC console.

• Select a Domain Type for the virtual machine:
  – xen_hvm (hardware virtualization, or fully virtualized): Enables you to select an ISO file from which to create the virtual machine.
  – xen_pvm (para-virtualized): Enables you to select a location for the mounted ISO file from which to create the virtual machine. Before you create the virtual machine using the paravirtualized method, mount the ISO file on an NFS share, or HTTP or FTP server. The ISO file must be available in the relevant repository.
  – xen_hvm_pv_drivers: Identical to xen_hvm but with additional paravirtualized drivers for improved performance of the virtual machine. This Domain Type is used to run Windows guest operating systems with an acceptable performance level.

• Select the Enable High Availability option if you want the guest virtual machine to run automatically on a different virtual server if the earlier virtual server shuts down.

• Select the Start VM After Creation check box to indicate whether the machine should automatically be started after it is created.

• The list of available disks appears in the Disk section. Click Add to add an additional storage.

5. Click Next. In the Schedule page, specify when the PXE bootable guest virtual machines are to be created and click Next.

6. Review the details entered so far and click Submit to create the PXE bootable guest virtual machines.
8.9 Viewing the Infrastructure Request Dashboard

The SSA Administrator can use the Request Dashboard to track the status of requests and reservations. The SSA administrator can view the requests across all zones for all users. The requests the SSA user can view depends on his zone and his instance level privileges.

Prerequisites

- Enterprise Manager Cloud Control is set up to manage the cloud environment.
- Appropriate self service users have been defined in the LDAP directory.
- Requests and reservations for resources have been submitted.

To view the Infrastructure Request Dashboard, follow these steps:

1. From the Enterprise menu, select **Cloud**, then select **Oracle VM Infrastructure Request Dashboard**. The Infrastructure Cloud Requests Dashboard appears.

2. The following charts are displayed:
   - Latest 10 Failed and Pending Requests
   - Oldest 10 Running Requests
   - Request Summary - Failed, Successful, and Partially Successful Requests
   - Average Request Wait Time (Zone)
   - Average Request Wait Time (Assemblies and Templates)
   - Average Request Processing Time (Zone)
   - Average Request Processing Time (Assemblies and Templates)

3. Click on the **View All Requests** tab to go to the All Cloud Requests page.

4. In this page, you can search for one of the following:
Request Name: The name of the request.

Request Type: The type of request that you want to view. This can be Assembly Deployment, Template Deployment, ISO Deployment, PXE Deployment, Clone Guest VM, Update Guest VM.

Requesting Application: The application making the request. You can view only Self Service requests from this dashboard.

Status: The status of the request such as Successful, Canceled, Scheduled, Error Ending, and so on.

For each request type you select, you can view the Request Name, Request Type, Created By, Status, Begin Date, End Date, Memory, CPU, VMs, and so on. You can also select a request and click Delete to remove the request.

Click on a Request Name link to drill down to the Request Details page.

8.9.1 Request Details Page

The Request Details page shows the details of the selected request. The name of the request, type, the OVM Manager associated with the request, status, date on which it was created, and so on are displayed.

General: This section displays the name of the request, request type, target name, and other details.

Deployment: This section shows the name of the requests and the targets that have been deployed. Click on request link to drill down to the Job Details page. Click on a target link to drill down to the Home page of the target.

8.9.2 Viewing the Assembly / Tier Instance Page

To view the Home page for the assembly or tier instance, follow these steps:

1. From the Enterprise menu, select Cloud, then select Oracle VM Infrastructure Request Dashboard.

2. The Infrastructure Request Dashboard page appears. Click the All Requests link in the Requests table.

3. In the All Requests page, click on an assembly deployment request name in the table. The Assembly Deployment page appears. Click on the Deployment tab. The assembly instance that has been deployed is displayed.

4. Click on the Assembly Instance link. The following page appears.
8.10 New Features in Enterprise Manager VT Plugin 13.2.3

This section describes the new features in Enterprise Manager VT Plugin 13.2.3:

8.10.1 Exporting VM to Virtual Appliance

This feature allows you to export a virtual machine (VM) to a virtual appliance from Enterprise Manager.

This feature is applicable to OVM Manager 3.4 or above versions only.

8.10.2 Increased Supported Limits

This feature supports increased memory and CPU limits for virtual machines.
8.10.3 Inbound Migration Lock

This feature allows you to protect an Oracle VM Server from attempts to move or migrate other virtual machines to that server.

8.10.4 Improving Assembly Deployment Code to Eliminate Extra Template Creation

This feature improves the assembly deployment code to create a VM directly from the assembly without extracting a template from it, for OVM 3.4.2 and above. This is currently exercised only if the assembly was imported in OVM, but is being deployed from Enterprise Manager.

8.10.5 Support for hot memory modify with PVHVM guest

This feature allows you to modify memory of a running PVHVM guest.
Part IV

Setting Up and Using Oracle Compute

This section contains the following chapters:

• Meeting the Prerequisites
• Using Oracle Compute
9

Meeting the Prerequisites

This chapter lists the prerequisites that must be met before you can discover and manage an Oracle Public Cloud Machine target in Enterprise Manager. It covers the following sections:

• Verifying or Installing the Virtual Infrastructure (VI) Plug-in
• Understanding Users in Oracle Public Cloud Machine

9.1 Verifying or Installing the Virtual Infrastructure (VI) Plug-in

By default, the Virtual Infrastructure (VI) plug-in is included with your installation of Enterprise Manager. To verify that this plug-in is installed:

1. From the Setup menu, select Extensibility and then Plug-ins.
2. Expand the Servers, Storage and Network folder.
3. Verify that the minimum Oracle Virtual Infrastructure plug-in version 13.2.1.0.0 appears in the list.

If the plug-in is not installed, then you must download and install it. See Deploying the Enterprise Manager for Virtual Infrastructure Plug-in for details

9.1.1 Deploying the Enterprise Manager for Virtual Infrastructure Plug-in

Much of the functionality available in Enterprise Manager Cloud Control is made available through plug-ins. As its name implies, a plug-in is a component or module that can be plugged into an existing Enterprise Manager installation to extend its management and monitoring capabilities.

You can deploy the Enterprise Manager for Virtual Infrastructure plug-in by using one of the following methods:

• If you have not yet installed Enterprise Manager, or have not yet upgraded to the latest Enterprise Manager release, you can deploy the plug-ins as part of the installation or upgrade process. You will select the Advanced Install mode and in the Select Plug-ins screen, select the plug-ins that you wish to install.

• If you already have Enterprise Manager Cloud Control 13c installed, you must download the needed plug-ins to the Software Library. You can then deploy the plug-ins to your Oracle Management Service (OMS).

See the Enterprise Manager Cloud Control Administrator’s Guide for instructions on downloading and deploying the plug-ins.
9.2 Understanding Users in Oracle Public Cloud Machine

The following types of users are available:

- **Cloud Administrator**: A cloud administrator can create other cloud administrators. The cloud administrators are created in the /cloud tenant namespace. The cloud administrator is responsible for maintaining the entire rack and has access to all tenants.

- **Tenant Administrator**: A default tenant administrator for a tenant is automatically created when a tenant is created. Cloud administrators can create other tenant administrators for a tenant depending on the requirements to manage the tenant users and the resources. Tenant Administrators have access to only those in which they are created.

- **Tenant User**: Cloud Administrators or Tenant Administrators can create Tenant Users. Tenant users have privileged access only to a particular tenant.

9.2.1 Cloud Administrator Tasks

The primary task of a cloud administrator is to setup the infrastructure for Oracle Compute Cloud Service and manage the overall cloud infrastructure. The infrastructure for self service consists of setting up the following:

- **Setting Up Tenants**: Tenants are entities that are allocated with quotas of the system resources. Tenant users are authorized to use the compute, storage, and memory resources of the tenant. You can create tenants with default or custom quota. Tenants created with default quota can use the resources without any limit. Or you can define CPU, memory, and storage resources for the tenant in the custom quota option. You can opt to oversubscribe the tenant CPU by defining the fraction in which the CPU resource must be oversubscribed.

- **Setting Up Networks**: When you create tenants, two security domains, namely Public and Private Security Domain are created. The public security domain is for deployment of networks for communication between the Compute nodes and entities external to the Oracle Public Cloud Machine. The private security domain is for deployment of networks for communication within the tenant. As a cloud administrator, you must set up public networks and service networks for use by the instances.

- **Setting Up Users**: By default, a tenant administrator is created when a tenant is created. Cloud administrator can grant tenant administrator role to some of the tenant users. Tenant Administrators can create Tenant Users, manage the users, instances, and private networks for instances.

- **Setting Up Tenant Resources**: Manage the tenant resources and decide upon vCPU oversubscription. Manage the tenant quota as the requirement for the resources increases and decreases.

- **Monitoring Hardware Components**: Monitor the hardware components such as compute node status, temperature, and hardware resources to ensure that they are maintained for cloud resources.

- **Monitoring Cloud Resources**: Monitor the cloud infrastructure resources for any incidents and ensure that the tenants have enough resources to host the instances.
9.2.2 Tenant Administrator Tasks

A default tenant administrator is created automatically when a tenant is created. The cloud administrator can create more tenant administrators as required to manage the tenant. The tasks of a tenant administrator include:

- Creating tenant users
- Creating IPoIB tenant networks
- Uploading templates
- Managing storage volumes

The tenant administrator has all the permissions as that of a tenant user to create and manage orchestrations, and instances. For detailed information on the tenant administrator operations, refer to the Oracle Public Cloud Machine Using Oracle Compute Cloud Service on OPCM.

9.2.3 Tenant User Tasks

The tenant user has privileged access to the tenancy to which the user belongs and can perform the following tasks:

- Provision resources
- Request orchestrations

For detailed information on the tenant user operations, refer to the Using Oracle Compute Cloud Service on Oracle Public Cloud Machine Guide.

9.3 Creating Users and Roles

You must create Tenant Administrator and Tenant User roles and map them to an OPCM target. To create an Enterprise Manager user role, follow these steps:

1. Log into Enterprise Manager as SYSMAN (or any user with the EM_CLOUD_ADMINISTRATOR role)
2. From the Setup menu, select Security, and then select Roles.
3. Click Create on the Roles page.
4. In the Create Role: Properties page, enter the name and description for the Tenant Administrator or Tenant User role and click Next.
5. Select the EM_SSA_USER role from the available roles list and move to the selected roles list.
   At this point, you can choose to directly navigate to the last page, complete the role creation process and use the Role Mappings page (see Mapping Enterprise Manager User Roles to Oracle Compute User Roles for details) to assign the Oracle Compute Site Target Privileges.
   Alternatively, you can click Next and continue with the rest of the steps in the wizard to assign the Oracle Compute Site Target Privileges manually.
6. In the Target Privileges step, click Add at the bottom left corner.
7. In the Search and Add Targets window, select the **Target Type** as Oracle Compute Site.

   The Oracle Compute Sites that have been registered in Enterprise Manager are listed.

8. Select the Oracle Compute site to which you want to map the user role and click **Select**.

9. Select **Advanced Privilege Settings** option in the bottom of the Target Privileges page.

10. For each Oracle Compute site target selected, edit the **Aggregate Privileges**.

11. Select the following actions:

    | Tenant Administrator | Tenant User |
    |----------------------|------------|
    | User Management      | N/A        |
    | Image Management     | N/A        |
    | Instance Management  | N/A        |

12. For the EM_SSA_USER role, select **Manage Target Privilege Grants** and unselect the **View** option.

13. Click **Next** in the following steps of the wizard and click **Finish** to create the Enterprise Manager role.

### 9.4 Mapping Enterprise Manager User Roles to Oracle Compute User Roles

You can associate an Enterprise Manager role with an Oracle Compute role. To define a role mapping, follow these steps:

1. Log in as SYSMAN (or any user with the EM_CLOUD_ADMINISTRATOR role).

2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**.

3. From the **Oracle Cloud** menu, select **Getting Started**, then click on the **Setup** link next to the Infrastructure - Oracle Compute service family in the left panel.

4. Click **Role Mappings**. In the Role Mappings page, from the drop down list, select the Oracle Compute Site in which the role mappings are to be defined.

5. Click **Create**. In the Create Role Mapping window, select the Enterprise Manager role and the Oracle Compute role with which it should be associated and click **Add** to create the role mapping.

**Note:**

You must match your Tenant administrator EM role with the Tenant Administrator Compute role, and your Tenant User EM role with your Tenant User Compute role.
10
Using Oracle Compute

This chapter provides self service users with instructions on using the Oracle Compute Self Service Portal to request, monitor, and manage Oracle Compute instances. It contains the following sections:

- Using the Oracle Compute Self Service Portal
- Creating a New Orchestration
- Viewing the Orchestration Details
- Creating Storage Volumes
- Managing the Library
- Discovering an Orchestration

10.1 Registering the Oracle Compute Site

To register the Oracle Compute Site, follow these steps:

1. From the Setup menu, select Add Target, then Add Targets Manually.
2. On the Add Targets Manually page, select Add Non-Host Targets Using Guided Process, then select Oracle Compute Site from the Type menu.
3. Click Add Using Guided Process and continue with the steps below.
4. On the Register Oracle Compute Site page, add the following Site Details information:
   - Target Name: The name to be used for the Oracle Compute site being created.
   - Monitoring Agent: Select your local OMS agent.
   - Service Manager Endpoint URL: Enter the PSM URL provided by Oracle Cloud Operations. Leave the other fields blank.
5. Add the following Credentials information:
   - Endpoint URL: Enter the Compute API endpoint provided by Oracle Cloud Operations (https://<endpoint URL IP>). This is the URL to which you submit HTTP requests or commands. To discover the Oracle Compute target, you must ensure that the Oracle Compute Site security certificate has been added to the Monitoring Agent keystore.
   - User Name: The user name (/cloud/monitor) required to access the Endpoint URL.
   - Password: The password required to access the Endpoint URL. Click Test Connection to test the site credentials.
6. In the Other Credentials information (optional):
   - SNMP V3 Credentials: Leave this field blank.
7. Click Continue. The Oracle Compute site is discovered along with the targets in the following hierarchy:
   - Oracle Compute Cluster
   - Oracle Server
   - Oracle Virtual Platform
   - Oracle VM Instance
   - Oracle Compute Orchestration

   To view the Oracle Compute Site Home page after the Oracle Compute site has been discovered, from the Targets menu, select All Targets, then click on the Oracle Compute Site target under Groups, Systems, and Services. The newly added Oracle Compute Site will now be listed.

10.1.1 Importing the Site Certificate

When using Enterprise Manager and a Secure Socket Layer (SSL) protocol to discover and monitor the Oracle Compute Site, the Secure Certificate must be imported before a secure communication link can be established. The Management Agent (running on the first privileged control VM) maintains a Java Keystore (JKS) truststore containing certificates of Certification Authorities (CAs) that it can trust or self signed certificates when establishing a secure connection.

The JKS Agent truststore is available at the following location:

$ORACLE_HOME/sysman/config/montrust/AgentTrust.jks

where ORACLE_HOME is the Management Agent instance home.

To download the certificate (CA Certificate or Root Certificate), follow these steps:

1. Open a browser window and enter the site URL in the address window.
2. Expand by clicking on I Understand the Risk and click Add Exception.
3. Under Certificate Status click the View button on the right hand side.
4. Click the Details tab. In the left hand side bottom column, click Export.
5. Save the certificate at your desired location with desired filename.

After downloading the certificate, you must update the Agent truststore (AgentTrust.jks). If a signed certificate from a self signed CA is being used on the Oracle Compute site, then the Root CA certificate for this must be added to JKS Agent truststore so that Management Agent can discover and monitor these Oracle Compute sites. To update the AgentTrust.jks, enter the following command:

emctl secure add_trust_cert_to_jks -password <password> -trust_certs_loc <loc> -alias <alias>

where:

- **password** is the password for the AgentTrust.jks (if not specified, you will be prompted for the password at the command line)
- **trust_certs_loc** is the location of the certificate file to be imported.
- **alias** is the alias of the certificate to be imported.
For example: `emctl secure add_trust_cert_to_jks -password welcome -trust_certs_loc /home/asaral/certs/emdev1_nimbula.crt -alias emdev1_nimbula`

### 10.2 Using the Oracle Compute Self Service Portal

To navigate to the Oracle Compute Self Service Portal page, login as a user with the EM_SSA_USER role. The Self Service Portal page is displayed. Select **Infrastructure - Oracle Compute** from the drop down list. The following page appears:

**Figure 10-1   Oracle Compute Self Service Portal**

It contains the following tabs:

- **Home**: The Home page lists the following details:
  - **Instances**: This region shows the list of instances that have been created and the status indicating whether they are Up or Down.
  - **Notifications**: Lists notifications such as orchestrations that have not been discovered, number of service offerings published in the last 7 days, and so on.
  - **Expiry**: Shows instances due to expire today, this week, or in the future.
  - **Usage**: Click the **Usage** icon to view the total quota (servers and memory) used so far by the self service user, including all the services that the user has created. Your quota includes both the number of Oracle VM instances, CPUs, memory, and storage across all your instances.
  - **Services**: This region shows the list of Oracle VM instances owned by the self service user. For each service, the name of the service, the status, service type, resource provider, and date on which it was created, and the date on which it is scheduled to expire is displayed. You can also see the services for which you have granted privileges. You can do the following:
    - **Create a New Instance**: To create an orchestration, click **Create Instance**. See Creating a New Orchestration.
    - **View a Service**: Click on the Name link to drill down to the VM Instance Home page.
* **Delete a Service**: Select a service from the table and click **Delete**. A confirmation message is displayed. Click **Yes** to delete the instance.

* **Extend**: Select a service and click **Extend** to extend the lifecycle of the instance.

* **Start a Service**: Select a service instance from the table and click **Start**. A request is submitted to start the service.

* **Stop a Service**: Select a service instance from the table and click **Stop**. A confirmation message is displayed. Click **Yes** to submit a request to stop the service.

* **History**: Select a service instance and click **History** to view the history of operations performed on the service instance.

* **Discover**: Select this option to discover any orchestrations and promote them as service instances.

* **Grant**: You can grant view or full privileges over the service instance to other users or roles. See Granting and Revoking Privileges.

* **Revoke Privileges**: You can revoke privileges you have granted to other users or roles.

  – **Requests**: This page shows a list of Start Orchestration, Discover Orchestration, and Service Deletion requests. For each request, the status, type, start date, and submission date of the request is displayed. Select columns from the View menu to view more details about the request. You can select a scheduled request and click Reschedule to reschedule the request. To delete a scheduled request, select the request and click Cancel. If a request that is scheduled such as Create gets canceled, all other associated requests are also canceled.

- **Storage**: See Creating Storage Volumes
- **Library**: See Managing the Library

### 10.3 Creating a New Orchestration

To create a set of Oracle VM instances with a customized configuration, you must create a new orchestration by following these steps:

1. Click **Request New Service** in the Infrastructure Oracle Compute Self Service Portal page.

#### Note:

When you log in for the first time, you must set the Oracle Compute Credentials. Click the **Preferences** link the top right corner of the page. The Preferences window appears. Click on the Infrastructure: Oracle Compute link in the left panel. Click **Set** in the Oracle Compute Site Credential region and enter the username and password required to access the Oracle Compute Site. Optionally, you can specify the host credentials for deploying the Management Agent.

2. Select the **Orchestration Service Template** from the Service Catalog. The Request Orchestration wizard appears.
3. Select the Oracle Compute Site in which the VM instances are to be created.

4. Enter a name for the orchestration and specify a description.

5. If any orchestration has been saved either as a deployment plan or as a JSON file, you select it here. If no saved orchestrations are available, click **Next** to continue. The Deployment Configuration page appears.

6. On this page, you can specify the configuration for the different components of your orchestration using one or more launch plans. A launch plan defines the configuration settings for one or more VM instances. In the Launch Plan window, enter a name for the launch plan and click **Add**. The launch plan name you entered appears under the Orchestration Template header in the launch panel.

7. Click on the **Launch Plan Configuration** tab. Enter the following details:
   - **High Availability**: You can specify a high availability policy for an orchestration, which affects how the orchestration is managed by the system. This can be:
     - No High Availability: If you choose this option, the orchestration components are neither restarted nor monitored.
     - Active: The components defined by the orchestration are restarted if they stop unexpectedly due to causes such as power failure and node disconnection.
     - Monitor: The components are not restarted, they are only monitored.
   - **Deploy on Different Nodes**: Select this check box to deploy the launch plan on different nodes.

8. Click on the **Common Settings** tab to define the default settings that will be used for all VM instances in this launch plan. The default setting can be overridden at the VM instance level.

Specify the following details:
• **Oracle Compute Template**: A template is a copy of virtual hard disk with an installed operating system used to launch an instance. The template must be a whole disk template (including a partition table and kernel) stored in a tar archive, compressed with gzip. Click the **Search** icon and select a template from the list.

• **Shape**: A shape is a combination of CPU, memory, and IO which define the characteristics of a virtual machine. Select a shape from the drop down list.

• **Configure EM Agent**: This checkbox will be disabled if the self service user does not have access to the EoIB OMS and IPoIB instance storage networks that are required to deploy the management agent on virtual machines.

• **Credentials**: You can set the SSH key credentials for password-less access to VM instances and host credentials for deploying the Management Agent. You can use:
  
  – **Oracle SSH Key**: If SSH key credentials have been set, and can be used as preferred credentials, select **Use Preferences** and choose the credential set from the drop down box. If you select **Enter Key**, you must specify the SSH public and private key pair required to access the VM instances. If you select **Key is in a file**, click **Browse** and select the public / private key from a file.
  
  – **Root SSH Key**: If SSH key credentials have been set for the host, and can be used as preferred credentials, select **Use Preferences** and choose the credential set from the drop down box. If you select **Enter Key**, you must specify the SSH public and private key pair required to access the VM instances. If you select **Key is in a file**, click **Browse** and select the public / private key from a file.
Oracle User: If you select Use Preferences, choose the preferred credentials from the drop down box. If you select Enter Password, you must enter the password for the Oracle user.

Root User: If you select Use Preferences, choose the preferred credentials from the drop down box. If you select Enter Password, you must enter the password for the root user.

Network Configuration: Click Add to select one or more network interfaces that will be associated with the VM instances. A network can be an IPoIB or EoIB network. In the Select Network window, you can choose:

- Tenant Networks: These are networks configured for each tenant to communicate with other servers within OPCM or outside.
- Service Networks: These are networks configured to communicate with other service providers such as ZFSSA or Exadata systems.

Storage Configuration: You can associate one or more storage volumes to the VM instances that are to be created. Click Create. In the Create Storage Volumes window, enter the name of the storage volume, size, select the storage properties, and the number of volumes to be created and click Add.

Advanced Configuration: You can optionally specify additional attributes for the VM instances. Click Add to add a key and value for the attribute.

After you have created the launch plan, you can add one or more VM instances that can use the launch plan. Select the launch plan you have created and click Add VM Instance. In the Add VM Instance window, specify the name and number of VM instances to be created. If you are adding more than one instance, the name you specify will be used as a prefix to generate a unique name for each VM instance. You can define configuration settings at the instance level and override the settings defined at the launch plan level.

To define instance level specific configuration settings, select the VM instance from the left panel. The Oracle VM Instance Configuration page appears. To define instance level settings, select the Override Common Settings checkbox to override the default launch plan level settings. Select the Oracle Compute Template, Shape, Network, and Storage Configuration.

In the Advanced Configuration region, you can optionally specify additional attributes. Click Add. In the Add Attributes window, specify the key and value for the attribute. In the Tags field, you can enter tags to identify the instance deployment request. In the Optional Network Configuration region, you can specify additional configuration parameters for the network defined in the Network Configuration region. You can specify a list of DNS servers, configure the network as the default gateway network, and configure the VM instance as a provider on the underlying selected service network. Click Next.

The Review page appears. Review the information entered so far and click Submit to submit the orchestration request or click Save as Deployment Plan to save the orchestration as a deployment plan that can be used for other orchestrations.

10.4 Viewing the Orchestration Details

To view the orchestration details, click on the Name link in the Services region of the Infrastructure - Oracle Compute Self Service Portal page.
This page contains the following regions:

- **General**: This region shows the name of the Oracle Compute Site, the target name, the number of launch plans, CPU, and allocated memory.

- **VM Instances**: Lists the VM instances in the launch plan and the configuration for each VM instance which includes the status, shape, template, VNC URL, and IP address. Click on the VM Instance link to drill down to the VM Instance Home page. If the VM instance is up and running, select the VM Instance and click **Shutdown** to shut down the instance. If the VM instance is down, click **Restart** to restart the instance.

You can perform the following operations on this page:

- Start
- Stop
- Update
- Shutdown

### 10.4.1 Viewing the Oracle VM Instance Home Page

To view this page, click on the **Name** link in the VM Instances region in the Oracle Compute Orchestration Details page.
This page shows the detailed information for the VM instance. The name of the Oracle Compute Site with which this instance is associated, the number of CPUs, allocated memory, storage, networks, relative CPU utilization, and so on are displayed. You can do the following:

- **Attach Storage**: Use this option to attach storage to the VM instance. Select one or more storage volumes and specify an index for each volume. The index value must be between 1 and 10. Click **Attach** to attach the storage volume to the VM instance.

- **Detach Storage**: Select one or more storage volumes from the list and click **Detach** to detach storage from the VM instance.

- **Edit VM Instance**: Select this option to modify the shape and network configuration for the VM instance.

### 10.5 Viewing the Service Networks

The service networks that are available are listed here. The subnet, type, description, CIDR, and IP address range is displayed.

### 10.6 Creating IPoIB Subnets for Tenant Networks

IPoIB networks are deployed on the private security domain. Multiple IPoIB virtual networks can be deployed on a security domain of the tenant. These IPoIB networks are not isolated from each other and can be created for each tenant.

To create an IPoIB subnet, follow these steps:

1. Select the Tenant Networks box and click **Create**. Enter the following details:
   - **Name**: Enter the name of the tenant administrator user.
vEthernet Name: Click the Search icon and select the vEthernet from the list.

Creation Mode: This can be CIDR / IP Range or Global IP.
- CIDR: Enter the IP address for the subnet in the CIDR (Classless Inter-Domain Routing) format. A CIDR address includes the standard 32-bit IP address and it indicates how many bits are used for the prefix.

For example, an address of 206.13.1.48/25 indicates that the first 25 bits are used to identify the unique network. The remaining bits are available to identify the specific host. The network you specify must not be used by another EoIB network.
- Global IP: An IP Pool is a pool of public IP ranges made up of one or more IP Pool entries. If global IP pool is enabled in the site configuration, specify the global IP pool address number. If this number is specified, the IP address is allocated from a global pool of IP addresses.

Ethernet Interface Index: Select this checkbox and specify the ethernet interface index number.

Description: Enter a description of the EoIB network.

IP Ranges: Click Add to add an IP address range in the format IP-IP. For example, 10.242.2.211-10.242.2.215.

2. Click Create to create the IPoIB subnet and return to the Networks page.

10.7 Creating Storage Volumes

1. Click on the Storage icon to view the Storage Volumes page. A storage volume object is a single volume that can be attached to an instance. On this page, the name of the storage volume, status, size, and its properties are displayed.

2. Click Create Volume. In the Create Storage Volume window, the name of the storage volume is displayed. Enter the size, description, and select a template for the volume. Click OK to create the storage volume.

3. You can take a snapshot or a copy of a storage volume and make the copy available to users belonging to another tenancy.

4. Select a storage volume from the list and click Snapshot Volume. In the Snapshot Storage Volume window, select a target tenant name in the Target Volume drop down field, and enter the name of the snapshot, specify the size, and a description for the snapshot.

5. Click OK to create the snapshot and return to the Storage page.

10.8 Managing the Library

This page lists the templates and saved deployment plans that are available to the tenant user. Click the Library icon to access this page.
For each template, the name, attributes, quota assigned, and the size of the template is displayed. You can choose to view all the templates, templates available to public, or templates available for the selected tenancy.

10.8.1 Uploading a Template

A template is a copy of virtual hard disk with an installed operating system used to launch an instance. The template must be a whole disk image (including a partition table and kernel) stored in a tar archive, compressed with gzip. To upload an template, follow these steps:

1. Click **Upload**. The Template Management: Upload Template window appears. While uploading the template, the Template Scope can be:
   - Public: The template will be available to all the users. If you select this option, enter the name of the template in the Name field.
   - Tenant: The template will be available only to users belonging to the selected tenancy. If you select this option, select the Tenant in the Name drop down field and specify the name of the template. The template will be available to all users in the selected tenancy.

2. Specify any additional attributes that will be used when the service instance is provisioned.

3. In the Select Template field, select the template that is to be uploaded. The template you upload can either be present in your local disk or from the Software Library.

4. Click **Upload** to upload the template. The newly uploaded template will appear with the following details:
   - Name: The name of the template. If the template is available to all users, the format of the name is /oracle/public/<template_name>. If the template is available only to users belonging a selected tenancy, the format is <tenant_name>/public/<template_name>.
10.8.2 Deleting a Template or a Deployment Plan

To delete a template:

1. Select the template from the list in the Library region and click **Delete**.
2. A confirmation message is displayed. Click **Delete** to confirm.
3. Click the Deployment Plans radio button to view the deployment plans that have been saved for later deployment.
4. Select a plan and click **Delete** and click **OK** to confirm the deletion.

10.9 Discovering an Orchestration

You can use this option to discover any orchestrations that have been created externally without using Enterprise Manager.

To discover an orchestration, follow these steps:

1. From the Actions menu, select Discover, then select Orchestration.
2. A confirmation message is displayed. Click Submit to discover the orchestrations.
3. A Discover Orchestration request is submitted and you can monitor the progress.
11 Oracle Compute REST APIs

This chapter describes the different REST APIs and covers the following:

• Using the REST API Tool
• Overview of REST Resources
• Supported Use Cases
• References

11.1 Using the REST API Tool

To use the REST API tool, follow these steps:

1. Use REST tool (for example Chrome's Postman plugin) to visit the Oracle Compute web service. The Oracle Compute web service entry is https://hostname:port/em/websvcs/restful/extws/virtualization/infrastructure. Before you call the API, you must use a trusted Enterprise Manager certificate.

2. Set the authorization header, using Basic Auth, enter the Enterprise Manager username and password, and click Refresh Header.

3. Set the Accept or Content-Type header value to application/json to perform the request.

The following table describes the REST HTTP methods you can use for OPCM objects:

Table 11-1    Rest HTTP Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>POST</td>
<td>Creates an object by using the JSON-formatted data in the request body.</td>
</tr>
<tr>
<td>GET</td>
<td>Retrieves information about the object/s specified in the request URI.</td>
</tr>
<tr>
<td>PUT</td>
<td>Updates the attributes of an object by using the JSON-formatted data in the request body.</td>
</tr>
<tr>
<td>DELETE</td>
<td>Deletes the object specified in the request URI.</td>
</tr>
</tbody>
</table>

11.2 Overview of REST Resources

This section provides an overview of the REST resources.
### Table 11-2  REST Resources for Target Type

<table>
<thead>
<tr>
<th>Target Type</th>

</tbody>
</table>

### 11.3 Supported Use Cases

The supported use cases are:

- Orchestration Use Cases
- Service Network Use Cases
- vEthernet Use Cases
- Subnet Use Cases
- IP Reservation Use Cases
- Subnet Access Use Cases
11.3.1 Orchestration Use Cases

The orchestration use cases are:

- Creating an Orchestration
- Performing an Orchestration Action

11.3.1.1 Creating an Orchestration

To create an orchestration, you must make a set of calls using the CFW resources by following these steps:

1. Call the Services to GET the Service GUID.

   **URL:** Refer the CFW table and prefix the https://Hostname:port to the url as follows:

   https://<hostname:port>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/

   **Input:** None

   **Output:**

   ```json
   {
     "name": "Services", "type": "Service", "totalResults": 2, "cfwItems": [
       {
         "id": "1", "name": "ORACLE_NIMBULA_ORCHESTRATION_TEMPLATE", "displayName": "Orchestration", "guid": "0E1D6A8E12B70BB5E05303B7F00AE6C0",
         "serviceType": "ORACLE_NIMBULA_ORCHESTRATION_SERVICE", "serviceFamily": "NIMBULA_INFRASTRUCTURE", "description": "Create a set of Oracle VM instances with customized configuration for multi-tier applications", "meta": "https://<hostname:port>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/0E1D6A8E12B70BB5E05303B7F00AE6C0/metadata", "canonicalLink": {
         "href": "https://<hostname:port>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/0E1D6A8E12B70BB5E05303B7F00AE6C0"},
       },
       {
         "id": "2", "name": "ORACLE_NIMBULA_SIMPLE_ORCHESTRATION_TEMPLATE", "displayName": "Simple Orchestration", "guid": "0E1D6A8E12BA0BB5E05303B7F00AE6C0", "serviceType": "ORACLE_NIMBULA_ORCHESTRATION_SERVICE", "serviceFamily": "NIMBULA_INFRASTRUCTURE", "description": "Create one or more Oracle VM instances with default configuration and minimum"
   ]
   ```
2. Use the meta link from the above output to get the metadata for the service to form the input.
   
   URL: Specify the service metadata using the GUID from output in Step 1.
   
   Input: None
   
   Output:
   
   ```json
   {"configurations":
   [{"name":"requestId","type":"STRING","description":"Cloud Framework Request ID","required":false,"secret":false},
   {"name":"orch_plan_swlib_urn","type":"STRING","description":"Orchestration Plan Software Library Component URN","required":false,"secret":false},{"name":"orch_plan","type":"LARGEDATA","description":"Orchestration Plan","required":false,"secret":false},{"name":"site_name","type":"STRING","description":"Oracle Nimbula Site","required":true,"secret":true}],"canonicalLink":{"href":"https://<hostname:port>/em/websvcs/restful/cloudservices/ssa/cfw/v2/services/0E1D6A8E12BA0BB5E05303B7F00AE6C0/metadata"},"selfLink":{"href":"https://<hostname:port>/em/websvcs/restful/cloudservices/ssa/cfw/v2/services"}}
   ```

   To build the orch_plan.xml, refer to the XSD in Section 5.4, "References".

3. Invoke the Create Orchestration Service Instance by building the input using the response parameters from Step 2.
   
   URL: Use Services URL with POST
   
   Input: Using the orchestration plan (orch_plan) as the input, build the XML using the values corresponding to the site like (Image List Name, Shape Name, Network, Storage, and so on). Repeat the same for all the ObjectPlans and specify the appropriate site_name value.
XML

{"offeringId": "0E1D6A8E12BA0BB5E05303B7F00AE6C0",
 "name": "/cloud/public/OrchtestUi", "instanceName": "/cloud/public/OrchtestUi",

      </ObjectMemberList>
    </ObjectPlan>
  </ObjectPlanList>
</ns2:ConfigurationData>
},
{"name": "site_name", "value": "nimbsite1"}]

Output: Service Request Id if the request is successful. If unsuccessful, use the Service Request URL to check the service request status.

11.3.1.2 Performing an Orchestration Action

Performing an orchestration action involves the following steps:

1. Get the Instance ID.
URL: Use the GET on Service Instances URL and append ?expanded=true -
/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances?
expanded=true
Input: None
Output:

{"name" : "Service Instances","type" : "Service
Instance","totalResults" : 1,"canonicalLink" : {"href"
:"https://hostname:port/em/websvcs/restful/extws/
cloudservices/ssa/cfw/v2/serviceinstances"},"cfwItems" : [{"name" : "del_2","guid" :
"51087FBC61473C5477167DAAB6BD1871","serviceFamily" :
"NIMBULA_INFRASTRUCTURE","serviceType" : "ORACLE_NIMBULA_ORCHESTRATION
_SERVICE","status" : "STATUS_UP","canonicalLink" : {"href"
:"https://hostname:port/em/websvcs/restful/extws/
cloudservices/ssa/cfw/v2/serviceinstances/51087FBC61473C5477167DAAB6BD1871"}}]

2. Get the ID of the action to be performed.
URL: Invoke Service Actions using GET
https://hostname:port/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/
serviceinstances/51087FBC61473C5477167DAAB6BD1871/actions
Input: None
Output:

{"name":"Actions","type":"Action","totalResults":8,"cfwItems":
[{"id":"2","name
":"DELETE","displayName":"Delete Orchestration","description":"Delete
Nimbula Orchestration"},{"id":"4","name":"START","displayName":"Start
Orchestration","description":"Start Oracle Compute Orchestration"},{"id":"5","name":"STOP","displayName":"Stop
Orchestration","description":"Stop Oracle Compute Orchestration"},
{"id":"6","name":"SHUTDOWNORCHESTRATION","displayName":"Shutdown
Orchestration","description":"Shutdown Oracle Nimbula Orchestration"},
{"id":"7","name":"RESTARTORCHESTRATION","displayName":"Restart
Orchestration","description":"Restart Oracle Nimbula Orchestration"},
{"id":"8","name":"DESTROYORCHESTRATION","displayName":"Destroy
Orchestration","description":"Destroy Oracle Nimbula Orchestration"},
{"id":"9","name":"UPDATERORCHESTRATION","displayName":"Update
Orchestration","description":"Update Oracle Nimbula Orchestration"},{"id":"10","name":"SNAPSHOT","displayName":"Snapshot VM
Instance","description":"Snapshot VM Instance"},"canonicalLink":{"href":
"/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/51087FBC61473C5477167DAAB6BD1871/"}}
3. Get the inputs for the action

URL: Invoke GET on Service Actions URL using the Action Id from the output in Step 2.

/em/websvcs/restful/extws/cloudservices:ssa/cfw/v2/serviceinstances/E8E4395513C2B72F01D91E6DB46D1701/actions/2

Input: None

Output:

{"id":2,"name":"DELETE","displayName":"Delete Orchestration","description":"Delete Oracle Compute Orchestration","actionInputs":
["name":"requestId","type":"STRING","description":"Cloud Framework Request ID","displayName":"requestId","required":false,"secret":false],
["name":"instance_guids","type":"VECTOR","description":"Orchestration Target GUIDs","displayName":"instance_guids","required":false,"secret":false],
["name":"instance_names","type":"VECTOR","description":"Orchestration Target Names","displayName":"instance_names","required":true,"secret":false],

4. Invoke the action. Prepare the Input for the action from the above output. As the above case requires four input parameters to perform this action, the request must contain the four elements{"actionId":2,"configurations":
["name":"requestId", "value":"7"],{"name":"site_name", "value":"site1"},
{"name":"instance_names", "value":["/hr/public/simple1"]},
{"name":"instance_guids", "value":["AC7F041E430A8B913D13B1F47E652580"]}]

URL: Use PUT to invoke the action.

/em/websvcs/restful/extws/cloudservices:ssa/cfw/v2/serviceinstances/E8E4395513C2B72F01D91E6DB46D1701

Input:

{"actionId":2,"configurations":
["name":"requestId", "value":"7"],{"name":"site_name", "value":"site1"},
{"name":"instance_names", "value":["/hr/public/simple1"]}]

Output:

{"requests": ["id": "4","actionName": "DELETE","canonicalLink":}
11.3.2 Service Network Use Cases

The service network use cases are:

- Create Service Network
- Update Service Network
- Delete Service Network

11.3.2.1 Create Service Network

Description: Post IPoIB service network JSON data.

Method: POST

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/servicenetworks

Input:

```
{  
  "name": "/cloud/public/svcnet",
  "type": "IPoIB",
  "description": "svcnet",
  "foreign_partition": false,
  "num_provider_nodes": 1
}
```

Output/Response:

```
{
  "name": "/cloud/public/svcnet",
  "id": "/cloud/public/svcnet",
  "type": "ipoib",
  "description": "svcnet",
  "pkey": "0x1027",
  "pkeyFromPool": false,
  "infranet": false,
  "numProviderNodes": 1,
  "foreignPartition": false,
  "links": [
    {
      "rel": "canonical"
    }
  ]
}```
11.3.2.2 Update Service Network

Description: PUT the JSON data to the Service Network's URL. The name in the JSON data must be the same as the name in the PUT URL.

Method: PUT

URL:

Input:

{
  "name": "/cloud/public/svcnet",
  "id": "/cloud/public/svcnet",
  "type": "eoib",
  "description": "svcnet - updated",
  "pkey": "0x1028"
}

Output/Response:

{
  "name": "/cloud/public/svcnet",
  "id": "/cloud/public/svcnet",
  "type": "eoib",
  "pkey": "0x1028",
  "pkeyFromPool": false,
  "infranet": false,
  "foreignPartition": false,
  "links": [
    {
      "rel": "canonical"
    }
  ]
}

11.3.2.3 Delete Service Network

Description: Send a DELETE request to the Service Network's URL.

Method: DELETE

URL:

11.3.3 vEthernet Use Cases

The vEthernet use cases are:

- Create EoIB vEthernet
- Update EoIB vEthernet
- Delete EoIB vEthernet

11.3.3.1 Create EoIB vEthernet

Description: Post vEthernet JSON data.

Method: POST

URL:

Input:

{
"name": "/cloud/public/eoibveth",
"description": "test",
"svcnet": "/cloud/public/svcnet",
"type": "eoib",
"id": 101,
"switchports": {
"denp07sw-ib03": [
"0A-ETH-1"
],
"denp07sw-ib02": [
"0A-ETH-1"
]
}
}

Output/Response:

{
"name": "/cloud/public/eoibveth",
"id": "/cloud/public/eoibveth",
"type": "eoib",
"description": "test",
"account": "/cloud/default",
"svcnet": "/cloud/public/svcnet",
"switchports": [
"/""denp07sw-ib03"",
"/""denp07sw-ib02"
]
}
11.3.3.2 Update EoIB vEthernet

Description: PUT the JSON data to the vEthernet’ s URL. The ‘description’, ‘svcnet’, ‘id’, and ‘switchports’ are editable. The name in the JSON data must be the same as the name in the PUT URL.

Note:
You can see the difference from the json format of the POST request. In this case, the vlanId attribute is used instead of the id attribute in the POST request.

Method: PUT
URL:
Input:

```
{
  "name": "/cloud/public/eoibveth",
  "description": "test3",
  "svcnet": "/cloud/public/svcnet",
  "type": "eoib",
  "vlanId": 103,
  "switchports": [
    "denp07sw-ib02": ["0A-ETH-1"],
    "denp07sw-ib03": ["0A-ETH-1"]
  ]
}
```

Output/Response:

```
{
  "name": "/cloud/public/eoibveth",
  "id": "/cloud/public/eoibveth",
  "type": "eoib",
```
11.3.3.3 Delete EoIB vEthernet

Description: Send a DELETE request to the vEthernet’s URL.

Method: DELETE

URL:

Output/Response: Status 204 No Content

11.3.4 Subnet Use Cases

The subnet use cases are:

- Create EoIB Subnet
- Create IPoIB Subnet
- Update Subnet
- Delete Subnet

11.3.4.1 Create EoIB Subnet

Description: Post EoIB Subnet JSON data.

Method: POST

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/vnets
11.3.4.2 Create IPoIB Subnet

Description: Post IPoIB Subnet JSON data.

Creating an IPoIB Subnet in Global IP mode.

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/vnets

Input:

```
{
    "name": "/cloud/public/ipoibsubnet_ip",
    "vethernet": "/cloud/public/ipoibveth", //choose an IPoIB vEthernet
    "description": "/cloud/public/ipoibsubnet global ip mode",
    "global_ip_num": 10
}
```

Output/Response:

```
{
    "name": "/cloud/public/ipoibsubnet_ip",
    "id": "/cloud/public/ipoibsubnet_ip",
    "description": "/cloud/public/ipoibsubnet global ip mode",
    "account": "/cloud/default",
    "infranet": false,
    "vethernet": "/cloud/public/ipoibveth",
    "cidr": "192.168.96.112/28",
    "ipranges": []
}
```
Creating IPoIB Subnet in CIDR mode

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/vnets

Input

{
  "name": "/cloud/public/ipolbsubnet_cidr",
  "vethernet": "/cloud/public/ipolbveth", //choose an IPoIB vEthernet
  "description": "/cloud/public/ipolbsubnet CIDR mode",
  "cidr": "192.168.220.1/24",
  "ipranges": [
    "192.168.220.2",
    "192.168.220.20"
  ]
}

Output/Response:

{
  "name": "/cloud/public/ipolbsubnet_cidr",
  "id": "/cloud/public/ipolbsubnet_cidr",
  "description": "/cloud/public/ipolbsubnet CIDR mode",
  "account": "/cloud/default",
  "infranet": false,
  "vethernet": "/cloud/public/ipolbveth",
  "cidr": "192.168.220.1/24",
  "ipranges": [
    "192.168.220.2",
    "192.168.220.20"
  ],
  "ethIndex": -1,
  "links": [
    {
      "href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/vnets/cloud/public/ipolbsubnet_cidr",
      "rel": "canonical"
    }
  ]
}
11.3.4.3 Update Subnet

Description: PUT the JSON data to the Subnet’s URL. The description, `global_ip_num`, `cidr`, `gateway`, `ipranges`, and `vethernet` fields are editable. The name in the JSON data must be the same as the name in the PUT URL.

Method: PUT

URL:

Input:

```json
{
   "name": "/cloud/public/ipobsubnet_ip",
   "vethernet": "/cloud/public/ipoibveth", // choose an IPoIB vEthernet
   "description": "/cloud/public/ipobsubnet global ip mode - Updated",
   "global_ip_num": 15
}
```

Output/Response:

```json
{
   "name": "/cloud/public/ipobsubnet_ip",
   "id": "/cloud/public/ipobsubnet_ip",
   "description": "/cloud/public/ipobsubnet global ip mode - Updated",
   "account": "/cloud/default",
   "infranet": false,
   "vethernet": "/cloud/public/ipoibveth",
   "cidr": "192.168.96.128/27",
   "ipranges": [
      "192.168.96.129-192.168.96.158"
   ],
   "global_ip_num": 30,
   "ethIndex": -1,
   "links": [
      {
         "rel": "canonical"
      }
   ]
}
```

11.3.4.4 Delete Subnet

Description: Send a DELETE request to the Subnet URL.
Method: DELETE

URL:

Output/Response: Status 204 No Content

11.3.5 IP Reservation Use Cases

1. Create IP Reservation
   Description: Post IP reservation JSON data.
   Method: POST
   URL:
   https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/ sites/<site_id>/vnetreservations
   Input:

   
   
   "name": "/<tenant>/public/192_168_220_2",
   "ip": "192.168.220.2",
   "vnet": "/cloud/public/ipobsubnet_cidr" //choose a subnet

   
   Output/Response:

   
   
   
   "name": "/satheesh/public/192_168_220_2",
   "id": "/satheesh/public/192_168_220_2",
   "used": false,
   "quota": "/satheesh",
   "ip": "192.168.220.2",
   "vnet": "/cloud/public/ipobsubnet_cidr",
   "links": [
   
   "href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/vnetreservations/satheesh/public/192_168_220_2",
   "rel": "canonical"
   
   ]

2. Delete IP Reservation
   Description: Send a DELETE request to the IP Reservation URL.
   Method: DELETE
   URL:
11.3.6 Subnet Access Use Cases

1. Create Subnet Access
   Description: Post Subnet Access JSON data.
   Method: POST
   URL:
   https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/
sites/{SITE_ID}/vnetaccess/<tenant>/public/vnetaccess_cidr
   Input:
   
   ```json
   {
   "name": "/<tenant>/public/vnetaccess_cidr",
   "vnet": "/cloud/public/ipoibsubnet_cidr", //choose a subnet
   "provider": true
   }
   ```
   Output/Response:
   
   ```json
   {
   "name": "<tenant>",
   "id": "<tenant>",
   "provider": true,
   "vnet": "/cloud/public/ipoibsubnet_cidr",
   vnetaccess_cidr",
   "links": [
   {
   "href": "<tenant>",
   "rel": "canonical"
   }
   ]
   ```

2. Delete Subnet Access
   Description: Send a DELETE request to the Subnet Access URL.
   Method: DELETE
   URL:
   https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/
sites/{SITE_ID}/vnetreservations/<tenant>/public/192_168_220_2
   Output/Response: Status 204 No Content
11.3.7 Storage Volume Use Cases

1. Create Storage Volume
   Description: Post Storage Volume JSON data.
   Method: POST
   URL:
   https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/storagevolumes
   Input:
   {
   "name": "/<tenant>/public/storage/volume1",
   "description": "test volume",
   "size": "1G"
   }
   Output/Response:
   {
   "name": "/<tenant>/public/storage/volume1",
   "properties": ["/oracle/public/storage/default"],
   "id": "/<tenant>/public/storage/volume1",
   "size": 1073741824,
   "description": "test volume",
   "status": "Initializing",
   "imageListEntryVersion": -1,
   "bootable": false,
   "links": [?
   {"href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/<site_id>/storagevolumes/<tenant>/public/storage/volume1",
   "rel": "canonical"
   }
   ]

2. Delete Storage Volume
   Description: Send a DELETE request to the Storage Volume URL
   Method: DELETE
   URL:
   Output/Response: Status 204 No Content
11.3.8 Tenancy Use Cases

1. List Tenant

Description: This is a GET request that lists all the tenants for a particular site. The output is displayed in two formats:

- application/json: This lists all the tenants with all their attributes in a JSON format.
- application/discovery+json: This lists the names of all the tenants. This is to keep the EM REST services in line with Oracle Compute.

Method: GET

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/tenants

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/

Input: No input required for a REST GET request. Set the content type header of the request as application/json or application/discovery+json.

Output/Response: All the tenants for the Oracle Compute Site are returned in a json format.

```json
{
  "items": [
    {
      "name": "cloud",
      "id": "cloud",
      "description": "Cloud administration tenant",
      "externalReference": "https://10.242.84.131/tenant/cloud",
      "links": [
        {
          "href": "https://10.242.84.131/tenant/cloud",
          "rel": "canonical"
        }
      ]
    },
    {
      "name": "lrgemcloud_nimbula_14275824",
      "id": "lrgemcloud_nimbula_14275824",
      "description": "Edit a tenant",
      "email": "user_management@example.com",
      "externalReference": "https://10.242.84.131/tenant/lrgemcloud_nimbula_14275824",
      "links": [ ]
    }
  ]
}
```
2. Get a Tenant

Description: This is a GET request that returns a specific tenant listed in the URL.

Method: GET

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/tenants/{tenantName}

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- tenantName: Name of the tenant to be returned

Input: No input required for a REST GET request. Set the content type header of
the request as application/json.

Output/Response: Requested tenant will be returned in JSON format.
3. Create a Tenant

Description: This is a POST request to create a tenant with the given input in JSON format.

Method: POST

URL:

https://<hostname:port>/em/websvc/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/tenants/

- **hostname**: OMS host name
- **port**: OMS HTTPS port
- **SITE_ID**: The Site ID is returned when site resource is accessed using https://<hostname:port>/em/websvc/restful/extws/virtualization/infrastructure/v1/sites/
- **tenantName**: Name of the tenant to be returned

Input: JSON representation of the tenant object as EM REST service. Set the content type and accept header of the request as application/json.

```
{
    "name": "TestTenant",
    "description": "Cloud administration tenant",
    "password": "EXAlogic_123",
    "email": "test@oracle.com"
}
```

Output/Response: Created tenant will be returned in JSON format.

```
{
    "name": "TestTenant",
    "id": "TestTenant",
    "description": "Cloud administration tenant",
    "externalReference": "https://10.242.84.131/tenant/cloud",
    "links": [
        {
            "href": "/em/websvc/restful/extws/virtualization/infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/tenants/TestTenant/",
            "rel": "canonical"
        }
    ]
}
```
4. Update a Tenant

Description: This is a PUT request to update a tenant with the given input in the JSON format.

Method: PUT

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/tenants/tenantName

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- tenantName: Name of the tenant to be updated

Input: JSON representation of the tenant object as EM REST service. Set the content type and accept header of the request as application/json.

```json
{
  "name": "TestTenant",
  "description": "Cloud administration tenant",
  "password": "EXAlogic_123",
}
```

Output: Updated tenant will be returned in JSON format.

```json
      "rel": "canonical"  } ] }
```

11.3.9 User Use Cases

1. List User

Description: This is a GET request that lists all the users for a particular site. The output is displayed in two formats:

- application/json: This lists all the users with all their attributes in a JSON format.
- application/discovery+json: This lists the names of all the users. This is to keep the EM REST services in line with Oracle Compute.

Method: GET

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/users

- hostname: OMS host name
• port: OMS HTTPS port
• SITE_ID: The Site ID is returned when site resource is accessed using
  https://<hostname:port>/em/websvcs/restful/extws/virtualization/
  infrastructure/v1/sites/

Input: No input required for a REST GET request. Set the content type header of
the request as application/json or application/discovery+json.

Output/Response: All the users for the Oracle Compute Site are returned in a json
format.

```json
{
  "items": [
    {
      "id": "/user1/administrator",
      "username": "/user1/administrator",
      "groups": [
        "/user1/admin"
      ],
      "role": "/user1/admin",
      "email": "user1@oracle.com",
      "customer": "user1",
      "blackListed": false,
      "externalReference": "https://10.242.84.131/user/user1/administrator",
      "fullname": "Administrator",
      "links": [
        {
          "href": "/em/websvcs/restful/extws/virtualization/
                   infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/usersnull",
          "rel": "canonical"
        }
      ]
    },
    {
      "id": "/lrgemcloud_nimbula_14276642/administrator",
      "username": "/lrgemcloud_nimbula_14276642/administrator",
      "groups": [
        "/lrgemcloud_nimbula_14276642/admin"
      ],
      "role": "/lrgemcloud_nimbula_14276642/admin",
      "email": "user2@oracle.com",
      "customer": "lrgemcloud_nimbula_14276642",
      "blackListed": false,
      "externalReference": "https://10.242.84.131/user/lrgemcloud_nimbula_14276642/administrator",
      "fullname": "Administrator",
      "links": [
        {
          "href": "/em/websvcs/restful/extws/virtualization/
                   infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/usersnull",
          "rel": "canonical"
        }
      ]
    }
  ]
}
```
2. Get a User

Description: This is a GET request that returns a specific user listed in the URL.
Method: GET
URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/users/{userName}

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- userName: Name of the user to be returned

Input: No input required for a REST GET request. Set the content type header of the request as application/json.

Output/Response: Requested user will be returned in JSON format.

{
  
  "id": "/user2/administrator",
  "username": "/user2/administrator",
  "groups": [ 
    "/user2/admin"
  ],
  "role": "/user2/admin",
  "email": "userabc@oracle.com",
  "customer": "user2",
  "blackListed": false,
  "externalReference": "https://10.242.84.131/user/alokak/administrator",
  "fullname": "Administrator core",
  "links": [ 
    
    "href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/users/alokak/administrator",
    "rel": "canonical"
  ]
}

3. Create a User

Description: This is a POST request to create a user with the given input in JSON format.
Method: POST
URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/users/
- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- userName: Name of the user to be returned

Input: JSON representation of the user object as EM REST service. Set the content type and accept header of the request as application/json.

```json
{
  "username": "/user2/testuser",
  "customer": "user2",
  "blacklisted": false,
  "fullname": "Test User",
  "role": "/cloud/users",
  "password": "EXAlogic_123",
  "email": "tuser@oracle.com"
}
```

Output/Response: Created user will be returned in JSON format.

```json
{
  "id": "/user2/testuser",
  "username": "/user2/testuser",
  "groups": [
    "/user2/users"
  ],
  "role": "/user2/users",
  "email": "tuser@oracle.com",
  "customer": "user2",
  "blacklisted": false,
  "externalReference": "https://10.242.84.131/user/user2/testuser",
  "fullname": "Test User",
  "links": [
    {
      "href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/users/user2/testuser",
      "rel": "canonical"
    }
  ]
}
```

4. Update a User

Description: This is a PUT request to update a user with the given input in the JSON format.

Method: PUT
URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/users/userName
- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- userName: Name of the user to be updated

Input: JSON representation of the tenant object as EM REST service. Set the
content type and accept header of the request as application/json.

```json
{
  "username": "/user2/testuser",
  "customer": "user2",
  "blacklisted": false,
  "fullname": "Test User",
  "role": "/cloud/users",
  "password": "EXAlogic_123",
  "email": "tuser123@oracle.com"
}
```

Output/Response: Updated tenant will be returned in JSON format.

```json
{
  "id": "/user2/testuser",
  "username": "/user2/testuser",
  "groups": [ 
    "/user2/users"
  ],
  "role": "/user2/users",
  "email": "tuser123@oracle.com",
  "customer": "user2",
  "blackListed": false,
  "externalReference": "https://10.242.84.131/user/user2/testuser",
  "fullname": "Test User",
  "links": [ 
    {
      "href": "https://10.242.84.131/user/user2/testuser",
      "rel": "canonical"
    }
  ]
}
```

5. Delete a User

Description: This is a DELETE request to delete a specific user requested in the
URL.

Method: DELETE
## 11.3.10 Quota Use Cases

1. **List Quota**

   **Description:** This is a GET request that lists the quota allocated for a particular site. The output is displayed in two formats:

   - application/json: This lists all the quotas with all their attributes in a JSON format.
   - application/discovery+json: This lists the names of all the quotas. This is to keep the EM REST services in line with Oracle Compute.

   **Method:** GET

   **URL:**

   https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/quotas

   - hostname: OMS host name
   - port: OMS HTTPS port
   - SITE_ID: The Site ID is returned when site resource is accessed using https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/

   **Input:** No input required for a REST GET request. Set the content type header of the request as application/json or application/discovery+json.

   **Output/Response:** All the quotas for the Oracle Compute Site are returned in a json format.

   ```json
   {
     "items": [
       {
         "name": "/user3",
         "id": "/user3",
         "usage": {
           
         
       }
   
   
```
"vnet": {
  "vnetreservations": 0
},
"nat": {
  "ipreservations": 0
},
"compute": {
  "instances": 1,
  "instance_restrictions": [
    "{}"
  ],
  "ram": 2048,
  "cpus": 1
},
"machineimage": {
  "number": 0,
  "megabytes": 0
},
"nds": {
  "megabytes": 0
}
},
"description": "Edit a quota named quotal",
"allowance": {
  "vnet": {
    "vnetreservations": 10
  },
  "nat": {
    "ipreservations": 10
  },
  "compute": {
    "instances": 20,
    "instance_restrictions": [
      "{""os_license":"200""}"
    ],
    "ram": 20000,
    "cpus": 10
  },
  "machineimage": {
    "number": 12000,
    "megabytes": 8048
  },
  "nds": {
    "megabytes": 1160000
  }
},
"externalReference": "https://10.242.84.131/quota/user3",
"links": [
  {
    "href": "/em/websvc/restful/EXTWS/virtualization/infrastructure/v1/sites/2C9C90E1A5A5084C2BBA23BE5DC04D43/quotas/user3",
    "rel": "canonical"
  }
]
2. Get a Quota

Description: This is a GET request that returns a specific quota listed in the URL.

Method: GET

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/quotas/{quotaName}

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- quotaName: Name of the quota to be returned

Input: No input required for a REST GET request. Set the content type header of the request as application/json.

Output/Response: Requested quota will be returned in JSON format.

```json
{
   "name": "/user3",
   "id": "/user3",
   "usage": {
      "vnet": {
         "vnetreservations": 0
      },
      "nat": {
         "ipreservations": 0
      },
      "compute": {
         "instances": 1,
         "instance_restrictions": [
            "{}"
         ],
         "ram": 2048,
         "cpus": 1
      },
      "machineimage": {
         "number": 0,
         "megabytes": 0
      },
      "nds": {
         "megabytes": 0
      }
   }
}
```
3. Update Quota

Description: This is a PUT request to update the quota with the given input in the JSON format.

Method: PUT

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/quotas/quotaName

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- quotaName: Name of the quota to be updated
Input: JSON representation of the tenant object as EM REST service. Set the content type and accept header of the request as application/json.

```
{
   "name": "/test",
   "description": "Test Quota updated",
   "allowance": {
      "vnet": {
         "vnetreservations": 10
      },
      "nat": {
         "ipreservations": 10
      },
      "compute": {
         "instances": 20,
         "instance_restrictions": [
            "{"os_license":"200"}"
         ],
         "ram": 20000,
         "cpus": 10
      },
      "machineimage": {
         "number": 12000,
         "megabytes": 8048
      },
      "nds": {
         "megabytes": 1160000
      }
   }
}
```

Output/Response: Updated quota will be returned in JSON format.

```
{
   "name": "/test",
   "id": "/test",
   "usage": {
      "vnet": {
         "vnetreservations": 0
      },
      "nat": {
         "ipreservations": 0
      },
      "compute": {
         "instances": 1,
         "instance_restrictions": [
            "{}"
         ],
         "ram": 2048,
         "cpus": 1
      },
      "machineimage": {
         "number": 0,
         "megabytes": 0
      }
   }
}
```
4. Delete Quota

Description: This is a DELETE request to delete a specific quota requested in the URL.

Method: DELETE

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/quotas/quotaName

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using

11.3.11 Template Use Cases

1. List Templates

Description: This is a GET request that lists all the templates for a particular site. The output is displayed in two formats:

- application/json: This lists all the templates with all their attributes in a JSON format.
- application/discovery+json: This lists the names of all the templates. This is to keep the EM REST services in line with Oracle Compute.

Method: GET

URL:

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using

Input: No input required for a REST GET request. Set the content type header of the request as application/json or application/discovery+json.

Output/Response: All the quotas for the Oracle Compute Site are returned in a json format.

```json
{
    "totalResults": 5,
    "count": 5,
    "links": [
        {
            "href": "https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/93B97C5E7E352676A3284D80F23714BF/templates",
            "rel": "canonical"
        }
    ],
    "items": [
        {
            "id": "/oracle/public/oel_public",
            "name": "/oracle/public/oel_public",
            "links": [
                {
                }
            ]
        }
    ]
}
```
2. Get a Template

Description: This is a GET request that returns a specific template listed in the URL.

Method: GET

URL:

https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/templates/{templateName}

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using

- templateName: Name of the template to be returned

Input: No input required for a REST GET request. Set the content type header of the request as application/json.

Output/Response: Requested quota will be returned in JSON format.

```
{
  "id": "/oracle/public/oel_public",
  "name": "/oracle/public/oel_public",
  "links": [
    {
      "href": "/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/93B97C5E7E352676A3284D80F23714BF/templates/oracle/public/oel_public",
      "rel": "canonical"
    }
  ],
  "fileLocation": "https://10.242.84.131:444/machineimage/oracle/public/oel_public",
  "state": "available",
  "attributes": { "OS": "Linux_x86" },
  "sizes": {
    "uploadedSizeInBytes": 376848450,
    "totalSizeInBytes": 376848450,
    "decompressedSizeInBytes": 5905612288
  }
}
```

3. Delete a Template

Description: This is a DELETE request to delete a specific template requested in the URL.
Method: DELETE

URL:
https://<hostname:port>/em/websvcs/restful/extws/virtualization/infrastructure/v1/sites/{SITE_ID}/templates/templateName

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- templateName: Name of the template to be deleted.

Input: No input required for a REST DELETE request.

Output/Response: No Output for REST DELETE request. A response code of 206 (No Content) is returned.

4. Upload a Template

Description: This is a POST request to upload a template using software library with a given input in JSON format.

Method: POST

URL:

- hostname: OMS host name
- port: OMS HTTPS port
- SITE_ID: The Site ID is returned when site resource is accessed using
- templateName: Name of the template to be deleted.

Input: JSON representation of the tenant object as EM REST service. Set the content type and accept header of the request as application/json

```
{
  "name": "/oracle/public/test2",
  "sizes": { "total": 376848450 },
  "attributes": { "OS": "Linux_x86" }
}
```

Output/Response: A job is submitted and a job id is returned in JSON format.

```
{ "job_id": "1A57035ED0D819A1E053179AF40A4A85" }
```

To get the component urn (urn) field in the above json, make sure the software library components have been uploaded and run the REST API:
5. Register and Deregister a Site

The Oracle Compute site can be registered using POST method to "/sites/" namespace with a JSON represents the site information, then a job will be submitted to register the site.

For example:

{  
  "site_target_name":"Demo",
  "endpoint_url":"https://10.242.84.131",
  "agent_url":"https://<hostname:port>/emd/main/",
  "monitoring_cred_username":"/cloud/administrator",
  "monitoring_cred_password":"EXAlogic_123",
  "graphite_url":"https://10.242.84.131/graphite"
}

A job id will be returned such as "{ "job_id": "139600CD1BC11B59E053481DF50A6F62" }"

Add an image (Register Site)

The table below displays the JSON format used for registering the site.

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>site_target_name</td>
<td>The target name for the site.</td>
</tr>
<tr>
<td>endpoint_url</td>
<td>Nimbula site's URL.</td>
</tr>
<tr>
<td>agent_url</td>
<td>The url for the agent monitoring the target.</td>
</tr>
<tr>
<td>slave_agent_url</td>
<td>The failover monitoring agent to be used as the standby agent. You can specify a list of agents in a JSON array format as follows: [&quot;url1&quot;,&quot;url2&quot;].</td>
</tr>
<tr>
<td>monitoring_cred_username</td>
<td>The monitoring credentials user name for the Oracle Compute site.</td>
</tr>
<tr>
<td>monitoring_cred_password</td>
<td>The monitoring credentials password for the Oracle Compute site.</td>
</tr>
<tr>
<td>graphite_url</td>
<td>The graphite URL.</td>
</tr>
<tr>
<td>graphite_username</td>
<td>The graphite credentials user name.</td>
</tr>
<tr>
<td>graphite_password</td>
<td>The graphite credentials password.</td>
</tr>
<tr>
<td>graphite_site_prefix</td>
<td>The graphite prefix string.</td>
</tr>
<tr>
<td>snmp_cred_type</td>
<td>The SNMP credentials type. The available values are V1, V2, and V3.</td>
</tr>
<tr>
<td>snmp_community_string</td>
<td>The SNMP community string available when snmp_cred_type is V1 or V2.</td>
</tr>
<tr>
<td>snmp_username</td>
<td>The user name for the SNMP credentials available when the snmp_cred_type is V3.</td>
</tr>
</tbody>
</table>
Table 11-7  (Cont.) JSON format used for registering the site

<table>
<thead>
<tr>
<th>Property</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>snmp_authpassword</td>
<td>The SNMP authorization password available when the snmp_cred_type is V3.</td>
</tr>
<tr>
<td>snmp_authprotocol</td>
<td>The SNMP authorization protocol (MD5 or SHA) available when the snmp_cred_type is V3.</td>
</tr>
<tr>
<td>snmp_privpassword</td>
<td>The SNMP privacy password available when the snmp_cred_type is V3.</td>
</tr>
</tbody>
</table>

The Oracle Compute Site can be de-registered using the Delete option. A job will be submitted to de-register the site. For example: ```{ "job_id": "10D4FDE1874E201BE053461DF50A5760" }``` A job id will be returned.

Part V
Direct Monitoring

This section describes how to discover and monitor a Xen based hypervisor and the associated virtual targets.

It contains the following chapters:

• Direct Monitoring of Xen Based Systems
Direct Monitoring of Xen Based Systems

This chapter describes the procedures to discover and monitor Xen based systems. It contains the following sections:

- Direct Monitoring Overview
- Discovering the Hypervisor Target
- Viewing the Oracle Server Home Page
- Viewing the Oracle Virtual Platform Home Page
- Viewing the Oracle VM Instance Home Page

12.1 Direct Monitoring Overview

You can directly monitor a Xen based Hypervisor, the bare metal machine, its operating system, and the virtual machines without relying on their monitoring software. Monitoring these targets involves the following:

- Direct Monitoring of the Oracle Virtual Server (Guest OS or DomU running on the Hypervisor) target based on Xen 4.1.2 or later.
- Direct monitoring of Oracle Server (Physical Server)
- Direct monitoring of the Oracle Virtual Server (Xen based Hypervisor).
- Direct Monitoring of the Oracle Virtual Platform or the host operating system of the hypervisor machine.

Note:

To enable direct monitoring of Xen based Hypervisors, the Oracle Virtual Infrastructure 12.1.0.2 plugin must be deployed on the Management Server. This plugin is automatically deployed on the Management Agent when the Hypervisor is registered.

The following figure shows the high level architecture.
Figure 12-1  Direct Monitoring Architecture

12.2 Discovering the Hypervisor Target

Prerequisites:

- To discover a Hypervisor target, the administrator must have the following privileges:
  - Add Any Target
  - Create Job
  - Operator privilege on the Management Agent that is monitoring the Hypervisor target.

To discover the Hypervisor by following these steps:

1. Log in to Enterprise Manager as a user with the above privileges.
2. From the Setup menu, select Add Targets, then select Add Targets Manually.
3. In the Add Targets Manually page, select Add Targets Using Guided Process (Also Related Targets) and select Oracle Virtual Platform from the Target Types drop down list.
5. In the Default Monitoring Agent and Credentials region, enter the following details:

**Note:**

The credentials specified in this region will be applied to all Oracle Virtual Platform targets discovered through this process by default. You can choose to override these credentials for a specific Oracle Virtual Platform target.

- **Monitoring Agent**: Click **Search** icon and select the Linux based default monitoring agent to monitor the targets.
- **Failover Monitoring Agent**: Click **Search** icon and select the failover, Linux based monitoring agent to monitor the targets.

**Note:**

To ensure that Hypervisors and the associated targets can be monitored smoothly in a large scale environment, you must use the following recommendation for the Java Heap Size.

- If the Total Number of Targets (includes Oracle Virtual Platform, Oracle Server, and Oracle Virtual Server targets) is less than or equal to 300, the Java Heap Size for the Management Agent must be set to 128 MB.
- If you add another 300 targets, you must increase the Java Heap Size by an additional 128 MB.

- **Privileged User**: This field is used to provide the user with access to certain privileged commands. The access is available either by a root user or through the Privilege Delegation options provided here.
Yes: If you select Yes, you must be a user who can execute the following xl / xm commands that require root access privileges:

`/usr/sbin/xl list*/usr/sbin/xl info*/usr/sbin/xl network-list*`,
`/usr/sbin/xl uptime*/usr/sbin/xl vcpu-list*/usr/sbin/dmidecode`,
`/usr/sbin/xentop,/usr/bin/xenstore-read,/usr/bin/xenstore-list`,
`/usr/bin/xenstore-ls./sbin/ethtool`

These commands allow you to collect virtualization metrics when they are executed. If the xl command is not present on the system, the following commands will be used:

`/usr/sbin/xm list*/usr/sbin/xm info*/usr/sbin/xm network-list*`,
`/usr/sbin/xm uptime*/usr/sbin/xm vcpu-list*/usr/sbin/dmidecode`,
`/usr/sbin/xentop,/usr/bin/xenstore-read,/usr/bin/xenstore-list`,
`/usr/bin/xenstore-ls./sbin/ethtool`

No: If you select No, you cannot execute the xl / xm commands, and virtualization and configuration metrics for the Oracle Virtual Platform target are not collected.

- **Credential Type:** Specify the credentials for the target being discovered. You can select Host Credentials or SSH Key Credentials. Depending on your choice, you must enter the credential properties as described in Setting the Credential Properties.

6. Click Add in the Host Name and IP Address region. In the Add Host/IP Address window, enter one or more host names, IP addresses or IP address ranges and click Add. Multiple host names, IP addresses or the ranges must be separated by a new line. The host names that you have added will appear in the Discover Oracle Virtual Platforms page.

7. You can choose to use the default agent and credentials or click Override to override them. You can also override the Failover Monitoring Agent credentials. In the Override Monitoring Agent and Credentials window, enter the monitoring agent and credential properties and click Override. This will override the monitoring credentials. The new agent and credentials you specify will be applied.

8. Optionally, you can also specify the Global Target Properties. The Enterprise Manager Target Properties allows you to store descriptive target information, such as Contact or Location, which can then be used in dynamic/administration group definition, reports, incident rules and notifications. The Global Target Credentials region allows you to specify the values for the target properties that are applied to all the targets discovered using this process.

9. Click Submit. The registration information is validated and a job is submitted. On completion of the job, the following targets are discovered from a host that is running a Xen based hypervisor.

- **Oracle Server:** The bare metal box running the hypervisor.
- **Oracle Virtual Platform:** The host operating system that represents the hypervisor process.
- **Oracle Virtual Server:** The virtual machines managed by the hypervisor domain.
12.2.1 Deleting the Targets

To delete the targets that have been discovered, you must first delete the Oracle Virtual Platform target. When this target is deleted, all associated Oracle Virtual Server and Oracle Server targets are deleted.

To delete the target, follow these steps:

1. From the Targets menu, select All Targets to navigate to the All Targets page.
2. In the left panel of the All Targets page, select Oracle Virtual Platform under Servers, Storage, and Network target type. The list of Oracle Virtual Platform targets available is displayed.
3. Click on one of the targets to navigate to the Oracle Virtual Platform Home page. From the Oracle Virtual Platform menu, select Target Setup, then select Remove Target. A confirmation message is displayed. Click Yes to delete the Oracle Virtual Platform target and the associated targets.

12.2.2 Setting the Credential Properties

You can specify the credentials for the Virtual Platform target being discovered. You can select the credential type as Host Credentials or SSH Key Credentials. Each of these credentials can be clubbed with the Sudo or PowerBroker privilege delegation option.

Figure 12-3  Discover Oracle Virtual Platform: Setting the Credentials

Host Credentials

If you have selected Host Credentials, you must specify the credential properties shown below:
• **User Name**: The user name required to access the target.

• **Password**: The password required to access the target.

• **Run Privilege**: This can be:
  
  – **None**: Run privileges are not required. This option is used when the user is root and the Privileged User option is set to Yes.
  
  – **Sudo**: If you select Sudo, you must specify the following:
    
    * **Sudo Command**: Sudo allows a permitted user to execute a command as the super user or another user as specified in the sudoers file. Enter the command in the format `/usr/bin/sudo -S -u %RUN_AS% %COMMAND%` where `/usr/bin/sudo` is the path to the sudo executable, `RUN_AS` is the name of the user who is executing the command and `COMMAND` represents that Sudo command being executed.
    
    * **Run As**: Specify root to run this command as a root user.
    
    * **Enable Pseudo Terminal**: Select the checkbox if the sudo command requires the user to log in to a real terminal (tty). If this flag is set, the sudo user must log into the machine via a separate terminal.

  – **PowerBroker**: If you select PowerBroker, you must specify the following:
    
    * **PowerBroker Command**: Enter the command in the format `/usr/bin/pbrun -l -u %RUN_AS% %COMMAND%` where `/usr/bin/pbrun` is the path to the PowerBroker executable, `RUN_AS` is the name of the user running the command, and `COMMAND` represents the PowerBroker command being executed.
    
    * **Password Prompt**: The prompt that is to be displayed when the password is specified.
    
    * **Run As**: Specify root to run this command as a root user.
    
    * **Profile**: Specify the user profile to be used to run this command.

**SSH Key Credentials**

If you select SSH Key Credentials, you must specify the user name, private and public key, passphrase (for further encryption), and the run privilege.

If you select Sudo or PowerBroker in the Run Privilege field, enter the additional details as listed in the Host Credentials section.

### 12.3 Viewing the Oracle Server Home Page

To view the Oracle Server Home page, follow these steps:

1. From the Targets menu, select All Targets to navigate to the All Targets page.

2. In the left panel of the All Targets page, select Oracle Server under Servers, Storage, and Network target type. The list of Oracle Server targets available is displayed.

3. Click on one of the targets to navigate to the Oracle Server Home page.
Figure 12-4  Oracle Server Home Page

This page contains the following regions:

- **General**: This region provides general details such as the Oracle Virtual Platform target, name of the target, CPU sockets, CPU cores, total memory, and local disk space.
- **Availability**: The chart in this region shows the status of the target over the last 24 hours.
- **Overview of Incidents and Problems**: This region shows any incidents or problems associated with the Oracle Server target.

## 12.4 Viewing the Oracle Virtual Platform Home Page

To view the Oracle Virtual Platform Home page, follow these steps:

1. From the **Targets** menu, select **All Targets** to navigate to the All Targets page.
2. In the left panel of the All Targets page, select **Oracle Virtual Platform** under Servers, Storage, and Network target type. The list of Oracle Virtual Platform targets available is displayed.
3. Click on one of the targets to navigate to the Oracle Virtual Platform Home page.
Figure 12-5 Oracle Virtual Platform Home Page

This page contains the following regions:

- **General:** This region shows general details such as the Oracle Server target, platform version, name of the target, VCPUs allocated to Dom0 and total VCPUs allocated to the Oracle Virtual Server targets. It also indicates if this is a Privileged User. Virtualization metrics are collected only for privileged users.

- **Members:** This region listed the virtual servers that belong to this virtual platform, their status, and the memory allocated to each virtual server. Host names corresponding to the Oracle Virtual Server target are also displayed if the Management Agent is present on the virtual server. By default, this column is not visible. You can select this column using the View drop down menu.

- **Network Activity:** This region shows the total throughput (MB per second) over the last 24 hours.

- **Overview of Incidents and Problems:** This region shows any incidents or problems associated with the Oracle Server target.

- **Charts:** The CPU utilization, Memory Utilization, Network, and Disk Activity charts show the activity over the last 24 hours. It shows the CPU and memory usage trending.

- **Availability:** The chart in this region shows the status of the target over the last 24 hours.

### 12.5 Viewing the Oracle VM Instance Home Page

To view the Oracle VM Instance Home page, follow these steps:

1. From the **Targets** menu, select **All Targets** to navigate to the All Targets page.
2. In the left panel of the All Targets page, select Oracle VM Instance under Servers, Storage, and Network target type. The list of Oracle VM Instance targets available is displayed.

3. Click on one of the targets to navigate to the Oracle VM Instance Home page.

Figure 12-6  Oracle VM Instance Home Page

This page contains the following regions:

- **General**: This region provides general details such as the Oracle Server and Oracle Virtual Platform targets, name of the target, and allocated memory.

- **Availability**: The chart in this region shows the status of the target over the last 24 hours.

- **Overview of Incidents and Problems**: This region shows any incidents or problems associated with the Oracle Server target.

- **Charts**: The CPU utilization, Memory Utilization, Network, and Disk Activity charts show the activity over the last 24 hours.
Part VI

Setting Up and Using Platform as a Service

This section describes the steps required to enable Platform as a Service, which encompasses the Database as a Service (DBaaS) and Middleware as a Service (MWaaS) Cloud models.

It contains the following chapters:

- Setting Up the PaaS Infrastructure
- Enabling the DBaaS Cloud
- Setting Up an MWaaS Cloud
This chapter covers the common operations that need to be performed to enable Platform as a Service (PaaS), which encompasses different service families such as Database as a Service (DBaaS) using Oracle Single Instance, and RAC or Middleware as a Service (MWaaS) using WebLogic Server, SOA Infrastructure, and Oracle Service Bus.

The PaaS model allows users to create platforms onto which consumers can deploy their own applications. A platform resource is typically comprised of a host, operating system, and application server, and may be virtualized. The platform may also include a database and even multiple hosts in a cluster. This chapter contains the following sections:

- About Service Families
- Common Setup Tasks

### 13.1 About Service Families

A service family can be classified as a group of services that provide a solution for a specific domain. For example, a Database Service provides RDBMS solutions and a WebLogic service provides the Java solutions for J2EE based application development and hosting.

Each service family can contain one or more service types. A service type provides a specialized service within a service family. For example, a database service can contain service types such as database service, schema service, or pluggable database service. A middleware service type can contain WebLogic service, OSB service, or SOA service. Each service type has certain fixed attributes, actions, configurations, metrics, and other properties.

A service instance is a cloud resource that is requested and managed by the self service user. For example, single instance database service instance, WebLogic service instance, and so on.

### 13.2 Common Setup Tasks

This section helps you get started by providing an overview of the common steps that must be performed before you set up a service family.

**Table 13-1  Setting Up the Service Family**

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>

<td>Configure the Software Library. See Setting Up the Software Library section for details.</td>
<td>Cloud Administrator</td>
</tr>
<tr>
<td>2</td>
<td>Deploy the necessary plug-ins. See Deploying the Required Plug-ins</td>
<td>Cloud Administrator</td>
</tr>
</tbody>
</table>

13.2.1 Adding Hosts

Oracle Management Agent (Management Agent) is one of the core components of Enterprise Manager Cloud Control. It works in conjunction with the plug-ins to monitor the targets running on a managed host. You must install Oracle Management Agents on your unmanaged hosts to monitor them in Enterprise Manager. See http://docs.oracle.com/cd/E24628_01/install.121/e22624/install_agent.htm#EMBSC187 for details.

13.2.2 Creating the Resource Providers

A resource provider is a target that represents the type of resources required to provision a service instance of a specific service type. A PaaS Infrastructure zone is a resource provider which contains one or more hosts. A Software Pool is another resource provider that can contain resources such as Oracle Home targets, Oracle database targets, and so on. Resource providers such as the Database Pool or Middleware Pool are dependent on the PaaS Infrastructure Zone.

Resources can be grouped under a resource provider for easier administration and management. Resource providers allow administrators to enforce policies for service provisioning and capacity planning.

To create a resource provider, follow these steps:

1. Login as a user with the appropriate role. To create a PaaS Infrastructure Zone, you must login as a user with the EM_CLOUD_ADMINISTRATOR role. To create all other resource providers such as database pools, schema pools, and so on, you must login as a user with the EM_SSA_ADMINISTRATOR role.

2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.

3. From the Oracle Cloud menu, select Resource Providers, then click Create. The Create Resource Provider window appears.

4. Select the type of resource provider you want to create. This can be:
   - PaaS Infrastructure Zone. See Creating a PaaS Infrastructure Zone.
5. Click **Create** and follow the steps in the wizard to create the selected resource provider.

### 13.2.2.1 Creating a PaaS Infrastructure Zone

A PaaS Infrastructure Zone can contain a group of hosts. Each zone can contain homogeneous resources of only one type. Each resource in a zone represents a location at which a service instance is to be deployed.

The first step in building a PaaS cloud is to create at least one PaaS Infrastructure Zone, which is done by selecting one more Enterprise Manager host targets and identifying the SSA enabled roles that users will need to in order to request resources in this zone.

#### Prerequisites

Before you create a PaaS Infrastructure Zone, you must ensure that the following prerequisites are met:

- The **EM_CLOUD_ADMINISTRATOR**, **EM_SSA_ADMINISTRATOR**, and **EM_SSA_USER** roles must have been created. See [Defining Roles and Assigning Users](#) for details.
• **Note:**

If you are using an OMS Shared System location in the Software Library, the credentials owner must grant privileges to the **CLOUD_ENGINE_USER**. Since the **CLOUD_ENGINE_USER** is a hidden user account, the owner of the named credential cannot grant **View** privileges from the Enterprise Manager Console. To address this issue, (especially on a Windows host where OMS Agent Filesystem is the recommended approach for setting up Software Library) you need to run the following EMCLI commands:

```bash
emcli login -username=<username> -password =<password>
emcli grant_privs -name=CLOUD_ENGINE_USER -
privileges="GET_CREDENTIAL;
CREC_NAME=<namedcred>:CRED_OWNER=<loginusername>"
```

• You must log in as a user with **EM_CLOUD_ADMINISTRATOR** privileges to create a PaaS Infrastructure Zone.

To create a PaaS Infrastructure Zone, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.
2. From the **Cloud Home** menu, select **Resource Providers**, then select **Create**. In the Create Resource Provider window, select **PaaS Infrastructure Zone**, then click **Create**. The Create PaaS Infrastructure Zone: General page appears.

**Figure 13-2   Create PaaS Infrastructure Zone: General**

3. Enter the target name, name, and description for the zone. Click **Next**.
4. Click **Add** to add one or more host members to the zone. The hosts that you select cannot be present in more than one PaaS Infrastructure Zone. Click **Next**.
5. In the Create PaaS Infrastructure Zone: Credentials page, specify the host credentials that are to be used for provisioning all targets in this zone. The credentials provided should be of global credential type (valid across the members in the zone) and owned by the current user. Click **Next**.

• **Note:**

To create new named credentials, from the **Setup** menu, select **Security**, then select **Named Credentials**. You can create user or password named credentials here. Other types of credentials such as SSH must be created from the **Security** menu and can be used here.
6. Specify appropriate values for the placement policy constraints based on the resources available to the host members. The placement policy constraints are used to set maximum ceilings for any host in the zone. Placement policy values are used during deployment to filter out hosts that are overburdened. You can define the following placement policy constraints for each host:

- Maximum CPU Utilization: The average CPU utilization percentage for the past 7 days.
- Maximum Memory Allocation: The average memory allocation for the past 7 days.

Hosts exceeding these thresholds will not be considered for provisioning operations.

7. Click Next. In the Create PaaS Infrastructure Zone: Characteristics page, specify the target properties such as cost center, lifecycle status, location, and so on.

8. Click Next. The Create PaaS Infrastructure Zone: Roles page appears. A PaaS Infrastructure Zone can be made available to a restricted set of self service users with the EM_SSA_USER role. Click Add to add and select the roles that can access this PaaS Infrastructure Zone.

9. Click Next. The Create PaaS Infrastructure Zone: Review page appears. Review the details of the zone being created and click Submit to create the zone. You will return to the Database and Cloud Home page.

You can use EMCLI commands (see Creating a PaaS Zone) or REST APIs (see Creating a PaaS Zone) to create a PaaS Infrastructure Zone.

13.2.2.1.1 Editing a PaaS Infrastructure Zone

To edit a PaaS Infrastructure Zone, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.

3. Select a PaaS Infrastructure Zone from the list and click Edit.

If you do not have access to or own the Named Credentials that have been defined for the PaaS Infrastructure Zone, you must specify new credentials.

4. Follow the steps in the wizard to edit the necessary parameters and click Submit to accept the changes.
13.2.2.1.2 Deleting a PaaS Infrastructure Zone

To delete a PaaS Infrastructure Zone, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. Select a PaaS Infrastructure Zone from the list and click Delete.
4. A confirmation message is displayed. Click Delete PaaS Infrastructure Zone to delete the zone.

13.2.2.2 Creating a PaaS Pool

The second step in building a PaaS cloud is to create software pools (for example, database or middleware Oracle Homes that exist on hosts within the PaaS Infrastructure Zone, or database instances for schema as a service). The figure below shows an example of a PaaS pool.
Figure 13-3  PaaS Pool

A PaaS pool must be a homogeneous collection of Oracle Homes of the same platform, type, and version. For example, Solaris 10 Oracle Database single instance version 10.2.0.5 or Oracle Enterprise Linux 5 x86-64 WebLogic Server version 10.3.6. You can create a Database Pool or a Middleware Pool.

- To create a Database Pool, see Creating a Database Pool.
- To create a Middleware Pool, see Creating a Middleware Pool.

13.2.2.2.1 Creating a Database Pool

A Database Pool contains a set of resources that can be used to provision a database instance within a PaaS Infrastructure Zone. A database pool is a collection of homogenous targets such as servers or clusters with database software installed. For more details, see Creating a PaaS Pool.
Depending on the type of database service you are setting up, you can do one of the following:

- Creating a Database Pool for Database as a Service
- Creating a Database Pool for Schema as a Service
- Creating a Database Pool for PDB as a Service

13.2.2.2 Creating a Middleware Pool

A Middleware Pool contains a set of resources that can be used to provision a service instance within a PaaS Infrastructure Zone. For more details on creating the middleware pool, see Creating a Middleware Pool.

13.2.3 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. To configure request settings, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Request Settings.

Figure 13-4    Configuring Request Settings

3. You can specify the following settings:
   - **Future Reservation**: How far in advance can a request be made.
   - **Request Archive Retention**: Period for which archived requests are stored before they are automatically deleted by the system.
   - **Request Duration**: Maximum duration for which requests can be made.
   - **Service Instance Share Settings**: You can choose to share the service instance with other users or roles by selecting either of the following checkboxes.
     - Enable SSA User to share service instances with other Users
Enable SSA User to share service instances with Roles

**Note:** By default, service instances are not shared with users or roles.

4. Click **Apply**.

Request settings can be defined for all services or a specific service family, service type or role. The most restrictive value of request settings is taken from all matched values. "No Restriction" on a level means the setting is not applied at this level and will not be considered in evaluating final value. For example, if a user requests a schema service and the Request Duration settings are as follows: All Services 30 Days, Database family 10 days, Schema service type (Global) 5 days, and Schema service type (SSAUser1 Role) 3 days. Then the most restrictive setting, 3 days from the Schema service type (SSAUser1 Role) setting, will be applied.

Share Service Instance Settings are taken from the highest enabled level. For example, if sharing is enabled for All Services, then sharing is allowed for all users regardless of any lower level settings. To turn off sharing for the Middleware family, you must first disable sharing at the All Services level, then disable sharing for the Middleware family and enable sharing for the other families. Any modified settings must be saved before making another selection. Any changes not yet applied will be discarded.

### 13.2.4 Setting Up Quotas

Quota is the aggregate amount of resources that can be granted to each self service user belonging to a certain role. This quota applies databases provisioned through the Database Cloud Self Service Portal or databases provisioned through REST APIs. To set up quotas, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Cloud** menu, select **Cloud Home**. The Cloud Home page is displayed. From the **Oracle Cloud** menu, click **Setup** and then select **Quotas**.

3. Click the **Databases** link on the left hand side. The quota definition page appears. Click **Create**.

   **Note:**

   Quota validation ensures that a request is executed only if the user’s current usage is within the limits specified for the roles to which the user belongs. Only the direct roles are considered for the quota determination, and not nested ones.

4. In the Create New Quota window, select the Role Name for which the quota is to be granted. Only roles that have the **EM_SSA_USER** privileges are displayed in the Select Roles dialog box. After you have selected the role, enter the following details:

   - **Memory**: Total allocated memory that can be assigned for all the databases owned by a specific user. This should be the total memory used by all:
     - Databases
     - Schemas requested
     - Pluggable Databases
• Storage: Total allocated storage that can be assigned for all the databases owned by a user. This should be total storage used by all:
  – Databases
  – Schemas requested
  – Pluggable Databases

  **Note:**
  Storage used for backups is not included here.

• Number of Database Requests: The number of databases that can be requested by a user at any point in time. The standby databases created as part of database requests will not be included in this quota. But the storage and memory values for the standby databases will be added to the total allocated storage and memory.

• Number of Schema Service Requests: The number of database services that can be requested by the user.

• Number of Pluggable Database Service Requests: The number of PDBs that can be requested by the user.

For example, if a user has 3 roles with quota setup for each role as shown in the table below:

<table>
<thead>
<tr>
<th>Role Name</th>
<th>Attribute</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Dev Role</td>
<td>Memory</td>
<td>30 GB</td>
</tr>
<tr>
<td>N/A</td>
<td>Storage</td>
<td>40 GB</td>
</tr>
<tr>
<td>N/A</td>
<td>DB Requests</td>
<td>10</td>
</tr>
<tr>
<td>N/A</td>
<td>Schema Requests</td>
<td>2</td>
</tr>
<tr>
<td>N/A</td>
<td>PDB Requests</td>
<td>3</td>
</tr>
<tr>
<td>Test Role</td>
<td>Memory</td>
<td>40 GB</td>
</tr>
<tr>
<td>N/A</td>
<td>Storage</td>
<td>60 GB</td>
</tr>
<tr>
<td>N/A</td>
<td>DB Requests</td>
<td>12</td>
</tr>
<tr>
<td>N/A</td>
<td>Schema Requests</td>
<td>3</td>
</tr>
<tr>
<td>N/A</td>
<td>PDB Requests</td>
<td>5</td>
</tr>
<tr>
<td>PM Role</td>
<td>Memory</td>
<td>Quota not set</td>
</tr>
<tr>
<td>N/A</td>
<td>Storage</td>
<td>Quota not set</td>
</tr>
<tr>
<td>N/A</td>
<td>DB Requests</td>
<td>Quota not set</td>
</tr>
<tr>
<td>N/A</td>
<td>Schema Requests</td>
<td>Quota not set</td>
</tr>
<tr>
<td>N/A</td>
<td>PDB Requests</td>
<td>Quota not set</td>
</tr>
</tbody>
</table>

The quota limits for each of the attributes would be determined based on all the roles to which a user directly belongs. The quota is calculated as the absolute maximum across the roles for each attribute value. For the user who belongs to the Dev, Test, and PM Role, the Quota is calculated as:

\[
\text{Value for Memory} = \text{MAX} (\text{Dev, Test, PM}) = \text{MAX} (2, 5, \text{NA}) = 5 \text{ GB}
\]
Value for Storage = MAX (Dev, Test, PM) = MAX (15, 10, NA) = 15 GB

Value for DB Requests = MAX (Dev, Test, PM) = MAX (10, 12, NA) = 12

Databases

Value for Schema Requests = MAX (Dev, Test, PM) = MAX (2, 3, NA) = 5

Database Services

Value for PDB Requests = MAX (Dev, Test, PM) = MAX (3, 5, NA) = 8 PDB

Services

A sample quota validation log generated by the user request follows:

Quota validation:

==================================================================
Quota Details
==================================================================
Total resources available
Memory: 15
Storage: 20
Number of Database Instances: 5
Number of Schema Services: 5
Number of Pluggable Databases: 10

==================================================================
Current Usage
==================================================================
Memory: 0.0
Storage: 0.0
Number of Database Instances: 0.0
Number of Database Services: 0.0

==================================================================
Requested Resource
==================================================================
Memory: 0.681640625
Number Of Databases: 1
Storage: 0.681640625

Enabling the DBaaS Cloud

This chapter covers the initial configuration required to enable a DBaaS Cloud. It contains the following sections:

- Getting Started
- Setting Up Credentials for Provisioning
- Provisioning Database Software for Database as a Service
- Provision the Database for Schema as a Service
- Provision a Container Database for PDB as a Service
- Configuring the Oracle Listener

14.1 Getting Started

This section helps you get started by providing a list of steps that must be performed to get started in setting up a private database cloud. Before you set up the database cloud, you must have completed the common setup tasks described in Common Setup Tasks.

Table 14-1  Getting Started with DBaaS

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Configure Privilege Delegation Settings on your managed hosts. See Configuring Privilege Delegation Settings</td>
<td>Super Administrator</td>
</tr>
<tr>
<td>2</td>
<td>Set up provisioning credentials. See Setting Up Credentials for Provisioning</td>
<td>Self Service Administrator</td>
</tr>
</tbody>
</table>
| 3    | • Setting up Database as a Service, you must provision the database software or create Oracle Homes. See Provisioning Database Software for Database as a Service.  

• Setting up Schema as a Service, you must provision the database. See Provision the Database for Schema as a Service.  

• Setting up Pluggable Database as a Service, you must create a container database (CDB) with one or more pluggable databases (PDBs). See Provision a Container Database for PDB as a Service. | Self Service Administrator |
| 4    | Configure the Listener. See Configuring the Oracle Listener.       | Self Service Administrator |
| 5    | If you are using the Snap Clone profile, you must register the storage servers. See Registering and Managing Storage Servers. | Self Service Administrator |
14.2 Setting Up Credentials for Provisioning

Before you perform any operations on the Managed Servers or databases, you must define the credentials that will be used by Enterprise Manager to connect to the targets.

You need to set up the following types of credentials:

- Normal credentials are the host operating system credentials used to provision the database software and create databases. For example, `oracle/<login password>`. These credentials are saved when the Database Pool is created and are used when the `EM_SSA_USER` requests a database or a schema.

- Privileged credentials are the host operating system credentials used to perform privileged actions like executing root scripts. These credentials are used deploying software (for running root.sh during deployment), for mounting and unmounting storage volumes (for databases created with snapshots) and so on. These credentials are saved along with the Database Pool if the pool is used for creating databases using snapshots.

- Database SYSDBA credentials are used and saved for schema as a service database pool. These credentials are required only for schema as a service.

**Note:**

It is recommended that the same OS user who owns the Oracle Home on the host, creates the database.

To create named credentials, follow these steps:

1. Log in to Enterprise Manager as an administrator with the `EM_SSA_ADMINISTRATOR` role.
2. From the Setup menu, select Security, then select Named Credentials.
3. Click Create in the Named Credentials page.
4. Enter the Credential Name and Credential Description. Set the Authenticating Target Type field to Host and Scope field to Global. Enter the user name and password in the Credential Properties section. If you need to set privileged credentials, select Sudo or PowerBroker in the Run Privilege field and enter values in the Run As and Profile fields.
5. Click Test and Save.
6. Verify these credentials against a host target and click OK.

14.3 Provisioning Database Software for Database as a Service

Before you can enable database as a service, the database software must already be provisioned on all hosts. Database software can be provisioned by an administrator with the `EM_SSA_ADMINISTRATOR` role in the following ways:
• **Provisioning Profile**
  – Capture a gold image of an existing database using a Provisioning Profile. See the Enterprise Manager Lifecycle Management Administrator's Guide for details.
  – Use the Provisioning Profile to provision the Clusterware/ASM or Grid Infrastructure (for Real Application Cluster databases), and Database Oracle Home. This method ensures that the necessary database plug-in (monitoring part of the database plug-in) is deployed onto the Management Agent as part of the database provisioning Oracle Home installation.

  To create a provisioning profile, from the Enterprise menu, select Provisioning and Patching, then select Database Provisioning and select the database provisioning deployment procedure to be used. You can select either Provision Oracle Database or Provisioning Oracle RAC Database deployment procedure.

  **Note:** Do not create a new database as part of this deployment procedure.

• **Using the Database Installer**
  – From the Setup menu, select Extensibility, then select Plug-ins, and deploy the complete SSA (Enterprise Manager for Oracle Cloud) plug-in on all the Management Agents in a PaaS Infrastructure Zone.
  – Run the Clusterware/ASM or Grid Infrastructure installer to set up the cluster and ASM (for RAC databases).
  – Run the Database Installer and ensure you select the Install Database Software Only option on all hosts.
  – Discover the cluster. From the Setup menu, select Add Target, then Add Targets Manually, and then select Add Non-Host Targets Using Guided Process (Also Adds Related Targets).

  Select:
  * Oracle Cluster and High Availability Service to discover the cluster.
  * Oracle Database, Listener and Automatic Storage Management to discover ASM and listeners.

  – From the Enterprise menu, you can also select Job, then select Library and submit the Discover Promote Oracle Home Target job to add the Oracle Home.

  For more details on provisioning the database software, see the Enterprise Manager Lifecycle Management Administrator's Guide.

### 14.4 Provision the Database for Schema as a Service

For schema as a service, you must deploy a single instance or RAC database. To deploy a database, you must use the Provision Oracle Database deployment procedure. See the Enterprise Manager Lifecycle Management Administrator's Guide for details.
14.5 Provision a Container Database for PDB as a Service

Note:

If pluggable databases (PDBs) need to be provisioned, you must be create container databases.

An Oracle Database can contain a portable collection of schemas, schema objects, and nonschema objects, that appear to an Oracle Net client as a separate database. This self-contained collection is called a pluggable database (PDB). A multi-tenant container database (CDB) is a database that includes one or more PDBs.

You can create a CDB either by using the Database Configuration Assistant (DBCA) or the CREATE_DATABASE SQL statement. See the Oracle Database Administrator's Guide for details. After the CDB is created, it consists of the root and the seed. The root contains minimal user data or no user data, and the seed contains no user data.

PDBs contain user data. After the CDB has been created, you can add PDBs to the CDB by using either of the following options:

- Create a new PDB. See the Enterprise Manager Lifecycle Management Administrator's Guide for details.
- Plug in an unplugged PDB into a CDB. See the Enterprise Manager Lifecycle Management Administrator's Guide for details.

14.6 Configuring the Oracle Listener

You need to configure an Oracle Home and the Oracle Listener before you can add them as Enterprise Manager targets.

To set up the Oracle Listener (Listener) for the database hosts, follow these steps:

1. Log in as a user with the EM_SSA_ADMINISTRATOR role and perform mass deployment of database homes on the newly added hosts as described in Adding Hosts

2. To configure a Listener running from the same Oracle Home on which the database instance is to be created, launch a Bash shell and enter the following commands:
   a. `<AGENT_BASE>/agent_inst/bin/emctl stop agent`
   b. `export TNS_ADMIN=<DB_HOME_LOCATION>/network/admin`
   c. `export ORACLE_HOME=<DB_HOME_LOCATION>`
   d. Run `$ORACLE_HOME/bin/netca` and create the listener. Make sure you have the same Listener name and Listener port on all the hosts.

3. To configure a Listener running from the Single Instance High Availability (SIHA) Oracle Home, launch a Bash shell and enter the following commands:
   a. `export ORACLE_HOME=<SIHA_HOME_LOCATION>`
b. Run `$ORACLE_HOME/bin/netca` and create the listener. Make sure you have the same listener name and listener port on all the hosts.

4. Log in as the user with the `DBAAS_ADMIN_ROLE` and discover the newly added Listener target on all the hosts. From the Setup menu, select Add Target, then select Add Target Manually.

5. Select the Add Non-Host Targets Using Guided Process option and select Target Type as Oracle Database, Listener, and Automatic Storage Management and click Add Guided Discovery and follow the steps in the wizard. Before you add the new Listener target, ensure the `ORACLE_HOME` for the Listener is pointing to the correct `ORACLE_HOME` location. This process adds the Oracle Home target which is used when a database pool is created.
Setting Up an MWaaS Cloud

This chapter covers the initial configuration required to set up and enable a Middleware as a Service Cloud which includes WebLogic as a Service, SOA as a Service, and OSB as a Service.

It contains the following sections:

• About Middleware as a Service
• Getting Started with Middleware as a Service

15.1 About Middleware as a Service

The Oracle Middleware as a Service (MWaaS) service family includes the following:

• WebLogic as a Service (WLaaS)
• SOA as a Service (SOaaS)
• Service Bus as a Service (SBaaS)
• Java Application Service (JVMaaS)

Oracle Enterprise Manager Cloud Control 12c offers a single management tool for creating, monitoring and managing a private MWaaS environment. MWaaS delivers a complete runtime environment comprised of all services necessary to deploy and run an enterprise-class application, including services such as application hosting, persistence store, application integration and APIs that enable programmatic access to additional computing services that might be required by an application. MWaaS facilitates deployment of applications without requiring the developer to deal with the complexity of underlying hardware and software components, thereby achieving cheaper and faster time-to-delivery.

Middleware as a Service provides:

• A shared, consolidated platform on which middleware services can be provisioned.
• A self service model for deploying and managing applications.
• Seamless integration with other services such as a Database as a Service (DBaaS) and Java Diagnostics as a Service (JDaaS).
• Ability to scale up and scale down resources manually and based on policies.
• Metering and Chargeback based on platform usage and the underlying infrastructure.

15.2 Getting Started with Middleware as a Service

This section helps you get started by providing a list of steps that must be performed to get started in setting a private middleware cloud. Before you set up MWaaS, you must have completed the common tasks listed in Common Setup Tasks.
Table 15-1  Getting Started with Middleware as a Service

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>You may need to configure Privilege Delegation Settings on your managed hosts. See Configuring Privilege Delegation Settings.</td>
<td>Super Administrator</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This is an optional step.</td>
<td></td>
</tr>
<tr>
<td>2</td>
<td>Creating a Middleware Home. See Provisioning a Middleware Home.</td>
<td>Self Service Administrator</td>
</tr>
<tr>
<td></td>
<td><strong>Note</strong>: This step is optional for SOAaaS and SBaaS. It is required only if a shared middleware home (NFS location) is used. If middleware home is local, it is provisioned by the deployment procedure used to create SOA or Service Bus service.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Load Middleware Provisioning Profiles into the Software Library. See Creating Provisioning Profiles.</td>
<td>Self Service Administrator</td>
</tr>
<tr>
<td>4</td>
<td>If you are setting up WebLogic as a Service (WLaaS), you must create a WebLogic Domain Provisioning Profile. See Creating a WebLogic Domain Provisioning Profile.</td>
<td>Self Service Administrator</td>
</tr>
</tbody>
</table>

15.2.1 Creating Provisioning Profiles

Provisioning profiles can be used to standardize deployments and help reduce errors when deployment procedures are configured. These provisioning profiles are used by operators for mass deployment. You can create a Middleware Provisioning Profile from a domain by using the Software Library. See Creating a WebLogic Domain Provisioning Profile for details.

15.2.1.1 Creating a WebLogic Domain Provisioning Profile

A WebLogic Domain Provisioning Profile consists of the Middleware Home, binaries, and the domain configuration. You can create a profile, save it in the Software Library, and then use the saved profile as the source for creating new WebLogic domains. This will ensure that future WebLogic installations follow a standard, consistent configuration.

Before you create a WebLogic Domain Provisioning profile, ensure that the following prerequisites are met:

- The Management Agent must be running on the Administration Server.
- You must have the host credentials for the Administration Server running on the source machine.
- The WebLogic Domain for which the profile is being created must be a monitored target in Enterprise Manager.
- The disk space required to create a profile is calculated as follows:
  \[
  \text{Disk Space} = \text{Middleware Home Size} + \text{WebLogic Domain Size} + \text{Space for Temporary Scripts}
  \]
- If Log Viewing support is required on the service instance, the self service administrator must do the following:
– Configure the host credentials required for querying the log files. From the Target menu, select **Logs**, then select **Configure Log Location Settings** to access the corresponding WebLogic domain target page and configure the credentials.

– Grant privileges to the self service user to access the host credentials specified in the Configure Log Location Settings page.

– Provide the view target privilege to the self service user to all the host targets associated with this WebLogic domain.

• If Fusion Middleware console access support is required, you must configure the WebLogic domain through Fusion Middleware Control. This ensures that the Fusion Middleware Control link is displayed in the Service Instance Home page in the Middleware Self Service Portal. See **Middleware Service Home Page**.

• The WebLogic Domain that is used to create a profile must meet the following requirements:
  – The machine associated with the WebLogic Server must not be of Unix type.
  – The Administration Server must not be associated with a machine.
  – The Administration Server must be present on the same host as one of the Managed servers.

• The maximum Java heap size of all the servers must have an appropriate -Xmx setting in multiples of 256. For example, Xms1024m -Xmx1536m -XX:PermSize=512m -XX:MaxPermSize=1536m and so on. You must define the -Xmx server setting to ensure that the MWaaS memory metric and quota checking feature works properly. The value of the memory metric for a MWaaS service is the sum of the maximum heap available for all servers in the service.

For detailed instructions on how to create a WebLogic Domain Provisioning profile, see the **Enterprise Manager Lifecycle Management Administrator’s Guide**.

### 15.2.2 Provisioning a Middleware Home

A Middleware Home consists of the WebLogic Server Home and optionally, one or more Oracle Homes. The Middleware Home must be created on the hosts that are part of the PaaS Infrastructure Zone. See **Creating a PaaS Infrastructure Zone** for details. If the Middleware Home has not been created on a host, that host cannot participate in the Middleware Pool.

You can:

• Use pre-provisioned Oracle Homes
• Create Oracle Homes on demand
• Use a combination of both

If you are provisioning the Middleware Home on multiple hosts, you must specify a shared mount directory that is accessible by all destination hosts.

> **Note:**

You can also manually install the Middleware Home and use the **Discover Promote Oracle Home Target** job to discover it in Enterprise Manager.
To create a Middleware Home, you must run the **Provision from Oracle Middleware Home Gold Image** deployment procedure.

**Prerequisites**

Before running this deployment procedure, you must meet the following prerequisites:

- The user must have Write permissions on:
  - The Working Directory on all destination hosts.
  - The Middleware Home on all destination hosts.

- An Oracle Middleware Home Gold Image must be present in the Software Library. For details on creating this gold image, you can create an Oracle Middleware Home Gold Image and save it in the Software Library. You can then use this gold image as the source for future Middleware Home installations. For the detailed procedure on creating an Oracle Middleware Home Gold Image, see the *Enterprise Lifecycle Management Administrator’s Guide*.

**15.2.2.1 Provision from Oracle Middleware Home Gold Image Deployment Procedure**

**Note:**

- If you have manually created and discovered a Middleware Home, this step can be ignored.
- You cannot have more than one Middleware Home of the same WebLogic Server version on a single host.

You can clone a Middleware Home from a gold image present in the Software Library. This gold image must have been created earlier by pointing to an existing Middleware Home. For a detailed description on cloning a Middleware Home from a gold image, refer to the *Enterprise Manager Lifecycle Management Administrator’s Guide*.
Part VII

Provisioning New Database Artifacts

This section describes the procedures to provision new databases, schemas, and pluggable databases using Database as a Service.

It contains the following chapters

- Getting Started with Database as a Service
- Creating Databases Using Database Template
- Creating Schemas
- Provisioning Pluggable Databases
Getting Started with Database as a Service

This chapter describes the procedure to different DBaaS use cases supported in this release. It contains the following sections:

- Supported DBaaS Use Cases
- Getting Started with DBaaS

16.1 Supported DBaaS Use Cases

The following figure provides an overview of the different flavors of Enterprise Manager DBaaS.

Figure 16-1   DBaaS Use Cases
This table lists the DBaaS use cases that are supported in this release and lists the different methods (GUI, EMCLI, and Rest API) that can be used to run these use cases.

### 16.2 Getting Started with DBaaS

To get started with database as a service, follow these steps:
1. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The following page appears:

![Figure 16-2  Cloud Home Page](image)

2. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. You must first perform the common setup tasks as described in **Common Setup Tasks**. This page is the main entry point for setting up database as a service.

3. Click the **Setup** link next to the Database Service Family in the left panel. Select one of the service types (Database, Pluggable Database, or Schema) from the drop down list and perform the necessary tasks required for the selected service type.

4. Depending on your selection, the list of tasks can be different. Any step that has been configured is marked with a green check mark and the non-configured are listed as not configured.

   **Note:**

   The service types you can access are based on your user role. For example, if you have logged in as a user (for instance **DBAAS_ADMIN**) who can access only Database service type, you will see only the tasks relevant to that service type. But if you have logged in as a user with the **EM_SSA_ADMINISTRATOR** role, you can view all the service types. See **Defining Roles and Assigning Users** for more details.

5. Depending on the service type you wish to configure, you can perform the relevant tasks required to set up that service type.
   - See **Provisioning New Database Artifacts**
   - See **Cloning Databases**
17

Creating Databases Using Database Template

This chapter describes the process involved in creating single instance and cluster databases using database template based profiles. It contains the following sections:

- Creating Databases Using Database Template
- Provisioning Standby Databases

17.1 Creating Databases Using Database Template

The DBCA template supports both structure plus data and structure only types. This database provisioning profile is created from the production or source database registered with Enterprise Manager. It supports both structure plus data and structure only types. This option is recommended if the database size being created is less than 50 GB.

The table below shows the list of tasks that are involved in creating a database using the database template based profile.

Table 17-1 Creating Databases Using Database Template

</tbody>
</table>

17.1.1 Creating Resource Providers

You must create one or more resource providers which include:
17.1.1.1 Creating a Database Pool for Database as a Service

To create a database pool for database as a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Database service family, click the Database Pool link and click Create.
3. In the Credentials region, specify the following credentials:
   - **Host**: Required for creating and starting the database.
   - **Root**: This is an optional field. It is required if you plan to use this database pool for database requests based on snap clone profile.
   - **Grid Infrastructure**: This is an optional field. It is required for registering database services with credentials.
   - **Automatic Storage Management**: This is an optional field. It is required if you plan to use this database pool for live cloning on any database running on ASM.

   **Note:**
   You can use Preferred Credentials or the Named Credentials. If you are using Preferred Credentials,
   - Host Credentials: Select the Target Type as Oracle Home and Credential Set as Normal Host Credentials.
   - Root Credentials: Select the Target Type as Host and Credential Set as Privileged Host Credentials.
   - Grid Infrastructure: Select the Target Type as Oracle High Availability Service and Credential Set as Host Credentials.
   - Automatic Storage Management: Select the Target Type as ASM Instance.
4. Enter a name and description for the database pool.
5. Specify the following details:
   - **PaaS Infrastructure Zone**: Select the PaaS Infrastructure Zone into which the database instance is to be provisioned.
   - **Database Configuration**: Specify the configuration of the database being provisioned. This can either be Single Instance or Cluster Database (RAC) but cannot be a combination of both.
   - **Platform and Version**: Specify the platform and version of the database being deployed.
6. Click **Add** and select one or more Oracle Homes to be added to the database pool.

7. In the Maximum Number of Database Instances (per host), enter the maximum number of database instances that can be running on each host in the pool.

   **Note:**
   
   For RAC databases, the value specified in this field is used to ensure that the nodes on which the database is be created meets this criteria.

8. Click **Submit** to create a database pool. The newly created pool will appear in the Database Cloud Self Service Portal Setup: Database Pools page. The database pool can now be added to the Service Template.

17.1.2 Creating a Database Provisioning Profile Using Database Template

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   - From the **Enterprise** menu, select **Cloud**, and then select **Cloud Home**. On the Cloud home page, click **Oracle Cloud**, select **Setup**, and then select **Data Sources**. On the Database: Data Sources page, in the Data Profiles tab, click **Create**.
   - From the Enterprise menu, select **Provisioning and Patching**, and then select **Database Provisioning**. On the Database Provisioning page, in the Profiles section, click **Create**.
   - From the database target home page, click **Oracle Database**, select **Provisioning**, and then select **Create Provisioning Profile**.

2. On the **Reference Target** page, click the search icon to select a target.

3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click **Select**.

4. On the **Reference Target** page, select the following steps:
   - Click **Data Content**.
   - Select **Structure Only** to include only the structural files in the template

   **Note:**
   
   You can use the Structure and Data option if the database size is lesser than or equal to 5 GB.

   - **Create**
   - **Database Template**
5. In the Credentials section, select **Named Credentials**. and then select a credential name from the Credential Name column (or) select **Preferred Credentials**. Click Next.

6. On the **Create Database Provisioning Profile** page, in the **Profile Information** section, add the following:

   - Specify or select a profile location in the software library where the database profile will be created.
   - Specify a unique profile name.
     
     For example:  
     Database Template for HR database

   - Add a description for the profile.
   - Verify the profile version and the vendor.
   - Add any additional notes such as host name, database, data content, data content mode, and the like.
7. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

8. Specify or select a working directory. Click **Next**.

9. On the **Review** page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 17.1.3 Creating a Container Database Provisioning Profile Using Database Template

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   - From the **Enterprise** menu, select **Cloud**, and then select **Cloud Home**. On the Cloud home page, click **Oracle Cloud**, select **Setup**, and then select **Data Sources**. On the Database: Data Sources page, in the Data Profiles tab, click **Create**.
   - From the Enterprise menu, select **Provisioning and Patching**, and then select **Database Provisioning**. On the Database Provisioning page, in the Profiles section, click **Create**.
• From the database target home page, click Oracle Database, select Provisioning, and then select Create Provisioning Profile.

2. On the Reference Target page, click the search icon to select a target Container Database.

Figure 17-1  Create Container Database: Reference Target

3. On the Reference Target page, perform the following steps:
   a. Click Data Content.
   b. Select Structure Only to include only the structural files in the template (Structure only Database templates are only supported to provision CDBs)
   c. Select Database Template.

4. In the Credentials section, select Named Credentials. and then select a credential name from the Credential Name column (or) select Preferred Credentials. Click Next.

Figure 17-2  Create Container Database: Reference Target

5. On the Create Database Provisioning Profile: page, in the Profile Information section, add the following:
   • Specify or select a profile location in the software library where the database profile will be created.
   • Specify a unique profile name.
   • Add a description for the profile.
   • Verify the profile version and the vendor.
     For example:
     Database Template for HR database
6. Select the Schedule.

7. Specify or select a working directory. Click **Next**.

8. On the **Review** page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 17.1.4 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. See **Configuring Request Settings**

### 17.1.5 Defining Quotas

After configuring the request settings, you must define quotas for each self service user. See **Setting Up Quotas**

### 17.1.6 Creating a Service Template Using Database Template Profile

A service template is a standardized service definition that is offered to self service users to create databases or schemas. Self service users can create one or more databases based on the service template definition.

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.

3. Click the Setup link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

Figure 17-3 Create Service Template: General (DBCA Template)

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. Click the Search icon next to the Source Identification field and select a DBCA template based profile from the list.

7. In the Database Definition region, specify the following:
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - **Database SID**: You can select Specify Prefix or Specified by User at Request Time.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.

     The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

     For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001,
MYDB0002 And in progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

- **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.

- **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

- **Enable Standby Database**: Select this checkbox if you want to provision standby databases using this service template. If this checkbox is selected, you have to add standby databases. See Creating a Service Template for details.

8. In the Zones region, click **Add** to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click **Assign Pool**. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

9. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

10. Click **Next**. The Create Service Template: Database page appears.

**Figure 17-4  Create Service Template: Database (DBCA Template)**

11. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed. The database values such as an Automatic Storage Management (ASM) disk group, location of the file system, and listener port you select must be available on the reference host.

12. Specify the following:

- **Storage Type**: This can be:
  - **Automatic Storage Management**: The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database
files that supports single-instance and RAC configurations. ASM groups
the disks in your storage system into one or more disk groups. If you
select ASM, select the Disk Group here.

- **File System**: The Oracle Database File System creates a standard file
system interface on top of files and directories that are stored in database
tables. If you select this option, you must specify or select the Location of
the File System.

- **Fast Recovery** (Optional): To simplify the management of backup and
recovery files, you can create a fast recovery area for your database. Select
the Enable Fast Recovery Area checkbox to specify the location in which
recovery related files must be stored. The fast recovery area can be a ASM
disk group or a file system that provides a centralized disk location for backup
and recovery file. Specify the location of the Fast Recovery Area and the Fast
Recovery Size. The amount of disk space to allocate for the fast recovery area
depends on the size and activity levels of your database.

To allow self service users to schedule backups and perform restore
operations, configure a Fast Recovery Area and select the Enable Archiving
check box.

- **Listener Port**: In the Listener Port field, specify listener port number that is to
be associated with the new database. If you have selected a 11.2 or later RAC
database, you must specify the scan port number.

- **Administrator Credentials**: Specify passwords for the system schemas of the
new database. These schemas will not be available to the self service users.
You can choose to use the same password for all the schemas or different
passwords for each schema. If these values are not specified, default values
will be used and the self service administrator can change them.

- **Non-Administrator Credentials**: Apart from the system schemas, if you want
to restrict access to other schemas, you can select them in the Non-
Administrator Credentials region and specify the password. These schemas
will be locked and the EM_SSA_USERS cannot access them. Click Next.

13. Click Next. The Create Service Template: Initialization Parameters page appears.
In this page, you can configure the values of various initialization parameters that
affect the operation of the database instance. Select a parameter and click the Set
icon to modify the value of the parameter.

14. Click Next. The Create Service Template: Customization page appears. Specify
the custom scripts that need to be executed before and after the database is
created. See Pre and Post Request Creation / Deletion Scripts for details.

15. In the Target Properties region, you can specify global target properties such as
Location, Department, Line of Business, and so on. You can do the following:

- Mark a property as mandatory by selecting the Required check box. If a
property is marked as mandatory, the self service user must specify a value
for this property while requesting a database.

- Lock a property. When a property is locked, the self service user cannot
modify the value of this property while requesting a database.

16. Click Next. The Create Service Template: Roles page appears. Click Add to
select the SSA user roles to which this service template will be available. All users
belonging to the selected role can use this service template. Click Next.
17. The Create Service Template: Review page appears. Click **Create**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page.

### 17.1.7 Creating a Service Template Using Database Template Profile for Container Database

A service template is a standardized service definition that is offered to self service users to create databases or schemas. Self service users can create one or more databases based on the service template definition.

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Setup** menu, select **Cloud**, then select **Database**. Click **Select Database** from the drop down menu.
3. Click the **Service Templates** link. The **Service Templates** page appears. Click **Create**. The **Create Service Template: General** page appears.

![Figure 17-5   Create Service Template: General (DBCA Template)](image)

4. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.
5. Select the **Create As Container Database** checkbox. The profiles created from the Container Database will be listed in the Profile list only if you select this checkbox.
6. In the Source Identification section, select the **Using profile** radio button. Click **Search** next to the **Profile** field and select a Container Database template based profile from the list.
7. In the Database Definition region, specify the following:
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - **Database SID**: You can select **Specify Prefix** or **Specified by User at Request Time**.
• **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created.

8. In the Zones region, click **Add** to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click **Assign Pool**. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

9. After you have selected the zone and the pool, the host target is populated in the **Reference Host** field.

10. Click **Next**. The **Create Service Template: Database** page appears.

![Create Service Template: Database (DBCA Template)](image)

11. Specify the following:

   • **Storage Type**: This can be:
     
     – **Automatic Storage Management**: The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select the Disk Group here.
     
     – **File System**: The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify or select the Location of the File System.

   • **Fast Recovery** (Optional): To simplify the management of backup and recovery files, you can create a fast recovery area for your database. Select the **Enable Fast Recovery Area** checkbox to specify the location in which recovery related files must be stored. The fast recovery area can be a ASM disk group or a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area and the Fast
Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

To allow self service users to schedule backups and perform restore operations, configure a Fast Recovery Area and select the **Enable Archiving** check box.

- **Listener Port**: In the Listener Port field, specify listener port number that is to be associated with the new Container Database.

- **Administrator Credentials**: Select either Use Same Password or Use different password option.

12. Click **Next**. The Create Service Template: Initialization Parameters page appears. In this page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the **Set** icon to modify the value of the parameter.

13. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See **Pre and Post Request Creation / Deletion Scripts** for details.

14. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:

- Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.

- Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

15. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the EM_SSA_USER roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

---

**Note:**

Please refer to MOS [Doc ID 1549855.1](https://support.oracle.com/ Mos Document ID 1549855.1) for plug-in and patch requirements for Container Database Provisioning from Self Service Portal.

---

17.1.8 Configuring Chargeback

 Optionally, you can configure the chargeback service. See Chargeback Administration.

17.1.9 Requesting a Database

 The self service user can now select the service template based on the database template profile and create a database. See Requesting a Database.
17.2 Provisioning Standby Databases

A data guard configuration consists of one primary database and one or more standby databases. The databases in a Data Guard configuration are connected by Oracle Net and may be dispersed geographically. There are no restrictions on where the databases are located, provided they can communicate with each other.

Oracle Data Guard ensures high availability, data protection, and disaster recovery for enterprise data. It provides a comprehensive set of services that create, maintain, manage, and monitor one or more standby databases to enable production Oracle databases to survive disasters and data corruptions. Oracle Data Guard maintains these standby databases as copies of the production database. If the production database becomes unavailable due to a planned or an unplanned outage, the Oracle Data Guard can switch any standby database to the production role, minimizing the downtime associated with the outage.

The production database, also referred to as the primary database, can be either a single-instance Oracle database or an Oracle Real Application Clusters (RAC) database. A standby database is a transactionally consistent copy of the primary database. Using a backup copy of the primary database, you can create one or more standby databases and incorporate them in a Data Guard configuration. Using Enterprise Manager Database as a Service, users with the EM_SSA_ADMINISTRATOR role can setup the DBaaS Cloud with single instance of RAC standby databases.

</table>
17.2.1 Defining Database Pools for Provisioning Standby Databases

A Data Guard configuration consists of one production database and one or more standby databases. To define a database pool for provisioning standby databases, you must follow these steps:

1. Create a database pool. See Creating a Database Pool for Database as a Service.
2. Associate the database pool with one or more pools that host standby databases. See Associating a Standby Database Pool with a Primary Database Pool.

17.2.1.1 Associating a Standby Database Pool with a Primary Database Pool

To include standby support, you must add one or more pre-created database pools on which the standby databases will be created by following these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Resource Providers, and select the database pool that has been designated as the primary database pool and click Edit. The Edit Pool: Setup page appears.

3. The pool details and the Oracle homes in the pool are displayed. You can now add one or more standby database pools and associate it with the primary database pool. Click Add in the Standby Pools region. The Add Standby Pools window appears.
4. Select one or more standby pools and click Select. The selected pools appear in the Standby Pools region. These pools are now associated with the primary database pool and can be used to provision standby databases.
Note:

The OS user name and password for the primary and standby database pool must be the same but the Named Credentials can be different.

5. Specify the Placement Constraints that will allow the self service administrator to set the maximum limits for resource utilization. For example, if you are using the database pool to provision standby databases, you can specify a higher value in the Maximum Number of Database Instances Per Host field, since the standby database may not be used for active operations all the time.

6. Click Submit. The primary pool is now associated with the standby database pool and can be used to provision standby databases.

17.2.2 Creating a Service Template

Service templates are standardized service definitions that allow self service users to create standby databases. Self service users can create one or more standby databases based on the service template definition. To create a database service template, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.

2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.

3. Click the Setup link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. Click the Search icon next to the Profile field and select a database provisioning profile.

7. You can select the following types of profiles:
   - RMAN Backup Based Database Provisioning Profile.
   - DBCA Template Based Database Provisioning Profile.

8. In the Database Definition region, specify the following:
   - Type: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - Database SID: This is an optional field. You can select Specify Prefix or Specified by User at Request Time.
     - Specify Prefix: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.

     The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for
the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And in progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

- **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.

- **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

- **Enable Standby Database**: Select this checkbox if you want to provision standby databases using this service template. The database lock icon and the Add Standby Database region appears. Click the database lock icon to lock the database. This forces the self service user to request standby databases. If unlocked, the self service user can deselect the standby database while submitting the database request.

9. Click **Add Standby Database**. In the Add Standby Database window that appears, specify the following details:

- **Standby Name**: The name used to identify the standby database.

- **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, you must specify the Number of Nodes.

- **Standby Domain Name**: Enter a domain name for the new standby database that is to be created.

- **Standby Protection Mode**: Specify the protection mode which can be:
  - Maximize Protection: Provides the highest level of data protection with no data loss. If this mode is selected, you must set the SYNC Redo Transport Mode on at least one standby database.

  - Maximize Availability: Provides very high data protection. If this mode is selected, you must set the SYNC Redo Transport Mode on at least one standby database.

  - Maximize Performance: Provides high data protection with the ASYNC Redo Transport Mode. If you select this mode, there is no performance impact on the primary database.

- **Enable Real Time Query**: Select this option to enable real time data query on the database. This feature requires an active data guard license.

- **Apply Delay**: Specifies the delay period before which the archived redo log data is applied on the standby database. When the property is set to 0 minutes, the redo log data is applied immediately on the standby database.
10. In the Pools and Zones (Primary Pools) region, click **Add** to add one or more PaaS Infrastructure zones into which the database instance is to be provisioned. Click **Assign Pool** and select a database pool which will be the primary database pool for the standby database.

11. In the Standby Pools region, you will see the list of standby databases that you have defined. From the drop-down list, select the standby pool with which the standby database is to be associated. You can associate multiple standby pools with one primary pool.

12. Click **Search** in the Reference Host field to select a host target.

13. Specify the Shared Location and click **Next** to continue to the Database Cloud Self Service Portal Setup: Database page.

14. The name of the Zone, Pool, and Reference Host you have selected is displayed. You can select the ASM Disk Group, File System Location, and Listener Port that is available on the Reference Host.

15. **Note:** If the Primary Pool is of single instance type, both single instance and RAC database pools are listed. But if the Primary Pool is RAC, only RAC database pools are listed in the Standby Pools region.

16. **Note:** The storage locations and listener ports must be identical on all the primary and standby pools.

- **Storage Type:** Storage type can be:
  - Automatic Storage Management: The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, specify the Disk Group here.
  - File System: The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify the Location of the File System.
- **Fast Recovery:** To simplify the management of backup and recovery files, you can create a fast recovery area for your database. The fast recovery area can be an ASM disk group or a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area.
and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

To allow self service users to schedule backups and perform restore operations, configure a Fast Recovery Area and select the **Enable Archiving** check box.

15. In the Port Number field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

16. In the Location fields, specify the RMAN Duplicate Backup location. This directory must be present on all members of the Primary and Standby pools. The free space available in this location must be equal to or more than the size of the database from which the profile has been created.

17. Specify the Administrator Credentials. Specify passwords for the system schemas of the new database. These schemas will not be available to the `EM_SSA_USERS`. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the `EM_ADMINISTRATOR` can change them.

18. Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password. These schemas will be locked and the `EM_SSA_USERS` cannot access them.

19. Click **Next**. The Database Cloud Self Service Portal Setup: Initialization Parameters page appears. In this page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click the **Set** icon to modify the value of the parameter.

### Note:

Database sizes that can selected by the self service user while creating a service instance are defined globally using EMCLI commands. A subset of these global database sizes can be defined on the Initialization Parameters page and the self service user can choose one of these sizes while creating a database.

20. Click **Next**. The Database Cloud Self Service Portal Setup: Scripts page appears. Specify the custom scripts that need to be executed before and after the database is created.

21. Click **Next**. The Database Cloud Self Service Portal Setup: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template.

22. Click **Next**. The Database Cloud Self Service Portal Setup: Review page appears. Review the information you have entered so far and click **Create**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.
Creating Schemas

You can create one or more schemas on a running database. Schemas can either be empty or based on a profile. This chapter covers the following sections:

- Getting Started
- Creating Resource Providers
- Creating a Database Provisioning Profile Using Export Schema Objects
- Configuring Request Settings
- Defining Quotas
- Configuring Chargeback
- Requesting a Schema

18.1 Getting Started

The data content of this database provisioning profile is compiled from an export dump created using the Data Pump tool. You can choose to export Schema objects (structure only) or the Schema with data (structure + data).

The table below shows the list of tasks that are involved in creating an empty schema or a schema based on profile.

<table>
<thead>
<tr>

18.2 Creating Resource Providers

You must create one or more resource providers which include:

- PaaS Infrastructure Zones: See Creating a PaaS Infrastructure Zone
- Schema Pool: See Creating a Database Pool for Schema as a Service

18.2.1 Creating a Database Pool for Schema as a Service

You can create a database service with one or more schemas with or without seed data and database objects. To do so, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Database service family, select Schema from the drop down list, click Schema Pool and click Create.
3. Enter a name and description for the schema pool.
4. In the Credentials region, specify the credentials that will be used for performing database operations. Specify the following credentials:
   - **Host**: Required for starting the database.
   - **Grid Infrastructure**: Required to register a database service with grid infrastructure credentials. These credentials are used when schema backups taken by the self service user from ASM need to be deleted.
   - **Database**: Required for creating schemas on the database. The database credentials must have SYSDBA privileges.
5. Specify the following details:
   - **PaaS Infrastructure Zone**: Select the PaaS Infrastructure Zone in which the databases are present. The schemas will be created on the databases selected for the pool.
• **Target Type:** Specify the configuration of the target database on which the schema is being deployed. This can be Single Instance or Cluster Database (RAC).

• **Platform and Version:** Specify the platform and version of the database being deployed.

6. Click **Add** and select one or more databases to be added to the pool. All databases you select must be present in the same PaaS Infrastructure Zone.

   **Note:**

   You can search for database groups that meet your requirements by specifying a search string in the Groups field.

   Specify the placement policy constraints to set maximum ceilings for resource utilization on each database. Placement policy constraints for each database can be defined by services or workloads as follows:

   • **Services:** If you select this check box, you must specify the Maximum Number of Database Services that can be running on each database.

   • **Workloads Associated with Service Requests:** The amount of resources (such as CPU and memory) to manage the workload can be specified here. Specify the total workload for each database.
     
     – **Maximum CPU Allocation:** Specify the maximum CPU that can be allocated to each database.
     
     – **Maximum Memory Allocation:** Specify the maximum memory that can be allocated for each database.

8. If you have chosen to set the placement constraints by **Workloads Associated with Service Requests**, you can choose to enable the resource manager by selecting the **Enable Resource Manager for CPU** check box. You can use the resource manager to manage the CPU resource and ensure that **EM_SSA_USER** will not exceed the maximum allocated value.

9. Click **Submit** to create a database pool. The newly created database pool will appear in the Database Cloud Self Service Portal Setup: Database Pools page.

### 18.3 Creating a Database Provisioning Profile Using Export Schema Objects

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   
   • From the **Enterprise** menu, select **Cloud**, and then select **Cloud Home**. On the Cloud home page, click **Oracle Cloud**, select **Setup**, and then select **Data Sources**. On the Database: Data Sources page, in the Data Profiles tab, click **Create**.
• From the Enterprise menu, select **Provisioning and Patching**, and then select **Database Provisioning**. On the Database Provisioning page, in the Profiles section, click **Create**.

• From the database target home page, click **Oracle Database**, select **Provisioning**, and then select **Create Provisioning Profile**.

2. On the Reference Target page, click the search icon to select a target.

3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click **Select**.

4. On the Reference Target page, select the following:
   - **Data Content**
   - **Structure and Data** to include physical and structural files from the database or **Structure Only** to include only the structural files in the template.
   - **Export Schema Objects**

5. In the Credentials section, select the database. In the Credentials column, you can select **Named Credentials** and then select a credential name from the Credential Name column (or) select **Preferred Credentials**. Click **Next**.

6. On the Content Options page, do the following:
   - Select the schema you want to include in the profile by clicking on a schema in the Available Schema list and moving it to the Selected Schema list.
**Note:**

When one or more schemas are selected, the database checks if the dependent schemas are also selected for export. If the dependent schemas are not exported, you will receive a warning. You can choose to go ahead with the selected schemas, or to include the schemas which were not initially selected.

The same warning is also displayed when you select a profile that does not have the dependent schemas exported.

**Note:**

The Available Schemas section displays only the user created schemas that has data content in it. All the empty schemas are filtered out by default.

**Note:**

System schemas such as SYS, SYSTEM, and DBSNMP will not be exported.

The user schemas which do not have their own tablespace are not shown in left side of the shuttle.

- In the Degree of Parallelism section, enter the number of threads required to perform the export operation.

**Note:**

Increasing the number of threads helps reduce the time required to create the profile at the cost of using system resources.

- In the Directory Locations section, click on **Add**. In the Select Directory window, select a directory object listed to perform the export operation, and then click **Select**.
The number of export threads determines the number of parallel export processes that will run in parallel during export. Hence, the dump file names should contain %U, to ensure the file names are auto generated with the running count to facilitate parallel operation along with the maximum size for the dump file. For example, 5GB. This means that the file rotation will start after 5GB limit is reached.

Ensure that the directory location is accessible. The directory object that you select must refer to a location that is accessible across all the nodes. You can also create a directory object on ASM. However, it is not supported on ASM.

In the Log subsection, click on the search icon. In the Select Directory window, select the directory object you require to perform the export operation, and then click Select.

In the Log subsection, enter the file name, and then click on Next.

You can make use of degree of parallelism with dump file names. The default value of dump files contain %U which creates a running count when degree of parallelism is greater than 1.

Also, this enables you to add multiple dump directories to distribute the storage if required.

7. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:

   • Specify or select a profile location in the software library where the database profile will be created.
   • Specify a unique profile name.
     For example:
     Export Schema Objects Provisioning Profile for HR database
   • Add a description for the profile.
   • Verify the profile version and the vendor.
   • Add any additional notes such as host name, database, data content, data content mode, and the like.
8. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

9. Specify or select a working directory. Click Next.

10. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click Submit. Otherwise, click Back repeatedly till you reach the page where you want to make changes. Click Cancel to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the Procedure Activity link in the Data Profiles tab.

### 18.4 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. See Configuring Request Settings

### 18.5 Defining Quotas

After configuring the request settings, you must define quotas for each self service user. See Setting Up Quotas

### 18.6 Creating a Service Template for Schema Based on Profile

One or more schemas can be created based on the service template definition. To create a service template for schema as a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.

3. Click the Setup link next to the Databases option in the left panel. Select Schema from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

**Figure 18-1 Create Service Template: General**

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source region, select the Import Schemas from Profile option and select a database provisioning profile from which the schema is to be imported. Click the Search icon next to the Profile field and select an export schema objects based profile from the list. If a profile does not exist, you must create one. See Creating a Database Provisioning Profile Using Export Schema Objects.

7. After selecting the profile, you must select the Master Account that has privileges on all the schemas. If the Master Account is not selected, the self service user will have to select it when requesting a schema.

8. In the Zones region, click Add to select a PaaS Infrastructure Zone into which the service instance is to be provisioned. Click Assign Pool to add a Database Pool for the zone.

9. After you have selected the zone and the pool, the host target is populated in the Reference Host field. If you have added multiple zones and pools, you must click the Search icon and select a host target from the list.

10. If you creating a service template based on an export schema objects profile, in the Shared Location region, specify the Path or the Shared Location in which the schema dumps are present. The Shared Location must be accessible by all the databases.

11. Click Next. The Create New Service Template: Configurations page appears.
Figure 18-2  Create Service Template: Configurations

Specify the following details:

- **Workload Size**: Workload represents the total CPU, memory, and storage requirements for each service. You can define workload sizes such as small, medium, and large for the schema service. Click **Create** and in the Create Workload window, enter the name, CPU, Memory, and Storage limit for each service. Select a workload size and click **Default** to designate it as the default workload size.

- **Assign Schema Privileges**: You can select existing roles or create a role that will be assigned to all the schemas. All database privileges such as CREATE_SESSION, CREATE_DIMENSION, and so on can be granted to the role. Enter the name of the user, description, and the privileges that will be granted to the user.

  **Note:**
  
  - If the role with the name specified already exists in the database, the database privileges cannot be modified.
  
  - The Master Account will have the CREATE_SESSION, CREATE_DIMENSION, CREATE_INDEXTYPE, CREATE_OPERATOR, CREATE_PROCEDURE, CREATE_SEQUENCE, CREATE_TABLE, CREATE_TRIGGER, CREATE_TYPE, CREATE_VIEW, and CREATE_SYNONYM privileges over all the schemas created as part of this service request.

- **Tablespace**: Specify the tablespace storage configuration. Enter the following details:

  - **Maximum Size**: The maximum size of the tablespace can be **Unlimited** or **Specified by the workload size selected at request time**.
- **Auto Extend**: Select this check box to automatically extend the new data file.

  ![Note]
  
  If you are creating an empty schema, the tablespaces are not listed in the Tablespace Details section. In this case, you must specify the Initial Size and the Increment value for the tablespace and only one tablespace is created.

- **Tablespace Details**: Based on the profile you have selected, one or more tablespaces are listed here. You can edit the following values in the table:
  - **Initial Size**: If you selected *Specified by the workload size selected at request time* in the Maximum Size field, enter the initial size of the tablespace.
  - **Increment**: If you have selected the **Auto Extend** checkbox, specify the size by which the data file is to be automatically incremented.
  - **Maximum Size**: If the tablespace storage is *Specified by workload size specified at request time*, enter the maximum size here that can be distributed across tablespaces.

12. Click **Next**. The Create Service Template: Scripts page appears. Specify the custom scripts that need to be executed before and after the service instance has been created. See Pre and Post Scripts section for details.

13. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:
   - Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a schema.
   - Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a schema.

14. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template.

15. Click **Next** to go to the Review page. Review the details entered so far and click **Submit**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.

### 18.7 Creating a Service Template with Empty Schema

One or more schemas can be created based on the service template definition. To create a service template that can be used to create empty schemas, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.
3. Click the Setup link next to the Databases option in the left panel. Select Schema from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

**Figure 18-3  Create Service Template: General (Empty Schema)**

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source region, select the Create User Defined Schemas option to create empty schemas which can be configured by the user. If you select this option, you must specify the Maximum Number of Schemas that can be created.

7. In the Zones region, click Add to select a PaaS Infrastructure Zone into which the service instance is to be provisioned. Click Assign Pool to add a Database Pool for the zone.

8. After you have selected the zone and the pool, the host target is populated in the Reference Host field. If you have added multiple zones and pools, you must click the Search icon and select a host target from the list.

Specify the following details:

- **Workload Size**: Workload represents the total CPU, memory, and storage requirements for each service. You can define workload sizes such as small, medium, and large for the schema service. Click Create and in the Create Workload window, enter the name, CPU, Memory, and Storage limit for each service. Select a workload size and click Default to designate it as the default workload size.

- **Assign Schema Privileges**: You can select existing roles or create a role that will be assigned to all the schemas. All database privileges such as CREATE_SESSION, CREATE_DIMENSION, and so on can be granted to the role. Enter the name of the user, description, and the privileges that will be granted to the user.

  **Note:**
  
  - If the role with the name specified already exists in the database, the database privileges cannot be modified.
  - The Master Account will have the CREATE_SESSION, CREATE_DIMENSION, CREATE_INDEXTYPE, CREATE_OPERATOR, CREATE_PROCEDURE, CREATE_SEQUENCE, CREATE_TABLE, CREATE_TRIGGER, CREATE_TYPE, CREATE_VIEW, and CREATE_SYNONYM privileges over all the schemas created as part of this service request.

- **Tablespace**: Specify the tablespace storage configuration. Enter the following details:
  
  - **Maximum Size**: The maximum size of the tablespace can be Unlimited or Specified by the workload size selected at request time.
Auto Extend: Select this check box to automatically extend the new data file. If this check box is selected, enter the following details:

Initial Size: Enter the initial size of the tablespace.
Increment: Specify the size by which the data file is to be automatically incremented.

10. Click Next. The Create Service Template: Scripts page appears. Specify the custom scripts that need to be executed before and after the service instance has been created.

11. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:

• Mark a property as mandatory by selecting the Required check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a schema.

• Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a schema.

12. Click Next. The Create Service Template: Roles page appears. Click Add to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template.

13. Click Next to go to the Review page. Review the details entered so far and click Submit. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.

18.8 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

18.9 Requesting a Schema

The self service user can now select the service template based on the database template profile and create a database. See Requesting a Schema.
This chapter describes the process involved in provisioning pluggable databases. It contains the following sections:

- Getting Started
- Creating Resource Providers
- Creating a Database Provisioning Profile Using Export Schema Objects
- Configuring Request Settings
- Defining Quotas
- Creating a Service Template for PDB Based on Profile
- Creating a Service Template for an Empty PDB
- Configuring Chargeback
- Requesting a Pluggable Database
- Creating Test Master Pluggable Databases and Snapshot Clones
- Enabling a Test Master Pluggable Database
- Disabling a Test Master Pluggable Database

### 19.1 Getting Started

An Oracle Database can contain a portable collection of schemas, schema objects, and nonschema objects, that appear to an Oracle Net client as a separate database. This self-contained collection is called a pluggable database (PDB). A multi-tenant container database (CDB) is a database that includes one or more PDBs. Oracle Database 12c Release 1 (12.1) and later versions allow you to create many PDBs within a single CDB.

|      | have created.                                                       |                                                                      |

19.2 Creating Resource Providers

You must create one or more resource providers which include:

- PaaS Infrastructure Zones: See Creating a PaaS Infrastructure Zone
- Database Pool:
  - See Creating a Database Pool for PDB as a Service

19.2.1 Creating a Database Pool for PDB as a Service

A Pluggable Database (PDB) is a portable set of schemas, schema objects, and related structures that appears logically to an application as a separate database. This self-contained collection is called a pluggable database (PDB). Every PDB is owned by a SYS user.

A container is a collection of schemas, objects, and related structures in a container database (CDB) that appears logically to an application as a separate database. A container database (CDB) is an Oracle database that includes zero, one, or many user-created PDBs.

A database pool for PDB as a Service must contain a set of container databases. The container databases must meet the following guidelines:

- All CDBs in a database pool must be of the same version and platform.
- All CDBs in a database pool must either be single instance databases or RAC databases. Mix and match of database types is not supported.

To create a database pool for PDB as a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Database service family, select Pluggable Database from the drop down link, click on the Pluggable Database Pool link and then click Create.
Figure 19-1  Create Database Pool: Setup Page (PDB)

3. Enter a name and description for the database pool.

4. In the Credentials region, specify the credentials that will be used for performing database operations. Specify the following credentials:
   - **Host**: Required for performing remote host operations.
   - **Grid Infrastructure**: Required to register a database service with grid infrastructure credentials.
   - **Database**: Required for creating the pluggable database.
   - **Container Database Wallet Password**: If the PDB is to be encrypted, you must specify the password required to open the wallet from the keystore.

5. Specify the following details:
   - **PaaS Infrastructure Zone**: Select a PaaS Infrastructure Zone in which the container databases are present. The PDBs will be created on the databases selected for the pool. For details on creating container databases, see Provision a Container Database for PDB as a Service.
   - **Target Type**: Specify the configuration of the target database on which the PDB is being deployed. This can be Single Instance or Cluster Database (RAC).
   - **Platform and Version**: Specify the platform and version of the database being deployed.

6. Click **Add** and select one or more container databases to be added to the pool. All databases you select must be present in the same PaaS Infrastructure Zone.

**Note:**

You can search for database groups that meet your requirements by specifying a search string in the Groups field.

Specify the placement policy constraints to set maximum ceilings for resource utilization on each database. Placement policy constraints for each database can be defined by services or workloads as follows:

- **Pluggable Database**: Select the Pluggable Database checkbox and specify the Maximum Number of Pluggable Databases that can be created inside each CDB.

- **Workloads Associated with Service Requests**: The amount of resources (such as CPU and memory) to manage the workload can be specified here. Specify the workload that is to be enforced for the pluggable database.
  - **Maximum CPU Allocation**: Specify the maximum CPU that can be allocated to each database.
  - **Maximum Memory Allocation**: Specify the maximum memory that can be allocated for each database.

For example: If a container database is caged to 2 CPUs with SGA of 4GB, and you specify the Maximum CPU Allocation and Maximum Memory Allocation as 80%:
  - the maximum CPU limit for each pluggable database is 1.6
  - the maximum SGA / memory limit for each pluggable database is 3.2

8. If you have chosen to set the placement constraints by **Workloads Associated with Service Requests**, you can choose to enable the resource manager by selecting the **Enable Resource Manager for CPU** check box. You can use the resource manager to manage the CPU resource and create Consumer Groups. A Consumer Group is used to ensure that the service gets the requested CPU cycles on a fully loaded system.

9. Click **Submit** to create a database pool for PDB as a service. The newly created database pool will appear in the Database Cloud Self Service Portal Setup: Database Pools page.
19.2.2 Creating an Oracle Cloud Database Pool for PDB as a Service

Enterprise Manager Cloud Control provides a single pane of glass for monitoring and managing on-premise as well as Oracle Cloud deployments, all from the same management cloud. By leveraging Enterprise Manager’s hybrid cloud management capabilities, database pools for PDBaaS can be created as a set of container databases on Oracle Cloud. This provides Enterprise Manager self service users with the capability to provision PDBs on Oracle Cloud. Once the Oracle Cloud container database target has been discovered by deploying an Enterprise Manager Agent for hybrid cloud (See Enabling Hybrid Cloud Management in the Enterprise Manager Administrator’s Guide), a database pool consisting of a set of container databases can be created on Oracle Cloud by following instructions listed in Creating a Database Pool for PDB as a Service.

19.3 Creating a Database Provisioning Profile Using Export Schema Objects

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   - From the Enterprise menu, select Cloud, and then select Cloud Home. On the Cloud home page, click Oracle Cloud, select Setup, and then select Data Sources. On the Database: Data Sources page, in the Data Profiles tab, click Create.
   - From the Enterprise menu, select Provisioning and Patching, and then select Database Provisioning. On the Database Provisioning page, in the Profiles section, click Create.
   - From the database target home page, click Oracle Database, select Provisioning, and then select Create Provisioning Profile.

2. On the Reference Target page, click the search icon to select a target.

3. In the Search and Select:Targets display box, select the database you want to create a profile for, and then click Select.

4. On the Reference Target page, select the following:
   - Data Content
   - Structure and Data to include physical and structural files from the database or Structure Only to include only the structural files in the template.
   - Export Schema Objects
5. In the Credentials section, select the database. In the Credentials column, you can select **Named Credentials** and then select a credential name from the Credential Name column (or) select **Preferred Credentials**. Click **Next**.

6. On the Content Options page, do the following:
   - Select the schema you want to include in the profile by clicking on a schema in the Available Schema list and moving it to the Selected Schema list.

**Note:**

When one or more schemas are selected, the database checks if the dependent schemas are also selected for export. If the dependent schemas are not exported, you will receive a warning. You can choose to go ahead with the selected schemas, or to include the schemas which were not initially selected.

The same warning is also displayed when you select a profile that does not have the dependent schemas exported.
The Available Schemas section displays only the user created schemas that have data content in it. All the empty schemas are filtered out by default.

System schemas such as SYS, SYSTEM, and DBSNMP will not be exported. The user schemas which do not have their own tablespace are not shown in the left side of the shuttle.

In the Degree of Parallelism section, enter the number of threads required to perform the export operation. Increasing the number of threads helps reduce the time required to create the profile at the cost of using system resources.

In the Directory Locations section, click on Add. In the Select Directory window, select a directory object listed to perform the export operation, and then click Select.

The number of export threads determines the number of parallel export processes that will run in parallel during export. Hence, the dump file names should contain %U, to ensure the file names are auto generated with the running count to facilitate parallel operation along with the maximum size for the dump file. For example, 5GB. This means that the file rotation will start after 5GB limit is reached.

Ensure that the directory location is accessible. The directory object that you select must refer to a location that is accessible across all the nodes. You can also create a directory object on ASM. However, it is not supported on ASM.
In the Log subsection, click on the search icon. In the Select Directory window, select the directory object you require to perform the export operation, and then click **Select**.

In the Log subsection, enter the file name, and then click on **Next**.

---

**Note:**

You can make use of degree of parallelism with dump file names. The default value of dump files contain `%U` which creates a running count when degree of parallelism is greater than 1.

Also, this enables you to add multiple dump directories to distribute the storage if required.

---

7. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:
   - Specify or select a profile location in the software library where the database profile will be created.
   - Specify a unique profile name.
     
     For example:
     
     Export Schema Objects Provisioning Profile for HR database
   - Add a description for the profile.
   - Verify the profile version and the vendor.
   - Add any additional notes such as host name, database, data content, data content mode, and the like.

8. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

9. Specify or select a working directory. Click **Next**.

10. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly.
till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 19.4 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. See Configuring Request Settings

### 19.5 Defining Quotas

After configuring the request settings, you must define quotas for each self service user. See Setting Up Quotas

### 19.6 Creating a Service Template for PDB Based on Profile

One or more pluggable databases can be created based on the service template definition. To create a service template for PDB as a service, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.
3. Click the **Setup** link next to the Databases option in the left panel. Select **Pluggable Database** from the drop down menu.
4. Click the **Service Templates** link. The Service Templates page appears. Click **Create**. The Create Service Template: General page appears.
5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Pluggable Database region, select the **Create Pluggable Databases** from Profile option and select a database provisioning profile that is to be used to create the pluggable database. Click the **Search** icon next to the Profile field and select an export schema objects profile from the list. If a profile does not exist, you must create one. See **Creating a Database Provisioning Profile Using Export Schema Objects** for details.

   • **Note:**

   You can also create a PDB from an unplugged PDB. To do so, follow these steps:
   
   – Unplug the PDB from the container database and specify the location in the Software Library which the PDB template (contains data files and the metadata XML file) is to be stored.
   
   – In the Service Template Creation wizard, specify the PDB template location in the Shared Location field. The PDB is created with the specified data files.

7. In the Pools and Zones region, click **Add** to select a PaaS Infrastructure Zone into which the pluggable database instance is to be provisioned. Click **Assign Pool** to add a Database Pool (for Pluggable Databases) for the zone.

   • **Note:**

   A database pool (for PDBs) must be present in the PaaS Infrastructure Zone that you select here.
8. After the database pool has been assigned, the container database into which the pluggable database is to be added is displayed in the Reference Container Database field. All the validations for the service template will be performed against this database.

9. If you have selected Create Pluggable Databases from Profile in the Pluggable Database region, in the Shared Location field, specify the Path or the shared location on all hosts in which the schema dumps are present. The Dump File Location must be accessible by all the databases.

10. In the Placement region, the pluggable database can be provisioned on the container database using one of the following options:

   • Selected by placement algorithm: If this option is selected, the container database will be selected based on the placement algorithm.
   
   • Selected by user during request: If this option is selected, while requesting a new PDB, the self service user can select the container database on which the PDB is to be provisioned.

11. In the Identification region, in the Pluggable Database Prefix Name field, specify the prefix that is to be used to generate a unique Pluggable Database name at the time of database creation. The prefix helps to identify the PDBs that are created using this service template.

![Create Service Template: Configurations (PDB)](image)

Specify the following details:

• **Workload Size**: Workload represents the total CPU, memory, number of sessions, and storage requirements for each service. You can define workload sizes such as small, medium, and large. The workload sizes defined here will be the default workload sizes available to the users with the `EM_SSA_USER` role.

Click **Create** and in the Create Workload window, enter the name, CPU, Memory, and Storage limit for each service.
• **Pluggable Database Administrator Privileges**: You can assign privileges to the Pluggable Database Administrator by:
  
  – **From Existing Database Roles**: If you select this option, click **Add Roles** to add one or more existing roles from which the privileges will be assigned to the Pluggable Database Administrator.
  
  – **Creating a new Database Role**: If you select this option, you must specify the Role Name, Description, and the Privileges such as `CREATE_SESSION`, `ALTER_SESSION`, `CREATE ANY OPERATOR`, `CREATE ANY PROCEDURE` and so on that will be assigned to the administrator.

• **Pluggable Database Storage**: The maximum size of the PDB storage can either be **Unlimited** or **Specified by the workload size selected at request time**.

• **Tablespace**: The tablespaces in the profile are displayed. You can edit the value of the Initial Size of the tablespace.

> **Note:**

You can create encrypted tablespaces by specifying a Tablespace Data Encryption (TDE) key. This encrypts and decrypts the data in the tablespace. If you are using a profile with encrypted tablespaces, you will be prompted for the wallet password here.

13. Click **Next**. The Create Service Template: Initialization Parameters page appears. In this page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click the **Set** icon to modify the value of the parameter.

14. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See **Pre and Post Request Creation / Deletion Scripts** for details.

15. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:

   • Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
   
   • Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

16. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the `EM_SSA_USER` roles to which this service template will be available. All users belonging to the selected role can use this service template.

17. Click **Next**. The Create Service Template: Review page appears where you can review the details entered so far.

18. Click **Submit**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.
19.7 Creating a Service Template for an Empty PDB

One or more pluggable databases can be created based on the service template definition. To create a service template for PDB as a service, follow these steps:

1. Log into Enterprise Manager as a user with the `EM_SSA_ADMINISTRATOR` role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.
3. Click the Setup link next to the Databases option in the left panel. Select Pluggable Database from the drop down menu.
4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

![Create Service Template: General (Empty)](image)

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.
6. In the Pluggable Databases region, select the Create Empty Pluggable Database option to create an empty PDB that can be configured by the user.
7. In the Pools and Zones region, click Add to select a PaaS Infrastructure Zone into which the pluggable database instance is to be provisioned. Click Assign Pool to add a Database Pool (for Pluggable Databases) for the zone.

**Note:**

A database pool (for PDBs) must be present in the PaaS Infrastructure Zone that you select here.

8. After the database pool has been assigned, the container database into which the pluggable database is to be added is displayed in the Reference Container...
Database field. All the validations for the service template will be performed against this database.

9. In the Placement region, the pluggable database can be provisioned on the container database using one of the following options:
   - Selected by placement algorithm
   - Selected by user during request

10. In the Identification region, in the Pluggable Database Prefix Name field, specify the prefix that is to be used to generate a unique Pluggable Database name at the time of database creation. The prefix helps to identify the PDBs that are created using this service template.

11. Click Next. The Create New Service Template: Configurations page appears.

![Figure 19-6  Create Service Template: Configurations (PDB)](image)

Specify the following details:

- **Workload Size**: Workload represents the total CPU, memory, number of sessions, and storage requirements for each service. You can define workload sizes such as small, medium, and large. The workload sizes defined here will be the default workload sizes available to the users with the `EM_SSA_USER` role.

  Click Create and in the Create Workload window, enter the name, CPU, Memory, and Storage limit for each service.

- **Pluggable Database Administrator Privileges**: You can assign privileges to the Pluggable Database Administrator by:
  - **From Existing Database Roles**: If you select this option, click Add Roles to add one or more existing roles from which the privileges will be assigned to the Pluggable Database Administrator.
  - **Creating a new Database Role**: If you select this option, you must specify the Role Name, Description, and the Privileges such as `CREATE_SESSION`, `ALTER_SESSION`, `CREATE ANY OPERATOR`, `CREATE ANY PROCEDURE` and so on that will be assigned to the administrator.
1. Click Next. The Create Service Template: Initialization Parameters page appears. In this page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click the Set icon to modify the value of the parameter.

12. Click Next. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

13. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:
   - Mark a property as mandatory by selecting the Required check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
   - Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

14. Click Next. The Create Service Template: Roles page appears. Click Add to select the EM_SSA_USER roles to which this service template will be available. All users belonging to the selected role can use this service template.

15. Click Next. The Create Service Template: Review page appears where you can review the details entered so far.

16. Click Submit. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.

19.8 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

19.9 Requesting a Pluggable Database

The self service user can now select the service template and create a pluggable database. See Requesting a Pluggable Database
Part VIII
Cloning Databases

This section describes how you can create full clones or snap clones either by using profiles or from a live database.

This section contains the following chapters:

• Supported Cloning Options
• Creating Full Clones
• Creating Snap Clones
20

Supported Cloning Options

This chapter describes the different options offered by Enterprise Manager to clone a database. It contains the following sections:

- About Data Lifecycle Management
- Supported Cloning Options

20.1 About Data Lifecycle Management

The Data Lifecycle Management (DLM) is a complete end-to-end solution offered by Enterprise Manager that enables administrators to refresh production databases after they are masked and instantly clone large databases on demand. The DLM solution:

- Supports creation of full and thin database clones.
- Is technology agnostic (storage and vendor agnostic).
- Integrates masking of production data and inline patching.
- Can be accessed through the Cloud Self Service Portal and the Database Provisioning dashboard.
- Is available through EMCLI and Rest APIs.

20.2 Supported Cloning Options

IT environments typically require multiple copies of production databases for application development and testing purposes. When an application developer or tester needs a database clone, he or she must typically go through an approval cycle, which then initiates a cumbersome and time-consuming cloning process that may span days. Clones are shared by multiple users and applications, which results in degraded performance due to increased sharing by multiple users. In such an environment, refreshing test data to reflect changes made to a production database is typically done on a fixed schedule, and may not be done as often as needed. As a result, it may often not be feasible to ensure that developers and testers are testing with the latest data.

Creating database clones with the latest data involves the following steps:

- Identifying the production database that is to be cloned.
- Taking periodic backups using RMAN Backup, RMAN Image, and so on.
- Masking the sensitive data.
- Mask and Subset Data on the Test Master Database
- Creating a test master which is a sanitized copy of the production database or creating a standby database.
- Creating full clones for performance or stress testing, and snap clones for functional testing.
• Refreshing the clones to keep them in sync with the changes in the production database.

Using Enterprise Manager, you can create full clones or snap clones either from the Administration Dashboard or from the Self Service Portal. The figure below shows the cloning options supported in Enterprise Manager.

**Figure 20-1  Supported Cloning Options**

Enterprise Manager allows you to create:

• **Full Clones:** You can make a full or complete copy of the production database using one of the following methods:
  – RMAN Backup
  – RMAN Duplicate
  – Data Pump
  For more details, see [Creating Full Clones](#).

• **Snap Clones:** You can make a snap clone or a thin clone using copy on write technology of the database. This model requires minimal space, provides instantaneous cloning, and is ideal for functional testing. You can create snap clones using one of the following solutions:
  – Software Solution
  – Hardware Solution
  For more details, see [Creating Snap Clones](#).
This chapter describes how to create a full database clone. It contains the following sections:

- Creating a Full Database Clone Using RMAN Backup from the Self Service Portal
- Creating a Full Database Clone Using RMAN Duplicate from the Self Service Portal

### 21.1 Creating a Full Database Clone Using RMAN Backup from the Self Service Portal

Database backups created by RMAN (Recovery Manager) are stored as image copies or backup sets. You can create profiles using these backups and use these profiles to create full database clones.

#### Table 21-1 Creating a Full Database Clone Using RMAN Backup

### 21.1.1 Creating Resource Providers

You must create one or more resource providers which include:

- PaaS Infrastructure Zones: See Creating a PaaS Infrastructure Zone
- Database Pool: See Creating a Database Pool for Database as a Service
21.1.1.1 Creating a Database Pool for Database as a Service

To create a database pool for database as a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.

2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Database service family, click the Database Pool link and click Create.

3. In the Credentials region, specify the following credentials:
   - **Host**: Required for creating and starting the database.
   - **Root**: This is an optional field. It is required if you plan to use this database pool for database requests based on snap clone profile. See Creating Snap Clones.
   - **Grid Infrastructure**: This is an optional field. It is required if you plan to use this database pool for live cloning using a database using ASM.

4. Enter a name and description for the database pool.

5. Specify the following details:
   - **PaaS Infrastructure Zone**: Select the PaaS Infrastructure Zone into which the database instance is to be provisioned.
   - **Database Configuration**: Specify the configuration of the database being provisioned. This can either be Single Instance or Cluster Database (RAC) but cannot be a combination of both.
   - **Platform and Version**: Specify the platform and version of the database being deployed.

6. Click Add and select one or more Oracle Homes to be added to the database pool.
7. In the Maximum Number of Database Instances (per host), enter the maximum number of database instances that can be running on each host in the pool.

**Note:**
For RAC databases, the value specified in this field is used to ensure that the nodes on which the database is be created meets this criteria.

8. Click Submit to create a database pool. The newly created pool will appear in the Database Cloud Self Service Portal Setup: Database Pools page. The database pool can now be added to the Service Template.

21.1.2 Creating a Database Provisioning Profile

You can create either of the following types of profiles:

- RMAN Backup. See Creating a Database Provisioning Profile Using RMAN Backup.
- Existing RMAN Backup. See Creating a Database Provisioning Profile Using Existing RMAN Backup.

**Note:**
It is recommended that you create the profile from a database that is designated as the test master database. For details on setting up the test master, see Enabling the Test Master for Snap Clone.

21.1.2.1 Creating a Database Provisioning Profile Using RMAN Backup

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using any of the following ways:
   - From the Enterprise menu, select Cloud, and then select Cloud Home. On the Cloud home page, click Oracle Cloud, select Setup, and then select Data Sources. On the Database: Data Sources page, in the Data Profiles tab, click Create.
   - From the Enterprise menu, select Provisioning and Patching, and then select Database Provisioning. On the Database Provisioning page, in the Profiles section, click Create.
   - From the database target home page, click Oracle Database, select Provisioning, and then select Create Provisioning Profile.

2. On the Reference Target page, click the search icon to select a target.

3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click Select.

4. On the Reference Target page, select the following:
   - Data Content
• **Structure and Data** to include physical and structural files from the database.

• **Create**

• **RMAN Backup**

5. In the Credentials section, select the database. In the Credentials column, you can select **Named Credentials** and then select a credential name from the Credential Name column (or) select **Preferred Credentials**. Click **Next**.

6. The Content Options page appears. On this page, do the following:

   • Select **Online Backup** or **Offline Backup**.

   • Enter the number of channels.

   **Note:**

   A channel is the connection between the RMAN and the database. The usage of channels in RMAN backups sets the degree of parallelism. Each channel represents one stream of data to the device type. The more number of channels you allocate, the faster the backup jobs run. The maximum number of channels you can use is 25.

   • (optional) Select **Compress files** and then select **High**, **Medium**, or **Low** strength of compression.

   • (optional) Select **Use File Encryption** and then, enter the password and confirm the password.

   • Select **Directory** for the Backup location, and enter the directory path (or) select **Fast Recovery Area**, which already contains a backup location.

   **Note:**

   Ensure that the given location is accessible to the nodes in the database pool.

   • Enter the backup file name format. This will be used to generate backup files. backup file tag, control file name, and control file tag.
• Enter the backup file tag. Backup files will be tagged with this tag.

• Enter the control file name. The control file backup will be generated with this name.

• Click Next.

7. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:

• Specify or select a profile location in the software library where the database profile will be created.

• Specify a unique profile name.
  
  For example:
  RMAN Backup Profile for HR database

• Add a description for the profile.

• Verify the profile version and the vendor.

• Add any additional notes such as host name, database, data content, data content mode, and the like.

8. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.
9. In the Purge Policy section, you have three options:
   - **None.** Select this option if you do not want to purge any data collected.
   - **Snapshots.** This option enables you to specify the maximum number of snapshots that can be purged.
   - **Day(s).** This option enables you to specify the number of days after which the data component should be purged.

10. Specify or select a working directory. Click **Next**.

11. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 21.1.2.2 Creating a Database Provisioning Profile Using Existing RMAN Backup

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   - From the **Enterprise** menu, select **Cloud**, and then select **Cloud Home**. On the Cloud home page, click **Oracle Cloud**, select **Setup**, and then select **Data Sources**. On the Database: Data Sources page, in the Data Profiles tab, click **Create**.
   - From the Enterprise menu, select **Provisioning and Patching**, and then select **Database Provisioning**. On the Database Provisioning page, in the Profiles section, click **Create**.
   - From the database target home page, click **Oracle Database**, select **Provisioning**, and then select **Create Provisioning Profile**.
2. On the Reference Target page, click the search icon to select a target.
3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click **Select**.

4. On the Reference Target page, select the following:
   - **Data Content**
   - **Structure and Data** to include physical and structural files from the database.
   - **Use Existing RMAN Backup**
5. In the Credentials section, select the database. In the Credentials column, you can select Named Credentials and then select a credential name from the Credential Name column (or) select Preferred Credentials. Click Next.

6. On the Content Options page, select an existing RMAN backup from the list provided.

**Note:**

The list of existing RMAN backups are fetched from the database. Backups with multiple tags are supported.

Click Next.
7. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:
   • Specify or select a profile location in the software library where the database profile will be created.
   • Specify a unique profile name.
     For example:
     Existing RMAN Backup Profile for HR database
   • Add a description for the profile.
   • Verify the profile version and the vendor.
   • Add any additional notes such as host name, database, data content, data content mode, and the like.

8. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

9. In the Purge Policy section, you have three options:
   • None. Select this option you do not want to purge any data collected.
   • Snapshots. This option enables you to specify the maximum number of snapshots that can be purged.
   • Day(s). This option enables you to specify the number of days after which the data component should be purged.

---

Note:

If a periodic RMAN profile is being used in a Service Template, then as an SSA_admin, you need to device a way to synchronously transfer all the backup pieces to a shared location among the Pool. Else, you need to take the backup on a shared nfs directory.
10. Specify or select a working directory. Click **Next**.

11. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 21.1.3 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. See **Configuring Request Settings**.

### 21.1.4 Defining Quotas

After configuring the request settings, you must define quotas for each self service user. See **Setting Up Quotas**.

### 21.1.5 Create Service Template Using RMAN Backup Profile

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.
3. Click the **Setup** link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the **Service Templates** link. The Service Templates page appears. Click **Create**. The Create Service Template: General page appears.

![Figure 21-2  Create Service Template (RMAN Backup)](image)

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source Identification section, select the **Using Profile** radio button, click the **Search** icon and select a RMAN Backup profile from the list.

7. In the Profile Version field, you can select either of the following:
   - Latest: This ensures that the latest profile is always used by the self service user.
   - Selected by user at request time: If this option is selected, the self service user can select a revision of the profile that is to be used when creating a service request.

8. In the Database Definition region, specify the following:
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - **Database SID**: This is an optional field. You can select **Specify Prefix** or **Specified by User at Request Time**.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.
     
     The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

     For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique
name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And In progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

- **Specified by User at Request Time:** If you choose this option, you can leave this field blank and specify the SID when you are making a database request.

- **Domain Name:** This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

- **Enable Standby Database:** Select this checkbox if you want to provision standby databases using this service template. If this checkbox is selected, you have to add standby databases.

9. In the Zones region, click **Add** to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click **Assign Pool**. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. Specify a Shared Location and click **Next**.

12. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number. Click **Next**. The Create Service Template: Database page appears.

**Figure 21-3  Create Service Template: Database (RMAN Backup)**

13. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.
The database values such as a Automatic Storage Management (ASM) disk group, location of the file system, and listener port you select must be available on the reference host.

14. Specify the following:
   - **Storage Type**: This can be:
     - **Automatic Storage Management**: The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select the Disk Group here.
     - **File System**: The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify or select the Location of the File System.
   - **Fast Recovery** (Optional): To simplify the management of backup and recovery files, you can create a fast recovery area for your database. Select the **Enable Fast Recovery Area** checkbox to specify the location in which recovery related files must be stored. The fast recovery area can be a ASM disk group or a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

   If the **Enable Archiving** check box is selected, the database will not be shut down during a refresh. This allows self service users to schedule backups and restore operations without shutting down the database.

15. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

16. Specify the **Administrator Credentials**. Specify passwords for the system schemas of the new database. These schemas will not be available to the EM_SSA_USERS. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the EM_ADMINISTRATOR can change them.

17. Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password. These schemas will be locked and the EM_SSA_USERS cannot access them.

18. Enter the name of the Master Account. You can specify the privileges that are to be provided to the master account user by specifying them in the Privileges field. Click Next.

19. Click Next. The Create Service Template: Initialization Parameters page appears. In this page, you can specify the following:
   - **Database Sizes**: Select the database sizes that are to be supported by this service template. You can select sizes such as small, medium, and large. Each database size has a specific memory, storage, CPU cores, and units. Select a size and select **Include in Template** to associate it with the service template. Click Default to designate it as the default database size.
• Initialization Parameters: You can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the Set icon to modify the value of the parameter.

20. Click Next. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

You can also specify a custom Post SQL Script and select the user who can run the script. For more details, see Selecting the Post SQL Script.

21. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. These properties will be applied to the database clones that are created. You can do the following:

• Mark a property as mandatory by selecting the Required check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.

• Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

22. Click Next. The Create Service Template: Roles page appears. Click Add to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click Next.

21.1.6 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

21.1.7 Requesting a Database

The self service user can now select the service template based on the database template profile and create a database. See Requesting a Database.

21.2 Creating a Full Database Clone Using RMAN Duplicate from the Self Service Portal

You can use the RMAN Duplicate feature to create a test master and use the test master to create a full database clone.

#### 21.2.1 Creating a Service Template Using RMAN Duplicate

To create a service template using an existing database, follow these steps:

1. Log into Enterprise Manager as a user with the `EM_SSA_ADMINISTRATOR` role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.
3. Click the **Setup** link next to the Databases option in the left panel. Select **Database** from the drop down menu.
4. Click the **Service Templates** link. The Service Templates page appears. Click **Create**. The Create Service Template: General page appears.

![Create Service Template: General: RMAN Duplicate](image)

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.
6. In the Source Identification section, select the **Using Existing Database** radio button, click the **Search** icon and select the test master database that you had created earlier.
7. Specify the host and database credentials.

8. In the Database Definition region, specify the following:
   - **Create**: Select **Full Clone Using RMAN Duplicate**. This option is used to create a full database clone using an existing database.
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - **Database SID**: This is an optional field. You can select **Specify Prefix** or **Specified by User at Request Time**.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters. The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.
     - **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.
   - **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

9. In the Zones region, click **Add** to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click **Assign Pool**. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. Specify a Shared Location and click **Next**.

12. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number. Click **Next**. The Create Service Template: Database page appears.

13. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.
   The database values such as a Automatic Storage Management (ASM) disk group, location of the file system, and listener port you select must be available on the reference host.

14. Specify the following:
   - **Storage Type**: This can be:
1. **Automatic Storage Management:** The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select the Disk Group here.

2. **File System:** The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify or select the Location of the File System.

3. **Fast Recovery (Optional):** To simplify the management of backup and recovery files, you can create a fast recovery area for your database. Select the **Enable Fast Recovery Area** checkbox to specify the location in which recovery related files must be stored. The fast recovery area can be an ASM disk group or a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

4. If the **Enable Archiving** check box is selected, the database will not be shut down during a refresh. This allows self service users to schedule backups and restore operations without shutting down the database.

15. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

16. Specify the **Administrator Credentials**. Specify passwords for the system schemas of the new database. These schemas will not be available to the **EM_SSA_USERS**. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the **EM_ADMINISTRATOR** can change them.

17. Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password. These schemas will be locked and the **EM_SSA_USERS** cannot access them. Click **Next**.

18. Click **Next**. The Create Service Template: Initialization Parameters page appears. In this page, you can specify the following:

   • **Database Sizes:** Select the database sizes that are to be supported by this service template. You can select sizes such as small, medium, and large. Each database size has a specific memory, storage, CPU cores, and units. Select a size and select **Include in Template** to associate it with the service template. Click **Default** to designate it as the default database size.

   • **Initialization Parameters:** You can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the **Set** icon to modify the value of the parameter.

19. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See **Pre and Post Request Creation / Deletion Scripts** for details.

20. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:
• Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.

• Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

21. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

22. The Create Service Template: Review page appears. Click **Create**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page.
Creating Snap Clones

This chapter describes how to create snap clones. It contains the following sections:

- About Snap Clones
- Registering and Managing Storage Servers
- Creating Test Master Pluggable Databases and Snapshot Clones

22.1 About Data Lifecycle Management

The Enterprise Manager Data Lifecycle Management solution provides a complete end to end automated flow to move data from the production environment to the test environment.

In a production environment, the database administrator will first take a backup of this production database, create a test master database from the backup, then mask the sensitive data, and finally create clones from the test master. The clones then need to be refreshed as required to ensure that the data is in sync with the production data. With the Data Lifecycle Management solution, this process is completely automated and can be performed either from the Cloning Dashboard or through the Self Service Portal.

22.2 About Snap Clones

Snap Clone provides a storage agnostic approach to creating rapid and space efficient clones of large databases. Clones of the production database are often required for test and development purposes, and it is difficult and time consuming to create these clones, especially if the databases are huge.

Enterprise Manager offers Snap Clone as a way to address this issue, so that thin clones can be created from production databases by using the copy on write technology available in some storage systems. This means that these clones take up little space initially (about 2 GB of writable space required for a thin clone of a multi-terabyte database), and will grow as inserts, updates and deletes are performed. Enterprise Manager offers two solutions with snap clone:

- Hardware Solution: Vendor specific hardware solution which supports NetApps, Oracle Sun ZFS storage appliance, EMC VMAX, and VNX.
- Software Solution: Storage agnostic software solution that supports all NAS and SAN storage devices. This is supported through use of the ZFS file system, and the CloneDB feature.

The main features of snap clone are:

- Self Service Driven Approach: Empowers the self service user to clone databases as required on an ad-hoc basis.
- Rapid Cloning: Databases can be cloned in minutes and not in days or weeks.
22.3 Registering and Managing Storage Servers

22.3.1 Overview of Registering Storage Servers

Registering a storage server, such as NetApp storage server, Sun ZFS storage server, or EMC storage server in Enterprise Manager enables you to provision databases using the snapshot and cloning features provided by the storage.

The registration process validates the storage, and discovers the Enterprise Manager managed database targets on this storage. Once the databases are discovered, you can enable them for Snap Clone. Snap Clone is the process of creating database clones using the Storage Snapshot technology.

Note:

Databases on Windows operating systems are not supported.

22.3.2 Before You Begin

Before you begin, note the following:

- Windows databases are not discovered as part of storage discovery. This is because the Windows storage NFS collection does not happen at all. NFS collection is also not supported on certain OS releases, and thus databases on those OS releases cannot be Snap Cloned. For further details please refer to the My Oracle Support note 465472.1. Also, NAS volumes cannot be used on Windows for supporting Oracle databases.
Snap Clone is supported on Sun ZFS Storage 7120, 7320, 7410, 7420 and ZS3 models, NetApp 8 hardware in 7-mode and c-mode, EMC VMAX 10K and VNX 5300, and Solaris ZFS Filesystem.

Snap Clone supports Sun ZFS storage on HP-UX hosts only if the OS version is B.11.31 or higher. If the OS version is lower than that, the Sun Storage may not function properly thereby Snap Clone gives unexpected results.

By default, the maximum number of NFS file systems that Enterprise Manager discovers on a target host is 100. However, this threshold is configurable. You can also choose a list of file systems to be monitored if you do not want all the extra file systems to be monitored.

The configuration file $agent_inst/sysman/emd/emagent_storage.config for each host agent contains various storage monitoring related parameters.

To configure the threshold for the NFS file systems, you need to edit the following parameters:

```
Collection Size:START
Disks=1000
FileSystems=1000
Volumes=1000
Collection Size:END
```

If you choose to provide a list of file systems to be monitored, it can be provided between the following lines:

```
FileSystems:START
FileSystems:END
```

Restart the Management Agent and refresh the host configuration for the changes to this configuration file to be effective.

If the OMS Repository is running on RDBMS with 11.1.0.7.0 and AL32UTF8 character set, you need to apply patch 11893621.

### 22.3.3 Prerequisites for Registering Storage Servers

Before you register a storage server, follow the prerequisites outlined in the following sections:

- **Configuring Storage Servers**
- **Customizing Storage Proxy Agents**

#### 22.3.3.1 Configuring Storage Servers

Before you register a storage server, you require the following privileges and licenses to successfully use Snap Clone:

- **Configuring NetApp Hardware**
- **Configuring Sun ZFS and ZS3 Hardware**
- **Configuring Solaris File System (ZFS) Storage Servers**
- **Configuring EMC Storage Servers**
Enterprise Manager Cloud Control 13c supports NetApp, Sun ZFS, Solaris File System (ZFS) and EMC storage servers.

Configuring NetApp Hardware

This section consists of the following:

- Obtaining NetApp Hardware Privileges
- Obtaining NetApp Hardware Licenses
- Creating NetApp Storage Credentials
- Configuring NetApp 8 Cluster Mode Hardware
- NetApp 8 Configuration Supported with Cluster Mode
- Preparing the NetApp 8 Storage and SVM

Obtaining NetApp Hardware Privileges

Privileges is a generic term. NetApp refers to privileges as Capabilities.

For NetApp storage server, to use Snap Clone, assign the following privileges or capabilities to the NetApp storage credentials:

- api-aggr-list-info
- api-aggr-options-list-info
- api-file-delete-file
- api-file-get-file-info
- api-file-read-file
- api-license-list-info
- api-nfs-exportfs-append-rules
- api-nfs-exportfs-delete-rules
- api-nfs-exportfs-list-rules
- api-nfs-exportfs-modify-rule
- api-snapshot-create
- api-snapshot-delete
- api-snapshot-list-info

You can assign these capabilities individually or by using wildcard notations. For example:

'api-volume-*', 'api-*', 'cli-*'
Obtaining NetApp Hardware Licenses

Snap Clone on a NetApp storage server requires a valid license for the following services:

- flex_clone
- nfs
- snaprestore

Creating NetApp Storage Credentials

To create the NetApp storage credentials, follow these steps:
1. Create ROLE `em_smf_admin_role` with all the recommended capabilities, such as `api-aggr-list-info`, `api-file-delete-file`, and the like.

2. Create GROUP `em_smf_admin_group` with the ROLE `em_smf_admin_role`.

3. Create USER `em_smf_admin` with GROUP `em_smf_admin_group` and a secure password.

**Note:**

The user `em_smf_admin` must be a dedicated user to be used by Oracle Enterprise Manager. Oracle does not recommend sharing this account for any other purposes.

---

**Configuring NetApp 8 Cluster Mode Hardware**

This topic discusses how to setup NetApp 8 cluster mode (c-mode) hardware for supporting Snap Clone in Enterprise Manager Cloud Control 13c.

NetApp 8 hardware in 7-mode is already supported for Snap Clone.

To configure NetApp 8 c-mode hardware, refer to the following sections:

- **NetApp 8 Configuration Supported with Cluster Mode**
- **Preparing the NetApp 8 Storage and SVM**

**NetApp 8 Configuration Supported with Cluster Mode**

The configuration supported with c-mode is as follows:

- Snap Clone features are supported only with SVM (Vserver).
- Registration of a physical cluster node is not supported.
- Multiple SVMs can be registered with Enterprise Manager Cloud Control 13c. All the registered SVMs are managed independently.

**Preparing the NetApp 8 Storage and SVM**

To prepare the NetApp 8 storage and SVM, ensure that the following requirements are done:

- The NetApp 8 c-mode hardware should have an SVM created. If not, you should create an SVM which will be registered with the Enterprise Manager.
- The SVM should have a network interface (LIF) with both Management and Data access. The domain name and IP address of this interface should be provided on the Storage Registration page in the Enterprise Manager.
• There should be at least one aggregate (volume) assigned to the SVM. The aggregates should not be shared between the SVMs.

• The SVM should have a user account that has the vsadmin-volume role assigned for ontapi access.

The user credentials should be supplied on the Storage Registration page in the Enterprise Manager.

• The root volume of SVM should have an export policy with a rule that allows Read Only access to all hosts. If you are using NFS v4, then the Superuser access needs to be granted from the Modify Export Rule dialog box.

**Note:**

- A directory named `em_volumes` is created with permissions 0444 inside the root volume of SVM. This directory will be used as an Enterprise Manager name space for the junction point.

- All the storage volumes created will use the junction point `/em_volumes` in the name space.

**Note:**

When you register an SVM in Enterprise Manager Cloud Control, the details of all the aggregates assigned to it are fetched. The total size of an aggregate is required to set the quota, perform space computation, and for reporting.

Presently, NetApp does not provide any Data ONTAP API to fetch the aggregate total size from an SVM. As a workaround, the available size of an aggregate is considered as the total size and is set as the Storage Ceiling during first Synchronize run. Storage Ceiling is the maximum amount of space that Enterprise Manager can use in an aggregate.

If the total space of an aggregate is increased on the storage, you can increase the Storage Ceiling till you consume the available space in that aggregate.

### Configuring Sun ZFS and ZS3 Hardware

This section consists of the following:

- Obtaining Sun ZFS Hardware Privileges
- Obtaining Sun ZFS Hardware Licenses
- Creating Sun ZFS Storage Credentials

#### Obtaining Sun ZFS Hardware Privileges

*Privileges* is a generic term. For example, Sun ZFS refers to privileges as *Permissions.*
For Sun ZFS storage server, to use Snap Clone, assign the following privileges or permissions to the Sun ZFS storage credentials:

**Note:**

All the permissions listed must be set to `true`. The scope must be `nas` and there must not be any further filters.

- changeProtocolProps
- changeSpaceProps
- clone and createShare
- destroy
- rollback
- takeSnap

Obtaining Sun ZFS Hardware Licenses

Snap Clone on Sun ZFS Storage Appliance requires a license for the Clones feature. A restricted-use license for the same is included with the Enterprise Manager Snap Clone.

Creating Sun ZFS Storage Credentials

To create the Sun ZFS storage credentials, follow these steps:

1. Create ROLE `em_smf_admin_role`.
2. Create AUTHORIZATIONS for the ROLE `em_smf_admin_role`.
3. Set SCOPE as `nas`.
4. Set the recommended permissions, such as, `allow_changeProtocolProps`, `allow_changeSpaceProps`, and the like to `true`.
5. Create USER `em_smf_admin` and set its ROLE property as `em_smf_admin_role`.

**Note:**

The user `em_smf_admin` must be a dedicated user to be used by Oracle Enterprise Manager. Oracle does not recommend sharing this account for any other purposes.

Configuring Solaris File System (ZFS) Storage Servers

This section consists of the following:

- Obtaining Solaris File System (ZFS) Privileges
- Obtaining Solaris File System (ZFS) Licenses
- Setting Up Solaris File System (ZFS) Storage Servers
Obtaining Solaris File System (ZFS) Privileges

Solaris File System (ZFS) refers to privileges as Permissions. For Solaris File System (ZFS) storage server, to use Snap Clone, grant the following permissions on the pool for the Solaris File System (ZFS) user:

- clone
- create
- destroy
- mount
- rename
- rollback
- share
- snapshot
- quota
- reservation
- sharenfs
- canmount
- recordsize

Obtaining Solaris File System (ZFS) Licenses

Solaris File System (ZFS) does not require any special hardware license. Only Oracle Solaris OS version 11.1 is supported.

Setting Up Solaris File System (ZFS) Storage Servers

Solaris File System (ZFS) storage servers can work with any storage hardware. You do not need to buy any additional storage hardware. Instead, you can attach your in-house storage hardware and to acquire the Oracle Snap Clone functionality. For example, you can attach LUNs from an EMC VMAX, VNX systems, a Hitachi VSP, or an Oracle Pillar Axiom FC array.

The following storage topology figure explains how this works:

Note:

This figure assumes that you have a SAN storage device with 4 x 1TB logical unit devices exposed to the Solaris File System (ZFS) storage server.
This section contains the following:

- **Prerequisites for Setting Up Solaris File System (ZFS) Storage Servers**
- **Requirements for Storage Area Network Storage**
- **Recommendations for Solaris File System (ZFS) Pools**
- **Configuring Solaris File System (ZFS) Users and Pools**

**Prerequisites for Setting Up Solaris File System (ZFS) Storage Servers**

Before you configure a Solaris File System (ZFS) storage server, ensure that you meet requirements:

- Ensure that `zfs_arc_max` is not set in `/etc/system`. If it needs to be set ensure that it is set to a high value such as 80% of RAM.
- Ensure that the storage server is configured with multiple LUNs. Each LUN should be a maximum of 1TB. A minimum 2 LUNs of 1TB each is recommended for a Snap Clone. Each LUN should have a mirror LUN which is mounted on the host over a different controller to isolate failover. A LUN can be attached to the Solaris host over Fibre Channel for better performance.

**Note:**

If Fibre Channel is not available, any direct attached storage or iSCSI based LUNs are sufficient.

- All LUNs used in a pool should be equal in size. It is preferable to use less than 12 LUNs in a pool.
- Apart from LUNs, the storage needs cache and log devices to improve zpool performance. Both these devices should ideally be individual flash/SSD devices. In case it's difficult to procure individual devices, one can use slices cut from a single device. Log device needs to be about 32GB in size and also have redundancy and
battery backup to prevent data loss. Cache device can be about 128GB in size and need not have redundancy.

**Requirements for Storage Area Network Storage**

The requirements for Storage Area Network (SAN) storage are as follows:

- It is recommended to create large LUNs and lesser number of LUNs. The maximum recommended size for a LUN is 3TB.
- LUNs should come from different SAN storage pools or an entirely different SAN storage device. These LUNs are needed for mirroring, to maintain the pool level redundancy. If your SAN storage maintains a hardware level redundancy, then you can skip this requirement.
- The LUNs should be exposed over Fiber Channel.

**Recommendations for Solaris File System (ZFS) Pools**

The recommendations for Solaris File system (ZFS) pools are as follows:

- Create the Storage pool with multiple LUNs of the same size. You can add more disks to the storage pool to increase the size based on your usage.
- The storage pool created on the Solaris File System (ZFS) storage server should use the LUNs coming from a different SAN storage pool or an entirely different SAN storage device. You can skip this if your SAN storage maintains hardware level redundancy.
- To repair data inconsistencies, use ZFS redundancy such as mirror, RAIDZ, RAIDZ-2 or RAIDZ-3 to repair data inconsistencies, regardless of whether RAIDZ is implemented at the underlying storage device.
- For better throughput and performance, use cache and log devices. Both these devices should ideally be on individual flash/SSD devices. In case of difficulty in procuring individual devices, you can use slices cut from a single device.

It is recommended to have the Log device at about 50% of RAM and also have redundancy and battery backup to prevent data loss. Cache device size could be based on the size of the workload and the pool.

Cache device do not support redundancy. This is optional.

- While creating the pool, it has to be sized to accommodate the test master database along with the cloned databases. A clone will co-exist with the parent database in the same storage pool. Therefore, you should plan for test master and clone capacity well ahead.

For example, The size of the test master is 1TB and you expect to create 10 clones with each of them expected to differ from the test master by 100G. Then, the storage pool should be minimum 2.5TB in size.

- Maintain the storage pool with at least 20% free space. If the free space falls below this level, then the performance of the pool degrades.

**Configuring Solaris File System (ZFS) Users and Pools**

You need to create a user which will be able to administer the storage from Enterprise Manager. To do this, run the following commands as root user:
# /sbin/useradd -d /home/emzfsadm -s /bin/bash emzfsadm
# passwd emzfsadm

Note:
The username should be less than or equal to 8 characters.

You need to configure the ZFS pool that is used to host volumes, and grant privileges on this pool to the user created. The `emzfsadm` user should have the privileges on all the zpools and its mount points in the system.

To configure the ZFS pool, refer to the following table and run the following commands:

Note:
The table displays a reference implementation, and you can choose to change this as required.

<table>
<thead>
<tr>
<th>Pool Name</th>
<th>lunpool</th>
</tr>
</thead>
<tbody>
<tr>
<td>Disks (SAN exposed LUNs over FC/iSCI)</td>
<td>lun1=c9t5006016E3DE0340Ed0, lun2=c9t5006016E3DE0340Ed1</td>
</tr>
<tr>
<td>Disks Mirror (SAN exposed LUNs over FC/iSCI)</td>
<td>mir1=c10t5006016E3DE0340Ed2, mir2=c10t5006016E3DE0340Ed3</td>
</tr>
<tr>
<td>Flash/SSD disk (log)</td>
<td>ssd1=c4t0d0s0</td>
</tr>
<tr>
<td>Flash/SSD disk (cache)</td>
<td>ssd2=c4t0d1s0</td>
</tr>
</tbody>
</table>

# zpool create lunpool mirror lun1=c9t5006016E3DE0340Ed0 mir1=c10t5006016E3DE0340Ed2 mirror lun2=c9t5006016E3DE0340Ed1 mir2=c10t5006016E3DE0340Ed3 log ssd1=c4t0d0s0 cache ssd2=c4t0d1s0

Example format output is as follows:

bash-4.1# /usr/sbin/format
Searching for disks...done

AVAILABLE DISK SELECTIONS:
0. c9t5006016E3DE0340Ed0 <DGC-VRAID-0532-1.00TB> /pci@78,0/pci8086,3c083/pci110df,f10080/fp@0,0/disk@w5006016e3de0340e,0
1. c9t5006016E3DE0340Ed1 <DGC-VRAID-0532-1.00TB> /pci@78,0/pci8086,3c083/pci110df,f10080/fp@0,0/disk@w5006016e3de0340e,1

### Configuring EMC Storage Servers

Before you use an EMC Symmetrix VMAX Family or an EMC VNX storage server, you need to first setup the EMC storage hardware for supporting Snap Clone in Oracle Enterprise Manager 13c. Ensure that all the requirements are met in the following sections:

- Supported Configuration for EMC Storage Servers
- Requirements for EMC Symmetrix VMAX Family and Database Servers
- Preparing the Storage Area Network
- Understanding VMAX Terminology
- Preparing the EMC VMAX Storage
- Preparing the EMC VNX Storage
- Preparing Database Servers
- Setting Privileged Host Monitoring Credentials

### Supported Configuration for EMC Storage Servers

Before you configure the EMC Symmetrix VMAX family or the EMC VNX storage server, check the following list. The list displays components that are supported and are not supported for EMC VMAX and EMC VNX storage.

- EMC VMAX 10K and VNX 5300 are certified to use. Higher models in the same series are expected to work.
- Only Linux and Solaris operating systems are supported. Other operating systems are not yet supported.
- Multi-pathing is mandatory.
- Only EMC PowerPath, and Solaris MPxIO are supported.
Switched fabric is supported. Arbitrated loop is not supported.

- Emulex (LPe12002-E) host bus adapters are certified to use. Other adapters are expected to work.
- SCSI over Fibre Channel is supported. iSCSI, NAS are not yet supported.
- Oracle Grid Infrastructure 11.2 is supported.
- Oracle Grid Infrastructure 12.1 with Local ASM Storage option is supported. Flex ASM is not supported.
- ASM Filter Driver is not supported.
- ASM support is only for raw devices. File System is not supported.
- Support for Thin Volumes (TDEV) on VMAX.
- Support for only LUNs on VNX. NAS is not yet supported.

Requirements for EMC Symmetrix VMAX Family and Database Servers

The requirement for the operating system version of EMC Symmetrix VMAX Family is:

- EMC VMAX Enginuity Version: 5876.251.161 and above
- SMI-S Provider Version: V4.6.1.6 and above
- Solutions Enabler Version: V7.6-1755 and above

**Note:**

The EMC VMAX Enginuity version is the Operating System version of the storage.

The SMI-Provider and Solutions Enabler are installed on a host in a SAN.

The requirements for database server are as follows:

**Oracle Database Requirements**

- Oracle Database 10.2.0.5 and higher

**Operating System Requirements**

- Oracle Linux 5 update 8 (compatible with RHEL 5 update 8) and above
- Oracle Linux 6 (compatible with RHEL 6) and above
- Oracle Solaris 10 and 11

**Multipathing Requirements**

- EMC PowerPath Version 5.6 or above as available for Linux Operating System release and kernel version
- EMC PowerPath Version 5.5 or above as available for Oracle Solaris 11.1 release
- EMC PowerPath Version 6 is not supported.
- Solaris MPxIO as available in latest update

**Oracle Grid Infrastructure Requirements**
• Oracle Grid Infrastructure 11.2
• Oracle Grid Infrastructure 12.1. Flex ASM is not supported.

Preparing the Storage Area Network

To prepare the storage area network, follow the configuration steps outlined in each section.

SAN Fabric Configuration

Configure your SAN fabric with multipathing by ensuring the following:

• You must have redundancy at storage, switch and server level.
• Perform the zoning such that multiple paths are configured from the storage to the server.
• Configure the paths such that a failure at a target port, or a switch or a host bus adapter will not cause unavailability of storage LUNs.
• Configure gatekeepers on the host where EMC SMI-S provider is installed. To configure gatekeepers, refer to the documentation available on the EMC website:

SMI-S Provider

You should install the SMI-S provider and Solutions Enabler on one of the servers in the fabric where the storage is configured. To install and configure the SMI-S provider, refer to the documentation available on the EMC website:

The SMI-S provider URL and login credentials are needed to interact with the storage. An example of an SMI-S Service Provider URL is https://rstx4100smis:5989.

These details are needed when you register a storage server. You are required to do the following:

• Ensure that the VMAX or VNX storage is discovered by the SMI-S provider.
• Add the VNX storages to the SMI-S provider.
• Create a user account with administrator privileges in the SMI-S provider to access the VMAX or VNX storage.
• Set a sync interval of 1 hour.

Setup
Understanding VMAX Terminology

The following table outlines VMAX terms that are used in this section. Refer to these terms to gain a better conceptual understanding, before you prepare the EMC VMAX storage.

Table 22-1  VMAX terminologies

<table>
<thead>
<tr>
<th>Term</th>
<th>Definition</th>
</tr>
</thead>
<tbody>
<tr>
<td>Logical Unit</td>
<td>An I/O device is referred to as a Logical Unit.</td>
</tr>
<tr>
<td>Logical Unit Number</td>
<td>A unique address associated with a Logical Unit.</td>
</tr>
<tr>
<td>Initiator</td>
<td>Any Logical Unit that starts a service request to another Logical Unit is referred to as an Initiator.</td>
</tr>
<tr>
<td>Initiator Group</td>
<td>An initiator group is a logical grouping of up to 32 Fibre Channel initiators (HBA ports), eight iSCSI names, or a combination of both. An initiator group may also contain the name of another initiator group to allow the groups to be cascaded to a depth of one.</td>
</tr>
<tr>
<td>Port Group</td>
<td>A port group is a logical grouping of Fibre Channel and/or iSCSI front-end director ports. The only limit on the number of ports in a port group is the number of ports in the Symmetrix system. It is also likely that a port group can contain a subset of the available ports in order to isolate workloads to specific ports. Note: As a pre-requisite, OEM expects a port group created with the name ORACLE_EM_PORT_GROUP and it should contain the required target ports.</td>
</tr>
<tr>
<td>Storage Group</td>
<td>A storage group is a logical grouping of up to 4,096 Symmetrix devices.</td>
</tr>
<tr>
<td>Target</td>
<td>Any Logical Unit to which a service request is targeted is referred to as a Target</td>
</tr>
<tr>
<td>Masking View</td>
<td>A masking view defines an association between one initiator group, one port group, and one storage group. When a masking view is created, the devices in the storage group are mapped to the ports in the port group and masked to the initiators in the initiator group.</td>
</tr>
<tr>
<td>SCSI Command</td>
<td>A service request is referred to as a SCSI command</td>
</tr>
<tr>
<td>Host Bus Adapter (HBA)</td>
<td>The term host bus adapter (HBA) is most often used to refer to a Fibre Channel interface card. Each HBA has a unique World Wide Name (WWN), which is similar to an Ethernet MAC address in that it uses an OUI assigned by the IEEE. However, WWNs are longer (8 bytes). There are two types of WWNs on a HBA: a node WWN (WWNN), which is shared by all ports on a host bus adapter, and a port WWN (WWPN), which is unique to each port. There are HBA models of different speeds: 1Gbit/s, 2Gbit/s, 4Gbit/s, 8Gbit/s, 10Gbit/s, 16Gbit/s and 20Gbit/s.</td>
</tr>
</tbody>
</table>

For more information on VMAX storage and terminologies, refer to the document *EMC Symmetrix VMAX Family with Enginuity* available in the EMC website.

Preparing the EMC VMAX Storage

Configure your EMC VMAX appliance such that it is zoned with all the required nodes where you need to provision databases. To prepare the EMC VMAX storage, do the following on the storage server:

- Ensure that all the Host Initiator ports are available from the storage side.
- It is recommended to create one initiator group per host with corresponding initiators to increase security. The 'Consistent LUNs' property of the immediate parent Initiator Group of the initiators should to set to 'No'
• Create a Port Group called ORACLE_EM_PORT_GROUP to be used by Oracle Enterprise Manager for creating Masking Views. This port group should contain all the target ports that will be viewed collectively by all the hosts registered in the Enterprise Manager Cloud Control system.

For example, host1 views storage ports P1 and P2, and host2 views storage ports P3 and P4. Then, the ORACLE_EM_PORT_GROUP should include all ports P1, P2, P3 and P4. Include only the necessary target ports as needed by the development infrastructure.

• Create a separate Virtual Provisioning Pool also known as Thin Pool, and dedicate it for Oracle Enterprise Manager.

• Ensure that the TimeFinder license is enabled to perform VP Snap

Preparing the EMC VNX Storage

Configure your EMC VNX appliance such that it is zoned with all the required nodes where you need to provision databases. To prepare the EMC VNX storage, do the following on the storage server:

Note:

EMC VNX Storage supports only LUN creation, cloning, and deletion. It does not support NAS.

• Ensure that all host initiator ports are available from the storage side.

• Ensure that the initiators belonging to one host are grouped and named after the Host on the EMC VNX storage.

• Create one storage group with one host for each of the hosts registered in Enterprise Manager.

For example, if initiators i1 and i2 belong to host1, register the initiators under the name Host1. Create a new storage group SG1 and connect Host1 to it. Similarly, create one storage group for each of the hosts that are to be added to Enterprise Manager.

Preparing Database Servers

To prepare your server for Enterprise Manager Snap Clone, ensure the following:

• Servers should be physical and equipped with Host Bus Adapters. NPIV and VMs not supported.

• Configure your servers with recommended and supported multipath software. If you use EMC PowerPath, then enable the PowerPath license. To enable the PowerPath license, use the following command:

  emcpreg -install

• If you need the servers to support Oracle Real Application Clusters, then install Oracle Clusterware.
ASM and Clusterware have to be installed and those components have to be discovered in Enterprise Manager as a target. Once ASM and Clusterware are installed, additional ASM disk groups can be created from Enterprise Manager.

• Enable Privileged Host Monitoring credentials for all the servers. If the server is part of a cluster, then you should enable privileged host monitoring credential for that cluster.

For more details on enabling privileged host monitoring credentials, refer to Oracle Enterprise Manager Framework, Host, and Services Metric Reference Manual.

• If you are using Linux, you should configure Oracle ASMLib, and set the `asm_diskstring` parameter to a valid ASM path. For example:

```
/dev/oracleasm/disks/
```

Update the boot sequence such that the ASMLib service is run first, and then the multipath service.

To install Oracle ASMLib, refer to the following website:

http://www.oracle.com/technetwork/server-storage/linux/install-082632.html

To configure Oracle ASMLib on multipath disks, refer to the following website:

http://www.oracle.com/technetwork/server-storage/linux/multipath-097959.html

Setting Privileged Host Monitoring Credentials

You should set the privilege delegation settings before setting Host monitoring credentials. Do the following:

1. From the **Setup** menu, click on **Security** and then select **Monitoring Credentials**.
2. On the Monitoring Credentials page, select **Cluster** or **Host** according to your requirement and then click **Manage Monitoring Credentials**.
3. On the Cluster Monitoring Credentials page, select **Privileged Host Monitoring Credentials** set for the cluster or host and click **Set Credentials**.

4. In the dialogue box that appears, specify the credentials, and click **Save**.

5. After the host monitoring credentials are set for the cluster, refresh the cluster metrics. Verify if the Storage Area Network metrics get collected for the hosts.
22.3.3.2 Customizing Storage Proxy Agents

A Proxy Agent is required when you register a NetApp, Sun ZFSSA or Solaris File System (ZFS) File System.

Before you register a NetApp storage server, meet the following prerequisites:

- Acquiring Third Party Licenses
- Uploading Storage Vendor SDK
- Overriding the Default SDK
- Overriding Third Party Server Components

Note:

Storage Proxy Agent is supported only on Linux Intel x64 platform.

Acquiring Third Party Licenses

The Storage Management Framework is shipped by default for Linux x86-64 bit platform, and is dependent on the following third party modules:

- Source CPAN - CPAN licensing apply
  - IO::Tty (version 1.10)
  - XML::Simple (version 2.20)
  - Net::SSLeay (version 1.52)
- Open Source - Owner licensing apply
  - OpenSSL (version 1.0.1e)

Uploading Storage Vendor SDK

Before you register a NetApp storage server, do the following:

1. Download the NetApp Manageability SDK version 5.0R1 for all the platforms from the following NetApp support site: http://support.netapp.com/NOW/cgi-bin/software

2. Unzip the 5.1 SDK and package the Perl NetApp Data OnTap Client SDK as a tar file. Generally, you will find the SDK in the lib/perl/NetApp folder. The tar file when extracted should look as follows:

NetApp.tar
  - netapp
    - NaElement.pm
    - NaServer.pm
    - NaErrno.pm

For example, the Software Library entity Storage Management Framework Third Party/Storage/NetApp/default should have a single file entry that contains NetApp.tar with the above tar structure.
3. Once the tar file is ready, create the following folder hierarchy in software library:
   Storage Management Framework Third Party/Storage/NetApp

4. Upload the tar file as a Generic Component named default.

   **Note:**
   To upload the tar file, you must use the OMS shared filesystem for the software library.

   The tar file should be uploaded to this default software library entity as a Main File.

### Overriding the Default SDK

The default SDK is used for all the NetApp storage servers. However, the storage server may work with only a certain SDK. In such a case, you can override the SDK per storage server, by uploading an SDK and using it only for this particular storage server.

To override the existing SDK for a storage server, upload the tar file to the Software Library entity. The tar file should have the structure as mentioned in Step 3 of the previous section.

The Software Library entity name should be the same as the storage server name.

For example, if the storage server name is `mynetapp.example.com`, then the Software Library entity must be as follows:

Storage Management Framework Third Party/Storage/NetApp/
mynetapp.example.com

   **Note:**
   A storage specific SDK is given a higher preference than the default SDK,

### Overriding Third Party Server Components

By default, all the required third party components are shipped for Linux Intel 64 bit platform. If you need to override it by any chance, package the tar file as follows:
Note:

The tar file should contain a thirdparty folder whose structure should be as mentioned below:

```
thirdparty
  -- lib
  |   -- engines
  |   |   -- lib4758cca.so
  |   |   -- libaep.so
  |   |   -- libbatalla.so
  |   |   -- libcapi.so
  |   |   -- libchil.so
  |   |   -- libcswift.so
  |   |   -- libgmp.so
  |   |   -- libgost.so
  |   |   -- libnuron.so
  |   |   -- libpadlock.so
  |   |   -- libsureware.so
  |   |   -- libubsec.so
  |   -- libcrypto.a
  |   -- libcrypto.so
  |   -- libcrypto.so.1.0.0
  |   -- libssl.a
  |   -- libssl.so
  |   -- libssl.so.1.0.0
  |   -- pm
  -- CPAN
  |   -- IO
  |   |   -- Pty.pm
  |   |   -- Tty
  |   |   |   -- Constant.pm
  |   |   |   -- Tty.pm
  |   |   -- Net
  |   |   -- SSLeay
  |   |   |   -- Handle.pm
  |   |   |   -- SSLeay.pm
  |   |   -- XML
  |   |   -- Simple.pm
  |   -- auto
  |   -- IO
  |   -- Tty
  |   |   -- Tty.bs
  |   |   -- Tty.so
  |   -- Net
  |   -- SSLeay
  -- SSLeay.bs
  -- SSLeay.so
```

Ensure that the tar file is uploaded to the Software Library entity which is named after the platform name, x86_64. The Software Library entity must be under the following:

Storage Management Framework Third Party/Server

The x86_64 entity, when uploaded is copied to all the storage proxy hosts irrespective of which storage server it would be processing. To use this entity on a specific storage proxy agent, name the entity after the host name.
For example, Storage Management Framework/Third Party/Server/x86_64 will be copied to any storage proxy host which is on an x86_64 platform. Similarly, Storage Management Framework Third Party/Server/myhost.example.com is copied only to myhost.example.com, if it is used as a storage proxy host.

The host name is given a higher preference than the platform preference.

22.3.4 Registering Storage Servers

To register a particular storage server, follow the procedure outlined in the respective section:

- Registering a NetApp or a Sun ZFS Storage Server
- Registering a Solaris File System (ZFS) Storage Server
- Registering an EMC Storage Server

22.3.4.1 Registering a NetApp or a Sun ZFS Storage Server

To register the storage server, follow these steps:

1. From the Setup menu, click on Provisioning and Patching, and then select Storage Registration.
2. On the Storage Registration page, in the Storage section, click on Register, and then select either NetApp Storage Appliance or Sun ZFS Storage Appliance, based on which storage server you want to register.

Note:

If you see a No named credentials available message, it means that no credentials are registered or the credentials are owned by another user.

Note:

You need the EM_STORAGE_ADMINISTRATOR role to complete the storage registration.
3. On the NetApp or Sun ZFS Storage Registration page, in the Storage section, do the following:

- Enter the storage server name in the Name field. Ensure that the name is the valid host name and contains no spaces and invalid characters.

- Select the protocol.

  **Note:**

  For NetApp storage, the connection is over http or https. For Sun ZFS storage, the connection is over ssh.

- Select the Storage Credentials, or click on the green plus sign to add.

  **Note:**

  These credentials will be used by the Management Agent to execute storage (NetApp or Sun ZFS) APIs. Only credentials owned by the user are displayed here.

  In the display box that appears, enter the storage server name and password. Confirm the password and click **OK**.

- Enter storage name aliases (optional). The storage name alias should be in lowercase.
Note:

A storage name alias is any name that may have been used when mounting a volume from the storage.

For example: IP address, FQDN, DNS alias, and the like.

A storage alias is necessary to identify the database targets on the storage. The database targets are identified by mapping the mount points to the files used by the database. For example, if the storage mystorage.com has an alias mystorage.net, and a database uses a data file mounted as mystorage.net:/u01, then mystorage.net must be added as an alias for the discovery to work.

When you register the storage, use the admin interface as the storage name. List the data interfaces in the storage alias section. The registered storage name will be used to perform registration operations and while mounting the volumes on target host, it will give preference to interfaces listed as storage aliases.

4. In the Agent to Manage Storage section, do the following:
   - Click Add to add a Management Agent host. A Storage Agent display box appears. Select a Management Agent from the Target Name column of the table. Then, click Select.

Note:

The Management Agent list displays only Linux X64 Management Agents.
The Management Agent selected is used for performing operations on the storage server.

- Once a Management Agent is selected, the Management Agent credentials are found and a named credential for the host is displayed.

**Note:**

The Management Agent credentials are used to connect to the Management Agent from Oracle Management Service.

Multiple Management Agents can be configured to monitor the storage device. Click **Add** to choose a second Management Agent if required.

**Note:**

Configuring multiple Management Agents to monitor the storage device provides you with a backup in the event that an host is down or the Management Agent is under blackout.
22.3.4.2 Registering a Solaris File System (ZFS) Storage Server

To register the storage server, follow these steps:

1. From the Setup menu, click on Provisioning and Patching, and then select Storage Registration.

2. On the Storage Registration page, in the Storage section, click on Register, and then select Solaris File System (ZFS)

Note:
If you see a No named credentials available message, it means that no credentials are registered or the credentials are owned by another user.

3. On the Register File System (ZFS) page, in the Storage section, do the following:
   - Enter the Solaris system name in the Name field. Ensure that the name is the valid host name or IP address and contains no spaces and invalid characters.
   - Select the protocol.
   - Select the Storage Credentials, or click on the green plus sign to add.

Note:
These credentials will be used by the Management Agent to execute Solaris file system APIs.
Only credentials owned by the user are displayed here.
In the display box that appears, enter the storage server name and password. Confirm the password and click **OK**.

- Enter storage name aliases (optional).

  The storage name alias should be in lowercase.

  **Note:**

  A storage name alias is any name that may have been used when mounting a volume from the storage.

  For example: IP address, FQDN, DNS alias, and the like.

  Storage alias is necessary to identify the database targets on the storage. The database targets are identified by mapping the mount points to the files used by the database. For example, if the storage mystorage.com has an alias mystorage.net, and a database uses a data file mounted as mystorage.net:/u01, then mystorage.net must be added as an alias for the discovery to work.

  When you register the storage, use the admin interface as the storage name. List the data interfaces in the storage alias section. The registered storage name will be used to perform registration operations and while mounting the volumes on target host, it will give preference to interfaces listed as storage aliases.

4. In the Synchronize Schedule section, specify the frequency to synchronize the storage details with the hardware.

   Ensure that the zpools setup is completed before clicking **Submit**. To setup the zpools, refer to Configuring Solaris File System (ZFS) Users and Pools.

22.3.4.3 Registering an EMC Storage Server

To register the storage server, follow these steps:
Note:
Before you register an EMC storage server, the storage server should be prepared. To prepare the storage server refer to Configuring EMC Storage Servers.

1. From the Setup menu, click on Provisioning and Patching, and then select Storage Registration.

2. On the Storage Registration page, in the Storage section, click on Register, and then select EMC Storage Array.

3. On the Register EMC Storage Appliance page, in the Storage section, do the following:
   - Specify the storage server name in the Name field. Ensure that the name is the valid storage name and contains no spaces and invalid characters.
   - For EMC storage, the connection is over SMI-S protocol. Specify the SMI-S Provider URL.
   - Specify the SMI-S User Credentials, or click on the green plus sign to add.
These credentials are used by the Enterprise Manager to interact with the EMC storage appliance. The credentials should be of the Administrator in the SMI-S provider and not that of the storage. Only credentials owned by the user are displayed here.

In the display box that appears, enter the SMI-S User name and password. Confirm the password and click OK.

4. In the Synchronize Schedule section, specify the frequency to synchronize the storage details with the hardware.

Click Submit.

22.3.5 Administering the Storage Server

To administer the storage server, refer to the following sections:

• Synchronizing Storage Servers
• Deregistering Storage Servers

22.3.5.1 Synchronizing Storage Servers

When you register a storage server for the first time, a synchronize job is run automatically. However, to discover new changes or creations, you should schedule a synchronize job to run at a scheduled time, preferably during a quiet period when Snap Clone actions are not in progress. To do this, follow these steps:

1. On the Storage Registration page, in the Storage section, click Synchronize.
**Note:**

When you click on Synchronize, a deployment procedure is submitted which discovers all databases monitored by Enterprise Manager Cloud Control which can be used for Snap Clone.

Windows databases are not discovered as part of storage discovery. This is because the Windows storage NFS collection does not happen at all. For further details please refer to the MOS note 465472.1

You need `EM_STORAGE_OPERATOR` role along with `GET_CREDENTIAL` privilege on the Storage Server and Storage Management Agent credentials to be able to synchronize the storage.

2. A confirmation box appears. Click **OK**.

![Confirmation](image)

This action now submits a one-time synchronization job.

**Note:**

The synchronization job fetches latest storage information, and recomputes the mapping between storage volumes and databases.

3. On the Storage Registration page, in the Storage section, to view the procedure details of the Management Agent host, click on the value (for example, Scheduled) in the Status column.

![Storage Registration Page](image)

4. On the Provisioning page, in the Procedure Steps section, click **View**, and then select **Expand All**. Keep clicking the Refresh button on the page to view the procedure activity as it progresses.
The synchronization status of the Management Agent on the Storage Registration page, changes to Succeeded once the synchronization process is complete.

5. To update a synchronize schedule of a registered storage server, select a storage server on the Storage Registration page and then click on **Edit**. On the Edit Storage page, in the Synchronize Storage section, edit the repetition time and frequency of the synchronize job.

![Provisioning](image)

**Note:**
The frequency of a synchronization job is set at 3 hours by default.

Click **Submit**.
22.3.5.2 Deregistering Storage Servers

To deregister a registered storage server, follow these steps:

**Note:**

To deregister a storage server, you need `FULL_STORAGE` privilege on the storage along with `FULL_JOB` privilege on the Synchronization GUID of the storage server.

1. From the **Setup** menu, click on **Provisioning and Patching**, and then select **Storage Registration**.
2. On the Storage Registration page, in the Storage section, select a storage server from the list of registered storage servers.
3. Select **Remove**.
   
   On the Remove Storage page, select the storage server that you want to deregister, and then click **Submit**.

   The storage server is now deregistered.

**Note:**

Once a storage is deregistered, the Snap Clone profiles and Service Templates on the storage will no longer be functional, and the relationship between these Profiles, Service Templates and Snap Cloned targets will be lost.

**Note:**

It is recommended to delete the volumes created using Enterprise Manager before deregistering a storage. As a self service user, you should submit deletion requests for the cloned databases.

To submit these deletion requests, click **Remove** from the Hierarchy tab on the Storage Registrations page for deleting the volumes that were created by Enterprise Manager for hosting test master databases.
22.3.6 Managing Storage Servers

To manage the storage server, refer to the following sections:

- Managing Storage Allocation
- Managing Storage Access Privileges
- Viewing Storage Registration Overview and Hierarchy
- Editing Storage Servers

22.3.6.1 Managing Storage Allocation

You can manage storage allocation by performing the following tasks:

- Editing the Storage Ceiling
- Creating Storage Volumes
- Resizing Volumes of a Database
- Creating Thin Volumes (for EMC Storage Servers)
- Example 22-1

**Editing the Storage Ceiling**

*Storage Ceiling* is the maximum amount of storage from a project, aggregate, or thin pool that Enterprise Manager is allowed to use. This ensures that Enterprise Manager creates clones in that project only till this limit is reached. When a storage project is discovered for the first time, the entire capacity of the project is set as the ceiling. In case of Sun ZFS, the quota set on the project is used.

**Note:**

You must explicitly set quota property for the Sun ZFS storage project on the storage end. Also, the project should have a non zero quota set on the storage end. Else, Enterprise Manager will not be able to clone on it.

To edit the storage ceiling, do the following:

1. On the Storage Registration page, from the Storage section, select the storage server for which you want to edit the storage ceiling.
2. Select the **Contents** tab, select the aggregate, and then click **Edit Storage Ceiling**.

**Note:**

*Edit Storage Ceiling* option enables you modify the maximum amount of storage that Enterprise Manager can use. You can create clones or resize volumes only till this limit is reached.
3. In the Edit Storage Ceiling dialog box, enter the storage ceiling, and then, click OK.

Creating Storage Volumes

To create storage volume, do the following:

1. On the Storage Registration page, from the Storage section, select the storage server for which you want to create storage volume.

2. Select the Contents tab, select the aggregate, and then select Create Storage Volumes.

3. On the Create Storage Volumes page, in the Storage Volume Details section, click Add.
4. Select a storage and specify the size in GB (size cannot exceed the storage size). The specified size should be able to accommodate the test master database size, without consuming the entire storage size.

Next, specify a mount point starting with /.

For example,
If the storage is "lunpool", select the "lunpool".
The specified size under the size column should not exceed the storage space. If the size of the "lunpool" is 100GB and the test master database is 10 GB, then specify size as 10GB.
The mount point should be a meaningful mount point starting with "/".
For example: /oracle/oradata

5. In the Host Details section, specify the following:

- **Host Credentials**: Specify the target host credentials of the Oracle software.
- **Storage Purpose**: For using Snap Clone, the most important options are as follows:
  - Oracle Datafiles for RAC
  - Oracle Datafiles for Single Instance

  **Note:**
  You can also store the *OCR and Voting disks and Oracle binaries* in the storage volume,

- **Platform**: Select the supported target platform. The volume will be mounted on the supported target platform.
- **Mount Options**: Mount options field is automatically filled based on the values specified for the storage purpose and the platform. Do not edit the mount options.
  - Select **NFS v3** or **NFS v4**.

6. Select one or more hosts to perform the mount operations by clicking **Add**.

If you select **Oracle Datafiles for RAC**, you would normally specify more than one host. The volume is then mounted on the specified hosts automatically after the completion of the procedure activity.
7. Click **Submit**.

When you click Submit, a procedure activity is executed. On completion of the procedure activity, the volumes get mounted on the target system. You can now proceed to create a test master database on the mounted volumes on the target system.

**Resizing Volumes of a Database**

When a database runs out of space in any of its volumes, you can resize the volume according to your requirement. To resize volume(s) of a clone, follow these steps:

**Note:**

This is not available for EMC storage servers.

**Note:**

Resizing of volumes of a Test Master database cannot be done using Enterprise Manager, unless the volumes for the Test Master were created using the Create Volumes UI.

**Note:**

You need the `FULL_STORAGE` privilege to resize volumes of a database or a clone. Also, ensure that the underlying storage supports quota management of volumes.

1. On the Storage Registration page, from the Storage section select the required storage server.

2. In the Details section, select the **Hierarchy** tab, and then select the target.
The Storage Volume Details table displays the details of the volumes of the target. This enables you to identify which of the volume of the target is running out of space.

3. In the Volume Details table, select **Resize**.

4. On the Resize Storage Volumes page, specify the New Writable Space for the volume or volumes that you want to resize. If you do not want to resize a volume, you can leave the New Writable Space field blank.

5. You can schedule the resize to take place immediately or at a later time.

6. Click **Submit**.

**Note:**
You can monitor the re-size procedure from the **Procedure Activity** tab.

**Creating Thin Volumes**
This section is only for EMC Symmetrix VMAX Family and EMC VNX Storage.

An EMC Symmetrix VMAX Family or an EMC VNX storage enables you to create thin volumes and ASM disks from the created thin volumes. To create thin volumes on an EMC Symmetrix VMAX Family or EMC VNX storage, follow these steps:
Note:

Enterprise Manager enables you to create a thin volume from a thin pool after clusterware and ASM components are installed.

After you install the clusterware and ASM components, the `asm_diskstring` parameter may be set to Null. This could cause failure during creation of the thin pool.

To prevent this from happening, set the `asm_diskstring` parameter to a valid disk path and restart the ASM instance.

For example, set the `asm_diskstring` parameter as:

```
/dev/oracleasm/disks/*
```

1. On the Storage Registration page, in the Storage section, select the EMC Symmetrix VMAX Family or EMX VNX storage on which you want to create thin volumes.

2. In the Details section, select the Contents tab, and then click Create Thin Volume.

3. In the Storage Details section, the ASM Disk Group is set to Create with External Redundancy, by default. ASM Disk Group creation is optional. If you want to create an ASM Disk Group with redundancy you can skip this step for now by selecting Do not create. I will create later. You can then later create it using the Oracle Enterprise Manager ASM target home page or the ASM Configuration Assistant.

4. Click Add to create multiple LUNs of same size and create an ASM disk group with those volumes. You can create one or more disk groups at a time.

5. Select the thin pool/storage pool, and then specify the number of thin volumes, and the size for the thin volume.
Note:

It is recommended to create larger LUNs and lesser number of LUNs. For example, if you want a disk group of size 200 GB, create 1 LUN of size 200 GB and make a disk group out of it. Do not create 10 x 20 GB LUNs for it.

Note:

A thin volume of size more than 240GB is not permitted by default on a VMAX storage. To create thin volumes of size more than 240GB, request the storage administrator to enable auto meta on the VMAX. The storage administrator can remove this restriction or in the alternative, create multiple thin volumes of size less than 240GB.

To create LUNs of size more than 240GB, contact the storage administrator to enable auto meta.

Do not create LUNs of size more than 2TB.

6. In the Host Details section, specify a host or a cluster, or select one by clicking the Search icon. The disks will be created on the ASM instance present on this host or cluster. A single disk partition is created on all the presented disks.

Note:

Only Linux and Solaris hosts are supported.

7. Specify the root and grid infrastructure credentials. Only the credentials that you own are listed.

Click Submit.
Note:

Once a Create Target request succeeds and a diskgroup has been created, you must manually set the attributes of the diskgroup in compatible.asm and compatible.rdbms depending on the version of the database that will be installed on the diskgroup.

Example 22-1  Understanding Space Utilization on EMC Storage Servers

Writable space implementation on EMC Storage Server is different from NetApp, Sun ZFS SA, and Sun ZFS storage servers. In NetApp, Sun ZFS SA, and Sun ZFS storage servers, writable space defined in a service template will be allocated from the storage pool to the clone database even if data is not written to the volume. In EMC storage servers (VMAX and VNX) space is only reserved on the storage pool. The space is consumed only when data is written to the volume or LUN.

For example, if you define 10GB writable space in a service template, in NetApp, Sun ZFS SA, and Sun ZFS, space of 10GB will be allocated to the clone database from storage pool even if data is not written to the volume. In an EMC storage, space is consumed only when data is written to the volume or LUN.

In Enterprise Manager, to create thin volumes (ASM Disk groups/LUNS) up to the maximum size defined for the storage pool, select the Contents tab on the Storage Registration page, and then select Create Thin Volume. The test master database can then be created on ASM Disk groups or LUNs.

The following graphic shows the Test Master database and the created clone database:

The following graphic shows the storage volume of the Test Master database:
The following graphic shows storage volume of the clone database:
Note:

ASM disk groups, as discussed, can be created using the Create Thin Volumes option. However, they can also be created using other methods. The following example illustrates the space usage on EMC VMAX and VNX storage servers:

Let us assume the Storage Pool is of size 1 TB and Storage ceiling is set to 1 TB.

Scenario 1:

If an Enterprise Manager Storage Administrator creates 2 ASM disk groups, as an example, DATA and REDO of sizes 125GB and 75GB respectively through the Create Thin Volume method and the Test Master database is created on those disk groups, used space on DATA and REDO disk groups are 100GB and 50GB respectively (remaining free space on DATA and REDO disk groups are 25GB), then each clone database created by a self service user will be allocated 25GB of writable space on the DATA and REDO disk groups.

New data written to the cloned database is the actual used space and can grow up to 25GB on each disk group. The DATA and REDO disk groups in this scenario.

The Enterprise Manager Storage Administrator will be able to create 600GB LUNs through the Create Thin volume method, assuming a clone database is created from a 200GB Test Master database. The size of the clone database will also be deducted from available space. The Self Service User will be able to create multiple clones. The number of clone databases that can be created cannot be estimated as it depends on the amount of new data written to the initial clone database in that storage pool.

Scenario 2:

If an Enterprise Manager Storage Administrator creates 2 ASM disk groups, as an example, DATA and REDO of sizes 850GB and 150GB respectively through the Create Thin Volume method, and the Test Master database is created on those ASM disk groups, used space on the DATA and REDO disk groups are 750GB and 50GB respectively (remaining free space on DATA and REDO is 100GB), then each clone database created by a self service user will be allocated 100GB of writable space on DATA and REDO disk groups.

New data written to the cloned database is the actual used space and can grow up to 100GB on each disk group. The DATA and REDO disk groups in this scenario.

Similar to Scenario 1, the Self Service User will be able to create multiple clones, but number of clone databases cannot be estimated. The Enterprise Manager Storage Administrator will not be able to create additional disk groups in scenario 2. This is the major difference when compared to Scenario 1.
In both scenarios, only the actual used space of the clones will be subtracted from the Storage Ceiling. The general formula for writable disk space is the difference between the LUN size and the actual space occupied by data.

22.3.6.2 Managing Storage Access Privileges

To manage storage access privileges for a registered storage server, follow these steps:

1. On the Storage Registration page, in the Storage section, select a storage server from the list of registered storage servers.

   **Note:**
   
   The Storage Registration page displays only the databases which you have VIEW_STORAGE privilege on.

2. Click **Manage Access**.

3. On the Manage Access page, do the following:
   - Click **Change**, if you need to change the Owner of the registered storage server.

   **Note:**
   
   The Owner of a registered storage server can perform all actions on the storage server, and grant privileges and roles to other Administrators.
• Click **Add Grant** to grant privileges to an Administrator, Role or both.
• On the Add Grant page, enter an Administrator name or select the type, and then click **Go**.
• Select an Administrator from the list of Administrators or Roles, and then click **Select**.

4. On the Manage Access page, you can change privileges of an Administrator or Role by selecting the Administrator or Role from the Grantee column, and then clicking **Change Privilege**.

5. In the Change Privilege display box, you can select one of the three following privileges:
   • View Storage (ability to view the storage)
   • Manage Storage (ability to edit the storage)
   • Full Storage (ability to edit or remove the storage)
   Click **OK**.

6. You can also revoke a grant to an Administrator by selecting the Administrator from the Grantee column, and then clicking **Revoke Grant**.

7. When you are done with granting, revoking, or changing privileges to Administrators or Roles, click **Submit**.

---

**Note:**

To be able to use the storage server, you also need to specifically grant privileges to the storage server and storage Management Agent credentials to the user.

---

**22.3.6.3 Viewing Storage Registration Overview and Hierarchy**

To view the storage registration overview, on the Storage Registration page, in the Details section, select the **Overview** tab. The Overview section provides a summary of storage usage information. It also displays a Snap Clone Storage Savings graph that shows the total space savings by creating the databases as a Snap Clone versus without Snap Clone.

---

**Note:**

If you have NetApp volumes with no space guarantee, you may see negative allocated space in the Overview tab. Set guarantee to 'volume' to prevent this.
To view the storage registration hierarchy, on the Storage Registration page, in the Details sections, select the **Hierarchy** tab. This displays the storage relationships between the following:

- Test Master Database
- Database Profile
- Snap Clone Database
- Snap Clone Database Snapshots

You can select a row to display the corresponding Volume or Snapshot Details.

If a database profile or Snap Clone database creation was not successful, and it is not possible to delete the entity from its respective user interface, click on the **Remove** button to access the Manage Storage page. From this page, you can submit a procedure to dismount volumes and delete the snapshots or volumes created from an incomplete database profile or snap clone database.

**Note:**

The Manage Storage page only handles cleanup of storage entities and does not remove any database profile or target information from the repository. The **Remove** button is enabled only if you have the **FULL_STORAGE** privilege.

You can also select the **Procedure Activity** tab on the right panel, to see any storage related procedures run against that storage entity.

To view the NFS Exports, select the **Volume Details** tab. Select **View, Columns**, and then select **NFS Exports**.

The Volume Details tab, under the Hierarchy tab also has a **Synchronize** button. This enables you to submit a synchronize target deployment procedure. The deployment procedure collects metrics for a given target and its host, determines which volumes
are used by the target, collects the latest information, and updates the storage registration data model. It can be used when a target has been recently changed, data files added in different locations, and the like.

### 22.3.6.4 Editing Storage Servers

To edit a storage server, on the Storage Registration page, select the storage server and then, click **Edit**. On the Storage Edit page, you can do the following:

- Add or remove aliases.
- Add, remove, or select an Agent that can be used to perform operations on the storage server.
- Specify a frequency to synchronize storage details with the hardware.

**Note:**

If the credentials for editing a storage server are not owned by you, an Override Credentials checkbox will be present in the Storage and Agent to Manage Storage sections. You can choose to use the same credentials or you can override the credentials by selecting the checkbox.

### 22.4 Creating Test Master Databases

This section contains the following topics:

- Creating a Discretely Synchronized Test Master
- Using a Physical Standby Database as a Test Master
- Creating a Storage Test Master

#### 22.4.1 Creating a Discretely Synchronized Test Master

A test master database is a sanitized version of the production database. Production data can be optionally masked before the test master is created. A test master can be created from a snapshot or an RMAN Backup profile taken at a prior point in time and refreshed at specific intervals. This option is useful if the source data has to be masked to hide sensitive data.

To create a test master, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. From the **Oracle Cloud** menu, select **Setup**, then select the Database Service family on the left panel. Select **Data Sources** and click on the **Test Master Databases** tab.

2. To create a new test master, click on the **Create** menu. Select a production database from which the test master is to be created and click **Select**. The Clone Database: Source and Destination page appears.

3. On the Create Test Master Database: Source and Destination page, do the following:

   - In the Source section, launch the credentials selector by selecting the search icons for SYSDBA Database and Database Host credentials. Click **OK**.
• In the Data Time Series section, select Now or Prior Point in Time.

If you selected Now, specify or search and select the SYSASM ASM Credentials. Now refers to Live Clone.

If you selected Prior Point in Time, a carousel of RMAN Backup images appear. Select the appropriate RMAN backup by clicking Select on the image.

Select a specific time between the selected backup or snapshot and the next (or latest point of source). The backups or dumps are created at specific intervals and the test master that is based on these will reflect the production database at specific points in time. To reflect the latest data in the production database, the test master needs to be periodically refreshed.

4. In the Destination Database Definition section, do the following:

• Specify a display name.

• Specify a global database name and SID.

A database is uniquely identified by a Global Database Name. The typical form of a name is name.domain. A database is referenced by at least one Oracle instance which is uniquely identified by SID.

• Select one of the following types of databases:

  – Single Instance Database.

    In the Hosts section, specify the Oracle Home location. The host gets specified by default. Next, select the Database Home credentials and the SYSASM ASM credentials.

  – RAC Database

    In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

    In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

  – RAC One Node Database

    In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

    In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

    **Note:**

    Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

    Click Next.

5. On the Create Test Master Database: Configuration page, do the following.
• Database Files Location: Specify the location in which the data files, temporary files, redo log files, and control files will be created. You must specify a mount point which must be present on a registered storage volume so that the self service administrator can enable this test master for snap clone.

You can select:

– File System: The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify or select the Location of the File System. You can specify a common location for all the files or you can select the Use Oracle Optimal Flexible Architecture-compliant directory structure (OFA) checkbox and specify different locations for data files, redo log files, and so on.

– Automatic Storage Management: The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select a common location for the database files.

• Recovery Files Location: To simplify the management of backup and recovery files, a fast recovery area can be created for your database. The fast recovery area can be a ASM disk group or a file system that provides a centralized disk location for backup and recovery file. To allow self service users to schedule backups and perform restore operations, you can select the Use Fast Recovery Area checkbox and specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

• Listener Configuration: Click Add to add one or more listener targets that are to be associated with the new database.

• Database Credentials: Specify the passwords for the administrative users (SYS, SYSTEM and DBSNMP) of the new database being cloned. You can choose to use the same password for all the schemas or different passwords for each schema.

6. Click Next. Some values such as db_block_size cannot be modified.

7. Click Next. The Create Test Master Database: Post Processing page appears. Specify the following details:

• Masking Definition: Data masking is the process of masking sensitive data in test or non-production databases. The masking definition defines the columns to be masked in the format of the masked data. Specify the masking definition to be applied after the database is cloned. After selecting the masking definition, select the In-Place Masking option to generate a script to replace the sensitive data in-place with masked data on the cloned database. For more details on creating a masking definition, see the Enterprise Manager Database Testing Guide.

Note:

The masking definition can be used only when you have the Oracle Data Masking and Subsetting license pack.
• Specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

• Specify the path for the SQL script which allows you to run the script against the newly cloned database as a user such as SYS, SYSTEM, or any other specified user. The SQL script allows you to customize the cloned database. For more details, see Selecting the Post SQL Script.

• Select the Create Data Profile check box if you wish to create a database provisioning profile that is based on the test master. These profiles can be refreshed automatically or at specified intervals. Different versions of the profile are saved and are available to the self service user until they are purged. This ensures that the test master is periodically updated and the latest data can be used by the self service user. You can create a database provisioning profile if:
  – This version of the test master must be available for cloning in future, even after the test master has been refreshed.

Enter the following details for the profile:

  – Profile Type: Select RMAN Backup or RMAN Image.
  – Backup Mode: If you select the RMAN Backup profile type, you can select one of the following: Select Online Backup to make a backup while the database is up and running. Select Offline Backup to shutdown the database for the duration of backup and bring it back once the backup is complete.
  – Backup Location: Enter the directory path that already contains a backup location.
  – Backup File Tag: Backup files will be tagged with the tag specified here.
  – Location: Select the directory for the backup location.
  – Enter the name, description, version number, vendor, and additional notes.
  – Purge Policy Type: This can be None, Snapshots, or Days. If you select None, the profiles will need to be manually deleted as required. If you select Snapshots, specify the maximum number of snapshots that can be retained. If you select Day(s), specify the number of days the profile can be retained.
  – Schedule: Specify whether the profile needs to be created immediately or at a later date.

8. Click Next. Specify the schedule for the creation of the test master. It can be created immediately (if physical standby used, it is created immediately and automatically refreshed) or can be created at a later date / time and refreshed at specified intervals.

9. Click Next. Review the information entered so far and click Submit to create the test master. After the test master has been created, you can refresh the test master as required to create a new version of the profile on which the test master is based.
22.4.2 Using a Physical Standby Database as a Test Master

A test master database is a sanitized version of the production database. A test master can be created from a live standby database by using the Oracle Data Guard feature. Profiles or snapshots can be created from the test master (see Creating a Database Provisioning Profile Using Snapshots) and these profiles can be used to create snap clones (see Requesting a Database). Since the test master is a physical standby database with live data, you must schedule and create profiles and snapshots on a periodic basis to ensure that the latest data is captured in the profile (see Creating and Refreshing Snapshots of the Test Master). Self service users can create multiple snap clones from each profile and refresh their snap clones (see Refreshing a Database) when a new profile or snapshot become available.

To create a test master, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select the Database Service family on the left panel. Click the Test Master Databases tab.

2. To create a test master from a live standby database, click Add and select a standby database that is to be designated as the test master. The newly added database appears in the Test Master Database page and can be used to create the snap clone database instances.

22.4.2.1 Enabling the Test Master for Snap Clone

After the test master database has been created, you must enable snap clone on the database.

To enable snap clone, follow these steps:

1. On the Storage Registration page, in the Details section, select the Databases tab, and then select the database from the table which you want to use for Snap Clone, and then click Enable Snap Clone.

   The Supported column in the table shows if the databases listed support Snap Clone or not.

   Note: If a database listed shows the Not Supported icon in the Supported column, you can view the Message column from the View menu. This column displays the reason. A possible reason is that the data files are missing on the
storage server and may be located on either local disk or some other unregistered storage server. Another reason could be that the data files reside on another storage that is not synchronized.

2. Once snap clone has been successfully enabled, a confirmation message appears. Click OK.

To view all the files located on the storage server, click **Show Files**. To view all the projects (aggregates), volumes, and snapshots in the storage server, select the **Contents** tab.

### 22.4.3 Creating a Storage Test Master

To create a storage test master, follow these steps:

1. From the **Targets** menu, select **Databases**.
2. On the Databases page, click the name of the database target that you want to create a storage test master for.
3. On the database home page, click **Oracle Database**, select **Cloning**, and then select **Create Snapshot Test Master**.
4. On the Create Storage Test Master page, in the Reference Database section, do the following:
   - Specify the database home credentials.
   - Specify the root credentials of the database.
   - Specify the database credentials.
5. In the Test Master field, specify a unique name for the storage test master that you want to create. For example, **PROD_TM_Storage_TestMaster**.
6. In the Storage Details section, do the following:
   - Select the storage server that you want to use to create a storage test master on.
   - Select the project, size, and mount point for RMAN image backup of data and control files. For example, select **emsdemo01** (2000.00 GB) as the project, select **3.0 GB** as the size, and specify `/PROD_TM_data` as the mount point.
   - Select the project, size, and mount point for archive log backup. For example, select **emsdemo01** (2000.00 GB) as the project, select **4.0 GB** as the size, and specify `/PROD_TM_arch` as the mount point.
7. In the Schedule section, you can choose to create the storage test master immediately, or you can select **Later**, and specify a time of your choice. You can also set a specific time or date to repeat the process.
8. In the Purge Policy section, select either of the following:
   - **None** - If you do not want to purge any data.
   - **Snapshots** - If you want to purge the data after a certain number of snapshots has been created. Select the number of maximum snapshots.
   - **Day(s)** - If you want to purge the data after a certain number of days. Select the number of days.
9. Click **Create**.
22.5 Creating Snap Clone Databases

This section contains the following topics:

• Creating Snap Clones from the Cloning Dashboard
• Creating Snap Clones from a Discretely Synchronized Test Master
• Creating Snap Clones from an In-Sync Test Master
• Creating Snap Clones from a Storage Test Master
• Creating a CloneDB Database

22.5.1 Creating Snap Clones from the Cloning Dashboard

You can create a snap clone from the Administration Dashboard and promote the snap clone as the Test Master Database. This section outlines the following procedures which you can use to create and manage snap clone databases:

• Creating a Snap Clone Database
• Creating a Test Master Database
• Enabling a Test Master Database
• Disabling a Test Master Database
• Creating a Test Master Pluggable Database
• Creating a Storage Test Master
• Creating a CloneDB Database
• Managing Clone Databases
• Refreshing Clone Databases
• Creating a Snapshot Clone of an Exadata Test Master Database

22.5.1.1 Creating a Snap Clone Database

To create a Database Snap Clone, follow these steps:

1. On the Databases page, you can access the Database Snap Clone wizard by following any one method:
• Select the database that you want to clone from the list of the databases displayed. On the Database homepage, click the Database menu, select Cloning, and then select Create Snap Clone.

• Right click on the database target name, select Database, select Cloning, and then select Create Snap Clone.

• Right click on the database target name, select Database, select Cloning, and then select Clone Management. On the Clone Management page, in the Snap Clone Databases box, click Create.

2. On the Create Snap Clone Database: Source and Destination page, do the following:

• In the Source section, launch the credentials selector by clicking the search icons for SYSDBA Database and Database Host credentials. Click OK.

• In the Data Time Series section, select Now or Prior Point in Time. If you selected Now, specify or search and select the SYSASM ASM Credentials. Now refers to Live Clone.

In the Database Snapshot section specify the location, name, description, version, and vendor of the snapshot profile which will be created as part of the clone database job. You can add additional notes, such as host name, database, data content, and data content mode.

### Create Snap Clone Database: Source and Destination

**Source**

* Global Database Name: snps
  * Type: Single Instance Database
  * Version: 11.2.0.4.0

  * SYSDBA Database Credentials: SYS_WEL_SNPSI
  * Database Host Credentials: AIME_2COOL

**Data Time Series**

- Now
- Prior Point in Time

**Database Snapshot**

Specify details of the snapshot profile which will be created as part of the clone database job.

* Location: Database Provisioning Profiles/11.2.0.4.0/Linux86_64

* Name: Database snps: Profile 29-06-2015 02:44 AM

* Description: Database Reference Profile 29-06-2015 02:44 AM from snps

* Version: 11.2.0.4.0

* Notes: Host Name: adx
  Database: snps
  Data Content: Structure and Data
• If you selected Prior Point in Time, a carousel of Storage Snapshot images appear. Select the appropriate RMAN backup by clicking **Select** on the image. You can create snap clones by selecting a storage snapshot from the carousel. You can modify this in case you have to create a new clone between these two time periods. Similarly, you can do the same for SCN by selecting the **Select SCN** option.

### Data Time Series

- **Now**
- **Prior Point in Time**

3. In the Destination Database Definition section, do the following:
   
   - Specify a display name.
   - Specify a global database name and SID.
     
     A database is uniquely identified by a Global Database Name. The typical form of a name is `name.domain`. A database is referenced by at least one Oracle instance which is uniquely identified by SID.
   
   - Select one of the following types of databases:
     
     - **Single Instance Database.**
       
       In the Hosts section, specify the Oracle Home location. The host gets specified by default. Next, select the Database Home credentials and the SYSASM ASM credentials.
     
     - **RAC Database**
       
       In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.
       
       In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.
     
     - **RAC One Node Database**
In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

Click Next.

**Note:**

Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

4. On the Create Snap Clone Database: Configuration page, do the following:

   - In the Configure Volumes, configure the volumes that will be used by the clone database, by specifying the following:

     - **Mount Point Prefix:** Specify a new mount point for the database being cloned. This value would be prefixed to an auto-generated mount point where a clone of this volume will be mounted. The volume will be mounted on `/<mount-prefix> <unique-suffix-generated-by-EM> /<source-path>`. The mount point prefix can be the **Same for All Volumes** or **Different for Each Volume**.

     **Note:**

     the volumes must be pre-created.

     - **Writable Space:** Specify the amount of space required for block changes. The value specified here cannot exceed the Storage Ceiling specified for the server. For example, for minimal data changes, you specify the value as 1% of the original volume size. The writable space can be the **Same for All Volumes** or **Different for Each Volume**.
• The storage details of the selected database are displayed in the Volume Content Information section. Click **Show Files** to view the layout of the database files in the volumes.

• In the Listener Configuration section, select the listener targets running under the new Oracle Home, to register the clone database. You can add new listeners by clicking Add, and specifying the listener name and port.

• In the Database Credentials section, specify passwords for the SYS, SYSTEM, and DBSNMP administrative users in the clone database. You can choose to have the same password for all the three users or a different password for each.

Click **Next**.

5. On the Create Snap Clone Database: Initialization Parameters page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click **Edit** to modify the value of the parameter.

Click **Next**.

6. On the Create Snap Clone Database: Post Processing page, specify the following:

• **Masking Definition**: Data masking is the process of masking sensitive data in test or non-production databases. The masking definition defines the columns to be masked in the format of the masked data. Specify the masking definition to be applied after the database is cloned.
Note:
The masking definition can be used only when you have a Subset-Masking license pack.

- Custom Scripts: Specify the custom scripts that need to be executed before and after the database is created.

Click Next.

7. On the Create Snap Clone Database: Schedule page, specify a unique deployment procedure instance name. You can choose to start the deployment procedure immediately or at a later time.

In the Notification Details section, you can choose to set the following notifications:
- Scheduled
- Running
- Action Required
- Suspended
- Succeeded
- Problems

Click Next.

8. On the Create Snap Clone Database: Review page, verify the details of the source database, the data source of the clone, and the destination database.

Click Submit.
22.5.1.2 Creating an Exadata Test Master Database

A test master database is a sanitized version of the production database. Production data can be optionally masked before the test master is created. A test master can be created from a snapshot or an RMAN Backup profile taken at a prior point in time and refreshed at specific intervals. This option is useful if the source data has to be masked to hide sensitive data.

To create a test master, follow these steps:

1. On the Databases page, you can access the Full Clone database wizard by following any one method:
   - Select the database that you want to clone from the list of the databases displayed. On the Database home page, click the Database menu, select Cloning, and then select Create Test Master.
   - Right click the database target name, select Database, select Cloning, and then select Create Test Master.
   - Right click on the database target name, select Database, select Cloning, and then select Clone Management. On the Clone Management page, in the Test Master Databases box, click Create.

2. On the Create Test Master Database: Source and Destination page, do the following:
   - In the Source section, launch the credentials selector by clicking the search icons for SYSDBA Database and Database Host credentials. Click OK.
   - In the Data Time Series section, select Now or Prior Point in Time.
     If you selected Now, specify or search and select the SYSASM ASM Credentials. Now refers to Live Clone.
     If you selected Prior Point in Time, a carousel of RMAN Backup images appear. Select the appropriate RMAN backup by clicking Select on the image. Select a specific time between the selected backup or snapshot and the next (or latest point of source). The backups or dumps are created at specific intervals and the test master that is based on these will reflect the production database at specific points in time. To reflect the latest data in the production database, the test master needs to be periodically refreshed.

3. In the Destination Database Definition section, do the following:
   - Specify a display name.
• Specify a global database name and SID.

A database is uniquely identified by a Global Database Name. The typical form of a name is `name.domain`. A database is referenced by at least one Oracle instance which is uniquely identified by SID.

• Select one of the following types of databases:
  
  – **Single Instance Database.**
    
    In the Hosts section, specify the Oracle Home location. The host gets specified by default. Next, select the Database Home credentials and the SYSASM ASM credentials.

  – **RAC Database**
    
    In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

    In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

  – **RAC One Node Database**
    
    In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

    In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

    **Note:**

    Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

Click Next.
4. On the Create Test Master Database: Configuration page, do the following:
   - Database Files Location: Specify the location in which the data files, temporary files, redo log files, and control files will be created.
   - Access Controls and Permissions: Specify the data files owner and group that should be given read-only permissions on the datafiles.
   - Listener Configuration: Select the listener with which the test master will be registered.
   - Database Credentials: Specify the passwords for the administrative users (SYS, SYSTEM and DBSNMP) of the new database being cloned. You can choose to use the same password for all the schemas or different passwords for each schema.
   - Click **Next**.
5. On the Create Test Master Database: Initialization Parameters page, you can configure the values of various initialization parameters that affect the operation of the database instance.

Select the parameter and click **Edit** to modify the value of the parameter. Some values such as `db_block_size` cannot be modified.

Click **Next**.
6. On the Create Test Master Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master DB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see [Oracle Data Masking and Subsetting Guide](#). Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for **Pre Script** and **Post Script**, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for **SQL Script**, specify the SQL scripts that you want to run after creating the test master PDB. For **Run As User**, select the user account that you want to use to run the SQL scripts.

Click **Next**.
7. On the Create Test Master Database: Schedule page, specify the schedule for the creation of the test master. It can be created immediately (if physical standby used, it is created immediately and automatically refreshed) or can be created at a later date / time and refreshed at specified intervals.

Click Next.
8. On the Create Test Master Database: Review page, review and verify the information specified and click Submit to create the test master. After the Test Master has been created, you can refresh the Test Master as required to create a new version of the profile on which the Test Master is based.
22.5.1.3 Creating a Test Master Database

To create a Test Master database, you can use either of the following solutions:

- Creating a Test Master Database Using the Clone Wizard
- Creating a Test Master Database Using EM CLI
22.5.1.3.1 Creating a Test Master Database Using the Clone Wizard

A test master database is a sanitized version of the production database. Production data can be optionally masked before the test master is created. A test master can be created from a snapshot or an RMAN Backup profile taken at a prior point in time and refreshed at specific intervals. This option is useful if the source data has to be masked to hide sensitive data.

To create a test master, follow these steps:

1. On the Databases page, you can access the Full Clone database wizard by following any one method:
   - Select the database that you want to clone from the list of the databases displayed. On the Database home page, click the Database menu, select Cloning, and then select Create Test Master.
   - Right click on the database target name, select Database, select Cloning, and then select Create Test Master.
   - Right click on the database target name, select Database, select Cloning, and then select Clone Management. On the Clone Management page, in the Test Master Databases box, click Create.

2. On the Create Test Master Database: Source and Destination page, do the following:
   - In the Source section, launch the credentials selector by selecting the search icons for SYSDBA Database and Database Host credentials. Click OK.
   - In the Data Time Series section, select Now or Prior Point in Time.
     If you selected Now, specify or search and select the SYSASM ASM Credentials. Now refers to Live Clone.
     If you selected Prior Point in Time, a carousel of RMAN Backup images appear. Select the appropriate RMAN backup by clicking Select on the image.
     Select a specific time between the selected backup or snapshot and the next (or latest point of source). The backups or dumps are created at specific intervals and the test master that is based on these will reflect the production database at specific points in time. To reflect the latest data in the production database, the test master needs to be periodically refreshed.

3. In the Destination Database Definition section, do the following:
   - Specify a display name.
   - Specify a global database name and SID.
     A database is uniquely identified by a Global Database Name. The typical form of a name is name.domain. A database is referenced by at least one Oracle instance which is uniquely identified by SID.
   - Select one of the following types of databases:
     - **Single Instance Database.**
       In the Hosts section, specify the Oracle Home location. The host gets specified by default. Next, select the Database Home credentials and the SYSASM ASM credentials.
     - **RAC Database**
In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

- **RAC One Node Database**

  In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.

  In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.

---

**Note:**

Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

Click **Next**.

4. On the Create Test Master Database: Configuration page, do the following.

   - **Database Files Location:** Specify the location in which the data files, temporary files, redo log files, and control files will be created.

You can select:

   - **File System:** The Oracle Database File System creates a standard file system interface on top of files and directories that are stored in database tables. If you select this option, you must specify or select the Location of the File System. You can specify a common location for all the files or you can select the **Use Oracle Optimal Flexible Architecture-compliant directory structure (OFA)** checkbox and specify different locations for data files, redo log files, and so on.

   - **Automatic Storage Management:** The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select a common location for the database files.

   - **Recovery Files Location:** To simplify the management of backup and recovery files, a fast recovery area can be created for your database. The fast recovery area can be a ASM disk group or a file system that provides a centralized disk location for backup and recovery file. To allow self service users to schedule backups and perform restore operations, you can select the Use Fast Recovery Area checkbox and specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

   - **Listener Configuration:** Click **Add** to add one or more listener targets that are to be associated with the new database.
• Database Credentials: Specify the passwords for the administrative users (SYS, SYSTEM and DBSNMP) of the new database being cloned. You can choose to use the same password for all the schemas or different passwords for each schema.

• Click Next.

5. On the Create Test Master Database: Initialization Parameters page, you can configure the values of various initialization parameters that affect the operation of the database instance.

Select the parameter and click Edit to modify the value of the parameter. Some values such as `db_block_size` cannot be modified.

Click Next.

6. On the Create Test Master Pluggable Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for Pre Script and Post Script, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for SQL Script, specify the SQL scripts that you want to run after creating the test master PDB. For Run As User, select the user account that you want to use to run the SQL scripts.

Click Next.

7. On the Create Test Master Database: Schedule page, specify the schedule for the creation of the test master. It can be created immediately (if physical standby used, it is created immediately and automatically refreshed) or can be created at a later date / time and refreshed at specified intervals.

Click Next.

8. On the Create Test Master Database: Review page, review and verify the information specified and click Submit to create the test master. After the Test Master has been created, you can refresh the Test Master as required to create a new version of the profile on which the Test Master is based.

22.5.1.3.2 Creating a Test Master Database Using EM CLI

To create a Test Master database execute the verb `emcli create_clone -inputFile=/tmp/create_test_master.props`, where `create_test_master.props` is the properties file with the parameters and values required to create the Test Master.

Sample properties file (create_test_master.props):

```
CLONE_TYPE=DUPPLICATE
COMMON_DB_DBSNMP_PASSWORD=password
COMMON_DB_SID=clonedb
COMMON_DB_SYSTEM_PASSWORD=sunrise
COMMON_DB_SYS_PASSWORD=sunrise
DATABASE_PASSWORDS=Sumrise1
COMMON_GLOBAL_DB_NAME=clonedb.xyz.com
DB_ADMIN_PASSWORD_SAME=true
DEST_LISTENER_SELECTION=DEST_DB_HOME
```
HOST_NORMAL_NAMED_CRED=HOST:SYSCO
IS_TESTMASTER_DATABASE=Y
USAGE_MODE = testMaster
CLOUD_TARGET = true
LISTENER_PORT=1526
ORACLE_BASE_LOC=/scratch/app
ORACLE_HOME_LOC=/scratch/app/product/11.2.0./dbhome_1
EM_USER=sys
EM_PWD=Sunrise1
SRC_DB_CRED=DB:SYSCO
SRC_DB_TARGET_NAME=ora.xyz.com
SRC_HOST_NORMAL_NAMED_CRED=HOST:SYSCO
TARGET_HOST_LIST=bl1.xyz.com

To verify the status of the Test Master database creation execute the EM CLI verb
emcli get_instance_status -instance={instance GUI}.

22.5.1.4 Enabling a Test Master Database

To convert a database to a test master database, follow these steps:

1. From the Targets menu, select Databases.

2. On the Databases page, right click on the database target that you want to enable as a test master database. From the menu that appears, select Oracle Database, select Cloning, and then select Enable Test Master.

3. On the Enable as a Test Master Database page, specify or search and select the SYSDBA database and database host credentials.

4. Specify or search and select the parent database from which the database has been cloned. This provides better lineage tracking.

5. Specify or select a data masking definition if you want to mask data in the cloned database before enabling it as a test master.

6. In the Custom Scripts section, you can select Software Library components that contain post cloning scripts. The clone database can also be customized by executing the post cloning SQL script.

7. In the Access Controls and Permissions section, specify the owner and group that should be given read-only permissions on the datafiles.

8. Click Submit.
22.5.1.5 Disabling a Test Master Database

To disable a test master database, follow these steps:

1. From the Targets menu, select Databases.
2. On the Databases page, right click on the database target that you want to disable as a test master database. From the menu that appears, select Oracle Database, select Cloning, and then select Disable Test Master.
3. On the Disable Test Master page, specify or search and select the SYSDBA database and database host credentials.
4. The Exadata Snapshot Clone Databases sections lists the database snapshot clones that will be deleted as part of the process of disabling the test master.
5. Click Submit. This action resets the datafiles to read-write mode and restarts the database in open mode. You can later make further changes to the database and then enable it as test master again, if you choose to.

22.5.1.6 Creating a Test Master Pluggable Database

To create a Test Master PDB, you can use either of the following solutions:

- Creating a Test Master Pluggable Database Using the Clone Wizard
- Creating a Test Master Pluggable Database Using EM CLI

22.5.1.6.1 Creating a Test Master Pluggable Database Using the Clone Wizard

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a test master PDB from a source PDB, using the new Clone PDB Wizard.

To create a test master PDB from a source PDB, follow these steps:

1. From the Targets menu, select Databases.
2. For View, select Search List. From the View menu, select Expand All.
3. Look for the source CDB (the CDB that the source PDB is a part of) in the list, then click the name of the PDB from which you want to create a test master PDB.
4. From the Oracle Database menu, select Cloning, then select Create Test Master.
Alternatively, in Step 3, you can right-click the name of the PDB from which you want to create a test master PDB, select Oracle Database, select Cloning, then select Create Test Master.

5. On the Create Test Master Pluggable Database: Source and Destination page, do the following:
   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the Pluggable Database Definition section, specify a name, and a display name for the test master PDB. Enterprise Manager uses the display name to identify the test master PDB target.
   - In the PDB Administrator Credentials section, specify the credentials of the admin user account that you want to use to administer the test master PDB.
   - In the Container Database section, specify the destination CDB (the CDB that the test master PDB must be a part of).
   - In the Credentials section, specify the SYSDBA credentials for the destination CDB, and the host credentials for the destination CDB. Also, if the destination CDB is using Automatic Storage Management (ASM) to manage disk storage, you must specify the ASM credentials.
   - Click Next.

6. On the Create Test Master Pluggable Database: Configuration page, do the following:
   - In the Database Files Location section, specify the storage location where the datafiles of the test master PDB must be stored. If the destination CDB is using ASM to manage disk storage, specify the disk group where the datafiles of the test master PDB must be stored.
   - To ensure that only the source PDB data model definition is cloned (and the source PDB data is not cloned), select Exclude User Data.
   - In the PDB Administrator Credentials section, specify the credentials of the admin user account that you want to use to administer the test master PDB.
   - In the Advanced Configuration section, specify the storage limits for the maximum size of the test master PDB, and the maximum size of a shared tablespace within the test master PDB. By default, no limits are placed on the values for these attributes. In the Miscellaneous section, select the logging option that you want to use for the tablespaces created within the test master PDB.
   - Note that if the destination CDB is part of an Exadata machine, the Access Controls and Permissions section is displayed in place of the Advanced Configuration section. In this case, you must specify the owner and the group that must be granted read only permissions on the datafiles.
Click Next.

7. On the Create Test Master Pluggable Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for Pre Script and Post Script, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for SQL Script, specify the SQL scripts that you want to run after creating the test master PDB. For Run As User, select the user account that you want to use to run the SQL scripts.

Click Next.

8. Specify an instance name for the deployment procedure. Also, specify the point in time when you want the deployment procedure to begin.

In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select Scheduled and Succeeded for Status for Notification, you will receive e-mail notifications when the deployment procedure is scheduled, and when it succeeds.

Click Next.

9. Review all the details you provided. If you want to edit certain details, click Back to navigate to the required page.

Click Clone to submit the deployment procedure to create a test master PDB from the source PDB.
22.5.1.6.2 Creating a Test Master Pluggable Database Using EM CLI

To create a Test Master pluggable database, execute the command "emcli pdb_clone_management -input_file=data:/xyz/sdf/pdb_test_master.props", where the sample contents of the `pdb_test_master.props` file is given below.

Sample properties file to create a Test master PDB:

```
SRC_PDB_TARGET=cdb_prod_PDB
SRC_HOST_CREDS=NC_HOST_SCY:SYCO
SRC_CDB_CREDS=NC_HOST_SYC:SYCO
SRC_WORK_DIR=/tmp/source
DEST_HOST_CREDS=NC_SLCO_SSH:SYS
DEST_LOCATION=/scratch/sray/app/sray/cdb_tm/HR_TM_PDB6
DEST_CDB_TARGET=cdb_tm
DEST_CDB_TYPE=oracle_database
DEST_CDB_CREDS=NC_HOST_SYC:SYCO
DEST_PDB_NAME=HR_TM_PDB6
IS_CREATE_AS_TESTMASTER=true
MASKING_DEFINITION_NAME=CRM_Masking_Defn
```

**Note:**
You will need to add two more parameters (ACL_DF_OWNER=oracle and ACL_DF_GROUP=oinstall) in case you need to create the Test Master on Exadata ASM.

22.5.1.7 Creating a Storage Test Master

To create a storage test master, follow these steps:

1. From the **Targets** menu, select **Databases**.
2. On the Databases page, click the name of the database target that you want to create a storage test master for.

3. On the database home page, click Oracle Database, select Cloning, and then select Create Snapshot Test Master.

4. On the Create Storage Test Master page, in the Reference Database section, do the following:
   - Specify the database home credentials.
   - Specify the root credentials of the database.
   - Specify the database credentials.

5. In the Test Master field, specify a unique name for the storage test master that you want to create.
   For example, PROD_TM_Storage_TestMaster.

6. In the Storage Details section, do the following:
   - Select the storage server that you want to use to create a storage test master on.
   - Select the project, size, and mount point for RMAN image backup of data and control files. For example, select emsdemo01 (2000.00 GB) as the project, select 3.0 GB as the size, and specify /PROD_TM_data as the mount point.
   - Select the project, size, and mount point for archive log backup. For example, select emsdemo01 (2000.00 GB) as the project, select 4.0 GB as the size, and specify /PROD_TM_arch as the mount point.

7. In the Schedule section, you can choose to create the storage test master immediately, or you can select Later, and specify a time of your choice. You can also set a specific time or date to repeat the process.

8. In the Purge Policy section, select either of the following:
   - None - If you do not want to purge any data.
   - Snapshots - If you want to purge the data after a certain number of snapshots has been created. Select the number of maximum snapshots.
   - Day(s) - If you want to purge the data after a certain number of days. Select the number of days.

9. Click Create.
22.5.1.8 Creating a CloneDB Database

You can create CloneDB databases only when you have RMAN Image backups. To create a CloneDB database, follow these steps:

1. On the Databases page, you can access the CloneDB wizard by following any one method:
   • Select the database that you want to clone from the list of the databases displayed. On the Database home page, click the Database menu, select Cloning, and then select Create CloneDB.
   • Right click on the database target name, select Database, select Cloning, and then select Create CloneDB.
   • Right click on the database target name, select Database, select Cloning, and then select Clone Management. On the Clone Management page, in the CloneDB Databases box, click Create.

2. On the Create CloneDB Database: Source and Destination page, do the following:
   • In the Source section, launch the credentials selector by selecting the search icons for SYSDBA Database and Database Host credentials. Click OK.
   • In the Source Data Time Series, Prior Point in Time is selected automatically. Select the appropriate RMAN Image backup by clicking Select on the image.
   You can create full clones by selecting a backup and optionally modify the time and SCN to do a point in time restore. The Select Time option has the minimum limit set to the current backups time and maximum time limit set to the next backup time. You can modify this in case you have to create a new clone between these two time periods. Similarly, you can do the same for SCN by selecting the Select SCN option.

3. In the Destination Database Definition section, do the following:
   • Specify a display name.
   • Specify a global database name and SID.
     A database is uniquely identified by a Global Database Name. The typical form of a name is name.domain. A database is referenced by at least one Oracle instance which is uniquely identified by SID.
   • The RAC Database type is selected by default.
     In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.
     In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.
Note:

Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

Click **Next**.

4. On the Create CloneDB Database: Configuration page, do the following:
   - In the Database Files Location, specify the location where you want the data files, temp files, redo log files, and control files to be created. The **File System** option is selected by default.
   - In the Recovery Files location, specify the location where you want the recovery files, such as archived redo logs, RMAN backups, and other related files to be created. You can choose to use the fast area recovery by selecting **Use Fast Recovery Area**. If you do, specify the fast recovery area size. The fast recovery area size is defaulted to that of source.
   - In the Listener Configuration section, select the listener targets running under the new Oracle Home, to register the clone database.
   - In the Database Credentials section, specify passwords for the SYS, SYSTEM, and DBSNMP administrative users in the clone database. You can choose to have the same password for all the three users or a different password for each.

Click **Next**.
5. On the Create CloneDB Database: Initialization Parameters page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click **Edit** to modify the value of the parameter.

Click **Next**.

6. On the Create CloneDB Database: Post Processing page, specify the following:

- **Masking Definition**: Data masking is the process of masking sensitive data in test or non-production databases. The masking definition defines the columns to be masked in the format of the masked data. Specify the masking definition to be applied after the database is cloned.

  **Note:**

  The masking definition can be used only when you have a Subset-Masking license pack.

- **Custom Scripts**: Specify the custom scripts that need to be executed before and after the database is created.

- **Create Data Profile**: This option enables you to automatically take a backup of the new cloned instance once it is created. When the clone or the Test Master is refreshed, this section displays the existing profiles created for the database. You can select the profile that has to be refreshed along with the database.

- **Create as Test Master**: This option if you want to create the cloned database as a Test Master database.

Click **Next**.
7. On the Create CloneDB Database: Schedule page, specify a unique deployment procedure instance name. You can choose to start the deployment procedure immediately or at a later time.

In the Notification Details section, you can choose to set the following notifications:

- Scheduled
- Running
- Action Required
- Suspended
- Succeeded
- Problems

Click Next.

8. On the Create CloneDB Database: Review page, verify the details of the source database, the data source of the clone, and the destination database.

Click Submit.
22.5.1.9 Managing Clone Databases

The Clone and Refresh page enables you to manage clone databases by adding clone databases, removing clone database, and promoting the clone databases as Test Master.

To access the Clone and Refresh page, navigate to an Oracle database target home page. On the home page, click Oracle Database, select Provisioning, and then select Clone and Refresh.

Adding Clone Databases

The Add button can be used to add the clones of the current databases which have already been created. To add a database clone instance, click on Add. In the Select Targets dialog box that opens, select a database target, and click Select. The database instance gets added to the Clones section in the Database Cloning page.

Removing Clone Databases

Only the databases that are added using the Add button can be removed using the Remove button. To remove a database clone instance, select the database clone instance that you want to remove, from the Clones section. Click Remove.

Promoting Clone Databases as Test Master

To promote a database clone database instance as Test Master, select the clone instance that you want to recreate from the Clone section. Click Promote as Test Master.

You can also remove the clone database instance from Test Masters, by selecting the clone database instance from the Clones section, and clicking Remove from Test Masters.

Refresh Clone Databases

To refresh a clone database, select the clone database instance from the Clone section, and then click Refresh. See Refreshing Clone Databases.

Creating Data Profiles

The Data Profiles tab on the Clone and Refresh page displays the data profiles that you have created from the clone database. On the Data Profiles page, you can view the contents of existing data profiles. You can also Edit and Refresh these data profiles.
You can also create a new data profile by clicking **Create**. This takes you to the Create Provisioning Profile wizard. Refer to *Enterprise Manager Cloud Control Administrator's Guide for information* on how to create a provisioning profile using this wizard.

### 22.5.1.10 Refreshing Clone Databases

To refresh a clone database, navigate to the Refresh and Clone page by following these steps:

1. From the **Targets** menu, select **Databases**.
2. On the databases home page, select the database clone instance that you want to refresh from the list of databases.
3. On the database target home page, click **Oracle Database**, select **Provisioning**, and then select **Clone and Refresh**.
4. On the Clone and Refresh page, select the **Refresh** tab.

The Refresh page displays the following sections:

- **Drift from Source Database**
  
  This section displays the name of the source database from which this database has been cloned. It shows the number of days since the clone database has been refreshed. Click **Refresh** to refresh the clone database.

- **Database Volume Details**
  
  This section displays the storage details for the selected databases. Click **Show files** to view the layout of the database files in the volumes. A display box appears that shows the storage layout and file layout of the selected database.

- **History**
  
  This section displays the past refreshes of the database. It shows the date and time of the refresh, where it has been refreshed from, the owner of the database, and the status of the refresh action.

- **Storage Utilization**
  
  This section displays the storage volume of the database, the storage contents, the mount point, the amount of writable storage used, and the synchronization date.
22.5.1.11 Creating a Snapshot Clone of an Exadata Test Master Database

To create a snapshot clone of an Exadata Test Master database, follow these steps:

1. From the Targets menu, select Databases.
2. On the Databases page, you can access the Database Snap Clone wizard by following any one method:
   - Select the test master database that you want to clone from the list of the databases displayed. On the Database homepage, click the Database menu, select Cloning, and then select Create Snapshot Clone.
   - Right click on the test master database target name, select Database, select Cloning, and then select Create Snapshot Clone.
3. On the Create Exadata Snapshot Clone Database: Source and Destination page, do the following:
   - In the Source section, launch the credentials selector by clicking the search icons for SYSDBA Database and Database Host credentials. Click OK.
   - In the Data Time Series section, Now is selected by default. Now refers to Live Clone.
   - Specify or select the SYSASM ASM credentials.
4. In the Destination Database Definition section, do the following:
   
   - Specify a display name.
   - Specify a global database name and SID.
   
   A database is uniquely identified by a Global Database Name. The typical form of a name is `name.domain`. A database is referenced by at least one Oracle instance which is uniquely identified by SID.
   
   - Select one of the following types of databases:
     
     - **Single Instance Database.**
       
       In the Hosts section, specify the Oracle Home location. The host gets specified by default. Next, select the Database Home credentials and the SYSASM ASM credentials.
     
     - **RAC Database**
       
       In the Hosts section, the cluster field is auto selected from the parent database and disabled. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.
       
       In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.
     
     - **RAC One Node Database**
       
       In the Hosts section, specify or select the cluster target. The Oracle Home location gets specified by default. Next, specify the Database Host credentials, and the SYSASM ASM credentials.
       
       In the Nodes section, select the cluster and Oracle Home to display one or more hosts on which the administrator managed Oracle RAC database will be created.
   
   Click **Next**.
Note:
Oracle supports inline patching as part of clones. When the destination home selected has patches applied such as the latest CPU or PSU, then the cloned database is automatically brought up with that level.

5. On the Create Exadata Snapshot Clone Database: Configuration page, do the following:
   - In the Database Files Location, specify the Sparse disk group and the redo log file size.
   - In the Recovery Files location, specify the location where you want the recovery files, such as archived redo logs, RMAN backups, and other related files to be created. You can choose to use the fast area recovery by selecting Use Fast Recovery Area. If you do, specify the fast recovery area size. The fast recovery area size is defaulted to that of source.
   - In the Listener Configuration section, select the listener targets running under the new Oracle Home, to register the clone database.
   - In the Database Credentials section, specify passwords for the SYS, SYSTEM, and DBSNMP administrative users in the clone database. You can choose to have the same password for all the three users or a different password for each.

   Click Next.

6. On the Create Exadata Snapshot Clone Database: Initialization Parameters page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click Edit to modify the value of the parameter.

   Click Next.
7. On the Create Exadata Snapshot Clone Database: Post Processing page, specify the following:

- **Masking Definition:** Data masking is the process of masking sensitive data in test or non-production databases. The masking definition defines the columns to be masked in the format of the masked data. Specify the masking definition to be applied after the database is cloned.

  **Note:** The masking definition can be used only when you have a Subset-Masking license pack.

- **Custom Scripts:** Specify the custom scripts that need to be executed before and after the database is created.

  Click Next.

8. On the Create Exadata Snapshot Database: Schedule page, specify a unique deployment procedure instance name. You can choose to start the deployment procedure immediately or at a later time.

   In the Notification Details section, you can choose to set the following notifications:

   - Scheduled
   - Running
   - Action Required
   - Suspended
   - Succeeded
   - Problems

   Click Next.

9. On the Create Exadata Snapshot Database: Review page, verify the details of the source database, the data source of the clone, and the destination database.

   Click Submit.
22.5.2 Creating Snap Clones from a Discretely Synchronized Test Master

You can create snap clones from a discretely synchronized test master if the test master is present on a NAS storage device. This table lists the steps involved in creating a snap clone using a snapshot profile.

Table 22-2   Creating Snap Clone - Discrete Flow

<table>
<thead>
<tr>

22.5.2.1 Getting Started

See Getting Started.

22.5.2.2 Registering Storage Servers

See Registering and Managing Storage Servers.

22.5.2.3 Creating Resource Providers

22.5.2.4 Configuring Request Settings

See Configuring Request Settings.

22.5.2.5 Defining Quotas

See Defining Quotas.

22.5.2.6 Creating a Service Template Using Snap Clone Profile

See Creating Service Template Using Snap Clone Profile.

22.5.2.7 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

22.5.2.8 Requesting a Database

The self service user can now select the service template based on the database template profile and create a database. See Requesting a Database.

22.5.2.9 Example: Creating Snap Clones from Discretely Synchronized Test Master

The following example shows how you can create snap clones from a test master database that is refreshed at discrete intervals.

1. First, you must make sure that all the prerequisites are met. See Getting Started.
2. Next, you must register the storage server. See Registering Storage Servers.
3. You must then create one or more PaaS Infrastructure Zones and one or more database pools. See Creating Resource Providers.
4. Then, you must define the quota that you wish to allocate to the self service users. See Defining Quotas.
5. The next step is to identify the production database (prod1) and create an RMAN backup prod1_backup.
6. Create a test master (testmaster1) based on prod1_backup. See Creating a Discretely Synchronized Test Master.
7. Next, you must enable **testmaster1** for snap clone. This allows creation of snap clones using snapshot technology. See **Enabling the Test Master for Snap Clone**.

8. Next, you must create a profile (**snap_profile**) that is based on **testmaster1**. See **Creating a Database Provisioning Profile Using Snapshots**

9. To make this profile available to the self service user, you must create a service catalog entry or a service template. Create a template called **Snap Clone Template1**. See **Creating a Service Template Using Snap Clone Profile**. In the Service Template, the **Profile Version** field is set to **Latest**. This will ensure that the self service user will always use the latest version of the profile to create database instances.

10. The self service user can then use the **Snap Clone Template1** to create the snap clone. See **Requesting a Database**.

11. To get the latest production data, the self service administrator refreshes **TestMaster1**. See **Refreshing the Test Master Database**.

12. Since the test master now contains updated data, a new revision of the profile must be created. See **Refreshing the Snap Shot Profile**.

13. Now that a new revision of the profile (**snap_profile**) is available, the self service user can refresh his database instance to get the latest production data. See **Refreshing a Database**. The storage space that was used by the older version of the test master will be reclaimed by the refreshed test master.

### 22.5.3 Creating Snap Clones from an In-Sync Test Master

You can create snap clones using a standby database that is designated as the test master database. The test master database is always current and in sync with the production database. To create snap clones using this approach, follow these steps:

#### Table 22-3  Creating Snap Clone (Continuous Flow)

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Follow the steps in the Getting Started section to enable DBaaS.</td>
<td>See <strong>Getting Started</strong>.</td>

</tr>
</tbody>
</table>
22.5.3.1 Getting Started

See Getting Started.

22.5.3.2 Registering Storage Servers

To register storage servers for:

- NetApp and Sun ZFS Storage Server: See Registering a NetApp or a Sun ZFS Storage Server.
- EMC Storage Server: See Registering an EMC Storage Server.

22.5.3.3 Creating Resource Providers

You must create one or more resource providers which include:

- PaaS Infrastructure Zones: See Creating a PaaS Infrastructure Zone.
- Database Pool: See Creating a Database Pool for Database as a Service

22.5.3.3.1 Creating a Database Pool for Database as a Service

To create a database pool for database as a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Database service family, click the Database Pool link and click Create.
3. In the Credentials region, specify the following credentials:
   - **Host**: Required for creating and starting the database.
   - **Root**: Users with these credentials can perform privileged actions like executing root scripts. For snap clone databases, the snapshots must be mounted by a root user. To facilitate this, privileged credentials must be set up to perform typical root user actions with SUDO privileges.
   - **Grid Infrastructure**: This is an optional field and is required only for creating snap clones on EMC storage to create ASM disks.
   - **Automatic Storage Management**: This is an optional field. It is required if you plan to use this database pool for live cloning on any database running on ASM.

4. Enter a name and description for the database pool.

5. Specify the following details:
   - **PaaS Infrastructure Zone**: Select the PaaS Infrastructure Zone into which the database instance is to be provisioned.
   - **Database Configuration**: Specify the configuration of the database being provisioned. This can either be Single Instance or Cluster Database (RAC) but cannot be a combination of both.
   - **Platform and Version**: Specify the platform and version of the database being deployed.

6. Click **Add** and select one or more Oracle Homes to be added to the database pool.

7. In the Maximum Number of Database Instances (per host), enter the maximum number of database instances that can be running on each host in the pool.
For RAC databases, the value specified in this field is used to ensure that the nodes on which the database is be created meets this criteria.

8. Click **Submit** to create a database pool. The newly created pool will appear in the Database Cloud Self Service Portal Setup: Database Pools page. The database pool can now be added to the Service Template.

### 22.5.3.4 Configuring Request Settings

You can configure the request settings by specifying when a request can be made, its duration, and so on. See Configuring Request Settings for details.

### 22.5.3.5 Defining Quotas

After configuring the request settings, you must define quotas for each self service user. See Setting Up Quotas for details.

### 22.5.3.6 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

### 22.5.3.7 Requesting a Database

The self service user can now select the service template based on the database template profile and create a database. See Requesting a Database.

### 22.5.3.8 Example: Creating Snap Clones from an In-Sync Test Master

The following example shows how you can create a snap clones from a physical standby database.

1. First, you must make sure that all the prerequisites are met. See Getting Started.
2. The next step is to identify the production database and the physical standby database. The production database is **prod1** and the standby database as **prod1stb**.
3. Next, you must register the storage server. This step validates the storage and discovers **prod1stb** on the storage server. See Registering Storage Servers.
4. You must then create one or more PaaS Infrastructure Zones and one or more database pools. See Creating Resource Providers.
5. Then, you must define the quota that you wish to allocate to the self service users. See Defining Quotas.
6. The next step is to designate the standby database, **prod1stb** as the test master.
7. Next, you must enable **prod1stb** for snap clone. This allows creation of snap clones using snapshot technology. See Enabling the Test Master for Snap Clone.
8. The next step is to create a snapshot profile from **prod1stb**. See Creating a Database Provisioning Profile Using Snapshots.
While creating the profile, specify the **Start Date** as 05/15/2015, the **Repeat** schedule as **Every N Days** and the Frequency as Every 1 day. Specify the **End By** date as 05/20/2015. A new version of the snapshot profile will be created every day from the Start date of 05/15/2015.

In the Purge Policy field, specify the **Number of Snapshots** as 5. This will ensure that after 5 versions of the snapshot are created, the first or oldest one will be purged.

9. To make this profile available to the self service user, you must create a service catalog entry or a service template. Create a template called **Snap Clone Template**. See Creating Service Template Using Snap Clone Profile. Set the Profile Version field to **Selected by user at request time**. The self service user can choose the profile version that is to be used to create the snap clone.

10. The self service user can then use the Snap Clone Template, select a version of the profile and use it to create the snap clone. See Requesting a Database. As and when a new version of the profile is available (see Creating and Refreshing Snapshots of the Test Master), the self service user can choose to refresh the profile to the latest version. See Refreshing a Database.

Based on the Purge Policy which is set to 5 snapshots, the older versions of the snapshots will be deleted. But if the self service user has a database that is using that snapshot, the profile cannot be deleted until the self service user has refreshed the profile to the latest version.

## 22.5.4 Creating Snap Clones from a Storage Test Master

You can use storage snapshots of the test master to create snap clones. This table lists the steps involved in creating a snap clone using a storage test master.

### Table 22-4  Creating Snap Clone - Discrete Flow

<table>
<thead>

22.5.4.1 Getting Started

See Getting Started.

22.5.4.2 Registering Storage Servers

See Registering and Managing Storage Servers.

22.5.4.3 Creating Resource Providers

22.5.4.4 Configuring Request Settings

See Configuring Request Settings.

22.5.4.5 Defining Quotas

See Defining Quotas.

22.5.4.6 Configuring Chargeback

Optionally, you can configure the chargeback service. See Chargeback Administration.

22.5.4.7 Requesting a Database

The self service user can now select the service template based on the database template profile and create a database. See Requesting a Database.

22.5.5 Creating a CloneDB Database

The CloneDB feature allows you to clone a database multiple times without copying the data into different locations. Instead Oracle Database creates the files in the Clone DB database using copy-on-write technology, so that only the blocks that are modified in the Clone DB database require additional storage on disk. Clone DB reduces the amount of storage required for testing purposes and enables rapid creation of multiple database clones. Clone DB is supported for database 11.2.0.3 or later versions.

You can create CloneDB databases by using a discretely synchronized test master by following these steps:

22.6 Creating a Database Provisioning Profile for Snap Clone

This section covers the following:

- Creating a Database Provisioning Profile Using Snapshots
- Creating a Database Provisioning Profile Using RMAN Database Image

22.6.1 Creating a Database Provisioning Profile Using Snapshots

Prerequisites for Creating a Database Provisioning Profile Using Snapshots

Before you create a database provisioning profile, follow these prerequisites:

- Ensure that the storage server you want to register for storage is available on the network. To register a storage server, refer to Registering and Managing Storage Servers.

  **Note:**

  NetApp, Sun ZFS, Solaris ZFS, and EMC storage servers are supported in Enterprise Manager Cloud Control 12c.

- Ensure that the storage server is connected to a Management Agent installed and monitored in Enterprise Manager Cloud Control for communication.
- Ensure that the storage server is registered, and at least one database should be present which is enabled for Snap Clone.
- To create the profile, you must have the **EM_STORAGE_OPERATOR** or **EM_STORAGE_ADMINISTRATOR** privileges.

Creating a Database Provisioning Profile Using Snapshots

To create a database provisioning profile, follow these steps:
When a snapshot is used by a database, it cannot be deleted. When you remove a snapshot, it becomes obsolete. This means that you cannot request any new databases using the obsolete snapshot. This is indicated by the red pushpin against the database, which means that the snapshot is pinned and cannot be used.

When the database using that snapshot is deleted, it gets automatically purged in the next run.

1. You can access the Database Provisioning page using any of the following ways:
   - From the Enterprise menu, select Cloud, and then select Cloud Home. On the Cloud home page, click Oracle Cloud, select Setup, and then select Data Sources. On the Database: Data Sources page, in the Data Profiles tab, click Create.
   - From the Enterprise menu, select Provisioning and Patching, and then select Database Provisioning. On the Database Provisioning page, in the Profiles section, click Create.
   - From the database target home page, click Oracle Database, select Provisioning, and then select Create Provisioning Profile.

2. On the Reference Target page, click the search icon to select a target.

3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click Select.

4. On the Reference Target page, select the following:
   - Data Content
   - Structure and Data to include physical and structural files from the database
   - Create
   - Storage Snapshots

5. In the Credentials section, select the database. In the Credentials column, you can select Named Credentials and then select a credential name from the Credential Name column (or) select Preferred Credentials. Click Next.

6. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:
   - Specify or select a profile location in the software library where the database profile will be created.
   - Specify a unique profile name.
For example:
Snap Clone Profile for HR database

- Add a description for the profile.
- Verify the profile version and the vendor.
- Add any additional notes such as host name, database, data content, data content mode, and the like.

7. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

8. In the Purge Policy section, you have three options:

- **None.** Select this option if you do not want to purge any data collected.
- **Snapshots.** This option enables you to specify the maximum number of snapshots that can be purged.
- **Day(s).** This option enables you to specify the number of days after which the data component should be purged.

9. Specify or select a working directory. Click **Next**.

10. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 22.6.2 Creating a Database Provisioning Profile Using RMAN

**Database Image**

To create a database provisioning profile, follow these steps:

1. You can access the Database Provisioning page using either of the following ways:
   - From the **Enterprise** menu, select **Cloud**, and then select **Cloud Home**. On the Cloud home page, click **Oracle Cloud**, select **Setup**, and then select **Data Sources**. On the Database: Data Sources page, in the Data Profiles tab, click **Create**.
   - From the Enterprise menu, select **Provisioning and Patching**, and then select **Database Provisioning**. On the Database Provisioning page, in the Profiles section, click **Create**.
   - From the database target home page, click **Oracle Database**, select **Provisioning**, and then select **Create Provisioning Profile**.

2. On the Reference Target page, click the search icon to select a target.
3. In the Search and Select: Targets display box, select the database you want to create a profile for, and then, click Select.

4. On the Reference Target page, select the following:
   - **Data Content**
   - **Structure and Data** to include physical and structural files from the database or **Structure Only** to include only the structural files in the template.
   - **Create**
   - **RMAN Database Image**
5. In the Credentials section, select the database. In the Credentials column, you can select Named Credentials and then select a credential name from the Credential Name column (or) select Preferred Credentials. Click Next.

6. On the Content Options page, specify the backup location for the RMAN image mode. By default, the backup location selected is Offline Backup. You can choose Online Backup only if it is enabled.

Then, select Directory for the backup location and enter the directory path, or select Fast Recovery Area, which already contains a backup location.
7. On the Create Database Provisioning Profile: Page, in the Profile Information section, do the following:
   - Specify or select a profile location in the software library where the database profile will be created.
   - Specify a unique profile name.
     For example: RMAN Database Image for HR database
   - Add a description for the profile.
   - Verify the profile version and the vendor.
   - Add any additional notes such as host name, database, data content, data content mode, and the like.

8. In the Schedule section, you can choose to start the profile creation immediately, or you can schedule it for a later time. You can also choose to repeat the creation of the provisioning profile, and set a repeat time.

9. In the Purge Policy section, you have three options:
   - **None.** Select this option you do not want to purge any data collected.
   - **Snapshots.** This option enables you to specify the maximum number of snapshots that can be purged.
   - **Day(s).** This option enables you to specify the number of days after which the data component should be purged.
10. Specify or select a working directory. Click **Next**.

11. On the Review page, ensure that the selections you have made in the previous pages are correctly displayed and click **Submit**. Otherwise, click **Back** repeatedly till you reach the page where you want to make changes. Click **Cancel** to abort the provisioning profile creation.

Once you have submitted the provisioning profile creation job, manually refresh the page if View Data has been set to Real Time: Manual Refresh. Else, set View Data to reload after a specific period of time, and then select an execution step from the Procedure Steps tree on the left pane to view the details.

To view the submitted jobs, select the **Procedure Activity** link in the **Data Profiles** tab.

### 22.7 Creating Service Templates for Snap Clone

This section contains the following topics:

- Creating Service Template Using Snap Clone Profile
- Creating a Service Template from a Storage Test Master
- Creating a Service Template Using RMAN Image Profile
- Creating a Service Template for EMC Snap Clone

#### 22.7.1 Creating Service Template Using Snap Clone Profile

To create a snap clone based service template, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role. The **EM_SSA_ADMINISTRATOR** role you select must also have the **EM_STORAGE_OPERATOR** privileges.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.

3. Click the Setup link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source Identification section, select the Using Profile radio button, click the Search icon and select the test master database based on the snap clone profile you created.

7. In the Profile Version field, you can select either of the following:
   - Latest: This ensures that the latest profile is always used by the self service user.
   - Selected by user at request time: If this option is selected, the self service user can select the profile to be used when creating a service request.

8. In the Database Definition region, specify the following:
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the number of nodes.
   - **Database SID**: This is an optional field. You can select **Specify Prefix** or **Specified by User at Request Time**.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters. The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for
the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And In progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

– Specified by User at Request Time: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.
  • Domain Name: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

9. In the Zones region, click Add to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click Assign Pool. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. Click Next. The Database Cloud Self Service Portal Setup: Database page appears.

Figure 22-3   Create Service Template: Database (Snap Clone)

12. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.

The database values such as the location of the file system and the listener port you select must be available on the reference host.

13. Specify the following details:
• **Storage**: You can configure the volumes that will be used by the database:
  
  – **Mount Point Prefix**: The mount point prefix can be the **Same for All Volumes** or **Different for Each Volume**.
    
    Specify the prefix for the new mount point for the database being provisioned. This value would be prefixed to an auto-generated mount point where a clone of this volume will be mounted. The volume will be mounted on `/<mount-prefix>_unique-suffix-generated-by-EM/<source-path>`. If the Mount Point Prefix is different for each volume, specify a different value for each volume,
  
  – **Writable Space**: The Writable Space can be the **Same for All Volumes** or **Different for Each Volume**.
    
    Specify the amount of space required for block changes. The value specified here cannot exceed the Storage Ceiling specified for the server. For example, for minimal data changes, you specify the value as 1% of the original volume size.

• **Enable Archiving**: If this check box is selected, the database will not be shut down during a refresh. This allows self service users to schedule backups and restore operations without shutting down the database.

• **Snapshot Policy**: Snapshots are sets of historical data for specific time periods. By default, Oracle Database automatically generates snapshots of the performance data once every hour and retains the statistics in the workload repository for 8 days. **Select the Allow the user to take snapshots for the new database** checkbox and specify the **Maximum Number of Snapshots** that can be taken.

  Snapshots can be created for a specific point in time. The number of snapshots is determined by the value specified by the self service administrator in the Maximum Number of Snapshots field. Once the snapshot has been taken, the database can be restored to a specific snapshot taken a particular point in time. For example, if there are several snapshots such as `snap1`, `snap2`, and `snap3`, if the database is restored to `snap2`, `snap3` will be deleted.

• In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

• **Administrator Credentials**: Specify passwords for the system schemas of the new database. These schemas will not be available to the EM_SSA_USERS. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the EM_ADMINISTRATOR can change them.

• **Non Administrator Credentials**: Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password.

• **Master Account Privileges**: Enter the name of the Master Account. You can specify the privileges that are to be provided to the master account user by specifying them in the Privileges field.

14. Click **Next**. The Create Service Template: Initialization Parameters page appears.
15. In this page, you can specify the following:
   • Database Sizes: Select the database sizes that are to be supported by this service template.
     
     **Note**: The database size definitions must have already been defined using the `emcli create_database_size` command. See [Database Size EM CLI Verbs](#) for details.
     
     You can select sizes such as small, medium, and large. Each database size has a specific memory, storage, CPU cores, and units. Select a size and select **Include in Template** to associate it with the service template. Click **Default** to designate it as the default database size.
   
   • Initialization Parameters: You can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the **Set** icon to modify the value of the parameter.

16. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See [Pre and Post Request Creation / Deletion Scripts](#) for details.
     
     You can also specify a custom Post SQL Script and select the user who can run the script. For more details, see [Selecting the Post SQL Script](#).

17. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. These properties will be applied to the database clones that are created. You can do the following:
   
   • Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
   
   • Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

18. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

22.7.2 Creating a Service Template from a Storage Test Master

To create a storage test master based service template, follow these steps:

1. Log into Enterprise Manager as a user with the `EM_SSA_ADMINISTRATOR` role. The `EM_SSA_ADMINISTRATOR` role you select must also have the `EM_STORAGE_OPERATOR` privileges.

2. From the `Enterprise` menu, select `Cloud`, then select `Cloud Home`. The Cloud Home page appears. From the `Oracle Cloud` menu, select `Setup`, then select `Getting Started`.

3. Click the `Setup` link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the `Service Templates` link. The Service Templates page appears. Click `Create`. The Create Service Template: General page appears.

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source Identification section, select the `Using Storage Test Master` radio button, click the `Search` icon and select the storage test master you created.

7. In the Profile Version field, you can select either of the following:
   - Latest: This ensures that the latest profile is always used by the self service user.
   - Selected by user at request time: If this option is selected, the self service user can select the profile to be used when creating a service request.

8. In the Database Definition region, specify the following:
   - Type: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the number of nodes.
• **Database SID**: This is an optional field. You can select **Specify Prefix** or **Specified by User at Request Time**.
  
  – **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.

  The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

  For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And In progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

  – **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.

• **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

9. In the Zones region, click **Add** to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click **Assign Pool**. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. Click **Next**. The Database Cloud Self Service Portal Setup: Database page appears. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.

  The database values such as the location of the file system and the listener port you select must be available on the reference host.

12. Specify the following details:

• **Storage**: You can configure the volumes that will be used by the database:
  
  – **Mount Point Prefix**: The mount point prefix can be the **Same for All Volumes** or **Different for Each Volume**.

    Specify the prefix for the new mount point for the database being provisioned. This value would be prefixed to an auto-generated mount point where a clone of this volume will be mounted. The volume will be mounted on `/<mount-prefix>_<unique-suffix-generated-by-EM>/<source-path>`. If the Mount Point Prefix is different for each volume, specify a different value for each volume,

  – **Writable Space**: The Writable Space can be the **Same for All Volumes** or **Different for Each Volume**.
Specify the amount of space required for block changes. The value specified here cannot exceed the Storage Ceiling specified for the server. For example, for minimal data changes, you specify the value as 1% of the original volume size.

- **Enable Archiving**: If this check box is selected, the database will not be shut down during a refresh. This allows self-service users to schedule backups and restore operations without shutting down the database.

- **Snapshot Policy**: Snapshots are sets of historical data for specific time periods. By default, Oracle Database automatically generates snapshots of the performance data once every hour and retains the statistics in the workload repository for 8 days. Select the **Allow the user to take snapshots for the new database** checkbox and specify the **Maximum Number of Snapshots** that can be taken.

  Snapshots can be created for a specific point in time. The number of snapshots is determined by the value specified by the self-service administrator in the Maximum Number of Snapshots field. Once the snapshot has been taken, the database can be restored to a specific snapshot taken a particular point in time. For example, if there are several snapshots such as snap1, snap2, and snap3, if the database is restored to snap2, snap3 will be deleted.

- In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

- **Administrator Credentials**: Specify passwords for the system schemas of the new database. These schemas will not be available to the EM_SSA_USERS. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the EM_ADMINISTRATOR can change them.

- **Non Administrator Credentials**: Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password.

- **Master Account Privileges**: Enter the name of the Master Account. You can specify the privileges that are to be provided to the master account user by specifying them in the Privileges field.

13. Click **Next**. The Create Service Template: Initialization Parameters page appears.

14. In this page, you can specify the following:

- **Database Sizes**: Select the database sizes that are to be supported by this service template.

  **Note**: The database size definitions must have already been defined using the `emcli create_database_size` command. See Database Size EM CLI Verbs for details.

  You can select sizes such as small, medium, and large. Each database size has a specific memory, storage, CPU cores, and units. Select a size and select **Include in Template** to associate it with the service template. Click **Default** to designate it as the default database size.

- **Initialization Parameters**: You can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the **Set** icon to modify the value of the parameter.
15. Click Next. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

You can also specify a custom Post SQL Script and select the user who can run the script. For more details, see Selecting the Post SQL Script.

16. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. These properties will be applied to the database clones that are created. You can do the following:

   • Mark a property as mandatory by selecting the Required check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
   • Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

17. Click Next. The Create Service Template: Roles page appears. Click Add to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click Next.

22.7.3 Creating a Service Template Using RMAN Image Profile

To create a service template using RMAN Image Profile, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.

2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.

3. Click the Setup link next to the Databases option in the left panel. Select Database from the drop down menu.

4. Click the Service Templates link. The Service Templates page appears. Click Create. The Create Service Template: General page appears.

Figure 22-6  Create Service Template: General (CloneDB)
5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. Click the Search icon next to the Profile field and select the test master database based on the RMAN Image profile.

7. In the Profile Version field, you can select either of the following:
   - Latest: This ensures that the latest profile is always used by the self service user.
   - Selected by user at request time: If this option is selected, the self service user can select the profile to be used when creating a service request.

8. In the Database Definition region, select the following:
   - **Create**: Select CloneDB Database option. Each file is copied as an image copy which is a bit-for-bit copy of a database file created on disk. Image copies are identical to copies created with operating system commands such as cp on Linux or COPY on Windows, but are recorded in the RMAN repository and so are usable by RMAN. This option allows you reduce the amount of storage and enables rapid creation of multiple databases.

   If you are doing an online backup, you must ensure that your Test Master database is in ARCHIVELOG mode and that all of the necessary archived redo log files are saved and accessible to the CloneDB database environment.

   If you are doing an offline backup, you must ensure that the backup copies are accessible to the CloneDB database environment.

   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.

   - **Database SID**: This is an optional field. You can select Specify Prefix or Specified by User at Request Time.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.

       The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.

       For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And In progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.

     - **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.

   - **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

9. In the Pools and Zones region, click Add to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click Assign Pool. Select a
pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.

12. In the Location field, specify the location for the database files. This must be an NFS location.

13. To simplify the management of backup and recovery files, you can optionally create a fast recovery area for your database. Select the **Enable Fast Recovery Area** checkbox to specify the location in which recovery related files must be stored. The fast recovery area can be a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.

   If the **Enable Archiving** check box is selected, the database will not be shut down during a refresh. This allows self service users to schedule backups and restore operations without shutting down the database.

14. If you have chosen to create a CloneDB database, you can optionally allow the user to take a backup copy of the database. Select the **Allow the user to take backup copy for the new database** checkbox. Specify the maximum number of backups allowed and the backup location.

15. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

16. Specify the **Administrator Credentials**. Specify passwords for the system schemas of the new database. These schemas will not be available to the `EM_SSA_USERS`. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the `EM_ADMINISTRATOR` can change them.

17. Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password. These schemas will be locked and the `EM_SSA_USERS` cannot access them. Click **Next**.

18. Click **Next**. The Create Service Template: Initialization Parameters page appears. In this page, you can configure the values of various initialization parameters that affect the operation of the database instance. Select the parameter and click the Set icon to modify the value of the parameter.

19. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

20. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:

   • Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
• Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

21. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

22. The Create Service Template: Review page appears. Click **Create**. The newly created service template will appear in the Database Cloud Self Service Portal Setup: Service Templates page.

### 22.7.4 Creating a Service Template for EMC Snap Clone

![Note: This option can be used only for snapshots created on EMC storage.](image)

**Prerequisites**

Before you can create snap clones on EMC storage, you must ensure that the prerequisites described in [Configuring EMC Storage Servers](#) are met.

To create a service template using an existing database, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.
3. Click the **Setup** link next to the Databases option in the left panel. Select **Database** from the drop down menu.
4. Click the **Service Templates** link. The Service Templates page appears. Click **Create**. The Create Service Template: General page appears.

![Figure 22-7 - Create Service Template: General: EMC Snap Clone](image)
5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Source Identification section, select the Using Existing Database radio button, click the Search icon and select the test master database that you had created earlier. See Using a Physical Standby Database as a Test Master for more details.

7. Specify the host and database credentials.

8. In the Database Definition region, the Create Snap Clone Database option is selected. Enter the following details:
   - **Type**: This can be Single Instance or Real Application Cluster (RAC). If you select RAC, specify the Number of Nodes.
   - **Database SID**: This is an optional field. You can select Specify Prefix or Specified by User at Request Time.
     - **Specify Prefix**: If you choose this option, enter a prefix that is to be used to generate a unique System Identifier (SID) at the time of database creation. The prefix helps to identify databases created using this service template. The prefix can be a maximum of 6 characters.
       The new database name generated will be based on the SID Prefix specified here. For example, if the prefix is specified as MYDB, the SID for the new database is generated as MYDB0000, MYDB0001, MYDB0002, and so on.
       For existing databases (running databases and in progress requests), a unique SID name is generated for single instance databases, or a unique name is generated for real application cluster databases. For example, if the existing SIDs running on a host are MYDB0000, MYDB0001, MYDB0002 And In progress are MYDB0003, MYDB0004, the new SID or database name generated for the new request is MYDB0005.
     - **Specified by User at Request Time**: If you choose this option, you can leave this field blank and specify the SID when you are making a database request.
   - **Domain Name**: This is an optional field. Enter a Domain Name to be used for the new database being created. You must ensure that the domain name does not contain a preceding "." (dot).

9. In the Zones region, click Add to select a PaaS Infrastructure Zone into which the database instance is to be provisioned. Click Assign Pool. Select a pool from the list and assign this pool to the PaaS Infrastructure Zone. The database will be provisioned into this pool.

10. After you have selected the zone and the pool, the host target is populated in the Reference Host field.

11. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number. Click Next. The Create Service Template: Database page appears.

12. In the Reference Host region, the name of the PaaS Infrastructure zone, the database pool, and the reference host you have selected in the Database Cloud Self Service Portal Setup: General page are displayed.
The database values such as a Automatic Storage Management (ASM) disk group, location of the file system, and listener port you select must be available on the reference host.

13. Specify the following:
   - **Storage Type**: Select Automatic Storage Management (ASM). The Oracle Automatic Storage Management (ASM) is a volume manager and a file system for database files that supports single-instance and RAC configurations. ASM groups the disks in your storage system into one or more disk groups. If you select ASM, select the Disk Group here.
   - **Fast Recovery** (Optional): To simplify the management of backup and recovery files, you can create a fast recovery area for your database. Select the Enable Fast Recovery Area checkbox to specify the location in which recovery related files must be stored. The fast recovery area can be an ASM disk group or a file system that provides a centralized disk location for backup and recovery file. Specify the location of the Fast Recovery Area and the Fast Recovery Size. The amount of disk space to allocate for the fast recovery area depends on the size and activity levels of your database.
     
     If the Enable Archiving check box is selected, the database will not be shut down during a refresh. This allows self service users to schedule backups and restore operations without shutting down the database.

14. In the Listener Port field, specify listener port number that is to be associated with the new database. If you have selected a 11.2 or later RAC database, you must specify the scan port number.

15. Specify the Administrator Credentials. Specify passwords for the system schemas of the new database. These schemas will not be available to the EM_SSA_USERS. You can choose to use the same password for all the schemas or different passwords for each schema. If these values are not specified, default values will be used and the EM_ADMINISTRATOR can change them.

16. Apart from the system schemas, if you want to restrict access to other schemas, you can select them in the Non-Administrator Credentials region and specify the password. These schemas will be locked and the EM_SSA_USERS cannot access them. Click Next.

17. Click Next. The Create Service Template: Initialization Parameters page appears. In this page, you can specify the following:
   - **Database Sizes**: Select the database sizes that are to be supported by this service template.
     
     **Note**: The database size definitions must have already been defined using the emcli create_database_size command. See Database Size EM CLI Verbs for details.

     You can select sizes such as small, medium, and large. Each database size has a specific memory, storage, CPU cores, and units. Select a size and select Include in Template to associate it with the service template. Click Default to designate it as the default database size.

   - **Initialization Parameters**: You can configure the values of various initialization parameters that affect the operation of the database instance. Select a parameter and click the Set icon to modify the value of the parameter.
18. Click **Next**. The Create Service Template: Customization page appears. Specify the custom scripts that need to be executed before and after the database is created. See *Pre and Post Request Creation / Deletion Scripts* for details.

19. In the Target Properties region, you can specify global target properties such as Location, Department, Line of Business, and so on. You can do the following:

- Mark a property as mandatory by selecting the **Required** check box. If a property is marked as mandatory, the self service user must specify a value for this property while requesting a database.
- Lock a property. When a property is locked, the self service user cannot modify the value of this property while requesting a database.

20. Click **Next**. The Create Service Template: Roles page appears. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

### 22.8 Snap Clone Data Creation

This section contains the following topics:

- **Requesting a Database**
- **Refreshing the Test Master Database**
- **Refreshing the Test Master Snapshots**
- **Snapshot Data Profile Refresh**
- **Refreshing a Database**

#### 22.8.1 Requesting a Database

To request a new database, follow these steps:

1. Click the **Request New Service** link on the Database Cloud Self Service Portal. The service offerings window is displayed.

2. In the Service Type drop down, select **All** to view all the service offerings available for the Database Service Family. You can select Database, Pluggable Database, or Schema to view service offerings only for the selected service type.

3. Select a service template from the list and click **Select**. The service template you select can be based on RMAN backup profile, physical standby database, or snapshot based profile. Select the appropriate template according to your requirement.

4. The New Database Service Request page appears.
Enter the following details:

- **Request Name**: Enter the name of the request.
- **Zone**: Select a PaaS Zone on which the database is to be deployed.
- **Database SID**: This field is displayed if the service template you have selected allows you to specify the database SID at request time. Enter a unique Database SID.
- **Database Service Name**: Enter a unique database service name. The name you specify must be unique across all database, pluggable database, and schema service requests. You cannot use the same database service name that has been used for future scheduled requests. If a Delete operation failed, you cannot use the name specified in the failed request.

**Note:**

- You can create a standby database only if the service template you select contains a database pool with standby databases.
- If the service template supports standby databases, depending on the preferences set up by the self service administrator, you can choose to create a standby database if required. You can also select from one or more standbys (a subset of what is defined in the service template). If you do not wish to create a standby database and you select only a subset of the topology supported by the service template, you can request one or more of the remaining standbys at a later point in time after the current request has been completed.
• **Deployment Input**: Specify the user name and password for the database. If you have selected an RMAN or snap clone based service template, and you are allowed to choose from the active data points, you can select an RMAN backup or snapshot here.

• **Schedule Request**: Specify the schedule for the request.

• **Service Instance Properties**: Any mandatory and optional target properties are displayed here. If a property is marked mandatory, you must enter a value for that property.

5. If the service template you selected is based on a RMAN Backup, Snapshot or RMAN Image profile, the list of available backups, snapshots, or images are listed in the Snapshot region. These snapshots reflect the state of the test master database at any point in time.

**Figure 22-9  Create Database (Snapshots)**

Select a snapshot from the list and click **Submit** to deploy the database to the selected zone. The new database that is created will be based on the selected snapshot.

**22.8.1.1 Requesting a Schema**

You can create a database service with one or more schemas and populate the schema with the required data.

**Requesting an Export Profile Based Schema**

You can create a schema based on a service template with a schema export profile or an empty service template. To create a schema based on a schema export profile, follow these steps:

1. Log in to Enterprise Manager as a user with **EM_SSA_USER** role or any role that includes **EM_SSA_USER** role.

2. The Database Cloud Self Service Portal page appears. Select **Databases** from the Manage drop down list to navigate to the Database Cloud Self Service Portal.
3. Click **Request New Service** in the Services region.

4. Choose a Schema Service Template with an schema export profile from the list and click **Select**. The Create Schema page appears. The name and description of the service template you have selected is displayed. Enter the following details:
   - **Request Name**: Enter a name for the schema service request.
   - **Zone**: Select the zone in which the schema is to be created.
   - **Database Service Name**: Enter a unique name for the database service.
   - **Workload Size**: Specify the workload size for the service request.
   - **Schema Prefix**: Enter a prefix for the schema. For clustered databases, the service is registered with Grid Infrastructure credentials.

5. Click **Rename Schema** to enter a new name for the schema. If you wish to retain the source schema name, ensure that the Schema Prefix field is blank.

6. Specify the password for the schema. Select the **Same Password for all Schemas** checkbox to use the same password for all the schemas.

7. The Master Account for the schema is displayed. The schema with Master Account privileges will have access to all other schemas created as part of the service request.

8. In the Tablespace Details region, the names of all the tablespaces in the schema are displayed. You can modify the tablespace name and specify a new name in the New Tablespace Name box.

9. Specify the schedule for the request and click **Submit** to create the schema.

**Requesting an Empty Schema**

To create a schema with an empty schema template, follow these steps:

1. Follow **steps 1 to 3** listed above and in the Select Service Template window, select an empty schema template from the list.

2. Specify the details of the schema as listed in **steps 4 to 7**.

3. In the Tablespace Details region, you can specify a separate tablespace for each schema or use the same tablespace for all the schemas.

4. Specify the schedule for the schema request and click **Submit** to create the schema.

**22.8.1.2 Requesting a Pluggable Database**

You can request a pluggable database based on a selected service template. To request a pluggable database, follow these steps:

1. Login to Enterprise Manager as a user with **EM_SSA_USER** role or any role that includes **EM_SSA_USER** role.

2. The Infrastructure Cloud Self Service Portal page appears. Select **Databases** from the Manage drop down list.

3. Click **Request New Service** in the Services region. In the Request New Service window that appears, select **Pluggable Database** from the Service Type drop down.

4. Choose a service template from the list and click **Select**. The Create Pluggable Database page appears.
Figure 22-10  New Pluggable Database Service Request

5. Specify the following details:
   - **Request Name**: Enter the name of the request.
   - **Zone**: Select a PaaS Infrastructure Zone with the container databases into which the pluggable database is to be deployed.
   - **PDB Name**: Enter a unique pluggable database name.

   **Note:**
   - The database service name you specify must be unique across all database, pluggable database, and schema service requests.
   - You cannot use the same database service name that has been used for future scheduled request.
   - If a Delete operation failed, you cannot use the name specified in the failed request.

   - **Database Service Name**: Enter a unique database service name.
   - **Workload Size**: Workload represents the total CPU, memory, and storage requirements for each service. Select the Workload Size from the drop down list.
   - **Deployment Input**: Specify the pluggable database administrator user name and password.
   - **Schedule Request**: Specify the schedule for the request.
   - **Service Instance Properties**: Any mandatory and optional target properties are displayed here. If a property is marked mandatory, you must enter a value for that property.

6. Click **Submit** to deploy the database to the selected zone.
22.8.2 Refreshing the Test Master Database

The test master database is created from an RMAN Backup profile of the production database taken at a particular point in time. Since the production database is constantly updated, to ensure that the latest production data is available in the test master, it has to be refreshed at periodic intervals.

To refresh the test master database, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select the Database Service family on the left panel. Click the Test Master Databases tab.

2. Select the test master that is to be refreshed and click Refresh. The Refresh Database: Source and Destination page appears.

3. Select the Prior Point in Time option and select the backup to which the test master is to be refreshed. You can modify the source and destination credentials.

4. If you select the Now option, you will see the following screen.

Figure 22-11 Test Master Refresh: Source and Destination (Now)

Click Next. The Configuration page appears.

Figure 22-12 Test Master Refresh: Configuration
5. Specify the Mount Point Prefix for the storage volume that will be used by the clone database and the database credentials. Click **Next**.

6. In the Initialization Parameters page, edit the values of various initialization parameters that affect the operation of the database instance. Click **Next**.

7. In the Post Processing page, specify the following:
   - **Masking Definition**: Data masking is the process of masking sensitive data in test or non-production databases. The masking definition defines the columns to be masked in the format of the masked data. Specify the masking definition to be applied after the database is cloned. After selecting the masking definition, select the In-Place Masking option to generate a script to replace the sensitive data in-place with masked data on the cloned database. For more details on creating a masking definition, see the *Enterprise Manager Database Testing Guide*

   - **Note**: The masking definition can be used only when you have the Oracle Data Masking and Subsetting license pack.

   - Specify the custom scripts that need to be executed before and after the database is created. See **Pre and Post Request Creation / Deletion Scripts** for details.

   - Specify the path for the SQL script which allows you to run the script against the newly cloned database as a user such as SYS, SYSTEM, or any other specified user. The SQL script allows you to customize the cloned database. For more details, see **Selecting the Post SQL Script**.

8. Click **Next**. Specify the schedule for the creation of the test master. It can be created immediately (if physical standby used, it is created immediately and automatically refreshed) or can be created at a later date / time and refreshed at specified intervals.

9. Click **Next**. Review the information entered so far and click **Submit** to refresh the test master.

   - **Note**: You can use the `emcli refresh_database` command to refresh the database. See **Database Profile EM CLI Verbs** for details.

When the test master is refreshed, you can create a new profile based on the updated test master. The self service user can choose to refresh the database instances to the latest profile. The storage space that was used by the older version of the test master will be reclaimed by the updated (refreshed) test master.

### 22.8.3 Refreshing the Test Master Snapshots

You can create a new revision of the storage test master by following these steps:
1. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select the Database Service family on the left panel. Click Data Sources.

2. In the Data Sources page, click the Test Master Snapshots tab. The list of the snapshots is displayed.

3. Select the profile to be refreshed and click Refresh. A confirmation message is displayed. Click Yes to submit the refresh profile job.

22.8.4 Snapshot Data Profile Refresh

This section covers the following topics:

- Refreshing the Snap Shot Profile
- Creating and Refreshing Snapshots of the Test Master

22.8.4.1 Refreshing the Snap Shot Profile

After the test master has been refreshed, you must create a new revision of the snapshot profile. To do so, you must refresh the snapshot profile by following these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select the Database Service family on the left panel. Click Data Sources.

2. In the Data Sources page, click the Data Profiles tab. The list of the profiles is displayed.
3. Select the profile to be refreshed and click Refresh Profile. A confirmation message is displayed. Click Yes to submit the refresh profile job.

22.8.4.2 Creating and Refreshing Snapshots of the Test Master

After the snapshot profile has been created, you can refresh the profile at scheduled intervals and create new versions of the profile.

To create a snapshot profile of the test master (or the physical standby database), follow the steps listed in Creating a Database Provisioning Profile Using Snapshots. To refresh a snapshot profile, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Setup, then select the Database Service family on the left panel. Click the Data Profiles tab.

2. Select the snapshot profile that is to be refreshed.

   Click Refresh. You will see a message indicating that a new snapshot (version) of the profile will be created. Click Yes to submit the refresh profile job and create a new snapshot.

22.8.4.2.1 Snapshot Purge Policy

Snapshots can be refreshed at regular intervals to ensure that the latest production data is available to the users. Every time a snapshot is refreshed, a new version of the snapshot is created. When the self service user refreshes his database to a newer version of the snapshot, the older versions can be deleted. You can delete them manually or define a purge policy while creating the snapshot.

22.8.5 Refreshing a Database

After you have created a database, you can keep the data current and consistent with the production database by refreshing it on a regular basis. To refresh a database, follow these steps:

1. In the Database Self Service Portal Home page, click on the Name link in the Services region to drill down to the Database Home page.
2. Click **Refresh**. The list of available snapshots or RMAN backups are displayed.
Select a snapshot profile from the list and click **Refresh**. You will see a message that the database will be refreshed to the selected snapshot version and older snapshots will be deleted. Click **Yes** to submit the Refresh Database Request job. On successful completion of the request, the database is refreshed and will be consistent with the selected snapshot profile.

### 22.9 Creating Test Master Pluggable Databases and Snapshot Clones

This section provides the following different solutions of creating test master pluggable database and snapshot clones of test master pluggable databases:

- Creating a Test Master Pluggable Database
Creating an Exadata Test Master Pluggable Database
Creating a Snapshot Clone of an Exadata Test Master PDB
Creating an ACFS Test Master Pluggable Database
Creating a Snapshot Clone of an ACFS Test Master PDB

22.9.1 Creating a Test Master Pluggable Database

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a test master PDB from a source PDB, using the new Clone PDB Wizard.

To create a test master PDB from a source PDB, follow these steps:
1. From the Targets menu, select Databases.
2. For View, select Search List. From the View menu, select Expand All.
3. Look for the source CDB (the CDB that the source PDB is a part of) in the list, then click the name of the PDB from which you want to create a test master PDB.
4. From the Oracle Database menu, select Cloning, then select Create Test Master.
   Alternatively, in Step 3, you can right click the name of the PDB from which you want to create a test master PDB, select Oracle Database, select Cloning, then select Create Test Master.
5. On the Create Test Master Pluggable Database: Source and Destination page, do the following:
   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the Pluggable Database Definition section, specify a name, and a display name for the test master PDB. Enterprise Manager uses the display name to identify the test master PDB target.
   - In the PDB Administrator Credentials section, specify the credentials of the admin user account that you want to use to administer the test master PDB.
   - In the Container Database section, specify the destination CDB (the CDB that the test master PDB must be a part of).
   - In the Credentials section, specify the SYSDBA credentials for the destination CDB, and the host credentials for the destination CDB. Also, if the destination CDB is using Automatic Storage Management (ASM) to manage disk storage, you must specify the ASM credentials.
   Click Next.
6. On the Create Test Master Pluggable Database: Configuration page, do the following:

In the Database Files Location section, specify the storage location where the datafiles of the test master PDB must be stored. If the destination CDB is using ASM to manage disk storage, specify the disk group where the datafiles of the test master PDB must be stored.

To ensure that only the source PDB data model definition is cloned (and the source PDB data is not cloned), select **Exclude User Data**.

In the PDB Administrator Credentials section, specify the credentials of the admin user account that you want to use to administer the test master PDB.

In the Advanced Configuration section, specify the storage limits for the maximum size of the test master PDB, and the maximum size of a shared tablespace within the test master PDB. By default, no limits are placed on the values for these attributes. In the Miscellaneous section, select the logging option that you want to use for the tablespaces created within the test master PDB.

Note that if the destination CDB is part of an Exadata machine, the Access Controls and Permissions section is displayed in place of the Advanced Configuration section. In this case, you must specify the owner and the group that must be granted **read only** permissions on the datafiles.

Click **Next**.

7. On the Create Test Master Pluggable Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see the *Oracle Data Masking and Subsetting Guide*. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for **Pre Script** and **Post Script**, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for **SQL Script**, specify the SQL scripts that you want to run after creating the test master PDB. For **Run As User**, select the user account that you want to use to run the SQL scripts.

Click **Next**.

8. Specify an instance name for the deployment procedure. Also, specify the point in time when you want the deployment procedure to begin.
In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select Scheduled and Succeeded for Status for Notification, you will receive e-mail notifications when the deployment procedure is scheduled, and when it succeeds.

Click Next.

9. Review all the details you provided. If you want to edit certain details, click Back to navigate to the required page.

Click Clone to submit the deployment procedure to create a test master PDB from the source PDB.

---

**Note:**

The pluggable database cloning procedure contains a prerequisite step that is enabled by default. This step causes the cloning procedure to fail. To disable this step, run the following command:

```
emctl set property -name oracle.sysman.db.pdb.prereq_enabled -sysman_pwd <sysman_password> -value false
```

To enable this step, run the following command:

```
emctl set property -name oracle.sysman.db.pdb.prereq_enabled -sysman_pwd <sysman_password> -value true
```

---

22.9.2 Creating an Exadata Test Master Pluggable Database

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a test master PDB from a source PDB, using the new Clone PDB Wizard.

To create a test master PDB from a source PDB, follow these steps:

1. From the Targets menu, select Databases.
2. For **View**, select **Search List**. From the **View** menu, select **Expand All**.

3. Look for the source CDB (the CDB that the source PDB is a part of) in the list, then click the name of the PDB from which you want to create a test master PDB.

4. From the **Oracle Database** menu, select **Cloning**, then select **Create Test Master**.

   Alternatively, in Step 3, you can right click the name of the PDB from which you want to create a test master PDB, select **Oracle Database**, select **Cloning**, then select **Create Test Master**.

5. On the Create Test Master Pluggable Database: Source and Destination page, do the following:

   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the Pluggable Database Definition section, specify a name, and a display name for the test master PDB. Enterprise Manager uses the display name to identify the test master PDB target.
   - In the PDB Administrator Credentials section, specify the credentials of the admin user account that you want to use to administer the test master PDB.
   - In the Container Database section, specify the destination CDB (the CDB that the test master PDB must be a part of).
   - In the Credentials section, specify the SYSDBA credentials for the destination CDB, and the host credentials for the destination CDB. Also, if the destination CDB is using Automatic Storage Management (ASM) to manage disk storage, you must specify the ASM credentials.

   Click **Next**.

6. On the Create Test Master Pluggable Database: Configuration page, do the following:

   In the Database Files Location section, specify the disk group where the data files of the test master PDB will be created.

   To ensure that only the source PDB data model definition is cloned (and the source PDB data is not cloned), select **Exclude User Data**.

   In the Access Controls and Permissions section, specify the owner and the group that must be granted *read-only* permissions on the data files.

   Click **Next**.
7. On the Create Test Master Pluggable Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see the Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for Pre Script and Post Script, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for SQL Script, specify the SQL scripts that you want to run after creating the test master PDB. For Run As User, select the user account that you want to use to run the SQL scripts.

Click Next.

8. Specify an instance name for the deployment procedure. Also, specify the point in time when you want the deployment procedure to begin.

In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select Scheduled and Succeeded for Status for Notification, you will receive e-mail notifications when the deployment procedure is scheduled, and when it succeeds.

Click Next.

9. Review all the details you provided. If you want to edit certain details, click Back to navigate to the required page.

Click Clone to submit the deployment procedure to create a test master PDB from the source PDB.
22.9.3 Creating a Snapshot Clone of an Exadata Test Master PDB

**Note:**
You can create snapshot clones of only those test master PDBs that are of version 12.1.0.2.0 or higher.

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a snapshot clone of a test master PDB using the new Clone PDB Wizard.

To create a snapshot clone of an exadata test master PDB, follow these steps:

1. From the **Targets** menu, select **Databases**.
2. For **View**, select **Search List**. From the **View** menu, select **Expand All**.
3. Look for the source CDB (the CDB that the source test master PDB is a part of) in the list, then click the name of the test master PDB that you want to clone.
4. From the **Oracle Database** menu, select **Cloning**, then select **Create Snapshot Clone**.
   Alternatively, in Step 3, you can right click the name of the test master PDB that you want to clone, select **Oracle Database**, select **Cloning**, then select **Create Snapshot Clone**.
5. On the Source and Destination: Create Snapshot Clone Pluggable Database, do the following:
   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the Credentials section, specify the SYSDBA credentials of the CDB.
   - In the Pluggable Database Definition section, specify the name of the PDB, and a display name of the PDB snapshot clone. Enterprise Manager uses the display name to identify the PDB snapshot clone target.
   - In the PDB Administrator Credentials section, specify the credentials of the Admin user account that you want to use to administer the PDB snapshot clone.
   To clone the test master PDB to a CDB different from the source CDB, select **Clone the Pluggable Database into a different Container Database**, then specify the destination CDB.
   - In the Credentials section, specify the CDB host credentials. Also, specify the ASM credentials of the ASM that will be used to manage disk storage.
6. If you do not need to specify anymore details, click **Clone**. This submits the deployment procedure to clone a PDB to a CDB that is deployed in a public cloud setup.

To specify other configuration details, mask data, as well as schedule the cloning process, click **Advanced**.

Follow the rest of the steps, if you have selected the Advanced option. The option to **Clone** is available on each page.

7. On the Create Snapshot Clone Pluggable Database: Source and Destination page, verify the details specified, and then click **Next**.

8. On the Create Snapshot Clone Pluggable Database: Configuration page, do the following:
   - In the Database Files Location section, specify the name of the Sparse disk group where the data files of the PDB snapshot clone will be created.
   - In the Advanced Configuration section, specify the storage limits for the maximum size of the PDB snapshot clone, and the maximum size of a shared tablespace within the PDB snapshot clone. By default, no limits are placed on the values for these attributes.
   - In the Miscellaneous section, select the default logging option for the tablespaces created within the PDB snapshot clone.
   - Click **Next**.
9. On the Create Snapshot Clone Pluggable Database: Post Processing section, in the Data Masking section, specify the data masking definition that you want to apply after cloning the PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see the Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for Pre Script and Post Script, specify the Oracle Software Library components that contain the scripts that you want to run before cloning, and after cloning the PDB respectively. Also, for SQL Script, specify the SQL scripts that you want to run after cloning the PDB. For Run As User, select the user account that you want to use to run the SQL scripts.

Click Next.

10. On the Create Snapshot Clone Pluggable Database: Schedule page, specify an instance name for the cloning deployment procedure. Also, specify the point in time when you want the cloning procedure to begin.

In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select Scheduled and Succeeded for Status for Notification, you will receive e-mail notifications when the cloning deployment procedure is scheduled, and when it succeeds.

Click Next.

11. On the Create Snapshot Clone Pluggable Database: Review page, review all the details you provided. If you want to edit certain details, click Back to navigate to the required page.

Click Clone to submit the deployment procedure to create a snapshot clone of the exadata test master PDB.
22.9.4 Creating an ACFS Test Master Pluggable Database

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a test master PDB from a source PDB, using the new Clone PDB Wizard.

To create a test master PDB from a source PDB, follow these steps:

1. From the **Targets** menu, select **Databases**.
2. For **View**, select **Search List**. From the **View** menu, select **Expand All**.
3. Look for the source CDB (the CDB that the source PDB is a part of) in the list, then click the name of the PDB from which you want to create a test master PDB.
4. From the **Oracle Database** menu, select **Cloning**, then select **Create Test Master**.

Alternatively, in Step 3, you can right click the name of the PDB from which you want to create a test master PDB, select **Oracle Database**, select **Cloning**, then select **Create Test Master**.

5. On the **Create Test Master Pluggable Database: Source and Destination page**, do the following:
   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the **Pluggable Database Definition section**, specify a name, and a display name for the test master PDB. Enterprise Manager uses the display name to identify the test master PDB target.
   - In the **PDB Administrator Credentials section**, specify the credentials of the admin user account that you want to use to administer the test master PDB.
   - In the **Container Database section**, specify the destination CDB (the CDB that the test master PDB must be a part of).
   - In the **Credentials section**, specify the SYSDBA credentials for the destination CDB, and the host credentials for the destination CDB. Also, if the destination CDB is using Automatic Storage Management (ASM) to manage disk storage, you must specify the ASM credentials.

   Click **Next**.

6. On the **Create Test Master Pluggable Database: Configuration page**, in the **Database Files Location section**, specify the ACFS mount point storage location where the data files of the test master PDB will be created.
To ensure that only the source PDB data model definition is cloned (and the source PDB data is not cloned), select **Exclude User Data**. Click **Next**.

7. On the Create Test Master Pluggable Database: Post Processing page, in the Data Masking section, specify the data masking definition that you want to apply after creating the test master PDB. Data masking masks sensitive data in a database.

For information on how to create a data masking definition, see the Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for **Pre Script** and **Post Script**, specify the Oracle Software Library components that contain the scripts that you want to run before, and after creating the test master PDB respectively. Also, for **SQL Script**, specify the SQL scripts that you want to run after creating the test master PDB. For **Run As User**, select the user account that you want to use to run the SQL scripts. Click **Next**.

8. Specify an instance name for the deployment procedure. Also, specify the point in time when you want the deployment procedure to begin.

In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select **Scheduled** and **Succeeded** for **Status for Notification**, you will receive e-mail notifications when the deployment procedure is scheduled, and when it succeeds. Click **Next**.

9. Review all the details you provided. If you want to edit certain details, click **Back** to navigate to the required page.
Click **Clone** to submit the deployment procedure to create a test master PDB from the source PDB.

![Image of deployment procedure]

### 22.9.5 Creating a Snapshot Clone of an ACFS Test Master PDB

#### Note:
You can create snapshot clones of only those test master PDBs that are of version 12.1.0.2.0 or higher.

If you have the 12.1.0.8 Enterprise Manager for Oracle Database plug-in deployed in your system, you can create a snapshot clone of a test master PDB using the new Clone PDB Wizard.

To create a snapshot clone of an exadata test master PDB, follow these steps:

1. From the **Targets** menu, select **Databases**.
2. For **View**, select **Search List**. From the **View** menu, select **Expand All**.
3. Look for the source CDB (the CDB that the source test master PDB is a part of) in the list, then click the name of the test master PDB that you want to clone.
4. From the **Oracle Database** menu, select **Cloning**, then select **Create Snapshot Clone**.

Alternatively, in Step 3, you can right click the name of the test master PDB that you want to clone, select **Oracle Database**, select **Cloning**, then select **Create Snapshot Clone**.

5. On the Source and Destination: Create Snapshot Clone Pluggable Database, do the following:
   - Specify the SYSDBA credentials for the source CDB. You can choose to use the preferred credentials, use a saved set of named credentials, or specify a new set of credentials.
   - In the Credentials section, specify the SYSDBA credentials of the CDB.
   - In the Pluggable Database Definition section, specify the name of the PDB, and a display name of the PDB snapshot clone. Enterprise Manager uses the display name to identify the PDB snapshot clone target.
   - In the PDB Administrator Credentials section, specify the credentials of the Admin user account that you want to use to administer the PDB snapshot clone.
To clone the test master PDB to a CDB different from the source CDB, select **Clone the Pluggable Database into a different Container Database**, then specify the destination CDB.

- In the Credentials section, specify the CDB host credentials. Also, specify the ASM credentials of the ASM that will be used to manage disk storage.

6. If you do not need to specify anymore details, click **Clone**. This submits the deployment procedure to clone a PDB to a CDB that is deployed in a public cloud setup.

To specify other configuration details, mask data, as well as schedule the cloning process, click **Advanced**.

Follow the rest of the steps, if you have selected the Advanced option. The option to **Clone** is available on each page.

7. On the Create Snapshot Clone Pluggable Database: Source and Destination page, verify the details specified, and then click **Next**.

8. On the Create Snapshot Clone Pluggable Database: Configuration page, do the following:
   - In the Database Files Location section, specify the name of the Sparse disk group where the data files of the PDB snapshot clone will be created.
   - In the Advanced Configuration section, specify the storage limits for the maximum size of the PDB snapshot clone, and the maximum size of a shared tablescape within the PDB snapshot clone. By default, no limits are placed on the values for these attributes.
   - In the Miscellaneous section, select the default logging option for the tablescape created within the PDB snapshot clone.
   - Click **Next**.
9. On the Create Snapshot Clone Pluggable Database: Post Processing section, in the Data Masking section, specify the data masking definition that you want to apply after cloning the PDB. Data masking masks sensitive data in a database. For information on how to create a data masking definition, see the Oracle Data Masking and Subsetting Guide. Note that you can apply a data masking definition only if you have the Subset-Masking license pack.

In the Custom Scripts section, for Pre Script and Post Script, specify the Oracle Software Library components that contain the scripts that you want to run before cloning, and after cloning the PDB respectively. Also, for SQL Script, specify the SQL scripts that you want to run after cloning the PDB. For Run As User, select the user account that you want to use to run the SQL scripts.

Click Next.

10. On the Create Snapshot Clone Pluggable Database: Schedule page, specify an instance name for the cloning deployment procedure. Also, specify the point in time when you want the cloning procedure to begin.

In the Notification section, select the deployment procedure states for which you want to receive e-mail notifications. For example, if you select Scheduled and Succeeded for Status for Notification, you will receive e-mail notifications when the cloning deployment procedure is scheduled, and when it succeeds.

Click Next.

11. On the Create Snapshot Clone Pluggable Database: Review page, review all the details you provided. If you want to edit certain details, click Back to navigate to the required page.

Click Clone to submit the deployment procedure to create a snapshot clone of the exadata test master PDB.
22.9.6 Enabling a Test Master Pluggable Database

To convert a pluggable database into a test master, follow these steps:

1. Right click on the pluggable database target name that you want to enable as a test master, select **Oracle Database**, select **Cloning**, and then select **Enable as a Test Master**.

2. On the Enable as a Test Master page, in the Credentials section, specify the credentials for the container database of the pluggable database, and the credentials of the Oracle Home.

3. In the Source section, specify or search for the parent database from which the database has been created. This provides better lineage tracking.

4. In the Data Masking section, you can choose to desensitize the data by applying masking templates or by running additional scripts of your choice.

5. In the Custom Scripts section, you can select the Software Library components which contain post cloning scripts. The clone database can also be customized by executing the post cloning SQL script.

6. Click **Submit**.

22.9.7 Disabling a Test Master Pluggable Database

Disabling a test master pluggable database, resets the data files to read-write mode and restarts the pluggable database in open mode. You can make further changes to the database and then enable it as a test master again.

To disable a test master pluggable database, follow these steps:

1. Right click on the test master pluggable database, select **Oracle Database**, select **Cloning**, and then select **Disable as a Test Master**.
2. On the Disable Test Master page, specify the credentials of the container database of the test master pluggable database. Also, specify the credentials of the Oracle Home.

3. Click **Submit.**
Using the DBaaS Self Service Portal

This chapter provides self service users with instructions on using the Database Cloud Self Service Portal to request, monitor, and manage database services. It contains the following sections:

- **About the Database Cloud Self Service Portal**
- **Provisioning of Database using Database Cloud Self Service Portal**
- **Requesting a Database**
- **Refreshing a Database**
- **Viewing the History of a Request**
- **Database Service Home Page**
- **Database Instance Home Page**
- **Standby Database Home Page**
- **Cluster Database Home Page**
- **Pluggable Database Home Page**

### 23.1 About the Database Cloud Self Service Portal

The Database Self Service Portal allows self service users to view, monitor and deploy databases on selected zones, as well as create schemas on running databases. To view the Database Cloud Self Service Portal, log in to Enterprise Manager as a user with **EM_SSA_USER** role or an user with the **EM_SSA_USER_BASE** role. Users with these roles must be part of the DBAAS Cloud Service Family and must have privileges for the DB, Schema, or PDB service types. The Self Service Portal appears. Select **Databases** from the **Manage** drop down list.

#### Figure 23-1  Database Cloud Self Service Portal

The Database Self Service Portal allows SSA users to view, monitor, deploy databases on selected zones, and create schemas on running databases.

The following details are displayed:
**Home:** This is the Home page for the Database Self Service Portal. It contains the following sections:

- **Notifications:** This section shows the number of databases that are expiring in the next 7 days.

- **Usage:** This region displays the quota that you currently have and how much has been used for the following:
  * Databases: The number of databases requested so far and the maximum number of databases that can be requested.
  * Schema Services: The number of schemas requested so far and the maximum number of schemas that can be requested.
  * Pluggable Databases: The number of PDBs requested so far and the maximum number of PDBs that can be requested.
  * Memory: The total amount of memory allocated to the user and the memory used by all databases and schemas requested so far.
  * Storage: The total storage volumes allocated to the user and the storage used by all databases requested so far.

- **Services:** This table lists the services that you currently own. You can request more databases, schemas, or PDBs by selecting the appropriate option from the Request New Service menu. You can also delete any databases you own to release it prior to expiration. Click on the service instance name to drill down to the database details page. This page provides basic monitoring capabilities and provides life cycle operations for the service.

  From the **Actions** menu, you can do the following:
  
  - **Start / Stop a Service Instance:** You can start a service instance that has been stopped or stop a service instance that is running.
  - **View History:** Select a service instance and click View History to view the history of operations performed on the service instance.
  - **Grant:** You can grant view or full privileges over the service instance to other users or roles. See Granting, Revoking, and Reassigning Privileges to Service Instances.
  - **Revoke:** You can revoke privileges that you have granted to other users or roles. See Granting, Revoking, and Reassigning Privileges to Service Instances.

- **Requests:** This table tracks the requests that you have created, deleted, or refreshed. For each request, the status, request type, service type, and submission date of the request is displayed. You can select a scheduled such as a Create or Delete request and click Reschedule to reschedule the request. To delete a scheduled request, select the request and click Cancel. If a request that is scheduled such as Create gets canceled, all other associated requests are also canceled.

- **Chargeback:** This page displays all the chargeback break-up data for the databases and pricing for different zones. The charge incurred will be calculated from the database requested date to current date. This page contains the following sections:
  
  - **Charge Trend:** This graph show the usage and charge trends over time.
– Aggregate By: You can aggregate the charge back data for the database by resources or metrics. You can export this data to an external application such as a spreadsheet.

– Charge Plans: The charge plans that have been assigned to each are displayed. Select a zone to view the pricing. The rate for each metric in the database zone for a specific time period is displayed.

• Preferences: Click this link to set up your preferences such as your default service portal, default PaaS Infrastructure Zone, default email address for notifications, and so on.

23.2 Provisioning of Database using Database Cloud Self Service Portal

To provision a database using Database Cloud Self Service Portal, follow these steps:

1. Log in to Enterprise Manager as a user with EM_SSA_USER privileges. The Database Cloud Service page appears. 
   Alternative you can select All Cloud Service and then select Databases Cloud Service.

2. Click Create Instance.

3. Choose a service template from the list and click Select.

4. Enter the following details:
   • PDB Name
   • Database Service Name
   • User Details in the master account section. The master user name should begin with “C##” or “c##”

5. Click the Submit.
23.3 Viewing the History of a Request

To view the history for a database instance, select the row in the Services column and select **History** from the **Actions** menu. All the requests that have been submitted for the database instance and the status of each request is displayed.

23.4 Database Service Home Page

Database services are logical abstractions for managing workloads in Oracle Database. Services divide workloads into mutually disjointed groupings. Each service represents a workload with common attributes, service-level thresholds, and priorities. The Database Service Home page provides a detailed view of the database service.

It contains the following regions:

- **Summary**: Displays the status of the database service and the database version.
- **Connection Details**: Shows the database connection details including the Connect String and the Master Account Name.
- **Export**: You can do the following:
  - Export: Click **Export** to take export dumps of all the schemas that are part of the service. In the Export window, enter the name, description, and specify when the export dump should be scheduled and click **Schedule**.
  - Import: Click **Restore** to restore schemas from the selected export dump.
  - Remove: Select an export dump and click **Remove** to delete it.
- **Requests**: This region shows the requests that you have created. For each request, the status, type, start date, and submission date of the request is displayed. You can select a scheduled request and click **Reschedule** to reschedule the request. To delete a scheduled request, select the request and click **Cancel**.
- **Schemas**: Displays the name of the schema and tablespace associated with the database service.
- **Resource Usage**: This region displays the workloads associated with the schema. This includes the CPU, Memory, and Storage allocated to the database service.
- **Performance**: This region displays a graph showing the Average Number of Active Sessions over the last 5 minutes.
23.5 Database Instance Home Page

The Database Instance Home page provides a detailed view of the database instance.

This page contains the following regions:

- **Summary**: The region of the Database Instance Home page provides a quick overview of the database status and provides basic information about the database. It shows the current status of the database and includes details such as the time stamp of instance start time, database version, date of the last backup, and so on.

- **Connection Details**: Shows the database connection details including the Connect String and the name of the user accessing the database.

- **Backup and Restore**: If the fast recovery area is configured for the database, you can schedule a daily backup for this database. Click Schedule Backup to perform this task. Once backups are available, you can click Restore to restore the database to a specific point in time. If the fast recovery area is not configured, your Database Administrator can configure the fast recovery area or publish a new service template that allows you to request databases with fast recovery area configured at the time of request fulfillment.

  **Note:**

  If the database instance has been created using a snap clone based profile, instead of the Backup and Restore region, you will see the Snapshot and Restore region with a list of snapshots. You can click Restore to restore data from a snapshot. See

- **Performance**: Shows the performance monitoring information for the database. Click on the Active Class tab to view a bar chart showing the amount of time spent either waiting for a resource or consuming CPU.

- **Resources**: Shows graphs indicating the resource consumption and include Host CPU, Active Sessions, Memory, and Data Storage.

- **SQL Monitoring**: Shows the SQL Response Time chart that shows the current response of the tracked set of SQL versus the reference collection response.

- **Requests**: This region shows the requests that you have created. For each request, the status, type, start date, and submission date of the request is displayed. You can select a scheduled request and click Reschedule to reschedule the request. To delete a scheduled request, select the request and click Cancel.

Starting and Stopping the Database

Depending on the state of the database, you can click Shutdown to shut down the database if the database is open, the Startup button if the database is shut down, or the Shutdown button if the state of the database is unknown or in a Status Pending state.
23.6 Standby Database Home Page

The Home page for a standby database instance contains the following regions:

- **Summary**: The region provides a quick overview of the database status and provides basic information about the database. It shows the current status of the database and includes details such as the time stamp of instance start time, database version, date of the last backup, and so on.

- **Connection Details**: Shows the database connection details for the primary database, and one or more standby databases. It includes the Connect String and the name of the user accessing the database.

- **Data Guard Summary**: This region shows the Protection Mode for all the databases (primary and standby) and the details of each database such as the type of database, role, redo transport mode, and so on. For more details, see [Creating a Service Template](#).

- **Performance**: Shows the performance monitoring information for the database. Click on the **Active Class** tab to view a bar chart showing the amount of time spent either waiting for a resource or consuming CPU.

- **Resources**: Shows graphs indicating the resource consumption and include Host CPU, Active Sessions, Memory, and Data Storage.

- **SQL Monitoring**: Shows the SQL Response Time chart that shows the current response of the tracked set of SQL versus the reference collection response.

- **Requests**: This region shows the requests that you have created. For each request, the status, type, start date, and submission date of the request is displayed. You can select a scheduled request and click **Reschedule** to reschedule the request. To delete a scheduled request, select the request and click **Cancel**.

23.7 Cluster Database Home Page

Use the Cluster Database Home Page to:

- Determine the current status of the Oracle Real Application Clusters database by viewing a series of metrics.
- Start or stop the cluster database.
- Schedule daily backups and perform a point-in-time-restore of the database.

**Note:**

The Home Page presents a high level view of the cluster database. Click the arrow key on the left margin to expand the master panel and view the Target Navigation pane. You can select a Database Instance from the left panel to view details for that instance. You can then perform operations such as Startup and Shutdown for the Database Instance.
The Cluster Database Home page displays information for the following sections:

- Summary
- Performance
- Configuration Changes
- Resources
- Jobs Running
- SQL Monitor
- Issues

**Summary**

The Summary section displays the status and diagnostics information about the cluster database.

**Status**

This section provides a quick view of the status of the cluster database and provides basic information about the cluster database. The status can be Up, Down, Under Blackout, Unmonitored, or Unknown, and the status is mirrored in the arrow icon that appears to the left.

The number of database instances in the cluster, the Up Time, Version, Load, Total Sessions, Available Space and other details are displayed. Following are the fields displayed in this section:

- **Instances**: Displays the number of cluster database instances that are up.
- **Up Time**: Displays the total elapsed time since the cluster database was started.
- **Availability**: Displays the percentage of time that the cluster database was available.
- **Version**: Displays this version of the Oracle Database.
- **Load**: Displays the number of average active sessions since this cluster database was started.
- **Total Sessions**: Displays the total cluster database sessions running.
- **Latest Backup**: Displays when the last backup of the database was performed.
- **Available Space**: Displays space available on the cluster database.
- **Total SGA**: Displays total system global area.
- **Problem Services**: Displays the services that have problems.

**Note**: QoS Status on Cluster Database Home page shows if the database is enabled for QoS Management. The possible states are:

- **Enabled**: Indicates that this database is enabled for QoS monitoring.
- **Disabled**: Indicates that this database is disabled for QoS monitoring.
- **Active**: Indicates that this database is enabled and monitored by QoS.

The QoS Status shown on the Cluster Database Home page is different from status shown on Quality of Service Dashboard. QoS Dashboard shows overall status of QoS itself in the Cluster.

**Jobs Running**
This table displays a report of the job executions that shows the scheduled, running, suspended, and problem (stopped/failed) executions for all Enterprise Manager jobs on the cluster database, ordered by submission of the job to the cluster database or to any member instance. If a value other than 0 appears in a field, you can click the number to go to the Job Activity page where you can view information about all scheduled, currently running, and past jobs.

**Note:** The four job status categories displayed group together job executions of similar status. For a complete list of job status values, refer to About Job Status. Use the Jobs tab to view all jobs or search for jobs of a certain status.

**Performance**

The Performance section shows active sessions during a one-hour window for activity classes and top services.

**Activity Class**

The Active Sessions chart shows potential problems inside the database. Categories, called wait classes, show how much of the database is waiting for a resource, such as CPU or disk I/O. The chart displays the load on the instance and identifies bottlenecks in performance.

To quickly identify problem areas, the chart displays a larger block of color to indicate more severe problems. Click the largest wait class on the highest peak, or alternatively click the corresponding wait class (indicated in yellow highlighting). Either action takes you to the Active Sessions Waiting page for the wait class selected, which shows top SQL, sessions, files, and objects for the wait class and also shows the associated wait events.

**Services**

The Active Sessions chart shows the top services waiting for the corresponding wait event during the time period shown. Only active services are shown. Click on one of the service legends to the right of the chart to go to the Service Activity page, where you can view real-time data showing the sessions load for all wait classes associated with the service.

**Resources**

The Resources section displays a bar chart showing relative CPU utilization of the Oracle host. This instantaneous value is refreshed every minute from the host by the Agent. The 100% represents the total CPU that the host system provides. The Instances tab is a break down of instance-wise measure of the resources, and the Database tab presents the overall measure.

**Host CPU**

This section displays a bar chart showing the relative CPU utilization across all hosts in the cluster. This instantaneous value is refreshed every minute by the Agent. The 100% represents the total CPU across all hosts in the cluster. Two values appear in the bar chart. The bottom, darker color corresponds to the Database legend and represents how much of the CPU is consumed by all the instances of this database. Click the Database link to go to the Top Activity page to display all wait classes and related statistics. The upper, lighter color corresponds to the Other legend and represents all other processes. Click the Other link to go to the Host Performance page for a quick glimpse of the utilization statistics (CPU, Memory, Disk I/O, and Program Resource Utilization) for this host.
The Load number is unrelated to the Host CPU chart. The Load number relates to the sum of the current CPU load for all cluster hosts. Click the Load link to go to the Host Performance page for a quick glimpse of the utilization statistics (CPU, Memory, Disk I/O, and Program Resource Utilization) for this host.

**Note:** The Host CPU section does not appear for pre-10g databases.

### Active Sessions

The bar chart shows the amount of time all instances consumed using I/O and CPU, and the amount of time it consumed in bottlenecks. The number shown beside the bar chart is a literal number representing the number of active sessions, rather than the total number of sessions. The chart shows the latest value instead of a historical value. The three session categories are always CPU, User I/O, and Wait.

The **Wait** category represents the value for all wait classes combined, excluding User I/O. All of the links go to the Cluster Database Performance page.

**User I/O** displays the average active sessions spent on waiting for user I/O. User I/O means that the workload originating from the user causes the database to read data from the disk or write data to the disk. Click the User I/O link to go to the Performance page to view potential problems inside and outside of the current database.

**CPU** displays the average active sessions spent on using CPU. Click the CPU link to go to the Top Activity page to display all wait classes and related statistics.

The **Maximum CPU** number is the total CPU count across all the cluster database hosts.

**Note:** The Active Sessions section does not appear for pre-10g databases.

### Memory

The chart shows the memory used by the database in GB.

**Shared Pool** displays various constructs that can be shared among users. For example:

- SQL statements that users implement are cached so that they can be reused if the same statement is used again.
- Information from the data dictionary is cached for quick access and reusability.
- Stored procedures, which are executable code that is stored in the database, can be cached for faster access.

**Buffer Cache** caches blocks of data retrieved from the database. If a piece of data can be found in the buffer cache, then there is no need to read it from disk. There are subcaches for multiple block sizes, if used.

**Large Pool** displays optional area used for buffering large I/O requests for various server processes.

**Java Pool** used for all session-specific Java code and data within the Java Virtual Machine (JVM).

**Other SGA** displays shared memory area that contains data and control information for the instance. Multiple users can share data within this memory area (controlled by Oracle), and information stored in the SGA can avoid repeated access from physical disk, a time consuming operation.

### Data Storage
The chart shows data storage details for tablespaces UNDOTBS, SYSAUX, and SYSTEM.

**SQL Monitor - Last Hour**

This section lists the SQL monitoring details for the last hour. The real-time SQL monitoring feature of Oracle Database enables you to monitor the performance of SQL statements while they are executing. By default, SQL monitoring automatically starts when a SQL statement runs parallel, or when it has consumed at least 5 seconds of CPU or I/O time in a single execution. It lists the status, duration, SQL ID, Session ID, Parallel, and Database Time.

**Instances**

The Instances table lists the instances for the cluster database, their availability, incidents, compliance score, ASM instance information, and ADDM findings. Click an instance name on the left-hand panel to go to the home page for that instance. Click the links in the table to get more information about that particular incident.

### 23.8 Pluggable Database Home Page

To view the Pluggable Database Home page, click on the PDB name link in the Databases region of the Database Cloud Self Service Portal.

This page contains the following regions:

- **Summary**: The region of the Database Instance Home page provides a quick overview of the database status and provides basic information about the database. It shows the current status of the database and includes details such as the time stamp of instance start time, database version, date of the last backup, and so on.

- **Connection Details**: Displays the connect string used to connect to the database.

- **Resource Usage**: Shows the usage details such as Expected Workload and Actual Workload.

- **Backup and Restore**: If the fast recovery area is configured for the database, you can schedule a daily backup for this database. Click **Schedule Backup** to perform this task. Once backups are available, you can click **Restore** to restore the database to a specific point in time. If the fast recovery area is not configured, your Database Administrator can configure the fast recovery area or publish a new service template that allows you to request databases with fast recovery area configured at the time of request fulfillment.

- **Performance**: Shows the performance monitoring information for the database. Click on the **Active Class** tab to view a bar chart showing the amount of time spent either waiting for a resource or consuming CPU.

- **SQL Monitoring**: Shows the SQL Response Time chart that shows the current response of the tracked set of SQL versus the reference collection response.

- **Requests**: This table tracks the requests that you have created. For each request, the status, type, start date, and submission date of the request is displayed. You can select a scheduled request and click **Reschedule** to reschedule the request. To delete a scheduled request, select the request and click **Cancel**.

**Starting and Stopping the Database**
Depending on the state of the database, you can use the Shutdown button to shut down the database if the database is open, the Startup button if the database is shut down, or the Shutdown button if the state of the database is unknown or in a Status Pending state.
Part IX
Maintaining and Customizing Databases

This section contains chapters on how to maintain a database pool and how to customize a database. It contains the following chapters:

- Maintaining the Database Pool
- Customizing Database as a Service
Maintaining the Database Pool

This chapter covers the database pool maintenance feature. It contains the following sections:

- About Database Pool Maintenance
- Creating a Database Gold Image
- Subscribing to an Image
- Deploying the Image
- Updating the Database
- Performing Ongoing Image Updates

24.1 About Database Pool Maintenance

Enterprise Manager offers a subscription based software maintenance feature that allows self service administrators to maintain the cloud by applying database updates which include:

- Minor Updates: Interim one-off patches including quarterly security patch updates (SPUs/CPUs) and Patchset Updates (PSUs).
- Major Updates: Patchsets such as (11.2.0.2 to 11.2.0.4) and major version upgrades 11.2.0.x to 12.1.0.x.

Any new database patches, patchsets, or updates are made available in the form of images. An image (also referred to as gold image) represents the software binary that is patched to the required level. Each newly created image from a new patch or patchset for a specific database version is a new version. For example, an image for Oracle Database version 11.2.0.4 contains gold images (such as Ver. 1, Ver. 2, and so on) at different patch or patchset levels.

A standalone database pool contains databases along with its Oracle Home infrastructure. A RAC database pool contains RAC databases along with Grid Infrastructure Instances and its associated Oracle Homes. Maintaining a database pool involves the following:

- Subscribe the database pool to an image that has been patched to the required level. This task has to be performed by a user with the EM_SSA_ADMINISTRATOR role.
- Deploy the image and switch the database from the old Oracle Home to a new Oracle Home. This task has to be performed by a user with the EM_SSA_ADMINISTRATOR role.
- Update the database. This task can be performed by a user with either the EM_SSA_ADMINISTRATOR role or EM_SSA_USER role.

This maintenance activity can be performed as and when a new patch or patchset update is available. A database pool is considered to be fully compliant if the targets in the pool are associated with the latest version of an image. If the targets are still
associated with an older version of the image, the database pool is considered to be non compliant. The goal of the self service administrator is to ensure all targets in the database pool are 100% compliant.

**Note:**

- For database upgrades, such as 11.2.0.x to 12.1.0.x, follow the steps in the *Enterprise Manager Lifecycle Management Administrator’s Guide* to perform maintenance activities.
- Database pool maintenance can also be performed for Grid Infrastructure targets.

The database pool maintenance feature is useful in:

- Reducing the number of different database software versions and patches in the pool.
- Standardizing the database software versions and patches across the enterprise.
- Streamlining and automating software upgrades and patches.
- Enabling the self service users to move to the new software version and update the database on their own terms.

**Note:**

You can use EMCLI commands to perform pool maintenance activities. For details, see *Database Fleet Maintenance EM CLI Verbs*.
Figure 24-1  Database Pool Maintenance Workflow

The following table shows the list of tasks involved in updating and maintaining a database pool.

Table 24-1  Database Pool Maintenance Tasks

<table>

24.2 Creating a Database Gold Image

An image is the software binary for the target (say Oracle database) on a given platform and release containing the required patch levels. For example, Image DB_11203_Linux represents Database software for 11.2.0.3 release applicable to Linux x86_64 platform containing patches like PSUs and other one-off patches at the needed level. Whenever there is a new patch, you must create a new version of the image from a reference target that contains a zipped up Oracle Home that has been brought to a certain certified or tested patch level.

To maintain the database pool, you must subscribe to an image which contains the latest patches or patchset. If no images exist, you must first create an image and then subscribe the database pool to the image.
To create an image, follow these steps:

1. Log in as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Enterprise** menu select **Cloud**, then select **Cloud Home**. From the Oracle Cloud menu, select Resource Providers, and click on a Database Pool in the list to navigate to the Database Pool Home page. From the Database Pool menu, select Members, and then click **Maintenance**. The Maintenance page appears. Click **Manage Subscriptions**.

3. The Manage Subscriptions page appears.

4. Click **Create a New Database Home Image**. The following dialog box appears:

![Creating a New Image](image.png)

Figure 24-2 Creating a New Image

5. In the Create a New Image dialog box, in the Reference Target section, specify the following details:
   - **Name** of the reference target. You can select the Search icon to select a target from the list provided. Once you select a target, the Oracle Home and Host Name details get automatically added.
   - **Oracle Home credentials**. You can click on the search icon to select existing Oracle Home credentials. Click OK. Next, you can click the Test button to check if the credentials are valid.
   - **Working Directory**. Specify the working directory or click the Search icon to select one.

6. In the Software Library Upload Location, specify the location, type, and upload file location. These details are already specified by default. You can verify them or change them.

7. In the Image Information section, specify the following details:
   - **Image Name**. Specify a new and unique name for the image. For example, DB11203_Linux_SALES_XYZ.
   - **Description** of the image. For example:
     
     DB Image for 11.2.0.3 Database software on Linux x86_64 starting with Oct PSU 2014 patch level
• **Version**: The display name used to refer to the version. For example, based on the description of the image, the version name can be specified as OCT PSU 2014.

• **Platform**: 

• **Version Name**: Specify a new and unique version name.

• **Notes**: Specify additional description for the image. For example, you can specify a description as:

  Database Patchset Update (PSU) October 2014 with additional 5 one-off patches for the Database Software.

8. Click **Create**. The newly created image will appear in the Oracle Database Home Images table and you will be subscribed to the newly created image. At this point, the database pool compliance is 0%. To make the database pool 100% compliant, you must do the following:

• Deploy the image. See Deploying the Image

• Update the image. See Updating the Database

### 24.3 Subscribing to an Image

When a new image is created, the database pool is automatically subscribed to the image. To begin maintenance, start by deploying the image. Follow steps listed in Deploying the Oracle Home.

If you want to maintain the database pool with another image, you must subscribe to the image. To subscribe to an existing image, follow these steps:

1. Login as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. Click on the Resource Providers link on the page. A list of database pools and PaaS Infrastructure zones are displayed.

3. Click on a **Database Pool** to view the Database Pool page.

4. From the **Database Pool** menu, select **Members**, then select **Maintenance**.

5. Click **Manage Subscriptions**. You will see a list of available and applicable images for Oracle Database. Select the **Update Subscriptions for Oracle Database** checkbox, select an image from the list and click **Subscribe**.
A message is indicating that pool is successfully subscribed to the image appears. The newly subscribed image is now available to the database pool and the database pool is 0% compliant. In the **Updates to Image Version** region of the Image Subscriptions page, the actions that need to be performed are listed. To make the database pool 100% compliant, you must deploy the image and update the database.

The pie chart shows the ratio of distribution of the targets in the database pool with respect to the image and the different versions of the image. Each version is represented as follows:

- **System Version Number (Version Display Name) (Number of targets in the version).** For example V1 (DEC PSU 2014) (2)
• Each version can have one of the following states:
  – Draft: This is a test version.
  – Restricted: This represents a Beta version that is released to a restricted set of targets.
  – Current: This represents the latest version of the image.

The maintenance goal of the administrator is to move all targets in the pool to the **Current** version of the image to keep the pool is up-to-date and compliant.

### 24.4 Deploying the Image

After the self service administrator has subscribed the database pool to a new image, the new image must be deployed. To deploy the image, follow these steps:

1. Navigate to the Image Maintenance page. Click the **Select** button in the **Updates to Image Version** region of the page. The following page appears:

   ![Deploying the Image](image)

To complete the maintenance process and update the database, 3 steps are required:

- **Deploy**: See Deploying the Oracle Home.
- **Activate**: See Activating the New Oracle Home
- **Update**: See Updating the Database

2. Specify the schedule for the deployment and click **Submit** to submit the job.

### 24.4.1 Deploying the Oracle Home

This option copies the image binaries to each of the hosts in the database pool and create new Oracle Homes on all them. When you navigate to this page, the **Deploy** step is highlighted and the status is **Pending**. The list of targets on which the image is to be deployed, the target owner, and the image version is displayed. To deploy the image, follow these steps:

1. Click **Deploy**. The following dialog box appears:
2. Specify the name, description, the new Oracle Home location, Working Directory, and Dispatcher Location.

3. Click Submit to deploy the image and create new Oracle Homes.

24.4.2 Activating the New Oracle Home

This step sends notifications to the self service users that a new update is available. Activating the newly deployed Oracle Homes also updates the self service template associated with the database pool and redirects any new database service requests to be created from the new Oracle Home. Click Activate to activate the Oracle Homes that have been successfully deployed.

24.4.3 Updating the Database

This step switches the database from the old Oracle Home to the new Oracle Home and completes the post install steps for all the patches related to the image. This step can either be performed by the self service administrator or the self service user.

After deploying the latest version of the image, the self service administrator can do either of the following:

- Apply the latest version and update the database. To update the database targets associated with the pool, select the Update option shown in Figure 24-5 and click Update. The latest patch will be applied on all the database targets in the pool. The database pool will now be 100% compliant.

- Notify the self service user about the updates by clicking Yes in the Delegate the Responsibility to the Self Service User field. The self service user can then choose to apply the updates by following these steps:
  1. Log in as a user with the EM_SSA_USER role.
  2. In the Self Portal Page, select Databases from the Manage drop down list. Click on a database for which updates are available to drill down to the Home page.
3. Click **Update** to switch the database to the new Oracle Home.

**Note:**

- When all the tasks (deploy, activate, and update) have been performed, the pool is successfully subscribed to the new image.
- When the database pool is subscribed to a newer version of an image, the compliance status of the pool changes will be at 0%. After the new version is deployed and all databases associated with the database pool are updated, the compliance will be at 100%.

### 24.5 Performing Ongoing Image Updates

When a new patch or patchset is available, to deploy the new patch on the database pool, you must ensure that the following tasks are performed:

- **Creating a New Version of the Image**
- **Deploying the Image**
- **Updating the Database**

#### 24.5.1 Creating a New Version of the Image

To create a new version of an image, follow these steps:

1. Login as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. Click on the Resource Providers link on the page. A list of database pools and PaaS Infrastructure zones are displayed.
3. Click on a **Database Pool** to view the Database Pool page.

4. From the **Database Pool** menu, select **Members**, then select **Maintenance**. The Image Subscriptions page appears.

5. Click the **Manage Image** link on the page. The Manage Images page appears.

---

### Figure 24-8  Manage Images

This page contains the following details:

- **Database Images**: This region displays the name of the image, number of subscribed targets, compliance score, product version, database type, and platform.

- **Deployments**: This region shows a pie chart that consists of the percentage of deployments for each version in the image.

- **Active Versions**: This region lists the number of active versions, the name of the versions, the version number, the status of the version (Current or Active), the number of deployments for each version, the creation date of each version, and the SSA owner of the version.

- **General**: The General tab lists the database type, product version, platform, state, description, creation date, and owner of the image. The Software tab lists the location of the Oracle Home, the product name, and the host name. If you have saved a snapshot of the image, you can view it by clicking **View**.

6. Click **Manage Versions** to manage the image versions.
This page consists of a table that lists the name of each version, the version number, the status of the version, the number of deployments of each version, the creation date of the version, and the owner of the version.

When you select a version, the General and Software tabs automatically displays the general and software details of the version.

7. From the Actions menu, select Create to create a new version of the image. The Create New Image dialog box appears.

8. Follow the steps listed in Creating a Database Gold Image to create the new image version. The database pool will now be subscribed to the new version.

After the new version has been created, you can click Set Current Version to set this version as the current version of the image. You can restrict the users who can use this version by clicking Set Restricted Version. If you set the version status as Restricted, no other user can access the version.

Editing an Image

To edit an image version, select the image and click Edit from the Actions menu. This option allows you to change the name of the image version.

Deleting an Image

To delete a database image, in the Images section, select the image that you want to delete, and then click Delete. Click Yes to confirm and delete the image.
This chapter describes the EMCLI commands that can be used to perform PDBaaS fleet operations. It contains the following sections:

- Preparing and Subscribing to the Software Image (SSA Admin)
- PDBaaS Pool Operations Performed by SSA Admin (Option 1)
- PDBaaS Pool Operations Performed by SSA Admin (Option 2)
- Update CDB (SSA Admin and SSA User Operations)
- PDBaaS Pool Cleanup Operations - SSA Admin

25.1 Preparing and Subscribing to the Software Image (SSA Admin)

To prepare and subscribe to the software image, follow these steps:

- **Create a Software Image of the Oracle Home with patches/patchsets**
  
  emcli db_software_maintenance -createSoftwareImage -input_file="data:\scratch\input_rac"

  where the contents of input_rac are:

  - IMAGE_NAME=DbGoldImage
  - IMAGE_DESCRIPTION=Gold Image for 12c db
  - REF_TARGET_NAME=ORACLE_HOME
  - IMAGE_SWLIB_LOC=Oracle Home Provisioning Profiles/12.1.0.2.0/linux_x64
  - REF_HOST_CREDENTIALS=ZONE_CREDS:TESTSUPERADMIN
  - WORKING_DIRECTORY=/tmp
  - STORAGE_TYPE_FOR_SWLIB=OmsShared
  - STORAGE_NAME_FOR_SWLIB=swlib
  - VERSION_NAME=Version1

- **Retrieve the Created Image**

  To get the id of the newly created image, run the following command:

  emcli db_software_maintenance -getImages

- **Subscribe the PDBaaS Pool to the Newly Created Image**

  emcli db_cloud_maintenance -subscribeTarget -pool_name=PDB_POOL -pool_type=pdbaas_pool -image_id=438AA95015F34E25E053FB7BB10A98E3B

  This command subscribes the PDBaaS pool, the CDB members and the PDBs associated with the CDBs. This is a db_cloud_maintenance operation and not a db_software_maintenance operation.
• Verify the PDBaaS Target and Its Subscriptions

To verify the PDBaaS target and its subscriptions, run the following command:

```
emcli db_software_maintenance -getSubscriptionsForContainer -
target_name="RAC Pool" -target_type=pdbaas_pool -
image_id=FE55AD7AB28974EFE04313B2F00AD4A0
```

### 25.2 PDBaaS Pool Operations Performed by SSA Admin (Option 1)

The PDBaaS pool operations that can be performed by SSA Admin are:

- **Deploy the Oracle Home from the subscribed image on the targets**

  ```
  emcli db_cloud_maintenance -performOperation -
purpose="DEPLOY_DB_SOFTWARE/DEPLOY_RAC_SOFTWARE" -pool_name="PDB_POOL" -
pool_type="pdbaas_pool" -name="Deploy Patch OH for Pool" -
target_type=oracle_home -description="Deploys the Patched Oracle home on target nodes" -input_file="data:/scratch/data_backup/deployoh.properties"
  ```

  The contents of the `deployoh.properties` are:
  - `NEW_ORACLE_HOME_LIST=/u01/app/oracle/product/patchedHome2`
  - `WORK_DIR_LOC=/tmp`
  - `DISPATCHER_LOC=/tmp`

  The following parameters can be added if the prerequisite checks need to be skipped during the **Deploy** operation:
  - `SKIP_PREREQUISITE_CHECKS=true`
  - `SKIP_CVU_CHECK=true`

  This step retrieves the list of Oracle Homes associated with the CDB members of the pool and creates a new Oracle Home for each, using the software image provided and creates a Oracle Home Lineage.

- **Migrate the Listeners**

  Run the following command to migrate the listeners:

  ```
  emcli db_cloud_maintenance -performOperation -
purpose="MIGRATE_LISTENER" -pool_name="PDB_POOL" -
pool_type="pdbaas_pool" -name="Migrate Listeners" -
target_type=oracle_home -description="Migrate the listeners to the new Oracle Home, if any"
  ```

- **Create / Deploy CDB**

  To create or deploy the CDB, run the following command:

  ```
  emcli db_cloud_maintenance -performOperation -purpose="DEPLOY_CDB" -
pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Deploy CDB" -
target_type=rac_database -description="Deploy a new CDB on the new OH for every CDB on the Pool using the prefix " -db_prefix="racdb"
  ```

  This step creates a new CDB for every CDB member of the pool by using the member CDBs structure only template. The new CDBs that are created will use the `db_prefix` for their names.
emcli db_cloud_maintenance -performOperation -purpose="DEPLOY_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Deploy CDB for a given target" -target_type=rac_database -description="Deploy a new CDB on the new OH for the selected CDB target" -db_name="slspc" -target_list="sales.us.oracle.com"

This step creates a new CDB for the selected CDB member of the pool specified in the target_list option, using its structure only template. The new CDBs that are created will use the db_prefix for their db name.

The CDBs created using this command will be marked as Passive and will be part of the pool’s member list. There will also be a lineage created between the CDBs.

- **Activate CDB**

emcli db_cloud_maintenance -performOperation -purpose="ACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the CDBs" -target_type=oracle_database/rac_database -description="Activates the newly created CDBs"

This step marks all the new CDBs in the pool that were created in the above step as Active and the existing CDBs as Inactive. Any further SSA requests will be forwarded to the newly activated CDBs.

emcli db_cloud_maintenance -performOperation -purpose="ACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the CDBs" -target_type=oracle_database/rac_database -description="Activates the newly created CDBs" -target_list="sales.us.oracle.com"

This step the given CDBs in the target_list as Active and is predecessor CDBs as Inactive. Any further SSA requests will be forwarded to the newly activated CDB.

### 25.3 PBaaS Pool Operations Performed by SSA Admin (Option 2)

The following operations can be performed by the SSA Admin:

- **Attach an existing CDB to the pool**

emcli db_cloud_maintenance -performOperation -purpose="ATTACH_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Attach an existing CDB as the successor" -target_type=oracle_database/rac_database -description="Attach an existing CDB as the successor" -destinationCDB="subjects.us.oracle.com" -target_list="crm.us.oracle.com"

This step will attach the destination CDB as the successor of the member CDB specified in the target_list. This will bypass the Deploy OH, Migrate Listener, Deploy CDB steps and will create the necessary lineage for Oracle home and CDB. The destination CDB should be in the same zone associated with the pool and on the same cluster. The newly attached CDB will be marked as Passive once it has been attached.

- **Activate the CDB**

emcli db_cloud_maintenance -performOperation -purpose="ACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the
CDBs" -target_type=oracle_database/rac_database -description="Activates the newly created CDBs"

This step marks all the new CDBs in the pool that were created in the above step as Active and the existing CDBs as Inactive. Any further SSA requests will be forwarded to the newly activated CDBs.

`emcli db_cloud_maintenance -performOperation -purpose="ACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the CDBs" -target_type=oracle_database/rac_database -description="Activates the newly created CDBs" -target_list="sales.us.oracle.com"

This step marks the specified CDBs in the target_list as Active and is predecessor CDBs as Inactive. Any further SSA requests will be forwarded to the newly activated CDB.

25.4 Update CDB (SSA Admin and SSA User Operations)

This section lists the Update CDB operations:

- **Update PDB — SSA Admin**

  `emcli db_cloud_maintenance -performOperation -purpose="UPDATE_PDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Update PDB to new CDB" -target_type=oracle_pdb -description="Relocates the PDB from its inactive CDB to newly active CDB" -target_list="crm.us.oracle.com_SDB1"

  The SSA Admin can update a PDB from its predecessor to the newly activated CDB.

- **Update PDB – SSA User – UI**

  The SSA User will see a **Update Database** button on the PDB home page once the new CDB has been activated and is available for update. The SSA User can schedule an update of the PDB with no additional inputs.

- **Update PDB – SSA User — RESTful API**

  The SSA can submit a Update PDB request using the RESTful API request.

  ```
  https://<host>:<port>/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/<requestid>
  Content-Type: application/oracle.com.cloud.common.PluggableDbPlatformInstance+json
  Accept: application/oracle.com.cloud.common.PluggableDbPlatformInstance+json
  Body: 
  |
  "operation" : "UPDATE_DATABASE",
  "update_schedule" : ""
  }
  Method: POST
  ```

25.5 PDBaaS Pool Cleanup Operations - SSA Admin

The following pool cleanup operations can be performed by the SSA Admin:

- **Deactivate the CDB**
If there are any issues with the newly activated CDB, the SSA Admin can deactivate them and use the old CDB as their member active CDB for new requests until the time the issue is sorted with the new CDB or they are removed from the pool (given that they do not service any PDB’s)

```
emcli db_cloud_maintenance -performOperation -purpose="DEACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Deactivate the CDBs" -target_type=oracle_database/rac_database -description="Deactivates the newly created CDBs"
```

This step marks all the new CDBs in the pool that were created in the above step as Passive and their predecessor CDBs as Active. Any further SSA requests will be forwarded to the newly activated CDBs.

```
emcli db_cloud_maintenance -performOperation -purpose="DEACTIVATE_CDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Deactivate the CDBs" -target_type=oracle_database/rac_database -description="Deactivates the newly created CDBs" -target_list=ºsales.us.oracle.comº
```

This step the given CDBs in the target_list as Passive and is predecessor CDBs as Active. Any further SSA requests will be forwarded to the newly activated CDB.

- **Rollback the PDB**

In case the PDB update has any issues with the CDB to which it was updated, the admin (and admin only) can do a rollback of the PDB to the CDB that was the predecessor of the currently active CDB.

```
emcli db_cloud_maintenance -performOperation -purpose="ROLLBACK_PDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the CDBs" -target_type=oracle_pdb -description="Rolls back the PDB to its parent CDB"
```

This step rolls back the PDBs associated with the pool to their respective parent CDBs.

```
emcli db_cloud_maintenance -performOperation -purpose="ROLLBACK_PDB" -pool_name="PDB_POOL" -pool_type="pdbaas_pool" -name="Activate the CDBs" -target_type=oracle_pdb -description="Rolls back the PDB to its parent CDB" -target_list=ºsales.us.oracle.com_FINº
```

This step rolls back the given PDBs in the target_list to their parent CDB.
Customizing Database as a Service

This chapter describes how to customize Database as a Service. It contains the following sections:

- **Pre and Post Request Creation / Deletion Scripts**

### 26.1 Pre and Post Request Creation / Deletion Scripts

You can run custom scripts before and after a service instance has been created. These requests can range from some additional host commands on the machine on which the database was created or commands to perform additional book activities and other operations on the newly provisioned database.

Similarly, you can run scripts after a service instance has been deleted if you need to undo the changes made during service cleanup.

The custom script must follow certain guidelines and consists of four parts:

- **Response File:** The response file contains the service template and request specific information. Before the custom script is executed, the request procedure, the request procedure generates a response file (file with name-value pairs) containing the data from the service template as well as the request-specific data such as the SID that is auto computed, the hosts on which the database will be deployed, and so on.

- **Driver Script:** This is the key driver script that will be invoked by the request procedure. The driver script accepts only one argument which specifies the location of the response file.

- **Other Scripts:** Apart from the driver script, you can specify other perl or sql scripts. These scripts must be invoked from the driver script.

- **Additional Variables:** You can include a file containing additional variables that can used by the custom script as applicable.

After the scripts have been created, they must be uploaded as a directive into the Software Library. In the Describe page, the name of the directive and the description is displayed. Click the **Configure** tab.

**Figure 26-1  Pre or Post Database Script: Configure**
The driver script accepts one command line argument which must be in the \texttt{INPUT\_FILE} format. This variable will be used at run-time to specify the location of the generated response file. Click the \textbf{Select Files} tab.

\textbf{Figure 26-2 Pre or Post Database Script: Select Files}

Specify any additional files that are required by the custom script. You can run the script from the same host on which the database instance or the database service was created or deleted.

\begin{quote}
\textbf{Note:}

if you need to change the content of the script, you must upload a newer version of the script to the Software Library. To use the latest version of the script, you must launch the Edit Service Template wizard and select the updated version of the script and save the template. This ensures that the latest version of the script will be used.
\end{quote}

\subsection*{26.1.1 Selecting the Post SQL Script}

A post SQL script can be created and uploaded to the Software Library. The self service administrator can select the script during service template creation. To specify the script, follow these steps:

1. Log in as a user with \texttt{EM\_SSA\_ADMINISTRATOR} role.
2. From the Enterprise menu, select Cloud. From the Cloud Home menu, select Service Template and then Create.
3. Select the Service Template type as Database and click Create.
4. Navigate to the Configuration page. Click the Search icon next to the Post SQL Script field and select the script from the Software Library.
5. In the Run As User drop down, the SYS user is selected by default.

If this user is selected, the SYS password provided on Database page in the wizard is used to run the post database creation SQL script.

If any other user is selected including Master Account, the password provided by the self service user for the Master Account while creating a service request will be used.
Note:
If the user account is locked, an error message is displayed. The user account must be open in the source database.

26.1.2 Sample Scripts

Sample scripts are available in the Software Library. To view the sample scripts, from the Enterprise menu, select Provisioning and Patching, then select Software Library. Select the DBaaS folder, then select Directives, and click the Samples folder to see the custom scripts.

![Sample Scripts](image)

26.1.3 Input Parameters for Pre and Post Database Scripts

This section lists the following:

- Input Parameters for DBaaS Pre and Post Request Creation Scripts
- Input Parameters for DBaaS Pre and Post Request Deletion Scripts
- Input Parameters for SchaaS Pre and Post Request Creation Scripts
- Input Parameters for SchaaS Pre and Post Request Deletion Scripts
- Input Parameters for PDBaaS Pre and Post Request Creation Scripts
- Input Parameters for PDBaaS Pre and Post Request Deletion Scripts
- Sample Input Files
- Sample PDBaaS Post Scripts

26.1.3.1 Input Parameters for DBaaS Pre and Post Request Creation Scripts

This table lists the input parameters for the DBaaS pre and post request creation scripts.
<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>ssaRequestId</td>
<td>The Request ID of the SSA user request.</td>
<td>3</td>
</tr>
<tr>
<td>ssaUser</td>
<td>The SSA user name.</td>
<td>Ssa_user1</td>
</tr>
<tr>
<td>ssaTargetName</td>
<td>The zone target name.</td>
<td>Myzone1</td>
</tr>
<tr>
<td>ssaTargetType</td>
<td>The zone target type.</td>
<td>Self_service_zone</td>
</tr>
<tr>
<td>zoneTargetName</td>
<td>The zone target name.</td>
<td>Myzone1</td>
</tr>
<tr>
<td>zoneTargetType</td>
<td>The zone target type.</td>
<td>Self_service_zone</td>
</tr>
<tr>
<td>DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN</td>
<td>The URN of the directive in the software library which will be executed before the creation of the PDB target.</td>
<td>oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:E9DE463D356E7433E04354B2F00A56C6:0.1</td>
</tr>
<tr>
<td>DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN</td>
<td>The URN of the directive in the software library which will be executed after the creation of the PDB target.</td>
<td>oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:E9DE463D356E7433E04354B2F00A56C6:0.1</td>
</tr>
<tr>
<td>SEL_HOST</td>
<td>The host selected as part of placement where the new database will be created.</td>
<td>Myhost.oracle.com</td>
</tr>
<tr>
<td>MEM_SIZE</td>
<td>The memory size of the requested database. This shall be the sum of sga and pga aggregate size or the total memory size.</td>
<td>2324</td>
</tr>
<tr>
<td>STORAGE_SIZE</td>
<td>The total storage size of the requested database</td>
<td>2324</td>
</tr>
<tr>
<td>HOST_CREDS</td>
<td>The credentials of the host where the database will be created.</td>
<td>Mycred1:dbaas_admin</td>
</tr>
<tr>
<td>WORK_DIR</td>
<td>The temporary working directory used for staging provisioning related files</td>
<td>/tmp</td>
</tr>
<tr>
<td>DB_ADMIN_PASSWORD_SAME</td>
<td>Indicates if the password provided for the sys, system and dbsnmp are same or different</td>
<td>true</td>
</tr>
<tr>
<td>DB_ORACLE_HOME_LOC</td>
<td>The oracle home in the selected host, from where the new Database will be created.</td>
<td>/scratch/aime/oraclehomes/dbbase/112030/dbhome1</td>
</tr>
<tr>
<td>DB_ORACLE_BASE_LOC</td>
<td>The oracle base of the selected oracle home.</td>
<td>/scratch/aime/oraclehomes/dbbase</td>
</tr>
<tr>
<td>TOTAL_MEMOR Y</td>
<td>The total memory for the chosen database if the memory management type is AMM.</td>
<td>0</td>

</tr>
<tr>
<td>INIT_PARAMS</td>
<td>The list of initialization parameter values that are set in the service template. The values are stored as paramName=paramValue[,paramName=paramValue]</td>
<td>processes=150,cluster_database=FALSE,db_name=,open_cursors=300,sga_target=1828716544,db_block_size=8192,audit_file_dest={ORACLE_BASE}/admin/DB_UNIQUE_NAME/adump,diagnostic_dest={ORACLE_BASE},*.cpu_count=0,db_recovery_file_dest={ORACLE_BASE}/fast_recovery_area,log_archive_format=%t_%s_%r.dbf,compatible=11.2.0.0.0,audit_trail=DB,remote_login_passwordfile=EXCLUSIVE,undo_tablespace=UNDOTBS1,db_recovery_file_dest_size=432230272,control_files=('{ORACLE_BASE}/oradata/{DB_UNIQUE_NAME}/control01.ctl','{ORACLE_BASE}/fast_recovery_area/{DB_UNIQUE_NAME}/control02.ctl'),pga_aggregate_target=608174080</td>
</tr>
<tr>
<td>DATABASE_TYPE</td>
<td>Type of database that will be provisioned as part of the request.</td>
<td>oracle_database or rac_database</td>
</tr>
<tr>
<td>USER_NAME</td>
<td>User Name (cannot be any of Oracle default accounts) which will be treated as the master account and will be used to login to the requested database.</td>
<td>Useracct1</td>
</tr>
<tr>
<td>INSTANCE_COUNT</td>
<td>Number of database instances that will be created in case if the request is for a RAC Database.</td>
<td>1</td>
</tr>
<tr>
<td>COMMON_DB_SID</td>
<td>The SID Prefix that has been provided in the Service Template with which a unique database name will be generated.</td>
<td>db000000</td>
</tr>
<tr>
<td>COMMON_DOMAIN_NAME</td>
<td>The Database Domain name provided in the Service Template which will be used to create the Database Target in Enterprise Manager.</td>
<td>Mycompany.com</td>
</tr>
<tr>
<td>LISTENER_PORT</td>
<td>The port number of the listener in the host to which the database will be attached.</td>
<td>1521</td>
</tr>
<tr>
<td>REF_ZONE</td>
<td>The reference zone used for the validations.</td>
<td>Myzone1</td>
</tr>
<tr>
<td>REF_POOL</td>
<td>The pool selected on the reference zone.</td>
<td>Mypool1</td>
</tr>
</tbody>
</table>
26.1.3.2 Input Parameters for DBaaS Pre and Post Request Deletion Scripts

This table lists the input parameters for DBaaS pre and post request deletion scripts.

<table>
<thead>
<tr>
<th>Variable Name</th>
<th>Description</th>
<th>Example</th>
</tr>
</thead>
<tbody>
<tr>
<td>REF_HOST</td>
<td>The reference host chosen from the pool.</td>
<td>Myhost1.oracle.com</td>
</tr>
<tr>
<td>REF_TGT</td>
<td>The reference host chosen from the pool</td>
<td>Myhost1.oracle.com</td>
</tr>
<tr>
<td>COMMON_GLOBAL_DB_NAME</td>
<td>The global database domain name.</td>
<td>db000000.myhost.oracle.com</td>
</tr>
<tr>
<td>DB_SID</td>
<td>The database SID of the database which is chosen for deletion. This can be used to connect to the database.</td>
<td>db000000</td>
</tr>
<tr>
<td>HOST_NAME</td>
<td>The host name where the DB chosen for deletion, resides.</td>

select name, con_id from gv$pdbs;
exit;
Part X

Setting Up Middleware as a Service

This section describes how to set up and use WebLogic as a Service (WLaaS), SOA as a Service (SOAaaS) and OSB as a Service (OSBaaS) service types. It contains the following chapters:

• Setting Up the WebLogic Self Service Portal
• Setting Up the SOAaaS or the OSBaaS Self Service Portal
• Using the MWaaS Self Service Portal
Setting Up the WebLogic Self Service Portal

This chapter describes the procedure to set up the Middleware Self Service Portal for WebLogic as a Service. It contains the following sections:

- Setting Up the WebLogic Self Service Portal
- Creating a Middleware Pool
- Configuring Request Settings
- Creating a Load Balancer Configuration
- Setting Up Quotas
- Creating a WebLogic Service Template
- Configuring Chargeback

27.1 Setting Up the WebLogic Self Service Portal

The EM_SSA_ADMINISTRATOR can configure and set up the WebLogic Cloud Self Service Portal by creating middleware pools, setting up quotas, defining request settings, configuring the load balancer, creating service templates, and configuring chargeback.

Figure 27-1 diagram shows the initial setup and the relationship between the various entities involved in setting up the WebLogic Middleware Self Service Portal.
Prerequisites

- One or more PaaS Infrastructure zones must have been created. See Creating a PaaS Infrastructure Zone for details.

To set up the WebLogic as a Service, follow these steps:

1. Set up one or more PaaS Infrastructure zones. See Creating a PaaS Infrastructure Zone for details.
5. Define quotas for each self service user role. See Setting Up Quotas.
6. Create service templates. You can create service templates that can be used to provision an instance of a service in a set of selected zones. See Creating a WebLogic Service Template.
7. Optionally, you can configure the Chargeback Service. See Configuring Chargeback.

27.2 Creating a Middleware Pool

A Middleware Pool contains a set of resources that can be used to provision a service instance within a PaaS Infrastructure Zone.
To create a Middleware Pool, follow these steps:

1. Log in to Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.
3. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. The common tasks that need to be performed before setting up a specific service family is displayed. Click the **Setup** link next to Middleware service family in the left panel.
4. Select **WebLogic** from the service type drop down list.
5. Click **Middleware Pools**. The existing middleware pools are listed on the Middleware Pools page.
6. Click **Create**. The Create Middleware Pool: General page appears. Enter a name and description for the Middleware Pool. Select the PaaS Infrastructure Zone in which the middleware pool is to be created.

   **Note**: You can also navigate to this page by selecting **Resource Providers** from the **Cloud Home** menu. The Resource Provides Home page appears. Click **Create** and select Middleware Pool as the type of the resource provider to be created to launch the Create Middleware Pool wizard.

   ![Create Middleware Pool: General](Figure 27-2)

7. Click **Next**. In the Members page, specify the following:
   - Exalogic: Select **Yes** if all the member host targets are on Exalogic.
   - Exalogic with Multiple Racks: If the hosts are on Exalogic, select **Yes** if the host targets are from multiple Exalogic racks thereby providing high availability across the racks.
   - Operating System and Platform: Specify the operating system and platform.
8. Click **Add** to add one or more hosts to the middleware pool. Click **Next**.
9. The Create Middleware Pool: Placement Constraints page appears. The placement constraints are used to set maximum limits on resource utilization for each host. In the Maximum Number of Java Servers (per host) field, enter the maximum number of Java Server instances that can be running on each host in the pool. Click **Next**.
10. In the Characteristics region, specify the following:
    - Domain Home Base Directory: This is a mandatory field. Specify the base directory in which the domain or the instances provisioned with this middleware pool are to be placed.
• Middleware Home Base Directory: This is a mandatory field. Specify the directory under which the Oracle Homes are to be created. Oracle Homes will be shared across services of the same type and version.

• Shared Oracle Home: If this field is set to Yes, all hosts in this middleware pool will use this Shared Oracle Home even if other Oracle Homes are present on these hosts.

**Note:**
If you are using a Shared Oracle Home, you must ensure that Write permissions are available on the $WL_HOME/common/lib directory. This is applicable for WebLogic Server versions 12.1.1 or earlier.

11. In the Target Properties region, specify the characteristics that will be used to tag and identify the target properties. Click Next.

12. Review the information and click Submit to create the middleware pool. The newly created pool middleware pool can now be used to create the Middleware Service Template.

### 27.3 Creating a Load Balancer Configuration

You can configure external pre-configured load balancers such as Oracle HTTP Server (versions 11x are supported but it is recommended that you use 11g PS6), Oracle Traffic Director (versions 11x are supported but it is recommended that you use OTD 11x PS6) or a third party load balancer.

**Note:** If you are using a 11g PS6 managed or collocated OHS load balancer, you must ensure that no change is done through the Admin / MBean interfaces. The as-a-service solution modifies the OHS files directly on the file system, so any changes made on a collocated OHS may not be replicated to the Administration Server. Additionally, any changes made through the Admin interfaces (such as MBean, WLST, and so on), may override the changes made directly to the *.conf files.

If you want to configure a third party load balancer, you must use a custom script to update the load balancer configuration. For more details on this script, see Custom Script Guidelines. A Middleware Pool or a Deployment Plan can be associated with only one of the load balancer configurations.

**Note:**
Setting up the Load Balancer Configuration is an optional step.

### Prerequisites

• OTD and OHS load balancers being configured must be installed on an Enterprise Manager monitored host and is used to route Web traffic to one or more MWaaS service instances. When a MWaaS service instance is created, updated (scaled up or scaled down), or deleted, the load balancer configuration is automatically updated.
To route HTTPS Web traffic, you must do the following:

- Create an OTD configuration (This is required only if you are configuring an Oracle Traffic Director type of load balancer).
- Create or install a certificate.

For more details configuring SSL authentication, refer to the *Oracle Traffic Director Administrator’s Guide* and the *Oracle HTTP Server Administrator’s Guide*.

To configure a load balancer, follow the steps below:

1. Log into Enterprise Manager as an user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.
3. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. The common tasks that need to be performed before setting up a specific service family is displayed. Click the **Setup** link next to Middleware service family in the left panel.

   **Note:**
   You can use a different navigation path to reach this page. From the **Cloud Home** menu, select **Setup**, **Service Settings**, then click **Middleware**.

4. Select **WebLogic** from the service type drop down list and click the **Load Balancer Configuration** link.
5. Click **Create** to create a new load balancer configuration.

**Figure 27-3  Load Balancer Configuration: General**

6. Enter the following details:
   - Name of the load balancer configuration.
   - Select the type of load balancer being configured. This can be Oracle HTTP Server (OHS), Oracle Traffic Director (OTD), or a Third Party Load Balancer.
   - If you are using OHS and OTD, select the host on which the load balancer is installed. This must be an Enterprise Manager monitored host. If you are using the OTD load balancer, you must enter **OTD 11g Admin Server** here.

   **Note:** If you are using another third party load balancer, select a host on which the load balancer can be configured either locally or remotely.
• Specify the Routing Protocol (HTTP, HTTPS, or both) and the Free Routing Port Range.
• Select the Monitoring Agent (Management Agent) and specify the Named Credentials.

**Note:**

- For OTD and OHS, the Monitoring Agent must be present on the same host on which the OTD/OHS load balancer instance is running. For third party load balancers, the Monitoring Agent must be present on the host on which the load balancer is being configured.
- For third party load balancers, the Monitoring Agent may not be present on the same host on which the load balancer is running. In this case, you can select any other monitoring agent (which is available on other host) from which the third party load balancer can be accessed or configured by executing the custom script.

7. Click **Next**. If you have selected the Load Balancer Type as Oracle HTTP Server, you must enter the following details:

- Instance Home: The directory in which the configuration data and binary files pertaining to Oracle HTTP Server instance is stored.
- Component Name: The component in the specific instance that is to be configured.

If you have selected the Load Balancer Type as:

- **Oracle HTTP Server:** Enter the following details:
  - **Instance Home:** The directory in which the configuration data and binary files pertaining to Oracle HTTP Server instance is stored.
  - **Component Name:** The component in the specific instance that is to be configured.
- **Oracle Traffic Director:** The following page appears:

*Figure 27-4  Load Balancer Configuration: Properties (Oracle Traffic Director - Pre12c))*

- **Oracle Home:** The directory in which the Oracle Traffic Director binaries are installed.
– **Admin Protocol**: Specify the protocol (HTTP or HTTPS) to be used by the Oracle Traffic Director Administration Server to forward requests. By default, this is HTTPS.

– **Admin Listen Port**: Specify the Administration Server listen port number.

– **SNMP Port**: The SNMP port configured for Oracle Traffic Director. The default port number is 11161.

– **Instance Node**: Specify the Oracle Traffic Director Instance node name.

– **Configuration Name**: This field is optional and is required only if you have selected HTTPS or HTTP_HTTPS as the Routing Protocol in the Load Balancer Configuration: General section. If you select the HTTP Admin Protocol, and do not specify a value in this field, the OTD Configuration Name is created as config1 by default. If the OTD Configuration has already been created, it must be a managed target in Enterprise Manager.

**Note**: If you select the HTTP protocol, it is recommended that an OTD Configuration is created manually and discovered as a managed target in Enterprise Manager.

– **Certificate Name**: This field is optional. If you selected HTTPS or HTTPS or HTTP_HTTPS as the Routing Protocol in the Load Balancer Configuration: General section, enter the name of the self signed certificate.

– **Virtual Server Name**: The name of the virtual server. If the virtual server does not exist, a virtual server with the name specified here will be created. In this release, host patterns are not defined for each virtual server in the configuration.

– **Privileged Named Credentials**: Specify the Named Credentials for the Administration Server.

If you selected the OTD version as **12c**, the following fields appear:

**Figure 27-5  Load Balancer Configuration: Properties (Oracle Traffic Director - 12c)**

![Image of Load Balancer Configuration: Properties](image)

Enter the following details:

– **Oracle Home**: The directory in which the Oracle Traffic Director binaries are installed.

– **Admin Server Protocol**: Specify the protocol (HTTP or HTTPS) to be used by the Administration Server of the OTD 12c WebLogic Domain.
- **Admin Server Port**: Specify the OTD12c Weblogic Domain Administration Server listen port number.

- **WebLogic Machine**: The host machine which the OTD load balancer is to be configured.

- **Configuration Name**: This field is optional and is required only if you have selected the HTTPS or HTTP and HTTPS Admin Protocol. If you select the HTTP Admin Protocol, and do not specify a value in this field, the OTD Configuration Name is created as `config1` by default. If the OTD configuration has already been created, it needs to be discovered as a target in Enterprise Manager.

  **Note:**
  
  If you have selected the HTTP Routing Protocol, it is recommended that the OTD configuration is created manually and discovered as a managed target in Enterprise Manager.

- **Certificate Name**: This field is optional. If you selected the HTTPS or HTTP and HTTPS Admin Protocol, enter the name of the created self signed certificate.

- **Virtual Server Name**: This field is optional and is required only if you have selected the HTTPS or HTTP and HTTPS Admin Protocol. Enter the name of the virtual server within the Oracle Traffic Director server instance that provides a unique IP address (or host name) and port combination through which Oracle Traffic Director can serve requests for one or more domains.

- **WebLogic Administration Server Credentials**: Enter the credentials for the OTD 12c Domain WebLogic Administration Server.

  - **Third Party Load Balancer**: Select a script to configure the load balancer. This script must have been uploaded to the Software Library and the Software Library Directive URN must be specified as the input for the script.

8. Click **Next**. The Create Load Balancer Configuration: Targets page appears.

9. Click **Add** to add one or more middleware pools (See Creating a Middleware Pool) with which the load balancer will be associated.

  **Note:**
  
  A Middleware Pool can be associated with only one load balancer configuration.

10. Click **Next**. Review the configuration and click Submit to create the Load Balancer Configuration. The newly created load balancer configuration appears in the Load Balancer Configurations table. Click the **Load Balancer Name** link in the table to view the load balancer configuration details. This shows the targets associated with the load balancer configuration and middleware service instances that are using the configuration.
27.3.1 Custom Script Guidelines

You can use a custom script to configure the load balancer. This script must be present in the Software Library as a directive. The directive must follow these guidelines:

- **LBR_WORK_DIRECTORY**: Specifies the directory in which the lbr.properties file will be staged. The name-value pairs present in the lbr.properties file are extracted by the custom script and these values are used to configure the load balancer.

- The following properties must be present in the lbr.properties file:
  - **THIRDPARTY_ROUTING_PROTOCOL**: This can be HTTP, HTTPS, or HTTP_HTTPS.
  - **HTTP_PORT_RANGE**: The range of ports (separated by hyphen '-') that can be used to configure for HTTP protocol. For example, 5000-6000.
  - **HTTPS_PORT_RANGE**: The range of ports (separated by hyphen '-') that can be used to configure for HTTPS protocol. For example, 7000-8000.
  - **LBR_HOST**: The host on which the load balancer is installed.
  - **UNIQUE_URI_REFERENCE**: This is the Service Instance Id (which is an unique value). This maps to the service instance (WebLogic Domain). If required, it can be used to uniquely identify an entity, such as the virtual server, route, and so on.
  - **CONFIGURATION_ACTION**: The actions that can be performed are:
    - *CREATE*: To create a service instance.
    - *ADD_SERVERS*: To scale up or add one or more servers.
    - *DELETE_SERVERS*: To scale down or delete one or more servers.
    - *REMOVE*: To delete a service instance.
  - **HTTP_WLS_MANAGED_SERVER_PORT_LIST**: A comma separated host:port (Managed Servers) list where port is a http port. For example, abc:123, xyz:456.
  - **HTTPS_WLS_MANAGED_SERVER_PORT_LIST**: A comma separated host:port (Managed Servers) list where port is an SSL port. For example, abc:123, xyz:456.

27.3.1.1 Sample Script (Oracle Cloud Application 12.1.0.8 or Earlier)

This sample script is applicable if are using 12.1.0.8 or earlier versions of the Oracle Cloud Application plugin.

**Sample Script I**

```perl
#!/usr/bin/perl
use File::Path;
#use File::Spec();
use File::Spec;
use Cwd;

my $dir = getcwd();
my $WORK_DIR = $ARGV[0];
```
print "The Input Parameters to the Third Party Script are as follows : "."\n";
print "lbrWorkDirectory = ".$WORK_DIR."\n";
print "====================================================================="."\n";
print "The lbr.property file contents accessible to this script are as follows "."\n";
my $textfile = "lbr.properties";

my %prop;
chdir($WORK_DIR) or die "Can't chdir to $WORK_DIR $!";
#Create Hash from properties
open FILE, "<$textfile" or die("Could not open text file '" . $textfile . '"': $!");
my %hash;
while ($line4 = <FILE>)
{
    chomp($line4);
    my ($key, $val) = split(/=/,$line4);
    print $key."= ".$val."\n";
    $hash{$key}=$val;
}
close FILE;
print "====================================================================="."\n";
my $ACTION = $hash{'CONFIGURATION_ACTION'};
if ( $ACTION eq "CREATE" ) {
    print " The Configuration Action is Create \n";
} elsif ( $ACTION eq "ADD_SERVERS" ) {
    print " The Configuration Action is Scale Up \n";
} elsif ( $ACTION eq "DELETE_SERVERS" ) {
    print " The Configuration Action is Scale Down \n";
} elsif ( $ACTION eq "REMOVE" ) {
    print " The Configuration Action is Remove \n";
} else {
    print " Unsupported Configuration Action".$ACTION."\n";
}
print "====================================================================="."\n";#
# logic to configure the LBR goes here#

27.3.1.2 Sample Script (Oracle Fusion Middleware 12.1.0.7 or Later)

This sample script is applicable if you are using 12.1.0.7 or later versions of the Oracle
Fusion Middleware plugin.

Sample Script II

#!/usr/bin/perl
use File::Path;
#use File::Spec();
use File::Spec;
use Cwd;

my $dir = getcwd();
my $WORK_DIR = $ARGV[0];

print "The Input Parameters to the Third Party Script are as follows : "."\n";
print "lbrWorkDirectory = ".$WORK_DIR."\n";
print "====================================================================="."\n";
print "The lbr.property file contents accessible to this script are as follows "."\n";
my $textfile = "lbr.properties";
my @prop;
chdir($WORK_DIR) or die "Can't chdir to $WORK_DIR $!";
#Create Hash from properties
open FILE, "<$textfile" or die("Could not open text file '" . $textfile . '"' . ': $!");
my %hash;
while ($line4 = <FILE>)
{
  chomp($line4);
  my ($key, $val) = split(/=/,$line4);
  print $key."= ".$val."\n";
  $hash{$key}=$val;
}
close FILE;

print "TP OUTPUT:FRONT_END_HOST_VALUE=example.host.com#FRONT_END_HTTP_PORT_VALUE=9000#FRONT_END_HTTPS_PORT_VALUE=9090#URI_PREFIX=app1#"."\n";

# logic to configure the LBR goes here
#

print "=".\n";";

---

**Note:**

If you are using Oracle Fusion Middleware 12.1.0.7 or later, the script must meet the following guidelines:

- After successfully completing the configuration, you must exit the program with command status '0'.
- If the configuration fails, you must exit the program with a 'non-zero' command status.
- Print the following information in the exact format as given below:

  ```
  print "TP OUTPUT:FRONT_END_HOST_VALUE=<host-name>#FRONT_END_HTTP_PORT_VALUE=<http_port>#FRONT_END_HTTPS_PORT_VALUE=<https_port>#URI_PREFIX=<uri-prefix-if-applicable>"."\n";
  ```

27.3.2 Adding the Third Party LBR Configuration to the Software Library

To add the third party LBR configuration script as a directive in the Software Library, follow these steps:

1. From the **Enterprise** menu, select **Provisioning and Patching**, then select **Software Library**.
2. From the **Actions** menu, select **Create Entity** and click **Directive** to launch the Create Entity: Directives wizard.
3. On the Describe page, enter the Name and Description. Click **Next**.
4. On the Configure page, click **Add** and specify the command line arguments that will be used to configure the directive. The Add Command Line Arguments dialog box appears.

5. In the Add Command Line Arguments dialog box, enter `LBR_WORK_DIRECTORY` in the Property Name field and leave the other two fields (Argument Prefix and Argument Suffix fields) blank.

   ![Software Library: Configure Page](image)

6. In the Configuration Properties section, select either Bash or Perl as defined in the script. Click **Next**.

7. On the Select Files page, you can select one or more files to be associated with the entity. Select the Upload Files option and select the Upload Location.

8. In the Specify Source section, select Local Machine, and click **Add**. In the Add File dialog box, click **Browse** to select the third party LBR configuration script file from the source location, and give a unique name, and click **OK**.

   ![Software Library: Select Files Page](image)

9. On the Review page, review all the details, and click **Save and Upload** to create the directive and upload it on the Software Library.

   The third party LBR configuration script is now present as a directive in the Software Library. This directive can be selected as the third party Directive URN parameter in the Load Balancer Configuration Create page. For more details on creating a Software Library directive, see the *Enterprise Manager Cloud Control Administrator's Guide*. 
Note:
If the third party load balancer is used for more than one service (WLaaS, SBaaS, or SOAaaS), you must set the following properties to ensure that a unique identity is maintained for each service type:

- SVC_INST_ID: Unique service instance ID. The custom script uses this ID to uniquely identify the service instance.
- SVC_Name: Name of the service. The custom script can identify the service type of the current service instance. This makes the service instance uniquely identifiable across the service types.
- LBR_WORK_DIRECTORY: The directory in which the lbr.properties file is staged.

27.4 Configuring Request Settings
You can configure the request settings by specifying when a request can be made, its duration, and so on. To configure the request settings, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Setup, then select Getting Started. The common tasks that need to be performed before setting up a specific service family is displayed. Click the Setup link next to Middleware service family in the left panel.
4. Select WebLogic from the service type drop down list and click Request Settings.
5. You can specify the following parameters to set the global settings or settings for a specific role.
   - **Future Reservation**: How far in advance can a request be made.
   - **Request Duration**: Maximum duration for which a service can exist.
   - **Archive Policy**: Maximum duration after which archived requests are automatically deleted.
   - **Service Instance Approval**: Select this checkbox if all requests need to be approved by the self service administrator.
   - **Service Instance Share Settings**: A service instance can be shared with another user or a role. You can select either or both the checkboxes:
     - Enable SSA User to share service instances with other Users.
Enable SSA User to share service instances with Roles.

See Configuring Request Settings for details on how to set these parameters.

6. Click **Apply**.

## 27.5 Setting Up Quotas

Quota is the aggregate amount of resources that can be granted to each self service user belonging to a certain role. This quota applies only to the service instances provisioned through the Middleware Self Service Portal. Each service instance that is provisioned including new service requests and scale up of existing service instances is subject to the quota allocated to the self service user. When the self service user has used up his allocated quota, he cannot make new service requests until a higher quota is allocated or his existing service instances have been reclaimed.

To define a quota, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**.

   **Note:**
   
   You can use a different navigation path to reach this page. From the **Cloud Home** menu, select **Setup, Quotas**, then click **Middleware**.

3. Click on the **Setup** link next to the Middleware Service family and select the WebLogic service type from the drop down list.
4. Click the **Quotas** link and then click **Create**.

   **Note:**
   
   Quota validation ensures that a request is executed only if the user’s current usage is within the limits specified for the roles to which the user belongs. Only the direct roles are considered for the quota determination, and not nested ones.

5. In the Create Quota window, select the Role Name for which the quota is to be granted. Specify the quota limits for the role as follows:
   - **Memory**: The maximum memory that can assigned to the instances owned by a specific user.
   - **Java Servers**: The number of Java Servers that can be owned by a user at any point in time.
   - Number of Non Oracle JVMs: Specify the number of Non Oracle JVMs.
27.6 Creating a WebLogic Service Template

A service template can be used to provision an instance of a service into a set of selected PaaS Infrastructure zones.

Prerequisites

• Set up and enable MWaaS as described in Getting Started with Middleware as a Service.

• A PaaS Infrastructure Zone must have been created.

• A WebLogic domain provisioning profile (see Creating a WebLogic Domain Provisioning Profile) with appropriate values must be present in the Software Library.

• A middleware pool must have been created.

• Named Credentials must be created. The user creating the service template must be the owner of the Named Credentials.

Note:

You can edit a service template that has active instances and modify the configuration parameters. When a service template is modified:

• New instances created after the changes have been made will use the new parameters.

• Old instances or instances created before the template was modified will use the earlier values.

• Changes made to zones and roles will be applicable to both old and new instances.

To create a WebLogic Service Template, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.

2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears. From the Oracle Cloud menu, select Setup, then select Getting Started.
3. Click on the **Setup** link next to the Middleware Service family and select the **WebLogic** service type from the drop down list.

4. Click the **Service Templates** link. You can create service templates that can be used to provision an instance of a service in a set of selected zones. Click **Create**.

5. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.

6. In the Provisioning Profile field, click the **Search** icon and select a WebLogic Domain Provisioning profile. The WebLogic Domain Provisioning Profile you select can contain either of the following:
   - One cluster with one or more WebLogic Servers. You can scale up or scale down by adding or deleting WebLogic servers to this cluster.
   - One WebLogic Server. In this case, the Scale Up and Scale Down options are not available.

   The details of the selected profile such as profile version, number of managed servers, topology, and so on are displayed.

**Figure 27-8  Create WebLogic Service Template: General**

7. Click **Next**. The Characteristics page appears.
Figure 27-9  Create WebLogic Service Template: Characteristics

In the Service Characteristics region, specify the following:

- **Distribute WebLogic Servers of a service instance on hosts from different Exalogic Racks**: Select Yes if the WebLogic Servers in a service instance are to be uniformly distributed on available Exalogic racks. Select No if the hosts are to be placed on the first available rack.

- **Distribute Load on Available Hosts**: Select Yes if the WebLogic Servers are to be uniformly distributed on available hosts. If you select No, the maximum number of servers possible will be provisioned on the first available host before provisioning on other hosts.

- **Enable Load Balancer**: Select Yes to enable the load balancer configuration for all the service instances that are created with this service template.

  **Note:**

  If the **Enable Load Balancer** field is set to 1 in the Create New Service Template: Configuration page, when you click **Search**, only middleware pools associated with a load balancer configuration are displayed. If there are no middleware pools associated with load balancer configurations, the list will be blank.

- **Expose Advanced Settings for the SSA User**: When set to Yes, the self service user will have access to advanced options such as Operating System, Enable sharing Service Instances with other SSA Users, Setting Target Properties for Monitoring Templates, and so on.

- **Expose WebLogic Admin Console and Fusion Middleware Control to SSA User**: If you select Yes, the users with the **EM_SSA_USER** role will have access to the WebLogic Admin Console and Fusion Middleware Control for each service instance created using this service template.
**Note:**

This field must be set to **Yes** only if the **EM_SSA_USER** needs to have complete control over the WebLogic Server and Fusion Middleware Control consoles. The **EM_SSA_USER** will then be able to perform all configuration changes and life cycle management operations from each console.

- **JRF Enabled Profile:** Indicates if the selected profile is JRF enabled. If set to **Yes** for WebLogic Server 12.1.2 and 12.1.3 instances, the self service user will be prompted for the database connection string and schema password while requesting a service.

  The self service user can either use a database that is cloned using the DBaaS RMAN Backup option, or a database that has been cloned outside DBaaS but discovered in Enterprise Manager. In the case of the latter option, after discovering the database, you must grant view privileges on the Database target to the self service user.

  A JRF enabled profile cannot be used to create a non-JRF WebLogic domain. If the value for this field has been set to **Yes**, it is recommended that the value is not changed.

8. In the Target Properties region, specify the characteristics that will be used to tag and identify the target properties. Service instances created from the template will have the characteristics.

9. Click **Next**. In the Create Middleware Service Template: Resource Providers page, click **Add** to select the Middleware Pool into which the service instances are to be provisioned. The PaaS Infrastructure Zone with which the middleware pool is associated is displayed.

10. Click **Next**. The Configuration page appears.

**Figure 27-10  Create WebLogic Template: Configuration**
Enter the following details:

- **WebLogic Administration Credentials**:
  - **WebLogic Username**: Enter a value of minimum 8 characters as the name of the user logging into the WebLogic server. This is a mandatory field.
  - **WebLogic Password**: Enter a value of minimum 8 characters as the password for the WebLogic server user. This is a mandatory field.

- **Java Home Location**: Specify the absolute path to the Java Home. This field must be specified if the WebLogic Domain Provisioning Profile selected earlier contains Middleware Home binaries.

- **Pre and Post Scripts**
  - **Prescript for Service Instance**: Select the script that should be executed before creating, deleting, scaling up, or scaling down a service instance.
  - **Postscript for Service Instance**: Select the script that should be executed after creating, deleting, scaling up, or scaling down a service instance.
  - **External Hosts for Executing Scripts**: Specify the external hosts on which these scripts should be executed.
  - **Named Credential for execution of scripts on external hosts**: Specify the credentials required to run the scripts on external hosts.
  - **Execute Scripts on Admin Server Host**: Select Yes if the scripts are to be executed on the Administration Server Host.
  - **Execute Scripts on Managed Server Hosts**: Select Yes if the scripts are to be executed on the Managed Server Hosts.

  **Note:**
  Zone level credentials are used to run these scripts on the Administration Server Host and the Managed Server Host.

The scripts must meet the following guidelines:
- Directive that is created should be a PERL directive.
- An input parameter named `INPUT_FILE_LOCATION` must be defined.
- The path to the location of a property file must be specified in the `INPUT_FILE_LOCATION` parameter.
- The property file contains information about the service instance and the domain.

See Sample Postscript for a sample script file, properties file, and the generated output.

- **Service Settings**:
  - **Topology**: This field is automatically set based on the profile you have selected in the Create Middleware Service Template for Physical: General page.
• **Port Range (Start - End):** Enter the port range for the WebLogic Server. The default start range is 1024 and the end range is 65000.

• **Placement Parameters:**
  – **Memory Usage Per Instance:** Specify the memory required for each additional WebLogic Server instance. This parameter must be specified (cannot be left blank) and the value must match the -Xmx value specified in the profile. For example, if the profile specifies -Xmx512m, the memory required value must be set to 0.5. Similarly, a profile value of -Xmx1024m would need a memory required value of 1, and so on.
  – **CPU Usage Per Instance:** Specify the CPU required for each additional WebLogic Server instance.

• **Server Startup Arguments**
  – **Managed Server Startup Arguments:** Specify the memory and Java arguments required to start the managed server. These arguments are used to control the memory size of the JVM server and create multiple templates with the same profile. For example, you can specify
    - `Xms1280m -Xmx1280m -XX:PermSize=128m -XX:MaxPermSize=256m -Dweblogic.security.SSL.ignoreHostnameVerification=true`.

  **Note:** If the Expose Advanced Settings for the SSA User flag is set to True, the self service user can modify these arguments while requesting a service.

• **Resource Management Script Parameters**
  – **Resource Management Script:** Specify the script for dynamic management of resources which allows you to increase or decrease the size of the middleware pool. This script must be present in the Software Library as a directive.
  – **Host for Executing Resource Management Script:** Select the host on which the resource provisioning script is to be executed.
  – **Named Credentials for Host:** Specify the named credentials for the selected host.

11. Click **Next**. In the Create Middleware Service Template for Physical: Roles page, click **Add** to select the self service user roles to which this service template will be available. All users belonging to the selected role can use this service template.

12. Click **Next**. The Create Middleware Service Template for Physical: Review page appears. Review the information entered so far and click **Submit**. The newly created service template will appear in the Middleware Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.

To edit an existing MWaaS service template, follow these steps:

1. Click **Edit** in the Service templates page to launch to the Edit Service Template wizard.

2. In this mode, you can modify the description, user name, password, and port range of the WebLogic Server instance being provisioned, add or remove PaaS Infrastructure Zones, Software Pools into which the template is being deployed, and add or remove users who can use this template.
27.6.1 Sample Postscript

This sample postscript prints the contents of the properties file and also prints details regarding the managed server, administration server, and so on.

27.6.1.1 Sample Properties File

The properties file contains the following:

OPERATION=CREATE
SERVICE_INSTANCE=inst_01
DOMAIN_NAME=inst_01_SSA_USER1
DOMAIN_HOME=/middleware/inst_01_SSA_USER1
MW_HOME=/middleware
WLS_HOME=/middleware/wlserver_10.3
ADMIN_SERVER=example.com,27877,8142
MANAGED_SERVERS=example.com,13614,1488,4166;
EXTERNAL_HOSTS=example.com
EXECUTE_SCRIPTS_ON_ADMIN_SERVER_HOST=Yes
EXECUTE_SCRIPTS_ON_MANAGED_SERVER_HOSTS=Yes

27.6.1.2 Sample Script

A sample script is given below:

```perl
#!/usr/bin/perl
use File::Path;
#use File::Spec();
use File::Spec;
use Cwd;

my $dir = getcwd();
my $inputFile = $ARGV[0];

print "Input File Location = ". $inputFile . "\n";
print "====================================================================" . "\n";
print "The properties file contents accessible to this script are as follows " . "\n";

my @prop;
#Create Hash from properties
open FILE, "<$inputFile" or die("Could not open text file '" . $inputFile . "': $!");
my %hash;
while ($line4 = <FILE>)
{
    chomp($line4);
    my ($key, $val) = split(/=/,$line4);
    print $key."= " . $val . "\n";
    $hash{$key}=$val;
}
close FILE;
print "====================================================================" . "\n";
my $ACTION = $hash{'OPERATION'};
if ( $ACTION eq "CREATE" ) {
    print "This is Service Instance Creation Operation \n";
} elsif ( $ACTION eq "SCALEUP" ) {
    print "This is Scale Up Operation \n";
} elsif ( $ACTION eq "SCALEDOWN" ) {
    print "This is Scale Down Operation \n";
}
```

Chapter 27
Creating a WebLogic Service Template
elsif ($ACTION eq "DELETE") {

27.6.2 Resource Management Script

The Resource Management Script specifies the location of the property file which contains a list of name value pairs. The content of the file varies based on the Create, ScaleUp, ScaleDown, and Delete operations.

27.6.2.1 Create Operation

The content of the file for the Create operation are:

ACTION=CREATE
ZONE_NAME=<value>
POOL_NAME=<value>
NUMBER OF SERVERS BEFORE THIS REQUEST=<value>
NUMBER OF SERVERS REQUESTED=<value>
NUMBER OF SERVERS POSSIBLE WITH AVAILABLE RESOURCES=<value>
NUMBER OF SERVERS NEEDED=<value>
MAXIMUM SERVERS ALLOWED PER HOST=<value>
MIDDLEWARE_HOME=<value>
EXPECTED CPU UTILIZATION IN PERCENTAGE=<value>
EXPECTED MEMORY CONSUMPTION IN GB=<value>

27.6.2.2 Scaleup Operation

The content of the file for the **Scaleup** operation are:
ACTION=SCALEUP
ZONE_NAME=<value>
POOL_NAME=<value>
NUMBER OF SERVERS BEFORE THIS REQUEST=<value>
NUMBER OF SERVERS REQUESTED=<value>
NUMBER OF SERVERS POSSIBLE WITH AVAILABLE RESOURCES=<value>
NUMBER OF SERVERS NEEDED=<value>
MAXIMUM SERVERS ALLOWED PER HOST=<value>
MIDDLEWARE_HOME=<value>
DOMAIN_NAME=<value>
EXPECTED CPU UTILIZATION IN PERCENTAGE=<value>
EXPECTED MEMORY CONSUMPTION IN GB=<value>

27.6.2.3 Scaledown Operation

The content of the file for the **Scaledown** operation are:
ACTION=SCALEDOWN
ZONE_NAME=<value>
POOL_NAME=<value>
NUMBER OF SERVERS BEFORE THIS REQUEST=<value>
NUMBER OF SERVERS BEING REMOVED=<value>
HOSTS FROM WHERE SERVERS BEING REMOVED=<value>
MIDDLEWARE_HOME=<value>
DOMAIN_NAME=<value>

27.6.2.4 Delete Operation

The content of the file for the **Delete** operation are:
ACTION=DELETE
27.7 Configuring Chargeback

Click the **Chargeback** tab to add the middleware pools to the Chargeback Application. On this page, you can determine chargeback zones, services, items, and prices. After Chargeback is set up, you can view charges and plan details.

You can configure chargeback and metering data based on the configuration and monitoring metrics collected from associated targets such as the host, managed server, and the PaaS Infrastructure Zone. The charge plans are based on the host, WebLogic (domain, cluster, and server), PaaS Infrastructure Zone, and configuration such as the WebLogic Domain version, OS version, vendor, and so on.

For details on setting up the Chargeback Service, see [Chargeback Administration](#).
This chapter describes the procedure to set up and enable the SOA Self Service Portal or the OSB Self Service Portal. It contains the following sections:

- Getting Started with SOAaaS and OSBaaS
- Setting Up DBaaS used to Clone a SOA Repository
- Prerequisites for Creating a SOA or an OSB Provisioning Profile
- Setting Up the SOA and OSB Cloud Self Service Portal
- Creating a SOA Instance

### 28.1 Getting Started with SOAaaS and OSBaaS

This section helps you get started by providing an overview of the steps involved in setting up SOA as a Service (SOAaaS) and OSB as a Service (OSBaaS) to provision a service instance on one or more physical hosts.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Clone the database used by the Source SOA domain or OSB domain. Oracle recommends using the DBaaS feature available in Enterprise Manager. See Setting Up DBaaS used to Clone a SOA Repository.</td>
</tr>
<tr>
<td>2</td>
<td>Meet the Prerequisites for creating the SOA/OSB provisioning profiles: See Prerequisites for Creating a SOA or an OSB Provisioning Profile</td>
</tr>
<tr>
<td>3</td>
<td>Setting Up SOA and OSB Cloud Self Service Portal. See Setting Up the SOA and OSB Cloud Self Service Portal</td>
</tr>
</tbody>
</table>

### 28.2 Setting Up DBaaS used to Clone a SOA Repository

Following are the high-level steps to setup the Database Self Service Portal and request for a database instance that can be used for setting up the SOA Self Service Portal. Cloning method followed for setting up database instance for SOA is using RMAN backup. Following are the high-level steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Follow the steps in the Getting Started section to enable DBaaS.</td>
<td>See Getting Started</td>
</tr>
</tbody>
</table>
Table 28-2  (Cont.) Provisioning Databases Using RMAN Backup Profile

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>2</td>
<td>Set up one or more PaaS Infrastructure Zones.</td>
<td>See <a href="#">Creating a PaaS Infrastructure Zone</a></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Oracle recommends using the same Infrastructure zone for Database and SOA/OSB.</td>
<td></td>
</tr>
<tr>
<td>3</td>
<td>Create a database provisioning profiles using the RMAN Backup option.</td>
<td>See <a href="#">Creating a Database Provisioning Profile Using RMAN Backup</a></td>
</tr>
<tr>
<td></td>
<td><strong>Note:</strong> Select the SOA/OSB dehydration store database used by the source SOA/OSB domain to create the profile.</td>
<td></td>
</tr>
<tr>
<td>4</td>
<td>Create a database pool.</td>
<td>See <a href="#">Creating a Database Pool for Database as a Service</a></td>
</tr>
<tr>
<td>5</td>
<td>Create a database service template for SOA.</td>
<td>See &quot;<a href="#">Creating a Database Service Template for SOA Profile</a>&quot;</td>
</tr>
<tr>
<td></td>
<td>Create a database service template for OSB.</td>
<td>See &quot;<a href="#">Creating a Database Service Template for OSB Profile</a>&quot;</td>
</tr>
<tr>
<td>6</td>
<td>While deploying a database for SOA/OSB, select the service template you have created.</td>
<td>See <a href="#">Requesting a Database</a></td>
</tr>
</tbody>
</table>

**Note:**
- The same user credentials that are used to create the Database Service instance should be used for creating the SOA/OSB Service instance. If you instead use other credentials, you must ensure that the SOA Service user has been granted the required accesses on the database.
- Along with DBaaS, PDBaaS is also supported for cloning a SOA repository.

Prerequisite to publish JRF template

To publish a template for a JRF 12.1.x domain follow this procedure as a prerequisite:

1. JRF 12.1.x domain contains data sources. The administrator must create a profile of the source database and publish a DBaaS template.
2. The user should request for a database service using the previously created template.
3. The user should request for a complete JRF domain using the previously requested database for the data sources in the domain.

28.2.1 Creating a Database Service Template for SOA Profile

**Prerequisite:**

To truncate the business data present inside the SOA dehydration store (source environment), use the truncate script provided as a part of the SOA product. For this,
you must first create a Generic Component and upload `truncate_soa_oracle.sql` script to Software Library. For more information on this, see the *Enterprise Manager Cloud Control Administrator’s Guide*.

Note that the `truncate` script `truncate_soa_oracle.sql`) is located in the following directory path: `/MW_HOME/SOA_ORACLE_HOME/rcu/integration/soainfra/sql/ truncate`

To create the service template for a SOA Profile, follow these steps:

1. Follow the steps listed in Creating a Database Provisioning Profile Using RMAN Backup to create the database profile.
2. On the Create Service Template: Customization page, specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.
3. Click Next. The Create Service Template: Roles page is displayed.
4. Click Add to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click Next.
5. On the Create Service Template: Review page review the field entries and click Create.

The newly created service template is displayed on the Database Cloud Self Service Portal Setup: Service Templates page.

### 28.2.2 Creating a Database Service Template for OSB Profile

**Prerequisite (Applicable only for OSB 11g targets)**

OSB uses Logging Last Resource (LLR) transaction optimization feature which creates LLR tables in the OSB schema for each managed server in the OSB domain, including the Administration Server.

As part of cloning the OSB database, you need to drop these tables. Otherwise, startup of the cloned OSB domain will fail. To drop these tables, you can create a a Generic Component and upload `llr_table.sql` script to the Software Library.

To create the script for each for each LLR table present in source OSB environment, add the following statement to the SQL script:

```sql
TRUNCATE table WL_LLR_<SERVER_NAME>
```

For example, if the OSB domain has administrator server and two managed servers with name `OSB_SERVER1` and `OSB_SERVER2`, then the content of the sql script would look like:

```sql
TRUNCATE table WL_LLR_ADMINSERVER
TRUNCATE table WL_LLR_OSB_SERVER1
TRUNCATE table WL_LLR_OSB_SERVER2
```

To create the service template for OSB profile, follow these steps:

1. Follow the steps listed in Creating a Database Provisioning Profile Using RMAN Backup to create the database profile.
2. On the Create Service Template: Customization page, specify the custom scripts that need to be executed before and after the database is created. See Pre and Post Request Creation / Deletion Scripts for details.

3. Click **Next**. The Create Service Template: Roles page is displayed.

4. Click **Add** to select the SSA user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

5. On the Create Service Template: Review page review the field entries and click **Create**.

   The newly created service template is displayed on the Database Cloud Self Service Portal Setup: Service Templates page.

### 28.3 Prerequisites for Creating a SOA or an OSB Provisioning Profile

Meet all the prerequisites mentioned in the *Enterprise Manager Lifecycle Management Administrator’s Guide* before creating a SOA or an OSB provisioning profile.

### 28.4 Setting Up the SOA and OSB Cloud Self Service Portal

The **EM_SSA_ADMINISTRATOR** can configure and set up the SOA/OSB Cloud Self Service Portal by creating middleware pools, setting up quotas, defining request settings, configuring the load balancer, creating service templates, and configuring chargeback.

#### Note:

To create a database profile for SOA or OSB domain, you must use a Single Instance database or a RAC database. For a RAC database, use GridLink data source. Multi datasource is not supported.

The following table lists the tasks that must be performed, and the user roles that can perform the task.

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>User Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Set up one or more PaaS Infrastructure Zones. See Creating a PaaS Infrastructure Zone</td>
<td>EM_CLOUD_ADMINISTRATOR</td>
</tr>
</tbody>
</table>
### Step 2: Creating SOA Provisioning Profiles

Meet the prerequisites mentioned in **Prerequisites for Creating a SOA or an OSB Provisioning Profile**.

For steps on how to create the SOA profile, see the *Enterprise Manager Lifecycle Management Administrator's Guide*.

**Note:** Ensure that you grant privileges on the profile to the **SSA_USER** role. A basic requirement is that the **SSA_USER** role has view privileges on the SOA profile.

To grant privileges, follow these steps:

1. In Cloud Control, from **Enterprise** menu, select **Provisioning and Patching**, then click **Software Library**.
2. On the Software Library home page, expand **Fusion Middleware Provision** option and the **Profiles** menu, to view all the SOA/OSB profiles.
3. Select one of the profiles, and from Actions menu, select **Grant/Revoke Privileges**.
4. On the Grant/Revoke Privileges page, click **Add** to select the **SSA_USER** role, then grant view privilege.

### Step 3: Creating a SOAaaS and OSBaaS Pool

EM_SSA_ADMINISTRATOR

### Step 4: Creating a Load Balancer Configuration

EM_SSA_ADMINISTRATOR

### Step 5: Configuring Request Settings

EM_SSA_ADMINISTRATOR

### Step 6: Setting Up Quotas

EM_SSA_ADMINISTRATOR

### Step 7: Creating SOA and OSB Service Templates

EM_SSA_ADMINISTRATOR

### Step 8: Configuring Chargeback

EM_SSA_ADMINISTRATOR

---

### 28.4.1 Creating a SOAaaS and OSBaaS Pool

A Middleware Pool contains a set of resources that can be used to provision a service instance within a PaaS Infrastructure Zone. You must create separate Middleware pools in the PaaS Infrastructure Zone for each WebLogic version of Middleware Home.

To create a SOA Pool or an OSB Pool, follow these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.
3. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. The common tasks that need to be performed before setting a specific service family is displayed. Click the **Setup** link next to Middleware service family in the left panel.

4. Select **SOA Infrastructure** or **Oracle Service Bus** from the drop down list, and then click **Middleware Pool**. The Middleware Pool page appears.

5. On the Middleware Pool page, click **Create**.

6. Enter the Target Name, a name, and description for the middleware pool.

7. Select the PaaS Infrastructure Zone in which the middleware pool is to be created. Click **Next**.

8. Click **Add** to add one or more hosts to the middleware pool. Click **Next**.

9. On the Placement Constraints page, in the Maximum Number of WebLogic Servers (per host) field, enter the maximum number of server instances that can be running on each host in the pool.

10. On the Characteristics page, specify the characteristics that will be used to tag and identify the target properties. The following options are possible:
   - To use a shared location, select **Yes** from the Shared Oracle Home menu, and provide an NFS path for the Middleware Home Base Directory. In this case, the SSA Administrator should make sure that the NFS path is mounted on all the hosts in the Middleware Resource Provider (used for SOA and OSB).
   - To use a local path, select **No** from Shared Oracle Home menu, and provide a location that is consistent across hosts in the Middleware Resource Provider.

11. On the Review page, click **Submit** to create a SOA or an OSB pool. The newly created pool can now be used to create the corresponding SOA and OSB Service Templates.

### 28.4.2 Creating SOA and OSB Service Templates

A Service Template is a service definition that can be used to provision a service instance on a middleware pool.

**Prerequisites**

- A PaaS Infrastructure Zone must have been created.
- A Middleware Pool must have been created.
A Middleware Provisioning Profile with appropriate values must be present in the Software Library. The owner of the profile must grant View privileges on the profile to the SSA user.

The database service template for a SOA profile and OSB profile are different. For information on how it can be created, see Creating a Database Service Template for SOA Profile and Creating a Database Service Template for OSB Profile.

If the SOA or OSB setup is configured with OHS or OTD settings, you must configure the Service Template also with these settings. To do so, on the Service Template creation page, ensure that you select Enabled for Load Balancer and provide the necessary OHS or OTD details. If not, the deployment procedure will fail and the Service Template will not get created.

**Note:**

You can edit a service template that has active instances and modify the configuration parameters. When a service template is modified:

- New instances created after the changes have been made will use the new parameters.
- Old instances or instances created before the template was modified will use the earlier values.
- Changes made to zones and roles will be applicable to both old and new instances.

To create a Middleware Service Template, follow these steps:

1. Log into Enterprise Manager as an user with the **EM_SSA_ADMINISTRATOR** role.
2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.
3. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. The common tasks that need to be performed before setting a specific service family is displayed. Click the **Setup** link next to Middleware service family in the left panel.
4. Select **SOA Infrastructure** or **Oracle Service Bus** from the drop down list and click **Service Templates**.
5. On the Service Templates page, click **Create**.
6. On the General page, enter a name and description for the service template. The name must be unique and the description should provide information on the type of service template being created.
7. In the Profile SOA field, click the **Search** icon and select a Provisioning profile. For information on how to create these profiles, see the **Enterprise Manager Lifecycle Management Administrator's Guide**. Click **Next**.
8. On the Characteristics page, specify the characteristics that will be used to tag and identify the target properties. Service instances created from the template will have the characteristics. Click **Next**.
9. On the Resource Providers page, click **Add** to select the Middleware Pool into which that the service instances can be provisioned. The Paas Infrastructure Zone with which the middleware pool is associated is displayed. Click **Next**.
10. On the Configuration page, enter the following details:

### Table 28-3  SOA Configuration Details

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Middleware Home Base Path and Java Home** | **Middleware Home Base Path**: If you have set the NFS path while creating resource provider, then that path is populated here by default, and you are recommended to retain the same path. However, if the path was not set while creating resource provider, the Middleware Home base path from the profile is displayed, which can be updated if required.  
  
  **Domain Home Base Path**: Enter the absolute path to the base directory where this domain should be created, or provide the relative path to the Middleware Home Base Path as follows: '$MIDDLEWARE_HOME/' prefix. For example, $MIDDLEWARE_HOME/domains.  
  
  Alternatively, you can set this from the Resource Provider Characteristics page. If you have set the values already, they will appear pre-populated here.  
  
  **Note**: For a shared middleware home, this domain home base path should be an absolute value.  
  
  **Java Home**: The Java home path used by source domain (from where the profile is created) is displayed here. You can change this path, if required. Ensure that same java version is used by destination domain as well.  
  
  **Note**: If you are using a Windows operating system, ensure that the Java home path does not have any spaces.  
  
  **Work Directory**: The files are staged in this directory during provisioning. Specify an absolute path or a path relative to middleware home base path. For example, $MIDDLEWARE_HOME/work |
| **Placement Parameters**                  | **Expected Memory Consumption**: Approximate CPU used by each additional instance in percentage. The memory consumption should be greater than or equal to the sum of Xms and MaxPermSize.  
  
  For example, -Xms1280m, MaxPermSize=256m. Sum = 1280 MB+256 MB= 1536 MB (1.536 GB). Make sure that the value entered for memory consumption is greater than or equal to 1.5 GB.  
  
  **Expected CPU Utilization**: Approximate Memory required by each additional instance in GB  
  
  **Note**: These properties will be used to assign hosts with sufficient resources available for instance creation. |
| **Server Startup Arguments**              | **Managed Server Startup Arguments**: Enter memory and java arguments to start the server.  
  
  Example: -Xms512m -Xmx1536m -XX:CompileThreshold=8000 -XX:PermSize=512m -XX:MaxPermSize=512m -Dweblogic.security.SSL.ignoreHostnameVerification=true”  
  
  **Note**: Coherence configuration is done automatically; there is no need to specify the coherence parameters here. |
| **Weblogic Administration User Credentials** | **Username**: This is the WebLogic username used to create a profile. The username will be populated by default, and should not be updated.  
  
  **Password**: This will be set as passowrd for created weblogic account. |
Table 28-3  (Cont.) SOA Configuration Details

<table>
<thead>
<tr>
<th>Name</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pre and Post Scripts</td>
<td><strong>Prescript for Service Instance</strong>: Select the script that should be executed before creating, deleting, or scaling up service instance. <strong>Postscript for Service Instance</strong>: Select the script that should be executed after creating, deleting, or scaling up service instance. <strong>Note</strong>: If you have upgraded from FMW plug-in 12.1.0.7 to FMW plug-in 12.1.0.8, then you will need to create a consolidated Prescript and a Postscript for your service. This script must include operations like create, delete, and scale-up. Save the file as a directive in the Software Library. Following this, you must edit the existing service template Configuration page, to include the newly created scripts. <strong>Hosts for Executing Scripts</strong>: Hosts discovered in Enterprise Manager, on which the scripts should run. Use ',' to separate multiple target hosts. <strong>Named Credentials for execution of scripts</strong>: Enter the Named Credentials for the hosts on which the scripts should run. Note that SSA Administrator should have View privileges on these Named Credentials. For example, CredName:CredOwner. <strong>Execute Scripts on Admin Server Hosts</strong>: Enter 1 (YES) to execute scripts on Managed Server Host, and 0 (NO) to Skip Administrator Server Host. <strong>Execute Scripts on Managed Server Hosts</strong>: Enter 1 (YES) to execute scripts on the Administrator Server Host, and 0 (NO) to Skip Managed Server Hosts. <strong>Note</strong>: After an upgrade the value of this flag gets reset. Make sure that you edit the existing service template, and set the flag value appropriately. The scripts must meet the following guidelines: • Directive that is created should be a PERL directive. • An input parameter named INPUT_FILE_LOCATION must be defined. • The path to the location of a property file must be specified in the INPUT_FILE_LOCATION parameter. • The property file contains information about the service instance and the domain. See Sample Postscript for a sample script file, properties file, and the generated output.</td>
</tr>
<tr>
<td>Port Range</td>
<td><strong>Port Range Start</strong>: Lower bound for choosing Free Ports <strong>Port Range End</strong>: Upper Bound for choosing Free Ports. <strong>Note</strong>: The port range will be used to assign ports for servers and nodemangers. It should be between 1024-65535. <strong>Enable Load Balancer</strong>: Enter Yes to enable and No to disable the LoadBalancer. Note that if you select YES', there should be a load balancer configured with the selected resource providers.</td>
</tr>
<tr>
<td>Load Balancer</td>
<td>Select Yes only if the source domain used in the service template has already been configured with a load balancer. If the source domain is not configured with a load balancer, you must select No. <strong>Note</strong>: If the source profile used in the service template has been configured with OHS or OTD, then select Yes to enable the load balancer. If not, the service template creation will fail.</td>
</tr>
</tbody>
</table>
Click **Next**.

11. On the Roles page, click **Add** to select the self service user roles to which this service template will be available. All users belonging to the selected role can use this service template. Click **Next**.

12. On the Review page, review the information entered so far and click **Submit**. The newly created service template will appear in the Middleware Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.

### 28.4.3 Sample Postscript

This sample postscript prints the contents of the properties file and also prints details regarding the managed server, administration server, and so on.

#### 28.4.3.1 Sample Properties File

The properties file contains the following:

```

28.4.3.2 Sample Script

A sample script is given below:

```perl
#!/usr/bin/perl
use File::Path;
#use File::Spec();
use File::Spec;
use Cwd;

my $dir = getcwd();
my $inputFile = $ARGV[0];

print "Input File Location = "."$inputFile."\n"
print "===================================================================="."\n"
print "The properties file contents accessible to this script are as follows "."\n"
my @prop;
#Create Hash from properties
open FILE, "<$inputFile" or die("Could not open text file "."$inputFile."": ": $!");
my %hash;
while ($line4 = <FILE>)
{
    chomp($line4);
    my ($key, $val) = split(/=/,$line4);
    print $key."= ".$val."\n"
    $hash{$key}=$val;
}
close FILE;
print "===================================================================="."\n"
my $ACTION = $hash{"OPERATION"};
if ( $ACTION eq "CREATE" ) {
    print " This is Service Instance Creation Operation 
"
} elsif ( $ACTION eq "SCALEUP" ) {
    print " This is Scale Up Operation 
"
} elsif ( $ACTION eq "DELETE" ) {
    print " This is Delete Service Instance Operation 
"
} else {
    print " Unsuppported Configuration Action".$ACTION."\n"
}
print "===================================================================="."\n"
my $ADMIN_SERVER = $hash{"ADMIN_SERVER"};

print "====================================================================Admin Server Details Begins===================================================================="."\n"
my @fields = split (//, $ADMIN_SERVER);
my $arraySize = @fields;
if ($arraySize == 4) {
    print "Admin Server Name is "."$fields[0]."\n"
    print "Admin Server Host Name is "."$fields[1]."\n"
    print "Admin Server NON SSL Port is "."$fields[2]."\n"
    print "Admin Server SSL Port is "."$fields[3]."\n";
```
} else {
    print "Admin Server Host Name is ".fields[0]."\n";
    print "Admin Server NON SSL Port is ".fields[1]."\n";
    print "Admin Server SSL Port is ".fields[2]."\n";
}
print "=-=-=-=-=-=-=-=-=-=-=-=-Admin Server Details Ends=-=-=-=-=-=-=-=-=-=-=-=-"."\n"

print "=-=-=-=-=-=-=-=-=-=-=-=-Managed Server's Details Begins=-=-=-=-=-=-=-=-=-=-=-=-"."\n";
my $MANAGED_SERVERS = $hash->{'MANAGED_SERVERS'};
my $managedServer;
my @noOfManagedServers = split (/;/, $MANAGED_SERVERS);
for ($count = 0; $count < @noOfManagedServers; $count++) {
    $managedServer = $noOfManagedServers[$count];
    @fields = split (//, $managedServer);
    @arraySize = @fields;
    if ( $ACTION eq "DELETE" ) {
        print "Managed Server Name is ".fields[0]."\n";
        print "Managed Server Host Name is ".fields[1]."\n";
        print "Managed Server NON SSL Port is ".fields[2]."\n";
        print "Managed Server SSL Port is ".fields[3]."\n";
    } else {
        print "Managed Server Host Name is ".fields[0]."\n";
        print "Managed Server NON SSL Port is ".fields[1]."\n";
        print "Managed Server SSL Port is ".fields[2]."\n";
    }
    print "\n"
}
print "=-=-=-=-=-=-=-=-=-=-=-=-Managed Server's Details Ends=-=-=-=-=-=-=-=-=-=-=-=-"."\n"

print "=-=-=-=-=-=-=-=-=-=-=-=-External Host's Details Begins=-=-=-=-=-=-=-=-=-=-=-=-"."\n";
my $EXTERNAL_HOSTS = $hash->{'EXTERNAL_HOSTS'};
my $hosts = split (//, $EXTERNAL_HOSTS);
for ($count = 0; $count < @hosts; $count++) {
    print "External Host is ".$hosts[$count]."\n";
}
print "=-=-=-=-=-=-=-=-=-=-=-=-External Host's Details Ends=-=-=-=-=-=-=-=-=-=-=-=-"."\n"

**28.4.3.3 Sample Script Output**

The output of the directive is given below:

```

28.4.4 Resource Management Script

The Resource Management Script specifies the location of the property file which contains a list of name value pairs. The content of the file varies based on the Create, ScaleUp, and Delete operations.

28.4.4.1 Create Operation

The content of the file for the **Create** operation are:

- **ACTION**=CREATE
- **ZONE_NAME**=<value>
- **POOL_NAME**=<value>
- **NUMBER OF SERVERS BEFORE THIS REQUEST**=<value>
- **NUMBER OF SERVERS REQUESTED**=<value>
- **NUMBER OF SERVERS POSSIBLE WITH AVAILABLE RESOURCES**=<value>
- **NUMBER OF SERVERS NEEDED**=<value>
- **MAXIMUM SERVERS ALLOWED PER HOST**=<value>
- **MIDDLEWARE_HOME**=<value>
- **EXPECTED CPU UTILIZATION IN PERCENTAGE**=<value>
- **EXPECTED MEMORY CONSUMPTION IN GB**=<value>

28.4.4.2 Scaleup Operation

The content of the file for the **Scaleup** operation are:

- **ACTION**=SCALEUP
- **ZONE_NAME**=<value>
- **POOL_NAME**=<value>
NUMBER OF SERVERS BEFORE THIS REQUEST=<value>
NUMBER OF SERVERS REQUESTED=<value>
NUMBER OF SERVERS POSSIBLE WITH AVAILABLE RESOURCES=<value>
NUMBER OF SERVERS NEEDED=<value>
MAXIMUM SERVERS ALLOWED PER HOST=<value>
MIDDLEWARE_HOME=<value>
DOMAIN_NAME=<value>
EXPECTED CPU UTILIZATION IN PERCENTAGE=<value>
EXPECTED MEMORY CONSUMPTION IN GB=<value>

28.4.4.3 Delete Operation

The content of the file for the Delete operation are:

ACTION=DELETE
ZONE_NAME=<value>
POOL_NAME=<value>
NUMBER OF SERVERS BEFORE THIS REQUEST=<value>
NUMBER OF SERVERS BEING REMOVED=<value>
HOSTS FROM WHERE SERVERS BEING REMOVED=<value>
MIDDLEWARE_HOME=<value>
DOMAIN_NAME=<value>

28.5 Creating a SOA Instance

This section provides the prerequisites and steps for creating a SOA instance. This procedure should be performed by logging in as a SSA user.

28.5.1 Prerequisites for Creating a SOA Instance

Meet the following prerequisites before creating a SOA instance:

- A database instance should be ready. To create a database instance see Requesting a Database.
- The EM SSA Administrator should have created a SOA service template. For the steps to create a SOA service template, see Creating SOA and OSB Service Templates.

28.5.2 Procedure for Creating a SOA Instance

Follow the steps below to create a SOA instance:

1. Log in to Enterprise Manager Cloud Control as a SSA user.
2. From the Enterprise menu, select Cloud, and then select Self Service Portal.

3. On the All Cloud Services page, click SOA Infrastructure.

4. On the Middleware Cloud Services page, click Create Instance button.

5. In the Service Catalog - Create Instance window, click Select Service Type dropdown box, select SOA Infrastructure, and then click Select against the desired Service Offering.

6. On the Create Instance page, enter the Instance Details and click Next.
7. Optionally, on the Characteristics page, enter the Target Properties and click Next.

8. On the Configuration page, select the **Database Instance** and enter the **Schema Password**. In the Create WebLogic User Account section, enter the **WebLogic User Name**, **WebLogic Password**, and **Confirm WebLogic Password** in their respective boxes and click Next.

9. On the Confirmation page, click Submit.

The newly created SOA Infrastructure is displayed on the Middleware Cloud Services page.

**Note:**

OSBaaS allows projects to be deployed on a single node as well as the cluster. It is strongly recommended that you do not deploy projects on individual nodes. Deploy projects on the cluster.
Setting Up the JVMaaS Self Service Portal

This chapter describes the procedure to set up the Middleware Self Service Portal for JVM as a Service. It contains the following sections:

- Setting Up the Java Application Service Self Service Portal
- Creating a Customized Middleware Profile
- Uploading the Middleware Profile to Software Library
- Creating a Service Template Based on Java Applications Profile

29.1 Setting Up the Java Application Service Self Service Portal

The EM_SSA_ADMINISTRATOR can configure and set up the JVM Cloud Self Service Portal by creating middleware pools, setting up quotas, defining request settings, creating service templates, and configuring chargeback.

To set up the Java Application Service, follow these steps:

1. Set up one or more PaaS Infrastructure zones. See Creating a PaaS Infrastructure Zone for details.
4. Define quotas for each self service user role. See Setting Up Quotas.
5. Create service templates. See Creating a Service Template Based on Java Applications Profile.
6. Optionally, you can configure the Chargeback Service. See Configuring Chargeback.

29.2 Creating a Customized Middleware Profile

For creating your own custom profile, you must create an XML file with all the mandatory and the optional parameters. This is explained using the following example which describes how to create a profile for the tomcatService.

1. Enter all the mandatory details required to define the profile like Internal Name, Owner. You can additionally provide a display name and a short description about your profile. Next, you must provide the platform information, the product list, a display name for the product, and so on:
Note:

If you plan to export the middleware profile to another Enterprise Manager system using the Export functionality offered by Software Library, you must ensure that the Display Name and the Internal Name for the profile in the customized XML script are the same. If not, the export/import operation will fail.

```xml
<?xml version="1.0"?>
<mw:profile xmlns:mw="http://xmlns.oracle.com/mw/profile"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:schemaLocation="http://xmlns.oracle.com/mw/profile ../../../../../../FmwProvisioningPojo/src/oracle/sysman/fmw/provisioning/pojo/profile/genericProfile.xsd"
name="TomcatProfile4" vendor="Oracle" version="1.0"
content="softwareOnly">
  <mw:displayName>
    Tomcat As A Service with Free Ports
  </mw:displayName>
  <mw:description>
    Profile for Provisioning single Node Tomcat Server with Bundled Application.
  </mw:description>
  <mw:platformInfo os="Linux" platform="x86-64" platformId="226"/>
  <mw:products>
    <mw:product name="Tomcat" version="10.3.6.0">
      <mw:displayName>
        Tomcat Bundled With Application
      </mw:displayName>
    </mw:product>
  </mw:products>
  <mw:properties>
    <mw:stringProperty name="PORT_RANGE_START" value="2000"/>
    <mw:stringProperty name="PORT_RANGE_END" value="3000"/>
    <mw:stringProperty name="PORTS_COUNT" value="3"/>
  </mw:properties>
</mw:profile>
```

2. Each services instance that is provisioned using this profile will be provided with free ports. These can be used as desired by the profile. You must provide values for: PORT_RANGE_START, PORT_RANGE_END, and PORTS_COUNT.

- PORT_RANGE_START and PORT_RANGE_END defines the range of the port values to be specified. If you do not specify anything, by default, 2000 and 3000 is considered respectively.
- PORTS_COUNT defines the number of ports required by the service. If not defined, no ports will be allotted to the service.

3. Actions defined in the profile XML file like Provision, Start, Stop, and Delete will be performed at different phases of the service instance life cycle.

- The Provision action determines how the service instance is created the first time. The software setup and configuration is performed as a part of this step. Importantly, you must define the following parameters here:
  - **Payload**: The actual application that is part of the profile.
  - **Procedure**: The variables that are dynamically replaced at runtime.
• The Start action defines how the software that is provisioned is started.
• The Stop action defines how the software that is provisioned is stopped.
• The Delete action deletes the service instances. The cleanup actions are performed as part of this step.

**Provision:** This action provisions your application in Enterprise Manager.

```xml
<!-- Mandatory Action list -->
<mx:actions default="provision">
  <!-- [Optional] Display name and description -->
  <mx:displayName>
    Provision Tomcat Server
  </mx:displayName>
  <mx:description>
    This action provisions only the Oracle Home from the profile.
  </mx:description>
  <!-- Mandatory Define the complete command including the executable and parameters -->
  <!-- EL is supported, variables can be taken from 3 sources: env, procedure and profile -->
  <mx:command name="createDirectory" executable="mkdir" errorMode="continue">
    <mx:param value="-p"/>
    <mx:param value="#{procedure.STAGING_DIRECTORY}" required="true"/>
  </mx:command>
  <mx:command name="unpack" executable="#{procedure.JAVA_HOME}/bin/jar" directory="#{procedure.STAGING_DIRECTORY}">
    <mx:param value="-xvf"/>
    <mx:param value="#{payload:tomcat_app.jar}" required="true"/>
  </mx:command>
  <mx:command name="configure" executable="/bin/sh" directory="#{procedure.STAGING_DIRECTORY}"
    <mx:param value="#{payload:fixpath_tc.sh}" required="true"/>
    <mx:param value="#{procedure.FREE_PORTS}"/>
    <mx:env name="SERVICE_HOME" value="#{procedure.STAGING_DIRECTORY}"/>
  </mx:command>
</mx:action>
```

As a part of the Provision step, you must create the `service.out` file at the staging directory, and the file must define the variables `jvm_jmx_port` and `jvm_service_console_url`.

For example, in the above XML file, there is a shell script called `fixpath_tc.sh` which prints the `jvm_jmx_port` and the `jvm_service_url`. The contents of the script are as follows:

```bash
echo "jvm_jmx_port=${PORT_LIST[1]}" >> $SERVICE_HOME/service.out
echo "jvm_service_console_url=http://$HOSTNAME:${PORT_LIST[0]}/tc_hello/HelloWorld" >> $SERVICE_HOME/service.out
```

Note that the `service.out` file must located in the staging directory. This file contains the values of the variables defined. For example:

```
jvm_jmx_port=2610
jvm_service_url=http://blr2201958.idc.oracle.com:2482/tc_hello/HelloWorld
```

**Note:** This step is mandatory if you want to discover the Java Application Service target in Enterprise Manager Cloud Console.
**Start:** This action starts the provisioned application.

```xml
<mw:action name="start">
  <!-- [Optional] Display name and description -->
  <mw:displayName>
    Start Tomcat Server
  </mw:displayName>
  <mw:description>
    This action Starts the provisioned Tomcat Server
  </mw:description>

  <!-- [Mandatory] Define the complete command including the executable and parameters -->
  <!-- EL is supported, variables can be taken from 3 sources: env, procedure and profile -->
  <mw:command name="StartTomcat" executable="/bin/sh" errorMode="continue"
    background="true" directory="#{procedure.STAGING_DIRECTORY}">
    <mw:param value="#{procedure.STAGING_DIRECTORY}/apache-tomcat-7.0.54/bin/startup.sh" required="true"/>
  </mw:command>
</mw:action>
```

**Stop:** This action stops the provisioned application.

```xml
<mw:action name="stop">
  <!-- [Optional] Display name and description -->
  <mw:displayName>
    Start Tomcat Server
  </mw:displayName>
  <mw:description>
    This action stops the provisioned Tomcat Server
  </mw:description>

  <!-- [Mandatory] Define the complete command including the executable and parameters -->
  <!-- EL is supported, variables can be taken from 3 sources: env, procedure and profile -->
  <mw:command name="stopTomcat" executable="/bin/sh" errorMode="continue"
    directory="#{procedure.STAGING_DIRECTORY}">
    <mw:param value="apache-tomcat-7.0.54/bin/shutdown.sh" required="true"/>
  </mw:command>
</mw:action>
```

**Delete:** This action stops and removes the provisioned application.

```xml
<mw:action name="delete">
  <!-- [Optional] Display name and description -->
  <mw:displayName>
    Remove Tomcat Server
  </mw:displayName>
  <mw:description>
    Delete
  </mw:description>

  <!-- [Mandatory] Define the complete command including the executable and parameters -->
  <!-- EL is supported, variables can be taken from 3 sources: env, procedure and profile -->
  <mw:command name="stopTomcat" executable="/bin/sh" errorMode="continue"
    directory="#{procedure.STAGING_DIRECTORY}">
    <mw:param value="apache-tomcat-7.0.54/bin/shutdown.sh" required="true"/>
  </mw:command>
</mw:action>
```
procedure and profile -->

```xml
<mw:command name="stopTomcat" executable="/bin/sh" errorMode="continue"
directory="#{procedure.STAGING_DIRECTORY}" >
  <mw:param value="apache-tomcat-7.0.54/bin/shutdown.sh" required="true"/>
</mw:command>

<mw:command name="removeTomcat" executable="rm" errorMode="continue"
directory="#{procedure.STAGING_DIRECTORY}" >
  <mw:param value="-rf"/>
  <mw:param value="#{procedure.STAGING_DIRECTORY}" required="true"/>
</mw:command>
</mw:action>
</mw:actions>

4. Discovery of JVM targets in Enterprise Manager is supported by default. To do so, run the
    oracle.sysman.emas.mwc.jvmaas.discovery.JVMTargetDiscovery script
    as follows:

```xml
<mw:discovery
    className="oracle.sysman.emas.mwc.jvmaas.discovery.JVMTargetDiscovery"
    dpName="JVMDiscovery"/>
</mw:profile>
```

29.3 Uploading the Middleware Profile to Software Library

To create a profile using the custom XML script that you have created, run the following command:

```
emcli create_mw_profile -input_file=propertiesXml="/scratch/profile/genericProfiles/
profile/tomcatService.xml" -host=blr2201958.idc.oracle.com -files="/scratch/profile/
genericProfiles/profile/tomcat_app.jar,/scratch/profile/genericProfiles/profile/fixpath_tc.sh"
```

Where,
- tomcatService.xml is the input file that describes the characteristics of the profile.
- blr2201958.idc.oracle.com is the host target where the stored during provisioning.
- tomcat_app.jar and fixpath_tc.sh are the files that have to be uploaded to Software Library.

Once the profile is created, to access the profile, you must log in to Enterprise Manager Cloud Console, and navigate to the Software Library home page. To do so, from Enterprise menu, select Patching and Provisioning, then click Software Library. On the Software Library home page, you will see your new profile under the Middleware Provisioning Generic profile folder. Alternatively, you can run the emcli list_mw_profile command to view the details of your profile.

**Note:** To list all the parameters used in a particular action of a profile, use the emcli command list_prov_parameters. For example, all the parameters used in the action provision in the tomcatService profile, run the following command:
Prerequisites

- Create a customized middleware provisioning profile using XML file. See Creating a Customized Middleware Profile for details.
  
  For creating a generic provisioning profile, see Creating Middleware Provisioning Profiles.

- Upload the profile to Software Library. See Uploading the Middleware Profile to Software Library for details.

A Middleware Service Template is a service definition that can be used to provision a service instance on a middleware pool.

Note:

You can edit a service template that has active instances and modify the configuration parameters. When a service template is modified:

- New instances created after the changes have been made will use the new parameters.
- Old instances or instances created before the template was modified will use the earlier values.
- Changes made to zones and roles will be applicable to both old and new instances.

To create a Java Applications Profile, follow these steps:

1. Log into Enterprise Manager as an user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Setup, then select Getting Started. The common tasks that need to be performed before setting a specific service family are displayed. Click the Setup link next to Middleware service family in the left panel.
4. Select Java Application Service from the drop down menu, and then click Service Template.
5. On the Java Application Service: Service Templates page, click Create.
6. Enter a name and description for the service template. The description must be unique and provide information on the type of service template being created.
7. Select the Java Application Profile that you want to use to create the template. Click the search icon, from the Select Software Library Component dialog box, select the template and click **Select**.

8. Click **Next**. On the Characteristics page, specify the characteristics that will be used to tag and identify the target properties. Service instances created from the template will have the characteristics.

9. Click **Next**. In the Create Middleware Service Template: Resource Providers page, click **Add** to select the Middleware Pool into which that the service instances can be provisioned. The PaaS Infrastructure Zone with which the middleware pool is associated is displayed.

10. Click **Next**. On the Configuration page, you can see all the parameters (the name-value pair) defined in the custom XML file with the procedure variable, or as a part of the `input.properties` file. You can enter a new value or update an existing value for a property using this page. Additionally, features like lock and hide are supported that allow you to lock or hide the value of a parameter, by selecting the corresponding check box on the page for the parameter.

    For example, if you have locked the value of `Oracle_INVENTORY` in your service template, then at the time of requesting for a service using this template, you will notice that the parameter is read-only and cannot be edited.

11. Click **Next**. On the Roles page, click **Add** to select the self service user roles to which this service template will be available. All users belonging to the selected role can use this service template.

12. Click **Next**. Review all the information entered, and click **Submit**. The newly created service template will appear in the Middleware Cloud Self Service Portal Setup: Service Templates page. You can click on the Service Template Name link to view additional details.
This chapter provides Self Service Application users with instructions on using the MWaaS Self Service Portal to request and monitor middleware services. It contains the following sections:

- Using the MWaaS Self Service Portal
- Requesting a Middleware Service
- Middleware Service Home Page
- SOA/OSB Service Home Page
- Java Application Service Instance Home Page
- Uploading a Java EE Component to the Software Library
- Application Home Page

### 30.1 Using the MWaaS Self Service Portal

The Middleware Self Service Portal allows self service users to view, monitor, and request middleware services. Users can request middleware services using any of the predefined service templates. They can deploy, undeploy applications, create data sources, scale up, and scale down services with minimal or zero intervention by the self service administrator.

**Prerequisites**

To view the Middleware Cloud Self Service Portal, log in to Enterprise Manager as a user with the `EM_SSA_USER` role or an user with the `EM_SSA_USER_BASE` role. Users with these roles must be part of the Middleware Cloud Service Family and must have privileges for the Service Bus, SOA Infrastructure, and WebLogic service types.

To view the MWaaS Self Service Portal, follow these steps:

1. Log into Enterprise Manager as a user with the `EM_SSA_USER` role. The All Cloud Services page appears. This page shows the list of all the available service offerings.
2. Click on the Middleware Cloud Services column to navigate to the Middleware Cloud Self Service Portal Home page.

**Figure 30-1** Middleware Cloud Services
3. The top region of this page shows the following icons:
   - **Instances**: This icon shows the number of service instances that have been created and their status.
   - **Expiry**: The number of instances due to expire today, next day, and in the future.
   - **Usage**: Shows the total quota (servers and memory) used so far by self-service user, including all the services that the user has created. This table shows the amount of quota being used by each of your service instances. Your quota includes both the total maximum heap memory and the total number of WebLogic servers you are allowed to use across all of your middleware service instances.
   - **Memory**: Shows the total memory used so far by the self-service user.

4. The Instances table shows the list of middleware services owned by the self-service user and any other services for which the user has view privileges. For each service, the name, status, resource provider with which the service is associated, the date on which the service was created, expiry date, and name of the user who created the service instance. You can perform the following actions:
   - **Create**: To create a new service instance, click Create Instance.
   - **View**: Click on the Name link to drill down to the Middleware Service Home page.
   - **Delete**: Select a service from the table and click Delete to delete the service instance.
   - **Extend**: Select a service and click Extend to extend the life of the service instance. You are prompted for the End Date. Enter a date later than the current one and click OK to extend the service instance.
   - **Start**: Select a service from the table and from the Actions menu, select Start. A request to start the service is submitted.
   - **Stop**: Select a service from the table and from the Actions menu, select Stop. A request to stop the service is submitted.
   - **Grant**: You can grant view, manage, or full privileges over the service instance to other users and roles.
   - **Revoke**: You can revoke privileges that you have granted to other users and roles.

5. Apart from these, the The Middleware Cloud Services page contains the following tabs:
   - **Requests**: Click on this tab to view a list of all requests. For each request, the status, type, start date, and submission date of the request is displayed. Click on the status icon to view the execution details of the request. These details are helpful in troubleshooting a failed request.
     
     Select columns from the View menu to view more details about the request. You can select a scheduled request and click Reschedule to reschedule the request. To delete a scheduled request, select the request and click Delete. If a request that is scheduled such as Create gets deleted, all other associated requests are also deleted.
   - **Chargeback**: This tab displays all the chargeback break-up data for the service. The charge incurred will be calculated from the service requested date to current date. This page contains the following regions:
– **Charge Trend**: This graph shows the usage and charge trends over time.

– **Details**: You can aggregate the chargeback data for the service by resources of metrics. You can export this data to an external application such as a spreadsheet.

– **Charge Plans**: The charge plans that have been assigned to each PaaS Infrastructure Zone are displayed. Select a zone to view the pricing. The rate for each metric in the zone for a specific time period is displayed.

For details on setting up the Chargeback Service, see Chargeback Administration.

- **Library**: This tab displays a list of Java EE application components that are available to the SSA user. You can do the following:
  
  – **Upload**: You can upload a new Java EE application component to the Software Library. See Uploading a Java EE Component to the Software Library for details.

  – **Delete**: Select a Java EE component from the list and click Delete to remove it from the library.

  – **Share / Stop Sharing**: You can share a component with one or more users and roles. Select the component and click Share. The Select and Share: Users and Roles window appears. From the Type drop list, select User or Role and click Search. The users or roles with which the component can be shared. Select one or more users or roles and click Share. The selected component is shared with the specified users and roles. To stop sharing the component, select the component and click Stop Sharing.

- **Policies**: Click the Policies tab to view the list of policies that you have defined. You can create a new Performance or Schedule Based Policy or a Policy Group for one or more middleware services and define Scale Up or Scale Down on these policies. See Defining Dynamic Elasticity Policies for Middleware Services.

### 30.1.1 Setting the Preferences

From the User menu in the top right hand corner of the page, select Preferences and then select SSA Portal Settings to set up your preferences such as the Default Service Type, Default Email Address for Notifications, Default Locale, Default PaaS Infrastructure Zone, and so on. To set the Middleware Cloud Self Service Portal as the default page that appears when you log in to the Self Service Portal, select Middleware in the Default Service Type drop down list and click Apply. For more details on setting the preferences, see Viewing Preferences.

### 30.1.2 Defining Dynamic Elasticity Policies for Middleware Services

> **Note:**

These policies are applicable only for the WebLogic Service type.

To define a policy, follow these steps:
1. Log into Enterprise Manager as a user the EM_SSA_USER role.

2. Click the Policies tab.

3. To create a policy, from the Create menu, you can select either of the following:
   - Schedule Based Policy
   - Performance Based Policy

30.1.2.1 Creating a MWaaS Schedule Policy

For instance, if you want to create a schedule based policy that states that a middleware service must be scaled up every Monday, follow these steps:

1. From the Create menu, select Schedule Policy. The following page appears:

   ![Create Schedule Policy](image)

2. Enter a name and description for the policy.

3. In the Policy Action field, select Scale Up and enter 2 as the Value in the Action Parameters field.

4. In the Start field, specify the date from which this policy must be effective.

5. In the Repeat field, select Specify Days of the Week and in the Days of the Week field, select Monday. Thus the service will be scaled up by 2 every Monday.

6. Click OK to create the policy. You will return to the Policies page where the policy you have defined will appear in the Policies table. To apply these policy for a target, click Add in the Associations region and select a target with which this policy must be associated.

30.1.2.2 Defining a MWaaS Performance Policy

Performance policies are formed based on the performance metrics of a specific target type and its associated targets. You can create conditions and rules for the policy based on the metrics. To define a performance policy, follow these steps:

2. Click Create and select the Performance Policy type.

3. In the General Information page, enter the name and description of the policy.

4. In the Rules and Relationships page, select a metric from the right panel and click Add to Definition. Specify the condition, value, and number of occurrences. When these conditions are met, the policy is executed.
5. Click Next. The Create Performance Policy: Rules page appears. The policy rule is displayed.

6. Select Scale Up or Scale Down from the Action drop down list.

7. In the Action Parameters field, enter a value next to the Number of WebLogic Servers. The value specified here is used to either increment or decrement the Number of WebLogic Servers depending on the Action selected.

9. In the Associations region, click Add and select one or more targets to be associated with this policy. The associated targets are listed in the Associations region.

   Click on the target link to view a list of policies associated with the target. Once the targets have been associated, the policy is activated. Click View History to view the policy action history.

30.2 Requesting a Middleware Service

You can use the Request New Service option to request a new middleware service. You can request the following types of middleware services:

- WebLogic Service, see Requesting a WebLogic Service
- SOA/OSB Service, see Requesting an Oracle Service Bus or SOA Infrastructure Service

30.2.1 Requesting a WebLogic Service

You can request a new WebLogic service on this page.

To request a service, follow these steps:

1. Click Create Instance in the Home page of the Middleware Cloud Self Service Portal.

2. The Service Catalog - Create Instance window appears. A list of service templates available to the self service user is displayed. Choose a WebLogic service template and click Select to launch the Create Instance wizard.

Figure 30-3  Create Instance: Instance
3. Enter a name for the instance and select the PaaS Infrastructure Zone in which the new service is to be deployed.

4. In the Instance Duration region, specify the schedule for the instance.
   - **Start Date**: You can choose **Immediately** (request is executed immediately) or **Later**. If you select the **Later** option, specify the date from which the service is to be available.
   - **End Date**: Select **Indefinitely** to make the service available for an indefinite period of time. If you select **Until**, specify the date on which it will be deleted and no longer available.

Click **Next**. The Characteristics page appears.

**Figure 30-4  Create Instance: Characteristics**

5. In the Service Characteristics region, specify the following:
   - **Distribute WebLogic Servers of a service instance on hosts from different Exalogic Racks**: Select **Yes** if the WebLogic Servers in a service instance are to be uniformly distributed on available Exalogic racks. Select **No** if the hosts are to be placed on the first available rack.
   - **Distribute Load on Available Hosts**: Select **Yes** if the WebLogic Servers are to be uniformly distributed on available hosts. If you select **No**, the maximum number of servers possible will be provisioned on the first available host before provisioning on other hosts.
   - **Enable Load Balancer**: Select **Yes** to enable the load balancer configuration for all the service instances that are created with this service template.

**Note:**

If the **Enable Load Balancer** field is set to 1 in the Create New Service Template: Configuration page, when you click **Search**, only middleware pools associated with a load balancer configuration are displayed. If there are no middleware pools associated with load balancer configurations, the list will be blank.
• **Expose Advanced Settings for the SSA User**: When set to Yes, the self service user will have access to advanced options such as Operating System, Enable sharing Service Instances with other SSA Users, Setting Target Properties for Monitoring Templates, and so on.

• **Expose WebLogic Admin Console and Fusion Middleware Control to SSA User**: If you select Yes, the users with the EM_SSA_USER role will have access to the WebLogic Admin Console and Fusion Middleware Control for each service instance created using this service template.

  **Note:**
  
  This field must be set to Yes only if the EM_SSA_USER needs to have complete control over the WebLogic Server and Fusion Middleware Control consoles. The EM_SSA_USER will then be able to perform all configuration changes and life cycle management operations from each console.

6. In the Target Properties region, specify the characteristics that will be used to tag and identify the target properties. Service instances created from the template will have the characteristics.

7. Click Next. The Configuration page appears.

**Figure 30-5  Create Instance: Configuration**

Enter the following:

• **Number of WebLogic Servers**: If the service template you have selected is based on a profile that contains a cluster with one or more WebLogic servers, specify the initial number of servers that can be present in the new service instance.
The Number of WebLogic servers you specify here cannot be less than the number of servers specified in the profile.

• **Minimum Number of WebLogic Servers:** Specify the minimum number of WebLogic servers that must be present in the middleware service instance. The value specified here must be less than or equal to the value specified in the Number of WebLogic Servers field.

If you have a profile with data sources, the Data Sources region appears. A list of all the data sources (either JRF or other application specific data sources) present in the profile are displayed. Before you create the service instance, you must configure the data sources present in the profile.

  – **A single data source:** Select the data source to be configured and click **Edit.** The Edit Data Source window appears. Specify the following details:

    * **Select Database Service Instance:** In the Edit Data Source Window, you can either select the database service instance or specify the database URL. If you have selected a JRF enabled profile, the listed Data Sources need to be configured with a database (Database Service Instance or the Database URL) that contains the relevant JRF schema.

    * **Database User Name and Password:** Specify the user name and password for the selected database and click **Test Connection** to test the connection. Click **Submit** to return to the Configuration page.

  – **Multiple data sources:** You can select two or more data sources and click **Edit.** In the Edit Data Source window, you can either select the database service instance or specify the database URL. While editing multiple data sources, you can enter one or more values for all the selected data sources. For example, you can set the password for all selected data sources to welcome1. While updating multiple data sources, you can choose to leave one or more fields blank. Only non empty fields are applied to the selected data sources. Click **Submit** to return to the Configuration page.

• **Create WebLogic User Account:** You can optionally choose to create a WebLogic user account on your service instance after it is provisioned. You will be able to access the WebLogic Server Administration Console using the user name and password specified here. Select the Create WebLogic User Account checkbox and specify the user name and password.

  **Note:** The Create WebLogic User Account will appear only if the **Expose WebLogic Admin Console and Fusion Middleware Control to SSA User** field was set to **Yes** when the template was created.

8. If the self service administrator has granted access to the Advanced Settings in the service template, you will see the **Advanced** region here. You can specify the following:

  • **Share Middleware Service Instance:** Select this checkbox to share the service instance with other users and roles. The Add region appears. Click **Add** and in the Grant Privilege window, select the user or role to which the privilege is to be granted. From the **Privilege to Grant** drop down list, select
the privilege you want to grant which can be **View**, **Manage**, or **Full** and click **Grant**.

### Note:

Privileges must be explicitly granted by the self service administrator through the Request Settings option. See **Granting, Revoking, and Reassigning Privileges to Service Instances** for details.

- **Managed Server Startup Arguments**: Specify the memory and Java system property arguments that are to be used when starting all the managed servers in the middleware service instance. For example, you can specify:

```bash
-Xms1280m -Xmx1280m -XX:PermSize=128m -XX:MaxPermSize=256m -Dweblogic.security.SSL.ignoreHostnameVerification=true
```

These parameters will override the value specified in the service template.

- **Operating System Details**: Select this checkbox to specify custom operating system credentials. You need to specify the following:
  - **Domain Home Base Directory**: Specify the base directory in which the instance is to be created. The path specified here will override the path specified in the middleware pool.
  - **User Name**: The operating system user name with privileges to write to the specified base directory.
  - **Password**: The password for the operating system user.

### Note:

Default values for the user name and password can be set using the Preferences option on the Middleware Self Service Portal page. If these values are set, they will be displayed here.

- In the Database region, select the database that was cloned from the same WebLogic domain as the one in the Middleware profile of the selected template.

### Note:

The Database region is displayed only if the selected template is based on a JRF enabled profile (12.x or later versions).

Specify the following:

- **Select Database Service Instance**: Select this option and choose a Database Service Instance from the drop down list.
- **Specify Database URL**: Enter the URL for the database.
- **Schema Password**: Enter the schema password.
9. Click **Next**, review the information entered so far and click **Submit** to create the service request. This request will now appear in the Request page in the Middleware Self Service Portal. You can monitor the status of this request in this table. When the request has been completed, you can refresh the page to view the new service in the Instances table.

### 30.2.2 Requesting an Oracle Service Bus or SOA Infrastructure Service

Log in with **SSA_USER** role to view, monitor, and request for SOA/OSB services using the Middleware Self Service portal.

**Prerequisite**

Oracle recommends that the database is cloned using DBaaS. If database is cloned using another SSA User account (for example, user1), then user1 needs to grant access on the database service instance to user2, assuming user2 is requesting for SOA / OSB instance. To request for a service, follow these steps:

1. On the Middleware Cloud Self Service Portal, click **Request New Service**.

2. The Request New Service dialog box appears. A list of service templates available in the zones that the SSA user can access, is displayed. Choose a service template and click Select to launch the Service Request page.

3. On the General page, enter a name for the service, and select the PaaS Infrastructure Zone in which the new service is to be deployed.

4. Specify the schedule for the service request.
   - **Start Date**: Choose Immediately (request is executed immediately) or Later. If you select Later, specify the date from which the service is to be available.
   - **End Date**: Select Indefinitely to make the service available for a indefinite period of time. If you select Until, specify the date on which the service will be deleted, and no longer available.

5. On the Configuration page, provide the following details:
   - For a SOA Service Template
     - In the SOA Dehydration Store section, select a database that you want to use as SOA Dehydration Store, and provide the schema password.
     - The following options are possible: You can select a database which is cloned using DBaaS RMAN Backup option, or a database which is cloned outside DBaaS but discovered in Cloud Control. If you use the latter option, then after discovering the database, you must grant view privileges on the Database target to the SSA User.

     - In the SOA Token Configuration section, click the Value field to customize the SOA token values.

     - In the Managed Server Startup Arguments, enter the memory and java arguments to start the managed server.
For an Oracle Service Bus Template:

- Select the database instance and provide the OSB schema password.

In the Create WebLogic User Account region, specify a WebLogic user account to be created for your service after it is provisioned. Enter a WebLogic User Name and WebLogic Password. These credentials will be used to access the WebLogic Administration Server console and the Fusion Middleware Console.

In addition to this, for an OSB service instance, the credentials you have provided in this section, can you used to access the OSB Console.

Click Next.

On the Review page, review all the configuration details.

Click Submit to create the service request. This request will now appear in the Requests table in the Home page of the Middleware Self Service Portal. You can monitor the status of this request in this table. When the request has been completed, you can refresh the page to view the new service in the Services table.
30.3 Middleware Service Home Page

The Middleware Service Home page provides detailed information about the services you have requested using the Request Service option. To view the Middleware Service Home page, click the Name link in the Middleware Services region in the Middleware Cloud Self Service Portal: Home tab. This page contains the following regions:

- **Summary**: Shows the availability status of the service, status summary of the WebLogic Servers, and the performance metrics for the underlying WebLogic cluster associated with this service. The following charts are displayed.
  - **Availability**: The availability status of the service.
  - **Resource Usage**: Shows the CPU and Heap Usage charts for all the servers in the cluster.
  - **Response and Load**: Shows the request processing time and number of requests per minute for the current service.
  - **General**: Shows charts for various performance metrics for the service.

- **Applications**: Lists all the applications deployed to this service. For each application, the name, status, and the key metrics such as Active Sessions, Request Processing Time, and Request per Minute are displayed. Click the Name link to drill down to the Application Home page. You can do the following:
  - **Deploy**: Click Deploy to deploy the application to the service. See Deploying and Redeploying an Application for details.
  - **Delete**: Select an application and click Delete to undeploy an application.
  - **Redeploy**: If you have an updated Java EE application component, you can select the application and click Redeploy to redeploy the application. See Deploying and Redeploying an Application for details.
  - **Start / Stop**: Select an application and click Start or Stop to start or stop the application.
  - **Test**: Select an application and click the Test icon. A list of URLs is displayed in the Application URLs dialog box. Click the URL to navigate to the associated page.

- **Libraries**: If any applications have been deployed as libraries, they are listed here. You can do the following:
  - **Deploy**: Click Deploy to deploy the application to the service. See Deploying an Application for details.
  - **Delete**: Select an application and click Delete to undeploy an application.
  - **Redeploy**: If you have an updated Java EE application component, you can select the application and click Redeploy to redeploy the application.
When deploying using the Self Service Portal you can create the deployment as a normal application or a library. Libraries are deployments that can be shared with other deployments. The Middleware Service home page shows normal applications in the Applications table and libraries in the Libraries table. Libraries may be deleted and redeployed, but only if they are not being referenced by any applications.

- **Data Sources**: This region is displayed only for WebLogic services. It shows all the data sources that are available for this service. For each data source, the Name, Database Service Name, JNDI name and the URL for the database is displayed. If the data source has been created using a database service, the name is displayed in the Database Service column. Click on the name to drill down to the Database Service Home page. You can create new data sources, edit or delete existing data sources, and test the connection of any specified data source.

- **Requests**: This table shows all the requests that have submitted for this service. These include requests such as Deploy, Undeploy, Redeploy, Scale Up, Scale Down, Start, Stop, Create, Edit, and Delete Data Source.

The following options are available from the Middleware Service Instance menu:

- **Set End Date**: Select this option to specify an end date for the middleware service. You can set the end date for a service. Select a service from the table and click Set End Date. In the popup window that appears, you can specify a new End Date for the middleware service instance. If you do not want the service to expire, select Indefinitely and click OK.

- **Start and Stop**: You can start or stop the service by selecting the appropriate option from the Middleware Service menu.

- **Scale Up and Scale Down**: See Scaling Up and Scaling Down a Service.

- **Service Instance Settings**: This shows the current value of the Minimum Number of WebLogic Servers and allows you to modify this value.

- **Select Metrics**: Click Select Metrics to add new charts, remove existing ones, and drag and drop metrics to charts. In the Metric Palette window that appears, select a metric or drag and drop a metric into an existing chart or create a new chart. By default, all new charts are displayed in the General section but you can drag and drop them to a different section. You can remove a metric/chart by unchecking a box in the Metric Palette or by clicking the x on the drag bar on the right side of the chart. You can move charts within their section by dragging them by that bar.

- **Restore Default Charts**: Click Restore Default Charts to restore the charts to the default settings. All chart additions, modifications and deletions are applicable to a specific service. An SSA user can have different charts for each service.

- **Log Messages**: Click Log Messages to view a list of messages sorted by message type, date, and so on. Select the date range, message type, and specify other filters in the Message field. Click Add Fields, select other fields.
to be included in the message, and click **Search**. The first 1000 messages that meet the search criteria are displayed. Click **Export Messages to File** to export the messages to a log file in `.txt`, `.xml`, or `.csv` format.

- **WebLogic Server Administration Console**: Click this option to launch the WebLogic Administration Console.
- **Fusion Middleware Control**: Click this option to launch the Fusion Middleware Control console.

---

**Note:**

The WebLogic Server Administration Console and the Fusion Middleware Control interfaces allow you to manage and monitor the Oracle Fusion Middleware components. The **WebLogic Server Administration Console** and **Fusion Middleware Control** options are available in the **Middleware Service** menu only if the *Expose WebLogic and FMW Console URLs to SSA User* field has been set to **Yes** in the Middleware Service Template. See [Creating a WebLogic Service Template](#) for details.

---

### 30.3.1 Deploying and Redeploying an Application

You can deploy a preconfigured Java EE application to a Service Instance. To deploy an application, follow these steps:

1. Log into Enterprise Manager as a user with the `EM_SSA_USER` role and navigate to the Middleware Cloud Self Service Portal page.
2. Click on a **Name** link in the Middleware Services region. The Middleware Service Home page appears.
3. Click **Deploy** in the Applications table. The Deploy Application page appears.

![Figure 30-6  Deploy Application](#)

4. Enter the following details:
   - **Application Name**: Enter a name for the application that is to be deployed.
   - **Application Component**: You can choose to:
     - **Select an application component from the Software Library**: Click the **Search** icon and select a Java EE application component from the Software Library.
Select an application archive from your desktop. Click Browse and select an application archive from your desktop.

- **Deploy as an application**: The deployment can be created as a normal application or as a library. If you select this option, click Browse in the Deployment Plan field and select a .xml file that contains the deployment options. This file overrides the deployment plan (if any) specified with the application component.

- **Deploy as a library**: You can deploy the application as a library. Libraries are deployments that can be shared by other deployments. Libraries should be available on all of the targets running their referencing applications.

5. Specify when the deploy operation should occur and click Deploy. After the request to deploy the application has been created, you will return to the Middleware Service Home page where a confirmation message is displayed.

### 30.3.1.1 Redeploying an Application

You can redeploy an application that has been deployed to a Service Instance. To redeploy an application, select a deployed application from the Applications table and click Redeploy. In the Redeploy Application page, select the Application Component that is to be redeployed, the deployment plan if any, and click Redeploy. You will see a confirmation message indicating that the application has been redeployed.

### 30.3.1.2 Deleting an Application

You can delete (undeploy) an application that has been deployed. Select the application to be deleted from the Applications table and click Delete. A confirmation message is displayed. Click Yes to undeploy the application.

### 30.3.2 Scaling Up and Scaling Down a Service

You can scale up or scale down a service.

**Note:**

The Scale Up and Scale Down options are available only if the service is based on a middleware service template that contains a middleware provisioning profile with one cluster. If the profile does not contain a cluster, these menu options will not be available.

On the Middleware Service Home page, select the following options from the Middleware Service menu:

- **Scale Up**: You can scale up a service by adding one more servers. The number of servers you can add is limited by your quota. Click Scale Up and enter the number of servers by which the service is to be scaled up. Click Submit to submit the scale up request and add more servers.

- **Scale Down**: Click Scale Down and enter the number of servers by which the service is to be scaled down. Click Submit to submit the scale down request and reduce the number of servers.
30.3.3 Creating a Data Source

In a WebLogic Server, you configure database connectivity by adding data sources to your WebLogic domain. WebLogic JDBC data sources provide database access and database connection management. Before an application can access a database, it must be configured to use the JDBC data source.

To create a data source for a service, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_USER role and navigate to the Middleware Cloud Self Service Portal page.
2. Click Create in the Data Sources table in the Middleware Service Home page. The Create Data Source page appears.

![Create Data Source](image)

**Create Data Source**

Use this page to create a data source on this middleware service.

- **Data Source Name**
- **JNDI Name**
- **Database Driver Class**: com.ddleek.jdbc.oracle.OracleDriver

Select the database by choosing a database service or by entering the database URL.

- **Select Database Service**
  - **Database Service**
  - **URL**

- **Specify Database URL**
  - **URL**

Specify the database credentials, then test the connection if desired.

- **Database User Name**
- **Password**
- **Confirm Password**

3. Enter the Data Source Name and the JNDI Name.
4. Select the Database Driver Class.
5. If you have a database service instance configured, you can select the Database Service and the corresponding URL is displayed. If not configured, you must manually enter the Database URL.
6. Specify the Database User Name and Password.
7. Click Create to create the data source.
30.3.3.1 Editing a Data Source

You can edit the properties of a data source. Click the Name link in the Data Sources table in the Middleware Service Home page. The Edit Data Source page appears. You can edit the properties of the data source. If some of the properties are changed, the data source needs to be redeployed and applications using this data source need to be restarted.

30.4 SOA/OSB Service Home Page

The SOA Home page provides detailed information about the services you have requested using the Requests option. To view the Middleware Service Home page, click the Name link in the Middleware Services region in the Middleware Cloud Self Service Portal: Home tab.

This page contains the following regions:

- **Performance Summary**: Shows the availability status of the service, status summary of the WebLogic Servers, and the performance metrics for the underlying WebLogic cluster associated with this service. The following charts are displayed.
  - **Availability**: The availability status of the service.
  - **Resource Usage**: Shows the CPU and Heap Usage charts for all the servers in the cluster.
  - **Response and Load**: Shows the request processing time and number of requests per minute for the current service.
• **General**: Shows charts for various performance metrics for the service.

• **Requests**: This table shows all the requests that have submitted for this service.

The following options are available from the Middleware Service Instance menu:

– **Set End Date**: Select this option to specify an end date for the middleware service.

– **Start and Stop**: You can start or stop the service by selecting the appropriate option from the Middleware Service menu.

– **Scale Up and Scale Down**: See Scaling Up and Scaling Down a Service.

– **Select Metrics**: Click **Select Metrics** to add new charts, remove existing ones, and drag and drop metrics to charts. In the Metric Palette window that appears, select a metric or drag and drop a metric into an existing chart or create a new chart. By default, all new charts are displayed in the General section but you can drag and drop them to a different section. You can remove a metric/chart by unchecking a box in the Metric Palette or by clicking the X on the drag bar on the right side of the chart. You can move charts within their section by dragging them by that bar.

– **Restore Default Charts**: Click **Restore Default Charts** to restore the charts to the default settings. All chart additions, modifications and deletions are applicable to a specific service. An SSA user can have different charts for each service.

– **Log Messages**: Click **Log Messages** to view a list of messages sorted by message type, date, and so on. Select the date range, message type, and specify other filters in the Message field. Click **Add Fields**, select other fields to be included in the message, and click **Search**. The first 1000 messages that meet the search criteria are displayed. Click **Export Messages to File** to export the messages to a log file in .txt, .xml, or .csv format.

– **WebLogic Server Administration Console**: Click this option to launch the WebLogic Administration Console.

– **Fusion Middleware Control**: Click this option to launch the Fusion Middleware Control console.

**Note:**

The WebLogic Server Administration Console and the Fusion Middleware Control interfaces allow you to manage and monitor the Oracle Fusion Middleware components. The **WebLogic Server Administration Console** and **Fusion Middleware Control** options are available in the Middleware Service menu only if the Expose WebLogic and FMW Console URLs to SSA User field has been set to 1 in the Middleware Service Template.

### 30.5 Java Application Service Instance Home Page

The General section displays a URL that can be used to access your service. Click **Download JVMD Agent** to download the JVM Diagnostics Agent war file. Ensure that you deploy the war file on the WebApps folder of the Application Server that is to be monitored. This enables the JVM Diagnostics Agent to start monitoring the Java Application target in Cloud Control.
The Java Application Service History section provides a quick view of the event log for your application, along with the time stamp. Basically details like when a particular application starts or when it was created, is captured and logged in this section.

Parameters that are printed to the `service.out` file is displayed in the Service Details section. This is particularly useful, when you want to view the port numbers assigned to the JVM JMX port.

In addition to this, memory usage and performance summary details are also available on this page.

### 30.6 Uploading a Java EE Component to the Software Library

You can upload pre-configured `ear`, `war`, `jar`, or `rar` files to the Software Library. These files are uploaded to the Software Library as Java EE Application components, which are then deployed to your service. To upload a file to the Software Library, click the **Library** tab. The Upload to Software Library field appears.

**Figure 30-8  Upload to Software Library**

Enter the name and description of the file being uploaded. You can then choose to upload files as follows:

- **Individual Files**: If you choose the **Upload Files Individually** option, you need to specify the following:
  - **Archive**: Select the archive file to be uploaded to the Software Library. This can be an `ear`, `war`, `jar`, or `rar` file. You can also optionally specify the following:
    - **Deployment Plan**: This is an `xml` file containing the deployment options for the Java EE Application component.
    - **Pre Deploy Script**: This is a script containing WLST commands. The Management Agent runs this script on the Administration Server associated with each instance before the application is deployed. You can use this script to create data sources, JMS end points, and any other resources that might be needed by the application that is being deployed.
    - **Post Deploy Script**: This is a WLST script that is executed by Management Agent on the Administration Server after the application is deployed.
deployed. You can use this script to perform any post deployment configuration. For example, if you need to roll back and undo the changes made by the pre deploy script, you can select this option.

- **Zip File**: If you select the **Upload Zip File** option, you must upload a zip file that contains the `JavaEEAppComp.manifest` file that describes the contents of the zip file.

Click **Upload** to upload the file to the Software Library.

### 30.7 Application Home Page

To view the Application Home page, select an application, and click the **Name** link in the Applications table on the Middleware Service Home page.

![MWaaS Application Home](image)

This page displays performance and availability for the application, along with a chart that shows response and load. You can redeploy, delete (undeploy), start, or stop the application using options from the **Application** menu.
Part XI
Monitoring the PaaS Cloud

This section describes how to administer and monitor Database as a Service (DBaaS) and Middleware as a Service (MWaaS). It contains the following chapter:

• Administering and Monitoring a PaaS Cloud
31 Administering and Monitoring a PaaS Cloud

This chapter describes the different options that are available to monitor the DBaaS and MWaaS services. It contains the following sections:

- Viewing the Cloud Home Page
- Viewing the List of Resource Providers
- Viewing the List of Service Templates
- Viewing the List of Service Instances
- Viewing the Cloud Request Dashboard
- Viewing All Cloud Requests
- Viewing the PaaS Infrastructure Zone Home Page
- Viewing the Database Pool Home Page
- Viewing the Schema Pool Home Page
- Viewing the Pluggable Database Pool Home Page
- Viewing the Middleware Pool Home Page
- Viewing the Cloud Services Reports

31.1 Viewing the Cloud Home Page

After the cloud services have been set up, and one or more self service users have submitted requests, you can view a unified view of the different service types on the Cloud Home page. You can use the rolled up data to identify problem areas and drill down for more details. From the Enterprise menu, select Cloud, then select Cloud Home to navigate to this page.
Note:

- To view this page, you must have View privilege on the Cloud target. Out-of-the-box user roles have this privilege by default.
- You can use the Personalize option to customize the Cloud Home page. This option allows you to add or delete regions, change the page layout, and so on.

- General: This region shows the following:
  - Resource Providers: The total number of PaaS Infrastructure zones and software pools that have been created is displayed. Click on the link to drill down to the Resource Providers page.
  - Service Templates: The total number of service templates that have been defined.
  - Total Requests: The total number of requests for configured cloud services. Click on the link to drill down to the All Requests page.
  - Service Instances: The total number of members that are up or down. Click on the link to drill down to the Service Instances page.
- Request Status: The status of service requests during a specific period. By default, the request status over the last 24 hours is displayed but you can select another duration such as 7 days, 30 days, and so on. You can view the request status for all requests or for a specific service type. To view the status for a specific service type, select type from the View drop down list.
- Issues: The availability, performance, security, and other incidents across all the configured service providers.
• Top Resource Provider Utilization: This region shows the Top level resource utilization for the configured resource providers. For example, the CPU and Memory Utilization for a PaaS Infrastructure Zone. To view more details, click the View Map link at the top of the region. This displays the Heat Map page with detailed information on the resource provider utilization. The number of resource providers and the threshold value to calculate color can be configured by using the Personalization feature.

• Daily Charge for the Last 30 Days: Shows rolled up chargeback data across all service types.

• Top Requested Services: This region lists the most requested service templates. You can see service utilization trend by user or service template for a selected period which can be 24 hours, 7 days, or 30 days.

The following options are available from the Cloud Home menu.

Note:
The following pages can be accessed only by users with the EM_SSA_ADMINISTRATOR role. To modify these pages, the users must have Manage privilege on the corresponding services and families. Out-of-the-box administrators have this privilege by default.

• Resource Providers: You can see the list of resource providers for which you have at least View Target Privilege. You can create a new resource provider, edit, or delete an existing resource provider. See Resource Providers Page.

  Note: To create a new service provider, you must have Create Target Privilege on that resource provider target type.

• Service Templates: Use this option to the Service Templates page from where you can create, edit, and delete service templates across different service families. See Service Templates Page for details.

• Services Instances: Shows a list of service instances. See Service Instances Page for details.

• Requests: Use this option to view all the requests, or view a summary in the Request Dashboard page.

• Setup: The Setup menu allows you to define global settings across the different service types. The following options are available:
  – Getting Started: The Getting Started page lists the minimum tasks that are required to configure a service type and the order in which these tasks must be completed. This page is useful to self service administrators who are not familiar with the product.
  – Service Settings: Allows you to specify service specific settings such as Load Balancer Settings for MWaaS.
  – Request Settings: Allow you to specify request settings at many different levels (from all services to a specific service type). See Configuring Request Settings.
  – Quotas: Allows you to define quota for each service family. See Setting Up Quotas.
31.1.1 Viewing the Resource Provider Utilization Heat Map

From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. On the Cloud Home page, click the View Map link in the Top Resource Provider Utilization% region to view the Resource Provider Utilization Heat Map.

Figure 31-2  Resource Provider Utilization Heat Map

This page shows the utilization metrics for all resource providers such as PaaS Infrastructure Zones, Database Pools, and Middleware Pools. The heat map provides a graphical representation of the resource provider utilization. On the Heat Map view, metrics are represented as boxes and the size and color of each box depicts potential problem areas. Select a box and click on a metric value to navigate to the Metric History page.

31.2 Viewing the List of Resource Providers

A resource provider is an entity that contains the actual resources required to provision the cloud services of a specific service type. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home** to navigate to the Cloud Home page. From the **Cloud Home** menu, select **Resource Providers** to see a list of resource providers.
Figure 31-3 Resource Providers Page

- Name: The name of the resource provider.
- Type: The type of resource provider. This can be:
  - PaaS Infrastructure Zone
  - Middleware Pool
  - Database Pool
  - Schema Pool
  - Pluggable Database Pool
- Owner: The user who created the resource provider.
- Parent: If the resource provider has a parent, it is listed here. For example, a PaaS Infrastructure Zone is the parent for a middleware or database pool.
- Members: The members associated with the resource provider (this includes member type and number of members).
- Service Instances: The service instance associated with the resource provider. Click on the link to drill down to the Home page.
- Description: A description of the resource provider specified by the administrator while creating the resource provider.

You can create a resource provider, edit an existing one, or delete a resource provider.

### 31.3 Viewing the List of Service Templates

From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Service Templates to view this page.
This page shows a list of all the service templates that are available to the self service administrator across the different service families. For each service template, the following details are displayed:

- Name of the service template
- The service family to which belongs (for example, Database, Middleware, and so on).
- The type of service.
- The owner of the service.
- The resource providers associated with the service template.
- The number of service instances associated with the service template.
- A description of the service template.

You can perform the following actions:

- **Create**: Select this option to launch the Create Service Template wizard.
- **Create Like**: Select this option to create a copy of an existing service template.
- **Edit**: Select a service template and click **Edit** to modify an existing template. Click **Submit** after modifying the template to update the template.
- **Delete**: Select a service template and click **Delete** to delete the template.
- **Grant and Revoke Privileges**: The **EM_SSA_ADMINISTRATOR** can grant or revoke service template privileges to other users with the **EM_SSA_ADMINISTRATOR** role.

### 31.3.1 Granting, Revoking, and Reassigning Service Template Privileges

The owner (the self service administrator who has created the template, or the **SUPER_USER**) can grant or revoke privileges over a service template to one or more users or roles. Only the **SUPER_USER** can grant or revoke privileges over all service templates to other users and roles.

- **Grant Privileges**: Select the service template for which privileges are to be granted and select **Grant** from the **Actions** menu.

To grant privileges to other users, select **User** in the Type drop down list and click **Search**. A list of users to whom the privileges can be granted is displayed. Select one or more users from the list and click **Grant** to grant the privilege.
In the Select **Privilege to Grant** drop down list, select **Manage** or **Full** to grant the privilege to the user. To allow users to edit, and modify the configuration in the service template, select **Manage** access. To allow users to edit, delete, and modify the service template, select **Full** access.

To grant privileges to one or more user roles, select **Role** in the Type drop down list and click **Search**. A list of roles to whom the privileges can be granted is displayed. Select one or more roles from the list and click **Grant** to grant the privilege.

- **Revoke**: Select a service template for which privileges have been granted and click **Revoke**. In the **Search** drop down list, you can select one of the following:
  - **Name**: The name of the user to whom the privilege has been granted.
  - **Type**: Select the type which can either be User or Role to whom the privilege has been granted.
  - **Privilege**: The type of privilege that has been granted which can be View, Manage, or Full.

Based on the search criteria, the list of users or roles to whom the privileges have been granted is displayed. Select the users or roles for whom the privileges are to be revoked and click **Revoke**.

- **Reassigning a Service Template**: Login as a Super Administrator user, select the template and click **Reassign** to reassign the ownership of the service template to another user. Select the user and click **Reassign** to reassign the service template.

### 31.4 Viewing the List of Service Instances

The Service Instance page shows the list of all service instances. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. From the **Oracle Cloud** menu, select **Service Instances** to view this page.

**Figure 31-5   Service Instances Page**

The following details are displayed:

- **Service Instance Name**: The name associated with the service instance. Click on the link to drill down to the target home page.
- **Status**: The status of the service instance.
- **Service Instance Type**: The type of request (Middleware or Database).
- **Resource Provider**: The Resource Provider with which the instance is associated.
- **Service Template**: The service template that was used to create the service instance.
• Policies: The number of policies associated with the service instance. Click on the link to drill down to the Policies page.
• Created By: The user who created this service instance.
• Creation Date: The date on which the service was created.
• Expiry Date: The date on which the service will expire and no longer be available.

You can perform the following actions:

![Note:]

You must have Manage privilege on the service types on which these operations are to be performed. This privilege is assigned to the out-of-the-box self service administrators roles by default.

• Start: Select a service instance that has been stopped and click Start to start the service.
• Stop: Select a service that is running and click Stop to stop the service.
• Delete: Select a service and click Delete. You are prompted to specify the schedule and indicate whether the service instance is to be deleted immediately or at a later date. Select the schedule and click OK to delete the request.
• History: Select a service and click History to view a list of all actions that have been performed on the service instance.
• Grant, Revoke, and Reassign Privileges: See Granting, Revoking and Reassigning Privileges to Service Instances.

31.4.1 Granting, Revoking, and Reassigning Privileges to Service Instances

The self service administrator can grant or revoke privileges over a service instance to one or more users or roles. Self service users can also grant or revoke privileges over service instances they own. The user who created the service instance (owner) or the SUPER_USER can reassign the ownership of a service instance to another user.

To grant or revoke access to a service instance, the self service administrator must select Enterprise > Cloud Home > Setup > Request Settings and enable the following flags:

• Enable self service user to share service instances with other Users.
• Enable self service user to share service instance Roles.

These settings can be defined either at global level, service family level, or at other User or Role level. See Creating a PaaS Infrastructure Zone for details.

• Grant Privileges: Select the service instance for which privileges are to be granted and select Grant from the Actions menu.

To grant privileges to other users, select User in the Type drop down list and click Search. A list of users to whom the privileges can be granted is displayed. Select one or more users from the list and click Grant to grant the privilege.
In the Select Privilege to Grant drop down list, select View, Manage, or Full to grant the privilege to the user. To allow users to edit, and modify the configuration in the service instance, select Manage access. To allow users to edit, delete, and modify the service instance, select Full access. To provide users with read only access, select View access.

To grant privileges to one or more user roles, select Role in the Type drop down list and click Search. A list of roles to whom the privileges can be granted is displayed. Select one or more roles from the list and click Grant to grant the privilege.

- **Revoke**: Select a service instance for which privileges have been granted and click Revoke. In the Search drop down list, you can select one of the following:
  - Name: The name of the user to whom the privilege has been granted.
  - Type: Select the type which can either be User or Role to whom the privilege has been granted.
  - Privilege: The type of privilege that has been granted which can be View, Manage, or Full.

Based on the search criteria, the list of users or roles to whom the privileges have been granted is displayed. Select the users or roles for whom the privileges are to be revoked and click Revoke.

- **Reassigning a Service Instance**: Login as a Super Administrator user, select the instance and click Reassign to reassign the ownership of the service instance to another user. Select the user and click Reassign to reassign the service instance.

**31.5 Viewing the Cloud Request Dashboard**

The self service administrator can use the Cloud Request Dashboard to track the status of all database and middleware requests. The self service administrator can view the requests across all resource providers for all users. The requests the self service administrator can view depends on the instance level privileges. All trends and graphs on this page apply to the current filter and time period specified. By default, the status across all services over the last 7 days is displayed.

From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Requests, then select Dashboard to view the cloud request dashboard.
The following charts are displayed:

- **Request Trends:** You can view recent trends for Failed, Successful, Average Wait Time, Average Processing Time and Scheduled requests. Trends are shown across two time periods (for example, previous week, current week). Click the drop down list in the Completed Requests chart to filter and view failed, successful, partially successful, or completed requests.
- **Average Request Wait Time:** The elapsed time from which a request is scheduled to start and its actual start time.
- **Average Request Processing Time (Zone):** The average time taken to process the request for the selected criteria. For example, if a specific service template is selected as the filter criteria, then the average time taken to create the service instance from the selected service template in the specified time period (last 24 hours, last 7 days, or last 30 days) is displayed.

You can choose to filter the requests listed on the page by selecting a value in the **View By** drop down list and specifying the **Filter** value and the **Type**. For example, if you select **Resource Provider** in the **View By** drop down list, and **All** in the **Filter** column, and **Create** in the **Type** column, you will see the Create requests for all resource providers.

You can click the **Edit** (wrench icon) option to edit the layout of the Request Dashboard page. The following service settings can be modified:

- **Summary Columns:** The number of columns that can be displayed in the Summary region.
- **Long Running Threshold:** The percentage of average processing time used to determine if the time taken to complete a request is longer than normal.
• Maximum Chart Items: The maximum number of resource providers, service types or service families that can be shown in each chart. The remaining items are listed in the All Others category.

• Include Archived Requests: Select this check box to include deleted but not yet purged requests in the charts. This option is useful in providing a more accurate picture of the total number of requests processed during the time periods.

• Chart Time Period: The default view period (7 days) for the chart.

Modify the values as required and click OK. To restore the earlier settings, click Restore Defaults.

31.6 Viewing All Cloud Requests

From the Enterprise menu, select Cloud, then select Cloud Home. From the Oracle Cloud menu, select Requests, then select Show All to view a list of all cloud service requests.

Figure 31-7    All Cloud Requests

For each request, the name of the request or job, status of the request, the request type (Create, Delete, and so on), the user who submitted the request, service type (database, schema, WebLogic, and so on), date on which the request was submitted, and so on is displayed. Click on the Name link to drill down to the Job Activity page. The Status link shows the Request Details popup window.

You can do the following:

• **Reschedule**: Select a request that is scheduled to run at a future date and click Reschedule to change the date on which the request should be initiated.

• **Delete**: Select a request and click Delete to delete the request. Deleted requests are still present in the repository and will be purged according to the purge policy defined in the Request Settings page. See Configuring Request Settings for details.

• **Clean Up**: Use this option to clean up failed requests. This may include shutting down any partially configured services and deleting any partially configured storage used for the failed service.

**Note**: Failed provisioning requests cannot be deleted unless they have been cleaned up.
31.7 Viewing the PaaS Infrastructure Zone Home Page

A zone is a logical entity that allows homogenous resources to be grouped together. The resources consist of components (servers, storage, networks, operating systems, applications) that are required to create new services. From the Enterprise menu, select Cloud, then select Cloud Home. Click on a resource provider link on the Cloud Home page to navigate to the Resource Providers page and click on the PaaS Infrastructure Zone link to drill down to the PaaS Infrastructure Zone Home page.

The PaaS Infrastructure Zone Home page contains the following regions:

- **General**: This region lists the total number of Hosts, Dependent Providers (Software Pool), Requests, and Service Instances in the zone. It also shows the Placement Policy Constraints that have been defined for the zone.
- **Request Summary**: Shows the percentage of requests that are in progress, failed, successful, partially successful, or scheduled.
- **CPU and Memory**: The average CPU and memory utilizations by Hosts in the zone is displayed in these charts.

**Note:**

You can set the thresholds for these metrics on the All Metrics page. To navigate to this page, from the PaaS Infrastructure Zone menu, select Monitoring, then select All Metrics. Select the metric for which the threshold is to be set, click Modify and change the settings.

- **Issues**: Shows the outstanding incidents and problems for the target.
• Members: Shows the members of the zones and the member type (Oracle VM Zone or Host).

• Hosts: Lists the hosts in the PaaS Infrastructure Zone. Click on the Utilization link to view details on the CPU and memory has been utilized for all the hosts, and the number of service instances created on the host. Click on the Name link to drill down to the Host Home page.

• Service Template Summary: Shows the service templates associated with the zone. The software pool associated with each service template and number of service instances in each resource pool is also displayed.

### 31.8 Viewing the Database Pool Home Page

A database pool contains a set of resources that can be used to provision a database instance within a PaaS Infrastructure Zone.

**Figure 31-9  Database Pool Home**

This page contains the following regions:

- **General**: This region displays the following:
  - **Summary**: Displays a description of the database pool and PaaS Infrastructure Zone to which it belongs.
  - **Members and Databases**: Shows the list of Members (Oracle Homes and Hosts) and Databases in the pool. The Databases region lists the total number of databases and the number of single instance or RAC databases in the pool.
  - **Placement Policy Constraints**: The placement policy constraints that specify maximum ceilings for each host member of the pool are displayed.

- **Standby Pools**: If one or more standby pools are present, they are listed here.

- **Top Utilized Hosts**: This region shows the list of top utilized hosts over the last 7 days. Click on the link to drill down to the Host Home page. You can sort by:
– Memory: The average memory utilized over the last 7 days as a percentage of the total memory on the host.
– CPU: The average CPU utilized over the last 7 days as a percentage of the CPU available on the host.
– Storage: The average storage utilized over the last 7 days as a percentage of the total storage available on the host.
– Instances: The number of database instances on the host.

• **Members:** Lists all the members in the database pool. Click on the links in the Members table to drill down to the Database or Host Home page.

• **Overview of Incidents and Problems:** This region lists any incidents or problems that have occurred.

• **Memory Utilization:** The chart shows the memory utilization by different hosts present in the database pool. The color coded chart shows the different memory utilization range across the different hosts.

• **CPU Utilization:** The chart shows the CPU utilization by different hosts present in the database pool. The color coded chart shows the different CPU utilization range across the different hosts.

• **Storage Utilization:** The chart shows the storage utilization by different hosts present in the database pool. The color coded chart shows the different storage utilization range across the different hosts.

• **Service Template and Instances:** Shows the service templates and service instances associated with the database pool.

### 31.9 Viewing the Schema Pool Home Page

You can define one or more schemas that can be deployed on a database.

**Figure 31-10  Schema Pool Home**
• **General:** This region displays the following:
  – Summary: Displays a description of the schema pool and PaaS Infrastructure Zone to which it belongs.
  – Members and Services: Shows the list of Members (Databases and Hosts) and Services in the pool.
  – Placement Policy Constraints: The placement policy constraints that specify maximum ceilings for each database member in the pool are displayed.

• **Top Allocated Databases:** This region shows the list of top utilized databases in the schema pool. Click on the link to drill down to the Database Instance page.
  – Memory: The total memory allocated for each service based on the workload as a percentage of the total SGA size of the database.
  – CPU: The total CPU allocated for each service based on the workload as a percentage of the CPU count.
  – Storage: The total storage utilized on all the tablespaces of the database as a percentage of the total size of the database.

Note:
Total here includes requests budgeted for services that have been requested and are active.

  – Services: The number of database services.

• **Members:** Lists all the members in the schema pool. Click on the links in the Members table to drill down to the Database Instance Home page.

• **Overview of Incidents and Problems:** This region lists any incidents or problems that have occurred.

• **Memory Allocation:** The chart shows the memory allocation across different databases present in the schema pool. The color coded chart shows the memory allocation range across all the databases.

• **CPU Allocation:** The chart shows the CPU allocation across different databases present in the schema pool. The color coded chart shows the CPU allocation range across all the databases.

• **Storage Allocation:** The chart shows the storage allocation across different databases present in the schema pool. The color coded chart shows the storage allocation range across all the databases.

• **Service Template and Instances:** Shows the service templates and service instances associated with the schema pool.

### 31.10 Viewing the Pluggable Database Pool Home Page

A PDB pool contains one or more container databases that can be used to create PDBs within a PaaS Infrastructure Zone.
This page contains the following regions:

- **General**: This region contains the following:
  - **Summary**: This region displays a description of the database pool and PaaS Infrastructure Zone to which it belongs. Click on the Parent PaaS Infrastructure Zone link to drill to the Home page.
  - **Members and Databases**: This region displays a list of Members (Oracle Homes and Hosts) and Databases in the pool. The Databases region lists the total number of databases and the number of single instance or RAC databases in the pool.
  - **Placement Policy Constraints**: The placement policy constraints that specify maximum ceilings for the pool are displayed.

- **Top Allocated Databases**: This region shows 5 to 15 pluggable databases (depending on your selection), sorted by Memory, CPU, Storage, or Services.
  - **Memory**: The total memory allocated for each service based on the workload as a percentage of the total SGA size of the Container database.
  - **CPU**: The total CPU allocated for each service based on the workload as a percentage of the total CPU count.
  - **Services**: The number of database services.

- **Members**: This region shows the list of members in the PDB pool. Click on the links in the Members table to drill down to the database or host home page.

- **Overview of Incidents and Problems**: This region shows a list of any incidents and problems that have occurred for any of the targets in the PDB pool.
• **Memory Allocation**: This chart shows the memory allocation by different container databases in the database pool. The color coded chart shows the memory allocation range across all the container databases.

   **Note:**
   Total here includes requests budgeted for services that have been requested and are active.

• **CPU Allocation**: This chart shows the CPU allocation by different container databases in the pool. The color coded chart shows the CPU allocation range across all the container databases.

• **Service Templates and Instances**: This region shows the list of service templates associated with the PDB pool. Click on the Service Template link to drill down to the Service Template Details page.

### 31.11 Viewing the Middleware Pool Home Page

The Middleware Pool Home page provides detailed information of the Middleware Pool. To view this page, from the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. Click on the **Resource Providers** link on the Cloud Home page to navigate to the Resource Providers page. Click on a Middleware Pool name to drill down to the Middleware Pool Home page. The Middleware Pool Home page contains the following regions:

#### Figure 31-12   Middleware Pool Home
• General: This region shows the following information:
  – Parent PaaS Infrastructure Zone: The zone with which the Middleware Pool is associated. Click on the link to drill down to the PaaS Infrastructure Zone Home page.
  – Oracle Homes: The total number of Oracle Homes in the Middleware Pool.
  – Oracle Home Version: The version of the Oracle homes.

• Placement Policy Constraints:
  – Total Java Servers (per host): The maximum number of WebLogic servers that can be running on each host.
  – Java Servers: The total number of WebLogic servers in the Middleware Pool.

• Load Balancer: This region shows the following details:
  – Load Balancer Configuration: The name of the load balancer configuration associated with the Middleware Pool. Click on the link to view the load balancer details.
  – Load Balancer Type: The type of load balancer. This can be Oracle HTTP Server, Oracle Traffic Director, or Third Party Load Balancer.

• Service Templates: The number of service templates with which the Middleware Pool is associated. For each service template, the name, a column indicating if the load balancer configuration has been enabled, and the description of the template is displayed. You can drill down to detailed page to see which MWaaS instances are associated with each service template.

• Service Instances: The service instances running on the Middleware Pool are displayed. For each service instance, the name, the status, date on which it is scheduled to expire, the service template with which is associated, and the location of the Oracle Home is displayed.

• Members: This region shows a list of members in the Middleware Pool. The name of the target, the target type, the host on which it is running, and the location of the Oracle Home is displayed.

### 31.12 Viewing the Cloud Services Reports

Oracle BI Publisher is an Oracle's enterprise reporting solution and provides a single reporting environment to author, manage, and deliver all of your reports and business documents. Utilizing a set of familiar desktop tools, such as Microsoft Word, Microsoft Excel, or Adobe Acrobat, you can create and maintain report layouts based on data from diverse sources. The Cloud Services BI reports consist of the following:

• Most Requested Service Types
• Service Request Status
• Service Request Types
• Cloud Requested Duration Thread

You can view these reports online and export them PDF, RTF, PowerPoint, and Excel formats. To view the reports, log into Enterprise Manager as a user with the [EM_CLOUD_ADMINISTRATOR](#) role and from the Enterprise menu, select Reports, then select [BI Publisher Reports](#). Click on a report under the Cloud Services menu to launch the BI Publisher application and directly view the report.
31.12.1 Most Requested Service Types

This report shows the most requested reports sorted by service type. You can filter the data displayed by selecting any of the following parameters:

- Service Family
- Service Type
- User Name
- Start Date
- End Date

Figure 31-13  Most Requested Cloud Service Type

31.12.2 Service Request Status

This report shows the service request trends sorted by status. You can filter the data displayed by selecting any of the following parameters:

- Service Family
- Service Type
- Request Type
- Request Status
- User Name
- Start Date
31.12.3 Service Request Type

This report shows the cloud request trends sorted by request type. You can filter the data displayed by selecting any of the following parameters:

- Service Family
- Service Type
- Request Type
- Request Status
- User Name
- Start Date
- End Date
31.12.4 Cloud Service Instance Duration Trend

This report shows the cloud service instance duration. You can filter the data displayed by selecting any of the following parameters:

- Submission Time
- Resource Provider
- Service Type
- Service Template
Figure 31-16  Cloud Service Instance Duration

This report shows cloud service instance duration.
Part XII
Dynamic Resource Provisioning

This section covers the dynamic resource provisioning feature.

It contains the following chapters:

• Dynamic Resource Provisioning with Oracle VM Server for SPARC
• Getting Started with Dynamic Resource Provisioning
• Dynamically Provisioning Resources in a DBaaS Cloud
• Dynamically Provisioning Resources in an MWaaS Cloud
32

Dynamic Resource Provisioning with Oracle VM Server for SPARC

Oracle Enterprise Manager Cloud Control integrates with Enterprise Manager Ops Center to create and manage virtual datacenters (vDC). Within the vDC, a vServer appears to users as a complete system, which they can optimize on demand as a DBaaS or MWaaS private cloud.

32.1 Integration for a PaaS Solution

In Oracle Enterprise Manager Ops Center, the IaaS cloud platform service is a virtual datacenter (vDC), a virtual environment supported by pooled servers, storage, and network resources. A cloud administrator sets up the vDC to run Oracle VM Servers for SPARC (logical domains). Enterprise Manager Cloud Control users are creating vServers in the logical domains automatically, as needed. Each vServer draws its requirements from the resources of the vDC.

This section explains how to create the vDC and to connect it to Enterprise Manager Cloud Control.

32.1.1 Prerequisites

- Enterprise Manager 12c Cloud Control Release 5 with Virtual Service Adaptor configured to connect to Ops Center's Enterprise Controller. See Getting Started with Dynamic Resource Provisioning.

- Enterprise Manager Ops Center Release 3 with managed storage and network assets. See Oracle Enterprise Manager Ops Center Installation for Oracle Solaris Operating System and Configure Reference guides for information about installing the product and discovering assets.

- Oracle Enterprise Manager Ops Center Client Kit, which includes modifications to enable communication between the two software products. This kit is available from My Oracle Support to https://support.oracle.com/.

The minimum requirement for Ops Center is the co-located configuration: one system hosts the Enterprise Controller, one Proxy Controller, and an embedded Oracle database.

- Requirements for Enterprise Controller:
  - A minimum of T4-1 Sun Server
  - Same or higher version of Oracle Solaris 11 as the version to be provisioned on vServers running Oracle VM Server for SPARC. Supported versions are Oracle Solaris 11, 11.1, and 11.2 but, for optimal performance use the latest SRU of Oracle Solaris 11.2.

- Requirements for Proxy Controller:
- Co-located with Enterprise Controller or running in a system with the same minimum requirements for server, network, and operating system as for the Enterprise Controller.

• Requirements for Oracle VM Server for SPARC control domain:
  - Oracle VM Server for SPARC 3.1 or later
  - Oracle Solaris 11, 11.1, and 11.2. The version must be the same or later than the version to run in the vServer. To provide different versions of Oracle Solaris 11, create a control domain for each operating system.
  - For optimal performance between storage elements and control domains, equip each server that hosts a control domain with a Fibre Channel HBA of at least 4 Gb and a 10 Gb Ethernet card. A 1 Gb Ethernet card is the minimum.
  - The right size of networks and virtual assets is not uniform. This document makes recommendations but your purposes and site requirements affect them. For a discussion of sizing, see the Oracle blog for some good practices in tuning resources for virtual assets at https://blogs.oracle.com/jsavit/entry/best_practices_top_ten_tuning

• Requirements for Oracle VMS Server for SPARC logical domain:
  - Oracle VM Server for SPARC 3.1 or later
  - The version of Oracle Solaris that is available in the Ops Center OS image repository.

• Requirements for storage resources:
  - Dedicated LUNs exposed only to appropriate WWNs. The LUNs must be fully-provisioned, not thin-provisioned. You can use Fibre Channel LUNs or iSCSI LUNs or both.
  - For Fibre Channel LUNs, create at least one SAN static storage library
  - For iSCSI LUNs, a SAN dynamic storage library is created when you discover the storage server; however, you cannot use this library for the vDC. Create at least one static SAN storage library. Use a 10 Gb Ethernet network connection and tune the number of iSCSI connections. For 8 threads/connection:
    iscsiadm modify initiator-node -c 8
  - For optimal performance between storage elements and control domains, equip each server that hosts a control domain with a Fibre Channel HBA of at least 4 Gb and a 10 Gb Ethernet card. A 1 Gb Ethernet card is the minimum.

• Requirements for networks:
  - A fabric backed by an isolated switch to provide separate interfaces to each control domain. An isolated switch is an isolated Ethernet switch or a set of non-routable VLANs spanning multiple network switches. The switch provides the VLAN IDs that provision virtual networks.
    * For host-managed or fully-managed fabric, you must reserve a range of VLAN IDs to be mapped to the control domains. When a private network is needed, one is created on demand, using one of the VLAN IDs, and deleted when no longer needed.
    * For an unmanaged fabric, you must create the private networks manually, using the Create Private Networks action and add them to the network domain. When a private network is needed, an available network is assigned.
A dedicated network domain. Do not use the Default network domain.

* At least one public network to provision OS and to access vServers. Public networks supply a block of IP addresses for provisioning the vServers. The number of IP addresses equals the number of vServers that can be supported. Consider the size of the network that can accommodate all your current and future requirements. Class C (for example, 10.0.0.1/24) networks enable you to create 256 vServers, Class 16C networks (for example, 10.0.0.2/20) enable you to create 4096 vServers.

* Private networks for Clusterware and internal host connectivity.

A set of dedicated VLANs IDs, configured on one or more network interfaces.

- Requirement for software libraries:
  - Place the libraries on a storage server with high transfer rates.
  - To provision an OS version, the Oracle Solaris 11 Software Update Library must contain the packages for that version. This repository is created during the product installation. In addition, you must download the Oracle Solaris 11 SRU library.
  - Limit the Oracle Solaris 11 Software Library to versions of releases and SRUs that are in active use.
  - Add packages from client kit to the Oracle Solaris 11 Software Library.

### 32.1.2 Overview of the Configuration of PaaS Solution

To set up the PaaS solution, you perform tasks on each component of the solution:

- **Configure Enterprise Manager Cloud Control**
- **Obtain the Client Kit**
- **Configure Enterprise Manager Ops Center**

#### 32.1.2.1 Configure Enterprise Manager Cloud Control

The Enterprise Manager's Virtual Service Adapter is the interface between Enterprise Manager and Enterprise Manager Ops Center. To configure the integration, the main component of Ops Center, the Enterprise Controller, is added as a staging server, as described in Adding the Stage Server.

When the configuration of Oracle Enterprise Manager Ops Center is complete, use the following information to configure Enterprise Manager Cloud Control:

- IP address of the Enterprise Controller
- Username and password of the cloud user account

#### 32.1.2.2 Obtain the Client Kit

Go to [https://support.oracle.com/](https://support.oracle.com/) to obtain the Ops Center Client Kit, p21190506_121050_Generic.zip. The kit is also available in the OC DVD bundle.

The kit contains packages that provision logical domains, modified to enable PaaS operations, and a script:

- ORCLsysman-iaas-cli.pkg
Extract the files in the compressed file to a location of your choice. These packages and script will be uploaded to Ops Center's repository for Oracle Solaris 11 and used in an OS Update Profile.

### 32.1.2.3 Configure Enterprise Manager Ops Center

The tasks in this section take 2-3 hours to complete. Some of them can be done simultaneously, that is, you do not have to wait for one job to complete before starting another one.

1. **Add Client Kit Contents to Software Library for Oracle Solaris 11**
2. **Preparing Network Resources for the vDC**: fabric, network domain, and public network
3. **Preparing Storage Resources**: a NAS storage library and a SAN storage library
4. **Create an OS Update Profile**
5. **Deploy Control Domains**
6. **Create the Server Pool**
7. **Create the vDC**
8. **Create the vDC account for PaaS**
9. **Create a new vServer Type**
10. **Create a vServer Template**
11. **Create a Private vNet**
12. **Validate the Integration and PaaS**

### 32.2 Configure Resources for vDC

A vDC relies on pools of networks, storage, and control domains. It provisions its servers from images in a current OS repository according to profiles in the repository.

#### 32.2.1 Add Client Kit Contents to Software Library for Oracle Solaris 11

The package that enables the PaaS solution is `post-script-paas-12.3.0.1407.p5p`. This file is in the compressed file you downloaded from My Oracle Support and resides in the directory where you extracted the contents of the compressed file. This procedure imports the file into Op Center's Oracle Solaris 11 repository so that it can enable communication between the Enterprise Manager Cloud Control staging server and the Ops Center resources.

Use the **Add Content** action to add ISO image files to the Oracle Solaris 11 Software Update Library manually.

1. Locate the image in the new repository.
2. Expand **Libraries** in the Navigation pane.
3. Click **Software Libraries**.
4. Click **Oracle Solaris 11 Software Update Library**.
5. Click **Add Content** in the Action pane.

![Figure 32-1 Add Content](image)

6. In the **Repository to add content from** field, enter the location of the file using the syntax: `file:///<fullpath>/post-script-paas-12.3.0.<buildnumber>.p5p`.
   
   If credentials are required, specify the system's credentials, `SystemDefinedSupportCredential`.
   
   When the job is completed, the file is listed in the Contents tab of the library.

### 32.2.2 Preparing Network Resources for the vDC

Fabrics are the physical infrastructure, consisting of network interface cards and network switches. Network domains are the logical infrastructure, combining network resources from at least one fabric. The networks used by virtual assets are created from the VLAN IDs managed by a network domain. The physical fabrics support these virtual networks, through the network domain, in a manner that depends on their type.

To supply network resources to a vDC, you create a network domain from an appropriate fabric.

You must have the role of Network Admin to create network domains.

#### 32.2.2.1 Identify a Fabric

To see the available fabrics, expand **Networks** in the Assets pane. Select **Fabrics**. For each fabric, the Dashboard in the center pane includes a Management Capability.
field. You have these options for providing physical network resources to a new network domain:

- Use an existing host-managed fabric.
- Convert an unmanaged fabric to host-managed and then use it.
- Create a new host-managed fabric.
- Use an unmanaged fabric.

**To convert an unmanaged fabric to a host-managed fabric**, use the **Assign VLAN ID Range** action. Specify a range that matches VLANs on the isolated switch that supports the fabric. If the fabric is not supported by an isolated switch, you can use an arbitrary VLAN ID range representing configured, non-routed VLANs, for example, 1001-1200.

**To create a new host-managed fabric**:

1. In the Navigation pane, navigate to **Networks**, then select **Fabrics** from the drop-down list.
2. In the Actions pane, click **Define Ethernet Fabric**.
3. In the wizard, enter a name in the **Fabric Name** field. Enter a description. Click **Next**
4. Enter the range of VLAN IDs. If the fabric is supported by an isolated switch, specify a range that matches the switch's VLANs. If the fabric is not supported by an isolated switch, use an arbitrary VLAN ID range, for example, 1001-1200.
5. Select the networks to be associated with the fabric, then click **Next**
6. Review the Summary, then click **Finish**. The new fabric is host-managed

**To use an unmanaged fabric**, assign a set of its public networks as private networks or convert the fabric to an host-managed fabric.

### 32.2.2.2 Create a Network Domain

After Ops Center manages the physical fabric, its network resources are in the system-defined Default Network Domain, but you cannot use the Default network domain for a virtual datacenter. Instead, create a network domain specifically to support a server pool that contains a vDC.

A network domain is a container for networks and handles the relationship between the physical fabrics and the server pool. The fabrics provide network resources such as links and IP subnets. Within the network domain, networks that have been discovered or specified are available for assignment. These are called public networks. Their network resources have been defined. Another type of network is dynamic, that is, the network is created when it is needed, using an IP address space available to the network domain. Because they exist only for a specific purpose and only within a specific network domain, they are called private networks.

To use virtual datacenters, the network domain must provide private networks. To use existing public networks for a virtual datacenter, add each network to the network domain, making it a static private network, because existing public networks already have an IP subnet addresses and VLAN IDs.
**Note:**

Do not attempt to use the Default Network Domain to support a virtual datacenter. Although you are not prevented from specifying the Default Network Domain, its networks will not be available for selection.

Although the network domain is providing the networks to the server pools, this is only a logical association using VLAN IDs. To use the network resources, each physical server that supports the control domains in the server pool must have a physical connection to a fabric in the network domain.

1. Expand Networks in the Navigation pane.
2. The Standard views shows Networks. The Default Network Domain is selected.
3. Click **Create Network Domain** in the Actions pane.
4. In the Identify Network Domain pane, enter the name and description of the network domain. You can also add tags.
5. In the Add Fabrics step, choose at least one fabric.
6. Accept the default value for the Network Creation Limit. This value is the maximum number of dynamic private networks that can be in use simultaneously and is set by the number of VLAN IDs in the range of VLAN IDs you set.

A private network uses an IP address from the pool of available IP addresses in the network domain. To exclude IP addresses that your organization is using for other purposes, specify them in the Reserved IP Address Ranges table. These addresses will not be available to dynamic private networks.

7. In the Associate Networks step, you add existing networks to the new network domain. Add the network you want to use as the public network. This network will be used to provision vServers.
8. Review and click **Finish**.

When the job is completed, the new network domain is listed in the Navigation pane.

### 32.2.2.3 Configure Public Network

Select the public network and then select **Edit Managed IP Ranges**. Specify a range or a series of IP addresses, as provided by your network administrator. These addresses will be used later to support logical domains.

### 32.2.3 Preparing Storage Resources

When Ops Center discovers a storage device, it creates a dynamic storage library, but these libraries cannot be used to support a vDC. Instead, create static storage libraries:

- Create a NAS storage library to store the metadata of the control domains. This storage is exclusive for the vDC. Do not use this library for any other purpose.
- Create at least one SAN library to store the operational data.

The storage libraries are block storage, which use Logical Unit Numbers (LUNs). The LUNs are backed by Fibre Channel disks or iSCSI disks in the form of LUNs.

SAN LUNs are associated with Fibre Channel or iSCSI target groups. Fibre Channel targets use a dedicated optical network and iSCSI targets use the IP network, but in both protocols, the targets in a target group expose one or more LUNs as a storage resource for the target's initiators.

For both protocols, acts as the initiator. To allow the target group and to identify each other as eligible initiators and targets, each one's Fibre Channel World Wide Name (WWN) or iSCSI IQN must be registered with the other one. recognizes the targets because the WWNs or IQNs of the storage server are recorded when the storage server is discovered. Any LUNs that have been assigned to that WWN or IQN are eligible to be used in a storage library.

### 32.2.4 Create a NAS Storage Library

These are the tasks for setting up a NAS storage library:

1. Identify the NAS Share
2. Create a NAS Storage Library
32.2.4.1 Identify the NAS Share

The NFS share is a file system on a NAS storage device. You can view the shares on managed storage servers from the user interface.

1. Expand Assets in the Navigation pane and click
2. Click All Assets to expand the section.
3. Click on the NAS storage server in the Storage section.
4. In the center pane, click the Storage Shares tab.

5. View the shares and choose one with capacity to support a server pool. You will use this share in the following procedure.

32.2.4.2 Create a NAS Storage Library

1. Expand Libraries in the Navigation pane. The new library will be created in the Filesystem Storage section.
2. Click New NAS Software Library in the Actions pane.
3. Enter a name for the library and a description. For example, identify how the new library will be used.
4. Do not associate a server pool with the new storage library. The server pool will be created later. Click Next.
5. By default, the wizard displays the option for using an exported share of a storage device. Because this procedure has set up an NFS share, click the Other option.
6. Enter the URL or IP address for the NFS server.

7. (Optional) You can specify the version of NFS that this storage uses. By default, uses the operating system's default NFS version. To specify a different version, allow the version to be changed.
   a. Click the Override NFS Version option.
   b. Click the drop-down list of NFS versions. Select a version.

8. Click the Next button to review a summary of the storage library.
9. Click the **Finish** button to submit the job.

When the job is completed, you can see the new storage library in the Libraries section of the Navigation pane.

### 32.2.5 Create SAN Storage Libraries using Fibre Channel LUNs

This section describes how to set up a static block storage library, backed by Fibre Channel LUNs. The number of LUNs in the storage library determines the number of virtual hosts that the library can support.

#### 32.2.5.1 What You Will Need

You will need the following to set up and use a block storage library:

- LUNs backed by a managed SAN server using the Fibre Channel protocol
- The role of Storage Admin

To create LUNs on the storage server, you must have the user account and password to log into the storage server and create the LUNs as targets.

#### 32.2.5.2 Configure the Storage Server

If you need to create LUNs and make them available to, see the storage server's documentation for instructions in how to perform the following:

- **Configure the initiator and the targets.** The initiator () must be able to recognize the targets (LUNs) and the targets must be able to recognize the initiator. Recognizes the targets because the WWNs of the storage server are recorded when the storage server is discovered. Any LUNs that have been assigned to that WWN are eligible to be used in a storage library. On the storage server, you must specify 's WWN as an initiator and assign LUNs to that initiator.

- **Enable multipathing on the Fibre Channel ports.** Multipathing is enabled by default on Oracle Solaris x86-based systems, but is disabled by default on Oracle Solaris SPARC-based systems. Use the `stmsboot -e` command to enable multipathing.

- **Create new LUNs.** It can take several hours for a new LUN to be displayed in 's user interface.

To verify iSCSI LUNs are available to the virtualization host, use the following command:

```bash
# iscsiadm list target -S
```

To verify Fibre Channel LUNs are available to the virtualization host, use the following command for Oracle Solaris 11:

```bash
# fcadm lu
```

#### 32.2.5.3 Create a Static Block Storage SAN Library

To specify the LUNs in a storage library, you specify the server pool that will use the storage library and then select LUNs from among the LUNs available to the server pool.

2. Click **New SAN Storage Library** in the Actions pane.

3. Enter the name and description of the library. Click **Next**.

4. You have the option to enable multipathed storage for guests of Oracle VM Servers. When you click the **LUNs sharing to LDOMs** option, each logical domain can get access to its storage through any of the domains in the server pool. If you
do not enable multi path storage, the logical domain gets access to storage through its primary domain. Click **Next**.

5. In the Identify LUNs step, select at least one LUN from the list of available LUNs. Because this is a static block storage library, the number of LUNs you select determines the number of virtual hosts that the library can support. For example, if you select eight LUNs, eight virtual hosts can use the storage library. You can select one LUN and then add more LUNs later. Click **Next**.

6. Review the details of the storage library in the Summary pane.

7. Click **Finish** to submit the job.

When the job is completed, the new storage library is displayed in the Libraries section of the Navigation pane in the Static Block Storage section. The center pane shows the library's Summary tab.
32.2.6 Create an OS Update Profile

The Oracle Solaris 11 OS Update profile installs packages as part of an OS Provisioning profile. This example shows how to create an OS Update profile that installs the integration package. You then add this profile to an OS Provisioning profile.

1. Expand **Plan Management** in the Navigation pane, then select **Update Profiles** under **Profiles and Policies**.

2. Click **New Profile** in the actions pane.

3. Enter a name and description for the profile. In this case, the profile is **PaaS base update**. Then select **Solaris 11**.
4. Keep the default filters and then search for each one of the following packages and files and click the Install icon.

SUNWhea
SUNWsprot
developer/assembler
developer/java/jdk-6
developer/java/jdk-7
post-script-paas

5. Click Create OS Update Profile. The profile appears in the list of Update profiles.

32.2.7 Deploy Control Domains

- Create an Provisioning Profile for Oracle VM Server for SPARC
- Create an OS Configuration Profile for Oracle VM Server for SPARC
- Apply the Deployment Plan

32.2.7.1 Create an Provisioning Profile for Oracle VM Server for SPARC

This profile provisions the Oracle Solaris 11 OS and includes the OS Update profile you created in Create an OS Update Profile.

2. Select OS Provisioning profile and click Create Profile in the Actions pane.

3. Enter the following details in the Create OS Profile - OS Provisioning wizard:
   - Name and description of the profile. In this case, the name of the profile is control_domain_osp.
   - Select Oracle VM Server for SPARC as the Subtype and V class as the target type
Click Next.

4. Select the following parameters:
   - For the Oracle VM Server for SPARC version, select Solaris 11.2 SRU 11.5.0 (LDom 3.2.0.1)
   - For the Systems Software group, select solaris-small-server.
   - For the Solaris 11 Update profile, select the OS Update Profile that you created: PaaS base update
Click Next.

5. Keep the default values for the OS setup parameters or edit the language, time zone, and NFS4 Domain values for your environment.

6. Enter the root password and confirm the password.

   Click Next.

8. Specify the user account for Oracle Solaris 11 OS. Root login is not enabled in Oracle Solaris 11 OS. Create a user account to SSH to the OS after provisioning. Provide a user name and password for the account.

   ![Specify User Account](image)

   Click Next.

9. Do not use iSCSI disks for provisioning Oracle VM Server for SPARC. Clear this option and click Next.

   ![Specify iSCSI Disk Usage](image)

10. The root (/) and a swap file system are defined by default but you must change the swap size, according to recommendations for sizing and performance. In general, each logical domain that this control domain supports will need 1 GB.

    Use a minimum of 8192 MB for the swap size.
Click Next.

11. Select DNS as the naming service in place, and provide the details, including the server names. Click Next.

12. Review the parameters selected for the profile and click Finish to create the OS provisioning profile.

The profile appears in the center pane and in the Profiles and Policies section of Plan Management.

32.2.7.2 Create an OS Configuration Profile for Oracle VM Server for SPARC

The OS Configuration profile lets you define the network interface that you want to use on the operating system. The first interface you define is the boot interface and also the primary interface. You can add more than one network interface. When you apply the plan to a target, you can select which network interface is the primary interface and define the IP address.

- Control domain configuration such as CPU Threads or Whole-cores, memory, Crypto Units, Virtual Console Port Range and Virtual Disk Server name.
- Options such as enabling MPxIO and SR-IOV, detaching the unused buses, and saving NVRAMRC values.
- OS management option to install the Agent Controller.
- Networking options to use IPMP or Link Aggregation.

The recommended minimum configurations for the control domain are described in the following sections.

32.2.7.2.1 CPU Resource Allocation

The number of system CPUs determines the number of control domain CPU threads:

- For less than 16 system CPUs, set the control domain CPU Threads to 2.
- For between 16 and 64 system CPUs, set the control domain CPU Threads to 4.
• For more than 64 system CPUs, set the control domain CPU Threads to 8.

You can select to allocate CPU resources either as CPU Threads or Whole-core.
Whole-core is the default value in Oracle Enterprise Manager Ops Center. When you allocate as Whole-core, all the CPU Threads in the core are allocated to the control domain. For example, when you allocate two cores in UltraSPARC T2 servers, the control domain is allocated with all the 16 CPU Threads in the core. You can also set the maximum cores constraint when you select Whole-core allocation type. The maximum number of cores constraint specifies the number of cores that must be assigned to the domain.

32.2.7.2.2 Crypto Units

Crypto units are the resources on the supported platforms that provide high-performance, dedicated cryptographic engines. These can be used for tasks such as encrypting and decrypting network traffic between a Secure Socket Layer (SSL) web server and an application server.

Each CPU core has one Crypto unit and four or eight CPU threads. Because the Crypto unit is part of a core, the Crypto unit is bound only to domains that contain at least one thread from the parent core. Crypto units cannot be split as CPU threads are split. For example, you have assigned the Crypto unit for the first CPU core to the control domain. When a new logical domain is assigned a thread from the first CPU core and the Crypto unit for that core is already assigned, the control domain cannot assign that Crypto unit to the new logical domain. Allocation of Crypto units might not succeed, especially when a core is split between domains. An Oracle VM Server might allocate fewer Crypto units or none at all.

You must assign at least one Crypto unit to the control domain because the Crypto unit enables domain migration.

The use of Crypto Units is not mandatory although it might speed the logical domain migration. Allocation of Crypto Units might not be available in all the hardware.

32.2.7.2.3 RAM

The amount of RAM for the control domain depends on the size of the system RAM and the load of the system.

• For system RAM less than 8 GB, set the control domain's RAM to 1 GB.
• For system RAM between 8 GB to 16 GB, set the control domain's RAM to 2 GB.
• For system RAM greater than 64 GB, set the control domain's RAM to 8 GB.

In Oracle Enterprise Manager Ops Center the default value is 4 GB as a recommended starting point for logical domains, and the minimum value is 1GB.

32.2.7.2.4 NVRAMRC Value

Automatic booting on a SPARC system uses the default boot device that is defined in the non-volatile RAM (NVRAM). User-defined commands that are executed during start-up are stored in the NVRAMRC file in the NVRAM. When you run an OS provisioning job on a SPARC machine, Oracle Enterprise Manager Ops Center resets the configuration to the factory default configuration and removes the information that is stored in the NVRAMRC file. The control domain OS configuration profile gives you the option to preserve the information in the NVRAMRC file before resetting the server to the factory defaults, and then restore the information after the reset.
To create an OS Configuration profile:

1. Select the Plan Management section and expand Profiles and Policies.
2. Select OS Configuration and click Create Profile in the Actions pane.
3. Enter a name and description in the Create Profile - OS Configuration wizard. In this case, the new profile has the name install_cdoms_osc.
4. Select Oracle VM Server for SPARC as the Subtype.
5. Click Next.

6. Select the Oracle VM Server for SPARC version to be installed. The version must match the version selected in the OS Provisioning profile.
7. Specify the resources that you want to assign to the control domain, according to the recommended minimum configuration. The remaining resources are then available for the logical domains.
   - **CPU Model**: Select Whole-core to allocate the CPU resource in cores.
   - **CPU Cores**: Enter the number of CPU core to be allocated to the control domain.
   - **Max CPU Cores**: Enter the number of CPU cores that must be assigned to control domain.
   - **Memory**: Enter the amount of memory required for control domain.
   - Do not provide any values for **Requested Crypto Units**.
   - **Virtual Console Port Range**: Enter the range between 5000 to 6000.
   - Keep the default name of the virtual disk server.

Clear the following options:
- **Enable Single Root I/O Virtualization (SR-IOV)**
- **Detach Unused Buses**
Click Next.

8. Select the option **Enable Multiplexed I/O** so that you can associate block storage libraries such as SAN and iSCSI for storage with the control domain.

Click Next.

9. Select **None** as the networking option for Oracle VM Server for SPARC.
Click **Next**.

10. Select the network interface to use for OS provisioning. Select the **Controller** that hosts the network interfaces and the corresponding network interface. The **Address Allocation** is Use Static IP by default and cannot be modified.

Select **Auto** to create a virtual switch automatically for the network connection to the control domain. The virtual switch is created in the default format. For example, the network 192.0.2.0/24, the virtual switch is created as 192.0.2.0_24.

Click **Next**.

11. Review the parameters and click **Finish** to create the OS configuration profile.

The job is initiated and the new OS configuration profile appears under Profiles and Policies in the Plan Management section. You can select the OS Configuration profile to view its details in the center pane.

### 32.2.7.3 Apply the Deployment Plan

Apply a deployment plan to provision Oracle VM Server for SPARC.

When you apply a deployment plan to provision Oracle VM Server for SPARC, you must have the following information to complete the installation:

- In the server hardware, obtain the network interface that is physically connected to the network that is managed by Oracle Enterprise Manager Ops Center.
- Both tagged and untagged networks are listed for network configuration. When OpenBoot PROM (OBP) is used, only untagged networks can be used for OS provisioning as you cannot boot from a tagged network.
- The IP address for the boot interface.
- If you want to identify the network interface using the MAC address, you can select to enter the MAC address instead of the boot interface.
- The details of network connection that you want to use to configure the OS after booting. For multiple network configuration, the first interface is always overwritten by the boot interface that is defined during the OS provisioning step. For single network configuration, it is same as the boot interface network.
• Do not select the option to place the Oracle VM Server for SPARC in a server pool.

1. Select the Provision OS plan in the Deployment Plans list.

2. Select Apply Deployment Plan in the Actions pane.

3. Select one or more assets and add to the target list.

4. Select the plan to be applied with minimal interaction. If required to change the profile parameters, then select **Allow me to override any profile values.**

5. Select not to review the steps that are not included in the plan and click **Next.**

6. The wizard collects information for provisioning Oracle VM Server for SPARC. Click **Next.**

7. In the Boot Interface Resource Assignments step, provide the following information:
   - **Network:** The network for the boot interface.
   - **Controller:** Select the controller that provides the network interface for OS provisioning. It is always default for the Oracle VM Server for SPARC provisioning.
   - **Interface:** Select the net0 interface from the list. This network interface is physically connected to the selected network.
   - **IP Address:** Enter the IP address for the boot interface.
   - (Optional) **Primary Hostname:** Enter the host name for Oracle VM Server for SPARC.

   If you want to identify the network interface by its MAC address, then select the option **Identify Network Interface by MAC Address** and enter the MAC address instead of selecting the Controller and the Interface.

   Click **Next** to view the OS provisioning summary.

8. Review the parameter of OS provisioning and click **Next.**

9. The following steps in the wizard collects information about OS configuration.

   Click **Next.**

10. Specify the network resources that were defined in the profile. Select the network and for each network, select the network interface and enter the IP address.

    The first network interface listed is the boot interface. For multiple network configuration, the first network interface is always overwritten by the boot interface network. You can select which is the primary network interface after the provisioning of the OS.

    For single network, the boot interface network will be the defined as the primary network during OS configuration.

    Click **Next.**

11. Do not select the option to add the Oracle VM Server for SPARC to a server pool.

    Click **Next.**

12. Review the summary of the OS configuration parameters and click **Next** to schedule the job.

13. Schedule the provisioning job to run immediately.
Click **Apply** to apply the deployment plan on the selected targets.

### 32.2.8 Create the Server Pool

A server pool is a group of control domains that has access to the same virtual and physical networks and storage resources. Server pools provide load balancing, high availability capabilities, and sharing of the resources for all the members of the pool.

This procedure creates a server pool containing the control domains you created, both storage libraries you created, and the network domain you created.

Before you begin, you must know the network interface that is the physical connection to the system that supports the control domain.

2. Click **Create Server Pool** in the Actions pane.
3. Enter a name and description for the server pool.
4. Select Oracle VM Server - SPARC from the Virtualization Technology list.
5. Click **Next**.
6. Select the Oracle VM Servers to be added to the server pool.

Click **Next**.

7. Select the new network domain to be associated with the server pool. When you select a the network domain, the Specify Physical Interface table is populated with the fabrics in the network domain.
8. Specify how each fabric connects to each Oracle VM Server.

**Note:**

In the Physical Interface column, for each Oracle VM Server, select the name of the NIC that the system that hosts the Oracle VM Server uses to connect to the fabric. The NIC that is displayed initially is not a default; you must specify the NIC to use.

Click **Next**.

9. Click the **Add Network** icon to associate the networks in the network domain with the servers in the server pool. Enter the number of connections to the network as 1.

Click **Next**.

10. Specify the network configuration settings for each Oracle VM Server. Both Oracle VM Servers are already connected to the selected network. The UI displays the existing connection details to the network.

Select interfaces for each fabric you selected in network domain:

- For the fabric that supports the public network (the routable network), select any existing interfaces to the control domain. If no interface has been connected to the control domain, select the interface that is connected to the Ethernet switch.
- For the host-managed fabric, select the interface that is connected to Ethernet switch. Do not use bonded interfaces.

**Note:**

In the NIC column, for each Oracle VM Server, select the name of the NIC that the system that hosts the Oracle VM Server uses to connect to the fabric. Specify the same NIC that you chose in Step 8.
11. Storage libraries that are reachable from the selected members of the pool are displayed. Select the NAS and the SAN storage library to be associated with the server pool. Do not select a dynamic storage library.

12. Select the placement and auto balancing policy:
   - Place the guest on Oracle VM Server with lowest relative load.
   - Do not auto balance the server pool.
   - Clear the option for Automatic Recovery.
13. Review the server pool information, then click Finish to create the server pool. The server pool is created and listed in the Server Pools view of the Assets section.

32.3 Set Up and Configure a Virtual Data Center

- Create the vDC
- Create the vDC account for PaaS
- Preparing the vServers

32.3.1 Create the vDC

The vDC inherits network resources and storage resources from the server pool. The vDC enables cloud users to create virtual machines and run applications. The cloud user provides networking to its virtual machines from the public networks that are allocated to each account or by creating private networks. The cloud user can use the public networks, or create a private vNet for use in the account. When the cloud users create a private vNet, either a dynamic private network is created or the static private network is available for use in that account.

1. Select vDC Management in the Navigation pane.
2. Click Create Virtual Datacenter in the Actions pane.
3. The first step Create Virtual Datacenter Wizard is an introduction to the vDC and the prerequisites for creating a vDC. Click Next.
4. In Specify Virtual Datacenter Details:
   - Provide a name and description for the vDC.
• Enter tags to distinguish this vDC from other vDCs.

• Select **Password Required** to enforce using credentials when creating vServers in the vDC. When this option is enabled, cloud users must specify a root password, with or without an SSH key. In addition, cloud users must specify either an SSH key or remote user credentials when creating vServers that use Oracle Solaris 11 OS.

Click **Next**.

5. Select the new server pool from the list.

6. Select one or more boot networks from the public network. You must select at least one network.

### Note:

Boot networks are required for vServer OS deployment. You must also add at least one boot network to each account in the vDC for creating vServers in the account. You can also assign a boot network to an account and use it as a public network for that account.

Click **Next**.

7. The vCPU sizing displays this information:

   • **Total number of vCPUs**: The total number of vCPU in the vDC for the updated vCPU to physical CPU Threads ratio.

   • **Avg memory per vCPU**: The average memory per vCPU in GB. The total memory available for the vDC by the total number of vCPUs. When you want to use the CPU and memory resources to the full extent, the vServers must use this amount of resources.

Accept the default values and click **Next**.

8. Select **Static Block Storage Libraries** as the storage type for the root disk.

9. Select the SAN storage library you created.

10. Select **Static Block Storage Libraries** as the storage type for the volume and template.

11. Select the SAN storage library you created.

   Click **Next**.

12. Confirm the vDC configuration and click **Finish** to create the vDC. The vServers will run in this vDC, according to the vServer type.

### 32.3.2 Create the vDC account for PaaS

In creating the account, you allocate resources from the vDC to the account. The resource allocation for all the accounts in a vDC can be more than the actual resources in a vDC. This oversubscription of the resources must be planned. You must update the resources when the requirement increases.

1. Expand vDC Management on the Navigation pane.

2. Expand vDCs, select the new vDC, then click **Accounts**.
3. On the Actions pane, click **Create Account**.

4. Enter the name for the account: `ocadmin`. Click **Next**.

5. Specify the quotas of vCPU, Memory, and Storage for the account.
   For this PaaS account, specify the maximum capacity of each resource.

6. In the Number of private vNets field, enter the number of private vNets for this account, which is the same as the number of VLAN IDs assigned. Click **Next**.
7. Select the cloud user that you want to assign to the account. Use the right arrow key to add this cloud user to the list of Assigned Cloud Users. You can use the other arrow buttons to adjust the list. Do not assign the root user.

Click Next.

8. View the Summary and click Finish to create the account. When the job is completed, a new account is created.

### 32.3.3 Preparing the vServers

A vServer is an entity that provides the outward interface of a stand-alone operating system that consumes CPU, storage, and memory resources. A vServer has its own identity, local storage, interfaces, and configuration that exist for the full lifetime of the vServer. You determine the creation of new vServers according to the account quota limits and applications requirements.

When creating a vServer, the following account resources are required:

- **A vServer type**: vServer Types are profiles that define the computing resources such as virtual CPU, memory, and storage size. You select the best suitable vServer type from those available for the account. vServer types are visible to cloud users during the vServer creation process.
- **A server template**: Server templates designate the OS provisioning and OS configuration for the vServer. You can either select a server template from those that exist for the account or create a new server template.
- **One or more virtual networks**: For the vServer network connectivity you must choose one or more vNets from the available vNets or create new ones before creating a vServer. vServers are only assigned to virtual networks at vServer creation time.

#### 32.3.3.1 Create a new vServer Type

When you create a vServer type, the VM hosting details display the following information in the wizard based on the resources defined:

- The number of virtualization servers in the vDC that have sufficient physical resources to host a vServer with the selected resources.
• An estimation of number of vServers that can be hosted with the total number of physical resources of the vDC.
• A warning when the current value of the memory size exceeds the selected storage size.

1. Select the vDC and click **Create vServer Type** in the Actions pane.
2. Provide a name and description to identify the type. For example:
   - single instance DBAAS
   - RAC instance DBAAS
   - RAC big instance DBAAS
3. Add tags for identification and classification of the vServer type. Click **Next**.
4. Specify values for vCPU, memory and storage resources. Click **Next**. The minimum amount of RAM for Oracle Solaris 11.2 is 2 GB. For example, Table 32-1 shows the recommended values for the DBaaS instances deploying Oracle 12c Database.

<table>
<thead>
<tr>
<th>Type</th>
<th>RAM</th>
<th>root</th>
<th>vCPU</th>
</tr>
</thead>
<tbody>
<tr>
<td>single instance DBAAS</td>
<td>4 GB</td>
<td>45 GB</td>
<td>16</td>
</tr>
<tr>
<td>RAC instance DBAAS</td>
<td>5 GB</td>
<td>45 GB</td>
<td>16</td>
</tr>
<tr>
<td>RAC big instance DBAAS</td>
<td>12 GB</td>
<td>45 GB</td>
<td>16</td>
</tr>
</tbody>
</table>

5. Review the information provided and click **Finish** to create the vServer type.

### 32.3.3.2 Create a vServer Template

Create a vServer template from the new OS profiles you created: provisioning, which includes the update profile, and configuration.

1. Select the account in the vDC Management section.
2. Click **Create Server Template** in the Actions pane.
3. In the wizard, skip the introduction and click **Next**.
4. Enter the name and description for the server template. Click **Next**.
5. Select the new OS provisioning profile, then click **Next**.
6. Select the new OS configuration profile from the list, then click **Next**.
7. Review the information and click **Finish** to create the server template.

The new template is created and available to create vServers.

### 32.3.3.3 Create a Private vNet

Private vNet is a private virtual network set up exclusively for an account. The vServers associated with this vNet have private virtual IP address for internal communication. In this PaaS solution, only RAC instances use private networks.
1. Expand vDC Management on the Navigation pane.
2. Expand vDCs, select the new vDC, then click Accounts.
3. Select the account you created.
4. On the Actions pane, click Create Private vNet.
5. Enter the name and description for the private virtual network. Click Next.
6. Use the slide bar to set the value of the number of elements. The values entered are rounded up to the next value of 13, 29, 61, 125, 253, 509, 1021, 2045, 4093, and 8189. Do not use the values of 1 or 5. You cannot change the size of a network after it is created so specify the size needed to accommodate your current and future requirements:
   • The number of elements is also the maximum number of vServers that can be part of this vNet. Class C networks (for example, 10.0.0.1/24) enable you to create 256 vServers and Class 16C networks (for example, 10.0.0.2/20) enable you to create 4096 vServers.
   • Whether the vNets will be shared or dedicated. If multiple RAC instances will share one or more networks, set the network size to 509 and more. If each RAC instance will have a dedicated network, limit the network size to 29 or 13.
7. Click Next.
8. Review the Summary, then click Finish to create the private virtual network.

The new private virtual network is listed in the Networks and vDC sections of the Navigation pane.
9. Connect the IP address from this new private virtual network to the vServer, using *Connect Private vNet* icon in the Private vNets table.

**Note:**

If you have multiple vNets, connect each vNet one at a time. Wait for each job to complete before making the next connection.

### 32.4 Validate the Integration and PaaS

Test the connections from Enterprise Manager Cloud Control and Enterprise Manager Ops Center to the cloud user. In this test, create two vServers with the same storage and network resources. If successful, one vServer can send information to and receive information from the other vServer.

### 32.4.1 Create Volumes for vServer

Use the following procedure to create volumes from shared disks. In normal operations, Enterprise Manager creates the volumes.

1. Expand **vDC Management** in the Navigation pane.
2. Select the account from the vDC Accounts list.
3. Click **Create Volume** in the Actions pane.
4. Enter a name for the volume.
   Click **Next**.
5. Check the **Shared** option.

6. Enter the size of the volume.
   Click **Next**.

7. Review the volume information and click **Finish** to create the volume.

8. Delete the volume when the job has completed.

### 32.4.2 Create Test vServers

Create two vServers with the same private network.

1. Expand vDC Management in the Navigation pane.

2. Select the account from the vDC Accounts list.

3. Click **Create vServer** in the Actions pane.
   The Create vServer Wizard is displayed.

4. Enter the following information in the **vServer Details** step:
   - Name and description for the vServer.
   - Tags for better identification and classification of the vServer.
   - Number of vServers to create.
   - The High Availability Support option has no effect in the PaaS integration.
   Click **Next**.

5. Select a server template from the list. Click **Next**.

6. Select a vServer type from the list. Click **Next**.

7. Select one or more volumes from the Available Volumes list. Use the arrow keys to move the selected volumes to the Attached Volumes list.
   For this test, attach the same volume to both vServers.
   Click **Next**.

8. Select one or more vNets from the list. Click **Next**.

9. Select the Static method for assigning the IP address.

10. Assign the IP address from the new private virtual network to the vServer. Click **Next**.

   You can also perform this step after you create the vServer by clicking the **Connect vNet** icon on the account’s Networks tab in the Private vNet table.

   Do not select a distribution group. Click **Next**.

11. Specify a root password. Click **Next**.

12. Confirm the vServer information provided in the Summary and click **Finish** to launch the job to create the vServer.

   After the job completes, the vServer is created and listed in the Navigation pane. By default, the DNS and other naming information is taken from the selected vNet or server template and added in the `/etc/resolv.conf` file of the vServer.
32.4.3 Verify Shared Storage and Connectivity

To verify connectivity, create two vServers. From the console, log into one vServer and use the `ping` command with the IP address of the other vServer. This succeeds on public network or private network.

To verify shared storage:

- For a Fibre Channel SAN storage: `fcadm lu`
- For iSCSI SAN storage: `iscsiadm list target -S`

The Client Kit also contains the `new_vDC.ksh` script that can be useful for diagnosing problems. Enterprise Manager uses the file when it starts the integration, using the file path `/tmp/INPUT/bootstrap.xml` but you can also perform this manually.

**Note:**

After you finish testing, delete the `bootstrap.xml` file and the `oc-pass.txt` files because they contain security information such as passwords and URLs.

1. Create a file named `bootstrap.xml` in the following form and using your site’s information.

   ```xml
   <bootStrap version="1.0" name="boot_strap"
   xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:noNamespaceSchemaLocation="bootstrap.xsd">
   <!-- Ops-center details required to establish connection before running the ops center commands -->
   <opsCenterDetails>
   <opsCenterURL>https://<yourhostname>.com</opsCenterURL>
   <!-- OpsCenter credentials -->
   <opsCenterUser>ocadmin</opsCenterUser>
   <opsCenterHome>/opt/oracle/iaas/cli/</opsCenterHome>
   <!-- Stage location on Ops Center Host -->
   <opsCenterStageLoc>/tmp/</opsCenterStageLoc>
   </opsCenterDetails>
   </bootStrap>
   
   <!-- Ops-center details required to establish connection before running the ops center commands -->

2. Issue the following commands:

   ```bash
   -bash-4.1$ echo password > /tmp/INPUT/oc-pass.txt
   -bash-4.1$ /opt/oracle/paas/tools/new_vDC.ksh
   ```

3. Review the output:

   Certificate added to truststore /export/home/ocadmin/.oracle_iaas/truststore

   Vserver types
   4159 EXTRA_LARGE Logical Domain extra-large instance type for vDC PaaS_vDC 17179869184
   28
   4158 LARGE Logical Domain large instance type for vDC PaaS_vDC 8589934592
   24
   4157 SMALL Logical Domain small instance type for vDC PaaS_vDC 4294967296
   20
   `
32.4.4 Diagnosing Problems

If a virtual datacenter is unable to create vnets, edit the network domain to increase the limit of private networks it can provide simultaneously.

If control domains are already running and you change the fabric that supports the server pool, you will need to configure the Fibre Channel controller:

1. `fcadm hba-port`
2. Identify active ports.
3. `fcadm remote-port -p <each_portID_from_output>`
4. `# cfgadm -c configure <controller_to_be_configured>`
This chapter provides an introduction to the Dynamic Resource Provisioning and describes how to set up the virtual service adapter so that it can communicate with virtual data center. It contains the following sections:

- About Dynamic Resource Provisioning
- Configuring the Solaris SPARC Adapter

### 33.1 About Dynamic Resource Provisioning

Oracle Enterprise Manager Ops Center provides a centralized management and optimization system by which administrators can create virtual operating systems, virtual systems, or a virtual data center in a cloud. The Enterprise Manager Platform as a Service allows administrators to create platforms onto which users can deploy database and middleware applications. By using the Dynamic Resource Provisioning feature, Enterprise Manager can now interface with the Enterprise Manager Ops Center to add or remove resources on demand to a PaaS Cloud.

This reduces the administrator overhead required while planning and setting up large infrastructure services. With this feature, administrators can:

- Dynamically add or remove virtual hardware
- Extend or downsize DBaaS or MWaaS in an automated manner.

To expand the capacity of a private cloud, the cloud administrator must request hardware and software from the Enterprise Manager Ops Center infrastructure administrator. The infrastructure administrator provides the host, network, and storage details to the cloud administrator who then uses these details to setup the PaaS infrastructure in the cloud.

In earlier releases, these tasks had to be performed manually. In this release, several of the steps have been automated and the cloud administrator can increase or decrease capacity by just a few clicks. To set up DBaaS / MWaaS on Solaris SPARC, the following steps are required:

- The virtual data center must be configured. This involves setting up the networks, storage volumes, creating server templates, and defining sizes. See [Set Up and Configure a Virtual Data Center](#).
- The virtual machine adapter must be configured. See [Creating the Virtual Machine Adapter Instance](#).
- The administrator can launch the Provision or De-Provision wizard to increase or decrease the capacity of the pool. For:
  - DBaaS: See [Dynamically Provisioning Resources in a DBaaS Cloud](#).
  - MWaaS: See [Dynamically Provisioning Resources in an MWaaS Cloud](#).
33.2 Configuring the Solaris SPARC Adapter

The Solaris SPARC Adapter acts as an interface between Enterprise Manager and Enterprise Manager Ops Center and allows cloud and self service administrators to dynamically provision or de-provision resources in their private cloud setup. Resources can be added when additional service instances need to be provisioned or decreased if existing resources are not being utilized. Resources can either be infrastructure resources like hosts (based on virtual machines) or platform resources like database and middleware Oracle Homes.

To configure the virtual service adapter, follow these steps:

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>Link</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Adding the Stage Server</td>
<td>See Adding the Stage Server.</td>
</tr>
</tbody>
</table>

33.2.1 Adding the Stage Server

A staging server is a managed host that communicates with the Enterprise Manager Ops Center to perform one or more of the following tasks:

- **Query**: Query and retrieve configuration information for Solaris SPARC systems from the Enterprise Manager Ops Center Virtual Data Center.
- **Provision the Virtual Machines**: Access the Enterprise Manager Ops Center to perform provisioning operations such as creating virtual machines, reserving networks and allocating storage on virtual machines.
- **De-provision the Virtual Machines**: Access the Enterprise Manager Ops Center to perform de-provisioning operations such as releasing networks, IP addresses, and storage on virtual machines.

Any managed host can be used as the staging server if the Enterprise Manager Ops Center Client kit has been installed and available for the platform. The following platforms are supported:

- Linux_x86
- Solaris_x64
- Solaris SPARC 64

Before the staging server can communicate with Enterprise Manager Ops Center, the Ops Center Client must be installed. To communicate with Enterprise Manager Ops Center, specify the IP address of the Ops Center’s Enterprise Controller and the credentials for the cloud user account after configuring of the Ops Center Client, as described in Dynamic Resource Provisioning with Oracle VM Server for SPARC.

To add a stage server, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home.
2. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Virtual Adapters service family and click on the Stage Servers link.

3. Click Add on the Stage Servers page. The Add Stage Server window appears.

4. In the Host field, select a managed host that is to be used as the staging server.

5. Specify the directory in which the staging files are to be stored. This directory is used to stage and execute the scripts, store temporary data and results.

6. Specify the credential type which can be:
   - Named: Select a named profile for which the credentials have been defined.
   - New: Select this option to specify new credentials. Enter the user name, password, specify the Run privilege and click OK.

7. Click OK to add the stage server.

You can add one or more stage servers that can be used to communicate with Enterprise Manager Ops Center when the Solaris adapter instance is being created. When one of the stage servers goes down, the next available one will be used to communicate with Enterprise Manager Ops Center.

33.2.2 Creating the Virtual Machine Adapter Instance

A virtual machine adapter instance is a managed target which can be used as an interface with the Infrastructure provider system (Enterprise Manager Ops Center) to manage the client machines.

To create an virtual machine adapter instance, follow these steps:

1. From the Enterprise menu, select Cloud, then select Cloud Home.

2. From the Oracle Cloud menu, select Setup, then select Getting Started. Click the Setup link next to the Virtual Adapters service family and click on the Instances link.

3. Click Create. The Create Infrastructure Adapter: General page appears. Enter the name and description for the adapter.

4. Select the PaaS Infrastructure Zone with which the adapter is to be associated. Any virtual machine provisioned using this adapter will be added as a host member to the PaaS Infrastructure Zone selected here. A PaaS Infrastructure Zone can be associated with only one adapter instance.

5. Click Next. In the Create Infrastructure Adapter: Connection Details page, specify the following:
   - Ops Center Web Service URL: Enter the URL that is to be used to connect to the Enterprise Manager Ops Center server.
   - Ops Center Admin User: Enter the name of the administrator who will be accessing the Enterprise Manager Ops Center server. This user is created when the virtual data center is set up.
   - Password: Enter the password for the administrator.
   - Stage Servers: Click Add to select the stage servers that are to be used to execute scripts to perform various operations such as provisioning, querying, and so on. You must select the correct stage server for this adapter instance. For example, there may be two administrators managing two different virtual
data centers with different accounts and using separate stage servers for each of their accounts. In this case, it is important that the correct stage server is selected here.

6. Click **Next**. In the Placement Constraints page, specify the maximum number of virtual machines that can be provisioned.

7. Click **Next**. In the Characteristics page, specify the characteristics that will be applied to the virtual machine adapter target as target properties. When a new virtual machine is created, these properties will be applied.

8. Click **Submit**. A Solaris SPARC adapter instance that can be used to communicate with the virtualized resource provider system (Enterprise Manager Ops Center) is created. Along with the Solaris SPARC adapter instance, a default virtual machine service template is also created. This template can be modified and copied to create more service templates. These templates provide the structural definition for the virtual machines that will be created.

### 33.2.3 Editing the Virtual Machine Adapter Instance

To edit a virtual machine adapter instance, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**.

2. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. Click the **Setup** link next to the **Virtual Adapters** service family and click on the **Instances** link.

3. Select a virtual machine adapter instance from the list and click **Edit**.

4. You can edit the following:
   - Name and description of the adapter.
   - PaaS Infrastructure Zone: You can select a new PaaS Infrastructure Zone with which the adapter instance is to be associated.
   - Fetch Configuration: Select this check box to retrieve the latest configuration information such subnet, storage, and so on available with the adapter. If the configuration has changed, the existing service templates may become invalid and scheduled provisioning operations may need to be manually purged.

5. Click **Next**. In the Connection Details page, you can modify the connection details, add a new stage server or remove an existing stage server. Click **Next**.

6. Modify the Placement Constraints if required. Click **Next** and modify the characteristics you have defined for the adapter instance if necessary.

7. Click **Next** and review the information entered so far. Click **Submit** to submit the changes made to the adapter instance.

### 33.2.4 Deleting the Virtual Machine Adapter Instance

To delete a virtual machine adapter instance, select an instance from the list and click **Delete**. A confirmation message is displayed. Click **Yes** to confirm and delete the adapter instance.
33.2.5 Creating the Virtual Machine Service Template

The virtual machine template describes the virtual machine configuration that can be used to provision a virtual machine on the infrastructure adapter instance.

This template can be used in the following cases:

- When the administrator chooses to provision the virtual infrastructure.
- When auto provisioning is not part of the service request. (This feature is available only for Middleware as a Service).

To create the virtual machine template, follow these steps:

1. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**.
2. From the **Oracle Cloud** menu, select **Setup**, then select **Getting Started**. Click the **Setup** link next to the **Virtual Adapters** service family and click on the **Service Templates** link.
3. Click **Create**. The General page appears. Enter the name and description for the template and click **Next**.
4. In the Characteristics page, specify the characteristics that will be applied to the virtual machines that will be provisioned using the Solaris SPARC adapter.
5. Click **Next**. In the Solaris Adapter page, click **Add** to select the Solaris SPARC Adapter with which the service template is to be associated.
6. Click **Next**. The Virtual Machine Configuration page appears. Depending on your use case (single instance, RAC, or middleware), the configuration details you specify will be different.

Enter the virtual machine configuration details:

- **Host Name Prefix**: Enter a prefix for the host name. This is a logical name used to group hosts of a certain request type.

- **Instance Size**: The list of available virtual machine hardware configurations (memory, CPU, and storage) are listed. The configurations are retrieved from the Enterprise Manager Ops Center when the Solaris adapter is registered. Select the configuration that best suits your requirements based on how much CPU, storage, and memory is required to run the operating system, the software that is to be deployed, and extra space for maintenance.

  If all configurations are selected, they will be displayed when the request is submitted.

  For example, if the operating system requires 2GB, the Database Home to be deployed requires 2GB, and the maintenance space (3.5 times the Database Home) + expected data to be stored (1GB), you must select at least 10 GB size.

- **Server Template**: The server template defines the operating system image being used. When you select a server template, configuration details such as...
virtual machine templates, virtual machine sizes, networks, and storage volumes that are accessible and available to the administrator are retrieved from the Enterprise Manager Ops Center. To maintain consistency across the software pool, all the Oracle homes in the pool must be of the same type and are expected to use the same operating system image.

Sample XML: Server Template

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<result xmlns="http://www.oracle.com/xml/ns/iaas"
xmlns:xsi="http://www.w3.org/2001/XMLSchema-instance"
xsi:type="DescribeServerTemplatesResult" requestId="8886">

    <vcpu>8</vcpu>
  </items>
</result>
```
• Networks: The list of available networks or VNET IDs are displayed. Select the public and private network interface for the virtual machine that is to be created. Multiple private and public networks can be available and you must decide which network is to be used for virtual machines created using this service template. For example, choose a network that has sufficient IP addresses available.

  – Single Instance Database: If you are defining a service template that will be used create virtual machines for single instance databases, specify Public Network Details.

  – RAC Database: If you are defining a service template that will be used to create virtual machines for cluster databases, specify Public Network Details and select public networks for virtual machines, Host IP, Scan IP, and Virtual IPs. For private interconnect, select Private Network Details and specify a private network with sufficient IP addresses available.

  – Middleware: If you are defining a service template that will be used to create virtual machines for middleware as a service specify the Public Network Details.

Sample XML: Networks

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<result xmlns="http://www.oracle.com/xml/ns/iaas"

</result>
```
• Storage: Select shared and local storage for the virtual machine that is to be created. By default, all the available resources are selected. You must select the storage that best meets your requirement or can specify the storage details while submitting the request.

   **Note:** Shared Storage (RAW) is applicable for RAC databases.

   For example, if you are creating this service template to provision a RAC database, you must select an instance size with sufficient storage.

Sample XML: Storage

```xml
<?xml version="1.0" encoding="UTF-8" standalone="yes"?>
<result xmlns="http://www.oracle.com/xml/ns/iaas"

   </items>
</result>
```

7. In the Host Configuration region, specify the Owner for the Host and Agent targets.

8. In the Agent Configuration region, select the **Push EM Agent** check box to deploy the Management Agent on the virtual machine and specify the following agent configuration details:
   - Platform: Select Oracle Solaris on SPARC (64-bit) platform.
• Port: Enter the port used for the Management Agent process. If no value is specified, then either 3872 or any free port between 1830 and 1849 will be used.

• Base Location: Specify the full path to the directory in which the Management Agent is to be installed. Ensure that the Base Location you specify in the response file is empty and has write permissions. This is a mandatory field.

• Privilege Delegation Settings: Specify the privilege delegation settings. See the Enterprise Manager Cloud Control Basic Installation Guide for more details.

• Pre and Post Installation Scripts: These shell scripts can be used if any custom operations need to be performed on the virtual machines. These scripts must be present on the host on which the Oracle Management Service is running or on the virtual machine.

  **Note:** The script will be present on the virtual machine only if it was bundled with the OS image.

• Credentials: Specify Named or New credentials.

9. Click **Next**. The Review page appears. Review the details entered so far and click **Submit** to create the virtual machine template.

After the virtual service adapter has been created and configured, you can associate it with software pools to provision virtual machines.
Dynamically Provisioning Resources in a DBaaS Cloud

This chapter describes the process of adding or removing resources based on demand to a DBaaS Cloud. It contains the following sections:

- Provisioning Resources
- De-Provisioning Resources

34.1 Provisioning Resources

After you have set up and configured the virtual service adapter, you can dynamically add or remove virtual resources to your DBaaS cloud whenever required.

Prerequisites

- The stage server must be identified. See Adding the Stage Server
- The Enterprise Manager Ops Center Client Kit must be deployed on the host that is being managed by Enterprise Manager.
- The Solaris Sparc Adapter instance must have been created and configured. See Creating the Virtual Machine Adapter Instance.

To provision new virtual resources in a DBaaS cloud, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Resource Providers. The list of existing resource providers is displayed. You can select one of the following:
   - Database Pool: If you select a database pool, when the provisioning procedure has been completed, a virtual machine is created, the Management Agent, and Database Software is deployed on the virtual machine (either by using an image if the pool is subscribed to it or by using a reference home in the pool), and the Oracle Home is added to the pool. The capacity of the pool is now increased.
   - PaaS Infrastructure Zone: If you select a PaaS Infrastructure Zone, when the provisioning procedure is completed, a virtual machine is created, the Management Agent is deployed, and a host is added to the pool.
4. Select one of the above resource providers from the list. From the Resources menu, select Provision.
5. In the General page, in the Execution Name field, enter a name for the provisioning procedure.

The virtual machine adapter with which this pool is associated is displayed.
6. In the Resources to be Provisioned field, enter the number of virtual machines that are to be provisioned.

7. Click **Next**. The Virtual Machine Configuration page appears.

   In the Service Template drop down field, select the Solaris Adapter service template from the list. The configuration details defined in the service template are displayed and can be modified.

   For example, the service template used for a RAC database requires a private network along with a public network for scan and virtual IPs. You can select the correct template, VM size, network, and storage to create a stand alone virtual machine or a multi node network set up for clustered data using this example. For a detailed description of the fields, see Creating the Virtual Machine Service Template

   For a single instance database, you must consider the database size while selecting the virtual server type. The size guidelines you need to follow for single instance database are as follows:

   \[ \text{SIDB VM size} > \text{OS size} + (3.5 \times \text{Oracle home size}) + \text{expected data size} \]

   For RAC databases, you must use the following sizing guidelines:

   \[ \text{RAC VM size} > \text{OS size} + (3.5 \times \text{Oracle home size}) \]

   In the case of RAC databases, data is stored on shared disk using ASM.

8. Click **Next**. If you are provisioning a RAC machine, specify the cluster name and the network from which the Scan IP is to be allocated. The Scan IP is allocated dynamically from the pool of IPs in this network.

9. Click **Next**. Specify the schedule for the provisioning procedure and click **Next**.

10. Review the information and click **Submit** to submit the provisioning job.

### 34.2 De-Provisioning Resources

You can remove or de-provision resources from your DBaaS cloud by following these steps:

1. Log into Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.

2. From the **Enterprise** menu, select **Cloud**, then select **Cloud Home**. The Cloud Home page appears.

3. From the **Oracle Cloud** menu, select **Resource Providers**. The list of existing resource providers is displayed.

4. Select a Database Pool or a PaaS Infrastructure Zone from the list. From the **Resources** menu, select **De-Provision**.

5. Enter a name and description for the procedure.

6. In the Resources to De-Provision region, click **Add** and select one or more Oracle homes to be de-provisioned.

   - **Single Instance Database**: You must select the Oracle homes that are to be deleted. All virtual machines hosting these Oracle homes will be deleted.
   - **RAC Database**: You must select all the Oracle homes that are part of the cluster. This will delete all virtual machines that are part of the cluster.
7. Click **De-Provision** to submit the job. The selected Oracle homes will be deleted and the virtual machines will be de-provisioned.
35

Dynamically Provisioning Resources in an MWaaS Cloud

This chapter describes the process of adding or removing resources based on demand to an MWaaS cloud. It contains the following sections:

• Provisioning Resources
• De-Provisioning Resources
• Enabling Dynamic Resource Provisioning

35.1 Provisioning Resources

After you have set up and configured the virtual machine adapter, you can dynamically add or remove virtual resources to your MWaaS cloud whenever required.

Prerequisites

• The stage server must be identified. See Adding the Stage Server.
• The Enterprise Manager Ops Center Client Kit must be deployed on the stage server.
• The Solaris Sparc Adapter instance must have been created and configured. See Creating the Virtual Machine Adapter Instance.

To provision new virtual resources in a MWaaS cloud, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Resource Providers. The list of existing resource providers is displayed.
4. Select a middleware pool from the list. From the Resources menu, select Provision.
5. In the General page, the virtual adapter instance with which the middleware pool is associated is displayed.
6. In the Execution Name field, enter a name for the provisioning procedure.
7. In the Resources to be Provisioned field, enter the number of virtual machines that are to be provisioned.
8. If dynamic provisioning has been enabled for this middleware pool, the Turn on Dynamic Provisioning flag is selected. If it has not been enabled, you can select the flag and enable it here. See Enabling Dynamic Resource Provisioning.
9. Click Next. The Virtual Machine Configuration page appears.

Enter the following details:
• Virtual Machine Template: Select the virtual machine template. This is the virtual adapter service template that was created while setting up the virtual service adapter. See Creating the Virtual Machine Service Template. Based on the template selected, the default virtual machine configuration is displayed. The configuration details can be modified.

10. Click Next. Specify the schedule for the provisioning procedure and click Next.
11. Review the information and click Submit to submit the provisioning job.

35.2 De-Provisioning Resources

You can remove or de-provision resources from your MWaaS cloud by following these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Cloud menu, select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Resource Providers. The list of existing resource providers is displayed.
4. Select a middleware pool from the list. From the Resources menu, select De-Provision.
5. Enter a name and description for the procedure.
6. In the Resources to De-Provision region, click Add and select one or more hosts to be de-provisioned.
7. Click De-Provision to submit the job and remove the selected hosts.

35.3 Enabling Dynamic Resource Provisioning

You can enable dynamic provisioning for a middleware pool. If dynamic provisioning is enabled, when a self service user requests for a middleware service (WLaaS, JVMaaS, SBaaS, SOAaaS), virtual machines are automatically provisioned. Similarly, when the self service user no longer requires the virtual machine, it is automatically de-provisioned.

To enable dynamic provisioning, follow these steps:

1. Log into Enterprise Manager as a user with the EM_SSA_ADMINISTRATOR role.
2. From the Enterprise Manager menu, select Cloud, then select Cloud Home. The Cloud Home page appears.
3. From the Oracle Cloud menu, select Resource Providers.
4. Select a middleware pool and from the Resources drop down menu, select Dynamic Provisioning and then select Turn On.
5. In the General page, the virtual machine adapter with which the resource provider is associated is displayed. See Creating the Virtual Machine Adapter Instance.
6. In the Resources to be Provisioned field, enter the number of resources that are to be provisioned with the specified configuration. The number of servers specified in the middleware profile used in the service template will override the value specified here. Click Next. The Virtual Machine Configuration page appears.
7. In the Service Template field, select the virtual machine template from the drop down list. The configuration details as defined in the template are displayed. You can use the selected service template configuration or modify it if required. See Creating the Virtual Machine Service Template for details.

8. Click Next. Review the information entered so far and click Save to save the configuration. The saved configuration will be applied on all virtual machines provisioned by the self service user.

35.3.1 Disabling Dynamic Provisioning

You can disable dynamic provisioning for a specific resource provider. Select a middleware pool for which dynamic provisioning has been enabled and from the Resources drop down, select Dynamic Provisioning, and then select Turn Off. A confirmation message is displayed. If you select Yes, dynamic provisioning will no longer be enabled for the selected resource provider.
Part XIII

JVM Diagnostics as a Service

This section describes the process to enable and use JVM Diagnostics as a Service. It contains the following sections:

• Setting Up JVM Diagnostics as a Service
• Using the JVM Diagnostics Self Service Portal
Setting Up JVM Diagnostics as a Service

This chapter describes the procedure to set up and enable JVM Diagnostics as a Service. It covers the following:

- About JVM Diagnostics as a Service
- Users and Roles
- Setting Up JVMDaaS
- Defining and Allocating Quotas
- Monitoring the JVMDaaS Environment

36.1 About JVM Diagnostics as a Service

JVM Diagnostics as a Service (JVMDaaS) enables IT organizations to provide JVM Diagnostics functionality in a self service manner and monitor JVMs within a Web based portal. The JVMs being monitored can either be monitored targets in Enterprise Manager or remote targets.

For example, a development organization may want to provide JVM Diagnostics functionality to its developers and QA personnel. The system administrator can provide this service through JVMDaaS. This helps reduce the organization cost by enabling developers and QA personnel to complete development tasks faster as JVM Diagnostics is easily accessible on any instance they are working on. Since the self service approach is used, there is no increase in the workload of the system administrator.

36.2 Users and Roles

Oracle Enterprise Manager supports different classes of Oracle users, depending upon the environment you are managing and the context in which you are using Oracle Enterprise Manager. User privileges provide a basic level of security in Enterprise Manager. They are designed to control user access to data and to limit the kinds of SQL statements that users can execute. When creating a user, you grant privileges to enable the user to log in to Enterprise Manager, to view and monitor targets, view various reports, monitor JVMs, and so on.

A role is a collection of Enterprise Manager resource privileges, or target privileges, or both, which you can grant to administrators or to other users. Based on the role to a user or administrator, the user will be granted the appropriate privilege in the Enterprise Manager environment. These roles can be based upon geographic location (for example, a role for Canadian administrators to manage Canadian systems), line of business (for example, a role for administrators of the human resource systems or the sales systems), or any other model. By creating roles, an administrator needs only to assign the role that includes all the appropriate privileges to his team members instead of having to grant many individual privileges.
Before using JVMDaaS, the Super Administrator must create users for the following roles:

- **EM_SSA_ADMINISTRATOR**
  Users with this role can define quotas and constraints for the self service users and grant them access privileges. Users with this role also have provisioning and patching designer privileges that allow them to create and save deployment procedures, create and view patch plans, and support the plug-in lifecycle on the Management Agent. These privileges are required for initial setup and ongoing maintenance of the infrastructure.

- **EM_SSA_ADMINISTRATOR_BASE**
  Users with this role can set up the Self Service Portal. Users with this role can define quotas and constraints for self service users and grant them access privileges.

- **EM_SSA_USER**
  Users with this role can access the Cloud JVM Diagnostics Service and all service families and types available.

- **EM_SSA_USER_BASE**
  Users with this role can access the Self Service Portal without access to any service family and type available. This needs explicit grant of service family and type. This role is frequently used in production environments.

### 36.3 Setting Up JVMDaaS

This section explains how to set up JVM Diagnostics as a Service. However, before you perform the setup tasks, you must ensure you have the necessary prerequisites.

Users with the **EM_SSA_ADMINISTRATOR** and **JVMDAAS** role must have been created. See [Creating Users and Roles](#).

To set up JVMDaaS, follow these steps:

1. Log in to Enterprise Manager as a user with the **EM_SSA_ADMINISTRATOR** role.
2. From the [Enterprise](#) menu, select **Cloud**, then select **JVM Diagnostics Home**.
3. Click the **Quotas** tab to allocate quota to one or more users with **JDAAS** role. See [Defining and Allocating Quotas](#).
4. Click the Home tab to manage and monitor the JVM Diagnostics Agents. See [Monitoring JVM Diagnostics Agents and Engines](#).

### 36.4 Defining and Allocating Quotas

In JVMDaaS, quotas represent the maximum number of JVMs you can monitor using JVMDaaS. Users with the **EM_SSA_ADMINISTRATOR** role can define quotas for self service users.

The following prerequisites are required:

- You must have created a user with the **EM_SSA_ADMINISTRATOR** role. This user must have the **EM_SSA_ADMIN** and JVM Diagnostics Administrator privileges.
- You must have created one or more users with the **JVMDAAS** role.
To set up quotas, follow these steps:

1. Click the **Quotas** tab. This page shows the list of roles and the maximum number of JVMs allocated to each role.

2. Click **Create**. In the Create Quota window that appears, specify the following:
   - **Role Name**: Specify the `EM_SSA_USER` role to which the quota is to be allocated.
   - **JVMs**: Specify the maximum number of JVMs or the quota that will be available to the selected role.
   - **JVMD Engine**: Specify the URL of the engine where you want the JVMD agent to connect to.

3. Click **OK** to create the quota and return to the JVM Diagnostics Cloud Self Service Portal Setup page. The quota (JVM pool) with the specified number of JVMs is listed in the Quotas page.

You can edit or delete a quota by selecting the name of the role to which the quota has been assigned and clicking the **Edit** or **Delete** option as required.

**Note:**

If you modify a quota that contains active JVMs, the new quota will be applicable only to the new JVM connections. The existing JVMs will continue to use the old quota.

### 36.5 Monitoring the JVMDaaS Environment

As the JVMDaaS administrator, use the JVM Diagnostics page to check the status of the entire JVMDaaS environment. You can also use this page to perform administrative operations like adding, editing, and deleting quota.

Click on the **Home** tab to view the JVM Diagnostics Home page. It contains the following regions:

- **Overview**: This region shows the total number of JVM Pools and JVMs for which quota has been allocated. It shows the number of active and deactivated JVMs.
- **JVM States**: This region shows a chart with the various states of the JVM.
- **Activated JVMs**: The region shows the number of the current active JVMs.
- **JVMs by Users**: This region is a tree based structure where JVMs are grouped based on their owners. This section lists the JVM User statistics including: member status summary (up, down, unknown), JVMs, whether the JVM is activated, owner of the JVM, and creation date of the JVM.
- **JVMD Engines**: This region lists the JVMD engines. Data includes the host on which the engine resides, port, SSL port, status, number of JVMs, and version of the engine.

**Quota**
Quota refers to the maximum number of JVMs a user (with a given Role) can monitor through JVMDaaS. If the user has been assigned more than one role, his quota will be the maximum quota from the roles assigned to him.

From this tab you can create quota by providing the number of JVMs and the JVMD engine. You can also edit and delete quota for a role.

**Engine Usage**

On this tab, you can view:

- **Engine Usage Graph**: Graphical view of the various JVMD engines deployed along with the number of JVMs allocated to the engine through Quota.

- **JVMD Engines Usage**: This region lists for each JVMD Engine and role, the quota, user count, and JVMs allocated to the engine.
Using the JVM Diagnostics Self Service Portal

This chapter explains how to access the JVM Diagnostics self service portal. It covers the following:

• Using the JVM Diagnostics Cloud Self Service Portal

• JVM Home Page

37.1 Using the JVM Diagnostics Cloud Self Service Portal

The JVM Diagnostics Cloud Self Service Portal allows self service users to view and monitor the JVMs allocated to them. To view this page, follow these steps:

1. Log in to Enterprise Manager as a user with the EM_SSA_USER role. The All Cloud Services page appears.

2. Click the JVM Diagnostics Cloud Services link. The page contains the following regions:

• **Usage**: This region shows the total number of JVMs allocated to the self service user. It also shows the number of available JVMs, and active and deactivated JVMs.

• **Getting Started**: This region contains links to conceptual topics.

• **My JVM Diagnostics**: This region lists the JVMs which are being monitored through JVMDaaS. The list includes both activated and deactivated JVMs.

Activated JVMs are ones which are being monitored. Deactivated JVMs are ones on which you have deployed the JVMD agent but preferred not to monitor the JVMD agent at this time.

The following actions can be performed:

– **Download Agent**: Before you can monitor the JVM, click Download Agent to download the JVM Diagnostics Agent .war file and deploy it on the Application Server that is to be monitored.

**Note:**

The quota assigned to the self service user must be greater than 0.

– **Remove**: Select a JVM and click Remove.
Note:
Before you remove the JVM, you must undeploy the JVM Diagnostics Agent from your application server. If it is not undeployed, the JVM Diagnostics Agent will reconnect and start monitoring the JVM again.

- **Activate**: After the .war file has been deployed, select a JVM and click **Activate** to start monitoring it.
- **Deactivate**: Select a JVM and click **Deactivate** to stop monitoring the JVM.
- Click the **Name** link to drill down to the Java Virtual Machine Home page. The Java Virtual Machine Home page provides a summary view of the JVM and displays the real time thread states. Click the **My JVM Diagnostics** link to return to the JVM Diagnostics Cloud Service page.

### 37.2 JVM Home Page

The JVM Home page displays the following details:

- **Summary**: Shows details of the JVM such as the JVM Pool to which it belongs, the host, JVM version, vendor, heap size, agent optimization level, and agent log level details.
- **Realtime Thread States**: Shows the state of the various threads in the JVM in the color coded columns. The current activity of the JVM including CPU usage, memory, number of threads waiting for a database response, network response, or number of threads waiting for synchronization lock, and number of idle threads are displayed. Click on a JVM to view the list of threads in the JVM and the details of each thread.
- **Active Threads**: The number of active threads in the JVM in the last 24 hours.
- **Top Requests**: Shows the top requests over the last 24 hours.

From this page, you can navigate to the following pages:

- JVM Performance Diagnostics: Shows the performance diagnostics data for the JVM.
- Live Thread Analysis: Shows the real time JVM data for the selected JVM.
- Cloud Self Service Portal: Takes you back the JVM Diagnostics Cloud Self Service Portal.
- Request Instance Diagnostics: Provides a detailed view of the JVMs, Requests, and Request Thread Instances that have participated in the execution of the selected Execution Context ID (ECID).
- Thread Snapshots: Provides details of the selected thread. Details can include: resource usage, thread states, call stack information, and so on.
- Heap Snapshots: Provides a snapshot of JVM memory which includes a view of all objects in the JVM along with the references between those objects.
• Class Histogram: Displays a list of saved histograms with details such as date on which the snapshot was taken, Snap ID, Timestamp, JVM Name and Version, and Description.

• JFR Snapshot: Provides information on the inner workings of the JVM as well as on the Java program running in the JVM.

• Memory Diagnostics: Provides the details regarding current memory pool usages and the garbage collections statistics.

• Java Workload Explorer: Provides a detailed view of all performance statistics associated with the JVM target.
Enabling Testing as a Service (TaaS)

This section provides an overview of Testing as a Service (TaaS), describes the configuration steps, and the testing self service portal.

This part contains the following chapters:

- About Testing as a Service
- Setting Up Testing as a Service
- Using the Testing as a Service Portal
About Testing as a Service

Testing as a Service (TaaS) is a cloud-based platform for delivering automated application testing services. It is a self-service solution designed for private clouds that:

- Orchestrates the testing process end-to-end by automating the provisioning of test labs including applications under test and test tools.
- Executes load and/or functional test scripts against the application.
- Provides rich application monitoring and diagnostics data for analysis.
- Has sophisticated chargeback facility for metering and charging the usage of the testing cloud by end-users.

Delivered through Enterprise Manager Cloud Control, TaaS makes it possible to significantly reduce testing time and costs without compromising quality and enables organizations to be more agile in delivering critical business applications to their users.

Key TaaS features include:

- Self-service portal for executing application load and functional tests.
- Test library with full access and security controls which stores all the test assets (scripts, databank files, scenario description and user configurable parameters) available to end users.
- On-demand automated provisioning of complete test labs that includes ability to deploy complex multi-tier applications, test tools, and test scripts. Pre-built assembly for Oracle Load Testing, Oracle Functional Testing, as well as custom test driver.
- Sharing of cloud hardware resource pools to help maximize hardware utilization while abiding by security policies.
- Integrated and rich application monitoring and diagnostics for middle tier and data tier, to ensure detection of bottlenecks and problems for the application under test.
- Resource metering and chargeback for tests that require to be charged to cost centers. These metering capabilities allow for tracking and charging for compute resources used.

38.1 TaaS Roles

There are three roles used in TaaS: Test Administrators, Test Designers, and Testers. The following sections describe these roles in more detail.

- Test Administrators
- Test Designers
- Testers
38.1.1 Test Administrators

TaaS enables Test Administrators to manage the application infrastructure for testing activities, define user activities for self-service testing, and manage test environments and test assets. See Figure 38-1.

Figure 38-1 Testing Cloud Administration Activities

From TaaS, the Test Administrator can:

- Set Up Applications
- Set Up Test Drivers
- Set Up Quotas
- Publish to User Roles
- Set Up Chargeback Service

38.1.2 Test Designers

TaaS enables Test Designers to create test assets and test environments that can be made available to users to perform testing activities. Test Designers create test scripts and testing scenarios by using the test drivers native capabilities. These scenarios include which parameters are configurable at run-time. See Figure 38-2.
From TaaS, the Test Designer can:

- Create Test Assets
- Create Test Environments

### 38.1.3 Testers

TaaS allows Testers to create tests from test assets and test environments that have been published to them by the Test Administrator. The Tester runs trials based on the test asset and environment, monitors ongoing trials, and analyzes the results of completed trials. The Tester can apply patches to an environment and rerun the trials to compare the results and determine how changes to the environment affect key metrics and overall performance. See Figure 38-3.
Figure 38-3  Testing Cloud End User Activities

From TaaS, the Tester can:

- **Verify Available Test Assets and Environments**
- **Create Tests**
- **Create and Run Trials**
- **Share Tests**
- **Monitor On-Going Trials**
- **Report and Compare Trial Data** from Previous Trials
- **View Activity and Usage Information**
- **View Deployment Information**
Setting Up Testing as a Service

This chapter provides an overview of the steps involved in setting up testing as a service (TaaS).
Many of these setup tasks are also required to use Infrastructure as a Service; if you have already set up IaaS, you will have already completed many of these tasks. This chapter contains the following sections:

• Getting Started
• Creating Test Administrators
• Creating an Assembly Component
• Creating a Deployment Plan

39.1 Getting Started

The table below provides an overview of TaaS setup tasks.

Table 39-1   Getting Started with TaaS

### 39.2 Creating Test Administrators

Follow these steps to create Test Administrators:

1. Log in to Enterprise Manager as a Super Administrator or a user who has privileges to create a new administrator.
2. From Setup, select Security, then select Administrator.
3. Create the TAASADMIN administrator with the EM_SSA_ADMINISTRATOR role.
4. Create the TAASDESIGNER administrator with the EM_TAAS_DESIGNER role.
5. Create the TAASUSER administrator with the EM_SSA_ROLE.

### 39.3 Creating an Assembly Component

To create a VT assembly, perform the following steps:

1. From the Enterprise menu, select Provisioning and Patching, then select Software Library.
2. Select the Root directory. Select Actions then select Create Folder.
3. Select the directory which has write access. From the Actions menu, select Create Entity, then select Virtualization.
4. Select Assembly as the type and click OK.
5. Provide the required value and click Next.
6. Select the upload mechanism. Click OK.

7. Click Add button to enter file name and click OK.

8. Continue to click Next until you are on the Review page and click Save and Upload.
   If you are uploading a file from the OMS or Agent, then you need to Upload Files to a destination where you want the files to be uploaded.

### 39.4 Creating a Deployment Plan

Perform the following steps to create a Deployment Plan:

1. From Enterprise menu, select Cloud, then select Infrastructure Home.

2. In the right panel, select a zone and right click.  
   **Note:** A Deployment Plan created from Zone is the only supported option. (If the deployment plan is created from Server Pool or Oracle VM Server, that deployment plan is not visible in TaaS.)

3. Select Deploy Assembly. Select the Assembly created in the Software Library or assembly directly imported in the storage repository. Click Next.

4. On the Assembly Deployment: Network and Agent page, select Enable Agent Push Configuration. The push means that the Enterprise Manager Agent will be pushed from Enterprise Manager after OVM creation.

5. Provide the Installation Base Directory, Platform, User Name, and Password.

6. Click Save as Plan. Provide the name of the plan and select the software library folder. Any other information to provide depends on the assembly you want to install.
Using the Testing as a Service Portal

After the TaaS environment has been setup, Test Administrators and Test Designers must perform their up front tasks before the Tester can start testing. In general, the tasks are:

- **Test Administrator** gives access and quotas for environments on the cloud, test assets, and virtual user test limits for the Oracle Load Testing test driver.
- **Test Designer** creates test assets (pre-packaged test scripts and scenarios) and test environments (templates for application-under-test, based on Oracle Assemblies) for users to consume.
- **Tester** is the consumer of the test assets and test environments for testing created by the Test Designer. The Tester also plans, executes, and analyzes the test results.

### 40.1 Prerequisites

Ensure the following prerequisites are met when using the Testing Cloud Self Service Portal.

**Before You Do Anything**

- Ensure Enterprise Manager Cloud Control is set up to manage the cloud environment.
- Ensure Self Service Application Plug-in is installed because Testing as a Service is part of the SSA plug-in.

**Prerequisites Specific to Test Designer**

- Has the privileges to access the Testing as a Service (TaaS) Test Designer options. This user must have the `EM_TAAS_DESIGNER` role.
- Must have knowledge about what applications are to be tested using Enterprise Manager and their structure (such as database servers, application servers, and configurations for the servers.)
- Has created test scripts using the Oracle Application Testing Suite scripting tool OpenScript, the Oracle Load Testing scenario, and the self-contained .scnzip file, and the Oracle Functional Testing scenario with its self-contained .zip file. For information on how to create and record scripts, refer to the Oracle Application Testing Suite documentation available by downloading the documentation set from:  
- Must be familiar with Enterprise Manager Cloud Control features.
• Has created Test Assets based on scripts and scenarios for Oracle Load Testing, Oracle Functional Testing, or other test drivers and Test Environments based on Oracle assemblies.

• Has deploy privileges over the Cloud Zones, otherwise he cannot create deployment plans.

• Has access to the Cloud Infrastructure.

**Prerequisites Specific to Test Administrator**

• Has the privileges to access the Testing Cloud Self Service Portal Test Administrator options. This user must have the EM_SSA_ADMINISTRATOR role.

• Must have knowledge about what applications are being deployed, managed, and tested using Enterprise Manager and their structure (such as database servers, application servers, and configurations for the servers.)

• Must have basic DB administration knowledge and have a good understanding of virtualization technologies.

• Must be familiar with Enterprise Manager Cloud Control features.

• Ensures that the Test Designer has created Test Assets and Test Environments.

• Ensures that the Testers have the privileges to access the Testing Cloud Self Service Portal user options.

• Publishes the test assets, test environments, and test drivers to the Tester role and the EM_SSA_USER role.

• Has deploy privileges over the Cloud Zones, otherwise he cannot create deployment plans.

• Has access to the Cloud Infrastructure.

**Prerequisites Specific to Tester and SSA Users**

• Must have the EM_SSA_USER role.

• Ensures that the Test Designer has created Test Assets and Test Environments.

• Ensures that the Test Administrator has assigned Test Assets, Test Environments, and Test Drivers to the Tester role (EM_SSA_USER).

• Has the privileges to access the TaaS Tester options.

• Has the privileges to access the Testing Cloud Self Service Portal user options.

• Must be familiar with Enterprise Manager Cloud Control features.

---

### 40.2 Test Administrator Tasks

Enterprise Manager allows TaaS Test Administrators to manage the application infrastructure for testing activities, define user activities for self-service testing, and manage test environments and test assets.

Specific responsibilities include:

• Manage the test drivers.

• Manage user roles and access to test drivers (specify which users have access to which plug-in.)

• Manage access to test environments and test assets based on users and roles.
• Assign the OVM and Zone privileges to the following roles and users:
  – OVM - View privilege to Test Designer and Test Administrator
  – Zone - Operator privilege to Test Designer and Test Administrator

Since TaaS cannot know before hand the zones and Oracle Virtual Machines present in user deployments, the Super Administrator, Cloud Administrator, or respective target owner will decide which zones and Oracle Virtual Machines are to be used.

The following tasks are performed by the Test Administrator.

• Setting Up Application Types
• Setting Up Oracle Load Testing Test Drivers
• Setting Up Oracle Functional Testing Test Drivers
• Setting Up Custom Test Driver Types
• Setting Up Quotas
• Publishing Test Environments, Test Assets, and Test Drivers
• Setting Up Chargeback Service

40.2.1 Setting Up Application Types

The Testing Cloud Self Service Portal allows Test Administrators to manage the application infrastructure for testing activities, define user activities for self-service testing, and manage test environments and test assets. Specific responsibilities include:

• Manage the test drivers.
• Manage user roles and access to test drivers (specify which users have access to which plug-in.)
• Manage access to test environments and test assets based on users and roles.
• Assign the OVM and Zone privileges to the following roles and users:
  – OVM - View privilege to Test Designer and Test Administrator
  – Zone - Operator privilege to Test Designer and Test Administrator

Since TaaS cannot know before hand the zones and Oracle Virtual Machines present in user deployments, the Super Administrator, Cloud Administrator, or respective target owner will decide which zones and Oracle Virtual Machines are to be used.

Note: Ensure the prerequisites are met before using the Testing Cloud Self Service Portal (see Prerequisites).

Follow this process to set up application types to be tested.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Test Administrator credentials.
2. From the Setup menu, select Cloud, then select Testing. The Test Administrator page appears.
3. Click Application Types located in the left panel to define application types.
4. Click **Add** to define the name and description of the application type to make available for testing.

5. Define the name and description and click **Save**.

### 40.2.2 Setting Up Test Drivers

A Test Driver is the package of software that Enterprise Manager uses to generate tests or workload against test systems based on a deployment plan.

Oracle provides two types of drivers: Oracle Load Testing and Oracle Functional Testing. The Oracle Load Testing test driver is used for load, scalability, and stress testing. This allows you to simulate hundreds or thousands of users using the software at the same time. Oracle Functional Testing test driver is used for functional and regression testing.

Since Oracle Load Testing and Oracle Functional Testing are created by Oracle, Oracle knows the specifics of the test drivers and provides seamless integration to these drivers.

You can register your own type of test drivers as long as you can build a deployment plan around your assembly which contains the testing product and software. However, when you create a custom test driver, you need to direct your scripts on how to launch and monitor your tests.

The Custom Test Driver allows Testers to use test tools from third party vendors together with TaaS. Use Custom Test Driver Types to define and register test-driver types which meet your specific testing needs.

The following sections explain how to register specific test drivers.

- Setting Up Oracle Load Testing Test Drivers
- Setting Up Oracle Functional Testing Test Drivers
- Setting Up Custom Test Driver Types

### 40.2.3 Setting Up Oracle Load Testing Test Drivers

The Oracle Load Testing test driver is used for load, scalability, and stress testing. This allows you to simulate hundreds or thousands of users using the software at the same time.

**Note:** Ensure the prerequisites are met before setting up Oracle Load Testing Test Drivers (see Prerequisites).

To register an Oracle Load Testing test driver, follow these steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Administrator credentials.
2. From the **Setup** menu, select **Cloud**, then select **Testing**. The Test Administrator page appears.
3. Click **Test Drivers** located in the left panel. The Test Driver page appears.
4. From the **Register** menu, select **Oracle Load Testing**.
5. Provide the following information:
   - **Name**: Enter a meaningful name for this Test Driver.
• **Deployment Plan**: Click the magnifying glass for selecting a deployment plan on which the test driver is based. In the resulting dialog box, select the Deployment Plan to be used for the test driver and click **Select**.

Ensure that Test Designers and Test Administrators create the deployment plan "on a zone". Also, ensure they have correct privileges to this zone. For information regarding deployment plans, see *Oracle Enterprise Manager Lifecycle Management Administrator's Guide*.

• **Version**: Version field is automatically filled in. The information is derived from the deployment plan.

• **Agent Deployment Plan**: Click the magnifying glass for selecting an Agent Deployment Plan.

The Agent deployment plan is a configuration file that defines an independent Agent machine on the cloud. Since TaaS registers the Agent deployment plan with a test driver, the Agent machine instance is used together with the test driver deployment plan to create the load test.

This allows TaaS to create independent agent machines on the cloud, allowing load generation capacity of a test driver to be scaled up depending upon the trial configuration and demand.

Ensure that the Agent Deployment Plan is scalable.

**Note**: Both the Deployment Plan's version of the Application Testing Suite and the Agent Deployment Plan's version of the Application Testing Suite must be same.

• **Description**: Enter a description for the Test Driver.

6. Click **Register**.

To view the details of a test driver that has already been registered, highlight the test driver in the table. The deployment plan, agent deployment plan, and assembly structure information are provided.

### 40.2.4 Setting Up Oracle Functional Testing Test Drivers

The Oracle Functional Testing Test Driver is used for functional and regression testing and validating application functionality.

**Note**: Ensure the prerequisites are met before setting up Oracle Load Testing Test Drivers and Oracle Functional Testing Test Drivers (see *Prerequisites*).

To register an Oracle Functional Testing test driver, follow these steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Test Administrator credentials.

2. From the **Setup** menu, select **Cloud**, then select **Testing**. The Testing Cloud Self Service Setup page appears.

3. Click **Test Drivers** located in the left pane. The Test Drivers pane appears.

4. From the **Register** menu, select **Oracle Functional Testing**.

5. Provide the following information:

   • **Name**: Enter a meaningful name for this Test Driver.
• **Deployment Plan**: Click the magnifying glass for selecting a deployment plan on which the test driver is based. In the resulting dialog box, select the Deployment Plan to be used for the test driver and click **Select**.

Ensure that Test Designers and Test Administrators create the deployment plan "on a zone". Also, ensure they have correct privileges to this zone. For information regarding deployment plans, see *Oracle Enterprise Manager Lifecycle Management Administrator's Guide*.

• **Version**: Version field is automatically filled in. The information is derived from the deployment plan.

• **Description**: Enter a description for the Test Driver.

• **Results Storage**: Use either the Result File System or the repository. The Result File System enables you to store, manage, and access the Functional Testing results for a longer duration and without any size limitations. These results can also be accessed from your external web clients and servers using the http and nfs protocols.

If you choose to use the repository, you are limited to 10 MB of storage. Results stored locally will be purged after two days.

6. Click **Register**.

To view the details of a test driver that has already been registered, highlight the test driver in the table. The deployment plan and assembly structure information are provided.

### 40.2.5 Setting Up Custom Test Driver Types

The Custom Test Driver allows testers to use test tools from third party vendors together with TaaS. Use Custom Test Driver Types to define and register test-driver types which meet your specific testing needs.

Oracle Load Testing and Oracle Functional Testing are types of drivers, and since they are created by Oracle, we (Oracle) know the specifics of the drivers. However, when you create a test driver, you need to direct your scripts on how to launch and monitor your tests. You can register your own type of test drivers as long as you can build a deployment plan around your assembly which contains the testing product and software.

**Note:**

If you are using third party test automation tools, these tools need to be registered as Custom Test Drivers.

Ensure the prerequisites are met before setting up Oracle Load Testing Test Drivers and Oracle Functional Testing Test Drivers (see **Prerequisites**).

To register a custom test driver, follow these steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Administrator credentials.

2. From the **Setup** menu, select **Cloud**, then select **Testing**. The Testing Cloud Self Service Setup page appears.
3. Click **Custom Types** located in the left panel. The Custom Test Driver Types page appears.

4. Click **Create**.

5. On the Add Custom Test Driver Type dialog, provide the following information:
   
a. Enter a meaningful name and description.

b. The Working Directory is a folder created on your Test Driver Virtual Machine (VM) where the operations will occur.

c. The Results Directory is a folder created on your Test Driver Virtual Machine (VM) and where the results of your tests will appear, TaaS will zip up the entire folder, send it to Enterprise Manager.

d. Pre-Execution Script is a file which performs pre-execution steps for your test. Click **Browse** to locate the file.

e. Execution Script is a file which launches the test. Click **Browse** to locate the file.

f. Progress Monitoring Script is a script which TaaS will run on the test driver, to determine if the test is running or complete (and its outcome). Click **Browse** to locate the file.

When the test is complete, TaaS reports the outcome of the test. TaaS looks at the value returned by this script to determine the test outcome (passed, failed, warning).

   **Note:** For TaaS to know the outcome of the trial, ensure that your script prints one of the following outcomes: passed, failed or warning, as the last line to the standard output.

g. Post-Execution Script is a file which performs the clean up steps after your test runs. Click **Browse** to locate the file.

h. Stop Execution Script is a script which TaaS will run on the test driver to stop the test execution.

i. Custom Parameters is a property file which contains the run-time parameters that will be passed to the test execution. You can configure these parameters during trial submission.

j. Click OK.

Once you provide these inputs, your type is defined and you can now register a new driver of this type.

6. To register a driver, on the Test Drivers page, select **Custom** from the Register menu.

7. Provide a meaningful name for this Test Driver.

8. Click the magnifying glass for selecting a deployment plan on which the test driver is based. In the resulting dialog box, select the Deployment Plan that should be used for the Custom test driver and click **Select**.

9. Enter a description for the Test Driver and click **Register**.

10. Select a Test Driver in the list then click on the component to drill down to the Deployment Plan details.
40.2.6 Setting Up Quotas

The Testing as a Service Portal allows you (Test Administrator) to set up usage quotas for Testers by specific roles. To set up quotas, follow these steps:

**Note:** Ensure the prerequisites are met before setting up quotas (see Prerequisites).

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Administrator credentials.
2. From the Setup menu, select Cloud, then select Testing. The Test Administrator page appears.
3. Click Quotas located in the left panel. The Quotas page appears.
4. Click Create.
5. For the Role Name, click the magnifying glass for selecting roles. In the resulting dialog box, select the role to set quotas for and click Select.
6. Enter the Number of Guest VMs (Virtual Machines), Number of CPUs, Memory (GB), Storage Size (GB), and Number of VUs (Virtual Users) to allocate to the selected role and click Create.

40.2.7 Setting Up Result File Systems

The Testing as a Service (TaaS) Portal allows you (Test Administrator) to setup result file systems for Testers.

Use Result File Systems to store, manage, and access the Functional Testing results for a longer duration and without any size limitations. These results can also be accessed from your external web clients and servers using the http and nfs protocols.

**Note:** Ensure the prerequisites are met before publishing test environments and test assets (see Prerequisites).

To set up result file systems, follow these steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Test Administrator credentials.
2. From the Setup menu, select Cloud, then select Testing. The Test Administrator page appears.
3. Click Result File Systems located in the left panel. The Result File System region appears.
4. Click Add.
5. On the Add Result File System dialog box, provide the following:
   - Name
   - Export Path - Full path to file that stores results, for example, nfs-server.mydomain.com:/export/OFTResults
   - HTTP Access URL - HTTP URL corresponding to the NFS path provided.
   - Description
6. Click Add.
40.2.8 Publishing Test Environments, Test Assets, and Test Drivers

The Testing as a Service (TaaS) Portal allows you (Test Administrator) to publish test asset assets, test environments, and test drivers to selected roles so they can be used when creating tests.

**Note:** Ensure the prerequisites are met before publishing test environments and test assets (see Prerequisites).

To publish test environments, test assets, and test drivers, follow these steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Administrator credentials.
2. From the Setup menu, select **Cloud**, then select **Testing**. The Test Administrator page appears.
3. Click **Publish** located in the left panel. The Publish page appears.
4. Click **Add**.
5. From the **Add** menu in the Select Test Assets, Test Environments, Test Drivers region, select either **Test Asset**, **Test Environment**, or **Test Driver**. In the resulting dialog box, select the appropriate item to be published and click **Select**. The Detail region displays the specific information for each test asset, test environment, and test driver.
6. Click **Add** in the Select Roles region. In the resulting dialog box, select the role to be published and click **Select**.
7. After all the test assets, test environments, test drivers, and roles have been selected, click **Publish**.

40.2.9 Setting Up Chargeback Service

**Note:** Ensure the prerequisites are met before setting up the chargeback service (see Prerequisites).

For information about Chargeback Service, refer to the Chargeback Administration chapter.

Follow this process to set up applications to be tested.

1. Log in to Enterprise Manager Cloud Control using Test Administrator credentials.
2. From the Setup menu, select **Cloud**, then select **Testing**. The Test Administrator page appears.
3. Click **Chargeback** located in the left panel to define the chargeback service.
4. Click **Configure Charge Plan** to define Extended Charge Plans. Plans may be defined by configuration or usage. If defining plans by usage, charges may be based on universal metrics (CPU, memory, storage) or by metrics specific to the targets. Use extended charge plans to set individual prices.
5. Click **Configure Targets** to assign Charge Plans. Charge plans must be assigned to targets. If targets are grouped into a zone, then a charge plan can be assigned to the zone, and will apply to all targets within that zone. If there are multiple zones, then different charge plans may be assigned to each one. The Self-Service
Application (SSA) administrator can determine chargeback pricing by assigning existing charge plans to the different zones.

6. Click **Configure Cost Center** to set up Cost Centers (Optional). Cost Centers may be set up to aggregate costs among groups of users, but are not required. If Cost Centers are set up, the chargeback reports by Cost Center are only available to SSA administrators.

### 40.3 Test Designer Tasks - Creating Test Assets and Test Environments

The following tasks are performed by the Test Designer:

- Creating Test Assets - General Information
- Creating Test Asset - Oracle Load Testing
- Creating Test Asset - Oracle Functional Testing
- Creating Test Asset - Custom Test
- Creating Test Environments

#### 40.3.1 Creating Test Assets - General Information

A Test Asset is a collection of test artifacts (scenarios, scripts, tests) that can be executed on a test environment. A test asset defines the actions that need to be executed to reproduce the workload against the test environment. The Testing Cloud Self Service Portal allows the Test Designer to create Test Assets based upon the available Test Drivers defined by the Test Administrator.

The Test Designer should know the application under test and its relevant Key Performance Indicators (KPIs). The Test Designer should also know the business use-cases for the test scenarios being run. Specific responsibilities include:

- The Test Designer should be skilled in Oracle OpenScript. If the Oracle Load Testing Test Driver is used, the Test Designer should be skilled in Oracle Load Testing. If a Custom Test Driver is used, the Test Designer should be skilled using the corresponding test scripting tool.
- The Test Designer should be skilled as DBA.
- Create Test Assets using the Testing as a Service portal.
- Create Test Environments using the Testing as a Service portal.
- If the Test Designer is required to create environments, the Test Designer must know how to create assemblies.

**Note:** Ensure the prerequisites are met before creating test assets (see Prerequisites).

#### 40.3.2 Creating Test Asset - Oracle Load Testing

Follow this process to create Oracle Load Testing test assets.

1. Log in to Enterprise Manager Cloud Control using Test Designer credentials.
2. From the **Enterprise** menu, select **Cloud**, then select **Self Service Portal**. The Infrastructure Cloud Self Service Portal page appears.

4. Click Test Assets to define the test asset to be added to the library.

5. From the Create menu, select Oracle Load Testing. The Oracle Load Testing Asset Properties page appears.

6. Provide the following information:
   - **Name**: Enter a meaningful name for this Test Asset.
   - **Description**: Enter a meaningful description for this Test Asset.
   - **Application Type**: Click the Application drop-down list and select the application to be tested from the list.
   - **Tags**: Enter any tags to use as keywords to further identify this test asset. These tags make test assets easier to identify and to understand the purpose of the asset.
   - **Scenario**: Click Browse and select the asset file you want to upload. The file type for Oracle Load Testing is SCNZIP. If the Test Asset was going to used to do large scalable testing using a number of agent machines, the scenario configuration file will have the Hardware Estimation Available feature enabled, as well as values for End Condition, Ramp-up Rate, and Number of Virtual Users.
   - **Configurable Parameters**: Choose none, any, or all of the parameters. The selected parameters will be exposed within TaaS and the parameters can be changed for the TaaS test runs.

7. Once all the information is provided, click Submit. The Test Asset is added to the library. Click on a test asset name to drill down to the Test Asset Details page.

### 40.3.3 Creating Test Asset - Oracle Functional Testing

Follow this process to create Oracle Functional Testing test assets.

1. Log in to Enterprise Manager Cloud Control using Test Designer credentials.

2. From the Enterprise menu, select Cloud, then select Self Service Portal. The Infrastructure Cloud Self Service Portal page appears.

4. Click Test Assets to define the test asset to be added to the library.

5. From the Create menu, select Oracle Functional Testing. The Oracle Functional Testing Asset Properties page appears.

6. Provide the following information:
   - **Name**: Enter a meaningful name for this Test Asset.
   - **Description**: Enter a meaningful description for this Test Asset.
   - **Application Type**: Click the Application drop-down list and select the application to be tested from the list.
   - **Tags**: Enter any tags to use as keywords to further identify this test asset. These tags make test assets easier to identify and to understand the purpose of the asset.
40.3.4 Creating Test Asset - Custom Test

Follow this process to create Custom test assets.

1. Log in to Enterprise Manager Cloud Control using Test Designer credentials.
2. From the Enterprise menu, select Cloud, then select Self Service Portal. The Infrastructure Cloud Self Service Portal page appears.
4. Click Test Assets to define the test assets to be added to the library.
5. From the Create menu, select Custom. The Custom Test Asset Properties page appears.
6. Select the type of Custom test driver.
   Enter a name and description for the test asset. In addition, for Custom asset type, you determine which parameters will be exposed to the user.
7. Click the Application drop-down list and select the application to be tested from the list.
8. Enter any tags to use as keywords to further identify this test asset. These tags make test assets easier to identify and to understand the purpose of the asset.
9. Click Browse and select the asset file you want to upload. The file type for Custom can be whatever file type understood by the test driver involved.
10. Click OK. The Test Asset is added to the library. Click on a test asset name to drill down to the Test Asset Details page.

40.3.5 Creating Test Environments

A Test Environment is a collection of entities that represents the entire application stack, thus an environment consists of the following elements:

- **Application under test (AuT):** Contains the software bits and application data. For example, for a deployed Siebel application, end users can modify settings, configurations, and parameters of the application.
- **Infrastructure under test (iAT):** These are entities the Application under test depends upon, for example, the cloud setup/infrastructure in a cloud deployment. Typically an infrastructure is something created for consumption of end users by administrators.
Note: Ensure the prerequisites are met before creating test environments (see Prerequisites).

Follow this process to create test environments.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Test Designer credentials.
2. From the Enterprise menu, select Cloud, then select Self Service Portal. The Self Service page appears.
4. Click Test Environments to define the test environments to be added to the library.
5. Click Create. The Test Environment Properties page appears.
6. Enter a name and description for the test environment.
7. Click the Application drop-down list and select the application to be tested from the list.
8. Enter any tags to use as keywords to further identify this test environment. These tags make test environments easier to identify and to understand the purpose of the environment.
9. Click the magnifying glass icon and select the Deployment Plan to use for this test environment.
   The Deployment Plans must already be created on a Zone where the Test Designer/Administrator has Operator privileges and which (the zone) is part of an Oracle VM Manager with view privileges to the same user.
10. If the Test Environment contains a Web Application, click Yes.
11. Click the Select web-application drop-down and select the appliance that will act as the application or web server when the environment is deployed in the cloud.
12. Click OK. The test environment is added to the library. Click on a test environment name to drill down to the Test Environment Details page. Click on a deployment plan name to drill down to the Deployment Plan Details page.

40.4 Tester Tasks - Using the Testing Environment

Once the Test Administrator and Test Designer have performed their respective tasks, the Tester can now start testing.

The Testing Cloud Self Service Portal allows Testers to create tests from test assets and test environments to perform testing activities. Testers create tests using test assets and environments that have been assigned to them by the Test Administrator.

The Tester should know the application under test and its relevant Key Performance Indicators (KPIs). The Tester should also know the business use-cases for the test scenarios being run. Specific responsibilities include:

• Running the tests by using the test assets and environments created by the Test Designer and assigned to them by the Test Administrator.
• Reserving resources from the cloud, cancel upcoming reservations, update configurations of resources that have been reserved (CPU, memory, and so on).
• Editing test scenarios set up by the Test Designer to specify run time test parameters and schedule the tests for execution.
• Performing the test run analysis to compare various metrics that are relevant to the application and business use-case.

The following tasks are performed by the Tester.

• Creating Tests
• Creating Tests - Oracle Load Testing Tests
• Creating Tests - Oracle Functional Testing Tests
• Creating Tests - Custom Tests
• Creating and Running Trials
• Creating and Running Oracle Load Testing Trial
• Creating and Running Oracle Functional Testing Trial
• Monitoring On-Going Trials
• Comparing Trial Results
• Sharing Tests
• Viewing Activity and Usage Information
• Viewing Deployment Information (Browse My Deployments)
• Browsing the Testing Home Page

40.4.1 Verifying Available Test Assets and Environments

The Testing Cloud Self Service Portal allows Testers to verify which test assets and test environments have been assigned to them by the Test Administrator.

Note: Ensure the prerequisites are met before verifying available test assets and environments (see Prerequisites).

Follow this process to verify test assets and test environments assigned to your role.

1. Log in to Enterprise Manager Cloud Control using Tester credentials. You are logged into Self Service Portal.
3. Click the My Library tab. The My Library tab shows the test environments and test assets published to you by the Test Administrator.
4. Click Test Environments.
5. Click on an environment to view the details about the environment. Click on the component to drill down to the Assembly Structure details.
6. Click Test Assets.
7. Click on a test asset to view the details about the asset.
40.4.2 Creating Tests

The Testing Cloud Self Service Portal allows Testers to create tests from test assets and environments to perform testing activities. Testers create tests using test assets and test environments that have been assigned to them by the Test Administrator.

**Note:** Ensure the prerequisites are met before creating tests (see Prerequisites).

See the following section for the types of tests you can create:

- Creating Tests - Oracle Load Testing Tests
- Creating Tests - Oracle Functional Testing Tests
- Creating Tests - Custom Tests

40.4.3 Creating Tests - Oracle Load Testing Tests

**Note:** Ensure the prerequisites are met before creating Tests (see Prerequisites).

Follow this process to create Oracle Load Testing tests.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into the Infrastructure Cloud Self Service Portal.
2. Click My Tests.
3. Click the My Tests tab in the Testing Cloud Self Service Portal.
4. From the Create menu, select Oracle Load Testing. The Create Test page appears.
5. Provide the name and description. In addition, click the magnifying glass icon, select the test asset to be used in this test, and click Continue.
6. Select the Source, click the magnifying glass icon, and select the test environment to be used in this test. Change the Mapping URLs settings if needed.
7. Click the Test Driver drop-down and select the test driver to use to run the test in the cloud.
8. The Hardware Estimate region displays the recommended number of agent machines to use for this test based on the Test Asset and Test Driver if the Test driver is configured with Agent Deployment plan.
9. Click OK. The test is added to the library that specifies an asset, an environment, and a test-driver. Click on a test name to drill down to the details page.

40.4.4 Creating Tests - Oracle Functional Testing Tests

**Note:** Ensure the prerequisites are met before creating Tests (see Prerequisites).

Follow this process to create Oracle Functional Testing tests.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into the Infrastructure Cloud Self Service Portal.
2. Click My Tests.
3. Click the **My Tests** tab in the Testing Cloud Self Service Portal.

4. From the **Create** menu, select **Oracle Functional Testing**. The Create Test page appears.

5. Provide the name and description.

6. Click **Add** to select one or more Functional Test Assets for the test. The order in which the assets are listed will be the order of their execution in the trial.

   Rearrange the order of the assets as needed by using the Move Up and Move Down arrows. You can also remove assets as needed.

7. Click **Continue**.

8. Select the Source, click the magnifying glass icon, and select the test environment to be used in this test. Change the Mapping URLs as needed.

9. Click the **Test Driver** drop-down and select the test driver to use to run the test in the cloud.

10. Click **OK**. The test is added to the library that specifies an asset, an environment, and a test-driver. Click on a test name to drill down to the details page.

### 40.4.5 Creating Tests - Custom Tests

**Note:** Ensure the prerequisites are met before creating Tests (see [Prerequisites](#)).

Follow this process to create Custom tests.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into the Infrastructure Cloud Self Service Portal.

2. Click **My Tests**.

3. Click the **My Tests** tab in the Testing Cloud Self Service Portal.

4. From the **Create** menu, select **Custom**. The Create Test page appears.

5. Enter a name and description for the test.

6. Click the magnifying glass icon, select the test asset to be used in this test, and click **Select**.

7. Select the test asset, review the details, and click **Continue**.

8. Select the Source and click the magnifying glass icon and select the test environment to be used in this test.

9. Select the test environment and click **Select**.

10. Click the **Test Driver** drop-down and select the test driver to use to run the test in the cloud.

11. Click **OK**. The test is added to the library that specifies an asset, an environment, and a test-driver. Click on a test name to drill down to the details page.

### 40.4.6 Creating and Running Trials

The Testing Cloud Self Service Portal allows Testers to create and run trials from the test instances that have been created in the portal. The Tester runs trials on the test asset and environment, monitors ongoing trials, and analyzes the results of completed trials.
Note: Ensure the prerequisites are met before creating and running trials (see Prerequisites).

See the following section for the types of trials you can create and run:

• Creating and Running Oracle Load Testing Trial
• Creating and Running Oracle Functional Testing Trial

40.4.7 Creating and Running Oracle Load Testing Trial

Follow this process to create and run Oracle Load Testing trials:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Infrastructure Cloud Self Service Portal.
2. Click My Tests in the Self Service Portal.
3. Click the My Tests tab in the Testing Cloud Self Service Portal.
4. Select a test to run for this trial.
5. Click Create... in the Trials section. The Create Trial page appears.
6. Enter a name and description for the trial.
7. In the Application Under Test Region, specify the Application Under Test instance details.
   • Create new instance: You can create new virtual machines on the cloud for the application under test.
   • Use existing instance: If you have created instances for this test or this application before, you can choose to re-use the same set of virtual machines instead of creating new ones.
     Re-using an existing instance is faster because there will be no need to deploy the instance.
   • If you are creating a new instance, enter a password of your choice for the Root Password and reenter to confirm it.

     Note:
     This value is not retrievable. DO NOT FORGET THIS PASSWORD.

   • (Optional) Specify the Stop Instance and Delete Instance settings and click Continue.
8. In the Test Asset Parameters region, you can:
   • Change the number of virtual users to run for this trial in the Trial Virtual Users column of each script.
     You can set these values ONLY if the Test Designer (who created the asset) has chosen to allow users to override the values. Otherwise, the application uses the information available in the asset and these controls are grayed out.
   • Specify the Ramp Up Rate settings for this trial.
You can change these values ONLY if the Test Designer (who created the asset) has chosen to allow users to override the values. Otherwise, the application uses the information available in the asset and these controls are grayed out.

- Set the **End Condition** settings for the Trial and click **Continue**.
  
  You can set these values ONLY if the Test Designer (who created the asset) has chosen to allow users to override the values. Otherwise, the application uses the information available in the asset and these controls are grayed out.
  
  If you do not set the test end conditions, the test runs until it is stopped manually.

After you have reviewed the Test Asset Parameters, click **Continue**.

9. In the Test Driver region, you can either create a new instance or use an existing instance. If the existing instance is being used by another trial, it will not be available.

Enter a password of your choice for the Master Password and reenter to confirm it. This is the password the Testing Cloud Self Service Portal will set for the Oracle Load Testing Virtual Machine and all accounts for Oracle Load Testing.

Specify the **Stop Instance** and **Delete Instance** settings and click **Continue**.

10. In Hardware Estimate region, you can estimate and add agent machines (hardware estimate feature).

If this is a Trial, use a Test Driver that has an Agent Deployment plan. The number is calculated based on parameters set in the previous step and the Agent Deployment plan. You can also specify a new number. The Hardware Estimate setting is enabled only when the Test driver has an Agent Deployment plan.

11. In the Schedule region, specify whether to start the trial immediately or schedule at a later time. A new trial will be created and submitted for execution.

Click **OK**. The initial execution of a trial will take some time to deploy the Virtual Machines, copy necessary software, and start the test.

### 40.4.8 Creating and Running Oracle Functional Testing Trial

Follow this process to create and run Oracle Functional Testing trials:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Infrastructure Cloud Self Service Portal.

2. Click **My Tests** in the Self Service Portal.

3. Click the **My Tests** tab in the Testing Cloud Self Service Portal.

4. Select a test to run for this trial.

5. Click **Create...** in the **Trials** section. The Create Trial page appears.

6. Enter a name and description for the trial.

7. In the Application Under Test region, specify the Application Under Test instance details.
   
   - Creating new instance: Users can create new virtual machines on the cloud for the application under test.
• Re-using an existing instance: If users have created instances for this test or this application before, they can choose to re-use the same set of virtual machines instead of creating new ones.

Re-using an existing instance is faster because there will be no need to deploy the instance.

• If creating a new instance, enter a password of your choice for the Master Password and reenter to confirm it.

**Note:**
This value is not retrievable. DO NOT FORGET THIS PASSWORD.

• Specify the **Stop Instance** and **Delete Instance** settings.

8. In the Asset Execution Settings region, select the assets that are to be executed. Click **Continue**.

9. In the Playback Settings region, change the settings as needed for this trial. To save time, you can copy the settings from another asset.
   Click Reset to go back to the original settings for this trial.

10. In the Data Banks region, review and modify the data banks used with this asset. Click **Continue**.

11. In the Test Driver region, either create a new instance of the test driver or use an existing instance.
   If the existing instance is being used by another trial, it will not be available.
   • Enter a password of your choice for the Master Password and reenter to confirm it.
   • Specify the **Stop Instance** and **Delete Instance** settings.

12. In the Schedule region, specify the schedule for starting the trial run and click **OK**. A new trial will be created and submitted for execution. The initial execution of a trial will take some time to deploy the Virtual Machines, copy necessary software, and start the test.

### 40.4.9 Monitoring On-Going Trials

The Testing Cloud Self Service Portal allows Testers to monitor running trials and create charts of the key performance indicators for the application-under-test.

**Note:** Ensure the prerequisites are met before monitoring on-going trials (see **Prerequisites**).

Follow this process to monitor on-going tests.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Infrastructure Cloud Self Service Portal.

2. Click **My Tests**.

3. Click the **My Tests** tab in the Testing Cloud Self Service Portal.
4. Select the test to view the trial details. The trial status information appears in the Trials pane.

5. Click on the trial name link in the Trials pane to navigate to the trial-home page.
   You can monitor the progress of the trial by clicking Status. If the status of the trial is In Progress, click the trial name which will take you to the trial home and the remaining trial information.

6. Expand the metric nodes and select metrics or counters to plot them in the chart. For Oracle Functional Testing, you can select items for Trial Result to display the result in detail.

7. View the Agent count associated to the current trial in the Test Driver Instance session.

40.4.10 Comparing Trial Results

The Testing Cloud Self Service Portal allows Testers to compare trial results and create charts of the key performance indicators for the application-under-test.

Note: This feature is only available for Oracle Load Testing Test Driver based trials.

Note: Ensure the prerequisites are met before comparing trial results (see Prerequisites).

Follow this process to compare trial results.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Infrastructure Cloud Self Service Portal.

2. Click My Tests.

3. Click the My Tests tab in the Testing Cloud Self Service Portal.

4. Select the test to view the trial details. The trial status information appears in the Trials pane.

5. Select two trials of the same test that have been previously run.
   To select 2 trials of the same test, select one trial, then click Shift/Control to select the other trial. The trials must belong to the same test.

6. Click Compare Results. You can compare the metrics of the two trials to view the differences.
   When in this mode, selecting any metric will chart two lines - one for each of the selected trials. You can also compare the Oracle Load Testing session summary report side-by-side.

40.4.11 Sharing Tests

To avoid duplication of effort, you can share tests with other users. Note that the person who created and shared the tests will be charged for any resource usage associated with the shared tests.

To share tests, perform the following steps:

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Self Service Portal.
2. Click **My Tests**.
3. Click the **My Tests** tab in the Testing Cloud Self Service Portal.
4. Select a test from the list of Tests on the My Tests page.
5. Click **Share**.
6. Select a user to share the Test with.
7. Click **Share**.
8. Click **Log Out**.

To verify that the test is shared:
1. Log in as the user whom you shared the test with.
2. Verify that you have access to the shared test.

### 40.4.12 Viewing Activity and Usage Information

The Testing Cloud Self Service Portal allows Testers to view summary information for test assets and test environments available to you, your quota as defined by the Test Administrator for your role, your current utilization of hardware resources, and submitted and scheduled trials.

**Note:** Ensure the prerequisites are met before viewing activity and usage information (see **Prerequisites**).

Follow this process to view activity and usage information.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Self Service Portal.
2. Click **My Tests**.
3. Click the **Home** tab in the Testing Cloud Self Service Portal. This tab shows summary information for test assets and test environments available to you, your quota as defined by the Test Administrator for your role, your current utilization of hardware resources, and submitted and scheduled trials.

### 40.4.13 Viewing Deployment Information

The Testing Cloud Self Service Portal allows Testers to create tests from test assets and test environments to perform testing activities using the Testing Cloud Self Service Portal. Testers create tests using test asset and environment that have been assigned to them by the Test Administrator. The Tester runs trials on the test asset and environment, monitors ongoing trials, and analyzes the results of completed trials.

**Note:** Ensure the prerequisites are met before viewing deployment information (see **Prerequisites**).

Follow this process to view activity and usage information.

1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Self Service Portal.
2. Click **My Tests**.
3. Click the **My Deployments** tab in the Testing Cloud Self Service Portal. This tab shows a table of all environments and test-drivers deployed for you.
4. Select a test environment or test driver instance. The details pane shows the appliances within the selected test environment or test driver instance.

5. Click on an appliance within the selected test environment or test driver instance to navigate to the details view of the appliance.

### 40.4.14 Browsing the Testing Home Page

The users HOME tab displays a summary of what the user has done, including resources consumed for testing and tests created by the user. From the HOME tab, users can quickly access previously executed test trials in order to compare results or to do more in depth post-run analysis.

The Testing home page provides information regarding the statistics of ongoing testing. General statistics are provided, as well as test assets and environments, ongoing test and trials, Oracle Load Testing, and the Infrastructure. It also provides an overview of the servers and infrastructure resources consumed by the user, like the number of servers provisioned, number of CPUs, as well as RAM and Storage.

When you log in as Test Designer, you only see the My Library tab. When you log in as Test Administrator, you see the Home tab. When you log in as a Super Administrator, you see both the Home and My Library tabs.

The sections on the Home tab are:

- **General** - Total counts of various artifacts available in the system, for example, its "total tests present in system", "total trials ran across all trials", and so on.
- **Test Assets/Environments** - Accumulation graph of test assets, environments, and machines in use in the Testing Cloud. Count and trend data are included. This is the Test Administrator's overview of the entire TaaS portal, regardless of Testers.
- **Tests and Trials** - Daily totals of the number of tests created or daily totals of the number of trial runs.
- **Infrastructure** - Daily consumption of infrastructure resources: CPU, Memory, and Disk space storage.
- **Oracle Load Testing (OLT)** - Daily total of the number of OLT Virtual Users (VU) that were run. Oracle Load Testing uses OpenScript scripts to simulate users accessing an application under test.

The vertical axis shows daily usage totals based upon the View selection in each of the regions.

The My Library tab provides details on both Test Assets and Test Environments.

1. Log in to Enterprise manager using Tester credentials.
2. Click **My Tests** radio button.
3. Click the **Home** tab.

You will see a summary of test assets and test environments available to you, your quota as defined by the Test Administrator for your role, your current utilization of hardware resources, and the submitted and scheduled trials.

### 40.4.15 Trial Page

The Trial Page provides the Results, Test Environment, Configuration, and Performance information of the trial.
The top of the page provides the general information of the trial including: status of the trial, results of the trial, start time of the trial with the option to stop the trial, the test being run, and the test environment being used.

**Results**

*Note*: The Results tab is only for Oracle Functional Testing.

From the Results tab, you can:

- Download the results to be viewed at another time.
- Browse the results location
- Generate a Report to be published in BI Publisher.

**Test Environment**

From the Test Environment tab, you can:

- Start, stop, and restart the Guest Virtual Machines used for the test.
- Start, stop, and restart the Test Driver Instance used for the test.

**Configuration**

From the Configuration tab, you can:

- View the details of the application that was tested.
- Test Driver used for the test.
- List of the Test Asset Parameters used.
- Schedule of the trial.

**Performance**

*Note*: The Performance tab is only available for Oracle Load Testing trials.

From the Performance tab, you can:

- View all the collected Oracle Load Testing counters and Enterprise Manager target metrics.
- Select interested counter(s)/metric(s) and show them in charts.

**Summary**

*Note*: The Summary tab is only available for Oracle Load Testing trials.

From the Summary tab, you can:

- See the summary report of this trial and AWR report if it is available.
- Generate Oracle Load Testing trial report and AWR report if it is available.

### 40.4.16 Viewing TaaS Reports

To facilitate the sharing of information about trials, TaaS provides reports using Business Intelligence Publisher (BI Publisher). These reports include the TaaS Oracle Functional Testing Trial Report and the TaaS Oracle Load Testing Trial Report.

To view these reports:
1. Log in to Enterprise Manager Cloud Control using Testing Cloud Self Service Portal Tester credentials. You are logged into Infrastructure Cloud Self Service Portal.

2. Click **My Tests**.

3. Click the **Home** tab in the Testing Cloud Self Service Portal. This tab shows summary information for test assets and test environments available to you, your quota as defined by the Test Administrator for your role, your current utilization of hardware resources, and submitted, scheduled, and completed trials.

4. Highlight a trial.

5. On the Results tab, click **Generate Report**.

### 40.4.17 Estimating Hardware Needed for Testing

The Test Driver hardware resource requirement depends on factors such as: number of virtual users for your Trial, ramp-up rate, number of script steps, number of variables in the script and script type.

To ensure that TaaS provides the appropriate amount of resources for your test trial, TaaS provides a hardware estimation feature. TaaS calculates and creates agent machines based on estimation results of CPU and memory resources consumed by the test asset in your test trial.

**Note:**

To use the Hardware Estimation Available feature, you must have selected the Hardware Estimation Data option on the Export File screen when creating the scenario.zip file in the Oracle Load Testing application.

To take advantage of this feature, the Test Administrator and Tester need to perform the following steps:

1. Define an Agent deployment plan for an Oracle Load Testing Test Driver.
   a. From Setup menu, select **Cloud**, then select **Testing**.
   b. On the Testing Cloud Self Service Setup page, select **Test Drivers** in the navigation tree.
   c. From the **Register** menu, select Oracle Load Testing.
   d. Provide the information for Name, Deployment Plan, Version, and so on.
      Ensure that the deployment plans you use are scalable.

2. View hardware estimation result in Test Oracle Load Testing Asset.
   a. From Enterprise menu, select **Cloud**, then select **Self Service Portal**.
   b. Select **My Tests**.
   c. On the Testing Cloud Self Service Portal page, click the **My Library** tab.
   d. Select **Test Assets**. Highlight the asset in which you are interested. The Scenario Configuration section states whether Hardware Estimation is available for this asset. An X denotes that the estimate is not available whereas a check mark denotes that it is.
3. To create a Test Asset, click **Create** and choose **Oracle Load Testing**. Provide the requisite information.
   
   - The scenario zip file is exported from the Oracle Load Testing application. Note that it is through the scenario zip file that the Hardware Estimation Data feature is enabled. To learn how to create a scenario, refer to the **Oracle Load Testing Load Testing User's Guide** available from the 'Oracle Application Testing Suite Downloads’ page: ([http://www.oracle.com/technetwork/oem/downloads/index-084446.html](http://www.oracle.com/technetwork/oem/downloads/index-084446.html)).
   
   - By choosing the configurable parameters, you can change these settings when you create a trial using this asset.

4. Evaluate Test Driver with estimation resource result.
   
   a. From the My Tests tab, select **Create**, then select **Oracle Load Testing**.
   
   b. Provide the requisite information and ensure that the source (Test Asset) is one that has the Hardware Estimation Data feature.

   **Note:** It is through the scenario zip file that the Hardware Estimation Data feature is enabled on the Export File page.

   Also note that the Hardware Estimate region contains the recommended number of agent machines to use for testing the selected Test Asset.

5. Start an Oracle Load Testing Trial Using Estimation Resource Result
   
   a. Click the **My Tests** tab. Highlight the test you want to use for the trial.
   
   b. In the Trials section, select **Create**.
   
   c. On the Create Trial screen:

      - Provide the requisite information in the Overview and Application Under Test regions. Click **Continue**.

      - For the Test Asset Parameters, if needed change the values for the Trial Virtual Users, Ramp-up Rate, and End Condition. Click **Continue**.

      - Provide the parameters for the Test Driver, Hardware Estimate, and Schedule. Click **OK**.

      **Note** that in the Hardware Estimate region, the number of agents is calculated by TaaS to meet the required resource needed for the trial. However, you can change the number of agents if you want.

6. View Agent Status in Trial Home

   On the My Tests tab, highlight the trial of interest.

7. View Agent Status in My Deployment Tab.

   On the My Deployments tab, highlight the deployment of interest. The Agent Status will be shown in the Agent tab.

8. Share/unshare the Agent between different test driver instances.
Part XV

Using Chargeback and Consolidation

This section describes the Chargeback and Consolidation features in Enterprise Manager.

It contains the following chapters:

• Chargeback Administration
• Enterprise Manager Consolidation
Chargeback Administration

This chapter describes the Chargeback application and details the administrative tasks necessary to set up and run the application. It then presents various ways to access and use the information Chargeback collects and aggregates. The chapter contains the following sections:

- Overview of Chargeback
- Setting Up Chargeback
- Self Service Applications and Zones within Chargeback
- Accessing Chargeback Information

41.1 Overview of Chargeback

This section gives a brief overview of the most important aspects of Chargeback. It covers the following topics:

- Why Implement Chargeback
- Enterprise Manager Chargeback

41.1.1 Why Implement Chargeback

The purpose of Chargeback is to gather data on resource use, allocate charges for the use of these resources, and present the results in a comprehensible format.

Chargeback is used to allocate the costs of IT resources to the people or organizations who consume them. While it can be applied in situations where IT resources are dedicated, it is particularly relevant in situations where resources are shared, as without some way to meter and charge for consumption there will be a tendency for users to allocate or use more resources than they need. This problem is exacerbated in cloud environments where users are able to provision their own resources using self-service.

Consider the following primary use cases:

- Increasingly, organizations are adopting consolidation platforms such as Oracle Exadata and Oracle Exalogic, where there are multiple applications running on a shared hardware platform. There needs to be a way to meter the resources consumed by each application so charges can be applied accordingly. This, in turn, helps to measure the business value of IT investments so that priority can be given to the applications with the greatest return on investment (ROI).

- With the popularity of cloud computing on the rise, where users have the ability to self-service provision resources such as databases and virtual machines, it is highly desirable to be able to meter the resources each cloud consumer uses so that they can be charged based on their consumption. Cloud consumers likewise benefit by rationing their consumption to that which provides optimal business value, thus contributing to the overall ROI of the organization's IT investment.
To sum up, adopting a Chargeback (or Showback) model can deliver significant benefits to both IT and Line of Business users:

- Chargeback benefits consumers by placing them in control of their IT costs.
- Chargeback benefits IT by helping to drive up utilization rates, thus reducing the number of physical resources they need to manage.

41.1.2 Enterprise Manager Chargeback

*Chargeback*, as the name implies, is a tool of accountability. The application's primary uses can generally be described as follows:

- Provide resource usage metering by aggregating and normalizing the enormous amount of metric data Enterprise Manager collects.
- Provide IT with a means to "charge" a currency amount to the consumers of resources.
- Provide consumers with reports detailing their consumption and associated charges.

41.1.2.1 Chargeback Entities

Chargeback calculates charges based on resource use. A resource is typically associated with an Enterprise Manager target. Chargeback collects metrics and configuration information for a subset of Enterprise Manager targets to calculate charges. A resource can also be something that an integrator customizes to be monitored and charged for in Enterprise Manager. Chargeback recognizes these Enterprise Manager targets and custom resources collectively as entities. For information on creating a custom entity, see the *Oracle Enterprise Manager Cloud Control Extensibility Programmer's Guide*.

**Note:**
You can also add Chargeback support for Enterprise Manager target types for which there is no current out-of-box Chargeback support. See *Chargeback and Metering EMCLI Verbs*, for more information.

Within Chargeback there is the concept of usage mode; that is, how an entity is metered. All entity types have a default usage mode. Administrators, when adding entities to Chargeback, decide which usage mode is applicable in a given context, if the entity in question has more than its default usage mode. Common usage modes include the following:

- Metered by instance—where charges accrue against a single cost center
- Metered by service—a database instance with multiple services bills by the service; charges by service can be to different cost centers, or charges for all services can be to the same cost center
- Metered by J2EE application—a WebLogic Server bills by the J2EE application; charges by application are to different cost centers

See *Adding Entities to Chargeback* for detailed information on adding entities to Chargeback.
41.1.2.2 Charge Plans

A charge plan defines the resources to charge for and their associated rates. Chargeback offers two types of charge plan—the universal charge plan and extended charge plans.

Universal Charge Plan

The universal charge plan contains the rates for three common resources:

- CPU
- Memory
- Storage

Note that the universal plan does not apply to all entity types. Universal rates are not applicable to J2EE applications, for example.

Extended Charge Plans

While CPU, memory and storage can be used for Chargeback across a variety of entity types, there may be situations where entity-specific charges are required. For example, you may want to base charges on the type of host OS (Windows or Linux), or on a database option such as Partitioning. In this instance, an extended charge plan can be used. The extended charge plan provides greater flexibility to Chargeback administrators, enabling you to:

- Define entity type-specific charges
- Define configuration and usage-based rates
- Define a flat charge independent of configuration or usage
- Override or adjust universal plan rates
- Establish peak hours at which to charge a premium rate
- Institute a tiered pricing structure based on levels of use

Chargeback ships a sample extended charge plan that you can use as-is or as a template for creating your own extended plans tailored to your environment. The shipped plan defines charges for the Oracle VM Guest entity type where charge items and applicable rates vary depending on machine size.

See Working with Charge Plans for detailed information on working with charge plans.

41.1.2.3 Cost Centers

When charges for the consumption of resources are calculated, these charges must be assigned somewhere. In Chargeback, the assignment of these costs is to a cost center. Cost centers are typically organized in a business hierarchy and may correspond to business units—sales, engineering, human resources, and so forth. The cost center hierarchy is defined within the Chargeback application and is used for rollup and drill-down purposes when reporting on usage and charges. There are also default mechanisms in place based on cost center properties set outside of Chargeback. See Creating Cost Centers for detailed information on creating cost centers.
41.1.2.4 Reports

The payoff for setting up Chargeback is the wealth of information it puts at your fingertips. The information is available in a variety of formats, including pie charts and bar graphs. You can drill down to details by cost center, entity type, and resource. Trending reports show charges and resource utilization over time, up to a year in fact, which can help in IT resource planning. In addition to the reporting function available to administrators within the application, self service users can view Chargeback information related to their entities within the self service portal, and Line of Business users can view Chargeback information in BI Publisher reports.

Report Cycle

Chargeback calculates charges for the current calendar month. This constitutes the report cycle. Any adjustments to configured charge plans and rates are retroactively applied to usage from the first day of the report cycle (that is, the first day of the current month). Charges accrued in previous calendar months are considered closed. Thus, modifications to charge plans do not affect the calculated charges for previous months.

See Accessing Chargeback Information for detailed information on accessing Chargeback information.

41.1.2.5 Chargeback and Metrics

Chargeback uses information that Enterprise Manager collects as a basis for metering. Chargeback metrics can be configuration-based, usage-based, or availability-based.

- Configuration-based metrics refer to things such as number of CPUs or database version; these metrics are considered static and thus have a daily aggregation.
- Usage-based metrics refer to things such as CPU utilization or memory consumption; these metrics have an hourly aggregation.
- Availability-based metrics measure the time an entity is available, otherwise known as an entity’s uptime. It is the number of minutes in a given hour an entity is considered available. The charge is prorated for downtime.

Charges can also be applied at a fixed rate.

Entity types for which charge rates can be defined for specific metrics include host, virtual machine, WebLogic Server, database instance, schema service, and pluggable database (PDB). Composite entity types can also be added to Chargeback. These include Cluster Database, Oracle WebLogic Cluster, Oracle WebLogic Domain, Oracle VM Zone, PaaS Infrastructure Zone, Oracle VM Server Pool, and so forth. Adding groups and systems automatically includes all members that are valid Chargeback entities. After an entity has been added to Chargeback, a collection job will run once a day against entity tables in Enterprise Manager to extract information for use by Chargeback.

41.2 Setting Up Chargeback

This section describes the following tasks, which must be completed to implement and support Chargeback services:

- Configuring Global Settings for Chargeback
• Working with Charge Plans
• Using the Plan Advisor
• Creating Cost Centers
• Adding Entities to Chargeback
• Assigning Cost Centers to Entities
• Assigning Charge Plans to Entities
• Running the Daily Data Collection Job

The person performing these tasks must have the necessary privileges. These privileges can be granted using the EM_CBA_ADMIN role.

Figure 41-1 shows a simple workflow of steps required to set up Chargeback.
Figure 41-1  Chargeback Setup Workflow

1. Open
2. Define Universal Plan
3. CPU Memory Storage Only?
   - Yes: Define Extended Plans
   - No: Set Up Cost Centers
4. Add Targets
5. SSA Zone Targets?
   - Yes: Assign Plans to Targets
   - No: Assign Cost Centers to Targets
6. Assign Plan to Zone
7. Setup Complete
Following initial setup, you perform tasks on a regular basis, such as:

- Adding new entities not discovered by the Chargeback daily job
- Updating charge plans
- Assigning charge plans and cost centers

Other events happen automatically. For example, new entities that are members of a composite entity (a VM Guest in a VM zone, for example) are discovered and added to Chargeback. The daily data collection job is responsible for capturing these changes, in addition to collecting metric and configuration data.

See Running the Daily Data Collection Job for detailed information on the daily collection job.

41.2.1 Configuring Global Settings for Chargeback

Click the Settings subtab on the Home tab to configure global settings.

- Peak Times
- Currency Symbol
- Uptime Calculations

41.2.1.1 Peak Times

Peak times establish days and hours of operation when premium rates apply to charges as defined in the associated charge plan. Chargeback ships with a default peak time window named Global, which defines peak hours as Monday through Friday, midnight to midnight. This in turn defines Saturday through Sunday, midnight to midnight as off-peak hours. The Global peak window is always associated with the universal charge plan, and with an extended charge plan by default. You can change an extended charge plan's association to a custom peak time window that you create.

1. Click Edit to open the set peak times dialog.
2. Click Create to open the peak time window dialog.
3. Specify a name for the peak time window.
4. Select the days of the week and hours of the day considered to be peak times of operation.
   By definition, days and hours not included are considered off-peak.
5. Click OK to complete time window creation.

You also can perform these other actions with peak time windows:

- Rename the time window.
- Remove the time window.
- Edit the day and time settings or add new days and times to the time window.
  Edits to peak windows are considered plan revisions. When you change a peak window currently associated with a charge plan, charges are recalculated for the current report cycle.
- Remove row settings from a time window.
41.2.1.2 Currency Symbol

You can change the default currency (USD) by clicking in the currency symbol text box and entering the desired currency symbol. The new selection becomes the default currency across all charge plans; that is, the universal plan and all extended charge plans. All reports, including historical reports, reflect the new currency. Note that no rate conversion occurs when you change the currency; that is, the numbers stay the same. Change from dollars to euros and a one dollar charge becomes a one euro charge.

41.2.1.3 Uptime Calculations

Select the appropriate radio button to ignore or include uptime in charge calculations. The default is to include uptime as a consideration. Note that to include uptime has an impact on all fixed and configuration-based charge calculations for all entities.

Chargeback prorates charges and discounts accordingly. So, for example, if an entity was available 22.5 hours in a 24-hour period, the daily charge would be adjusted 1.5 hours. A change in the uptime setting is effective from the beginning of the current report cycle, but does not impact previous report cycles; that is, charges in historical reports are not prorated based on a change made to the setting in the current cycle.

Click Save to update the settings.

Example

To demonstrate the difference in factoring in uptime, consider the following charge plan configurations:

• A universal charge plan that charges two dollars a day per gigabyte of memory allocation, a dollar a day per gigabyte of storage, and no charge for CPU usage
• An extended charge plan for a Guest VM (medium), with a base charge of a dollar an hour and a memory allocation adjustment of x5

Given these charge plans, a user requisitions a Guest VM with 4 GB of memory and 100 GB of disk space for two consecutive days. The first day the uptime metric records 20 hours and the second day, 24 hours.

When uptime is not a factor in the calculations, the charge per day is 164 dollars, computed as follows:

• Forty dollars a day for memory (4 GB * $2 * 5)
• A hundred dollars a day for storage (100 GB * $1)
• A base charge of 24 dollars a day (24 hours * $1)

When uptime is a factor, charges for the first day are 137 dollars (rounded up), computed by subtracting the four hours of downtime from the per day charge (20/24 * 164).

41.2.2 Working with Charge Plans

As described in the Overview, there are two types of charge plan, the universal charge plan and extended charge plans.
The universal charge plan establishes rates for three basic metrics (CPU, memory, and storage). For example, charge a dollar a day for a CPU (generic), two dollars a week per GB of memory, and a dollar a week per GB of storage. Optionally, different rates can be applied per CPU architecture. For example, charge different rates for a PA-RISC, a SPARC, and an x86. You can create multiple revisions of the universal charge plan for use in the future.

An extended charge plan enhances the universal plan to include entity-specific metrics. You may want to implement charges that relate to specific characteristics of an entity. An extended charge plan affords that flexibility. The entity type determines the items for which rates can be charged.

In defining an appropriate charge plan for use with a given entity type, you have to decide on a case-by-case basis whether the three basic metrics of CPU, memory, and storage are sufficient to charge for resource use. If the answer is no, then you have to define an extended plan for the entity type.

In any case, you want to define the universal charge plan for general use. You can then indicate in an extended charge plan how the universal plan rates apply.

An extended charge plan consists of groups of entity-type specific charge items. Entity-specific charge templates are available for the following entity types:

- Host
- Oracle WebLogic Server (includes J2EE applications)
- Oracle VM Guest
- Database Instance (includes database services)
- Pluggable Database (PDB)
- Schema Service

Chargeable items and applicable rate adjustments vary, depending on the entity type.

With an extended plan you can base charges on entity-specific charge items. For example, you may want an additional charge for a host running Windows OS, or a database with the Partitioning option installed. In addition to configuration- and usage-based charge items, you can include a fixed charge. For example, charge $100 a month for each host, regardless of consumption.

You may find that even with an extended plan, the charge items available for a given entity type are insufficient for your particular needs. In this case, you can introduce custom charge items through use of CLI verbs. For additional information, see Chargeback and Metering EMCLI Verbs.

This section covers the following topics:

- Charge Plans and Effective Dates
- Charge Plans and Peak Windows
- Charge Plans and Tiered Pricing
- Creating and Revising the Universal Charge Plan
- Creating an Extended Charge Plan
- Viewing Charge Item Metadata
- Using Conditions in Charge Plans
- Using the Estimate Charges Feature
41.2.2.1 Charge Plans and Effective Dates

When you create a charge plan (universal or extended), you establish the plan's effective date, which is always the first of a month. The plan revision remains in effect until you create a new plan revision whose effective date determines the previous plan revision's termination.

Say, for example, you want to set up a charge plan for a calendar year, in which a new plan revision goes into effect each quarter. You create an initial plan revision that goes into effect January 1. The plan shows an effective date of Jan. 1, yyyy - Onward. You create a plan revision that goes into effect April 1. The initial plan revision now shows an effective date of Jan. 1, yyyy - Mar. 31, yyyy, and the new plan revision, Apr. 1, yyyy - Onward. You create two more plan revisions, one with an effective date of July 1 and the other with an effective date of October 1. You now have four plan revisions with effective dates as follows:

- Jan. 1, yyyy - Mar. 31, yyyy
- Apr. 1, yyyy - Jun. 30, yyyy
- Jul. 1, yyyy - Sep. 30, yyyy
- Oct. 1, yyyy - Onward

Only current and future plan revisions appear in the Charge Plans navigation pane. You can retrieve expired plan revisions by selecting Historical Revisions from the View menu.

41.2.2.2 Charge Plans and Peak Windows

You can define hours of operation for days of the week that you consider to be high volume and thus times for which you want to charge a premium rate. This is a so-called peak window, which you associate with a particular charge plan that has a certain rate structure. Say, for example, Monday through Friday, 8:00 a.m. to 6:00 a.m., is your peak window, which you have named Prime. You associate the Prime window with a charge plan where peak hours have one rate structure and the rest of the week, or non-peak hours have a different structure. You can define multiple peak windows which you associate with different charge plans. For more information, see Configuring Global Settings for Chargeback.

41.2.2.3 Charge Plans and Tiered Pricing

You can tie a tiered-pricing structure to charge items within a charge plan that establishes boundaries that determine how much to charge. Say, for example, you want to charge a certain rate for the first 10 GB of storage used, a different rate for the next 10 GB, and a different rate for anything over 20 GB. Chargeback provides this capability within the charge plan framework. Implement tiered pricing as part of charge plan creation. See Creating an Extended Charge Plan.

41.2.2.4 Creating and Revising the Universal Charge Plan

Set up the universal charge plan as follows:

1. How to proceed depends on the revision date:
- If the effective date under Universal Charge Plan starts in the past, select the revision in the navigation pane, then select **Revision** from the Create menu.

- If the effective date under Universal Charge Plan is current or in the future, select the revision in the navigation pane and click **Set Rates**.

2. In the dialog that opens, select the effective date of the revision. Note that a change to rates currently in effect is retroactive to the beginning of the cycle. Click **OK**.

3. In the Charge Plan editor, set the rates and charge frequency for the three basic metrics.
   Select a row, enter the rate and select the frequency from the drop-down menu.
   The rates set here are effective from the beginning of the current month, and have no impact on any previous month.

4. Make additional entries for different CPU architectures, as required.
   a. Click the **Add** button.
   b. Select a CPU from the drop-down menu and click **OK**.
   c. In the new row added to the table, enter the rate and select the charge frequency from the drop-down menu.

5. When done, click the **Save** button in the upper right hand corner to complete the universal charge plan revision.

### 41.2.2.5 Creating an Extended Charge Plan

Set up an extended charge plan as follows:

1. From the **Create** menu, select **Plan**. The Charge Plan editor opens.

2. Enter a name for the plan. The name must be unique but the plan can have multiple, date-based revisions.

3. Choose a peak time window for which to set premium charge rates. For more information, see **Charge Plans and Peak Windows**.

4. Click **Add**. The Add Entity Types dialog opens.

5. Select from the list of supported entity types. As a plan can serve more than one entity type, you can multiselect in the dialog. Click **OK**.
   Selected entity types appear in a table with one configuration (default) indicated.

6. Click **Set Up Configurations** to open the Set Up Configurations dialog, then click **Add** to open the Add Configuration dialog.
   Add a condition to set up a configuration for the entity type selected. The list of conditions available derives from the entity type. Select from the list, choose an operator, and set the condition value. You can specify a value or click the search icon to select the condition value from a list, or to search for some other value.
   You might, for example, set a condition of machine architecture for a host entity type, where there are two options: sparc sun4u and AMD64. You can then use the **Move Up** and **Move Down** buttons to establish the order of precedence in matching conditions, if applicable.
   Click **OK** when done with configuration setup.
As Figure 41-2 shows, the charge plan table now displays separate columns for conditional configurations and the default configuration.

Figure 41-2  Setting Up an Entity Configuration

Note that you can set only a single condition for a configuration. Suppose you want to change the condition from machine size to high availability for VM Guest. To do so, open the Set Up Configurations dialog and remove the machine size condition items. When you click Add, the high availability condition item is now available.

7. Click Add Item to open the Add Item dialog. Use this dialog to add charge items based on entity type for billing purposes.

Select a charge item from the drop-down list. The list of items derives from the entity type. For certain items, you can select the charge type from a drop-down list —flat rate, per unit, and so forth.

For some items, you can select the rate formula type: standard or tiered, where tiered represents a range up to a declared boundary. Set the upper bound of tier 1. The number then becomes the lower bound of tier 2. Click Add to add a third tier and specify the upper bound of tier 2, which then becomes the lower bound of tier 3. For more information, see Charge Plans and Tiered Pricing.

You can also set conditions, the same as for configurations in Step 6. For a database metered by service, charges are per service. For a WebLogic Server metered by J2EE application, charges are per application. Make your selection and click OK.

The charge plan table now displays a row for the charge item just added. A column appears for each configuration. Click the help icon to see a pop-up description of the charge item.

8. In the charge item row, specify the rate and select the frequency for each configuration. Say, for example, you added a CPU count charge item for entity type host, for which you want to charge a $1 a week per unit for the SPARC architecture, $.50 a week per unit for the AMD architecture, and $.75 per unit a week for all other architectures. Make the appropriate entries in the respective columns as displayed in Figure 41-3.
Figure 41-3    Setting a Condition on a Charge Item

<table>
<thead>
<tr>

<td>1x</td>
</tr>
<tr>
<td>CPU Rate Factor</td>
<td>1x</td>
</tr>
<tr>
<td>Memory Rate Factor</td>
<td>1x</td>
</tr>
<tr>
<td>Storage Rate Factor</td>
<td>1x</td>
</tr>
<tr>
<td>Recovery Cost</td>
<td></td>
</tr>
</tbody>
</table>

9. Repeat Steps 7 and 8 to include additional charge items for the entity type.

10. Optional. Make rate adjustments to the universal charge plan basic metrics for this extended charge plan. Make adjustments by specifying a factor of the base rate, where 1, the default, represents the prevailing base rate. So, for example, enter 1.5 to increase the rate by 50 percent; enter .5 to decrease the rate by 50 percent. If you want to ignore a universal plan rate altogether, enter 0.

Expand the rate factor for a metric to see what the actual charge is. For example, if the rate adjustment for memory allocation is 1.5 and the rate is $2 a month, the adjusted rate will be $3 a month.

The metrics available for an entity type determine which rate adjustments are possible. For example, you cannot make rate adjustments for a WebLogic Server metered by a J2EE application.

Suppose, given the example, you want to adjust the CPU rate to 75 percent for the AMD architecture and to 125 percent for the SPARC, leaving the rate as is for the rest. Make appropriate entries as shown in Figure 41-4.

Figure 41-4    Extended Plan Showing Customized Charge Items

<table>
<thead>
<tr>
<th>Host</th>
</tr>
</thead>
<tbody>
<tr>
<td><img src="image1" alt="Add Item..." /></td>
</tr>
</tbody>
</table>

<table>

<th>Charge by Configuration: Machine Architecture</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>AMD64</td>
</tr>
<tr>
<td>CPU Count</td>
<td>$0.50/Week</td>
</tr>
<tr>
<td>Universal Rate Adjustments</td>
<td>1.25</td>
</tr>
<tr>
<td>CPU Rate Factor</td>
<td>0.75</td>
</tr>
<tr>
<td>CPU Usage</td>
<td>$3.00/Week</td>
</tr>
<tr>
<td>Rate Factor x CPU Usage</td>
<td>$2.25/Hour</td>
</tr>
<tr>
<td>Memory Rate Factor</td>
<td>1x</td>
</tr>
<tr>
<td>Storage Rate Factor</td>
<td>1x</td>
</tr>
<tr>
<td>Recovery Cost</td>
<td></td>
</tr>
</tbody>
</table>
11. If you used the Plan Advisor to create the plan, recovery costs associated with recouping your investment appear as part of the plan details. You can edit these values as necessary. For more information, see Using the Plan Advisor.

12. When done, click the **Save** button in the upper right hand corner to complete the extended charge plan revision for the entity type.

You can now assign the extended charge plan to an entity instance of the appropriate entity type. Remember that extended charge plans are automatically effective from the beginning of the month.

### 41.2.2.6 Viewing Charge Item Metadata

The charge item library enables you to see at-a-glance detailed information about the charge items known within your Chargeback installation. This includes all charge items for well-known Enterprise Manager target types as well as for custom entity types introduced by integrators.

In many cases, charge items can be taken at face value: amount of memory used. In other cases, however, it is not so clear cut. Is the charge for database memory use computed based on allocated SGA memory or on the amount of memory used? What is the underlying metric or configuration used to determine CPU time or DB time usage? In cases such as these the usage value is only a part of some formula or customized query used to compute charges. In any event, you can take advantage of the detailed information available as you create extended charge plans.

1. From the **Enterprise** menu, select **Chargeback** and click the **Charge Plans** tab.
2. Click the **Charge Item Library** icon.
   
   The charge items metadata browser opens, displaying a table of all known charge items.
3. Optional. Select **Columns** from the **View** menu to alter the display and to show hidden columns, which might be of interest to you.
4. Optional. Click **Export** to save the charge items metadata content in a spreadsheet.

Consider the following as you view charge item metadata:

- The information is organized by entity type.
- Resource category is an internal bucket that Chargeback uses to organize charge items.
- Source type denotes a charge item as usage-based, configuration-based, or fixed.
- Chargeable means a rate can be defined for the item. An item without the check in the Chargeable column does not itself have a rate defined. Machine Architecture, for example, is a condition rather than a chargeable item.
- An Invalid indicator means the selected usage mode is not appropriate for the entity type.
- User-defined distinguishes custom charge items from out-of-box charge items.
- Charge items that are inactive cannot be added to new plans but can still be used in existing plans. They may also have meaning to historical plans.
- Metric Group and Metric Column link a charge item to its Enterprise Manager collection data. See the "Using Metric Extensions" chapter in the *Enterprise Manager Cloud Control Administrator’s Guide* for more information.
41.2.2.7 Using Conditions in Charge Plans

Conditions introduce considerable flexibility when creating extended charge plans. You can create variations known as configurations that allow you to determine a set of rates to charge based on entity configuration. You base configurations on a property or attribute of an entity, such as the size of a virtual machine. The sample extended plan (identified as Sample Charge Plan), for example, sets conditions on a VM Guest entity type, based on the machine size of the virtual machine, allowing for different sets of charges to apply depending on machine size. There is also an implied default configuration, which is the charge plan itself if no configurations are set up, or the charge plan of record if there is no match for a configuration condition. The sample extended plan thus has four configurations, one each for machine sizes small, medium, and large, plus the default "Other."

Similarly, you can place a condition on an individual charge item that determines if a charge will be applied. For example a condition set on Partitioning means charge only if partitioning is used.

Use the Like condition operator with string-based entity type and charge items to match a range of string values. For example, set a Like condition on a database instance to match on all 11g releases (Like 11%). Or use it as a wildcard (Like %) to match on any string of characters (or none). Use an underscore (Like _) to match any single character. Use backslash to escape a wildcard character (Like \%). Use a double backslash to escape the escape character (Like\\%)

When you have multiple configurations, you have to set the order of precedence to determine how conditions are applied. Suppose you have the following sequence of configurations based on the host operating system:

- OS Like %Linux%
- OS Like %Linux 6%
- Default

The second condition (Linux 6) will never be tested because the first will always take precedence when the OS is any version of Linux. Thus, you have to make the test for Linux 6 first to base charges specifically on the Linux 6 OS.

Contrast the Like operator with the Equals operator, where the match must be exact, and there is no wildcard recognition. So, for example, Equals 11.2% does not match 11.2.0 or 11.2.1. You must specify Equals 11.2.0 or Equals 11.2.1. Note also that all string matching is case-sensitive. Equals UPPER is not the same as Equals upper. There is also a Not Equals operator with which you can exclude specific string values.

Consider these other condition examples:

- For a shared database, set a condition to base the charge on the nodes of a RAC.
- For a dedicated database instance, use the SQL Executions charge item to set a charge rate on SQL statement executions per second.

Conditions give you flexibility. For example, you may want to create many charge plans with no conditions and assign individually to entities. Or, you can create a single charge plan with many conditions, and assign to many entities.
41.2.2.8 Using the Estimate Charges Feature

The estimate charges feature supports the following use cases:

- Project the likely effects of rate changes in a charge plan on an entity or a cost center based on prior average usage where available.
- Compare the effects of different charge plans on entities or cost centers based on prior usage.

To see the effects of rate changes in a charge plan:

1. On the Charge Plans tab, click the Estimate button.
2. On the Estimate Charges page, select a charge plan in which rates have been changed and the effective date of the plan.
3. Choose the basis on which to estimate charges; that is, based on entities or cost centers, then click Add.
4. Select entities assigned to a specific charge plan, or entities not yet added to Chargeback. Select cost centers from the list of available cost centers, including the default cost center.
5. After you make your selections, review the results. Click the respective radio button to view estimated charges in a tabular or graphical format.

To compare different charge plans:

1. On the Estimate Charges page, select the plans to compare and the respective effective dates.
2. Choose the basis on which to compare the plans; that is, based on entities or cost centers, then click Add. select the entities or cost centers to consider.
3. Select entities or cost centers as appropriate. Entities can be associated with either plan being compared or unassociated.
4. After you make your selections, review the results. The comparison appears in the table denoting the difference between the plans both as a monetary value and a percentage. A graphic summary appears to the right. You can change the summary view by selecting from the drop-down menu to the right of the summary.

Details of the comparison appear in the region below the table, where the system breaks out differences by charge items in the respective charge plan.

Chargeback bases estimations on usage for the selected date range. The system first identifies all chargeable entities. The system then applies plan rates to the daily average to determine daily estimated charges. Next it multiplies the daily estimated charges by the number of days in the report cycle to determine total estimated charges. Even if an entity is added mid-month, the system shows the estimation as if available for the whole month.

If the entity selected is not already in Chargeback, the system runs the Enterprise Manager ETL job on the entity to collect configuration and metering data; the job takes into account any child entities. If Chargeback metrics are not available, the system runs the daily collection job. The system then builds the daily average in order to display the estimated charges.
41.2.2.9 Revising Extended Charge Plans

You can update an extended charge plan in the following ways:

- Make changes to the charge rates in effect for the current or a future cycle.
- Create a plan revision for the next or a later report cycle, based on an existing plan.

To make changes to the charge rates in effect for the current or a future cycle:

1. Select the plan revision in the navigation pane and click **Set Rates**.
2. Make adjustments to the charge items and rates in effect.
3. Click **Save** to update the plan revision.

Note the warning when changing charge rates for the current cycle that the changes are retroactive to the beginning of the cycle.

To create a plan revision for the next or a later report cycle, based on an existing plan revision:

1. Select a plan in the navigation pane, then select **Revision** from the **Create** menu.
2. In the dialog that opens, select the effective date of the revision. The default date is the first month after the most recently added revision. For example, if the current cycle is for May and a June revision already exists, July 01 is the default effective date. Click **OK**.
3. In the familiar create-like model, the configurations, charge items, and rate adjustments for the plan you selected in the navigation pane appear in the plan details table on the right.
   
   Edit the plan details as desired:
   
   - Add and remove entity types.
   - Add and remove configurations.
   - Add, change, and delete charge items.
   - Make adjustments to metric rates.
4. When done, click **Save** to complete the plan revision.

41.2.3 Using the Plan Advisor

The Plan Advisor is a Chargeback feature that aids in deducing charge rates that make sense in terms of the entities and configurations for which the charge plan will be created. A wizard guides you through the process as follows:

- **Selecting the Entity or Entity Type**
- **Setting Up Configurations**
- **Projecting Recovery Costs**
- **Setting Rates for Charge Items**
41.2.3.1 Selecting the Entity or Entity Type

The selection of entity or entity type has consequences as described in Step 2 of the process.

1. On the Charge Plans tab, click the Plan Advisor button, then select New Plan. You can create a plan for an entity or an entity type.
2. Enter a name for the plan and select the effective date. Choose whether to create a plan for an entity or an entity type.
   If you are creating a plan for an entity instance, select the usage mode. If the entity is not yet in Chargeback, it will be added to Chargeback and assigned to the charge plan upon plan creation.
   If you are creating a plan for an entity type, select chargeable entities to be used for calculating usages upon which to base suggested rates. These entities will not be assigned the plan upon plan creation.
3. Click the Add button and select an entity type. Select any chargeable entities you might want to include as part of the plan.
4. Click Next to set up plan configurations.

41.2.3.2 Setting Up Configurations

The configurations you set up here are the same as when you create a charge plan; that is, you set conditions upon which to base charges, OS is like Linux 6, for example.

1. Select the entity type table row and click the Setup Configurations button to open the Set Up Configurations dialog.
2. Click Add to open the Add Configuration dialog.
3. Set a condition for the entity type selected. The list of conditions available derives from the entity type. Select from the list, choose an operator, and set the condition value. You can specify a value or click the search icon to select the condition value from a list, or to search for some other value.
   If you have selected chargeable entities, the same condition applies to each.
4. Click Next to enter recovery parameters.

41.2.3.3 Projecting Recovery Costs

Recovery refers to amortizing your investment in resources over a fixed period of time to determine how much in monthly charges you have to generate to recover your investment.

1. Enter a monetary amount for the total recovery cost and period of time in months over which to offset the amount.
2. Enter the number of entity instances to share the recovery cost. If you selected chargeable entities, that number appears by default. You can edit the number.
3. Enter a percentage of the recovery cost that the instances need to generate monthly. Include a percentage for the default configuration. The total has to be 100.
4. Click in the Amount column to calculate the percentage amount and monthly recovery rate per instance.

5. Click Next to review suggested rates to charge to recover your investment.

### 41.2.3.4 Setting Rates for Charge Items

Complete the plan by providing a weighting factor for charge items; that is, the percentage of monthly income each item should generate. The charge items that appear derive from the plan's entity type. You can include configurations as additional charge items.

1. Select a configuration in the left pane.

2. For each charge item, click in the Weighting column and assign a percentage. All charge items including any added configurations must total 100 percent.

3. Click in the Cost/Month column to calculate a monetary value for the assigned percentage.

   For usage charge items, the system computes average daily usage on the usage patterns of the chargeable entities to calculate a suggested rate. A suggested rate of zero means the usage value is too high or the recovery cost entered is too low.

4. Optional. Click **Add** to include a configuration as an additional charge item. Use this option as a way to augment the configurations set up in Step 2.

5. Click **Save** to complete plan creation and add the entity to Chargeback, if applicable.

### 41.2.4 Creating Cost Centers

Cost centers are vehicles for aggregating charges. A cost center can be an individual, a department within an organization, or a multitalored business hierarchy that spreads charges across the enterprise. You can create a business hierarchy by setting up cost centers and assigning users to the business units.

As part of Enterprise Manager user setup, an administrator can be assigned to a cost center. This cost center property then becomes the parent within Chargeback in place of the default cost center. For example:

- The daily data collection job creates a cost center for each Enterprise Manager user. If a cost center was assigned as part of user setup, it becomes the parent of the user's daily collection cost center; otherwise, the Chargeback default cost center becomes the parent of the user's daily collection cost center.

- A cost center is automatically assigned to an SSA entity during setup. If a cost center was assigned to the SSA requestor as part of Enterprise Manager user setup prior to the SSA entity being added to Chargeback, it becomes the parent of the SSA cost center; otherwise, the Chargeback default cost center becomes the parent of the SSA cost center.

Oracle recommends use of the Enterprise Manager user cost center property as a way to better manage cost center hierarchies within Chargeback.

A cost center can originate in the following ways:

- **Setting the Cost Center Property for an Enterprise Manager User**
- **Setting the Cost Center Property on the Target Home Page**
41.2.4.1 Setting the Cost Center Property for an Enterprise Manager User

Enterprise Manager users who administrate Chargeback should be assigned to a cost center in their account profile.

1. From the Setup menu, select Security, then select Administrators.
2. Search for and select the administrator in question, then click Edit.
3. On the Properties page, enter an appropriate value for the Cost Center property as it relates to charges accruing to this user.
4. Advance to the Review page and click Finish.

You can of course also set the cost center property as part of the overall user account creation process.

This cost center will take precedence over the default cost center in Chargeback.

41.2.4.2 Setting the Cost Center Property on the Target Home Page

When you make a server request in the process of setting up a self service application, the Cost Center target property of the target, VM Guest for example, is automatically set to the user login of the person making the request. When the entity is configured for Chargeback, the user login is imported and appears in the Cost Center column for that entity on the Entities tab. Its parent is the Enterprise Manager user cost center if assigned; otherwise, it is consigned to the Chargeback default cost center.

You cannot change the cost center assignment for an SSA entity, but you can reassign the SSA user out of the default cost center to a more appropriate cost center, if desired, as described in Creating High-Level Cost Centers in Chargeback.

Similarly, you can manually set an entity's Cost Center target property to an appropriate value (user ID), which will subsequently be imported and appear in the Cost Center column on the Entities tab when the entity is configured for Chargeback. Its parent is the Enterprise Manager user cost center if assigned; otherwise, the user ID is consigned to the Chargeback default cost center from which it can subsequently be reassigned to another cost center. This method is relevant only for non-self service entities; it provides a way to automatically set the cost center when the entity is added to Chargeback.

To create a cost center in this fashion:

1. On the All Targets page, select the target in question and go to the target home page.
2. From the target type menu, select Target Setup, then select Properties.
3. Click Edit and enter a value for the Cost Center property, then click OK.

The value will appear as described when the target is configured for Chargeback.

Note that if you change the Cost Center property for an entity that has already been added to Chargeback, the system does not recognize the new value.
41.2.4.3 Creating High-Level Cost Centers in Chargeback

A user who provisions an entity using the self service portal appears under the associated Enterprise Manager user cost center as a consequence of adding the SSA entity to Chargeback. If there was no Enterprise Manager user cost center assigned, the SSA user appears under the Chargeback default cost center, from which the user can subsequently be reassigned to an appropriate cost center as described in Step 4 of the process below.

To create a cost center manually:

1. From the Enterprise menu, select Chargeback.
2. Select the Cost Centers tab and then click the Add button.
3. Enter the appropriate information in the New Cost Center dialog:
   - The cost center takes a unique name by which it is known internally in the system.
   - The cost center also takes a meaningful name that appears in the user interface and generated reports.
   - Indicate the cost center's position in the tree hierarchy; that is, whether it should be root or nested. You can subsequently change its position in the hierarchy.

   When you click OK, the new cost center appears in the table.

4. Cost centers typically equate to business organizations. When you select a cost center row, users who are part of the organization appear in the region below. Users can also be unassigned.

   In addition to the cost centers you create, there also is a system default cost center that serves as a clearinghouse for unassigned users. These include:
   - Self service users; that is, the user login of the person setting up the SSA who do not otherwise have an Enterprise Manager user cost center assigned
   - Users designated as the Cost Center target property on the target home page who do not otherwise have an Enterprise Manager user cost center assigned

   You can reassign these users to roll up charges to a higher-level cost center.
   a. First, select the default cost center row in the Cost Center table. This exposes the users consigned to the default cost center.
   b. Next, select a user row in the Users table.
   c. Click the Assign to Cost Center button that is now active.
   d. In the dialog that opens, designate the cost center to which to assign the user, then click OK.

      The user now appears in the designated cost center.

5. As the cost centers list grows, you may find that you want to combine cost centers, sales under marketing, for example. To do so, select the cost center row, then select Move from the Action menu. The change is effective from the beginning of the current reporting cycle.

   In the dialog that opens, indicate whether to include nested cost centers and choose where in the tree to move the cost center, then click OK.
6. At some point, you may decide to deactivate the cost center. To do so, select the cost center row and click the Remove button. Indicate whether to deactivate nested cost centers as well. The change is effective from the beginning of the current reporting cycle. Deactivation means the cost center can no longer be assigned to an entity, but its association with entities remains in previous report cycles; that is, if you run a report for a previous cycle, the entity assignment reflects the deactivated cost center.

Note the following about cost center moves, for example when a cost center (and its users) move to a different parent:

- The user assignment of an entity resource remains the same: the PC assigned to J Doe remains assigned to J Doe.
- Likewise, the resource usage assignment remains the same, but the report rollup reflects the new cost center parent child relationship, unless the administrator changes the assignment. The cost center move effects a change in the usage assignment, which is associated with the cost center and user ID.

41.2.5 Adding Entities to Chargeback

Decide on the entities whose resources you want to manage within Chargeback. You have to add entities to start collecting metrics against which to calculate charges. Note that if you want to add a Real Application Cluster (RAC) that has member instances already monitored in Chargeback, you must first remove those instances from Chargeback.

For certain database entity types, you have to enable metric collection before you can add entities of these types to Chargeback:

- Database instance where metering is by service
- Cluster database where metering is by service
- CDB (both single instance and RAC)
- Pool databases used for provisioning schema services and pluggable database services provided as part of a PaaS Infrastructure zone

For information on enabling metric collection, see Configuring Metric Collection for Enterprise Manager Database Services.

A CDB is a composite entity. When you add a CDB instance, all of its pluggable databases (PDBs) are automatically discovered and reported as children of the CDB instance. Usage and charges are calculated at the PDB level.

When you add a PaaS Infrastructure Zone entity, all of its databases (single instance and RAC), database services, and PDBs are automatically discovered and reported as children of the zone. Usage and charges are calculated at the entity level.
You must have the ADD_CHARGEBACK_TARGET role assigned to add any entity monitored in the Enterprise Manager instance that qualifies for Chargeback support. Without it, the Add button is disabled. As in the process of adding entities you can also assign charge plans and cost centers, these privileges must be included: MANAGE_CBA_ENTITY_OBJ_PRIV, ASSIGN_CHARG_PLAN_PRIV, and ASSIGN_CBA_COST.CENTER_PRIV.

The VIEW_CAT_TARGET role allows you to see Chargeback data related to a specific entity. The VIEW_ANY_CAT_TARGET role allows you to see Chargeback data related to any entity.

1. From the Enterprise menu, select Chargeback.
2. Select the Entities tab and click the Add button.
   The Add Entities wizard opens, where you perform the following steps:
   a. Selecting Entities for Chargeback
   b. Making Assignments
   c. Reviewing Entity Setup

It may take up to 24 hours after an entity is added to Chargeback for its metering data to appear. To stop collecting data on entities, select the entities involved and click the Remove button.

As new services for cluster members are discovered as part of the daily collection, they appear automatically in the tree hierarchy under the RAC node. The charge plan in effect is automatically assigned. Make cost center assignments accordingly.

41.2.5.1 Configuring Metric Collection for Enterprise Manager Database Services

Metric collection for Enterprise Manager database services is disabled by default for the following entity types:

- Database instance metered by database service
- RAC metered by database service or PDB
- CDB (both single instance and RAC)
- Pool databases used for provisioning schema services and pluggable database services provided as part of a PaaS Infrastructure zone

You have to enable metric collection before Chargeback can manage resources on these entities.

To effect change to metric data collections, you must be assigned the MANAGE_TARGET_METRICS role on the specific target.

1. From the Targets menu, select Databases.
2. Locate the target in the table and open its home page (provide credentials if requested).
3. From the Oracle Database menu, select Monitoring, then select Metric and Collection Settings.
4. On the Metric and Collection Settings page, change the view to All Metrics.
5. As shown in Figure 41-5, scroll down to EM Database Services (not simply Database Services), click Disabled, and complete the enabling process.

![Figure 41-5 Enabling Metric Collection for Database Services](image)

Do this for each cluster member in a RAC and for each CDB instance.

Alternatively, you can use the following EMCLI command to enable the metric collection on the corresponding database entity instance:

```bash
emcli modify_collection_schedule -targetType='oracle_database' -targetNames=target_name1;target_name2 -collectionStatus='ENABLED' -collectionName='DBService' -preview='N';
```

Where target_namen is an appropriate database target instance.

### 41.2.5.2 Selecting Entities for Chargeback

Step 1 in the Add Entities wizard is to select the entities you want to add to Chargeback and establish a usage mode where applicable.

For certain database entity types, you have to enable Enterprise Manager metric collection before you can add entities of these types to Chargeback:
• Database instance where metering is by service
• Cluster database where metering is by service
• CDB (both single instance and RAC)
• Pool databases used for provisioning Oracle Database Services and pluggable
database services provided as part of a PaaS Infrastructure zone

For information on enabling metric collection, see Configuring Metric Collection for
Enterprise Manager Database Services.

1. Click the Add button.

2. In the dialog that opens search for the entity types you want to add. Use criteria to
filter your search.

To add a database as a service entity type (DBaaS or SchaaS), select the PaaS
Infrastructure Zone entity type. Database services and PDBs appear as children of
the zone parent.

Note:

Database (single instance and RAC) and CDB entities that provision
service entities for a PaaS Infrastructure Zone cannot themselves be
added as entities to Chargeback. To do so may lead to nondeterministic
behavior in charge plan assignments. Thus, in cases of conflict no plan
assignment is allowed.

3. In the search results list, select the specific entities you want to add. Note that you
can multiselect entities. Click Select.

The dialog closes and a progress indicator notes the search for associated
entities. The selected entities then appear in the table. For a composite entity, its
members are accounted for in the Members column, provided they are new
members that can be added to Chargeback. A check mark in the Valid column
indicates that metrics and configuration data will be collected for the entity and
used in charge calculations. So, for example, the metered check mark is not set
for a WebLogic domain because data collection occurs at the WebLogic Server
level.

4. Optional. Set the usage mode to other than the default where applicable to declare
how to perform metering.

Select the usage mode from the drop-down list. Choices depend on the entity
type; in some cases, there is only one choice, Metered. A database, for example,
offers three choices: Metered by Database Instance, Metered by Service, or
Metered by PDB.

5. Click Next to make charge plan and cost center assignments.

41.2.5.3 Making Assignments

Step 2 in the Add Entities wizard is to make charge plan and cost center assignments.

Charge plans provide a basis for calculating the cost of resource consumption.

1. Select the entity in the table and click the Assign Plan button.
2. In the dialog that opens:
   a. Specify plan inheritance. **Propagate** assigns the plan to children of the entity if they have no plan assigned. **Override** assigns the plan regardless, removing the current plan assignment, if any.
   b. Select the extended charge plan appropriate to entity selection.
   c. Click **OK**.

The dialog closes, and the plan assignment appears in the entity table row.

You can opt not to assign charge plans now and assign them after adding the entities for Chargeback. See **Assigning Charge Plans to Entities** for more information.

Cost centers provide a way to aggregate the charges accrued for resource consumption.

1. Select the entity in the table and click the **Assign Cost Center** button.

2. In the dialog that opens:
   a. Specify cost center inheritance. **Propagate** assigns the cost center to children of the entity if they have no cost center assigned. **Override** assigns the cost center regardless, removing the current cost center assignment, if any.
   b. Select the cost center appropriate to entity selection.
   c. Click **OK**.

The dialog closes, and the cost center assignment appears in the entity table row.

You can opt not to assign cost centers now and assign them after adding the entities for Chargeback. See **Assigning Cost Centers to Entities** for details.

When done, click **Next** to review entity setup and complete the task of adding entities to Chargeback.

### 41.2.5.4 Reviewing Entity Setup

Step 3 in the Add Entities wizard provides an opportunity to review your selections and assignments, before completing the task. If satisfied, click **Submit**.

You return to the **Entities** tab where a message confirms that \( n \) number of entities were successfully added. For more information on what happens after entities are added, see **After Adding Entities to Chargeback**.

### 41.2.5.5 After Adding Entities to Chargeback

After adding entities to Chargeback, you can use various filtering criteria in the search pane on the left to alter the display in the table on the right. When you select a check box, the display changes to reflect your selections.

- Use the filtering capabilities to search by entity type or entities within type.
- Search to differentiate between entities that are assigned a cost center or charge plan and those that are unassigned.
- Use filtering criteria to check on collection status.
- Follow charge trends for those entities with a history of data collection and charge activity.

Use the save search capability as follows:
1. Click the save icon to preserve your search criteria.

2. Select Manage Saved Search from the drop-down menu to set or clear the default search or to remove a saved search.

3. Select a saved search from the drop-down menu to execute the search.

Note that the entities table has a flat structure. When you add entities that include members, they appear as singular entries in the table, without regard to hierarchy. To see the hierarchical relationship, select an entity row and click the Hierarchy subtab in the Details region. For more information, see Viewing an Entity's Collected Metric Data and Other Entity Details.

4. Defining Plan Assignment Rules

You can define rules to assign a charge plan to an entity based on criteria you select. Rules fire prior to the daily data collection job. Entities without assigned charge plans are assigned a plan based on rule order.

When you make a plan assignment, you have the option of selecting a plan from a list of available plans or of letting rules criteria determine the plan.

**Note:**

There is a system rule that establishes plan inheritance from the closest parent. This rule is uneditable.

1. From the Enterprise menu, select Chargeback and click the Entities tab.

2. From the Action menu, select Set Plan Assignment Rules.

3. Click the Add button.

4. Select a charge plan to assign from the drop-down list and provide a description for the rule.

5. Click Add Group to define criteria.
   a. Select the left operand from the drop-down list (Entity Type, Parent Entity, Tenant).
   b. Select an operator (Equals, Not Equals).
   c. Click the search icon to select the right operand. The left operand determines the list of available choices. For example, if the left operand is Tenants, the list of available tenants known to Chargeback appears in the right operand dropdown list.

6. To add additional criteria, click the Add Item button. A new set of selection dropdown boxes appear that includes a Boolean operator. Set the Boolean to AND or OR to indicate whether all sets of criteria must match or any one constitutes a match.

   Select the operands and operator as above.

7. When done with criteria, click Add to complete rule creation.

8. Rules fire in the order of appearance. Use the Move Up and Move Down buttons to reorder rule precedence as necessary.
41.2.6 Assigning Cost Centers to Entities

Cost centers are a way of distributing charges for resource usage. A cost center is automatically assigned to an SSA entity as part of SSA setup (Cost Center target property). Use this manual process only for assigning cost centers to non-SSA entities.

**Note:**
You also can perform cost center assignment when adding an entity for Chargeback. See Step 2 of the Add Entities wizard described in Making Assignments.

1. From the **Enterprise** menu, select **Chargeback**.
2. Select the **Entities** tab.
3. Select the entity to which you want to assign a cost center and click the **Assign Cost Center** button.
4. In the dialog that opens:
   a. Specify cost center inheritance. **Propagate** assigns the cost center to children of the entity if they have no cost center assigned. **Override** assigns the cost center regardless, removing the current cost center assignment, if any.
   b. Select the cost center appropriate to entity selection.
   c. Click **OK**.

The dialog closes, and the table of entity assignments refreshes to reflect the assignment.

When charges are calculated, unassigned entities are assigned to the default cost center. Note that assigning a cost center to a composite entity maps directly to the composite entity, and to any children that otherwise have no direct cost center assignment.

A group member with one cost center assignment who is a member of another group with a different cost center assignment is in conflict as noted on the **Entities** tab for the affected group member. It is also possible that a group member is part of a regular target hierarchy as well as a group. For example, a database (DB1) appears under a zone (PaaS zone 1) and under a group (Group 1). In these cases, charges continue to be calculated, but are charged to the default cost center until an administrator resolves the conflict, at which time charges will accrue against the appropriate cost center.

Shared services under a RAC node can be assigned to different cost centers.
To unassign a cost center, select the entities involved and select **Unassign Cost Center** from the **Action** menu.

### 41.2.7 Assigning Charge Plans to Entities

When assigning charge plans to entities, you have the option of assigning plans individually to child members or assigning at an ancestor level and having the child members inherit the assigned plan.

An extended charge plan includes parameters for how to apply universal charge rates to an assigned entity. You also can replace an extended plan by reassigning the universal plan to an entity.

For SSA entities (zones), the person performing SSA setup assigns the charge plan to the zone as part of setup so that all entities within the zone inherit the plan.

**Note:**

You also can perform charge plan assignment when adding an entity for Chargeback. See Step 2 of the Add Entities wizard described in **Making Assignments.**

---

1. From the **Enterprise** menu, select **Chargeback**.
2. Select the **Entities** tab. A list of entities appears showing assigned cost centers and charge plans.
3. Select the entity to which you want to assign a charge plan click the **Assign Plan** button, then choose the appropriate action.
4. **Rule Based Assignment** asks to confirm that you want to run rules to assign a plan. Click **OK**. Rules fire to determine plan assignment based on rules criteria. For more information, see **Defining Plan Assignment Rules**.
5. **Direct Assignment** opens a dialog that displays a list of plans that apply only to the entity type. Proceed as follows:
   a. Specify plan inheritance. **Propagate** assigns the plan to children of the entity if they have no plan assigned. **Override** assigns the plan regardless, removing the current plan assignment, if any.
b. Select the extended charge plan appropriate to entity selection.

c. Click OK.

The dialog closes, and the table of entity assignments refreshes to reflect the assignment.

A group member with one plan assignment who is a member of another group with a different plan assignment is in conflict as noted on the Entities tab for the affected group member. It is also possible that a group member is part of a regular target hierarchy as well as a group. For example, a database (DB1) appears under a zone (PaaS zone 1) and under a group (Group 1). In these cases, no charges are calculated for the entity until an administrator resolves the conflict, at which time calculations resume. If there is no resolution before the close of the reporting cycle, charges can no longer be calculated.

A RAC can be metered by database instance, database service, or PDB. Each RAC member appears under the RAC node in the tree hierarchy and can be assigned to different charge plans and different cost centers.

To unassign a charge plan, select the entities involved and select Unassign Plan from the Action menu.

41.2.8 Running the Daily Data Collection Job

The daily data collection in Chargeback is an ETL—extract, transform, load—process where information is extracted from one source, transformed into an appropriate format, and loaded into a repository.

Enterprise Manager collects metric and configuration information on entities and stores it in the Management Repository. These collections occur with varying frequencies. When an entity is added to Chargeback, the application extracts the data from the repository and transforms it for use in Chargeback-dedicated tables. This process of extracting and transforming data is the Chargeback data collection process, which is scheduled to run every 24 hours. Chargeback maintains its own data collection tables because it needs to perform various transformations on the data, and to provide a historical data reference.

Given the 24-hour cycle, any Chargeback activity is not immediately apparent. For example, if you change a cost center assignment, it may take up to 24 hours (until the next data collection job runs) for reports to show the change. To circumvent the cycle, you can run the collection job on-demand to update the tables immediately.

1. From the Enterprise menu, select Chargeback.
2. Select the Entities tab.
3. From the Action menu, select On-demand data collection.

Chargeback data collection tables are updated to reflect the most recent activity.

To check on the job schedule:

1. From the Enterprise menu, select Job, then select Activity.
2. On the Job Activity page, click Advanced Search.
3. In the Advanced Search region, select Chargeback Data Loader from the Job Type drop-down list, then click Go.
4. Check the Scheduled column for the next scheduled job execution.
Do not change the job schedule.

**Chargeback Data Retention Period**

Chargeback retains the data it collects as follows:

- Hourly data remains available for three months by default. To see what your current retention period is for hourly data, execute the following query:

  ```sql
  select * from EM_INT_PARTITIONED_TABLES where table_name like '@EMCT_CBA_CHARGE_1HOUR'
  ```

  To adjust the hourly retention period, execute the following command sequence:

  ```sql
  begin
  gc_interval_partition_mgr.SET_RETENTION('SYSMAN', 'EMCT_CBA_CHARGE_1HOUR', 4);
  end;
  ```

  This example extends the hourly retention period to four months.

- Daily data remains available for 24 months by default. To see what your current retention period is for daily data, execute the following query:

  ```sql
  select * from EM_INT_PARTITIONED_TABLES where table_name like '@EMCT_CBA_CHARGE_1DAY'
  ```

  To adjust the daily retention period, execute the following command sequence:

  ```sql
  begin
  gc_interval_partition_mgr.SET_RETENTION('SYSMAN', 'EMCT_CBA_CHARGE_1DAY', 36);
  end;
  ```

  This example extends the daily retention period to 36 months.

### 41.3 Self Service Applications and Zones within Chargeback

A key component of cloud computing is availability of self service applications. Enterprise Manager includes SSAs for Oracle VM, database, and middleware.

1. To access the respective portal, from the **Enterprise** menu, select **Cloud**, then select **Self Service Portal**.
2. On the Self Service Portal page, select a service type from the **Manage** drop-down menu.
3. Click the **Chargeback** icon in the left pane to view charge trends and details for the selected service type, provided it was configured for Chargeback.

While performing cloud setup, you can link directly into Chargeback to configure the respective zone. Note that zone setup is a prerequisite.

1. From the **Setup** menu, select **Cloud**, then select as follows:
   - **Infrastructure**—to set up VM types.
   - **PaaS Infrastructure Zones**—to manage PaaS Infrastructure zones.
   - **Database**—to set up database resource pools.
   - **Middleware**—to set up middleware resource pools.
• **Testing**—to add application types for use by test designers to organize test-related activities.

2. Each respective home page has a **Chargeback** selection on the left. Click it to display an informational page on Chargeback setup that includes links into Chargeback to perform setup.

Chargeback supports several zones including Oracle VM and PaaS Infrastructure, which includes DBaaS, MWaaS, Schema as a Service (SchaaS), and Pluggable Database as a Service (PdbaaS).

Within Chargeback, the respective zone hierarchies appear as follows on the **Show Hierarchy** subtab of the **Entities** tab, PaaS Infrastructure under the Cloud category and Oracle VM under the Servers, Storage and Network category:

![Note](image-url)

A PaaS Infrastructure zone can contain a database instance, a RAC instance, a database service, a composite application, or any combination of these, as represented below.

<table>
<thead>
<tr>
<th>Zones</th>
<th>Zone Hierarchy</th>
</tr>
</thead>
<tbody>
<tr>
<td>PaaS Infrastructure</td>
<td>PaaS Infrastructure Zone</td>
</tr>
<tr>
<td></td>
<td>Single Instance Database</td>
</tr>
<tr>
<td></td>
<td>Cluster Database</td>
</tr>
<tr>
<td></td>
<td>Database Instance1</td>
</tr>
<tr>
<td></td>
<td>Database Instance2</td>
</tr>
<tr>
<td></td>
<td>Schema Service</td>
</tr>
<tr>
<td></td>
<td>Pluggable Database</td>
</tr>
<tr>
<td></td>
<td>Oracle Composite Application</td>
</tr>
<tr>
<td></td>
<td>WebLogic Domain</td>
</tr>
<tr>
<td></td>
<td>WebLogic Cluster</td>
</tr>
<tr>
<td></td>
<td>Oracle WebLogic Server1</td>
</tr>
<tr>
<td></td>
<td>Oracle WebLogic Server2</td>
</tr>
<tr>
<td></td>
<td>Oracle WebLogic Server</td>
</tr>
<tr>
<td>Oracle VM</td>
<td>Oracle VM Zone</td>
</tr>
<tr>
<td></td>
<td>Oracle VM Server Pool</td>
</tr>
<tr>
<td></td>
<td>Oracle VM Guest1</td>
</tr>
<tr>
<td></td>
<td>Oracle VM Guest2</td>
</tr>
</tbody>
</table>

The following characteristics apply to all entity type zones:

• Adding a zone to Chargeback automatically includes all child instances.

• Removing a zone from Chargeback automatically removes all child instances.

• A child instance with no explicitly assigned charge plan inherits the plan of its nearest ancestor above it in the hierarchy.

• A child instance with no explicitly assigned cost center inherits the cost center of its nearest ancestor above it in the hierarchy.
• Querying on charges at a given level within the hierarchy will include all charges for the levels below (either directly or indirectly).

• New members discovered or added to a zone are automatically recognized by Chargeback at the next data collection cycle.

As the Chargeback Administrator with respect to self service, you should perform all configuration-related tasks on the self service zone rather than on child entities.

The SSA user is automatically associated with the SSA entity as the cost center, when the SSA entity is added to Chargeback. See Assigning Cost Centers to Entities to learn about assigning cost centers. When assigning charge plans, a plan assigned to a zone applies to all members within the zone that do not otherwise have a plan assigned. See Assigning Charge Plans to Entities to learn about assigning charge plans.

### 41.4 Accessing Chargeback Information

Once a Chargeback data collection cycle completes, you can begin to parse the information in a variety of ways. This section covers the following topics:

- Following Usage and Charge Trends
- Viewing an Entity’s Collected Metric Data and Other Entity Details
- Generating and Distributing Chargeback Reports
- Viewing Chargeback Information in the Self Service Portal
- Sharing Chargeback Data with Other Applications

#### 41.4.1 Following Usage and Charge Trends

Once you define charge plans, set up cost centers, and begin to monitor entities, trends in usage and charges emerge. Trending reports show metric or charge trends over a defined period of time and are useful for end users who want to see how their charges change over time. They are also useful to the IT department for capacity planning purposes.

The Home tab displays bar graphs that denote usage and charge trends over time. Each trend region has an Option link in the upper-right corner that opens a dialog where you can customize the display.

**Usage Trend Options**

Customize the usage trend display as follows:

- **Time Period**—Select the desired time period to chart usage trends; default is the current year
- **Aggregation**—Select how to group usage across the selected time period; default is monthly
- **Usage Value Type**—Show usage as a percent (utilization) or as a consumptive value; default is utilization
- **Resource**—Show usage in terms of a particular metric (CPU, memory, or storage); default is the three metrics

Figure 41-6 displays a usage trend showing CPU, disk, and memory utilization over the past week, aggregated daily.
Figure 41-6  Sample Usage Trend Graph

Charge Trend Options

Customize the charge trend display as follows:

- **Time Period**—Select the desired time period to chart charge trends; default is current year
- **Aggregation**—Select how to group charges across the selected time period; default is monthly
- **Group By**—Group charges by either cost center or entity type; default is cost center
- **Cost Center**—Display charge trends for all cost centers, a particular cost center, or for unassigned users; default is all

Figure 41-7 displays a charge trend showing last week's charges for the VM Guest entity type, aggregated daily.
41.4.2 Viewing an Entity’s Collected Metric Data and Other Entity Details

View a selected entity's metric data and other relevant information such as collection status, any associated problems, current rate of recovery, an audit trail of activities affecting the entity, and more.

You can view an entity's metrics in graph form or as a time-stamped report of raw metric data. You can export the latter view to an external application such as a spreadsheet.

Note that you might have to expand the metric data region at the bottom of the Entities tab to expose the subtabs referenced in the instructions below.

1. From the Enterprise menu, select Chargeback.
2. Select the Entities tab and then select an entity to view.
   - Select the Metered Data (Chart) subtab below the entities list, to view a wave graph of data metrics for the entity. Select the metric to display from the drop-down list on the right. The metric selection is entity-type dependent. For a WebLogic Server metered by J2EE application, the metrics are per application. For a database metered by service, the metrics are service-related. For a RAC, metrics are represented as a multiline graph grouped by cluster member, where each line maps to usage by a particular member for the selected service.
   - Select the Metered Data (Table) subtab to view the raw numbers. In this view, you can filter the data and export it as a csv-formatted file. You also can change the focus to another entity. For a RAC, the view shows the same service data for all cluster members within the RAC.
   - Select the Show Hierarchy subtab to view the hierarchical relationships of a container entity and its chargeable entities.

Figure 41-7  Sample Charge Trend Graph
• Select the **Collection Status** subtab to glean statistical data such as error count and when metric data was last collected. For a RAC, collection status is for all cluster members within the RAC regardless of service selected.

• Select the **Problems** subtab to view any problems related to the selected entity such as with the data collection process. The summary entry links directly to Incident Manager where you can learn more about the problem and potential solutions. A service request (SR) number appears if assigned. There is also a **Problems** subtab on the **Home** tab that notes issues related to the whole of Chargeback. There are here likewise direct links to Incident Manager.

**Note:**
Within Incident Manager, you can view, track, and manage the life cycle of a problem and its associated incidents. Support Workbench allows you to further investigate and report a problem. As the Chargeback Administrator, you require full privileges on all hosts and Management Agents associated with the Oracle Management Service to view problem details in the Support Workbench.

• Select the **Rate of Recovery** subtab to see if an entity is on-track to meet the projected monthly figure the Plan Advisor calculated.

• Select the **Audit** subtab to see who performed certain tasks such as assigning a cost center to the entity and when.

• Click the help icon that appears in a charge details row to see a pop-up description of the applicable charge item.

**Figure 41-8** shows a chart tracking instance uptime for the selected entity over a span of seven days.

**Figure 41-8  Sample Entity Metric Data**

Note that you can see additional details on the Job Activity page.

1. From the **Enterprise** menu, select **Job**, then select **Activity**.
2. Click Advanced Search and specify the following filtering criteria:
   • Select **Chargeback Data Loader** as Job Type.
• Select **Targetless** as Target Type.
• Select appropriate values for Status and Scheduled Start.

3. Click **Go**.

The log output for each job step captures any warnings or errors encountered.

### 41.4.3 Generating and Distributing Chargeback Reports

Chargeback reports are a powerful analytical tool for tracking resource usage and charge distributions. These summary reports show information related to charge or resource utilization broken down by cost center, entity type and resource. They enable you to quickly assess the entities or cost centers with the greatest charges or resource utilization. Summary reports are primarily useful for drill-down purposes.

Data collection occurs once a day. The daily data collection job for the current cycle is based on charge plan and cost center assignments. The reporting cycle defines the time period for which to calculate charges. The cycle is for the current month starting on the first day of the month.

**Note:**

Changes in Chargeback setup are not immediately reflected in reports. For example, if you change a cost center assignment, it may take up to 24 hours (until the next data collection job runs) for reports to show the change. If you have SYSMAN Super Administrator privileges, however, you can initiate data collection on-demand from the **Entities** tab. To do this, select **On-demand data collection** from the **Action** menu.

To generate ad hoc reports:

1. From the **Enterprise** menu, select **Chargeback**.
2. Select the **Reports** tab.
3. Design your report from the following options:
   - Use the current report cycle or customize a date range to report on.
   - Choose between summary and trending report types. A summary report presents a pie-chart breakdown, while a trending report uses a y-axis multiple bar chart to denote usage trends.
   - Select specific or all tenants.
   - Select specific cost centers or report on all users.
   - Select specific entities or entity types or report on all entities within all entity types.
   - Choose the metric to report on.

Click **View Report** to see the results.

The report displays color-coded graphs summarizing charges by cost center, entity type, and resource, with details displayed in the table at the bottom. Hover over a color box link in the respective graph to highlight the report contents for the color-coded selection, for example memory in the resource graph.
Figure 41-9 displays a summary report showing charges for the current reporting cycle for all tenants, cost centers, and entity types, with a breakdown by resource.

Figure 41-9  Summary Report for a Cost Center and Entity Type

4. Filter the details by choosing from the drop-down list; the default is All. Use the query-by-example feature (icon to the right of the action buttons) to search report details. The icon acts as a toggle; clicking it alternately shows or hides text and selection boxes above the table columns. The feature is also available in the View menu. Enter search criteria in various combinations by selecting a date and by typing values in the respective columns. Press Enter to activate the search.

5. Click the Export button in the details region to export report contents to file.

6. Click Publish Report to make report contents public. This action integrates with BI Publisher, where you can:
   - Save reports in a variety of formats (Excel, PowerPoint, HTML, PDF)
   - Distribute generated reports to e-mail lists (users who do not have access to Enterprise Manager, for example) on a defined schedule

For information on BI Publisher setup, see the "Installing BI Publisher on Enterprise Manager" chapter in the Enterprise Manager Cloud Control Advanced Installation and Configuration Guide.

Reporting on Uptime

When you choose to report on the uptime metric, the details display the fractions of hours in a day an entity was available over the course of the reporting cycle. You can see the adjustment for down time when you report on the charge metric. The report shows the charge, the adjustment, and the adjusted charge.

Making Manual Adjustments

If necessary, you can make manual adjustments to charges for an entity after reporting on the charge metric. These manual adjustments can be positive or negative. Perhaps the customer is entitled to a discount, or maybe an incorrect charge rate was applied.

1. Run a report based on the charge metric.

2. Select the entity in the details portion of the report, then click the Adjust Charges button.

3. Enter a notation justifying the adjustment in the space provided.
4. Specify the amount of the adjustment in the space provided. Place a minus sign (-) before the number to reduce the charge.

5. Click Update to review the result of the adjustment. If satisfied, click Save.

The system updates the report with the adjusted charge.

The adjustment will be reflected on the charge date or at the start of the report cycle, as applicable.

### 41.4.4 Viewing Chargeback Information in the Self Service Portal

You can access Chargeback information as it relates to self service applications from the self service portal.

1. From the Enterprise menu, select Cloud, then select Self Service Portal.

2. On the Self Service Portal page, select a service type from the various categories of services.

3. On the selected services page, click the Chargeback icon in the left pane to view charge trends and details for the selected service type, provided it was configured for Chargeback. The informational breakdown is as follows:

   - The top portion of the page breaks down total charges by resource or service type selected from the View By drop-down menu on the right. Click a charge number to isolate the details.

   - The bottom portion of the page offers display alternatives:

     - **Charge Trend** calculates charges across a date range for various metrics. If you hover over a metric, memory for example, the bar graph changes to reflect only that metric.

     - **Details** breaks down the summary charges displayed in the top portion across the complete spectrum of Chargeback attributes. You can reorder the data by selecting from the Detail Level drop-down menu. You can also display additional information by exposing more columns.

     When the detail level is by date, an Hourly Details button appears. Click the button to display a pop-up showing a break down by the hour.

     You can make manual adjustments to charges by selecting a table row and clicking the Adjust Charges button.

**Figure 41-10** shows a sample Chargeback informational breakdown in the self service portal for Middleware Cloud Services.
41.4.5 Sharing Chargeback Data with Other Applications

Amassed Chargeback data is a valuable commodity that can be made available to other applications. There are several ways to do this:

- Export administrative reports (Export button on the Reports tab in Chargeback)
- Publish administrative reports via BI Publisher (Publish button on the Reports tab in Chargeback)
- Export details of charge trends for self service applications (Export button on the Chargeback tab in the self service portal)
- Execute the EM CLI verb `get_metering_data` to generate comma-separated output on usage and, optionally, charge data (see Chargeback and Metering EMCLI Verbs, for more information)

In addition, Enterprise Manager supports repository views to access information in the Management Repository for further processing and presentation. There are two views available (`MGMT$EMCT_CBA_CHARGE_HOURLY` and `MGMT$EMCT_CBA_CHARGE_DAILY`) to access Chargeback information in the Management Repository. See the Enterprise Manager Cloud Control Extensibility Programmer’s Reference for more information.
Enterprise Manager Consolidation offers two consolidation solutions:

- Host Consolidation Planner, for consolidating physical or virtual source servers to physical or virtual destination servers.
- Database Consolidation Workbench, for consolidating or migrating databases to new or existing servers. Database Consolidation Workbench is part of the Real Application Testing option. For further details, please refer to Oracle Database Licensing Information User Manual.

This chapter contains the following sections:

- Overview of Consolidation
- Host Consolidation Planner
- Database Consolidation Workbench
- Topics Common to Host and Database Consolidations

42.1 Overview of Consolidation

Key Concepts

The central theme of consolidation is to combine existing server or database sources to existing or yet-to-be-purchased destination servers or databases.

Consolidation starts with a project, which defines the scope of a potential effort, including:

- The type of consolidation. The following types of consolidation schemes are supported:
  - P2V: From physical source servers to Oracle Virtual Machine (VM) destination servers
  - P2P: From physical source servers to physical destination servers
  - D2D: From database sources to new database on new server destinations or to existing database destinations
  - D2S: From database sources to new or existing servers
- The preliminary set of candidate source servers to consider consolidating from
- The preliminary set of candidate destination servers to consider consolidating to
- The duration over which data used to generate consolidation scenarios will be collected for the source servers
- The benchmark used to measure CPU capacities when determining how many source servers can be consolidated to a destination server

Each consolidation project contains one or more consolidation scenarios that are generated based on the inputs provided, which include:
• The source server resource requirements that a destination server must meet, including one or more of the following: CPU, memory, disk I/O, network I/O, and disk storage

• Any business, compliance or technical constraints that must be considered

• The destinations to consider in the scenario

A set of pre-configured consolidation scenarios are provided, representing aggressive, medium, and conservative consolidation schemes. Each scenario is generated based on inputs you provide. Alternatively, you can create your own custom scenarios that best suit your situation. Once created, you can compare the various scenarios to determine which consolidation strategy best meets your requirements.

Each scenario also includes initial mappings between each source and the destination it may be consolidated to. You can choose to create mappings manually, or allow Enterprise Manager Consolidation to create them automatically. Once all inputs are specified, you can run the scenario and evaluate the results. Subsequently, you can rerun the scenario to re-evaluate the scenario based on the previously specified conditions with the latest available data. The results of the previous analysis will be over-written. You can also create a new scenario based on an existing scenario, where you tweak certain values to customize the new scenario.

The Process

• Create a consolidation project.

• Define one or more consolidation scenarios within the project. You have two options:
  – Use a pre-configured consolidation scenario.
  – Create a custom consolidation scenario.

• Evaluate your consolidation scenarios in the Consolidation console.

• Modify the settings of your scenarios to generate different results. Continue this process until you have the most optimal scenario(s) for your situation.

When consolidating multiple sources to more than one destination, the resource requirements of sources are checked against the resource capacity of the destinations. To consolidate all identified sources to the least number of destinations, Enterprise Manager Consolidation tries to identify a set of sources that have known resource requirements that will fit into a destination’s corresponding available resources as tightly as possible.

Host consolidation uses per-hour requirements, allowing it to maximize use of destination resources by matching peak usage periods of one source to low-usage periods of another. Database consolidation does the same except when using the ultra conservative resource allocation method (the default), in which case, it uses the highest usage observed across a specified date range in seeking the best destination fit.

42.2 Host Consolidation Planner

Host Consolidation Planner enables you to match managed sources you want to consolidate with new or existing destinations. Host Consolidation Planner supports the following combinations:
Consolidate source servers to generic physical machines, Oracle engineered systems (Exadata Database Machines or Exalogic Elastic Cloud systems), or Oracle Virtual Machine (VM) servers.

Consolidate source servers to physical machines configured in the Oracle Cloud. In a consolidation of this type, an Oracle Compute Cloud configuration mimics a host, except that only memory and CPU capacity are of consequence as resources to be considered.

Host Consolidation Planner leverages data collected from managed targets by Cloud Control and factors in business and technical requirements to help you determine the optimum scenarios.

The following sections describe Host Consolidation Planner:

- Overview of Host Consolidation Planner
- Creating a Host Consolidation Planner Project
- Creating a Host Consolidation Planner Scenario
- Other Host Consolidation Scenario Creation Options
- Evaluating Host Consolidation Scenarios

42.2.1 Overview of Host Consolidation Planner

Over the years, the typical enterprise data center will grow steadily due to the addition of servers required to satisfy the needs of the business. This growth typically results in excess servers that occupy rack space, consume a lot of power for cooling, and require system maintenance such as security and patching.

Depending on the procurement cycle or the specific hardware vendor agreement in effect, enterprises may acquire different types of server hardware and operating systems, inadvertently creating a confusing array of systems that administrators need to manage, administer, patch and upgrade. This in turn increases labor and ongoing maintenance and support costs against IT budgets. Enterprises look at consolidation as a way to migrate their disparate systems onto standardized operating systems and hardware, with the ultimate goal of reducing costs.

Enterprises also are increasingly investigating virtualization technologies such as Oracle Virtual Machine by moving from physical to virtual servers. This makes it possible to use the shared hardware infrastructure while getting the benefits of isolation that virtualization provides.

The goal of consolidation is to identify such under-utilized servers and find a way to consolidate them, enabling the enterprise to free up as many servers as possible while continuing to maintain service levels. Since servers have different levels of CPU capacity, Host Consolidation Planner uses computer benchmark data to normalize the CPU usage for a given hardware in the consolidation process. Specifically, Host Consolidation Planner uses the following CPU benchmarks for different classes of hardware:

- SPECint®_base_rate2006 for database hosts, application hosts, or mixed-workload hosts
- SPECjbb®2005 for middleware platforms

Host Consolidation Planner enables you to match managed target sources you want to consolidate with new or existing target destinations. Consolidate source servers to
generic physical machines, Oracle engineered systems (Exadata Database Machines or Exalogic Elastic Cloud systems), or Oracle Virtual Machine (VM) servers.

You can also consolidate source servers to physical machines configured in the Oracle Cloud. In a consolidation of this type, an Oracle Cloud Compute configuration mimics a host, except that only memory and CPU capacity are of consequence as resources to be considered.

By leveraging metric and configuration data collected from managed target servers by Enterprise Manager Cloud Control, Host Consolidation Planner helps you determine the optimum consolidation scenarios that also reflect business and technical constraints in the consolidation process.

42.2.2 Creating a Host Consolidation Planner Project

You create a host consolidation project for each consolidation effort, then add individual consolidation scenarios within it. You can then compare consolidation scenarios to determine which consolidation strategy makes the most sense.

After the project is defined, a Cloud Control job is submitted to collect available data for the specified targets from the Management Repository. Once the job finishes, the project becomes an active project. As long as the project is in an active state, data collection will continue.

Creating a project involves the following steps:

- Selecting the Host Consolidation Project Type
- Specifying Host Source Candidates
- Specifying Host Destination Candidates
- Setting Data Collection Parameters
- Choosing a Pre-configured Scenario
- Reviewing and Saving the Host Consolidation Project

42.2.2.1 Selecting the Host Consolidation Project Type

Complete Step 1 of the host consolidation project creation process as follows:

1. From the Enterprise menu, select Consolidation, then select Host Consolidation Planner.
2. Click the Create Project button.
3. Enter the consolidation project name and, optionally, a description.
4. Select the host consolidation type:
   - From physical source servers to Oracle VM servers (P2V)
   - from physical source servers to physical servers (P2P)
5. Click Next to specify source candidates.

42.2.2.2 Specifying Host Source Candidates

Complete Step 2 of the host consolidation project creation process as follows:
1. Select an appropriate benchmark from the drop-down menu.
   - Specify SPECint®_base_rate2006 for database hosts, application hosts, or mixed-workload hosts
   - Specify SPECjbb®2005 for middleware platforms

2. Click **Add Source Servers** to select the source servers to be consolidated from a list of managed server candidates. Use the filtering criteria to refine your target search. Choose from the filtered results, then click **Select**.
   
   The sources you select appear in the table. Note that you can subsequently cull the list by removing selected source servers.

3. Optionally set server I/O capacities for disk I/O request and network I/O volume capacities. Click **Specify Server I/O Capacity** to estimate these I/O capacities for all source involved in the consolidation project. Note that you can subsequently fine-tune these estimates by clicking a row and editing the values for the various capacities.

4. Click **Next** to specify destination candidates.

### 42.2.2.3 Specifying Host Destination Candidates

Complete Step 3 of the host consolidation project creation process as follows:

1. Optionally select one or more existing servers to consolidate the source servers to.
   - If you are consolidating from physical servers to Oracle Virtual Servers (P2V), click **Add Existing Virtual Servers as Destinations** to view a list of existing VM-based Exalogic Elastic Cloud systems and Oracle Virtual Machine destination servers to consolidate the source servers to. Use the target type filter to differentiate the two. Select the servers you want to add, then click **Select**.
     
     The destinations you select appear in the table. Note that you can subsequently cull the list by removing selected destination servers.
   - If you are consolidating from physical servers to physical servers (P2P), click **Add Existing Oracle Engineered System as Destinations** to search for the Exadata Database Machine servers or Exalogic Elastic Cloud servers to consolidate the source servers to. Use the target type filter to differentiate the two. Select the servers you want to add, then click **Select**.
     
     The destinations you select appear in the table. Note that you can subsequently cull the list by removing selected destination servers.

2. Optionally edit estimated CPU capacity, I/O request, and network I/O volume by clicking in a row and changing the value. You can also edit the I/O value by...
clicking **Specify Server I/O Capacity** to estimate these I/O capacities for all destination servers involved in the consolidation project.

3. Click **Next** to set up data collection.

### 42.2.2.4 Setting Data Collection Parameters

Specify the duration over which data used to generate host consolidation scenarios will be collected for the source servers specified in the project. This data will be used to determine the resource requirements that a destination server must meet.

1. Specify the minimum number of days to collect data. The default minimum value is 21 days. To use existing historical data to run and view consolidation scenarios immediately, set the minimum number of days to 0.

2. Specify the maximum number of days to collect data. The default maximum value is 90 days.

3. Specify when to begin the data collection process.

   Note that once data collection begins, you can elect to suspend and resume collecting at any time from the **Actions** menu in the Consolidation console.

4. Optionally select **Continue Data Collection Over the Maximum Days** to purge the oldest day’s data when data for a new day is added.

5. Click **Next** to choose a pre-configured scenario.

### 42.2.2.5 Choosing a Pre-configured Scenario

When creating a host consolidation project, you can optionally choose to generate pre-configured consolidation scenarios to add to the project.

These scenarios are generated using data collected for the sources defined in the consolidation project at the time the project is created. If insufficient data is available when the project is created, the pre-configured scenarios will be automatically generated once the minimum amount of data has been collected.

Host Consolidation Planner ships with three out-of-the-box scenarios that represent aggressive, medium, and conservative consolidation schemes.

1. Choose whether to use a pre-configured scenario by clicking the appropriate radio button. Choosing the option displays a list of the out-of-the-box consolidation scenarios available. By default, the scenarios are designated by the method used to aggregate source target resource usage:

   - **Aggressive**: Aggregate data based on *average* daily usage per hour.
     
     This typically results in a high consolidation (source:destination) ratio, because more sources will “fit” into each destination. But because more sources are involved, the odds that one or more will not meet the resource requirements are higher.

   - **Medium**: Aggregate data based on the 80 percentile usage.
     
     This typically results in a source:destination ratio somewhere between Aggressive and Conservative aggregations.

   - **Conservative**: Aggregate data based on *maximum* daily usage per hour.
     
     This typically results in a lower source:destination ratio, because fewer sources will “fit” into each destination.
Usage statistics are calculated based on the following criteria:

- **Resource Requirements**: Source requirements, such as CPU, memory (GB) and disk capacity, that must be met by destinations.
- **Applicable Dates**: The days of the week on which resource usage metrics are collected.
- **Target Server Utilization Limit**: The maximum resource utilization (percentage) that can be used on destinations. The scenario method in effect determines utilization percentage.

2. Select the pre-configured scenario you want to use. You can select any or all scenarios.

3. Select whether to factor new (phantom) or existing destinations in the scenario.

4. Proceed as follows, based on project type and selections:
   - For P2V projects using new servers, specify resource requirements for CPU capacity, memory, and disk storage. Optionally, you can enter quantities of resources to hold in reserve for virtualization software. These reserves are deducted from system capacity before calculating utilization percentages.
   - For P2V projects using existing servers, there is nothing to specify. The scenario method determines resource requirements. Note that this option is available only if existing virtual servers were added as destination candidates in step three of the wizard.
   - For P2P projects using new servers and engineered systems, there is nothing to specify. The system selects an appropriate Exadata configuration based on requirements.
   - For P2P projects using new servers and generic servers, specify resource requirements for CPU capacity, memory, and disk storage. You do not, however, have the option to enter resources to hold in reserve.
   - For P2P projects using existing servers, there is nothing to specify. The scenario method determines resource requirements. Note that this option is available only if existing virtual servers were added as destination candidates in step three of the wizard.

5. Click **Next** to review the consolidation project.

   The pre-configured scenarios will be generated when the project is created using data collected for the source servers defined in the consolidation project.

   You can also opt to create your own custom scenario once the consolidation project has been completed.

### 42.2.2.6 Reviewing and Saving the Host Consolidation Project

Review the specifics of the host consolidation project. Use the **Back** button to return to a given step to make changes. If satisfied, click **Submit**. A message confirms that the project has been created and the job has been submitted.

Once the project is created, it will show up in the Consolidation console. Consolidation scenarios can then be defined for this project.
42.2.3 Creating a Host Consolidation Planner Scenario

You can create custom host consolidation scenarios instead of or in addition to using the pre-configured scenarios. Multiple scenarios can be created within a project, enabling you to compare different scenarios before deciding on a solution. New consolidation scenarios are created within an existing consolidation project. You can create host consolidation scenarios for planning purposes only.

Creating a scenario involves the following steps:

- **Setting Up the Scenario**
- **Defining Constraints for Host Consolidation**
- **Planning the Destination for a Physical Server to Virtual Server Project**
- **Planning the Destination for a Physical Server to Physical Server Project**
- **Mapping Host Sources to Destinations**
- **Reviewing and Saving the Host Consolidation Scenario**

**42.2.3.1 Setting Up the Scenario**

Complete Step 1 of the host consolidation scenario creation process as follows:

1. From the **Enterprise** menu, select **Consolidation**, then select **Host Consolidation Planner**.
2. Click the consolidation project for which the scenario is intended.
3. Click the **Create Scenario** button.
4. Specify the scenario details, such as scenario name.
5. Specify the source resources to consider. Host Consolidation Planner will aggregate the specified resources to determine the total requirements.
   - **Resource Type**: The server requirements, such as CPU, memory (GB), and I/O capacity that must be considered.
   - **Scale Factor**: Provide room for growth on the destination for each source. The resource requirement estimate uses the scale factor to pad the estimate for consolidation. So, for example, if the estimated requirement for a given source, based on usage data, is 2 GB of memory, which equates to a scale factor of 1, and you specify a scale factor of 1.1, 2.2 GB will be required to consolidate that source.
   - **Applicable Days**: The days of the week on which resource usage metrics are collected.
   - **Resource Allocation**: The method used to aggregate daily server source resource usage. Values are:
     - **Aggressive**: Aggregate data based on average daily usage per hour.
       This typically results in a high consolidation (source:destination) ratio, because more sources will “fit” into each destination. But because more sources are involved, the odds that one or more will not meet the resource requirements are higher.
– Medium: Aggregate data based on the 80 percentile usage. This typically results in a source:destination ratio somewhere between Aggressive and Conservative aggregations.

– Conservative: Aggregate data based on maximum daily usage per hour. This typically results in a lower source:destination ratio, because fewer sources will “fit” into each destination.

• The date ranges should define a period of time that is typical of standard resource requirements.

6. Click Estimated Requirements to view the estimated total resource requirements.

For server consolidations, resource requirements are shown based on the averaged hourly requirement. The displayed requirements reflect the scale factor (if any) specified for the resource. The 24-hour requirement pattern will be used as the minimum requirements that must be met by consolidation destinations.

7. Optionally exclude or include sources, as appropriate.

8. Click Next to define consolidation constraints.

42.2.3.2 Defining Constraints for Host Consolidation

Specify business, corporate, or technical constraints that must be enforced. Constraints can guide the allocation process during automatic source-to-destination mapping. For manual mappings between sources and destinations, constraints can calculate violations.

Complete Step 2 of a host consolidation scenario as follows:

1. Select compatible server criteria.

   Servers are considered compatible if they have the same specified target properties and configurations. If you are consolidating multiple source servers to a single destination server, only compatible servers can be consolidated together on the same destination server.

2. Specify mutually exclusive server criteria.

   Certain types of source servers are mutually exclusive and should not be consolidated together on the same destination server due to various reasons. For example, nodes of an Oracle cluster should not be placed in the same failure group.

3. Click Preview Effect of Constraints to view a list of source servers that are not compatible based on the defined constraints.

4. Click Next to specify destination server candidates.

42.2.3.3 Planning the Destination for a Physical Server to Virtual Server Project

For a P2V project:

1. Choose destination server candidates using either of the following options:

   • Click Use New (Phantom) Servers if you plan to use destination servers that have yet to be provisioned or purchased, then select either of the following options:

     – Use Oracle Engineered System and click the search icon to select an appropriate configuration type for an Exalogic Elastic Cloud system.
Use Generic Servers and provide the estimated CPU capacity if available; otherwise, click the search icon next to the CPU capacity input field, then select a server configuration that most closely matches your needs.

Adjust the memory and storage estimates as necessary.

In a virtual environment, you can also specify a quantity of the resource to be set aside (reserved) for use by supervisory software in the database machine. This quantity is subtracted from the total capacity of the destination before consolidating source servers into the remaining resource. For example, if your estimated memory requirement is 12 GB and you specify a reserve of 2 GB, only 10 GB is available for consolidation.

Host Consolidation Planner will determine how many destination servers are required as part of the consolidation results.

Click Use Existing Servers to specify a set of existing managed servers to use as destinations.

These are the servers you specified when defining the scope for the consolidation project. Host Consolidation Planner will determine the available hardware resources based on collected usage data.

By default, the consolidation process will try to use as few destination servers as possible. If you prefer, choose to balance the source load across all destinations.

2. Accept the defaults or edit the percentages for Maximum Allowed Resource Utilization on Destination Servers. Contrast these allowances, which provide headroom on destination servers, with the scale factor, which provides headroom for individual source servers.

3. Click Next to map the source servers to the destination servers.

42.2.3.4 Planning the Destination for a Physical Server to Physical Server Project

For a P2P project:

1. Choose destination server candidates using either of the following options:

   - Click Use New (Phantom) Servers if you plan to use destination servers that have yet to be provisioned or purchased, then select one of the following options:
     - Use Oracle Engineered System and select either Exadata Database Machine or Exalogic Elastic Cloud. Click the search icon and select a configuration type appropriate to either choice.
     - Use Generic Servers and provide the estimated CPU capacity if available; otherwise, click the search icon next to the CPU capacity input field, then select a server configuration that most closely matches your needs.
     - Use Oracle Compute Cloud and select the cloud computing configuration, or shape, to use as the destination. See About Oracle Compute Cloud Shapes, for information on shapes.
• Click **Use Existing Servers** to specify a set of existing managed servers to use as destinations for the project.

These are the servers you specified when defining the scope for the consolidation project. Host Consolidation Planner will determine the available hardware resources based on collected usage data. If you did not explicitly specify destination candidates, all source servers are potential destinations for consolidation.

By default, the consolidation process will try to use as few destination servers as possible. If you prefer, choose to balance the source load across all destinations.

2. Accept the defaults or edit the percentages for **Maximum Allowed Resource Utilization on Destination Servers**. Contrast these allowances, which provide headroom on destination servers, with the scale factor, which provides headroom for individual source servers.

3. Click **Next** to map the source servers to the destination servers.

### 42.2.3.5 Mapping Host Sources to Destinations

Next, map the host sources to the destinations they will be consolidated to. The objective is to fit source requirements with each destination’s available resources as tightly as possible.

Oracle recommends that you allow Host Consolidation Planner to perform this mapping automatically. This will allow the tool to maximize resource utilization of destinations based on resource capabilities and the various consolidation constraints specified. If you use manual mapping, the source will be mapped to the destination even if the destination lacks sufficient capacity. In addition, manual mapping may violate previously declared constraints.

When you have chosen existing destinations, you can optionally map each source and destination manually:

1. Click a source in the list.

2. Click the flashlight icon to select the destination to map to the source. Note that you can map a single source to a destination or multiple sources to a destination, but there can be only one destination.

   The resulting consolidation report will show any resource and/or constraint violations due to such manual mapping.

3. Click **Next** to review the consolidation scenario.

### 42.2.3.6 Reviewing and Saving the Host Consolidation Scenario

Finally, review the various parameters set in the new host scenario. Use the **Back** button if you need to make changes; otherwise, proceed as follows:

• Optionally, you can save the scenario as a template, which can then be shared with other users. If you want to do this, click **Save Scenario as a Template**. In the dialog that opens, browse to a location in the local file system and save the template as an XML file.

• Click **Submit**. A message appears confirming that a job has been submitted for further analysis of the scenario. Results appear at the bottom of the Consolidation home page when done.
42.2.4 Other Host Consolidation Scenario Creation Options

You can create a host consolidation scenario based on an existing scenario. Select an applicable scenario under a consolidation project and then select **Create Like Scenario** from the **Actions** menu. Modify the scenario as desired, provide a meaningful name, and submit for analysis as usual.

If you saved a scenario as a template, you can subsequently import the scenario into another environment.

1. On the Host Consolidation Planner home page, select **Create Scenario from Template** from the **Actions** menu.
2. Browse to a saved template XML file in the local file system. Click **Open**.
3. Indicate the extent to which you want to replicate the saved template; that is, in terms of the resources, constraints, and destinations planning represented by the template. Click **Update** if you make any changes.
4. Click **OK** to import the saved template. The imported scenario opens in the wizard where you can edit and save it in Host Consolidation Planner.

42.2.5 Evaluating Host Consolidation Scenarios

You can view details for your consolidation scenarios using the Consolidation console. After evaluating the consolidation scenario results, you can define different plans as well as rerun existing scenarios to re-evaluate them based on the previously specified conditions with the latest available data. The results of the previous analysis will be over-written. You can also create a new scenario based on an existing scenario, where you tweak certain values to customize the new scenario. This iterative process helps you obtain the optimized consolidation scenario which is generated by compromising various factors and weighing different trade-offs.

Compare the consolidation scenarios you create to determine which consolidation strategy best meets your requirements.

Your objective is to:

* Match source resource requirements with destinations best able to meet those requirements.
* Fit source requirements with each destination's available resources as tightly as possible, so you can get maximum usage of destination capacity.
* Provide room for growth on destinations by allowing for headroom as a factor of resource requirements.
* Optionally balance the source workload across all available destinations.

1. From the **Enterprise** menu, select **Consolidation**, then select **Host Consolidation Planner**.
2. First, examine the project containing the scenario you want to view.
   * The **Status** column indicates the status of data collection, based on the minimum and maximum collection days specified for the project.
• The General tab summarizes the project in terms of type, collection details, number of sources, and so forth.

• Click the Source Candidates tab to view various usage data collected for the sources defined in the project. Data can include utilization rates for CPU, memory, storage, and disk and network I/O, depending on the project type.

• Click the Source Workload tab to view source resource usage data collected. The default display is a heat map, a grid of 24 hours by 30 days, showing the workload for a given hour as a color indicating the load relative to 100% of capacity, and a number showing the actual percentage. Alternatively, you can view the same data as a line graph. You can filter either view by source, resource type, and month.

• Click the Destination Candidates tab to view a breakdown of hardware details and projected resource utilization by destination candidate, based on the sources to be consolidated.

• Click the Report button above the table when the project is selected to view summarized information and more details.

3. Next, view the data for a specific scenario. The General tab summarizes the scenario in terms of resource type and allocation, constraints, destination types, and so forth. For a completed analysis, click any metric in the row to view details on the respective tab, as follows:

• Sources: The list of sources to consolidate, including their projected CPU and memory capacities and requirements.

• Destinations: The list of destinations to which the sources will be consolidated. Resource configuration and calculated utilization are shown for each destination.

For consolidations to the cloud, resources of consequence are CPU capacity and memory.

• Ratio: The ratio of sources to destinations. By default, Host Consolidation Planner will try to “fit” sources into as few destinations as possible.

• Mapping: The destinations to which specific sources will be mapped. The analysis includes estimated CPU and memory requirements and utilization, enhanced by suggested CPU and memory allocation figures to consider. These suggestions represent a reasonable compromise between requirements and destination server capacity.

• Confidence: The percentage of the data collected for sources that meet the source usage requirements defined in the scenario. This value is aggregated for all sources defined with the project.

• Violations: The number of violations of technical or business constraints defined in the scenario. This metric is applicable only if the scenario uses auto-mapping of sources to destinations.

• Exclusions: The number of sources that do not have a qualified mapping to a destination. These are sources that exceed the capacity of available destinations.

A different set of constraints may result in a different optimal scenario. Modify the constraints to come up with different scenario results.
42.3 Database Consolidation Workbench

Database Consolidation Workbench provides a comprehensive end-to-end solution for managing database consolidation. It enables you to match managed sources you want to consolidate with new or existing destinations. Database Consolidation Workbench supports the following combinations:

- Consolidate source databases (single instance or RAC) to fewer destination databases, using the database to database (D2D) consolidation type. Destinations can be existing databases (both non-CDB and CDB) or new databases on new servers, which can be Oracle Exadata Database Machines, Oracle Compute Cloud shapes, or generic servers.

- Consolidate source databases (single instance or RAC) to fewer servers where the number of databases stays the same, using the database to server (D2S) consolidation type. Destinations can be existing servers or new servers, which can be Oracle Exadata Database Machines, Oracle Compute Cloud shapes, or generic servers.

Database Consolidation Workbench uses database metrics in assessing resource requirements for database consolidation. You must have Oracle Enterprise Manager 13c Release 1 Database Plug-in or later to collect the database metrics Database Consolidation Workbench uses.

The following sections describe Database Consolidation Workbench:

- Overview of Database Consolidation Workbench
- Creating a Database Consolidation Workbench Project
- Creating a Database Consolidation Workbench Scenario
- Other Database Consolidation Scenario Creation Options
- Evaluating Database Consolidation Scenarios
- About the Advisor Feature of Database Consolidation Workbench
- About Compression Advisor
- Estimating Compressed Storage Requirements
- About Implementing a Database Consolidation Scenario
- Implementing a Database Consolidation Scenario
- Assessing the Performance Impact of Database Migration on SQL Workload

42.3.1 Overview of Database Consolidation Workbench

Database Consolidation Workbench offers flexibility for various customer scenarios:

- Consolidate 10.2 and higher database versions.
- Consolidate to Oracle private or public cloud or to Exadata.
- Use high availability options to minimize downtime, subject to source and destination database platform and version.

Database Consolidation Workbench takes the guess work out of consolidation by basing analysis on historical workload (database and host metrics). It eliminates human error by automating all phases of consolidation from planning to deployment.
Consolidation optimization advice enables you to estimate resource allocation under various consolidation scenarios, from ultra conservative, representing a peak maximum load, to aggressive, measured as the average daily usage per hour. Use optimization advice to identify conflicts based on workload characteristics and Exadata suitability. Assess the impact of compression on I/O and storage, including I/O offloading and Flash Cache technology.

As servers have become more and more powerful, with much greater workload capacity, enterprises with many small databases running on different servers find that their servers are greatly underutilized. Their aim is to consolidate these small databases onto fewer servers, thereby reducing their hardware purchasing cost and ongoing maintenance expenditures.

At the same time, database customers, in assessing their performance needs, want to evaluate resource utilization over a total specified time period to ensure meeting peak demand.

When weighing source I/O requirements to determine needed destination capacity, the key is I/O capacity of external storage units of Oracle Engineered Systems such as Exadata and Exalogic typically shared by databases.

Database Consolidation Workbench collects detailed storage information regarding total space allocated and total space used for each source database by segment type (Table, Index, LOB, Other). It then estimates how much space can be saved by compressing the data. Depending on the segment type and database version, estimates are given for several types and levels of compression.

- At the project level, Database Consolidation Workbench displays data storage requirements by database and segment type, with compressed and uncompressed values.
- At the scenario level, Database Consolidation Workbench recommends a specific type and quantity of Exadata external storage system, based on the requirement and customer input with regard to compression and other storage options.

Database Consolidation Workbench collects the following I/O requirements:

- I/O requests per second (IOPS)
- I/O bandwidth (MB/Second)

Database Consolidation Workbench fits the requirements to external storage unit I/O capacity, using the ratio of I/O bandwidth to IOPS to characterize each source database workload as either OLTP or DSS. These findings determine whether Database Consolidation Workbench considers IOPS, I/O bandwidth, or both when consolidating to external storage. Note, however, that users can override these recommendations.

Thus, when consolidating databases, Database Consolidation Workbench attempts to fit CPU and memory capacity to the destination, but not database storage and I/O capacity.

### 42.3.2 Creating a Database Consolidation Workbench Project

You create a database consolidation project for each consolidation effort, then add individual consolidation scenarios within it. You can then compare consolidation scenarios to determine which consolidation strategy makes the most sense.
After the project is defined, a Cloud Control job is submitted to collect available data for the specified targets from the Management Repository. Once the job finishes, the project becomes an active project. As long as the project is in an active state, data collection will continue.

Creating a project involves the following steps:

- Selecting the Database Consolidation Project Type
- Specifying Database Source Candidates
- Specifying Database Destination Candidates
- Setting Data Collection Parameters
- Choosing a Pre-configured Scenario
- Reviewing and Saving the Database Consolidation Project

### 42.3.2.1 Selecting the Database Consolidation Project Type

Complete Step 1 of the database consolidation project creation process as follows:

1. From the **Enterprise** menu, select **Consolidation**, then select **Database Consolidation Workbench**. This selection is also available from the **Administration** menu on the Databases target home page.
2. Click the **Create Project** button.
3. Enter the consolidation project name and, optionally, a description.
4. Select the appropriate consolidation type.
   - From databases to server containers (D2S)
   - From databases to database containers (D2D).
5. Click **Next** to specify source candidates.

### 42.3.2.2 Specifying Database Source Candidates

Complete Step 2 of the database consolidation project creation process as follows:

1. SPECint®_base_rate2006, as the appropriate benchmark for database consolidations, is preselected. Click **Select Source Databases** to select the source databases to be consolidated from a list of Oracle Enterprise Manager-managed database candidates. Use the filtering criteria to refine your target search. Choose from the filtered results, then click **Select**.
   
   The sources you select appear in the table. Note that you can subsequently cull the list by removing selected source databases.
2. Optionally edit estimated CPU capacity rates by clicking in a row and changing the value.
3. Click **Next** to specify destination candidates.

### 42.3.2.3 Specifying Database Destination Candidates

Complete Step 3 of the database consolidation project creation process as follows:

1. Optionally select one or more existing destinations to consolidate the sources to.
• If you are consolidating from databases to server containers (D2S), click **Add Existing Servers as Destinations** to view a list of existing destination servers to consolidate the source databases to. Use the filtering criteria to refine the search. Select the servers you want to add, then click **Select**.

The destinations you select appear in the table. Note that you can subsequently cull the list by removing selected destination server containers.

• If you are consolidating from databases to database containers (D2D), click **Select Destinations** to search for the database containers to consolidate the source databases to. Use the filtering criteria to refine the search. Select the database containers you want to add, then click **Select**.

The destinations you select appear in the table. Note that you can subsequently cull the list by removing selected destination database containers.

**Note:**

If you do not select existing destinations, the consolidation will be to new (phantom) destinations.

2. Click **Next** to set up data collection.

### 42.3.2.4 Setting Data Collection Parameters

Specify the duration over which data used to generate database consolidation scenarios will be collected for the source databases specified in the project. This data will be used to determine the resource requirements that a destination server or database must meet.

1. Specify the minimum number of days to collect data. The default minimum value is 21 days. To use existing historical data to run and view consolidation scenarios immediately, set the minimum number of days to 0.

2. Specify the maximum number of days to collect data. The default maximum value is 90 days.

3. Specify when to begin the data collection process.

   Note that once data collection begins, you can elect to suspend and resume collecting at any time from the **Actions** menu in the Consolidation console.

4. Optionally select **Continue Data Collection Over the Maximum Days** to purge the oldest day’s data when data for a new day is added.

5. Click **Next** to choose a pre-configured scenario.

### 42.3.2.5 Choosing a Pre-configured Scenario

When creating a database consolidation project, you can optionally choose to generate pre-configured consolidation scenarios to add to the project.

These scenarios are generated using data collected for the sources defined in the consolidation project at the time the project is created. If insufficient data is available when the project is created, the pre-configured scenarios will be automatically generated once the minimum amount of data has been collected.
Enterprise Manager Consolidation ships with three out-of-the-box scenarios that represent aggressive, medium, and conservative consolidation schemes.

1. Choose whether to use a pre-configured scenario by clicking the appropriate radio button. Choosing the option displays a list of the out-of-the-box consolidation scenarios available. By default, the scenarios are designated by the method used to aggregate source target resource usage:
   - Aggressive: Aggregate data based on average daily usage per hour.
     This typically results in a high consolidation (source:destination) ratio, because more sources will “fit” into each destination. But because more sources are involved, the odds that one or more will not meet the resource requirements are higher.
   - Medium: Aggregate data based on the 80 percentile usage.
     This typically results in a source:destination ratio somewhere between Aggressive and Conservative aggregations.
   - Conservative: Aggregate data based on maximum daily usage per hour.
     This typically results in a lower source:destination ratio, because fewer sources will “fit” into each destination.

Usage statistics are calculated based on the following criteria:

   - Resource Requirements: Source requirements, such as CPU, memory (GB) and disk capacity, that must be met by destinations.
   - Applicable Dates: The days of the week on which resource usage metrics are collected.
   - Target Server Utilization Limit: The maximum resource utilization (percentage) that can be used on destinations. The scenario method in effect determines utilization percentage.

2. Select the pre-configured scenario you want to use.

3. Select whether to factor new or existing destinations in the scenario. For a D2S project, the choice is either a new (phantom) or existing Exadata Database Machine. For a D2D project, you have to select the appropriate database architecture in addition to choosing a new or existing database on a new or existing Exadata Database Machine.

4. Click Next to review the consolidation project.

The pre-configured scenarios will be generated when the project is created using data collected for the databases defined in the consolidation project.

You can also opt to create your own custom scenario once the consolidation project has been completed.

### 42.3.2.6 Reviewing and Saving the Database Consolidation Project

Review the specifics of the database consolidation project. Use the Back button to return to a given step to make changes. If satisfied, click Submit. A message confirms that the project has been created and the job has been submitted.

Once the project is created, it will show up in the Consolidation console. Consolidation scenarios can then be defined for this project.
42.3.3 Creating a Database Consolidation Workbench Scenario

You can create custom database consolidation scenarios instead of or in addition to using the pre-configured scenarios. Multiple scenarios can be created within a project, enabling you to compare different scenarios before deciding on a solution. New consolidation scenarios are created within an existing consolidation project.

You can create consolidation scenarios for planning purposes. You also can implement the scenario, which enables you to perform the database migration on-demand.

Creating a scenario involves the following steps:

- Setting Up the Scenario
- Defining Constraints for Database Consolidation
- Planning the Destination for a Database to Database Project
- Planning the Destination for a Database to Server Project
- Mapping Database Sources to Destinations
- Reviewing and Saving the Database Consolidation Scenario

42.3.3.1 Setting Up the Scenario

Complete Step 1 of the database consolidation scenario creation process as follows:

1. From the Enterprise menu, select Consolidation, then select Database Consolidation Workbench. This selection is also available from the Administration menu on the Databases target home page.
2. Click the consolidation project for which the scenario is intended.
3. Click the Create Scenario button.
4. Specify the scenario details, such as scenario name.
5. Specify the source resources to consider. Database Consolidation Workbench will aggregate the specified resources to determine the total requirements.

   - Resource Type: The server requirements such as CPU and memory (GB) that must be considered.
   - Scale Factor: Provide room for growth on the destination for each source. The resource requirement estimate uses the scale factor to pad the estimate for consolidation. So, for example, if the estimated requirement for a given source, based on usage data, is 2 GB of memory, which equates to a scale factor of 1, and you specify a scale factor of 1.1, 2.2 GB will be required to consolidate that source.
   - Applicable Days: The days of the week on which resource usage metrics are collected.
   - Resource Allocation: The method used to aggregate overall database source resource usage. Values are:
     - Aggressive: Aggregate data based on average daily usage per hour.

   This typically results in a high consolidation (source:destination) ratio, because more sources will “fit” into each destination. But because more
sources are involved, the odds that one or more will not meet the resource requirements are higher.

- **Medium**: Aggregate data based on the 80 percentile usage. This typically results in a source:destination ratio somewhere between Aggressive and Conservative aggregations.

- **Conservative**: Aggregate data based on maximum daily usage per hour. This typically results in a lower source:destination ratio, because fewer sources will “fit” into each destination.

- **Ultra Conservative**: Do not aggregate data by hourly usage; rather, use the highest usage observed across the specified date range. This is the default for database consolidations.

  - The date ranges should define a period of time that is typical of standard resource requirements.

6. Click **Estimated Requirements** to view the estimated total resource requirements. For database consolidations, it is the single value that characterizes requirements over the date range.

7. Optionally exclude or include sources, as appropriate.

8. Click **Next** to define consolidation constraints.

### 42.3.3.2 Defining Constraints for Database Consolidation

Specify business, corporate or technical constraints that must be enforced. Constraints can guide the allocation process during automatic source-to-destination mapping. For manual mappings between sources and destinations, constraints can calculate violations.

Complete Step 2 of a database consolidation scenario as follows:

1. **Select compatible database criteria.**
   
   Databases are considered compatible if they have the same specified target properties and configurations. Use target properties and configurations to consolidate databases based on functional area or database release and version.

2. **Specify mutually exclusive source database criteria.**
   
   Use conditions to restrict consolidation of Data Guard/standby databases.

3. Click **Preview Effect of Constraints** to view a list of source databases that are not compatible based on the defined constraints.

4. Click **Next** to specify destination server candidates.

### 42.3.3.3 Planning the Destination for a Database to Database Project

For a D2D project:

1. **Choose destination database candidates using either of the following options:**
   
   - Click **Use New (Phantom) Database on New Phantom Servers** if you plan to use a destination database that does not yet exist. Specify destination database requirements:
     
     - Is the destination to be a container database (CDB) or a single instance database?
– Is the database to be clustered?
– If clustered, what is the minimum number of RAC instances (at least 2)?
– Is the server to be Exadata, Cloud, or generic?
Adjust the memory and storage estimates as necessary.

• Click **Use Existing Databases** to view a set of existing qualified destination database candidates for the project.

2. Proceed according to your selection in Step 1:

• **For new:**

  – If you selected Oracle Exadata for server in Step 1, click the search icon to select an Exadata Database Machine configuration type.

  – If you selected Oracle Compute Cloud for server in Step 1, click the search icon to select the cloud computing configuration, or shape, to use as the destination. See **About Oracle Compute Cloud Shapes**, for information on shapes.

  – If you selected Generic Server for server in Step 1, provide the estimated CPU capacity if available; otherwise, click the search icon next to the CPU capacity input field, then select a server configuration that most closely matches your needs. Enter a memory capacity in gigabytes.

• For existing, there is no action to take; you can only view the candidates.

3. Configure shared storage.

  • **Shared Storage Unit**—Selection can be a generic storage unit (default for generic server) or one of many Exadata storage units.

    – Destination databases running on generic servers share a single storage system for usable storage space, IOPS, and I/O bandwidth. Accept the defaults or specify capacity values for the respective metrics.

    – Destination databases running on Exadata Database Machines share a single storage system at a particular rack level; that is, usable storage space, IOPS, and I/O bandwidth are shared across one rack of the database machine. Capacity values for these metrics are not editable.

  • **ASM Redundancy**—Specify the level of redundancy to use. You may, for example, want to set the level to high for mission critical systems, whereas, normal would be adequate for test and development systems.

4. Specify the compression to use for various segment types. Use compression type to adjust the storage space requirement.

  • **Table Compression Type**—Choices include BASIC, OLTP, QUERY HIGH or LOW, ARCHIVE HIGH or LOW. For database versions earlier than 11.2, only OLTP is supported.

  • **Index Compression Type**—Choices include HIGH or LOW.

  • **LOB Compression Type**—Choices include HIGH, MEDIUM, or LOW.

5. Accept the defaults or edit the percentages for **Maximum Allowed Resource Utilization on Destination Servers**. Contrast these allowances, which provide headroom on destination servers, with the scale factor, which provides headroom for individual source servers.

6. Click **Next** to map the source databases to the destination database.
42.3.3.4 Planning the Destination for a Database to Server Project

For a D2S project:

1. Choose destination server candidates using either of the following options:
   - Click **Use New (Phantom) Servers** if you plan to use destination servers that have yet to be provisioned or purchased, then select one of the following options:
     - **Oracle Exadata** and click the search icon to select a configuration type appropriate Exadata Database Machine.
     - **Generic Server** and provide the estimated CPU capacity if available; otherwise, click the search icon next to the CPU capacity input field, then select a server configuration that most closely matches your needs. Adjust the memory estimate as necessary.
     - **Oracle Compute Cloud** and click the search icon to select the cloud computing configuration, or shape, to use as the destination. See About Oracle Compute Cloud Shapes, for information on shapes.
   - Click **Use Existing Servers** to specify a set of existing managed servers to use as destinations for the project.
     These are the servers you specified when defining the scope for the consolidation project. Database Consolidation Workbench will determine the available hardware resources based on collected usage data.
     By default, the consolidation process will try to use as few destination servers as possible. If you prefer, choose to balance the source load across all destinations.

2. Configure shared storage.
   - **Shared Storage Unit**—Selection can be a generic storage unit (default for generic server) or one of many Exadata storage units.
     - Destination databases running on generic servers share a single storage system for usable storage space, IOPS, and I/O bandwidth. Accept the defaults or specify capacity values for the respective metrics.
     - Destination databases running on Exadata Database Machines share a single storage system at a particular rack level; that is, usable storage space, IOPS, and I/O bandwidth are shared across one rack of the database machine. Capacity values for these metrics are not editable.
   - **ASM Redundancy**—Specify the level of redundancy to use. You may, for example, want to set the level to high for mission critical systems, whereas, normal would be adequate for test and development systems.

3. Specify the compression to use for various segment types. Use compression type to adjust the storage space requirement.
   - **Table Compression Type**—Choices include BASIC, OLTP, QUERY HIGH or LOW, ARCHIVE HIGH or LOW. For database versions earlier than 11.2, only OLTP is supported.
   - **Index Compression Type**—Choices include HIGH or LOW.
   - **LOB Compression Type**—Choices include HIGH, MEDIUM, or LOW.
4. Accept the defaults or edit the percentages for Maximum Allowed Resource Utilization on Destination Servers. Contrast these allowances, which provide headroom on destination servers, with the scale factor, which provides headroom for individual source servers.

5. Click Next to map the source databases to the destination servers.

42.3.3.5 Mapping Database Sources to Destinations

Next, map the database sources to the destinations they will be consolidated to. The objective is to fit source requirements with each destination's available resources as tightly as possible.

Oracle recommends that you allow Database Consolidation Workbench to perform this mapping automatically. This will allow the tool to maximize resource utilization of destinations based on resource capabilities and the various consolidation constraints specified. If you use manual mapping, the source will be mapped to the destination even if the destination lacks sufficient capacity. In addition, manual mapping may violate previously declared constraints.

When you have chosen existing destinations, you can optionally map each source and destination manually:

1. Click a source in the list.
2. Click the flashlight icon to select the destination to map to the source. Note that you can map a single source to a destination or multiple sources to a destination, but there can be only one destination

   The resulting consolidation report will show any resource and/or constraint violations due to such manual mapping.
3. Click Next to review the consolidation scenario.

42.3.3.6 Reviewing and Saving the Database Consolidation Scenario

Finally, review the various parameters set in the new database scenario. Use the Back button if you need to make changes; otherwise, proceed as follows:

- Optionally, you can save the scenario as a template, which can then be shared with other users. If you want to do this, click Save Scenario as a Template. In the dialog that opens, browse to a location in the local file system and save the template as an XML file.
- Click Submit. A message appears confirming that a job has been submitted for further analysis of the scenario. Results appear at the bottom of the Consolidation home page when done.

42.3.4 Other Database Consolidation Scenario Creation Options

You can create a database consolidation scenario based on an existing scenario. Select an applicable scenario under a consolidation project and then select Create Like Scenario from the Actions menu. Modify the scenario as desired, provide a meaningful name, and submit for analysis as usual.

If you saved a scenario as a template, you can subsequently import the scenario into another environment.
1. On the Database Consolidation Workbench home page, select **Create Scenario from Template** from the **Actions** menu.

2. Browse to a saved template XML file in the local file system. Click **Open**.

3. Indicate the extent to which you want to replicate the saved template; that is, in terms of the resources, constraints, and destinations planning represented by the template. Click **Update** if you make any changes.

4. Click **OK** to import the saved template.

The imported scenario opens in the wizard where you can edit and save it in Database Consolidation Workbench.

### 42.3.5 Evaluating Database Consolidation Scenarios

You can view details for your consolidation scenarios using the Consolidation console. After evaluating the consolidation scenario results, you can define different scenarios as well as rerun existing scenarios to re-evaluate them based on the previously specified conditions with the latest available data. The results of the previous analysis will be over-written. You can also create a new scenario based on an existing scenario, where you tweak certain values to customize the new scenario. This iterative process helps you obtain the optimized consolidation scenario which is generated by compromising various factors and weighing different trade-offs.

Compare the consolidation scenarios you create to determine which consolidation strategy best meets your requirements.

Your objective is to:

- Match source resource requirements with destinations best able to meet those requirements.
- Ensure that the destination's available capacity can accommodate the combined calculated workloads of all source databases.
- Provide room for growth on destinations by allowing for headroom as a factor of resource requirements.
- Optionally balance the source workload across all available destinations.

1. From the **Enterprise** menu, select **Consolidation**, then select **Database Consolidation Workbench**. This selection is also available from the **Administration** menu on the Databases target home page.

2. First, examine the project containing the scenario you want to view.

   - The **Status** column indicates the status of data collection, based on the minimum and maximum collection days specified for the project.
   - The **General** tab summarizes the project in terms of type, collection details, number of sources, and so forth.
   - Click the **Source Candidates** tab to view various usage data collected for the sources defined in the project. Data can include utilization rates for CPU, memory, storage, and disk and network I/O, depending on the project type.

   Data might include the estimated compression ratio. As noted on the page, if listed as not available, you can gather compression estimates prior to creating scenarios. Click the **Deploy Database Consolidation Workbench Packages** link in the on-screen text above the details to submit a compression advice job.
• Click the **Source Workload** tab to view source resource usage data collected. The default display is a line graph. Alternatively, you can view the same data as a heat map, a grid of 24 hours by 30 days, showing the workload for a given hour as a color indicating the load relative to 100% of capacity, and a number showing the actual percentage. You can filter either view by source, resource type, and month.

• Click the **Destination Candidates** tab to view a breakdown of hardware details and projected resource utilization by destination candidate, based on the sources to be consolidated.

• Click the **Advisor Findings** tab to view the results of checks run on database performance data. Findings reveal potential performance bottlenecks and recommend ways of reducing or eliminating them. Severity may be informational, a warning, or critical in nature. Mouse over the rule for a description of what the rule checks for and suggestions for a resolution. The finding may be truncated. Mouse over it to see the complete description.

• Click the **Report** button above the table when the project is selected to view summarized information and more details.

3. Next, view the data for a specific scenario. The **General** tab summarizes the scenario in terms of resource type and allocation, constraints, destination types, and so forth. For a completed analysis, click any metric in the row to view details on the respective tab, as follows:

• **Sources**: The list of sources to consolidate, including their projected CPU and memory capacities and requirements.

• **Destinations**: The list of destinations to which the sources will be consolidated. Resource configuration and calculated utilization are shown for each destination.

For consolidations to the cloud, resources of consequence are CPU capacity and memory.

• **Ratio**: The ratio of sources to destinations. By default, Database Consolidation Workbench will try to “fit” sources into as few destinations as possible.

• **Mapping**: The destinations to which specific sources will be mapped. The analysis includes estimated CPU and memory requirements and utilization, enhanced by suggested CPU and memory allocation figures to consider. These suggestions represent a reasonable compromise between requirements and destination server capacity. See Figure 42-1 for a screen capture of a representative consolidation mapping.

• **Storage**: Summary of storage requirements and compression estimates for each source database. In calculating storage estimates, Database Consolidation Workbench ignores local storage on Exadata compute nodes (local disks that contain system software), and focuses on data storage contained in Exadata storage units. The system recommends the number of such units needed, based on the source storage requirements and the compression specifications in the scenario.

Drill down for detailed information. For example, numbers in the Space (GB) (Estimated) column are links. Click the link for a source database to open a compression estimates pop-up. The highlighted row represents the table compression type selected when creating the scenario.
Similarly, click the links in the IOPS and IO Bandwidth columns to see a breakdown of IOPS and IO bandwidth into read and write components, and in some cases, into small and large I/O subcomponents. You can also see the impact of Exadata Simulation on a source database, in the event of a SQL Performance Analyzer simulation.

When the destination is an existing server or database that uses Automatic Storage Management (ASM), the system checks and reports the storage space capacity, projected utilization (%), projected space usage (GB), and additional storage capacity (GB) required, if any, on each ASM destination.

- **Confidence**: The percentage of the data collected for sources that meet the source usage requirements defined in the scenario. This value is aggregated for all sources defined with the project.
- **Violations**: The number of violations of technical or business constraints defined in the scenario. This metric is applicable only if the scenario uses auto-mapping of sources to destinations.
- **Exclusions**: The number of sources that do not have a qualified mapping to a destination. These are sources that exceed the capacity of available destinations. An exclusion can occur simply because there is not enough of a resource to accommodate a source.

A different set of constraints may result in a different optimal scenario. Modify the constraints to come up with different scenario results.

- **Schema Conflicts**: Lists schemas that exist in more than one source database or that also exist in the destination database. This is specific to D2D scenarios where you chose a non-CDB (single instance) database architecture in the Destinations Planning step of scenario creation. Schema conflicts do not involve Oracle-supplied system schemas.
- **Advisor Findings**: Potential performance bottlenecks and recommended ways of reducing or eliminating them. Also indicates possible problems that can arise based on the consolidation specification.

Severity may be informational, a warning, or critical in nature. Mouse over the rule for a description of what the rule checks for and suggestions for a resolution. The finding may be truncated. Mouse over it to see the complete description.

Figure 42-1 shows the mapping for a simple database-to-database consolidation using the default phantom destination (clustered CDB/PDB). The figure illustrates the key points of mapping as explained in Table 42-1.

**Figure 42-1  Database Consolidation Mapping**
Table 42-1 explains the key points of mapping as annotated in Figure 42-1.

42.3.6 About the Advisor Feature of Database Consolidation Workbench

The Advisor gathers database performance data from the Automatic Workload Repository (AWR) and uses the data as input to rules. The rules are evaluated to determine if performance bottlenecks exist in the source or destination databases, and provide advice on how to relieve the problem. At the scenario level, the rules also look at source databases in combination as well as at destination specifications to determine if the consolidation might experience performance problems.

Advisor findings are viewable for both projects and scenarios, as a column on the Database Consolidation Workbench home page, and as a tab in the respective project and scenario details region.

42.3.7 About Compression Advisor

The Compression Advisor estimates how much space compression savings each source database can potentially benefit from for different types of supported compression types, and calculates how much space the uncompressed data would require. The results appear on the Storage tab of a database consolidation scenario. You can also specify how to compress data in the destination, so that reductions can be applied when determining how much storage will be needed. To enable the estimation of compression, you have to deploy a job to each source database and run...
compression advice to make the results available to Database Consolidation Workbench.

42.3.8 Estimating Compressed Storage Requirements

If you want to factor in compression ratios on source databases as part of a database consolidation, you have to submit a Deploy Database Consolidation Workbench Packages job to gather compression advice on each source. You can do this beforehand or following project creation.

1. From the Enterprise menu, select Job, then select Activity.
2. On the Jobs page, click the Create Job button.
3. Locate Deploy Database Consolidation Workbench Packages in the Job Type list and click Select.
   This takes you to the job creation page, where you also land when you click the Deploy Database Consolidation Workbench Packages link on the Source Candidates tab within a database consolidation project that has already been created.
4. Enter a name for the compression advice job.
5. Add database targets that are source candidates to a consolidation. You can multiselect, but the target type (single instance or cluster), must be the same. Select in the table the target instances you want to include in the job.
6. On the Parameters tab, set Run Compression Advice to Yes.
7. Complete the rest of the job creation process and submit the job. Note that the job needs to run with SYSDBA credentials on the target databases.

The result of these actions makes estimated compression ratios available to Database Consolidation Workbench. Note that it may take up to 24 hours after compression advice is run for the metrics to collect the data into Enterprise Manager for scenario analysis.

42.3.9 About Implementing a Database Consolidation Scenario

After creating a database consolidation scenario, you can implement the mapping by migrating source databases to their mapped destinations using any of four supported migration methods:

- Data Guard Physical Standby (minimal downtime)
- RMAN Clone
- Data Pump (full or schema) Export and Import (cross-platform)
- Full Transportable Export and Import (minimal downtime, cross-platform)

Implementing a database consolidation scenario generates an XML file that you edit directly within Database Consolidation Workbench to provide supplementary information such as necessary credentials. You then save the file locally to be input to an EMCLI command that submits deployment procedures to perform the actual migration.
42.3.10 Implementing a Database Consolidation Scenario

Implement a scenario by deploying a procedure to perform a database migration.

1. From the Enterprise menu, select Consolidation, then select Database Consolidation Workbench.

2. Select a completed database consolidation scenario on the Database Consolidation Workbench home page and click Implement Scenario.

3. Select a migration method, RMAN Clone for example, from the available options. Mouse over a method to see a description. Note, in particular, minimum version requirements.

4. Click Generate Migration Command to create an EMCLI migration command and associated migration XML file.

5. Click Edit Migration XML to address any issues listed under Messages and to add supplementary information. The generated file is heavily commented to indicate the information needed, such as database and host credentials, location of working directory, and so forth.

6. Click Validate to ensure XML conformance.

7. Click Save and Return if you want to preserve the XML file and any edits you may have made, and go back to the Database Consolidation Workbench home page. The file will be available the next time you want to implement the scenario.

8. Click Download Migration XML to save the file to the local file system.

When you are ready to migrate the source databases, run the EMCLI command (emcli migrate_db -file=<migration_xml_file_path>), passing the XML file saved locally as input. When run, the command submits deployment procedures to perform the migration. You can track the migration on the Procedure Activity page; select Provisioning and Patching, then Procedure Activity from the Enterprise menu.

When the migration method is Data Guard Physical Standby, you can invoke parameters within the migrate_db command that control downtime. You can also ignore prerequisite XML validation.

Use the get_sample_migration_xml EMCLI command to generate a sample XML migration file that demonstrates source and destination mappings, based on the chosen migration method.

See the Enterprise Manager Command Line Interface guide for details on the migration commands.

42.3.11 Database Migration and Encrypted Tablespace

If a source database uses encrypted tablespace, you will not be able to access data in these tables on the destination following the migration until you copy the wallet from the source location to a location on the destination. You can find the wallet location in the sqlnet.ora file. The default location of the file is based on the TNS Admin or ORACLE_HOME/network/admin location.

After you copy the wallet to the destination, update the sqlnet.ora file on the destination with the location where you copied the wallet. For example:
ENCRYPTION_WALLET_LOCATION =
   (SOURCE =
    (METHOD = FILE)
    (METHOD_DATA =
     (DIRECTORY = /scratch/jdoe/app/jdoe/admin/dben/wallet)
     )
   )

After updating the file, you have to open the wallet before you can access data in the encrypted tablespace.

1. From the **Targets** menu, select **Databases**, then search for the destination database.
2. On the destination database home page, select **Transparent Data Encryption** from the **Security** menu.
3. Open the wallet by providing the requisite password.

You can now access data in the encrypted tablespace.

For detailed information on encryption, wallets, and other security-related issues, see the *Oracle Database Advanced Security Guide*.

### 42.3.12 Assessing the Performance Impact of Database Migration on SQL Workload

System changes such as migrating a database may cause changes to execution plans of SQL statements, resulting in a significant impact on SQL performance. You can analyze performance impact of database migration on SQL workload using SQL Performance Analyzer to identify the SQL statements that have improved, remained unchanged, or regressed after the system change.

The typical flow to assess the performance impact on SQL workload using SQL Performance Analyzer is as follows:

1. Capture the SQL workload that you intend to analyze and store it in a SQL tuning set.
2. Pre-system change, create a SQL Performance Analyzer task.
3. Build the pre-change SQL trial by test executing or generating execution plans for the SQL statements stored in the SQL tuning set.
4. Perform the system change.
5. Build the post-change SQL trial by re-executing the SQL statements in the SQL tuning set on the post-change system.
6. Generate a report to identify the impact of change on the SQL statements.
7. View the SQL Performance Analyzer report to compare pre- and post-change SQL performance. You can access the report from the destination database home page by selecting SQL then SQL Performance Analyzer Home from the Performance menu.

As noted, this is the typical flow to use SQL Performance Analyzer. In the case of a database migration, you only need to perform the first and last steps listed above—create the SQL tuning set and view the report. The migration job does the rest:

- Creates the SQL Performance Analyzer task.
• Builds the pre-change SQL trial.
• Performs the database migration.
• Builds the post-change SQL trial.
• Generates the report.

For detailed information on using the feature, see "Part I SQL Performance Analyzer" in the *Oracle Database Testing Guide*.

### 42.4 Topics Common to Host and Database Consolidations

The following sections cover topics that are common to host and database consolidations:

- How Enterprise Manager Consolidation Analyzes a Consolidation Scenario
- Viewing Consolidation Reports
- Managing Data Collections
- About Oracle Compute Cloud Shapes

#### 42.4.1 How Enterprise Manager Consolidation Analyzes a Consolidation Scenario

To analyze a consolidation scenario, Enterprise Manager Consolidation follows a defined process.

For host consolidations, Enterprise Manager Consolidation estimates the hourly and overall resource requirements for each of the consolidation sources. Using metric data collected by Enterprise Manager, it calculates the requirement for each hour and for all hours (in the specified collection days), selecting the average, 80th percentile, or maximum value, depending on the selected resource allocation style (Aggressive, Medium, or Conservative).

For database consolidations, Enterprise Manager Consolidation uses the Ultra Conservative resource allocation style, which selects the maximum value of the resource over the entire time period.

Enterprise Manager Consolidation adjusts the value if a scale factor is specified. It further adjusts memory requirements in D2D scenarios by reducing the portion of memory used for the SGA by 50%, 40% or 30%, again depending on the resource allocation style. The resource requirement displayed for the source is the overall requirement determined by the resource allocation style and adjustments.

If the consolidation scenario includes existing destinations, Enterprise Manager Consolidation performs a similar calculation to determine the hourly and overall usage values for each destination. It does not scale or otherwise adjust these values, but calculates them using average, 80th percentile, or maximum values depending on the resource allocation style.

For host consolidations into new or existing destinations, Enterprise Manager Consolidation matches the hourly requirements for each source against the available hourly capacity of a destination. (Existing destinations start this process populated with their existing hourly workloads; new destinations start in an empty state.) If the destination can accommodate all hourly requirements for all resources, a successful consolidation occurs.
For database consolidations, Enterprise Manager Consolidation adds together the single workload values for each source database to determine which databases map to each destination.

If any requirement cannot be consolidated, Enterprise Manager Consolidation tries the next destination until one is found with sufficient capacity. If the consolidation is to existing destinations and none have sufficient remaining capacity, the source is excluded from the consolidation. For consolidation to new destinations, another destination is created to accommodate the source.

- For D2D scenarios with RAC database destinations, where the workload is shared across multiple instances, the process differs. Each source database's workload is consolidated onto all instances in the RAC database, and the total workload is balanced across all instances. This is also true for D2S scenarios with Exadata or cluster destinations.

- For D2D scenarios with Container database (CDB) destinations, each source database is consolidated to a separate pluggable database (PDB) within the CDB. Source databases that are in conflict due to user-specified constraints are consolidated to separate CDBs.

- By default, Enterprise Manager Consolidation consolidates sources to the fewest possible destinations. However, for scenarios with multiple existing destinations, you can choose to spread the workload across all destinations instead.

The scenario Mapping page displays the results of the consolidation. The contents of this page vary depending on the project type and the resources selected for consolidation, but in general displays the following:

- Projected destinations, and the sources consolidated to each destination.

- For each resource, the capacity of the destination, together with the percentage and amount of that resource that will be consumed by the sources consolidated to it and existing workload, if any. Enterprise Manager Consolidation estimates this amount by finding the largest hourly usage for the resource on the destination. The source line shows the percentage of the destination's resources that will be used by that source.

### 42.4.2 Viewing Consolidation Reports

You can repurpose consolidation project and scenario details in report form that you can capture in a variety of formats and distribute to a wider audience, as described in the following sections:

- Viewing Consolidation Project Reports
- Viewing Consolidation Scenario Reports

#### 42.4.2.1 Viewing Consolidation Project Reports

To view a project report, select the host or database project on the respective Consolidation home page and click the Report button above the table. The report page repurposes project details as stacked, scrollable tables representing the tabbed information that appears in the project's details on the home page.

Click Publish Report to capture report contents. This action integrates with BI Publisher, where you can:

- Save reports in a variety of formats (Excel, PowerPoint, HTML, PDF).
• Distribute generated reports to e-mail lists (users who do not have access to Enterprise Manager, for example) on a defined schedule.

Click OK to return to the Consolidation home page.

42.4.2.2 Viewing Consolidation Scenario Reports

To view a project scenario report, select the host or database scenario within the project on the Consolidation home page and click the Report button above the table. The report page repurposes scenario details as stacked, scrollable tables representing the tabbed information that appears in the scenario's details on the home page.

Click Publish Report to capture report contents. This action integrates with BI Publisher, where you can:
• Save reports in a variety of formats (Excel, PowerPoint, HTML, PDF).
• Distribute generated reports to e-mail lists (users who do not have access to Enterprise Manager, for example) on a defined schedule.

Click OK to return to the Consolidation home page.

42.4.3 Managing Data Collections

Manage data collections by viewing the status of your host or database projects.

1. On the respective Consolidation home page select View Data Collection from the Actions menu.

2. The view lists sources within a project where you can perform the following tasks:
• View the latest collection status by project.
• Select a source to see its collection history and troubleshoot potential problems with the collection.
• Click the link under Data Collection Jobs to go to the job activity page where you can view and administer the latest data collection job.
• Update the latest CPU performance metric values by following the instructions to download a CSV file with the latest rates. After downloading the file, click Browse to locate the file in the local file system and click Load to update the rates in Enterprise Manager Consolidation.

42.4.4 About Oracle Compute Cloud Shapes

A shape defines the number of Oracle Compute Units (OCPUs) and the amount of RAM available for an instance. An OCPU provides the equivalent CPU capacity of the current 3.0 GHz 2012 Intel Xeon processor with hyper threading enabled. Each OCPU corresponds to two hardware execution threads, known as vCPUs.

A wide range of shapes is available to help you select a combination of processing power and memory for your instances that best suits your business requirement. While selecting a shape for your instance, consider the nature of applications that you will deploy on the instance, the number of users that you expect to use the application, and also how you expect the load to scale in the future. Remember to also factor in the CPU and memory resources that will be used by the OS.

To determine the shape that meets your resource requirements, you may want to experiment with a shape and test it with a representative workload.
The following table provides the list of shapes currently available in Oracle Compute Cloud Service. The shapes named OC3 through OC7 represent standard combinations of OCPUs and memory, while shapes named OC1M through OC5M represent high memory configurations, where the memory allocation is double that of the standard configurations.

<table>
<thead>
<tr>
<th>Name</th>
<th>OCPUs</th>
<th>vCPUs</th>
<th>Memory (GB)</th>
</tr>
</thead>
<tbody>
<tr>

Part XVI
Using the Cloud APIs

This section describes the cloud application programming interfaces (APIs) and the RESTful (Representational State Transfer) API.

It contains the following chapters:

- Introduction to Cloud APIs
- Cloud Resource Models
- EM CLI Verbs for Database as a Service Administrator
- Database as a Service Administrator REST APIs.
- Database as a Service SSA User REST APIs.
- DBaaS REST APIs and EM CLI Verbs Based Use Cases.
- SSA Administration REST APIs.
- SSA Portal Management REST APIs.
- WebLogic as a Service REST APIs.
- SOAaaS and OSBaaS APIs
- Rapid Start Cloud Setup
- Chargeback and Metering EMCLI Verbs.
- Introduction to Blueprints.
- Cloud Blueprints and Blueprint Reference.
- Infrastructure as a Service REST APIs.
- Testing as a Service REST APIs.
Cloud computing is a style of computing in which dynamically scalable and deployed resources are provided as a service over the network.

Users need not have knowledge of, expertise in, or control over the underlying infrastructure in the cloud that supports the services rendered to the users. As enterprises (companies, governments, and other organizations) integrate their existing IT infrastructures and IT resources with the sharable cloud paradigm, it is imperative for cloud enablers to provide a uniform API that these enterprises can use to tailor the cloud to their business processes and economic models.

The Representational State Transfer (REST) API presented here focuses on the resource models and their attributes.

This chapter contains the following sections:

- Introduction
- When to Use Cloud REST APIs
- Change History
- Common Behaviors

### 43.1 Introduction

As IT deployments become more complex, an abstraction of the infrastructure resources becomes more relevant to address concerns of compliance and configuration. Furthermore, such abstractions enable consumers to self serve the exact service they need and operationally control these services without any significant administrator involvement.

The REST API enables an infrastructure provider to service their customers by allowing them to perform the following:

- Browse templates that contain definitions and metadata of a logical unit of service.
- Deploy a template into the cloud and form an IT topology on demand.
- Perform operations (such as ONLINE, OFFLINE) on the resources.

The REST API is based on the HTTP protocol and GET, POST, PUT, and DELETE requests are all used. Resource representations documented here are in JavaScript Object Notation (JSON).

The REST API presupposes no particular structure in the Uniform Resource Identifier (URI) space. The starting point is a URI, supplied by the cloud service provider, that identifies the cloud itself. The cloud's representation contains URIs for the other resources in the cloud. Operations on the cloud resources are performed by making an HTTP request against the URI of the resource.

The specification of this Cloud REST API includes the following:
- Common behaviors that apply across all requests and responses, error messages, and common resource attributes.
- Resource models, which describe the JSON data structures used in requests and responses.
- Requests that may be sent to cloud resources and the responses expected.

### 43.2 When to Use Cloud REST APIs

The Cloud REST APIs can be used to integrate Enterprise Manager with custom-built or 3rd party self service consoles and service desks. A few example scenarios include:

- Deploying databases and Oracle VM assemblies from custom-built self-service consoles.
- Integration into a bigger orchestration flow, such as a provisioning preceded with approval workflows.
- Deploying databases and Oracle VM assemblies from service desks.
- As a part of public clouds where the tenant interface of the cloud is typically different and serves service procurement, tenant registration, and so on.

### 43.3 Change History

The following table describes the high level changes to Enterprise Manager Cloud Control's Cloud Service Portal Plug-in 12.1.0.4 to 12.1.0.5.

<table>
<thead>
<tr>
<th>Abstract</th>
<th>Description</th>
<th>Impacts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Availability of QuotaUsage resource.</td>
<td>Service family type may provide resource quota usage information through the API.</td>
<td>Additional attributes are added to the respective resource models to reference the quota usage.</td>
</tr>
<tr>
<td>Availability of ServiceTemplateFinds resource.</td>
<td>Service family type may provide supports to query for Service Template resources.</td>
<td>Cloud level interactions return a list of service templates satisfying the listing criteria.</td>
</tr>
</tbody>
</table>

The following table describes the high level changes to Enterprise Manager Cloud Control's Cloud Service Portal Plug-in 12.1.0.2 to 12.1.0.4.
## Table 43-2  Changes to the Resource Model (from 12.1.0.2 to 12.1.0.4)

<table>
<thead>
<tr>
<th>Abstract</th>
<th>Description</th>
<th>Impacts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Introduction of x-specification-version header.</td>
<td>x-specification-version is a new header introduced in this release. The purpose of this header is to inform the backend server to switch between various supported versions of the Cloud Resource Model. By default, if this header is not specified, the server will automatically use the latest version of the resource model. Each server response will also now include x-specification-version.</td>
<td>If a client wishes to interact with the web service using the previous (pre-12.1.0.4 Cloud Service Portal release) resource model in 12.1.0.4 Cloud Service Portal, the following header can be specified. x-specification-version: 10000 For example, GET /em/cloud with x-specification-version: 10000 will return the pre 12.1.0.4 release CloudServicePortal Cloud resource.</td>
</tr>
<tr>
<td>Cloud media type is updated to be service oriented.</td>
<td>Before this release, top level Cloud media type is IaaS centric. However, with the additions of Middleware as a Service in this release, the Cloud media type is transformed into a generic service model where additional XaaS can be plugged into the system without further remodel of the media type. The Cloud media type is no longer backward compatible. (However, using the x-specification-version header can still allow a client to switch back to the older media type).</td>
<td></td>
</tr>
<tr>
<td>Consolidate the concept of VDC into Zone.</td>
<td>Resource relationships that are supported by the IaaS centric VDC are now consolidated into the generic Zone resource. The VDC resource is currently not visible from the 12.1.0.4 Cloud Service Portal resource model. Interacting with the 12.1.0.4 Cloud Service Portal resource model would be centric around Zone instead of VDC.</td>
<td></td>
</tr>
<tr>
<td>&quot;media_type&quot; attribute for resources.</td>
<td>Each resource will have a &quot;media_type&quot; attribute to support client introspections in the generic service model. In other words, a Collection attribute in a resource may contain list of resources that are of different media type extending the same abstract media type. The interaction with the web service may be introspective. For example, the Cloud resource contains &quot;service_templates&quot; attribute that describes the list of service templates that are from various XaaS. Each service template item in the &quot;service_templates&quot; may be of different media types, but these media types should contain all the attributes of the generic ServiceTemplate model.</td>
<td></td>
</tr>
<tr>
<td>&quot;Accept&quot; header may be optional.</td>
<td>If the intention of the interaction is clear, you do not need to specify the &quot;Accept&quot; header. The web service will introspect the resource URI automatically to return the resource with the most specific media type.</td>
<td></td>
</tr>
</tbody>
</table>
Table 43-2  (Cont.) Changes to the Resource Model (from 12.1.0.2 to 12.1.0.4)

<table>
<thead>
<tr>
<th>Abstract</th>
<th>Description</th>
<th>Impacts</th>
</tr>
</thead>
<tbody>
<tr>
<td>Generic and Specific media types.</td>
<td>This version introduces the concept of Generic and Specific media types to support inheritance. For example, application/oracle.com.cloud.common.ServiceTemplate is a Generic media type and application/oracle.com.cloud.common.VMTemplate is a specific type that extends the above generic type. A specific type can extend another specific type (just like object inheritance).</td>
<td>It is now possible to use the Generic type to inquire about the resource. For example, if an URI represents a resource of specific type Y that extends generic type X, then, GET URI shall also accept the &quot;accept&quot; header of value X. Furthermore, attributes in specific type Y are expected to include the attributes in generic type X, and therefore clients shall be able to interact with the resource on the generic type.</td>
</tr>
</tbody>
</table>

43.4 Common Behaviors

The following sections specify constraints that apply to all the requests and responses that occur in the REST APIs supported by the Oracle Cloud Computing Platform.

43.4.1 Transport Protocol

All of the platform APIs are based on the Hypertext Transfer Protocol (HTTP), version 1.1 (RFC 2616). Each request will be authenticated using HTTP Basic Authentication (RFC 2617) unless otherwise noted. Therefore, requests sent from the public Internet (and not on a secure channel such as a VPN) must use the HTTPS protocol.

43.4.2 URI Space

The resources in the system are identified by URIs. To begin operations, the URI for a resource must be known. Dereferencing the URI yields a representation of the resource containing resource attributes and links to associated resources.

Assumptions about the layout of the URIs or the structure of resource URIs should not be made.

43.4.3 Media Types

In this specification, resource representations and request bodies are encoded in JavaScript Object Notation (JSON), as specified in RFC 4627. Each type of resource has its own media-type, which matches the following pattern:

application/oracle.com.cloud.common.Xxxxx+json

where Xxxxx represents the portion of the identifier unique to a particular representation format for each resource. The identifier must be globally unique in the space of vnd.com.oracle.cloud, and the media type should be registered in accordance to RFC 4288.
The Platform must provide representations of all resources available in JSON. The Platform must accept requests encoded in JSON.

43.4.4 Request Headers

In requests made to services implementing Oracle Cloud Platform APIs, several specific HTTP headers are used as described in the following table:

**Table 43-3 Request Headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Supported Values</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Accept</td>
<td>Comma-delimited list of media types or media type patterns</td>
<td>Indicates to the server what media types are acceptable.</td>
<td>Recommended on requests that will produce a response message body.</td>
</tr>
<tr>
<td>Authorization</td>
<td>“Basic” plus user name and password (per RFC 2617).</td>
<td>Identifies the user making this request.</td>
<td>Yes on most of the requests.</td>
</tr>
<tr>
<td>Content-Length</td>
<td>Length (in bytes) of the request message body.</td>
<td>Describes the size of the message body.</td>
<td>Yes on requests that contain a message body.</td>
</tr>
<tr>
<td>Content-Type</td>
<td>Media type describing the request message body.</td>
<td>Describes the representation and syntax of the request message body.</td>
<td>Yes on requests that contain a message body.</td>
</tr>
<tr>
<td>Host</td>
<td>Identifies the host receiving the message.</td>
<td>Required to allow support of multiple origin hosts at a single IP address.</td>
<td>All requests.</td>
</tr>
<tr>
<td>X-YYYYYClient-Specification-Version</td>
<td>String containing a specification version number.</td>
<td>Declares the specification version of the YYYY API that this client was programmed against.</td>
<td>No.</td>
</tr>
</tbody>
</table>

43.4.5 Response Headers

Specific HTTP headers included in the responses returned from the platform are described in the following table:

**Table 43-4 Response Headers**

<table>
<thead>
<tr>
<th>Header</th>
<th>Supported Values</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Content-Type</td>
<td>Media type describing the response message body.</td>
<td>Describes the representation and syntax of the response message body.</td>
<td>Yes, on responses that contain a message body.</td>
</tr>
<tr>
<td>Location</td>
<td>Canonical URI of the resource, either newly created, or the original referenced resource.</td>
<td>Returns a URI that can be used to request a representation of the resource.</td>
<td>Yes, on responses to requests that create a new resource, or change an existing resource.</td>
</tr>
</tbody>
</table>
### Table 43-4  (Cont.) Response Headers

<table>
<thead>
<tr>
<th>Header</th>
<th>Supported Values</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>Cache-Control</td>
<td>Max-age, public, no-store, mustrevalidate, proxyrevalidate.</td>
<td>How the representation of the resource should be cached, and its freshness.</td>
<td>No. For public resources (such as a list of public assemblies or templates) that do not change frequently, allowing lenient cache-control to optimize the response. This will never be returned on a privileged resource or a resource request that contains an authorization header.</td>
</tr>
</tbody>
</table>

### 43.4.6 HTTP Status Codes

Oracle Cloud Computing Platform APIs return standard HTTP response codes as described in the following table, under the conditions listed in the description.

### Table 43-5  HTTP Response Codes

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>100 Continue</td>
<td>The client should continue with its request. This interim response is used to inform the client that the initial part of the request has been received and has not yet been rejected by the platform. The client should continue by sending the remainder of the request or, if the request has already been completed, ignore this response.</td>
</tr>
<tr>
<td>200 OK</td>
<td>The request was successfully completed. If this request created a new resource that is addressable with a URI, and a response body is returned containing a representation of the new resource, a 200 status will be returned with a location header containing the canonical URI for the newly created resource.</td>
</tr>
<tr>
<td>201 Created</td>
<td>A request that created a new resource was completed and no response body containing a representation of the new resource is being returned. A location header containing the canonical URI for the newly created resource will be returned.</td>
</tr>
<tr>
<td>202 Accepted</td>
<td>The request has been accepted for processing, but the processing has not been completed. Per the HTTP/1.1 specification, the returned entity (if any) should include an indication of the request's current status. A location header containing the canonical URI for the not-yet completed resource is returned along with the status attribute indicating its progress.</td>
</tr>
<tr>
<td>400 Bad Request</td>
<td>The request could not be processed because it contains missing or invalid information (such as validation error on an input field, a missing required value, and so on).</td>
</tr>
<tr>
<td>401 Unauthorized</td>
<td>The authentication credentials included with this request are missing or invalid.</td>
</tr>
<tr>
<td>403 Forbidden</td>
<td>The server recognized your credentials, but you do not possess authorization to perform this request.</td>
</tr>
<tr>
<td>404 Not Found</td>
<td>The request specified a URI of a resource that does not exist.</td>
</tr>
</tbody>
</table>
Table 43-5  (Cont.) HTTP Response Codes

<table>
<thead>
<tr>
<th>Header</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>405 Method Not Allowed</td>
<td>The HTTP verb specified in the request (DELETE, GET, HEAD, POST, PUT) is not supported for this request URI.</td>
</tr>
<tr>
<td>406 Not Acceptable</td>
<td>The resource identified by this request is not capable of generating a representation corresponding to one of the media types in the Accept header of the request.</td>
</tr>
<tr>
<td>409 Conflict</td>
<td>A creation or update request could not be completed because it would cause a conflict in the current state of the resources supported by the platform. For example, an attempt is made to create a new resource with a unique identifier that is already assigned to some existing resource or an attempt is made to modify a resource attribute which is not yet completed.</td>
</tr>
</tbody>
</table>
| 410 Gone                      | The requested resource is no longer available at the server and no forwarding address is known. This condition is expected to be considered permanent. Clients with link editing capabilities should delete references to the Request-URI after user approval.  
If the server does not know, or has no facility to determine, whether or not the condition is permanent, the status code 404 (Not Found) should be used instead. This response is cacheable unless indicated otherwise. |
| 412 Precondition Failed       | The precondition given in one or more of the request-header fields evaluated to + when it was tested on the server. This response code allows the client to place preconditions on the current resource meta-information (header field data) and thus prevent the requested method from being applied to a resource other than the one intended. |
| 500 Internal Server Error     | The server encountered an unexpected condition which prevented it from fulfilling the request.                                                                                                               |
| 501 Not Implemented           | The server does not (currently) support the functionality required to fulfill the request.                                                                                                                  |
| 503 Service Unavailable       | The server is currently unable to handle the request due to temporary overloading or maintenance of the server.                                                                                             |

43.4.7 Common Resource Attributes

All the resource entities in this specification may contain the following common resource attributes.

43.4.7.1 Resource State

This attribute denotes the state of the resource describing the lifecycle of the resource. This differs from the status of the entity represented by the resource which has entity specific semantics.

The following table shows the Data Model of this attribute.
Table 43-6  ResourceState Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>state</td>
<td>String</td>
<td>The current state of the resource as last known. This is a label containing lifecycle state (for example, INITIATED, CREATING, CREATED, DESTROYING, DESTROYED, READY). When there are vendor extensions, the vendor shall publish and document their semantics.</td>
<td>1</td>
</tr>
<tr>
<td>progress</td>
<td>Integer</td>
<td>This indicates the progress made as an approximate percentage. Not all state labels assign semantic meaning to this field.</td>
<td>0..1</td>
</tr>
<tr>
<td>messages</td>
<td>Message[]</td>
<td>Include the message data model instances to denote noteworthy communications.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

43.4.8 Collection

This attribute is a meta resource that represents a collection field in a resource. For example, a VDC contains a collection of VMs and the field that represents the list of VMs is implemented in this type.

In the resource model, a collection field is denoted as Collection<type>, for example, Collection<VM>.

Table 43-7  Collection<type> Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>URI that represents the collection of entities.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of the entity that this collection contains.</td>
<td>1</td>
</tr>
<tr>
<td>total</td>
<td>Integer</td>
<td>Total number of elements that can be safely assumed to be in the elements list.</td>
<td>0..1</td>
</tr>
<tr>
<td>elements</td>
<td>&lt;TYPE&gt;[]</td>
<td>List of entities in this collection. The URI of the entities must be populated by the platform. When dereferencing the URI, the client must use the type field in the Accept header (except in the case where type = URI). If this is not returned, then the collection is an empty list.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

In addition to the resource type, the collection also supports Collection<URI> where the type field is "URI". This basic type collection requires additional type casting where the URI can be dereferenced properly.

This basic type collection requires additional type casting where the URI can be dereferenced properly. It is also permissible to have a collection of type collection, for example, Collection<Collection<Server>>.
43.4.9 Error Response Message

Successful requests will generally return an HTTP status code of 200 (OK), 201 (Created), 202 (Accepted), or 204 (No Content) to indicate that the requested action has been successfully performed or submitted.

In addition, a response message body (with an appropriate media type) containing a representation of the requested information might also be included. However, it is possible for a number of things to go wrong.

The various underlying causes are described by various HTTP status codes in the range 400-499 (for client side errors) or 500-599 (for server side problems).

If a response is returned with an error status code (400-499 or 500-599), the server will also return a response message body containing a message data model, with zero or more message data models, describing what went wrong. The text values of such messages might be used, for example, to communicate with a human user of the client side application.

The entire list of messages included in a single error response is encapsulated in a messages data model. The media type shall be returned in the Content-Type header. The client shall not include the Messages media type in the Accept header.

**Table 43-8 Messages Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>messages</td>
<td>Message</td>
<td>Zero or more message data for each individual message.</td>
<td>0..n</td>
</tr>
</tbody>
</table>

An individual message contains the following fields:

**Table 43-9 Individual Message Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>code</td>
<td>String</td>
<td>Zero or more message data for each individual message.</td>
<td>0..1</td>
</tr>
<tr>
<td>field</td>
<td>String</td>
<td>Name of the field from the request data model that this message is associated with.</td>
<td>0..1</td>
</tr>
<tr>
<td>hint</td>
<td>String</td>
<td>Localized text further describing the nature of the problem, possibly including potential workarounds that the client could try.</td>
<td>0..1</td>
</tr>
<tr>
<td>text</td>
<td>String</td>
<td>Localized text describing the nature of the problem reported by this message.</td>
<td>1</td>
</tr>
<tr>
<td>severity</td>
<td>String</td>
<td>Label indicating the severity of the error condition represented by this message. Vendor shall publish the enumerators that are associated with this field and their semantics.</td>
<td>0..1</td>
</tr>
<tr>
<td>stack_trace</td>
<td>String</td>
<td>Vendor specific stack trace associated with this message.</td>
<td>0..1</td>
</tr>
<tr>
<td>source</td>
<td>String</td>
<td>Symbolic identifier of the service implementation component that triggered this message.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
Cloud Resource Models

This chapter specifies the representations of the resources that the Enterprise Manager Cloud REST APIs operate on.

This chapter specifies the representations of the resources that the REST APIs operate on. It contains the following sections:

- Enterprise Manager Cloud Resource Model 10001
- About Cloud Resources
- Resource Data Models

44.1 Enterprise Manager Cloud Resource Model 10001

This version of the Cloud resource model is the culmination of the XaaS implementation for Cloud Service Portal Plug-in, where additional service types can be used to support the creation and lifecycle management of service instances.

For this release of Enterprise Manager Cloud Control's Cloud Service Portal Plug-in, 10001 is the default version when /em/cloud is accessed by the client. Specifically, the client can specify x-specification-version: 10001 in the HTTP header to examine whether or not a resource supports version 10001. It is important to note that the resource type from different versions may not be inter-mixed in a request. For example, 10001 may reject a request where the content is shaped like the 10000 version of the resource.

The following table contains the top level description of the resources:

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>application/oracle.com.cloud.common</td>
<td>This media type namespace contains “common” resources that are not specific to resource types in XaaS implementation. It is customary that XaaS implementation may extend a common resource type by responding to the request where the accept/content-type is the base type. This is similar to Java’s class typing where one can always typecast the base class to an implementation class.</td>
</tr>
<tr>
<td>Cloud</td>
<td>This is the top level media type of the entry point /em/cloud where the client can get a high level view of the Cloud as a whole.</td>
</tr>
<tr>
<td>ServiceTemplate</td>
<td>This is the common media type that represents a service template each XaaS can extend to create a service instance.</td>
</tr>
<tr>
<td>ServiceInstance</td>
<td>This represents the common media type that represents a service instance. Each XaaS can extend this media type to represent the service instances that it supports.</td>
</tr>
<tr>
<td>ServiceFamilyType</td>
<td>This represents XaaS or a service family.</td>
</tr>
</tbody>
</table>
Table 44-1  (Cont.) Top Level Resource Descriptions

<table>
<thead>
<tr>
<th>Resource</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>InstanceType</td>
<td>This represents a type of service instance. For example, VM is an extending media type of ServiceInstance and there is a corresponding InstanceType? that describes what a VM instance may contain.</td>
</tr>
<tr>
<td>Metric</td>
<td>This represents a metric of a resource. For example, performance metrics such as CPU utilization and network utilization are metrics of a VM instance. This does not need to be constrained to performance metrics only. Any measurable or observable time series data can be represented as a metric.</td>
</tr>
<tr>
<td>MultipartMetric</td>
<td>This extends the Metric, but represents a multi-dimensional observation.</td>
</tr>
<tr>
<td>CloudInteractions</td>
<td>This represents the collection of interactions that are supported by the Cloud. The data of this resource would be protocol dependent. For example, in HTTP protocol, the data would consist of the supported HTTP request triple of (request method, accept type, and content type).</td>
</tr>
<tr>
<td>QuotaUsage</td>
<td>This represents the quota information in the context of a service family.</td>
</tr>
</tbody>
</table>

### 44.2 About Cloud Resources

Cloud resource representations are made up of fields, each with a name and value, encoded using a JavaScript Object Notation (JSON) dictionary. The values may be lists, dictionaries, or numeric or string literals, each of which is represented in JSON in accordance with RFC 4627.

Each type of cloud resource has its own Internet Media Type. The media type SHALL conform to the pattern application/oracle.com.cloud.common.Xxxxxxxx+json, and the specific media type for each resource model is included in square brackets in the corresponding section header.

Cloud resources are now organized by common service entities where specific services (for example, Infrastructure as a Service) provide resources extending common service entities where appropriate. The figure below shows the resource model relationships on the common resources and Infrastructure as a Service as a service specific resources.
44.3 Resource Data Models

The following sections provide details on the different cloud resource data models.

44.3.1 Cloud [application/oracle.com.cloud.common.Cloud+json]

A Cloud represents the user’s starting view of all accessible resources. The following table describes the cloud data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Human readable name. It is a UNICODE string to support different languages.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>Brief description. This is a UNICODE string to support different languages.</td>
<td>12.1.0.1</td>
</tr>
</tbody>
</table>
Table 44-2  (Cont.) Cloud Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_templates</td>
<td>Collection&lt;ServiceTemplates&gt;</td>
<td>0..1</td>
<td>List of service templates that are accessible to the user.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>service_family_type</td>
<td>Collection&lt;ServiceFamilyType&gt;</td>
<td>0..1</td>
<td>The list of service family types that are supported by the Cloud.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>zones</td>
<td>Collection&lt;Zone&gt;</td>
<td>0..1</td>
<td>List of zones that are supported by the cloud and accessible to the user.</td>
<td>12.1.0.2</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>0..1</td>
<td>Cloud that is online and running would have READY as its state. If this field is not returned, the client can assume the cloud is READY. If the state of the returned field is not READY, the client cannot assume the viability of subsequent interactions into the cloud.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>1</td>
<td>Value of this media type with the payload format. For example, application/oracle.com.cloud.common.Cloud+json.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>

44.3.2 ServiceTemplate [application/oracle.com.cloud.common.ServiceTemplate+json]

A ServiceTemplate represents the definition of the deployable service. For a user, a ServiceTemplate represents the definition of the deployable service. Users can create cloud resources by interacting with the URI of a ServiceTemplate. The cloud shall instantiate the resources and their configurations as specified in the definition of the ServiceTemplate.

VMTemplate is a subclass to the ServiceTemplate resource and therefore it is possible to get the ServiceTemplate from the URI of a VMTemplate. The following table shows the ServiceTemplate Data Model.

Table 44-3  ServiceTemplate Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>GET against this URI refreshes the client representation of the ServiceTemplate definition to this user.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Human readable name given to the ServiceTemplate. It is a UNICODE string to support different languages.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>A brief description given to the ServiceTemplate. It is a UNICODE string to support different languages.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>1</td>
<td>The string that describes the type of the service template.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>
Table 44-3  (Cont.) ServiceTemplate Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>created</td>
<td>Timestamp</td>
<td>1</td>
<td>Date and time, in ISO 8601 format, when the ServiceTemplate was created.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>service_family_typ e</td>
<td>String</td>
<td>0..1</td>
<td>The name of the service family type under which this service template is categorized.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>default_instance_ media_type</td>
<td>String</td>
<td>0..1</td>
<td>The default media type of the service instance that can be created using this template. For example, a VMTemplate would have VM for this attribute to indicate that VMTemplate can be deployed into a VM service instance.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>1</td>
<td>Only a service template with a READY state can be deployed.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>deployment_param s</td>
<td>List of Deployment Parameters</td>
<td>0..1</td>
<td>Contains the list of data structure of Deployment Parameters to indicate the parameters that may be specified during the service instance deployment using this template</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>zones</td>
<td>List of Zones</td>
<td>0..1</td>
<td>Contains the list of Zone resources that this service template can be used to create service instances with</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>service_instances</td>
<td>Collection&lt;?&gt;</td>
<td>0..1</td>
<td>Contains the list of service instances that are created with this template.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>

The following table describes the structure of the Deployment Parameters.

Table 44-4  Deployment Parameter Structure

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>The name of the parameter that needs to be specified during deployment.</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>A brief description of the deployment parameter.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>1</td>
<td>The type of the deployment parameter. It is an enumeration of the following values, STRING, INTEGER, NUMBER, and LIST.</td>
</tr>
<tr>
<td>default_value</td>
<td>String</td>
<td>0..1</td>
<td>The default value for this parameter.</td>
</tr>
<tr>
<td>required</td>
<td>Boolean</td>
<td>1</td>
<td>TRUE if this parameter is required, FALSE otherwise.</td>
</tr>
<tr>
<td>sensitive</td>
<td>Boolean</td>
<td>1</td>
<td>TRUE if this parameter denotes a password. FALSE otherwise.</td>
</tr>
</tbody>
</table>

44.3.3 Zone [application/oracle.com.cloud.common.Zone+json]

A Zone represents a logical boundary where the resources may reside. A Zone can represent a particular geographically location such as Europe Zone, North America
Zone, East Asia Zone. A zone can also represent characteristics, such as high network bandwidth or DMZ secured. Furthermore, a Zone can be organizational in nature, such as Financial Department Zone, Testing Zone, and Development Zone.

There should not be any assumption of exclusivity of underlying infrastructures in the Zones unless otherwise noted. For example, Zone A and Zone B can be on the same physical network serving two different departments, but their physical infrastructure setup is transparent to cloud users.

Table 44-5    Zone Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>GET against this URI refreshes the client representation of the Zone definition to this user.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Name of the Zone.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>Human readable description of the Zone. It is a UNICODE string to support different languages.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>1</td>
<td>The media type of the resource.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>0..1</td>
<td>The resource state of the resource.</td>
<td>12.1.0.1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>0..1</td>
<td>The name of the service family type that this zone is associated with. Each Zone is contextualized in the service family type.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>service_templates</td>
<td>Collection&lt;ServiceTemplate&gt;</td>
<td>0..1</td>
<td>Collection of the service templates that this zone supports and can be deployed into.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>service_instances</td>
<td>Collection&lt;ServiceInstance&gt;</td>
<td>0..1</td>
<td>Collection of the service instances that are in this zone.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>

44.3.4 Service Family Type [application/oracle.com.cloud.common.ServiceFamilyType+json]

A service family type is a category of services that are offered by the cloud. For example, IaaS is a category that encapsulates infrastructure services. Mwaas is a category that encapsulates middleware services. These categories are predefined.

The following table describes the ServiceFamilyType Data Model
### Table 44-6  Service Family Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>

<td>Collection QuotaUsage</td>
<td>0..1</td>
<td>The collection of quota usages of the perspective family type of the authenticated user.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>quota_def</td>
<td>Json Object</td>
<td>0..1</td>
<td>The family type specific quota metadata information, this may include some permission information. The structure of this object would be documented in the perspective family type resource model.</td>
<td>12.1.0.5</td>
</tr>
</tbody>
</table>

#### 44.3.5 Service Instance Type [application/oracle.com.cloud.common.InstanceType+json]

A service instance type describes the common metadata about service instances of the type. This can be interpreted analogously as a Class where the service instance of the type is an instantiation of the class.

The following table describes the ServiceFamilyType Data Model.
Table 44-7  Service Instance Type

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>

<td>12.1.0.4</td>
</tr>
</tbody>
</table>

44.3.6 Metric [application/oracle.com.cloud.common.Metric+json]

This resource represents a time series data that may be performance or configuration related. For example, CPU utilization could be a metric for a VM resource, Tablespace usages could be a metric for a Database resource.

The following table describes the Metric Data Model.

Table 44-8  Metric Data Model

<table>

</table>

### 44.3.7 Service Instance [application/oracle.com.cloud.common.ServiceInstance+json]

A service instance describes the some common metadata about service instances. This is an abstract media type where the actual implementation would be provided by each XaaS service. It is expected that the extending resources respect GET request with this abstract media type.

The following table describes the Service Instance Data Model.

### Table 44-9  Service Instance Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>A GET against this URIrefreshes the client representation of the ServiceInstance definition to this user.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Name of the ServiceInstance.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>Human readable description of the Service Instance. Shall be a UNICODE string to support different languages.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>1</td>
<td>The resource state of the resource.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>1</td>
<td>The media type of the resource.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>metrics</td>
<td>Collection</td>
<td>0..1</td>
<td>Collection of metrics that are observed on the resource.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>
Table 44-9  (Cont.) Service Instance Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>1</td>
<td>The name of the ServiceFamilyType that this service instance is in context of.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>0..1</td>
<td>The status of the entity represented by the service instance. For example, for service instance VM, the value could be STARTED, STOPPED, or any other values that are appropriate for VM. Each extending resource should describe the enumeration of status that are applicable.</td>
<td>12.1.0.4</td>
</tr>
<tr>
<td>created</td>
<td>ISO 8601 Date</td>
<td>0..1</td>
<td>The date of which the service instance is created.</td>
<td>12.1.0.4</td>
</tr>
</tbody>
</table>

44.3.8 Quota Usage [application/oracle.com.cloud.common.QuotaUsage+json]

A quota usage describes the amount of some resource used by the authentication used in the context of a service family type. For example, in IaaS, there were quota defined for CPU, Memory, number of servers, where the usages of each is encapsulated into a Quota Usage resource.

The following table describes the Quota Usage Data Model.

Table 44-10  QuotaUsage Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>A GET against this URI refreshes the client representation of the QuotaUsage</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Name of the QuotaUsage.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>Human readable description of the Service Instance. Shall be a UNICODE string to support different languages.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>1</td>
<td>The media type of the resource.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>1</td>
<td>The identification representation of the resource.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>1</td>
<td>The service family type of the resource.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>used</td>
<td>Number</td>
<td>1</td>
<td>How much of the resource is used. The type is represented by the &quot;unit&quot; attribute.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>maxAllowed</td>
<td>Number</td>
<td>0..1</td>
<td>What is the maximum amount of resource that may be used by the authenticated user.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>unit</td>
<td>String</td>
<td>1</td>
<td>The unit of the resource.</td>
<td>12.1.0.5</td>
</tr>
</tbody>
</table>
44.3.9 Service Template Finds [application/oracle.com.cloud.common.ServiceTemplateFinds+json]

Service Template Finds is a resource that would search and filter service templates under the entire cloud given the search criteria. Each service family type shall document the scope of support (for example, list of filter attributes).

The following table describes the Service Template Finds Data Model.

Table 44-11  ServiceTemplateFinds Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>1</td>
<td>A GET against this URI refreshes the client representation of the Service TemplateFinds. If service templates were added/removed that matched the criteria, refreshing the link will reflect the changes.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>1</td>
<td>Name of the ServiceTemplateFinds.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>0..1</td>
<td>Human readable description of the Service Instance. Shall be a UNICODE string to support different languages.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>filters</td>
<td>Json Object</td>
<td>1</td>
<td>Map of key-value pair to indicate the filter criteria.</td>
<td>12.1.0.5</td>
</tr>
<tr>
<td>finds</td>
<td>Collection</td>
<td>1</td>
<td>Collection of entities (could be any subtype of the service template) that satisfies the filter criteria.</td>
<td>12.1.0.5</td>
</tr>
</tbody>
</table>

The following table describes the attributes supported in the filters:

Table 44-12  Filter Attributes

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>media_type</td>
<td>The specific service template media to search for. This will be an exact match of the media type.</td>
<td>12.1.0.5 Cloud Service Portal Plug-in (IaaS service family type only)</td>
</tr>
<tr>
<td>name</td>
<td>A service template will be returned if the name contains the specified string. This is case insensitive, so OEL and oel will return the same result.</td>
<td>12.1.0.5 Cloud Service Portal Plug-in (IaaS service family type only)</td>
</tr>
</tbody>
</table>

44.4 Cloud REST API Examples

The following sections provide examples of different interactions in Enterprise Manager Cloud Control 12.1.0.2 with the 12.1.0.5 Cloud Service Portal Plug-in. These examples illustrate the shape of the various resources. In this version, default x-specification-version is assumed at 10001.
44.4.1 Cloud Resource

Use the top level /em/cloud to introspect the Cloud resource. The following table describes the GET method features:

Table 44-13  Cloud Resource GET Method

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud">https://example.oracle.com/em/cloud</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI</td>
</tr>
<tr>
<td></td>
<td>=X-specification-Version: 10001</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

The following returns the Cloud resource:

```json
{
   "uri": "/em/cloud",
   "name": "Oracle Cloud by Enterprise Manager",
   "description": "This represents the Cloud resource of the Oracle Enterprise Manager Cloud Management solution",
   "resource_state": {
      "state": "READY"
   },
   "media_type": "application/oracle.com.cloud.common.Cloud+json",
   "zones": [
      {

"media_type" : "application/oracle.com.cloud.common.AssemblyTemplate+json" ,  
"service_family_type" : "iaas" ,  
"type" : "Assembly"  
}  
]
even though the Accept type was not specified, the Web service still unambiguously returns the Cloud resource because "/em/cloud" address uniquely identify the Cloud as the default resource to be returned.

The following table shows the Cloud resource picking up specific attributes
**Table 44-14**  Cloud Resource GET Method

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud?service_family_types.name">https://example.oracle.com/em/cloud?service_family_types.name</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

Here are the selective attributes:

```json
{
    "name": "Oracle Cloud by Enterprise Manager",
    "service_family_types": [
        {
            "uri": "/em/cloud/service_family_type/jaas",
            "name": "jaas",
            "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
            "type": "jaas"
        },
        {
            "uri": "/em/cloud/service_family_type/dbaas",
            "name": "dbaas",
            "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
            "type": "dbaas"
        },
        {
            "uri": "/em/cloud/service_family_type/opc",
            "name": "opc",
            "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
            "type": "opc"
        },
        {
            "uri": "/em/cloud/service_family_type/iaas",
            "name": "iaas",
            "media_type": "application/oracle.com.cloud.iaas.IaasServiceFamilyType+json",
            "type": "iaas"
        }
    ]
}
```

This feature is supported on all the common resources where only selective attributes would be gathered and returned to the client.

### 44.4.2 Service Family Type Resource

The following table shows the features of the Service Family Type resource:

---

**Chapter 44**

                "unit" : "COUNT"
            },
            {
                "name" : "Servers Quota",
                "description" : "Servers Quota",
                "maxAllowed" : "20",
                "unit" : "COUNT"
            }
        ]
    }
}
```
44.4.4 Service Instance Type Resource

This is the resource that describes the type of services that are provided by a particular Service Family Type.

Table 44-18  Service Instance Type Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/instance_type/vm%40iaas">https://example.oracle.com/em/cloud/instance_type/vm%40iaas</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

The following is the Service Instance Type resource:

```json
{
  "uri" : "/em/cloud/instance_type/vm%40iaas",
  "name" : "vm",

```
44.4.5 Zone Resource

The following table shows the features of the Zone resource:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/iaas/zone/D73AF0D42C8459E11419862797D1F37D">https://example.oracle.com/em/cloud/iaas/zone/D73AF0D42C8459E11419862797D1F37D</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

The following is the Zone resource, automatically cast to the application/oracle.com.cloud.iaas.Zone+json media type

```json
{
  "uri" : "/em/cloud/iaas/zone/D73AF0D42C8459E11419862797D1F37D" ,
  "name" : "cloud_zone" ,
  "resource_state" : 
    {
      "state" : "READY"
    } ,
  "context_id" : "D73AF0D42C8459E11419862797D1F37D" ,
  "media_type" : "application/oracle.com.cloud.iaas.Zone+json" ,
  "service_family_type" : "iaas" ,
  "type" : "VM_ZONE" ,
  "service_templates" : 
```
"media_type": "application/oracle.com.cloud.common.ServiceTemplate+json",
"total": "7",
"elements": [
  {
    "uri": "/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CDA817FAPF%3A0.1",

]
44.4.6 Service Template Resource

As can be seen from the previous examples, the elements in the collection shown all have "media_type" as an attribute to clearly indicate what its resource type is. The following table shows the features of the Service Template resource:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CD817FAF%3A0.1">https://example.oracle.com/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CD817FAF%3A0.1</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

This is the resource returned as the complete VMTemplate resource.

```json
{
  "uri": "/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CD817FAF%3A0.1",
  "name": "template_sanity",
  "description": "test template",
  "resource_state": {

    "type": "STRING",
    "defaultValue": "NO",
    "require": "false",
    "sensitive": "false"  
}
44.4.7 Metric Resource

A metric contains time series information and depending on the type of the metric, rollup information can also be retrieved. For example,

**Table 44-21  Service Template Resource**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD">https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

Here is the response from the web service:

```json
{
   "uri" : "/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD",
   "name" : "CPU_Utilization",
   "media_type" : "application/oracle.com.cloud.common.Metric+json",
   "resource_state" : {
      "state" : "READY"
   },
   "type" : "NUMBER",
   "current_value" : "52.53868103027344",
   "current_time" : "2012-08-22T01:28:14+0000",
   "time_range" : [
      "2012-08-22T01:18:14+0000",
      "2012-08-22T01:28:14+0000"
   ],
   "time_range_epoch" : [
      "1345598294965",
      "1345598894965"
   ],
   "rollup_unit" : "RAW"
}
```
"values": [
  {
    "time_utc": "2012-08-22T01:21:44+0000",
    "value": "52.53868103027344"
  }
],
"key": "iaas:vm:CPU_Utilization:523CAE80A305928C9C5BE8A67A4181FD"
}

The default time range is 10 minutes. To modify the time range, query parameters can be used to specify the time range. For example, the following would get the metric data for the last 50 minutes:

**Table 44-22 Service Template Resource**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD?time_range_epoch=1345595894965~1345598894965">https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD?time_range_epoch=1345595894965~1345598894965</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
<tr>
<td>Since</td>
<td>12.1.0.4 Cloud Service Portal Plug-in</td>
</tr>
</tbody>
</table>

The query parameter "time_range_epoch" contains 2 numbers separated by "~" to indicate FROM time and TO time, inclusive. Here is the response:

```json
{
  "uri": "/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD",
  "name": "CPU_Utilization",
  "media_type": "application/oracle.com.cloud.common.Metric+json",
  "resource_state": {
    "state": "READY"
  },
  "type": "NUMBER",
  "current_value": "52.53868103027344",
  "current_time": "2012-08-22T01:29:19+0000",
  "time_range": [
    "2012-08-22T00:38:14+0000",
    "2012-08-22T01:28:14+0000"
  ],
  "time_range_epoch": [
    "1345595894965",
    "1345598894965"
  ],
  "rollup_unit": "RAW",
  "values": [
    {
      "time_utc": "2012-08-22T01:21:44+0000",
      "value": "52.53868103027344"
    },
    {
      "time_utc": "2012-08-22T01:16:44+0000",
      "value": "52.53868103027344"
    }
  ]
}
```
Similarly, to specify a different rollup unit, the following interaction shows the HOURLY rollup for the last 7 hours:

Table 44-23 Service Template Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD?time_range_epoch=1345571178252~1345611178252&amp;rollup_unit=HOURLY">https://example.oracle.com/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD?time_range_epoch=1345571178252~1345611178252&amp;rollup_unit=HOURLY</a></td>
</tr>
</tbody>
</table>

Here is the response from the web service for the aggregated information:

```json
{
    "uri": "/em/cloud/metric/iaas%3Avm%3ACPU_Utilization%3A523CAE80A305928C9C5BE8A67A4181FD",

44.5 Service Request REST APIs

This section covers the following REST APIs for rescheduling and deleting DBaaS and MWaaS service requests.

Table 44-24  Supported Methods for Service Request

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameters</th>
<th>Request Payload</th>
<th>Response Payload</th>
<th>Canonical Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>

</tbody>
</table>

44.6 Service Request Collection

ServiceRequestCollection is a collection resource representing a Cloud Administrator’s view of all the accessible Service Request resources (which can be canceled or rescheduled). The following table describes the ServiceRequestCollection data model.

Table 44-25  ServiceRequestCollection Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Occurs</th>

EM CLI Verbs for Database as a Service Administrator

This chapter provides details on the Enterprise Manager Command Line Interface (EM CLI) verbs for Enterprise Manager Self Service Applications administration users for Database as a Service (DBaaS). For other EM CLI verbs related to cloud administration see Enterprise Manager Command Line Interface Guide.

The EM CLI enables you to access Enterprise Manager Cloud Control functionality from text-based consoles (shells and command windows) for a variety of operating systems. You can call Enterprise Manager functionality using custom scripts, such as SQL*Plus, OS shell, Perl, or Tcl, thus easily integrating Enterprise Manager Functionality with a company’s business process.

The following sections are covered in this chapter:

• PaaS Zone EM CLI Verbs
• Software Pool EM CLI Verbs
• Database Quota EM CLI Verbs
• Database Request Settings EM CLI Verbs
• Database Size EM CLI Verbs
• Database Profile EM CLI Verbs
  – About Database Provisioning Profile Types
  – Creating Provisioning Profiles using EM CLI
  – Sample EM CLI Property Files
  – Database Profile EM CLI Verbs
  – Creating a Database Profile Using EM CLI Verbs
  – Editing a Database Profile Using EM CLI Verbs
  – Deleting a Database Profile Using EM CLI Verbs
  – Viewing All the Database Profiles
  – Refreshing a Database Profile Using EM CLI Verbs
• Service Template EM CLI Verbs
• Service Template Executable .json Files
• Creating a Database Clone Using EM CLI Verbs
• Refreshing a Database Using EM CLI Verbs
• Deleting a Database Using EM CLI Verbs
• Deleting a Database Clone Using EM CLI Verbs
• Database Fleet Maintenance EM CLI Verbs
45.1 PaaS Zone EM CLI Verbs

The following table provides details of the supported verbs for the PaaS zone resource.
### Table 45-1  Paas Zone EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli create_paas_zone | Creates a PaaS infrastructure zone. | emcli create_paas_zone
- name - Name of the PaaS infrastructure zone to be created.
- credential - Global named credentials to be used for provisioning in this PaaS infrastructure zone.
- hosts - Comma separated list of the host targets to be added as members of this Paas infrastructure zone. PaaS infrastructure zone can contain either hosts or Oracle VM zones as members.
- ovm_zones - Comma separated list of the Oracle VM zone targets to be added as members of this Paas infrastructure zone.
- roles - Comma separated list of SSA roles that can access this PaaS infrastructure zone.
- description - Description of the PaaS infrastructure zone.
- cpu_utilization - This placement policy constraint allows the cloud administrator to set maximum thresholds for any host. Value entered must be between 1 and 100. If not provided, the default value is taken to be 80 percent. This parameter is not needed if Oracle VM zone targets are added as members.
- memory_utilization - This is a placement policy constraint for the PaaS infrastructure zone. The value entered must be between 1 and 100. If it is not provided, the default value is taken to be 80 percent. This parameter is not needed if Oracle VM zone targets are added as members. | emcli create_paas_zone
- name=<Name of PaaS zone>
- credential=<Global Named Credential>
- [hosts=<Host1,Host2,Host3...>]
- ovm_zones=<OVMZone1,OVMZone2,OVMZone3...>
- roles=<SsaRole1,SsaRole2,...>
- description=<Description of PaaS zone>
- [cpu_utilization=<Value between 1 and 100>]
- [memory_utilization=<Value between 1 and 100>] |

Example:

emcli create_paas_zone
- name=MyPaaSZone
- credential=AIME__N
- hosts=xyxy.example.com
- roles="SSA_USER_ROLE1"
- description="Test PaaS zone"
- cpu_utilization=90
- memory_utilization=90

**Sample Output:**
PaaS Infrastructure Zone "MyPaaSZone" created successfully.
### Table 45-1  (Cont.) Paas Zone EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| `emcli update_paas_zone` | Updates a PaaS infrastructure zone. | `emcli update_paas_zone`<br>- name - Name of the existing PaaS infrastructure zone.<br>- credential - Global named credentials to be updated.<br>- add_hosts - Comma separated list of the host targets to be added as members of the Paas infrastructure zone. The hosts to be added should not have been added to other existing PaaS zones.<br>- remove_hosts - Comma separated list of the host targets to be removed from the Paas infrastructure zone.<br>- add_ovm_zones - Comma separated list of the Oracle VM zone targets to be added as members of the Paas infrastructure zone. The Oracle VM zones to be added should not have been added to other existing PaaS zones.<br>- remove_ovm_zones - Comma separated list of the Oracle VM zone targets to be removed from the Paas infrastructure zone.<br>- add_roles - Comma separated list of SSA roles to be added that can access the PaaS infrastructure zone.<br>- remove_roles - Comma separated list of SSA roles to be removed from the PaaS infrastructure zone.<br>- description - Updated description of the PaaS infrastructure zone.<br>- cpu_utilization - This placement policy constraint allows the cloud administrator to set maximum thresholds for any host. The value entered must be between 1 and 100.<br>- memory_utilization - This placement policy constraint is for the memory utilization of the PaaS infrastructure zone. The value entered must be between 1 and 100. | `emcli update_paas_zone`<br>- name=<Name of PaaS zone>  
[-description=<Description of PaaS zone>]  
[-credential=<Global Named Credential>]  
[-add_hosts=<Host1,Host2,Host3 ...>]  
[-remove_hosts=<Host4,Host5...>]  
[-add_ovm_zones=<OVMZone1,OVMZone2,OVMZone3...>]  
[-remove_ovm_zones=<OVMZone4,OVMZone5...>]  
[-add_roles=<SsaRole1,SsaRole2,...>]  
[-remove_roles=<SsaRole3,SsaRole4,...>]  
[-cpu_utilization=<Value between 1 and 100>]  
[-memory_utilization=<Value between 1 and 100>] |

**Example:**

```shell
emcli update_paas_zone
- name=MyPaaSZone  
- credential=AIME_N  
- add_hosts=xyxy.example.com  
- remove_hosts=xxy.example.com  
- add_roles="SSA_USER_ROLE1"  
- remove_roles="SSA_USER_ROLE2"  
- description="Test PaaS zone"  
- cpu_utilization=90  
- memory_utilization=90
```

**Sample Output:**

PaaS Infrastructure Zone "MyPaaSZone" updated successfully.
Table 45-1  (Cont.) Paas Zone EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli delete_paas_zone | Deletes a PaaS infrastructure zone. The PaaS infrastructure zone cannot be deleted if there is an existing Software pool associated with it.  
• name - Name of the existing PaaS infrastructure zone to be deleted.  
Example:  
emcli delete_paas_zone  
- name=MyPaaSZone  
Sample Output:  
PaaS Infrastructure Zone "MyPaaSZone" deleted successfully | emcli delete_paas_zone  
- name=<Name of PaaS zone>                                                                                                                 |
| emcli get_paas_zone_detail | Retrieves the PaaS infrastructure zone details.  
• name - Details of the existing PaaS infrastructure zone, such as Name, Description, Named Credentials, Number of Hosts, Roles, Maximum Memory Allocation (%), and Maximum CPU Utilization (%).  
Example:  
emcli get_paas_zone_detail  
- name=MyPaaSZone  
Sample Output:  
Name MyPaaSZone  
Description TEST zone  
Named Credentials AIME_N  
Number of Hosts 1  
Roles SSA_USER_ROLE1  
Maximum Memory Allocation (%) 90  
Maximum CPU Utilization (%) 90 | emcli get_paas_zone_detail  
- name=<Name of PaaS zone>                                                                                                                 |

45.2 Software Pool EM CLI Verbs

The following table provides details of the supported verbs for the Software pool resource.
Table 45-2  Software Pool EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli create_pool</td>
<td>Creates a database, schema, or pluggable database pool.</td>
<td>emcli create_pool</td>
</tr>
<tr>
<td></td>
<td>• name - Name of the Software pool to be created.</td>
<td>-name=&lt;Name of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• target_type - Target type of the Software pool to be created.</td>
<td>-target_type=&lt;Target type of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• paas_zone - Name of PaaS infrastructure zone in which the Software pool</td>
<td>-paas_zone=&lt;PaaS Infrastructure Zone of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>is to be created.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• members - Comma separated list of targets to be added as members of the</td>
<td>-members=&lt;Member1, Member2...&gt;</td>
</tr>
<tr>
<td></td>
<td>Software pool.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• description - Description of the Software pool.</td>
<td>-description=&lt;Description of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• placement_constraints - Comma separated key value pairs of the placement</td>
<td>[-placement_constraints=&lt;constraint1=value1, constraint2=value2...&gt;]</td>
</tr>
<tr>
<td></td>
<td>constraints that allow the self service administrator to set maximum</td>
<td></td>
</tr>
<tr>
<td></td>
<td>ceilings for resource utilization. This provides protection for the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>members of the database pool in terms of resource consumption. Use the</td>
<td></td>
</tr>
<tr>
<td></td>
<td>get_pool_allowed_placement_constraints verb to get the available</td>
<td></td>
</tr>
<tr>
<td></td>
<td>placement constraints for a pool target type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• member_constraints - Comma separated key value pairs that restricts</td>
<td>[-member_constraints=&lt;constraint1=value1, constraint2=value2&gt;]</td>
</tr>
<tr>
<td></td>
<td>the addition of member targets to a software pool with a set criteria.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Use to the get_pool_allowed_member_constraints verb to get the available</td>
<td></td>
</tr>
<tr>
<td></td>
<td>placement constraints and their possible values for a pool target type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• properties - Comma separated key value pairs for additional properties</td>
<td>[-properties=&lt;property1=value1, property2=value2&gt;]</td>
</tr>
<tr>
<td></td>
<td>that need to be specified based on the software pool target type.</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

- To procure the GUID run the following command:
  
  ```bash
  emcli get_procedures
  [-type={procedure type}]
  ```

  **Sample command:**
  
  ```bash
  emcli get_procedures -type=DBPROV
  ```

- Root credentials are optional. They are required if you want to use the pool for snap cloned database requests.
- Grid Infrastructure credentials are optional. They are required if you are creating only a RAC database.
- ASM credentials are optional. They are required if you want to use the database pool for live cloning of a database using ASM.
- An existing pool with similar configuration can be associated to the new database pool as a standby pool. To do so use the standby_pools property. To associate multiple pools the pool names should be separated using the pipe symbol.

**Examples:**

- Database pool -
  
  ```bash
  emcli create_pool
  -name=MyDbPool
  ```
Table 45-2  (Cont.) Software Pool EM CLI Verbs

<table>
<thead>
<tr>

</tr>
<tr>
<td></td>
<td></td>
<td>cdb_credential_guid=DBA449B8967AAF77E040F00A73B11F55&quot;</td>
</tr>
</tbody>
</table>

**Sample Output:**

Software Pool "MySchemaPool" created successfully
Table 45-2  (Cont.) Software Pool EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli update_pool</td>
<td>Updates a database, schema, or pluggable database pool (whichever specified).</td>
<td>emcli update_pool - name=&lt;Name of Software Pool&gt; -target_type=&lt;Target type of Software Pool&gt; [-description=&lt;Description of Software Pool&gt;] [-add_members=&lt;Member1, Member2...&gt;] [-remove_members=&lt;Member4, Member5...&gt;] [-placement_constraints=&lt;constraint1=value1,constraint2=value2...&gt;] [-properties=&lt;property1=value1, property2=value2&gt;]</td>
</tr>
</tbody>
</table>

- **name** - Name of the existing Software pool.
- **target_type** - Target type of the existing Software pool. For example: mwaas_zone for middleware pool, oracle_cloud_zone for database pool, and schaas_pool for schema pool.
- **description** - Description of the Software pool.
- **add_members** - Comma separated list of targets to be added as members of the Software pool. The targets to be added must satisfy the member constraints of the Software pool.
- **remove_members** - Member targets to be removed from the Software pool.
- **placement_constraints** - Comma separated key value pairs of the placement constraints that allow the self service administrator to set maximum ceilings for resource utilization. This provides protection for the members of the Software pool in terms of resource consumption.
- **properties** - Comma separated key value pairs for properties that need to be updated based on the Software pool target type.

Examples:

- **Database pool** -
  
  emcli update_pool
  -name=MyDbPool
  -target_type=oracle_cloud_zone
  -paas_zone=MyPaaSZone
  -add_members=
    OraDb11g_home1_1_slc03qtn
  -remove_members=
    OraDb11g_home1_2_slc01mdr
  -description="Test Database Pool"
  -placement_constraints="MAX_INSTANCES=7"
  -properties="*host_credential_guid=DBA449B8967AAF77E040F00A73B11F55, root_credential_guid=DBA449B8967AAF77E040F00A73B11F55"

  **Sample Output:**
  Software Pool "MyDbPool" updated successfully.

- **Schema pool** -
  
  emcli update_pool
  -name= MySchemaPool
  -target_type= schaas_pool
  -add_members=
    simple.us.example.com
  -remove_members=
    Simple1.us.example.com
Table 45-2  (Cont.) Software Pool EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>-description=&quot;Test Database Pool&quot;</td>
<td>-placement_constraints=</td>
<td>&quot;MAX_SERVICES=17, USE_WORKLOAD=false, MAX_CPU_USAGE=90, MAX_MEMORY_USAGE=90, ENFORCE_CPU=false&quot;</td>
</tr>
</tbody>
</table>

**Sample Output:**
Software Pool "MySchemaPool" updated successfully.

- **Pluggable database pool** -

  emcli update_pool
  -name= MyPdbPool
  -target_type= pdbaas_pool
  -paas_zone=MyPaaSZone
  -add_members=database
  -remove_members=database
  -description="Test PDB Pool"
  -placement_constraints=
    "MAX_PDB_SERVICES=7, PDBS_USE_WORKLOAD=true, MAX_CPU_USAGE_BY_PDBS=90, 
    MAX_MEMORY_USAGE_BY_PDBS=90, PDBS_ENFORCE_CPU=true"
  -properties=
    "host_credential_guid=DBA449B8967AAF77E040F00A73B11F55,
    gi_credential_guid=DBA449B8967AAF77E040F00A73B11F55,
    cdb_credential_guid=DBA449B8967AAF77E040F00A73B11F55"

**Sample Output:**
Software Pool "MyPdbPool" updated successfully.

45.3 Database Quota EM CLI Verbs

The following table provides details of the supported verbs for Database quota.
Table 45-3  Database Quota Em CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli create_dbaas_quota | Creates database quota for a EM_SSA_USER role. | emcli create_dbaas_quota  
- role_name="<Name of SSA User Role>"  
- databases="<Number of Database Requests>"  
- schema_services="<Number of Schema Service Requests>"  
- pluggable_databases="<Number of Pluggable Database Service Requests>"  
- memory="<Memory(GB)>"  
- storage="<Storage(GB)>" |
|  |  |  |
|  | role_name: Name of SSA user Role for which quota is to be created |  |
|  | databases: Number of database service requests allowed. |  |
|  | schema_services: Number of schema service requests allowed. |  |
|  | pluggable_databases: Number of pluggable database requests allowed. |  |
|  | memory: Amount of memory usage allowed. |  |
|  | storage: Amount of storage usage allowed. |  |

Example

emcli create_dbaas_quota  
- role_name="My Role"  
- databases="10"  
- schema_services="10"  
- pluggable_databases="10"  
- memory="99"  
- storage="99"

Sample Output
Quota for "MyRole" setup successfully.
Table 45-3  (Cont.) Database Quota Em CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli update_dbaas_quota | Updates the database quota for the SSA user role.                           | emcli update_dbaas_quota  
 |                          | • role_name - Name of the SSA user role for which quota is to be updated.   | -role_name="<Name of SSA User Role>"                                    |
|                          | • databases - Number of database service requests allowed.                   | -databases="<Number of Database Requests>"                              |
|                          | • schema_services - Number of schema service requests allowed.              | -schema_services="<Number of Schema Service Requests>"                 |
|                          | • pluggable_databases - Number of PDB service requests allowed.             | -pluggable_databases="<Number of Pluggable Database Service Requests>" |
|                          | • memory - Amount of memory usage allowed.                                  | -memory="<Memory(GB)>"                                                 |
|                          | • storage - Amount of storage space usage allowed.                          | -storage="<Storage(GB)>"                                               |

Example

emcli update_dbaas_quota
  -role_name="My Role"
  -databases="10"
  -schema_services="10"
  -pluggable_databases="10"
  -memory="99"
  -storage="99"

Sample Output
Quota for "My Role" updated successfully.

<table>

45.5 Database Size EM CLI Verbs

The table below lists the supported verbs for Database size resource.

Table 45-5  Database Size EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli create_database_size</td>
<td>Specify one or more attributes that make up this database size. The different attributes are separated by a semicolon (;). Attributes specified in the database size override values specified in the service template</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• name- Create a name for the size.</td>
<td>emcli create_database_size -name=&quot;&lt;Size name&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>• description - Create a description for the size.</td>
<td>-description=&quot;&lt;Size description&gt;&quot;</td>
</tr>
<tr>
<td></td>
<td>• attributes - The different attributes are separated by a semicolon (;). Users can specify values for the following attributes:</td>
<td>[-attributes=&quot;cpu:&lt;number of cores&gt;;memory:&lt;memory in GB&gt;;processes:&lt;max number of processes&gt;;storage:&lt;Total Storage in GB allocated to database&gt;;&quot;]</td>
</tr>
<tr>
<td></td>
<td>– cpu: Total number of CPU cores.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>– memory: Total maximum memory in GB.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>– processes: Total number of processes that can simultaneously connect to Oracle.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>– storage: Total storage that is allocated to Oracle (in GB).</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>emcli create_database_size -name=Small -description=&quot;Small size database&quot; -attributes=&quot;cpu:4;storage:50;memory:4&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Sample Output:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Database size 'Small' has been successfully created.</td>
<td></td>
</tr>
<tr>
<td>Verb</td>
<td>Description</td>
<td>Format</td>
</tr>
<tr>
<td>-------------------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>-------------------------------------------------------------------------</td>
</tr>
</tbody>
</table>
| emcli update_database_size | Specify one or more attributes that have to be modified. The different attributes are separated by a semicolon (;). If you want to remove an attribute from the database size definition, specify 'remove' against that attribute.  
- **name** - Name of the existing database.  
- **description** - Updates the description of the existing size.  
- **attributes** - The different attributes are separated by a semicolon (;). Users can specify values for the following attributes:  
  - **cpu** - Total number of CPU cores.  
  - **memory** - Total maximum memory in GB.  
  - **processes** - Total number of processes that can simultaneously connect to Oracle.  
  - **storage** - Total storage that is allocated to Oracle (in GB).  
  Example:  
  ```
  emcli update_database_size -name=Small -description="Small size database" -attributes="cpu:4;storage:50;memory:4"
  ```  
  **Sample Output:**  
  Database size 'Small' has been successfully updated.  | emcli update_database_size  
  `-name="<Existing size name>"  
  `-description="<Size description>"  
  [-attributes="cpu:<number of cores>;memory:<memory in GB>;processes:<max number of processes>;storage:<Total storage in GB allocated to database>;"] |
| emcli delete_database_size | Deletes database size.  
- **name** - Name of the existing database.  
  Example:  
  ```
  emcli delete_database_size -name=small
  ```  
  **Sample Output:**  
  Database size 'Small' has been successfully deleted.  | emcli delete_database_size  
  `-name="<Existing size name>" |
### 45.6 Database Profile EM CLI Verbs

This section explains the different database provisioning profiles used for Database as a Service. It also explains how these profiles can be created using the EM CLI verbs. The following topics are covered:

- About Database Provisioning Profile Types
- Creating Provisioning Profiles using EM CLI
- Creating a Database Profile Using EM CLI Verbs
- Editing a Database Profile Using EM CLI Verbs
- Deleting a Database Profile Using EM CLI Verbs
- Viewing All the Database Profiles
- Refreshing a Database Profile Using EM CLI Verbs

#### 45.6.1 About Database Provisioning Profile Types

Given below are the four types of Database provisioning profiles used in Database as a Service and Schema as a Service:

- DBCA Template
- RMAN
- Snapclone
- Schema
45.6.1.1 DBCA Template

The DBCA template supports both structure plus data and structure only types. This database provisioning profile is created from the production or source database registered with Enterprise Manager.

Note:
Structure and data requires a shutdown of the database. It should be used for very small databases (< 50GB).

45.6.1.2 RMAN

This data content of this database provisioning profile comprises the RMAN backup pieces. Any of the following methods can be used to create the RMAN profile:

• Hot RMAN backup - This option is enabled only when the archive log mode on the source database is turned ON.
• Cold RMAN backup - In this case, the source database is brought down to take the RMAN backup.
• Existing backup - This option can be used when the RMAN backup is already taken on the source and you want to use one of the existing RMAN backups to create a profile.
• Existing backup pieces when there is no access to the source database - Create profile source database using existing backup pieces when there is no access to the source database. This option can be used when the RMAN backup is already taken on the source and kept in a known location. This option is only supported using EM CLI verbs.

45.6.1.3 Snapclone

The data content of this database provisioning profile is derived from Snapshot information on the filer (NetApp or SunZFS filer) of all the volumes where the datafiles for the source database are residing.

45.6.1.4 Schema

The data content of this database provisioning profile is compiled from an export dump created using the Data pump tool. You can choose to export Schema objects (structure only) or the Schema with data (structure and data).

Note that you cannot export empty schemas or include Oracle schemas (these schemas are not available for selection). Schemas that are filtered out are listed below:
Table 45-6  Filtered Out Schema

<td>MTSSYS</td>
<td>OUTLN</td>
<td>TRACESRV</td>
<td></td>
</tr>
</tbody>
</table>

45.6.2 Creating Provisioning Profiles using EM CLI

This method allows the administrators or cloud provisioning operators to create the database provisioning profile using EM CLI verbs. The following is the syntax of the verb:

```
emcli create_dbprofile -input_file=data:<Prop file name>
```

For the verb description and options see Table 45-13.

For the steps to be followed to create a database profile, see Creating a Database Profile Using EM CLI Verbs.

This command takes in a property file that completely describes the type of profile that will be created and the options used. For property files of different database provisioning profiles, see Sample EM CLI Property Files.

45.6.3 Sample EM CLI Property Files

The following sections provide sample EMCLI property files for the database provisioning profiles:

- DBCA Template
- New RMAN Backup from the Source Database
- Existing RMAN Backup from the Source Database
- Existing RMAN Backup on the Stage Location
- Snapclone Database
- Schema Database

45.6.4 Database Profile EM CLI Verbs

The table below provides the verbs related to database profile.
### Table 45-13  Database Profile EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>emcli create_dbprofile</code></td>
<td>Creates a new database profile. Options:</td>
<td><code>emcli create_dbprofile</code></td>
</tr>
<tr>
<td></td>
<td>- <code>input_file</code> - A property file which completely describes the type of profile that will be created and the options used. Enter <code>emcli help describe_dbprofile_input</code> for help with populating values for the property file. For property file details see <a href="#">Sample EM CLI Property Files</a>.</td>
<td><code>-input_file=data:&quot;absolute file path&quot;</code></td>
</tr>
<tr>
<td></td>
<td>- <code>schedule</code></td>
<td>`-schedule= [frequency:interval</td>
</tr>
<tr>
<td></td>
<td>- <code>purge_policy</code> - Purges the collected data based on number of days or count of snapshots. If it is not specified, the default is NONE. Allowed values are DAYS, and SNAPSHOTS.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- DAYS specifies the number of days after which the data component should be purged.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>- SNAPSHOT specifies the count or number of data components, after which the older data will be purged.</td>
<td></td>
</tr>
</tbody>
</table>

**Example**

```sh
eemcli create_dbprofile -input_file="data:/tmp/profile.txt" -schedule="frequency:interval;start_time:14-10-05 05:30;end_time:14-10-12 05:23;repeat:30;grace_period:60;tz:America/New_York" -purge_policy=DAYS:2
```
Table 45-13  (Cont.) Database Profile EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>

### Table 45-13  (Cont.) Database Profile EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| **emcli refresh_dbprofile** | Refreshes the database profile.  
Options:  
- **-comp_loc** - Indicates the database profile component location in the software library.  
Example:  
emcli refresh_dbprofile -comp_loc="Database Provisioning Profiles/11.2.0.4.0/linux_x64/Database xyxy.example.com Profile102" | emcli refresh_dbprofile -comp_loc="Database Profile component location in software library" |
| **emcli delete_database** | Deletes the database.  
Options:  
- **-input_file** - Indicates the file containing properties required for deleting a database. For details, see [Deleting a Database Using EM CLI Verbs](#).  
Example:  
emcli delete_database -input_file=data:/u01/files/delete_clone.props  
The properties file contains the following:  

- **DB_TARGET_GUID**=TARGET GUID for database to be deleted  
- **HOST_CREDS**=Name of EM Credential:EM User  
- **HOST_NAME**=Host Name Database Resides on  
- **ORACLE_BASE**=Database to be removed Base  
- **ORACLE_HOME**=Database to be removed Home  
- **DBNAME**=Database Name  
- **DB_SID**=Database SID, Not Service Name  
- **DB_TARGET_NAME**=Target name of Database in EM | emcli delete_database -input_file=data:”File containing properties required for deleting a database” |
Table 45-13  (Cont.) Database Profile EM CLI Verbs

<tbody>
<tr>
<td>emcli delete_oracle_database &lt;command&gt;</td>
<td>Deletes the single instance database based on the &lt;command&gt; entered.</td>
<td>emcli delete_oracle_database &lt;command&gt;: software [-listeners]-all [-input_file=data:”File containing properties required for deleting a clone”] [-schedule=[frequency:interval</td>
</tr>
<tr>
<td>Command:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• software - deletes the Single Instance database home.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• listeners - deletes or de-configures listeners running from the Oracle home.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• all - deletes the instances, listeners and the software home.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Options:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• input_file - Indicates the file containing properties required for deleting a database.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• [-schedule] - Indicates the schedule for cleanup:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– frequency - Frequency type with which the Oracle Database will be removed. It can be interval (in minutes), weekly, monthly or yearly</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– start_time - Denotes the starting time of Cleanup Oracle Database in the format yy-MM-dd HH:mm</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– end_time - Denotes the end time of Cleanup Oracle Database in the format yy-MM-dd HH:mm</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– repeat - Repetition rate at Cleanup Oracle Database. If the frequency is interval, then repeat will be in minutes</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– months - Number of months after which repetition of Cleanup Oracle Database occurs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– days - Number of days after which repetition of Cleanup Oracle Database occurs</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– tz - Time Zone ID for example tz:America/New_York</td>
<td></td>
<td></td>
</tr>
</tbody>
</table>

Example:
emcli delete_oracle_database -all -input_file=data:u01/loc/del_db.props

The properties file contains the following:

ORACLE_HOME_TARGET_LIST= Oracle Home Target Name in Enterprise Manager
ORACLE_HOME_NORMAL_CRED_NAME= Oracle Home credential name in the format <cred name>:<cred owner>
ORACLE_HOME_ROOT_CRED_NAME= Oracle Home root credentials in the format <cred name>:<cred owner>
TMP_DIR_LOC= Temporary Working Directory
<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli delete_oracle_restart <command> | De-configures and deletes the Oracle Restart (SIHA and instances) based on the <command> entered. | emcli delete_oracle_database <command>:
- instance |-software|-all
- [-input_file=data:"File containing properties required for deleting a clone"]
- [-schedule=[frequency:interval|daily|weekly|monthly|yearly];
- start_time:yy-MM-dd HH:mm;
- end_time:yy-MM-dd HH:mm;
- [repeat:=m];
- [months:#,#,#,...];
- [days:#,#,#,...];
- [tz:{java timezone ID}];
- [grace_period:xxx]; |

Commands:
- instance - de-configures the Oracle Restart (SIHA) instance only.
- software - deletes the empty Oracle Restart (SIHA) home.
- all - de-configures and deletes Oracle Restart (SIHA) home.

Options:
- input_file - Indicates the file containing properties required for deleting a database.
- [-schedule] - Indicates the schedule for cleanup and restart:
  - frequency - Frequency type with which the Oracle Database will be removed. It can be interval (in minutes), weekly, monthly or yearly.
  - start_time - Denotes the starting time of Cleanup Oracle Database in the format yy-MM-dd HH:mm.
  - end_time - Denotes the end time of Cleanup Oracle Database in the format yy-MM-dd HH:mm.
  - repeat - Repetition rate at Cleanup Oracle Database. If the frequency is interval, then repeat will be in minutes.
  - months - Number of months after which repetition of Cleanup Oracle Database occurs.
  - days - Number of days after which repetition of Cleanup Oracle Database occurs.
  - tz - Time Zone ID for example tz:America/New_York.

Example:
```bash
emcli delete_oracle_restart -all -
input_file=data:u01/loc/del_siha.props
```

The properties file contains the following:
```
ORACLE_HOME_TARGET_LIST=Oracle Home Target Name in Enterprise Manager
ORACLE_HOME_NORMAL_CRED_NAME= Oracle Home credential name in the format <cred name>:<cred owner>
ORACLE_HOME_ROOT_CRED_NAME= Oracle Home root credentials in the format <cred name>:<cred owner>
TMP_DIR_LOC= Temporary Working Directory
```

</table>

**Note:**

• To know the input file parameters that need to be set/provided, enter the command, `emcli db_clone_management -deleteDatabase -print_properties`

• The delete database verb uses the Named credentials that is set in the software pool and not the Preferred credentials.
45.6.5 Creating a Database Profile Using EM CLI Verbs

This section describes the procedure to create a database profile, RMAN backup, RMAN image backup or a Snapshot backup using EM CLI verbs.

**Note:**

The procedure to create a RMAN backup, RMAN image backup or Snapshot database is the same as the procedure to be followed to create a database profile. However, the only difference is in the property file used for the different flavours.

**Figure 45-1  Creating a Database Profile Using EM CLI Verbs**

1. Create the template properties file from a procedure definition.
2. Enter values for the variables and the target lists in the properties file.
3. Submit the EM CLI verb to create the DB profile using the properties file.
4. Verify the progress and the status of the DB profile creation.
Follow the steps below to create a database profile:

1. Create a template properties file from a procedure definition.

To create a template properties file follow the steps below:

a. Retrieve the GUID or the name of the procedure. Run the following command to retrieve these.

   ```bash
   emcli get_procedures [-type={procedure type}]
   
   Sample command:
   emcli get_procedures -type=DBPROV
   
   Sample output:
<table>
<thead>
<tr>
<th>GUID</th>
<th>Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0A15E9DC285B2EF5E053E87BF00A6701</td>
<td>DBPROV</td>
<td>CLOUD_DEPLOYSOFTWARE_NAME</td>
</tr>
<tr>
<td>Software Life Cycle Management Procedure</td>
<td>14.52</td>
<td>ORACLE</td>
</tr>
<tr>
<td>0A15E9DC20712EF5E053E87BF00A6701</td>
<td>DBPROV</td>
<td>CLEANUP_DB_PROC</td>
</tr>
<tr>
<td>Cleanup Mass Database</td>
<td>13.0</td>
<td>ORACLE</td>
</tr>
<tr>
<td>0A15E9DC205C2EF5E053E87BF00A6701</td>
<td>DBPROV</td>
<td>DBREPLAYCLIENTDP_NG</td>
</tr>
<tr>
<td>Provision Oracle Database Client</td>
<td>14.0</td>
<td>ORACLE</td>
</tr>
<tr>
<td>0A15E9DC204E2EF5E053E87BF00A6701</td>
<td>DBPROV</td>
<td>SINA_SIDB_PROC</td>
</tr>
<tr>
<td>Provision Oracle Database</td>
<td>14.0</td>
<td>ORACLE</td>
</tr>
<tr>
<td></td>
<td></td>
<td></td>
</tr>
</tbody>
</table>
   
   b. Input the GUID or the name as an input value in the following command to generate a template properties file.

   ```bash
   emcli describe_procedure_input
   [-procedure={procedure GUID}]
   [-name={procedure name or procedure configuration}]
   [-owner={owner of the procedure or procedure configuration}]
   [-parent_proc={procedure of the procedure configuration. This only applies to describe a procedure configuration with the same name}]
   
   Sample command:
   emcli describe_procedure_input -
   procedure=0A15E9DC204E2EF5E053E87BF00A6701> /tmp/snapprofile.txt
   
2. Enter new values in the properties file.

Use an editor to edit the properties file. Enter the desired values for the variables and save the properties file.

For different flavours of database profile see the following:

- To create a new database profile with data and structure configure the mandatory parameters, and required optional parameter (DATA_CONTENT=METADATA_AND_DATA) in the Table 45-14.
- To create a new database profile with data only configure the mandatory parameters, and required optional parameter (DATA_CONTENT=DATA) in the Table 45-14.
- To create an RMAN backup, see Table 45-15.
- To create an RMAN image backup see Table 45-16.
- To create an snapshot database, configure the mandatory parameters along with the REF_NODE_SELECTED, DATA_CONTENT, REF_HOST_CREDENTIALS, REF_DB_CREDENTIALS, PROFILE_VERSION, and PROFILE_VENDOR parameters in Table 45-15.

3. Execute the following EM CLI verb to create a database profile, using the updated properties file as the input file.

```bash
emcli create_dbprofile
   -input_file=data:"file:path"
   [-schedule=
      [frequency:interval|daily|weekly|monthly|yearly];
      start_time:yy-MM-dd HH:mm;
      end_time:yy-MM-dd HH:mm;
      [repeat:#m];
      [months:#,#,#,...];
      [days:#,#,#,...];
      [tz:{java timezone ID}];
      [grace_period:xxx];
      [-purge_policy=days|snapshots: number]

Samples:
emcli create_dbprofile -input_file=data:"/tmp/snapprofile.txt" -schedule="start_time:14-06-23 01:00;frequency:yearly;end_time:14-05-28 01:00;days:1,3,8,7,10;months:1,3,9,11,1" -purge_policy="SNAPSHOTS:1"

emcli create_dbprofile -input_file=data:"/tmp/snapprofile.txt" -schedule="start_time:14-05-28 01:00;frequency:monthly;end_time:14-05-28 01:00;days:1,3,8,7" -purge_policy="DAYS:1"

emcli create_dbprofile -input_file=data:"/tmp/snapprofile.txt" -
45.6.6 Editing a Database Profile Using EM CLI Verbs

This section describes the procedure to edit a database profile using EM CLI verbs.
Follow the steps below to edit a database profile:

1. Identify the location of the database profile in the software library.

   Execute the following command to locate the database profile.

   ```
   emcli list_dbprofiles
   [-details]
   
   Sample command:
   emcli list_dbprofiles
   
   Sample output:
   Name=Profile_snap,Location=Database Provisioning Profiles/11.2.0.4.0/linux_x64/
   Name=Profile_rman,Location=Database Provisioning Profiles/11.2.0.4.0/linux_x64/
   ```

2. Edit the database profile with the following command, using the obtained location.

   ```
   emcli edit_dbprofile
   -comp_loc="Database Profile component location in software library"
   [-schedule=](
   [frequency:interval] daily | weekly | monthly | yearly);
   start_time:yy-MM-dd HH:mm;
   end_time:yy-MM-dd HH:mm;
   [repeat:#m];
   [months:#,#,...];
   [days:#,#,...];
   [tz:{java timezone ID}];
   ```
Sample command:
emcli edit_dbprofile -comp_loc="Database Provisioning Profiles/11.2.0.4.0/linux_x64/Profile_snap" -schedule="start_time:14-07-22 03:00;frequency:interval;end_time:14-07-22 23:00;repeat:30" -purge_policy="DAYS:1"

Sample output:
The Create Database Profile deployment procedure with new schedule and purge policy has been submitted successfully with the instance name: 'CreateDatabaseProfile_SYSMAN_07_22_2014_03_00_PM' and execution_guid= '0AE6096550756B26E0539878B10A6FF5'
You can track the status of profile creation using the following command:
emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -showJobOutput

3. Verify the status of the database profile edit by executing the following EM CLI verb.

emcli get_instance_status
[-instance={instance guid}]
[-exe=execution guid]
[-xml]
[-details]
[-showJobOutput]
[-tailLength={last N characters}]

Sample:
emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5

Sample output:
0AE6096550716B26E0539878B10A6FF5, PROFILE, CreateDatabaseProfile_SYSMAN_07_22_2014_03_00_PM, Running

To know the complete status of each of the steps in xml format, execute the following command.

emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -showJobOutput

45.6.7 Deleting a Database Profile Using EM CLI Verbs

This section describes the procedure to delete a database profile using EM CLI verbs.
Follow the steps below to delete a database profile:

1. Identify the location and version of the database profile component in the software library.

   Execute the following command to locate the database profile.

   ```
   emcli list_dbprofiles
   [-details]
   ```

   **Sample command:**
   ```
   emcli list_dbprofiles
   ```

   **Sample output:**
   ```
   Name=Profile_snap,Location=Database Provisioning Profiles/11.2.0.4.0/linux_x64/,Type=STORAGE_SNAPSHOT,Status=Ready,Description= Database Reference Profile 05-11-2014 12:40 PM from database.mycompany.com
   Version: STORAGE_SNAPSHOT_05_11_2014_12_40_PM,contains=STORAGE_SNAPSHOT(s),removalOverdue=0,sourceDatabaseName=database.mycompany.com.

   Name=Profile_rman,Location=Database Provisioning Profiles/11.2.0.4.0/linux_x64/,Type=RMAN,Status=Ready,Description=Database Reference Profile 04-11-2014 12:40 PM from database.mycompany.com
   Version: RMAN_04_11_2014_12_40_PM,contains=RMAN(s),removalOverdue=0,sourceDatabaseName=database.mycompany.com.
   ```
2. Delete the database profile with the following command, using the obtained location and version.

```bash
guide delete_dbprofile
   -comp_loc="Database Profile component location in software library"
   [-version="Database Profile component version name"]
```

**Sample command:**
```bash
guide delete_dbprofile -comp_loc="Database Provisioning Profiles/11.2.0.4.0/
linux_x64/Profile_snap"
```
```bash
guide delete_dbprofile -comp_loc="Database Provisioning Profiles/11.2.0.4.0/
linux_x64/Profile_snap" -version="STORAGE_SNAPSHOT__05_11_2014_12_40_PM"
```

**Sample output:**
Delete Database Profile deployment procedure has been submitted successfully
with the instance name :©DeleteDatabaseProfile_SYSMAN_07_22_2014_03_00_PM© and
execution_guid=©0AE6096550756B26E0539878B10A6FF5©
You can track the status of profile creation using the following command:
```bash
guide get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -
showJobOutput
```

3. Verify the status of the database profile deletion by executing the following EM CLI verb.

```bash
guide get_instance_status
   [-instance={instance guid}]
   [-exe=execution guid]
   [-xml]
   [-details]
   [-showJobOutput]
   [-tailLength={last N characters}]}
```

**Sample:**
```bash
guide get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5
```

**Sample output:**
0AE6096550716B26E0539878B10A6FF5, PROFILE,
DeleteDatabaseProfile_SYSMAN_07_22_2014_03_00_PM, COMPLETED
To know the complete status of each of the steps in xml format, execute the
following command.
```bash
guide get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -
showJobOutput
```

45.6.8 Viewing All the Database Profiles

Execute the following command to view all the database profiles with their details.

```bash
guide list_dbprofiles
   [-details]
```

**Sample command:**
```bash
guide list_dbprofiles
```

**Sample output:**
```
Name=Profile_snap,Location=Database Provisioning Profiles/11.2.0.4.0/
linux_x64/,Type=STORAGE_SNAPSHOT,Status=Ready,Description= Database Reference
Profile 05-11-2014 12:40 PM from database.mycompany.com
Version: STORAGE
```
45.6.9 Refreshing a Database Profile Using EM CLI Verbs

This section describes the procedure to refresh a database profile using EM CLI verbs.

**Figure 45-4  Refreshing a Database Profile Using EM CLI Verbs**

Follow the steps below to refresh a database profile:

1. Identify the location of the database profile component in the software library.

   Execute the following command to locate the database profile.

   ```
   emcli list_dbprofiles
   [-details]
   ```

   **Sample command:**
   
   ```
   emcli list_dbprofiles
   ```

   **Sample output:**
2. Refresh the database profile with the following command, using the obtained location.

```bash
emcli refresh_dbprofile
   -comp_loc="Database Profile component location in software library"
```

**Sample command:**

```bash
emcli refresh_dbprofile -comp_loc="Database Provisioning Profiles/11.2.0.4.0/ linux_x64/ Profile_snap"
```

**Sample output:**

A Refresh Single Profile procedure has been submitted successfully with the instance name: "RefreshSingleProfile_SYSMAN_07_22_2014_03_00_PM" and execution_guid= "0AE6096550756B26E0539878B10A6FF5"

You can track the status of profile creation using the following command:

```bash
tail -f emcli.log
emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -showJobOutput
```

3. Verify the status of the database profile refresh by executing the following EM CLI verb.

```bash
emcli get_instance_status
   [-instance={instance guid}]
   [-exe=execution guid]
   [-xml]
   [-details]
   [-showJobOutput]
   [-tailLength={last N characters}]]
```

**Sample:**

```bash
emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5
```

**Sample output:**

```
0AE6096550716B26E0539878B10A6FF5, PROFILE,
RefreshSingleProfile_SYSMAN_07_22_2014_03_00_PM, Running
```

To know the complete status of each of the steps in xml format, execute the following command.

```bash
emcli get_instance_status -exe=0AE6096550756B26E0539878B10A6FF5 -xml -details -showJobOutput
```

### 45.7 Service Template EM CLI Verbs

The table below lists the supported verbs for Service Template resource.

The .json file content samples are provided in [Service Template Executable .json Files](#)
### Table 45-17  Service Template EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli create_service_template</td>
<td>Creates a database, schema, or pluggable database service template. The input_file should be a JSON based metadata file which should have the necessary configuration for the specific service template creation. Samples of the JSON service executable metadata files are available at Service Template Executable .json Files. Examples:</td>
<td><code>emcli create_service_template</code>&lt;br&gt;-name=&quot;&lt;Name of Service Template&gt;&quot;&lt;br&gt;-service_family=&quot;&lt;Service family for which the Service Template is being created&gt;&quot;&lt;br&gt;-service_type=&quot;&lt;Service type for which the Service Template is being created&gt;&quot;&lt;br&gt;-pool_target_type=&quot;Target type of Software Pools to be associated with the Service Template&quot;&lt;br&gt;-software_pools=&quot;&lt;SwPool1,SwPool2,SwPool3,...&gt;&quot;&lt;br&gt;-roles=&quot;&lt;SsaRole1,SsaRole2,...&gt;&quot;&lt;br&gt;-description=&quot;&lt;Description of Service Template&gt;&quot;&lt;br&gt;-input_file=&quot;data:&lt;Name of Service executable MetaData File&gt;&quot;</td>
</tr>
<tr>
<td>• Database service template-</td>
<td></td>
<td><code>emcli create_service_template</code>&lt;br&gt;-name=&quot;Database service template&quot;&lt;br&gt;-service_family=&quot;DBAAS&quot;&lt;br&gt;-service_type=&quot;DB&quot;&lt;br&gt;-pool_target_type=&quot;oracle_cloud_zone&quot;&lt;br&gt;-software_pools=&quot;MyPoolOH&quot;&lt;br&gt;-roles=&quot;SSA_USER_ROLE&quot;&lt;br&gt;-description=&quot;Database small instance service template.&quot;&lt;br&gt;-input_file=&quot;data:executable.json&quot;</td>

Note:

In the JSON body mentioned above:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id. The ID is provided at the end of the output. For example, in the output shown below, oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1 is the ID.

```
Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1
```

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in About Cloud Resources.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate `serviceType:DB` in the JSON response. Note the `serviceTemplateTypeId` under `serviceType:DB` and use the value in the POST body shown above.

- REF_ZONE indicates the reference zone among the zones to be associated with the template.

- REF_POOL indicates the reference pool among the pools to be associated with the template.

- REF_HOST indicates the host of the reference target from the pool targets.

- REF_TGT indicates the reference target from the pool targets.

- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as `SELECT_ORACLE_HOME_AT_RUNTIME`, or to be selected by the SSA user by entering the value as `SELECT_ORACLE_HOME_FROM_REQUEST`.

These parameters are mandatory and are required to identify the reference target to create the database.

]
]
### Note:

In the JSON body mentioned above:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

- To derive the REF_ZONE to be associated with the Service template, execute a GET request.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in [Viewing Details of the Software Pools Resource](#).

- To derive the `serviceTemplateTypeId` value, perform a GET operation on the URI `-em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate `serviceType:DB` in the JSON response. Note the `serviceTemplateTypeId` under `serviceType:DB` and use the value in the POST body shown above.

- REF_ZONE indicates the reference zone among the zones to be associated with the template.

- REF_POOL indicates the reference pool among the pools to be associated with the template.

- REF_HOST indicates the host of the reference target from the pool targets.

- REF_TGT indicates the reference target from the pool targets.

- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as `SELECT_ORACLE_HOME_AT_RUNTIME`, or to be selected by the SSA user by entering the value as `SELECT_ORACLE_HOME_FROM_REQUEST`.

These parameters are mandatory and are required to identify the reference target to create the database.

45.8.5 RMAN Based RAC One Node Database Service Template .json File

Note:

In the JSON body mentioned above:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

```
Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1
```

- To derive the REF_ZONE to be associated with the Service template, execute a GET request.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the `serviceTemplateTypeId` value, perform a GET operation on the URI - `em/websvcs/restful/xtws/cloudservices/admin/cfw/v2/servicetemplates/templateetypes` and locate `serviceType:DB` in the JSON response. Note the `serviceTemplateTypeId` under `serviceType:DB` and use the value in the POST body shown above.

- REF_ZONE indicates the reference zone among the zones to be associated with the template.

- REF_POOL indicates the reference pool among the pools to be associated with the template.

- REF_HOST indicates the host of the reference target from the pool targets.

- REF_TGT indicates the reference target from the pool targets.

- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as `SELECT_ORACLE_HOME_AT_RUNTIME`, or to be selected by the SSA user by entering the value as `SELECT_ORACLE_HOME_FROM_REQUEST`.

These parameters are mandatory and are required to identify the reference target to create the database.

}
{"name": "DNFS.USE_OFA",
"value": "N"
}
{"name": "COMMON_DOMAIN_NAME",
"value": "us.example.com"}
Note:

In the JSON body mentioned above:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

- To derive the REF_ZONE to be associated with the Service template, execute a GET request.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate `serviceType:DB` in the JSON response. Note the `serviceTemplateTypeId` under `serviceType:DB` and use the value in the POST body shown above.

- REF_ZONE indicates the reference zone among the zones to be associated with the template.

- REF_POOL indicates the reference pool among the pools to be associated with the template.

- REF_HOST indicates the host of the reference target from the pool targets.

- REF_TGT indicates the reference target from the pool targets.

- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as `SELECT_ORACLE_HOME_AT_RUNTIME`, or to be selected by the SSA user by entering the value as `SELECT_ORACLE_HOME_FROM_REQUEST`. These parameters are mandatory and are required to identify the reference target to create the database.

```

```
Note:

In the JSON body mentioned above:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

- Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_ZONE to be associated with the Service template, execute a GET request.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templateatypes` and locate `serviceType:DB` in the JSON response. Note the `serviceTemplateTypeId` under `serviceType:DB` and use the value in the POST body shown above.

- REF_ZONE indicates the reference zone among the zones to be associated with the template.

- REF_POOL indicates the reference pool among the pools to be associated with the template.

- REF_HOST indicates the host of the reference target from the pool targets.

- REF_TGT indicates the reference target from the pool targets.

- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as `SELECT_ORACLE_HOME_AT_RUNTIME`, or to be selected by the SSA user by entering the value as `SELECT_ORACLE_HOME_FROM_REQUEST`.

These parameters are mandatory and are required to identify the reference target to create the database.

---

**Note:**

- To get the software library ID of the "PDBAAS_CUSTOM_PRE_SCRIPTS_URN" and "PDBAAS_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

  Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_DATA_ZONE to be associated with the Service template, execute a GET request.

- To derive the ID of the Software Pool that needs to be entered as "poolIds", execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate "serviceType":"DB" in the JSON response. Note the serviceTemplateTypeId under "serviceType":"DB" and use the value in the POST body shown above.

- In the table above, the SELECT_TARGET_OPTION parameter defines if the SSA User has the option to select the Container Database (CDB) while requesting for a PDB. If the value for the parameter is set as SELECT_TARGET_FROM_REQUEST, then the SSA User has the option to choose the CDB. If no value is defined, or if the value is set to SELECT_TARGET_AT_RUNTIME, then the placement algorithm selects the CDB.
45.8.13 RAC Pluggable Database Using an Empty Pluggable Database Service Template .json File

Note:

• To get the software library ID of the "PDBAAS_CUSTOM_PRE_SCRIPTS_URN" and "PDBAAS_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

• To derive the REF_DATA_ZONE to be associated with the Service template, execute a GET request.

• To derive the ID of the Software Pool that needs to be entered as "poolIds", execute a GET request as shown in Viewing Details of the Software Pools Resource.

• To derive the `serviceTemplateTypeId` value, perform a GET operation on the URI `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate "serviceType":"DB" in the JSON response. Note the `serviceTemplateTypeId` under "serviceType":"DB" and use the value in the POST body shown above.

• In the table above, the `SELECT_TARGET_OPTION` parameter defines if the SSA User has the option to select the Container Database (CDB) while requesting for a PDB. If the value for the parameter is set as `SELECT_TARGET_FROM_REQUEST`, then the SSA User has the option to choose the CDB. If no value is defined, or if the value is set to `SELECT_TARGET_AT_RUNTIME`, then the placement algorithm selects the CDB.

        }
    ]
}
```
45.9 Creating a Database Clone Using EM CLI Verbs

This section describes the procedure to create a database clone using EM CLI verbs.

*Note:*

The procedure to create a Test master database is the same as the procedure to be followed to create a database clone. However, the only difference is in the property file parameters used to create the clone when compared to the property file parameters for Test master database.
Follow the steps below to create a database clone or a Test master database:

1. Create a template properties file from a procedure definition.

There are two approaches for creating a template properties file. Follow either method 1 or method 2 (given below).

- **Method 1: Using Enterprise Manager UI to create a clone of a database and generate the properties file from it**

  To create a template properties file follow the steps below:

  a. Create a database clone via the Enterprise Manager UI.

  Note down the **Deployment Procedure Instance Name** while creating the clone.
For example, Deployment Procedure Instance Name = CloneDatabase_SYSMAN_12_24_2014_15_58_PM.

**b. Use the instance name in the following command to generate a template properties file.**

```
emcli get_instance_data
[-instance={instance_guid}]
[-exec={execution_guid}]
[-name={execution name}]
[-owner={execution owner}]
```

**Sample:**

```
emcli get_instance_data -name='CloneDatabase_SYSMAN_12_24_2014_15_58_PM'
-owners='SYSMAN' > /tmp/create_clone.props
```

### Method 2: Generating the properties file using EM CLI verbs

To create a template properties file using EM CLI verbs, follow the steps below:

**a.** Retrieve the GUID or the name of the procedure. Run the following command to retrieve these.

```
emcli get_procedures
[-type={procedure type}]
```

**Sample command:**

```
emcli get_procedures -type=DBConfig
```

**Sample output:**

<table>
<thead>
<tr>
<th>GUID</th>
<th>Type</th>
<th>Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>0A15E9DC20772EF5E053E87BF00A6701</td>
<td>DBConfig</td>
<td>db_clone_eb_procedure</td>
</tr>
<tr>
<td>0A15E9DC20A12EF5E053E87BF00A6701</td>
<td>DBConfig</td>
<td>db_config_procedure</td>
</tr>
<tr>
<td>0A15E9DC20422EF5E053E87BF00A6701</td>
<td>DBConfig</td>
<td>config_db_create_procedure</td>
</tr>
</tbody>
</table>

**b.** Input the GUID or the name as an input value in the following command to generate a template properties file.

```
emcli describe_procedure_input
[-procedure={procedure GUID}]
[-name={procedure name or procedure configuration}]
[-owner={owner of the procedure or procedure configuration}]
[-parent_proc={procedure of the procedure configuration. This only applies to describe a procedure configuration with the same name}]
```

**Sample command:**

```
emcli describe_procedure_input
-procedure=0A15E9DC20A12EF5E053E87BF00A6701 > /tmp/create_clone.props
```

2. **Enter new values in the properties file.**

   Use an editor to edit the properties file. Enter the desired values for the variables and save the properties file.

The table below shows the properties file parameters used to create a database clone. To see the properties file parameters for creating a Test master database, see Table 45-19.
Note:

To see the list of required and optional variables in the properties file, enter the command `emcli db_clone_management <command> -print_properties`. Where, `<command>` can be one of the following: `-createFullClone`, `-createTestMaster`, `-createCloneDB`, `-createSnapClone`, `-createSnapshotClone`, or `-cloneToCloud`.

<td>Is the same as Database storage type.</td>
</tr>
</tbody>
</table>

3. Execute one of the following EM CLI verbs to create a database clone (or Test master), using the updated properties file as the input file:

- For a full database clone: `emcli db_clone_management -createFullClone -input_file="path to the cloning properties file"
- For a DNFS profile based database clone: `emcli db_clone_management -createCloneDB -input_file="path to the cloning properties file"
- For a database snap clone: `emcli db_clone_management -createSnapClone -input_file="path to the cloning properties file"
- For a database snapshot clone: `emcli db_clone_management -createSnapshotClone -input_file="path to the cloning properties file"`
For a database clone on to the cloud - `emcli db_clone_management -cloneToCloud -input_file="path to the cloning properties file"

For creating a Test Master database - `emcli db_clone_management -createTestMaster -input_file="path to the cloning properties file"

**Samples:**

```
emcli db_clone_management -createFullClone -inputFile=/tmp/create_clone.props
emcli db_clone_management -createCloneDB -input_file=/tmp/create_clone.props
emcli db_clone_management -createSnapClone -inputFile=/tmp/create_clone.props
emcli db_clone_management -createSnapshotClone -input_file=/tmp/
create_clone.props
emcli db_clone_management -cloneToCloud -inputFile=/tmp/create_clone.props
emcli db_clone_management -createTestMaster -inputFile=/tmp/create_clone.props
```

**Sample output:**

```
Submitting clone database procedure... 0AF491A8D9FE29F2E0539878B10A6333
Deployment procedure submitted successfully
```

4. **Verify the status of the database clone creation by executing the following EM CLI verb.**

```
emcli get_instance_status [-instance={instance guid}] [-exe=execution guid] [-xml] [-details] [-showJobOutput] [-tailLength={last N characters}]]
```

**Sample:**

```
emcli get_instance_status -instance=0AF491A8D9FE29F2E0539878B10A6333
```

**Sample output:**

```
0AF491A8DA0529F2E0539878B10A6333, DBConfig, db_config_procedure 1419435633924, COMPLETED
```

To know the complete status of each of the steps in xml format, execute the following command.

```
emcli get_instance_status -instance=0AF491A8D9FE29F2E0539878B10A6333 -xml -details -showJobOutput
```

### 45.10 Refreshing a Database Using EM CLI Verbs

This section describes the procedure to refresh a database using EM CLI verbs.
Follow the steps below to refresh a database:

1. Refresh the database by executing the `emcli db_clone_management -refreshDatabase` command mentioned below.

The EM CLI command requires a properties file as an input. The properties file details are mentioned in the table below.

Note: To see the list of required and optional variables in the properties file, enter the command `emcli db_clone_management -refreshDatabase -print_properties`.

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory Parameters</td>
<td>DB_TEMPLATE_STAGE=/tmp</td>
<td>Staging area used to store files transferred from source host.</td>
</tr>
<tr>
<td>COMMON_DB_SYSTEM_PASSWORD=come</td>
<td>COMMON_DB_SYSTEM_PASSWORD=come</td>
<td>Password to be set for SYSTEM user.</td>
</tr>
<tr>
<td>COMMON_DB_DBSNMP_PASSWORD=come</td>
<td>COMMON_DB_DBSNMP_PASSWORD=come</td>
<td>Password to be set for DBSNMP user.</td>
</tr>
<tr>
<td>COMMON_DB_SYS_PASSWORD</td>
<td>COMMON_DB_SYS_PASSWORD=come</td>
<td>Password to be set for SYS user.</td>
</tr>
<tr>
<td>ASMSYSPWD</td>
<td>ASMSYSPWD=come</td>
<td>ASM SYS password to login to ASM. This parameter is only applicable if database files are on ASM. Otherwise, it is not required.</td>
</tr>
</tbody>
</table>
Table 45-20  (Cont.) Sample Properties File for Refreshing a Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLONE_TYPE</td>
<td>CLONE_TYPE=RMAN_P</td>
<td>Type of clone.</td>
</tr>
<tr>
<td>TARGET_TYPE</td>
<td>TARGET_TYPE=rac_dat</td>
<td>Type of target. Accepted values are oracle_database or rac_database.</td>
</tr>
<tr>
<td>TARGET_NAME</td>
<td>TARGET_NAME=database1</td>
<td>Name of the target.</td>
</tr>
<tr>
<td>ORACLE_HOME</td>
<td>ORACLE_HOME_LOC=</td>
<td>Location of Oracle home.</td>
</tr>
<tr>
<td>SRC_SYS_PWD</td>
<td>SRC_SYS_PWD=Come</td>
<td>Source SYS password.</td>
</tr>
<tr>
<td>SRC_SID</td>
<td>SRC_SID=orcl</td>
<td>Source database SID.</td>
</tr>
</tbody>
</table>

emcli db_clone_management -refreshDatabase
   -input_file=data:"file:path"

Sample:
emcli db_clone_management -refreshDatabase -input_file=data:"/tmp/refr.txt"

Output:
Refresh Database deployment procedure has been submitted successfully with the instance name:"RefreshDatabase_SYSMAN_06_23_2014_01_00_PM" and execution_guid='0AE6096550756B26E0539878B10A6FF5'

To know the status of the procedure in xml format, execute the following command.

e/cli get_instance_status -exec=0AE6096550756B26E0539878B10A6FF5 -xml -details -showJobOutput

2. Verify the status of the database refresh by executing the following EM CLI verb.

emcli get_instance_status
   [-instance={instance guid}]
   [-exe=execution guid]
   [-xml]
   [-details]
   [-showJobOutput]
   [-tailLength={last N characters}]

Sample:
emcli get_instance_status -exe=0AFDFE7D36525B18E0539878B10A39FB

Sample output:
0AFDFE7D36525B18E0539878B10A39FB, DBPROV, RefreshDatabase_SYSMAN_06_23_2014_01_00_PM, COMPLETED

To know the complete status of each of the steps in xml format, execute the following command.

emcli get_instance_status
   -exe=0AF491A8D9FE29F2E0539878B10A6333
   -xml -details -showJobOutput
45.11 Deleting a Database Using EM CLI Verbs

This section describes the procedure to delete a database using EM CLI verbs.

Follow the steps below to delete a database:

1. Delete the database with the `emcli delete_database` command mentioned below.
   
   The EM CLI command requires a properties file as an input. The properties file details are mentioned in the table below.

Table 45-21 Sample Properties File for Deleting a Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST_CREDS</td>
<td>HOST_CREDS=sys:come,</td>
<td>Credentials of the host in <code>&lt;Credentials name&gt;:&lt;Credentials owner&gt;</code> format.</td>
</tr>
<tr>
<td>DB_TARGET_GUID</td>
<td>DB_TARGET_GUID=083B2D3F9B911BD3E0539B78B10A3096</td>
<td>GUID of the target database.</td>
</tr>
<tr>
<td>DATABASE_TYPE</td>
<td>DATABASE_TYPE=dbTypeSI,</td>
<td>Type of database. Permissible values are either dbTypeSI or dbTypeRAC.</td>
</tr>
<tr>
<td>DB_ORACLE_HOME_LOC</td>
<td>DB_ORACLE_HOME_LOC=/u01/oracle/product/dbhome,</td>
<td>Location of Oracle home.</td>
</tr>
<tr>
<td>DB_TARGET_NAME</td>
<td>DB_TARGET_NAME=m2.xyz.com,</td>
<td>Name of the target database.</td>
</tr>
</tbody>
</table>
### Table 45-21 (Cont.) Sample Properties File for Deleting a Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DB_SID</td>
<td>DB_SID=clem</td>
<td>Database SID. In case of a RAC database provide the same value as provided for DB_TARGET_NAME.</td>
</tr>
<tr>
<td>HOST_NAME</td>
<td>HOST_NAME=abc.example.com,</td>
<td>Name of the host in case of a SI database. In case of a RAC database enter the Cluster database target host name. To retrieve it, use the EM repository query (select host_name from mgmt$target where target_name='MyDB.example.com' and target_type='rac_database').</td>
</tr>
<tr>
<td>ORACLE_BASE</td>
<td>ORACLE_BASE=/u01/ap/oracle</td>
<td>Oracle base location.</td>
</tr>
<tr>
<td>DBNAME</td>
<td>DBNAME=clem</td>
<td>Database name in case of SI database. In case of a RAC database enter the Cluster database target 'DBName' Target property. To retrieve this property use the EM repository query (select property_value from mgmt$target_properties where target_name='MyDB.example.com' and target_type='rac_database' and property_name='DBName')</td>
</tr>
</tbody>
</table>

**Optional Parameters**

| ROOT_CREDS   | ROOT_CREDS=ABDCGA45268SDF | Privileged credentials GUID. This parameter is required if the target database is snapshot based and mounted on a volume. |

**emcli delete_database**

-input_file=data:"Path of file containing properties required for deleting a database"

**Sample:**

emcli delete_database -input_file=data:/u01/files/delete_clone.props

**Output:**

Submitting delete database procedure...
0AFDFE7D36525B18E0539878B10A39FB
Deployment procedure submitted successfully

**Note:**

The delete database verb uses the Named credentials that is set in the software pool and not the Preferred credentials.

2. Verify the status of the database deletion by executing the following EM CLI verb.

emcli get_instance_status
[-instance={instance guid}]
[-exe=execution guid]
[-xml]
[-details]
[-showJobOutput]
[-tailLength=\{last N characters\}]}

Sample:
emcli get_instance_status -instance=0AFDF7D36525B18E0539878B10A39FB

Output:
0AFDF7D36555B18E0539878B10A39FB, DBPROV, DB_CLEANUP_PROC 1419457116034, COMPLETED

To know the complete status of each of the steps in xml format, execute the following command.
emcli get_instance_status -instance=0AF491A8D9FE29F2E0539878B10A6333 -xml -details -showJobOutput

45.12 Deleting a Database Clone Using EM CLI Verbs

This section describes the procedure to delete a database clone using EM CLI verbs.

Follow the steps below to delete a database clone:

1. Delete the database clone with the emcli db_clone_management -deleteDatabase command mentioned below.

   The EM CLI command requires a properties file as an input. The properties file details are mentioned in the table below.
### Table 45-22  Sample Properties File for Deleting a Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Mandatory Parameters</strong></td>
<td></td>
<td></td>
</tr>
<tr>
<td>HOST_CREDS</td>
<td>HOST_CREDS=sys:com:e,</td>
<td>Credentials of the host in &lt;Credentials name&gt;:&lt;Credentials owner&gt; format.</td>
</tr>
<tr>
<td>DB_TARGET_GUID</td>
<td>DB_TARGET_GUID=083B2D3F9B911BD3E0539878B10A3096</td>
<td>GUID of the target database. Select the Target_GUID from mgmt$target, where target_name='MyDB.example.com' and target_type='rac_database'</td>
</tr>
<tr>
<td>DATABASE_TYPE</td>
<td>DATABASE_TYPE=dbTypeSI,</td>
<td>Type of database. Permissible values are either dbTypeSI or dbTypeRAC.</td>
</tr>
<tr>
<td>DB_ORACLE_HOME_LOC</td>
<td>DB_ORACLE_HOME_LOC=/u01/oracle/product/dbhome,</td>
<td>Location of Oracle home.</td>
</tr>
<tr>
<td>DB_TARGET_NAME</td>
<td>DB_TARGET_NAME=m2.xyz.com,</td>
<td>Name of the target database.</td>
</tr>
<tr>
<td>DB_SID</td>
<td>DB_SID=clem</td>
<td>Database SID. In case of a RAC database provide the same value as provided for DB_TARGET_NAME.</td>
</tr>
<tr>
<td>HOST_NAME</td>
<td>HOST_NAME=abc.example.com,</td>
<td>Name of the host in case of a SI database. In case of a RAC database enter the Cluster database target host name. To retrieve it, use the EM repository query (select host_name from mgmt$target where target_name='MyDB.example.com' and target_type='rac_database').</td>
</tr>
<tr>
<td>ORACLE_BASE</td>
<td>ORACLE_BASE=/u01/app/oracle</td>
<td>Oracle base location.</td>
</tr>
<tr>
<td>DBNAME</td>
<td>DBNAME=clem</td>
<td>Database name in case of SI database. In case of a RAC database enter the Cluster database target 'DBName' Target property. To retrieve this property use the EM repository query (select property_value from mgmt$target_properties where target_name='MyDB.example.com' and target_type='rac_database' and property_name='DBName').</td>
</tr>
</tbody>
</table>
Table 45-22 (Cont.) Sample Properties File for Deleting a Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Optional Parameters</td>
<td></td>
<td></td>
</tr>
<tr>
<td>ROOT_CRED   S</td>
<td>ROOT_CRED=ABDCG A45268SDF</td>
<td>Privileged credentials GUID. This parameter is required if the target</td>
</tr>
<tr>
<td></td>
<td></td>
<td>database is snapshot based and mounted on a volume.</td>
</tr>
</tbody>
</table>

emcli db_clone_management -deleteDatabase -input_file=data:"Path of file containing properties required for deleting a clone"

**Sample:**
emcli db_clone_management -deleteDatabase -input_file=data:u01/files/delete_clone.props

**Output:**
Submitting delete database procedure...
0AFDFE7D36525B18E0539878B10A39FB
Deployment procedure submitted successfully

**Note:**
The delete database verb uses the Named credentials that is set in the software pool and not the Preferred credentials.

2. Verify the status of the database clone deletion by executing the following EM CLI verb.

eincl get_instance_status
[-instance={instance guid}]
[-exe=execution guid]
[-xml]
[-details]
[-showJobOutput]
[-tailLength={last N characters}]

**Sample:**
emcli get_instance_status -instance=0AFDFE7D36525B18E0539878B10A39FB

**Output:**
0AFDFE7D36555B18E0539878B10A39FB, DBPROV, DB_CLEANUP_PROC 1419457116034, COMPLETED

To know the complete status of each of the steps in xml format, execute the following command.

eincl get_instance_status -instance=0AF491A8D9FE29F2E0539878B10A6333 -xml -details -showJobOutput

45.13 Database Fleet Maintenance EM CLI Verbs

The following table provides details of the verbs supported for Database fleet maintenance.
**Note:**

The EM CLI verb options mentioned in square brackets - [] are optional.
Table 45-23  Database Software Maintenance EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli db_software_maintenance - createSoftwareImage</td>
<td>Creates a new software image provided in the oracle home. The createSoftwareImage verb takes either data (a .txt file) or getInputVariableList from the command line.</td>
<td></td>
</tr>
<tr>
<td>• input_file- Path of the input file.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• getInputVariableList - Provides the list of variables to be specified in the input file.</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Examples:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• To get the list of all the parameters to be passed inside the data file, run the following command:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>emcli db_software_maintenance - createSoftwareImage - getInputVariableList=true</td>
<td></td>
<td></td>
</tr>
<tr>
<td>• To create a new image and a version, use the following example:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>emcli createSoftwareImage - input_file=&quot;data:&quot;/home/user/input_rac&quot;</td>
<td></td>
<td></td>
</tr>
<tr>
<td>Where the contents of the input_rac file are:</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– IMAGE_NAME=DbGoldImage</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– IMAGE_DESCRIPTION=Gold Image for 11g db</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– REF_TARGET_NAME=ORACLE_HOME</td>
<td></td>
<td></td>
</tr>
<tr>
<td>– IMAGE_SWLIB_LOC=Oracle Home Provisioning</td>
<td></td>

<td></td>
<td></td>
</tr>
</tbody>
</table>

emcli db_software_maintenance -createVersion

Creates a new version in an existing image using an existing software library component.

- version_name - Name of the version.
- image_id - Name of the image.
- external_id - External ID of the version. For example, the URN of the software library gold image.
- status - Status of the version. For example, DRAFT, ACTIVE, CURRENT, or RESTRICTED.

Example:

emcli db_software_maintenance -subscribeTarget

Creates a new or modifies the existing target subscription.

- target_name - Name of the target.
- target_type - Target type.
- [parent_target_name] - Parent target name.
- [parent_target_type] - Parent target type.
- image_id - Name of the image.
- version_id - Name of the version

Example:
emcli db_software_maintenance -subscribeTarget -target_name="POOL NAME" -target_type=oracle_cloud_zone -image_id=FE55AD7AB28974EFE04313B2F00AD4A0

emcli db_software_maintenance -createVersion -version_name="Version1" -image_id="xxx" -external_id="yyy" -status="CURRENT"
<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli db_software_maintenance - updateVersionStatus | Updates version of the image.  
• version_id - Id of the version.  
• status - Status of the version. For example, DRAFT, ACTIVE, CURRENT, or RESTRICTED. | emcli db_software_maintenance -updateVersionStatus  
-version_id="xxx"  
-status="CURRENT"
Example:  
emcli db_software_maintenance -updateVersionStatus -version_id=02A635A0D8D904A4E05362F3E40ADFD8 -status=CURRENT |
| emcli db_software_maintenance - getImageSubscriptions | Returns the list of subscribed targets.  
• image_id - Name of the image. | emcli db_software_maintenance -getImageSubscriptions  
-image_id="xxx"
Example:  
emcli db_software_maintenance -getImageSubscriptions -image_id="01B5F14FD57D7B89E05313B2F00A739g" |
| emcli db_software_maintenance - deleteImage | Deletes an image.  
• image_id - Name of the image to be deleted.  
• [force] - Deletes forcibly even if the image has subscribed targets. | emcli db_software_maintenance -deleteImage  
-image_id="xxxx"
Example:  
emcli db_software_maintenance -deleteImage -image_id="01B5F14FD57D7B89E05313B2F00A739g" |
| emcli db_software_maintenance - unsubscribeTarget | Unsubscribes the target.  
• target_name - Name of the target.  
• target_type - Target type.  
• image_id - Name of the image. | emcli db_software_maintenance -unsubscribeTarget  
-target_name="xxx"  
-target_type=yyy  
-image_id=zzz
Example:  
emcli db_software_maintenance -unsubscribeTarget -target_name="POOL NAME" -target_type=oracle_cloud_zone -image_id=FE55A7D7A28974EFE04313B2F00AD4A0 |
### Table 45-23  (Cont.) Database Software Maintenance EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| `emcli db_software_maintenance -searchImage` | Searches the image based on the provided filters. Use '%' for wildcard.  
  • `[name_pattern]` - Indicates the name pattern.  
  • `[version_pattern]` - Indicates the version pattern.  
  • `[description_pattern]` - Indicates the version pattern.  
  • `[owner]` - Indicates the owner name.  
  • `[target_type]` - Indicates the target type.  
  • `[platform_id]` - Indicates the platform ID. For example, 226 for Linux x86_64.  
  Examples:  
  • `emcli db_software_maintenance -searchImage -name_pattern="%GI%"`  
  • `emcli db_software_maintenance -searchImage -platform_id="226"` | `emcli db_software_maintenance -searchImage -platform_id="xxx" -[name_pattern= "name_pattern"] -[version_pattern= "version_pattern"] -[description_pattern= "description_pattern"] -[owner= "owner"] -[target_type= "target_type"] -[platform_id= "platform_id"]` |
| `emcli db_software_maintenance -getTargetSubscriptions` | Returns the list of subscriptions for the given target.  
  • `target_name` - Name of the target.  
  • `target_type` - Target type.  
  • `image_type` - Type of the image.  
  Example:  
  `emcli db_software_maintenance -getTargetSubscriptions -target_name="POOL NAME" -target_type="oracle_cloud_zone"` | `emcli db_software_maintenance -getTargetSubscriptions -target_name="xxxx" -target_type="yyyy" -image_type="zzzz"` |
| `emcli db_software_maintenance -getVersions` | Returns the list of the versions for the given image.  
  • `image_id` - Name of the image.  
  • `[version_status]` - Status filter for the version.  
  Example:  
  `emcli db_software_maintenance -getVersions image_id="01B5F14FD57D7B89E05313B2F00A739F" -version_status=CURRENT` | `emcli db_software_maintenance -getVersions -image_id="xxxx" -version_status=CURRENT` |
| `emcli db_software_maintenance -getImages` | Returns the list of image present in the system.  
  Example:  
  `emcli db_software_maintenance -getImages` | `emcli db_software_maintenance -getImages` |
### Table 45-23 (Cont.) Database Software Maintenance EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli db_software_maintenance - getSubscriptionsForContainer | Return the subscriptions for the container target such as the database pool.  
- image_id - Name of the image.  
- target_name - Name of the target.  
- target_type - Target type in EM.  
Example:  
`emcli db_software_maintenance -getSubscriptionsForContainer -target_name="POOL NAME" -target_type=oracle_cloud_zone -image_id=FE55AD7AB28974EFE04313B2F00AD4A0` | `emcli db_software_maintenance -getSubscriptionsForContainer -target_name="xxxx" -target_type="yyyy" -image_id="zzzz"` |
| emcli db_cloud_maintenance - activateSoftware | Activates a new software of the pool.  
- pool_name - Name of the pool.  
- pool_type - Type of the pool.  
- [force] - Forcibly activates the new members.  
Example:  
`emcli db_cloud_maintenance -activateSoftware -pool_name=POOL -pool_type=oracle_cloud_zone -force=true` | `emcli db_cloud_maintenance -activateSoftware -pool_name=xxxx -pool_type="yyy" -force="true"` |
emcli db_cloud_maintenance -performOperation

Verb Description Format
emcli db_cloud_maintenance
- performOperation
- name="update"
- description="Update RAC database Instance"
- purpose="UPDATE_RACDB"
- start_schedule="start_time:2014/09/01 00:00"
- pool_name="xxx"
- pool_type="yyy"
- target_type=rac_database
- target_list="rac1.example.com"
45.14 Database Request Handling EM CLI Verbs

The table below lists the supported verbs for database request handling.

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli cleanup_dbaas_requests | Removes/cleans-up a failed request from the host and EM. Cleans-up all failed requests from a pool. Optionally, it cleans-up failed requests for a specific user. The options -ids and -pool_name cannot be used together. | `emcli cleanup_dbaas_requests [-ids="<request id>"] [-name="<size name>"] [-target_name="<target name>"] [-target_type="<rac_database|oracle_database|oracle_dbsvc|oracle_pdb>"] [-host_creds="<credname:credunder>"] [-root_creds="<credname:credowner>"] [-pool_name="<pool name>"] [-pool_type="<database|schema|pluggable_database>"] [-user="<SSA User name>"] [-all] [-description="<size description>"] [-attributes="<cpu:<value>;memory:<value>;storage:<value>]
|  | Remains-up a failed request from the host and EM. Cleans-up all failed requests from a pool. Optionally, it cleans-up failed requests for a specific user. The options -ids and -pool_name cannot be used together. | `emcli cleanup_dbaas_requests [-ids="<request id>"] [-name="<size name>"] [-target_name="<target name>"] [-target_type="<rac_database|oracle_database|oracle_dbsvc|oracle_pdb>"] [-host_creds="<credname:credunder>"] [-root_creds="<credname:credowner>"] [-pool_name="<pool name>"] [-pool_type="<database|schema|pluggable_database>"] [-user="<SSA User name>"] [-all] [-description="<size description>"] [-attributes="<cpu:<value>;memory:<value>;storage:<value>]

Note:

The clean-up operation explained here can also be performed using a REST API. For details, see Clearing a Collection of Service Requests.

Example:

```
emcli cleanup_dbaas_requests -ids="10"
emcli helpemcli cleanup_dbaas_requests -ids="10;11;12"
emcli cleanup_dbaas_requests -pool_name="database_pool" -pool_type="database"
emcli cleanup_dbaas_requests -pool_name="database_pool" -pool_type="database" -all
emcli cleanup_dbaas_requests -pool_name="database_pool" -pool_type="database" -all -user="SSA_USER"
```

Sample Output:

```
Service Template "My Schema Service Template" created successfully
```
Table 45-24  (Cont.) Force Cleanup EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli dbaas_artifacts -list_reserved_artifacts</td>
<td>Lists the existing reserved artifacts. Examples:</td>
<td>emcli dbaas_artifacts -list_reserved_artifacts -type requestId -all</td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -list_reserved_artifacts -type=&quot;SID&quot; For Single Instance databases, enter type= &quot;SID&quot;, where SID is the user readable artifact name of the ORACLE_SID.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -list_reserved_artifacts -type=&quot;SERVICE_NAME&quot; (for database instances)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -list_reserved_artifacts -type=&quot;PDB_NAME&quot; (for pluggable databases)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -list_reserved_artifacts -type=&quot;TABLESPACE_NAME&quot; (for schemas)</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -list_reserved_artifacts -all (for databases, pluggable databases and schemas)</td>
<td></td>
</tr>
<tr>
<td>emcli dbaas_artifacts -remove_reserved_artifact</td>
<td>Removes/cleans-up the specified reserved names and artifacts. To identify or derive the values for the type and value parameters, refer the previous command (emcli dbaas_artifacts -list_reserved_artifacts). Examples:</td>
<td>emcli dbaas_artifacts -remove_reserved_artifact -type=Sid, or SERVICE_NAME, or PDB_NAME, or TABLESPACE_NAME&gt; -value=&lt;value for the specified type&gt;</td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -remove_reserved_artifact -type=SID -value=&quot;DBS1&quot;</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli dbaas_artifacts -remove_reserved_artifact -type=SERVICE_NAME -value=&quot;DBS1s&quot;</td>
<td></td>
</tr>
</tbody>
</table>

45.15 Cloning a Pluggable Database

The EM CLI verb `emcli pdb_clone_management` creates a new clone of an existing pluggable database.

The details of the verb are as follows:
Table 45-25  Pluggable Database Cloning EM CLI Verb

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli pdb_clone_management</td>
<td>Creates a new clone of an existing pluggable database.</td>
<td>emcli pdb_clone_management</td>
</tr>
<tr>
<td></td>
<td>• -input_file - Location of the file containing properties required for cloning the pluggable database. See Table 45-26 for details.</td>
<td>-input_file</td>
</tr>
<tr>
<td></td>
<td>• [-cloneToOracleCloud] - Indicates that the destination container database (CDB) is on Oracle Cloud.</td>
<td>[-cloneToOracleCloud]</td>
</tr>
<tr>
<td></td>
<td>• [-enableTestMaster] - Enables the given PDB target as Test Master in Enterprise Manager.</td>
<td>[-enableTestMaster]</td>
</tr>
<tr>
<td></td>
<td>• [-disableTestMaster] - Removes the given PDB target as Test Master in Enterprise Manager.</td>
<td>[-disableTestMaster]</td>
</tr>
</tbody>
</table>

Example:
emcli pdb_clone_management -input_file=data:/u01/files/pdb_clone.props

The table below explains the required parameters and values in the properties file that needs to be used as an input file for cloning a pluggable database. You can either have a full clone of the pluggable database or a snapshot clone. For details of full clone and snapshot clones see, Pluggable Database Full Clone Methods, and Pluggable Database Snapshot Clone Types.

Table 45-26  Sample Properties File for Cloning a Pluggable Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRC_PDB_TARGET</td>
<td>SRC_PDB_TARGET=cdb_prod_PDB</td>
<td>Enterprise Manager (EM) target name of the source pluggable database (PDB).</td>
</tr>
<tr>
<td>SRC_HOST_CREDS</td>
<td>SRC_HOST_CREDS=NC_HOST_SHYSYSCO</td>
<td>Named credentials for the source target host.</td>
</tr>
<tr>
<td>SRC_CDB_CREDS</td>
<td>SRC_CDB_CREDS=NC_DB_SYS:SYSCO</td>
<td>Named credentials for the source CDB.</td>
</tr>
<tr>
<td>SRC_WORK_DIR</td>
<td>SRC_WORK_DIR=/tmp/source</td>
<td>Work directory at the source host where files are temporarily stored. If this parameter is not provided, the agent work directory is used.</td>
</tr>
<tr>
<td>DEST_HOST_CREDS</td>
<td>DEST_HOST_CREDS=NC_SLEO_SSH:SYSCO</td>
<td>Named credentials for the destination target host. If destination host is on Oracle Cloud, then the value for this parameter should be the host SSH credentials.</td>
</tr>
<tr>
<td>DEST_LOCATION</td>
<td>DEST_LOCATION=/scratch/app/cdb_tm/HR_TM_PDB6_</td>
<td>Data file location in the destination where the new PDB should be hosted.</td>
</tr>
<tr>
<td>DEST_CDB_TARGET</td>
<td>DEST_CDB_TARGET=cd_b_tm</td>
<td>EM target name of CDB where the new PDB should be cloned.</td>
</tr>
</tbody>
</table>
### Table 45-26 (Cont.) Sample Properties File for Cloning a Pluggable Database

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>DEST_CDB_TYPE</td>
<td>DEST_CDB_TYPE=oracle_database</td>
<td>EM target type of the destination CDB.</td>
</tr>
<tr>
<td>DEST_CDB_CREDS</td>
<td>DEST_CDB_CREDS=NC_DB_SYS:SYSCO</td>
<td>Named credentials for the destination CDB.</td>
</tr>
<tr>
<td>DEST_PDB_NAME</td>
<td>DEST_PDB_NAME=HR_TMP_PDB6</td>
<td>Name of the new PDB.</td>
</tr>
<tr>
<td>Optional Parameters</td>
<td></td>
<td></td>
</tr>
<tr>
<td>SRC_CDB_TARGET</td>
<td>SRC_CDB_TARGET=cdb_prodt_DB</td>
<td>EM target name of the CDB containing the source PDB.</td>
</tr>
<tr>
<td>SRC_CDB_TYPE</td>
<td>N/A</td>
<td>EM target type of the CDB containing the source PDB.</td>
</tr>
<tr>
<td>IS_SNAPSHOT_COPY</td>
<td>IS_SNAPSHOT_COPY=true</td>
<td>Indicates that the clone is a snapshot clone.</td>
</tr>
<tr>
<td>SRC_HOST</td>
<td>SRC_HOST=xyz.example.com</td>
<td>EM target name of the host containing the source CDB. If this value is not provided, it will be derived from the CDB.</td>
</tr>
<tr>
<td>DEST_HOST</td>
<td>DEST_HOST=xyz.example.com</td>
<td>EM target name of host containing the destination CDB. If this value is not provided, it will be derived from the CDB.</td>
</tr>
<tr>
<td>EXISTING_BACKUP</td>
<td>EXISTING_BACKUP=/user1/pdbbackup/app/PROD_PDB_Backup_1429779</td>
<td>Indicates the absolute location of the existing backup in the file system, and if it should be used to clone the new PDB.</td>
</tr>
<tr>
<td>EXISTING_BACKUP_METADATA</td>
<td>EXISTING_BACKUP_METADATA=/user1/pdbbackup</td>
<td>Absolute location of the metadata template of the backup. This parameter is required, if EXISTING_BACKUP is provided.</td>
</tr>
<tr>
<td>BACKUP_TYPE</td>
<td>BACKUP_TYPE=OSIMAGE</td>
<td>Indicates the backup type. The accepted values are TAR, OSIMAGE, and RMAN. If an existing backup (EXISTING_BACKUP parameter) is provided, this parameter represents the type of the backup. If not, this parameter represents the type of backup that should be taken during job execution. If both, EXISTING_BACKUP and BACKUP_TYPE are not provided, the source PDB, will be unplugged, and copied over to the destination for creating a new clone. Once the datafiles are copied, the source PDB will be plugged back.</td>
</tr>
</tbody>
</table>

### 45.15.1 Pluggable Database Full Clone Methods

The different methods of full cloning that are possible with a pluggable database are mentioned below. The process of achieving them are by configuring certain parameters in the properties file, while using the `emcli pdb_clone_management` verb.
• Operating System (OS) Image backup (supported only for Oracle Cloud)
  Takes a backup of the source PDB and creates a new PDB. The BACKUP_TYPE parameter should specify the type of backup. The EXISTING_BACKUP and EXISTING_BACKUP_METADATA parameters should not be provided.

• Existing backup (supported for on-premise PDBs and Oracle Cloud PDBs)
  Uses an existing backup of the source PDB and creates a new PDB. The BACKUP_TYPE parameter should specify the type of backup. The EXISTING_BACKUP parameter should specify the location with the backup name and EXISTING_BACKUP_METADATA should specify the location and the metadata file name for the backup.

Note:
If the destination PDB and the source PDB are in different CDBs wherein, both the CDBs are on-premise (or on Oracle Cloud), then ensure that the source PDB is in read-write mode. This is necessary since a database link is created in the destination CDB for cloning the PDB, and a temporary user is created in the source PDB for using the database link. If there is an existing database link in the destination CDB that connects to the source PDB, then use the parameter EXISTING_DB_LINK_NAME to provide the database link name in the properties file.

• Unplug/plug (supported only for Oracle Cloud)
  Unplugs the source PDB and creates a new PDB at the destination using the unplugged source, and then plugs the source back. Both, EXISTING_BACKUP and BACKUP_TYPE parameters should not be provided.

45.15.2 Pluggable Database Snapshot Clone Types
The different methods of snapshot cloning that are possible with a pluggable database on-premise are mentioned below. The process of achieving them are by configuring certain parameters in the properties file, while using the emcli pdb_clone_management verb.
Note:

For all the snapshot clone types, in addition to the mandatory parameters in Table 45-26, add the parameter IS_SNAPSHOT_COPY=true, to the properties file. A sample of the properties file is shown below:

```
#---------------------------------#

# Snapshot Copy flag                   #
#---------------------------------#
IS_SNAPSHOT_COPY = true
```

- **Exadata sparse clone snapshot**
  
The Exadata sparse clone snapshot will work only if the destination PDB data file location is in sparse ASM disk group in an Exadata machine, and the source and destination PDB data files share the same ASM instance.

  Set the value of the DEST_LOCATION to create an Exadata sparse clone. The DEST_LOCATION should be the name of the ASM sparse disk group. For example, +SPARSEDG.

- **ACFS (ASM cluster file system) snapshot**
  
The ACFS snapshot will work only if the source and destination PDB data file location is in common ACFS file system.

- **CLONEDB initialization parameter set to FALSE**
  
  When you create a snapshot clone of a source PDB and the CLONEDB initialization parameter of the destination host is set to FALSE, the underlying file system for the source PDB's files must support storage snapshots. Such file systems include Oracle Automatic Storage Management Cluster File System (Oracle ACFS) and Direct NFS Client storage.

- **CLONEDB initialization parameter set to TRUE**
  
  When you create a clone of a source PDB and the CLONEDB initialization parameter of the destination host is set to TRUE, the underlying file system for the
source PDB’s files can be any local file system, network file system (NFS), or clustered file system that has Direct NFS enabled. However, the source PDB must remain in open read-only mode as long as any clones exist.

### 45.16 Creating a Test Master Pluggable Database

The EM CLI verb `emcli pdb_clone_management` creates a new clone of an existing pluggable database. The same verb is used to create a Test Master of a pluggable database. However, the properties file used for the verb is different. For details of the verb see Table 45-25. For details of the properties file used to create the Test Master see Table 45-27.

#### Table 45-27   Sample Properties File for Creating a Pluggable Database Test Master

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Mandatory Parameters to Create a Test Master</td>
<td>SRC_PDB_TARGET=cdb_prod_PDB</td>
<td>Enterprise Manager (EM) target name of the source pluggable database (PDB).</td>
</tr>
<tr>

<tr>
<td>RUN_AS_USER_PWD</td>
<td>RUN_AS_USER_PWD=gosad</td>
<td>Password to run the post SQL script.</td>
</tr>
<tr>
<td>ACL_DF_GROUP_PERM</td>
<td>ACL_DF_GROUP_PERM=read only</td>
<td>Level of permission to be given to the group for the Exadata ASM disk group data files of the cloned PDB.</td>
</tr>
<tr>
<td>ACL_DF_OWNER_PERM</td>
<td>ACL_DF_OWNER_PERM=read only</td>
<td>Level of permission to be given to the owner for the Exadata ASM disk group data files of the cloned PDB.</td>
</tr>
<tr>
<td>ACL_DF_OTHER_PERM</td>
<td>ACL_DF_OTHER_PERM=read only</td>
<td>Level of permission to be given to others for the Exadata ASM disk group data files of the cloned PDB.</td>
</tr>
<tr>
<td>SRC_CDB_TARGET</td>
<td>SRC_CDB_TARGET=cdb_prodt_DB</td>
<td>EM target name of the CDB containing the source PDB.</td>
</tr>
</tbody>
</table>
Table 45-27 (Cont.) Sample Properties File for Creating a Pluggable Database Test Master

<table>
<thead>
<tr>
<th>Parameters</th>
<th>Sample values</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>SRC_CDB_TYPE</td>
<td>N/A</td>
<td>EM target type of the CDB containing the source PDB.</td>
</tr>
<tr>
<td>SRC_HOST</td>
<td>SRC_HOST=xyz.example.com</td>
<td>EM target name of the host containing the source CDB. If this value is not provided, it will be derived from the CDB.</td>
</tr>
<tr>
<td>DEST_HOST</td>
<td>DEST_HOST=xyz.example.com</td>
<td>EM target name of host containing the destination CDB. If this value is not provided, it will be derived from the CDB.</td>
</tr>
<tr>
<td>EXISTING_BACKUP</td>
<td>EXISTING_BACKUP=/user1/pdbbackup/app/PROD_PDB_Backup_14297779</td>
<td>Indicates the absolute location of the existing backup in the file system, and if it should be used to clone the new PDB.</td>
</tr>
<tr>
<td>EXISTING_BACKUP_METADATA</td>
<td>EXISTING_BACKUP_METADATA=/user1/pdbbackup</td>
<td>Absolute location of the metadata template of the backup. This parameter is required, if EXISTING_BACKUP is provided.</td>
</tr>
<tr>
<td>BACKUP_TYPE</td>
<td>BACKUP_TYPE=OSIMAGE</td>
<td>Indicates the backup type. The accepted values are TAR, OSIMAGE, and RMAN. If an existing backup (EXISTING_BACKUP parameter) is provided, this parameter represents the type of the backup. If not, this parameter represents the type of backup that should be taken during job execution. If both, EXISTING_BACKUP and BACKUP_TYPE are not provided, the source PDB, will be unplugged, and copied over to the destination for creating a new clone. Once the datafiles are copied, the source PDB will be plugged back.</td>
</tr>
</tbody>
</table>

A sample of the properties file for creating a Test Master PDB on Exadata is shown below:

```plaintext

#### 45.20 Using the db_clone_management EM CLI Verb

`emcli db_clone_management` is an umbrella EM CLI verb which can be used to perform various tasks for database management. For various actions though the verb remains the same the command within the verb varies. For details, see the table below.
Table 45-34  db_clone_management EM CLI Verb Description

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli db_clone_management</td>
<td>Verb for database clone life-cycle management. Commands:</td>
<td>emcli db_clone_management &lt;command&gt;</td>
</tr>
<tr>
<td></td>
<td>-createFullClone - Creates a full clone database.</td>
<td>-target_name=&quot;database target name&quot;</td>
</tr>
<tr>
<td></td>
<td>-createTestMaster - Creates a Test Master database.</td>
<td>-target_type=&quot;database target type - oracle_database</td>
</tr>
<tr>
<td></td>
<td>-createCloneDB - Creates a CloneDB database.</td>
<td>[-clone_type=&quot;clone type - &lt;LIVE</td>
</tr>
<tr>
<td></td>
<td>-createSnapClone - Creates a Snap Clone database.</td>
<td>{ -input_file=&quot;path of the input properties file&quot;</td>
</tr>
<tr>
<td></td>
<td>-createSnapshotClone - Creates an Exadata Sparse clone database.</td>
<td>{ -usage}</td>
</tr>
<tr>
<td></td>
<td>-cloneToCloud - Clones a database to Oracle Cloud.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-enableTestMaster - Enables a database as Test Master.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-disableTestMaster - Disables a Test Master database.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-refreshDatabase - Refreshes a database from its source.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-deleteDatabase - Deletes a database and removes the target from Enterprise Manager.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-listClones - Lists the clones of a database.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-listTestMasters - Lists the Test Master databases.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-listDatabaseBackups - Lists RMAN backup and image profiles of a database.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-listDatabaseSnapshots - Lists snapshot profiles of a database.</td>
<td></td>
</tr>
<tr>
<td>Options:</td>
<td>-target_name - Name of the database target.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-target_type - Type of the database target.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Possible values are: &quot;oracle_database&quot; for a single instance database or &quot;rac_database&quot; for a RAC database.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This option needs to be specified if -target_name option is specified.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-clone_type - Type of clone.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Possible values are: &quot;LIVE&quot; to perform a live clone or &quot;POINT_IN_TIME&quot; to perform a prior point in time clone.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-input_file - Path of the file containing input properties.</td>
<td></td>
</tr>
<tr>
<td>Help options:</td>
<td>-print_properties - Lists the input properties required for database clone procedures.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>This option mandates the presence of -target_name and -target_type.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-usage - Use this option to show detailed usage of the verb.</td>
<td></td>
</tr>
</tbody>
</table>
45.21 Invoking a REST API Using EM CLI Verb

`emcli invoke_ws` is an EM CLI verb used to invoke a REST API to perform the action expected by the REST API. The medium however is Enterprise Manager command line interface.

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td><code>emcli invoke_ws</code></td>
<td>Invokes the Enterprise Manager Web service to act as per the REST API passed via this verb. Options:</td>
<td><code>emcli invoke_ws</code>&lt;br&gt; -wsname=&lt;WebService Name&gt;&lt;br&gt; -method=&lt;method name&gt;&lt;br&gt; [-payload=&lt;Payload&gt;]&lt;br&gt; [-accept=&lt;accept type&gt;]&lt;br&gt; [-type=response type]&lt;br&gt; [-param=Query Parameters]&lt;br&gt; [-input_file=&lt;Input File for payload data&gt;]</td>
</tr>
<tr>
<td></td>
<td>-wsname - Indicates the URI of the resource.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-method - Specifies the REST method.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-payload - Indicates the json/xml input payload.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-accept - Payload type. These are standard REST API values.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-type - Standard REST API response types.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-param - This option is used to pass a form/query parameter value. For example, -param=&quot;name:value&quot;. More than one parameter can be specified. For example, -param=&quot;name:value&quot; -param=&quot;zip:12345&quot;.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>The parameter can be provided through a file. For example, the parameters can be specified in a text file with name <code>file.txt</code> and the command can have the options as: -param=&quot;name:tag&quot; - input_file=&quot;tag:file.txt&quot;, wherein the parameter name will derive the value from the input file <code>file.txt</code>.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-input_file - Use this option to pass in payload or param value from file.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Examples:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param=&quot;name:Administrators&quot;</td>
<td>Invokes list resource and sources all administrators</td>
</tr>
<tr>
<td></td>
<td>• emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param=&quot;name:tag&quot; -input_file=&quot;tag:file.txt&quot;</td>
<td>Invokes list resource and sources all administrators. The name parameter is read from <code>file.txt</code>.</td>
</tr>
</tbody>
</table>

A sample of the contents of the `file.txt` is shown below.

Database as a Service Administrator REST APIs

This chapter describes the resource models for the Administration flows of Database as a Service (DBaaS) REST APIs, and their responses.

The following topics are covered in this chapter:

• Summary of Database as a Service Administrator REST APIs
• Creating a New DBaaS Cloud Setup Using REST APIs
• Database as a Service Administrator Operations REST APIs
  – PaaS Zones and PaaS Zone REST APIs
  – Software Pools and Software Pool REST APIs
  – Database Request Settings REST APIs
  – Database Quota REST APIs
  – Service Template REST APIs

46.1 Summary of Database as a Service Administrator REST APIs

The table below shows a summary of all the DBaaS Administrator REST APIs covered in this chapter.

Table 46-1  Summary of Administrator DBaaS REST APIs

<table>
<thead>
<tr>

46.2 Creating a New DBaaS Cloud Setup Using REST APIs

The Cloud Administrator sets up the cloud infrastructure for DBaaS. The figure below illustrates the steps to be followed to setup the DBaaS cloud setup.

Table 46-1 (Cont.) Summary of Administrator DBaaS REST APIs

<table>
<thead>
<tr>
<th>Resource</th>
<th>Data Model</th>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Service template</td>
<td>Table 46-38</td>
<td>Viewing Details of the ServiceTemplate Resource</td>
<td>Not supported</td>
<td>Supported</td>
<td>Deleting a Database / Schema / Pluggable Database Service Template</td>
</tr>
</tbody>
</table>

Note:
In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.
As an example, Table 46-2 illustrates a step-by-step process to create DBaaS using REST APIs and EM CLI verbs (where necessary).

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Create a PaaS infrastructure zone. Refer to Creating a PaaS Zone. Note: To view the existing PaaS zones perform a GET operation. Refer to Viewing Details of the PaaS Zones Resource.</td>
</tr>
</tbody>
</table>
Table 46-2 (Cont.) Creating DBaaS using REST APIs

<table>
<thead>
<tr>
<th>Step</th>
<th>Action</th>
</tr>
</thead>
</table>
| 2    | Create one of the following Database Pools:  
|      | • Database Pool - refer to Creating a Database Pool  
|      | • Schema Pool - refer to Creating a Schema Pool  
|      | • Pluggable Database Pool - refer to Creating a Pluggable Database Pool  
|      | **Note:** To view the existing Database Pools perform a GET operation. Refer to Viewing Details of the Software Pools Resource. |
| 3    | Create DBaaS Request Settings for a user role. Refer to Creating Database Request Settings. |
| 4    | Create Quota for a user role. Refer to Creating DBaaS Quota for a Role.  
|      | **Note:** This step is optional. |
| 5    | Create a Profile to capture the source database information for provisioning. Refer to EM CLI Verbs for Database as a Service Administrator.  
|      | A profile can represent a complete database or a set of related schemas that form an application. |
| 6    | Create a Service Template for any one of the following based on the selected Database Pool:  
|      | • Database Pool - refer to:  
|      | – Creating a Service Template for DBCA Based Database  
|      | – Creating a Service Template for RMAN Based Single Instance Database  
|      | – Creating a Service Template for RMAN Based Single Instance Database with Single Instance Standby  
|      | – Creating a Service Template for RMAN Based RAC One Node Database  
|      | – Creating a Service Template for RMAN Based RAC One Node Database With Standby  
|      | – Creating a Service Template for RMAN Based RAC Database With Standby  
|      | – Creating a Service Template for DNFS Based Database  
|      | • Schema Pool - refer to Creating a Service Template for a Schema  
|      | • Pluggable Database Pool - refer to Creating a Service Template for a Pluggable Database |

The DBaaS cloud setup is ready to be administered.

46.3 Database as a Service Administrator Operations REST APIs

This section covers all the REST APIs for the Cloud Administrator flows. The REST APIs in this section are classified as follows:

- PaaS Zones and PaaS Zone REST APIs
- Software Pools and Software Pool REST APIs
- Database Request Settings REST APIs
- Database Quota REST APIs
- Service Template REST APIs

46.3.1 PaaS Zones and PaaS Zone REST APIs

The REST APIs in this section are categorized as PaaS zones REST APIs and PaaS zone REST APIs. PaaS zone represents a PaaS Infrastructure Zone whereas PaaS
zones is a collection resource representing a Cloud Administrator's view of a group of all the accessible individual PaaS zone resources.

This section covers the following:

- PaaS Zones REST APIs
- PaaS Zone REST APIs
- PaaS Zones and PaaS Zone REST API Examples

### 46.3.1.1 PaaS Zones REST APIs

PaaS zones is a collective representation of all the individual PaaS zone resources. PaaS zones has the media type `application/oracle.com.cloud.common.PaaSZones+json`.

The following table describes the PaaS zones data model.

**Table 46-3  PaaS Zones Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>Displays name of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
<td>Type of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in the collection.</td>
<td>1</td>
</tr>
<tr>
<td>Count</td>
<td>Integer</td>
<td>Number of elements returned.</td>
<td>1</td>
</tr>
<tr>
<td>Items</td>
<td>Collection of PaaSZone</td>
<td>List of PaaS zone resources. If there are no instances, the items will be present but will be empty.</td>
<td>1</td>
</tr>
<tr>
<td>totalCount</td>
<td>Integer</td>
<td>Total number of PaaS zone resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent to the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

### 46.3.1.1.1 Supported Request Methods for PaaS Zones

The following table lists all the operations that are supported on the PaaS zones resources.

**Table 46-4  Supported Request Methods for PaaS Zones**

<table>
<thead>
<tr>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>

### 46.3.1.2 PaaS Zone REST APIs

This resource represents a PaaS Infrastructure Zone. PaaS zone has the media type `application/oracle.com.cloud.common.PaaSZone+json`.
The following table describes the PaaS zone data model.

### Table 46-5  PaaS Zone Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Name</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>A human readable name given to the PaaS zone. This field is non-editable.</td>
<td>1</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name for the PaaS zone.</td>
<td>0..1</td>
</tr>
<tr>
<td>guid</td>
<td>String</td>
<td>Unique GUID of the PaaS zone that identifies the resource.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description of the PaaS zone.</td>
<td>0..1</td>
</tr>
<tr>
<td>targetType</td>
<td>String</td>
<td>Target type of the PaaS zone to be created.</td>
<td>1</td>
</tr>
<tr>
<td>Members</td>
<td>Collection&lt;members&gt;</td>
<td>Members of PaaS zone. These must be added as EM targets in advance.</td>
<td>1</td>
</tr>
<tr>
<td>credentials</td>
<td>Collection&lt;PaaSzoneCredential&gt;</td>
<td>Credentials associated with the PaaS zone.</td>
<td>1</td>
</tr>
<tr>
<td>placementConstraints</td>
<td>Collection&lt;ParameterValueHolder&gt;</td>
<td>Placement constraints for the PaaS zone that allows the cloud administrator to set a maximum ceilings for resource utilization.</td>
<td>0..1</td>
</tr>
<tr>
<td>characteristics</td>
<td>Collection&lt;ParameterValueHolder&gt;</td>
<td>Characteristics associated with the PaaS zone.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the PaaS zone.</td>
<td>1</td>
</tr>
</tbody>
</table>

46.3.1.2.1 Supported Request Methods for PaaS Zone

The following table lists all the operations that are supported on the PaaS zone resources.

### Table 46-6  Supported Request Methods for PaaS Zone

<table>
<thead>
<tr>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>No</td>
<td>Yes</td>
</tr>
</tbody>
</table>

46.3.1.3 PaaS Zones and PaaS Zone REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control 12.1.0.3 with Cloud Application plug-in 12.1.0.7 and higher. The following examples are covered:

- Viewing Details of the PaaS Zones Resource
- Viewing Details of a PaaS Zone Resource
- Creating a PaaS Zone
- Updating a PaaS Zone
- Deleting a PaaS Zone
46.3.1.3.1 Viewing Details of the PaaS Zones Resource

A GET request issued on the Resource Providers resource with the query parameter "type=self_service_zone" provides the details of all the individual PaaS zones which are already existing in the PaaS zones resource.

Table 46-7  GET Request Configuration for Viewing Details of the PaaS Zones Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>

    }
]
}

46.3.1.3.2 Viewing Details of a PaaS Zone Resource

The GET request on the PaaS zone resource can be issued to retrieve its details. The configuration for GET to PaaS zone is as follows:

Table 46-8  GET Request Configuration for Viewing Details of a PaaS Zones Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/23</td>
</tr>
<tr>

        { "name": "ORACLE.SYSMAN.CFW.ORCL_GTP_CONTACT",
```
46.3.1.3.3 Creating a PaaS Zone

A PaaS zone is created with a POST request on the PaaS zones collection resource.

The configuration for POST to PaaS zones is as follows:

Table 46-9  POST Request Configuration for Creating a PaaS Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: basic ZGVtb3VvZXI6ZGVtb3VvZXI= Content-Type: application/json</td>
</tr>
<tr>
<td><strong>Body</strong></td>
<td>{   &quot;useExistingTarget&quot;: false,</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;My Test Zone&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;type&quot;: &quot;self_service_zone&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;credentials&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{   &quot;name&quot;: &quot;normal_credential_guid&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;MY_ZONE_CREDS0afb3e85-f&quot;                           }</td>
</tr>
<tr>
<td></td>

</tr>
<tr>
<td></td>
<td>&quot;placementConstraints&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{   &quot;name&quot;: &quot;MAX_CPU_UTILIZATION&quot;,</td>
</tr>
</tbody>
</table>
|                          |         "value": "90" }                                                   }

**Request method**  POST

A sample of the response received is shown below.

```json
{"message": "Resource provider with name "My Test Zone" and type "self_service_zone" created successfully.",
"canonicalLink": {
    "href": "https://example.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/23"}}
```
46.3.1.3.4 Updating a PaaS Zone

The PUT request with payload updates an existing PaaS Infrastructure Zone.

The configuration for PUT to PaaS zones is as follows:

Table 46-10  PUT Request Configuration for Updating a PaaS Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/23</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzXl6ZGVtb3VzXl=</td>
</tr>
<tr>
<td>Body</td>
<td>{   &quot;memberTargetType&quot;: &quot;host&quot;,   &quot;credentials&quot;: [     {&quot;name&quot;: &quot;normal_credential_guid&quot;,       &quot;value&quot;: &quot;NC_HOST_2015-10-09-095917&quot; }   ],   &quot;placementConstraints&quot;: [     {&quot;name&quot;: &quot;MAX_CPU_UTILIZATION&quot;,       &quot;value&quot;: [ &quot;92&quot; ] }   ] }</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "message": "Resource provider with ID \"23\" updated successfully."
}
```

46.3.1.3.5 Deleting a PaaS Zone

The DELETE request on the URI of the PaaS zone can be issued to delete a PaaS zone instance. The configuration for deleting in PaaS zone is as follows:

Table 46-11  DELETE Request Configuration to delete a PaaS Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/23</td>

</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
}
```
46.3.2 Software Pools and Software Pool REST APIs

This section covers the following:

- Software Pools
- Software Pool
- Software Pool REST API Examples

46.3.2.1 Software Pools

Software pools is a collection resource representing an SSA Administrator's view of all the accessible individual Software pool resources. Software pools has the media type application/oracle.com.cloud.common.SoftwarePools+json.

The following table describes the Software pools data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>Displays name of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
<td>Type of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in the collection.</td>
<td>1</td>
</tr>
<tr>
<td>Count</td>
<td>Integer</td>
<td>Number of elements returned.</td>
<td>1</td>
</tr>
<tr>
<td>Items</td>
<td>Collection</td>
<td>List of PaaS zone resources. If there are no instances, the items will be present but will be empty.</td>
<td>1</td>
</tr>
<tr>
<td>totalCount</td>
<td>Integer</td>
<td>Total number of PaaS zone resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent to the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

46.3.2.1.1 Supported Request Methods for Software Pools

The following table lists all the operations that are supported on the Software pools resources.

<table>
<thead>
<tr>
<th></th>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
</tr>
</tbody>
</table>
46.3.2.2 Software Pool

A Software pool resource represents a collection of homogeneous servers or clusters that are used to service requests within a PaaS Infrastructure Zone. All members within a Software pool must be of the same type and must belong to the same PaaS Infrastructure Zone. Software pool has the media type `application/oracle.com.cloud.common.SoftwarPool+json`.

The following table describes the Software pool data model.

### Table 46-14  Software Pool Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>A human readable name given to the Software pool.</td>
<td>1</td>
</tr>
<tr>
<td>ID</td>
<td>String</td>
<td>Pool GUID that uniquely identifies the resource.</td>
<td>1</td>
</tr>
<tr>
<td>Description</td>
<td>String</td>
<td>As brief description given to the software pool.</td>
<td>0..1</td>
</tr>
<tr>
<td>poolTargetTyp e</td>
<td>String</td>
<td>Target type of the Software Pool to be created. Example: &quot;oracle_cloud_zone&quot; for Database Pool, &quot;schaas_pool&quot; for Schema Pool, &quot;pdbaas_pool&quot; for Pluggable Database Pool.</td>
<td>1</td>
</tr>
<tr>
<td>paasZone</td>
<td>String</td>
<td>Name of the PaaS zone associated with this Software Pool.</td>
<td>1</td>
</tr>
<tr>
<td>Members</td>
<td>Collection &lt;String&gt;</td>
<td>Members of PaaS zone. They can be either Host members or Oracle VM Zone members.</td>
<td>1</td>
</tr>
<tr>
<td>memberType</td>
<td>String</td>
<td>The target type of the members of PaaS zone. It can be either &quot;host&quot; for Host members or &quot;oracle_vm_zone&quot; for Oracle VM Zone members.</td>
<td>1</td>
</tr>
<tr>

<td>Filters on a Software Pool restrict the addition of member targets to it with a set criteria.</td>
<td>1</td>
</tr>
<tr>
<td>Properties</td>
<td>Collection &lt;String&gt;</td>
<td>Additional properties that need to be specified for a specific pool target type.</td>
<td>1</td>
</tr>
<tr>
<td>membersToAdd</td>
<td>Collection &lt;String&gt;</td>
<td>Targets to be added to an existing Software Pool while editing it.</td>
<td>0..1</td>
</tr>
<tr>
<td>membersToRemove</td>
<td>Collection &lt;String&gt;</td>
<td>Targets to be removed from an existing Software Pool while editing it.</td>
<td>0..1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
</tbody>
</table>

46.3.2.2.1 Supported Request Methods for Software Pool

The following table lists all the operations that are supported on the Software pool resources.
### 46.3.2.3 Software Pool REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control 12.1.0.3 with Cloud Application plug-in 12.1.0.7 and higher. The following examples are covered here:

- Viewing Details of the Software Pools Resource
- Viewing Details of a Software Pool Resource
- Viewing Details of a Software Pool Capacity
- Creating a Database Pool
- Updating a Database Pool
- Creating a Schema Pool
- Updating a Schema Pool
- Creating a Pluggable Database Pool
- Updating a Pluggable Database Pool
- Deleting a Database / Schema / Pluggable Database Pool

#### 46.3.2.3.1 Viewing Details of the Software Pools Resource

**Table 46-16  GET Request Configuration for Viewing Details of the Software Pools Resource**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools</td>

</table>

A sample of the response received is shown below:

```json
{
  "name": "Software Pools",
  "type": "Software Pool",
  "hasMore": false,
  "count": 4,
  "items": [
    {
      "name": "SI Databases Zone",
      "type": "oracle_cloud_zone",
    }
  ]
}
```
46.3.2.3.2 Viewing Details of a Software Pool Resource

The GET request on the Software pool URI can be issued to retrieve its details.

The configuration for GET on Software pool is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/xtws/cloudservices/admin/cfw/v1/softwarepools/E827809080C16F75E040F20A60511EA2</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.
46.3.2.3.3 Viewing Details of a Software Pool Capacity

The GET request on the Software pool capacity URI can be issued to retrieve its details.

In the table below, the URI to view the Software pool capacity is /em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/C0DE0DEB3A8195A4707704360463060B/capacity. However, it can be modified to add certain query parameters to view the desired output. The query parameters and their descriptions are given below:

- **showUsageSummary**: Includes resource utilization data at pool level. Values can be “yes”, “y”, or “true” which are all case insensitive. If value is not provided or if the given value is other than the listed values, “usageSummary” will not be available in the response.
- **showMemberLevelUsage**: Includes resource utilization data at pool member level. Values can be “yes”, “y”, or “true” which are all case insensitive. If value is not
provided or if the given value is other than the listed values, "memberLevelUsage" will not be available in the response.

- **diskGroups**: Provides the list of ASM disk group names for storage computation. If the value is not provided, storage values will not be available in the response. Multiple values can be provided by using the format given below in the request URI:
  
  `diskGroups=<Value1>&diskGroups=<Value2>&...`

- **cpuMemAveUtilDays**: Indicates the number of days to include the collected metrics for computing CPU and memory utilization. If no value is provided, the default value is taken as 7 days.

The configuration for GET on Software pool is as follows:

**Table 46-18 GET Request Configuration for Viewing Details of the Software Pool Capacity**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/E284FAAA7FBA6A06F7090115A3E07299/capacity?showMemberLevelUsage=y&amp;showUsageSummary=true&amp;diskGroups=RECOC1&amp;diskGroups=DATAC1&amp;cpuMemAveUtilDays=3</code></td>
</tr>
<tr>

<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td>{ &quot;name&quot;: &quot;DB_POOL&quot;, &quot;poolTargetType&quot;: &quot;oracle_cloud_zone&quot;, &quot;description&quot;: &quot;Database Pool of Oracle Homes&quot;, &quot;paasZone&quot;: &quot;SLC01MDR_ZONE&quot;, &quot;members&quot;: [ &quot;OraDb11g_home1_2_slc01mdr&quot; ], &quot;serviceFamily&quot;: &quot;DBAAS&quot;, &quot;serviceType&quot;: &quot;DBAAS&quot;, &quot;constraints&quot;: { &quot;items&quot;: [ {&quot;name&quot;: &quot;MAX_INSTANCES&quot;, &quot;value&quot;: &quot;10&quot;} ] }, &quot;filters&quot;: { &quot;items&quot;: [ {&quot;name&quot;: &quot;CONFIGURATION&quot;, &quot;value&quot;: &quot;oracle_database&quot;}, {&quot;name&quot;: &quot;VERSION&quot;, &quot;value&quot;: &quot;11.2.0.2.0&quot;}, {&quot;name&quot;: &quot;PLATFORM&quot;, &quot;value&quot;: &quot;226&quot;} ] }, &quot;properties&quot;: { &quot;items&quot;: [ {&quot;name&quot;: &quot;host_credential_guid&quot;, &quot;value&quot;: &quot;E84E88308E46A725E040F20A605125DD&quot;}, {&quot;name&quot;: &quot;root_credential_guid&quot;, &quot;value&quot;: &quot;E84E88308E46A725E040F20A605125DD&quot;}, {&quot;name&quot;: &quot;standby_pools&quot;, &quot;value&quot;: &quot;DB_POOL1</td>
</tr>
</tbody>
</table>

**Note:**
- **name**: Indicates the name of the pool.
- **poolTargetType**: Indicates the target type for DBaaS pool. oracle_cloud_zone is the target type specific for DB OH pool.
- **paasZone**: Indicates the name of the PaaS infrastructure zone.
- **members**: Is a comma and string separated list of target names of Oracle homes, and members of the pool.
- **constraints**: Indicates the constraints on the pool. Allowed values is MAX_INSTANCES.
- **filters**: Indicates the filters applicable to define the version and type of the oracle homes of the pool, including VERSION, CONFIGURATION (oracle_database, rac_database) and PLATFORM (provide reference to list of code, for example, 226 for linux).
- **properties**: Indicates the collection resource to define properties of the pool like Host credential GUID, Root credential GUID, and Standby pools.

|                  |       {"name": "MAX_MEMORY_USAGE_BY_PDBS", "value": "90"},  
|                  |       {"name": "PDBS_ENFORCE_CPU", "value": "true"}  
|                  |     ]  
|                  |   },  
|                  |   "filters": {  
|                  |     "items": [  
|                  |       {"name": "TARGET_TYPE_CDB","value": "oracle_database"},  
|                  |       {"name": "VERSION_CDB","value": "12.1.0.1.0"},  
|                  |       {"name": "PLATFORM_CDB","value": "226"}  
|                  |     ]  
|                  |   }  
|                  |}``

Request method: POST

A sample of the response received is shown below.

```json
{  
  name: "PDB_POOL",
}
```
A sample json for creating pluggable database pool is shown below:

```json
{
    "name": "PDBaaS.NEW_POOL",
    "useExistingTarget": false,
    "type": "pdbaas_pool",
    "memberTargetType": "rac_database",
    "members": ["EM12_CDB"],
    "parentResourceProviderId": "161",
    "credentials": [
        { "name": "cdb_credential_guid", "value": "SSA_POC_DBAAAS_ADMIN" },
        { "name": "cdb_wallet_password", "value": null },
        { "name": "gi_credential_guid", "value": "SSA_POC_ORACLE" },
        { "name": "host_credential_guid", "value": "SSA_POC_ORACLE" }
    ],
    "placementConstraints": [
        { "name": "MAX_PDB_SERVICES", "value": [99] },
        { "name": "MAX_CPU_USAGE_BY_PDBS", "value": [90] }
    ]
}
```
46.3.2.3.9 Updating a Pluggable Database Pool

A PUT operation is issued on Software Pools Collection resource to update a Software Pool.

The configuration for PUT to Software pools is as follows:

Table 46-24 PUT Request Configuration for Updating a Pluggable Database Pool

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td></td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;PDB_POOL&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;poolTargetType&quot;: &quot;pdbaas_pool&quot;,</td>

<tr>
<td></td>
<td>]</td>
</tr>
<tr>
<td></td>
<td>},</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Note: Ensure at least one member remains as a part of the pool while issuing the request. If all the members are added to the membersToRemove attribute, the PUT request may fail.

Request method | PUT

A sample of the response received is shown below.

Status 200 OK
Content-Type: application/json
46.3.2.3.10 Deleting a Database / Schema / Pluggable Database Pool

To delete a SoftwarePool Instance raise the DELETE request on the URI of the Database pool. The configuration for deleting a Software pool is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extend/cloudservices/admin/cfw/v1/softwarepools/$id</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic $Authorization$=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "message": "Software Pool "PDB_POOL" updated successfully."
}
```

46.3.3 Database Request Settings REST APIs

This section describes the REST request/response interactions for Database Request Settings.

**Note:**

Request Settings REST APIs are only supported by the Oracle Cloud Application plug-in version 12.1.0.7.0 and higher.

The topics covered in this section are:

- Database Request Settings Resource Model
- Dbaas Request Settings Resource
- Supported Operations for Dbaas Request Settings
- Dbaas Request Settings REST API Examples

46.3.3.1 Database Request Settings Resource Model

Cloud resources are organized by common service entities, and specific services (for example, Database Request Settings) provide resources by extending these common service entities. The Database Request Settings is a cloud resource for which instance
The following sections describe the resources that are supported by the Database Request Settings REST APIs and provide examples of supported operations.

### 46.3.3.2 Dbaas Request Settings Resource

The Dbaas Request Settings extends the cloud resource. It describes the database request settings related to service instances. Dbaas Request Settings has media type `application/oracle.com.cloud.common.DbaasRequestSettings+json`.

The following table describes the Dbaas Request Settings data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description given to the template</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceStatus</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the service template.</td>
<td>1</td>
</tr>
<tr>
<td>service_family_t</td>
<td>String</td>
<td>Dbaas</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>Can be used to perform cloud interactions like GET and POST.</td>
<td>1</td>
</tr>
<tr>
<td>RequestSettings</td>
<td>String</td>
<td>The current database request settings.</td>
<td>1</td>
</tr>
</tbody>
</table>

### 46.3.3.3 Supported Operations for Dbaas Request Settings

The following table lists all the operations that are supported on the database quota service resources.

<table>
<thead>
<tr>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

### 46.3.3.4 Dbaas Request Settings REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control. The following examples are covered:

- Viewing Details of the Dbaas Request Settings Resource
- Creating Database Request Settings
46.3.3.4.1 Viewing Details of the DBaaS Request Settings Resource

The table below shows the REST API configuration for viewing details of the DBaaS request setting resource.

**Table 46-28 GET Request Configuration for Viewing Details of the DBaaS Request Setting Resource**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>/em/cloud/dbaas/requestsettings</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri" : "/em/cloud/dbaas/requestsettings",
  "name" : "DBaaS Request Settings",
  "description" : "DBaaS Request settings",
  "resource_state" : {
    "state" : "READY"
  },
  "media_type" : "application/oracle.com.cloud.common.DbaasRequestSettings+json",
  "service_family_type" : "dbaas",
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/requestsettings",
  "Request Settings" : {
    "futureReservationLength" : "No Reservation",
    "defaultRetirementPeriod" : "No Reservation",
    "maximumArchiveDuration" : "No Reservation"
  }
}
```

46.3.3.4.2 Creating Database Request Settings

This section describes how to create the request settings using the cloud resources.

The configuration for POST to DbaasRequestSettings is as follows:

**Table 46-29 POST Request Configuration for Creating DBaaS Request Settings**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>em/cloud/dbaas/requestsettings</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.common.DbaasRequestSettings+json</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbaasRequestSettings+json</td>
</tr>
</tbody>
</table>
Table 46-29 (Cont.) POST Request Configuration for Creating DBaaS Request Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td>{ &quot;future_reservation_length&quot;: &quot;2 Months&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;maximum_archive_duration&quot;: &quot;10 Weeks&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;default_retirement_period&quot;: &quot;No Reservation&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Request method POST

A sample of the response received is shown below.

```
{
  "uri" : "/em/cloud/dbaas/requestsettings",
  "name" : "Dbaas Request Settings",
  "description" : "Dbaas Request settings",
  "resource_state" : {
    "state" : "READY",
    "messages" : [
      {
        "date" : "2013-08-27T09:13:03+0000",
        "text" : "Request settings have been updated."
      }
    ]
  },
  "media_type" : "application/oracle.com.cloud.common.DbaasRequestSettings+json",
  "service_family_type" : "dbaas",
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/requestsettings"
}
```

46.3.4 Database Quota REST APIs

This section describes the REST request/response interactions for setting up Quota.

Note:
Quota REST APIs are only supported by the Oracle Cloud Application plug-in version 12.1.0.7.0 and higher.

The topics covered in this section are:
- Database Quota Resource Model
- Dbaas Quota Resource
- Supported Operations for DbaaS Quota
- Database Quota REST API Examples
46.3.4.1 Database Quota Resource Model

Cloud resources are organized by common service entities, and specific services (for example, Database Quota) provide resources by extending these common service entities. The Database Quota is a cloud resource for which an instance does not exist.

The following sections describe the resources that are supported by the Database Quota REST APIs and provide examples of supported operations.

46.3.4.2 Dbaas Quota Resource

The Dbaas Quota extends the cloud resource. It describes the quota settings for all roles. Dbaas Quota has the media type application/oracle.com.cloud.common.DbaasQuota+json.

The following table describes the Dbaas Quota data model.

Table 46-30 Dbaas Quota Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occur</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>String</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the service template that this type represents</td>
<td>1</td>
</tr>
<tr>
<td>service_family_type</td>

</tbody>
</table>

46.3.4.4 Database Quota REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control 12.1.0.3 with Cloud Application plug-in 12.1.0.7 and higher. The following examples are covered:

- Viewing Details of the DBaas Quota Resource
- Creating DBaaS Quota for a Role
- Updating DBaaS Quota for a Role
- Deleting DBaaS Quota for a Role

46.3.4.4.1 Viewing Details of the DBaaS Quota Resource

Table 46-32  GET Request Configuration for Viewing Details of the DBaaS Quota Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/dbaas/quota</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/dbaas/quota",
  "name": "DbaaS User Quota",
  "description": "User Quota for the user",
  "resource_state": {
    "state": "READY"
  },
  "media_type": "application/oracle.com.cloud.common.DbaasQuota+json",
  "service_family_type": "dbaas",
  "canonicalLink": "/em/websvcs/restful/EXTWS/cloudservices/service/v0/ssa/em/cloud/dbaas/quota",

</tr>
</tbody>
</table>

A sample of the response received is shown below.

{                                                                              |
  "uri" : "/em/cloud/dbaas/quota",                                              |
46.3.4.4.3 Updating DBaaS Quota for a Role

This section describes how update the quota already setup for a role using the Cloud resources. The configuration for PUT to DBaaS Quota is as shown in the table below.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/cloud/dbaas/quota</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>

<tr>
<td></td>
<td>&quot;pluggable_databases&quot;: &quot;22&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;storage&quot;: &quot;99&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;memory&quot;: &quot;99&quot;</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
   "uri": "/em/cloud/dbaas/quota",
   "name": "DbaaS User Quota",
   "description": "User Quota for the user",
   "resource_state": {
      "state": "READY",
      "messages": [
         {
            "date": "2013-08-27T08:48+0000",
            "text": "Quota for Role DBAAS_ROLE setup successfully."
         }
      ]
   },
   "media_type": "application/oracle.com.cloud.common.DbaasQuota+json",
   "service_family_type": "dbaas",
   "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/quota"
}
```
46.3.4.4 Deleting DBaaS Quota for a Role

This section describes how delete the quota setup for a role using the Cloud resources. The configuration for deleting in DBaaS Quota is as follows:

**Table 46-35  DELETE Request Configuration for Deleting a DBaaS Quota for a Role**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>em/cloud/dbaas/quota</code></td>

</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "uri": "/em/cloud/dbaas/quota",
    "name": "Dbaas User Quota",
    "description": "User Quota for the user",
    "resource_state": {
        "state": "READY",
        "messages": [
            {
                "text": "Quota for Role SSA_USER_ROLE deleted successfully.",
                "date": "2015-12-08T07:18:08+0000"
            }
        ]
    },
    "media_type": "application/oracle.com.cloud.common.DbaasQuota+json",
    "service_family_type": "dbaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/quota"
}
```

46.3.5 Service Template REST APIs

This section covers the following:

- Service Templates Resource
46.3.5.1 Service Templates Resource

Service Templates is a collection resource representing a Cloud Administrator's view of all the accessible service template resources. Service Templates has the media type `application/oracle.com.cloud.common.ServiceTemplates+json`.

The following table describes the Service Templates data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>Displays name of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>Type</td>
<td>String</td>
<td>Type of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in the collection.</td>
<td>1</td>
</tr>
<tr>
<td>Count</td>
<td>Integer</td>
<td>Number of elements returned.</td>
<td>1</td>
</tr>
<tr>
<td>Items</td>
<td>Collection</td>
<td>The elements of this collection.</td>
<td>1</td>
</tr>
<tr>
<td>totalCount</td>
<td>Integer</td>
<td>Total number of PaaS zone resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent to the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

46.3.5.1.1 Supported Operations for Service Templates

The following table lists all the operations that are supported on the Service Templates resource.

<table>
<thead>
<tr>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>Yes</td>
<td>No</td>
<td>No</td>
</tr>
</tbody>
</table>

46.3.5.2 Service Template Resource

A service template is a standardized service definition that can be used by self service users to provision a service instance. Service Template has the media type `application/oracle.com.cloud.common.ServiceTemplate+json`.

The following table describes the Service Template data model.
### Table 46-38  Service Template Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>Name</td>
<td>String</td>
<td>A human readable name given to the ServiceTemplate.</td>
<td>1</td>
</tr>
<tr>
<td>ID</td>

#### 46.3.5.2.1 Supported Operations for Service Template

The following table lists all the operations that are supported on the Service Template resource.

**Table 46-39  Supported Operations for Service Template**

<table>
<thead>
<tr>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>
</tr>
</thead>
<tbody>
<tr>
<td>Yes</td>
<td>No</td>
<td>Yes</td>
<td>Yes</td>
</tr>
</tbody>
</table>

**46.3.5.3 Service Templates and Service Template REST API Examples**

The following sections provide examples of interaction with Enterprise Manager Cloud Control 12.1.0.3 with Cloud Application plug-in 12.1.0.7 and higher. The following examples are covered:

- Viewing Details of the Service Templates Resource
- Viewing Details of the ServiceTemplate Resource
- Creating a Service Template for DBCA Based Database
- Creating a Service Template for RMAN Based Single Instance Database
- Creating a Service Template for RMAN Based Single Instance Database with Single Instance Standby
• Creating a Service Template for RMAN Based RAC One Node Database
• Creating a Service Template for RMAN Based RAC One Node Database With Standby
• Creating a Service Template for RMAN Based RAC Database With Standby
• Creating a Service Template for RAC Database with Standby Using a DBCA Template
• Creating a Service Template for DNFS Based Database
• Creating a Service Template for Snap Clone Single Instance Database (with Archiving Enabled)
• Creating a Service Template for Snap Clone Single Instance Database (without Archiving Enabled)
• Creating a Service Template for a Schema
• Creating a Service Template for a Pluggable Database
• Creating a Service Template for RAC Pluggable Database Using an Empty Pluggable Database
• Creating a Service Template for RAC Pluggable Database Using a Profile Pluggable Database
• Deleting a Database / Schema / Pluggable Database Service Template

46.3.5.3.1 Viewing Details of the Service Templates Resource

The configuration for GET request is shown in the table below.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "name": "Service Templates",
    "type": "Service Template",
    "totalResults": 5,
    "cfwItems": [
    {
        "id": "1",
        "name": "Database Creation on Individual Hosts",
        "guid": "203D5C842C2C17C3E053C075B10A73E3",
        "canonicalLink": {
            "href": "https://xyz.example.com:4473/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/1"
        }
    }
]```
46.3.5.3.2 Viewing Details of the ServiceTemplate Resource

The GET request on the ServiceTemplate URI can be issued to retrieve its details. The configuration for GET to ServiceTemplate is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/61</td>
</tr>
</tbody>
</table>

Table 46-41 GET Request Configuration for Viewing Details of the Service Template Resource
Table 46-41  (Cont.) GET Request Configuration for Viewing Details of the Service Template Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzXi6ZGVtb3VzXi=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

Chapter 46
Database as a Service Administrator Operations REST APIs

46-53
Note:

In the REST API body mentioned above:

- REF_ZONE indicates the reference zone among the zones to be associated with the template.
- REF_POOL indicates the reference pool among the pools to be associated with the template.
- REF_HOST indicates the host of the reference target from the pool targets.
- REF_TGT indicates the reference target from the pool targets.
- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as SELECT_ORACLE_HOME_AT_RUNTIME, or to be selected by the SSA user by entering the value as SELECT_ORACLE_HOME_FROM_REQUEST.

These parameters are mandatory and are required to identify the reference target to create the database.

A sample of the response received is shown below.

```
{
   "message": "Service template with ID "1C39F32393A709C3E053C075B10AEE15\" created successfully."
}
```

46.3.5.3.4 Creating a Service Template for Container Database

A POST operation is issued on Service Templates collection resource to create a Container based Database Service Template. The configuration for POST to Service Templates is as follows:

| | 
| | ,

**Note:**

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

- Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.

- To derive the ID of the Software Pool that needs to be entered as "values"(under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the `serviceTemplateTypeId` value, perform a GET operation on the URI `https://em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate "serviceType":"DB" in the JSON response. Note the `serviceTemplateTypeId` under "serviceType":"DB" and use the value in the POST body shown above.

**Request method**  
POST
Note:

In the REST API body mentioned above:

- REF_ZONE indicates the reference zone among the zones to be associated with the template.
- REF_POOL indicates the reference pool among the pools to be associated with the template.
- REF_HOST indicates the host of the reference target from the pool targets.
- REF_TGT indicates the reference target from the pool targets.
- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as SELECT_ORACLE_HOME_AT_RUNTIME, or to be selected by the SSA user by entering the value as SELECT_ORACLE_HOME_FROM_REQUEST.

These parameters are mandatory and are required to identify the reference target to create the database.

A sample of the response received is shown below.

```json
{
   "message": "Service template with ID \"1C39F32393A709C3E053C075B10AEE15\" created successfully."
}
```

46.3.5.3.6 Creating a Service Template for RMAN Based Single Instance Database with Single Instance Standby

A POST operation is issued on Service Templates collection resource to create a RMAN based Single Instance Database with Single Instance standby Service Template. The configuration for POST to Service Templates is as follows:

<td>]</td>
</tr>
</tbody>
</table>

**Note:**

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

  Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in **Cloud Resource**.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in **Viewing Details of the Software Pools Resource**.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate "serviceType": "DB" in the JSON response. Note the `serviceTemplateTypeId` under "serviceType": "DB" and use the value in the POST body shown above.
Note:

In the REST API body mentioned above:

- REF_ZONE indicates the reference zone among the zones to be associated with the template.
- REF_POOL indicates the reference pool among the pools to be associated with the template.
- REF_HOST indicates the host of the reference target from the pool targets.
- REF_TGT indicates the reference target from the pool targets.
- SELECT_ORACLE_HOME_OPTION allows the Oracle home to be automatically selected by entering the value as SELECT_ORACLE_HOME_AT_RUNTIME, or to be selected by the SSA user by entering the value as SELECT_ORACLE_HOME_FROM_REQUEST.

These parameters are mandatory and are required to identify the reference target to create the database.

A sample of the response received is shown below.

```json
{
  "message": "Service template with ID \"xxxx\" created successfully."
}
```

46.3.5.3.7 Creating a Service Template for RMAN Based RAC One Node Database

A POST operation is issued on Service Templates collection resource to create a RMAN based RAC One Node Database Service Template. The configuration for POST to Service Templates is as follows:

A sample of the response received is shown below.

```
{
  "message": "Service template with ID "xxxx" created successfully."
}
```

46.3.5.3.8 Creating a Service Template for RMAN Based RAC One Node Database With Standby

A POST operation is issued on Service Templates collection resource to create a RMAN based RAC One Node Database with Standby Service Template.

In the example shown below there are two standbys created, one standby RAC one node database is a Near DR (disaster recovery) created on the same pool as the primary RAC one node database, and the other standby Far DR database is a single instance database created on a different pool. This setup is essential for a disaster recovery setup wherein two standby databases are created for data protection. The POST body shown below can be modified to have only one standby database (either SI or RAC one node) as well.

The configuration is as follows:
### Table 46-47  POST Request Configuration for Creating a Service Template for RMAN Based RAC One Node Database With Standby

Note:

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id. The ID is provided at the end of the output. For example, in the output shown below, oracle:defaultService:em:provisioning: 1:cmp:COMP_Directives:none: 01AB6F25F31B7671E0537850B10A9B85:0.1 is the ID.

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.

- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - em/websvcs/restful/extws/cloudservices/admin/cfw/v2/serviceTemplates/templatetypes and locate "serviceType": "DB" in the JSON response. Note the serviceTemplateTypeId under "serviceType": "DB" and use the value in the POST body shown above.

Request method

POST

A sample of the response received is shown below.

{  
  "message": "Service template with ID "xxxx" created successfully."  
}

46.3.5.3.9 Creating a Service Template for RMAN Based RAC Database With Standby

A POST operation is issued on Service Templates collection resource to create a RMAN based RAC Database with Standby Service Template.
The configuration to create a RAC database with single instance standby database is similar to the configuration for a RAC database with a RAC one node standby. The only difference in the payloads to create different standbys is defined by the configuration parameter STANDBY_DB_DETAILS.

The sample value for the STANDBY_DB_DETAILS parameter for creating a RAC database with RAC one node standby is:

"pool=Near RAC DR Pool;databaseSIDPrefix=;databaseType=rac_database;isRACOne=Y;standbyConfigName=Near DR;redoMode=ASYNC;realtimeQuery=false;databaseDelay=60;databaseUniqueName=;standbyStorageType=FS;standbyStorageLocation=;standbyFRAType=FS;standbyFRAlocation=;standbyFRASize=;standbyLsnrPort=;domainName=us.example.com"

Whereas, the sample value for the STANDBY_DB_DETAILS parameter for creating a RAC database with single instance standby is:

"pool=Near DR Pool;databaseSIDPrefix=;databaseType=oracle_database;standbyConfigName=Near DR;redoMode=ASYNC;realtimeQuery=false;databaseDelay=60;databaseUniqueName=;standbyStorageType=FS;standbyStorageLocation=;standbyFRAType=FS;standbyFRAlocation=;standbyFRASize=;standbyLsnrPort=;domainName=us.example.com"

The sample POST configuration shown below is for a RAC database with single instance standby Service Template. Apply the required value for the STANDBY_DB_DETAILS parameter in the sample shown below:

<td>&quot;name&quot;: &quot;DEFAULT_DATABASE_SIZE&quot;, &quot;value&quot;: &quot;Big&quot;</td>
<td></td>
</tr>
</tbody>
</table>

**Note:**

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name=":Pre or Post Standby Database Script:" -show_entity_rev_id. The ID is provided at the end of the output. For example, in the output shown below, oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1 is the ID.

  Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.
- To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.
- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - `em/websvcs/restful/extwts/cloudservices/admin/cfw/v2/`

</tbody>
</table>

**Note:**

- To get the software library ID of the "DBAAS_SSA_CUSTOM_PRE_SCRIPTS_URN" and "DBAAS_SSA_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="Pre or Post Standby Database Script" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1 is the ID.

- Pre or Post Standby Database Script,0.1,Pre or Post Standby Database, Script,Ready,Directives,,Production,ORACLE,,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.
To derive the ID of the Software Pool that needs to be entered as "values" (under "lookupCharacteristics"), execute a GET request as shown in Viewing Details of the Software Pools Resource.

To derive the serviceTemplateTypeId value, perform a GET operation on the URI - em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes and locate "serviceType": "DB" in the JSON response. Note the serviceTemplateTypeId under "serviceType": "DB" and use the value in the POST body shown above.

A sample of the response received is shown below.

```
{
  "message": "Service template with ID \"xxxx\" created successfully."
}
```

46.3.5.3.12 Creating a Service Template for Snap Clone Single Instance Database (with Archiving Enabled)

Request method

A sample of the response received is shown below.

```json
{
    "message": "Service template with ID "xxxx" created successfully."
}
```

46.3.5.3.13 Creating a Service Template for Snap Clone Single Instance Database (without Archiving Enabled)

A POST operation is issued on Service Templates collection resource to create a Snap Clone single instance database (without archiving enabled) Service Template.

All the configuration values for the REST API for Snap Clone without archiving would remain the same as in the REST API for Snap Clone with archiving, except for the THIN_PROVISIONING:USE_ARCHIVING parameter. Ensure that the configuration value for "name": "THIN_PROVISIONING:USE_ARCHIVING" in the body is set to "value": "No" in the Table 46-51 for creating a Snap Clone single instance database (without Archiving enabled) Service template.

46.3.5.3.14 Creating a Service Template for a Schema
A POST operation is issued on Service Templates Collection resource to create a Schema Service Template. The configuration for POST to ServiceTemplates is as follows:

**Table 46-52  POST Request Configuration for Creating a Service Template for a Schema**

</tbody>
</table>

Note:
- To get the software library ID of the "PDBAAS_CUSTOM_PRE_SCRIPTS_URN" and "PDBAAS_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id. The ID is provided at the end of the output. For example, in the output shown below, oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1 is the ID.

- Pre or Post Standby Database Script,0.1,Pre or Post Standby Database Script,Ready,Directives,,Production,ORACLE,,,oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1

- To derive the REF_DATA_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.

- To derive the ID of the Software Pool that needs to be entered as "poolIds", execute a GET request as shown in Viewing Details of the Software Pools Resource.

- To derive the serviceTemplateTypeId value, perform a GET operation on the URI - em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes and locate "serviceType":"DB" in the JSON response. Note the serviceTemplateTypeId under...
Table 46-53  (Cont.) POST Request Configuration for Creating a Service Template for a Pluggable Database

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>&quot;serviceType&quot;:&quot;DB&quot;</td>
<td>and use the value in the POST body shown above.</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

**Note:**

In the table above, the SELECT_TARGET_OPTION parameter defines if the SSA User has the option to select the Container Database (CDB) while requesting for a PDB. If the value for the parameter is set as SELECT_TARGET_FROM_REQUEST, then the SSA User has the option to choose the CDB. If no value is defined, or if the value is set to SELECT_TARGET_AT_RUNTIME, then the placement algorithm selects the CDB.

A sample of the response received is shown below.

<tr>
<td>- To derive the REF_DATA_ZONE to be associated with the Service template, execute a GET request as shown in Cloud Resource.</td>
<td></td>
</tr>
<tr>
<td>- To derive the ID of the Software Pool that needs to be entered as &quot;poolIds&quot;, execute a GET request as shown in Viewing Details of the Software Pools Resource.</td>
<td></td>
</tr>
<tr>
<td>- To derive the serviceTemplateTypeId value, perform a GET operation on the URI <code>- em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes</code> and locate &quot;serviceType&quot;:&quot;DB&quot; in the JSON response. Note the serviceTemplateTypeId under &quot;serviceType&quot;:&quot;DB&quot; and use the value in the POST body shown above.</td>
<td></td>
</tr>
</tbody>
</table>

Request method POST

A sample of the response received is shown below.

```json
{
   "message": "Service template with ID \"xxxxx\" created successfully."
}
```

46.3.5.3.17 Creating a Service Template for RAC Pluggable Database Using a Profile Pluggable Database
A POST operation is issued on ServiceTemplates Collection resource to create a ServiceTemplate for a RAC Pluggable database using a profile Pluggable database. The configuration for POST to ServiceTemplates is as follows:

<td>&quot;value&quot;: &quot;prp&quot; }</td>
<td></td>
</tr>
<tr>
<td>}</td>
<td></td>
</tr>
</tbody>
</table>

Note:

- To get the software library ID of the "PDBAAS_CUSTOM_PRE_SCRIPTS_URN" and "PDBAAS_CUSTOM_POST_SCRIPTS_URN" run the EM CLI command `emcli list_swlib_entities -name="<Pre or Post Standby Database Script>" -show_entity_rev_id`. The ID is provided at the end of the output. For example, in the output shown below, `oracle:defaultService:em:provisioning:1:cmp:COMP_Directives:none:01AB6F25F31B7671E0537850B10A9B85:0.1` is the ID.

- To derive the `REF_DATA_ZONE` to be associated with the Service template, execute a GET request as shown in [Cloud Resource](#).

- To derive the ID of the Software Pool that needs to be entered as "poolIds", execute a GET request as shown in [Viewing Details of the Software Pools Resource](#).

- To derive the `serviceTemplateTypeId` value, perform a GET operation on the URI `- em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes` and locate "serviceType":"DB" in the JSON response. Note the `serviceTemplateTypeId` under "serviceType":"DB" and use the value in the POST body shown above.

<table>
<thead>
<tr>
<th>Request method</th>
<th>POST</th>
</tr>
</thead>
</table>
Note:

In the table above, the SELECT_TARGET_OPTION parameter defines if the SSA User has the option to select the Container Database (CDB) while requesting for a PDB. If the value for the parameter is set as SELECT_TARGET_FROM_REQUEST, then the SSA User has the option to choose the CDB. If no value is defined, or if the value is set to SELECT_TARGET_AT_RUNTIME, then the placement algorithm selects the CDB.

A sample of the response received is shown below.

```json
{
    "message": "Service template with ID \"xxxx\" created successfully."
}
```

### 46.3.5.3.18 Deleting a Database / Schema / Pluggable Database Service Template

The DELETE request on the URI of the Service Template can be issued to delete a ServiceTemplate Instance. The configuration for deleting in ServiceTemplate is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/servicetemplates/E87A364660A25B39E040F20A60510FDD</td>
</tr>
<tr>
<td>Note:</td>
<td>For Database Service Templates the URI is em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/61</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzXl6ZGVtb3VzXl=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "message": "Service Template \"E87A364660A25B39E040F20A60510FDD\" deleted successfully."
}
```
This chapter describes the resource models of Database as a Service (DBaaS) REST APIs for SSA user, and their responses. The REST APIs for the SSA user are classified based on the database type. The first section in this chapter provides a summary of all the REST APIs in this chapter whereas the following sections cover the REST APIs based on the database type. The sections in this chapter are as follows:

- **Summary of Database as a Service SSA User REST APIs**
- **Database as a Service**
  - DB Zone
  - DB Platform Template
  - DB Platform Instance
- **Schema as a Service**
  - Schema Platform Template
  - Schema Platform Instance
- **Pluggable Database as a Service**
  - Pluggable DB Platform Template
  - Pluggable DB Platform Instance

### 47.1 Summary of Database as a Service SSA User REST APIs

The table below shows a summary of all the DBaaS SSA user REST APIs covered in this chapter.

</table>

**Note:**

In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.

### 47.2 Database as a Service

This section describes the resource model for Database as a Service (DBaaS) REST APIs, and the REST request or response interactions.

This section contains the following topics:

- Database as a Service Resource Model
- Supported Operations for Database as a Service Resources
- Database as a Service REST API Examples
47.2.1 Database as a Service Resource Model

Cloud resources are organized by common service entities and specific services (for example, Database as a Service) provide resources by extending these common service entities. Figure 47-1 shows the DBaaS resource model:

Figure 47-1    Database as a Service Resource Model

The following sections describe the resources that are supported by the Database as a Service family type and provide examples of supported operations.

The resource models are:
47.2.1.1 DB Zone

DB Zone extends application/oracle.com.cloud.common.Zone. This resource represents the view of a PaaS Infrastructure Zone that supports DBaaS resources. DB Zone has the media type application/oracle.com.cloud.common.DbZone+json, and the URI format is /em/cloud/dbaas/zone/<zone id>.

The following table describes the DB Zone data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the Zone definition to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Zone. SHALL be a UNICODE string to support different languages.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Human readable description of the Zone. SHALL be a UNICODE string to support different languages.</td>
<td>0..1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The resource state of the resource.</td>
<td>1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>The name of the service family type that this zone is associated with. It is &quot;dbaas&quot; for this.</td>
<td>1</td>
</tr>
<tr>
<td>templates</td>
<td>Collection &lt;ServiceTemplate&gt;</td>
<td>Collection of the service templates that this zone supports and can be deployed into. Currently, DBPlatformTemplate is the only supported type.</td>
<td>1</td>
</tr>
<tr>
<td>service_instances</td>
<td>Collection &lt;ServiceInstance&gt;</td>
<td>Collection of the service instances that are created in this zone.</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the resource.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>The type of the zone which is &quot;self_service_zone&quot; by default.</td>
<td>1</td>
</tr>
<tr>
<td>context_id</td>
<td>String</td>
<td>Zone GUID</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>Can be used to perform cloud interactions like GET and POST.</td>
<td>1</td>
</tr>
<tr>
<td>default_db_size_name</td>
<td>String</td>
<td>Selected default database size.</td>
<td>1</td>
</tr>
<tr>
<td>db_sizes</td>
<td>List&lt;Object&gt;</td>
<td>List of available database sizes.</td>
<td>1</td>
</tr>
</tbody>
</table>

47.2.1.2 DB Platform Template

The DB Platform Template extends the Service Template resource. This resource represents service templates created for creating databases. The databases may be created using profiles which are created using database templates, rman backups,
and SnapClone. It is permissible to accept the Service Template media type on an instance of DB Platform Template. It is a preconfigured deployable service that realizes a DB Platform Instance resource. DB Platform Template has the media type `application/oracle.com.cloud.common.DbPlatformTemplate+json`, and the URI format is `/em/cloud/dbaas/dbplatformtemplate/<template id>`.

The following table describes the DB Platform Template data model.

### Table 47-3  DB Platform Template Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description given to the template</td>
<td>0..1</td>
</tr>
<tr>
<td>created</td>
<td>Timestamp</td>
<td>Date and time, in ISO 8601 format, when the template was created/last modified.</td>
<td>1</td>
</tr>
<tr>
<td>zones</td>
<td>Collection</td>
<td>List of all zones on which this service template is published</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>Denotes the type of Service Template. For example, &quot;dbaas&quot;.</td>
<td>1</td>
</tr>
<tr>
<td>service_instances</td>
<td>Collection</td>
<td>All service instances created based on this DBPlatformTemplate.</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the service template that this type represents.</td>
<td>1</td>
</tr>
<tr>
<td>db_type</td>
<td>String</td>
<td>Type of the Database when provisioned. It can have one of the two values: &quot;oracle_database&quot; and &quot;rac_database&quot;.</td>

</tr>
<tr>
<td>instance_configurable_params</td>
<td>String[]</td>
<td>List of parameters required to provision a DbPlatformInstance from this template. Username, Password, SID and Service name in this case.</td>
<td>1</td>
</tr>
<tr>
<td>deployment_params</td>
<td>List&lt;Object&gt;</td>
<td>Description of the parameters which are required while creating a service instance.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>The type of the service template which is &quot;dbaas&quot; by default.</td>
<td>1</td>
</tr>
<tr>
<td>subtype</td>
<td>String</td>
<td>The sub type of the instance created based on this template. It has a value &quot;db&quot; in this case.</td>
<td>1</td>
</tr>
<tr>
<td>node_count</td>
<td>Number</td>
<td>Number of Nodes. Implicit 1 for SI DB and explicit count for the RAC Db types.</td>
<td>0..1</td>
</tr>
<tr>
<td>db_version</td>
<td>String</td>
<td>Version of the database which can be created using this template.</td>
<td>0..1</td>
</tr>
<tr>
<td>context_id</td>
<td>URI</td>
<td>The unique id of the template.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 47-3  (Cont.) DB Platform Template Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>Can be used to perform cloud interactions like GET and POST.</td>
<td>1</td>
</tr>
</tbody>
</table>
| sid_option        | String  | Option for the ssa user to specify database SID while requesting DB. This field can have either of the following values:  
|                   |         | • 'ssauser' - SSA user needs to specify SID  
|                   |         | • 'prefix' - SSA user need not to specify SID                    | 1      |
| standby_enabled   | String  | Indicates whether standby is enabled in the template.            | 1      |
| standbydbs        | List<Object> | List of standby database configurations.                        | 1      |
| standby_protection_mode | String | Indicates the protection mode of the standby database.       | 1      |
| db_sizes          | List<Object> | List of available database sizes.                      | 1      |
| default_db_size_name | String | Selected default database size.                                 | 1      |

### 47.2.1.3 DB Platform Instance

The DB Platform Instance extends the Service Instance resource. It is linked to an Oracle Database Instance or Cluster Database target in Enterprise Manager Cloud Control. DB Platform Instance has the media type application/oracle.com.cloud.common.DbPlatformInstance+json, and the URI format is /em/cloud/dbaas/dbplatforminstance/byrequest/<request id>.

The following table describes the DB Platform Instance Data Model.

### Table 47-4  DB Platform Instance Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>

47.2.3 Database as a Service REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control with Cloud Application plug-in 12.1.0.4 and higher. The following examples are covered:

- Viewing Details of All the Cloud Resources
- Filtering Output for Specific Resource Attributes
- Viewing Details of the Service Family Type Resource
- Viewing Details of the Service Instance Type Resource
- Viewing Details of a Service Requests Resource
- Viewing Details of the DB Zone
- Viewing Details of the DB Platform Template Resource
- Creating a Database Instance
  - Creating a Database by Passing a Request on the DB Zone
Creating a Database by Passing a Request on the DB Platform Template

- Viewing the Database Creation Details
- Updating a Database
- Deleting a Database Instance
- Lifecycle operations on a Database Instance
  - Shutting down a Database
  - Starting up a Database
  - Scheduling a Backup of the Database
  - Restoring a Database from a Backup
  - Adding a Standby Database
  - Removing a Standby Database
  - Refreshing a Database
- Lifecycle operations on a Snap clone Database Instance
  - Creating a Snapshot
  - Restoring from a Snapshot List
  - Deleting a Snapshot

47.2.3.1 Viewing Details of All the Cloud Resources

Use the top level /em/cloud to introspect the Cloud resource. The operation explained herein lists all the resources accessible to the user.

Table 47-6  GET Request Configuration for Viewing Details of All the Cloud Resources

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the Cloud resource is shown below.

```json
{
  "uri": "/em/cloud",

    }
  ]
}
47.2.3.2 Filtering Output for Specific Resource Attributes

The following description indicates the interaction with the cloud resource for identifying specific attributes (service family type in this case):

Table 47-7  GET Request Configuration for Filtering Specific Resource Attributes

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud?service_family_types,name</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "name": "Oracle Cloud by Enterprise Manager",
  "service_family_types": [
    {
      "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
      "total": "4",
      "elements": [
        {
          "uri": "/em/cloud/service_family_type/jaas",
          "name": "jaas",
          "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
          "type": "jaas",
          "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/jaas"
        },
        {
          "uri": "/em/cloud/service_family_type/dbaas",
          "name": "dbaas",
          "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
          "type": "dbaas",
          "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/dbaas"
        },
        {
          "uri": "/em/cloud/service_family_type/opc",
          "name": "opc",
          "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
          "type": "opc",
          "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/opc"
        }
      ]
    }
  ]
}
```
This feature, where only selective attributes are gathered and returned to the client, is supported on all the common resources.

47.2.3.3 Viewing Details of the Service Family Type Resource

The GET operation on the Service Family Type resource lists all the DBaaS resources accessible to a user. The configuration for the Service Family Type resource is as follows:

Table 47-8    GET Request Configuration for Viewing Details of the Service Family Type Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/service_family_types/dbaas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

X-specification-version: 10001
Content-Type: application/oracle.com.cloud.common.ServiceFamilyType+json;
charset=ISO-8859-1
{
  "uri": "/em/cloud/service_family_type/dbaas",
  "name": "dbaas",
  "resource_state": {
    "state": "READY"
  },
  "media_type": "application/oracle.com.cloud.common.ServiceFamilyType+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/dbaas",
  "type": "dbaas",
  "service_templates": {
    "media_type": "application/oracle.com.cloud.common.ServiceTemplate+json",
    "total": "2",
    "elements": [
      {
        "uri": "/em/cloud/dbaas/dbplatformtemplate/DEC94FE6D49DAA21E040F20A60511D14",
        "name": "SLC01NBV_SNAPCLONE_ST",
        "description": "",
        "media_type": "application/oracle.com.cloud.common.DbPlatformTemplate+json",
        "service_family_type": "dbaas",
      }
    ]
  }
}
"elements": [ 
    {
      "uri": "/em/cloud/request/DEC87CE5B1DA175DE040F20A605150F8",
      "name": "SLC01NBV_DBCA_ST - Mon Jun 10 00:20:08 PDT 2013_CREATE_20_25",
      "media_type": "application/oracle.com.cloud.common.Request+json",
      "status": "SUCCESS",
      "lifecycle_type": "CREATE",
      "canonicalLink": "https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/cloud/request/DEC87CE5B1DA175DE040F20A605150F8"
    }
  ]
}

The media type application/oracle.com.cloud.common.ServiceFamilyType+json is returned automatically as the most detailed resource.

### 47.2.3.4 Viewing Details of the Service Instance Type Resource

A GET request on a Service Instance Type resource list all the supported services that are provided by a particular service family type.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/instance_type/dbPlatformInstance%40dbaas</td>
</tr>
<tr>
<td>Request headers</td>

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/instance_type/dbPlatformInstance%40dbaas",
  "name": "dbPlatformInstance",
  "description": "Db Instance",
  "media_type": "application/oracle.com.cloud.common.InstanceType+json",
  "instance_media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/instance_type/dbPlatformInstance%40dbaas"
}
```

### 47.2.3.5 Viewing Details of a Service Requests Resource

A GET request on a Service Requests resource lists the details of a service request.
Table 47-10  GET Request Configuration for Viewing Details of a Service Request Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests/&lt;request_id&gt;</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "id": "21",
  "name": "Request a RAC One Database_CREATE_43_47#21",
  "status": "SUCCESS",
  "serviceType": "DB",
  "serviceFamily": "DBAAS",
  "actionName": "Create Database",
  "startDate": "2015-07-21T17:13:47Z",
  "createdOn": "2015-07-21T17:13:47Z",
  "createdBy": "SYSMAN",
  "owner": "SYSMAN",
  "canonicalLink": {

}
```

47.2.3.6 Viewing Details of the DB Zone

A GET request on a zone lists all the resources available in the zone. The DB zone resource configuration is as follows:

Table 47-11  GET Request Configuration for Viewing Details of the DB Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/zone/82CF1C28FA20A183C99D138FF8065F19</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri" : "/em/cloud/dbaas/zone/B49F86387B81DAED9A3D672D722CF29D",
```
47.2.3.7 Viewing Details of the DB Platform Template Resource

A GET request on the DB Platform Template resource provides details of a DB Service Template.

As shown in previous examples, the elements in the collection shown all have media_type as an attribute to clearly indicate what its resource type is.
Table 47-12  GET Request Configuration for Viewing Details of the DB Platform Template Resource

"units": "cores"
},
{
"name": "Memory",
"value": "4",
"units": "GB"
}
]
In the sample output shown above, the GET on the service template configured for a single instance database shows `hosts_for_placement` parameter instead of `clusters_for_placement`.

### 47.2.3.8 Creating a Database Instance

This section describes how to create a service instance using Cloud resources. As DB is a service instance in the service family type `dbaas`, you need to identify the zone of the same family type to create the database. There are two approaches to creating a database:

1. By issuing a POST request on the DB Zone on which the database is to reside.
2. By issuing a POST request on the DB Platform Template of which the database is to be based on.

Note the attributes in the submitted body for the POST. The pattern is the same for other service instance creations. Since the intention is clear, the `zone` attribute is not required while performing POST on the DB Zone. Similarly, the `based_on` attribute is not needed when performing POST on the DB Platform Template.

The two approaches to create a database are described in the following sections:

- [Creating a Database by Passing a Request on the DB Zone](#)
- [Creating a Database by Passing a Request on the DB Platform Template](#)

#### 47.2.3.8.1 Creating a Database by Passing a Request on the DB Zone

The configuration for performing POST to the Db Zone is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/zone/82CF1C28FA20A183C99D138FF8065F19</code></td>
</tr>
</tbody>
</table>
Table 47-13 (Cont.) POST Request Configuration for Creating a Database by Passing a Request on the DB Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| **Request headers** | Authorization: basic ZGVtb3VzX1I6ZGVtb3VzX1I=  
|                  | Content-Type: application/oracle.com.cloud.common.DbPlatformInstance+json  
|                  | Accept: application/oracle.com.cloud.common.DbPlatformInstance+json         |

**Body**

```json
{
  "based_on": "/em/cloud/dbaas/dbplatformtemplate/4107",
  "name": "SI_12C_WEBMSWIN1252.AL16.UTF16.8192.LRG.001",
  "description": "",
  "start_date": "2013-08-02T14:20:00Z\nAsia/Calcutta",
  "end_date": "2013-08-02T17:20:00Z\nAsia/Calcutta",
  "standby_required": "true",
  "params": {
    "username": "maoracle",
    "password": "maoracle",
    "database_sid": "dngdb05h",
    "service_name": "dngdb05h_svc",
    "common_domain_name": "us.oracle.com",
    "standbydbs": [
      {
        "standbydb_name": "standby",
        "standbydb_sid": "dngdb06h",
        "standbydb_domain_name": "us.oracle.com"
      }
    ]
  }
}
```

**Request method**

POST

---

**Note:**

In the body above **start_date** indicates the time, time zone and date when the request is scheduled to create the database and **end_date** indicates when the database should be deleted. These parameters are optional.

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/21",
  "name": "Test_create_intance",
  "resource_state": {
    "state": "INITIATED",
    "messages": [
      {
        "date": "2014-11-25T09:52:49+0000",
        "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/22"
      }
    ]
  }
}
```
47.2.3.8.2 Creating a Database by Passing a Request on the DB Platform Template

The configuration for performing POST to the DbPlatformTemplate is as follows:

Table 47-14 POST Request Configuration for Creating a Database by Passing a Request on the DB Platform Template

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatformtemplate/CC3BBB665A6BC6FFE040F00AEEF252456</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;zone&quot;: &quot;/em/cloud/dbaas/zone/82CF1C26FA20A183C99D138FF8065F19&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;&lt;Request name&gt;&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;description&quot;: &quot;&lt;Request Description&gt;&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;standby_required&quot;: &quot;true&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;params&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;username&quot;: &quot;Master Account username for the DB&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;password&quot;: &quot;Password for the Master Account on the DB&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;database_sid&quot;: &quot;Database SID&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;service_name&quot;: &quot;Name of the additional service to be created&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;database_host_name&quot;: &quot;abc.mycompany.com,def.mycompany.com&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;db_size_name&quot;: &quot;Medium&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;standbydbs&quot;: [</td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;standbydb_name&quot;: &quot;STBY2&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;standbydb_sid&quot;: &quot;stio62&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>&quot;database_profile_version&quot;: &quot;RMAN_06_27_2014_14_18_PM&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Request method POST
Note:

- database_host_name parameter is mandatory if the service template is configured for custom placement.
- The value for the database_host_name parameter should be a host present in the same zone.
- For a SI database provide only one host name. For a RAC database the number of hosts provided should be equal to the number of nodes in the node_count, within the same zone that is specified, and in a single cluster.

A sample of the response received is shown below.

```json
{
    "uri" : "https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/cloud/dbaas/dbplatforminstance/byrequest/22" ,
    "name" : "Test_create_instance" ,
    "resource_state" : {
        "state" : "INITIATED"
    },
    "media_type" : "application/oracle.com.cloud.common.DbPlatformInstance+json" ,
    "canonicalLink" : "https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/cloud/dbaas/dbplatforminstance/byrequest/23" ,
    "status" : "SCHEDULED"
}
```

The response shown above is the same as the previous version. If the zone is not specified, then it is not possible for the web service to determine where the DB should be deployed.

47.2.3.8.3 Creating a Container Database Instance

The configuration for performing POST to the Container Database Instance is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/zone/82CF1C28FA20A183C99D138FF8065F19</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
</tbody>
</table>
Table 47-15  (Cont.) POST Request Configuration for Creating a Container Database Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td></td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
</tbody>
</table>
|         |   "based_on": "/em/cloud/dbaas/dbplatformtemplate/142",
|         |   "name": "CDB instance request via REST",
|         |   "description": "cdb using rest api",
|         |   "params": { |
|         |     "database_sid": "rstcdb1",
|         |     "username": "c##oracle",
|         |     "password": "welcome",
|         |     "service_name": "srvc_rstcdb1",
|         |     "pdb_name": "rstcpdb1"
|         |   }         |
|         | }           |
| Request method | POST |

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/21",
  "name": "Test_create_instance",
  "resource_state": {
    "state": "INITIATED"
  }
}
```

47.2.3.9 Viewing the Database Creation Details

After the POST is performed for the database creation, you can perform the GET operation on the resource identified by the return URI to keep track of the status.

Table 47-16  GET Request Configuration for Viewing the Database Creation Details

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatforminstance/byrequest/7</td>
</tr>
</tbody>
</table>
Table 47-16 (Cont.) GET Request Configuration for Viewing the Database Creation Details

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/22",
  "name": "Test_create_instance_CREATE_55_42",
  "description": "Create Database for test.",
  "resource_state": {
    "state": "CREATING"
  },
  "context_id": "22",
  "media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
  "status": "IN_PROGRESS",
  "created": "2013-06-07 23:09:04",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/dbplatforminstance/byrequest/22"
}
```

Note that the `resource_state` attribute shows CREATING state to indicate that the database is being created. If the GET operation is performed after the database is created, the response displays the database resource in READY state, as shown below:

```json
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/22",
  "name": "db000000.mycompany.com",
  "resource_state": {
    "state": "READY",
    "messages": [
      {
        "date": "2014-11-25T09:52:49+0000",
        "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/22",
        "text": "Delete Request ID is : 22"
      }
    ]
  },
  "context_id": "22",
  "media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/dbplatforminstance/byrequest/22",

47.2.3.10 Updating a Database

A database which is associated to an older version of the image associated to the software pool, can be updated to the latest version (latest version of the Oracle home). To do so, execute the POST REST API shown below.
Note:
The database can be updated only to the latest version.

Table 47-17  POST Request Configuration for Updating a Database

<table>
<thead>
<tr>
<th>Feature</th>

47.2.3.11 Deleting a Database Instance

The DELETE operation on the URI of the resource can be run to delete a DB Service Instance. The configuration values for the DELETE operation are:

Table 47-18  DELETE Request Configuration for Deleting a Database Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatforminstance/byrequest/7</td>
</tr>
</tbody>
</table>
Table 47-18  (Cont.) DELETE Request Configuration for Deleting a Database Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/22",
  "name": "db000000.mycompany.com",
  "resource_state": {
    "state": "DESTROYING",
    "messages": [
      {
        "text": "Submit DELETE operation on application/oracle.com.cloud.common.DbPlatformInstance+json 'db000000.mycompany.com'. The process has job id '41'",
        "date": "2013-06-07T23:16:20+0000"
      }
    ]
  },
  "context_id": "22",
  "media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/dbplatforminstance/byrequest/22",
  "type": "rac_database"
}
```

After a few minutes, the GET operation on the database URI will result in the following interaction:

Table 47-19  GET Request Configuration for Viewing the Database Creation Details

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/dbaas/dbplatforminstance/byrequest/7</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

The web service responds with the following details:

```
{
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/23",
  "name": "sidb0001.host1.mycompany.com",
  "resource_state": {
    "state": "DESTROYING"
  }
}```
The database status indicates DELETED after the database is deleted.

47.2.3.12 Lifecycle operations on a Database Instance

The POST request on the URI of the resource can be issued to perform an operation on a database.

You can perform the following operations using a POST request:

- Shutting down a Database
- Starting up a Database
- Scheduling a Backup of the Database
- Restoring a Database from a Backup
- Adding a Standby Database
- Removing a Standby Database
- Refreshing a Database

47.2.3.12.1 Shutting down a Database

The configurations for the POST on a DbPlatformInstance is as follows:
### Table 47-20  POST Request Configuration for Shutting Down a Database

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatforminstance/byrequest/7</td>

      "units" : "MB"
    }
  ]
}
```
47.2.3.12.3 Scheduling a Backup of the Database

For scheduling a backup of the database the user has to provide the time at which backups needs to scheduled. This should be in the `YYYY-MM-DDTHH:MM:SSZFullTimeZonename` format.

For example, to schedule in PST time you should enter `2013-08-27T12:34:45ZAmerica/Los_Angeles`. The time zone portion is optional. If you do not want to provide the time zone, then enter `2013-08-27T12:34:45Z`.

If a POST request to schedule a backup has already been issued, the subsequent POST request to schedule the backup will reschedule the backup time as per the latest POST request.

The configurations for the POST on a DbPlatformInstance is as follows:

**Table 47-22  POST Request Configuration for Scheduling a Backup of the Database**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatforminstance/byrequest/7</td>
</tr>
</tbody>
</table>
| Request headers  | Authorization: basic ZGVtb3VvZXI6ZGVtb3VzZXI=  
|                  | Content-Type: application/oracle.com.cloud.common.DbPlatformInstance+json  
|                  | Accept: application/oracle.com.cloud.common.DbPlatformInstance+json |
| Body             |  
|                  | {  
|                  |   "operation" : "BACKUP",  
|                  |   "backup_schedule" : "2013-08-27T12:34:45ZAsia/Calcutta"  
|                  | } |
| Request method   | POST |

A sample of the response received is shown below.

```json
{
  "uri" : "/em/cloud/dbaas/dbplatforminstance/byrequest/101" ,
  "name" : "dbc00000.xyxy.example.com" ,
  "resource_state" : {  
    "state" : "INITIATED" ,
```
"messages": {
  "date": "2013-08-27T07:17:56+0000",
  "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/129",
  "text": "Successfully submitted BACKUP operation on service instance. Request id - 129."
}
"context_id": "101",
"media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
"canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/dbplatforminstance/byrequest/101",
"status": "RUNNING",
"created": "2013-08-26 05:09:13",
"based_on": "/em/cloud/dbaas/dbplatformtemplate/E409626BC260F517E040F20A605152CD",
"connect_string": "(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP)(HOST=xyxy.example.com)(PORT=1521)))(CONNECT_DATA=(SID=dbc00000)))",
"target_type": "oracle_database",
"destination_zone": "/em/cloud/dbaas/zone/675B859C36772FB7856771B1D57F79F8",
"total_sessions": "0",

```
47.2.3.12.4 Restoring a Database from a Backup

To restore a database from a backup, the user has to provide the point-in-time when the database is to be restored. The time mentioned should be in the `YYYY-MM-DDTHH:MM:SSZFullTimeZonename` format.

For example, to schedule in PST time you should enter `2013-08-27T12:34:45ZAmerica/Los_Angeles`. Time zone is optional. If you do not want to provide the time zone, enter `2013-08-27T12:34:45Z`.

The restore time is based on the backups available. Refer to `RMAN_backup_list` section in the output of the GET request.

The configurations for the POST on a DbPlatformInstance is as follows:

**Table 47-23** POST Request Configuration for Restoring Database from a Backup

<table>

47.2.3.13 Lifecycle operations on a Snap clone Database Instance

The POST request on the URI of the resource can be run to perform an operation on a database. The following operations can be performed by using POST.

- Creating a Snapshot
- Restoring from a Snapshot List
- Deleting a Snapshot

47.2.3.13.1 Creating a Snapshot

The configurations for the POST on a DbPlatformInstance is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/dbplatforminstance/byrequest/7</code></td>
</tr>
</tbody>
</table>
Table 47-27 (Cont.) POST Request Configuration for Creating a Snapshot

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXIt6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.common.DbPlatformInstance+json</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;operation&quot;: &quot;CREATE_PROFILE&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;snapshot_name&quot;: &quot;test_API_export&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;snapshot_desc&quot;: &quot;testing export option from APIs&quot;</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/101",
    "name": "dbc00000.xyxy.example.com",
    "resource_state": {
        "state": "INITIATED",
        "messages": [
            {
                "date": "2013-08-27T07:17:56+0000",
                "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/129",
                "text": "Successfully submitted CREATE_PROFILE operation on service instance. Request id - 130."
            }
        ]
    },
    "context_id": "101",
    "media_type": "application/oracle.com.cloud.common.DbPlatformInstance+json",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/dbplatforminstance/byrequest/101",
    "status": "RUNNING",
    "created": "2013-08-26 05:09:13",
    "based_on": "/em/cloud/dbaas/dbplatformtemplate/E4D9626BC260F517E040F20A605152CD",
    "connect_string": "(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP)(HOST=host1)(PORT=1521))(CONNECT_DATA=(SID=dbc00000)))",
    "target_type": "oracle_database",
    "destination_zone": "/em/cloud/dbaas/zone/675B859C36772FB7856771B1D57F79F8",
    "total_sessions": "0",
    "last_backup": "null",
    "master_username": "test",
    "db_version": "11.2.0.2.0",
    "average_active_sessions": "null",
    "allocated_sessions": "46",
    "measurable_attributes": [
        {
            "name": "up_time",
            "value": "0",
            "units": "Hours"
        }
    ]
}
```
After the snapshot is created, the response of a GET operations yields the result shown below.

```
{
    "uri": "/em/cloud/dbaas/dbplatforminstance/byrequest/101",
    "name": "dbc00000.xyxy.example.com",

47.3 Schema as a Service

This section describes the resource model for Schema as a Service (SchaaS) REST API and the REST request/response interactions.

**Note:**

SchaaS REST APIs are only supported by the Oracle Cloud Application plug-in version 12.1.0.6.0 and higher

This section contains the following topics:

- **Schema as a Service Resource Model**
- **Supported Operations for Schema as a Service Resources**
- **Schema as a Service REST API Examples**

### 47.3.1 Schema as a Service Resource Model

Cloud resources are organized by common service entities, and specific services (for example, Schema as a Service) provide resources by extending these common service entities. The figure below shows the SchaaS resource model.
The following sections describe the resources that are supported by the Schema as a Service REST APIs and provide examples of supported operations. Schema as a Service uses the same Cloud, Service Family, and DB Zone resources as described in Database as a Service Resource Model.

The following resource models are described:

- Schema Platform Template
- Schema Platform Instance

### 47.3.1.1 Schema Platform Template

The Schema Platform Template extends the Service Template resource. It represents the service template created for Schema Service creation. It can be a template for creating a schema service using profile based schemas (schema with data) or for creating a schema service containing empty schemas.

It is permissible to accept the Service Template media type on an instance of Schema Platform Template. It is a preconfigured deployable service that realizes a Schema Platform Instance resource. Schema Platform Template has the media type
The following table describes the Schema Platform Template Data Model.

### Table 47-30  Schema Platform Template Data Model

47.3.3 Schema as a Service REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control with Cloud Application plug-in 12.1.0.6 and higher. The examples for GET on cloud, GET on dbaas family type and GET on Db Zone are covered in the Dbaas REST APIs section. The following examples are covered:

- Viewing Details of the Schema Platform Template Resource
- Creating a Schema Service
  - Creating a Schema by Passing a Request on the DB Zone
  - Creating a Schema by Passing a Request on the Schema Platform Template
- Viewing Details of the Schema Service Creation
- Deleting a Schema Service
- Object Missing
  - Exporting a Schema
  - Restoring a Schema from Exported Schema Dumps
  - Deleting the Exported Schema Dumps
  - Changing Schema Passwords

47.3.3.1 Viewing Details of the Schema Platform Template Resource

A GET request on the Schema Platform Template resource provides the details of the resource.
Table 47-33  GET Request Configuration for Viewing Details of the Schema Platform Template Resource

47.3.3.2 Creating a Schema Service

This section describes how to create a database service using the Cloud resources. As Database service is also a service instance in the service family type `dbaas`, you need to identify the zone of the same family type in which to create the database service. There are two approaches to creating a database service:

- By passing a POST request on the DB Zone on which DB service is to be created
- By passing a POST request on the Schema Platform Template resource of which the database service is to be based on

Note the attributes in the submitted body for the POST. The pattern is the same for other service instance creations. Since the intention is clear, the `zone` attribute is not required while performing the POST operation to the Db Zone. Similarly, the `based_on` attribute is not needed when performing the POST operation to the SchemaPlatformTemplate.

The following operations are described in this section:

- Creating a Schema by Passing a Request on the DB Zone
- Creating a Schema by Passing a Request on the Schema Platform Template

47.3.3.2.1 Creating a Schema by Passing a Request on the DB Zone

The configuration for performing POST to DB Zone is as follows:
Table 47-34  POST Request Configuration for Creating a Schema by Passing a Request on the DB Zone

<table>

                                "original_name": "SCHEMA_USER_2" ,  
                                "password": "sunset1"  
                              }  
                            ] ,  
                            "workload_name": "SMALL" ,  
                            "service_name": "TestService" ,  
                            "masterAccount": "Schema_User11_01" ,  
                            "tablespaces": [  
                              {  
                                "old_tablespace_name": "DUMPTBSP2" ,  
                                "new_tablespace_name": "tablespace2"  
                              } ,  
                              {  
                                "old_tablespace_name": "DUMPTBSP1" ,  
                                "new_tablespace_name": "tablespace1"  
                              }  
                            ]  
                          } ,  
                          "zone": "/em/cloud/dbaas/zone/9A71CBEA8CA367D0D0425697DC39B3AF9"  
                      } |

**Request method**: POST

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/23" ,  
  "name": "TestRequest" ,  
  "resource_state": {  
    "state": "INITIATED"  
  } ,
} ```
The response shown above is the same as the previous version. If the zone is not specified, then it is not possible for the web service to determine where the database service should be deployed.

47.3.3.3 Viewing Details of the Schema Service Creation

After the database service creation has been performed by performing the POST operation, you can perform the GET operation to get the resource identified by the return URI to keep track of the status.

### Table 47-36  GET Request Configuration for Viewing Details of the Schema Service Creation

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatforminstance/byrequest/22</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/22",
  "name": "TestRequest_CREATE_55_42",
  "description": "Create Service for test.",
  "resource_state": {
    "state": "CREATING",
    "context_id": "22",
    "media_type": "application/oracle.com.cloud.common.SchemaPlatformInstance+json",
    "status": "IN_PROGRESS",
    "created": "2013-06-07 23:09:04",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/22"
  }
}
```

Note that the `resource_state` attribute shows `CREATING` to indicate that the database service is being created. After the database service is created, the GET operation returns the database service resource with `READY` state, as shown below:

```
{
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/22",
  "name": "Service_1_35E576F22E97E",
  "resource_state": {
    "state": "READY"
  }
}
```
47.3.3.4 Deleting a Schema Service

The DELETE request can be issued on the URI of the resource to delete a database service. The configuration for the DELETE request is as follows:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatforminstance/byrequest/22</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "uri" : "/em/cloud/dbaas/schemaplatforminstance/byrequest/22" ,
    "name" : "Service_1_35E576F22E97E" ,
    "resource_state" : {
        "state" : "DESTROYING" ,
        "messages" : [
            {
                "text" : "Submit 'DELETE' operation on 'application/oracle.com.cloud.common.SchemaPlatformInstance+json' 'Service_1_35E576F22E97E'. The process has job id '41'" ,
                "date" : "2013-06-07T23:16:20+0000"
            }
        ]
    }
}
```
After some time, a GET request on the database service URI results in the following interaction:

Table 47-38  GET Request Configuration for Viewing the Status of the Schema Service

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/dbaas/schemaplatforminstance/byrequest/22</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/22",
  "name": "Service_1_35E576F22E97E",
  "resource_state": {
    "state": "DESTROYING"
  },
  "context_id": "2",
  "media_type": "application/oracle.com.cloud.common.SchemaPlatformInstance+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/22",
  "type": "oracle_dbsvc"
}
```

The status of the database service shows **DELETED** after the schema service is deleted.

### 47.3.3.5 Object Missing

This object is not available in the repository.

#### 47.3.3.5.1 Exporting a Schema
For exporting schema, the user can optionally provide the date at which the export should be taken. The date and time should be in the `YYYY-MM-DDTHH:MM:SSZFullTimeZonename` format.

For example to schedule in PST time user should enter

```
2013-08-27T12:34:45ZAmerica/Los_Angeles
```

However, the time zone is optional. If you do not want to provide the time zone, then enter: `2013-08-27T12:34:45Z`.

The configurations for the POST on a SchemaPlatformInstance is described below:

**Table 47-39  POST Request Configuration for Exporting a Schema**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatforminstance/byrequest/7</code></td>
</tr>
</tbody>
</table>
| Request headers    | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
|                    | Content-Type: application/oracle.com.cloud.common.SchemaPlatformInstance +json  
| Body               | {  
|                    |   "operation" : "EXPORT",  
|                    |   "profile_name" : "test_API_export",  
|                    |   "profile_desc" : "testing export option from APIs",  
|                    |   "export_schedule" : "2013-07-31T02:10:45ZAsia/Calcutta"  
| Request method     | POST                                                                                    |

A sample of the response received is shown below.

```
{
  "uri" : "/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,
  "name" : "Service_8E958EC718B11" ,
  "resource_state" : {  
    "state" : "INITIATED" ,
    "messages" : [  
      {  
        "date" : "2013-08-27T07:34:43+0000" ,
        "text" : "Successfully submitted EXPORT operation on schema instance. Request id - 130." ,
        "uri" : "/em/cloud/dbaas/schemaplatforminstance/byrequest/130"
      }
    ]
  }
}
```

Request id - 130.

```
"context_id" : "123" ,
"media_type" : "application/oracle.com.cloud.common.SchemaPlatformInstance+json" ,
"canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,
"target_type" : "oracle_dbsvc"
```
After the export operation is completed, a GET operation on schema service yields below output

```
{
    "uri" : "/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,
    "name" : "Service_E895BE718B11" ,
    "resource_state" : {
        "state" : "READY"
    } ,
    "context_id" : "123" ,
    "media_type" : "application/oracle.com.cloud.common.SchemaPlatformInstance+json" ,
    "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,
    "status" : "RUNNING" ,
    "created" : "2013-08-26 23:49:30" ,
    "based_on" : "/em/cloud/dbaas/schemaplatformtemplate/E4D9626BC252F17E040F20A605152CD" ,
    "target_type" : "oracle_dbsvc" ,
    "connect_string" : "(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP)(HOST=host1)(PORT=1521)))(CONNECT_DATA=(SERVICE_NAME=Service_8E95BE718B11.us.example.com)))" ,
    "destination_zone" : "/em/cloud/dbaas/zone/675B859C36772FB7856771B1D57F79F8" ,
    "schema_list" : [
        {
            "service_name_prefix" : "" ,
            "workload_name" : "" ,
            "schema" : [
                {
                    "username" : "",
                    "original_name" : "schema200" ,
                    "password" : ""
                }
            ]
        }
    ] ,
    "db_version" : "11.2.0.2.0" ,
    "export_dump_list" : [
        {
            "name" : "test_API_export" ,
            "description" : "testing export option from APIs" ,
            "status" : "Ready"
        }
    ]
}
```

47.3.3.5.2 Restoring a Schema from Exported Schema Dumps

The restore schema from dump activity is based on the available export dumps. Refer to export_dump_list section in the output of the GET request to view the URN of the dump.

The configurations for the POST on a SchemaPlatformInstance are described below:
Table 47-40  POST Request Configuration for Restoring a Schema from the Exported Schema Dumps

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatforminstance/byrequest/7</td>
</tr>
</tbody>
</table>
| Request headers    | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
Content-Type: application/oracle.com.cloud.common.SchemaPlatformInstance +json  
| Body               | {  
  "operation": "IMPORT",  
  "state": "INITIATED",  
  "messages": [  
    {  
      "date": "2013-08-27T07:34:43+0000",  
      "text": "Successfully submitted IMPORT operation on schema instance. Request id - 132."  
    }  
  ] |
| Request method     | POST |

A sample of the response from the above interaction is shown below.

```json
{
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/123",
  "name": "Service_8E958EC718B11",
  "resource_state": {  
    "state": "INITIATED",
    "messages": [
      {  
        "date": "2013-08-27T07:34:43+0000",
        "text": "Successfully submitted IMPORT operation on schema instance. Request id - 132."
      }
    ]
  },
  "context_id": "123",
  "media_type": "application/oracle.com.cloud.common.SchemaPlatformInstance+json",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/123",
  "target_type": "oracle_dbservice"
}
```

47.3.3.5.3 Deleting the Exported Schema Dumps

Deleting the export dump depends on the available export dumps. Refer to `export_dump_list` section in the output of the GET request to view the URN of the dump.

The configuration for the POST on a SchemaPlatformInstance is as follows:
Table 47-41  POST Request Configuration for Deleting the Exported Schema Dumps

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatforminstance/byrequest/7</td>
</tr>
</tbody>
</table>
| Request headers          | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
                          | Content-Type: application/oracle.com.cloud.common.SchemaPlatformInstance +json |
| Body                     | {  
                          |   "operation": "DELETE_EXPORT",  
                          |   "profile_urn": "oracle:defaultService:em:provisioning:  
                          |   "cmp:COMP_Component:SUB_DbProfile:DECB2AAA09CCD711E040F20A60514F92:0.1"  
                          | } |

Request method POST

A sample of the response received is shown below.

```
{  
  "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,  
  "name": "Service_8E958EC718B11" ,  
  "resource_state": {  
    "state": "INITIATED" ,  
    "messages": [  
      {  
        "date": "2013-08-27T07:34:43+0000" ,  
        "text": "Successfully submitted DELETE_EXPORT operation on schema instance. Request id - 135." ,  
        "uri": "/em/cloud/dbaas/schemaplatforminstance/byrequest/135"  
      }  
    ]  
  } ,  
  "context_id": "123" ,  
  "media_type": "application/oracle.com.cloud.common.SchemaPlatformInstance+json" ,  
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/schemaplatforminstance/byrequest/123" ,  
  "target_type": "oracle_dbsvc"  
}
```

47.3.3.5.4 Changing Schema Passwords

The configuration for the POST on a SchemaPlatformInstance is as follows:
Table 47-42  POST Request Configuration for Changing the Schema Passwords

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/schemaplatinstance/byrequest/7</td>
</tr>
</tbody>
</table>
| **Request headers** | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
Content-Type: application/oracle.com.cloud.common.SchemaPlatformInstance +json  
| **Body**         | {  
  "operation" : "CHANGE_PWD",  
  "schema_name" : "schema1",  
  "new_password" : "welcome"  
} |
| **Request method** | POST |

A sample of the response from the above interaction is shown below.

```
{
  "uri" : "/em/cloud/dbaas/schemaplatinstance/byrequest/123" ,
  "name" : "Service_8E958EC718B11" ,
  "resource_state" : {  
    "state" : "INITIATED" , 
    "messages" : [  
      {  
        "date" : "2013-08-27T07:34:43+0000" ,
        "text" : "Successfully submitted CHANGE_PWD operation on schema instance. Request id - 136." ,
        "uri" : "/em/cloud/dbaas/schemaplatinstance/byrequest/136"
      }
    ]  
  }
}

```

47.4 Pluggable Database as a Service

This section describes the resource model for Pluggable Database as a Service (PdbaaS) REST API and the REST request/response interactions.

**Note:**

PdbaaS REST APIs are only supported by the Oracle Cloud Application plug-in version 12.1.0.7.0 and above.
47.4.1 Pluggable Database as a Service Resource Model

Cloud resources are organized by common service entities, and specific services (for example, Pluggable Database as a Service) provide resources by extending these common service entities. The figure below shows the PdbaaS resource model.

Figure 47-3  Pluggable Database as a Service Resource Model

The following sections describe the resources that are supported by the Pluggable Database as a Service REST APIs and provide examples of supported operations. Pluggable Database as a Service uses the same Cloud, Service Family, and DB Zone resources as described in Database as a Service Resource Model.

The following resource models are described in this section:

• Pluggable DB Platform Template
• Pluggable DB Platform Instance
47.4.1.1 Pluggable DB Platform Template

The Pluggable DB Platform Template extends the Service Template resource. It represents the service template created for Pluggable Database creation. It can be a template for creating a pluggable database using profile based pluggable database (pdb with data) or for creating an empty pluggable database. It is permissible to accept the ServiceTemplate media type on an instance of Pluggable DB Platform Template. It is a preconfigured deployable service that realizes a Pluggable DB Instance resource. Pluggable DB Platform Template has the media type application/oracle.com.cloud.common.PluggableDbPlatformTemplate+json and URI format /em/cloud/dbaas/pluggabledbplatformtemplate/<template id>.

The following table describes the Schema Platform Template Data Model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description given to the template.</td>
<td>0..1</td>
</tr>
<tr>
<td>created</td>
<td>Timestamp</td>
<td>Date and time, in ISO 8601 format, when the template was created/last modified.</td>
<td>1</td>
</tr>
<tr>
<td>zones</td>
<td>Collection &lt;DbZone&gt;</td>
<td>List of all zones configured for this template.</td>
<td>0..1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>

</tr>
</tbody>
</table>

47.4.1.2 Pluggable DB Platform Instance

The Pluggable Db Platform Instance extends the Service Instance resource. It is linked to Pluggable Database target in Enterprise Manager Cloud Control. Pluggable Db Platform Instance has the media type `application/oracle.com.cloud.common.PluggableDbPlatformInstance+json` and URI format `/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/<request id>`.

The following table describes the Schema Platform Instance Data Model:

Table 47-44  Pluggable DB Platform Instance Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given given to the pluggable database</td>
<td>1</td>
</tr>
<tr>
<td>destination_zone</td>
<td>Zone</td>
<td>The Zone to which the pluggable database is deployed</td>
<td>1</td>
</tr>

47.4.3 Pluggable Database as a Service REST API Examples

The following sections provide examples of interaction with Enterprise Manager Cloud Control with Cloud Application plug-in 12.1.0.7 and higher. The examples for GET on cloud, GET on dbaas family type and GET on Db Zone are covered in the Dbaas REST APIs section. The following examples are covered:

- Viewing Details of the Pluggable Db Platform Template Resource
- Creating a Pluggable Database
  - Creating a Pluggable Database by Passing a Request on the DB Zone
  - Creating a Pluggable Database by Passing a Request on the Pluggable DB Platform Template
- Viewing Details of the Pluggable Database Creation
- Deleting a Pluggable Database Instance
- Lifecycle operations on a Pluggable Database Instance
  - Shutting Down a Pluggable Database
  - Starting up a Pluggable Database
  - Scheduling a Backup for a Pluggable Database
  - Restoring a Pluggable Database from a Backup
47.4.3.1 Viewing Details of the Pluggable Db Platform Template Resource

A GET request on a Pluggable Db Platform Template provides the details about a Pluggable DB service template.

Table 47-46  GET Request Configuration for Viewing Details of the Pluggable DB Platform Template Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>

47.4.3.2 Creating a Pluggable Database

This section describes how to create a pluggable database using the Cloud resources. As Pluggable Database is also a service instance in the service family type “dbaas”, you need to identify the zone of the same family type in which to create the pluggable database. There are two approaches to create a pluggable database:

- Creating a Pluggable Database by Passing a Request on the DB Zone
• Creating a Pluggable Database by Passing a Request on the Pluggable DB Platform Template

Note the attributes in the submitted body for the POST. The pattern is the same for other service instance creations. Because the intention is clear, the "zone" attribute is not required while POSTing to the Db Zone. Similarly, the "based_on" attribute is not needed when POSTing to the PluggableDbPlatformTemplate.

47.4.3.2.1 Creating a Pluggable Database by Passing a Request on the DB Zone

The following shows the configuration for POSTing to Db Zone:

Table 47-47  POST Request Configuration for Creating a Pluggable Database by Passing a Request on the DB Zone

<table>

<td>{ &quot;name&quot;: &quot;Comment&quot;, &quot;value&quot;: &quot;BofA testing&quot; } }</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Request method  POST
The target_name property is a mandatory property if the custom placement option (SELECT_TARGET_OPTION) is set to "SELECT_TARGET_FROM_REQUEST" in the PDB service template. Also, the CDB name provided should be available in the chosen zone.

A sample of the response received is shown below.

```json
{
    "uri": "/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/122",
    "name": "Request for an Empty PDB BofA",
    "resource_state": {
        "state": "INITIATED",
        "messages": [
            {
                "uri": "/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/123",
                "text": "Delete Request ID is : 123",
                "date": "2015-11-19T10:41:38+0000"
            }
        ]
    },
    "media_type": "application/oracle.com.cloud.common.PluggableDbPlatformInstance+json",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/122",
    "status": "SCHEDULED"
}
```

47.4.3.3 Viewing Details of the Pluggable Database Creation

A GET request on a Pluggable DB Platform Instance provides the status and other information about the resource.

### Table 47-49  GET Request Configuration for Viewing Details of the Pluggable Database Creation

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/31</td>
</tr>
</tbody>
</table>
| Request headers | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=
                     Accept: application/oracle.com.cloud.common.PluggableDbPlatformInstance+json |
| Body          | None                                                                        |
| Request method | GET                                                                         |

A sample of the response received is shown below.

```json
{
    "uri": "/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/31",
    "name": "Test Service_CREATE_11_53",
}```
"description": "Create Database for \"Test Service\",",
"resource_state": {
  "state": "CREATING",
  "context_id": "31",
  "media_type": "application/oracle.com.cloud.common.PluggableDbPlatformInstance +json",
  "status": "IN_PROGRESS",
  "created": "2013-06-07 23:09:04",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/31"
}

Note that the resource_state attribute shows CREATING state which indicates that the pluggable database is being created. After the pluggable database is created, the GET operation returns the pluggable database resource with READY state, as shown below:

{
  "destination_zone": "/em/cloud/dbaas/zone/9A71CBEABCA367D0D425697DC39B3AP9",
  "media_type": "application/oracle.com.cloud.common.PluggableDbPlatformInstance +json",
  "db_version": "12.1.0.1.0",
  "resource_state": {
    "state": "READY",
    "messages": [
      {
        "date": "2014-11-25T09:52:49+0000",
        "uri": "/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/22",
        "text": "Delete Request ID is : 22"
      }
    ],
    "status": "RUNNING",
    "based_on": "/em/cloud/dbaas/pluggabledbplatformtemplate/E3379E249513428E040F50A994210F5",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/31",
    "connect_string": "(DESCRIPTION=(ADDRESS_LIST=(ADDRESS=(PROTOCOL=TCP)(HOST=host1)(PORT=15211)) (CONNECT_DATA=(SERVICE_NAME=MYPDB_000)(INSTANCE_NAME=t105kfv)(UR=A) (SERVER=DEDICATED)))",
    "uri": "/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/31",
    "context_id": "31",
    "created": "2013-08-05 17:30:30",
    "name": "database_MYPDB_000",
    "target_type": "oracle_pdb"
  }
}

47.4.3.4 Deleting a Pluggable Database Instance

The DELETE request on the URI of the resource can be issued to delete a pluggable database. For example, the following DELETE request is issued:
Table 47-50  DELETE Request Configuration for Deleting a Pluggable Database Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/cloud/dbaas/pluggabledbplatforminstance/byrequest/7</td>

}

Note that the status of the pluggable database will be "DELETED" once the pluggable database instance is deleted.

47.4.3.5 Lifecycle operations on a Pluggable Database Instance

The POST request on the URI of the resource can be issued to perform an operation on a pluggable database.

You can perform the following tasks using POST request:

- Shutting Down a Pluggable Database
- Starting up a Pluggable Database
- Scheduling a Backup for a Pluggable Database
- Restoring a Pluggable Database from a Backup

47.4.3.5.1 Shutting Down a Pluggable Database

The following describes the configurations for the POST on a PluggableDbPlatformInstance:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>

DBaaS REST APIs and EM CLI Verbs Based Use Cases

This chapter describes the procedure for different DBaaS use cases supported in this release. It contains the following sections:

- Getting Started with DBaaS With REST APIs and EM CLI Verbs
- Creating Databases Using Database Template With REST APIs and EM CLI Verbs
- Creating Empty Schemas and Schemas Based on Profile With REST APIs and EM CLI Verbs
- Creating Empty PDBs and PDBs Based on Profile With REST APIs and EM CLI Verbs
- Migrating/Transferring Data from One Database to Another
- Creating Databases Using Snap Clone With REST APIs and EM CLI Verbs
- Creating Full Database Clones Using RMAN With REST APIs and EM CLI Verbs
- Configuring Custom Database Placement Option Using REST APIs
- Service Catalog of Database as a Service

48.1 Getting Started with DBaaS With REST APIs and EM CLI Verbs

The following figure provides an overview of the different flavors of Enterprise Manager DBaaS.
This table lists the DBaaS use cases that are supported in this release and lists the different methods (EMCLI, and REST API) that can be used to run these use cases.

**Table 48-1  DBaaS Use Cases**

48.2 Creating Databases Using Database Template With REST APIs and EM CLI Verbs

The DBCA template supports both structure plus data and structure only types. This database provisioning profile is created from the production or source database registered with Enterprise Manager. It supports both structure plus data and structure only types. This option is recommended if the database size being created is less than 50 GB.

The table below shows the list of tasks that are involved in creating a database using the database template based profile.

You can create single instance and cluster databases using database template based profiles.

Note:

In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

Table 48-2   Creating Databases Using Database Template with REST APIs and EM CLI Verbs

</tbody>
</table>
### 48.2.1 Creating Standby Databases With REST APIs and EM CLI Verbs

A data guard configuration consists of one primary database and one or more standby databases. The databases in a Data Guard configuration are connected by Oracle Net and may be dispersed geographically. There are no restrictions on where the databases are located, provided they can communicate with each other.

Oracle Data Guard ensures high availability, data protection, and disaster recovery for enterprise data. It provides a comprehensive set of services that create, maintain, manage, and monitor one or more standby databases to enable production Oracle databases to survive disasters and data corruptions. Oracle Data Guard maintains these standby databases as copies of the production database. If the production database becomes unavailable due to a planned or an unplanned outage, the Oracle Data Guard can switch any standby database to the production role, minimizing the downtime associated with the outage.

The production database, also referred to as the primary database can be either a single-instance Oracle database or an Oracle Real Application Clusters (RAC) database. A standby database is a transaction-wise consistent copy of the primary database. Using a backup copy of the primary database, you can create one or more standby databases and incorporate them in a Data Guard configuration. Using

| 9    | While deploying a database, select the service template (associated with the DBCA template based profile) you have created. Additionally, you can also specify the standby database information while requesting the database. | See Creating a Database Instance | See Creating a Database Instance |
48.3 Creating Empty Schemas and Schemas Based on Profile With REST APIs and EM CLI Verbs

The data content of a database provisioning profile is compiled from an export dump. You can choose to export Schema objects (structure only) or the Schema with data (structure and data).

The table below shows the list of tasks that are involved in creating an empty schema or a schema based on profile.

![Note:]

In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

48.4 Creating Empty PDBs and PDBs Based on Profile With REST APIs and EM CLI Verbs

An Oracle Database can contain a portable collection of schemas, schema objects, and non-schema objects, that appear to an Oracle Net client as a separate database. This self-contained collection is called a pluggable database (PDB). A multi-tenant container database (CDB) is a database that includes one or more PDBs. Oracle Database 12c Release 1 (12.1) and later versions allow you to create many PDBs within a single CDB.

**Note:**
In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

### 48.5 Migrating/Transferring Data from One Database to Another

To migrate data from one database to another using EM CLI verbs, follow the steps below:

1. Enter the EM CLI verb `emcli describe_dbprofile_input -data_mode=EXPORT`. The output provides all profile creation input variables.

   **Note:**

   Export is supported only for database whereas import is supported for both database and PDBs. This indicates that the source should always be a database and the destination can be either a database or a PDB.

2. Use the input variables to create a properties file with values for all the variables.

3. Export data from the source database by creating a database profile. To do so, enter the verb `emcli create_dbprofile - input_file=data:<properties file name along with path>`. 
4. Enter the verb to transfer data: `emcli data_transfer -input_file=data:/u01/files/data_trans.props`.
   For the verb and properties file details see Transferring Data Between Databases.

5. Enter the verb to import data in to the destination database: `emcli dbimport -input_file=data:/u01/files/dbimport.props`.
   For the verb and properties file details see Importing Data from Export Dumps to a Database.

48.6 Creating Databases Using Snap Clone With REST APIs and EM CLI Verbs

Snap Clone is a Self-Service-Application (SSA) way of creating fast and space-saver clones of huge databases. Clones of the production database are often required for test and development purposes, and it is difficult and time consuming to create these clones, especially if the databases are huge.

Enterprise Manager offers Snap Clone as a way to address this issue, so that thin clones can be created from production databases by using the copy on write technology available in some storage systems. This means that these clones take up little space initially (about 2 GB of writable space required for a thin clone of a multi-terabyte database), and will grow as inserts, updates and deletes are performed. Enterprise Manager offers two solutions with snap clone:

- Hardware Solution: Vendor specific hardware solution which supports NetApps, Oracle Sun ZFS storage appliance, EMC VMAX, and VNX.
- Software Solution: Storage agnostic software solution that supports all NAS and SAN storage devices. This is supported through use of the ZFS file system, and the CloneDB feature.

The main features of snap clone are:

- Self Service Driven Approach: Empowers the self service user to clone databases as required on an ad-hoc basis.
- Rapid Cloning: Databases can be cloned in minutes and not in days or weeks.
- Space Efficient: This feature allows users to significantly reduce the storage footprint.

This section contains the following sub-sections:

- Creating a Snap Clone Using a Profile With REST APIs and EM CLI Verbs
- Creating a Snap Clone Using Live Database With REST APIs and EM CLI Verbs
- Continuous Sync
48.6.1 Creating a Snap Clone Using a Profile With REST APIs and EM CLI Verbs

This table below lists the steps involved in creating a snap clone using a snapshot or an RMAN Image profile.

### Note:

In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

<table>

48.6.3 Continuous Sync

A continuous sync setup has a production database and a Test master database which is on a filer (NAS storage). The Test master is an RMAN image backup of the data files and is scheduled to run a backup of the production database at regular intervals. Thereby the Test master database gets continuous/live data from the production database.

To set up a continuous sync database setup, follow the steps below:

Table 48-8  Creating a Continuous Sync Setup Using EM CLI Verbs

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>EM CLI Verb</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Add an existing standby database. Currently, this task can be accomplished only via the UI screen.</td>
<td>Not available</td>
</tr>
</tbody>
</table>

</tr>
</tbody>
</table>

### 48.7 Creating Full Database Clones Using RMAN With REST APIs and EM CLI Verbs

There are two ways of cloning full databases using RMAN. They are:

- Creating a Full Database Clone Using RMAN Backup
- Creating a Full Database Clone Using RMAN Duplication (Live Cloning)
- Discrete Sync

#### 48.7.1 Creating a Full Database Clone Using RMAN Backup

Database backups created by RMAN (Recovery Manager) are stored as image copies or backup sets. You can create profiles using these backups and use these profiles to create full database clones.

#### Note:

In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

### Table 48-9 Cloning Databases Using RMAN Backup Profile with REST APIs and EM CLI Verbs

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>REST APIs</th>
<th>EM CLI Verbs</th>
</tr>
</thead>
<tbody>
<tr>
<td>1</td>
<td>Follow the steps in the Getting Started section to enable DBaaS.</td>

| 10   | While deploying a database, select the service template you have created. | See Creating a Database Instance | See Creating a Database Instance |

### 48.7.2 Creating a Full Database Clone Using RMAN Duplication (Live Cloning)

Database backups created by RMAN (Recovery Manager) are stored as image copies or backup sets. You can create profiles using these backups and use these profiles to create full database clones.

Note:

In the table below, wherever REST APIs are not available for any steps EM CLI verbs are provided, and vice-versa.

### Table 48-10  Creating a Full Database Clone Using RMAN Backup With REST APIs and EM CLI Verbs

<table>
<thead>
<tr>

</tr>
<tr>
<td>9</td>
<td>While deploying a database, select the service template you have created.</td>
<td>See Creating a Database Instance</td>
<td>See Creating a Database Instance</td>
</tr>
</tbody>
</table>

### 48.7.3 Discrete Sync

A discrete sync setup has a production database which is not available for direct cloning operations and thereby with no standby database. The administrator schedules periodic backups on the production database and uses the backups to create the Test master database.

To set up a discrete sync database setup, follow the steps below:

### Table 48-11  Creating a Discrete Sync Setup Using EM CLI Verbs

<table>
<thead>
<tr>
<th>Step</th>
<th>Task</th>
<th>EM CLI Verb</th>
</tr>
</thead>
<tbody>
<tr>

</tbody>
</table>
48.8 Configuring Custom Database Placement Option Using REST APIs

This section describes the custom database placement feature using REST APIs. See the following sections for further details:

- Custom Database Placement Option for Databases Using REST APIs
- Custom Database Placement Option for Pluggable Databases Using REST APIs

48.8.1 Custom Database Placement Option for Databases Using REST APIs

With the custom database placement option, an SSA user has the option of choosing the host on which the database instance is created. This option has to be enabled in the service template by the SSA Administrator while creating the service template. The `SELECT_ORACLE_HOME_OPTION` parameter in the JSON body of the service template defines if the SSA User has the option to select the host while requesting for a database instance. If `SELECT_ORACLE_HOME_OPTION` is set with the value "SELECT_ORACLE_HOME_FROM_REQUEST" the SSA User has the option to choose the database host while requesting the database. If the parameter is not defined, or if the value for the parameter is not set, or if the value is set to "SELECT_ORACLE_HOME_AT_RUNTIME", then the SSA User will not have the option of choosing the database host and the database instance will be created on the host selected by the placement algorithm during the execution of the request.

After the option is set in the service template, the SSA User can perform a GET operation on the service template URI to view the available hosts. The "hosts_for_placement" parameter (in the case of a SI database), and "clusters_for_placement" and "hostsInCluster" parameters (in case of a RAC database) provide the details of the available hosts to the SSA User. The SSA User is then required to define the host name for placing the database in the "database_host_name" parameter in the POST operation for requesting a database instance.

The "database_host_name" parameter is a mandatory parameter if the custom placement option is set in the service template. Note that multiple values for `database_host_name` request parameter can be provided as comma separated values. For a RAC database request, the number of hosts specified in this parameter should match with the number of nodes configured in the service template, and all of the hosts provided should belong to the same cluster and should be present in the selected zone.

48.8.2 Custom Database Placement Option for Pluggable Databases Using REST APIs

With the custom database placement option, an SSA user has the option of choosing the Container Database (CDB) on which the Pluggable Database (PDB) instance is created. This option has to be enabled in the service template by the SSA Administrator while creating the service template.
The `SELECT_TARGET_OPTION` parameter in the JSON body of the PDB service template defines if the SSA User has the option to select the host while requesting for a database instance. If `SELECT_ORACLE_HOME_OPTION` is set with the value "SELECT_TARGET_FROM_REQUEST" the SSA User has the option to choose the CDB while requesting the database. If the parameter is not defined, or if the value for the parameter is not set, or if the value is set to "SELECT_TARGET_AT_RUNTIME", then the SSA User will not have the option of choosing the CDB and the PDB instance will be created on the CDB selected by the placement algorithm during the execution of the request.

After the option is set in the PDB service template, the SSA User can perform a GET operation on the service template URI to view the available CDBs. The "target_nodes_for_placement" parameter provides the details of the available CDBs to the SSA User. The SSA User is then required to define the CDB target name for placing the PDB in the "target_name" parameter in the POST operation for requesting a PDB instance.

The "target_name" parameter is a mandatory parameter if the custom placement option is set in the service template. The CDB target name specified in this parameter should be present in the selected zone.

### 48.9 Service Catalog of Database as a Service

Service catalog is a collection of pre-approved database configurations available to selected consumers for on demand, self service provisioning. It enforces consistency and automation, and helps reduce the database management overhead.

Service catalog offers:

- Self-service provisioning which provides IT agility
- Enterprise-wide service catalog which provides standardization and compliance
- Database cloning using snap clone which saves time and storage space
- Metering, chargeback and quota which ensures service governance
- Performance and lifecycle management which guarantees service levels
- Patching, upgrading and configuration automation which lowers operational costs

The following section explains the REST APIs required for setting up a sample multi-datacenter DBaaS.

### 48.9.1 Multi-Datacenter DBaaS Setup

Multi-datacenter DBaaS setup is the best possible structure of DBaaS configuration in an enterprise with multiple data centers where all aspects related to data safety, recovery and backup are considered at the highest levels.
Multi-datacenter DBaaS setup requires creating a Primary RAC software pool and two Standby software pools. Of the two standby software pools, the near disaster recovery (DR) pool is a RAC software pool and the other, which is the far DR is a single instance software pool. After the software pools are created, the service template is created to establish the relation between the software pools. This setup is offered as a Multi-datacenter DBaaS setup to the SSA user.

The topics covered under this section are:

- Administrator Steps for Creating the Multi-Datacenter DBaaS Setup
- SSA User REST API Request for Using the Multi-Datacenter DBaaS Setup

### 48.9.1.1 Administrator Steps for Creating the Multi-Datacenter DBaaS Setup

This section explains the steps to setup the Multi-datacenter DBaaS using REST APIs. For the EM CLI verb equivalent of the REST APIs run the `emcli invoke_ws` command for each of the REST APIs in the steps below. For details on `emcli invoke_ws` command, refer to EM CLI Verbs for Database as a Service Administrator.

Follow the steps below to setup the Multi-datacenter DBaaS:

1. Create a PaaS zone for the data center with the single instance software pool (Far DR).

To create a PaaS zone, issue the REST API request given below.

#### Table 48-12 Request Configuration to Create a PaaS Zone

<table>
<thead>
<tr>

| **Request method** | POST |
This chapter provides details of the Cloud REST APIs and Service Template REST APIs for SSA Administration functions.

REST APIs for PaasZone management, and SoftwarePool management, along with other REST APIs used to fetch the REST API catalog, REST API output, and metadata and expansion of a resource are described in this chapter.

This chapter also provides details on the Enterprise Manager Command Line Interface (EMCLI) verbs for PaaS Infrastructure Zone, Software Pool, and Service Template operations for Enterprise Manager Self Service Applications Admin users. The EMCLI enables you to access Enterprise Manager Cloud Control functionality from text-based consoles (shells and command windows) for a variety of operating systems.

Note:

For the SSA Plug-in release 12.1.0.9, a new framework is introduced for the REST APIs which is referred to as the v2 framework. The new framework consists of a different approach and signatures, as a result of which the REST APIs also differ when compared to the earlier framework. The earlier framework (v1) is deprecated and users are suggested to move to the v2 REST APIs and EM CLI verbs.

Unique EM CLI verbs for v2 are restricted to those actions which do not have an REST API equivalent. For every REST API in the v2 framework, an equivalent EM CLI verb in the form of emcli invoke_ws exists. For details see EM CLI Verbs for SSA Operations for V2.

In v2, REST APIs for the Self Service Portal application are generally used by the SSA users. These REST APIs are generally in the .../ssa/... format. For example, /em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/. REST APIs for administrative functions (i.e., .../admin/... format) are REST APIs that configure the SSA Portal setup, such as creating zones, templates, etc., which are generally performed by Cloud or SSA Administrators. The Admin REST APIs are covered in this chapter.

This chapter covers the following sections:

- Summary of SSA Administration REST APIs for V2
- Summary of SSA Administration REST APIs for V1
- Catalog APIs for V1 and V2
- Resource Provider for V2
  - Resource Providers - Collection Resource for V2
  - Resource Provider - Singular Resource for V2
- Service Templates - Collection Resource for V2
Chapter 49
Summary of SSA Administration REST APIs for V2

49.1 Summary of SSA Administration REST APIs for V2

The table below shows a summary of all the User preference and Request scheduling REST APIs covered in this chapter for the v2 framework.

Note:

In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.

49.3 Catalog APIs for V1 and V2

Catalog APIs provide an overview of all the REST APIs existing in the cfw plugin. All of these are GET REST APIs which contain description and information about each REST API.
The REST APIs have been broadly categorized into v1 and v2 REST APIs. The v1 REST APIs refer to the existing v1 catalog REST API. The v2 REST API provides a summarized overview on both SSA user and Administrator REST APIs.

Table 49-3  Cfw API Catalog Collection Data Model

<table>
<thead>
<tr>

</tbody>
</table>

49.3.1 CFW API Catalog REST API Examples

This sections describes the REST APIs for the Cfw API catalog resource. The following operations are described in this section:

- Viewing the High Level Catalog APIs for V1 and V2
- Viewing the V1 Catalog APIs
- Viewing the V2 Catalog APIs
- Viewing the V1 Catalog APIs for SSA Portal
- Viewing the V2 Catalog User APIs
- Viewing the V2 Catalog Admin APIs

49.3.1.1 Viewing the High Level Catalog APIs for V1 and V2

The GET request configuration to view the high level catalog APIs is shown below.

Chapter 49

Catalog APIs for V1 and V2
49.3.1.5 Viewing the V2 Catalog User APIs

The v2 endpoint provides further refined overview of v2 side user REST APIs grouped according to entities. For example, all the Service instance related REST APIs are listed together for entity=serviceinstances.

REST APIs with variable inputs, are marked with attribute "templated" and curly brackets.

The GET request configuration to view the v2 catalog user APIs is shown below.

Table 49-8    GET Request Configuration for Viewing V2 Catalog User APIs

49.4 Resource Provider for V2

A Resource Provider provides the grouping of resources for easier administration and management.

A resource provider is a composite target that represents the type of resources required to provision a service instance of a service type. For example, a Database service type needs oracle_home targets in its resource provider and a schema service type needs oracle_database, and oracle_rac targets in its resource provider.

49.4.1 Resource Providers - Collection Resource for V2

Resource Providers is a collection resource representing a Cloud Administrator's view of all the accessible Resource Provider resources. The following table describes the Resource Providers data model.
### Table 49-10  Resource Providers Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in the collection.</td>
<td>1</td>
</tr>
<tr>
<td>count</td>
<td>Integer</td>
<td>Number of elements returned.</td>
<td>1</td>
</tr>
<tr>
<td>items</td>
<td>Collection</td>
<td>List of Resource Provider resources. In case no instance exist, the items</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>Collection</td>
<td>field will be empty.</td>
<td></td>
</tr>
<tr>
<td>count</td>
<td>Integer</td>
<td>Total number of Resource Provider resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET request against this URI refreshes the client representation of</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td>URI</td>
<td>this resource.</td>
<td></td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent to the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

#### 49.4.2 Resource Provider - Singular Resource for V2

A Resource Provider cloud resource represents an instance of a Resource provider. The following table describes the Resource Provider data model.

### Table 49-11  Resource Provider Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the Resource Provider. This field is non-</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>editable.</td>
<td></td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name for the Resource Provider.</td>
<td>0..1</td>
</tr>
<tr>
<td>guid</td>
<td>String</td>
<td>Unique GUID of the Resource Provider that identifies the resource.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description of the resource.</td>
<td>0..1</td>
</tr>
<tr>
<td>targetType</td>
<td>String</td>
<td>Target type of the Resource Provider to be created. Example: &quot;cfw_sampuxaas_rsrc_provider&quot; for sample xas Resource Provider.</td>
<td>1</td>
</tr>
<tr>
<td>Members</td>
<td></td>
<td>Members of Resource Provider. These must be added as EM targets in</td>
<td>1</td>
</tr>
<tr>
<td></td>
<td></td>
<td>advance.</td>
<td></td>
</tr>
<tr>
<td>credentials</td>
<td>Collection&lt;ResourceProviderCredential&gt;</td>
<td>Credentials associated with the Resource Provider.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 49-11 (Cont.) Resource Provider Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>placement constraint</td>
<td>Collection&lt;EntityValueHolder&gt;</td>
<td>Placement constraints for a Resource Provider that allows the cloud administrator to set a maximum ceilings for resource utilization.</td>
<td>0..1</td>
</tr>
<tr>
<td>characteristics</td>
<td>Collection&lt;EntityValueHolder&gt;</td>
<td>Characteristics associated with the Resource Provider.</td>
<td>1</td>
</tr>
<tr>
<td>canonical Link</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
</tbody>
</table>

### 49.4.3 Supported Methods for Resource Provider Resource

The table below lists the supported methods for the Resource Provider singular resource.

### Table 49-12 Supported Methods for Resource Provider

<table>
<thead>
<tr>
<th>Request Method</th>
<th>Canonical Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>
<td>Returns list of Resource Providers.</td>
</tr>
<tr>
<td>POST</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>
<td>Creates an instance of Resource Provider.</td>
</tr>
<tr>
<td>POST</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/filteredtargets</td>
<td>Returns filtered targets.</td>
</tr>
<tr>
<td>GET</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/types/{resourceprovidertype}</td>
<td>Returns the Resource Provider type metadata.</td>
</tr>
<tr>
<td>GET</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}</td>
<td>Returns details of the specified Resource Provider.</td>
</tr>
<tr>
<td>PUT</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}</td>
<td>Updates the specified Resource Provider.</td>
</tr>
<tr>
<td>DELETE</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}</td>
<td>Deletes the specified Resource Provider.</td>
</tr>
</tbody>
</table>
Table 49-12  (Cont.) Supported Methods for Resource Provider

<table>
<thead>
<tr>
<th>Request Method</th>
<th>Canonical Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}/configuration</td>
<td>Returns the Resource Provider's saved configuration.</td>
</tr>
<tr>
<td>GET</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}/metrics</td>
<td>Returns the metric of the specified Resource Provider.</td>
</tr>
<tr>
<td>POST</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}/members</td>
<td>Provisions resources.</td>
</tr>
<tr>
<td>DELETE</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}/members</td>
<td>De-provisions resources.</td>
</tr>
<tr>
<td>POST</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/{resourceproviderid}/members/metadata</td>
<td>Returns the provisioning metadata required to provision resources.</td>
</tr>
</tbody>
</table>

The table below shows the filtered targets request data model supported for the POST request on the URI - /em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/filteredtargets in the v2 framework.

Table 49-13  Filtered Targets Request Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occur</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>String</td>
<td>Type of resource provider.</td>
<td>1</td>
</tr>
<tr>
<td>membtargetType</td>
<td>String</td>
<td>Target type of the member.</td>
<td>0..1</td>
</tr>
<tr>
<td>parentProviderId</td>
<td>String</td>
<td>Type of parent resource provider.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

The table below shows the filtered targets response data model supported for the POST request on the URI - /em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/filteredtargets in the v2 framework.

Table 49-14  Filtered Targets Response Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>membtargetType</td>
<td>String</td>
<td>Target type of the member.</td>
</tr>
<tr>
<td>List&lt;String&gt;</td>
<td>String</td>
<td>List of targets.</td>
</tr>
</tbody>
</table>
The table below shows the resource provider metadata data model supported for the GET request on the URI - /em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/types/{resourceprovidertype} in the v2 framework.

**Table 49-15  Resource Provider Metadata Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>type</td>
<td>String</td>
<td>Type of Resource provider.</td>
</tr>
<tr>

</tbody>
</table>

49.4.4 Resource Provider REST API Examples

This section describes the operations on the Resource Provider. The following operations are covered in this section:

- Viewing all the Resource Providers
- Viewing all the Types of Resource Providers
- Creating a Resource Provider
49.4.4.1 Viewing all the Resource Providers

A GET operation is issued to view all the Resource Providers.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI= Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "name": "Resource Providers",
  "type": "Resource Provider",
  "canonicalLink": {
    "href": "https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/"
  },

49.5 Service Templates - Collection Resource for V2

Service Templates is a collection resource representing an SSA administrator's view of all the accessible Service Template resources. The following table describes the Service Template data model.
Table 49-36  Service Templates Collection Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of the collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Indicates the type of the collection resource.</td>
<td>0..1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in the</td>
<td>1</td>
</tr>
<tr>
<td>count</td>
<td>Integer</td>
<td>Number of elements returned.</td>
<td>1</td>
</tr>
<tr>
<td>items</td>
<td>Collection</td>
<td>List of Service Template resources In case no instances exist, items field is empty.</td>
<td>1</td>
</tr>
<tr>
<td>totalCount</td>
<td>Integer</td>
<td>Total number of Service Template resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent of the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

49.5.1 Supported Operations

49.5.2 Service Templates REST API Examples for V2

This section describes the REST API operations supported on the Service Templates resource. The following operations are explained:

- Viewing all the Service Templates
- Viewing all the Service Template Types
- Viewing the Metadata Required for Creating a Service Template
- Viewing the Resource Provider Characteristics Required for Creating a Service Template
- Viewing Configurations Required for Creating a Service Template
- Creating a Service Template
- Updating a Service Template
- Viewing Details of a Specific Service Template
- Viewing Configuration Details of a Specific Service Template
- Deleting a Service Template

49.5.2.1 Viewing all the Service Templates

A GET operation is issued to view all the Service Templates.
### Table 49-47  GET Request Configuration for Viewing all the Service Templates

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates</code></td>
</tr>
</tbody>
</table>
| Request headers | Authorization: `basic ZGVtb3VzZXI6ZGVtb3VzZXI=`  
                      | Content-Type: application/json                                                |
| Body          | None                                                                          |
| Request method | GET                                                                           |

{
  "message": "Service template with id "62" deleted successfully."
}
```

49.5.3 Creating a Service Template in V2

This section provides the procedure to create a Service Template using REST APIs.

Follow the steps below to create a Service Template:

1. Identify the Service Template type.

   The GET operation returns the list of Service Template types available to the Administrator. Note down the serviceType and serviceTemplateTypeId fields of the required Service Template.

2. Obtain the metadata for the selected Service Template type.

   Perform a POST operation on the URI - https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/metadata, using the serviceType and serviceTemplateTypeId fields from the previous step. See, Viewing the Metadata Required for Creating a Service Template.

   The POST operation returns a response containing information regarding service template characteristics and payloads. Note these fields as they are required to be set with values in the next step.
3. Obtain the resource provider characteristics for the selected Service Template type.

The POST operation returns a response with resourceProvider look up characteristics. Note the details.

4. Obtain configuration details for the selected Service Template type.

Perform a POST operation on the URI - https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/configurations, by providing a payload with values for all the fields collected so far. See, Viewing Configurations Required for Creating a Service Template.

The POST operation returns a response with a list of configurations for the Service Template. Note the details.

5. Create the Service Template.

Perform a POST operation on the URI - https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates, by providing a payload with values for all the fields collected so far. See, Creating a Service Template.

The POST operation creates a Service Template with the configured values.

### 49.6 Service Types for V2

This section describes the Service Types for the v2 framework.

Table 49-57 Service Types Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of the collection resource.</td>
<td>1</td>

</tbody>
</table>

49.7.2 Service Requests REST API Examples for V2

This sections describes the REST APIs for the Service requests resource. The following operations are explained:

- Viewing Details of all the Service Requests
- Viewing Details of a Service Request
- Rescheduling a Service Request
- Clearing a Collection of Service Requests
- Cancelling a Service Request
- Deleting a List of Service Requests

49.7.2.1 Viewing Details of all the Service Requests

A GET operation is issued to view details of all the Service requests.

Table 49-61  GET Request Configuration for Viewing Details of All the Service Requests

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicerequests</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI= Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>
A sample of the response received is shown below.

```json

49.9 Request Settings for V2

Settings are to be applied by an SSA administrator, and can be used for request processing. Settings are categorized as follows:

- Global settings - These are the general settings that are applicable across all service types.
- Service family settings - These settings are specific to a service family.
- Service type settings - These settings are specific to a service type.

49.9.1 Request Settings Data Model

The table below shows the Request Settings data model.

<td>RequestPolicy</td>
<td>The maximum duration of time (in days) during which a Self Service user can retain a service instance.</td>
<td>1</td>
</tr>
<tr>
<td>RequestArchivePolicy</td>
<td>RequestPolicy</td>
<td>The duration of time (in days) after which the &quot;Completed&quot;, Self Service create requests will be purged from the repository.</td>
<td>1</td>
</tr>
</tbody>
</table>

49.9.3 Request Settings REST API Examples for V2

This sections describes the REST APIs for the Request settings resource. The following operations are explained:

- Viewing Details of the Global Request Settings
- Updating the Global Request Settings
- Viewing Details of the Global Request Settings for a Collection of Roles
- Creating Global Request Settings for a Role
- Viewing Details of Global Request Settings for a Specific Role
- Updating Global Request Settings for a Specific Role
- Deleting Global Request Settings for a Specific Role
- Viewing Details of the Request Settings for a Service Family
- Updating the Request Settings for a Service Family
- Viewing Details of the Service Family Settings by Roles
- Creating Service Family Settings for a Role
- Viewing Details of the Service Family Request Settings for a Specific Role
- Updating the Service Family Request Settings for a Specific Role
- Deleting Service Family Request Settings for a Specific Role
49.9.3.1 Viewing Details of the Global Request Settings

A GET operation is issued to view details of the Global request settings resource.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/setup/requestsettings/global</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI= Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
  "requestSettings": [
    {
      "description": "This setting controls how far a user can make a request",
      "displayName": "Future Reservation Length",
      "name": "FUTURE_RESERVATION_LENGTH",
      "restrictionPolicy": "No Restriction"
    },
    {
      "description": "This setting controls the maximum duration for which a user can make a request",
      "displayName": "Request duration Length",
      "name": "REQUEST_DURATION_LENGTH",
      "restrictionPolicy": "No Restriction"
    },
    {
      "description": "This setting controls the maximum duration after which archived requests will be automatically deleted by the system",
      "displayName": "Request Archive Retention Length",
      "name": "REQUEST_ARCHIVE_RETENTION_LENGTH",
      "restrictionPolicy": "No Restriction"
    },
    {
      "description": "Sharing enabled/disabled",
      "name": "SERVICE_INSTANCE_USER_SHARE_ALLOWED",

```
49.9.3.2 Updating the Global Request Settings

A PUT operation is issued to update the Global request settings resource.

Table 49-80  PUT Request Configuration for Updating the Global Request Settings Resource

49.10 VM Adapters for V2

This section explains the VM Adapters REST APIs.

49.10.1 VM Adapters Data Model

The table below shows the VM Adapters data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the resource.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of the resource.</td>
</tr>
<tr>
<td>totalResults</td>
<td>int</td>
<td>The total results.</td>
</tr>
<tr>
<td>items</td>
<td>List&lt;VMAdapter&gt;</td>
<td>The list of VM Adapters</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>CfwLink</td>
<td>A GET request against this URI refreshes the client representation of this resource.</td>
</tr>
<tr>
<td>selfLink</td>
<td>CfwLink</td>
<td>Refers to the resource equivalent to the containing elements.</td>
</tr>
</tbody>
</table>

49.10.2 Supported Operations

The table below provides the operations supported on the VM Adapters resource.

<table>
<thead>
<tr>
<th>Request Method</th>
<th>Canonical Link</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/vmadapters</td>
<td>Returns all the registered VM Adapters.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/vmadapters/{name}</td>
<td>Returns the registered VM Adapter's details.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/vmadapters/stagingservers</td>
<td>Returns the staging servers.</td>
</tr>
<tr>
<td>POST</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/vmadapters/stagingservers</td>
<td>Creates a staging server.</td>
</tr>
</tbody>
</table>

49.10.3 VM Adapters REST API Examples for V2

This sections describes the REST APIs for the VM Adapter resource. The following operations are explained:
49.10.3.1 Viewing Details of All the Registered VM Adapters

A GET operation is issued to view details of all the registered VM Adapters.

Table 49-102   GET Request Configuration for Viewing Details of All the Registered VM Adapters

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/vmadapters</td>

<td>{ &quot;targetName&quot; : &quot;blr223141.idc.oracle.com&quot;, &quot;location&quot; : &quot;script/location&quot;, &quot;credentialGuid&quot; : &quot;25D30ADD427484310DBC8CF6211A383B&quot;}</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

{ "message" : "StagingServer created successfully."}

49.11 SSA Admin Resources for V1

The Cloud REST APIs can be categorized as follows:

- Collection Resources
  - PaasZones for V1
  - SoftwarePools for V1
  - Service Template Management for V1

- Singular Resources
  - PaasZone for V1
  - SoftwarePool for V1
  - Service Template Management for V1

Every singular resource has its own attributes and methods supported on it, but in general all singular resources have some common attributes, as described in the following table.

Table 49-106  Common Resource Attributes for Singular Resources

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Method</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Any</td>
<td>Name of Resource</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Any</td>
<td>Resource Type</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Any</td>
<td>Description</td>
<td>0..1</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>GET</td>
<td>Resource Identifier</td>
<td>0..1</td>
</tr>
<tr>
<td>createdOn</td>
<td>TimeStamp</td>
<td>GET</td>
<td>Date and time, in W3C format when the resource was created.</td>
<td>0..1</td>
</tr>
<tr>
<td>createdBy</td>
<td>String</td>
<td>GET</td>
<td>User who created resource</td>
<td>0..1</td>
</tr>
</tbody>
</table>
Table 49-106  (Cont.) Common Resource Attributes for Singular Resources

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Method</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>modifiedOn</td>
<td>TimeStamp</td>
<td>GET</td>
<td>Date and time, in W3C format when the resource was last modified</td>
<td>0..1</td>
</tr>
<tr>
<td>ModifiedBy</td>
<td>Date</td>
<td>GET</td>
<td>User who last modified resource</td>
<td>0..1</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>GET</td>
<td>User who owns resource</td>
<td>0..1</td>
</tr>
<tr>
<td>etag</td>
<td>String</td>
<td>GET</td>
<td>HTTP Entity tag value</td>
<td>0..1</td>
</tr>
<tr>
<td>lastModified</td>
<td>String</td>
<td>GET</td>
<td>HTTP Last-Modified value</td>
<td>0..1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>GET</td>
<td>Preferred Version of Resource</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>GET</td>
<td>Refers to resource equivalent to the containing element</td>
<td>1</td>
</tr>
</tbody>
</table>

Where:

- **Supported Method:** Indicates in which method type this attribute will be available
- **Supported Method type ‘Any’:** Indicates that it might be available with GET, PUT, or POST methods, but not for DELETE.
- **Occurs:** An occurrence of 0..1 indicates it is an optional parameter. An occurrence of 1 means the parameter is mandatory.

49.11.1 Viewing Details of the REST API Entry Point Resources

The table below shows the GET configuration for viewing details of the REST API resources.

Table 49-107  GET Request Configuration for Viewing Details of the REST API Resources

49.12.1 PaasZones REST API Examples

The following sections provide example PaasZones REST API operations. Note that you can also use EMCLI commands to perform a range of different operations (including, create, update, and delete operations) and these commands are described in EM CLI Verbs for SSA Operations for V2.

The following operations are covered in this section.

- Viewing PaaS Zones Metadata
- Listing PaaS Zones

### 49.12.1.1 Viewing PaaS Zones Metadata

The table below shows the GET configuration for viewing the metadata.

Table 49-110 GET Request Configuration for Viewing the Metadata

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>

    ]
}
```
49.13 PaasZone for V1

This resource represents a PaaS Infrastructure Zone. The following table describes the PaaSZone [application/oracle.com.cloud.common.PaaSZone+json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Methods</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Any</td>
<td>A human readable name given to the PaaS Zone. It is non editable.</td>
<td>1</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>GET</td>
<td>Zone ID. GET method will have value for this element.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Any</td>
<td>A brief description given to the zone.</td>
<td>0..1</td>
</tr>
<tr>
<td>credential</td>
<td>String</td>
<td>Any</td>
<td>Global Named Credentials to be used for provisioning in this PaaS Infrastructure Zone</td>
<td>1</td>
</tr>
<tr>
<td>members</td>
<td>Collection&lt;String&gt;</td>
<td>GET POST</td>
<td>Members of PaaS Zone. They can be either Host members or Oracle VM Zone members.</td>
<td>1</td>
</tr>
<tr>
<td>memberType</td>
<td>String</td>
<td>GET POST</td>
<td>Target type of the members of PaaS Zone. It can be either &quot;host&quot; for Host members or &quot;oracle_vm_zone&quot; for Oracle VM Zone members.</td>
<td>1</td>
</tr>
<tr>
<td>constraints</td>
<td>Collection&lt;EntityValueHolder&gt;</td>
<td>Any</td>
<td>Placement Policy Constraints allow the cloud administrator to set maximum thresholds for any host. Refer to zone metadata REST API for more information.</td>
<td>0..1</td>
</tr>
<tr>
<td>roles</td>
<td>Collection&lt;String&gt;</td>
<td>GET POST</td>
<td>SSA roles that can access this PaaS Infrastructure Zone.</td>
<td>0..1</td>
</tr>
<tr>
<td>pools</td>
<td>Collection&lt;Software Pool&gt;</td>
<td>GET</td>
<td>Software Pools associated with this PaaS Zone</td>
<td>0..1</td>
</tr>
<tr>
<td>membersToAdd</td>
<td>Collection&lt;String&gt;</td>
<td>PUT</td>
<td>Host or Oracle VM Zone targets to be added to an existing PaaS Zone while editing it.</td>
<td>0..1</td>
</tr>
<tr>
<td>membersToRemove</td>
<td>Collection&lt;String&gt;</td>
<td>PUT</td>
<td>Host or Oracle VM Zone targets to be removed from an existing PaaS Zone while editing it.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
Table 49-112  (Cont.) PaaSZone Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Methods</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>rolesToAdd</td>
<td>Collection &lt;String&gt;</td>
<td>PUT</td>
<td>SSA roles to be added while editing a PaaS Zone</td>
<td>0..1</td>
</tr>
<tr>
<td>rolesToRemove</td>
<td>Collection &lt;String&gt;</td>
<td>PUT</td>
<td>SSA roles to be removed while editing a PaaS Zone.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

Where:

- **Supported Methods:** Value 'Any' indicates GET/POST/PUT

  Depending on the Supported Methods column value, the respective attributes need to be specified in the Request Payload or are available in the Response Payload after the operation in complete.

  For example, while executing a PUT operation, the name, description, credential, membersToAdd, membersToRemove, constraints, rolesToAdd, and rolesToRemove attributes can be specified in the Request payload.

- The constraints attribute is not defined for a PaasZone when its memberType is oracle_vm_zone.

- The MAX_CPU_UTILIZATION and MAX_MEMORY_ALLOCATION are the two placement constraints supported for a PaaS Zone when the memberType is "host". If they are not provided, then their default value is taken to be 80 percent.

The following table describes the supported methods on the PaaSZone resource:

Table 49-113  Supported Methods on PaaSZone Resources

### 49.13.1 PaaS Zone REST API Examples

The following sections provide example Paas Zone REST API operations. Note that you can also use EMCLI commands to perform a range of different operations on a PaaS Zone (including, create, update, and delete) and these commands are described in EM CLI Verbs for SSA Operations for V2.
The following operations are covered in this section.

- Creating a PaaS Zone
- Updating a PaaS Zone
- Deleting a PaaS Zone
- Viewing Details of the PaasZone
- Viewing the Expanded form of a PaasZone

### 49.13.1.1 Creating a PaaS Zone

The table below shows the POST configuration for creating a PaaS zone.

**Table 49-114 POST Request Configuration for Creating a PaaS Zone**

<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

Status 200 OK
Content-Type: application/json
{
  "name": "pzone1",
  "description": "This zone contains Host members",
  "type": "PaaS Infrastructure Zone",
  "id": "A3CF2D49CFF3FEE64D073303EA51F8E",
  "credential": "SXAASJUNITHOSTCRED",
}
49.13.1.5 Viewing the Expanded form of a PaasZone

The get request supports expands query parameter. Based on this query parameter the relevant attribute for a PaasZone is expanded.

The following query parameters are supported:

- members
- role
- constraints
- pools

The table below shows the GET configuration for expanded view of a PaaS zone.

**Table 49-118  GET Request Configuration for an Expanded View of a PaaS Zone**

<table>

49.14.1 Software Pools REST API Example

The following provides an example of a SoftwarePools REST API operation. Note that you can also use EMCLI commands to perform a range of different operations on
Software Pools (including, create, update, and delete) and these commands are described in EM CLI Verbs for SSA Operations for V2

The following operations are covered in this section.

- Viewing Details of the Software Pools
- Filtering Output based on Search Query Parameters

49.14.1.1 Viewing Details of the Software Pools

The table below shows the GET configuration for viewing details of the Software pools.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools</td>

49.14.1.2 Filtering Output based on Search Query Parameters

Search on the Software Pools is supported on the following by the following query parameters:

- `zonename`
- `pooltype`

Single or multiple search parameters may be specified at once. Wildcard search is supported using ‘%’ character.

The table below shows the GET configuration for filtering the Software pools.

**Table 49-122  GET Request Configuration for Filtering the Software Pools**

49.15 SoftwarePool for V1

A SoftwarePool resource represents a collection of homogeneous servers or clusters that are used to service requests within a PaaS Infrastructure Zone. All members within a SoftwarePool must be of the same type and must belong to the same PaaS Infrastructure Zone.

In addition, to maintain homogeneity, the members must satisfy a set of filter criteria that restrict the addition of members to a SoftwarePool. The following table describes the SoftwarePool [application/oracle.com.cloud.common.SoftwarePool+json] data model.

Table 49-123 SoftwarePool Data Model

49.15.1 SoftwarePool REST API Examples

The following sections provide example SoftwarePool REST API operations. Note that you can also use EMCLI commands to perform a range of different operations on a Software Pool (including, create, update, and delete operations) and these commands are described in EM CLI Verbs for SSA Operations for V2.

The following operations are covered in this section.
• Creating a Software Pool
• Updating a Software Pool
• Deleting a Software Pool
• Viewing Details of the Software Pool
• Expands Query Parameter

49.15.1.1 Creating a Software Pool

A POST operation is issued on Software Pools Collection resource to create a Software Pool.

The table below shows the POST configuration for creating a Software pool.

Table 49-125 POST Request Configuration for Creating a Software Pool

<table>
<thead>
<tr>

    etag: null
    lastModified: null
    canonicalLink: "https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/687FE169ED3556CED38D11DC9BDD5CCD"
```
49.15.1.5 Expands Query Parameter

GET operation on SoftwarePool resource supports the expands query parameter to expand the following link resource attributes:

- **members**: Expands the members attribute to show all the members of this Software Pool.
- **filters**: Expands the filters attribute to show the filter criteria of the members of this Software Pool.
- **constraints**: Expands the constraints attribute to show the placement constraints associated with this Software Pool.
- **all**: Expands all the attributes of the Software Pool when returning the Software Pool details.

The URI has the following format:

https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/{poolid}/?expands=<paramname>

Example:

https://hostname/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/687FE169ED3556CED38D11DC9BDD5CCD?expands=members

If no query parameter is specified then software pool details data is returned to the user without any attributes expanded.

49.15.2 SoftwarePoolMetadata for V1

This provides the metadata information for all the software pool target types that is needed while creating a Software Pool. The following table describes the SoftwarePoolMetadata [application/oracle.com.cloud.common.SoftwarePools+json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>poolType</td>
<td>String</td>
<td>Target type of the Software Pool</td>
<td>1</td>
</tr>
<tr>
<td>poolTypeDisplay</td>
<td>String</td>
<td>Display name of this Software Pool target type.</td>
<td>0..1</td>
</tr>
<tr>
<td>poolTypeDescription</td>
<td>String</td>
<td>Description of the Software Pool target type.</td>
<td>0..1</td>
</tr>
<tr>
<td>serviceFamily</td>
<td>String</td>
<td>Represents the service family to which this pool type belongs.</td>
<td>1</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Represents the service type to which this pool type belongs.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 49-129 (Cont.) SoftwarePoolMetadata Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>constraints</td>
<td>Collection&lt;ValueDescriptor&gt;</td>
<td>Represents the metadata information about the possible placement constraints for this pool type.</td>
<td>0..1</td>
</tr>
<tr>
<td>filters</td>
<td>Collection&lt;ValueDescriptor&gt;</td>
<td>Represents the metadata information about the possible filters (member constraints) for a pool type.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

The GET method for the SupportedPoolMetadata resource has the following characteristics:

- **Response Payload:**
  
  SoftwarePoolMetadata (Json Payload)

- **URI:**
  
  `em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/metadata`

- **Descriptions:**
  
  Retrieves the metadata information for all the software pool types like service type, service family, available constraints, and available filters.

#### 49.15.2.1 Retrieving Software Pool Metadata REST API Example

A GET request is issued to obtain the SoftwarePoolMetadata URI, which is then used to retrieve the metadata information of all the software pool types. Note that you can also use EMCLI commands to retrieve Software Pool information and these commands are described in [EM CLI Verbs for SSA Operations for V2](https://docs.oracle.com/en/us/essentials/essentials-ss佰19383196.0.0.0/essentials-ss佰19383196.0.0.0.htm#essentials-ss佰19383196.0.0.0-toc.htm).

The table below shows the GET configuration for viewing metadata of the Software pools.

#### Table 49-130 GET Request Configuration for Viewing Metadata of the Software Pools

      }  
}
49.15.3 SoftwarePoolFilteredTargets for V1

This gives the available targets in a given PaaS Infrastructure Zone based on the filter criteria given, that can be used in POST operation on SoftwarePool resource. The following table describes the SoftwarePoolFilteredTargets [application/oracle.com.cloud.common.SoftwarePoolFilteredTargets+json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>targetType</td>
<td>String</td>
<td>Target type of the Software Pool. Example: &quot;mwaas_zone&quot; for Middleware Pool, &quot;oracle_cloud_zone&quot; for Database Pool, &quot;schaas_pool&quot; for Schema Pool. Refer SoftwarePoolsMetadata resource to get the available filters for a pool target type. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>paasZone</td>
<td>String</td>
<td>Name of the PaaS Zone representing a filter criteria. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>targets</td>
<td>Map&lt;String, List&lt;String&gt;&gt;</td>
<td>Filtered targets after applying the filter criteria.</td>
<td>1</td>
</tr>
<tr>
<td>filters</td>
<td>Collection&lt;Filters&gt;</td>
<td>Filter criteria that needs to be applied to get the filtered targets. Refer SoftwarePoolsMetadata resource to get the available filters for a pool target type. [POST]</td>
<td>1</td>
</tr>
</tbody>
</table>

Note that filtered targets satisfy the following:

- Are part of the given PaaS Infrastructure zone.
- Satisfy the filter criteria passed.
- Are not part of any other Software Pool.

The POST method for the SupportedPoolFilteredTargets resource has the following characteristics:

- Request Payload:
  SoftwarePoolFilteredTargets (Json Payload)
- Response Payload
SoftwarePoolFilteredTargets (Json Payload)

- **URI:**
  
  `em/websvcs/restful//extws/cloudservices/admin/cfw/v1/softwarepools/filteredtargets`

- **Descriptions:**
  
  Retrieves the metadata information for all the software pool types, such as service type, service family, available constraints, and available filters.

### 49.15.3.1 Retrieving Available Filtered Targets - REST API Example

A POST operation on SoftwarePoolFilteredTargets resource is issued to fetch the filtered targets based on the paas zone and filters given. Note that you can also use EMCLI commands to retrieve Filtered Targets information and these commands are described in EM CLI Verbs for SSA Operations for V2.

The table below shows the POST configuration for viewing the filtered targets of the Software pools.

**Table 49-132  POST Request Configuration for Viewing Metadata of the Software Pools**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td><code>{  &quot;targetType&quot;: &quot;mwaas_zone&quot;,  &quot;paasZone&quot;: &quot;IT_MW_Zone1&quot;,  &quot;filters&quot;: {  &quot;items&quot;: [{&quot;name&quot;: &quot;VERSION&quot;, &quot;value&quot;: &quot;10.3.6.0&quot;}]}}</code></td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

Status 201 Created
Content-Type: application/json

```
{
  targets: [
    oracle_home: [2]
    0: "WebLogicServer10_3_6_0_s1c01afx_6775",
    1: "WebLogicServer10_3_6_0_adc2201439_4731"
  }
  canonicalLink: "https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/softwarepools/filteredtargets"
}```
49.15.4 SoftwarePoolCapacity for V1

This resource retrieves the software pool capacity details like CPU utilization, memory allocation, and number of instances for the pool entities. The following table describes the SoftwarePoolCapacity [application/oracle.com.cloud.common.SoftwarePoolCapacity+json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Software Pool. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Target type of the Software Pool. Example: &quot;mwaas_zone&quot; for Middleware Pool, &quot;oracle_cloud_zone&quot; for Database Pool, &quot;schaaas_pool&quot; for Schema Pool.</td>
<td>1</td>
</tr>
<tr>
<td>capacity</td>
<td>Collection&lt;Filters&gt;</td>
<td>Filter criteria that needs to be applied to get the filtered targets. Refer SoftwarePoolsMetadata resource to get the available filters for a pool target type. [POST]</td>
<td>1</td>
</tr>
</tbody>
</table>

The GET method for the SupportedPoolCapacity resource has the following characteristics:

- **Response Payload**
  SoftwarePoolCapacity (Json Payload)

- **URI:**
  https://<OMS_HOST>:<OMS_CONSOLE_PORT>/em/websvcs/restful//extws/cloudservices/admin/cfw/v1/softwarepools/{poolId}/capacity

- **Descriptions:**
  Retrieves the software pool capacity details.

49.15.4.1 Retrieving Software Pool Capacity

A GET on SoftwarePoolCapacity resource is issued to get the Software Pool capacity details. Note that you can also use EMCLI commands to retrieve Software Pool Capacity information and these commands are described in EM CLI Verbs for SSA Operations for V2.

The table below shows the GET configuration for viewing the Software pool capacity.
Table 49-134   GET Request Configuration for Viewing the Software Pool Capacity

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>

49.16 Composite Resource Attributes for V1

Some of the resource entities in this specification contain the following composite resource attributes:

- ValueDescriptor for V1
- ValueEntity for V1
- EntityValueHolder for V1
- PoolEntityCapacity for V1
- ResourceTypeCapacity for V1

49.16.1 ValueDescriptor for V1

This describes the metadata regarding the type of value that can be set upon an associated object. The following table describes the data model:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the datum being described.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the datum being described.</td>
<td>1</td>
</tr>
<tr>
<td>defaultValue</td>
<td>String</td>
<td>Default value of the datum being described.</td>
<td>1</td>
</tr>
<tr>
<td>isRequiredValue</td>
<td>Boolean</td>
<td>True if the value is required.</td>
<td>1</td>
</tr>
<tr>
<td>possibleValues</td>
<td>Collection&lt;Val</td>
<td>Optional list of valid values of the datum being</td>
<td>0..1</td>
</tr>
<tr>
<td></td>
<td>uentity&gt;</td>
<td>described.</td>
<td></td>
</tr>
</tbody>
</table>

49.16.2 ValueEntity for V1

This represents a value (string representation) and their description (caption). The following table describes the data model:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>String representation of the actual value of the entity.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Caption of the entity that describes it.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

49.16.3 EntityValueHolder for V1

This represents a simple entity having a name, value and description. The following table describes the data model:
Table 49-137  EntityValueHolder Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the entity</td>
<td>1</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>String representation of the actual value of the entity</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Caption of the entity that describes it.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

49.16.4 PoolEntityCapacity for V1

This represents the capacity details of individual entities of the Software Pool. The following table describes the data model:

Table 49-138  PoolEntityCapacity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>entityName</td>
<td>String</td>
<td>Name of the entity</td>
<td>1</td>
</tr>
<tr>
<td>entityType</td>
<td>String</td>
<td>Target type of the entity.</td>
<td>1</td>
</tr>
<tr>
<td>entityCapacity</td>
<td>Collection&lt;Resourc eTypeCapacity&gt;</td>
<td>Collection of capacity details of a particular resource type like Storage Utilization, CPU Utilization.</td>
<td>1</td>
</tr>
</tbody>
</table>

49.16.5 ResourceTypeCapacity for V1

This represents the capacity details of a particular resource type, such as Storage Utilization and CPU Utilization. The following table describes the data model:

Table 49-139  ResourceTypeCapacity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>resourceType</td>
<td>String</td>
<td>Type of the resource like Storage Utilization.</td>
<td>1</td>
</tr>
<tr>
<td>resourceUsed</td>
<td>String</td>
<td>String representation of the used resource.</td>
<td>1</td>
</tr>
<tr>
<td>resourceThreshold</td>
<td>String</td>
<td>String representation of the resource threshold.</td>
<td>0..1</td>
</tr>
<tr>
<td>resourceUnit</td>
<td>String</td>
<td>String representation of the unit in which the utilization of the resource is measured.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

49.17 Service Template Management for V1

This section describes the resources and REST APIs that can be used to manage service templates.
49.17.1 Service Templates for V1

Service templates is a collection resource representing a Cloud Administrator's view of all the accessible service template resources. The following table describes the Service Templates data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>hasMore</td>
<td>Boolean</td>
<td>Indicates whether there are more elements in this collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>count</td>
<td>Integer</td>
<td>The number of elements in the collection resource.</td>
<td>1</td>
</tr>
<tr>
<td>items</td>
<td>Collection of &lt;integer&gt;</td>
<td>List of service template resources. If there are no service templates present, this field will be blank.</td>
<td>1</td>
</tr>
<tr>
<td>totalCount</td>
<td>Integer</td>
<td>Total number of service template resources.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent to the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

49.17.1.1 Supported Methods on ServiceTemplates Resources

The following table describes the supported methods on the ServiceTemplates resources.

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameters</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
</table>

49.17.1.2 ServiceTemplates REST API Example

An example of ServiceTemplates REST API operation is given below.
Listing Service Templates

A GET request on ServiceTemplates resource is issued to list all the Service Templates.

The table below shows the GET configuration for viewing the Software pool capacity.

**Table 49-142  GET Request Configuration for Viewing All the Service Templates**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/servicetemplates</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

Status 200 OK
Content-Type: application/json

```
{
    "name":"Service Templates",
    "type":"Service Template",
    "hasMore":false,
    "items":[
        {
            "id":"E821074692058B5DE040F00AA37D75AB",
            "name":"ST_DB_SCH_01",
            "serviceFamily":"DBAAS",
            "description":"Database Schema Service Template",
            "canonicalLink":"https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/servicetemplates/E821074692058B5DE040F00AA37D75AB"
        }
    ],
    "totalCount":1,
    "canonicalLink":"https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/servicetemplates"
}
```

49.17.2 Service Template for V1

A service template is a standardized service definition that can be used by self service users to provision a service instance. The following table describes the Service Template.

**Table 49-143  ServiceTemplate Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Methods</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Any</td>
<td>A human readable name given to the service template. This field cannot be edited.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 49-143 (Cont.) ServiceTemplate Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Supported Methods</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceFamily</td>
<td>String</td>
<td>Any</td>
<td>Service Family.</td>
<td>1</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Any</td>
<td>Service type</td>
<td>1</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>GET</td>
<td>Service template ID. The GET method contains the value for this element.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Any</td>
<td>A brief description given to the service template.</td>
<td>0..1</td>
</tr>
<tr>
<td>roles</td>
<td>Collection&lt;Role&gt;</td>
<td>GET, POST</td>
<td>SSA roles that can access the template.</td>
<td>0..1</td>
</tr>
<tr>
<td>poolIds</td>
<td>Collection&lt;String&gt;</td>
<td>POST</td>
<td>Software Pool IDs associated with this template.</td>
<td>1</td>
</tr>
<tr>
<td>serviceExecutableMeta</td>
<td>ServiceExecutableMetaDataEntity</td>
<td>Any</td>
<td>Service executable to be used for the service template.</td>
<td>0..1</td>
</tr>
<tr>
<td>createdOn</td>
<td>String (Date / Time)</td>
<td>GET</td>
<td>Date and time on which the resource was created.</td>
<td>0..1</td>
</tr>
<tr>
<td>createdBy</td>
<td>String</td>
<td>GET</td>
<td>User who created the resource.</td>
<td>1</td>
</tr>
<tr>
<td>modifiedOn</td>
<td>String (Date / Time)</td>
<td>GET</td>
<td>Date and time on which the resource was modified.</td>
<td>0..1</td>
</tr>
<tr>
<td>modifiedBy</td>
<td>String</td>
<td>GET</td>
<td>User who modified the resource.</td>
<td>1</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>GET</td>
<td>User who owns the resource.</td>
<td>1</td>
</tr>
<tr>
<td>etag</td>
<td>String</td>
<td>GET</td>
<td>HTTP entity value tag.</td>
<td>0..1</td>
</tr>
<tr>
<td>lastModified</td>
<td>String</td>
<td>GET</td>
<td>HTTP last modified value</td>
<td>0..1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>GET</td>
<td>Preferred version of resource.</td>
<td>1</td>
</tr>
</tbody>
</table>

where:
- **Supported Method:**
  - Indicates the method type where this attribute will be available.
  - The method type **Any** indicates that this resource is available for GET, PUT, or POST methods.
- **Occurs:** An occurrence is 0..1 indicates that this is an optional parameter. An occurrence of 1 indicates that this parameter is mandatory.

### 49.17.2.1 Supported Methods on ServiceTemplate Resources

The following table describes the supported methods for servicetemplates resources.
Table 49-144  Supported Methods on ServiceTemplate Resources

<table>

<tbody>
<tr>
<td>secret</td>
<td>boolean</td>
<td>Boolean if parameter is secret.</td>
</tr>
<tr>
<td>subconfigurations</td>
<td>Collection&lt;TemplateConfigParam&gt;</td>
<td>Set of possible values.</td>
</tr>
</tbody>
</table>

49.17.6 PayloadDescriptor for V1

The following table describes the PayloadDescriptor data model

Table 49-148  PayloadDescriptor data model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the payload entity.</td>
</tr>
<tr>
<td>id</td>
<td>String</td>
<td>Id of the payload entity.</td>
</tr>
</tbody>
</table>

49.17.7 ServiceTemplate Metadata for V1

The ServiceTemplate Metadata is used to generate JSON Payloads that are required to create the service template instance. The following table describes ServiceTemplate Metadata Data Model.

Table 49-149  ServiceTemplate Metadata Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>serviceFamily</td>
<td>String</td>
<td>Name of the service family.</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Name of service type.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Can be one of: JOB, DP, CDP, PROFILE</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td></td>
</tr>
<tr>
<td>payload</td>
<td>Boolean</td>
<td>Is true if payload is expected.</td>
</tr>
<tr>
<td>payloads</td>
<td>Collection&lt;PayloadMetaData&gt;</td>
<td>Boolean if parameter is required.</td>
</tr>
</tbody>
</table>

49.17.8 PayloadMetaData for V1

The following table describes the PayloadMetadata.
### Table 49-150  PayloadMetaData

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>Payload Id.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of payload</td>
</tr>
<tr>
<td>defaultValue</td>
<td>String</td>
<td>Default value</td>
</tr>
</tbody>
</table>

### 49.17.9 ServiceTemplate MetaData for V1

The following table describes the supported methods on the ServiceTemplateMetaData.

### Table 49-151  Supported Methods on ServiceTemplateMetaData

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameters</th>
<th>Request Payload</th>
<th>Response Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>NA</td>
<td>Collection&lt;ServiceTemplateMetaData&gt; (Json Payload)</td>
<td>ServiceExecutableMetaEntity (Json Payload)</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/admin/cfw/v1/servicetemplates/{serviceFamily}/executable/metadata</td>
<td>Retrieve metadata for given service family and service type for CDP, DP, and so on.</td>
</tr>
</tbody>
</table>

### 49.17.10 ServiceTemplates REST API Example

This section covers examples of ServiceTemplates REST API operations.

- Creating Service Templates
- Updating a Service Template
- Deleting a Service Template
- Viewing Details of a Service Template
- Viewing Metadata of a Service Template

<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

**Note:**

- This payload is the one that we get via GET call of metadata.
- User fills `<user_input>` appropriately to get ServiceExecutableMetaDataEntity as response.
- User uses this ServiceExecutableMetaDataEntity in his/her create Payload with values set accordingly to create Service Template MetaData.

A sample of the response received is shown below.

49.18 EM CLI Verbs for Self Service Applications

The Enterprise Manager Command Line Interface (EM CLI) enables you to access Enterprise Manager Cloud Control functionality from text-based consoles (shells and command windows) for a variety of operating systems. You can call Enterprise Manager functionality using custom scripts, such as SQL*Plus, OS shell, Perl, or Tcl, thus easily integrating Enterprise Manager functionality with a company's business process.

This section provides details on the EM CLI verbs for Enterprise Manager Self Service Applications (SSA) Admin users.

49.18.1 Introduction

A new framework is introduced for the release 12.1.0.9, along with which new EM CLI verbs are introduced. The EM CLI verbs associated with the previous version of the framework are deprecated and users are suggested to move to the supported EM CLI verbs. The EM CLI verbs for the deprecated version are listed as v1 and the supported EM CLI verbs are listed as v2:

- EM CLI Verbs for SSA Operations for V2
- EM CLI Verbs for SSA Operations for V1

All PaaS Infrastructure Zone EM CLI operations are available only to users with a EM_CLOUD_ADMINISTRATOR role and Software Pool operations can be performed only by users with a EM_SSA_ADMINISTRATOR role. EM CLI verbs will obtain user information from the security context and verify only those users authorized to perform these operations.

49.18.2 EM CLI Verbs for SSA Operations for V2

The following table provides details of the supported verbs (v2). Note that these verbs are available to SSA Administrator users only and cannot be used with an EM_SSA_USER role.
Table 49-158 EM CLI Verbs Supported for V2

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>emcli invoke_ws</td>
<td>Invokes the Enterprise Manager Web service. Options:</td>
<td>emcli invoke_ws</td>
</tr>
<tr>
<td></td>
<td>- wsname - Indicates the URI of the resource.</td>
<td>- wsname=&lt;WebService Name&gt;</td>
</tr>
<tr>
<td></td>
<td>- method - Type of the REST method.</td>
<td>- method=&lt;methodName&gt;</td>
</tr>
<tr>
<td></td>
<td>- payload - Indicates the json/xml input payload.</td>
<td>[-payload=&lt;Payload&gt;]</td>
</tr>
<tr>
<td></td>
<td>- accept - Payload type. These are standard jersey values.</td>
<td>[-accept=&lt;accept type&gt;]</td>
</tr>
<tr>
<td></td>
<td>- type - Standard jersey response types.</td>
<td>[-type=response type]</td>
</tr>
<tr>
<td></td>
<td>- param - Use this option to pass in form/query parameter value. For example, -</td>
<td>[-param=Query Parameters]</td>
</tr>
<tr>
<td></td>
<td>param=&quot;name:value&quot;. More than one parameter can be specified. For example, -</td>
<td>[-input_file=&lt;Input File for payload data&gt;]</td>
</tr>
<tr>
<td></td>
<td>param=&quot;name:value&quot; -param=&quot;zip:12345&quot;. The parameter can be provided through a file. To read from file, specify as shown in the example: -</td>
<td></td>
</tr>
<tr>
<td></td>
<td>param=&quot;name:tag&quot; -input_file=&quot;tag:file.txt&quot;. In this example, the name parameter will be read from file file.txt.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-input_file - Use this option to pass in payload or param value from file.</td>
<td></td>
</tr>
</tbody>
</table>

Examples:

- emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param="name:Administrators"
Invokes list resource and sources all administrators

- emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param="name:tag" -input_file="tag:file.txt"
Invokes list resource and sources all administrators.
The name parameter is read from file.txt.

<td>Creates a new PaaS Infrastructure zone with the provided payload.</td>
<td>Same as above.</td>
</tr>
<tr>
<td></td>
<td>Example:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>emcli invoke_ws -method=&quot;post&quot; -wsname=&quot;/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders/&quot; -type=&quot;application/json&quot; -accept=&quot;application/json&quot; -payload='{&quot;useExistingTarget&quot;:false, &quot;name&quot;:&quot;CLI_ZONE&quot;, &quot;type&quot;:&quot;self_service_zone&quot;, &quot;credentials&quot;: [ {&quot;name&quot;:&quot;normal_credential_guid&quot;, &quot;value&quot;:&quot;AKM&quot; } ], &quot;memberTargetType&quot;: &quot;host&quot;, &quot;members&quot;: [&quot;myhost2.idc.example.com&quot;], &quot;placementConstraints&quot;: [{&quot;name&quot;:&quot;MAX_CPU_UTILIZATION&quot;, &quot;value&quot;: [75]},{&quot;name&quot;:&quot;MAX_MEMORY_ALLOCATION&quot;, &quot;value&quot;: [75]}], &quot;characteristics&quot;: [ {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_CONTEXT&quot;,&quot;value&quot;: [&quot;123456789&quot;]}, {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_COST_CENTER&quot;,&quot;value&quot;: [&quot;IDC.NOIDA&quot;]}, {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_DEPARTMENT&quot;,&quot;value&quot;: [&quot;CFW&quot;]}, {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_LIFE_CYCLE_STATUS&quot;,&quot;value&quot;: [&quot;Test&quot;]}, {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_LINE_OF_BUS&quot;,&quot;value&quot;: [&quot;ST&quot;]}, {&quot;name&quot;:&quot;EXAMPLE.SYSMAN.CFW.ORCL_GTP_LOCATION&quot;,&quot;value&quot;: [&quot;IDC&quot;]}], &quot;roles&quot;: [&quot;SSA_USER&quot;]}'</td>
<td></td>
</tr>
<tr>
<td>Verb</td>
<td>Description</td>
<td>Format</td>
</tr>
<tr>
<td>-------------</td>
<td>-----------------------------------------------------------------------------</td>
<td>------------------------------------------------------------------------</td>
</tr>
<tr>
<td>emcli get_targets</td>
<td>Obtain status and alert information for targets. Options:</td>
<td>emcli get_targets</td>
</tr>
<tr>
<td></td>
<td>• -targets=name:type - Name or type can be either a full value or a pattern match using &quot;%&quot;. Also, name is optional, so the type alone may be specified.</td>
<td>[-targets=[name1:type 1;[name2:type2;...]]]</td>
</tr>
<tr>
<td></td>
<td>• -limit_rows=&quot;Maximum number of targets to be retrieved&quot; - Defaults to 2000 rows, if not specified.</td>
<td>[-limit_rows=&quot;Maximum number of targets to be retrieved&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -config_search=&quot;Configuration Search UI Name&quot; - Search UI name should be the display name of the configuration search.</td>
<td>[-config_search=&quot;Configuration Search UI Name&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -alerts - Displays the count of critical and warning alerts for each target.</td>
<td>[-alerts]</td>
</tr>
<tr>
<td></td>
<td>• -noheader - Displays tabular output without column headers.</td>
<td>[-noheader]</td>
</tr>
<tr>
<td></td>
<td>• -unmanaged - Displays unmanaged targets (no status or alert information).</td>
<td>[-unmanaged]</td>
</tr>
<tr>
<td></td>
<td>• -properties - Displays unmanaged targets with properties.</td>
<td>[-properties]</td>
</tr>
<tr>
<td></td>
<td>• -separator_properties=&quot;separator_properties&quot; - Displays unmanaged target properties with separator_properties.</td>
<td>[-separator_properties=&quot;separator_properties&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -subseparator_properties=&quot;subseparator_properties&quot; - Displays unmanaged target properties with subseparator_properties.</td>
<td>[-subseparator_properties=&quot;subseparator_properties&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -script - This option is equivalent to - format=&quot;name:script&quot;.</td>
<td>[-script]</td>
</tr>
<tr>
<td></td>
<td>• -format - Format specification (default is - format=&quot;name:pretty&quot;).</td>
<td>[-format]</td>
</tr>
<tr>
<td></td>
<td>• -format=&quot;name:pretty&quot; prints the output table in a readable format but is not intended to be parsed by scripts.</td>
<td>[-format=&quot;name:pretty&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -format=&quot;name:script&quot; sets the default column separator to a tab and the default row separator to a new line. The column and row separator strings may be specified to change these defaults.</td>
<td>[-format=&quot;name:script&quot;]</td>
</tr>
<tr>
<td></td>
<td>• -format=&quot;name:csv&quot; sets the column separator to a comma and the row separator to a newline.</td>
<td>[-format=&quot;name:csv&quot;]</td>
</tr>
</tbody>
</table>

Examples:

- emcli get_targets
  Displays a maximum of 2000 targets. Critical and Warning columns are not shown.
- emcli get_targets -limit_rows=20
  Displays a maximum of 20 targets. Critical and Warning columns are not shown.
- emcli get_targets -alerts
  Displays a maximum of 2000 targets. Critical and Warning columns are shown.
- emcli get_targets -targets="oracle_database"
Table 49-158  (Cont.) EM CLI Verbs Supported for V2

<tr>
<td>cancel_cloud_service_requests</td>
<td>Cancels cloud service requests. Either user or names option should be provided. Both cannot be used simultaneously.</td>
<td>emcli cancel_cloud_service_requests - user=&quot;username&quot; [-family=&quot;family&quot;] [-ids=&quot;id1:id2:...&quot;]</td>
</tr>
</tbody>
</table>

Example

emcli cancel_cloud_service_requests - user="user1"

Cancels all Scheduled cloud requests whose owner is specified user.

emcli cancel_cloud_service_requests - user="user1" -family="family1"

Cancels all Scheduled cloud requests owned by "user1" and service family="family1".

emcli cancel_cloud_service_requests - user="user1" -ids="1;2"

Cancels all Scheduled cloud requests owned by "user1" and with ids 1" and "2."
<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>delete_cloud_service_instances</td>
<td>Deletes the cloud service instances based on a specified filter. This option cleans up all objects owned by a self service user when the instance is deleted.</td>
<td>emcli delete_cloud_service_instances -user=&quot;username&quot; [-family=&quot;family&quot;] [-type=&quot;type&quot;]</td>
</tr>
<tr>
<td></td>
<td>• user: The user name to be used to filter service instances to be deleted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• family: The service family name to be used to filter service instances to be deleted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>• type: The service type to be used to filter service instances to be deleted.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>Examples:</td>
<td></td>
</tr>
<tr>
<td></td>
<td>emcli delete_cloud_service_instances -user=&quot;user1&quot;</td>
<td>Deletes all cloud instances whose owner is the specified user.</td>

49.18.3 EM CLI Verbs for SSA Operations for V1

The following table provides details of the deprecated verbs (v1). Users are suggested to avoid using these verbs. These verbs are available to SSA Administrator users only and cannot be used with an EM_SSA_USER role.
### Table 49-159  EM CLI Verbs for V1

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_paaS_zone</td>
<td>Creates a PaaS Infrastructure Zone.</td>
<td><code>emcli create_paaS_zone</code>-name=&lt;Name of PaaS Zone&gt;-credential=&lt;Global Named Credential&gt;-hosts=&lt;Host1,Host2,Host3...&gt;-ovm_zones=&lt;OVMZone1,OVMZone2,OVMZone3...&gt;-roles=&lt;SsaRole1,SsaRole2...&gt;-description=&lt;Description of PaaS Zone&gt;-cpu_utilization=&lt;Value between 1 and 100&gt;-memory_utilization=&lt;Value between 1 and 100&gt;</td>
</tr>
</tbody>
</table>

- **name** - Name of the PaaS Infrastructure Zone to be created
- **credential** - Global Named Credentials to be used for provisioning in this PaaS Infrastructure Zone.
- **hosts** - Comma separated list of the Host targets to be added as members of this Paas Infrastructure Zone. PaaS Infrastructure Zone can contain either hosts or Oracle VM Zones as members.
- **ovm_zones** - Comma separated list of the Oracle VM Zone targets to be added as members of this Paas Infrastructure Zone.
- **roles** - Comma separated list of SSA roles that can access this PaaS Infrastructure Zone.
- **description** - Description of the PaaS Infrastructure Zone.
- **cpu_utilization** - Placement Policy Constraints allow the cloud administrator to set maximum thresholds for any host. Value entered must be between 1 and 100. If not provided, default value is taken to be 80 percent. Parameter is not needed if Oracle VM Zone targets are added as members.
- **memory_utilization** - Another Placement Policy Constraint for PaaS Infrastructure Zone. Value entered must be between 1 and 100. If not provided, default value is taken to be 80 percent. Parameter is not needed if Oracle VM Zone targets are added as members.

**Example:**

```bash
emcli create_paaS_zone
-name=MyPaaSZone
-credential=ABCDEF
-hosts=slc03qtn.us.example.com
-roles="SSA_USER_ROLE1,SSA_USER_ROLE2"
-description="Test PaaS zone"
-cpu_utilization=40
-memory_utilization=70
```

**Sample Output:**

PaaS Infrastructure Zone "MyPaaSZone" created successfully.
<table>
<thead>
<tr>

<td>delete_paaS_zone</td>
<td>Deletes a PaaS Infrastructure Zone. PaaS Infrastructure Zone cannot be deleted if there is an existing Software Pool associated with it.</td>
<td>emcli delete_paaS_zone-name=&lt;Name of PaaS Zone&gt;</td>
</tr>
<tr>
<td>get_paaS_zone_detail</td>
<td>Retrieves the PaaS Infrastructure Zone details.</td>
<td>emcli get_paaS_zone_detail-name=&lt;Name of PaaS Zone&gt;</td>
</tr>
</tbody>
</table>
### Table 49-159  (Cont.) EM CLI Verbs for V1

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>create_pool</td>
<td>Creates a Software Pool.</td>
<td>emcli create_pool -name=&lt;Name of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• name - Name of the Software Pool to be created</td>
<td>-target_type=&lt;Target type of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• target_type - Target type of the Software Pool to be created</td>
<td>-paas_zone=&lt;Paas Infrastructure Zone of Software Pool&gt;</td>
</tr>
<tr>
<td></td>
<td>• paas_zone - Name of PaaS Infrastructure Zone in which the Software Pool is to be created.</td>
<td>-members=&lt;Member1, Member2...&gt;</td>
</tr>
<tr>
<td></td>
<td>• members - Comma separated list of targets to be added as members of the Software Pool.</td>
<td>[- description=&lt;Description of Software Pool&gt;]</td>
</tr>
<tr>
<td></td>
<td>• description - Description of the Software Pool.</td>
<td>[- placement_constraints=&lt;constraint1=value1, constraint2=value2...&gt;]</td>
</tr>
<tr>
<td></td>
<td>• placement_constraints - Comma separated key value pairs of the placement constraints that allow the self service administrator to set maximum ceilings for resource utilization. This provides protection for the members of the Software Pool in terms of resource consumption. Refer to the get_pool_allowed_placement_constraints verb to get the available placement constraints for a pool target type.</td>
<td>[- member_constraints=&lt;constraint1=value1, constraint2=value2...]</td>
</tr>
<tr>
<td></td>
<td>• member_constraints - Comma separated key value pairs that restricts the addition of member targets to a Software Pool with a set criteria. Refer to the get_pool_allowed_member_constraints verb to get the available member constraints and their possible values for a pool target type.</td>
<td>[- properties=&lt;property1=value1, property2=value2&gt;]</td>
</tr>
<tr>
<td></td>
<td>• properties - Comma separated key value pairs for additional properties that need to be specified based on the Software Pool target type.</td>
<td></td>
</tr>
</tbody>
</table>

Example:

```bash
e.cli  create_pool
   -name=MyDbPool
   -target_type=oracle_cloud_zone
   -paas_zone=MyPaaSZone
   -members=OraDb11g_home1_1_slc03qtn
   -description="Test Database Pool"
   -member_constraints="CONFIGURATION=oracle_database,VERSION=11.2.0.3.0,PLATFORM=226"
   -placement_constraints="MAX_INSTANCES=7"
   -properties="host_credential_guid=DBA449B8967AA77E040F00A73B11F55,
                root_credential_guid=DBA449B8967AA77E040F00A73B11F55"
```

Sample Output:

Software Pool "MyDbPool" created successfully.

Note:

- This verb is for DB Pool. The target_type for Schema Pool is schaas_pool.
### Table 49-159 (Cont.) EM CLI Verbs for V1

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| update_pool        | Updates a Software Pool.  
• name - Name of the existing Software Pool.  
• target_type - Target type of the existing Software Pool. For example: "mwaas_zone" for Middleware Pool, "oracle_cloud_zone" for Database Pool, and "schaas_pool" for Schema Pool.  
• description - Description of the Software Pool.  
• add_members - Comma separated list of targets to be added as members of the Software Pool. The targets to be added must satisfy the member constraints of the Software Pool.  
• remove_members - Member targets to be removed from the Software Pool.  
• placement_constraints - Comma separated key value pairs of the placement constraints that allow the self service administrator to set maximum ceilings for resource utilization. This provides protection for the members of the Software Pool in terms of resource consumption.  
• properties - Comma separated key value pairs for properties that need to be updated based on the Software Pool target type. | emcli update_pool - name=<Name of Software Pool> -target_type=<Target type of Software Pool> [-description=<Description of Software Pool>] [-add_members=<Member1, Member2...>] [-remove_members=<Member4, Member5...>] [-placement_constraints=<constraint1=value1, constraint2=value2...>] [-properties=<property1=value1, property2=value2>] |
| delete_pool        | Deletes a Software Pool. Software Pool cannot be deleted if there is an existing Service Template associated with it.  
• name - Name of an existing Software Pool.  
• target - Target type of the Software Pool. | emcli delete_pool - name=<Name of Software Pool> -target_type=<Target type of Software Pool> |
| get_pool_detail    | Retrieves the Software Pool details, such as name, target type, description, PaaS Infrastructure Zone, number of members, placement constraints, and member constraints.  
• name - Name of the Software Pool.  
• target - Target type of the Software Pool | emcli get_pool_detail - name=<Name of Software Pool> -target_type=mwaas_zone |
<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td>get_pool_capacity</td>
<td>Retrieves the software pool capacity details like CPU utilization, memory allocation, and number of instances per host for the pool entities.</td>

This chapter covers the REST APIs for request scheduling and user preference management.

**Note:**

For the SSA Plug-in release 12.1.0.9, a new framework is introduced for the REST APIs which is referred to as the v2 framework. The new framework consists of a different approach and signatures, as a result of which the REST APIs also differ when compared to the earlier framework. The earlier framework (v1) is deprecated and users are suggested to move to the v2 REST APIs and EM CLI verbs.

In v2, REST APIs for the Self Service Portal application are generally used by the SSA users. These REST APIs are generally in the .../ssa/... format. For example, /em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/. REST APIs for administrative functions (i.e., .../admin/... format) are REST APIs that configure the SSA Portal setup, such as creating zones, templates, etc., which are generally performed by Cloud or SSA Administrators. The SSA user REST APIs are covered in this chapter.

This chapter contains the sections listed below. The first two sections provide summaries of all the v2 and v1 REST APIs covered in this chapter, whereas the following sections provide the user preference and request scheduling resource details and their REST APIs.

- Summary of SSA User REST APIs for V2
- Summary of User REST APIs for V1
- Common REST Entities for V2
  - Cfw Resource for V2
  - Cfw Link for V2
  - Cfw Value Descriptor for V2
- Catalog APIs
- Service Types for V2
- Services for V2
  - Service Collection for V2
  - Service Offering for V2
  - Request Metadata for V2
- Service Requests REST APIs for V1 and V2
  - Service Requests Resource for V2
Service Request Collection - Collection Resource for V1
Service Request REST API Examples for V1 and V2

- Service Instances for V2
- Quota Usage for V2
- User Preferences for V2
- User Preferences for V1
  - My Preferences for V1
  - Canonical Link for V1
  - General Preferences for V1
- Composite Resource Attributes for V1
  - RequestEntity Data Model for V1
  - InstanceExpireEntity Data Model for V1
  - QuotaEntity Data Model for V1
- Supported Methods for General Preferences (for V1)
- Service Specific User Preferences for V1
  - Service Preferences for V1
  - Supported Methods for My Preferences (for V1)
  - ServicePreferenceMetadata Data Model for V1
  - Composite Resource Attributes for V1
  - Service Preferences REST API Examples for V1
  - My Database Preferences REST API Examples for V1
  - My Middleware Preferences REST API Examples for V1
  - My Tests Preferences for V1

50.1 Summary of SSA User REST APIs for V2

The table below shows a summary of all the User preference and Request scheduling REST APIs covered in this chapter for the v2 framework.

</tr>
</tbody>
</table>

**Note:**
In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.

### 50.3 Common REST Entities for V2

This section describes the common REST entities to the cloud framework resources. These entities are specific to the new Cloud Framework (CFW) v2.

#### 50.3.1 Cfw Resource for V2

Cfw resource is the base class for cloud framework resources. This resource fields that are common to all singular resources.

### Table 50-3 Cfw Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the resource.</td>
</tr>
<tr>
<td>createdOn</td>
<td>String</td>
<td>Date of creation.</td>
</tr>
</tbody>
</table>
Table 50-3  (Cont.) Cfw Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>createdBy</td>
<td>String</td>
<td>Details of the creator.</td>
</tr>
<tr>
<td>modifiedOn</td>
<td>String</td>
<td>Date of last modification.</td>
</tr>
<tr>
<td>modifiedBy</td>
<td>String</td>
<td>Details of the modifier.</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>Indicates the owner of the resource.</td>
</tr>
<tr>
<td>e-Tag</td>
<td>String</td>
<td>Indicates the Etag.</td>
</tr>
<tr>
<td>lastModified</td>
<td>String</td>
<td>Details of the last modification.</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>Cfw Link</td>
<td>Indicates the canonical link of the resource.</td>
</tr>
</tbody>
</table>

50.3.2 Cfw Link for V2

Cfw link is the base class for the link to a resource.

Table 50-4  Cfw Link Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>href</td>
<td>String</td>
<td>Indicates the URI or URI template. If the value is a URI template, then the templated property should be true.</td>
</tr>
<tr>
<td>templated</td>
<td>Boolean</td>
<td>Is True if href is a URI template, else false. The default value is false.</td>
</tr>
<tr>
<td>rel</td>
<td>String</td>
<td>Indicates the name of the link relation that the consumer may lookup as a secondary key (in addition to the type property) to retrieve actual link details, e.g. href or profile.</td>
</tr>
<tr>
<td>profile</td>
<td>String</td>
<td>Indicates the Json-schema describing the resource expected when deferring the target resource.</td>
</tr>
<tr>
<td>method</td>
<td>String</td>
<td>The method for requesting the target of the link.</td>
</tr>
<tr>
<td>mediaType</td>
<td>String</td>
<td>Description of the link target.</td>
</tr>
</tbody>
</table>

50.3.3 Cfw Value Descriptor for V2

Cfw value descriptor defines the dynamic data.

Table 50-5  Cfw Value Descriptor Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>Indicates the ID.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Indicates the name.</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Indicates the value.</td>
</tr>
<tr>
<td>defaultValue</td>
<td>String</td>
<td>Indicates the default value.</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Provides a description.</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Provides the display name.</td>
</tr>
</tbody>
</table>
### Table 50-5  (Cont.) Cfw Value Descriptor Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>required</td>
<td>Boolean</td>
<td>Signifies if required or not.</td>
</tr>
<tr>
<td>secret</td>
<td>Boolean</td>
<td>Signifies if it is a secret or not.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Indicates the type.</td>
</tr>
<tr>
<td>unitOfmeasurement</td>
<td>String</td>
<td>Indicates the unit of measurement.</td>
</tr>
<tr>
<td>values</td>
<td>List</td>
<td>Provides the list of values.</td>
</tr>
<tr>
<td>subvalues</td>
<td>List&lt;CfwValueDescriptor&gt;</td>
<td>Provides the list of sub-values.</td>
</tr>
<tr>
<td>subtype</td>
<td>String</td>
<td>Provides the type of elements in the values.</td>
</tr>
</tbody>
</table>

### 50.4 Catalog APIs

This section covers the Catalog APIs for SSA user.

#### 50.4.1 Supported Operations

The table below lists the supported operations for the Catalog APIs.

### Table 50-6  Supported operations for Catalog APIs

<table>
<thead>
<tr>
<th>Method</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/cfw/API</td>
<td>Returns links to available REST API catalogs.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/cfw/API/v2</td>
<td>Returns links to REST API catalog by user type.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfwv2/API</td>
<td>Returns user REST API catalog.</td>
</tr>
</tbody>
</table>

### 50.4.2 REST API Catalog Examples for V2

This section contains examples of the Catalog APIs. The following REST API examples are covered:

- Viewing Details of the Available REST API Catalogs
- Viewing Details of the API Catalog by User Type
- Viewing Details of the User API Catalog

#### 50.4.2.1 Viewing Details of the Available REST API Catalogs

The table below shows the GET configuration for viewing details of the available REST API catalogs.
Table 50-7  GET Request Configuration for Viewing Details of the Available REST API Catalogs

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/cfw/API</td>
</tr>

50.5 Service Types for V2

This section covers the Service type REST APIs.

50.5.1 Service Types REST API Example for V2

The Service types REST API for SSA user is as follows.

The query parameter `servicefamily` can be optionally used in the GET request to filter the output for the given service family type.

50.5.1.1 Viewing Details of Service Types

The table below shows the GET configuration for viewing details of Service types.
Table 50-10  GET Request Configuration for Viewing Details of Service Types

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicetypes</td>

}
```
50.6 Services for V2

The Services resource is defined by the Service collection resource, Service offering resource and the Request metadata resource. These resource are explained below.

The following topics are covered in this section:

- Service Collection for V2
- Service Offering for V2
- Request Metadata for V2
- Supported Operations for Services for V2
- Services REST API Examples for V2
- Creating a Service Instance using V2

50.6.1 Service Collection for V2

Service collection resource is an extension of the oracle.sysman.cfw.cloudAPI.common.CfwCollection resource.

Table 50-11  Service Collection Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the collection. The value is &quot;Services&quot;.</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of the collection. The value is &quot;Services&quot;.</td>
</tr>
<tr>
<td>totalResults</td>
<td>Integer</td>
<td>The total count of items.</td>
</tr>
<tr>
<td>cfwItems</td>
<td>List&lt;ServiceOffering&gt;</td>
<td>Provides the list of ServiceOffering.</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>Cfw link</td>
<td>Indicates the canonical link.</td>
</tr>
<tr>
<td>selfLink</td>
<td>Cfw link</td>
<td>Indicates the self link.</td>
</tr>
</tbody>
</table>

50.6.2 Service Offering for V2

Service offering resource is an extension of the oracle.sysman.cfw.cloudAPI.common.CfwResource resource. Service offering resource encapsulates the service offering that is available to the user using which the user can provision a service instance.

Table 50-12  Service Offering Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>id</td>
<td>String</td>
<td>Indicates the ID of the service offering.</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the service offering.</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name of the service offering.</td>
</tr>
<tr>
<td>guid</td>
<td>String</td>
<td>GUID of the service offering.</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Indicates the service type.</td>
</tr>
</tbody>
</table>
Table 50-12  (Cont.) Service Offering Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>

<td>String</td>
<td>Indicates the service family.</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the service offering.</td>
</tr>
<tr>
<td>modifiedOn</td>
<td>String</td>
<td>Indicates the date of the modification.</td>
</tr>
<tr>
<td>lastModified</td>
<td>String</td>
<td>Indicates the date of the last modification.</td>
</tr>
<tr>
<td>meta</td>
<td>String</td>
<td>Meta details of the service offering.</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>Cfw link</td>
<td>Indicates the canonical link.</td>
</tr>
<tr>
<td>selfLink</td>
<td>Cfw link</td>
<td>Indicates the self link.</td>
</tr>
</tbody>
</table>

50.6.3 Request Metadata for V2

Request metadata resource is an extension of the oracle.sysman.cfw.cloudAPI.common.CfwResource. Request metadata encapsulates the data required to create a service instance. This response returned is filled by user with appropriate values and is used as in "POST" payload required for creation of service instance.

Table 50-13  Request Metadata Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceName</td>
<td>String</td>
<td>Name of the service instance.</td>
</tr>
<tr>
<td>schedule</td>
<td>Schedule entity</td>
<td>Schedule of the request.</td>
</tr>
<tr>
<td>configurations</td>
<td>List&lt;CfwValueDescriptor&gt;</td>
<td>Provides the list of configurations.</td>
</tr>
<tr>
<td>characteristics</td>
<td>List&lt;Characteristic&gt;</td>
<td>Provides the list of characteristics.</td>
</tr>
</tbody>
</table>

50.6.4 Supported Operations for Services for V2

The table below lists the supported operations for the Services resource.

Table 50-14  Supported operations for Services Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services</td>
<td>Returns list of service offerings.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/{serviceguid}</td>
<td>Returns service offering details.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/{serviceguid}/metadata</td>
<td>Returns service offering metadata details.</td>
</tr>
</tbody>
</table>
50.6.5 Services REST API Examples for V2

This section contains the REST APIs which are a part of the Services resource. The following REST API tasks are covered.

- Viewing Details of the Services Resource
- Viewing Details of the Service Offering Resource
- Viewing Details of the Request Metadata
- Creating a Service Instance

50.6.5.1 Viewing Details of the Services Resource

The table below shows the GET configuration for viewing details of the Services resource.

<table>
<thead>
<tr>

    "id":"16",
    "actionName":"CREATE",
    "canonicalLink":{
      "href":"https://cloudcompany.com/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests/16"
    }
  },
  {
    "id":"17",
    "actionName":"DELETE",
```
50.6.6 Creating a Service Instance using V2

This section provides the procedure to create a Service instance using REST APIs.

Follow the steps below to create a Service instance:

   The GET operation returns all the service offerings. Note the required service offering.

2. Perform a GET operation on the URI - `em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/{serviceofferingid}/metadata`, using the service offering ID from the previous step. See, Viewing Details of the Request Metadata.

   The GET operation returns the metadata of the service offering. Note the metadata fields.

3. Perform a POST operation on the URI - `em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/`, by providing values for the metadata fields. See, Creating a Service Instance.

   The POST generates a request for the creation of a Service instance. The request payload is expected to have the following fields with values set.
   - `offeringId` - A unique ID for identifying the Service instance.
   - `name` - A name for the Service instance.
   - `schedule` - This is an optional field and has two sub-fields, `scheduleStartTime` and `scheduleEndTime`. To schedule an instance for future use provide `scheduleStartTime` value. Additionally, to set expiry or end time for the service instance set the `scheduleEndTime`.
   - `instanceName` - This field is dependent on the chosen service offering and may or may not be required.
   - `configurations` - This field is dependent on the chosen service offering and may or may not be required.
   - `characteristics` - This field is dependent on the chosen service offering and may or may not be required.

50.7 Service Requests REST APIs for V1 and V2

A user with the EM_SSA_USER role can reschedule and cancel requests that are in the scheduled state.
All the REST APIs will be available from the top level URI /extws/cloudservices/ssa/cfw/v1/.

50.7.1 Service Requests Resource for V2

The Service requests resource is an extension of oracle.sysman.cfw.cloudAPI.pojo.request.RequestSummary. A request enables a SSA user to initiate a task for immediate or future execution.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestType</td>
<td>String</td>
<td>Type of request.</td>
</tr>
<tr>
<td>serviceFamily</td>
<td>String</td>
<td>Name of service family.</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Name of service type.</td>
</tr>
<tr>
<td>startDate</td>
<td>String</td>
<td>Start date of request.</td>
</tr>
<tr>
<td>endDate</td>
<td>String</td>
<td>End date of request.</td>
</tr>
<tr>
<td>lastModifiedDate</td>
<td>String</td>
<td>Date of last modification of request.</td>
</tr>
<tr>
<td>timeZone</td>
<td>String</td>
<td>Time zone of the request.</td>
</tr>
<tr>

<td>String</td>
<td>Execution logs.</td>
</tr>
<tr>
<td>status</td>
<td>Request status</td>
<td>Status of the request.</td>
</tr>
</tbody>
</table>

50.7.2 Service Request Collection - Collection Resource for V1

Service Request Collection is a collection resource representing a Cloud Administrator's view of all the accessible Service Request resources. The following table describes the Service Request Collection data model for v1.

<table>
<thead>

</tbody>
</table>

The table below shows the query parameters supported for the GET request on the Service Requests resource in the v2 framework.

Table 50-23  Query Parameters for Service Requests in V2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Input</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>servicetype</td>
<td>Name of service type</td>
<td>Returns service type specific information.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
Table 50-23  (Cont.) Query Parameters for Service Requests in V2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Input</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
</table>
| status    | Status of service request | Returns status specific information. The possible values are:  
  • CANCELLED  
  • CLEANUP_ERROR  
  • CLEANUP_FAILED  
  • CLEANUP_SCHEDULED  
  • CLEANED  
  • CLEANING_UP  
  • EXECUTION_ERROR  
  • INCOMPLETE  
  • IN_PROGRESS  
  • NO_QUOTA_ERROR  
  • NO_RESOURCE_ERROR  
  • PARTIAL_SUCCEEDED  
  • ENDED  
  • ERROR_ENDING  
  • ENDING  
  • EXECUTING  
  • SAVED  
  • SCHEDULED  
  • SCHEDULING  
  • ERROR_SCHEDULING  
  • SUCCESS   | Optional                |
| expanded  | Boolean; true or false  | If true, RequestCollection returns a list of requests cfwItems, else status wise summary of requests is returned.  
  Possible values are true, and false. Any value apart from true or false is ignored and treated as false.  | Optional  |
| servicefamily | Name of service family | Returns service family specific information.                                                       | Optional  |

50.7.4 Service Request REST API Examples for V1 and V2

This section lists all a few REST API example scenarios. The following operations are covered in this section:

V2:

- Retrieving Top Level View of Service Requests in V1 and V2
- Querying the Service Requests Resource for Status=SUCCESS in V2
- Querying the Service Requests Resource for Expanded=true and Expanded=false in V2
- Querying the Service Requests Resource for status=SUCCESS&expanded=false and status=SUCCESS&expanded=true in V2
- Viewing Details of a Service Request in V2
• Deleting a Service Request in V2
• Rescheduling a Service Request that is in a Scheduled State in V1 and V2
• Viewing the Logs of a Service Request in V2
• Querying the Logs of a Service Request in V2

V1:
• Retrieving Top Level View of Service Requests for a Specific Service Family in V1
• Retrieving Top Level View of Service Requests for a Specific Status in V1
• Rescheduling a Service Request that is in a Cancelled State (or in a state other than Scheduled) in V1
• Deleting a Service Request that is in a Scheduled State in V1
• Deleting a Service Request that is in a Canceled State (or in a state other than scheduled) in V1

50.7.4.1 Retrieving Top Level View of Service Requests in V1 and V2

Table 50-24   GET Request Configuration for Viewing Details of Service Requests Resource in V1 and V2

<table>

            "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests?status=SCHEDULED&expanded=true"
        }
    ],
    "canonicalLink": {
        "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests"
    },
    "selfLink": {
        "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests?status=SUCCESS&expanded=true"
    }
}
```
50.7.4.3 Querying the Service Requests Resource for Expanded=true and Expanded=false in V2

The table below shows the GET configuration for querying the Service requests resource for expanded=true. A similar approach is followed for expanded=false, where the query change is made in the URI.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests?expanded=true</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received for expanded=true is shown below.

```json
{
  "name": "Service Requests",
  "type": "Service Request",
  "totalResults": 5,
  "cfwItems": [
    {
      "id": "5",
      "name": "Rst_rpc_14-09-11 09.52.58_11-Sep-14 21:53:06.663",
      "startDate": "2014-09-11T16:23:06Z",
      "status": "SUCCESS",
      "canonicalLink": {
        "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests/5"
      },
      "displayName": "Rst_rpc_14-09-11 09.52.58_11-Sep-14 21:53:06.663"
    },
    {
      "id": "4",
      "name": "Remove Sample XaaS Service_XaaS_Storage__11-Sep-14 21:52:58.553",
      "startDate": "2017-07-12T23:48:10Z",
      "status": "SCHEDULED",
      "canonicalLink": {
        "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests/4"
      },
      "displayName": "Remove Sample XaaS Service_XaaS_Storage__11-Sep-14 21:52:58.553"
    },
    {
      "id": "3",
      "name": "Rst_en_14-09-11 09.52.58_11-Sep-14 21:52:58.363",
      "startDate": "2014-09-11T16:22:58Z"
    }
  ]
}
```
A sample of the response received for expanded=false is shown below.

```json
{
  "name": "Request summary grouped by status",
  "totalResults": 5,
  "requestSummary": [
    {
      "status": "SUCCESS",
      "count": 3,
      "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests?status=SUCCESS&expanded=true"
    },
    {
      "status": "SCHEDULED",
      "count": 2,
      "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/servicerequests?status=SCHEDULED&expanded=true"
    }
  ]
}
```
50.7.4.4 Querying the Service Requests Resource for status=SUCCESS&expanded=false and status=SUCCESS&expanded=true in V2

The table below shows the GET configuration for querying the Service requests resource for status=SUCCESS&expanded=false. A similar approach is followed for status=SUCCESS&expanded=true, where the query change is made in the URI.

Table 50-27 GET Request Configuration for Querying a Service Request for status=SUCCESS&expanded=false in V2

50.8 Service Instances for V2

Service instances resources comprises of Service instance and Action entities. The data models of the Service instances resource and its associated entities is given below.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>guid</td>
<td>String</td>
<td>Guid of the service instance.</td>
</tr>
<tr>
<td>serviceFamily</td>
<td>String</td>
<td>Name of the service family.</td>
</tr>
<tr>
<td>serviceType</td>
<td>String</td>
<td>Name of the service type.</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>Status of the service instance.</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name of the service instance.</td>
</tr>
<tr>
<td>targetType</td>
<td>String</td>
<td>Target type of the service instance.</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>offeringId</td>
<td>String</td>
<td>Guid of the service.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the request.</td>
<td>1</td>
</tr>
<tr>
<td>instanceName</td>
<td>String</td>
<td>Name of the service instance.</td>
<td>0..1</td>
</tr>
<tr>
<td>schedule</td>
<td>ScheduleEntity</td>
<td>Schedule of the request.</td>
<td>0..1</td>
</tr>
<tr>
<td>configurations</td>
<td>List&lt;CfwValueDescriptor&gt;</td>
<td>Configurations.</td>
<td>0..1</td>
</tr>
<tr>
<td>characteristics</td>
<td>List&lt;Characteristic&gt;</td>
<td>List of characteristics.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

The supported request parameters and their descriptions are provided in the table below.

50.8.1 Supported Methods for Service Instance in V2

The table below provides information on the supported methods for Service instance resource.

<table>
<thead>
<tr>
<th>Request Method</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/</td>
<td>Returns the service instances collection details. See Table 50-41, for query parameters.</td>
</tr>
<tr>
<td>Request Method</td>
<td>URI</td>
<td>Description</td>
</tr>
<tr>
<td>----------------</td>
<td>-----</td>
<td>-------------</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}</td>
<td>Returns the details of specified service instance.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}/actions</td>
<td>Returns actions available on the specified service instance.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}/attributes</td>
<td>Returns attributes for the specified service instance.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}/actions/{actionid}</td>
<td>Returns the action details and the action inputs required to execute the action on the specified service instance.</td>
</tr>
<tr>
<td>PUT</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}</td>
<td>Executes the action on a given service instance.</td>
</tr>
</tbody>
</table>

The table below shows the query parameters supported for the GET request on the Service instance resource in the v2 framework.

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Input</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>servicetype</td>
<td>Name of service type.</td>
<td>Returns service type specific information.</td>
<td>Optional</td>
</tr>
</tbody>
</table>
### Table 50-41 (Cont.) Query Parameters for Service Instance in V2

<table>
<thead>
<tr>
<th>Parameter</th>
<th>Input</th>
<th>Description</th>
<th>Required</th>
</tr>
</thead>
<tbody>
<tr>
<td>status</td>
<td>Status of service instance.</td>
<td>Returns status specific information. The possible values are:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PENDING_CREATION: Indicates that a request to create the service instance is scheduled to run on a later date and the relevant service instance is scheduled to be created.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• PROCESSING_CREATION: Indicates that a request to create the service instance is running and is in the process of creation.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• ERROR_CREATION: Indicates that a request to create the service instance failed due to error.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_DOWN: Indicates that the service instance is currently down.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_UP: Indicates that the service instance is up and running fine.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_METRIC_ERROR: Indicates that the system (EM/OMS) monitoring the service instance has encountered issues while collecting certain data on the service instance.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_AGENT_DOWN: Indicates that the agent monitoring the service instance is down. Hence, the monitoring data of the service instance cannot be uploaded.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_UNREACHABLE: Indicates that the system is not able to get the service instance availability status.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_BLACKOUT: Indicates that the Administrator has black-out the service instance for upgrades/patches. The upgrades will be applied generally to the machines hosting the service.</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• STATUS_PENDING: Indicates that the system is in the process of collecting the availability status of the service instance.</td>
<td></td>
</tr>
<tr>
<td>expanded</td>
<td>Boolean; true or false.</td>
<td>ServiceInstanceCollection contains cfwItems if true and serviceInstanceSummary if false.</td>
<td>Optional</td>
</tr>
</tbody>
</table>

### 50.8.2 Service Instances REST API Examples for V2

This section provides the REST API examples of the Service instances resource. The following operations are covered in this section:

- Viewing Details of the Service Instance Resource in V2
- Querying the Service Instance Resource in V2
- Viewing Details of a Service Instance in V2
50.8.2.1 Viewing Details of the Service Instance Resource in V2

The table below shows the GET request configuration.

**Table 50-42   GET Request Configuration for Viewing Details of Service Instance Resource in V2**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "name": "Service Instances Summary",
  "totalResults": 7,
  "serviceInstanceSummary": [
    {
      "status": "STATUS_UP",
      "count": 3
    },
    {
      "status": "PENDING_CREATION",
      "count": 4
    }
  ],
  "canonicalLink": {
    "href": "https://xx.idc.example.com:24503/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances"
  }
}
```

50.8.2.2 Querying the Service Instance Resource in V2

The table below shows the GET request configuration for querying the Service instance resource based on the following parameters:

- expanded=true
- expanded=false
Table 50-43  GET Request Configuration for Querying Service Instance Resource in V2

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI for expanded=true</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances?expanded=true</td>
</tr>
<tr>
<td>URI for expanded=false</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances?expanded=false</td>
</tr>
<tr>
<td>URI for servicetype=CFW_SAMPLEXAAS_SERVICE</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances?servicetype=CFW_SAMPLEXAAS_SERVICE</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received for expanded=false is shown below.

```
{
"name": "Service Instances Summary",
"totalResults": 7,
"serviceInstanceSummary": [
  {
"status": "STATUS_UP",
"count": 3
},
  {
"status": "PENDING_CREATION",
"count": 4
}
],
```
50.8.2.3 Viewing Details of a Service Instance in V2

The table below shows the GET request configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzXl6ZGVtb3VzXl6=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "name": "test",
  "targetName": "test",
  "guid": "CCA88E9507D4A9E2214935F956D83150",
  "serviceType": "CFW_SAMPLEXAAS_SERVICE",
  "serviceFamily": "CFW_SAMPLEXAAS_SERVICEFAMILY",
  "status": "STATUS_UP",
  "targetType": "Cfw_Xaas_DB_Service",
  "createdOn": "2014-11-15T00:00:00ZAsia/Calcutta",

A sample of the response received is shown below.
50.8.3 Executing Actions on a Service Instance in V2

This section provides the procedure to execute an action on a Service instance using REST APIs.

Follow the steps below to execute an action on a Service instance:

   The GET operation returns all the supported actions that an user can execute on the specified Service instance. The Action name, Action ID, Display name and Description are provided for each action. Note the required Action ID.

2. Perform a GET operation on the URI - `/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances/{instanceid}/actions/{actionid}`, using the Action ID from the previous step. See, Viewing Details of the Action Inputs Required To Execute an Action on a Service Instance in V2.

   The GET operation returns all the action details and the action inputs. Some actions require action inputs to complete an action. Action inputs capture the data or input which is to be provided by the user while executing an action on an instance. Note the action inputs.

   The PUT operation executes the action on the Service instance. To execute the action, provide appropriate action input values as configurations in the payload.

50.9 Quota Usage for V2

This section describes the quota usage REST APIs for SSA user.

50.9.1 Supported Operations for Quota Usage for V2

The table below lists the supported operations for quota usage.
## Table 50-49  Supported Methods for Quota Usage

<table>
<thead>
<tr>
<th>Request Method</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/quotausage</td>
<td>Returns links to quota usage.</td>
</tr>
<tr>
<td>GET</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/quotausage/{servicefamily}</td>
<td>Returns quota usage by service family.</td>
</tr>
</tbody>
</table>

### 50.9.2 Quota Usage REST API Examples for V2

This section provides the REST API examples for Quota usage. The following examples are covered:

- Viewing Details of Quota Usage
- Viewing Details of Quota Usage by Service Family

#### 50.9.2.1 Viewing Details of Quota Usage by Service Family

The table below shows the GET request configuration.

## Table 50-50  GET Request Configuration for Viewing Details of Quota Usage by Service Family

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>

A sample of the response received is shown below.

```json
{
  "message": "User service preferences updated successfully."
}
```

50.11 User Preferences for V1

An SSA user (with the `EM_SSA_USER` role) can set user preferences (both general and service specific) using Cloud REST APIs.

50.11.1 My Preferences for V1

This is the top level resource and is used to get the following preferences:
50.11.2 Canonical Link for V1

The URI (canonicalLink) for user preferences is \texttt{em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/}. A GET request to this URI provided a top level view of the general and service specific preferences. The table below shows the GET request configuration on this URI.

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameter s</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
</table>

50.11.3 General Preferences for V1

This represents the general user preferences that are applicable across all service types.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>emailAddress</td>
<td>String</td>
<td>This is the default email address for receiving cloud notifications.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
### Table 50-66  (Cont.) General Preferences Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>locale</td>
<td>String</td>
<td>This is the default locale for receiving cloud notifications. The default locale is English. Supported values include: • en (English) • es_ES (Spanish) • zh_CN (Simplified Chinese) • zh_TW (Traditional Chinese) • ja (Japanese) • ko (Korean) • fr (French) • pt_BR (Brazilian Portugese) • de (German)</td>
<td>0..1</td>
</tr>
<tr>
<td>request</td>
<td>RequestEntity</td>
<td>Request notification values.</td>
<td>0..1</td>
</tr>
<tr>
<td>instanceExpire</td>
<td>InstanceExpireEntity</td>
<td>Instance expiry notification values.</td>
<td>0..1</td>
</tr>
<tr>
<td>quota</td>
<td>QuotaEntity</td>
<td>Instance expiry notification values.</td>
<td>0..1</td>
</tr>
<tr>
<td>quotaThreshold</td>
<td>Integer</td>
<td>Notifications will be sent to users when resources exceed the defined quota percentage.</td>
<td>0..1</td>
</tr>
<tr>
<td>defaultServiceType</td>
<td>String</td>
<td>This is the default service after successful login to Self Service Portal. If not specified, this is defaulted to servers. Supported service type values include: IAAS (Servers), DBAAS (Databases), MWAAS (Middleware), TAAS (Tests)</td>
<td>0..1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
</tbody>
</table>

### 50.12 Composite Resource Attributes for V1

The following composite resource attribute data model are described in this section.

- RequestEntity
- InstanceExpireEntity
- QuotaEntity

### 50.12.1 RequestEntity Data Model for V1

The following table describes the RequestEntity data model:

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestNotifications</td>
<td>boolean</td>
<td>This allows the user to receive notifications for different statuses of the request.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
Table 50-67  (Cont.) RequestEntity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>requestStatus</td>
<td>List&lt;String&gt;</td>
<td>The list of request statuses for which notifications are enabled. Supported</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>request status values are:</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Incomplete</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Scheduling</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Scheduling Error</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Scheduled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Canceled</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Insufficient Quota</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Insufficient Resources in Zone</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• In Progress</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Execution Error</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Partially Succeeded</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Success</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• Running</td>
<td></td>
</tr>
<tr>
<td></td>
<td></td>
<td>• All</td>
<td></td>
</tr>
</tbody>
</table>

50.12.2 InstanceExpiryEntity Data Model for V1

The following table describes the InstanceExpiryEntity data model:

Table 50-68  InstanceExpiryEntity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>instanceExpiryNotifications</td>
<td>boolean</td>
<td>Enables user to receive notifications for service instances that are scheduled to expire based on the notification period.</td>
<td>0..1</td>
</tr>
<tr>
<td>daysBeforeFirstNotification</td>
<td>Integer</td>
<td>The number of days before the first notification is sent to the user before the expiry date of the service instance.</td>
<td>0..1</td>
</tr>
<tr>
<td>daysBeforeSecondNotification</td>
<td>Integer</td>
<td>The number of days before the second notification is sent to the user before the expiry date of the service instance.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

50.12.3 QuotaEntity Data Model for V1

The following table describes the QuotaEntity data model:

Table 50-69  QuotaEntity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>quotaNotifications</td>
<td>boolean</td>
<td>Receive quota related notification when the quota reaches the specified threshold.</td>
<td>0..1</td>
</tr>
<tr>
<td>quotaThreshold</td>
<td>Integer</td>
<td>Notifications will be sent to users when resources exceed the defined quota percentage.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
50.13 Supported Methods for General Preferences (for V1)

The following table shows the supported methods:

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameters</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUT</td>
<td>NA</td>
<td>GeneralPreferences</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/general</td>
<td>Updates the general preferences for an SSA user.</td>
</tr>
</tbody>
</table>

50.13.1 Viewing Details of the General Preferences for an SSA User

The table below provides the configuration for a GET request to know the general preferences for an SSA user.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/general/</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```javascript
{
  "emailAddress": "john.smith@cloudcompany.com",
  "locale": "English",
  "request": {
    "requestNotifications": true,
    "requestStatus": ["SUCCESS","INCOMPLETE"]
  }
}

  message: "General Preferences updated successfully." }

50.14 Service Specific User Preferences for V1

This section describes the following:

50.14.1 Service Preferences for V1

The Service Preferences resource represents the user preferences of an SSA user per service family.

Table 50-73  ServicePreferences Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
</tbody>
</table>
| servicePreferences | Collection<
|                   | EntityValueHolder> | User preferences of SSA user for a specific service family.                | 1      |
50.14.2 Supported Methods for My Preferences (for V1)

<table>
<thead>
<tr>
<th>Method</th>
<th>Query Parameters</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>NA</td>
<td>NA</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services</td>
<td>This gives the top level view of service preferences for all service families.</td>
</tr>
<tr>
<td>PUT</td>
<td>NA</td>
<td>ServicePreferences</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/&lt;servicefamily&gt;</td>
<td>Updates the user preferences of SSA user for a specific service family.</td>
</tr>
</tbody>
</table>

50.14.3 ServicePreferenceMetadata Data Model for V1

This fetches the set of user preferences metadata relevant to the respective service family. Using this, the user can identify the user preferences available for each service family and the possible values of each.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>canonicalLink</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of this resource.</td>
<td>1</td>
</tr>
<tr>
<td>servicePreferencesMeta</td>
<td>Collection&lt;ValueDescriptor&gt;</td>
<td>The set of user preferences metadata relevant to the respective service type.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
50.14.4 Composite Resource Attributes for V1

Some of the resource entities in this specification contain the following composite resource attributes:

50.14.4.1 ValueEntity Data Model for V1

This represents a value (string representation) and their description (caption). The following table describes the data model:

Table 50-76 ValueEntity Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>value</td>
<td>String</td>
<td>String representation of the actual value of the entity.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Caption of the entity that describes it.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

50.14.4.2 EntityValueHolder Data Model for V1

This represents a simple entity having a name, value and description. The following table describes the data model:

Table 50-77 EntityValueHolder Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the entity.</td>
<td>1</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>String representation of the actual value of the entity.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Caption of the entity that describes it.</td>
<td>0..1</td>
</tr>
</tbody>
</table>

50.14.4.3 ValueDescriptor Data Model for V1

This describes the metadata regarding the type of value that can be set upon an associated object. The following table describes the data model:

Table 50-78 ValueDescriptor Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the datum being described.</td>
<td>1</td>
</tr>
<tr>
<td>displayName</td>
<td>String</td>
<td>Display name of the datum being described.</td>
<td>0..1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the datum referred.</td>
<td>0..1</td>
</tr>
<tr>
<td>currentValue</td>
<td>String</td>
<td>Current value of the datum being described.</td>
<td>0..1</td>
</tr>
<tr>
<td>isRequiredAttribute</td>
<td>boolean</td>
<td>True if the value of the datum is required.</td>
<td>0..1</td>
</tr>
<tr>
<td>possibleValues</td>
<td>Collection&lt;ValueEntity&gt;</td>
<td>Optional list of valid values of the datum being described.</td>
<td>0..1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the datum referred.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
50.14.5 Service Preferences REST API Examples for V1

This section describes the REST API examples of the Service Preferences resource.

50.14.5.1 Viewing Details of the Service Preferences Resource

The table below shows the GET request configuration for getting top level view of service preferences for all service families.

Table 50-79   GET Request Configuration for Viewing Details of Service Preferences Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

Status 200 OK

{
  DBAAS: {
    displayName: "My Database Preferences"
    description: "User preferences for Database services"
    canonicalLink: "/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/dbaas"
  }
  MWAAS: {
    displayName: "My Middleware Preferences"
    description: "User preferences for Middleware services"
    canonicalLink: "/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/mwaas"
  }

</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{  
  servicePreferencesMetadata: {  
    items:  
    {  
      name: "defaultPaasZone"  
      displayName: "Default PaaS Infrastructure Zone"  
      description: "Default PaaS Infrastructure Zone"  
      currentValue: ""  
      isRequiredAttribute: false  
      possibleValues:  
      {  
        value: "dbaas_west_coast_zone"  
      }  
    }  
  }  
  canonicalLink: "/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/dbaas/metadata"  
}
```

50.14.6.2 Updating DBaaS User Preferences

The table below shows the PUT request configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Specification</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>https://&lt;OMS_HOST&gt;:&lt;OMS_CONSOLE_PORT&gt;/em/websvcs/restful/extws/cloudservices/ssa/cfw/v1/mypreferences/services/dbaas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/json</td>
</tr>
</tbody>
</table>
Table 50-81  (Cont.) PUT Request Configuration for Updating the DBaaS User Preferences

A sample of the response received is shown below.

Status 200 OK

{  
  message: "Service Preferences updated successfully."
}
This chapter describes the resource model for WebLogic as a Service (WLaaS) REST APIs and their responses. Application component filtering, which is supported for WLaaS zones, and templates are also described.

**Note:**

For the Plug-in release 12.1.0.9, a new framework is introduced for the REST APIs which is referred to as the v2 framework. The new framework consists of a different approach and signatures, as a result of which the REST APIs also differ when compared to the earlier framework. The earlier framework (v1) is deprecated and users are suggested to move to the v2 REST APIs.

This chapter contains the topics listed below. The first two sections provide a summary of all the REST APIs covered in this chapter whereas the following sections provide the resource details and the related REST APIs.

- **Summary of WebLogic as a Service REST APIs for V2**
- **Summary of WebLogic as a Service REST APIs for V1**
- **Resource Providers for V2 - PaaS Infrastructure Zone and Middleware Pool**
- **Quotas for V2**
- **Service Templates for V2**
- **Load Balancer Configurations for V2**
- **User Operation REST API Examples for V2**
- **WebLogic as a Service Resource Model for V1**
  - **Cloud**
  - **JaaS Service Family Type**
  - **Zone**
  - **JavaPlatformTemplate**
  - **Java Platform Instance**
  - **Application Instance Deployment**
  - **DataSource**
  - **Application Instance Component**
- **Application Component Filtering for V1**
- **Load Balancer Configuration for V1**
- **Quotas for V1**
51.1 Summary of WebLogic as a Service REST APIs for V2

The table below shows a summary of all the v2 WLaaS REST APIs covered in this chapter.

<table>
<thead>
<tr>
<th>Resource</th>
<th>Data Model</th>
<th>GET</th>
<th>POST</th>
<th>PUT</th>
<th>DELETE</th>

Note:

In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.

51.3 Resource Providers for V2 - PaaS Infrastructure Zone and Middleware Pool

Resource Providers is a collection resource representing a Cloud Administrator’s view of all the accessible Resource provider resources. In the WLaaS structure, PaaS Infrastructure zone and Middleware pool are the Resource provider resources. The following table describes the Resource Providers data model.

Table 51-3  Resource Providers Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of this collection resource.</td>

</tr>
</tbody>
</table>

51.3.1 Resource Providers - PaaS Infrastructure Zone and Middleware Pool REST API Examples

This section provides the REST API examples for PaaS infrastructure zones and Middleware pools.

The REST APIs covered in this section are:

- Viewing Details of All the Resource Providers
- Creating a PaaS Infrastructure Zone
- Creating a Middleware Pool
- Updating a PaaS Infrastructure Zone
- Updating a Middleware Pool
- Deleting a Resource Provider (PaaS Infrastructure Zone or Middleware Pool)

51.3.1.1 Viewing Details of All the Resource Providers

The following table shows an example of a GET operation on the Resource providers URI to return its representation.

Table 51-4  GET Request Configuration for Viewing Details of the Resource Providers

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>

51.4 Quotas for V2

The table below provides the data model for Quotas resource.

Table 51-10  Quotas Data Model for V2

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of the quota.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the quota resource.</td>
<td>1</td>
</tr>
<tr>
<td>quotas</td>
<td>Collection &lt;Quota Item&gt;</td>
<td>List of quotas. In case no quota exist, the quotas field will be empty.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent of the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>
51.4.1 Quotas REST API Examples

This section lists the REST APIs for the Quotas resource.

The REST APIs covered in this section are:

- Viewing Details of Quota Settings
- Creating a Quota for a SSA User Role
- Updating a Quota for a SSA User Role
- Deleting a Quota for a SSA User Role

51.4.1.1 Viewing Details of Quota Settings

The following table shows an example of a GET operation on the quotas URI to return its representation. This operation returns quota settings for all the SSA user roles for MWaaS.

Table 51-11    GET Request Configuration for Viewing Details of Quota Settings

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  name: "Middleware Cloud Quotas",
  description: "Middleware Cloud Quotas per SSA User Role"
  quotas: [1]
  0: {
    roleName: "SSA_USER_ROLE"
    memory: "4"
    javaServersCount: "10"
  } |
  selfLink: "https://slc06ekg.us.example.com:5416/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas"
}
```

51.4.1.2 Creating a Quota for a SSA User Role

The following table shows an example of a POST operation on the quotas URI to create a quota for the SSA user role.
Table 51-12  POST Request Configuration for Creating a Quota Setting for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
</tbody>
</table>
| **Body** | { 
| | "roleName": "SSA_ROLE" |
| | "memory": "5" |
| | "javaServersCount": "10" |
| | } |
| **Request method** | POST |

A sample of the response received is shown below.

Status 200 OK

```
{
  message: "Quota has been created."
  statusUri: "https://slc03sey.us.example.com:11040/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas"
}
```

51.4.1.3 Updating a Quota for a SSA User Role

The following table shows an example of a PUT operation to update a quota for the SSA user role.

Table 51-13  PUT Request Configuration for Updating a Quota Setting for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
</tbody>
</table>
| **Body** | { 
| | "roleName": "SSA_ROLE" |
| | "memory": "10" |
| | "javaServersCount": "5" |
| | } |
| **Request method** | PUT |

A sample of the response received is shown below.

Status 200 OK

```
{
  message: "Quota has been updated."
  statusUri: "https://xxyy.us.example.com:11040/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas"
}
```
51.4.1.4 Deleting a Quota for a SSA User Role

The following table shows an example of a DELETE operation to delete a quota for a SSA user role.

Table 51-14  DELETE Request Configuration for Deleting a Quota for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>

#### 51.6 Load Balancer Configurations for V2

Load balancer configurations is a collection resource. The table below shows the data model for the Load balancer configurations collection resource.
Table 51-21  Load Balancer Configurations Data Model for V2

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of the load balancer configurations.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the load balancer configurations resource.</td>
<td>1</td>
</tr>
<tr>
<td>lbrconfigs</td>
<td>Collection</td>
<td>List of load balancer configurations. In case, load balancer configurations do not exist, the lbrconfigs field will be empty.</td>
<td>1</td>
</tr>
<tr>
<td>selfLink</td>
<td>URI</td>
<td>Refers to the resource equivalent of the containing elements.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.6.1 Load Balancer Configuration for V2

Load balancer configuration is a singular resource. The table below shows the data model for the Load balancer configuration singular resource.

Table 51-22  Load Balancer Configuration Data Model for V2

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Display name of the load balancer configuration.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the load balancer configuration resource.</td>
<td>1</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Indicates the type of Load balancer. It is either Oracle Traffic Director (OTD), or Oracle Https Server(OHS), or third party.</td>
<td>1</td>
</tr>
<tr>
<td>id</td>
<td>Integer</td>
<td>Indicates the Load balancer configuration ID. The id is unique.</td>
<td>1</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>Owner of the Load balancer configuration.</td>
<td>1</td>
</tr>
<tr>
<td>host</td>
<td>String</td>
<td>Load balancer host. The Load balancer host must be added as a EM target in advance.</td>
<td>1</td>
</tr>
<tr>
<td>credential</td>
<td>String</td>
<td>Credential associated with the Load balancer host.</td>
<td>1</td>
</tr>
<tr>
<td>agentTargetName</td>
<td>String</td>
<td>Indicates the agent target name.</td>
<td>1</td>
</tr>
<tr>
<td>instanceHome</td>
<td>String</td>
<td>Load balancer instance home location.</td>
<td>1</td>
</tr>
<tr>
<td>poolTargets</td>
<td>Collection</td>
<td>List of Guids of Middleware pool associated to the Load balancer (Resource provider).</td>
<td>1</td>
</tr>
<tr>
<td>properties</td>
<td>Collection</td>
<td>List of all properties of Load balancer configuration.</td>
<td>1</td>
</tr>
<tr>

</tbody>
</table>
51.6.2 Load Balancer Configurations REST API Examples

This section details the REST APIs for Load balancer configurations for v2.

The REST APIs covered in this section are:

- Viewing all the Load Balancer Configurations
- Viewing Details of a Specific Load Balancer Configuration
- Creating a Load Balancer Configuration
- Updating a Load Balancer Configuration
- Deleting a Load Balancer Configuration

51.6.2.1 Viewing all the Load Balancer Configurations

The following table shows an example of a GET operation to view all the Load balancer configurations.

Table 51-23  GET Request Configuration for Viewing Details of all Load Balancer Configurations

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/lbrconfigs</td>

51.8 User Operation REST API Examples for V2

The following REST API examples are described in this section:

- Viewing Details of all Service Templates
- Viewing Details of all Service Instances
- Viewing all Service Instances With UP Status
- Creating a Service Instance Request
- Viewing Details of all Possible Actions on a Specific Service Instance
- Scaling Up a Service Instance
- Scaling Down a Service Instance
- Stopping a Service Instance
- Starting a Service Instance
- Deleting a Service Instance
- Viewing Details of Java EE Applications Components from the Software Library
51.8.1 Viewing Details of all Service Templates

The following table shows an example of a GET operation to view all the service templates.

Table 51-29    GET Request Configuration for Viewing Details of all Service Templates

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extend/cloudservices/ssa/cfw/v2/services</td>

<tr>
<td>Body</td>
<td>{ &quot;dsName&quot;: &quot;ds_1&quot; }</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  message: "Test Connection succeeded for data source ",
  statusUri: "https://xyxy.example.com:5416/em/websvcs/restful//extws/cloudservices/ssa/wlaas/v2/serviceinstances"
}
```

51.9 WebLogic as a Service Resource Model for V1

The following sections describe the resource models that are supported by the Java as a Service family type and provide examples of supported operations. The following resource models are described:

- Cloud
- JaaS Service Family Type
- Zone
- JavaPlatformTemplate
- Java Platform Instance
- Application Instance Deployment
- DataSource
- Application Instance Component
- Filtering Service Templates
- Filtering Zones

The figure below shows the WebLogic as a Service resource model.
51.9.1 Cloud

The following table describes the Cloud [application/oracle.com.cloud.common.Cloud +json] data model.

Table 51-56  Cloud Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>

51.9.2 JaaS Service Family Type

Jaas service family type is a category of services that are offered by WebLogic as a Service (WLaaS). The following table describes the Jaas ServiceFamilyType [application/oracle.com.cloud.common.ServiceFamilyType+json] data model:

Table 51-58  JaaS Service Family Type Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the Jaas ServiceFamilyType definition to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Jaas ServiceFamilyType.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Human readable description of the Service Family Type. Shall be a UNICODE string to support different languages.</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The resource state of the resource.</td>
<td>0..1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the resource.</td>
<td>1</td>
</tr>
<tr>
<td>service_templates</td>
<td>Collection &lt;ServiceTemplate&gt;</td>
<td>The collection of service templates that are of this service family type.</td>
<td>0..1</td>
</tr>
<tr>
<td>zones</td>
<td>Collection &lt;Zone&gt;</td>
<td>The collection of zones that support service instances of this service family type.</td>
<td>0..1</td>
</tr>
</tbody>
</table>
Table 51-58  (Cont.) JaaS Service Family Type Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>instance_types</td>
<td>Collection</td>
<td>The collection of instance types that are supported by this service family type.</td>
<td>0..1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.9.2.1 Viewing Detail of the JaaS Service Family Type Resource

The following shows an example of a GET operation on the JaaS Service Family Type URI to return its representation.

Example Request:

Table 51-59  GET Request Configuration for Viewing Details of the JaaS Service Family Type Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/service_family_type/jaas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXRlZG52b3Vsb29tZXM= Accept: application/oracle.com.cloud.common.ServiceFamilyType+json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response:

```json
{
  "uri" : "/em/cloud/service_family_type/jaas",
  "name" : "jaas",
  "resource_state" : {
    "state" : "READY"
  },
  "media_type" : "application/oracle.com.cloud.common.ServiceFamilyType+json",
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/jaas",
  "type" : "jaas",
  "service_templates" : {
    "media_type" : "application/oracle.com.cloud.common.ServiceTemplate+json",
    "total" : "1",
    "elements" : [
      {
        "uri" : "/em/cloud/jaas/javaplatformtemplate/D016ADD465462ACE040F20AD18167BA",
        "name" : "PS4_LowHeapTemplate",
        "service_family_type" : "jaas",
        "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/service_family_type/jaas"
      }
    ]
  }
}
```
51.9.2.2 Creating an Application Instance Component by Passing a POST Request on the Jaas Service Family Type Resource

ApplicationInstanceComponent can be created using a post request on Jaas. Right now this is being done using a Java Program. The following shows a sample program:

```java
import java.io.File;
import java.io.FileInputStream;
import java.io.PrintWriter;
import java.io.StringWriter;
import java.util.ArrayList;
import java.util.List;
import java.util.Properties;
import oracle.sysman.emInternalSDK.ssa.cloudapi.client.EMRestService;

public class FileUpload {
    static public void main(String[] args)
```
throws Exception {
    String emUser = <<JAAS_USER_NAME>>;
    String emPassword = <<password>>;
    String emHost = <<host_machine_name/ip>>;
    String emPort = <<port>>;
    String emLocation = "https://"+emHost+":"+emPort;
    String applicationLocation = <<application_location>>;
    String deployPlanLocation = <<deploy_plan_location>>;
    File f = new File(applicationLocation+"deploy_app.ear");
    StringWriter sw = new StringWriter();
    PrintWriter pw =new PrintWriter(sw);
    pw.println("{");
    String fileName = "MyApplication"+emUser+"_"+System.currentTimeMillis();
    pw.println("""name":""""+fileName+"""",");
    pw.println("""description":""""Riddles App",");
    pw.println("""originate":""""STREAMING",");
    pw.println("""files":[");
    pw.println(""");
    //pw.println("""path":""""swlib_internal_path",");
    pw.println("""file_archive_path":""""swlib_internal_path",");
    pw.println("""content_type":""""application/octet-stream",");
    pw.println("""source":""""f.getName()+""""+");
    pw.println(""");
    pw.println(""");
    pw.print(""}"");
    pw.flush();
    pw.close();
    String content = sw.toString();
    System.out.println("CONTENT:
    "+content+
    ");
    String content = "{content+""n""");
    List<EMRestService.MultipartItem> items = new ArrayList<EMRestService.MultipartItem>();
    EMRestService.MultipartItem item1, item2, item3, item4, item5;
    item1 = new EMRestService.MultipartItem("item1", false);
    item1.setContentType("multipart/form-data");
    item1.setContent(content);
    items.add(item1);
    item2 = new EMRestService.MultipartItem("item2", true);
    item2.setFileAlias(f.getName());
    item2.setFile(f);
    items.add(item2);
    File deploymentPlanFile = new File(applicationLocation+"deployment_plan.xml");
    item3 = new EMRestService.MultipartItem("item3", true);
    item3.setFileAlias(deploymentPlanFile.getName());
    item3.setFile(deploymentPlanFile);
    items.add(item3);
    File preDeployFile = new File(deployPlanLocation+" predeploy_script.py");
    item4 = new EMRestService.MultipartItem("item4", true);
    item4.setFileAlias(preDeployFile.getName());
    item4.setFile(preDeployFile);
    items.add(item4);

    item5.setFileAlias(postDeployFile.getName());
    item5.setFile(postDeployFile);
    items.add(item5);
    String uri = emLocation+"/em";
    EMRestService ers = new EMRestService(uri, emUser, emPassword.getBytes());
    ers.setReadTimeout(600*1000);
51.9.3 Zone

The following table describes the Zone [application/oracle.com.cloud.common.Zone +json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the zone definition to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Zone.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Human readable description of the Zone. It is a UNICODE string to support different languages.</td>
<td>0...1</td>
</tr>
<tr>
<td>context_id</td>
<td>String</td>
<td>This is an ID indication the internal reference of the zone.</td>
<td>1</td>
</tr>
<tr>
<td>service_instances</td>
<td>Collection</td>
<td>Collection of the service instances that are in this zone.</td>
<td>0..1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>The name of the service family type that this zone is associated with. Each Zone is contextualized in the service family type.</td>
<td>0..1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The resource state of the resource.</td>
<td>0..1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>The media type of the resource.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.9.3.1 Viewing Details of the Zone Resource

The following shows an example of a GET operation on the Zone URI to return its representation.

Example Request:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
</tbody>
</table>
Table 51-61  (Cont.) GET Request Configuration for Viewing Details of a Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response:

```
{
  "uri" : "/em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51" ,
  "name" : "Zone1" ,
  "description" : "Zone for Physical Pool" ,
  "resource_state" : {
    "state" : "READY"
  } ,
  "context_id" : "A1B44A4EBCC4563125D9D0A3AAE4FD51" ,
  "media_type" : "application/oracle.com.cloud.jaas.Zone+json" ,
  "service_family_type" : "jaas" ,
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/zone/ A1B44A4EBCC4563125D9D0A3AAE4FD51" ,

    "uri" : "/em/cloud/jaas/javaplatforminstance/8AF6E65447FBA84E968CCD909BD05D42" ,
    "name" : "MyServer-1" ,
    "media_type" : "application/oracle.com.cloud.jaas.JavaPlatformInstance+json" ,
    "status" : "RUNNING"
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/javaplatforminstance/8AF6E65447FBA84E968CCD909BD05D42"
  }
}
```

51.9.4 JavaPlatformTemplate

The JavaPlatformTemplate extends the CloudServiceTemplate SDK class. It is permissible to accept the ServiceTemplate media type on an instance of JavaPlatformTemplate. It is a preconfigured deployable entity that realizes a JavaPlatformInstance resource.

Table 51-62  JavaPlatformTemplate Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>
Table 51-62  (Cont.) JavaPlatformTemplate Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the template.</td>
<td>1</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>A brief description given to the template.</td>
<td>0...1</td>
</tr>
<tr>
<td>created</td>
<td>Timestamp</td>
<td>Date and time, in ISO 8601 format, when the template was created/last modified.</td>
<td>1</td>

<td>This is an ID indication the internal reference of the service template.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.9.4.1 Viewing Details of the Java Platform Template Resource

The following shows an example of a GET operation on the JavaPlatformTemplate URI to return its representation.

Example Request:

Table 51-63  GET Request Configuration for Viewing Details of the Java Platform Template Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatformtemplate/ D016AADD465462ACE040F20AD18167BA</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>
51.9.4.2 Creating a Java Platform Instance by Passing POST Request on a Java Platform Template

The following shows a sample POST on the JavaPlatformTemplate URI to create an "empty" JavaPlatformInstance by providing:

- Name of JavaPlatformInstance in "name" attribute
• Destination Zone URI in “zone” attribute

Example Request:

Table 51-64  POST Request Configuration for Creating a Java Platform Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatformtemplate/ D016AADD465462ACE040F20AD18167BA</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.jaas.JavaPlatformInstance+json</td>
</tr>
</tbody>
</table>
| Body                 | {
|                      |   "name" : "rtjul17",
|                      |   "zone" : "/em/cloud/jaas/zone/C355810A6"                   |
|                      | }                                                                             |

Request method  POST

Example Response (When the operation is in progress):

```json
{
  "uri" : "/em/cloud/jaas/javaplatforminstancerequest/1",
  "name" : "rtjul17_Create_20120717_045804697",
  "resource_state" : {
    "state" : "INITIATED",
    "messages" : [
      {
        "text" : "null",
        "date" : "2012-07-17T09:16:13+0000"
      }
    ]
  },
  "context_id" : "1",
  "service_family_type" : "jaas",
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/javaplatforminstancerequest/1",
  "status" : "SCHEDULED",
  "created" : "2013-05-09T07:06:57+0000"
}
```

Example Response (After the instance has been created):

```json
{
  "uri" : "/em/cloud/jaas/javaplatformtemplate/D016AADD465462ACE040F20AD18167BA",
  "name" : "PS4_LowHeapTemplate",
  "description" : "This is a service template using the CDP CDP_PS4_lowHeap_MWProfile",
  "resource_state" : {
    "state" : "READY"
  },
  "context_id" : "D016AADD465462ACE040F20AD18167BA",
  "service_family_type" : "jaas",
```
51.9.4.3 Viewing Details of the Java Platform Request Resource

The following shows a sample GET operation on the JavaPlatform Request URL:

**Example Request:**

**Table 51-65   GET Request Configuration for Viewing the Status of the Java Platform Request**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatforminstancerequest/1</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VvZXi6ZGVtb3VvZXi=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>
Example Response (When the operation is in progress):

```json
{
  "uri": "/em/cloud/jaas/javaplatforminstancerequest/1",
  "name": "rtjul17_Create_20120717_045804697",
  "resource_state": {
    "state": "INITIATED",
    "messages": [
      {
        "text": "null",

      }
    ]
  }
}
```
JavaPlatformInstance will extend the ServiceInstance from the Cloud framework resource model. It is linked to an Oracle Composite Application target in Enterprise Manager.

"media_type": "application/oracle.com.cloud.jaas.JavaPlatformInstance+json",
"service_family_type": "jaas",
"canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/javaplatforminstancerequest/121",
"status": "SCHEDULED",
"created": "2013-05-09T09:08:38+0000"
}
```
51.9.5.3 Viewing Status of the DELETE Request

Example Request:

Table 51-69 GET Request Configuration for Viewing Status of the Delete Operation

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatforminstancerequest/121</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response (When the operation is in progress):

```
{
    "uri" : "/em/cloud/jaas/javaplatforminstancerequest/121",
    "name" : "rtjul17_Delete_20120719_035504227",
    "resource_state" : {
        "state" : "INITIATED",
        "messages" : [
            {
                "text" : "null",
                "date" : "2012-07-19T09:16:13+0000"
            }
        ]
    },
    "context_id": "121",
    "media_type": "application/oracle.com.cloud.jaas.JavaPlatformInstance+json",
    "service_family_type": "jaas",
    "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/javaplatforminstancerequest/121",
    "status": "SCHEDULED",
    "created" : "2013-05-09T09:16:13+0000"
}
```

Example Response (when the operation is complete):

The Status field will show that the resource has been deleted.

51.9.5.4 Creating an Application Instance Deployment By Passing a POST Request on Java Platform Instance

The following shows a sample POST operation on the JavaPlatformInstance URI to deploy an ApplicationInstanceDeployment.

- Name of ApplicationInstanceDeployment in the "name" attribute
- ApplicationInstanceComponent URI in the "application_instance_component" attribute
Example Request:

Table 51-70  POST Request Configuration for Creating an Application Instance Deployment Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatforminstance/8AF6E65447FBA84E968CCD909BD05D42</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-Type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json</td>

```

51.9.5.5 Viewing Status of the Application Instance Deployment Creation Request

The following shows a sample GET of an Application Instance Deployment Request returned by POST to create Application Instance.
Example Request:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappju118@131</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response (When the operation is in progress)

```
{
    "uri": "/em/cloud/jaas/applicationinstancedeploymentrequest/ rtriddappju118@131",
    "name": "rtriddappju118_Deploy_20120718_051319824",
    "resource_state": {
        "state": "INITIATED",
        "messages": [
            {
                "date": "2012-07-18T12:13:28+0000",
                "text": "null"
            }
        ]
    },
    "context_id": "rtriddappju118@131",
    "media_type": "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json",
    "service_family_type": "jaas",
    "status": "SCHEDULED"
}
```

Example Response (When the operation is complete)

```
{
    "uri": "/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3",
    "name": "rtriddappjul19",
    "resource_state": {
        "state": "READY"
    },
    "context_id": "9D8868C9632E3",
    "media_type": "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json",
    "service_family_type": "jaas",
    "status": "RUNNING",
    "http_application_invocation_url": {
        "ms_3": "http://example.com:32463/RiddlesWeb",
        "ms_4": "http://example.com:40298/RiddlesWeb"
    },
    "https_application_invocation_url": {
        "ms_3": "https://example.com:3550/RiddlesWeb",
        "ms_4": "https://example.com:41467/RiddlesWeb"
    }
}
```
51.9.5.6 Creating a Data Source by Passing a POST Request on the Java Platform Instance Resource

The following shows a sample POST operation on the JavaPlatformInstance URI to create a DataSource on the JavaPlatformInstance

- Name of DataSource in the "name" attribute
- JNDI Name in "jndi_name" attribute
- JDBC Driver in "jdbc_driver" attribute
- Database connect string in "database_connect_string" attribute
- Database type in "database_type" attribute
- username and password

Example Request:

Table 51-72 POST Request Configuration for Creating a Data Source on the Java Platform Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatforminstance/8AF6E65447FBA84E968CCD909BD05D42</td>

  }
}
```

51.9.5.8 Scaling Up/Down the Service Instance

The following shows a sample PUT operation on JavaPlatformInstance URI to scale up or scale down the service instance. The final server count is contained in "server_count" attributes. A Scale up or scale down request will be submitted according to Current server count being greater than or lesser than the Final server count.

Example Request:

Table 51-74 PUT Request Configuration for Scaling Up/Down the Service Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/javaplatforminstance/CF4339D922C5</td>
</tr>
<tr>

```

51.9.6 Application Instance Deployment

This represents the deployment of an Application Instance in a JavaPlatformInstance.

Table 51-75  Application Instance Deployment Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the instance.</td>
<td>1</td>
</tr>
</tbody>
</table>
### Table 51-75 (Cont.) Application Instance Deployment Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>application_instance_component</td>
<td>ApplicationInstanceComponent (uri,name,version)</td>
<td>The ApplicationInstanceComponent in the Software library which was used during deployment of this instance. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>http_application_invocation_url</td>
<td>Map&lt;String, String&gt;</td>
<td>Map of server name and HTTP URL of the deployed application. Will be populated after the instance has been created.</td>
<td>0…1</td>
</tr>
<tr>
<td>https_application_invocation_url</td>
<td>Map&lt;String, String&gt;</td>
<td>Map of server name and HTTPS URL of the deployed application. Will be populated after the instance has been created.</td>
<td>0…1</td>
</tr>
<tr>
<td>contained_in</td>
<td>JavaPlatformInstance (uri,name)</td>
<td>JavaPlatformInstance on which the application is deployed.</td>
<td>1</td>
</tr>
<tr>
<td>deployment_plan</td>
<td>String</td>
<td>Vendor specific configuration parameters for this deployment in the prescribed XML format. [POST]</td>
<td>0…1</td>

<td>Collection &lt;Metric&gt;</td>
<td>The list of metrics (uri, name, type current_value) that are pertinent to this service instance.</td>
<td>0…1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>Denotes the type of ApplicationInstanceDeployment (for example, “jaas”).</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>Indicates the additional media type that clients can use to perform a GET.</td>
<td>1</td>
</tr>
<tr>
<td>context_id</td>
<td>String</td>
<td>This is an ID indication of the internal reference of the application deployment.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

#### 51.9.6.1 Viewing Details of the Application Instance Deployment Resource

The following shows a sample GET operation on the ApplicationInstanceDeployment URI to return its representation.
Example Request:

Table 51-76  GET Request Configuration for Viewing Details of the Application Instance Deployment

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3</td>
</tr>
</tbody>
</table>
| Request headers | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
| Body | None |
| Request method | GET |

Example Response:

HTTP/1.1 200 OK
Content-Type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json
Content-Length: nnn

```json
{
  "uri": "/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3",
  "name": "rtriddappjul19",
  "resource_state": {
    "state": "READY"
  },
  "media_type": "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json",
  "service_family_type": "jaas",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3",

    "media_type": "application/oracle.com.cloud.jaas.JavaPlatformInstance+json",
    "status": "RUNNING",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/javaplatforminstance/CF4339D922C"
  }
}
```
51.9.6.2 Deleting an Application Instance Deployment

The following shows a sample DELETE operation on the Application Instance Deployment URI which undeploys the application from Java Platform Instance.

Example Request:

**Table 51-77  DELETE Request Configuration for Deleting an Application Instance Deployment**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXIi6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

Example Response:

HTTP/1.1 200 OK
Content-Type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json
Content-Location: /em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@184
Cache-Control: public
Content-Length: nnn
{
  "uri": "/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@184",
  "name": "rtriddappjul19_Undeploy_20120723_011757881",
  "resource_state": {
    "state": "INITIATED",
    "messages": [
      {
        "date": "2012-07-23T08:18:01+0000",
        "text": "null"
      }
    ]
  },
  "media_type": "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json",
  "service_family_type": "jaas",
  "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@184",
  "status": "SCHEDULED"
}

51.9.6.3 Viewing Status of the Application Instance Deployment Deletion Request

The following shows a sample GET operation on an Application Instance Deployment Request.
Example Request:

Table 51-78  GET Request Configuration for Viewing the Status of the Application Instance Deployment Deletion

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappju119@184</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response: (operation in progress):

```
{
    "uri" : "/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappju119@184",
    "name" : "rtriddappju119_Undeploy_20120723_011757881",
    "resource_state" : {
        "state" : "INITIATED",
        "messages" : [
            {
                "date" : "2012-07-23T08:18:01+0000",
                "text" : "null"
            }
        ]
    },
    "context_id" : "rtriddappju119@184",
    "media_type" : "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json",
    "service_family_type" : "jaas",
    "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappju119@184",
    "status" : "SCHEDULED"
}
```

Example Response: (operation is complete):

The status field will show that the resource has been deleted.

51.9.6.4 Starting, Stopping and Redeploying an Application Instance Deployment

The following shows a sample PUT operation on the Application Instance Deployment URI to start or stop the instance.

- **STOPPED to RUNNING**
  
  Put on status attribute, value = "START"

- **RUNNING to STOPPED**
  
  Put on status attribute, value = "STOP"
• **REDEPLOY**

  Put on status attribute, value = “REDEPLOY” and ApplicationInstanceComponent URI in the “application_instance_component” attribute

**Example Request: Starting/Stopping**

**Table 51-79  PUT Request Configuration for Starting/Stopping the Status of the Application Instance Deployment**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Content-type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json</td>
</tr>
<tr>
<td>Body</td>
<td></td>
</tr>
<tr>
<td></td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot; : &quot;STOP&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

**Example Response:**

HTTP/1.1 200 OK
Content-Type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json
Content-Location: /em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@182
Cache-Control: public
Content-Length: nnn
{                                                                                   |
  "uri" : "/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@182" , |
  "name" : "rtriddappjul19_Stop_20120723_123327380" ,                            |
  "resource_state" : {                                                             |
    "state" : "INITIATED" ,                                                       |
    "messages" : [                                                               |
      {                                                                             |
        "date" : "2012-07-23T07:33:27+0000" ,                                      |
        "text" : "null"                                                            |
      ]                                                                           |
    ]                                                                           |
  }                                                                           |
  "media_type" : "application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json" , |
  "service_family_type" : "jaas" ,                                               |
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@182" , |
  "status" : "SCHEDULED"                                                        |
}
Example Request for Redeploying:

```plaintext
PUT /em/cloud/jaas/applicationinstancedeployment/9D8868C9632E3
Host: cloudcompany.com
Authorization: Basic xxxxxxx
Content-type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment+json
{
    "status": "STOP",
    "application_instance_component": "/em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC414FFB7A0912357E040F10A716015F9%3A0.1"
}
```

Example Response:

```plaintext
{
    "uri": "/em/cloud/jaas/applicationinstancedeploymentrequest/rtriddappjul19@183",

```

51.9.7 DataSource

The DataSource resource model has the following characteristics:

The following table describes the DataSource [application/oracle.com.cloud.jaas.DataSource+json] data model.

**Table 51-80  DataSource Data Model**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the data source. [POST][PUT]</td>
<td>1</td>
</tr>
</tbody>
</table>
Table 51-80  (Cont.) DataSource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>jndi_name</td>
<td>String[]</td>
<td>JNDI path to where this data source will be bound. Applications look up the data source on the JNDI tree by this name when reserving a connection. [POST][PUT]</td>
<td>1</td>
</tr>
<tr>
<td>database_type</td>
<td>String</td>
<td>The DBMS of the database that the data source represents. [POST]</td>
<td>0…1</td>
</tr>
<tr>
<td>jdbc_driver</td>
<td>String</td>
<td>The database driver used to connect to the database. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>contained_in</td>
<td>JavaPlatformInstance (uri, name)</td>
<td>JavaPlatformInstance on which the data source exists.                                                                 [POST]</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>database_connect_string</td>
<td>String</td>
<td>Connect String of the database can be provided to create the data source. [POST][PUT]</td>
<td>0…1</td>
</tr>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>Denotes the type of Data Source (for example, &quot;jaas&quot;).</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>Indicates the additional media type that clients can use to perform a GET.</td>
<td>1</td>
</tr>
<tr>
<td>username</td>
<td>String</td>
<td>Username of the DB connection.</td>
<td>1</td>
</tr>
<tr>
<td>password</td>
<td>String</td>
<td>Password of the DB connection.</td>
<td>1</td>
</tr>
<tr>
<td>context_id</td>
<td>String</td>
<td>This is an ID indication the internal reference of the data source.</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.9.7.1 Viewing Details of the Data Source Resource

The following shows a sample GET operation on the DataSource URI to return its representation.

Example Request:

Table 51-81  GET Request Configuration for Viewing Details of the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/datasource/rtrepsdsjul18@CF4339D922C</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.jaas.DataSource+json</td>
</tr>
</tbody>
</table>
Table 51-81  (Cont.) GET Request Configuration for Viewing Details of the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response:

```json
{
    "uri": "/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C",
    "name": "rtrepodsjul18",
    "resource_state": {
        "state": "READY"
    },
    "context_id": "rtrepodsjul18@CF4339D922C",
    "media_type": "application/oracle.com.cloud.jaas.DataSource+json",
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C",
    "jndi_name": [
        "jndi_1"
    ],
    "jdbc_driver": "oracle.jdbc.OracleDriver",
    "username": "sysam",
    "database_connect_string": "jdbc:oracle:thin:sysman/sysman@example.com:15044:sjuly14",
    "contained_in": {
        "media_type": "application/oracle.com.cloud.jaas.JavaPlatformInstance+json",
        "context_id": "CF4339D922C51",
        "name": "rtjul17",
        "uri": "/em/cloud/jaas/javaplatforminstance/CF4339D922C51"
    }
}
```

51.9.7.2 Deleting a Data Source

The following shows a sample DELETE operation on the DataSource URI removes it from the JavaPlatformInstance.

Example Request:

Table 51-82  DELETE Request Configuration for Deleting the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.jaas.DataSource+json</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
</tbody>
</table>
Table 51-82  (Cont.) DELETE Request Configuration for Deleting the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

Example Response:

HTTP/1.1 200 OK
Content-Type: application/oracle.com.cloud.jaas.DataSource+json
Content-Location: /em/cloud/jaas/datasourcerequest/rtrepodsjul18@201
Cache-Control: public
Content-Length: nnn

```
{
  "uri" : "/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
  "name" : "rtrepodsjul18_DeleteDS_20120723_024836692",
  "resource_state" : {
    "state" : "INITIATED",
    "messages" : [
      {
        "date" : "2012-07-23T09:48:37+0000",
        "text" : "null"
      }
    ]
  },
  "media_type" : "application/oracle.com.cloud.jaas.DataSource+json",
  "service_family_type" : "jaas",
  "canonicalLink" : "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
  "status" : "SCHEDULED"
}
```

51.9.7.3 Viewing Status of the Data Source Deletion Request

The following shows a sample GET operation on a DataSource request.

Example Request:

Table 51-83  GET Request Configuration for Viewing Status of the Data Source Deletion

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>
Example Response: (operation in progress):

```json
{
    "uri": "/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
    "name": "rtrepodsjul18_DeleteDS_20120723_024836692",
    "resource_state": {
        "state": "INITIATED",
        "messages": [
            {
                "date": "2012-07-23T09:48:37+0000",
                "text": "null"
            }
        ]
    },
    "context_id": "rtrepodsjul18@201",
    "media_type": "application/oracle.com.cloud.jaas.DataSource+json",
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
    "status": "SCHEDULED"
}
```

Example Response: (operation is complete)

The status field will show that the resource has been deleted.

51.9.7.4 Updating a Data Source

The following shows a sample PUT operation on the DataSource URI to update the DataSource to add/remove JNDI names and edit the database connect string. An example request for TEST DataSource is also provided.

Example Request:

Table 51-84  PUT Request Configuration for Updating the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXJ6ZGVtb3VzZXJ6=</td>
</tr>
<tr>
<td></td>
<td>Accept: application/oracle.com.cloud.jaas.DataSource+json</td>
</tr>
<tr>
<td></td>
<td>Content-type: application/oracle.com.cloud.jaas.DataSource+json</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;jndi_name&quot;: [&quot;jndi_2&quot;],</td>
</tr>
<tr>
<td></td>
<td>&quot;database_connect_string&quot;: &quot;jdbc:oracle:thin:sysman/</td>
</tr>
<tr>
<td></td>
<td><a href="mailto:sysman@example.com">sysman@example.com</a>:15044:sep25cc&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;username&quot;: &quot;sysman&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;password&quot;: &quot;sysman&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

Request method PUT
Example Response:

```json
{
    "uri": "/em/cloud/jaas/datasourcerequest/rtrepodsjul18@CF4339D922C",
    "name": "rtrepodsjul18_UpdateDS_20121216_062909975",
    "resource_state": {
        "state": "READY",
        "messages": [
            {
                "date": "2012-12-16T14:29:16+0000",
                "text": "null"
            }
        ]
    },
    "context_id": "rtrepodsjul18@681",
    "media_type": "application/oracle.com.cloud.jaas.DataSource+json",
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasourcerequest/rtrepodsjul18@191",
    "status": "SCHEDULED"
}
```

Example Request for TEST Data Source

### Table 51-85  PUT Request Configuration for Testing the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C</td>
</tr>
</tbody>
</table>
| **Request headers** | Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=  
|                  | Accept: application/oracle.com.cloud.jaas.DataSource+json                   |
|                  | Content-type: application/oracle.com.cloud.jaas.DataSource+json             |
| **Body**         | {                                                                               |
|                  |   "status": "TEST"                                                            |
|                  | }                                                                               |
| **Request method** | PUT                                                                           |

Example Response

```json
{
    "uri": "/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C",
    "name": "rtrepodsjul18",
    "resource_state": {
        "state": "READY"
    },

    "media_type": "application/oracle.com.cloud.jaas.DataSource+json",
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasourcerequest/rtrepodsjul18@CF4339D922C",
    "jndi_name": [
        "jndi_1"
    ],
```
51.9.7.5 Viewing Status of the Data Source Request

The following shows a sample GET on Data Source request.

Example Request:

Table 51-86 GET Request Configuration for Viewing Status of the Data Source

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response (when operation is in progress):

```
{
    "uri": "/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
    "name": "rtrepodsjul18_DeleteDS_20120723_024836692",
    "resource_state": {
        "state": "INITIATED",
        "messages": [
            {
                "date": "2012-07-23T09:48:37+0000",
                "text": "null"
            }
        ]
    },
    "context_id": "rtrepodsjul18@201",
    "media_type": "application/oracle.com.cloud.jaas.DataSource+json",
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasourcerequest/rtrepodsjul18@201",
    "status": "SCHEDULED"
}
```

Example Response (when operation is complete):

```
{
    "uri": "/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C",
    "name": "rtrepodsjul18",
    "context_id": "rtrepodsjul18@CF4339D922C",
    "resource_state": {
        "state": "COMPLETED",
        "messages": [
            {
                "date": "2012-07-23T09:48:37+0000",
                "text": "null"
            }
        ]
    },
    "service_family_type": "jaas",
    "canonicalLink": "/em/websvcs/restful/extws/cloudservices/service/v0/ssa/em/cloud/jaas/datasource/rtrepodsjul18@CF4339D922C",
    "status": "SCHEDULED"
}
```
51.9.8 Application Instance Component

This represents the application component in the software library. It can be created by POST-ing to the Jaas service type.

The following table describes the ApplicationInstanceComponent [application/oracle.com.cloud.jaas.ApplicationInstanceComponent+json] data model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>URI</td>
<td>A GET against this URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>A human readable name given to the instance. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>creator</td>
<td>String</td>
<td>Creator of the ApplicationInstanceComponent in the Software Library.</td>
<td>1</td>
</tr>
<tr>
<td>created</td>
<td>Timestamp</td>
<td>Date and time, in ISO 8601 format, when the instance was created.</td>
<td>1</td>
</tr>
<tr>
<td>version</td>
<td>String</td>
<td>Version of the ApplicationInstanceComponent in the Software library. [POST]</td>
<td>1</td>
</tr>
<tr>
<td>resource_state</td>
<td>ResourceState</td>
<td>The validity of the fields on a GET should be guaranteed only when the resource state is READY. Otherwise, the client should not assume the validity of the fields.</td>
<td>1</td>
</tr>
<tr>
<td>context_id</td>
<td>String</td>
<td>This is an ID indication the internal reference of the ApplicationInstanceComponent.</td>
<td>1</td>
</tr>
</tbody>
</table>
Table 51-87  (Cont.) Application Instance Component Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
<th>Occurs</th>
</tr>
</thead>
<tbody>
<tr>
<td>service_family_type</td>
<td>String</td>
<td>Denotes the type of ApplicationInstanceComponent (for example, &quot;jaas&quot;).</td>
<td>1</td>
</tr>
<tr>
<td>media_type</td>
<td>String</td>
<td>Indicates the additional media type that clients can use to perform a GET.</td>
<td>1</td>
</tr>
<tr>
<td>status</td>
<td>String</td>
<td>Status of the ApplicationInstanceComponent in the Software Library.</td>
<td>1</td>
</tr>
<tr>
<td>maturity</td>
<td>String</td>
<td>Maturity of the ApplicationInstanceComponent in the Software Library.</td>
<td>1</td>
</tr>
<tr>
<td>component_type</td>
<td>String</td>
<td>Component type of ApplicationInstanceComponent (for example, Java EE Application).</td>
<td>1</td>
</tr>
<tr>
<td>canonicalLink</td>
<td>String</td>
<td>GET against this normalized/canonical URI refreshes the client representation of the resources accessible to this user.</td>
<td>1</td>
</tr>
</tbody>
</table>

51.9.8.1 Viewing Details of the Application Instance Component Resource

The following shows a sample GET operation on the ApplicationInstanceComponent URI to return its representation.

Example Request:

Table 51-88  GET Request Configuration for Viewing Details of the Application Instance Component

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC514D5CF9FC00CD7E040F10A716020D0%3A0.1</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzX16ZGVtb3VzX16=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

Example Response:

HTTP/1.1 200 OK
Content-Type: application/oracle.com.cloud.jaas. ApplicationInstanceComponent+json
Content-Location: /em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC514D5CF9FC00CD7E040F10A716020D0%3A0.1
Cache-Control: public

{
    "uri": "/em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC514D5CF9FC00CD7E040F10A716020D0%3A0.1"
51.9.8.2 Deleting an Application Instance Component

The following shows a sample DELETE operation on the ApplicationInstanceComponent URI.

**Example Request:**

**Table 51-89  DELETE Request Configuration for Deleting the Application Instance Component**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC514D5CF9FC00CD7E040F10A716020D0%3A0.1</td>
</tr>
<tr>
<td>Request header</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

**Example Response:**

```json
{
    "uri" : "/em/cloud/jaas/applicationinstancecomponent/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3ACOMP_Component%3ASUB_JavaEEApplication%3AC514D5CF9FC00CD7E040F10A716020D0%3A0.1",
    "resource_state" : { 
        "state" : "DESTROYED"
    },
    "context_id" : "oracle:defaultService:em:provisioning:"
}```
51.10 Application Component Filtering for V1

Application component filtering is supported for JaaS zones, templates, and application components.

51.10.1 Filtering Service Templates

The filtering attributes supported are name, service_template_type, owner, and media_type. The following are sample requests and responses to Service Template Finds:

Example Request

Table 51-90  GET Request Configuration for Filtering Service Templates

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud?filters=</td>
</tr>
<tr>
<td>Body</td>
<td>{ &quot;filters&quot;: {&quot;name&quot;: &quot;RiddleApp&quot;} }</td>
</tr>
</tbody>
</table>

Example Response

```json
{
  "uri" : "/em/cloud/finds/service_template/bNVkaWFfdH1wZSUyNTNEYXBwbGljYXRpb241MjUyRm9yYWNsZS5jb20uY2xvdWQvY29tbW9uL1Nl%0AcnZpY2VUZW1wbGF0Zm9ybWF0L3JpZGRsZUFw%3D%3D",
  "name" : "Service Template Finds",
  "media_type" : "application/oracle.com.cloud.common.ServiceTemplateFinds+json",
  "description" : "This is a Resource Finds for 'Service Template Finds' with media type 'application/oracle.com.cloud.common.ServiceTemplateFinds+json'",
  "resource_state" : { "state" : "READY" },
  "filters" : { "media_type" : "application/oracle.com.cloud.common.ServiceTemplateFinds+json" },
  "finds" : { "media_type" : "application/oracle.com.cloud.common.ServiceTemplateFinds+json" }
}```
51.10.2 Filtering Zones

The filtering attributes supported are name, owner, service_family_type, and media_type.

Example for Filtering Zones

Table 51-91  GET Request Configuration for Filtering Zones

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud?filters=</td>
</tr>
<tr>
<td>Request</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>headers</td>
<td>Accept: application/oracle.com.cloud.common.ZoneFinds+json</td>
</tr>
<tr>

51.11 Load Balancer Configuration for V1

The following table describes the load balancer configuration.

<table>
<thead>
<tr>
<th>Method</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>NA</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs</td>
<td>Returns all load balancer configurations with lbr Id, lbr name and lbr self link.</td>
</tr>
<tr>
<td>GET</td>
<td>NA</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs/{lbr id}</td>
<td>Returns all details about the given load balancer configuration.</td>
</tr>
<tr>
<td>POST</td>
<td>LBR Config Item (Json Payload)</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs</td>
<td>Creates a new load balancer configuration.</td>
</tr>
<tr>
<td>PUT</td>
<td>LBR Config Item (Json Payload)</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs</td>
<td>Edits the load balancer configuration.</td>
</tr>
<tr>
<td>DELETE</td>
<td>NA</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs/{lbr id}</td>
<td>Deletes the lbr with the specified lbr id.</td>
</tr>
</tbody>
</table>

51.11.1 Load Balance Configuration REST API Examples

This section explains the REST API examples related to the Load Balancer Configuration.

51.11.1.1 Viewing Details of the Load Balancer Configuration Resource

The table below lists the GET request configuration.
Table 51-93  GET Request Configuration for Viewing Details of the Load Balancer Configuration Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/lbrconfigs</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
    name: "Load Balancer Configurations"
    description: "Load Balancer Configurations available"

Request method | POST

51.14 User Operation REST API Examples for V1

The following operations are described in this section:

- Starting/Stopping Service Instances
- Rescheduling Service Instance
- Viewing Details of the Java EE Application Components in Software Library
- Deploying an Application as a Library
- User Operations for Scheduling Support
51.14.1 Starting/Stopping Service Instances

The following table describes the REST API to stop a service instance.

Table 51-103  PUT Request Configuration for Starting/Stopping Service Instances

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>em/websvcs/restful/extws/cloudservices/ssa/mwaas/v1/serviceinstances/</code>{instance_id}</td>
</tr>
<tr>
<td>Request</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>headers</td>
<td></td>
</tr>
</tbody>
</table>
| Body          | `{  
|              |   "operation":"STOP"  
|              | }                          |
| Request       | PUT                                                                         |
| method        |                                                                             |

A sample of the response received is shown below.

```
{
    message: "Stop service instance request has been submitted. Request ID = 122"
    statusUri:  
        "https://example.com:5416/em/websvcs/restful/extws/cloudservices/ssa/cf 
        w/v1/servicerequests"
}
```

Similar to the above example, to start a service instance all the features of the REST API shown above remain the same, except for "operation":"START" should be mentioned in the Body instead of "operation":"STOP".

51.14.2 Rescheduling Service Instance

The following table describes the reschedule service instance configuration. The following REST API reschedules the service instance based on the schedule date.

Table 51-104  PUT Request Configuration for Rescheduling a Service Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/serviceinstances/</code>{instance_id}</td>
</tr>
<tr>
<td>Request</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>headers</td>
<td></td>
</tr>
<tr>
<td>Body</td>
<td></td>
</tr>
<tr>
<td>Request</td>
<td></td>
</tr>
<tr>
<td>method</td>
<td></td>
</tr>
</tbody>
</table>
Table 51-104  (Cont.) PUT Request Configuration for Rescheduling a Service Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
</table>
| Body    | `{  
  "operation":"RESCHEDULE",
  "reschedule":"2013-12-20T02:10:45ZAsia/Calcutta"
}` |

Request method

A sample of the response received is shown below.

```json
{
  message: "Reschedule request has been submitted. Request ID = 124",
  statusUri: "https://example.com:5416/em/websvcs/restful/extws/cloudservices/ssa/cf
w/v1/servicerequests"
}
```

51.14.3 Viewing Details of the Java EE Application Components in Software Library

The following table describes the Java EE application components configuration. The following REST API returns all the Java EE app components uploaded in the software library.

Table 51-105  GET Request Configuration for Rescheduling a Service Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/javaeeappcomponets</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  name: "Java EE Application Components uploaded in My Library",
  selfLink: "https://example.com:5416/em/websvcs/restful/extws/cloudservices/ssa/mwaas/v1/javaeeappcomponets",
  appUrns: [1]
  0: {
    type: "Java EE Application"
```
### 51.14.4 Deploying an Application as a Library

This section shows the REST APIs to deploy, redeploy, and undeploy the application as a library.

#### Table 51-106  Deploy Application as a Library Supported Request Methods

<table>
<thead>
<tr>
<th>Method</th>
<th>Request Payload</th>
<th>URI</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>PUT</td>
<td>Instance Item</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/serviceinstances/{Instance_Guid}</td>
<td>Deploys application as a library.</td>
</tr>
<tr>
<td>PUT</td>
<td>Instance Item</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/mwaas/v1/serviceinstances/{Instance_Guid}</td>
<td>Redeploys the deployed application.</td>

51.15 EMCLI Support for Administration Operations

This section contains a few samples and usage of the EM CLI commands. For more details, refer to the Enterprise Manager Command Line Reference Guide.

Table 51-115  General WLaaS EM CLI Verbs

<table>
<thead>
<tr>
<th>Verb</th>
<th>Description</th>
<th>Format</th>
</tr>
</thead>
<tbody>
<tr>
<td></td>
<td>-wsname - Indicates the URI of the resource.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-method - Type of the REST method.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-payload - Indicates the json/xml input payload.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-accept - Payload type. These are standard jersey values.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-type - Standard jersey response types.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-param - Use this option to pass in form/query parameter value. For example, -param=&quot;name:value&quot;. More than one parameter can be specified. For example, -param=&quot;name:value&quot; -param=&quot;zip:12345&quot;. The parameter can be provided through a file. To read from file, specify as shown in the example: -param=&quot;name:tag&quot; -input_file=&quot;tag:file.txt&quot;. In this example, the name parameter will be read from file file.txt.</td>
<td></td>
</tr>
<tr>
<td></td>
<td>-input_file - Use this option to pass in payload or param value from file.</td>
<td></td>
</tr>
</tbody>
</table>

Examples:

- emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param="name:Administrators"
  Invokes list resource and sources all administrators

- emcli invoke_ws -wsname=/em/websvcs/restful/emws/core/v0/list/dataservice -method=get -param="name:tag" -input_file="tag:file.txt"
  Invokes list resource and sources all administrators. The name parameter is read from file.txt.
<table>
<thead>
<tr>

<th>Description</th>
<th>Format</th>
</tr>
</thead>
</table>
| emcli get_targets    | Obtain status and alert information for targets.                            | emcli get_targets [-targets="[name1:type1; name2:type2;...]" [-alert]
                                                                                   [-noheader] [-script | -format=
                                                                                   [name:<pretty|script|csv>; [-limit_rows="Maximum number of
                                                                                   [column_separator:"column_sep_string"]; [config_search="Configuration
                                                                                   [row_separator:"row_sep_string"];]
                                                                                   Search UI Name"] [-unmanaged]
                                                                                   [-properties]
                                                                                   [-separator_properties="properties_separator_string"]
                                                                                   [-subseparator_properties="properties_subsep_string"] |

Options:
- -targets=name:type - Name or type can be either a full value or a pattern match using "%". Also, name is optional, so the type alone may be specified.
- -limit_rows="Maximum number of targets to be retrieved" - Defaults to 2000 rows, if not specified.
- -config_search="Configuration Search UI Name" - Search UI name should be the display name of the configuration search.
- -alerts - Displays the count of critical and warning alerts for each target.
- -noheader - Displays tabular output without column headers.
- -unmanaged - Displays unmanaged targets (no status or alert information).
- -properties - Displays unmanaged targets with properties.
- -separator_properties="separator_properties" - Displays unmanaged target properties with separator_properties.
- -subseparator_properties="subseparator_properties" - Displays unmanaged target properties with subseparator_properties.
- -script - This option is equivalent to -format="name:script".
- -format - Format specification (default is -format="name:pretty").
  - -format="name:pretty" prints the output table in a readable format but is not intended to be parsed by scripts.
  - -format="name:script" sets the default column separator to a tab and the default row separator to a new line. The column and row separator strings may be specified to change these defaults.
  - -format="name:csv" sets the column separator to a comma and the row separator to a newline.

Examples:
- emcli get_targets
  Displays a maximum of 2000 targets. Critical and Warning columns are not shown.
- emcli get_targets -limit_rows=20
  Displays a maximum of 20 targets. Critical and Warning columns are not shown.
- emcli get_targets -alerts
<table>
<thead>

</table>
SOAaaS and OSBaaS APIs

This chapter describes the resource model for SOA as a Service (SOAaaS) APIs and OSB as a Service (OSBaaS) APIs and their responses. In particular, this chapter contain the following topics:

• PaaS Infrastructure Zone and Middleware Pool
• Quotas
• Service Templates
• Load Balance Configuration
• SSA User Operation API Examples

52.1 PaaS Infrastructure Zone and Middleware Pool

This section lists the APIs for PaaS Infrastructure zone and Middleware pool.

• Viewing Details of All the Resource Providers
• Creating a PaaS Infrastructure Zone for SOA/OSB Domains
• Creating Middleware Pool for SOA/OSB
• Updating a PaaS Infrastructure Zone
• Updating a Middleware Pool
• Deleting a Resource Provider (PaaS Infrastructure Zone or Middleware Pool)

52.1.1 Viewing Details of All the Resource Providers

The following table shows an example of a GET operation on the Resource providers URI to return its representation.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbfWfuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>
52.1.2 Creating a PaaS Infrastructure Zone for SOA/OSB Domains

The following table shows an example of a POST operation on the Resource providers URI to create a PaaS infrastructure zone.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/resourceproviders</td>

    javaServersCount: "10"
  }
  selfLink: "https://slc06ekg.us.example.com:5416/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas"
}
```

52.2.2 Creating a Quota for a SSA User Role

The following table shows an example of a POST operation on the quotas URI to create a quota for the SSA user role.

Table 52-8  POST Request Configuration for Creating a Quota Setting for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>{ &quot;roleName&quot;: &quot;SSA_ROLE&quot;, &quot;memory&quot;: &quot;5&quot;, &quot;javaServersCount&quot;: &quot;10&quot; }</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

52.2.3 Updating a Quota for a SSA User Role

The following table shows an example of a PUT operation to update a quota for the SSA user role.
Table 52-9 PUT Request Configuration for Updating a Quota Setting for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbfWfuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;roleName&quot;: &quot;SSA_ROLE&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;memory&quot;: &quot;10&quot;</td>
</tr>
<tr>
<td></td>
<td>&quot;javaServersCount&quot;: &quot;5&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
</tbody>
</table>

52.2.4 Deleting a Quota for a SSA User Role

The following table shows an example of a DELETE operation to delete a quota for a SSA user role.

Table 52-10 DELETE Request Configuration for Deleting a Quota for a SSA User Role

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/quotas</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbfWfuOnN5c21hbg==</td>

<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>DELETE</td>
</tr>
</tbody>
</table>

52.3 Service Templates

This section lists the APIs for Service Templates,

- Viewing Details of all Service Templates
- Viewing Details of a Specific Service Template
- Deleting a Service Template
- Creating a Service Template
52.3.1 Viewing Details of all Service Templates

The following table shows an example of a GET operation on the service templates URI to return its representation.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.3.2 Viewing Details of a Specific Service Template

The following table shows an example of a GET operation on a specific service template URI to return its representation.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/21/</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.3.3 Deleting a Service Template

The following table shows an example of a DELETE operation to delete a service template.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/21</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
</tbody>
</table>
### 52.3.4 Creating a Service Template

The table below lists the POST request configuration for creating SOA/OSB service templates.

#### 52.3.4.1 Viewing Service Template Types

The following table shows an example of a GET operation on the service template type URI to return its representation.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/templatetypes/</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

#### 52.3.4.2 Getting Service Template Metadata Details

The following is an example of a POST operation on the Service Template URI to update the Service template metadata information.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/metadata</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;serviceType&quot;:&quot;OSB_SERVICE&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;serviceTemplateTypeId&quot;:&quot;21&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>
Table 52-15  (Cont.) POST Request Configuration for Getting Service Template Metadata Details

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

52.3.4.3 Getting the Resource Provider Characteristics

The following is an example of a POST operation on the Service Template URI to create the resource providers.

Table 52-16  POST Request Configuration for Getting the Resource Provider Characteristics

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/resourceProviders</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
<tr>
<td>Body</td>
<td>`{</td>
</tr>
<tr>
<td></td>
<td>&quot;serviceType&quot;: &quot;OSB_SERVICE&quot;,</td>

</tr>
<tr>
<td></td>
<td>&quot;value&quot;: &quot;&lt;user_input&gt;&quot;,</td>
</tr>
<tr>
<td></td>
<td>&quot;required&quot;: true</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>],</td>
</tr>
<tr>
<td></td>
<td>&quot;characteristics&quot;: []</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>

52.3.4.4 Creating the Service Template Configuration

The following is an example of a POST operation on the Service Template URI to create the service template configuration.
### Table 52-17  POST Request Configuration for Creating the Resource Providers

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td>/em/websvcs/restful/extws/cloudservices/admin/cfw/v2/servicetemplates/configurations</td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg==</td>
</tr>
</tbody>
</table>
| **Body**    | Payload: Use b,c responses.  
  
  ```
  {
  "serviceType": "OSB_SERVICE",
  "serviceTemplateTypeId": "21",
  "rscProvAssocOption": ["byRscLookupChars"],
  "payloads": [  
    {
      "name": "Profile for OSB",
      "value": "oracle:defaultService:em:provisioning:
        1:cmp:COMP_Component:SUB_FWMBundle:

### 52.4 Load Balance Configuration

This section explains the API examples related to the Load Balancer Configuration.

- Viewing Details of all the Load Balancer Configuration Resource
- Viewing Details of the specified Load Balancer Configuration
- Creating the Load Balancer Configuration
52.4.1 Viewing Details of all the Load Balancer Configuration Resource

The table below lists the GET request configuration.

Table 52-19  GET Request Configuration for Viewing Details of the Load Balancer Configuration Resource

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/lbrconfigs</td>
</tr>
<tr>
<td>Request headers</td>
<td></td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.4.2 Viewing Details of the specified Load Balancer Configuration

The table below lists the GET request configuration for viewing details of the specified Load Balancer Configuration.

Table 52-20  GET Request Configuration for Viewing Details of the specified Load Balancer Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/lbrconfigs/{{lbrId}}</td>
</tr>
<tr>
<td>Request headers</td>
<td>None</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.4.3 Creating the Load Balancer Configuration

The following is an example of a POST operation on the Load Balancer URI to create the load balancer configuration.

Table 52-21  POST Request Configuration for Creating the Load Balancer Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/lbrconfigs</td>
</tr>
</tbody>
</table>
52.4.4 Editing the Load Balancer Configuration

The table below lists the PUT request configuration for editing the Load Balancer Configuration.

Table 52-22  PUT Request Configuration for Editing the Load Balancer Configuration

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/admin/wlaas/v2/lbrconfigs</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization :Basic c3lbWFuOnN5c21hbg==</td>
</tr>
</tbody>
</table>

</tbody>
</table>

52.5 SSA User Operation API Examples

The following API examples are described in this section:

- Viewing Details of all Service Templates
- Viewing Details of all Service Instances
- Viewing all Service Instances With UP Status
- Viewing the Service Offering Metadata
• Creating a Service Instance Request
• Viewing all the Action IDs for the Service Instances
• Stopping a Service Instance
• Starting a Service Instance
• Deleting a Service Instance
• Scaling Up a Service Instance

52.5.1 Viewing Details of all Service Templates

The following table shows an example of a GET operation to view all the service templates.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/services/</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: Basic c3lzbWFuOnN5c21hbg=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.5.2 Viewing Details of all Service Instances

The following table shows an example of a GET operation to view all the service instances.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/ssa/cfw/v2/serviceinstances</td>
</tr>
<tr>
<td>Request headers</td>
<td>None</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

52.5.3 Viewing all Service Instances With UP Status

The following table shows an example of a GET operation to view all the service instances with UP status.
Table 52-26  
GET Request Configuration for Viewing all Service Instances with UP Status

<table>
<thead>
<tr>

Rapid Start Cloud Setup

This chapter describes the rapid start cloud setup kit. It contains the following sections:

- Introduction
- Installing the Kit
- Contents of the Kit
- Prerequisites
- Artifacts Created by the Rapid Start Kit
- Rapid Kit Modes
- Cloud Setup Inputs: Simple Mode
- Cloud Setup Inputs: Advanced Mode
- Command Line Interface
- Rapid Start Kit Sample Run

53.1 Introduction

Setting up the DBaaS cloud involves a series of steps. The user with the `CLOUD_ADMINISTRATOR` role has to go through many wizards and clicks to complete the setup. This requires a considerable amount of effort and time before the DBaaS is ready to use.

The Rapid Start Kit provides a single command solution to setup Cloud for Database as a Service (DBaaS) and Pluggable Database as a Service (PDBaaS). One command creates all the Cloud artifacts like Roles, Administrators, Credentials, Database Profiles, PaaS Infrastructure Zone, Database Pools and Service Templates. Once the Rapid Start Kit has been successfully executed, requests can be made to provision databases, and PDBs.

Rapid start kit can create complex topologies involving multiple zones, pools and service templates. It also supports standby databases.

53.2 Installing the Kit

The Rapid Start Kit is shipped along with Oracle Cloud Application 12.1.0.8.0. The kit is available on the Oracle Management Server host with the Oracle Cloud Application 12.1.0.8.0 deployed in plug-in home directory. The Rapid Start Kit can be used from the host on which the Oracle Management Server (OMS) is installed or from any other host that can access Oracle Management Server host using Enterprise Manager Command Line Interface (emcli).
53.2.1 OMS Host

The Rapid Start Kit can be used directly from the host on which the OMS has been installed. No separate installation of the kit is required. The kit is available in the following directory:

EM_BASE/oracle/MW/plugins/oracle.sysman.ssa.oms.plugin_12.1.0.8.0/dbaas/setup

53.2.2 Other Hosts

The kit can also be used from any other host. To install the kit on any other machine, copy the setup directory to the desired location on the target machine.

53.3 Contents of the Kit

The Rapid Start Kit contains the following files:

- **Cloud Setup Script:**
  
  `dbaas/setup/exadata_cloud_setup.py`
  `dbaas/setup/database_cloud_setup.py`

  These scripts contain the code for the one command cloud setup. The scripts use the input files or the cloud artifacts as defined in the configuration file.

- **Cloud Boundary XML:**
  
  `dbaas/setup/config/cloud_boundary.xml`
  `dbaas/setup/config/cloud_custom_boundary.xml`

  Cloud Boundary defines the cloud topology. It has the zones and pools along with host names, oracle home locations or container database names. The `cloud_boundary.xml` file can be used as a template for simple cloud setup on Exadata machines with one zone and pool. The `cloud_custom_boundary.xml` can be used for advanced cloud setup on any set of machines with multiple zones and pools.

- **Database as a Service Input XML:**
  
  `dbaas/setup/config/dbaas_cloud_input.xml`
  `dbaas/setup/config/dbaas_cloud_custom_input.xml`

  The Cloud Setup for Database as a Service uses the `dbaas_cloud_input.xml` as the input file. The script reads this configuration file and sets up the cloud artifacts as defined in the file. Simple cloud setup on the Exadata machine is defined in `dbaas_cloud_input.xml` template file and advanced cloud setup should use `dbaas_cloud_custom_input.xml`.

- **Pluggable Database as a Service Input XML:**
  
  `dbaas/setup/config/pdbaas_cloud_input.xml`
  `dbaas/setup/config/pdbaas_cloud_custom_input.xml`

  The Cloud Setup for Pluggable Database as a Service uses the `pdbaas_cloud_input.xml` as the input file. The script reads this configuration file and sets up the cloud artifacts as defined in the file. Simple cloud setup on
Exadata machine is defined in pdbaas_cloud_input.xml template file and advanced cloud setup should use pdbaas_cloud_custom_input.xml.

53.4 Prerequisites

Certain prerequisites must be fulfilled before running the Rapid Start Kit. This includes OMS setup with the correct plug-in versions as listed in the Supported Plug-ins section. Cloud setup can be done on Real application cluster machines with Database instance or Oracle Homes installed. The prerequisites are described in the following sections:

53.4.1 Oracle Management Server

- The Oracle Management Server must have the Oracle Cloud Application 12.1.0.8 deployed.
- The Software Library must have been configured.

53.4.2 EMCLI Setup

EMCLI with scripting option must be set up on the host from which the kit is going to be executed. To set up EMCLI on the host, follow these steps:

1. Download the emcliadvancedkit.jar from the OMS using URL https://<omshost>:<omsport>/em/public_lib_download/emcli/kit/emcliadvancedkit.jar
2. Set your JAVA_HOME environment variable and ensure that it is part of your PATH. You must be running Java 1.6.0_43 or greater. For example:
   - setenv JAVA_HOME /usr/local/packages/j2sdk
   - setenv PATH $JAVA_HOME/bin:$PATH
3. You can install the EMCLI with scripting option in any directory either on the same machine on which the OMS is running or on any machine on your network (download the emcliadvancedkit.jar to that machine)
   java -jar emcliadvancedkit.jar client -install_dir=<emcli client dir>
4. Run emcli help sync from the EMCLI Home (the directory where you have installed emcli) for instructions on how to use the "sync" verb to configure the client for a particular OMS.
5. Navigate to the Setup menu then the Command Line Interface. See the Enterprise Manager Command Line Tools Download page for details on setting EMCLI.

53.4.3 Infrastructure Setup

To prepare the infrastructure for cloud setup, make sure that the Real Application Cluster machines are available and the required databases and oracle homes have been setup on them. Targets must have been discovered in Oracle Management Server. The following sections describe the setup requirement for PDbaaS and DBaaS.
53.4.3.1 Pluggable Database as a Service

You must ensure that the Real Application Cluster machine is available and has a 12.1.0.1 Container Database version running on it. All the hosts from Real Application Cluster have the Management Agents installed on it. The following targets must be discovered using the guided discovery process:

- Oracle Cluster
- Cluster ASM
- Oracle RAC Database
- Oracle Database Listeners

53.4.3.1.1 Database as a Service

You must ensure that the Real Application Cluster machine with Oracle home version 12.1.0.1 or 11.2.0.3 installed on it is available. All the hosts in the Real Application Cluster must have the Management Agents installed on it. The following targets must be discovered using guided discovery process:

- Oracle Cluster
- Cluster ASM
- Oracle RAC Database
- Database Instance
- Oracle Database Listener

53.5 Artifacts Created by the Rapid Start Kit

The Rapid Start Kit uses cloud input files to create cloud entities. Cloud Input files define the list of entities and input values for each of the entity. See Contents of the Kit for more details on input files. This section explains the Cloud artifacts created as part of cloud setup.

The following actions occur when the Cloud script is executed:

1. The following roles are created:

<table>
<thead>
<tr>
<th>Role</th>
<th>Associated System Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSA_USER_ROLE</td>
<td>EM_SSA_USER</td>
</tr>
</tbody>
</table>

2. The following users are created:

<table>
<thead>
<tr>
<th>Administrator / User</th>
<th>Associated Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>CLOUD_ADMIN</td>
<td>EM_CLOUD_ADMINISTRATOR</td>
</tr>
<tr>
<td>SSA_ADMIN</td>
<td>EM_SSA_ADMINISTRATOR</td>
</tr>
</tbody>
</table>
Table 53-2  (Cont.) Created Users

<table>
<thead>
<tr>
<th>Administrator / User</th>
<th>Associated Role</th>
</tr>
</thead>
<tbody>
<tr>
<td>SSA_USER1</td>
<td>EM_SSA_USER1</td>
</tr>
<tr>
<td>SSA_USER2</td>
<td>EM_SSA_USER2</td>
</tr>
<tr>
<td>SSA_USER3</td>
<td>EM_SSA_USER3</td>
</tr>
</tbody>
</table>

3. The Rapid Start Kit does not support the creation of credentials out-of-the-box. The following credentials must be created manually when prompted by the kit during cloud setup:

Table 53-3  Credentials to be Created Manually

<table>
<thead>
<tr>
<th>Credentials</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>HOST_CRED</td>
<td>Host credentials with host user name and password.</td>
</tr>
<tr>
<td>HOST_CRED_ROOT</td>
<td>Host credentials with root access.</td>
</tr>
<tr>
<td>DB_CRED</td>
<td>Database access credentials.</td>
</tr>
<tr>
<td>GI_CRED</td>
<td>Grid infrastructure owner user.</td>
</tr>
</tbody>
</table>

Note: A limited support is provided to create named credentials. The credential section is commented in the template XMLs. Un-comment the credential section to enable creation of named credentials.

4. The quota is set for the SSA_USER_ROLE.

5. The PaaS Infrastructure Zone is created and the hosts that are part of the Oracle Cluster are added as members of the zone.

6. Database provisioning profiles. The Rapid Start Kit can create the following database profiles as part of cloud setup:
   - DBCA Template
   - DBCA Template with data
   - Profile using RMAN image
   - Schema profile with full export database
   - Snapshot database profile

7. The user with the EM_SSA_ADMIN role creates the following:
   - DBaaS Pool: The DBaaS Pool contains the Oracle Homes from the hosts that are part of the selected zone. The DBaaS Pool is used for Database as a Service.
   - PDBaaS Pool: The PDBaaS Pool has the container database instances from the hosts that are part of the selected zone. The PDBaaS Pool is used for Pluggable Database as a Service.

8. The user with the EM_SSA_ADMIN role creates the following:
• Default Database Service Template: This service template can be used to submit a request for a Database.
• Default Pluggable Database Service Template: This service template can be used to submit a request for a Pluggable Database.
• Service templates using database profiles.

53.6 Rapid Kit Modes

The Rapid Start Kit supports two modes:

• Simple Mode (on Exadata only)
• Advanced Mode (on Exadata and non Exadata)

53.6.1 Simple Mode (On Exadata Only)

In the simple mode, the Rapid Start kit creates a single zone and pool on a specified Exadata Machine. The reference templates for the simple mode are:

pdbaas_cloud_input.xml
dbaas_cloud_input.xml
cloud_boundary.xml

53.6.2 Advanced Mode (Exadata and Non Exadata)

In the advanced mode, the Rapid Start kit can be used to create multiple zones and pools on any set of hosts. The reference templates for advanced mode are:

pdbaas_cloud_custom_input.xml
dbaas_cloud_custom_input.xml
cloud_custom_boundary.xml

53.7 Cloud Setup Inputs: Simple Mode

The cloud setup requires many user inputs specific to the RAC environment and the cloud artifacts. The Rapid Start Kit has two configuration files that define the cloud input. The following cloud input files are under the configuration directory.

• cloud_boundary.xml: Defines the cloud topology.
• dbaas_cloud_input.xml: Defines the cloud artifacts and the input values for Database as a Service.
• pdbaas_cloud_input.xml: Defines the cloud artifacts and the input values for Pluggable Database as a Service.

Review the cloud input files and map the artifacts with the ones defined in Artifacts Created by the Rapid Start Kit. The user marked with cloudadmin="True" is used as the Cloud Administrator to create the PaaS Zone and the user marked as ssaadmin="True" is used to create the Database Pools. All default passwords used by the kit are welcome1.
Note: The simple mode can be used to create a cloud only on an Exadata machine. For non-exadata setup, refer to Cloud Setup Inputs: Advanced mode.

53.7.1 Pluggable Database as a Service: Simple Mode

There is no environment specific value in `pdbaas_cloud_input.xml`. Pluggable Database as a Service can be run with out of box input xml without any change.

53.7.2 Database as a Service: Simple Mode

Database as a service has few environment specific values. User must set them to suite the Real Application Cluster used.

**Table 53-4   Environment Details Input Guidelines**

<table>
<thead>
<tr>
<th>XML Input</th>
<th>Edit Guideline</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pool Filters:</td>
<td>Edit the platform value to ARU id of Real Application Cluster machine platform. Use 226 for Linux x86-64, 267 for Solaris x86, and 23 for Solaris Sparc 64. Edit the database version to the correct value from the database installed on Real Application Cluster machine.</td>
</tr>
<tr>
<td>Service Template:</td>
<td>Cloud Setup Supports Real Application Cluster with ASM and File System. Specify the disk group names used for Redo files, Recovery files and Data files for ASM and shared locations for File System.</td>
</tr>
<tr>
<td>&lt;COMMON_DB_SYSTEM_PASSWORD&gt;</td>
<td>Specify the passwords for system, dbsnmp and sys accounts.</td>
</tr>
</tbody>
</table>

53.7.3 Input Customization: Simple Mode

The Rapid Setup Kit supports logical customization of input values. The customer can make a copy of the out-of-the-box input file. Customize the input values logically and pass the modified file to the Rapid Setup Kit.

For example: The user wants to change the Role name from `SSA_USER_ROLE` to `SSA_QA_ROLE`. Change should be done as follows:

Original xml tag:
The user must look at all the usages of above Role name and change them accordingly. Due to the change in Role name, the following user tag:

```xml
<user>
  <userName>SSA_USER1</userName>
  <passWord>welcome1</passWord>
  <!-- system roles or above created role -->
  <systemRole>SSA_QA_ROLE</systemRole>
</user>
```

Must change to use the new role name

```xml
<user>
  <userName>SSA_USER1</userName>
  <passWord>welcome1</passWord>
  <!-- system roles or above created role -->
  <systemRole>SSA_USER_ROLE</systemRole>
</user>
```

The user can edit the names and descriptions of Roles, Users, Credential Names, Pool Names and Service template names and their properties defined in the input XML. For example: The user may want to customize the work load to suit the environment for PDBaaS. The user can customize the database SID name and Domain name as follows: Change these tags from dbaas_cloud_input.xml

```xml
<DB_SID_PREFIX>dbsid</DB_SID_PREFIX>
<COMMON_DOMAIN_NAME>mycompany.com</COMMON_DOMAIN_NAME>
```

To

```xml
<DB_SID_PREFIX>dbsid</DB_SID_PREFIX>
<COMMON_DOMAIN_NAME>company.com</COMMON_DOMAIN_NAME>
```

Similarly the init parameters for DbaaS can be changed for sga_target and the pga_aggregate_target by editing their values in the dbaas_cloud_input.xml.

53.8 Cloud Setup Inputs: Advanced Mode

The Advanced Mode is useful to setup the cloud on any set of hosts with customized cloud topology. The Rapid Start Kit has three configuration template files that define the cloud input. The following cloud input files are under the configuration directory.

- cloud_custom_boundary.xml: Defines the cloud topology.
• dbaas_cloud_custom_input.xml: Defines the cloud artifacts and the input values for Database as a Service.
• pdbaas_cloud_custom_input.xml: Defines the cloud artifacts and the input values for Pluggable Database as a Service.

Review the cloud input files and map the artifacts with the ones defined in Artifacts Created by the Rapid Start Kit. The user marked with cloudadmin="True" is used as the Cloud Administrator to create the PaaS Zone and the user marked as ssaadmin="True" is used to create the Database Pools. All default passwords used by the kit are welcome1.

53.8.1 Creating Custom Users

To create custom users, edit the following tags in the cloud_input.xml file to add the new user name roles. The user marked with cloudadmin="True" is used as the Cloud Administrator to create the PaaS Zone and the user marked as ssaadmin="True" is used to create the Database Pools.

```
<user cloudadmin="True">
    <userName>CLOUD_ADMIN</userName>
    <!-- If password is empty, default password welcome1 will be used -->
    <passWord></passWord>
    <!-- system roles or above created custom role name -->
    <systemRole>EM_CLOUD_ADMINISTRATOR</systemRole>
</user>
```

**Note:**

- You can set one user as the self service administrator by specifying ssaadmin="True".
- You can set one user as the cloud administrator by specifying cloudadmin="True".

53.8.2 Pluggable Database as a Service: Advanced Mode

The following input customizations are required to prepare the input files for Pluggable database as a service.

- Make a copy of cloud_custom_boundary.xml template file.
- Edit the copy to define the zones and pools. You can create a zone with multiple pools and multiple such zones based on the cloud topology.

**Table 53-5 XML Editing Guidelines for Creating Pools and Zones**

<table>
<thead>
<tr>
<th>XML Input</th>
<th>Edit Guidelines</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;dbinstance&gt;</td>
<td>Provide the container database instance name for each pool definition in pdbaaspool tag.</td>
</tr>
<tr>
<td>&lt;dbName&gt;&lt;/dbName&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;/dbinstance&gt;</td>
<td></td>
</tr>
</tbody>
</table>
XML Input | Edit Guidelines
--- | ---
Pool Filters: `<dbType>rac_database</dbType>` `<version>12.1.0.1.0</version>`  | Edit the database version and database type to the type and version of database used for the pool. For cluster databases, specify the type as `rac_database`, and for single instance databases, specify the type as `oracle_database`.

`<zone>DBaaS Zone</zone>`  | Provide the zone name to which the pool belongs.

Make a copy of `pdbaas_cloud_custom_input.xml` template file. You can use an existing profile or create a new database profile using a reference target using Rapid Start Kit. Remove the profiles tag to use existing profile. The template contains sample tags for different types of profiles. Edit the XML to remove the profiles that are not required for the setup. Provide following details to create the database profile as part of cloud setup using the Rapid Start Kit.

Table 53-6  XML Editing Guidelines for Creating a Database Profile

53.8.3 Database as a Service: Advanced Mode

The following input customizations are required to prepare the input files for Pluggable database as a service.

- Make a copy of cloud_custom_boundary.xml template file.
- Edit the copy to define the zones and pools. You can create a zone with multiple pools and multiple such zones based on the cloud topology.
Table 53-8  XML Editing Guidelines to Define Zones and Pools

<table>
<thead>
<tr>
<th>XML Input</th>
<th>Edit Guide Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>&lt;dbHome&gt;</td>
<td>Provide the Oracle Homes present on these hosts will be part of this Database Pool.</td>
</tr>
<tr>
<td>&lt;hostName&gt;host1.example.com&lt;/hostName&gt;</td>
<td>Provide the full path for Oracle Home Location.</td>
</tr>
<tr>
<td>&lt;oracleHomeLocation&gt;/u01/app/oracle/product/11.2.0.4.0/dbhome_1&lt;/oracleHomeLocation&gt;</td>
<td>Multiple &lt;dbHome&gt; tags can be provided.</td>
</tr>
<tr>
<td>&lt;dbHome&gt;</td>
<td></td>
</tr>
<tr>
<td>Pool Filters:</td>
<td></td>
</tr>
<tr>
<td>&lt;dbType&gt;rac_database&lt;/dbType&gt;</td>
<td>Edit the database version and database type to the type and version of database used for the pool.</td>
</tr>
<tr>
<td>&lt;version&gt;12.1.0.1.0&lt;/version&gt;</td>
<td></td>
</tr>
<tr>
<td>&lt;zone&gt;DBaaS Zone&lt;/zone&gt;</td>
<td>Provide the zone name to which the pool belongs.</td>
</tr>
<tr>
<td>&lt;standbyPool&gt;&lt;/standbyPool&gt;</td>
<td>Specify the standby pool names for this pool.</td>
</tr>
</tbody>
</table>

Make a copy of pdbaas_cloud_custom_input.xml template file. You can use an existing profile or create a new database profile using a reference target using Rapid Start Kit.

The following profiles can be created using the Rapid Start Kit:

- Database profile using DBCA template
- Database profile using DBCA template with data
- Snapshot database profile

Provide the following details to create the database profile as part of cloud setup using the Rapid Kit.

Table 53-9  XML Editing Guidelines to Create a Database Profile

<table>
<thead>
<tr>
<th>XML Input</th>
<th>Edit Guide Line</th>
</tr>
</thead>
<tbody>
<tr>
<td>Reference database details:</td>
<td>Specify following details for reference database used for creating the profile.</td>
</tr>
<tr>
<td>&lt;REFERENCE_DATABASE&gt;refdb&lt;/REFERENCE_DATABASE&gt;</td>
<td>Reference database target name from Enterprise Manager.</td>
</tr>
<tr>
<td>&lt;REF_NODE_SELECTED&gt;abc1.example.com&lt;/REF_NODE_SELECTED&gt;</td>

<tr>
<td>-----------</td>
<td>----------------</td>
</tr>
</tbody>
</table>
| `<snapshot>True</snapshot>` | Set to ‘True’ for Snapshot profile. Ensure the following before enabling the Snapshot option:  
  - The storage appliance is registered with Enterprise Manager  
  - Snap clone option is enabled for the Database used as reference  
  - Profile owner user (SSA_ADMIN) has access to the storage  
  - Storage credential and Agent credential used for storage monitoring have view permission for SSA_ADMIN user.  
  Note: To set the permission, follow the instructions below:  
  1. On the Enterprise Manager console, click **Setup**.  
  2. Click **Security** and then select **Named Credentials**.  
  3. Select the credential and then click **Manage Access**.  
  4. Click **Add Grant**.  
  5. Select SSA_ADMIN user and click **Select**.  
  6. Click **Save**. |
| `<rman>` | RMAN Image Profile inputs:  
  - `<enable>True</enable>`  
  - `<rmanImage>True</rmanImage>`  
  - `<RMANImageMode>ONLINE</RMANImageMode>`  
  - `<BackupLocation>/u01/sk</BackupLocation>`  
  - `<BackupFileTag>feb201402221143</BackupFileTag>`  
  - `<rman>` | Set enable flag to False.  
  Set rmanImage flag to True.  
  Provide a backup location and backup tag to identify the location for backup files.  
  Note: The rman tag will not be present if the profile is not created using rman backup. |
| Credentials: | Enter the credential names for Grid Credential, Reference database credentials and host credentials in `<CRED_NAME>:<CRED_OWNER_USER>` format  
  - `<REF_GI_CREDENTIALS>ORACLE_NORMAL:SSA_ADMIN</REF_GI_CREDENTIALS>`  
  - `<REF_DB_CREDENTIALS>DB_CREDENTIALS:SSA_ADMIN</REF_DB_CREDENTIALS>`  
  - `<REF_HOST_CREDENTIALS>ORACLE_NORMAL:SSA_ADMIN</REF_HOST_CREDENTIALS>`  
  - `<PROFILE_NAME>RAC dbm01 Profile</PROFILE_NAME>`  
  - `<PROFILE_DESC>Database provisioning profile</PROFILE_DESC>` | Enter the profile name and description.  
  Enter this profile name in the service template that consumes the profile. |
Edit the input xml to create single or multiple service templates. The following service templates can be created using the Rapid Start Kit:

- Service template using DBCA template profile
- Service template using DBCA template with data profile
- Service template using snapshot database profile

Provide following details to create the database service template.

Log in to Oracle Management Server url `https://omshost.example.com:7802/em© to submit the request for Pluggable Database.

53.9 Command Line Interface

This section describes step by step instructions for setting up the Cloud using Rapid Start Kit. Make sure all the targets are discovered in Enterprise Manager before starting with Cloud Setup Script.

53.9.1 Usage

-help option describes all the supported options.

Usage: emcli @database_cloud_setup.py [-exadata_target_name=<EM system target name>] [-dbaas|-pdbaas] [-cloud_boundary=<file name>] [-cloud_input=<file name>]

-pdbaas: This flag is used to setup Cloud for Pluggable Database as a Service.
-dbaas: This flag is used to setup Cloud for Database as service.
-cloud_input=<path to custom cloud input xml> [ Optional]
Cloud input XML defines Enterprise Manager entities created as part of Cloud Setup.
Default file config/dbaas_cloud_input.xml will be used for database setup
Default file config/pdbaas_cloud_input.xml will be used for pluggable database setup.
Use dbaas_cloud_custom_input.xml or pdbaas_cloud_custom_input.xml to perform an advanced cloud setup.
-cloud_boundary=<path to custom cloud boundary xml> [ Optional]
Cloud boundary XML defines scope for Zones, Pools and the Cloud Hosts.
Default file config/cloud_boundary.xml will be used.
Use cloud_custom_boundary.xml to perform an advanced cloud setup.
-exadata_target_name
Pass Exadata Machine Name from Enterprise Manager when setup is running from non-Exadata machine and cloud is set on Exadata machine. This will perform simple cloud setup.
-help: Displays Cloud Setup help
For example:
Setup Cloud on a Cluster Machine or a set of standalone hosts:
Run the script on a cluster node or any standalone Machine:
emcli @database_cloud_setup.py -pdbaas : Sets up Cloud for PDBaaS using list of container databases given in cloud_boundary.xml
emcli @database_cloud_setup.py -dbaas : Sets up Cloud for DBaaS using given list of hosts and oracle home given in cloud_boundary.xml
53.9.2 Database as a Service (DBaaS)

The following command can be used to setup DBaaS.

```
ORACLE_HOME/bin/emcli @database_cloud_setup.py -pdbaas -cloud_input=<Full path to cloud input xml> -cloud_boundary=<Full path to cloud boundary xml>
```

where the -pdbaas flag indicates that this is used set up Database as a Service.

The script retrieves the list of hosts and the location of the Oracle Home. Enter the following input when prompted by the Rapid Start Kit.

**Table 53-11  User Input Details**

<table>
<thead>
<tr>
<th>User Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Manager Host Name</td>
<td>Hostname</td>
</tr>
<tr>
<td>Enterprise Manager Port Number</td>
<td>Port number for the secure port.</td>
</tr>
<tr>
<td>Enterprise Manager User Name</td>
<td>Enter name of user with administration privileges (sysman).</td>
</tr>
<tr>
<td>Enterprise Manager User Password</td>
<td>Enter the password for the sysman user.</td>
</tr>
<tr>
<td>Password for the CLOUD_ADMIN user</td>
<td>This user is created by the kit. The default password is welcome1.</td>
</tr>
<tr>
<td>Credential verification.</td>
<td>Create the credentials when prompted by the kit.</td>
</tr>
</tbody>
</table>

If any of the cloud artifacts already exist in Enterprise Manager, the Rapid Setup Kit shows the message and does not create or modify it. The Cloud Setup script can be run again multiple times in case of any failure after fixing the issue. The kit creates the new artifacts and shows the message for already existing ones.

53.9.3 Pluggable Database as a Service (PDBaaS)

The following command can be used to set up PDBaaS.

```
ORACLE_HOME/bin/emcli @database_cloud_setup.py -pdbaas -exadata_target_name=<Exadata target name from EM>
```

```
ORACLE_HOME/bin/emcli @database_cloud_setup.py -pdbaas -cloud_input=<Full path to cloud input xml> -cloud_boundary=<Full path to cloud boundary xml>
```

where:

- the -pdbaas flag indicates that this sets up for Pluggable Database as Service

Enter the following input when prompted by the Rapid Setup Kit.
### Table 53-12  User Input Details

<table>
<thead>
<tr>
<th>User Input</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Enterprise Manager Host Name</td>
<td>Hostname</td>
</tr>
<tr>
<td>Enterprise Manager Port Number</td>
<td>Port number for the secure port.</td>
</tr>
<tr>
<td>Enterprise Manager User Name</td>
<td>Enter name of user with administration privileges (sysman).</td>
</tr>
<tr>
<td>Enterprise Manager User Password</td>
<td>Enter the password for the sysman user.</td>
</tr>
<tr>
<td>Password for the CLOUD_ADMIN user</td>
<td>This user is created by the kit. The default password is welcome1.</td>
</tr>
<tr>
<td>Credential verification</td>
<td>Create the credentials when prompted by the kit.</td>
</tr>
</tbody>
</table>

If any of the cloud artifacts already exist in Enterprise Manager, the Rapid Setup Kit shows the message and does not create or modify it. The Cloud Setup script can be run again multiple times in case of any failure after fixing the issue. The kit creates the new artifacts and shows the message for already existing ones.

### 53.9.4 Securing the Cloud Setup

The Rapid Setup Kit creates the Administrators as part of Cloud Setup. The kit allows the user to secure the cloud setup so that only authorized users can be given access to the selected functionality. If the user opts to secure the Cloud Setup, the passwords for the users created by the kit will automatically expire. Enterprise Manager allows resetting the password on first login by each user.

#### 53.9.4.1 Expire Default Passwords

The Rapid Start Kit will ask for confirmation and will expire the passwords for all the users that are part of input xml.

#### 53.9.5 Set New Passwords

Administrator should log in to Enterprise Manager as each user is created. Enterprise Manager will ask to set a new password on first login.

**Note:** If you want to re-run the kit after the passwords have been expired by Rapid Kit, new passwords must be set for CLOUD_ADMIN and SSA_ADMIN users before re-running the Rapid Kit and the new passwords must be used when prompted during the second run.
This chapter describes the EMCLI verbs used for Chargeback and Metering and provides details on verb names, descriptions, parameters and syntax. Examples of verb output and commands are also provided. This chapter contains the following sections:

- Performing UI Equivalent Chargeback Operations
- Using Custom Charge Items
- Examples of Custom Charge Item Verb Use
- Creating a Generic Entity Type
- Retrieving Metering Data from Enterprise Manager

### 54.1 Performing UI Equivalent Chargeback Operations

The section describes EMCLI verbs with which you can perform the same operations you can perform within the Chargeback user interface.

#### 54.1.1 list_chargeback_entity_types

Lists all entity types that Chargeback supports. You can optionally list all entity types and their respective usage mode, or all usage modes that a particular entity type supports.

**Syntax**

```
list_chargeback_entity_types
- [usage_mode]
- [entity_type="eType"]
```

**Parameters**

- **usage_mode**—(optional) displays all applicable usage modes for each entity type
- **entity_type**—(optional) displays all applicable usage modes for the specified entity type

**Examples**

```
list_chargeback_entity_types
```

<table>
<thead>
<tr>
<th>Entity Type</th>
<th>Entity Type Display Name</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle_database</td>
<td>Database Instance</td>
</tr>
<tr>
<td>host</td>
<td>Host</td>
</tr>
</tbody>
</table>

```
list_chargeback_entity_types -usage_mode
```

<table>
<thead>
<tr>
<th>Entity Type</th>
<th>Entity Type Display Name</th>
<th>Usage Mode</th>
</tr>
</thead>
<tbody>
<tr>
<td>oracle_database</td>
<td>Database Instance</td>
<td>dbMetered</td>
</tr>
<tr>
<td>oracle_database</td>
<td>Database Instance</td>
<td>dbByService</td>
</tr>
</tbody>
</table>
54.1.2 list_chargeback_entities

Lists all entities that have been added to Chargeback; that is, all entities of any type for which charges and metering are calculated.

**Syntax**

list_chargeback_entities

**Examples**

Output appears in tabular format and displays the following information for each added entity:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Entity Name</td>
<td>acme_db</td>
</tr>
<tr>
<td>Entity Guid</td>
<td>xrdbyy</td>
</tr>
<tr>
<td>Entity Type</td>
<td>oracle_database</td>
</tr>
<tr>
<td>Creation Date</td>
<td>2014-01-01 00.00.00.0</td>
</tr>
<tr>
<td>Parent Entity Name</td>
<td>No Parent</td>
</tr>
<tr>
<td>Parent Entity Type</td>
<td>Not Applicable</td>
</tr>
<tr>
<td>Cost Center Name</td>
<td>cc1</td>
</tr>
<tr>
<td>Charge Plan Name</td>
<td>cp1</td>
</tr>
</tbody>
</table>

54.1.3 add_chargeback_entity

Adds an entity instance of a given entity type to Chargeback with the specified usage mode.

**Syntax**

add_chargeback_entity
   -entity_name="eName"
   -entity_type="eType"
   -usage_mode="uMode"

**Parameters**

- entity_name—identifies an entity instance by name currently being monitored by Enterprise Manager that you want to add to Chargeback.
• entity_type—identifies the entity type of the instance being added.
• usage_mode—specifies the usage mode; that is, how the entity instance is to be metered. Use the list_chargeback_entity_types verb with the -entity_type option to see available usage modes.

Examples

add_chargeback_entity -entity_name="db1" -entity_type="oracle_database" -usage_mode="dbMetered"

Adds the entity db1 to Chargeback, metered by database instance.

54.1.4 remove_chargeback_entity

Removes an entity instance of a given entity type from Chargeback; that is, terminates Chargeback activity on the entity with the specified usage mode.

Syntax

remove_chargeback_entity
  -entity_name="eName"
  -entity_type="eType"
  -[entity_guid="entity guid"]

Parameters

• entity_name—identifies an entity instance by name that you want to remove from Chargeback.
• entity_type—identifies the entity type of the instance being removed.
• entity_guid—optional specifies the globally unique identifier by which the entity is known internally. When there are multiple entities of the same type with the same name, command output lists all such entities with additional details including GUID. Execute the command again, this time using entity_guid instead of the other parameters to correctly identify the intended entity.

Examples

remove_chargeback_entity -entity_name="db1" -entity_type="oracle_database"

Removes the Oracle database entity db1 from Chargeback.

54.1.5 list_charge_plans

Lists all charge plans currently in use in Chargeback. Optionally lists charge plans scheduled for use in the future. Can also optionally list current or future plans by entity type or charge plan details.

Syntax

list_charge_plans
  [-[entity_type="entity type" -[ all]]
  -[charge_plan="charge plan name" -[all]]
  -[ all]]
Parameters

- entity_type—lists all active charge plans for the specified entity type.
- charge_plan—lists details about a particular charge plan.
- all—lists all active and future charge plans in Chargeback, or for a specified entity type, or the details of all active and future versions of the specified charge plan.

Examples

Output appears in tabular format and displays the following information, depending on parameters specified:

<table>
<thead>
<tr>
<th>Column Name</th>
<th>Column Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Charge Plan Name</td>
<td>cp1</td>
</tr>
<tr>
<td>Entity Type</td>
<td>host</td>
</tr>
<tr>
<td>Description</td>
<td>Host flat rate plan</td>
</tr>
<tr>
<td>Start Date</td>
<td>2014-01-01 00.00.00.00</td>
</tr>
<tr>
<td>End Date</td>
<td>2014-02-01 00.00.00.00</td>
</tr>
</tbody>
</table>

54.1.6 assign_charge_plan

Assigns a specified charge plan to an entity of a particular type.

Syntax

assign_charge_plan
  -entity_name="eName"
  -entity_type="eType"
  -plan_name="pName"
  -[entity_guid="entity guid"]

Parameters

- entity_name—identifies the entity to which a plan is to be assigned.
- entity_type—identifies the entity type of the named entity. Charge plans are entity-type specific.
- plan_name—specifies the name of an existing charge plan to be assigned to the entity.
- entity_guid—(optional) specifies the globally unique identifier by which the entity is known internally. When there are multiple entities of the same type with the same name, command output lists all such entities with additional details including GUID. Execute the command again, this time using entity_guid instead of the other parameters to correctly identify the intended entity.

Examples

assign_charge_plan -entity_name="db1" -entity_type="oracle_database" -plan_name="plan1"
Assigns charge plan plan1 to database instance db1 of entity type Oracle Database.

54.1.7 unassign_charge_plan

Removes the charge plan assignment from the specified entity.

Syntax

unassign_charge_plan
   -entity_name="eName"
   -entity_type="eType"
   -[entity_guid="entity guid"]

Parameters

• entity_name—identifies the entity from which to remove the plan assignment.
• entity_type—identifies the entity type of the named entity.
• entity_guid—(optional) specifies the globally unique identifier by which the entity is known internally. When there are multiple entities of the same type with the same name, command output lists all such entities with additional details including GUID. Execute the command again, this time using entity_guid instead of the other parameters to correctly identify the intended entity.

Examples

unassign_charge_plan -entity_name="db1" -entity_type="oracle_database" -plan_name="plan1"

Removes the charge plan assignment from database instance db1 of entity type Oracle Database.

54.1.8 list_cost_centers

Lists all cost centers known to Chargeback or cost centers in various hierarchical displays.

Syntax

list_cost_centers
   -[cost_center_name=cName]
   -[parent]
   -[children]
   -[top]
   -[leaf]

Parameters

• cost_center_name—identifies a specific cost center for which other options can be specified.
• parent—displays the cost center parent of the specified cost center.
• children—lists all children cost centers of the specified cost center.
• top—displays ancestor cost centers of the specified cost center.
• displays leaf node cost centers of the specified cost center.
Examples

list_cost_centers

<table>
<thead>
<tr>
<th>Cost Center Name</th>
<th>Parent Node</th>
<th>Number</th>
</tr>
</thead>
<tbody>
<tr>
<td>cc1</td>
<td></td>
<td>[2,4,0,0]</td>
</tr>
<tr>
<td>cc11</td>
<td>cc1</td>
<td>[2,2,0,0]</td>
</tr>
<tr>
<td>cc12</td>
<td>cc1</td>
<td>[0,0,0,0]</td>
</tr>
<tr>
<td>cc111</td>
<td>cc11</td>
<td>[0,0,0,0]</td>
</tr>
<tr>
<td>cc112</td>
<td>cc11</td>
<td>[0,0,0,0]</td>
</tr>
</tbody>
</table>

The number column represents number of immediate child cost centers, total child cost centers, number of immediate users, total users, reading left to right.

With the above example as a basis, list_cost_centers verb options appear as follows:

list_cost_centers -cost_center_name="cc11" -parent

Parent Node
cc1

list_cost_centers -cost_center_name="cc1" -children

Children Nodes
cc11
cc12

list_cost_centers -cost_center_name="cc111" -top

Hierarchy
[cc1]----->[cc11]----->[cc111]

list_cost_centers -cost_center_name="cc1" -leaf

Leaf Nodes
cc111
cc112
cc12

54.1.9 assign_cost_center

Assigns a specified cost center to an entity of a particular type.

Syntax

assign_cost_center
    -entity_name="eName"
    -entity_type="eType"
    -cost_center_name="cName"
    -[entity_guid="entity guid"]

Parameters

- entity_name--identifies the entity to which a cost center is to be assigned.
- entity_type--identifies the entity type of the named entity.
- cost_center_name--specifies the name of an existing cost center to be assigned to the entity.
• entity_guid—(optional) specifies the globally unique identifier by which the entity is known internally. When there are multiple entities of the same type with the same name, command output lists all such entities with additional details including GUID. Execute the command again, this time using entity_guid instead of the other parameters to correctly identify the intended entity.

Examples

assign_cost_center_plan -entity_name="db1" -entity_type="oracle_database" -cost_center_name="cc1"

Assigns cost center cc1 to database instance db1 of entity type Oracle Database.

54.1.10 unassign_cost_center_plan

Removes the cost center assignment from the specified entity.

Syntax

unassign_cost_center_plan
   -entity_name="eName"
   -entity_type="eType"
   -[entity_guid="entity guid"]

Parameters

• entity_name—identifies the entity from which to remove the cost center assignment.
• entity_type—identifies the entity type of the named entity.
• entity_guid—(optional) specifies the globally unique identifier by which the entity is known internally. When there are multiple entities of the same type with the same name, command output lists all such entities with additional details including GUID. Execute the command again, this time using entity_guid instead of the other parameters to correctly identify the intended entity.

Examples

unassign_cost_center_plan -entity_name="db1" -entity_type="oracle_database" -plan_name="plan1"

Removes the cost center assignment from database instance db1 of entity type Oracle Database.

54.2 Using Custom Charge Items

The following sections provide some sample commands along with descriptions and examples. These verbs are used in the following circumstances:

• You would like to meter/charge based on the metric extension/custom configuration that you have defined. Custom charge items can also be used for out of box metrics and target properties. Note that Chargeback only supports metric extensions without key columns.
• These custom charge items, when created in Chargeback, allow you to meter or charge for the custom item like any existing charge items that are shipped along
with a plug-in, such as CPU Utilization. Note that the EM_CBA_ADMIN role is required to access these verbs.

54.2.1 list_charge_item_candidates

Lists the items that can be registered to Chargeback.

**Syntax**

```
emcli list_charge_item_candidates
-target_type=<target type>
-source_data_type=<metric|config|property>
-target_name=<target name>
-config_name=<config name>
-config_data_source=<target name>
-all
```

**Parameters**

- **target_type**—(required) name of target type. Supported target types include: `oracle_database`, `oracle_vm_guest`, `host`, `oracle_pdb`, and `weblogic_j2eeserver`.
- **source_data_type**—valid values are `metric`, `config`, and `property`.
- **target_name**—if specified, metering and charge data are retrieved only for the named target. If you do not specify a valid target name, or if the specified target has not been enabled in the given date range, then no data is generated. If this parameter is not specified, All targets for the specified target-type are included.
- **config_name**—required if `source_data_type=config`.
- **config_data_source**—data source of the configuration. Required if `source_data_type=config`.
- **all**—displays all items, including out of box metrics of target type. Without this option, only user-defined metric extensions, and configuration extensions are displayed.

**Examples**

```
emcli list_charge_item_candidates -target_type="oracle_database" -source_data_type="metric"
```

```
emcli list_charge_item_candidates -target_type="oracle_database" -source_data_type="config" -target_name="myDatabase" -config_name="myCustomCCS" -config_data_source="ccsfile"
```

54.2.2 create_charge_item

Creates a charge item for Chargeback.

**Syntax**

```
emcli create_charge_item -input_file="property_file:<full path of property file>"
```

**Parameters**

The option [-input_file] is the full path of a file that contains the item properties. The following properties can be defined in the file:
• target_type–(required) specifies the target type. Supported target types include: oracle_database, oracle_vm_guest, host, oracle_pdb, and weblogic_j2eeserver.

• source_data_type–(required) specifies the source data type. Valid values are metric, config, and property.

• item_name–(required) specifies the name of the item.

• metric_group–metric group name as listed in list_item_candidates. This is a required property if source_data_type=metric.

• metric_column–metric column name as listed in list_item_candidates. Required property if source_data_type=metric.

• config_view–config view name as listed in list_item_candidates. Required property if source_data_type=config.

• config_key–config key name as listed in list_item_candidates. Required property if source_data_type=config.

• config_column–config column name as listed in list_item_candidates. Required property if source_data_type=config.

• config_data_source–data source of configuration metric. Required property if source_data_type=config.

• property–property name as listed in list_item_candidates. Required property if source_data_type=property.

• item_displayname–(required) item display name.

• unit–unit display name.

• aggregation_type–type of aggregation to use for this item. Applicable only if data type=number. Valid values are sum and avg. Default value is avg.

• is_config_condition–Is the item used conditionally in a charge plan. Valid values are 0, 1. Default value is 0.

• item_category–category of item. Default value is instance. Valid values are cpu, storage, memory, network, and instance.

• data_type–data type. Default value is number. Valid values are string and number.

Examples

emcli create_charge_item -input_file="property_file:/home/user/property_file"
Contents of /home/user/property_file:
  target_type=host
  source_data_type=metric
  item_name=total_proc
  metric_group=Load
  metric_column=noOfProcs
  item_displayname=Total Processes
  unit=process
  aggregation_type=avg
  item_category=instance
  data_type=number

emcli create_charge_item -input_file="property_file:/home/user/property_file"
Contents of /home/user/property_file:
  target_type=oracle_database
  source_data_type=config
  item_name=custom_config
  config_view=myCustomCCS
54.2.3 delete\_charge\_item

Deletes the custom charge item from Chargeback.

Syntax

```
emcli delete_charge_item -target_type=<target type> -item_name=<Item name>
```

Parameters

- **target\_type**—(required) specifies the target type associated with the custom charge item. Supported target types for this release include oracle\_database, oracle\_vm\_guest, host, oracle\_pdb, and weblogic\_j2eeserver.
- **item\_name**—(required) name of the custom charge item to be deleted.

Examples

```
emcli delete_charge_item -target_type="oracle\_database" -item_name="SampleMetricExtension"
```

```
emcli delete_charge_item -target_type="host" -item_name="SampleCustomConfig"
```

54.3 Examples of Custom Charge Item Verb Use

The following sections provide end-to-end examples in the correct use of Custom Charge Item verbs for custom configurations.

54.3.1 Metric Extension (PGA)

In this example, a metric extension "PGA" with a metric column named "PGA Memory" is created for a database instance target to collect PGA size.

**Figure 54-1    PGA Memory**
1. Log in to EMCLI and use the Chargeback EMCLI verb `list_charge_item_candidates` to list the items that can be registered to Chargeback.

![Figure 54-2 list_charge_item_candidates](image)

2. Create a property file `prop_file` to generate the custom charge item for the PGA Memory metric column.

For this metric, the charge rate will be based on the average value over a number of samples, with aggregation_type is set to “avg”.

![Figure 54-3 Set aggregation_type](image)

3. Create custom item in Chargeback using `create_charge_item` EMCLI verb.

![Figure 54-4 Create custom item](image)

4. After the custom charge item is created, open the Enterprise Manager Cloud Control user interface.
5. Navigate to the Charge Plans page. Click **Create** and select **Plan**.

6. Click **Add** under Entity Types and select the entity type for the chargeback.

7. Click **Add Item** and select the new custom item from the **Item Name** drop-down box. Rates can be set against custom items similar to those set for out-of-box charge items.

**Figure 54-5  Create Plan: Custom Plan**

As the aggregation_type is set to "avg", the charge rate is related to a time period (for example, per GB per time period).

### 54.3.2 Metric Extension (Application A Orders)

A metric extension named “Application A Orders” with a metric column called “Orders Processed” is created for a database instance target. This metric collects the number of orders processed by Application A.
1. Log in to EMCLI and use the Chargeback EMCLI verb `list_charge_item_candidates` to list the items that can be registered to Chargeback.

2. Create a property file `prop_file2` to generate a custom charge item for the “Orders Processed” metric column.

   For this metric, the charge rate will be based on total number of orders processed, with aggregation_type set to “sum”.

---

**Figure 54-6** Metric Extensions

**Figure 54-7** `list_charge_item_candidates`
3. Create a custom item in Chargeback using the `create_charge_item` EMCLI verb.

4. After the custom charge item is created, open the Enterprise Manager Cloud Control user interface.

5. Navigate to the Charge Plans page. Click **Create** and select **Plan**.

6. Click **Add** under Entity Types and select the entity type for the chargeback.

7. Click **Add Item** and select the new custom item from the **Item Name** drop-down box. Rates can be set against custom items similar to those set for out-of-box charge items.
As the aggregation_type is set to “sum”, the charge rate does not depend upon time periods but rather on the total value of “Orders Processed”.

8. Add the database target to Chargeback and assign the “Custom Plan”.

9. Following the daily ETL run, the charge/usage is calculated against new custom items. The charge/usage of custom items can be viewed from the Chargeback report page.
54.3.3 Configuration Extensions

A configuration extension named “Config Extensions” is created for the database instance target. This collects the number of high available tablespaces and the name of each high available tablespace as shown below. In this example, the high available tablespaces value is used as the basis of the new custom charge item.

1. Log in to EMCLI and use the Chargeback EMCLI verb `list_charge_item_candidates` to list the configuration items that can be registered to Chargeback. Note that config_name is the name of the configuration extension shown on the UI (“Config Extensions” in this case). Similarly, config_data_source is the name of the config column shown on the UI (in this case “tmp/dbconfig.xml”).

2. Create a property file `prop_file1` to generate a custom charge item for the “Number of High Available Tablespaces” metric column.

Note that the config_key value comes from the output of the “Custom Config Key” column in the output of the `list_charge_item_candidates` verb described previously. Similarly, the value of the config_view should be the value of “Custom Config Name” above.
3. Create a custom item in Chargeback using the `create_charge_item` EMCLI verb.

4. After the custom charge item is created, open the Enterprise Manager Cloud Control user interface.

5. Navigate to the Charge Plans page. Click **Create** and select **Plan**.

6. Click **Add** under Entity Types and select the entity type for the chargeback.

7. Click **Add Item** and select the new custom item from the **Item Name** drop-down box. Rates can be set against custom items similar to those set for out-of-box charge items.
8. Add the database target to Chargeback and assign the “Custom Plan”.

9. After the daily ETL run, the charge/usage is calculated against new custom items. The charge/usage of custom items can be viewed from the Chargeback report page.

54.4 Creating a Generic Entity Type

Enterprise Manager supports an almost limitless number of target types. Only a relatively small number have out-of-box Chargeback support. You can, however, create a custom entity type for an Enterprise Manager target type for which there is no current Chargeback support. There is a one-to-one correspondence of custom entity type to Enterprise Manager target type.

Use the EM CLI verb emcli `add_custom_cb_entity_type` to identify the custom entity type in terms of an existing target type.
Syntax

```
add_custom_cb_entity_type -target_type=target_type
```

Where `target_type` is a known Enterprise Manager target type for which there is no current Chargeback support; for example, Oracle Apache.

After creating the custom entity type, customize charge items appropriate to the new entity type, following the process described in **Using Custom Charge Items**.

**Charge Item Properties**

For example, you might create a custom charge item based on an input property file named `properties_oracle_apache` where the properties are as follows:

```
target_type=oracle_apache
source_data_type=metric
item_name=active_sessions
metric_group=ohs_server
metric_column=sessions.active
item_displayname=Active Sessions
unit=sessions
aggregation_type=avg
item_category=instance
data_type=number
```

The custom charge item is based on the average number of active sessions.

**Implementation**

Now proceed as follows:

1. Create a charge plan for the Oracle Apache entity type that includes the active sessions customized charge item.
2. Add the Oracle Apache entity type to Chargeback using the Add wizard in the application, as you would for any entity type. The Oracle Apache entity type is available in Target Selector dialog.
3. Assign the charge plan you created in Step 1 to the Oracle Apache entity type.
4. Optional. Assign a cost center to the Oracle Apache entity type.
5. Using the reporting feature to view metering and charge data related to the Oracle Apache entity type.

**54.5 Retrieving Metering Data from Enterprise Manager**

The Chargeback REST APIs can be used to integrate Enterprise Manager with Billing and Revenue Management systems (including Oracle BRM). They also provide flexible Chargeback mechanisms. Some examples include:

- Integration with a billing system with different rate plans for small, medium, and large configurations.
- To calculate Chargeback for a flexible time period. For example, months starting from 15th and ending on the 15th.
- To rationalize Chargeback based on other attributes that are not captured by Enterprise Manager.
To adjust or round up Chargeback based on usage. For example charge is calculated for the full-day even if the usage is for the partial day.

54.5.1 get_metering_data

Retrieves Chargeback metering data in the form of comma-separated output with each row or line containing usage (and optionally charge) information for the specified parameters.

Syntax

```
emcli get_metering_data
[-start_date=<start date in mmddyyyy> [-end_date=<end_date in mmddyyyy>]]
[-target_type=<target type> [-target_name=<target name>]]
[-cost_center=<cost center name>]
[-charge]
```

Parameters

All parameters of this verb are optional.

- **start_date**—specifies the start date in mmddyyyy format by which to filter data retrieval, commencing at midnight. Default is the start date of the current report cycle.
- **end_date**—specifies the end date in mmddyyyy format by which to filter data retrieval, terminating at midnight. Default is the end date of the current report cycle.
- **target_type**—specifies the target types by which to filter data retrieval, provided targets of the specified types have been configured for Chargeback within the specified date range. Default is to retrieve data for all targets of all target types that have been configured for Chargeback within the specified date range.
- **target_name**—retrieves metering and charge data only for the named target of the specified target type. If the target name is invalid or has not been configured for the specified date range, no data retrieval occurs. The default retrieves data for all targets of the specified target type.
- **cost_center**—specifies a cost center name as it appears on the Cost Center tab in Chargeback. Retrieves appropriate metering and charge data provided the cost center name is valid as of the specified date range. Default value is the logged-in user. To retrieve metering and charge data for all cost centers, specify “All Users” (in quotes). Each user is also a consumer (cost center) in Chargeback. The logged-in user’s privileges determine metering and charge data retrieved across different targets.
- **charge**—retrieves both metering and charge data. Default retrieves only metering data.
Note:

The privileges required to view target information in Chargeback are:

- **VIEW_CAT_TARGET**: Allows you to view information for a specific target (active or inactive).
- **VIEW_ANY_CAT_TARGET**: Allows you to view information for any Chargeback target (active or inactive).

54.5.2 Data Retrieval Output

This `get_metering_data` verb generates the following output:

- **CONSUMER_NAME**: Name of the cost-center.
- **TARGET_TYPE**: Type of target.
- **TARGET_NAME**: Name of the target.
- **ITEM_TYPE**: Type of the item or metric. Possible values are: `config`, `fixed`, `metric`, `property`, and `usage`.
- **CATEGORY_NAME**: Possible values are: `cpu`, `memory`, `storage`, `activity`, `instance`, `network`, `service`, and `software`.
- **ENTITY_NAME**: Name of the shared entity (valid when the target is enabled in Chargeback in shared mode).
- **ITEM_DISPLAY_NAME**: Display name of the item or metric (in English language). **Note**: Translation support is currently not available.
- **VALUE_AVERAGE**: Average value for the metric on the given date (valid for numeric metrics).
- **STRING_VALUE**: Value for the metric data (valid for string-based metrics).
- **DATA_TYPE**: Data type of the metric. This can be `string` or `number`.
- **UNIT**: Unit of the metric data (for example, req and GB).
- **COLLECTION_DATE**: Date on which the data is collected from the Enterprise Manager metric or configuration tables.
- **PLAN_NAME**: Name of the Charge Plan associated with the particular target.
- **CHARGE**: Charge value for the specific metric of the target on the particular date.
- **DEFINED_RATE**: Charge rate defined in the charge plan associated with the target.
- **RATE_TYPE**: Type of the rate. Possible values are: **No value (blank)**, `Flat`, `config`, and `usage`.
- **RATE_FACTOR**: Adjustment rate for universal metrics, as defined in the associated extended Chargeplan.
- **CHARGE_RATE_UNIT**: Unit, corresponding to the metric or item, as defined in the Charge Plan for the specific rate. For example, for an item or metric named `CPU Utilization (%)` or `CPU Utilization (%) per service`, the value will be "CPU". For a metric or item named `Base Charge`, the value will be "instance", a metric
named ‘User Requests’, the value will be “req”). If the rate defined in Chargeplan is $1 per MB per day, the value for this column will be “MB”.

• CHARGE_TIME_UNIT: Time unit as defined in the Charge Plan for the specific rate. (such as, hourly, daily, weekly, monthly, yearly). For example, if the rate defined in Charge Plan is $1 per MB per Day, value for this column will be daily.

Example: Sample Output

"CONSUMER_NAME","TARGET_TYPE","TARGET_NAME","ITEM_TYPE","CATEGORY_NAME","ENTITY_NAME","ITEM_DISPLAY_NAME","STRING_VALUE","PLAN_NAME","COLLECTION_DATE","CHARGE","VALUE_AVERAGE","DEFINED_RATE","RATE_TYPE","RATE_FACTOR","CHARGE_RATE_UNIT","CHARGE_TIME_UNIT","NORMALIZE_RATE","ADJUST_RATE","DATA_TYPE","UNIT"

54.5.3 get_metering_data Examples

Following are examples of verb usage:

• emcli get_metering_data: Returns metering information for all targets (active or enabled in Chargeback) for the current report cycle for the logged in user.

• emcli get_metering_data -charge: Returns metering and charge information for all targets (active or enabled in Chargeback) for the current report cycle for the logged in user.

• emcli get_metering_data -start_date=01202011-cost_center=ORG1: Returns metering information for all targets (active or enabled in Chargeback) starting from 20th January 2011 until the end of the month for the ORG1 cost-center.

• emcli get_metering_data -start_date=01152011 -end_date=02152011 -target_type=oracle_database: Returns metering information for all Oracle DB targets (active or enabled in Chargeback) that are owned by the logged in user, starting from 15th January 2011 until the 15th February 2011.

• emcli get_metering_data -target_type=host target_name=my_host -cost_center=organization1: Returns metering and charge information for "my_host" target (of type host) for the current report cycle for "organization1" cost-center.

• emcli get_metering_data -cost_center="All Users": Returns metering and charge information for all targets (active or enabled in Chargeback) in the current report cycle for all cost centers.
• Log in as cba_admin_user (who is the Chargeback Administrator) and enter the following commands:
  – `emcli get_metering_data`: Returns metering information for all targets (active or enabled in Chargeback) for the current report cycle for the cba_admin_user.
  – `emcli get_metering_data -cost_center=ssa_user1`: Returns metering information for all targets (active or enabled in Chargeback) that are owned by the ssa_user1 in the cost center in the current report cycle.

• If the value specified for the cost center, target type, and/or target name is incorrect, no data is generated. For example, the following commands will not generate data:
  – `emcli get_metering_data -target_type=unknown`
  – `emcli get_metering_data -target_type=oracle_database -target_name=unknown_target`

  **Note:** There is no target with the name `unknown_target` configured in Enterprise Manager.
Introduction to Blueprints

This chapter introduces the cloud blueprints (referred to as blueprints in this chapter) for the Oracle Private Cloud and describes how to use them and create your own blueprints. It contains the following sections:

- Introduction to Blueprints
- Uses of the Blueprint
- Enterprise Manager Cloud Concepts
- Blueprint Concepts
- Deploying a Blueprint
- Blueprint Deployment Processing
- Blueprint Examples
- Conclusion

55.1 Introduction to Blueprints

Blueprints are used to describe a desired set of inter-related cloud resources. Like architectural blueprints, they describe what you want including how they are configured to interact with each other, but not how to build them. For instance, a blueprint does not describe the order in which to create the components. Rather, the blueprint orchestration logic figures that out based on inter-resource dependencies.

As an example, suppose you want to create a set of interacting cloud resources such as a WebLogic server instance, an application, and a database. To do so, you must first create the database and WebLogic server instance, deploy the application, and create a JEE datasource that is to be used by the WebLogic server to connect to the database.

You could perform all these operations manually, through the Enterprise Manager Cloud Self Service Portal. You would request creation of the WebLogic server and database and wait for either to complete. Periodically, you would check the status of the creation requests. Once the WebLogic server is created, you could deploy the application. When both the WebLogic server and database are created, you could create the JEE datasource.

Alternatively, you can use a blueprint that describes the four cloud resources to automate the process. To do so, you request instantiation of the blueprint and provide any input parameter values required by the blueprint. The blueprint initiates the creation of the resources and monitors the creation process to ensure that the dependent resources are automatically created as soon as the required resources are created.

The rest of this chapter introduces the blueprint concepts including how to deploy an existing blueprint as well as how to write your own. You can also refer to the Cloud Blueprints and Blueprint Reference for more details on blueprints.
55.2 Uses of the Blueprint

A blueprint can be used to automate the creation of service instances. An EM_SSA_USER can use blueprints for various reasons:

- To create an application composed of several service instances and related cloud resources.
- To create such sets of instances several times.
- To facilitate instance creation for other EM_SSA_USERS.
- To eliminate the manual interactive steps that would otherwise be needed to create the set of instances.
- To create a textual representation that can be reviewed and modified by other users.

To summarize, blueprints allow you to automate the creation of a set of service instances.

For example, the Quality Assurance team in an enterprise needs to allocate and release resources required to test a Web application. Instead of manually creating the service instances using the Enterprise Manager Cloud Self Service application, a blueprint can be used to perform this task. One person authors a blueprint so that all QA engineers can simply invoke the blueprint and enter a few input parameter values, after which the resources are created. Each user can watch as the blueprint processor displays the status for creation of each resource.

Another example illustrates the use of a blueprint to address simplicity and consistency concerns. An IT shop has a service template that accepts 8 input parameters. For a specific group of users, the same set of values should be used for 6 of those 8 parameters. A simple blueprint accepts 2 parameters and uses the template to instantiate the instances with the other 6 parameters consistently defined.

55.3 Enterprise Manager Cloud Concepts

The concepts described in this section are Enterprise Manager cloud concepts. They are not introduced as part of blueprints but are concepts used by blueprints. Since they form the basis for blueprints, they are summarized below.

- **Oracle Cloud API**: The Oracle Cloud API (see Introduction to Cloud APIs) defines a RESTful programming interface to consumers of IaaS, MWaaS, and DBaaS based on Oracle's solution stack. It is the Oracle Cloud API that the blueprint processor uses to create cloud resources based on what's specified by the blueprint.

- **Oracle Cloud Resource Model**: The Oracle Cloud Resource Model (see Cloud Resource Models) details the types of resources one can manipulate via the Oracle Cloud API and, for each type, both its attributes and the operations that can be performed on instances of a resource type.

- **Cloud Resource Types and Attributes**: The cloud resource model specifies a set of attributes that are common to all cloud resources, such as uri (its URI) and resource_status (with values such as READY and CREATING). The model also defines a set of cloud resource types and their attributes. Some resource types discussed later in this document are:
– **DbPlatformInstance**: A database platform instance is created using a template. It has attributes such as zone (location for DBaaS instance) and params (to specify username and password).

– **JavaPlatformInstance**: A JEE server instance is also created using a template. Similar to DbPlatformInstance, a JavaPlatformInstance has attributes like zone. An example of a MWaaS-specific attribute is `application_instance_deployments`, that identifies all applications deployed to the instance.

– **ApplicationInstanceDeployment**: A resource type that represents an application deployment to a JavaPlatformInstance.

– **Datasource**: A resource type that represents a datasource of a JavaPlatformInstance. It is contained in a JavaPlatformInstance and refers to a Databasenstance.

• **Resource Containment**: A cloud resource can contain other resources. For instance, a Datasource of a JavaPlatformInstance is contained in the JavaPlatformInstance, and a template contains all service instances that were created using that template.

Every resource you create will be contained in a parent cloud resource. As part each resource definition in your blueprints, you will identify the resource’s container.

### 55.4 Blueprint Concepts

A blueprint generally describes one or more cloud resources to be created. A user deploys a blueprint to create the resources described by the blueprint, at which time he provides any input parameter values used by the blueprint. To create each resource, the blueprint specifies its attribute values, which may be hard-coded, come from blueprint input parameters, or gleaned from other resources. In instantiating all the resources, the blueprint system determines the resource dependencies and uses this to order the resource creation and/or configuration required to properly create the instances described by a blueprint.

• **Input Parameters**: A blueprint can define input parameters. Each parameter definition specifies a name, datatype and optional specifications such as default value. A user who deploys a blueprint must specify the value for all parameters not having a default.

• **Resource**: A blueprint resource defines how to construct a cloud resource. It specifies a set of attributes and the parent cloud resource that is to contain the newly created resource. Each resource in a blueprint also has a name, which must be unique within a blueprint.

• **Outputs**: If outputs are specified, the specified values are displayed when blueprint deployment completes. Output parameters can be used to display information derived during deployment such as to inform the end user of the URL of a JEE application deployment.

• **Intrinsic Functions**: The blueprint language includes a set of predefined functions, illustrated below.

• **Named Literals**: As a programming convenience, blueprints can include a Data section. This is commonly used to specify symbolic names for literal values.

• **Dependencies**: Blueprint deployment is done by creating resources in parallel when possible, but a resource that depends on another resource can’t be created
until the latter resource is created. Such dependencies are often implicit, but blueprint processing identifies dependencies and orchestrates the overall steps.

55.5 Deploying a Blueprint

Prerequisites:

- You have the blueprint file.
- You must have installed the blueprint processor software.

A blueprint file is a text file in which the author has used the blueprint language to describe what is required. You deploy the blueprint by running the blueprint processor. For instance, on Windows you would use a command as follows:

```
bp_processor.py myfile.yml -u myname -c https://myhost/em/cloud
```

In this example, the `-u` option specifies the Enterprise Manager user id. If the password is not specified here, you are prompted for it when you execute the blueprint file. The `-c` option is used to specify the cloud URL. There are numerous other command line options. To view a description of supported options, enter

```
bp_processor.py deploy -h
```

55.6 Blueprint Deployment Processing

When a blueprint is deployed, the runtime logic processes the input parameters and orchestrates the creation of resources, doing so in parallel when possible. It also monitors progress and keeps the user informed. The output you see will depend on the blueprint and your environment. The example below shows the use of a blueprint that deploys a Weblogic server, application, database, and JEE Datasource. The output from running this blueprint should give you a sense for the blueprint processing steps.

```
C:\Users\myname\Dropbox\Code\blueprints>bp_processor.py xyzApp.yml -c https://... -g deployment_report
...
Cloud user id: ssa_user1
Password:
```

The command you entered above specifies the cloud URL (via the `-c` option) and a directory into which to place the optional deployment report (the `-g` option). You then entered the credentials as prompted to proceed.

```
Blueprint Processor - Invocation Summary
-------------------------------
Cloud URI:                https://...
User:                     ssa_user1
Blueprint file:           xyzApp.yml
Timeout:                  90 minutes, 0 seconds
Refresh frequency:        15 seconds
Inputs:
Pause points:             (none)
Debug logging:            False
Instance name:            default_instance_name
Graphical report dir:     deployment_report
Versions:
```
Note: Most of the information in the Invocation Summary reflects default values used because you have not specified the corresponding options.

Because the blueprint you are using defines input parameters, you are then prompted to provide values:

Input Parameter Value Entry
-------------------------------------
Zone to use for db (Zone1):
Password to use for db (welcome1):

In this example, you pressed Enter to accept the default value for zone, Zone1 and then entered a password.

Once all the necessary information has been provided, the blueprint processor starts creating the resources and monitoring the progress. This is depicted in a "vertical timeline" so you can observe the progress. Each resource to be created is represented by a column. As the state transitions for each resource occur, they are noted in the corresponding column of the vertical timeline.

First, the list of all possible states, with their abbreviations, is printed. The states reflect the processing phases and the outcome of each phase.

To process any resource definition, the first step is to evaluate the expressions of the definition that describe the resource (State Key: e). In some cases, evaluation must be delayed (State Key: ep). Once fully evaluated, a creation request is made (State Key: c) and the processing for that resource is successfully completed (State Key: CS). After the State Key is printed, the resource creation timeline appears:
You can see that the timeline is vertical and the four resources are MyApp, MyDB, MyDS, and MyWebServer.

The MyWebServer resource definition is evaluated (state key: e) first. When this is successful, the creation process begins (state key: c). Parallely, the MyDB resource is evaluated and the creation process is initiated. Then the MyDS resource is evaluated and the blueprint processor determines that the evaluation cannot be completed until the MyWebServer resource is created. The same process is applicable to the MyApp resource. When the MyDB and MyWebServer resources are successfully created (state key: CS), the creation process for MyApp and MyDS resources can proceed.

Next, the Outputs section of our example blueprint is processed:

In the example above, you can see that the blueprint specifies one output value named “URL” and a value is represented with https://….

When all the resources have been successfully created, the blueprint processor summarizes the results. This includes the processing summary for each requested resource as well as the timing information for each resource and the overall run:
55.7 Blueprint Examples

This section illustrates the use of the blueprint concepts and syntax by guiding the reader through progressively more complex examples of blueprints. If you do not plan to author any blueprints, you can skip this section.

55.7.1 Blueprint Structure and Basics

A cloud blueprint specifies a set of desired cloud resources and represents these resources via a text file. Blueprints leverage a standard for easily readable data-structured text called YAML.
YAML is a standard notation, like XML and JSON. As with JSON, YAML is used to represent information via lists, dictionaries, and nesting. These concepts are sufficient to capture all blueprint semantics.

55.7.1.1 Simple Blueprint

A blueprint is a document that you can think of as containing sections. The simplest useful blueprint specifies only the Resources section and a single resource. In this example, the resource is a database defined by a template.

Resources
MyDB:
   Type: application/oracle.com.cloud.common.DbPlatformInstance+json
   Container: ... (refers to db template)
   Properties: ... (provides properties of db)

The above blueprint defines one blueprint resource named MyDB. The Type entry specifies the media type for ‘database’ as defined by the Cloud Resource Model API. The Container entry identifies the parent cloud resource to contain the newly created object. (Per Cloud Resource Models, all cloud resources are created by adding them to existing containers). Being a database service instance, it will be created via the database template used to create the service. How to specify the container will be shown later, so we just use ellipses here. Similarly, the data required by that template is specified in the Properties entry and shown later. Now let us add an ‘Inputs’ section...

Inputs:
DbZone:
   Type: String
   DefaultValue: Zone1
   Prompt: Zone to use for db
DbPassword:
   Type: String
   DefaultValue: welcome1
   Prompt: Password to use for db
   Sensitive: True
Resources:
MyDB:
   Container: ...
   Properties: ...

When the user requests deployment of this blueprint, he provides a value for the DbZone parameter or takes the default specified by the blueprint (Zone1). The value of user provided input parameters can be used by other parts of the blueprint, in particular to provide attribute values needed to create resources. More on this later.

55.7.1.2 Simple Resource: Database Service Instance

In a blueprint, one uses blueprint resources to describe the cloud resources to create. For each blueprint resource, the information required by the Cloud Resource Model is provided.

The following blueprint specifies a single resource to create a database service instance:

MyDB:
   Type: application/oracle.com.cloud.common.DbPlatformInstance+json
   Container: ...
Properties:
  zone: ...
  name: jbName
  params:
    username: app_user
    password: change_me

Each resource definition in a blueprint specifies a name, a Container into which to add the resource, and Properties used to specify the characteristics of what to create. In this case:

- The **name** of the blueprint resource definition is MyDB. The name is used in the scope of a blueprint, e.g. to inform the user deploying a blueprint about progress for each resource. In more complex cases, we will see that the name can be referenced elsewhere within a blueprint.

- The **Container** entry specifies the URI of the container to which the new resource will be added. To create a database service instance, we identify the service template that corresponds to the kind of database we want. (We'll see how to do that when we introduce the topic of intrinsic functions.)

- The **Properties** entry specifies values needed to create the resource. In this case, the model requires that we specify zone, name, and params properties. These specify the zone in which the instance is to be created, its name, and a list of name/value pairs required by the selected template.

### 55.7.1.3 Intrinsic Functions

To operate on data, blueprints support the use of intrinsic functions. All function names begin with “f_” and are invoked with a list of arguments. Continuing the above example, we use two intrinsic functions, to return the URI of the desired container and the desired zone.

Resources:

**MyDB:**
- Type: application/oracle.com.cloud.common.DbPlatformInstance+json
- Container:
  - f_getTemplateURI:
    - Small Database Service Template_automation_VIMAL_si
    - dbaas
- Properties:
  - zone:
    - f_getZoneURI: ...
  - name: jbName
  - params:
    - username: app_user
    - password: ...

As you can see, the *f_getTemplateURI* function takes 2 arguments, the name of the template and its service type. The current supported service types are: dbaas, jaas, and iaas (Database-, Java-, and Infrastructure-as-a-Service). The *f_getZoneURI* is analogous to the *f_getTemplateURI* but for zones. Other intrinsic functions will be introduced below. The full set of functions is described in Cloud Blueprints and Blueprint Reference.
55.7.1.4 Simple Resource with Parameter

To the above example blueprint, we now add the use of 2 parameters. By doing so, the user who deploys the blueprint, can specify which zone and password to use.

Inputs:
DbZone:
  Type: String
  DefaultValue: Zone1
  Prompt: Zone to use for db
DbPassword:
  Type: String
  DefaultValue: welcome1
  Prompt: Password to use for db
  Sensitive: True

Resources:
MyDB:
  Type: application/oracle.com.cloud.common.DbPlatformInstance+json
  Container:
    f_getTemplateURI:
    - Simple DB Template
    - dbaas
  Properties:
    zone:
      f_getZoneURI:
      - f_path:
        - "Inputs.DbZone.Value"
        - dbaas
    params:
      username: app_user
      password:
        f_path:
        - 'Inputs.Password.Value'

The Inputs section defines the two input parameters and the values of the parameters are accessed via the f_path intrinsic function. The f_path function is used to evaluate path expressions to access any data in your blueprint as well as any cloud resource data to which you have access. In our example, the path expression just uses the dot operator to access nested attributes, first access the Inputs attribute (Inputs section) of the blueprint and within that, the UserId attribute, and within that the Value attribute.

55.7.1.5 Data Section (Named Literals)

Suppose your blueprint creates several databases and suppose that you do not want to prompt the user for the username and password. Furthermore, you want to code your blueprint so that it is easy to change the password later. In a procedural language, you would use a named literal in order to document the intent and so that you can change it once at the top of your code. Within a blueprint, you do this by using the Data section.

Data:
QADBCreds:
  user: sysman
  password: sysman
Resources:
MyDB1:
  Type: application/oracle.com.cloud.common.DbPlatformInstance+json
  Container:
In the above case, you can see that the Data section takes a YAML structure, which can be traversed via the 'path' function, in the same way shown for Inputs earlier.

55.7.2 Putting It All Together – Multiple Interdependent Resources

In this more elaborate example, we show how one might create a database and an application that uses it. To do so, the blueprint specifies four cloud resources:

- Database service instance
- Java service instance
- Datasource of the Java service instance
- Application of the Java service instance

New constructs are highlighted below

Inputs:

DbZone:
  Type: String
  DefaultValue: Zone1
  Prompt: Zone to use for db
DbPassword:
  Type: String
  DefaultValue: welcome1
  Prompt: Password to use for db
  Sensitive: True

Macros:

# Return a name with unique (date-time) suffix
# The one argument is a 'name' string
f_myDescriptiveName:
  - 1
  - f_concat:
    - arg_1
    - '_'
    - f_path:
      - 'Info.time_suffix'

Resources:
MyDB:
  Type: application/oracle.com.cloud.common.DbPlatformInstance+json
  Container:
     f_getTemplateURI:
        - Small Database Service Template_automation_VIMAL_si
        - dbaas
  Properties:
     zone:
        f_getZoneURI:
           - f_path:
             - "Inputs.DbZone.Value"
     params:
       username: app_user
       password:
        f_path:
           - "Inputs.DbPassword.Value"
     name: jbName
MyWebServer:
  Container:
     f_getTemplateURI:
        - PS4_LowHeapTemplate
        - jaas
  Properties:
     name:
        f_myDescriptiveName:
           - jb_pf
     zone:
        f_getZoneURI:
           - Zone1
           - jaas
MyDS:
  Type: application/oracle.com.cloud.jaas.DataSource
  Container:
     f_getResourceURI:
        - MyWebServer
  Properties:
     name: QA_app_DS
     jndi_name:
        - jndi_1
        - jndi_2
     jdbc_driver: oracle.jdbc.OracleDriver
     database_type: Oracle
     database_connect_string:
        f_concat:
           - 'jdbc:oracle:thin:@'
           - f_getResourceAttr:
             - MyDB
             - connect_string
     username: app_user
     password:
        f_path:
           - "Inputs.DbPassword.Value"
MyApp:
  Type: application/oracle.com.cloud.jaas.ApplicationInstanceDeployment
  Container:
     f_getResourceURI:
        - MyWebServer
  Properties:
     application_instance_component:
        f_getAppCompURI:
55.7.2.1 Macro Section

If you have a sequence of constructs that you tend to repeat, you can use macro expansion to improve the readability of your blueprint. Macros also enable you to encapsulate logic, for instance, you can modify the logic in one place to affect all code that refers to it. Our example blueprint defines a macro named `f_myDescriptiveName`. It takes one string parameter and appends "_" as well as a string representation of the current time.

55.7.2.2 Attributes of Created Resources (Dependencies)

The key new feature introduced by this example is the ability to refer to attributes of created resources. For instance, the Cloud Resource Model for Datasource defines a `database_connect_string` attribute whose value is required to create a Datasource. The contents of the string will not be available until after the database is created, so it is clearly not something the blueprint author can know in advance. Instead, he uses an intrinsic function to refer to the needed property of the newly created database. (Each DatabasePlatformInstance exposes a `connect_string` property.) To do this, the Datasource specifies the value of JDBCConnectString via the `f_getResourceAttr` intrinsic function:

```
MyDS:
...
Properties:
...
database_connect_string:
  f_concat:
  - 'jdbc:oracle:thin:@'
  - f_getResourceAttr:
    - MyDB
    - connect_string
```

In this case, the `f_getResourceAttr` function waits for the MyDB resource to be created and then returns the value of its connect_string property. Similarly, the creation of a Datasource is done by adding it to the JavaPlatformInstance that is created first, so we need to refer to the JavaPlatformInstance's URI.

```
MyDS:
...
Container:
  f_getResourceURI:
  - MyWebServer
```

In this case, the `f_getResourceURI` function waits for the MyWebServer resource to be created and then returns its URI. (In addition to adding a Datasource to MyWebServer,
we also must add an ApplicationInstanceDeployment, so the same approach is used for both.)

**Note:** Though the `f_path` function can be used to achieve the same effect, the `f_getResourceAttr` knows to wait for the resource creation to succeed and its state be READY before attempting to get its attribute.

More generally, blueprint resources can refer to other resources and blueprint orchestration accounts for such dependencies, creating resources in parallel when possible.

### 55.7.3 Visual Depiction of Blueprint Processing

The blueprint processor can also generate an HTML report that includes a graphical representation of the blueprint. This may be used to help understand the overall structure of the blueprint and the relationship of blueprint entities. In addition, the report can include the results of deploying the blueprint.

The following example report is for the example blueprint described in Blueprint Deployment Processing. The first part of the report summarizes the run:

**Figure 55-1  Blueprint Report Title**

```
ORACLE Enterprise Manager Cloud Control
Deployed Blueprint Graphical Report

Blueprint file: xyzApp.yml
Cloud URI: 

Cloud resources created: 4 of 4
Duration: 29 minutes, 59.9 seconds
Completion time: 12/17/12, 14:54:50
```

Next is the graphical depiction, in which two types of arcs are used. One depicts containment. For example, the containment of a datasource within a WebLogic server. The other depicts how data is used across the elements of a blueprint. If blueprint deployment is successful, the status of all resources will be Ready (green) and you can click on a resource, which links to another report section where you can view the values of its attributes at the time of creation.
Figure 55-2  Blueprint Graphical Depiction

This is followed by a legend to explain the graphical conventions:
Finally, each created resource is summarized. (Clicking on a resource definition in the graphical depiction takes you directly to the resource summary for the selected resource.)
Figure 55-4  Blueprint Created Cloud Resources - I
55.8 Conclusion

This ends the introduction to cloud blueprints. Many features are only described in Cloud Blueprints and Blueprint Reference including:

- Blueprint macrosPath expressions for browsing the Cloud and debugging blueprints
- Setting breakpoints and debugging blueprints
- Hints, tips, and frequently asked questions.
Cloud Blueprints and Blueprint Reference

This chapter serves as a reference to the blueprint processing features of Oracle Enterprise Manager Cloud. It presents concepts, describes how to install and run the blueprint processor, and documents the blueprint language. Also included are sections to help in your use of the blueprint processor, such as use of the blueprint debugger, what to do when errors are diagnosed, and frequently asked questions. Before reading this document, you must have read Introduction to Blueprints.

Note:
Click here to view a visual demonstration on how to automate the creation of cloud resources with Cloud Blueprints.

It contains the following sections:
• Installing the Blueprint Processor
• Optional Components for Graphical Summary Report
• Running the Blueprint Processor
• Blueprint Processing Phases
• Language Specifics
• Overview of Blueprint Content
• Dealing with Errors
• Simulation Mode
• Debugging with the Blueprint Processor
• Tips and Hints

56.1 Installing the Blueprint Processor

Installing the blueprint processor consists of two steps:
• Install Python 2.7, if not already present.
• Install the blueprint processor files.

To use the “-g” option and generate graphical depictions of blueprints, additional software must be installed as described in Optional Components for Graphical Summary Report.

Detailed instructions to install the blueprint processor on Linux and Windows is given below.
56.1.1 Linux (Oracle Linux)

Installing the blueprint processor on Oracle Linux involves the following steps:

- Installing Python
- Installing the Blueprint Processor From Zip File
- Testing the Installation

56.1.1.1 Installing Python

- Download a version of Python, version 2.7 or higher (but not 3.x). For instance, use http://www.python.org/ftp/python/2.7.3/Python-2.7.3.tgz.
- Untar it, for example by entering the following commands:
  
  ```
  tar xzf Python-2.7.3.tgz
  cd Python-2.7.3
  ```

- Execute these commands:
  
  ```
  ./configure --prefix=$HOME
  make
  make install
  ```

  **Note:** During the configure step, you may see output that includes warnings about some modules that could not be created on your platform, but those modules may not be needed; their absence may not adversely affect use of the blueprint processor.

  Python build finished, but the necessary bits to build these modules were not found:

  ```
  bsdbsync       dl       imageop
  sunaudiodev
  ```

  To find the necessary bits, look in the `setup.py` in detect_modules() for the module's name.

  Failed to build these modules:

  `sqlite3`

- The python interpreter should be installed in your home bin directory. Test it. `$HOME/bin/python2.7`

- You should see the Python banner... something like this:

  ```
  Python 2.7.3 (default, May 25 2012, 11:33:27)
  [GCC 4.1.2 20080704 (Red Hat 4.1.2-50)] on linux2
  Type "help", "copyright", "credits" or "license" for more information.
  ```
56.1.1.2 Installing the Blueprint Processor from Zip File

- Unzip the blueprint distribution file to a directory, e.g. named bp_installation
- To run the blueprint processor, you must do the following:
  cd to the directory, e.g. bp_installation
  Enter this command: python bp_processor.py <filename> <options>

56.1.1.3 Testing the Installation

- Navigate to the directory that contains the blueprint processor files.
- Enter this command to confirm you can run the blueprint processor, in this case just to see the help text:
  $HOME/bin/python2.7 bp_processor.py helloWorld.yml -h
- You should see the help text, as follows:
  **Usage:**
  bp_processor.py [options] BlueprintFileName
  **Example:**
  bp_processor.py myfile.yml -i "name:Joe" -i "count:2" -u jabauer -c https://...
  **Options:**
  -h, --help         show this help message and exit
  -c CLOUD_URI, --cloud_uri=CLOUD_URI.
  Ex: https://myhost:4473/em/cloud
  -u USER, --user=USER user id
  -p PASSWORD, --password=PASSWORD
  password If not provided, you'll be prompted.
  -t TIMEOUT, --timeout=TIMEOUT
  timeout (seconds)
  -i INPUT_VALUE, --input_value=INPUT_VALUE
  <param name>=<param value> e.g. -i "name:Joe Blogs"
  -r REFRESH_FREQUENCY, --refresh_frequency=REFRESH_FREQUENCY
  # of seconds between dots in timeline. Zero: no dots
  -n INSTANCE_NAME, --instance_name=INSTANCE_NAME
  name of blueprint instance to create
  -d, --debug more logging, including http traffic
  -E, --pause_error Drop into debugger if error occurs
  -I, --pause_input Pause before processing Input section
  -R, --pause_resource Pause before processing Resource section
  -O, --pause_output Pause before processing Output section
  -T, --pause_terminate Pause before termination, but after output processing
  or error
  -g GRAPHIC_RESULTS, --graphic_results=GRAPHIC_RESULTS
  Directory for deployed blueprint graphical report
  -G GRAPHIC_BLUEPRINT, --graphic_blueprint=GRAPHIC_BLUEPRINT
  Directory for undeployed blueprint graphical report

- Enter this command to simulate running a blueprint without having to connect to a cloud environment:
  $HOME/bin/python2.7 bp_processor.py helloWorld.yml
You should see something like this...

[jabauer@zzzzzzz blueprints]$ $HOME/bin/python2.7 bp_processor.py
helloWorld.yml

Blueprint Processor - Invocation Summary
----------------------------------------
  Cloud URI:          sim
  User:               None
  Blueprint file:     helloWorld.yml
  Timeout:            90 minutes, 0 seconds
  Ellipses frequency: 15 seconds
  Inputs:
    Pause points:       (none)
    Debug logging:      False
    Instance name:      default_instance_name

17:10:31 WARNING: No Resources specified in blueprint. Nothing will be created

56.1.2 Windows

Installing the blueprint processor on Windows involves the following steps:

• Installing Python
• Installing the blueprint processor from Zip File
• Testing the Installation

56.1.2.1 Installing Python

• Go to http://www.python.org/download/releases/2.7.3. You will see that there are several options for installing Python.
• Download the MSI Installer. Run it. Accept the defaults suggested by the installer.
• Note the directory into which Python was installed, typically ;c:\python27
• Add the Python directory to your path, so you can run it from the command line:
  • Windows XP
    * Start -> My Computer -> Properties
* Select the Advanced tab
* Click Environment Variables
* You can update the path for ‘Current User’ and, if you have sufficient privileges, for ‘System’. The latter is required if you want all users to be able to run Python.
* Add this to the end of the Path string:
  ;c:\python27
  – Windows 7 (Windows Vista)
* From the Start menu, select My Computer, then select Properties.
* Select the Advanced System Settings tab on the left.
* Click Environment Variables.
* You can update the path for ‘Current User’ and, if you have sufficient privileges, for ‘System’. The latter is required if you want all users to be able to run Python.
* Add this to the end of the Path string:
  ;c:\python27
* Click OK as needed (i.e. for two dialog boxes)

  • Test the Python installation:
    – Open a new command window. (The new environment variable value will not be visible in previously opened command windows.)
    – Type python
    – The Python interpreter should start.
    – Type ‘exit()’

56.1.2.2 Installing the Blueprint Processor from Zip File

  • Unzip the blueprint distribution file to a directory, e.g. named bp_installation.
  • To run the blueprint processor you will...
    – cd to bp_installation
    – Enter this command: python bp_processor.py <filename> <options>
    – Alternatively use: bp_processor.py <filename> <options>

56.1.2.3 Testing the Installation

  • Navigate to the directory that contains the blueprint processor files.
  • Enter this command to confirm you can run the blueprint processor, in this case just to see ‘help’ text:
    python bp_processor.py helloWorld.yml -h
  • Enter this command to simulate running a blueprint without having to connect to a cloud environment:
    python bp_processor.py helloWorld.yml
56.2 Optional Components for Graphical Summary Report

The blueprint processor can generate a summary report that includes a graphical depiction of the blueprint. (To generate such reports, use the –g or –G option.) For these options to produce reports, the following third party software must be installed.

- **Install GraphViz**: To install GraphViz, see [http://www.graphviz.org](http://www.graphviz.org). Download the software for your platform and follow the instructions.
- **Install Pydot**: To install pydot, see [http://code.google.com/p/pydot/](http://code.google.com/p/pydot/). Download the software (zip or tar file). The blueprint processor was tested using pydot version 1.0.28.
  
  PyDot can be installed using setuptools. For example, `sudo easy_install pydot`
  
  You can also use the `setup.py` script in the zip/tar file. From the directory into which you unzipped or untarred the file, run that script: `python setup.py install`

56.3 Running the Blueprint Processor

To deploy a blueprint, you run the blueprint processor and provide the name of the blueprint file plus any desired command options. For a full set of command options, use the command’s –h option:

**Usage:**

```bash
C:\...\python bp_processor.py interactiveTests\helloWorld.yml
```
bp_processor.py [options] BlueprintFileName

Example:

bp_processor.py myfile.yml -i "name:Joe" -i "count:2" -u jabauer -c https://...

Options:

-h, --help        show this help message and exit
-c CLOUD_URI, --cloud_uri=CLOUD_URI.
    Ex: https://myhost:4473/em/cloud
-u USER, --user=USER user id
-p PASSWORD, --password=PASSWORD
    password If not provided, you'll be prompted.
-t TIMEOUT, --timeout=TIMEOUT
    timeout (seconds)
-i INPUT_VALUE, --input_value=INPUT_VALUE
    <param name>:<param value> e.g. -i "name:Joe Blogs"
-r REFRESH_FREQUENCY, --refresh_frequency=REFRESH_FREQUENCY
    # of seconds between dots in timeline. Zero: no dots
-n INSTANCE_NAME, --instance_name=INSTANCE_NAME
    name of blueprint instance to create
-d, --debug        more logging, including http traffic
-E, --pause_error  Drop into debugger if error occurs
-I, --pause_input  Pause before processing Input section
-R, --pause_resource Pause before processing Resource section
-O, --pause_output Pause before processing Output section
-T, --pause_terminate Pause before termination, but after output processing
    or error
-g GRAPHIC_RESULTS, --graphic_results=GRAPHIC_RESULTS
    Directory for deployed blueprint graphical report
-G GRAPHIC_BLUEPRINT, --graphic_blueprint=GRAPHIC_BLUEPRINT
    Directory for undeployed blueprint graphical report

Options that are not self explanatory are described below:

- Input_value: For each input parameter, you can provide a –i or –input_value string
  of the form <param name>:<value>. You should use quotation marks around each
  input parameter specification, e.g. -i "name:Joe Blogs". To provide values for more
  than one input parameter, use the -i command line option more than once. For
  example, bp_processor.py _processor.py myfile.yml -i "DbZone:Zone1" -i
  "DbPassword:myPw"

- If an input parameter defined in the blueprint is not provided on the command line,
  you will be prompted as follows:

    pause_*: Pause (enter the blueprint debugger), just prior to beginning the Input/
    Resource/Output processing phases.

    In the case of pause_error, the debugger is entered in the event of an error. In the
    case of pause_terminate, the debugger is entered prior to terminating the blueprint
    processor. Use of the debugger commands is described in Debugging with the
    Blueprint Processor. If no CLOUD_URI is specified, the blueprint processing is
    simulated. See the section titled Simulation Mode.

- Timeout: The number of seconds after which the blueprint process must be
  terminated. (If the processor is waiting for completion of a cloud request, e.g. a
  POST request, termination occurs when that request completes.)
56.4 Blueprint Processing Phases

Blueprint processing is done in phases. Describing the phases, will help you:

- Understand how blueprints are evaluated and resources created.
- Set pause points at phase transitions. (This can help with cloud browsing and debugging as explained in Pause Points).
- Connect to the designated Cloud resource.
- Monitor the process. If creation succeeds, other resources may then become unblocked for creation. If creation fails, terminate the resource creation phase.

The phases are:

- **Initialization**: Parse the blueprint.
- **Input Processing**: If the blueprint defines input parameters and if some were not provided on the command line, the user is prompted for the parameter values.
- **Resource Creation**: For each resource defined in the blueprint, verify if the resource has no dependencies on other resources that have not been created yet, initiate creation.
- **Output Processing**: Evaluate and display any output values. (If the resource creation phase was terminated due to errors, some output values may not be available.)

A detailed description of each phase is given below.

56.4.1 Initialization

The blueprint file is read and parsed and a connection to the designated Cloud resource is made. The parsed blueprint content is captured in memory and then augmented. A member named Cloud is added, whose value is the Cloud resource as documented in Cloud Resource Models. Another member named Info, which provides environmental information, is also added. Its value is a set of name/value pairs such as time and a string like ‘13:02:45’ representing the time when processing began. Oracle-provided macros are loaded into the Macros section of the blueprint (except for any whose name conflicts with a blueprint-defined macro).

56.4.2 Input Parameter Evaluation

Input parameter processing is then done and the input parameters set. Any parameters specified in the blueprint that were not provided on the command line are prompted for. Each input parameter value is stored in the Value attribute of the input parameter in the blueprint. The values can be accessed with this path expression: Inputs.<parameterName>.Value. (See Evaluation Intrinsics for details.)

56.4.3 Resource Creation

To process the Resources section, each resource is effectively processed in parallel. The following is done for each resource: First, the expression specified for the Container section is evaluated. When successful and when the cloud resource it identifies is in the READY state, all expressions of the resource’s Properties subsection are evaluated. (When evaluation of a resource’s Properties or Container
section cannot be completed and must wait, the resource is marked and the blueprint processor proceeds to process other resources. Periodically, it reattempts to evaluate this and any other marked resources.) Once all evaluation for a resource definition is complete, the document derived from the Properties section is used to request creation of the cloud resource (i.e. it is POSTed to the container URI). If successful, the URI of the newly created cloud resource is stored in the `_uri` attribute of the blueprint's resource definition. At this point, that URI represents the resource that is being created. The blueprint processor then polls the resource being created to track its status. From a state of CREATING, the resource should eventually transition to a success or failure state. If it transitions to a failure state, the blueprint processor diagnoses the situation and terminates. If creation succeeds and the resource enters the READY state, this may enable evaluation of other resource definitions to proceed. If the timeout value specified on the command line is exceeded, the blueprint processor is terminated. Any cloud resources whose creation was initiated may continue in the ‘creating’ state for some time before succeeding or failing. In addition to timing out, other failures may occur such as an error evaluating an expression or an error code returned from the cloud, e.g. in response to a creation request. In all such cases, the blueprint processor diagnoses the situation and terminates.

56.4.4 Outputs

After all resources have been successfully evaluated, the Outputs section is processed, at which time each named output expression is evaluated and their values printed. Then a graphical report that depicts the blueprint and what got created is generated, if it was requested and a summary of blueprint processing is displayed to the user.

56.5 Language Specifics

A blueprint is a text file that represents a set of cloud resources that are to be created. The text is formatted in YAML or JSON. Both YAML and JSON are notations for representing data structures of lists and name/value pairs, which can be nested. A blueprint is such a structure. (See [YAML] and [JSON] for concise descriptions.) You can use JSON or YAML notation for your blueprints, but we recommend using YAML. With YAML you can write blueprints that are more concise and somewhat easier to read. YAML also offers useful capabilities not present in JSON, such as the ability to include comments. For these reasons, we have chosen to use YAML in the examples that follow. (Incidentally, YAML allows the inclusion of JSON notation in YAML documents, i.e. YAML is a superset of JSON.)

56.6 Overview of Blueprint Content

At the top level, a blueprint may contain any of the following name/value pairs, which can be viewed as blueprint section types:

- Inputs
- Data
- Macros
- Resources
- Outputs
Order of appearance in the blueprint is not significant. No other sections are allowed and each section can appear only once. No section is truly required in a blueprint, but you must include a Resources section with at least one resource definition if you intend to create a cloud resource via the blueprint. A section may only appear once in a blueprint.

56.6.1 Inputs Section

The Inputs section is used to describe input parameters. Each parameter has a unique name and has the following attributes:

- **Type**: “String” or “Number”. If “Number” is specified, the input value must be numeric. (Default: “String”.)
- **Prompt**: A string to be used when prompting. (Default: The parameter name.)
- **DefaultValue**: The value to use if the user responds to the prompt by simply pressing Enter. (Default: “”).
- **Order**: The sequence in which the values need to be entered. If not specified, ordering is arbitrary.
- **Sensitive**: “True” or “False”. If “True”, what the user enters interactively will not be echoed. (Default: “False”.)
- **Value**: Set at runtime, using the value provided by the user (or the default value)

Processing input parameters starts with those input parameter values provided on the command line. For any not provided, the user is prompted.

56.6.1.1 Example 1

Inputs:
UserId:
   DefaultValue: qa_user
   Prompt: User id
   Order: 1
Password:
   Sensitive: True
   Order: 2
...

In this blueprint snippet, the author has defined 2 input parameters. Both are of type String. A default user id is specified but the user must provide a password. If neither is provided on the command line, the use of Order assures that UserId is requested first.

56.6.1.2 Example 2

In this interaction

C:\work>bp_processor.py test2.yml -c https://... -u jon -p myPW -t 665

Blueprint Processor - Invocation Summary
-------------------------------
Cloud URI: https://xyxy.example.com:15430/em/cloud
User: ssa_user1
Blueprint file: xyzApp.yml
Timeout: 90 minutes, 0 seconds
Refresh frequency: 15 seconds
Inputs:
The user provided no input parameters as part of the command line, so he is prompted for the two values. He pressed Enter for the user id, accepting the default of qa_user. And he entered a password, which was not echoed.

56.6.1.3 Example 3

The following interaction is almost the same, except that the user id is provided on the command line:

```
C:\work>bp_processor.py test2.yml -c https://... -u jon -p myPW -t 665 -i
"UserId:joe"
``` 

**Blueprint Processor - Invocation Summary**

```
Cloud URI: https://xyxy.example.com:15430/em/cloud
User: ssa_user1
Blueprint file: xyzApp.yml
Timeout: 90 minutes, 0 seconds
Refresh frequency: 15 seconds
Inputs:
Pause points: Inputs
Debug logging: False
Instance name: default_instance_name
Graphical report dir: deployment_report
Versions:
  Blueprint processor: 12.1.0.5, 10-Oct-2012
  Cloud protocol: 10001
```

In this case, the user is only prompted for a password. Another example can be found at Example 3 - Default Input Parameter Value via Cloud Lookup which uses an intrinsic function to perform a runtime lookup for the default value.

56.6.2 Resources Section

The Resources section is used to describe the cloud resources you wish to create. Each resource description has a unique name and has the following attributes:

- Container: The URI of the parent cloud resource.
• Type: The media type of the resource, as defined by the Cloud Resource Model. (see Cloud Resource Models). (If the specified Container is a resource that is a subtype of ServiceTemplate, this value is optional and the default type of the ServiceTemplate is assumed.)

• Properties: A set of name/value pairs used to specify values required per the Cloud Resource Model.

For each resource you wish to create, you must know its type, its parent, and the properties you must provide to specify its characteristics. For more details, see the Cloud Resource Models.

For instance, a JavaPlatformInstance must specify:

• A container resource, using the URI of a JavaPlatformTemplate. (You choose a template by selecting one that creates an instance most suited to your needs.)

• The properties required by the Cloud Resource Model. For JavaPlatformInstance, these are:
  – Name
  – Zone (the URI of a zone)

Example

In a blueprint, the Resource description of a JavaPlatformInstance might look like this:

```
MyJavaServer1:
  Container:
    f_getTemplateURI:
      - Small WLS
      - jaas
    Properties:
      name: Foo
      zone:
        f_getZoneURI:
          - Zone1
          - jaas
```

The above example does not specify Type because, this is optional when the container is a subtype of ServiceTemplate. Had we wanted to explicitly specify the media type, we could have written:

```
MyJavaServer1:
  Type: application/oracle.com.cloud.jaas.JavaPlatformInstance
  Container:
    ...
```

Our example uses the f_getTemplateURI and f_getZoneURI intrinsic functions to look up the required URI's. Resource definitions have access to numerous such functions as described in Intrinsic Functions. Resource definitions can also use user-defined macros, as described in Macros Section.

56.6.3 Outputs Section

The Outputs section is used to describe the set of “outputs” of a blueprint. In this release, outputs are just used by the blueprint author to specify information to display at the end of a successful deployment. For instance, he may define an output that displays the URL of an application deployed to a JavaPlatformInstance. Each output
description has a unique name and one required attribute named “Value”. That attribute generally specifies a blueprint expression whose value would be of interest to the user who instantiates a blueprint. (One may also include a “Description” attribute for each output definition.)

Example

The following Outputs section specifies one output to display:

```
Outputs:
  Application_URL:
    Description: URL of the deployed app
    Value:
      f_getResourceAttr:
      - MyApp
      - http_application_invocation_url
```

In this example, the output definition uses the `f_getResourceAttr` intrinsic function to retrieve the `http_application_invocation_url` attribute of a newly created ApplicationInstanceDeployment. (See Cloud Resource Models for more information on that attribute.)

56.6.4 Data Section

The Data section contains arbitrary YAML text. The data defined in this section can be accessed through intrinsic functions and can be used in various ways during blueprint deployment. For instance, the author of a blueprint may wish to use the concept of named literals to improve the readability and maintainability of a blueprint. He may want to use short descriptive names instead of long literal values such as cryptic URI's. He may also anticipate needing to change a value used by a blueprint, in which case it can be specified once in the Data section and referenced throughout the blueprint.

Example

The following blueprint excerpts show a Data section that contains an item named `db_conn_str`, a long JDBC connect string that is referenced later in the a DataSource resource definition.

```
Data:
  db_conn_str: 'jdbc:oracle:thin:sysman/sysman@hostname.zzz.com:15044:smay16'
Resources:
  ...
  MyDatasource:
    Type: application/oracle.com.cloud.jaas.DataSource
    ...
    Properties:
      name: jbTest
      jdbc_driver: oracle.jdbc.OracleDriver
      database_type: Oracle
      database_connect_string:
        f_path:
        - Data.db_conn_str
      ...
```
56.6.5 Macros Section

The notation used in blueprints can be verbose. If you have a sequence of constructs that you tend to repeat, you can use macro expansion to improve the readability of your blueprint. Macros also enable you to encapsulate logic so that changes made one in section get reflected throughout the document. The Macros section is used to define macros that can be invoked/expands from elsewhere in the blueprint. A macro invocation may occur wherever a function invocation is allowed, indeed, the notation is identical and one cannot tell from the invocation whether it is an intrinsic function or a macro that is being invoked. (In this way, a macro can be used to override an intrinsic function. Also, some Oracle-provided intrinsic functions are implemented as macros.)

Each macro definition has a unique name and its definition specifies two values:

- The number of arguments it uses.
- The textual representation of the macro expansion.

When a macro is invoked, its textual representation replaces the invocation. Wherever the textual representation specifies a value of arg_<integer>, the value of that argument is used instead.

Example

Consider this somewhat contrived blueprint:

Macros:

```
# Return a string that describes a resource being created
# The one argument is a 'name' string
f_myDescriptiveName:
  - 1
  - f_concat:
    - "Resource ",
    - arg_1
    - " created for blueprint instance ",
  - f_path:
    - "Info.instance_name"
  - f_path:
    - "Info.date"
```

Resources:

```
MyJavaServer:
  Container:
    f_getTemplateURI:
      - Small WLS
      - jaas
  Properties:
    name:
      f_myDescriptiveName:
        - MyFirstJavaServer
  zone:
    f_getZoneURI:
      - Zone1
      - jaas
```

Outputs:

```
NameOfServer:
  Value:
    f_path:
      - "Resources.MyJavaServer.Properties.name"
```
The Macros section defines one macro named f_myDescriptiveName, which takes one string argument and constructs a larger string adding descriptive information. The macro is then invoked as part of the MyJavaServer resource definition. It is invoked with a value of “MyFirstJavaServer” and the resource will be created with a ‘name’ property whose value is "Resource MyFirstJavaServer created for blueprint instance myQAInstance on 5/9/2012".

```
Blueprint Processor - Invocation Summary
----------------------------------------
Cloud URI:                https://...
User:                     sysman
...  
13:32:22 INFO:   Output values specified: 1
...  
```

56.6.6 Expressions

A blueprint uses 'expressions' to compute values at deployment time. In many cases, the expressions are simple literal string values such as a user_name attribute whose value is app_user. In other cases, values are constructed via user-defined macros (see Macros Section) and intrinsic functions (see Intrinsic Functions).

Two intrinsic functions, f_path and f_eval, are provided to evaluate the two types of expression string:

- Path expression
- Eval (or Blueprint) expression

These expression types are described below. They can be used not only in calls to f_path and f_eval but also in the blueprint debugger.

56.6.6.1 Path Expressions

Path expressions are similar to JSONPath [JSONpath] and XPath expressions and are used to extract values from blueprints and cloud resources as well as to traverse URI's that link you to other resources. The starting point for evaluating a path expression is generally the in-memory blueprint. Recall that it contains all the information from your blueprint plus these attributes:

- Cloud: the cloud resource, which is defined in Cloud Resource Models and has attributes that describe the overall cloud as well as those that enable you to traverse to all other cloud resources (to which you have access).
- Info: a section that contains runtime information you may wish to refer to such as the instance name specified when blueprint processing was initiated, the current date, etc. Other blueprint-processor-computed values such as the input parameters provided by the end-user and the URI's of resources once they have been created.

All this information can be accessed via path expressions. The rest of this section summarizes syntax and semantics and provides examples. As you have seen in earlier sections, the f_path intrinsic function provides one way to evaluate path expressions. In the examples that follow, we use another mechanism, the blueprint debugger, described further in Debugging with the Blueprint Processor. As you will see, you can use this not only to explore the contents of your blueprint runtime data.
but also to explore the contents of the cloud. In the following descriptions, \(<doc>\) refers to the YAML data structure on which the operator acts.

In the example: \(\text{Cloud.zones.elements}[0]\)

The value of the runtime blueprint's Cloud attribute is the first \(<doc>\). The dot-operator in 'zones' is applied to that \(<doc>\), yielding a new \(<doc>\) whose value is that of the zones attribute of the first \(<doc>\). Numerous examples are provided to illustrate the use of the operators.

### 56.6.6.2 Operator Summary

- **Dot Operator ("Member of"): \(<doc>.<name>\):** As seen in previous examples, the dot operator selects a value from a document. If \(<doc>\) has an attribute named \(<name>\), the value of \(<name>\) is returned. Otherwise, expression evaluation fails.

- **Square Bracket ("List Indexing"): \(<doc>[<integer>]\):** If \(<doc>\) is a list of values, the value of the \(<integer>\)th element is returned. Otherwise, expression evaluation fails. Indexing is zero-based, i.e. the first element is specified as "\(<doc>[0]\)".

- **Dollar Sign ("Literal string prefix"): \(<doc> \$ <string>\):** To begin a path expression with a string literal, use the '$' prefix, for instance:

\[
$"/em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51" ->
\]

In the above example, you know the URI of a specific resource and use the arrow operator to view its contents.

This syntax is only useful at the beginning of a path expression, but for consistency with the overall path notation, one can place the $ operator anywhere in a path expression. Other path expression operators operate on the \(<doc>\) to the left. The $ operator simply replaces the left value with the value of the literal string to the right.

In short, the $ operator returns the literal string value. If the right operand is not a literal string, expression evaluation fails.

- **Arrow ("URI Traversal"): \(<doc> ->\):** If \(<doc>\) is a URI, traverse to the identified resource and return its document. In other words, perform a GET on the URI specified by \(<doc>\). If \(<doc>\) is not a URI or the GET fails, expression evaluation fails.

For instance, in this path expression...

\[
\text{Cloud.zones.elements}[0].uri->
\]

the expression to the left of the arrow operator returns the URI of a zone. The arrow operator is used to traverse to the zone, i.e. it performs a GET on the URI and displays the contents:

- context_id: A1B44A4EBCC4563125D9D0A3AAE4FD51
- description: Zone for Physical Pool
- media_type: application/oracle.com.cloud.jaas.Zone+json
- name: Zone1
- resource_state:
  - state: READY
- service_family_type: jaas
- service_instances:
  - elements: []
  - media_type: application/oracle.com.cloud.common.ServiceInstance+json
  - total: '0'
- uri: /em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
In most cases the traversal operator is sufficient, but you can also specify traversal qualifiers. In particular, you can specify a media type and request parameters. These are optional and enclosed in square brackets. Multiple qualifiers can be specified, separated by commas. To specify a media type, use a string (enclosed in quotes or double quotes).

- To specify a request parameter there are two styles:
  - Identifier
  - Identifier = quotedValue

Overall, there are 3 forms of traversal qualifiers

- quotedValue: media type
- Identifier: a request parameter that has no value
- Identifier = quotedValue a request parameter that has a value

For instance, the following path expression traverses to the cloud URI and specifies three qualifiers (a media type and two request parameters).

```plaintext
Cloud.uri-> ["application/oracle.com.cloud.common.ServiceTemplateFinds +json", filters="{"filters": {"service_family_type":"jaas"}}", name]
```

The first parameter is the media type to be used to request that the cloud process a filter/query as described in Cloud Resource Models. The remaining two are request parameters, also described in Cloud Resource Models. The second is named 'filters' with a value that specifies the filtering to perform (expressed as a JSON string). The last is named 'name' and has no value. This specifies that the name attribute is to be returned.

### 56.6.6.3 Example: Viewing all values of Info

As noted above, the Info section contains environmental information that may be of use when constructing your blueprint. This example shows how to see those values that are currently available in the Info section. Suppose you are looking for a value you can use to construct a unique name. You run the blueprint processor and enter debug mode. (You can do this by specifying "-I" on the command line.

```plaintext
C:\Users\jabauer\Dropbox\Code\blueprints>bp_processor.py helloWorld.yml -c https://xyxy.example.com:15430/em/cloud -u sysman -p sysman -I ...
```

Blueprint Processor - Invocation Summary

```
----------------------------------------
Cloud URI:                https://xyxy.example.com:15430/em/cloud
User:                     sysman
Blueprint file:           helloWorld.yml
...

...Pause point, prior to Input processing...
For command info, enter (h)elp
```

Paused: Info
date: 1/11/2013
Here, you see that there are 6 values stored in the Info section. There is one named uuid that is a universally unique hexadecimal string. You may prefer to go with time_suffix, as being sufficiently unique and more readable. More values may be added between the time of writing this document and when the blueprint processor ships, so you can use this technique to see what's available in the version you are using.

56.6.6.4 Examples: Viewing Blueprint Values

Suppose you have a blueprint that begins with...

Inputs:
  DbPassword:
    Type: String
    DefaultValue: welcome1
    Prompt: Password to use for db
    Sensitive: True

Say you run the blueprint processor and specify command line options to pause just before processing the Inputs and Resources section, e.g. you specify "-RI".

...Pause point, prior to Input processing...
For command info, enter (h)elp

Paused: Inputs.DbPassword
DefaultValue: welcome1
Prompt: Password to use for db
Sensitive: true
Type: String

At the first pause point above, you enter the expression 'Inputs.DbPassword' and see that it has the attributes you specified in your blueprint. That includes DefaultValue, Prompt, and Sensitive. Note that it does not have an attribute named Value because input processing has not been performed yet.

Paused: c
...continuing...

Input Parameter Value Entry
---------------------------
Password to use for db (welcome1):

...Pause point, prior to processing Resources section...
For command info, enter (h)elp

Paused: Inputs.DbPassword.Value
welcome1

Paused: Inputs.DbPassword
DefaultValue: welcome1
Prompt: Password to use for db
Sensitive: true
Type: String
Value: welcome1
You then enter `c` to continue and are prompted for a password. You enter one, which is not echoed because you specified that it was **Sensitive**. Then the second (prior to processing the Resources section) pause point is reached. You enter "Inputs(DbPassword).Value" to see the value of your password and then enter "Inputs(DbPassword)" to see the value of all attributes for the DbPassword input parameter.

### 56.6.6.5 Examples: Browsing Your Cloud

Path expressions also offer an easy way to explore the resources in the cloud and their attributes. That is because, at the beginning of blueprint processing, the cloud resource (as defined in **Cloud Resource Models**) is read and placed into the in-memory blueprint structure. By starting your path expression with **Cloud**, you can browse attributes of the Cloud resource and navigate via URI's to any other resource to which you have access.

To start, we look at the **description** of the cloud to which you connected:

**Paused:** `Cloud.description`
This represents the Cloud resource of the Oracle Enterprise Manager Cloud Management solution
**Paused**

Now let us do something more useful, for example, look at the cloud's zones attribute:

**Paused:** `Cloud.zones` elements:
- `media_type`: application/oracle.com.cloud.jaas.Zone+json
  - `name`: Zone1
  - `service_family_type`: jaas
  - `uri`: /em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
  - `description`: Zone for Physical Pool
  - `media_type`: application/oracle.com.cloud.common.DbZone+json
  - `name`: Zone1
  - `type`: self_service_zone
  - `uri`: /em/cloud/dbaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
  - `media_type`: application/oracle.com.cloud.opc.OpcZone+json
  - `name`: OPC Zone
  - `service_family_type`: opc
  - `type`: opc
  - `uri`: /em/cloud/opc/opczone
  - `media_type`: application/oracle.com.cloud.common.Zone+json
  - `total`: 3

Here, we see that the 'zones' attribute contains three attributes, elements, **media_type**, and total. Their meanings are described in **Cloud Resource Models**.

We wish to focus on the first zone listed, so we use the square bracket (list indexing) syntax:

**Paused:** `Cloud.zones.elements[0]`
- `media_type`: application/oracle.com.cloud.jaas.Zone+json
  - `name`: Zone1
  - `service_family_type`: jaas
  - `uri`: /em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51

We can further specify that we wish to focus on the 'uri' attribute by adding another dot-operator:

**Paused:** `Cloud.zones.elements[0].uri`
/em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
To view the resource to which that URI refers, we add the arrow (traversal) operator:

```plaintext
Paused: Cloud.zones.elements[0].uri->
context_id: A1B44A4EBCC4563125D9D0A3AAE4FD51
description: Zone for Physical Pool
media_type: application/oracle.com.cloud.jaas.Zone+json
name: Zone1
resource_state:
  state: READY
service_family_type: jaas
service_instances:
  elements: []
  media_type: application/oracle.com.cloud.common.ServiceInstance+json
  total: '0'
uri: /em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
```

As you would expect, you can continue to add to your path expressions, for instance you can write "multi-hop" expressions that traverse multiple URIs, e.g. …

```plaintext
Paused:
Cloud.service_templates.elements[0].uri->zones.elements[0].name
Zone1

Paused:
Cloud.service_templates.elements[0].uri->zones.elements[0].uri->
context_id: A1B44A4EBCC4563125D9D0A3AAE4FD51
description: Zone for Physical Pool
media_type: application/oracle.com.cloud.jaas.Zone+json
name: Zone1
resource_state:
  state: READY
service_family_type: jaas
service_instances:
  elements: []
  media_type: application/oracle.com.cloud.common.ServiceInstance+json
  total: '0'
uri: /em/cloud/jaas/zone/A1B44A4EBCC4563125D9D0A3AAE4FD51
```

In the above example, the service_templates attribute of the Cloud is used to identify the first service template. We then traverse its URI to get to the template, where we identify the first zone in its list of supported zones. We then traverse its URI to get to the full definition of the zone. In most cases the traversal operator is sufficient, but if there is no default media-type defined for the URI, you may need to specify the media-type to be retrieved, as specified in Cloud Resource Models. In the following example, we provide a media type even though it wasn't needed.

```plaintext
Paused:
Cloud.service_templates.elements[0].uri->
["application/oracle.com.cloud.jaas.JavaPlatformTemplate"]
```

```plaintext
context_id: D2520A0CFFE34BCE040F20A4C1B2D8F
created: '2013-01-02 09:35:52.0'
default_instance_media_type:
application/oracle.com.cloud.jaas.JavaPlatformInstance+json
...
```

Similarly, you can use the traversal qualifier syntax to specify request parameters as defined in Cloud Resource Models. For example:

```plaintext
Paused:
Cloud.service_templates.elements[0].uri->[created, resource_state]
created: '2013-01-02 09:35:52.0'
```
56.6.6 Eval or Blueprint Expressions

An 'eval' (aka 'blueprint') expression is any expression you can include in your blueprint.

**Example: Simple Intrinsic Function Evaluation**

Eval expressions can be evaluated in the debugger via the ‘e’ or ‘eval’ command. After entering the command, you enter the lines that comprise the expression followed by an empty line. Suppose you want to experiment with the f_concat intrinsic:

```plaintext
Paused: e
Eval: f_concat:
Eval:  - xxx
Eval:  - yyy
Eval:
xxxxyyy
Paused:
```

You enter the call to f_concat (in 3 lines) and the value is printed after you terminate the expression with an empty line.

This time you nest another call:

```plaintext
Paused: e
Eval: f_concat:
Eval:  - xxx
Eval:  - f_path:
Eval:    - 'Inputs.DbPassword.Value'
Eval:  - yyy
Eval:
xxxxmySecretyyy
Paused:
```

As you can see, this provides a way to experiment with snippets of blueprint.

**Example: Lookup Intrinsic Function**

In this example, suppose your blueprint includes the use of f_getTemplateURI to look up a template URI:

```plaintext
Resources:
  MyDB:
    Container:
      f_getTemplateURI:
        - Small DB
        - dbaas

If you think the wrong URI is being returned, you can check like this...
```

```plaintext
Paused: e
Eval:  f_getTemplateURI:
Eval:    - templatel
Eval:    - jaas
Eval:
/em/cloud/jaas/javaplatformtemplate/5FAB458D36BD8A7EE040E50A038F6D45
Paused:
```
This shows the URI value returned by `f_getTemplateURI` with the arguments you entered.

### 56.6.7 Intrinsic Functions

Intrinsic functions are functions that blueprints can use to compute/return desired information. For instance, the `f_concat` function returns the concatenation of its string arguments and the `f_getZoneURI` function looks up and returns the URI of a zone. The normal usage of intrinsic functions is to provide values needed as part of the Resources and Outputs sections, but an intrinsic function can be placed wherever a literal value is allowed. For instance, one can use an intrinsic to derive the DefaultValue used for an Input parameter.

This section describes the currently available intrinsic functions.

#### 56.6.7.1 Evaluation Intrinsics

These two intrinsics are used to evaluate expressions (of different types) and return a single value.

##### 56.6.7.1.1 `f_path(pathExpr)`

Apply the `pathExpr` string to the blueprint document, returning the specified value.

**Parameters**

- **pathExpr**: e.g. “member.subMember…”

  A path expression that describes how to traverse and extract information from the document. See Path Expressions.

##### 56.6.7.1.1.1 Example - Value from Data Section

To specify a resource’s property value using a literal value defined in the Data section of your blueprint …

```plaintext
...  
params:
  MasterUser:
    f_deref:
      - "Data.QADBCreds.user"
...  
```

##### 56.6.7.1.1.2 Example 2 - Value from Inputs Section

To do the same as above, only using an input parameter value …

```plaintext
...  
params:
  MasterUser:
    f_deref:
      - "Inputs.my_param.value"
...  
```

##### 56.6.7.1.1.3 Example 3 - Default Input Parameter Value via Cloud Lookup
Intrinsic functions can appear in sections other than the Resources section. For instance, this blueprint shows the use of f_path in the Inputs section.

**Inputs:**

JavaSvcZone:
- **DefaultValue:**
  - f_path:
    - 'Cloud.zones.elements[0].name'
  - Type: String
  - Prompt: Enter the name of a jaas zone

... 

The blueprint author here wants to provide an arbitrary default zone name, so the path expression selects the first zone that appears in the ‘zones’ attribute of the cloud. The default value (shown in the prompt) is computed at runtime:

**Input Parameter Value Entry**

```
 Enter the name of a jaas zone (east_coast_zone):
```

### 56.6.7.1.2 f_eval(blueprintExpr)

Evaluate blueprintExpr, returning the specified value. See Eval or Blueprint Expressions for information on blueprint expressions.

**Parameters**

- **blueprintExpr**: YAML text to be evaluated as if it appeared in a blueprint.

### 56.6.7.1.2.1 Example (Contrived)

The f_eval intrinsic is used internally by the blueprint processor, and it's unlikely you will need to use it. (You just use the blueprint expression directly.) One reason you might want to use this function is if you have a variable whose value is a blueprint expression in the form of a YAML string.

**Data:**

- demoOfYamlMultilineText: |
  This is a multi-line text string which is carefully indented. :-)
- myBlueprintExpressionText: |
  f_concat:
  - 'Mister '
  - 'Mxyzptlk'

**Outputs:**

- demoOfYamlMultilineText:
  Value:
  - f_path:
    - 'Data.demoOfYamlMultilineText'
- myBlueprintExpressionText:
  Value:
  - f_path:
    - 'Data.myBlueprintExpressionText'
- useOfEvalOnExpressionText:
  Value:
  - f_eval:
    - f_path:
      - 'Data.myBlueprintExpressionText'
Which results in this output:

18:49:58 INFO: Output Processing
18:49:58 INFO: -----------------
18:49:58 INFO:
18:49:58 INFO: Output values specified: 3
18:49:58 INFO: Value of demoOfYamlMultilineText: This is a multi-line text string which is carefully indented. :-)
18:49:58 INFO: Value of myBlueprintExpressionText: f_concat:
- 'Mister '  
- 'Mxyzptlk'

56.6.7.2 Resource Access Intrinsic

These intrinsics are used to access resource attributes. As part of their operation, unlike f_path, they assure that the resource is in the READY state, waiting if needed.

56.6.7.2.1 f_getResourceAttr(bpResName, pathExpr)

Get the value of a cloud resource attribute after it is READY.

**Parameters**

- **bpResName**: Resource name (specified in blueprint)
- **pathExpr**: Same semantics as used in f_deref, only against the document of the cloud resource identified by bpResName.
- **Returns**: result of evaluating pathExpr of the resource, once it is created and its resource_state is READY.

**Example 1**

To add an application to a MW platform, an Application resource can use this Container clause...

Container:

```
f_getResourceAttr:
  - myJavaPlatform
  - uri
```

**Example 2**

To access the name of the zone in which your MW platform was created, you can write...

```
f_getResourceAttr:
  - myPlatform
  - zone.name
```

56.6.7.2.1.1 f_getResourceURI(bpResName)

Get the URI for a blueprint-defined resource. This is just a shorthand for using f_getResourceAttr with the specified attribute being ‘uri’.

**Parameters**

- **bpResName**: Name used in the blueprint resource definition.
• **Returns**: URI

**Example**
To define a Datasource resource that is to be contained in a JavaPlatformInstance resource created elsewhere in your blueprint...

```
MyDatasource:
  Type: Datasource
  Container:
    f_getResourceURI:
      - MyJavaServer
```

### 56.6.7.3 Lookup Intrinsics

These intrinsics search for a template, zone, or application component, returning its URI.

#### 56.6.7.3.1 `f_getTemplateURI(name, type)`

Get the URI for a template, based on its name and type.

**Parameters**
- **name**: Template name
- **type**: A service type name. The current list of allowed values is iaas, jaas, and dbaas
  
- **Returns**: URI

**Example**
A blueprint resource to create a database using template simpleDb, could be written...

```
Container:
  f_getTemplateURI:
    - simpleDb
    - dbaas
```

#### 56.6.7.3.1.1 `f_getZoneURI(name, type)`

Get the URI for a zone, based on its name and type.

**Parameters**
- **name**: Zone name
- **type**: A service type name. The current list of allowed values is iaas, jaas, and dbaas
  
- **Returns**: URI

**Example**
To get the URI of zone EMEA_db_zone...

```
f_getZoneURI:
  - EMEA_db_zone
  - dbaas
```
56.6.7.3.1.2 \texttt{f\_getAppCompURI(name, owner, version)} ...

Get the URI for an application component, based on its name, owner, and version.

**Parameters**

- **name**: Application component name
- **owner**: Owner of application component
- **version**: Version of application component. If blank, the latest version is used.
- **Returns**: URI

**Example**

To get the URI of the most recent version of the application component \texttt{jbcomponent}, owned by \texttt{SSA\_USER1} ...

\begin{verbatim}
  f\_getAppCompURI:
  - jbcomponent
  - SSA\_USER1
  -
\end{verbatim}

Note that the third argument is required.

56.6.7.4 Debugging Intrinsics

These intrinsics are used to establish breakpoints or printpoints.

56.6.7.4.1

\begin{verbatim}
f\_break(expression, [breakpointMessage])
\end{verbatim}

Pause evaluation of the blueprint, print optional message, and enter blueprint debugger.

**Parameters**

- **expression**: any blueprint expression
- **breakpointMessage**: Message to be printed when the intrinsic function is invoked, just prior to entering the debugger.
- **Returns**: Value of expression. This is computed when the ‘continue’ command is entered.

**Note**: See Debugging with the Blueprint Processor for examples and other information on how to use breakpoints to help debug your blueprints.

56.6.7.4.2 \texttt{f\_print(expression, [printpointMessage])}

Print a line that displays the value of expression. Pause evaluation of the blueprint, print optional message, and enter blueprint debugger.

**Parameters**

- **expression**: any blueprint expression
• **printpointMessage**: Message to be printed when the intrinsic function is invoked, just prior to entering the debugger.

• **Returns**: Value of expression.

**Note**: The line printed looks like this:

```python
>>> Printpoint [<printpoint message>]:

Value = <expression>
```

See [Debugging with the Blueprint Processor](#) for examples and other information on how to use breakpoints to help debug your blueprints.

### 56.6.7.5 Other Intrinsics

```python
f_concat(string1, … stringN):
```

Returns the concatenation of the string arguments.

**Parameters**

- **string***: A string to be concatenated with the other string arguments

**Example**

To set the description of a JavaPlatformInstance to “Created by blueprint FOO on <current date>” ...

**Resources**:

- **MyJavaServer**:
  ```
  ...
  Properties:
  - description:
    - f_concat:
    - "Created by blueprint FOO on "
    - f_path:
    - "info.date"
  ...
  ```

### 56.7 Dealing with Errors

This section illustrates various types of errors you may encounter and, by example, how to interpret/resolve the issues.

#### 56.7.1 YAML Syntax Errors

Any syntax errors encountered by the YAML parser are diagnosed by the parser. Consider this blueprint snippet...

```yaml
# Example of YAML syntax error
Data:
  - userId: Lex
  - password: changeMe
  ...
```

In the above example, the YAML parser would detect an indentation error and diagnose it like this:
18:55:59 ERROR: Error loading blueprint YAML:
while parsing a block mapping
  in "<string>", line 2, column 1:
   Data:
     ^
expected <block end>, but found '<block mapping start>'
  in "<string>", line 4, column 3:
    password: changeMe
     ^

The second half of the diagnostic, the "expected" part, is usually the most helpful. In this case, it tells you the error was detected at the token 'password', what it was expecting, and what it found. One common error to avoid is the use of tabs in the YAML file. YAML does not allow tab characters.

56.7.2 Protocol Version Mismatch

A diagnostic like this...

Blueprint Processor - Invocation Summary
----------------------------------------
Cloud URI:              http://xyxy.example.com:4473/em
User:                   sysman
Blueprint file:         examples/evalintrinsic.yml
Timeout:                90 minutes, 0 seconds
Refresh frequency:      15 seconds
Inputs:                
Pause points:           Inputs, Termination
Debug logging:          False
Instance name:          default_instance_name
Versions:               
  Blueprint processor: 12.1.0.4 May 25
  Cloud protocol:      10001

19:05:06 INFO: Connecting to cloud: http://xyxy.example.com:4473/em

The diagnostic in bold, indicates that the blueprint processor was able to connect to the site but did not get the expected response. In particular, the site returned no x-specification-version value as part of the HTTP response. This can happen if you specified an incorrect cloud URI. For instance, in the above example, the URI was not of the form

https://host:port/em/cloud

A common mistake is to omit the "cloud". Also, do not forget to use https, not http. If the diagnostic indicates it found a protocol version that is lower than the one expected, that may indicate that you are using a version of the blueprint processor that requires a more recent version of Enterprise Manager.

56.7.3 Expression Evaluation Error

As part of blueprint processing, an attempt to evaluate an expression may result in an error. Examples of errors include:

- Passing the wrong number of parameters to an intrinsic function
- Referring to a non-existent intrinsic function
• Referring to a non-existent cloud resource such as a zone or template

When an expression evaluation error occurs, the issue is diagnosed and the expression is displayed. For instance, consider this contrived blueprint:

Outputs:
ExampleValue:
Value:
  f_concat:
  - MyApp

To keep the example short, the blueprint only has an Outputs section and one expression, which is a call to f_concat. Notice that f_concat requires at least two parameters, but only one is provided. When the blueprint processor is run for this blueprint, this is displayed:

15:26:25 INFO: Output Processing
15:26:25 INFO: -----------------
15:26:25 INFO: Output values specified: 1
15:26:25 ERROR: Value of ExampleValue: Expression could not be evaluated.
Error is...
15:26:25 ERROR: Function macro concat requires parameter count between 2 and 99, not 1
15:26:25 ERROR: Expression being evaluated at the time:
15:26:25 ERROR: {'f_concat': ['MyApp']}
15:26:25 INFO: 

The blueprint processor attempts to print the value of 'ExampleError' when the error occurs. After displaying the diagnostic, the expression being evaluated at the time of the error is displayed (in JSON notation). Expressions are generally nested, and the error may occur within a subexpression. In that case, the diagnostic includes an expression stack, so that you can see the specific expression in error as well as the outer context. For instance, consider this contrived blueprint:

Outputs:
ExampleValue:
Value:
  f_concat:
  - aaa
  - bbb
  - f_concat:
  - ccc

Notice that the expression involves two uses of f_concat. The outer use is correct, but there is an error with the inner use. When the blueprint processor is run for this blueprint, this is displayed:

15:42:50 INFO: Output Processing
15:42:50 INFO: -----------------
15:42:50 INFO: Output values specified: 1
15:42:50 ERROR: Value of ExampleValue: Expression could not be evaluated.
Error is...
15:42:50 ERROR: Function macro concat requires parameter count between 2 and 99, not 1
15:42:50 ERROR: Expression evaluation stack follows (with failed expression at bottom) ... 
15:42:50 ERROR: ----- 
15:42:50 ERROR: | Expr: {'f_concat': ['aaa', 'bbb', {'f_concat': ['ccc']}]} 
15:42:50 ERROR: | Expr: {'f_concat': ['ccc']}
The expression evaluation stack shows the outer expression at the top and the expression with the error at the bottom. This stack only has two levels but in general there are many levels and each level of evaluation is shown. (The next example illustrates a multi-level expression evaluation stack.) When a macro is evaluated, its definition is expanded and this expansion is shown in the expression evaluation stack. For instance, consider this contrived blueprint:

Outputs:
  ExampleValue:
    Value:
      f_getZoneURI:
        - myZone
        - jaas

In this case, the expression is a call to \texttt{f\_getZoneURI} and the error is that the zone 'myZone' does not exist. When the blueprint processor is run for this blueprint, this is displayed:

15:57:17  INFO: Output Processing
15:57:17  INFO: -----------------
15:57:17  INFO:
15:57:18  ERROR: Value of ExampleValue: Expression could not be evaluated.
Error is...
15:57:18  ERROR: Name not found: myZone
15:57:18  ERROR: find_one for predicate \{'f\_EQ': \{'f\_pathc': \{'name\'}\}, 'myZone'\} failed
15:57:18  ERROR: Expression evaluation stack follows (with failed expression at bottom) ...
15:57:18  ERROR: ----- 
15:57:18  ERROR: |   Expr: \{'f\_getZoneURI': \{'myZone', 'jaas'\}\}
15:57:18  ERROR: |   Expr: \{'f\_pathc': \{'f\_findByName': \{'f\_pathc': \{'f\_path': \{'Cloud.service_family_types.elements\'}, 'jaas'\}, '\.uri->.zones.elements'\}, 'myZone'\}, '\.uri'\}\}
15:57:18  ERROR: |   Expr: \{'f\_findByName': \{'f\_pathc': \{'f\_findByName': \{'f\_path': \{'Cloud.service_family_types.elements\'}, 'jaas'\}, '\.uri->.zones.elements'\}, 'myZone'\}\}
15:57:18  ERROR: |   Expr: \{'f\_findOne': \{'f\_pathc': \{'f\_findByName': \{'f\_path': \{'Cloud.service_family_types.elements\'}, 'jaas'\}, '\.uri->.zones.elements'\}, \{'f\_EQ': \{'f\_path': \{'name\'}\}, 'myZone'\}, \{'f\_concat': \{'Name not found: ', 'myZone'\}\}\}

When the error is detected, a diagnostic is displayed: "Name not found: myZone". In this case, the error should be clear and you need not bother reading further.

But to illustrate how macro expansion and multi-level nested expressions are shown in the expression evaluation stack, we continue walking through the example. The top line of the stack shows the outer expression, which is what was specified in the blueprint as the expression for 'Value'. Because the \texttt{f\_getZoneURI} intrinsic is implemented as a macro, line 2 of the expression evaluation stack shows the expression after macro expansion. (It is long, so line wrapping is needed.)

Line 3 shows the subset of line 2 that was being evaluated when the error occurred and line 4 shows the same expression after the \texttt{f\_findByName} macro was expanded.
Note:
Intrinsic macros use some internal functions, which is why you see names like f_pathc.

56.7.4 Cloud Resource Creation Error

In the previous example, the failure to create a resource was detected some time after the request was accepted. In some cases, the request to create may fail immediately. If an error occurs while attempting to create a resource, you will see a diagnostic that identifies the resource, the error code, and some diagnostic text. In the following example, the attempt to create a resource name MyJavaPf failed with an HTTP code of 500. Reading further, you can see diagnostic text like, “cannot process request for …”, “Unable to start the Instance deployment”, and "stack_trace_cause": "java.lang.IllegalArgumentException: Unable to service executable from service template..."

```
14:43:37 INFO:          MyJavaPf
14:43:37 INFO:         /    
14:43:37 INFO:        /    MyDatasource
14:43:37 INFO:       /    /  
14:43:38 INFO:   -----------
14:43:38 INFO:   | e  |    |
14:43:38 INFO:   | es |    |
14:43:42 ERROR: Failure creating resource MyJavaPf: 500
{

      "stack_trace": 
```
```
In this example, the HTTP code is 500. Any code that begins with a 5 indicates that the cloud server encountered an unexpected exception. This could be due to an environment issue or even a bug in the server software. Since a 5xx code reflects a server error, you should contact the self service administrator. In other cases, you may see a 4xx error code, which is returned when the client seems to have erred. In such cases, you should check the ‘hint’ and ‘message’ information for clues as to what went wrong, because you may be able to correct an error you made. The blueprint processor lists the diagnostic information it receives, but for security reasons, the cloud server may not provide sufficient information to diagnose the issue. In this case, you should contact the self service administrator, who in turn can often diagnose the issue by reviewing the log files for the cloud request.

56.8 Simulation Mode

The blueprint processor simulation mode can be used to aid in developing and testing blueprints. In this mode, the requests normally sent to the cloud server are simulated as well as the results returned by the server. Otherwise the blueprint processing logic is the same. To run the blueprint processor in this mode, you simply do not specify a cloud URI, i.e. do not use the -c option on the command line.

One benefit of simulation mode is the speed with which you can run a blueprint and try variations. Normal running of blueprints involves cloud requests for which the processing may be quite time consuming. When in simulation mode, the default behavior is that requests to create each resource consume 2 seconds and then succeed. Another benefit is the ability to test various possibilities. For each resource, you can specify the simulated processing time as well as whether the request succeeds or fails. To do this for a given resource, use the Simulation attribute when defining a resource. For example:
MyJavaServer1:
   Container:
      f_getTemplateURI:
         - Small WLS
         - jaas
   Properties:
      destination_zone:
         f_getZoneURI:
            - MyZone
            - jaas
   params:
      user: app_user
      password: pw_you_should_change
   Simulation:
      delay: 3
      result: f

In the above example, creation of MyJavaServer1 will fail after 3 seconds.

56.9 Debugging with the Blueprint Processor

In addition to running the blueprint processor such that it deploys the blueprint and runs to completion, there are mechanisms you can use to debug blueprints. These are akin to mechanisms you may have used for debugging other applications, like print statements and the use of a debugger to interactively display values used by your application. To enter the debugger at a particular point of execution, you can use either of two mechanisms. The simpler approach, which will usually be sufficient, is to use command line options that cause execution to pause between processing phases. These are called “pause points” and are described below. The alternative approach enables you to break at a more specific point, such as just prior to evaluating an expression for a specific resource’s property. To do this, you edit the blueprint to include a breakpoint. When either a pause point or breakpoint is reached, control is transferred to the “debugger”. In the debugger, you enter various commands to display contents of the blueprint as well as that of the cloud to which you are connected.

56.9.1 Printing Intermediate Results

The essence of blueprint processing is to evaluate expressions and create resources once all required expressions have been evaluated. At any point during evaluation of an expression, you may wish to see some intermediate results to confirm the value is what you expected. To do so, you use the intrinsic function f_print.

Wherever an expression can appear in a blueprint, you simply nest it in a call to print. Optionally, you can include a second text message argument. When print is encountered, the text message and expression value are printed.

Examples This (contrived) example shows how you plan to use a lookup table to access a template name for use in a call to f_getTemplateURI.

Data:
   MyTemplates:
      - {name: DbTemplate, type: dbaas}
      - {name: MWTemplate, type: jaas}
   ...
Resources:
   MyDB:
      Container:
Suppose the code is not behaving as you intend, and you want to view the intermediate results before passing the name to `f_getTemplateURI`. Wrap the expression in a call to `f_print` like this:

```python
Data:
    MyTemplates:
    - {name: DbTemplate, type: dbaas}
    - {name: MWTemplate, type: jaas}
...
Resources:
    MyDB:
        Container:
            f_getTemplateURI:
                - f_print:
                - f_path:
                    - 'Data.MyTemplates[0].name'
                - dbaas
                Properties:
...
```

At runtime, the value of the expression is printed:

```
16:52:05 INFO: Resource State Timeline
16:52:05 INFO: -----------------------
16:52:05 INFO:        MyDB
16:52:05 INFO:       /-----
16:52:05 INFO:   |   |
>>> Print-point:
    Value = DbTemplate
...
```

A print point message can also be provided, which is useful when you have multiple print points in your blueprint:

```python
Data:
    MyTemplates:
    - {name: DbTemplate, type: dbaas}
    - {name: MWTemplate, type: jaas}
...
Resources:
    MyDB:
        Container:
            f_getTemplateURI:
                - f_print:
                - f_path:
                    - 'Data.MyTemplates[0].name'
                My printpoint for template name
                - dbaas
                Properties:
...
```

At runtime, the value of the expression is printed:
56.9.2 Pause Points

The easiest way to specify points at which to enter the debugger by using **pause points**. These are specified via command line options as described in [Running the Blueprint Processor](#). You can specify that the blueprint processor pause and the debugger entered at any of these points:

- Prior to evaluating the Input section and prompting for Input parameters
- Prior to evaluating the Resources section
- Prior to evaluating the Output section
- Prior to termination, but after output processing or detecting an error that will terminate processing
- When an error is encountered, just prior to termination

Once the debugger is entered, you can use the commands described in [Debugger Commands](#) below. To continue blueprint execution, enter the **continue** command.

**Example 1**

Suppose you just want to browse the cloud resources at your server. Specify the **-I** option, which drops you into the debugger before attempting any blueprint processing.

**Example 2**

It is often useful to specify the **-E** (or **—error_debug**) option, which drops you in the debugger if an error is encountered. (Otherwise, execution simply terminates.)

56.9.3 Breakpoints

Breakpoints are defined via the **f_breakpoint** intrinsic function as described in [Debugging Intrinsics](#). Whenever evaluation encounters an **f_breakpoint** invocation, the optional text string parameter value is printed and the debugger entered.

56.9.4 Debugger Commands

When you enter the debugger, you will see a prompt of "Paused:". At this prompt, there are several commands you can use including "help" or "h". For example:

`Paused: h`

Commands are...

- **p[ath] <path expression>:** evaluate path expr
- **e[val]:** read & evaluate blueprint expression
- **c[ontinue]:** continue blueprint instantiation
56.9.4.1 Path Command

The path command is used to evaluate arbitrary path expressions as described earlier in Path Expressions. (Unlike other debugger commands, the “p” or “path” keyword is not required.)

Example: Viewing values in blueprint

You can view values in your blueprint such as the value of an input parameter:

C:\bp> bp_processor.py -c https://...:15430/em/cloud -u sysman -p sysman -R xyzApp.yml ...Blueprint Processor - Invocation Summary

Cloud URI:                https://xyxy.example.com:15430/em/cloud
User:                     sysman
Blueprint file:           xyzApp.yml
Timeout:                  90 minutes, 0 seconds
Refresh frequency:        15 seconds
Inputs:
Pause points:             Resources
Debug logging:            False
Instance name:            default_instance_name
Graphical report dir:
Versions:
  Blueprint processor:   12.1.0.5, 10-Oct-2012
  Cloud protocol:        10001

Input Parameter Value Entry

Zone to use for db (Zone1):
Password to use for db (welcome1):

...Pause point, prior to processing Resources section...
For command info, enter (h)elp

Paused: path Inputs
DbPassword:
  DefaultValue: welcome1
  Prompt: Password to use for db
  Sensitive: true
  Type: String
  Value: mySecret
DbZone:
  DefaultValue: Zone1
  Prompt: Zone to use for db
  Type: String
  Value: Zone1

Paused: Inputs.DbPassword.Value
mySecret

Paused:
In the above example, the simple test blueprint specifies two input parameters, DbZone and DbPassword.

- When prompted, you accepted the default, for the first parameter by pressing **Enter**. For the second, you entered your password.
- Notice that your command line options included “-R”, which tells the blueprint processor to pause just prior to evaluating the Resources section of your blueprint. The **Paused** prompt appears, and you enter the **path** command with the path expression **Inputs**. The value of the Inputs section of the blueprint is then printed, namely the 2 input parameters and their values. The values include both those provided by the blueprint and the current runtime values, in this case **Zone1** and **mySecret**.
- You then simply entered a path expression. The **path** command is assumed if no explicit command is entered.

56.9.4.2 Continue Command

The continue command is used to resume blueprint processing. Example

Continuing the previous example...

Paused: Inputs.MyNum
{Sensitive: true, Type: Number, Value: '123'}

Paused: **continue**

56.9.4.3 Exit Command

The **exit** command terminates the blueprint processor.

56.9.4.4 Eval Command

The **eval** command is used to evaluate any expression you can include in your blueprint.

Example

Suppose you are debugging your blueprint and it appears to be failing when looking up a template by name. You can use the **eval** command to evaluate expressions that appear in your blueprint. First you try executing the expression of interest as it appears in your blueprint:

Paused: e
Eval: f_getTemplateURI:
Eval: - JaaS Template
Eval: - jaas
Eval: 18:05:01 ERROR: Name not found: JaaS Template
Expression evaluation stack follows (with failed expression & diagnostic at bottom) ...

```
| Expr: {'f_getTemplateURI': ['JaaS Template', 'jaas']}
| Expr: {'f_path': ['f_findByName': ['f_findByName': ['f_path':
Cloud.service_types.elements']], 'jaas']}, '.uri->
.service_templates.elements'], 'JaaS Template']], '.uri']}
| Expr: {'f_findByName': ['f_path': ['f_findByName': ['f_path':
Cloud.service_types.elements]], 'jaas']}, '.uri->.service
```
In the above example, you first enter the `eval` or `e` command. Then you enter the expression. Note that indentation is significant, as it always is in YAML. You see the same diagnostic you got when processing your blueprint, but now you can experiment with other values. Eventually, you realize that the template was created with two spaces in the name. You try with that name. It works, and the result of the expression evaluation, in this case a URI, is displayed.

```yaml
Paused: e
  Eval: f_getTemplateURI:
  Eval:   - JaaS  Template
  Eval:   - jaas
  Eval: /em/cloud/jaas/javaplatformtemplate/C086733BCCF2A4F3E040F10A716049A8
Paused:
```

56.10 Tips and Hints

This section lists a few tips and hints that may be useful while working with blueprints.

56.10.1 Editing YAML - Notepad ++ Example

YAML documents use indentation to denote containment semantics. This may affect your choice of editor or editing options. For instance, YAML does not allow tabs, so you should disable any editor options that cause automatic tab insertion. As an example, suppose you use Notepad++ (http://notepad-plus-plus.org). You would set the "replace by spaces" setting in Preferences -> Language Menu/Tab Settings. Better still, if your file has a suffix of ".yml", Notepad++ sets options to be suitable for YAML. For instance, it colorizes the text based on YAML syntax. If you do not use ".yml", you can manually set the language to YAML. (Settings -> Preferences -> Language Menu -> …)

56.10.2 YAML Duplicate and Name / Value Pairs

YAML requires that name/value pairs at the same level use unique names. Any duplicates override earlier occurrences. For instance, these two blueprints are equivalent:

```
Data:
  Password: doNotChangeMe
  UserId: QA_user
  Password: changeMe
Resources:
...
```

```
Data:
  UserId: QA_user
  Password: changeMe
```

---
56.10.3 Explicit Dependencies

Suppose your blueprint defines two resources X and Y. If creation of X depends on the successful creation of Y, there will usually be a data-dependency between the two. However, if that's not the case, you can include anywhere in the definition of ResourceX an expression like ...

```plaintext
f_getResourceAttr:
- ResourceY
- uri
```

56.10.4 Hint: Use ‘-T’ Option

While developing and testing your blueprint, it's a good idea to use the -T command line option. This tells the blueprint processor to drop you into the debugger prior to terminating for any reason. Should any results be unexpected, whether an outright error or just unexpected output, you can use the debugger to investigate.

Infrastructure as a Service REST APIs

This chapter describes the resource models for Infrastructure as a Service (IaaS) REST APIs and their responses. The first section provides a summary of all the REST APIs covered in this chapter whereas the following sections provide the IaaS resource models and other details.

- **Summary of Infrastructure as a Service REST APIs**
- **Infrastructure as a Service Resource Model**
  - Changes for Infrastructure as a Service
  - IaaS Zone [application/oracle.com.cloud.iaas.Zone]
  - AssemblyInstance [application/oracle.com.cloud.common.AssemblyInstance +json]
  - Scalability Group [application/oracle.com.cloud.common.ScalabilityGroup +json]
  - VM [application/oracle.com.cloud.common.VM+json]
  - VNet [application/oracle.com.cloud.common.VNet+json]
  - NetworkInterface [application/oracle.com.cloud.common.NetworkInterface +json]
  - VMTemplate [application/oracle.com.cloud.common.VMTemplate+json]
  - AssemblyTemplate [application/oracle.com.cloud.common.AssemblyTemplate +json]
  - IaasServiceFamilyType [application/oracle.com.cloud.iaas.IaasServiceFamilyType+json]
  - IaaS Quota Definition [application/oracle.com.cloud.iaas.Quota+json]
- **Infrastructure as a Service REST API Examples**
- **Support for Version 1000**

57.1 Summary of Infrastructure as a Service REST APIs

The table below shows a summary of all the IaaS REST APIs covered in this chapter.

<table>
<thead>

Note: In the table above, “supported” indicates that the operation is supported on the resource. However, there is no example in the chapter for this operation.

57.2 Infrastructure as a Service Resource Model

Infrastructure as a Service supports the compute, network, and storage resources that form the basics of IT components. The IaaS resource model supports common cloud interactions on these resources. The following diagram illustrates the high level resource relationships and how they are related to the common resources:

Figure 57-1  IaaS Resource Model
The following describes the resource models that are supported by the IaaS family type.

57.2.1 Changes for Infrastructure as a Service

The following describes the high level updates to the resources for Infrastructure as a Service:

Table 57-2  Cloud Service Portal 12.1.0.5

<table>
<thead>

57.2.3 AssemblyInstance [application/oracle.com.cloud.common.AssemblyInstance+json]

Extends: application/oracle.com.cloud.common.ServiceInstance

An AssemblyInstance is a logical grouping of resources from a deployment request of an Assembly template. The lifecycle of the resources in an AssemblyInstance can be managed centrally through the assembly instance.

Note: A service template of Assembly type is deployed into an AssemblyInstance.

The following table describes the AssemblyInstance Data Model.

Table 57-4  AssemblyInstance Data Model

57.2.4 Scalability Group [application/oracle.com.cloud.common.ScalabilityGroup+json]

Extends: application/oracle.com.cloud.common.ServiceInstance

The Scalability Group is a collection of servers and corresponding virtual networks. Scalability Group contains a collection of homogenous entities. The cloud service provider should enforce the semantics of “sameness”. Operations such as scale_out and scale_in of the scalability group may be supported by the provider in the homogenous scalability group.

The following table describes the ScalabilityGroup Data Model.
### Table 57-5  ScalabilityGroup Data Model

57.3 Infrastructure as a Service REST API Examples

The following sections provide examples of the different operations supported by the IaaS REST APIs:

- Creating a Service Instance
  - Creating a VM
    * POST to the IaaS Zone on which the VM is to reside
    * POST to the VM Template on Which the VM is to be Based on
  - Viewing Details of the VM Creation Status
  - Creating an Assembly Instance
- Updating a VM Service Instance
  - Changing the VM Status
  - Changing the VM Size
  - Adding a VM Disk
- Deleting a Service Instance
57.3.1 Creating a Service Instance

This section describes how to create a service instance using the Cloud resources.

57.3.1.1 Creating a VM

As VM is a service instance in the service family type “iaas”, you need to identify the zone of the same family type in which to create the VM. There are two approaches to creating a VM:

1. POST to the IaaS Zone on which the VM is to reside
2. POST to the VM Template on Which the VM is to be Based on

Note the attributes in the submitted body for the POST. The pattern is the same for other service instance creations. Because the intention is clear, the "zone" attribute is not required while POSTing to the "iaas" Zone. Similarly, the "based_on" attribute is not needed when POSTing to the VMTemplate.

57.3.1.1.1 POST to the IaaS Zone on which the VM is to reside

The following shows the configuration for POSTing to Iaas Zone:

Table 57-17    POST Request Configuration for Creating a VM by Passing a Request on the IaaS Zone

<table>

                         "root_password":"welcome1"  
                         }  
                         }|

Request method  POST

Supported since release  12.1.0.1 Cloud Service Portal plug-in

A sample of the response received from the above interaction is shown below.
57.3.1.1.2 POST to the VM Template on Which the VM is to be Based on

The following describes the configurations for POSTing to the VMTemplate:

Table 57-18  POST Request Configuration for Creating a VM by Passing a Request on the VM Template

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CD8A817FA%3A0.1</code></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXIxI6ZGVtb3VzZXI=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
<tr>
<td>Body</td>
<td><code>{  &quot;zone&quot;: </code>/em/cloud/iaas/zone/D73AF0D42C8459E11419862797DF37D&quot;,  &quot;cpu&quot;: [2,0],  &quot;memory&quot;: &quot;512&quot;,  &quot;params&quot;:  {    &quot;server_prefix&quot;:&quot;STPOST&quot;,    &quot;vnc_password&quot;:&quot;welcome1&quot;,    &quot;root_password&quot;:&quot;welcome1&quot;  }}`</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.4 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

A sample of the response received from the above interaction is shown below.

```json
{
  "uri": "/em/cloud/iaas/server/byrequest/101",
  "name": "VDOSI VM Creation 1345391921407",
  "resource_state": [
    "state": "INITIATED",
    "messages": []
  ],
  "context_id": "102",
  "media_type": "application/oracle.com.cloud.common.VM+json",
  "service_family_type": "iaas",
  "created": "2012-08-19T16:09:02+0000"
}
```
This response is the same as the previous version.

If the zone is not specified, then it is not possible for the Web service to determine where the VM should be deployed. The following interaction illustrates this:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.com/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB563E5E13E040578CDA817FAF%3A0.1">https://example.com/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB563E5E13E040578CDA817FAF%3A0.1</a></td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
<tr>
<td>Body</td>
<td>{ &quot;cpu&quot; : [2,0], &quot;memory&quot; : &quot;512&quot;, &quot;params&quot; : { &quot;server_prefix&quot; : &quot;STPOST&quot;, &quot;vnc_password&quot; : &quot;welcome1&quot;, &quot;root_password&quot; : &quot;welcome1&quot; } }</td>
</tr>
</tbody>
</table>

The following is the response from the Web service:

```json
{
    "messages" : [
        {
            "hint" : "'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource",
            "stack_trace" : "oracle.sysman.emInternalSDK.ssa.cloudapi.rest.RestServletException: 'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource\n\tat oracle.sysman.emInternalSDK.ssa.cloudapi.rest.RestServletException: 'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource\n\tat oracle.sysman.emInternalSDK.ssa.cloudapi.rest.RestServletException: 'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource\n\tat oracle.sysman.emInternalSDK.ssa.cloudapi.rest.RestServletException: 'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource\n\tat oracle.sysman.emInternalSDK.ssa.cloudapi.rest.RestServletException: 'zone' attribute needs to be specified to complete 'POST' request for 'application/oracle.com.cloud.common.VM' resource
}
```
57.3.1.2 Viewing Details of the VM Creation Status

After passing the POST request to create the VM, you can issue the GET request on the resource identified by the return URI to keep track of the VM creation status. See the table below for a sample GET request configuration for viewing the VM creation details.

**Table 57-20** GET Request Configuration for Viewing Details of the VM Creation Status

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/byrequest/101</td>
</tr>
<tr>
<td>Request header</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri": "/em/cloud/iaas/server/byrequest/101",
  "name": "VDOSI VM Creation 1345391921407",
  "resource_state": {
    "state": "CREATING",
    "messages": [
      {
        "text": "The Request with ID '101' is being processed, and has Job Id 'C7999760937CCB98E040578CDAA8170D96'",
        "date": "2012-08-19T16:14:11+0000"
      }
    ]
  },
  "context_id": "101",
  "media_type": "application/oracle.com.cloud.common.VM+json",
  "service_family_type": "iaas",
  "created": "2012-08-19T15:58:42+0000"
}
```
Note that the `resource_state` attribute is showing `CREATING` state to indicate the VM is still being created. Once the VM is created, the same GET will return the VM resource with "READY" state, as shown below:

```json
{
    "uri": "/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095",
    "name": "STPOST",
    "resource_state": {
        "state": "READY"
    },
    "context_id": "C5CA59AF9386975E8AEA45B0F040F095",
    "media_type": "application/oracle.com.cloud.common.VM+json",
    "metrics": {
        "media_type": "application/oracle.com.cloud.common.Metric+json",
        "total": "4",
        "elements": [
            {
                "uri": "/em/cloud/metric/iaas%3Avm%3ACPU_Utilization",
                "name": "CPU_Utilization",
                "media_type": "application/oracle.com.cloud.common.Metric+json",
                "type": "NUMBER",
                "current_value": "",
                "current_time": "2012-08-19T16:17:02+0000"
            },
            {
                "uri": "/em/cloud/metric/iaas%3Avm%3ATotal_Network_Throughput",
                "name": "Total_Network_Throughput",
                "media_type": "application/oracle.com.cloud.common.Metric+json",
                "type": "NUMBER",
                "current_value": "",
                "current_time": "2012-08-19T16:17:02+0000"
            },
            {
                "uri": "/em/cloud/metric/iaas%3Avm%3ATotal_Disk_Throughput",
                "name": "Total_Disk_Throughput",

  </LocalDisks>
</HardwareConfiguration>
The "deploy_plans" attribute contains both the default deployment plan for each zone and the preconfigured deployment plans that are accessible by the user for this service template. To create an assembly instance, the deployment plan should be used.

The configuration specified in the "params" is the primary configuration. In addition, deployment plans can be used to describe detailed product and resource configurations. There are some product configurations where "<Required>true</Required>", and they should also be updated to capture the product configuration values.

The following table shows an example of a POST request to create an assembly instance:

|                 | \n

Request method  POST

A sample of the response received is shown below.

```json
{
   "uri" : "/em/cloud/iaas/assemblyrequest/223" ,
   "name" : "VDOSI Assembly Creation 1345575147280" ,
   "resource_state" : {   
      "state" : "INITIATED" ,
      "messages" : [   
         {   
            "text" : "The Request with ID '223' is scheduled with Job Id 'C7CB0EBE83C22D70E040578CDA8126E6'" ,
            "date" : "2012-08-21T18:52:31+0000"
         }   
      ]
   },
   "context_id" : "223" ,
   "media_type" : "application/oracle.com.cloud.common.AssemblyInstance+json" ,
   "service_family_type" : "iaas" ,
   "status" : "SCHEDULED" ,
   "created" : "2012-08-21T18:52:28+0000"
}
```

To track the status of the Assembly Instance creation issue a GET request on the returned URI. See the table below for details.

Table 57-23  GET Request Configuration for Viewing Details of the Assembly Instance Creation Status

<table>
<thead>
<tr>

57.3.2 Updating a VM Service Instance

A service instance may be resized, its status updated, or additional resources added.

The VM resource supports the following changes:

- The "status" can be updated (for example, from STARTED to STOPPED or from STOPPED to STARTED). See, Changing the VM Status.
- The "cpu" and "memory" can be updated (for example to resize the VM). See, Changing the VM Size.

Note:
For the 12.1.0.4 Cloud Self Service Portal release, VM is no longer required to be STOPPED before modifying the "cpu" and "memory".
- Additional resources, for example a VM disk can be added. See, Adding a VM Disk.
- Any updates supported on the VM resource from 10000 version are also supported on the 10001 version of the resource.

57.3.2.1 Changing the VM Status

The following shows the GET of the VM's status:

Table 57-24  GET Request Configuration for Viewing the Current Status of the VM

```
{
  "uri" : "/em/cloud/iaas/server/vm/C5CA59AF9386975E88E4A580F040F095",
  "status" : "STARTED"
}
```

To update the status, use the PUT method to the resource "uri". Note that the "uri" attribute is the one that directly references to the resource.
<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: &quot;STOPPED&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The Web service response displays the 200 response code, along with the current VM attributes.

To confirm the status of the VM issue the following GET request on the VM:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/byrequest/101?status,uri</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The Web service returns the following:

```json
{
  "uri": "/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095",
  "status": "STOPPED"
}
```

Attempting to submit a PUT transient status value would result in the following:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095</td>

"hint": "Status 'STOPPING' specified by the PUT request is transient, and is not a valid status",
"text": "Did not successfully execute 'PUT' resource operation on 'application/oracle.com.cloud.common.Cloud' identified by '/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095'"
```
```
}
```
```

Attempting to submit the existing status to the VM will result in the following interaction:

Table 57-28  PUT Request Configuration for Changing the VM Status to the Current Status

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095?resource_state</td>
</tr>
</tbody>
</table>
Table 57-28  (Cont.) PUT Request Configuration for Changing the VM Status to the Current Status

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;status&quot;: &quot;STOPPED&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The web service responds with the following:

```json
{
   "resource_state": {
      "state": "READY",
      "messages": [
         {
            "date": "2012-08-19T17:23:49+0000",
            "text": "Current Virtual Machine Status 'STOPPED' is the same as the requested status. Status change is not needed"
         }
      ]
   }
}
```

When modifying a service instance, the messages communicated will be encapsulated in the `resource_state` attribute. For example, to START the VM again, the following PUT request can be issued:

Table 57-29  PUT Request Configuration for Starting the VM

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td><a href="https://example.com/em/cloud/iaas/server/vm/C5CA59AF9386975E8AE45B0F040F095?resource_state">https://example.com/em/cloud/iaas/server/vm/C5CA59AF9386975E8AE45B0F040F095?resource_state</a></td>
</tr>
<tr>
<td>Headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=Content-Type: application/oracle.com.cloud.common.VM+json</td>

<td>&quot;status&quot;: &quot;STARTED&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Method</td>
<td>PUT</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The web service will respond with the following:
57.3.2.2 Changing the VM Size

The CPU and Memory of a VM can be adjusted to increase or decrease the capacity. For example, to adjust the VM's CPU to 1 vCPU and increase the memory from 512 to 1024, the following PUT request can be issued:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095?resource_state</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
<tr>
<td>Body</td>
<td>{ &quot;cpu&quot;:[1,0], &quot;memory&quot;:&quot;1024&quot; }</td>
</tr>
<tr>
<td>Request method</td>
<td>PUT</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "resource_state": {
        "state": "READY",
        "messages": [
            {
                "text": "PUT resource operation on 'application/oracle.com.cloud.common.VM' identified by 'C5CA59AF9386975E8AEA45B0F040F095' is successfully submitted with reference '106'",
                "date": "2012-08-20T01:15:28+0000"
            }
        ]
    }
}
```

After some time, the new capacity is reflected in the VM resource through the GET request:
**Table 57-31   GET Request Configuration for Viewing the Current Size of the VM**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AE45B0F040F095?resource_state,cpu,memory,status</td>
</tr>
<tr>
<td>Request header</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "resource_state": {
    "state": "READY"
  },
  "status": "STARTED",
  "cpu": [
    "1",
    "0"
  ],
  "memory": "1024"
}
```

### 57.3.2.3 Adding a VM Disk

An additional disk may be added to the VM resource. For example, to add two additional disks, the following PUT request can be issued:

**Table 57-32   PUT Request Configuration for Adding a VM Disk**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AE45B0F040F095?resource_state</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=Content-Type: application/oracle.com.cloud.common.VM+json</td>
</tr>
</tbody>
</table>
| Body        | {
  "disks": [
    ["additional_1","5120"],
    ["additional_2","10240"]
  ]
} |
| Parameters/Constraints | If an entry in the "disks" attribute is new, then a new disk would be added. If an entry in the "disks" attribute exists already, then, it would be ignored. |
| Request method | PUT |
| Supported since release | 12.1.0.5 Cloud Service Portal plug-in |
A sample of the response received is shown below.

```
"resource_state" : {  
  "state" : "READY" ,  
  "messages" : [  
    {  
      "text" : """"PUT" resource operation on 'application/oracle.com.cloud.common.VM' identified by 'C5CA59AF9386975E8AEA45B0F040F095' is successfully submitted with reference '2''
      ,  
      "date" : "2013-02-26T19:53:15+0000"  
    }  
  ]  
}  
```

After some time, the new disks are reflected in the VM resource using the GET request.

**Table 57-33  GET Request Configuration for Verifying Addition of New Disks in the VM Resource**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095?resource_state.disks</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the Web service response is shown below.

```
{  
  "resource_state" : {  
    "state" : "READY"  
  },  
  "disks" : [  
    [  
      "system.img (2)",  
      "1400"
    ],  
    [  
      "default_disk",  
      "10240"
    ],  
    [  
      "additional_1",  
      "5120"
    ],  
    [  
      "additional_2",  
      "10240"
    ]  
  ]  
}  
```
57.3.3 Deleting a Service Instance

The DELETE request on the URI of the resource can be issued to delete a Service Instance. For example, the following DELETE request is issued:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td><code>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095</code></td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td><strong>Body</strong></td>
<td>None</td>
</tr>
<tr>
<td><strong>Request method</strong></td>
<td>DELETE</td>
</tr>
<tr>
<td><strong>Supported since release</strong></td>
<td>12.1.0.1 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
"uri" : "/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095",
"resource_state" : {   
  "state" : "READY",
  "messages" : [
    {      
      "text" : "DELETE resource operation on 'application/oracle.com.cloud.common.VM' identified by 'C5CA59AF9386975E8AEA45B0F040F095' is successfully submitted with reference 'C7A83335CB63DA7BE040578CDA814DDC'",
      "date" : "2012-08-20T01:24:38+0000"
    }
  ]
},
"context_id" : "C5CA59AF9386975E8AEA45B0F040F095",
"media_type" : "application/oracle.com.cloud.common.VM+json",
"service_family_type" : "iaas",
```

After some time, the GET request on the VM URI will result in the following interaction:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>URI</strong></td>
<td><code>/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095</code></td>
</tr>
<tr>
<td><strong>Request headers</strong></td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td><strong>Body</strong></td>
<td>None</td>
</tr>
<tr>
<td><strong>Request method</strong></td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the web service returned response is shown below.
Note the "status" of the VM has the "DELETED" value.

57.3.4 Listing Service Instances

There are various references to service instances in the resource model, and they are all in context of the resource themselves. For example, "service_instances" in the Zone resource would list the elements that are in that Zone, while "service_instances" in the ServiceTemplate resource would list the elements that are based on that service template.

For example, the following list the service instances in a zone.

Table 57-36  GET Request Configuration for Viewing Service Instances in a Zone

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/iaas/zone/D73AF0D42C8459E11419862797D1F37D?service_instances</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXi6ZGVtb3VzZXi=</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
<tr>
<td>Supported since release</td>
<td>12.1.0.4 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The following response is received:

```json
{
    "service_instances" : {
        "media_type" : "application/oracle.com.cloud.common.ServiceInstance+json" ,
        "total" : "2" ,
        "elements" : [
            {
                "uri" : "/em/cloud/iaas/server/vm/523CAE80A305928C9C5BE8A67A4181FD*",
                "name" : "ZONEPOST",
                "media_type" : "application/oracle.com.cloud.common.VM+json",
                "status" : "STARTED"
            },
            {
                "uri" : "/em/cloud/iaas/server/vm/C5CA59AF9386975E8AEA45B0F040F095*",
                "name" : "STPOST",
                "media_type" : "application/oracle.com.cloud.common.VM+json",
                "status" : "STARTED"
            }
        ]
    }
}```
Similarly, you can list the service instances from the service templates:

### Table 57-37  GET Request Configuration for Viewing Service Instances Under a Service Template

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URL</td>
<td>/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3AC76CEB5563EA5E13E040578CDA817FAF%3A0.1?service_instances</td>
</tr>
<tr>
<td>Request headers</td>
<td>Authorization: basic ZGVtb3VzZXI6ZGVtb3VzZXI=</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
<tr>
<td>Supported since</td>
<td>12.1.0.4 Cloud Service Portal plug-in release</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```
{
  "service_instances": [
    { "uri": "/em/cloud/iaas/server/vm/C5CA59AF9386975E8AA45B0F040F095*", "name": "STPOST", "media_type": "application/oracle.com.cloud.common.VM+json", "status": "STARTED" },
    { "uri": "/em/cloud/iaas/server/vm/523CAE80A305928C9C5BE8A674A181FD*", "name": "ZONEPOST", "media_type": "application/oracle.com.cloud.common.VM+json", "status": "STARTED" }
  ]
}
```

### 57.3.5 Searching Service Templates

Searching for a service template through cloud can be performed by constructing ServiceTemplateFinds resource. ServiceTemplateFinds is synonymous to a “report” that contains elements satisfying the condition specified.

For example, the following will return service template with the name OEL in it.
Table 57-38    POST Request Configuration for Filtering Service Templates

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;filters&quot;: {</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;: &quot;OEL&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
<tr>
<td>Supported since</td>
<td>12.1.0.5 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
    "uri": "/em/cloud/finds/service_template/bWVkaWFdHlwZSlyNNEVXKwbGljYXRpb24lMjUyRm9yYWNsZS5jb20uY2xvdWQuY29tW9uLiNl%0AcnZpY2VUZlwbGF0ZSUyMj5hMjU1Lm9zRE9FTA%3D%3D",
    "name": "Service Template Finds",
    "media_type": "application/oracle.com.cloud.common.ServiceTemplateFinds+json",
    "description": "This is a Resource Finds for "Service Template Finds" with media type 'application/oracle.com.cloud.common.ServiceTemplateFinds+json'",
    "resource_state": {
        "state": "READY"
    },
    "filters": {
        "media_type": "application/oracle.com.cloud.common.ServiceTemplate",
        "name": "OEL"
    },
    "finds": {
        "media_type": "application/oracle.com.cloud.common.ServiceTemplate",
        "total": "1",
        "elements": [
            {
                "uri": "/em/cloud/iaas/servicetemplate/vm/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3ATemplate%3A79757269%3A0.1",
                "name": "OEL4.0 For Testing",
                "media_type": "application/oracle.com.cloud.common.VMTemplate+json",
                "type": "Template"
            }
        ]
    }
}
```

Currently, the following attributes are supported by the "filters":

---

Chapter 57
Infrastructure as a Service REST API Examples

57-47
Table 57-39  Filters

<table>
<thead>
<tr>
<th>Attributes</th>
<th>Description</th>
<th>Since</th>
</tr>
</thead>
<tbody>
<tr>
<td>media_type</td>
<td>The specific service template media to search for. This would be an exact match of the media type.</td>
<td>12.1.0.5 Cloud Service Portal Plugin (IaaS service family type only)</td>
</tr>
<tr>
<td>name</td>
<td>A service template would be returned if the name contains the specified string, case insensitive (so, OEL and oel in the example above would return the same result).</td>
<td>12.1.0.5 Cloud Service Portal Plugin (IaaS service family type only)</td>
</tr>
</tbody>
</table>

If an attribute specified is not recognized by the system, it will be ignored. For example, the following will return service templates containing the name DUMMY:

Table 57-40  POST Request Configuration for an Unrecognized Attribute

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud</td>
</tr>
<tr>
<td>Body</td>
<td>{</td>
</tr>
<tr>
<td></td>
<td>&quot;filters&quot;:{</td>
</tr>
<tr>
<td></td>
<td>&quot;name&quot;:&quot;DUMMY&quot;</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
<tr>
<td></td>
<td>}</td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Request method</th>
<th>POST</th>
</tr>
</thead>
<tbody>
<tr>
<td>Supported since release</td>
<td>12.1.0.5 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

The response received is shown below.

```json
{}
"uri": "/em/cloud/finds/service_template/b4VKaWFdH1w2SUyNTNEXXbG1yXKrbp241MjUyRm9yYWNs2S5jb20uY2xvdWQuY29tbW9uLiN1%0Acm2pY2VU2WlbGFO2SUyRm5hbWU1MzRERVRTU1Z",
"name": "Service Template Finds",
"media_type": "application/oracle.com.cloud.common.ServiceTemplateFinds+json",
"description": "This is a Resource Finds for 'Service Template Finds' with media type 'application/oracle.com.cloud.common.ServiceTemplateFinds+json'",
"resource_state": {
  "state": "READY"
},
"filters": {
  "media_type": "application/oracle.com.cloud.common.ServiceTemplate",
  "name": "DUMMY"
},
"finds": {
  "media_type": "application/oracle.com.cloud.common.ServiceTemplate",
  "total": "0",
```
Since there were no service templates with "DUMMY" as part of its name, no service templates are returned.

Please note, once the resource ServiceTemplateFinds is created, its URI can be used for performing the same query by issuing a GET request. If new templates were added that also satisfy the conditions, it would be returned as well.

For example, let's use the DUMMY example's URI, and this time, a service template with "DUMMY" in its name was created.

Table 57-41    GET Request Configuration for Filtering Service Templates Using the URI of a Preset POST Filter

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>

<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
<tr>
<td>Supported since</td>
<td>12.1.0.5 Cloud Service Portal plug-in</td>
</tr>
</tbody>
</table>

Shown below is the response of the GET request after the service template was created and published by the administrator:

```json
{
   "uri" : "/em/cloud/finds/service_template/bWVkaWFfdHlwZSUyNTNEYXBwbGljYXRpb24IMjUyRm9yYWNsZS5jb20uY2xvdWQuY29tbW9uLmNl%0AcnZpY2VUZW1wbGF0ZSUyRm5hbWU1MjUzRERTU1Z",
   "name" : "Service Template Finds",
   "media_type" : "application/oracle.com.cloud.common.ServiceTemplateFinds+json",
   "description" : "This is a Resource Finds for 'Service Template Finds' with media type 'application/oracle.com.cloud.common.ServiceTemplateFinds+json'",
   "resource_state" : {
      "state" : "READY"
   },
   "filters" : {
      "media_type" : "application/oracle.com.cloud.common.ServiceTemplate",
      "name" : "DUMMY"
   },
   "finds" : {
      "media_type" : "application/oracle.com.cloud.common.ServiceTemplate",
      "total" : "1",
      "elements" : [
         {
            "uri" : "/em/cloud/iaas/servicetemplate/assembly/oracle%3AdefaultService%3Aem%3Aprovisioning%3A1%3Acmp%3AVirtualization%3A1Assembly%3AD6A7D3D84B605D11E040F20A0B524E1C%3A0.1",
            "name" : "Dummy OEL Assembly"
         }
      ]
}
```
As the document previous noted, this 12.1.0.4 Cloud Service Portal Plugin supports the specification version 10000. To start, issue the following HTTP request on the Enterprise Manager:

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td><code>/em/cloud</code></td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri" : "/em/cloud",
  "name" : "Infrastructure Cloud",
  "description" : "Infrastructure Cloud with Self Service Portal and Virtualization Managements",
  "service_templates" : {
    "uri" : "/em/cloud/collection/servicetemplates",
    "type" : "application/oracle.com.cloud.common.ServiceTemplate+json",
    "total" : "7",
    "elements" : [
      {
        "name" : "sidb_assembly",
        "type" : "Assembly",
        "version" : "0.1"
      },
      {
        "name" : "wls_assembly",
        "type" : "Assembly",
        "version" : "0.1"
      },
      {
        "name" : "template_sanity",
        "type" : "Template",
```
Similarly, to return the list of resources in the VDC, the following can be issued (note that X-specification-version must be included in the header whenever working with 10000 version resources):

**Table 57-43 GET Request Configuration for Viewing Details of the VDC Resources**

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/cloud/vdc/default/D73AF0D42C8459E11419862797D1F37D</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json

}
Chapter 57
Support for Version 1000
If the X-Specification-Version header was not specified, the response received would be similar to the following:

```json
{
    "messages": [
        {
            "text": "Media Type 'application/oracle.com.cloud.common.VDC' specified in the request cannot be supported by the Cloud Resource. Cloud Resource supports Media Type 'application/oracle.com.cloud.common.Cloud+json'",
            "date": "2012-08-19T15:17:08+0000"
        }
    ]
}
```

**Note:**
Only Infrastructure Service resources are supported on 10000 version. Features supported are the same as the previous version.
Testing as a Service REST APIs

This chapter describes the resource models for Testing as a Service (TaaS) REST API and the REST request/response interactions. This chapter contains the sections listed below. The first section provides a summary of all the REST APIs covered in this chapter, whereas the following sections provide an introduction to TaaS, the TaaS resource models and the REST API examples.

- Summary of Testing as a Service REST APIs
- Introduction to Testing as a Service REST API
- Testing as a Service Resource Model
  - Application Resource
  - TestDriverType Resource
  - TestDriver Resource
  - QuotaUsage Resource
  - TestAsset
  - OltScenario
  - CustomParameters
  - OFTAssetScript Resource
  - OfAssetScriptCsvDatabanks
  - OftPlaybackSettings Resource
  - OftDatabaseDatabanks
  - TestEnvironment
  - Test
  - Trial
  - Metric
  - MetricValue
  - OltSession
  - OltCounter
  - OltCounterValue
  - OfTrialAssetExecution
  - TestDriverInstance
  - TestEnvironmentInstance Resource
  - Operation
  - TestType
  - Target
58.1 Summary of Testing as a Service REST APIs

58.2 Introduction to Testing as a Service REST API

Using the TaaS REST API, you can:

- Interact with the TaaS application without accessing the TaaS user interface.
- Run TaaS functions in script form.
- Easily integrate TaaS with your existing applications and systems.

The TaaS REST API is implemented using the RESTful (Representational State Transfer) Web Service. A complete explanation about the Cloud REST APIs is available in Introduction to Cloud APIs.

58.2.1 How to Use Testing as a Service REST API

The following diagram shows how a Tester uses Testing as a Service:

Figure 58-1  Testing Cloud End User Activities

Here are a few tasks and operations you can perform using the TaaS REST API:

- Tests
  List/view/create/update/delete tests and list all trials that belong to a test.
• Quota and Usage
  See overall quota usage of a user.

• Trials
  View/create/update/delete trials of a trial and its operations/details on Trial Home page.

• Test Asset/Test Environment
  List/view test asset and test environments being published to TaaS user.

• Test Driver/Environment Instances
  List/view/create/update/delete/start/stop instances of test driver and test environment.

58.2.2 How Resource Models Are Used in TaaS

The purpose of using Testing as a Service is to create tests and then run trials using the tests. Figure 58-2 shows the resources used to define tests and the trials.

Simply put:

1. Test driver types are used when defining test assets.
2. Test assets, test environments, targets, and test drivers are used when defining tests.
3. Tests, test environment instances, and test driver instances are used when defining trials.

Figure 58-2 shows these resources and their relationships.
Figure 58-2  TaaS Resources Relationship Diagram
58.3 Testing as a Service Resource Model

Most resources have common attributes such as context_id and uri. context_id is an identifier which could be a GUID or a unique ID of the corresponding entity in the database table.

Methods GET/POST/PUT/DELETE (corresponding to read/create/update/delete methods) are standard HTTP methods. Usually GET means find/query, POST means create, PUT means update, and DELETE means delete/remove. For example, when a field is marked as '[POST] required', this means that when you create a resource (use the POST method), you must provide this field.

The available resources are:

- Application Resource
- TestDriverType Resource
- TestDriver Resource
- QuotaUsage Resource
- TestAsset
- OltScenario
- CustomParameters
- OFTAssetScript Resource
- OftAssetScriptCsvDatabanks
- OftPlaybackSettings Resource
- OftDatabaseDatabanks
- TestEnvironment
- Test
- Trial
- Metric
- MetricValue
- OltSession
- OltCounter
- OltCounterValue
- OftTrialAssetExecution
- TestDriverInstance
- TestEnvironmentInstance Resource
- Operation
- TestType
- Target
- OltAgent
58.3.1 Application Resource

Application types are used by Test Designers when creating Test Assets and Test Environments. The application type is metadata used to organize test related activities.

The following table describes the Application resource model.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the application</td>
</tr>
<tr>
<td>contextId(id)</td>
<td>Long</td>
<td>Context ID of the application</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the Application resource.

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET)</td>
<td>Returns a list of applications</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/applications</td>
</tr>
<tr>
<td>GET</td>
<td>Returns an application by ID.</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/applications/1</td>
</tr>
</tbody>
</table>

58.3.2 TestDriverType Resource

The TestDriverType (Test Driver Type) resource defines the type of Test Driver.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the custom test driver type</td>
</tr>
<tr>
<td>contextId(id)</td>
<td>Long</td>
<td>Context ID of the test driver type</td>
</tr>
<tr>
<td>testTypeUri</td>
<td>String</td>
<td>URI of test type (Oracle Load Testing, Oracle Functional Testing, or Custom)</td>
</tr>
<tr>
<td>testTypeName</td>
<td>String</td>
<td>Name of test type</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the TestDriverType resource.
Table 58-5  Supported Methods for TestDriverType Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without context_id)</td>
<td>Returns a list of test driver types</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_driver_types</td>
</tr>
<tr>
<td>GET</td>
<td>Returns a test driver type by ID.</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_driver_types/1</td>
</tr>
</tbody>
</table>

58.3.3 TestDriver Resource

The TestDriver (Test Driver) resource is the package of software that Enterprise Manager uses to generate tests or workload against test systems based on a deployment plan.

Table 58-6  TestDriver Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the test driver</td>
</tr>
<tr>
<td>testDriverTypeUri</td>
<td>String</td>
<td>URI of the test driver type being set to this test driver</td>
</tr>
<tr>
<td>testDriverTypeName</td>
<td>String</td>
<td>Test driver type name of the test driver</td>
</tr>
<tr>
<td>version</td>
<td>String</td>
<td>Version of the test driver</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the test driver</td>
</tr>
<tr>
<td>contextId(guid)</td>
<td>String</td>
<td>Context ID of the test driver</td>
</tr>
<tr>
<td>resultsStorage</td>
<td>String</td>
<td>Result storage type of the Oracle Functional Testing test driver</td>
</tr>
<tr>
<td>resultFileSystem</td>
<td>OftRfsEntit y</td>
<td>Detailed result file system information for Oracle Functional Testing test driver, if the 'resultsStorage' attribute is 'rfs'.</td>
</tr>
</tbody>
</table>

Table 58-7  Supported Methods for the TestDriver Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without context_id)</td>
<td>Returns a list of test drivers</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_drivers</td>
</tr>
<tr>
<td>GET</td>
<td>Returns a test driver by GUID</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_drivers/C0D0F1A8F11A2EA1E040E50A42B870CF</td>
</tr>
</tbody>
</table>

OftRfsEntity Subtype

The OftRfsEntity (Oracle Functional Testing RFS Entity) subtype represents a NFS (Network File System) that provides the file storage service, and optional access to the stored file with HTTP protocol, for the end user.
Table 58-8  OftRfsEntity Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the result file system</td>
</tr>
<tr>
<td>exportPath</td>
<td>String</td>
<td>Export path for the result file system</td>
</tr>
<tr>
<td>httpAccessUrl</td>
<td>String</td>
<td>HTTP URL to access the result file system</td>
</tr>
</tbody>
</table>

58.3.4 QuotaUsage Resource

The QuotaUsage (Quota Usage) resource represents usage quotas for Testers by specific roles, including the Number of Guest VMs (Virtual Machines), Number of CPUs, Memory (GB), Storage Size (GB), and Number of VUs (Virtual Users).

Table 58-9  QuotaUsage Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>maxNumberOfGuestVM</td>
<td>Long</td>
<td>Maximum number of guest Virtual Machines that are allowed to be assigned to the role</td>
</tr>
<tr>
<td>maxNumberOfCpu</td>
<td>Long</td>
<td>Maximum number of CPUs that are allowed to be assigned to the role</td>
</tr>
<tr>
<td>maxMemory</td>
<td>Double</td>
<td>Maximum amount of memory that is allowed to be assigned to the role</td>
</tr>
<tr>
<td>maxStorageSize</td>
<td>Double</td>
<td>Maximum amount of storage that is allowed to be assigned to the role</td>
</tr>
<tr>
<td>maxNumberOfVU</td>
<td>Long</td>
<td>Maximum number Virtual Users that are allowed to be assigned to the role</td>
</tr>
<tr>
<td>numberOfCpu</td>
<td>Long</td>
<td>Number of CPUs used</td>
</tr>
<tr>
<td>numberOfGuestVM</td>
<td>Long</td>
<td>Number of guest Virtual Machines used</td>
</tr>
<tr>
<td>memory</td>
<td>Double</td>
<td>Amount of memory</td>
</tr>
<tr>
<td>storageSize</td>
<td>Double</td>
<td>Amount of storage used</td>
</tr>
<tr>
<td>numberOfVU</td>
<td>Long</td>
<td>Number of Virtual Users used</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the QuotaUsage resource.

Table 58-10  Supported Methods for QuotaUsage Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Returns quota and usage of current user.</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/quota_usage/user_quota_usage</td>
</tr>
</tbody>
</table>
58.3.5 TestAsset

A Test Asset is a collection of test artifacts (scenarios, scripts, tests) that can be executed on a test environment. A test asset defines the actions that need to be executed to reproduce the workload against the test environment.

**Table 58-11** Test Asset Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the test asset</td>
</tr>
<tr>
<td>testDriverTypeUri</td>
<td>String</td>
<td>URI of the test driver type of the test asset.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Oracle Functional Testing, Oracle Load Testing, or Custom test drivers)</td>
</tr>
<tr>
<td>testDriverTypeName</td>
<td>String</td>
<td>Name of the test driver type of the test asset.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>(Oracle Functional Testing, Oracle Load Testing or Custom test drivers)</td>
</tr>
<tr>
<td>applicationUri</td>
<td>String</td>
<td>URI of the application being associated with this test asset</td>
</tr>
<tr>
<td>applicationName</td>
<td>String</td>
<td>Name of the application being associated with this test asset</td>
</tr>
<tr>
<td>tags</td>
<td>String</td>
<td>Tags of the test asset. A tag is a keyword assigned to an asset. Tags help describe the test asset and allows it to be found again in browsing or searching.</td>
</tr>
<tr>
<td>lastModified</td>
<td>String (ISO 8601 date)</td>
<td>Last time the test asset was modified</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>User name of the owner</td>
</tr>
<tr>
<td>contextId(guid)</td>
<td>String</td>
<td>Context ID of the test asset</td>
</tr>
<tr>
<td>oltTestAssetSettings</td>
<td>OltTestAssetSettings</td>
<td>Specific test asset settings for Oracle Load Testing test asset.</td>
</tr>
<tr>
<td>oftTestAssetSettings</td>
<td>OftTestAssetSettings</td>
<td>Specific test asset settings for Oracle Functional Testing test asset.</td>
</tr>
<tr>
<td>customTestAssetSettings</td>
<td>CustomTestAssetSettings</td>
<td>Specific test asset settings for Custom test asset.</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the TestAsset resource.

**Table 58-12** Supported Methods for TestAsset Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without context_id)</td>
<td>Returns a list of test assets being published to current user</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_assets</td>
</tr>
<tr>
<td>GET</td>
<td>Returns attributes of test asset by GUID.</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/C0D0F1A8F11A2EA1E040E50A42BB70CF</td>
</tr>
</tbody>
</table>
**OltTestAssetSettings Subtype**

Use the OltTestAssetSettings subtype to provide specific test settings for the Oracle Load Testing test asset.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>vuCountEditable</td>
<td>Boolean</td>
<td>Whether script VU counts are editable</td>
</tr>
<tr>
<td>rampupSettingEditable</td>
<td>Boolean</td>
<td>Whether rampup is editable</td>
</tr>
<tr>
<td>endConditionEditable</td>
<td>Boolean</td>
<td>Whether end condition is editable</td>
</tr>
<tr>
<td>oltScenarioFileDownloadUri</td>
<td>String</td>
<td>URI of the Oracle Load Testing test scenario file download location</td>
</tr>
<tr>
<td>oltScenarioUri</td>
<td>String</td>
<td>URI of the Oracle Load Testing scenario details</td>
</tr>
</tbody>
</table>

**OftTestAssetSettings Subtype**

Use OftTestAssetSettings subtype to provide specific test settings for the Oracle Functional Testing test asset.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scriptDetailsUri</td>
<td>String</td>
<td>URI for the Oracle Functional Testing script details</td>
</tr>
<tr>
<td>scriptFileUri</td>
<td>String</td>
<td>URI used to indicate the download URL for the Oracle Functional Testing script zip file</td>
</tr>
</tbody>
</table>

**CustomTestAssetSettings Subtype**

Use the CustomTestAssetSettings subtype to provide specific test settings for the Oracle Custom test asset.

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scriptFileDownloadUri</td>
<td>String</td>
<td>URI of the custom script file download location</td>
</tr>
<tr>
<td>customParametersUri</td>
<td>String</td>
<td>URI of the custom parameters</td>
</tr>
</tbody>
</table>

**58.3.6 OltScenario**

OltScenario (Oracle Load Testing OLT Scenario) represents detail scenario information for an Oracle Load Testing Test Asset.
Table 58-16  OltScenario Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>testAssetContextId</td>
<td>String</td>
<td>Context ID of the test asset</td>
</tr>
<tr>
<td>testAssetUri</td>
<td>String</td>
<td>URI of the test asset</td>
</tr>
<tr>
<td>hardwareEstimationAvailable</td>
<td>Boolean</td>
<td>Whether hardware estimation is available for this scenario</td>
</tr>
<tr>
<td>ramupDescription</td>
<td>String</td>
<td>Description of test asset default rampup setting</td>
</tr>
<tr>
<td>endConditionDescription</td>
<td>String</td>
<td>Description of test asset default end condition</td>
</tr>
<tr>
<td>scriptVuCounts</td>
<td>OltScript</td>
<td>VU counts for scripts in the scenario</td>
</tr>
</tbody>
</table>

The following table lists the method supported in the OltScenario resource.

Table 58-17  Supported Method for OltScenario Resource

<table>
<thead>
<tr>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>Returns Oracle Load Testing Scenario</td>
<td>em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/DFF34956DD08E27AE040F50A351D3DB5/olt_scenario</td>
</tr>
</tbody>
</table>

OltScript Subtype

Use the OltScript subtype to identify the Oracle Load Testing script.

Table 58-18  OltScript Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the script</td>
</tr>
<tr>
<td>vuCount</td>
<td>Integer</td>
<td>Number of virtual user count</td>
</tr>
</tbody>
</table>

58.3.7 CustomParameters

Custom Parameters is a collection of custom parameter settings for custom Test Asset or custom Trial.

Table 58-19  CustomParameters Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
</tbody>
</table>
Table 58-19  (Cont.) CustomParameters Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>parameters</td>
<td>List of CustomParameter</td>
<td>List of custom parameter</td>
</tr>
</tbody>
</table>

The following table lists the method supported in the CustomParameters resource.

Table 58-20  Supported Method for CustomParameter Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Returns custom parameters</td>
<td>• From custom test asset:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/DFF34956DD08E27AE040F50A351D3DB5/custom_parameters</td>
</tr>
<tr>
<td></td>
<td></td>
<td>• From custom trial:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>em/websvcs/restful/extws/cloudservices/taas/v1/trials/E06DE62ACC497B71E040F50A351D66D0/custom_parameters</td>
</tr>
</tbody>
</table>

CustomParameter Subtype

The customParameter subtype is used in custom test asset or custom trial. Each customParameter represents a custom defined parameter.

Table 58-21  CustomParameter Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the parameter</td>
</tr>
<tr>
<td>value</td>
<td>String</td>
<td>Value of the parameter</td>
</tr>
<tr>
<td>defaultValue</td>
<td>String</td>
<td>Default value of the parameter</td>
</tr>
<tr>
<td>configurable</td>
<td>Boolean</td>
<td>Is the parameter configurable</td>
</tr>
</tbody>
</table>

58.3.8 OFTAssetScript Resource

OFTAssetScript (Oracle Functional Testing Asset Script) represents the detailed data for a script (in zip format) of an Oracle Functional Testing test asset. URI for more detailed data (if available), for example, the Open Script script information, databanks, playback settings, are retrievable from this resource.

Table 58-22  OFTAssetScript Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>testAssetContextId</td>
<td>String</td>
<td>Context ID for the test asset</td>
</tr>
<tr>
<td>testAssetUri</td>
<td>String</td>
<td>URI for the test asset</td>
</tr>
</tbody>
</table>
Table 58-22  (Cont.) OFTAssetScript Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>scripts</td>
<td>List of OftScriptEntity</td>
<td>List of detailed data for each Open Script script inside this asset script zip file</td>
</tr>
<tr>
<td>urlsInsideScripts</td>
<td>List of String</td>
<td>List of URLs inside the Open Script scripts of this Oracle Functional Testing asset script zip file</td>
</tr>
<tr>
<td>csvDatabanksUri</td>
<td>String</td>
<td>URI for the resource that represents the comma-separated value (CSV) databanks</td>
</tr>
<tr>
<td>playbackSettingsUri</td>
<td>String</td>
<td>URI for the resource that represents the playback settings</td>
</tr>
<tr>
<td>dbDatabanksUri</td>
<td>String</td>
<td>URI the resource that represents the database databanks</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the OFTAssetScript resource.

Table 58-23  Supported Methods for OFTAssetScript Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Returns Oracle Functional Testing test asset script by asset GUID.</td>
<td>/em/websvcs/restful/extWA/cloudservices/taas/v1/test_assets/E3F48FC047CCE9E5E040F50A2D1E128E/oft_script_details</td>
</tr>
</tbody>
</table>

OftScriptEntity Subtype

Use the OftScriptEntity subtype to provide the specific details for the Oracle Functional Testing script entity.

Table 58-24  OftScriptEntity Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Open Script script</td>
</tr>
<tr>
<td>type</td>
<td>String</td>
<td>Type of Open Script script</td>
</tr>
<tr>
<td>version</td>
<td>String</td>
<td>Version of the Open Script script</td>
</tr>
<tr>
<td>encrypted</td>
<td>Boolean</td>
<td>Indicates if the script is encrypted or not</td>
</tr>
<tr>
<td>modules</td>
<td>List of OftScriptModuleEntity</td>
<td>Modules defined and used in this Open Script script</td>
</tr>
</tbody>
</table>

OftScriptModuleEntity Subtype

Use the OftScriptModuleEntity subtype to provide the specific details for the Oracle Functional Testing script module entity.
Table 58-25  OftScriptModuleEntity Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the Open Script module</td>
</tr>
</tbody>
</table>

58.3.9 OftAssetScriptCsvDatabanks

The OftAssetScriptCsvDatabanks (Oracle Functional Testing Asset Script Comma-Separated Values Databanks) resource represents a list of CSV databank. The OFT Asset Script CSV Databanks resource is represented with type CsvDatabankCollection.

Databanks are used to hold unlimited amounts of input data that can be automatically fed into your Web application.

Table 58-26  OftAssetScriptCsvDatabanks Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>testAssetContextId</td>
<td>String</td>
<td>Context ID of the test asset</td>
</tr>
<tr>
<td>testAssetUri</td>
<td>String</td>
<td>URI for the test asset</td>
</tr>
<tr>
<td>scriptDetails</td>
<td>String</td>
<td>URI for the asset script details</td>
</tr>
<tr>
<td>csvDatabanks</td>
<td>List of OftAssetCsvDatabankEntity</td>
<td>List of detailed data for all CSV databanks inside the Oracle Functional Testing asset script</td>
</tr>
</tbody>
</table>

The following table lists the method supported in the OftAssetScriptCsvDatabanks resource.

Table 58-27  Supported Method for OftAssetScriptCsvDatabanks Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without context_id)</td>
<td>Returns a list of csv databanks for the specified test asset script</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/E3F48FC047CCE9E5E040F50A2D1E128E/oft_script_details/csv_data_banks</td>
</tr>
</tbody>
</table>

CsvDatabank Subtype

Use the CsvDatabank subtype to provide the specific details for the Oracle Functional Testing asset script resource.
### Table 58-28  CsvDatabank Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the csv databank</td>
</tr>
<tr>
<td>contents</td>
<td>String</td>
<td>Contents inside the comma-separated value (CSV) databank</td>
</tr>
</tbody>
</table>

#### 58.3.10 OftPlaybackSettings Resource

The OftPlaybackSettings (Oracle Functional Testing Playback Settings) resource represents all the playback settings configuration for a script.

### Table 58-29  OftPlaybackSettings Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>testAsset</td>
<td>ContextId</td>
<td>Context ID for the test asset</td>
</tr>
<tr>
<td>TestAsset</td>
<td>Uri</td>
<td>URI for the test asset</td>
</tr>
<tr>
<td>scriptDetailsUri</td>
<td>Script</td>
<td>URI for the asset script details</td>
</tr>
<tr>
<td>values</td>
<td>String</td>
<td>Playback settings configuration contents for the asset script</td>
</tr>
</tbody>
</table>

The following table lists the method supported in the OftPlaybackSettings resource.

### Table 58-30  Supported Methods for OftPlaybackSetting Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Returns playback settings for specified Oracle Functional Testing asset script</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/E3F48FC047CCE9E5E040F50A2D1E128E/of Script_details/playback_settings</td>
</tr>
</tbody>
</table>

#### 58.3.11 OftDatabaseDatabanks

The OftDatabaseDatabanks (Oracle Functional Testing Database Databanks) resource represents a list of database databanks for a specified Oracle Functional Testing test asset. OftDatabaseDatabanks is represented with type DbDatabankCollection.

Databanks are used to hold unlimited amounts of input data that can be automatically fed into your Web application.
Table 58-31 OftDatabaseDatabanks Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>testAssetContextId</td>
<td>String</td>
<td>Context ID for the test asset</td>
</tr>
<tr>
<td>testAssetUri</td>
<td>String</td>
<td>URI for the test asset</td>
</tr>
<tr>
<td>scriptDetailsUri</td>
<td>String</td>
<td>URI for the asset script details</td>
</tr>
<tr>
<td>databaseDatabanks</td>
<td>List of OftScriptDbDataBankEntity</td>
<td>List of detailed data for all database databanks inside the Oracle Functional Testing asset script</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the OftDatabaseDatabanks resource.

Table 58-32 Supported Methods for OftDatabaseDatabanks Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without id parameter)</td>
<td>Returns a list of database databanks for the specified test asset script</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_assets/E3F708CCD6CAC1E6E040F50A2D1E4ADE/of_script_details/db_data_banks</td>
</tr>
</tbody>
</table>

OftScriptDbDataBankEntity Subtype

Use the OftScriptDbDataBankEntity subtype to provide the specific details for the Oracle Functional Testing script database databank entity resource.

Table 58-33 OftScriptDbDataBankEntity Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>alias</td>
<td>String</td>
<td>Alias of the database databank</td>
</tr>
<tr>
<td>driver</td>
<td>String</td>
<td>Driver for the database databank</td>
</tr>
<tr>
<td>connectUrl</td>
<td>String</td>
<td>Connection URL for the database databank</td>
</tr>
<tr>
<td>userName</td>
<td>String</td>
<td>User name for the database databank</td>
</tr>
<tr>
<td>sql</td>
<td>String</td>
<td>SQL string defined inside the database databank</td>
</tr>
</tbody>
</table>

58.3.12 TestEnvironment

TestEnvironment is a collection of resources that represents the entire application stack.

Table 58-34 TestEnvironment Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
</tbody>
</table>
### Table 58-34  (Cont.) TestEnvironment Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the test environment</td>
</tr>
<tr>
<td>applicationUri</td>
<td>String</td>
<td>URI of the application of this test environment.</td>
</tr>
<tr>
<td>applicationName</td>
<td>String</td>
<td>Name of the application of this test environment</td>
</tr>
<tr>
<td>tags</td>
<td>String</td>
<td>Tags of the test environment</td>
</tr>
<tr>
<td>owner</td>
<td>String</td>
<td>User name of the owner of this test environment</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the test environment</td>
</tr>
<tr>
<td>lastModified</td>
<td>String (ISO 8601 date)</td>
<td>Last modified date of the test environment</td>
</tr>
<tr>
<td>contextId</td>
<td>String</td>
<td>Context ID (GUID) of the test environment</td>
</tr>
</tbody>
</table>

The following table lists the methods supported in the TestEnvironment resource.

### Table 58-35  Supported Methods for TestEnvironment Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>LIST (GET without ID parameter)</td>
<td>Returns a list of test environments being published to current user</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_environments</td>
</tr>
<tr>
<td>GET</td>
<td>Returns test environment by GUID</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_environments/C0D0F1A8F11A2EA1E040E50A42BB70CF</td>
</tr>
</tbody>
</table>

58.3.13 Test

**Note:** Test is a parent resource of the Trial resource.

Testers use this resource to create tests from test assets and test environments to perform testing activities. Testers create tests using test assets and environments that have been assigned to them by the Test Administrator.

### Table 58-36  Test Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the resource</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the test. When using the POST method, name is required. When using the PUT method, name is optional.</td>
</tr>
<tr>
<td>testDriverTypeUri</td>
<td>String</td>
<td>URI of the test driver type</td>
</tr>
<tr>
<td>testDriverTypeName</td>
<td>String</td>
<td>Name of the test driver type</td>
</tr>
<tr>
<td>description</td>
<td>String</td>
<td>Description of the test. [POST] [PUT] optional</td>
</tr>
</tbody>
</table>
Table 58-36  (Cont.) Test Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>testAssets</td>
<td>List of AssetInTest Entity</td>
<td>List of the test assets of this test. For Oracle Load Testing or custom test, one asset is used. For Oracle Functional Testing test, one or more test assets could be defined. [POST] [PUT] required</td>
</tr>
<tr>
<td>testEnvironment Uri</td>
<td>String</td>
<td>URI of the test environment of this test</td>
</tr>
<tr>
<td>testEnvironment Name</td>
<td>String</td>
<td>Name of the test environment of this test</td>
</tr>
<tr>
<td>useEnvironment Library</td>
<td>Boolean</td>
<td>Returns true if the associated test environment is from 'my library'. Returns false if the associated test environment is an existing Enterprise Manager target</td>
</tr>

<tr>
<td>testAssetUri</td>
<td>String</td>
<td>GUID of the test environment. [POST][PUT] optional.</td>
</tr>
<tr>
<td>testAssetName</td>
<td>String</td>
<td>Name of the test asset</td>
</tr>
</tbody>
</table>

ReplaceUrl Subtype

Represents a URL replacing a recorded script within test asset. While a trial is running, a URL starting with the specified segment will be replaced by the given string before the URL request is sent.

Table 58-39  ReplaceUrl Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>originalUrl</td>
<td>String</td>
<td>Original recorded URL in the script of the Test Asset. This field is optional</td>
</tr>
<tr>
<td></td>
<td></td>
<td>for the POST and PUT methods.</td>
</tr>
<tr>
<td>newUrl</td>
<td>String</td>
<td>New URL to replace original URL. This field is optional for the POST and PUT</td>
</tr>
<tr>
<td></td>
<td></td>
<td>methods.</td>
</tr>
<tr>
<td>replaceType</td>
<td>String</td>
<td>Value of KEEP_SAME, FROM_APPLIANCE, SPECIFIED. KEEP_SAME: newUrl is ignored.</td>
</tr>
<tr>
<td></td>
<td></td>
<td>FROM_APPLIANCE newUrl is set from test environment appliance. SPECIFIED:</td>
</tr>
<tr>
<td></td>
<td></td>
<td>originalUrl is replaced by newUrl that provided by user.</td>
</tr>
</tbody>
</table>

58.3.14 Trial

**Note:** Trial is a child resource of Test.

Testers to create and run trials from the test instances that have been created. The Tester runs trials on the test asset and environment, monitors ongoing trials, and analyzes the results of completed trials.
### Table 58-40 Trial Resource Model Data Model

</tbody>
</table>
OltTrialSettings Subtype

Use the OltTrialSettings subtype to provide specific trial settings for the Oracle Load Testing trial.

Table 58-42 Oracle Load Testing Trial Settings Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>oltSessionName</td>
<td>String</td>
<td>Name of the Oracle Load Testing session</td>
</tr>
<tr>
<td>oltSessionUri</td>
<td>String</td>
<td>URI of the Oracle Load Testing session resource</td>
</tr>
<tr>
<td>rampup</td>
<td>OltRampup</td>
<td>Oracle Load Testing rampup setting. [POST][PUT] optional, using default setting from test asset if null</td>
</tr>
<tr>
<td>endCondition</td>
<td>OltEndCondition</td>
<td>Oracle Load Testing trial end condition setting. [POST][PUT] optional, using default setting from test asset if null</td>
</tr>
<tr>
<td>scriptVuCounts</td>
<td>OltScript</td>
<td>Script VU counts setting. Refer to the details on OltScript in OltTestAssetSettings. [POST][PUT] optional, using default setting from test asset if null</td>
</tr>
<tr>
<td>numberOfAgentDeployments</td>
<td>Long</td>
<td>Number of agent deployments</td>
</tr>
</tbody>
</table>

OltRampup Subtype

Use the OltRampup subtype to provide the specific details for the rampup settings used in the Oracle Load Testing trial. OltRampup represents the rate at which an OLT trial starts running virtual users.

Table 58-43 OltRampup Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>rampupOption</td>
<td>Integer</td>
<td>Rampup setting option. Value from 1,2,3,4.</td>
</tr>
<tr>
<td>user</td>
<td>Integer</td>
<td>Number of users [POST][PUT] required if rampupOption 1,2</td>
</tr>
<tr>
<td>percent</td>
<td>Double</td>
<td>Number of percent [POST][PUT] required if rampupOption 3,4.</td>
</tr>
<tr>
<td>seconds</td>
<td>Long</td>
<td>Number of seconds [POST][PUT] required if rampupOption 1,3</td>
</tr>
<tr>
<td>iterations</td>
<td>Long</td>
<td>Number of iterations [POST][PUT] required if rampupOption 2,4</td>
</tr>
</tbody>
</table>
OltEndCondition Subtype

Use the OltEndCondition subtype to provide the specific end conditions used in the Oracle Load Testing trial.

**Table 58-44  OltEndCondition Subtype**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>endConditionOption</td>
<td>Integer</td>
<td>End condition option. Value from 1,2. 1: end after X seconds 2: end after X iterations</td>
</tr>
<tr>
<td>afterSeconds</td>
<td>Long</td>
<td>Number of seconds. [POST][PUT] required if endConditionOption 1</td>
</tr>
<tr>
<td>afterIterations</td>
<td>Long</td>
<td>Number of iterations. [POST][PUT] required if endConditionOption 2</td>
</tr>
</tbody>
</table>

CustomTrialSettings Subtype

Use the CustomTrial Settings subtype to provide the specific custom trial settings used in the trial resource.

**Table 58-45  CustomTrialSettings Subtype**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>resultAvailable</td>
<td>Boolean</td>
<td>States whether the custom result is available. This field is read only.</td>
</tr>
<tr>
<td>resultStatus</td>
<td>String</td>
<td>Status of custom result. Value from RESULT_PASSED, RESULT_FAILED, RESULT_PASSED_WITH_WARN</td>
</tr>
<tr>
<td>resultDownloadUri</td>
<td>String</td>
<td>URI of result file download place.</td>
</tr>
<tr>
<td>customParametersUri</td>
<td>String</td>
<td>URI of custom parameters.</td>
</tr>
<tr>
<td>parameters</td>
<td>List of</td>
<td>The custom parameters setting for custom trial. Refer to CustomParameter definition on CustomTestAssetSettings. [POST][PUT] optional, using default setting from test asset if null.</td>
</tr>
<tr>
<td></td>
<td>CustomParameter</td>
<td></td>
</tr>
</tbody>
</table>

OftAssetExecutionCollection Subtype

Use the OftAssetExecutionCollection subtype to provide the specific Oracle Functional Testing asset execution collection settings used in the trial resource.

**Table 58-46  OftAssetExecutionCollection Subtype**

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>trialContextId</td>
<td>String</td>
<td>Context ID for the trial</td>
</tr>
<tr>

<td>String</td>
<td>Context ID of the asset</td>
</tr>
<tr>
<td>assetUri</td>
<td>String</td>
<td>URI of the asset</td>
</tr>
<tr>
<td>configuration</td>
<td>AssetConfigurationEntity</td>
<td>Configuration of the Oracle Functional Testing trial asset execution.</td>
</tr>
<tr>
<td>executionResult</td>
<td>AssetResultEntity</td>
<td>Result of the Oracle Functional Testing trial asset execution.</td>
</tr>
</tbody>
</table>

The following table lists the method supported in the OftTrialAssetExecution resource.
Table 58-58  Supported Method for OftTrialAssetExecution Resource

<table>
<thead>
<tr>
<th>Method</th>
<th>Description</th>
<th>Sample URI</th>
</tr>
</thead>
<tbody>
<tr>
<td>GET</td>
<td>Returns data of an Oracle Functional Testing trial execution by trial and execution context ID</td>
<td>/em/websvcs/restful/xtws/cloudservices/taas/v1/trials/E3F85B2946C890BAE040F50A2D1E2D1B/executions/E3F85B2946C990BAE040F50A2D1E2D1B</td>
</tr>
</tbody>
</table>

AssetConfigurationEntity Subtype

Use the AssetConfigurationEntity subtype to provide the specific asset configuration entity settings used in the Oracle Functional Testing Trial Asset Execution resource.

Table 58-59  AssetConfigurationEntity Subtype

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>runAlways</td>
<td>Boolean</td>
<td>Configure if the execution will always run without considering previous errors.</td>
</tr>
<tr>
<td>continueOnWarning</td>
<td>Boolean</td>
<td>Configure if the execution will always run without considering previous errors.</td>
</tr>
<tr>
<td>continueOnError</td>
<td>Boolean</td>
<td>Configure if the execution will continue to run in the event there are errors in the previous execution.</td>
</tr>
<tr>
<td>playbackSettings</td>
<td>List of</td>
<td>List of playback settings configuration.</td>
</tr>
<tr>

58.3.23 Operation

An Operation represents one allowed operation on a resource, for example, TestEnvironmentInstance/TestDriverInstance/Trial.

The supported operations for test environment instance are: start, stop, restart.

The supported operations for test driver instance are: start, stop, restart, add_agents, remove_agent, acquire_agent.

The supported operation for trial is stop.
### Table 58-68  Operation Resource Data Model

<table>
<thead>
<tr>
<th>Field</th>
<th>Type</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>uri</td>
<td>String</td>
<td>URI of the operation</td>
</tr>
<tr>
<td>name</td>
<td>String</td>
<td>Name of the operation</td>

58.4 Testing as a Service REST API Examples

The following are examples of how to use the TaaS REST API.

- Viewing Details of all Applications
- Querying an Application by Context ID
- Viewing Details of All Test Assets
- Querying a Test Asset by Context ID
- Viewing Details of all Test Environments
- Querying a Test Environment by Context ID
- Viewing Details of all Test Drivers
- Querying a Test Driver by Context ID
- Querying Test Driver Type by Context ID
- Viewing Details of all Test Environment Instances
- Querying a Test Environment Instance by Context ID
- Creating a Test Environment Instance
- Executing an Operation on Test Environment / Driver Instance
- Deleting a Stopped Test Environment Instance
- Viewing Details of All Test Driver Instances
- Querying a Test Driver Instance by Context ID
- Creating a Test Driver Instance
- Deleting a Stopped Test Driver Instance
- Viewing Details of All Tests
- Querying a Test by Context ID
- Creating a Test
- Deleting a Test
- Viewing Details of All Trials
• Querying a Trial by Context ID
• Creating a New Trial
• Updating a Trial
• Deleting a Trial

58.4.1 Viewing Details of all Applications

The table below shows the GET request configuration.

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/applications</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request</td>
<td>GET</td>
</tr>
</tbody>
</table>

A sample of the response received is shown below.

```json
{
  "uri": "https://example.com/em/websvcs/restful/extws/cloudservices/taas/v1/applications",
  "items": [
    {
      "uri": "https://example.com/em/websvcs/restful/extws/cloudservices/taas/v1/applications/1",

58.4.13 Executing an Operation on Test Environment / Driver Instance

**Note:**

The executable operation depends on the status of the test environment instance. Operations are start, stop, and restart.

The table below shows the POST request configuration.

Table 58-89  POST Request Configuration for Executing an Operation on a Test Environment / Driver Instance

<table>
<thead>
<tr>
<th>Feature</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>URI</td>
<td>/em/websvcs/restful/extws/cloudservices/taas/v1/test_environment_instances/1/operations/stop</td>
</tr>
<tr>
<td>Body</td>
<td>None</td>
</tr>
<tr>
<td>Request method</td>
<td>POST</td>
</tr>
</tbody>
</table>
A sample of the response received is shown below.

Operation request has been submitted.

### 58.4.14 Deleting a Stopped Test Environment Instance

The table below shows the DELETE request configuration.
